INTERSECTION MITIGATION DISCUSSION

The proposed project would result in significant impacts at the following 16 study intersections under existing plus project and/or 2040 cumulative impacts.

- (#1) King/Third (*2040 cumulative*)
- (#2) King/Fourth (existing plus project, 2040 cumulative)
- (#3) King/Fifth/I-280 ramps (existing plus project, 2040 cumulative)
- (#4) Fifth/Harrison/I-80 westbound off-ramp (existing plus project, 2040 cumulative)
- (#5) Fifth/Bryant/I-80 eastbound on-ramp (existing plus project, 2040 cumulative)
- (#6) Third/Channel (existing plus project, 2040 cumulative)
- (#7) Fourth/Channel (existing plus project, 2040 cumulative)
- (#8) Seventh/Mission Bay Drive (existing plus project, 2040 cumulative)
- (#10) Third/South (existing plus project, 2040 cumulative)
- (#13) Third/16th (*2040 cumulative*)
- (#14) Fourth/16th (existing plus project, 2040 cumulative)
- (#15) Owens/16th (existing plus project, 2040 cumulative)
- (#16) Seventh/Mississippi/16th (existing plus project, 2040 cumulative)
- (#17) Illinois/Mariposa (existing plus project, 2040 cumulative)
- (#20) Mariposa/I-280 northbound off-ramp (existing plus project, 2040 cumulative)
- (#22) Third/Cesar Chavez (*2040 cumulative)*

Generally, to mitigate poor operating conditions of study intersections, additional travel lane capacity would be needed on one or more of the approaches to the intersection. The provision of additional travel lane capacity by narrowing sidewalks, removal of on-street parking, and/or removal of transit lanes or bicycle lanes would generally be infeasible and inconsistent with the transit, bicycle, and pedestrian environment encouraged by the City's *Transit First* Policy as it would remove space dedicated to transit, pedestrians, and/or bicycles and would increase the distances required for pedestrians to cross the street.

The proposed project would result in significant impacts at one intersection under the No Event scenario during the weekday p.m. peak hour.

- (#16) Seventh/Mississippi/16th – At this intersection, additional travel lane capacity would be required at all approaches to reduce impacts during the weekday p.m. peak hour. Provision of additional capacity at this intersection is constrained by the transit-only lanes om 16th Street (to be implemented as part of the 22 Fillmore Transit Priority Project, which would remove one eastbound and one westbound mixed-flow travel lane), and the bicycle lanes on Mississippi and Seventh Streets (City-designated bicycle route #23).

At the following 13 study intersections, the proposed project would result in significant impacts, primarily during the weekday evening and late evening peak hours for the Basketball Game scenario (the two time periods immediately before and immediately after a basketball game). During overlapping events, the project would result in additional impacts during the weekday p.m. peak and Saturday evening peak hours, as well as during the weekday evening and late evening peak hours. As noted in the EIR discussion, these traffic impacts would be event-related, primarily caused by large attendance events, and SFMTA PCOs would be stationed at a number of these intersections to actively manage traffic flows during pre-event and post-event periods for these scenarios.

- (#2) King/Fourth (Basketball Game scenario)
- (#3) King/Fifth/I-280 ramps (overlapping events)
- (#4) Fifth/Harrison/I-80 westbound off-ramp (Basketball Game scenario, overlapping events)
- (#5) Fifth/Bryant/I-80 eastbound on-ramp (Basketball Game scenario, overlapping events)
- (#6) Third/Channel (Basketball Game scenario)
- (#7) Fourth/Channel (Basketball Game scenario)
- (#8) Seventh/Mission Bay Drive (Basketball Game scenario)
- (#10) Third/South (overlapping events)
- (#14) Fourth/16th (overlapping events)
- (#15) Owens/16th (overlapping events)
- (#17) Illinois/Mariposa (overlapping events)
- (#20) Mariposa/I-280 northbound off-ramp (overlapping events)

To reduce intersection impacts during events to less than significant (i.e., to LOS D or better), additional travel lane capacity would generally be needed on multiple approaches, depending on the peak hour of analysis (e.g., weekday evening attendee arrivals versus weekday late evening attendee departures). Within Mission Bay the roadway network has virtually been built out already per the Mission Bay Infrastructure Plan, and additional right-of-way is not available to provide more travel lanes. Furthermore, many streets (e.g., Third Street, Fourth Street, Seventh Street, King Street, Channel Street, Owens Street, South Street, Mission Bay Drive, Mariposa Street) do not have parking lanes at the approaches to the study intersections that could be converted to a travel lane.

Sidewalk widths within Mission Bay are generally 12 feet wide, including landscaping and utilities near the curb edge; thus, narrowing of sidewalk would remove and limit space currently dedicated to pedestrians. In addition, the existing T Third light rail tracks on Third Street and the transit-only lanes on 16th Street (to be provided as part of the 22 Fillmore Transit Priority Project) constrain the provision of additional travel lanes on these two streets. The analysis of the northbound I-280 off-ramp at Mariposa Street already includes the near-term off-ramp widening at the approach to Mariposa Street to be completed by fall 2015, and additional capacity on the ramp itself is not available due to the columns supporting the I-280 freeway mainline above. At the downtown intersections at Fifth/Harrison/I-80 westbound off-ramp and Fifth/Bryant/I-80 eastbound on-ramp, intersection operations have been optimized to accommodate peak period travel demands. The geometry of the freeway ramps were already maximized a few years ago as part of the Bay Bridge West Approach seismic upgrade project conducted by Caltrans (between 2003 and 2009).

Under 2040 cumulative conditions, the proposed project would result in significant cumulative impacts or have a considerable contribution to LOS E or LOS F conditions at three additional study intersections: King/Fourth, Third/16th, and Third/Cesar Chavez. As noted above, the ability to add additional travel lane capacity on King, Third, 16th and Cesar Chavez Streets is not available.

- (#1) King/Third – additional eastbound, westbound, and northbound travel lane capacity would be required to reduce impacts during the weekday p.m. peak hour and Saturday evening peak hours.
- (#13) Third/16th – additional southbound capacity would be required to reduce impacts during the weekday p.m. peak hour.
- (#22) Third/Cesar Chavez – additional eastbound, westbound, northbound, and southbound capacity would be required to reduce impacts during the weekday p.m. peak hour.

APPENDIX TR-5
PROPOSED PROJECT
FREEWAY MAINLINE AND RAMP ANALYSIS

TRANSIT COOPERATIVE RESEARCH PROGRAM

The nation's growth and the need to meet mobility, environmental, and energy objectives place demands on public transit systems. Current systems, some of which are old and in need of upgrading, must expand service area, increase service frequency, and improve efficiency to serve these demands. Research is necessary to solve operating problems, to adapt appropriate new technologies from other industries, and to introduce innovations into the transit industry. The Transit Cooperative Research Program (TCRP) serves as one of the principal means by which the transit industry can develop innovative near-term solutions to meet demands placed on it.

The need for TCRP was originally identified in *TRB Special Report 213—Research for Public Transit: New Directions,* published in 1987 and based on a study sponsored by the Urban Mass Transportation Administration—now the Federal Transit Administration (FTA). A report by the American Public Transportation Association (APTA), Transportation 2000, also recognized the need for local, problem-solving research. TCRP, modeled after the longstanding and successful National Cooperative Highway Research Program, undertakes research and other technical activities in response to the needs of transit service providers. The scope of TCRP includes a variety of transit research fields including planning, service configuration, equipment, facilities, operations, human resources, maintenance, policy, and administrative practices.

TCRP was established under FTA sponsorship in July 1992. Proposed by the U.S. Department of Transportation, TCRP was authorized as part of the Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA). On May 13, 1992, a memorandum agreement outlining TCRP operating procedures was executed by the three cooperating organizations: FTA, the National Academies, acting through the Transportation Research Board (TRB); and the Transit Development Corporation, Inc. (TDC), a nonprofit educational and research organization established by APTA. TDC is responsible for forming the independent governing board, designated as the TCRP Oversight and Project Selection (TOPS) Committee.

Research problem statements for TCRP are solicited periodically but may be submitted to TRB by anyone at any time. It is the responsibility of the TOPS Committee to formulate the research program by identifying the highest priority projects. As part of the evaluation, the TOPS Committee defines funding levels and expected products.

Once selected, each project is assigned to an expert panel, appointed by the Transportation Research Board. The panels prepare project statements (requests for proposals), select contractors, and provide technical guidance and counsel throughout the life of the project. The process for developing research problem statements and selecting research agencies has been used by TRB in managing cooperative research programs since 1962. As in other TRB activities, TCRP project panels serve voluntarily without compensation.

Because research cannot have the desired impact if products fail to reach the intended audience, special emphasis is placed on disseminating TCRP results to the intended end users of the research: transit agencies, service providers, and suppliers. TRB provides a series of research reports, syntheses of transit practice, and other supporting material developed by TCRP research. APTA will arrange for workshops, training aids, field visits, and other activities to ensure that results are implemented by urban and rural transit industry practitioners.

The TCRP provides a forum where transit agencies can cooperatively address common operational problems. The TCRP results support and complement other ongoing transit research and training programs.

PLATFORMS AND WAITING AREAS

Levels of Service for Bus Stops and Station Platforms

Levels of service for passenger queuing and waiting areas, such as station platforms, are shown in Exhibit 10-32. The thresholds were developed based on average pedestrian space, personal comfort, and degrees of internal mobility. LOS is presented in terms of average area per person and average interpersonal space (distance between people).

The LOS required for waiting within a facility is a function of the amount of time spent waiting, the number of people waiting, the waiting pattern (in a queue versus looser standing),and a desired level of comfort. Typically, the longer the wait or the looser the waiting pattern, the greater the space per person required. A person's tolerance of a level of crowding will vary with time. People will accept being tightly packed on an elevator for one minute, but not in a waiting area for 15 minutes (*17*).

A person's acceptance of close interpersonal spacing will also depend on the characteristics of the population, the weather conditions, and the type of facility. For example, commuters may be willing to accept higher levels or longer periods of crowding than intercity and recreational travelers (*17*).

Exhibit 10-32
Levels of Service for Queuing Areas

LOS	Average Pedestrian Area (ft²/p)	Average Pedestrian Area (m²/p)	Average Inter-Person Spacing (ft)	Average Inter-Person Spacing (m)
A	≥ 13	≥ 1.2	≥ 4.0	≥ 1.2
B	10–13	0.9–1.2	3.5–4.0	1.1–1.2
C	7–10	0.7–0.9	3.0–3.5	0.9–1.1
D	3–7	0.3–0.7	2.0–3.0	0.6–0.9
E	2–3	0.2–0.3	<2.0	<0.6
F	< 2	< 0.2	*Variable*	*Variable*

Source: *Fruin (2).*

The typical design LOS used for bus stops and station platforms is LOS C to D or better. Passenger congestion in the LOS E range is experienced only on the most crowded elevators or transit vehicles. LOS D represents crowding with some internal circulation possible; however, this LOS is not recommended for long-term waiting periods. The presence of passengers who use wheelchairs, strollers, or bicycles, or carry luggage or packages should be assessed and suitable provision made in station space.

Platform Usage

The shape and configuration of a station platform is dictated by many systemwide factors. Platform length is typically based on transit vehicle length and the number of transit vehicles using the platform at any one time. Platform width is dependent upon structural considerations, passenger queuing space, circulation requirements, and entry/exit locations.

Transit platforms can be divided into the following areas (*20*):

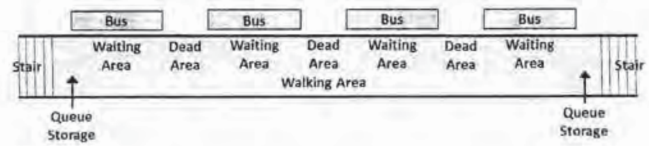
- Walking areas;
- Waiting areas;

2 OF 3

- Waiting area buffers (adjacent to the platform edge and to waiting areas), with the platform edge denoted by a 18-in. (0.5-m) detectable warning strip;
- Dead areas between bus loading areas or train doors;
- Space taken up by seats, pillars, and other obstructions; and
- Queue storage.

Exhibit 10-33 illustrates the use of these areas for a transit platform serving buses.

Exhibit 10-33
Transit Platform Areas



Source: Benz (*20*).

There are several different platform components which impact capacity and size requirements.

Walking and waiting do not occur evenly over the platform area. Some areas are used primarily for walking (e.g., near entry/exit locations and along the back edge of the platform) while other areas are used primarily for waiting (e.g., loading areas). Areas that are generally not used by passengers are termed *dead areas*. These areas are typically present between buses at a bus terminal or in front of or behind a train at a rail station. Dead areas should be taken into consideration when choosing the size and configuration of a platform. Where a platform serves multiple routes, special consideration should be made of passengers who will continue to wait on the platform until their train or bus arrives.

Platform Sizing

Evaluation Procedure

The procedures to determine the size of a transit platform are based on maintaining a desirable pedestrian LOS in the waiting and circulation areas, while providing needed buffer space and reserving space for physical objects, such as staircases or seating. The following is a list of steps recommended for determining the desired platform size:

1. Based on the desired LOS, choose the corresponding average pedestrian space from Exhibit 10-32; LOS D = 3 sf/ped
2. Adjust as appropriate for passenger characteristics (e.g., wheelchair usage, luggage, bicycles);
3. Estimate the maximum passenger demand for the platform at a given time; 240 train if all exit
4. Calculate the required waiting space by multiplying the average space per person by the maximum passenger demand; 10 on platform / 250 passengers
5. Calculate the additional walkway width needed to serve arriving passengers by using the appropriate procedures for walkways described previously; 250 x 3sf/ped =
6. Calculate the queue storage space required for exit points (at stairs, escalators, and elevators) as described previously; 750 sf

3 OF 3

PLATFORM
160 x 9 FEET =
160 x 5 FEET
EFFECTIVE = 800
RAMP
50 x 4 FEET =
50 x 3 FEET
EFFECTIVE = 150
950
sf

7. Consider the additional platform space that will be unused, including dead areas and physical obstructions;
8. Add a buffer zone to the width of the platform (18 in., or 0.5 m, on each side having direct access to a roadway or trackway); 2 FEET ON EITHER EDGE
9. Calculate the total platform area by summing the required waiting space, walkway width, queue storage at exit points, dead areas, and buffer zone width; and
10. Apply a safety or growth factor if appropriate.

The result of this calculation will be a minimum platform area required to meet demand. Actual platform area and dimensions may be determined by other factors, such as minimum clearances and architectural considerations, especially in low- to medium-volume stations. Calculation Example 3 later in this chapter demonstrates the application of this process.

Designing for Emergency Evacuation

NFPA 130 does not directly affect overall platform area unless obstacles, such as a stairway or open platform edge, require additional platform width to provide egress capacity past the obstacle (*1*). The standard specifies that egress routes must be at least 44 in. (1.12 m) wide. When such a route passes between an open platform edge, an additional 18 in. (450 mm) must be provided. When a route passes a sidewall or obstacle such as a stairway, an additional width of 12 in. (300 mm) must be provided. With both an open platform edge and a sidewall, a total width of 74 in. (1.87 m) would be required.

Shelters and Waiting Rooms

Level of Service

No specific LOS has been suggested for shelters, waiting rooms, or seating. The space provided within shelters or waiting rooms can be assessed using the LOS thresholds for queuing spaces, as presented in Exhibit 10-32. These thresholds are based on average pedestrian space, personal comfort, and degrees of mobility within the space. However, local circumstances must be taken into consideration when determining what the projected or desirable occupancy is, since such spaces are rarely used by all passengers and may only be used to the maximum extent on limited days of the year, depending on local climates. For example, shelters may be used on a daily basis for 6 months of the year in a colder northern climate but may be used only a few days a month in warmer, dryer climates. As a result, it may be more desirable to handle full stop or station loads in the more adverse climate, but provide more limited capacity relative to station passenger volumes where the shelter is used less often.

Evaluation Procedures

The LOS for persons standing in a shelter or waiting room may be assessed using the LOS criteria for queuing spaces, as presented in Exhibit 10-32. In larger waiting rooms where circulation is to be maintained or other activities such as ticket selling are occurring, the time-space analysis approach described in Equation 10-4 and Equation 10-5 can be applied or a pedestrian simulation software applied. A simpler analysis

SUBJECT: Transit Data for Transportation Impact Studies

Purpose

The purpose of this memorandum is to provide an update to the data used in transportation analyses for determining capacity utilization for the San Francisco Municipal Transportation Agency (SFMTA) individual lines and screenlines and regional transit screenlines.

Background

The SFMTA Board has adopted an "85 percent" capacity utilization standard for transit vehicle loads. In other words, transit lines should operate at or below 85 percent capacity utilization. The SFMTA Board has determined that this threshold more accurately reflects actual operations and the likelihood of "pass-ups" (i.e., vehicles not stopping to pick up more passengers). The Planning Department, in preparing and reviewing transportation impact studies, has similarly utilized the 85 percent capacity utilization as a threshold of significance for determining peak period transit demand impacts to the SFMTA lines. Previously, SFTMA Transit Effectiveness Project ridership data, collected in 2007 and 2008, has been utilized by the Planning Department to determine capacity utilization at the maximum load point (MLP) for bus and light rail lines. SFMTA has recently began to provide to the Planning Department updated ridership counts using automatic passenger count data for buses and updated manual counts for rail.[1] SFMTA intends to update this data annually, or as needed.

SFMTA and Regional Transit Screenline Analysis

Typically, transit impacts are analyzed through a screenline analysis. A screenline analysis assumes that there are identifiable corridors or directions of travel which are served by a grouping of transit lines. Therefore, an individual line would be combined with other transit lines in a corridor and corridors combined into a screenline in determining significance. However, on a case-by-case basis the Planning Department may request individual line capacity utilization analysis. In either case, the same methodology for impact determination would apply.

Four screenlines have been established in San Francisco to analyze potential impacts of projects on SFMTA service: the northeast screenline, the northwest screenline, the southeast screenline, and the southwest screenline, with sub-corridors within each screenline. The SFMTA routes by screenline and sub-corridors are shown in Attachment A, along with a schematic illustration of the screenlines and updated screenline data. As discussed above, the Planning Department uses 85 percent capacity utilization as the threshold of significance for identifying transit crowding impacts.

[1] Tables included in Transportation Impact Studies should reference "SFMTA Transit Ridership Counts 2010/2011". The manual rail counts were taken in the Fall of 2010 and the automatic passenger counts are from 2011.

Four principal regional transit providers serve San Francisco: BART from the East Bay and Peninsula; SamTrans from the Peninsula; AC Transit from the East Bay, and Golden Gate Bridge, Highway and Transportation District (GGBHTD) from the North Bay. Two additional ferry providers exist besides GGBHTD: Alameda Harbor Bay Ferry from the East Bay and Blue & Gold Fleet from the North Bay and East Bay. For regional transit providers, the MLP is typically at the San Francisco City limit (i.e., the East Bay MLP would occur at the Transbay Tube and on the Bay Bridge; the North Bay MLP would occur at the Golden Gate Bridge; and the South Bay MLP would occur at the southern city border). The regional transit providers by screenline are shown in Attachment B, along with a schematic illustration of the screenlines and updated screenline data. The Planning Department uses 100 percent capacity utilization as the threshold of significance for identifying regional transit crowding impacts.

SFMTA Individual Line Analysis

Sometimes, transit impacts are analyzed on a corridor or line-by-line basis. The following table (see Attachment C for full data) provides an example of the data and capacity utilization calculation using updated SFMTA transit data for outbound (OB) and inbound (IB) 1 California and 10 Townsend during the PM peak hour. This is not meant to represent the format or content of the table that would be included in transportation impact studies, rather it is a sample of the full transit ridership and capacity data set.[2] Please refer to Attachment D for a Glossary of Terms.

TABLE 1
EXAMPLE OF SFMTA FALL 2010/2011 CAPACITY UTILIZATION DATA (PM PEAK HOUR)

SFMTA Line	(A) 100% Planning Capacity per Vehicle	(B) Headway (Mins)	(C) Average Max Load	(D) = (60/B * C) Peak Hour Load	MLP	(E) = (60/B * A) Peak Hour Capacity	(F) = (D/E) Peak Hour Capacity Utilization
1 (OB)	63	3.5	53	909	California/ Presidio	1,080	84.2%
1 (IB)	63	3.5	35	600	California/ Laurel	1,080	55.6%
10 (OB)	63	20.0	57	171	2nd/ Howard	189	90.5%
10 (IB)	63	20.0	62	186	Pacific/ Powell St	189	98.4%

In the above example, OB 1 California is 0.8 percent below the 85 percent threshold of significance and IB 1 California is 29.4 percent below the threshold at the respective MLPs. Generally, if a proposed project would generate enough trips on a particular line (in the above example for the 1 California, nine trips (OB) and 318 trips (IB)) that it would cause the route to exceed the 85 percent capacity utilization, it would be considered to result in a significant transit impact.

[2] Note: The methodology and threshold of significance used for analyzing transit impacts are remaining the same; only the data used for that analysis is changing.

Also in the above example, OB 10 Townsend is 5.5 percent above the 85 percent threshold of significance and IB 10 Townsend is 13.4 percent above the threshold of significance at the respective MLPs. In these situations, the analysis needs to calculate the percentage of trips that the proposed project contributes to the line. If the percent contribution to the total peak hour ridership at the MLP is five percent or greater, then the proposed project would contribute substantially to transit crowding and would result in a significant impact.

> Example: The proposed project would contribute 20 transit trips to the IB 10 Townsend, therefore the peak hour load would be 206 (186 + 20). The 20 transit trips would constitute 9.7 percent (20/206 = 9.71%) of the Existing plus Proposed Project peak hour load. This would be considered a significant impact. If on the on the other hand, the proposed project contributed nine transit trips to the IB 10 Townsend, the impact would be considered less than significant because proposed project transit trips would only account for 4.6 percent of the Existing plus Proposed Project peak hour load (9/195 = 4.61%).[3]

Applicability

Generally, the updated SFMTA data should be used in any transportation impact study that has yet to reach the screencheck submittal phase and all future transportation impact study (!) cases. The transportation planner, in coordination with the environmental planner, will determine on a case-by-case basis whether a project is not subject to this general applicability requirement. Applicability questions should be directed to the ! case planner.

[3] In the transportation impact study (TIS), numbers should be reported to the tenth of the percentage point, however, calculations should be done to the hundredth of the percentage point to determine significance. For example, if the calculation is 4.95 percent, the TIS should report 5.0 percent (significant impact). Conversely, if the calculation is 4.94 percent, the TIS should report 4.9 percent (less-than-significant impact).

"Note: This seasonal automatic passenger count (APC) and load information may vary from the annualized transit ridership data provided to the Federal Transit Administration. This data is provided for planning purposes only."

*Spring 2012 ridership data was used due to errors in Fall 2011 ridership data.

Lines operating at capacity utilization of 85 percent or greater are highlighted in **bold**.

Attachment D – Glossary of Terms

Average Max Load – The actual ridership (or load) number at the maximum load point for the worst half hour (doubled) during the peak period.

Headway – The scheduled peak period time between buses, streetcars, trains, or light rail vehicles on the same line.

Maximum Load Point – The transit stop on a given line with the estimated greatest demand.

Net Available Capacity – The estimated number of passengers that can be accommodated during the peak hour on a line without exceeding the line's capacity. Calculation is peak hour capacity multiplied by 85 percent minus the peak hour load.

Peak Hour – The one-hour during the peak period where ridership at a maximum load point is estimated to be at its highest.

Peak Hour Capacity – The estimated volume of ridership that can be accommodated per line during the peak hour. The calculation is equal to the peak hour (60 minutes) divided by the peak hour scheduled headway multiplied by the capacity of the line (provided by SFMTA).

Peak Hour Capacity Utilization – The estimated percent capacity of the line that is being used by riders during the peak hour. The calculation is equal to the peak hour load (ridership) divided by the peak hour capacity.

Peak Hour Load – The estimated ridership for a bus or rail route at the maximum load point during the peak hour. Calculation is sixty minutes divided by the headway multiplied by the average max load.

Peak Period – The time period during the day where crowding on the transit system is at its highest. During the AM, it is defined between 6 AM to 9 AM. During the PM, it is defined between 4 PM to 7 PM.

100 Percent Capacity per Vehicle – The capacity per SFMTA vehicle that includes both seated and standing capacity, where standing capacity, is somewhere between 30 to 80 percent seated capacity (depending upon the specific transit vehicle configuration). The capacity per regional transit vehicle is equal to the seated capacity. The following presents the 100 percent capacity of different SFMTA vehicles:[1]

- historic streetcar – 70 passengers (F Market & Wharves);
- light rail vehicle – 119 passengers (J Church, KT Ingleside);
- modified light rail – 238 passengers (L Taraval, M Ocean View, and N Judah);
- standard bus – 63 passengers (remaining lines not listed in modified bus); and
- modified bus:
  - 45 passengers (35 Eureka, 36 Teresita, 37 Corbett, 39 Coit, 56 Rutland, and 66 Quintara)
  - 69 passengers (81X Caltrain Express, 82X Levi Plaza Express[2])
  - 73 passengers (1AX California 'A' Express)[2]
  - 94 passengers (1BX California 'B' Express,[2] 8X Bayshore Express, 8AX Bayshore 'A' Express, 8BX Bayshore 'B' Express, 14 Mission, 14L Mission Limited, 14X Mission Express, 38 Geary, 38L Geary Limited, 41 Union,[3] 49 Van Ness-Mission)
  - Other (lines 16X Noriega Express and 30 Stockton)[4]

[1] Note that the different capacities for each line are provided by SFMTA and are subject to change.

[2] Only during AM inbound peak period.

[3] Only during AM peak period.

[4] These two lines have other modified buses specific to these lines that differ throughout the day (see Attachment C).

SUBJECT: Regional & Local 2040 Cumulative Transit Screenlines for Transportation Impact Studies

Purpose

The purpose of this memorandum is to provide an update to the Cumulative screenline transit data provided in the *Transit Data for Transportation Impact Studies* memorandum dated June 21, 2013 which provided direction for the transportation analyses of transit impacts for the San Francisco Municipal Transportation Agency (SFMTA), including the use of local and regional transit screenlines.

Background

Typically, transit impacts are analyzed through a screenline analysis. A screenline analysis assumes that there are identifiable corridors or directions of travel which are served by a grouping of transit lines. Therefore, an individual line would be combined with other transit lines in a corridor and corridors combined into a screenline in determining significance. Four screenlines have been established in San Francisco to analyze potential impacts of projects on SFMTA service: the northeast screenline, the northwest screenline, the southeast screenline, and the southwest screenline, with corridors within each screenline.

The SFMTA and SF Planning Department have recently updated both the regional and local transit screenlines to address the City's current cumulative context horizon year, 2040. These updated screenlines are included in the updated and Table A-2 and Table B-2. For Muni, the Planning Department and SFMTA use 85 percent capacity utilization as the performance standard/threshold of significance for identifying transit crowding impacts. For regional providers, the Planning Department uses 100 percent capacity utilization as the threshold of significance for identifying regional transit crowding impacts.

Applicability

Generally, the updated SFMTA data should be used in any transportation impact study that has yet to reach the screencheck submittal phase and all future transportation impact study (!) cases. The transportation planner, in coordination with the environmental planner, will determine on a case-by-case basis whether a project is not subject to this general applicability requirement. Applicability questions should be directed to the ! case planner.

TABLE A-2
CUMULATIVE (2040) PEAK HOUR

Muni Screenline Sub-corridor	AM Peak Hour (Inbound)			PM Peak Hour (Outbound)		
	Ridership	Capacity	Utilization	Ridership	Capacity	Utilization
Northeast						
Kearny/Stockton[1]	7,394	9,473	78.1%	6,295	8,329	75.6%

Other Lines[11]	1,795	2,027	**88.6%**	1,582	1,927	82.1%
Screenline Total	*9,286*	*12,944*	*71.7%*	*8,372*	*12,781*	*65.5%*
Southwest						
Subway lines[12]	6,314	7,020	**89.9%**	5,692	6,804	83.7%
Haight/Noriega[13]	1,415	1,596	**88.7%**	1,265	1,596	79.3%
Other lines[14]	175	560	31.3%	380	840	45.2%
Screenline Total	*7,904*	*9,176*	*86.1%*	*7,337*	*9,240*	*79.4%*
Muni Screenlines Total	*33,237*	*43,188*	*77.0%*	*31,282*	*41,665*	*75.1%*

Screenlines and corridors operating at capacity utilization of **85 percent or greater are highlighted in bold**. Some of the individual lines within certain corridors have been adjusted to be in the appropriate city "quadrant" per the screenline. Thus, for some sub-corridors (e.g., Kearny/Stockton AM Peak Hour), the total does not match the individual lines' maximum load point ridership and capacity .

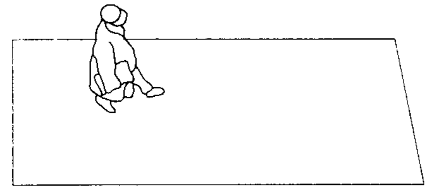
LOS A

Pedestrian Space > 60 ft^2/p *Flow Rate* $\leq$ 5 p/min/ft

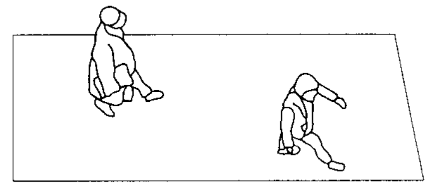
At a walkway LOS A, pedestrians move in desired paths without altering their movements in response to other pedestrians. Walking speeds are freely selected, and conflicts between pedestrians are unlikely.



LOS B

Pedestrian Space > 40–60 ft^2/p *Flow Rate* > 5–7 p/min/ft

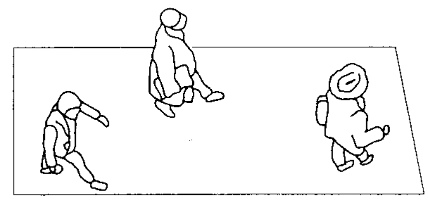
At LOS B, there is sufficient area for pedestrians to select walking speeds freely, to bypass other pedestrians, and to avoid crossing conflicts. At this level, pedestrians begin to be aware of other pedestrians, and to respond to their presence when selecting a walking path.



LOS C

Pedestrian Space > 24–40 ft^2/p *Flow Rate* > 7–10 p/min/ft

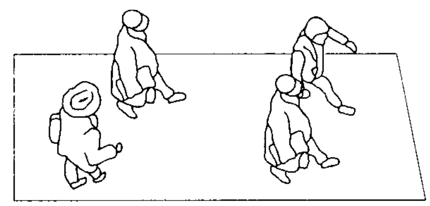
At LOS C, space is sufficient for normal walking speeds, and for bypassing other pedestrians in primarily unidirectional streams. Reverse-direction or crossing movements can cause minor conflicts, and speeds and flow rate are somewhat lower.



LOS D

Pedestrian Space > 15–24 ft^2/p *Flow Rate* > 10–15 p/min/ft

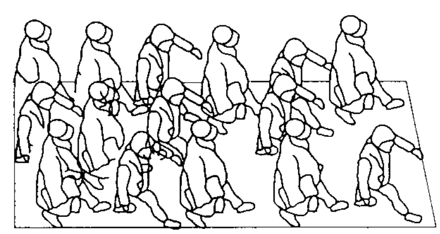
At LOS D, freedom to select individual walking speed and to bypass other pedestrians is restricted. Crossing or reverse-flow movements face a high probability of conflict, requiring frequent changes in speed and position. The LOS provides reasonably fluid flow, but friction and interaction between pedestrians is likely.



LOS E

Pedestrian Space > 8–15 ft^2/p *Flow Rate* > 15–23 p/min/ft

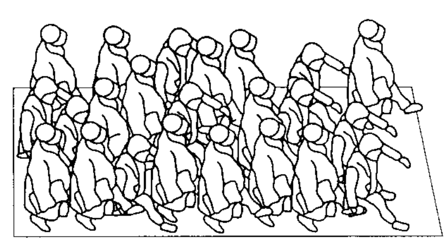
At LOS E, virtually all pedestrians restrict their normal walking speed, frequently adjusting their gait. At the lower range, forward movement is possible only by shuffling. Space is not sufficient for passing slower pedestrians. Cross- or reverse-flow movements are possible only with extreme difficulties. Design volumes approach the limit of walkway capacity, with stoppages and interruptions to flow.



LOS F

Pedestrian Space $\leq$ 8 ft^2/p *Flow Rate* varies p/min/ft

At LOS F, all walking speeds are severely restricted, and forward progress is made only by shuffling. There is frequent, unavoidable contact with other pedestrians. Cross- and reverse-flow movements are virtually impossible. Flow is sporadic and unstable. Space is more characteristic of queued pedestrians than of moving pedestrian streams.



Pedestrian Walkway LOS

Appendix TR-10

Proposed Project Off-street Spaces Supply versus Mission Bay South Design for Development Requirements

Table T-2

Summary of Proposed and D4D Required Transportation-related Facilities
Updated April 2015

ITEM	Proposed by the Project	Mission Bay South D4D Requirement (3,4,5)
Vehicle Parking Spaces (On-site and 450 South Street)		
Event center (1)	415	563
Office	537	537
Retail/Restaurant	130	172
Total	**1,082**	1,272
ADA Parking Spaces (part of total above)	22	24
Class 1 Bicycle Parking Spaces		
Event center (2)	400	400
Office	104	104
Retail/restaurant	7	7
Total	511	511
Class 2 Bicycle Parking Spaces		
Event Center/Office/Retail/Restaurant	75	0
Loading Spaces (on-site)		
Event center	7	7
Office	3	3
Retail/Restaurant	3	3
Total	**13**	10

Notes:

1. 283 spaces within the project site + 132 spaces within 450 South Street.

2. Class 1 bicycle parking for event center would be provided via a permanent bicycle valet (during events) of 300 spaces, and 100 temporary staffed bicycle corrals.

3. The D4D does not contemplate an off-street parking standard for a multipurpose event center, therefore, the proposed changes to the D4D include a new parking standard for the event center that promotes sharing parking with the retail and office uses, as well as limits parking to promote the use of transit. Also, as part of the standard, allow off-site parking for the event center to be further than the 600 feet from the entrance of the event center. (Mission Bay Blocks 29-32 Major Phase Application, Appendix A)

4. The existing D4D does not contemplate a loading standard for a multi-purpose event center, therefore the proposed changes to the D4D include a standard for the event center loading area that reflects the increased intensity of demand from standard commercial buildings. (Mission Bay Blocks 29-32 Major Phase Application, Appendix A)

5. The existing D4D does not require provision of Class 2 bicycle parking spaces, car share spaces, or shower and locker facilities.

APPENDIX TR-11
MISSION BAY FSEIR MITIGATION MEASURES

Summary of Transportation Mitigation Measures in 1998 Mission Bay FSEIR				
#	**Measure Name**	**Area Applicability**	**Status**	**GSW?**
MEASURES INCLUDED AS PART OF PROJECT				
Intersections				
E.1	Third/King	Mission Bay North and South	completed	No
E.2	Third/Berry	Mission Bay North and South	completed	No
E.3	Third/Owens (Third/Channel)	Mission Bay South	completed	No
E.4	Third/The Commons (Third/Mission Bay Drive)	Mission Bay South	completed	No
E.5	Third/South	Mission Bay South	completed	No
E.6	Third/16th	Mission Bay South	completed	No
E.7	Third/Mariposa	Mission Bay South	completed	No
E.8	Fourth/King	Mission Bay North	completed	No
E.9	Fourth/Berry	Mission Bay North	completed	No
E.10	Fourth/Owens (Fourth/Channel)	Mission Bay South	completed	No
E.11	Fourth/UCSF (Fourth/Gene Friend Way)	Mission Bay South	completed	No
E.12	Fourth/16th	Mission Bay South	completed	No
E.13	Fourth/Mariposa	Mission Bay South	completed	No
E.14	Seventh/16th	Mission Bay South	completed	No
E.15	Owens/16th	Mission Bay South	completed	No
E.16	Owens/Mariposa/I-280	Mission Bay South	completed	No
E.17	I-280 On-ramp/Mariposa	Mission Bay South	completed	No
E.18	Seventh/The Commons (Seventh/Mission Bay Drive)	Mission Bay South	completed	No
E.19	Fifth/King	Mission Bay North	pending, in design, Caltrans approval required	Np
Street Segments				
E.21	Third Street	Mission Bay North and South	completed	No
E.22	Mariposa Street	Mission Bay South	completed	No
E.23	Fourth Street	Mission Bay North and South	completed	No
E.24	King Street	Mission Bay North	completed	No
E.25	Owens Street (Channel Street)	Mission Bay South	partial buildout, not adjacent to site	No
E.26	N. Commons/S. Commons/Seventh (N. & S. MB Blvd/MB Drive)	Mission Bay South	partial buildout, not adjacent to site	No
Transit				
E.27	22 Fillmore	Mission Bay South	SFMTA, completed 55 16th route, 22 Fillmore by 2018	No
E.28	30/45 Union-Stockton	Mission Bay South	revised to 10 Townsend in TEP	No
MEASURES IDENTIFIED IN THE FSEIR				
Intersections				
E.29	Seventh/Brannan	Mission Bay South	pending with UCSF	No
E.30	Seventh/Townsend	Mission Bay North	completed	No
E.31	Seventh/Berry	Mission Bay North	street network revised, no longer exists	NA
E.32	Seventh/N. Commons/S. Commons	Mission Bay South	completed	No
E.33	16th/Potrero	Mission Bay South	Superceded by TEP	No

E.34	16th/Vermont	Mission Bay South	completed	No
E.35	Eighth/Townsend	Mission Bay North	Modern Roundabout Instead of Signal	No
E.36	Third/Townsend	Mission Bay North	completed	No
E.38	Fourth/King	Mission Bay North	completed	No
Street Segments				
E.41	Fourth Street (for E.38)	Mission Bay North	completed	No
E.42	Seventh Street (for E.29 through 32)	Mission Bay North and South	may not be possible or required	No
Regional				
E.43	Increase Bay Bridge tolls for SOV trips during commute hours.	Mission Bay North and South	MTC/BATA implemented this	No
Transit				
E.44	Encourage AC Transit to expand service	Mission Bay North and South	No AC Transit shortfall	No
E.45	Extend & operate T Third to Mariposa St	Mission Bay North and South	to be implemented with Central Subway	No
Transportation System Management				
E.46	Transportation Management Org (46.a - 46.b)	Mission Bay North and South		
46.a	Transportation Management Association		completed, ongoing	No
46.b	Transportation Coordinating Committee		completed, ongoing	No
E.47	Transportation System Management Plan (47.a - 47.h)		completed, implemented by Mission Bay TMA	
47.a	Shuttle Bus	Mission Bay North and South	completed, ongoing, part of OPA	OPA
47.b	Transit Pass Sales	Mission Bay North and South	completed, ongoing, part of OPA	OPA
47.c	Employee transit subsidies	Mission Bay North and South	completed, ongoing, part of OPA	OPA
47.d	Ped signal at Owens St near ped bridge at Fifth Street	Mission Bay South	Not adjacent to project site	No
47.e	Secure bicycle parking	Mission Bay North and South	completed, ongoing, part of OPA	OPA
47.f	Appropriate street lighting	Mission Bay North and South	completed, ongoing, part of OPA	OPA
47.g	Transit and ped & bike route information	Mission Bay North and South	completed, ongoing, part of OPA	OPA
47.h	Parking management guidelines	Mission Bay North and South	completed, ongoing, part of OPA	OPA
47.i	Flexible Work Times/Telecommuting	Mission Bay South	completed, ongoing, part of OPA	OPA
E.49	Ferry Service	Mission Bay North and South	being implemented by WETA	No
E.20	Seventh/Berry	Mission Bay North	Rejected by SF BOS, Not part of 1998 MB MMRP	
E.37	Third/King	Mission Bay North	Rejected by SF BOS, Not part of 1998 MB MMRP	
E.39	King Street (for E.37)	Mission Bay North	Rejected by SF BOS, Not part of 1998 MB MMRP	
E.40	Third Street (for E.37)	Mission Bay North	Rejected by SF BOS, Not part of 1998 MB MMRP	
E.48	Constrain parking supply within UCSF	Mission Bay South	Rejected by SF BOS, Not part of 1998 MB MMRP	
OPA = Owners Participation Agreement. These measures assumed to be part of the proposed project.				
WETA = Water Emergency Transportation Authority. WETA is a regional public transit agency tasked with operating and expanding ferry service on the San Francisco Bay and with coordinating the water transit response to regional emergencies. Under the San Francisco Bay Ferry brand, WETA carries over 1.8 million passengers annually utilizing a fleet of 12 high speed passenger-only ferry vessels. San Francisco Bay Ferry currently serves the cities of Alameda, Oakland, San Francisco, South San Francisco and Vallejo.

APPENDIX AQ

Air Quality Supporting Information

Air Quality Appendix

1 Introduction

At the request of Environmental Science Associates (ESA), on behalf of the Golden State Warriors (GSW or Sponsor), ENVIRON International Corporation (ENVIRON) conducted a California Environmental Quality Act (CEQA) analysis of criteria air pollutants (CAPs) and precursor emissions associated with the proposed construction of a multi-purpose event center and ancillary development Mission Bay Blocks 29-32 in San Francisco, CA ("Project" or "Site").[1] The analysis prepared by ENVIRON will be used to inform preparation of the Subsequent Environmental Impact Report (SEIR) on the project. This Air Quality Protocol describes the methodology used for evaluation of air quality impacts from construction and operational sources.

The proposed project is not located in an Air Pollution Exposure Zone (APEZ) as defined by the San Francisco Planning Department, Environmental Planning Division (SFEP). However, in the event that the proposed project could result in increased emissions over those assumed for prior approved development for the site in the Mission Bay Final Subsequent Environmental Impact Report (FSEIR), the project impacts could be substantial enough to create a new APEZ. Therefore, preparation of a construction health risk assessment (HRA) and operational HRA are included as part of the air quality impact analysis to demonstrate that the Project will not create an APEZ at nearby sensitive receptors.

1.1 Project Understanding

The proposed Project would be located at Blocks 29-32 of Mission Bay, as designated in the Mission Bay Redevelopment Area. The Mission Bay Redevelopment Area has a Final Supplemental Environmental Impact Report (FSEIR) from1998.

Two alternatives to the project are also considered, as discussed below.

1.1.1 Proposed Project

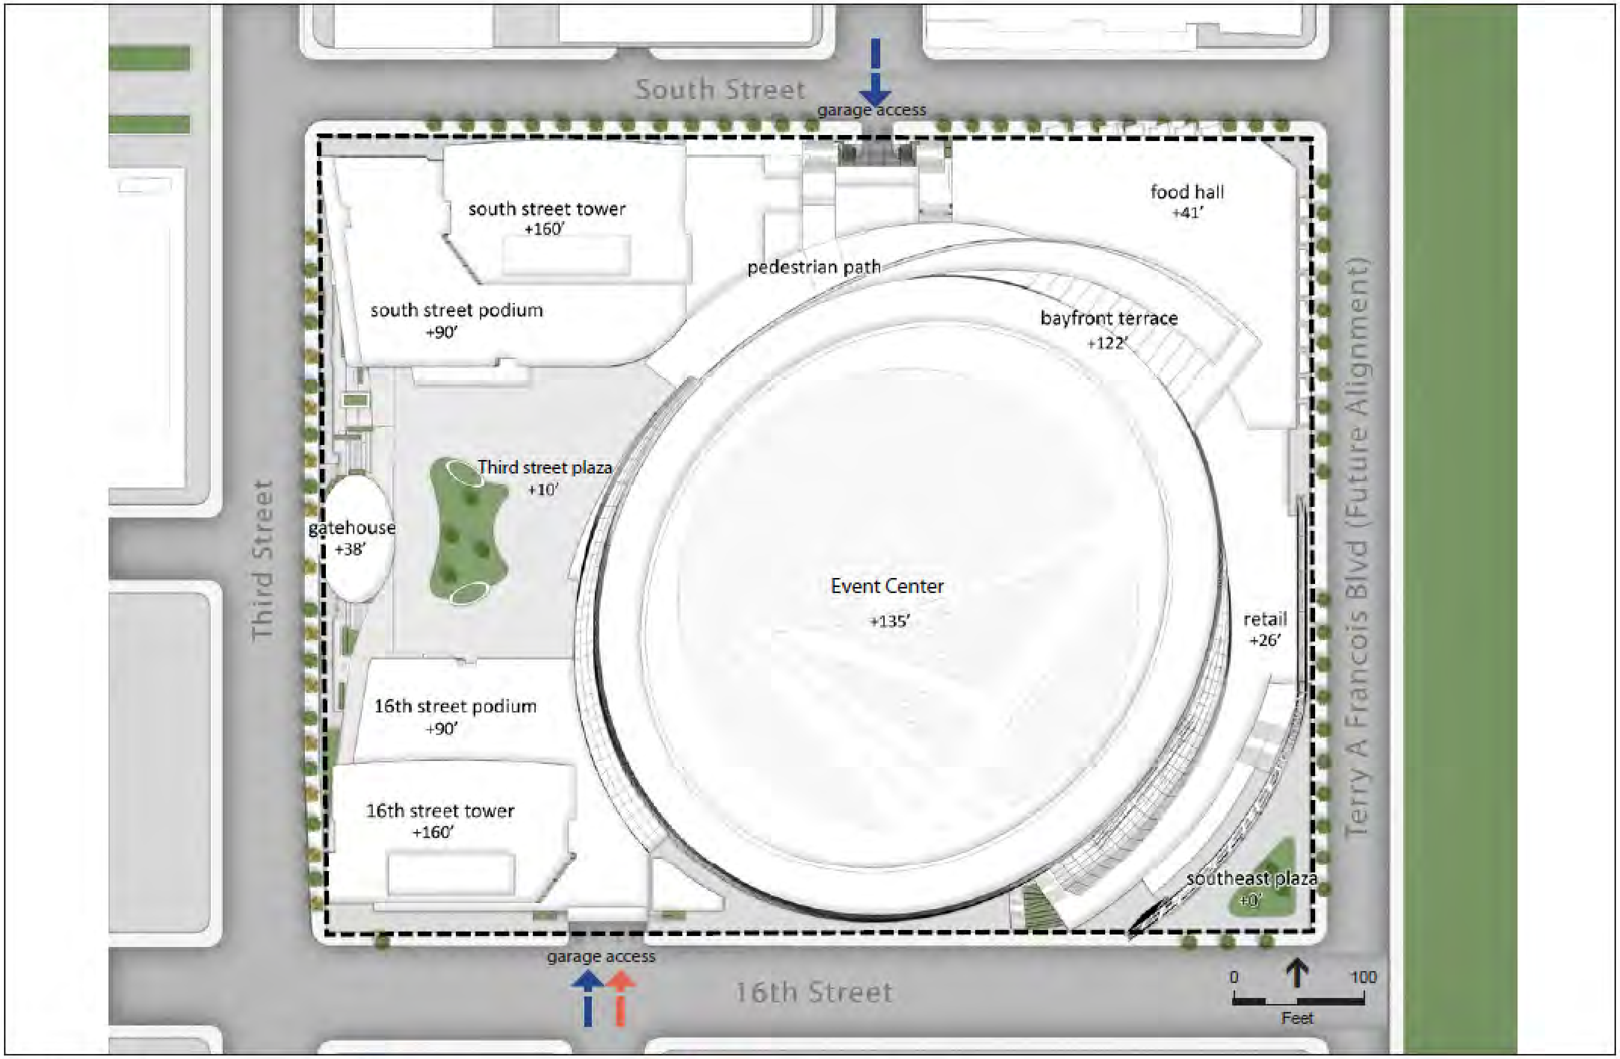
The Project would be located at Blocks 29-32 of Mission Bay within the Mission Bay Redevelopment Area of San Francisco. The rectangular site is bound by Third Street to the west, South Street to the north, Terry Francois Boulevard to the east, and 16th Street to the south. Blocks 29-32 are approximately 11 acres, which are currently vacant. Currently, there are residential land uses to the northwest and south of the proposed Project site, but none immediately adjacent to the site.

The GSW, the Project proponent, propose to create a new approximately 18,000-seat multi-purpose event center and ancillary development including multiple office buildings, retail, restaurants, structured parking, plaza areas, and other amenities. Based on data provided by the GSW, the Project build-out for Blocks 29-32 would include approximately 750,000 gross square feet (gsf) for a multi-use events center and 25,000 gsf for the GSW offices; 580,000 gsf of non-GSW office space; 475,000 gsf of parking (950 spaces); 125,000 gsf of retail space including sit-down restaurants, quick-service restaurants, and soft goods retail.[2] The privately

[1] A separate greenhouse gas inventory will be prepared using similar methods as part of an application for judicial streamlining under Public Resources Code 21178-21189.3.

[2] Notice of Preparation, Table 1. November 19, 2014.

Figure 1. Conceptual Design Site Plan



Project Site Boundary
Auto Access Location
Truck Loading Access

financed events center would host the Bay Area's National Basketball Association (NBA) basketball team, the GSW, during the NBA season, as well as provide a year-round venue for a variety of other uses, including, but not limited to, concerts, cultural events, family shows, conferences, and conventions. The preliminary, conceptual layout is shown in Figure 1 of this Air Quality Protocol. The Project will also include new back-up engines.

Construction of the Project is anticipated to proceed with the offices and arena being built concurrently. The air quality analysis used the construction schedule and phases proposed by the Project Sponsor to estimate construction impacts.

1.1.2 Project Alternatives

The SEIR alternatives analysis included the No Project Alternative (the currently approved development on Blocks 29-32) and one other alternative, a reduced intensity project. These alternatives are analyzed qualitatively in this study.

Alternative A: No Project

- Under the first alternative, all aspects of the current operation at Oracle Arena in Oakland are retained.
- In Alternative A, the No Project Alternative, 1,056,000 square feet of office space would be constructed at the Project site instead of the proposed arena plus office buildings and other uses. As part of the 1998 Mission Bay Redevelopment Area SEIR, Blocks 29-32 are entitled for up to 1,056,000 square feet of office space. Alternative A also includes up to 31,700 gsf of retail use.
- ENVIRON evaluated construction and operation of Alternative A to an equal level of detail as the Project. ENVIRON modeled construction emissions using accepted methodologies such as modeling with California Emissions Estimator Model (CalEEMod®). Because there is no change at the Oracle Arena in Alternative A, the sole impacts come from the office and retail space at Blocks 29-32. As such, only the office and retail space is considered in the impacts analysis.

Alternative B: Reduced Intensity at Blocks 29-32

- Under Alternative B, Blocks 29-32 adjustments will be made to retail uses, office uses, and parking spaces at Blocks 29-32. All other aspects of the proposed Project will remain unchanged.
- From an air quality perspective, this Alternative is expected to have reduced impacts from those of the Project because of its reduced scope.

1.2 Objective

The purpose of the air quality analysis is to assess potential criteria pollutant emissions and ozone precursor emissions that would result from construction and operation of the proposed Project consistent with guidelines and methodologies from air quality agencies, specifically, the Bay Area Air Quality Management District (BAAQMD), the California Air Resources Board (ARB), and the US Environmental Protection Agency (USEPA).

Consistent with CEQA requirements, this Air Quality Analysis evaluates mass emissions of CAPs from both construction and operational activities (including traffic generated from the proposed Project). The scope of this Air Quality Analysis also includes a construction HRA and operational HRA to determine whether the Project contributes to cumulative effects at nearby receptors over the significance thresholds used by SFEP.

1.3 Project Methodology

Construction emissions associated with the Project would be from off-road construction equipment and on-road mobile sources. There would also be operational emissions associated with the Project from traffic-related sources and stationary sources such as boilers and five standby emergency generators. An equivalent level of detail was used in analyzing the Project and the Alternatives. To that extent, the “Project Methodology” discussed throughout this document applies to all Alternatives.

The City of San Francisco, in conjunction with the BAAQMD, has recently completed a City-wide HRA to evaluate cumulative cancer risks and fine particulate matter less than 2.5 micrometer in diameter ($PM_{2.5}$) concentrations from existing stationary and mobile sources. The construction HRA and operational HRA in this Air Quality Analysis was conducted to be consistent with the City-wide HRA.

1.3.1 Project Impacts

The following three sources of emissions were analyzed in the Project build-out year of 2018. For the construction years, ENVIRON assumed uncontrolled emissions based on the construction fleet statewide average for that year. For example, in 2015, the fleet-average emission factor for 2015 were used, and in 2016 the fleet-average emission factor for 2016 were used. Estimation of trip lengths relied on state survey data and season ticket holder addresses.

The three sources of emissions considered are:

1. Project construction (both without implementation of measures to reduce Project impacts and with such measures in place as per Section 5 of this Analysis);
2. Project stationary source emissions in the first Project operation year; and
3. Project traffic emissions in the first Project operation year.

2 Emissions Estimates

The methods used to estimate the emissions of CAPs and Toxic Air Contaminants (TACs) from the Project are described here. Because estimation techniques are different for construction and operation, they are discussed separately below.

2.1 Calculation Methodologies for Construction Emission Sources

Construction emission calculation methodologies cover off-road equipment, which is primarily diesel-fueled, on-road vehicles, and architectural coatings. Calculation methodologies for each type of emissions are explained separately. The methodology used to calculate emissions from each category is presented in Table 1: Emissions Calculations Methodology.

2.1.1 Off-road Diesel Equipment

Project-specific construction equipment inventories that include details on the type, quantity, construction schedule, and hours of operation anticipated for each piece of equipment for each construction phase were provided by the Sponsor. For the diesel-fueled equipment, ENVIRON used methodologies consistent with CalEEMod® to estimate emissions.[3] Where Project-specific equipment information is not available, CalEEMod® default values were used. Load factors for each piece of equipment were based on the default load factor in ARB's 2011 Off-Road Equipment Model (OFFROAD2011).

2.1.2 On-road Haul Trucks and Delivery Trucks and Vans

On-road truck emissions were calculated using the total number of trucks provided by the Sponsor as part of the SEIR project description and emission factors from ARB's EMission FACtor model (EMFAC2011) model. For haul trucks, a 20-mile one-way trip length was used, based on CalEEMod® default truck trip lengths, and for vendor trucks a 7.3-mile trip length was used, based on the regional default vendor trip length from CalEEMod®. The emission factors for running emissions for criteria pollutants were generated with the last version of the EMFAC2011, released on September 30, 2011, and updated in January 2013. The model includes updated information on California's car and truck fleets and travel activity.

Emissions reported by the model were converted to units of grams of pollutant emitted per vehicle mile traveled (VMT) using the daily VMT for running emissions, or grams of pollutant emitted per trip for idling, starting, and evaporative emissions.

2.1.3 Construction Worker Commuting Vehicles

Worker commute trip emissions were included in the emissions inventory for construction. The number of trips by workers was estimated based on data received from ESA in coordination with the Sponsor with regard to construction phasing. ENVIRON used emission factors from EMFAC2011 and default construction worker trip lengths from CalEEMod® to estimate worker trip emissions.

Operation	Generator[4]	$E = EF * HP * Hr$	ARB/USEPA Off-Road Engine Standards

Notes:

1. E_C: off-road equipment exhaust emissions (lb).

2. On-road mobile sources include all diesel truck trips

E_R: running exhaust and running losses emissions (lb).

E_S: vehicle starting exhaust and evaporative ROG emissions (lb).

E_I: vehicle idling emissions (lb).
EF_I: vehicle idling emission factor (g/hr-trip). From EMFAC2011.
T_I: idling time
C: unit conversion factor.

3. E_{ext}: annual or other long-term average emission factor (lb/VMT).
k: particle size multiplier for particle size range (lb/VMT); sL: road surface silt loading (g/m^2); W: average weight (tons) of all the vehicles traveling the road; P: number of "wet" days with at least 0.254 mm (0.01 in) of precipitation during the averaging period; N: number of days in the averaging period (365 for annual).

4. E: generator engine emissions
EF: compression-ignition (diesel) engine emission factor. ARB/USEPA engine PM standard based on engine tier will be used.
HP: generator horsepower; Hr: generator hours. Assume 50 hours of operation annually as a conservative assumption.

Other Abbreviations:

2.1.4 Architectural Coating and Consumer Products Emissions

ENVIRON used CalEEMod® to estimate reactive organic gas (ROG) emissions from architectural coating. Compliance with BAAQMD regulations restricting the volatile organic compound (VOC) content of commercial paints was assumed. ENVIRON used the San Francisco-specific area source emission factors developed by SFEP for ROG from consumer products which is 1.51E-05 lb/ROG/sqft/day.

2.1.5 Summary of Project Construction Criteria Pollutant Emissions

CAPs from Project construction phases were added and then normalized over the number of days in the construction period.

2.2 Calculation Methodologies for Operational Emission Sources

Operational emission calculation methodologies are divided into stationary, area, and mobile sources. For each category, emissions are estimated based on data from the Project Sponsor. The methodology used to calculate operational emissions from each category is presented in Table 1: Emissions Calculations Methodology.

2.2.1 Stationary Sources

The proposed Project will include new natural gas-fired boilers and five diesel back-up engines. Emissions were calculated based on information provided by the Project Sponsor and assume Tier 4 ARB and USEPA off-road diesel engine standards (ARB 2013). It should be noted that these stationary sources will be permitted with the BAAQMD and all sources are expected to comply with applicable Best Available Control Technology (BACT) and Best Available Control Technology for Toxics (TBACT) requirements.

2.2.2 Area Sources

The proposed Project includes area sources such architectural coatings, landscape equipment, and consumer products use. These emissions were estimated using CalEEMod®, based on the type and size of land uses associated with the Project. ENVIRON used San Francisco-specific area source emission factors developed by SFEP for ROG from consumer products.

2.2.3 Mobile Sources

The proposed Project would generate vehicle trips, which were provided by SEIR transportation analysts in coordination with ESA. Project traffic was evaluated using EMFAC2011 for the vehicle fleet mix in the San Francisco Bay Area. Additionally, Project-specific types of traffic such as delivery trucks were evaluated using vehicle-type specific emission factors from EMFAC2011, based on Project-specific traffic data as provided by ESA in coordination with the Sponsor. Fugitive road dust emissions are estimated using methodologies consistent with CalEEMod®. The methodologies used to calculate operational mobile emissions can be found in Table 1: Emissions Calculations Methodology.

3 Health Risk Assessment

3.1 Introduction

The objective of the HRA is to evaluate the potential impacts of construction and operation of the Project on off-site receptors in the Mission Bay neighborhood of San Francisco. The criterion for whether or not the Project presents a significant air quality impact under the CEQA is if the Project will "expose sensitive receptors to substantial pollutant concentrations," from Appendix G of the CEQA Guidelines.[4] To evaluate impacts in San Francisco, SFEP requires an HRA for an Environmental Impact Report (EIR) if a project is within an APEZ,[5] defined as an area in which modeled air pollution exceeds "either: (1) a cancer risk of greater than 100 per one million exposed, and/or (2) $PM_{2.5}$ concentrations in excess of 10 microgram per cubic meter (µg/m^3) (including ambient)."[6]

The Project is not in an APEZ, based on air dispersion modeling performed by the San Francisco Department of Public Health in conjunction with SFEP and the BAAQMD.[7] The Project is not bounded by an APEZ, either, with the nearest APEZ falling over the University of California, San Francisco (UCSF) Mission Bay campus, to the west of the Project. The parcels immediately surrounding the Project have average excess cancer risks below 50 in one million persons, with lower risks to the east of Third Street. The nearest residential parcel is the UCSF dormitory to the northwest of the Project; risks at this parcel are below 26 in one million, although the average period of residence in the dormitory is less than the 70 years assumed in excess cancer risk calculations. Another sensitive receptor is located at the UCSF Medical Center at Mission Bay to the southwest of the Project; risks at this parcel are below 45 in one million, but again the average period of residence is less than 70 years. At the dormitory, background $PM_{2.5}$ concentration from the City-wide modeling is 8.5 µg/m^3. At the UCSF Medical Center, background $PM_{2.5}$ concentration is 8.6 µg/m^3.

Since the Project is not in an APEZ, the subsequent criterion of significance is whether or not the Project will create an APEZ. The Project's excess cancer risk and $PM_{2.5}$ contribution is evaluated for contributions from two schemes, construction and operation. A lifetime cumulative risk and annual average $PM_{2.5}$ concentration including both construction and operation is considered and compared against the APEZ thresholds. Annual average $PM_{2.5}$ concentration

6 Department of Public Health, Environmental Health, City and County of San Francisco. 2014. Memorandum to file Re 2014 Air Pollutant Exposure Zone Map. April 9.

7 See Air Pollutant Exposure Zone map (http://www.sfdph.org/dph/files/EHSdocs/AirQuality/AirPollutantExposureZoneMap.pdf) and DPH website (http://www.sfdph.org/dph/eh/Air/Article38.asp).

For parcel-specific information, see the Zoning designation for Mission Bay South Redevelopment Plan Blocks 29-32; Assessor's Block 8722, Lots 001 and 008. This is the parcel bounded by South Street on the north, Third Street on the west, 16th Street on the south, and roughly by the future planned realigned Terry A. Francois Boulevard on the east.

The Project is not in a "health vulnerability layer" as defined in the 2014 Air Pollutant Exposure Zone Map memorandum, either, as it is not in the affected zip codes or within 500 feet of a freeway.

during both construction and after operation of the Project as considered individually and compared against the APEZ thresholds.

To show that the Project will not create an APEZ at nearby residential or sensitive receptors, ENVIRON performed a construction HRA using the USEPA AERMOD model[8] and performed an operational HRA using the BAAQMD screening tools and the USEPA SCREEN3 model.[9]

Many elements of the HRA are designed to provide conservative (that is, health protective) overestimates of impacts to off-site receptors. For residential receptors, the assumption of 24 hours per day of exposure represents a maximum exposure, since based on USEPA activity studies people spend on average 58 to 82% of their time at home, depending on age group (USEPA 2011). In addition, indoor air concentrations are not the same as outdoor air concentrations, however this analysis assumes that there is no filtration or attenuation in the indoor air. Other conservative assumptions made here include the use of BAAQMD screening tables for on-road traffic and the maximum generator risk of 30 in one million, assuming the generators are permitted as three separate projects. The BAAQMD HRA guidelines are also designed to be protective of human health, for example relying on the 80th percentile breathing rate for adults rather than the average and the upper 95th percentile breathing rate for children rather than the average (BAAQMD 2010).

3.2 Estimated Air Concentrations for Construction HRA

Consistent with the City-wide HRA, the air toxics analysis evaluated health risks and $PM_{2.5}$ concentrations resulting from the Project upon the surrounding community. Project construction is planned for a 27-month period starting in late 2015. The Project Sponsor provided ENVIRON with the proposed construction off-road equipment list, count, and activity; and on-road vehicle traffic. ARB tools and methods were used to estimate emissions of diesel particulate matter (DPM) and other TACs from the off- and on-road equipment list.

3.2.1 Chemical Selection

The cancer risk analysis in the construction HRA is based on DPM concentrations and total organic gases (TOGs) from diesel equipment and on-road vehicles. Diesel exhaust, a complex mixture that includes hundreds of individual constituents (California Environmental Protection Agency [Cal/EPA] 1998), is identified by the State of California as a known carcinogen (Cal/EPA 2014). Under California regulatory guidelines, DPM is used as a surrogate measure of carcinogen exposure for the mixture of chemicals that make up diesel exhaust as a whole (Cal/EPA 2014). Cal/EPA and other proponents of using the surrogate approach to quantifying cancer risks associated with the diesel mixture indicate that this method is preferable to a component-based approach. A component-based approach involves estimating risks for each of the individual components of a mixture. Critics of the component-based approach believe it will underestimate the risks associated with diesel as a whole because the identity of all chemicals in the mixture may not be known or exposure and health effects information for all chemicals identified within the mixture may not be available. Furthermore, Cal/EPA has concluded that “potential cancer risk from inhalation exposure to whole diesel exhaust will exceed the multi-

[8] Available at http://www.epa.gov/ttn/scram/dispersion_prefrec.htm#aermod.

[9] Available at http://www.epa.gov/ttn/scram/dispersion_screening.htm.

pathway cancer risk from the speciated components (Cal/EPA 2003)." The analysis of DPM for this Project is based on the surrogate approach, as recommended by Cal/EPA.

3.2.2 Project Sources

Near-field air dispersion modeling of DPM and $PM_{2.5}$ from Project construction sources was conducted using the USEPA AERMOD model.[10] For each receptor location, the model generates average air concentrations that result from emissions from multiple sources.

Air dispersion models such as AERMOD require a variety of inputs such as source parameters, meteorological parameters, topography information, and receptor parameters. When site-specific information was unknown, ENVIRON used default parameter sets that are designed to produce conservative (i.e., overestimated) air concentrations.

3.2.3 Meteorological Data

Air dispersion modeling applications require the use of meteorological data that ideally are spatially and temporally representative of conditions in the immediate vicinity of the site under consideration. For this HRA, BAAQMD's Mission Bay meteorological data for the year 2008 was used, which aligns with the San Francisco City-wide HRA Methodology (BAAQMD 2012).

3.2.4 Terrain Considerations

Elevation and land use data was imported from the National Elevation Dataset (NED) maintained by the United States Geological Survey (USGS 2013). An important consideration in an air dispersion modeling analysis is the selection of whether or not to model an urban area. Due to the urban nature of San Francisco, the site was modeled with the urban population of 805,235, corresponding to the 2010 US Census.

3.2.5 Emission Rates

Emitting activities were modeled to reflect the actual hours of construction. Emissions were modeled using the χ/Q ("chi over q") method, such that each phase has unit emission rates (i.e., 1 gram per second [g/s]), and the model estimates dispersion factors (with units of [$\mu g/m^3$]/[g/s]).

For annual average ambient air concentrations, the estimated annual average dispersion factors are multiplied by the annual average emission rates. The emission rates will vary day to day, with some days having no emissions. For simplicity, the model assumed a constant emission rate during the entire year.

In the construction model, modeled meteorological hours of the day are restricted to 7:00 am to 1:00 am, the likely hours for emissions to occur. This way, only representative meteorological data was considered in determining the dispersion factors. Emission rates are adjusted such that on average, unit emission rates are modeled, i.e. 1 g/s for 24 hours a day, 7 days a week. Thus, the model provides an annual average concentration that can be incorporated directly into the health risk calculations assuming 24 hours of daily exposure.

[10] On November 9, 2005, the USEPA promulgated final revisions to the federal Guideline on Air Quality Models, in which it recommended that AERMOD be used for dispersion modeling evaluations of criteria air pollutant and toxic air pollutant emissions from typical industrial facilities.

3.2.6 Source Parameters

Source location and parameters are necessary to model the dispersion of air emissions. The duration of construction on Blocks 29-32 is anticipated to be up to 27 months, with arena and office building construction proceeding concurrently. At any given time there will be multiple emissions sources associated with construction equipment within the construction zone.

Table 2: Modeling Parameters summarizes the source parameters associated with the construction HRA. The construction area was modeled as an Area source encompassing the entire Project site, following City-wide HRA Methodology. The Area source model included emissions from both off-road construction equipment and off-site trucks (trucks going to and from construction zones[11]). A release height of 5 meters was used, with an initial vertical dimension of 1.4 meters. Emissions were distributed uniformly throughout the area source representing construction of that phase.

Table 2: Modeling Parameters
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Period	Source	Source Dimension	Number of Sources[1,2]	Release Height[3]	Initial Vertical Dimension[4]	Initial Lateral Dimension
		[m]		[m]	[m]	[m]
Construction	Construction Equipment and On-Road Trucks	Project Area	2	5.0	1.4	N/A

Notes:
1. Due to lack of specific instructions on modeling of construction emissions from BAAQMD, ENVIRON used methodology from the City-wide HRA when setting up the model. According to the City-wide HRA methodology, construction sources are modeled as area sources.
2. The number of sources is to be determined based on the geometry of the truck routes.
3. According to the City-wide HRA methodology, release height of the modeled construction was set to 5 meters
4. According to the City-wide HRA methodology, initial vertical dimension of the modeled construction sources was set to 1.4 meters.

BAAQMD, 2012. *The San Francisco Community Risk Reduction Plan: Technical Support Documentation, V9.*

[11] ENVIRON assumed a 20 mile one-way trip length for Construction Hauling, based on CalEEMod™ default values, if Project-specific data is not available.

3.2.7 Receptors

Offsite receptors were placed at locations collocated with the grid receptors used in the City-wide HRA and within 2,000 feet of the Project site. Receptors were modeled at a height of 1.8 meters above terrain height, a default breathing height for ground-floor receptors, consistent with the City-wide HRA analysis. As discussed previously, average annual dispersion factors were estimated for each receptor location.

3.2.8 Modeling Adjustment Factors

Cal/EPA (2003) recommends applying an adjustment factor to the annual average concentration modeled assuming continuous emissions (i.e., 24 hours per day, 7 days per week), when the actual emissions are less than 24 hours per day and exposures are concurrent with construction activities occurring at the Project.

Off-site residents are assumed to be exposed to construction emissions 24 hours per day, seven days per week. This assumption is consistent with the modeled emission rates (24 hours per day, 7 days per week), even though actual construction operations may occur for fewer than 24 hours per day and fewer than 7 days per week. Thus, the annual average concentration need not be adjusted. This approach simplifies the model set up, yet does not underestimate exposure since ENVIRON is evaluating chronic health risk impacts and follows City-wide HRA Methodology.

3.3 Risk Characterization Methods for Construction HRA

The following sections discuss in detail the various components required to conduct the HRA.

3.3.1 Exposure Assessment

3.3.1.1 Potentially Exposed Populations

The Construction HRA conservatively evaluated impacts at the off-site receptors assuming child residents.[12] As the residential exposure assumptions are more conservative than those for other sensitive receptor types, a conservative approach of considering all receptors as residential receptors was used. In addition, for the purposes of the cumulative APEZ analysis, the HRA also evaluated impacts at the UCSF Medical Center at Mission Bay assuming a child receptor. The impacts at the hospital consider outdoor air concentrations only, although indoor air at hospitals is filtered to lower indoor air particulate matter concentrations versus outdoor air.

3.3.1.2 Exposure Assumptions

The exposure parameters used to estimate excess lifetime cancer risks for all potentially exposed populations for the construction and operation scenarios are based on risk assessment guidelines from Cal/EPA (2003) and BAAQMD (2010), unless otherwise noted, and are presented in Table 3: Exposure Parameters.

[12] As Child Resident exposure assumptions are more conservative than those for Adult Residents, a conservative approach of considering all off-site receptors as Child Residents during Construction scenario is used in this HRA.

Table 3: Exposure Parameters
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Exposure Parameter	Units	Construction	
		Child Resident	Hospital Child
Daily Breathing Rate (DBR)[1]	[L/kg-day]	581	581
Exposure Time (ET)[2]	[hours/24 hours]	24	24
Exposure Frequency (EF)[3]	[days/year]	350	365
Exposure Duration (ED)[4]	[years]	2	1
Averaging Time (AT)	[days]	25,550	25,550
Intake Factor, Inhalation (IF_{inh})	[m^3/kg-day]	0.016	0.0083

Notes:
1. Daily breathing rate for child resident reflects default breathing rate from BAAQMD 2010.
2. Exposure time for child resident reflects default exposure time from BAAQMD 2010.
3. Exposure frequency for child resident reflects default exposure frequency from BAAQMD 2010.
4 The exposure duration was assumed to be 2 years for child resident reflecting the actual construction duration. Exposure time was conservatively assumed to be 1 year for hospital child.

Abbreviations:
BAAQMD = Bay Area Air Quality Management District; L = liter; kg = kilogram; m^3 = cubic meter

Reference:
BAAQMD. 2010. Air Toxics NSR Program Health Risk Screening Analysis (HRSA) Guidelines. January.

3.3.1.3 Calculation of Intake

The dose estimated for each exposure pathway is a function of the concentration of a chemical and the intake of that chemical. The intake factor for inhalation, IF_{inh}, can be calculated as follows:

$$IF_{inh} = \frac{DBR * ET * EF * ED * CF}{AT}$$

Where:

IF_{inh}	=	Intake Factor for Inhalation (m^3/kg-day)
DBR	=	Daily Breathing Rate (L/kg-day)
ET	=	Exposure Time (hours/24 hours)
EF	=	Exposure Frequency (days/year)
ED	=	Exposure Duration (years)
AT	=	Averaging Time (days)
CF	=	Conversion Factor, 0.001 (m^3/L)

The chemical intake or dose is estimated by multiplying the inhalation intake factor, IF_{inh}, by the chemical concentration in air, C_i. When coupled with the chemical concentration, this calculation is mathematically equivalent to the dose algorithm given in Office of Environmental Health Hazard Assessment (OEHHA) Hot Spots guidance (Cal/EPA 2003).

3.3.2 Toxicity Assessment

The toxicity assessment characterizes the relationship between the magnitude of exposure and the nature and magnitude of adverse health effects that may result from such exposure.

Following City-wide HRA Methodology for cancer risk calculations, ENVIRON included toxicity for DPM for all source categories, and additionally included organic gases from on-road gasoline-powered vehicles. Toxicity values are summarized in Table 4: Carcinogenic Toxicity Values.

Table 4: Carcinogenic Toxicity Values
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Source	Analysis	Chemical	Cancer Potency Factor
			[mg/kg-day]$^{-1}$
Construction Diesel Vehicles	Cancer Risk	Diesel PM	1.1
Construction Gasoline Vehicles	Cancer Risk	1,3-Butadiene	0.6
		Acetaldehyde	0.01
		Benzene	0.1
		Ethylbenzene	0.0087
		Formaldehyde	0.021
		Naphthalene	0.12

Abbreviations:
ARB: Air Resources Board; Cal/EPA: California Environmental Protection Agency; mg/kg-day: per milligram per kilogram-day; OEHHA - Office of Environmental Health Hazard Assessment; PM: Particulate Matter

Reference:
Cal/EPA. 2014. OEHHA/ARB Consolidated Table of Approved Risk Assessment Health Values. July.

3.3.3 Calculated Age-Specific Sensitivity Factors

The estimated excess lifetime cancer risks for a resident child were adjusted using the age sensitivity factors (ASFs) recommended in the Cal/EPA OEHHA Technical Support Document (TSD) (2009) and the cancer risk adjustment factors (CRAFs) recommended by BAAQMD (2010). This approach accounts for an “anticipated special sensitivity to carcinogens” of infants and children. Cancer risk estimates are weighted by a factor of 10 for exposures that occur from the third trimester of pregnancy to two years of age and by a factor of three for exposures that occur from two years through 15 years of age. No weighting factor (i.e., an ASF of one, which is equivalent to no adjustment) is applied to ages 16 to 70 years.

3.3.4 Estimation of Cancer Risks

Excess lifetime cancer risks are estimated as the upper-bound incremental probability that an individual will develop cancer over a lifetime as a direct result of exposure to potential carcinogens. The estimated risk is expressed as a unitless probability. The cancer risk attributed to a chemical is calculated by multiplying the chemical intake or dose at the human exchange boundaries (*e.g.,* lungs) by the chemical-specific Cancer Potency Factor (CPF).

The equation used to calculate the potential excess lifetime cancer risk for the inhalation pathway is as follows:

$$Risk_{inh} = C_i \times CF \times IF_{inh} \times CPF \times ASF$$

Where:

$Risk_{inh}$	=	Cancer Risk; the incremental probability of an individual developing cancer as a result of inhalation exposure to a particular potential carcinogen (unitless)
C_i	=	Annual Average Air Concentration for $Chemical_i$ ($\mu g/m^3$)
CF	=	Conversion Factor (mg/µg)
IF_{inh}	=	Intake Factor for Inhalation (m^3/kg-day)
CPF_I	=	Cancer Potency Factor for $Chemical_i$ (mg chemical/kg body weight-day)$^{-1}$
ASF	=	Age Sensitivity Factor (unitless)

3.4 Operational Traffic Screening

BAAQMD on-road traffic tools were used along with Project-specific data to estimate $PM_{2.5}$ and health-risk impacts from on-road traffic. The BAAQMD San Francisco County Surface Street Screening Tables[13] provide screening risk estimates for this level of traffic for north-south roadways and east-west roadways in San Francisco County. All traffic generated by the Project was assumed to travel along the four segments surrounding the Project Site, resulting in a conservative estimate of impacts from mobile sources, as all Project traffic may not take these routes.

3.5 Operational Stationary Sources

The Project will include new natural gas-fired boilers to provide heating to the proposed arena. According to the BAAQMD,[14] non-diesel boilers are regarded as minor, low-impact sources that can be excluded from the CEQA process. The Project will also include 5 stationary emergency diesel engines which will require stationary source permits from the BAAQMD. BAAQMD Rule 2-5-302 limits project risks to 10 in one million, so for screening purposes incremental risk from the generators is assumed to be 10 in one million. In the worst case, the generators might have up to 3 different owners, resulting in 3 permits with risks of up to 10 in one million each, for a total potential generator risk of 30 in one million.

$PM_{2.5}$ impacts were modeled using the USEPA SCREEN3 model. SCREEN3 is a Gaussian air dispersion model that uses a worst-case, not site-specific, meteorological dataset to estimate maximum impacts.

4 Measures to Reduce Project Impacts

Based on the analysis above, a consultation was conducted with OCII, EP, ESA, and the Project sponsor to identify and develop feasible control measures that would reduce Project impacts. For construction emissions two compliance levels of emissions control measures were assessed: use of construction equipment with EPA Tier 2 engines with Level 3 Verifiable Diesel Emission Control Strategy (VDECS) and EPA Tier 4 engines. While use of equipment with Tier 4 would be the most effective emissions control strategy, the analysis also considers a minimum compliance scenario using use of equipment with EPA Tier 2 engines with Level 3 VDECS, acknowledging that there may be instances where a particular piece of off-road equipment with a Tier 4 engine is: (1) technically not feasible, (2) would not produce desired emissions reductions due to expected operating modes, or (3) there is a compelling emergency need to use off-road equipment that do not have Tier 4 engines.

Construction			
$PM_{2.5}$ Concentration from Uncontrolled Construction Emissions	0.31	0.31	1.2
$PM_{2.5}$ Concentration from Tier 4 Controlled Construction Emissions	0.044	0.044	0.17
$PM_{2.5}$ Concentration from Tier 2 + ARB NOx VDECS Controlled Construction Emissions	0.053	0.053	0.21
2014 Background $PM_{2.5}$ Concentration[1]	8.5	8.6	8.4
Total $PM_{2.5}$ Concentration (Construction, Uncontrolled scenario)	8.8	8.9	9.6
Total $PM_{2.5}$ Concentration (Construction, Tier 4 Controlled scenario)	8.5	8.7	8.5
Total $PM_{2.5}$ Concentration (Construction, Tier 2 + ARB NOx VDECS Controlled scenario)	8.5	8.7	8.6
Cumulative Threshold[2]	10	10	10
Total $PM_{2.5}$ Concentration Exceeds Threshold? (Uncontrolled scenario)	No	No	No
Total $PM_{2.5}$ Concentration Exceeds Threshold? (Tier 4 Controlled scenario)	No	No	No
Total $PM_{2.5}$ Concentration Exceeds Threshold? (Tier 2 + ARB NOx VDECS Controlled scenario)	No	No	No
Operational			
$PM_{2.5}$ Concentration from Operational Traffic	0.32	0.32	0.32
$PM_{2.5}$ Concentration from Emergency Diesel Generators[3]	0.055	0.055	0.055
2014 Background $PM_{2.5}$ Concentration[1]	8.5	8.6	8.4
Total $PM_{2.5}$ Concentration (Operational)	8.9	9.0	8.7
Cumulative Threshold[2]	10	10	10
Total $PM_{2.5}$ Concentration Exceeds Threshold? (Operational)	No	No	No

Notes:
1. 2014 background risk from the Citywide HRA database for all receptors.
2. Cumulative threshold is the threshold for creating an Air Pollutant Exposure Zone (APEZ), as defined by the San Francisco Planning Department, Environmental Planning.
3. Back-calculated assuming a cancer risk of 10 in a million for each of the three generators (total of 30 in a million). The cancer risk of 10 in a million is the maximum allowable Project cancer risk from toxic air contaminants in the BAAQMD, and exposure assumptions for a 70-year resident.

Abbreviations:
BAAQMD: Bay Area Air Quality Management District
HRA: Health Risk Assessment
μg: microgram
m^3: cubic meter

Table 6.1-7
Exposure Parameters and Cancer Risk Adjustment Factors
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Exposure Parameter	Units	Construction			
		Child Resident	Adult Resident	Hospital Child	Daycare Child
Daily Breathing Rate (DBR)[1]	[L/kg-day]	581	302	581	581
Exposure Time (ET)[2]	[hours/24 hours]	24	24	24	11
Exposure Frequency (EF)[3]	[days/year]	350	350	365	253
Exposure Duration (ED)[4]	[years]	2.0	2.0	1.0	0.67
Averaging Time (AT)	[days]	25,550	25,550	25,550	25,550
Intake Factor, Inhalation (IF_{inh})	[m^3/kg-day]	0.016	0.0083	0.0083	0.0018
Cancer Risk Adjustment Factor[5]	[-]	10	1.0	10	10
Modeling Adjustment Factor[6]	[-]	N/A	N/A	N/A	3.15

Notes:

1. Daily breathing rate reflects default breathing rate from BAAQMD 2010.
2. Exposure time reflects default exposure time from BAAQMD 2010.
3. Exposure frequency reflects default exposure frequency from BAAQMD 2010.
4. Assumes all construction-related emissions will be emitted within the first two years. Operation of the daycare center is not expected to take place until mid- to late-2017; since Project construction will be largely completed by that time, an exposure duration of 8 months was used as a conservative estimate.
5. Based on BAAQMD 2010.
6. Construction emissions are conservatively assumed to occur concurrently with the operation of the daycare center. As such, a modeling adjustment factor of (365/253)*(24/11) = 3.15 is applied for the daycare child receptor.

Calculation:

IF_{inh} = DBR * ET * EF * ED * CF / AT

CF = 0.001 (m^3/L)

Abbreviations:

BAAQMD: Bay Area Air Quality Management District
L: liter
kg: kilogram
m^3: cubic meter

References:

BAAQMD. 2010. BAAQMD Air Toxics NSR Program Health Risk Screening Analysis (HRSA) Guidelines. January.

Excess Cancer Risk from Tier 4 Controlled Construction Emissions[2]	[in a million]	7.7	0.40	4.0	10.4
Excess Cancer Risk from Tier 2 + ARB NOx VDECS Controlled Construction Emissions[2]	[in a million]	9.2	0.48	4.8	12.5
Excess Cancer Risk from Operational Traffic Emissions[3]	[in a million]	7.2	7.2	7.2	7.2
Excess Cancer Risk from Emergency Diesel Generators[4]	[in a million]	30	30	30	30
2014 Background Risk[5]	[in a million]	26	26	44	20
Total Excess Cancer Risk (Uncontrolled Scenario)	[in a million]	117	66	109	131
Total Excess Cancer Risk (Tier 4 Controlled Scenario)	[in a million]	71	64	85	68
Total Excess Cancer Risk (Tier 2 + ARB NOx VDECS) Controlled Scenario)	[in a million]	72	64	86	70
Cumulative Threshold[6]	[in a million]	100	100	100	100
Total Risk Exceeds Threshold? (Uncontrolled Scenario)	-	Yes	No	Yes	Yes
Total Risk Exceeds Threshold? (Tier 4 Controlled Scenario)	-	No	No	No	No
Total Risk Exceeds Threshold? (Tier 2 + ARB NOx VDECS Controlled Scenario)	-	No	No	No	No

Notes:
1. From Cal/EPA 2013.
2. Represent health impacts for a residential receptor at the dormitory, hospital, or daycare.
3. The screening values reflect a 70-year cancer risk with age sensitivity factors applied (BAAQMD 2012).
4. A cancer risk of 10 in a million, the maximum allowable Project cancer risk from toxic air contaminants in the BAAQMD, is conservatively assumed.
5. 2014 background risk from the Citywide HRA database for all receptors.
6. Cumulative threshold is the threshold for creating an Air Pollutant Exposure Zone (APEZ), as defined by the San Francisco Planning Department, Environmental Planning.

Calculation:
Cancer Risk = [AnnualConc] × [CF] × [IF_{inh}] × [CPF] x [CRAF] x [MAF]
CF = 0.001 (mg/µg)

Abbreviations:
BAAQMD: Bay Area Air Quality Management District
Cal/EPA: California Environmental Protection Agency
CRAF: Cancer Risk Adjustment Factor
HRA: Health Risk Assessment
IF_{inh}: Intake Factor, Inhalation
kg: kilogram
mg: milligram
PM: Particulate Matter
µg: microgram

Construction Area Emissions Estimates

Table 6.1-19

Venue	Floor Area [ft^2]	Building Surface Area[1] [ft^2]	Architectural Coatings: Reapplication Rate	Architectural Coatings: Indoor Paint VOC EF[2] [g/L]	Architectural Coatings: Outdoor Paint VOC EF[2] [g/L]	Architectural Coatings: Architectural Coating VOC emissions[3] [lb/yr]
Event Center	750,000	1,500,000	100%	100	150	7,823
GSW Office Space	25,000	50,000				261
Office Space	580,000	1,160,000				6,050
Retail Space	125,000	250,000				1,304
Parking and Loading	475,000	950,000				4,955

Notes:

1. Consistent with CalEEMod, residential building surface area is assumed to be 2.7 times the floor area, and non-residential 2 times the floor area.
2. Based on BAAQMD paint VOC regulations, 100 g/L for flat paints, generally used indoors, and 150 g/L for all other architectural coatings. Building area is assumed to be 75% indoors and 25% outdoors, consistent with CalEEMod.
3. Uses CalEEMod assumptions of 1 gallon of paint covers 180 square feet.

Area Sources	Total Emissions [ton/yr]: ROG	CO	NO_x	PM_{10}	$PM_{2.5}$
Architectural Coatings	10.20	--	--	--	--
Total Project Emissions:	10.20	0.00	0.00	0.00	0.00

Mobile Source CAP Emissions Estimates

Table 6.1-20
Project CAPs Emission Factors

Emission Factor[1]	Units	Pollutant

ROG Resting Loss	[g/trip]	0.044	-	-	-	-

Notes:

1. From EMFAC2011, calendar year 2017, San Francisco Bay Area. Emission factors are weighted by VMT for all vehicle categories.

Mobile Source CAP Emissions Estimates

Table 6.1-21

Project CAPs Emission Calculations

Trip Type	Scenario	Daily One-way Vehicle Trips[1]			Days Per Year[2]	Weighted Trip Length [mile][3]	Emissions [ton/yr]				
		Arena	Retail	Office			ROG	CO	NO_x	PM_{10}	$PM_{2.5}$
Mission Bay, Weekend Trips	Basketball Event Days	8,715	3,106	509	30	20.1	1.4	14	3.9	0.47	0.22
	Concert Event Days	8,715	3,106	509	55	20.1	2.6	26	7.1	0.86	0.40
	No Event Days	55	5,313	509	19	7.8	0.21	1.9	0.49	0.055	0.026
Mission Bay, Weekday Trips	Basketball Event Days	8,589	2,560	2,542	30	18.7	1.5	15	4.0	0.49	0.22
	Concert Event Days	8,589	2,560	2,542	45	18.7	2.2	22	6.1	0.73	0.34
	Convention Event Days	3,921	2,560	2,542	61	15.4	1.7	16	4.5	0.54	0.25
	No Event Days	55	4,393	2,542	125	7.9	1.6	15	3.9	0.44	0.20
Total Emissions:							**11**	**110**	**30**	**3.6**	**1.6**

Notes:

1. Daily vehicle trips provided by Adavant Consulting in a final memorandum titled "Travel, Parking, and Loading Demand Estimates for the Proposed Event Center & Mixed-Use Development at Mission Bay Blocks 29-32 - Case No. 2014.1441E". Office use includes GSW offices.

2. The maximum number of home games (60) in a season was conservatively assumed. Furthermore, it is assumed that half of the games will take place on weekends. Vehicle generation associated with all concert and family show events is approximated by concert trips, while the other 61 events are assumed to be convention events on weekdays.

3. Trip length for each scenario is weighted by the number of trips in each land use category. Arena vehicle trips are assumed to have a trip length of 25 miles/trip based on season ticket holder addresses. Season ticket holders account for approximately 60% seating at Warrior games. Vehicle trips from retail and office space are assumed to have a trip length of 11.98 miles/trip, based on 2006 average commute trip length in the Bay Area (MTC 2008).

Mobile Source CAP Emissions Estimates

Table 6.1-22

Road Dust Calculations

Total Annual VMT

Trip Type	Scenario	VMT [mile/yr]
Mission Bay, Weekend Trips	Basketball Event Days	7,418,424
	Concert Event Days	13,600,444
	No Event Days	870,239
Mission Bay, Weekday Trips	Basketball Event Days	7,688,333
	Concert Event Days	11,532,500
	Convention Event Days	8,457,295
	No Event Days	6,891,904
	Total VMT	**56,459,139**

Pollutants	Emissions Factor [lb/VMT]	Emissions [ton/yr]
Fugitive PM_{10}	0.00063	17.84
Fugitive $PM_{2.5}$	0.00016	4.38

Road Dust Equation[1]

E = k*(sL)^0.91 * (W)^1.02 * (1-P/4N)

where:

E = annual average emission factor in the same units as k	
k = particle size multiplier for particle size range and units of interest	
PM_{10} (lb/VMT)	0.0022
$PM_{2.5}$ (lb/VMT)	0.00054
sL = road surface silt loading (grams per square meter) (g/m^2)	0.1
W = average weight (tons) of all the vehicles traveling the road	2.4
P = number of "wet" days with at least 0.01 in of precipitation during theaveraging period	64
N number of days in the averaging period	365

Notes:

1. Road dust equation and parameters are based on CalEEMod defaults for the San Francisco Bay Area Air Basin.

Table 6.1-23
Mobile Source CAPs Emission Reduction

Oracle Arena and GSW Oakland HQ Vehicle Trips Calculation

Employee Commute/ Non-Commute Trips

Scenario	Total Employees[1]	Total Driving Employees[2]	% SOV[3]	% Carpool[3]	Carpool Density [people/ vehicle][4]	Trips/ Roundtrip	Total Vehicle Trips per Day	Average operating days per year[5]	Total Vehicle Trips per Year
Oracle Arena Operations Employees	71	55	86%	14%	2	2	103	260	26,859
GSW Headquarters Employees	150	128	94%	6%	2	2	248	260	64,350

Notes:

1. Oracle Arena Operations employees assumed to be the same as the estimated number of employees at the proposed event center. Number of existing GSW employees at the Oakland headquarters is based on the Project Notice of Preparation dated 11/19/2014.
2. A 78.1% driving rate was assumed for the Oracle Arena employees according to the most recent Bay Area Census data (http://www.bayareacensus.ca.gov/bayarea.htm). GSW employees who drive based on a 85% driving rate according to Ben Draa, Senior Financial Analyst, GSW.
3. Oracle Arena employees SOV and carpool rates from Bay Area Census data. GSW Headquarters SOV and carpool rates from Ben Draa, Senior Financial Analyst,
4. A carpool density of two people per vehicle is assumed to be conservative.
5. Assumes 5 days per week for 52 weeks per year.

Spectator Trips

Scenario	Total Spectators Per Event[1]	Total Driving Spectators[2]	% SOV[3]	% Carpool[3]	Carpool Density [people/ vehicle][3]	Trips/ Roundtrip	Total Vehicle Trips per Event	Event Days per Year[4]	Total Vehicle Trips per Year
Oracle Arena Game Spectators	18,250	16,250	20%	80%	3	2	15,167	47	712,833
Oracle Arena Non-game Event Spectators	9,125	9,125	20%	80%	3	2	8,517	42	357,700

Notes:

1. Average spectator count and transit riders from Ben Draa, Senior Financial Analyst, GSW.
2. Ben Draa, Senior Financial Analyst, GSW, estimated that 2,000 of the total spectators take public transit or taxis per event.
3. The carpool assumptions are conservative in that 20% of the driving spectators would drive alone, while the remaining 80% would carpool at a density of 3 people per vehicle.
4. Number of GSW games is based on the 2013-2014 season and number of non-game events is based on four-year averages (2010-2013).

Vendor and Event Staff Trips

Scenario	Total Event Staff Per Event[1]	Total Driving Staff[1]	% SOV[2]	% Carpool[2]	Carpool Density [people/ vehicle][3]	Trips/ Roundtrip	Total Vehicle Trips per Event	Event Days per Year[4]	Total Vehicle Trips per Year
Oracle Arena Game Event Staff	1,013	791	86%	14%	2	2	1,474	47	69,274
Oracle Arena Non-game Event Staff	645	504	86%	14%	2	2	939	42	39,419

Notes:

1. A 78.1% driving rate was assumed for the vendor and event staff according to the most recent Bay Area Census data (http://www.bayareacensus.ca.gov/bayarea.htm). GSW employees who drive based on a 85% driving rate according to Ben Draa, Senior Financial Analyst, GSW.
2. SOV and carpool rates from Bay Area Census data.
3. A carpool density of two people per vehicle is assumed to be conservative.
4. Number of GSW games is based on the 2013-2014 season and number of non-game events is based on four-year averages (2010-2013).

Table 6.1-24
Mobile Source CAPs Emission Reduction

Total		**3.7**	**10**	**1.2**	**0.57**

Notes:

1. CalEEMod Default Trip Length for Commercial-Worker trips in the San Francisco Bay Area Air Basin.
2. Non-commute trips are assumed to have a trip length of 3 miles.
3. Trip length is an estimation based on season ticket holder addresses. Season ticket holders account for approximately 60% of seating at Warrior games.
4. Annual vehicle trips based on number of vendors at each event and total number of event days per year.
5. Annual vehicle trips based on 1.5 bus trips per game, 2 trips per round trip and 44 events per year. Count of opposing team bus trips from Ben Draa, Senior Financial Analyst, GSW. Event days per year includes 3 preseason games and 41 regular-season games.
6. Trip length is the driving distance from Union Square, San Francisco, where the Opposing Team is assumed to stay, to Oracle Arena.
7 Annual vehicle trips based on a daily delivery count of 8 from Ben Draa, Senior Financial Analyst, GSW. Assume 5 days per week for 52 weeks per year.
8. CalEEMod Default Trip Length for Commercial-Nonwork trips in the San Francisco Bay Area Air Basin.
9. Represents reduction in regional VMT-related emissions due to relocation of Warriors games from Oakland to San Francisco only.
10. From EMFAC2011, calendar year 2017, San Francisco Bay Area. Emission factors are weighted by VMT for all vehicle categories.

Table 6.1-26
Mobile Source CAPs Emission Reduction

Reduction in Road Dust Emissions

Road Dust Equation[1]
E = k*(sL)^0.91 * (W)^1.02 * (1-P/4N)

where:
E = annual average emission factor in the same units as k
k = particle size multiplier for particle size range and units of interest

PM_{10} (lb/VMT)	0.0022
$PM_{2.5}$ (lb/VMT)	0.00054
sL = road surface silt loading (grams per square meter) (g/m^2)	0.1
W = average weight (tons) of all the vehicles traveling the road	2.4
P = number of "wet" days with at least 0.01 in of precipitation during theaveraging period	64
N number of days in the averaging period	365

Pollutants	Emissions Factor [lb/VMT]	VMT Reduction [mile/yr]	Emission Reduction [ton/yr]
Fugitive PM_{10}	0.00063	19,458,556	6.1
Fugitive $PM_{2.5}$	0.00016		1.5

Notes:
1. Road dust equation and parameters are based on CalEEMod defaults for the San Francisco Bay Area Air Basin.

Generator Emissions Estimates

Project Emission Calculations **Table 6.1-27**

Location	Size		Fuel Type	Operation[1] (hrs/yr)	Emission Factors[2,3]					Emissions			
					NMHC	ROG	CO	NOx	PM	ROG	CO	NOx	PM
	[kW]	[hp]			[g/bhp-hr]					[ton/yr]			
Arena Standby Emergency	1,500	2,012	diesel	50	0.14	0.15	2.6	0.50	0.020	0.017	0.29	0.055	0.0022
Arena Standby Emergency	1,500	2,012	diesel	50	0.14	0.15	2.6	0.50	0.020	0.017	0.29	0.055	0.0022
Office Tower 1	750	1006	diesel	50	0.14	0.15	2.6	0.50	0.020	0.0083	0.14	0.028	0.0011
Office Tower 2	750	1006	diesel	50	0.14	0.15	2.6	0.50	0.020	0.0083	0.14	0.028	0.0011
Marketplace	500	671	diesel	50	0.14	0.15	2.2	0.30	0.015	0.0055	0.081	0.011	0.0006
									Total Emissions:	0.055	0.95	0.18	0.0072

Notes:

1. Operation is conservatively assumed to be 50 hours per year, the maximum allowable by the Bay Area Air Quality Management District.
2. Criterial Air Pollutants emission factors based on Tier 4 standards from the ARB and USEPA Off-Road Compression-Ignition (Diesel) Engine Standards (ARB 2013). Emission factors for PM_{10} and $PM_{2.5}$ are conservatively based on the PM emission standard.
3. The emission factors for ROG were calculated from the NMHC emission factors using conversion factors for diesel engines (USEPA 1997) and assuming that VOC and ROG are equivalent (ARB 2009).

Boiler Emissions Estimates

Project Emission Calculations

Table 6.1-28

Quantity[1]	Fuel Type	Size Per Boiler[1]	Higher Heating Value[2]	Fuel Consumption[3]	Operation[4] (hrs/yr)	Emission Factors[5,6,7]						Emissions			
						CO	NOx	CO	NOx	ROG	PM	CO	NOx	ROG	PM
		Btu/hr	Btu/scf	scf/hr		ppmv (dry at 3% O_2)		lb/MMBtu		lb/10^6 scf		[ton/yr]			
4	Natural Gas	4,000,000	1,020	3,922	8,760	400	30	0.30	0.037	5.5	7.6	21	2.6	0.38	0.52

Notes:
1. Quantity and Size based on Project Sponsor estimate and is consistent with the total estimated heating load.
2. Higher heating value is the average natural gas heating value in AP-42 Section 1.4.
3. Fuel consumption calculated from size and higher heating value.
4. The boiler is assumed to operate for every hour of the year.
5. CO and NOx emission factors in ppm from BAAQMD Regulation 9 Rule 7.
6. CO and NOx emission factors converted from ppm to lb/MMBtu using the F-Factor method described in USEPA Method 19 for natural gas fuel (USEPA 2001).
7. ROG and PM emission factors from AP-42 Section 1.4 Table 1.4-2.

Table 6.2-1
Construction Particulate Matter Emissions
for the No Project Alternative
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Emissions	Units	Uncontrolled Scenario
Project construction $PM_{2.5}$ emissions[1]	[lb/project]	1396
Project construction DPM emissions[1]	[lb/project]	892
Construction duration	[years]	1.5
Annual $PM_{2.5}$ emissions	[lb/year]	960
Annual DPM emissions	[lb/year]	613
Average $PM_{2.5}$ emissions	[g/s]	0.014
Average DPM emissions	[g/s]	0.009

Notes:
1. Includes emissions from off-road equipment and on-road sources.

2. Annual emissions are calculated by dividing the project construction emissions by the construction duration. Average DPM emissions are calculated by converting pounds per year to grams per second using standard conversions. Average $PM_{2.5}$ emissions calculated by scaling average DPM emissions by the ratio of project construction $PM_{2.5}$ to project construction DPM.

Abbreviations:
DPM: Diesel particulate matter
lb: pound
g: gram
s: second

Table 6.2-2
Annual Average Daily Traffic from Project Operation
for the No Project Alternative
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Trip Type	Scenario	Days Per Year	Daily One-way Vehicle Trips[1]
Mission Bay, Weekday Trips	No Event Days	260	5,510
Mission Bay, Weekend Trips	No Event Days	105	2,145
		Annual One-way Vehicle Trips:	1,657,825
		Annual Average Daily Traffic (AADT):[2]	**4,542**

Notes:
1. Based on traffic data from Adavant Consulting.
2. Annual one-way vehicle trips is calculated by multiplying total daily one-way vehicle trips by total days per year. Annual one-way vehicle trips is divided by 365 days per year to get AADT.

Abbreviations:
AADT: Annual average daily traffic

Table 6.2-3
Screening $PM_{2.5}$ Concentrations and Cancer Risks from Operational Traffic
for the No Project Alternative
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Impact[1]	North-South Roadway Impact	East-West Roadway Impact	Total Impact from 4 Adjacent Roadways
$PM_{2.5}$ Concentration (ug/m^3)	0.080	0.078	0.32
Lifetime Cancer Risk (in a million)	2.2	1.4	7.2

Notes:
1. Based on BAAQMD County Surface Street Screening Tables for San Francisco County. A distance of 10 feet from the roadway and an annual average daily traffic (AADT) volume of 10,000 vehicles per day (vpd) was conservatively assumed since the AADT shown in Table 7.2-2 is less than 10,000 vpd.

Abbreviations:
AADT: annual average daily traffic
BAAQMD: Bay Area Air Quality Management District
vpd: vehicles per day

References:

Bay Area Air Quality Management District (BAAQMD). 2011. Roadway Screening Analysis Tables. December. Available online at :
http://www.baaqmd.gov/~/media/Files/Planning%20and%20Research/CEQA/County%20Surface%20Street%20Screening%20Tables%20Dec%202011.ashx?la=en

Annual Maximum $PM_{2.5}$ Conc at Hospital Receptor (µg/m^3)	**0.14**
Diesel PM Emission Rate (g/s)	0.0088
Annual Maximum DPM Conc at Dormitory Receptor (µg/m^3)	**0.092**
Annual Maximum DPM Conc at Hospital Receptor (µg/m^3)	**0.091**

Abbreviations:
g: gram
m: meter
m^2: square meter
m^3: cubic meter
PM: particulate matter
s: second
µg: microgram

Table 6.2-5
Screening $PM_{2.5}$ Concentration Results
for the No Project Alternative
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Scenario	Concentration [µg/m^3]		
	Dormitory Receptor	Hospital Receptor	Daycare Receptor
Construction			
$PM_{2.5}$ Concentration from Uncontrolled Construction Emissions	0.10	0.10	0.38
2014 Background $PM_{2.5}$ Concentration[2]	8.5	8.6	8.4
Total $PM_{2.5}$ Concentration (Construction)	8.6	8.7	8.7
Cumulative Threshold[3]	10	10	10
Total $PM_{2.5}$ Concentration Exceeds Threshold? (Uncontrolled scenario)	No	No	No
Operational			
$PM_{2.5}$ Concentration from Operational Traffic	0.32	0.32	0.32
$PM_{2.5}$ Concentration from Emergency Diesel Generators[1]	0.055	0.055	0.055
2014 Background $PM_{2.5}$ Concentration[2]	8.5	8.6	8.7
Total $PM_{2.5}$ Concentration (Operational)	8.9	9.0	9.1
Cumulative Threshold[3]	10	10	10
Total $PM_{2.5}$ Concentration Exceeds Threshold? (Operational)	No	No	No

Notes:
1. Back-calculated assuming a cancer risk of 10 in a million for each of the three generators (total of 30 in a million). The cancer risk of 10 in a million is the maximum allowable Project cancer risk from toxic air contaminants in the BAAQMD, and exposure assumptions for a 70-year resident.
2. 2014 background risk from the Citywide HRA database for all receptors.
3. Cumulative threshold is the threshold for creating an Air Pollutant Exposure Zone (APEZ), as defined by the San Francisco Planning Department, Environmental Planning.

Abbreviations:
BAAQMD: Bay Area Air Quality Management District
HRA: Health Risk Assessment
µg: microgram
m^3: cubic meter

Table 6.2-6
Exposure Parameters and Cancer Risk Adjustment Factors
for the No Project Alternative
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Exposure Parameter	Units	Construction			
		Child Resident	Adult Resident	Hospital Child	Daycare Child
Daily Breathing Rate (DBR)[1]	[L/kg-day]	581	302	581	581
Exposure Time (ET)[2]	[hours/24 hours]	24	24	24	11
Exposure Frequency (EF)[3]	[days/year]	350	350	365	253
Exposure Duration (ED)[4]	[years]	1.5	1.5	1	0.67
Averaging Time (AT)	[days]	25,550	25,550	25,550	25,550
Intake Factor, Inhalation (IF_{inh})	[m^3/kg-day]	0.012	0.0060	0.0083	0.0018
Cancer Risk Adjustment Factor[5]	[-]	10	1	10	10
Modeling Adjustment Factor[6]	[-]	N/A	N/A	N/A	3.15

Notes:
1. Daily breathing rate reflects default breathing rate from BAAQMD 2010.
2. Exposure time reflects default exposure time from BAAQMD 2010.
3. Exposure frequency reflects default exposure frequency from BAAQMD 2010.
4. Assumes all construction-related emissions will be emitted within the first 1.5 years. Operation of the daycare center is not expected to take place until mid- to late-2017; since Project construction will be largely completed by that time, an exposure duration of 8 months was used as a conservative estimate.
5. Based on BAAQMD 2010.
6. Construction emissions are conservatively assumed to occur concurrently with the operation of the daycare center. As such, a modeling adjustment factor of (365/253)*(24/11) = 3.15 is applied for the daycare child receptor.

Calculation:

IF_{inh} = DBR * ET * EF * ED * CF / AT

CF = 0.001 (m^3/L)

Abbreviations:
BAAQMD: Bay Area Air Quality Management District
L: liter
kg: kilogram
m^3: cubic meter

References:

BAAQMD. 2010. BAAQMD Air Toxics NSR Program Health Risk Screening Analysis (HRSA) Guidelines. January. http://baaqmd.gov/~/media/Files/Engineering/Air%20Toxics%20Programs/hrsa_guidelines.ashx?la=en

Table 6.2-7
Screening Cancer Risk Results
for the No Project Alternative
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Scenario	Units	Dormitory Receptor		Hospital Child Receptor	Daycare Child Receptor
		Child Resident	Adult Resident		
Diesel PM Cancer Potency Factor (CPF)[1]	$[mg/kg\text{-}day]^{-1}$	1.1	1.1	1.1	1.1
Excess Cancer Risk from Uncontrolled Construction Emissions[2]	[in a million]	12	0.61	8.3	22
Excess Cancer Risk from Operational Traffic Emissions[3]	[in a million]	7.2	7.2	7.2	7.2
Excess Cancer Risk from Emergency Diesel Generators[4]	[in a million]	30	30	30	30
2014 Background Risk[5]	[in a million]	26	26	44	41
Total Excess Cancer Risk	[in a million]	74.9	63.8	89.6	99.7
Cumulative Threshold[6]	[in a million]	100	100	100	100
Total Risk Exceeds Threshold?	-	No	No	No	No

Notes:
1. From Cal/EPA 2013.
2. Represent health impacts for a residential receptor at the dormitory, hospital, or daycare.
3. The screening values reflect a 70-year cancer risk with age sensitivity factors applied (BAAQMD 2012).
4. A cancer risk of 10 in a million, the maximum allowable Project cancer risk from toxic air contaminants in the BAAQMD, is conservatively assumed.
5. 2014 background risk from the Citywide HRA database for all receptors.
6. Cumulative threshold is the threshold for creating an Air Pollutant Exposure Zone (APEZ), as defined by the San Francisco Planning Department, Environmental Planning.

Calculation:
Cancer Risk = [AnnualConc] × [CF] × $[IF_{inh}]$ × [CPF] x [CRAF] x [MAF]
CF = 0.001 (mg/µg)

Abbreviations:
BAAQMD: Bay Area Air Quality Management District
Cal/EPA: California Environmental Protection Agency
CRAF: Cancer Risk Adjustment Factor
HRA: Health Risk Assessment
IF_{inh}: Intake Factor, Inhalation
kg: kilogram
mg: milligram
PM: Particulate Matter
µg: microgram

Mission Bay Blocks 29-32 Alternative A

San Francisco County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	1,056.00	1000sqft	10.27	1,056,000.00	0
Regional Shopping Center	31.70	1000sqft	0.73	31,700.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	4.6	**Precipitation Freq (Days)**	64
Climate Zone	5			**Operational Year**	2017
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	349	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - CO2 intensity factor of 349 for 2017 from http://www.pge.com/includes/docs/pdfs/shared/environment/calculator/pge_ghg_emission_factor_info_sheet.pdf

Land Use - Retail acreage is Caleemod default; Office acreage was adjusted to make total acreage equal to 11 acres, per NOP site description. Square footage from Jose's comment.

Construction Phase - For consistency with project runs, construction was assumed to begin in 2015. No demolition - no buildings currently onsite.

Architectural Coating - Coating VOC contents reduced to meet limits of BAAQMD Reg 8 Rule 3: Interior coating limit of 100 g/L. Exterior limit of 150 g/L.

Vehicle Trips - Trip rates from traffic study, allocated to each land use subtype using same percent allocations from Caleemod defaults.

Energy Use - Title 24 eletricity and natural gas energy intensities have been adjusted for 2013 standards per CEC report: http://www.energy.ca.gov/2013publications/CEC-400-2013-008/CEC-400-2013-008.pdf

Table 6.3-1
Toxicity-Weighted Construction Emissions
for the Reduced Intensity Alternative
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Chemical	Unit Risk Factor[1] $(ug/m^3)^{-1}$	Uncontrolled Project Emissions[3] (lb/project)	Weighted (lb/project)-$(m^3/\mu g)$	Percent Contribution to Risk
Diesel PM[4]	3.0E-04	3,626	1.1	99.8%
TACs from Speciated Gasoline TOG due to Tailpipe Emissions[2]	1.81E-06	1,263	0.0023	0.21%
TACs from Speciated Gasoline TOG due to Evaporative Losses[2]	1.07E-07	1,861	0.0002	0.02%

Chemical	Unit Risk Factor[1] $(ug/m^3)^{-1}$	Controlled Tier 4 Project Emissions[3] (lb/project)	Weighted (lb/project)-$(m^3/\mu g)$	Percent Contribution to Risk
Diesel PM[4]	3.0E-04	548	0.16	98.5%
TACs from Speciated Gasoline TOG due to Tailpipe Emissions[2]	1.81E-06	1,263	0.0023	1.4%
TACs from Speciated Gasoline TOG Evaporative Losses[2]	1.07E-07	1,861	0.0002	0.1%

Notes:

1. From Cal/EPA 2013.
2. From BAAQMD 2012.
3. Emissions estimates are subject to change before publication of draft Environmental Impact Report.
4. Includes DPM emissions from off-road equiment and on-road sources. Emissions in the controlled scenario reflect the use of Tier 4 off-road equipment.

Abbreviations:

PM: particulate matter
lb: pound
g: gram
s: second
TOG: Total Organic Gas
µg: microgram

Table 6.3-2
Construction Particulate Matter Emissions
for the Reduced Intensity Alternative
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Emissions	Units	Uncontrolled Scenario	Controlled Tier 4 Scenario	Controlled Tier 2 + ARB NOx VDECS Scenario
Project construction $PM_{2.5}$ emissions[1]	[lb/project]	3,629	551	648
Project construction DPM emissions[1]	[lb/project]	3,626	548	645
Construction duration	[years]	2	2	2
Average $PM_{2.5}$ emissions[2]	[g/s]	0.026	0.004	0.005
Average DPM emissions[2]	[g/s]	0.026	0.004	0.005

Notes:

1. Includes emissions from off-road equiment and on-road sources. Emissions in the controlled scenario reflect the use of Tier 4 or Tier 2 + ARB NOx VDECS off-road equipment.

2. Annual emissions are calculated by dividing the project construction emissions by the construction duration. Average DPM and $PM_{2.5}$ emissions are calculated by converting pounds per year to grams per second using standard conversions.

Abbreviations:

DPM: Diesel particulate matter
lb: pound
g: gram
s: second

Table 6.3-3
Annual Average Daily Traffic from Project Operation
for the Reduced Intensity Alternative
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Trip Type	Scenario	Days Per Year	Daily One-way Vehicle Trips[1]
Mission Bay, Weekday Trips	Basketball Event Days	30	11,692
	Concert and Family Show Event Days[2]	45	11,692
	Convention Event and Other Event Days[3]	61	7,024
	No Event Days	125	4,258
Mission Bay, Weekend Trips	Basketball Event Days	30	10,893
	Concert and Family Show Event Days[2]	55	10,893
	No Event Days	19	3,556
		Annual One-way Vehicle Trips:	2,831,083
		Annual Average Daily Traffic (AADT):[4]	**7,756**

Notes:
1. Based on traffic data from Adavant Consulting.
2. Trips associated with concert and family show event days are conservatively assumed to be equal to basketball event days as presented in the traffic study.
3. Trips associated with convention and other event days are conservatively assumed to be equal to convention event days as presented in the traffic study.

Abbreviations:
AADT: Annual average daily traffic

Table 6.3-4
Screening $PM_{2.5}$ Concentrations and Cancer Risks from Operational Traffic
for the Reduced Intensity Alternative
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Impact[1]	North-South Roadway Impact	East-West Roadway Impact	Total Impact from 4 Adjacent Roadways
$PM_{2.5}$ Concentration (ug/m^3)	0.080	0.078	0.32
Lifetime Cancer Risk (in a million)	2.2	1.4	7.2

Notes:

1. Based on BAAQMD County Surface Street Screening Tables for San Francisco County. A distance of 10 feet from the roadway and an annual average daily traffic (AADT) volume of 10,000 vehicles per day (vpd) was conservatively assumed since the AADT shown in Table 2 is less than 10,000 vpd.

Total $PM_{2.5}$ Concentration (Construction, Tier 4 Controlled scenario)	8.5	8.7	8.5
Total $PM_{2.5}$ Concentration (Construction, Tier 2 + ARB NOx VDECS Controlled scenario)	8.5	8.7	8.6
Cumulative Threshold[2]	10	10	10
Total $PM_{2.5}$ Concentration Exceeds Threshold? (Uncontrolled scenario)	No	No	No
Total $PM_{2.5}$ Concentration Exceeds Threshold? (Tier 4 Controlled scenario)	No	No	No
Total $PM_{2.5}$ Concentration Exceeds Threshold? (Tier 2 + ARB NOx VDECS Controlled scenario)	No	No	No
Operational			
$PM_{2.5}$ Concentration from Operational Traffic	0.32	0.32	0.32
$PM_{2.5}$ Concentration from Emergency Diesel Generators[2]	0.055	0.055	0.055
2014 Background $PM_{2.5}$ Concentration[1]	8.5	8.6	8.4
Total $PM_{2.5}$ Concentration (Operational)	8.9	9.0	8.7
Cumulative Threshold[2]	10	10	10
Total $PM_{2.5}$ Concentration Exceeds Threshold? (Operational)	No	No	No

Notes:
1. 2014 background risk from the Citywide HRA database for all receptors.
2. Cumulative threshold is the threshold for creating an Air Pollutant Exposure Zone (APEZ), as defined by the San Francisco Planning Department, Environmental Planning.
3. Back-calculated assuming a cancer risk of 10 in a million for each of the three generators (total of 30 in a million). The cancer risk of 10 in a million is the maximum allowable Project cancer risk from toxic air contaminants in the BAAQMD, and exposure assumptions for a 70-year resident.

Abbreviations:
BAAQMD: Bay Area Air Quality Management District
HRA: Health Risk Assessment
µg: microgram
m^3: cubic meter

Table 6.3-7
Exposure Parameters and Cancer Risk Adjustment Factors
for the Reduced Intensity Alternative
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Exposure Parameter	Units	Construction			
		Child Resident	Adult Resident	Hospital Child	Daycare Child
Daily Breathing Rate (DBR)[1]	[L/kg-day]	581	302	581	581
Exposure Time (ET)[2]	[hours/24 hours]	24	24	24	11
Exposure Frequency (EF)[3]	[days/year]	350	350	365	253
Exposure Duration (ED)[4]	[years]	2	2	1	0.67
Averaging Time (AT)	[days]	25,550	25,550	25,550	25,550
Intake Factor, Inhalation (IF_{inh})	[m^3/kg-day]	0.016	0.0083	0.0083	0.0018
Cancer Risk Adjustment Factor[5]	[-]	10	1	10	10
Modeling Adjustment Factor[6]	[-]	N/A	N/A	N/A	3.15

Notes:

1. Daily breathing rate reflects default breathing rate from BAAQMD 2010.
2. Exposure time reflects default exposure time from BAAQMD 2010.
3. Exposure frequency reflects default exposure frequency from BAAQMD 2010.
4. Assumes all construction-related emissions will be emitted within the first two years. Operation of the daycare center is not expected to take place until mid- to late-2017; since Project construction will be largely completed by that time, an exposure duration of 8 months was used as a conservative estimate.
5. Based on BAAQMD 2010.
6. Construction emissions are conservatively assumed to occur concurrently with the operation of the daycare center. As such, a modeling adjustment factor of (365/253)*(24/11) = 3.15 is applied for the daycare child receptor.

Calculation:

IF_{inh} = DBR * ET * EF * ED * CF / AT

CF = 0.001 (m^3/L)

Abbreviations:

BAAQMD: Bay Area Air Quality Management District
L: liter
kg: kilogram
m^3: cubic meter

References:

BAAQMD. 2010. BAAQMD Air Toxics NSR Program Health Risk Screening Analysis (HRSA) Guidelines. January.

Excess Cancer Risk from Tier 4 Controlled Construction Emissions[2]	[in a million]	7.2	0.37	3.7	10
Excess Cancer Risk from Tier 2 + ARB NOx VDECS Controlled Construction Emissions[2]	[in a million]	8.5	0.44	4.4	11
Excess Cancer Risk from Operational Traffic Emissions[3]	[in a million]	7.2	7.2	7.2	7.2
Excess Cancer Risk from Emergency Diesel Generators[4]	[in a million]	30	30	30	30
2014 Background Risk[5]	[in a million]	26	26	44	20
Total Excess Cancer Risk (Uncontrolled Scenario)	[in a million]	111	66	106	122
Total Excess Cancer Risk (Tier 4 Controlled Scenario)	[in a million]	70	64	85	67
Total Excess Cancer Risk (Tier 2 + ARB NOx VDECS) Controlled Scenario)	[in a million]	72	64	86	69
Cumulative Threshold	[in a million]	100	100	100	100
Total Risk Exceeds Threshold? (Uncontrolled Scenario)	-	Yes	No	Yes	Yes
Total Risk Exceeds Threshold? (Tier 4 Controlled Scenario)	-	No	No	No	No
Total Risk Exceeds Threshold? (Tier 2 + ARB NOx VDECS Controlled Scenario)	-	No	No	No	No

Notes:
1. From Cal/EPA 2013.
2. Represent health impacts for a residential receptor at the dormitory, hospital, or daycare.
3. The screening values reflect a 70-year cancer risk with age sensitivity factors applied (BAAQMD 2012).
4. A cancer risk of 10 in a million, the maximum allowable Project cancer risk from toxic air contaminants in the BAAQMD, is conservatively assumed.
5. 2014 background risk from the Citywide HRA database for all receptors.
6. Cumulative threshold is the threshold for creating an Air Pollutant Exposure Zone (APEZ), as defined by the San Francisco Planning Department, Environmental Planning.

Calculation:
Cancer Risk = [AnnualConc] × [CF] × [IF_{inh}] × [CPF] x [CRAF]
CF = 0.001 (mg/µg)

Abbreviations:
BAAQMD: Bay Area Air Quality Management District
Cal/EPA: California Environmental Protection Agency
CRAF: Cancer Risk Adjustment Factor
HRA: Health Risk Assessment
IF_{inh}: Intake Factor, Inhalation
kg: kilogram
mg: milligram
PM: Particulate Matter
µg: microgram

Reduction in Offroad Construction Equipment Emissions

	Emissions (pounds)			
	ROG	NOx	PM_{10}	$PM_{2.5}$
Uncontrolled				
Offroad Equipment Building Construction Emissions	4,617	60,008	2,567	2,567
Offroad Equipment Building Construction Emissions Reduction[1]	843	10,958	469	469
With Tier 4 Off-road Equipment				
Offroad Equipment Building Construction Emissions	871	4,616	113	113
Offroad Equipment Building Construction Emissions Reduction[1]	159	843	21	21
With Tier 2 + ARB NOx VDECS Off-road Equipment				
Offroad Equipment Building Construction Emissions	186	33,002	210	210
Offroad Equipment Building Construction Emissions Reduction[1]	34	6,026	38	38

Notes:

1. This represents the reduction in offroad equipment emissions in the Building Construction phase due to lower square footage associated with non-arena land uses. A scaling factor of 0.18, which represents the reduction in total square footage of the Project, was applied to determine the emission reduction. The construction emission summary table reflects this reduction in construction equipment emissions.

Construction Area Emissions Estimates (Reduced Intensity Alternative)

Venue	Floor Area[1]	Building Surface Area[2]	Architectural Coatings: Reapplication Rate	Architectural Coatings: Indoor Paint VOC EF[3]	Architectural Coatings: Outdoor Paint VOC EF[3]	Architectural Coatings: Architectural Coating VOC emissions[4]
	[ft^2]	[ft^2]		[g/L]	[g/L]	[lb/yr]
Event Center	750,000	1,500,000	100%	100	150	7,823
GSW Office Space	25,000	50,000				261
Office Space	348,000	696,000				3,630
Retail Space	75,000	150,000				782
Parking and Loading	375,000	750,000				3,911

Notes:

1. Square footage for office and retail space reflects a 40% reduction. Parking and loading square footage was scaled by the number of anticipated parking spots in the Reduced Intensity Alternative (750).

2. Consistent with CalEEMod, residential building surface area is assumed to be 2.7 times the floor area, and non-residential 2 times the floor area.

3. Based on BAAQMD paint VOC regulations, 100 g/L for flat paints, generally used indoors, and 150 g/L for all other architectural coatings. Building area is assumed to be 75% indoors and 25% outdoors, consistent with CalEEMod.

4. Uses CalEEMod assumptions of 1 gallon of paint covers 180 square feet.

Area Sources	Total Emissions [ton/yr]				
	ROG	CO	NO_x	PM_{10}	$PM_{2.5}$
Architectural Coatings	8.20	--	--	--	--
Total Project Emissions:	8.20	0.00	0.00	0.00	0.00

Mobile Source CAP Emissions Estimates (Reduced Intensity Alternative)

Project CAPs Emission Factors

Emission Factor[1]	Units	Pollutant

Notes:

1. From EMFAC2011, calendar year 2017, San Francisco Bay Area. Emission factors are weighted by VMT for all vehicle categories.

Mobile Source CAP Emissions Estimates (Reduced Intensity Alternative)

Project CAPs Emission Calculations

Trip Type	Scenario[1]	Daily One-way Vehicle Trips[2]			Days Per Year[3]	Weighted Trip Length [mile][4]	Emissions				
		Arena	Retail	Office			ROG	CO	NO_x	PM_{10}	$PM_{2.5}$
							[ton/yr]				
Mission Bay, Weekend Trips	Basketball Event Days	8,715	1,864	314	30	21.7	1.3	13	3.7	0.45	0.21
	Concert and Family Show Event Days	8,715	1,864	314	55	21.7	2.5	24	6.8	0.82	0.38
	No Event Days	55	3,187	314	19	7.9	0.13	1.2	0.30	0.034	0.016
Mission Bay, Weekday Trips	Basketball Event Days	8,589	1,536	1,567	30	20.6	1.4	14	3.8	0.46	0.21
	Concert and Family Show Event Days	8,589	1,536	1,567	45	20.6	2.1	20	5.7	0.69	0.32
	Other Event Days	3,921	1,536	1,567	61	17.5	1.5	14	4.0	0.48	0.22
	No Event Days	55	2,636	1,567	125	8.0	1.0	9	2.4	0.27	0.12
						Total Emissions:	**9.8**	**97**	**26.6**	**3.20**	**1.47**

Notes:
1. "Other event days" refer to convention events. Scenario naming is consistent with Project Traffic Study.
2. Daily vehicle trips provided by Adavant Consulting. Office use includes GSW offices.
3. The maximum number of home games (60) in a season was conservatively assumed. Furthermore, it is assumed that half of the games will take place on weekends. Vehicle generation associated with all concert and family show events is approximated by concert trips, while the other 61 events are assumed to be convention events on weekdays.
4. Trip length for each scenario is weighted by the number of trips in each land use category. Arena vehicle trips are assumed to have a trip length of 25.05 miles/trip based on season ticket holder addresses. Season ticket holders account for approximately 60% seating at Warrior games. Vehicle trips from retail and office space are assumed to have a trip length of 11.98 miles/trip, based on 2006 average commute trip length in the Bay Area (MTC 2008).

Mobile Source CAP Emissions Estimates (Reduced Intensity Alternative)

Road Dust Calculations

Total Annual VMT

Trip Type	Scenario	VMT [mile/yr]
Mission Bay, Weekend Trips	Basketball Event Days	7,088,632
	Concert and Family Show Event Days	12,995,825
	No Event Days	533,873
Mission Bay, Weekday Trips	Basketball Event Days	7,220,378
	Concert and Family Show Event Days	10,830,567
	Other Event Days	7,505,786
	No Event Days	4,246,568
	Total VMT	**50,421,631**

Pollutants	Emissions Factor [lb/VMT]	Emissions [ton/yr]
Fugitive PM_{10}	0.00063	15.94
Fugitive $PM_{2.5}$	0.00016	3.91

Road Dust Equation[1]

E = k*(sL)^0.91 * (W)^1.02 * (1-P/4N)

where:

E = annual average emission factor in the same units as k	
k = particle size multiplier for particle size range and units of interest	
PM_{10} (lb/VMT)	0.0022
$PM_{2.5}$ (lb/VMT)	0.00054
sL = road surface silt loading (grams per square meter) (g/m^2)	0.1
W = average weight (tons) of all the vehicles traveling the road	2.4
P = number of "wet" days with at least 0.01 in of precipitation during averaging period	64
N number of days in the averaging period	365

Notes:

1. Road dust equation and parameters are based on CalEEMod defaults for the San Francisco Bay Area Air Basin.

Notes:
1. The four source groups are:
   - CONPIERS: Offroad construction equipmient at Piers 30-32
   - CONSWL: Offroad construction equipmient at Seawall Lot 330
   - ROAD: Onroad construction trips
   - MARINE: Construction marine vessels
2. The controlled scenario reflects the use of Tier 3 offroad construction equipment with diesel particulate filters.

Abbreviations:
DPM: diesel particulate matter
g: gram
s: second

Table 6.4-3
Annual Average Daily Traffic from Project Operation
for the Piers 30-32 + Seawall Lot 330 Project Alternative
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Trip Type	Scenario	Days Per Year	Daily One-way Vehicle Trips[1]
Weekday Trips	Basketball Event Days	30	7,215
	Concert Event Days[2]	45	6,533
	Convention Event Days	61	4,400
	No Event Days	125	2,705
Weekend Trips	Basketball Event Days	30	7,838
	Concert Event Days[2]	55	6,533
	No Event Days	19	2,998
		Annual One-way Vehicle Trips:	1,768,377
		Annual Average Daily Traffic (AADT):	**4,845**

Notes:
1. Based on traffic data from Adavant Consulting.
2. Trips conservatively assumed to be equal to basketball event days.

Table 6.4-4
Screening $PM_{2.5}$ Concentrations and Cancer Risks from Operational Traffic
for the Piers 30-32 + Seawall Lot 330 Project Alternative
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Impact[1]	North-South Roadway Impact	East-West Roadway Impact	Total Impact from 4 Adjacent Roadways
$PM_{2.5}$ Concentration ($\mu g/m^3$)	0.080	0.078	0.32
Lifetime Cancer Risk (in a million)	2.2	1.4	7.2

Notes:
1. Based on BAAQMD County Surface Street Screening Tables for San Francisco County. A distance of 10 feet from the roadway and an annual average daily traffic (AADT) volume of 10,000 vehicles per day (vpd) was conservatively assumed since the AADT shown in Table 7.2-2 is less than 10,000 vpd.

Table 6.4-5
SCREEN3 Construction Screening Inputs and Outputs
for the Piers 30-32 + Seawall Lot 330 Project Alternative
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Parameter	Inputs and Outputs
Source	Water Taxis
Source Type	Area
Emission Rate (g/s-m^2)	0.00167
Release Height (m)	6
Length of larger side (m)	40
Length of smaller side (m)	15
Area (m^2)	600
Receptor Height (m)	1.8
Urban/Rural (U/R)	U
Met Choice	1 - Full Met
Distance from receptor with highest Project impact (m)	160
Distance from receptor with highest background impact (m)	240
Dispersion Factor (µg/m^3 per g/s)	
1-hour dispersion factor at receptor with highest Project impact	1,374
Annual Average Dispersion Factor at receptor with highest Project impact[1]	**137**
1-hour dispersion factor at receptor with highest background impact	708
Annual Average Dispersion Factor at receptor with highest background impact[1]	**71**
Concentration (µg/m^3)	**Uncontrolled**
DPM/$PM_{2.5}$ Emission Rate[2] (g/s)	5.9E-04
Annual Maximum DPM/$PM_{2.5}$ Conc at receptor with highest Project impact	**0.08**
Annual Maximum DPM/$PM_{2.5}$ Conc at receptor with highest background impact	**0.04**

Notes:

1. A scaling ratio of 0.1 is applied to convert the 1-hour dispersion factor to annual dispersion factor per BAAQMD Permit Modeling Guidance.

2. 40% of the mass emissions were conservatively assumed to be emitted at the dock.

Abbreviations:
DPM: diesel particulate matter
g: gram
m: meter
m^2: square meter
m^3: cubic meter
s: second
µg: microgram

Table 6.4-6
AERMOD Construction Modeling Results
for the Piers 30-32 + Seawall Lot 330 Project Alternative
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Receptor	UTMx (m)	UTMy (m)	Cancer Risk Increase (in one million)		Maximum Annual $PM_{2.5}$ Concentration ($\mu g/m^3$)	
			Uncontrolled	Controlled	Uncontrolled	Controlled
Residential receptor with highest Project impacts	553,820	4,182,280	285	44	1.8	0.29
Residential receptor with highest background impacts	553,720	4,182,500	17	2.7	0.13	0.021

Abbreviations:
m: meter
m^3: cubic meter
PM: particulate matter
UTM: Universal Transverse Mercator
µg: microgram

Table 6.4-7
Screening $PM_{2.5}$ Concentration Results
for the Piers 30-32 + Seawall Lot 330 Project Alternative
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Scenario	Concentration [µg/m^3] Residential Receptor with Highest Project Impact	Concentration [µg/m^3] Residential Receptor with Highest Background Impact
Construction		
2014 Background $PM_{2.5}$ Concentration[1]	9.1	10.1
$PM_{2.5}$ Concentration from Uncontrolled Construction Emissions	1.8	0.13
$PM_{2.5}$ Concentration from Controlled Construction Emissions	0.29	0.021
Significance Threshold[2]	0.2	0.2
Project $PM_{2.5}$ Concentration Exceeds Threshold? (Uncontrolled scenario)	Yes	No
Project $PM_{2.5}$ Concentration Exceeds Threshold? (Controlled scenario)	Yes	No
Operational		
2014 Background $PM_{2.5}$ Concentration[1]	9.1	10.1
$PM_{2.5}$ Concentration from Operational Traffic	0.32	0.32
$PM_{2.5}$ Concentration from Emergency Diesel Generators[3]	0.055	0.055
$PM_{2.5}$ Concentration from Water Taxis	0.081	0.042
Total Project $PM_{2.5}$ Concentration (Operational)	0.45	0.41
Significance Threshold[2]	0.2	0.2
Total Project $PM_{2.5}$ Concentration Exceeds Threshold? (Operational)	Yes	Yes

Notes:
1. From the Citywide HRA database.
2. Significance threshold of 0.2 µg/m^3 is applicable since the alternative is in an Air Pollutant Exposure Zone.
3. Back-calculated assuming a cancer risk of 10 in a million for each of the three generators (total of 30 in a million). The cancer risk of 10 in a million is the maximum allowable Project cancer risk from toxic air contaminants in the BAAQMD, and exposure assumptions for a 70-year resident.

Abbreviations:
BAAQMD: Bay Area Air Quality Management District
HRA: Health Risk Assessment
µg: microgram
m^3: cubic meter

Table 6.4-8
Exposure Parameters and Cancer Risk Adjustment Factors
for the Piers 30-32 + Seawall Lot 330 Project Alternative
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Exposure Parameter	Units	Adult Resident			
		Construction Year Year 1	Construction Year Year 2	Construction Year Year 3	Water Taxis Operation
Daily Breathing Rate (DBR)[1]	[L/kg-day]	581	581	581	302
Exposure Time (ET)[2]	[hours/24 hours]	24	24	24	24
Exposure Frequency (EF)[3]	[days/year]	350	350	350	350
Exposure Duration (ED)[4]	[years]	1	1	1	70
Averaging Time (AT)	[days]	25,550	25,550	25,550	25,550
Intake Factor, Inhalation (IF_{inh})	[m^3/kg-day]	0.0080	0.0080	0.0080	0.29
Cancer Risk Adjustment Factor[5]	[-]	10	10	4.75	1.7

Notes:
1. Daily breathing rate reflects default breathing rate from BAAQMD 2010.
2. Exposure time reflects default exposure time from BAAQMD 2010.
3. Exposure frequency reflects default exposure frequency from BAAQMD 2010.
4. Construction-related emissions will be emitted over 3 years. For operation, the exposure duration is 70 years for a resident.
5. Based on BAAQMD 2010.

Calculation:

IF_{inh} = DBR * ET * EF * ED * CF / AT

CF = 0.001 (m^3/L)

Abbreviations:

BAAQMD: Bay Area Air Quality Management District
L: liter
kg: kilogram
m^3: cubic meter

References:

BAAQMD. 2010. BAAQMD Air Toxics NSR Program Health Risk Screening Analysis (HRSA) Guidelines. January.

Table 6.4-9
Screening Cancer Risk Results
for the Piers 30-32 + Seawall Lot 330 Project Alternative
GSW Mission Bay Multi-Purpose Event Center & Ancillary Development
San Francisco, California

Scenario	Units	Residential Receptor with Highest Project Impact	Residential Receptor with Highest Background Impact
Diesel PM Cancer Potency Factor (CPF)[1]	$[mg/kg\text{-}day]^{-1}$	1.1	1.1
2014 Background Risk[2]	[in a million]	113	560
Excess Cancer Risk from Uncontrolled Construction Emissions[3]	[in a million]	285	17
Excess Cancer Risk from Controlled Construction Emissions[3]	[in a million]	44	2.7
Excess Cancer Risk from Operational Traffic Emissions[4]	[in a million]	7.2	7.2
Excess Cancer Risk from Emergency Diesel Generators[5]	[in a million]	30	30
Excess Cancer Risk from Water Taxis[6]	[in a million]	44	23
Total Project Excess Cancer Risk (Uncontrolled Scenario)	[in a million]	366	77
Total Project Excess Cancer Risk (Controlled Scenario)	[in a million]	125	62
Significance Threshold[7]	[in a million]	7	7
Total Risk Exceeds Threshold? (Uncontrolled Scenario)	-	Yes	Yes
Total Risk Exceeds Threshold? (Controlled Scenario)	-	Yes	Yes

Notes:
1. From Cal/EPA 2013.
2. From the Citywide HRA database for the residential receptor.
3. Represent health impacts at the residential receptor with highest Project impacts and highest background impacts.
4. The screening values reflect a 70-year cancer risk with age sensitivity factors applied (BAAQMD 2012).
5. A cancer risk of 10 in a million, the maximum allowable Project cancer risk from toxic air contaminants in the BAAQMD, is conservatively assumed.
6. The cancer risk from water taxis operation is based on screening values and exposure parameters associated with a 70-year resident.
7. Significance threshold of 7 in a million is applicable since the alternative is in an Air Pollutant Exposure Zone.

Calculation:
Cancer Risk = [AnnualConc] × [CF] × [IF_{inh}] × [CPF] x [CRAF]
CF = 0.001 (mg/µg)

Abbreviations:
BAAQMD: Bay Area Air Quality Management District
Cal/EPA: California Environmental Protection Agency
CRAF: Cancer Risk Adjustment Factor
HRA: Health Risk Assessment
IF_{inh}: Intake Factor, Inhalation
kg: kilogram
mg: milligram
PM: Particulate Matter
µg: microgram

Support Tugboat	0.65	1.30	5.66	0.31	0.31
Small Boats	0.78	1.58	6.50	0.37	0.37
Total Emissions:	2.11	4.18	18.21	1.03	1.03

Piers 30-32 and SWL 330 Uncontrolled Marine Equipment Activities, Emission Factors and Emissions

Notes:

1. Main engine numbers and horsepower of the barge tugboat and support tugboat are estimated values based on correspondence with Kurt Ricci, construction project director at Webcor. Other parameters are typical values based on Initial Statement of Reasons (ISOR) for Proposed Regulation for Commercial Harbor Craft (ARB 2007).
2. The oldest engine model year in the Commercial Harbor Craft database was selected to represent the uncontrolled scenario (ARB 2012).
3. Engine load factors based on average values in Emissions Estimation Methodology for Commercial Harbor Craft (ARB 2012).
4. Operating hours of tugboat engines based on correspondence with Kurt Ricci, construction project director at Webcor. Small boats are assumed to operate two hours per construction day.
5. Small boats required for pile repair and strengthening operations under the pier are assumed to be work boats with average vessel characteristics.
6. CAP emission factors, fuel correction factors, and engine deterioration factors based on Emissions Estimation Methodology for Commercial Harbor Craft (ARB 2012).
7. Marine vessel CAP emissions are calculated according to the following equation:

$$\text{Emissions} = EF_0 \times F \times (1 + D \times A/UL) \times HP \times LF \times Hr$$

where
EF_0 is the model year, horsepower and engine use (propulsion or auxiliary) specific zero hour emission factor (when engine is new);
F is the fuel correction factor which accounts for emission reduction benefits from burning cleaner fuel;
D is the horsepower and pollutant specific engine deterioration factor, which is the percentage increase of emission factors at the end of the useful life of the engine;
A is the age of the engine when the emissions are estimated;
UL is the vessel type and engine use specific engine useful life;
HP is rated horsepower of the engine;
LF is the vessel type and engine use specific engine load factor; and
Hr is the number of annual operating hours of the engine.

8. It was conservatively assumed that all PM is PM_{10} and $PM_{2.5}$.

Total Emissions:	0.63	3.19	3.45	0.08	0.08

Piers 30-32 and SWL 330 Controlled Marine Equipment Activities, Emission Factors and Emissions

Notes:

1. Main engine numbers and horsepower of the barge tugboat and support tugboat are estimated values based on correspondence with Kurt Ricci, construction project director at Webcor. Other parameters are typical values based on Initial Statement of Reasons (ISOR) for Proposed Regulation for Commercial Harbor Craft (ARB 2007).
2. The engine age was conservatively assumed to be 1 to represent the age at the end of the pile installation phase.
3. Engine load factors based on average values in Emissions Estimation Methodology for Commercial Harbor Craft (ARB 2012).
4. Operating hours of tugboat engines based on correspondence with Kurt Ricci, construction project director at Webcor. Small boats are assumed to operate two hours per construction day.
5. Small boats required for pile repair and strengthening operations under the pier are assumed to be work boats with average vessel characteristics.
6. CAP emission factors, fuel correction factors, and engine deterioration factors based on Emissions Estimation Methodology for Commercial Harbor Craft (ARB 2012).
7. Marine vessel CAP emissions are calculated according to the following equation:

$$Emissions = EF_0 \times F \times (1 + D \times A/UL) \times HP \times LF \times Hr$$

where
EF_0 is the model year, horsepower and engine use (propulsion or auxiliary) specific zero hour emission factor (when engine is new);
F is the fuel correction factor which accounts for emission reduction benefits from burning cleaner fuel;
D is the horsepower and pollutant specific engine deterioration factor, which is the percentage increase of emission factors at the end of the useful life of the engine;
A is the age of the engine when the emissions are estimated;
UL is the vessel type and engine use specific engine useful life;
HP is rated horsepower of the engine;
LF is the vessel type and engine use specific engine load factor; and
Hr is the number of annual operating hours of the engine.

8. It was conservatively assumed that all PM is PM_{10} and $PM_{2.5}$.

	No Event Days	2,705	125	8.1	0.62	5.45	1.26	0.19	0.09
				Total Emissions:	**6**	**54**	**13.3**	**2.1**	**1.0**

Notes:
1. Daily vehicle trips provided by Adavant Consulting.
2. The maximum number of home games (60) in a season was conservatively assumed. Furthermore, it is assumed that half of the games will take place on weekends. Vehicle generation associated with all concert and family show events is approximated by concert trips, while the other 61 events are assumed to be convention events on weekdays.
3. Trip length for Piers 30-32 is an estimation based on season ticket holder addresses. Season ticket holders account for approximately 60% seating at Warrior games. Trip length for SWL330 is assumed to be average commute trip length in the Bay Area (MTC 2008).

Road Dust Calculations

Total Annual VMT

Trip Type	Scenario	VMT [mile/yr]
Piers 30-32 + SWL330, Weekend Trips	Basketball Event Days	4,924,634
	Concert Event Days	7,219,719
	No Event Days	457,694
Piers 30-32 + SWL330, Weekday Trips	Basketball Event Days	4,514,372
	Concert Event Days	5,907,043
	Convention Event Days	4,851,740
	No Event Days	2,741,809
	Total VMT	**30,617,010**

Pollutants	Emissions Factor [lb/VMT]	Emissions [ton/yr]
Fugitive PM_{10}	0.00063	9.676
Fugitive $PM_{2.5}$	0.00016	2.3751

Road Dust Equation[1]

E = k*(sL)^0.91 * (W)^1.02 * (1-P/4N)

where:

E = annual average emission factor in the same units as k

k = particle size multiplier for particle size range and units of interest

PM_{10} (lb/VMT)	0.0022
$PM_{2.5}$ (lb/VMT)	0.00054
sL = road surface silt loading (grams per square meter) (g/m^2)	0.1
W = average weight (tons) of all the vehicles traveling the road	2.4
P = number of "wet" days with at least 0.01 in of precipitation during the averaging period	64
N = number of days in the averaging period	365

Notes:
1. Road dust equation and parameters are based on CalEEMod defaults for the San Francisco Bay Area Air Basin.

Marine Sources CAPs Emissions Estimates

Notes:

1. Water taxi information based on current and expected future vessel characteristics (communication with Tideline Marine Group).
2. Engine load factors based on average values in Emissions Estimation Methodology for Commerical Harbor Craft (ARB 2012).
3. Based on Project sponsor information.
4. CAP Emission Factors (EFs) for all water taxis based on the California CHC Emissions Estimation Database. BAAQMD (2004) policy and diesel engine conversion factors (USEPA) were used to calculate the NOx and ROG emission factors from the combined emission factors. It is also assumed that VOC and ROG are equivalent (ARB 2009).
5. CAP EFs based on standards from the ARB and USEPA Off-Road Compression-Ignition (Diesel) Engine Standards (ARB 2013).
6. CAPs emissions from marine engines are calculated according to the following equation:

   $Emissions = EF_0 \times F \times (1 + D \times A/UL) \times HP \times LF \times Hr$

   where

   EF_0 is the model year, horsepower and engine use (propulsion or auxiliary) specific zero hour emission factor (when engine is new);

   F is the fuel correction factor which accounts for emission reduction benefits from burning cleaner fuel;

   D is the horsepower and pollutant specific engine deterioration factor, which is the percentage increase of emission factors at the end of the useful life of the engine;

   A is the age of the engine when the emissions are estimated;

   UL is the vessel type and engine use specific engine useful life;

   HP is rated horsepower of the engine;

   LF is the vessel type and engine use specific engine load factor; and

   Hr is the number of annual operating hours of the engine.
7. $PM_{2.5}$ is conservatively assumed to be equal to total PM.

Notes:
1. Quantity and Size based on estimates provided by the Project Sponsor.
2. Higher heating value is the average natural gas heating value in AP-42 Section 1.4.
3. Fuel consumption calculated from size and higher heating value.
4. The boiler is assumed to operate for every hour of the year.
5. CO and NOx emission factors in ppm from BAAQMD Regulation 9 Rule 7.
6. CO and NOx emission factors converted from ppm to lb/MMBtu using the F-Factor method described in USEPA Method 19 for natural gas fuel (USEPA 2001).
7. ROG and PM emission factors from AP-42 Section 1.4 Table 1.4-2.

Abbreviations:
Btu - British Thermal Unit
CO - carbon monoxide
hr - hour
lb - pound
MMBtu - million Btu
NOx - nitrogen oxides
O_2 - oxygen
PM - particulate matter
ppmv - parts per million by volume
ROG - reactive organic gases
scf - standard cubic feet
yr - year

Notes:

1. Number of hearths used is default percent provided by BAAQMD as per CalEEMod methodology. All hearths assumed to be gas-powered; installation of new wood burning fireplaces banned (San Francisco Building Code, Chapter 31, Section 3102.8).
2. Emissions calculated using emission factors from AP-42, Chapter 1, for residential furnaces, as per CalEEMod methodology. Heating value of natural gas was assumed to be 1,020 MMBtu/MMSCF, and default CalEEMod values were used for average heating rate per hour and average time of use per year for San Francisco.

Area Sources	Total Engine Emissions [ton/yr]				
	ROG	CO	NO_x	PM_{10}	$PM_{2.5}$
Architectural Coatings	0.87	--	--	--	--
Consumer Products	4.39	--	--	--	--
Landscaping	0.04	1.33	0.02	0.01	0.01
Hearths	0.00	0.01	0.00	0.00	0.00
Total Project Emissions:	5.30	1.33	0.02	0.01	0.01

APPENDIX HYD

Combined Sewer Impacts Analysis Technical Memorandum

Subject:	**Combined Sewer Impacts Analysis**
Project:	Golden State Warriors Arena EIR
Prepared By:	Beth Goldstein, PE, LEED AP, QSD/QSP
Date:	February 25, 2015
Reference:	130001

1 Purpose

The purpose of this analysis is to determine the changes, if any, to the frequency, duration or volume of combined sewer discharges (CSDs) from the City's combined sewer system (CSS) due to the contribution of dry weather flow (DWF) from the proposed Golden State Warriors (GSW) arena in the Mission Bay area of San Francisco, CA. This analysis considers only the impact to CSD from changes in DWF only, it does not analyze the impacts on dry weather capacity of the CSS (that analysis is being conducted by SFDPW)[1].

2 Scenarios Analyzed

Three scenarios were analyzed: base case, project, and cumulative. The base case scenario includes existing conditions plus developments and improvements expected to be substantially complete previous to occupancy of the GSW arena. The project scenario adds the DWF from the arena only and the cumulative scenario adds the project DWF plus DWF from reasonably foreseeable projects in the basin. In all three scenarios, the wet weather flow (stormwater runoff) is assumed to not contribute to the CSS; rather is treated and pumped directly to the Bay. All DWF from the proposed GSW arena is assumed to flow to the Mariposa pump station (MPS), therefore Mariposa is the only basin analyzed.

3 Description of Model

The model used for this analysis is a single basin, mass balance hydrologic model developed by SFDPW called "hydrocalc". It takes static hydrologic inputs such as area, C factor, storage volume, pumping rate, and applies a user selected rainfall file as time varying input. The time step is 5 minute.

4 Model Inputs

The following inputs were used in analyzing the three scenarios described in Section 2:

[1] SFDPW, "Mariposa Pump Station (MPS) Dry Weather Flow Hydraulic Analysis", Technical Memorandum from Bassam Aldhafari to Manfred Wong and Bessie Tam, February 3, 2015.

Annual Rain (inch)[1]	Contributing Acres[2]	C Factor[1]	WW Pump[2] (mgd)	DW Pump[2] (mgd)
26	180	0.76	10	1.2

Data Sources:
1. SFDPW ICM model
2. SFDPW TM, 2/3/15

The only input which varies between scenarios is the DWF contribution. The DWF contributions by scenario were derived from the SFDPW MPS TM (2/3/15) and are detailed in the table in Attachment 1. The contributing area outlined in the SFDPW TM is shown in Attachment 2.

5 Model Results

The model predicts the following changes to estimated CSD frequency, volume and duration assuming average DWF to the Mariposa Pump Station:

	DWF (mgd)	Frequency (Count)	Volume (Mgal)	Duration (Hrs)
Baseline	1.21	10	5.34	17.2
Project	1.38	10	5.63	17.3
Cumulative	1.69	10	6.32	18.2

Assuming peak DWF for the arena only (a conservative assumption that every overflow occurs during maximum occupancy), the model predicts the following:

	DWF (mgd)	Frequency (Count)	Volume (Mgal)	Duration (Hrs)
Baseline	1.21	10	5.34	17.2
Project	2.28	10	7.2	19.4
Cumulative	2.60	11	7.98	21.8

ATTACHMENT 1.

Mission Bay FSEIR Mitigation Measures: Applicability to Proposed Project

This page intentionally left blank

MISSION BAY FSEIR MITIGATION MEASURES: APPLICABILITY TO PROPOSED PROJECT

	MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
D. VISUAL QUALITY AND URBAN DESIGN			
North/ South	D.1 **Lighting and Glare** Design parking structure lighting to minimize off-site glare. The design could include 45-degree cutoff angles on light fixtures to focus light within the site, and specifications that spill lighting from parking areas would be 0.25 foot-candle or less at 5 feet from the property line of the parking areas. Applies to individual sites within the Project Area.	No	Pursuant to Public Resources Code 21099(d), aesthetics impacts of the proposed GSW project are not considered significant. Consequently, Mission Bay FSEIR Mitigation Measure D.1 is not required.
South	D.2 **Architectural Resources - Evaluation of Fire Station No. 30** D.2a. Retain an architectural historian to prepare an evaluation of the architectural integrity and historical importance of Fire Station No. 30 prior to development on this site. If the building is determined to be eligible for the National Register, preserve, rehabilitate, and reuse the building in a manner that is consistent with the Secretary of the Interior's guidelines for historic preservation. D.2b. If Fire Station No. 30 is found to be eligible for the National Register, require the following mitigation measures to reduce (though not eliminate) the significant impact prior to demolition of the structure: Prepare a Historical American Building Survey, including the precise recording of the structure through measurements, drawings, and photographs Provide sufficient detail in the survey documentation so that after demolition the historical structure could be reconstructed from the survey data File copies of the records and documents with the appropriate federal, state, and city agencies Include salvage and selective re-use of building materials in the mitigation program once the survey has been completed Upon completion, provide a copy of the report to the San Francisco Planning Department, the President of the San Francisco Landmarks Preservation Advisory Board, and the San Francisco Redevelopment Agency.	No	Mission Bay FSEIR Mitigation Measure D.2a-b is only applicable to development within the Fire Station 30 site, and not the project site, and consequently, it is not applicable to the proposed project.
North / South	D.3 **Archaeological Resources** Retain the services of an archaeologist, because of the strong possibility of encountering the remains of cultural or historic artifacts or features in the six historic resources areas. The Environmental Review Officer (ERO) in consultation with the President of the Landmarks Preservation Advisory Board (LPAB) and the archaeologist would determine: 1) whether the archaeologist should instruct all excavation and foundation crews on the project site of the potential for discovery of historic archaeological deposits and artifacts, and the procedures to be followed if such materials are uncovered; and 2) prior to the commencement of foundation excavation, a program of archaeological testing.	No	Mission Bay FSEIR Mitigation Measure D.3 is only applicable to development within the Mission Bay FSEIR-identified historic resource areas in the Mission Bay plan area, and not the project site. Consequently, Mission Bay FSEIR Mitigation Measure D.3 is not applicable to the proposed project.

		MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
D. VISUAL QUALITY AND URBAN DESIGN (cont.)				
North / South (cont.)		Retain a qualified historic archaeologist to supervise a pre-foundation excavation testing program for each phase of Project Area development or each construction site, as appropriate, using a series of mechanical, exploratory borings or other testing methods determined by the archaeologist to be appropriate. A qualified historical archaeologist would supervise the testing in the six historic resource areas to determine the probability of finding cultural and historical remains. At the completion of the archaeological testing program, the archaeologist would submit a written report first and directly to the ERO and the President of the LPAB, with a copy to the project sponsor, which describes the findings, assesses their significance and proposes appropriate recommendations for any additional procedures necessary for the mitigation of adverse impacts to cultural resources determined to be significant. Retain a certified archaeologist to supervise a program of on-site monitoring during site excavation in the six historic resource areas, following site clearance and pre-excavation testing. The certified archaeologist would record observations in a permanent log. Should cultural or historic artifacts be found following commencement of excavation activities, the archaeologist would assess the significance of the find, and immediately report to the ERO and the President of LPAB. Upon receiving the advice of the consultant and the LPAB, the ERO would recommend specific mitigation measures, if necessary. The monitoring program, whether or not there are finds of significance, would result in a written report to be submitted first and directly to the ERO and the President of the LPAB, with a copy to the project sponsor. Suspend excavation or construction activities which might damage discovered cultural resources for a total maximum of four weeks over the course of construction at each site to permit inspection, recommendation and retrieval, if appropriate. Implement an appropriate security program to prevent looting or destruction, if cultural resources of potential significance are discovered. Any discovered cultural artifact assessed as significant by the archaeologist upon concurrence by the ERO and the President of the LPAB would be placed in a repository designated for such materials or possibly exhibited in a public display. Following approval of the archaeological testing and monitoring program reports by the ERO and the President of LPAB, a final report would be sent to the California Archaeological Site Survey Office at Sonoma State University, the Foundation for San Francisco's Architectural Heritage and the State Office of Historic Preservation. The Office of Environmental Review would receive three final copies of the final archaeological findings report. Archaeological testing could be coordinated with other site investigations for geotechnical and toxic waste purposes.		However the Initial Study for the proposed project identifies Mitigation Measure M-CP-2a (Archaeological Testing, Monitoring and/or Data Recovery Program) which would in effect implement the requirements of Mission Bay FSEIR Mitigation Measure D.3 at the project site.
North / South	D.4 D.4a.	**<u>Archaeological Exploration Program</u>** Develop archaeological exploration programs, consistent with Measure D.3, above, for pre-identified sensitive historic archaeological areas that should include the following: Define specific research parameters and prepare a written study plan in consultation with the ERO and LPAB prior to subsurface exploration, with emphasis on National Register determination of historical significance and the maximum retrieval of archaeological data	No	Mission Bay FSEIR Mitigation Measure D.4 is only applicable to development within the Mission Bay FSEIR-identified historic resource areas in the Mission Bay plan area, and not the project site. Consequently, Mitigation Measure D.3 is not applicable to the proposed project.

	MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
D. VISUAL QUALITY AND URBAN DESIGN (cont.)			
North / South (cont.)	D.4b. Examine large-scale exposure of soil profiles D.4c. Complete detailed field records, including photographs and drawings, to document subsurface soil profiles, archaeological deposits and integrity of such deposits D.4d. Complete a detailed report of findings to describe research and exploration methodologies, testing results, all archaeological findings and recommendations for resource management		However, the Initial Study for the proposed project identifies Mitigation Measure M-CP-2a (Archaeological Testing, Monitoring and/or Data Recovery Program) which would in effect implement the requirements of Mission Bay FSEIR Mitigation Measure D.4 at the project site.
North / South	D.5 **Archaeological Monitoring at 19th Century City Dump** Archival review suggests that depositional integrity of the late 19th-century city dump has been lost because of scavenging while the dump was in operation; however, important historical artifacts may still be present. Pre-construction archaeological testing is therefore not recommended. Archaeological monitoring during construction would be the appropriate mitigation measure for that area. Therefore, retain the services of a qualified archaeologist. The ERO in consultation with the President of the LPAB and the archaeologist would determine whether the archaeologist should instruct all excavation and foundation crews in the area of the 19th-century city dump of the potential for discovery of cultural and historic artifacts or features. If such artifacts or features were uncovered, follow procedures described in Measure D.3 for suspension of construction activities, notification of the ERO and President of the LPAB, and development recovery measures, as appropriate.	No	Mission Bay FSEIR Mitigation Measure D.5 is only applicable to development within the 19th Century City Dump site, and not the project site. Consequently, Mission Bay FSEIR Mitigation Measure D.5 is not applicable to the proposed project.
North / South	D.6 **Unknown Archaeological Remains** The entire Mission Bay Project Area has at least some sensitivity for the presence of unknown archaeological remains. Prehistoric cultural deposits could be encountered in three identified areas and unknown historical features, artifact caches and debris areas could be located anywhere in the Project Area. Follow procedures for instructing excavation crews, notifying the ERO and President of the LPAB, and developing recovery measures, as described in Measure D.3, above. In addition, in the event that prehistoric archaeological deposits are discovered, consult local Native American organizations. Dialogue with the ERO, LPAB and the archaeological consultant would take place in developing acceptable archaeological testing and excavation procedures, particularly in regard to the disposition of cultural materials and Native American burials.	No	The City has updated its standard mitigation measures for accidental discovery of archeological resources. Consequently, MB FSEIR Mitigation Measure D.6 replaced with Mitigation Measure M-CP-2b (Accidental Discovery of Archaeological Resources)
North / South	D.7 **Pedestrian-Level Winds** Require a qualified wind consultant to review specific designs for buildings 100 feet or more in height for potential wind effects. The Redevelopment Agency would conduct wind review of high-rise structures above 100 ft. Wind tunnel testing would also be required unless, upon review by a qualified wind consultant, and with concurrence by the Agency, it is determined that the exposure, massing and orientation of the buildings are such that impacts, based on a 26-mile-per-hour hazard for a single hour of the year criterion, will not occur. The purpose of the wind tunnel studies is to determine design-specific impacts and to provide a basis for design modifications to mitigate these impacts. Projects within Mission Bay, including UCSF, would be required to meet this standard or to mitigate exceedances through building design.	Yes	Pursuant to Mission Bay FSEIR Mitigation Measure D.7, wind tunnel testing was conducted for the proposed development at Blocks 29-32, the results of which are included in the SEIR.

			MB FSEIR Mitigation Measure Applicability to Project	Notes
		MISSION BAY FSEIR SECTION / MITIGATION MEASURE		
D. VISUAL QUALITY AND URBAN DESIGN (cont.)				
North / South	D.8	**Shadows** The Redevelopment Plan documents would require analysis of potential shadows on existing and proposed open spaces during the building design and review process when exceptions to certain standards governing the shape or locations of buildings are requested that would cause over 13% of Mission Creek Park (either North or South), 20% of Bayfront Park, 17% of Triangle Square or 11% of Mission Bay Commons to be in continuous shadow for a period of one hour from March to September between 10:00 a.m. and 4:00 p.m.	Yes	Pursuant to Mission Bay FSEIR Mitigation Measure D.8, a shadow analysis was conducted for the proposed development at Blocks 29-32, the results of which are included in the SEIR.
E. TRANSPORTATION				
North	E.1 E.1a. E.1b. E.1c.	**Third Street/King Street** Widen the northbound approach to provide an additional through lane on the west side of Third Street. Reconfigure the existing traffic signal. Install "Don't Block the Box" signs.	No	Mission Bay FSEIR Mitigation Measure E.1 has already been implemented, and consequently, is not applicable to the proposed project.
North	E.2 E.2a. E.2b. E.2c.	**Third Street/Berry Street** Restripe the northbound approach to provide an additional through lane. Reconfigure the existing traffic signal. Install "Don't Block the Box" signs.	No	Mission Bay FSEIR Mitigation Measure E.2 has already implemented, and consequently, is not applicable to the proposed project.
South	E.3 E.3a.	**Third Street/Owens Street** Install a new traffic signal.	No	Mission Bay FSEIR Mitigation Measure E.3 has already implemented, and consequently, is not applicable to the proposed project.
South	E.4 E.4a.	**Third Street/The Common** Install new traffic signals.	No	Mission Bay FSEIR Mitigation Measure E.4 has already implemented, and consequently, is not applicable to the proposed project.
South	E.5 E.5a.	**Third Street/South Street** Install a new traffic signal.	No	Mission Bay FSEIR Mitigation Measure E.5 has already been implemented, and consequently, is not applicable to the proposed project.

	MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
E. TRANSPORTATION (cont.)			
South	E.6 **<u>Third Street/16th Street</u>** E.6a. Widen the northbound approach to provide two exclusive left-turn lanes. E.b. Reconfigure the existing traffic signal.	No	Mission Bay FSEIR Mitigation Measure E.6 has already been implemented, and consequently, is not applicable to the proposed project.
South	E.7 **<u>Third Street/Mariposa Street</u>** E.7a. Widen the eastbound approach to provide an additional through lane. E.7b. Widen and restripe the westbound approach to provide an exclusive left-turn lane and an additional through lane. E.7c. Reconfigure the existing traffic signal.	No	Mission Bay FSEIR Mitigation Measure E.7 has already been implemented, and consequently, is not applicable to the proposed project.
North	E.8 **<u>Fourth Street/King Street</u>** E.8a. Widen the eastbound approach to provide an exclusive right-turn lane. E.8b. Reconfigure the existing traffic signal. E.8c. Install "Don't Block the Box" signs.	No	Mission Bay FSEIR Mitigation Measure E.8 has already been implemented, and consequently, is not applicable to the proposed project.
North	E.9 **<u>Fourth Street/Berry Street</u>** E.9a. Restripe the westbound approach to provide an additional lane. E.9b. Restripe the northbound approach to provide an additional lane. E.9c. Reconfigure the existing traffic signal. E.9d. Install "Don't Block the Box" signs.	No	Mission Bay FSEIR Mitigation Measure E.9 has already been implemented, and consequently, is not applicable to the proposed project.
South	E.10 **<u>Fourth Street/Owens Street</u>** E.10a. Install a new traffic signal.	No	Mission Bay FSEIR Mitigation Measure E.10 has already been implemented, and consequently, is not applicable to the proposed project.
South	E.11 **<u>Fourth Street/UCSF private street</u>** E.11a. Install a new traffic signal.	No	Mission Bay FSEIR Mitigation Measure E.11 has already been implemented, and consequently, is not applicable to the proposed project.
South	E.12 **<u>Fourth Street/16th Street</u>** E.12a. Install a new traffic signal.	No	Mission Bay FSEIR Mitigation Measure E.12 has already been implemented, and consequently, is not applicable to the proposed project.

	MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
E. TRANSPORTATION (cont.)			
South	E.13 **Fourth Street/Mariposa Street** E.13a. Widen the eastbound and westbound approaches to provide exclusive left-turn lanes. E.13b. Install a new traffic signal.	No	Mission Bay FSEIR Mitigation Measure E.13 has already been implemented, and consequently, is not applicable to the proposed project.
South	E.14 **Seventh Street/16th Street** E.14a. Remove on-street parking on all approaches. E.14b. Restripe the northbound and eastbound approaches to provide an additional through lane. E.14c. Restripe the southbound approach to provide an additional through lane and an exclusive left-turn lane. E.14d. Restripe the westbound approach to provide an additional through lane and a right-turn pocket. E.14e. Install a new traffic signal. E.14f. Provide the appropriate traffic warning devices for the Caltrain track crossing.	No	Mission Bay FSEIR Mitigation Measure E.14 has already been implemented, and consequently, is not applicable to the proposed project.
South	E.15 **Owens Street/16th Street** E.15a. Install a new traffic signal.	No	Mission Bay FSEIR Mitigation Measure E.15 has already been implemented, and consequently, is not applicable to the proposed project.
South	E.16 **Owens Street/Mariposa Street/I-280 Off-ramp** E.16a. Widen the eastbound approach to provide an exclusive left-turn lane. E.16b. Reconfigure the existing traffic signal.	No	Mission Bay FSEIR Mitigation Measure E.16 has already been implemented, and consequently, is not applicable to the proposed project.
South	E.17 **I-280 On-ramp/Mariposa Street** E.17a. Widen the westbound approach to provide an exclusive left-turn lane. E.17b. Install a new traffic signal.	No	Mission Bay FSEIR Mitigation Measure E.17 has already been implemented, and consequently, is not applicable to the proposed project.
South	E.18 **Seventh Street/The Common** E.18a. Install a new traffic signal. E.18b. Provide the appropriate traffic warning devices for the Caltrain railroad track at-grade crossing.	No	Mission Bay FSEIR Mitigation Measure E.18 has already been implemented, and consequently, is not applicable to the proposed project.

	MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
E. TRANSPORTATION (cont.)			
North	E.19 **Fifth Street/King Street** E.19a. Narrow approximately 250 feet of the median on the westbound approach to provide an exclusive left-turn lane. E.19b. Restripe the I-280 off-ramp touchdown and narrow the median on the south side of King Street for a distance of about 300 feet beginning at the intersection with Fifth Street, to increase the number of eastbound lanes from the existing two to three. E.19c. Reconfigure the existing traffic signal.	No	Mission Bay FSEIR Mitigation Measure E.19 is a mitigation measure applicable to development within Mission Bay North, and is therefore not applicable to the proposed project. Mission Bay FSEIR Mitigation Measure E.19 is assumed to be implemented by 2040, and is included in the Cumulative scenario
North/ South	E.21 **Third Street** E.21a. Widen the west side of Third Street between Berry Street and King Street to accommodate the additional lanes described in Measure E.01. E.21b. Widen Third Street for approximately one-third the distance between Mariposa Street and 16th Street to accommodate the lane configuration described in Measure E.6. E.21c. In cooperation with the Public Transportation Commission and the Department of Public Works, reconfigure Third Street in the Project Area to accommodate the Third Street light rail transit median while maintaining two travel lanes in each direction and exclusive left-turn lanes at specific locations, as listed in Measures E.06 and E.07.	No	Mission Bay FSEIR Mitigation Measure E.21 has already been implemented, and consequently, is not applicable to the proposed project.
South	E.22 **Mariposa Street** E.22a. Widen Mariposa Street between Terry A. François Boulevard and Pennsylvania Street, including the bridge over the Caltrain tracks.	No	Mission Bay FSEIR Mitigation Measure E.22 has already been implemented, and consequently, is not applicable to the proposed project.
North / South	E.23 **Fourth Street** E.23a. Widen Fourth Street between China Basin Channel and King Street to accommodate the Third Street light rail tracks and a MUNI station platform between Berry and King Streets. E.23b. Extend Fourth Street southward, parallel to Third Street, to intersect with Mariposa Street at the existing intersection with Minnesota Street.	No	Mission Bay FSEIR Mitigation Measure E.23 has already been implemented, and consequently, is not applicable to the proposed project.
North	E.24 **King Street** E.24a. Widen eastbound King Street between Fifth and Fourth Streets to accommodate the lane configurations for the Fourth Street/King Street intersection in Measure E.08. E.24b. Construct westbound King Street frontage road between Fifth Street and Berry Street.	No	Mission Bay FSEIR Mitigation Measure E.24 has already been implemented, and consequently, is not applicable to the proposed project.

	MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
E. TRANSPORTATION (cont.)			
South	E.25 **Owens Street** E.25a. Construct Owens Street between Third and Fourth Streets, providing a median approximately 24 feet wide to accommodate the MUNI Third Street light rail line, with no on-street parking. E.25b. Construct Owens Street between Fourth Street and The Common, providing on-street parking on the north side of the street only. E.25c. Extend Owens Street northward from 16th Street to The Common, providing no on-street parking. E.25d. Construct Owens Street between 16th Street and Mariposa Street, providing no on-street parking.	No	Mission Bay FSEIR Mitigation Measure E.25 has been partially implemented. Owens Street between Third Street and the traffic circle at Mission Bay Drive has been renamed Channel Street. Mission Bay FSEIR Mitigation Measures E.25a and E.25c have already been implemented, and consequently, are not applicable to the proposed project. The section of Owens Street between Fourth Street and the traffic circle at Mission Bay Drive (FSEIR Mitigation Measures E.25b) has been partially implemented and will be completed as planned development adjacent to Owens Street is completed. Therefore FSEIR Mitigation Measure E.25b is not applicable to the proposed project. The section of Owens Street between 16th and Mariposa Streets is under construction as part of the UCSF Medical Center project (FSEIR Mitigation Measures E.25d), and therefore is not applicable to the proposed project.
South	E.26 **North Common and South Common Streets connection to Seventh Street** E.26a. Construct an "at-grade" connection to Seventh Street across Caltrain tracks, in conjunction with Measure E.18 for the new intersection. E.26b. Prohibit parking at trolleybus stops for the 22-Fillmore line east of Third Street where bus line is extended.	No	Mission Bay FSEIR Mitigation Measure E.26 has already been implemented (i.e., Mission Bay Drive), and consequently, is not applicable to the proposed project.
South	E.27 **Muni Line 22-Fillmore** Reroute the MUNI 22-Fillmore trolleybus line to travel on 16th Street to Third Street, and then north on Third Street to The Common. If not already accomplished, install trolleybus wire support poles and/or eyebolts on buildings along the new route, and complete North Common Street and South Common Street east of Third Street. Prohibit parking on North Common and South Common Streets at trolleybus stops.	No	As part of Mission Bay FSEIR Mitigation Measure E.27, the temporary 55 16th Street motor coach route between Mission Street and Third Street was initiated in February 2015. The

	MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
E. TRANSPORTATION (cont.)			
South (cont.)			extension of the 22 Fillmore into Mission Bay will be implemented as part of the Muni Forward project Mission Bay FSEIR Mitigation Measure E.27 has already been implemented, and consequently, is not applicable to the proposed project.
South	E.28 **<u>Muni Line 30-Stockton or 45-Union/Stockton</u>** Extend about half of the 30-Stockton or the 45-Union/Stockton trolley buses south and east of the current terminus at the Caltrain terminal to the current terminus of the 22-Fillmore line, at the same time that the 22-Fillmore is rerouted as called for in Measure E.27. Route trolley buses to Connecticut Street via Townsend or Mission Bay Street, and then east to a new terminus near Third and 20th Streets. The coordination of Measure E.27 with E.28, to provide extended MUNI trolleybus service to Mission Bay by rerouting the 22-Fillmore and 30-Stockton or 30/45-Union/Stockton lines, shall be accomplished in phases, if necessary, to provide service as early in project development as MUNI service may be needed. The phases may include: E.28.a. Construct Mission Bay Street, the Seventh Street Connector to North and South Common Streets and the Caltrain at-grade rail crossing, and the portion of North and South Common Streets east of Third Street, early enough in project development to accommodate MUNI trolleybus travel, including poles and eyebolts supporting trolley wires, and provide poles and/or eyebolts supporting trolley wires along 16th Street and a portion of Common Streets in the Project Area, as described in Measure E.27 and above in this Measure; or E.28.b. If item E.28a is not feasible sufficiently early in project development, for an interim period until the necessary streets and trolley wires have been constructed as part of adjacent development, construct the portion of North and South Common Streets east of Third Street and install poles and/or eyebolts supporting trolley wires along the new route for the 22-Fillmore, and extend some but not all of the trolleybuses, so that both Mission Bay and Lower Potrero areas continue to be served. This measure involves only limited service to Mission Bay; or E.28.c. If item E.28a is not feasible sufficiently early in project development, for an interim period until the necessary streets and trolley wires have been constructed as part of adjacent development, provide service to Mission Bay temporarily using diesel buses on 16th Street; or E.28.d. Use a combination of items E.28b and E.28c to provide MUNI trolley bus service to both the Mission Bay and Lower Potrero areas until necessary streets and trolley wires have been constructed as part of adjacent development in the Project Area.	No	As part of the TEP/Muni Forward project, the planned 10 Townsend service improvements will replace the extension of the 30 Stockton or 45 Union-Stockton into Mission Bay. Mission Bay FSEIR Mitigation Measure E.28 will be implemented as part of the TEP/Muni Forward project.

	MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
E. TRANSPORTATION (cont.)			
North	E.29 **Seventh Street/Brannan Street** E.29a. Restripe the northbound approach to provide three lanes.	No	Mission Bay FSEIR Mitigation Measure E.29 is a mitigation measure applicable to development within Mission Bay North, and is therefore not applicable to the proposed project. This improvement will be implemented as part of buildout of the UCSF LRDP in Mission Bay.
North	E.30 **Seventh Street/Townsend Street** E.30.a. Restripe the southbound, eastbound, and westbound approaches to provide a left-turn lane, a through lane, and a right-turn lane. E.30.b. Restripe the northbound approach to provide a left turn lane, a through lane, and a shared right-through lane.	No	Mission Bay FSEIR Mitigation Measure E.30 has already been implemented, and consequently, it is not applicable to the proposed project
North	E.31 **Seventh Street/Berry Street** E.31.a. Restripe the eastbound approach to provide two lanes. E.31.b. Restripe the northbound approach to provide a shared left-through lane and a through lane and restripe the southbound approach to provide a through lane and a shared right-through lane.	No	The Mission Bay street network has since been revised, and Mission Bay FSEIR Measure E.31 is no longer applicable.
South	E.32 **Seventh Street/North and South Common Streets** E.32a. Restripe the northbound approach to provide two through lanes, and a right-turn lane. E.32.b. Restripe the southbound approach to provide two through lanes, and a left-turn lane.	No	Mission Bay FSEIR Mitigation Measure E.32 has already been implemented, and consequently, is not applicable to the proposed project.
South	E.33 **16th Street/Potrero Street** Restripe the eastbound and westbound approaches to provide a left-turn lane, a through lane and a shared right-through lane.	No	Mission Bay FSEIR Mitigation Measure E.33 has been superseded by improvements planned for 16th Street as part of Muni Forward, and is not applicable to the proposed project.
South	E.34 **16th Street/Vermont Street** Install a new traffic signal.	No	Mission Bay FSEIR Mitigation Measure E.34 has already been implemented, and consequently, is not applicable to the proposed project

	MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
E. TRANSPORTATION (cont.)			
North	E.35 **Eighth Street/Townsend Street** E.35.a. Eliminate traffic circle and reconfigure intersection. E.35.b. Install a new traffic signal.	No	Mission Bay FSEIR Mitigation Measure E.35 is a mitigation measure applicable to development within Mission Bay North, and consequently, is not applicable to the proposed project. The SFMTA has determined that signalization would create more problems for pedestrians and congestion for vehicular traffic, and application of modern roundabout techniques to improve operation of the intersection would be more appropriate.
North	E.36 **Third Street/Townsend Street** E.36.a. Remove the on-street parking on the westbound approach during the p.m. peak commute period. E.36.b. Provide an additional westbound through lane during the p.m. peak commute period.	No	Mission Bay FSEIR Mitigation Measure E.36 has already been implemented, and consequently, is not applicable to the proposed project.
North	E.38 **Fourth Street/King Street** Widen the southbound approach to provide an additional lane, and restripe the intersection to provide one exclusive left-turn lane, one exclusive through lane, one shared right-through lane, and an exclusive right-turn lane for the southbound Fourth Street approach.	No	Mission Bay FSEIR Mitigation Measure E.38 has already been implemented, and consequently, is not applicable to the proposed project.
North	E.41 **Fourth Street** Widen the west side of Fourth Street for approximately half the distance between Townsend Street and King Street to provide the additional southbound lane noted in Mitigation Measure E.38, including providing additional right-of-way.	No	Mission Bay FSEIR Mitigation Measure E.41 has already been implemented, and consequently, is not applicable to the proposed project.
North / South	E.42 **Seventh Street** Eliminate on-street parking on both sides of Seventh Street between Townsend and 16th Streets during the morning and afternoon peak commute periods to accommodate the lane configuration changes described in Mitigation Measures E.29, E.30, E.31, and E.32.	No	Mission Bay FSEIR Mitigation Measure E.42 has already been implemented, and consequently, is not applicable to the proposed project.
North / South	E.43 **Increase Bay Bridge Tolls** Increase Bay Bridge tolls for single-occupant vehicle (SOV) trips during commute hours to discourage non-carpool traffic.	No	Mission Bay FSEIR Mitigation Measure E.43 has been implemented, and consequently, is not applicable to the proposed project.

	MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
E. TRANSPORTATION (cont.)			
North / South	E.44 **AC Transit District** Encourage the Alameda-Contra Costa Transit District to expand transbay service to accommodate cumulative demand; encourage the Metropolitan Transportation Commission to provide funding for AC Transit District service expansion, and support AC Transit District in its requests for funding for other sources.	No	Future cumulative AC Transit service is projected to accommodate cumulative ridership, and therefore additional AC Transit service is not required. Mission Bay FSEIR Mitigation Measure E.44 consequently, is not applicable to the proposed project.
North/ South	E.45 **Extend N-Judah MUNI Metro Line** Extend and operate the route of the N-Judah MUNI Metro line from the Embarcadero station to Mariposa Street, using the MMX and Third Street light rail tracks.	No	Mission Bay FSEIR Mitigation Measure E.45 to be implemented with the Central Subway, and consequently, is not applicable to the proposed project.
North/ South	E.46 **Transportation Management Organizations** E.46.a Form a Mission Bay Transportation Management Association (TMA) to implement a Transportation System Management (TSM) Plan. E.46.b Form a Transportation Coordinating Committee (TCC) including representatives of Project Area property owners, UCSF, SFRA and appropriate City staff, including DPT, MUNI, and DPW, to address area-wide transportation planning issues and coordinate with other uses and neighborhoods in nearby areas.	No	Mission Bay FSEIR Mitigation Measure E.46 has been implemented, and consequently, is not applicable to the proposed project.
North/ South	E.47 **Transportation System Management (TSM) Plan** Prepare a TSM Plan, which could include the following elements:		
North/ South	E.47.a. ***Shuttle Bus System*** Operate shuttle bus service between Mission Bay and regional transit stops in San Francisco (e.g., BART, Caltrain, Ferry Terminal, Transbay Transit Terminal), and specific gathering points in major San Francisco residential neighborhoods (e.g., Richmond and Mission Districts).	Yes	This measure was adopted to encourage use of alternate modes and reduce auto mode. A Mission Bay South Transportation Management Plan has been developed which incorporates this mitigation measure, and it is part of the Mission Bay South Owner Participation Agreement for development within Mission Bay. Because the project sponsor would be subject to the Owner Participation Agreement, this mitigation measure is assumed to be part of the proposed project.

	MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
E. TRANSPORTATION (cont.)			
North/ South	E.47.b. ***Transit Pass Sales*** Sell transit passes in neighborhood retail stores and commercial buildings in the Project Area.	Yes	This measure was adopted to encourage use of alternate modes and reduce auto mode. A Mission Bay South Transportation Management Plan has been developed which incorporates this mitigation measure, and it is part of the Mission Bay South Owner Participation Agreement for development within Mission Bay. Because the project sponsor would be subject to the Owner Participation Agreement, this mitigation measure is assumed to be part of the proposed project.
North/ South	E.47.c. ***Employee Transportation Subsidies*** Provide a system of employee transportation subsidies for major employers.	Yes	This measure was adopted to encourage use of alternate modes and reduce auto mode. A Mission Bay South Transportation Management Plan has been developed which incorporates this mitigation measure, and it is part of the Mission Bay South Owner Participation Agreement for development within Mission Bay. Because the project sponsor would be subject to the Owner Participation Agreement, this mitigation measure is assumed to be part of the proposed project.
South	E.47.d. ***Pedestrian Signals at Owens Street Near the Pedestrian Bridge.*** Pedestrian signals at this location will provide continuity between the pedestrian bridge near Fifth Street and the pedestrian path adjacent to Owens Street, and the residential units in the central subarea of Mission Bay South.	No	Mission Bay FSEIR Mitigation Measure E.47d is not adjacent to the project site, and consequently, is not applicable to the proposed project.

	MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
E. TRANSPORTATION (cont.)			
North/ South	E.47.e. ***Secure Bicycle Parking*** Provide secure bicycle parking areas in parking garages of residential buildings, office buildings, and research and development facilities. Provide secure bicycle parking areas by 1) constructing secure bicycle parking at a ratio of 1 bicycle parking space for every 20 automobile parking spaces, and 2) carrying out an annual survey program during project development to establish trends in bicycle use and to estimate demand for secure bicycle parking and for sidewalk bicycle racks, increasing the number of secure bicycle parking spaces or racks either in new buildings or in existing automobile parking facilities to meet the estimated demand. Provide secure bicycle racks throughout Mission Bay for the use of visitors.	Yes	This measure was adopted to encourage use of alternate modes and reduce auto mode. A Mission Bay South Transportation Management Plan has been developed which incorporates this mitigation measure, and it is part of the Mission Bay South Owner Participation Agreement for development within Mission Bay. Because the project sponsor would be subject to the Owner Participation Agreement, this mitigation measure is assumed to be part of the proposed project.
North/ South	E.47.f. ***Appropriate Street Lighting*** Ensure that sidewalks in Mission Bay are sufficiently lit to provide pedestrians and bicyclists with a greater sense of safety, and thereby encourage Mission Bay employees, visitors, and residents to walk and bicycle to and from Mission Bay.	Yes	This measure was adopted to encourage use of alternate modes and reduce auto mode. A Mission Bay South Transportation Management Plan has been developed which incorporates this mitigation measure, and it is part of the Mission Bay South Owner Participation Agreement for development within Mission Bay. Because the project sponsor would be subject to the Owner Participation Agreement, this mitigation measure is assumed to be part of the proposed project.
North/ South	E.47.g. ***Transit, Pedestrian and Bicycle Route Information*** Provide maps of the local and citywide pedestrian and bicycle routes with transit maps and information on kiosks throughout the Project Area to promote multi-modal travel.	Yes	This measure was adopted to encourage use of alternate modes and reduce auto mode. A Mission Bay South Transportation Management Plan has been developed which incorporates this mitigation measure, and it is part of the Mission Bay South Owner Participation Agreement for development within Mission Bay. Because the project sponsor would be subject to the Owner Participation Agreement, this mitigation measure is assumed to be part of the proposed project.

	MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
E. TRANSPORTATION (cont.)			
North/ South	E.47.h. ***Parking Management Guidelines*** Establish parking management guidelines for the private operators of parking facilities in the Project Area.	Yes	This measure was adopted to encourage use of alternate modes and reduce auto mode. A Mission Bay South Transportation Management Plan has been developed which incorporates this mitigation measure, and it is part of the Mission Bay South Owner Participation Agreement for development within Mission Bay. Because the project sponsor would be subject to the Owner Participation Agreement, this mitigation measure is assumed to be part of the proposed project.
South	E.47.i ***Flexible Work Time/Telecommuting*** Where feasible, offer employees in the Project Area the opportunity to work on flexible schedules and/or telecommute so they could avoid peak hour traffic conditions.	Yes	This measure was adopted to encourage use of alternate modes and reduce auto mode. A Mission Bay South Transportation Management Plan has been developed which incorporates this mitigation measure, and it is part of the Mission Bay South Owner Participation Agreement for development within Mission Bay. Because the project sponsor would be subject to the Owner Participation Agreement, this mitigation measure is assumed to be part of the proposed project.
North/ South	E.49 **Ferry Service** Make a good faith effort to assist the Port of San Francisco and others in ongoing studies of the feasibility of expanding regional ferry service. Make good faith efforts to assist in implementing feasible study recommendations.	No	This measure is currently being implemented by the Water Emergency Transportation Authority.

	MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
F. AIR QUALITY			
North/ South	F.1 **TSM Measures** Implement measures to decrease vehicle trips, as described in Mitigation Measures E.46 through E.50 in Section VI.E, Mitigation Measures: Transportation	Yes	
North/ South	F.2 **Construction PM_{10}** As conditions of construction contracts, require contractors to implement the following mitigation program, based on the instructions in the BAAQMD CEQA Guidelines, at all construction sites within the Project Area: F.2.a. Water all active construction areas at least twice a day, or as needed to prevent visible dust plumes from blowing off-site F.2.b. Use tarpaulins or other effective covers for on-site storage piles and for haul trucks that travel on streets F.2.c. Pave, apply water three times daily, or apply (non-toxic) soil stabilizers on all *unpaved* parking areas and staging areas at construction sites F.2.d. Sweep all paved access routes, parking areas, and staging areas daily (preferably with water sweepers) F.2.e. Sweep streets daily (preferably with water sweepers) if visible amounts of soil material are carried onto public streets F.2.f. Hydroseed or apply (non-toxic) soil stabilizers to inactive construction areas (previously graded areas inactive for ten days or more) F.2.g. Enclose, cover, water twice daily or apply (non-toxic) soil binders to exposed stockpiles (dirt, sand, etc.) F.2.h. Limit traffic speeds on unpaved roads to 15 mph F.2.i. Install sandbags or other erosion control measures to prevent silt runoff to public roadways F.2.j. Replant vegetation in disturbed areas as quickly as possible F.2.k. Install wheel washers for all exiting trucks, or wash off the tires or tracks of all trucks and equipment leaving the site F.2.l. Install wind breaks, or plant trees / vegetative wind breaks at windward side(s) of construction areas F.2.m. Suspend excavation and grading on large construction sites when winds (instantaneous gusts) exceed 25 mph F.2.n. Limit the area subject to excavation, grading and other construction activity at any one time	No	Mission Bay FSEIR Mitigation Measure F.2.a-n would effectively be implemented through compliance with the requirements of the Construction Dust Control Ordinance that was adopted in 2008. Therefore, Mission Bay FSEIR Mitigation Measure F.2 is not applicable to the proposed project.

		MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
F. AIR QUALITY (cont.)				
North/ South	F.3	**Toxic Air Contaminants (TACs)** Prior to issuing a certificate of occupancy for a facility containing potential toxic air contamination sources, obtain written verification from BAAQMD either that the facility has been issued a permit from BAAQMD, if required by law, or that permit requirements do not apply to the facility	No	Mission Bay FSEIR Mitigation Measure F.3 has been superseded by current BAAQMD permit requirements for diesel generators, and consequently, is not applicable to the proposed project.
South	F.4	**Meteorology Station** As soon as possible, to provide reliable wind data for informational purposes, and where applicable, to facilitate the preparation of risk assessment studies, locate and maintain a meteorology station at an appropriate location within the Project Area.	No	Mission Bay FSEIR Mitigation Measure F.4.a-g has already been implemented, and consequently, is not applicable to the proposed project.
	F.4.a.	Hire a contractor to select appropriate sites for location of the meteorology station to ensure accuracy of data. Preferably the site would be located at a first phase building at the UCSF site, which is centrally located in the Project Area		
	F.4.b.	Once site selections are recommended, contact the BAAQMD for consultation and comment on the sites		
	F.4.c.	Hire a contractor to select certified equipment and software		
	F.4.d.	Consult the BAAQMD on the equipment and software that is selected prior to purchase		
	F.4.e.	Construct and site the station according to BAAQMD standards (written guidelines may be obtained from the District)		
	F.4.f.	Provide data from the station to the BAAQMD on a real-time basis		
	F.4.g.	At a minimum, take continuous wind speed and direction measurements for a period of at least two years		
North/ South	F.5	**Dry Cleaning Facilities** Prohibit dry cleaning facilities that conduct on-site dry cleaning operations in residential areas within the Project Area. For any dry cleaning operations with the Project Area, require vapor barriers in their design and construct so as to reduce exposure to perchloroethylene and any other toxic air contaminants handled at the facility.	No	Mission Bay FSEIR Mitigation Measure F.5 is no longer applicable due to the regulatory phase out of perchloroethylene.
North/ South	F.6	**Child-Care Buffer Zones** Require preschool and childcare centers to notify BAAQMD and the San Francisco Department of Public Health regarding the locations of their operations, and require these centers to consult with these agencies regarding existing and possible future stationary and mobile sources of toxic air contaminants. The purpose of these consultations is to obtain information so that preschool and childcare centers can be located to minimize potential impacts from toxic air contaminants emissions sources.	No	Mission Bay FSEIR Mitigation Measure F.6 does not apply to the proposed project because the only TAC sources (diesel generators and motor vehicles) would be located in the garage where there would be no office uses or associated child care facilities.

		MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
G. NOISE AND VIBRATION				
North/ South	G.1	**<u>Noise Reduction in Pile Driving</u>** Use noise-reducing pile driving techniques such as pre-drilling pile holes (if feasible, based on soils) to the maximum feasible depth, installing intake and exhaust mufflers on piledriving equipment, vibrating piles into place when feasible, installing shrouds around the piledriving hammer where feasible, and restricting the hours of operation.	No	The project proposes to install piles using drilling and cast-in-place techniques, and as a result, would implement Mission Bay FSEIR Mitigation Measure G.1 as part of the project. Consequently, Mission Bay FSEIR Mitigation Measure G.1 is not warranted for, nor applicable to, the proposed project.
North	G.2	**<u>Analyze Potential Vibrations from Caltrain</u>** Analyze potential vibration from Caltrain on the western-most block of Mission Bay North at Berry and King Streets, adjacent to Caltrain tracks, based on information about localized soils, and, if the analysis shows vibration could be significant without mitigation, design and construct foundations of buildings proposed to be on that block with vibration-reducing features to reduce potential impacts from adjacent passenger trains.	No	Mission Bay FSEIR Mitigation Measure G.2 is only applicable to development on the western-most block of Mission Bay North at Berry and King Streets, adjacent to Caltrain tracks. The project site is not in this location, and consequently, Mitigation Measure G.2 is not applicable to the proposed project.
H. SEISMICITY				
North/ South	H.1	**<u>Heavy Equipment Storage</u>** During the build-out period, store heavy construction equipment in the Project Area during the buildout period that is capable of traveling on damaged roads, clearing debris, and opening access to, and within, the Project Area after a major earthquake.	No	Implementation of the San Francisco Emergency Response Plan, the site-specific emergency response plan required under the Fire Code, and life safety requirements of the Building and Fire Codes fulfill the intent of Mission Bay FSEIR Mitigation Measure H.1.
North/ South	H.2	**<u>Emergency Preparedness and Emergency Response</u>** Following build-out, coordinate emergency response plans with the City regarding use of heavy equipment from the City storage yard in the vicinity of the Project Area	No	Implementation of the San Francisco Emergency Response Plan, prepared in 2008; implementation of the site-specific emergency response plan required under the Fire Code, and life safety requirements of the Building and Fire Codes fulfill the intent of Mission Bay FSEIR Mitigation Measure H.2.

		MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
H. SEISMICITY (cont.)				
	H.3	**Comprehensive Preparedness and Response Plan**		
North/ South	H.3.a.	Require the formulation of a comprehensive preparedness and response plan for the entire Project Area (as opposed to the typical building-by-building plan), integrated with the City's emergency response plans and in coordination with the Mayor's Office of Emergency Services. An emergency response plan should include: Community coordination and response Coordination with government services Outreach and training (not only for employees but also residents) Food and water Shelter Sanitation Consideration of need and potential locations for special facilities (operations, medical, etc.) in the context of the citywide Emergency Response Plan and the Project Area's location in Emergency Response District 3 Organization of employees into response teams Employee training in response procedures, including setting up a command post, communications, first aid, evacuation, security and clean-up	No	Mission Bay FSEIR Mitigation Measure H.3a is applicable to the entire plan area, and not for individual developments in the plan area, including the proposed project, and consequently, is not applicable to the proposed project.
North/ South	H.3.b.	In addition to the Project Area-wide plan, require each building or complex in the Project Area to prepare an emergency response plan. Each plan would be the responsibility of the owner(s) of each building or complex, and would be reviewed by the City periodically to ensure it is kept up to date.	No	Section 12.202(e)(1) of the San Francisco Fire Code, and the provisions of the Building Code fulfill the intent of Mission Bay FSEIR Mitigation Measure H.3b.
South	H.4	**Fire Station No. 30** Provide seismic rehabilitation of Fire Station No. 30 in the Project Area, if the building is to be reused for human occupancy.	No	Mission Bay FSEIR Mitigation Measure H.4 is only applicable to Fire Station 30, not the project site, and consequently, is not applicable to the proposed project.
South	H.5	**New Fire Station** At the time the San Francisco Fire Department determines the population or building density is high enough to warrant it, provide a new fire station in Mission Bay South to reduce the effects of limited emergency access to and from the site following a major earthquake.	No	The new Public Safety Building at Third Street and Mission Rock became operational in April 2015, and satisfies the requirements of Mission Bay FSEIR Mitigation Measure H.5.

		MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
H. SEISMICITY (cont.)				
North/ South	H.6	**Facilitate Emergency Access Routes** As part of the comprehensive preparedness plan identified in Mission Bay FSEIR Measure H.3, identify and implement feasible measures to facilitate and improve emergency access routes to the site, especially in the vicinity of Seventh and Owens Streets. Such measures could include design of open spaces to allow vehicle access following in a catastrophic event; designing underground utilities at the Owens and Seventh Streets connector to minimize severe damage or disconnection caused by earthquakes; constructing heavier pavement sections along critical routes if indicated through a geotechnical study; and siting buildings within the area bounded by Seventh Street, the Seventh Street connector, Owens Street, and 16th Street in a manner that would allow emergency vehicle access between these buildings in a catastrophic event.	No	Mission Bay FSEIR Mitigation Measure H.6 is applicable to the entire plan area, and not for individual developments in the plan area, including the proposed project, and consequently, is not applicable to the proposed project.
North/ South	H.7	**Corrosivity** Test soils for sulfate and chloride content. If necessary, use admixtures in concrete so it would not be susceptible to attack by sulfates, and/or use coated metal pipes so that pipes would be more resistant to corrosion by chlorides.	No	The site-specific geotechnical investigation required by, and conducted in accordance with, the California and San Francisco Building Codes would address the potential for corrosion of the project's concrete piles, and would include specifications for the concrete to ensure that the piles would not be adversely affected by corrosion. Consequently, Mission Bay FSEIR Mitigation Measure H.7 no longer necessary.
I. HEALTH AND SAFETY				
South	I.1	**Biohazardous Materials Handling Guidelines** Require businesses that handle biohazardous materials and do not receive federal funding to certify that they follow the guidelines published by the National Research Council and the United States Department of Health and Human Services Public Health Service, National Institutes of Health, and Centers for Disease Control, as set forth in *Biosafety in Microbiological and Biomedical Laboratories, Guidelines for Research Involving Recombinant DNA Molecules (NIH Guidelines)*, and *Guide for the Care and Use of Laboratory Animals,* or their successors, as applicable.	Yes	Mission Bay FSEIR Mitigation Measure I.1 is included under SEIR Initial Study Mitigation Measure M-HZ-1a. Guidelines for Handling Biohazardous Materials.
South	I.2	**Use of HEPA Filters.** Require businesses handling biohazardous materials to certify that they use high efficiency particulate air (HEPA) filters or substantially equivalent devices on all exhaust from Biosafety Level 3 laboratories unless they demonstrate that exhaust from their Biosafety Level 3 laboratories would not pose substantial health or safety hazards to the public or the environment. Require such businesses to certify that they inspect or monitor the filters regularly to ensure proper functioning.	Yes	Mission Bay FSEIR Mitigation Measure I.2 is included under SEIR Initial Study Mitigation Measure M-HZ-1a. Guidelines for Handling Biohazardous Materials.

	MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
I. HEALTH AND SAFETY (cont.)			
South	I.3 **Handling of Biohazardous Materials** Require businesses handling biohazardous materials to certify that they do not handle or use biohazardous materials requiring Biosafety Level 4 containment (i.e., dangerous or exotic materials that pose high risks of life-threatening diseases or aerosol-transmitted infections, or unknown risks of transmission) in the Project Area.	Yes	Mission Bay FSEIR Mitigation Measure I.3 is included under SEIR Initial Study Mitigation Measure M-HZ-1a. Guidelines for Handling Biohazardous Materials.
J. CONTAMINATED SOILS AND GROUNDWATER			
North/ South	J.1 **Risk Management Plan(s)** Prior to any site development activities in the Project Area, develop and implement an RWQCB-approved Risk Management Plan or Plans (RMP). The RMP shall address all site development activities and post-development activities and shall include specific measures that would be protective of human health and the aquatic environment. The human health standards to be applied in the RMP are a cumulative cancer risk of 1×10^{-5} and Hazard Index of 1, or more stringent standards as may be required by the RWQCB. Amend the RMPs as required by the RWQCB to reflect new information regarding contamination, land use decisions, or as a result of Article 20 compliance. ***RMP Enforcement*** J.1a Provide an enforcement structure for RMPs, to be in place and effective during construction and after project development, including: i. Develop and record a restrictive covenant as an Environmental Restriction and Covenant under California Civil Code Section 1471 that: a. Places limits on future uses in the Project Area consistent with the provisions in the RMP; b. Provides notice to current and future property owners that the RMP contains use restrictions and other requirements and obligates property owners to provide like notice to occupants; and c. Provides notice to current and future property owners that the RWQCB maintains residual regulatory enforcement authority over all portions of the Project Area sufficient to compel enforcement of the entire RMP. ii. As part of any future transfer of property title of any portion of the Project Area, require current property owners to provide a copy of the RMP to each of their future transferees. ***Pre-Development*** Include, at a minimum, the following elements in the RMP: J.1b Limit direct access to areas with exposed native soils (defined as soils that exist at the site prior to project approval) and perform inspections to verify that measures taken to limit direct access are maintained.	No	The Mission Bay RMP was completed for the Mission Bay Plan Area in 1999, in accordance with Mission Bay FSEIR Mitigation Measure J.1. In addition, a Revised RMP was completed for Pier 64 vicinity, including Blocks 29-32, in 2006. Consequently, Mission Bay FSEIR Mitigation Measure J.1 has been fulfilled by the preparation of these plans.

	MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
J. CONTAMINATED SOILS AND GROUNDWATER (cont.)			
North/ South (cont.)	Alternatively, for each location with exposed native soils, provide risk management procedures for those areas. If this alternative is chosen, for each exposed soil location that would remain vacant and undeveloped at the initiation of development, and for each site that becomes vacant and includes exposed native soil, evaluate and document potential health risks to the general public that could occur before site development using the following process: Evaluate sampling results to determine constituents that could pose a risk to the general public. Identify populations who could be exposed to the constituents in soils based on land uses within and adjacent to the Project Area. Exposed populations that would be considered would include adult and child visitors/trespassers, nearby residents (adults and children), and workers not involved in project construction within and adjacent to the Project Area. Using specific EPA- and DTSC-recommended exposure assumptions, identify the appropriate exposure pathways and assumptions in consultation with the RWQCB. Using the specific exposure assumptions identified above, adopt contaminant-specific interim target levels (ITLs) following regulatory risk assessment guidelines established by DTSC and EPA. Compare ITLs to the range of concentrations detected in exposed native soils to identify areas where ITLs are exceeded. No further action prior to development (other than that required under Article 20 or other applicable regulations) would be required in areas in which ITLs are not exceeded. J.1c For areas where ITLs are exceeded, identify specific Interim Risk Management (IRM) measures that would reduce potential contamination-related risks to Project Area occupants and visitors during site build-out. Based on the results of the ITL evaluation and need for site controls, general IRM measures could include measures such as: i. Limit Direct Access to Uncovered Native Soil on Undeveloped Portions of the Project Area. To effectively limit access, install fencing or other physical barriers around the identified areas, and post Ano trespassing@ signs. ii. Hydroseed or Apply Other Vegetative or Other Cover to Uncovered Areas. Hydroseed or apply other vegetative or other cover to the uncovered areas to reduce the potential for windblown dusts to be generated, and to reduce the potential for individuals to have direct contact with the native soils. iii. Include Safety Notices in Leases. Notify tenants of occupied portions of the Project Areas of the potential risks involved with the disturbance of existing cover (asphalt, concrete, vegetation) or exposed native soil. iv. Conduct Periodic Inspections of Open Spaces. Conduct periodic inspections of the Project Area to reduce the illegal occupancy of open areas by transient populations, and to reduce the illegal dumping by unauthorized occupants or off-site populations. Implement additional security measures such as fencing and/or the use of security guards, if inspections show a need.		

	MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
J. CONTAMINATED SOILS AND GROUNDWATER (cont.)			
North/ South (cont.)	v. Periodic Monitoring. Perform inspections verifying that risk management measures remain effective by identifying disturbances to cover materials that could result in the exposure of underlying native soil and by identifying areas where temporary fencing or other physical barriers might need to be reinstalled. If the inspections identify areas where measures have been rendered ineffective, implement corrective action. ***Development*** J.1d Include in the RMP, health and safety training and health protection objectives for workers who may directly contact contaminated soil during construction and/or maintenance, including Cal/OSHA worker safety regulations appropriate to the type of construction activity, location, and risk relative to the potential types of hazards associated with contaminated soil or groundwater, and where appropriate, compliance with Title 8, Group 16, requirements. J.1e Identify site access controls to be implemented during construction, such as: i. Secure construction site to prevent unauthorized pedestrian/vehicular entry with fencing or other barrier of sufficient height and structural integrity to prevent entry and based upon the degree of control required. ii. Post Ano trespassing@ signs. iii. Provide on-site meetings with construction workers to inform them about security measures and reporting/contingency procedures. J.1f Identify protocols for managing soil during construction, which will include at a minimum: i. The dust controls found in Measure F.02 in Section VI.F, Mitigation Measures: Air Quality. ii. Standards for imported fill (defined as fill brought onto the site from outside the Project Area) that are protective of human health and the aquatic environment and an identified minimum depth of fill to be required for landscaped areas. iii. A requirement that prior to placement, if native soil in the Project Area is to be used on site in any manner that could result in direct human exposure, characterization of the soil be conducted to confirm that it meets appropriate standards approved by the RWQCB and would be appropriate for the intended use. iv. Protocols for managing stockpiled and excavated soils. v. A program for off-site dust monitoring, consisting of real-time monitoring for PM10 concentrations to demonstrate that the health and safety of all individuals not engaged in construction activities would not be adversely affected by chemicals that could be contained in dust generated by soil-disturbing activities. If monitoring shows dust levels exceeding 250 g/m3, implement additional dust control measures, such as continuous misting of exposed areas with water, until concentrations are reduced below the action level.		

	MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
J. CONTAMINATED SOILS AND GROUNDWATER (cont.)			
North/ South (cont.)	J.1g Identify protocols for managing groundwater, which will include at a minimum: i. Procedures to prevent unacceptable migration of contamination from defined plumes during dewatering, such as monitoring, counter-pumping, or installing sheetpiles down to Bay Mud before dewatering. ii. Procedures for the installation of subsurface pipelines and other utilities, where necessary, to prevent lateral transmission of chemicals in groundwater. Such procedures could include, but would not be limited to, selection of proper backfill materials and thickness and installation of clay plugs or barrier collars. J.1h Include SWPPP requirements and BMPs as described in Mitigation Measure K.01 in Section VI.K, Mitigation Measures: Hydrology and Water Quality. J.1i Include a requirement that construction personnel be trained to recognize potential hazards associated with underground features that could contain hazardous materials, previously unidentified contamination, or buried hazardous debris. J.1j Develop and describe procedures for implementing a contingency plan, including appropriate notification and control procedures, in the event unanticipated subsurface hazards are discovered during construction. Control procedures could include, but would not be limited to, further investigation and removal of USTs or other hazards. J.1k Establish procedures, as necessary, so that construction activities avoid interfering with any RWQCB-required site investigation and remediation in the free product area. ***<u>Post-Development</u>*** J.1l Except where testing demonstrates that native soils meet standards established by the RWQCB as being protective of human health and the aquatic environment, require that upon project completion, all native soils shall be capped, so as to preclude human contact by using buildings, paved surfaces (such as parking lots, sidewalks, or roadways), or fill of a kind and depth approved by the RWQCB. J.1m Prohibit residences with unrestricted access to soils in front yards or backyards anywhere in the Project Area. J.1n Prohibit access to native soils for private use. If disturbance of native subsurface soils or groundwater dewatering is planned, carry out these activities in accordance with the elements of the RMP called for in Measures J.01d through J.01k. Following construction or excavation or soil disturbance, restore the cap in accordance with the provisions of the RMP as called for in Measure J.01l. J.1o Prohibit the use of shallow groundwater within the Project Area for domestic, industrial, or irrigation purposes. Permit installation of groundwater wells within the Project Area only for environmental monitoring purposes. Secure and lock environmental wells installed within the Project Area to prevent unauthorized access to the groundwater. In the event the use of shallow groundwater is proposed, perform an assessment of the risks from direct exposure to the groundwater prior to use and obtain RWQCB or other appropriate regulatory agency approval of the results of the assessment and proposed uses		

		MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
J. CONTAMINATED SOILS AND GROUNDWATER (cont.)				
North/ South	J.2	**Site Specific Risk Evaluation** Carry out a site-specific risk evaluation for each site in a non-residential area proposed to be used for a public school or child care facility; submit to RWQCB for review and approval. If cancer risks exceed 1×10^{-5} and/or non-cancer risk exceeds a Hazard Index of 1, carry out remediation designed to reduce risks to meet these standards or select another site that is shown to meet these standards.	Yes	Included under SEIR Initial Study Mitigation Measure M-HZ-2: RMP Provisions for Child Care Facilities.
K. HYDROLOGY AND WATER QUALITY				
North/ South	K.1	**Stormwater Pollution Prevention Program (SWPPP)** Develop and implement a comprehensive Stormwater Pollution Prevention Plan (SWPPP) for all construction activities within the Project Area to avoid and minimize erosion and sedimentation in China Basin Channel and San Francisco Bay and to manage other aspects of the construction site. Include at least the following Best Management Practices, or substantially equivalent measures.	No	Compliance with the current General Construction NPDES Permit would ensure a SWPPP with appropriate BMPs would be developed and implemented. Consequently Mitigation Measures K.1a through K.1i are not needed.
	K.1.a.	Minimize dust during demolition, grading, and construction by lightly spraying exposed soil on a regular basis.		
	K.1.b.	Minimize wind and water erosion on temporary soil stockpiles by spraying with water during dry weather and covering with plastic sheeting or other similar material during the rainy season (November to April).		
	K.1.c.	Minimize the area and length of time during which the site is cleared and graded.		
	K.1.d.	Prevent the release of construction pollutants such as cement, mortar, paints and solvents, fuel and lubricating oils, pesticides, and herbicides by storing such materials in a bermed, or otherwise secured, area.		
	K.1.e.	As needed, install filter fences around the perimeter of the construction site to prevent off-site sediment discharge. Prior to grading the bank slopes of China Basin Channel for the proposed channel-edge treatments, install silt or filter fences to slow water and remove sediment. As needed, properly trench and anchor in the silt or filter fences so that they stand up to the forces of tidal fluctuation and wave action, and do not allow sediment-laden water to escape underneath them.		
	K.1.f.	Follow design and construction standards found in the *Manual of Standards for Erosion and Sediment Control Measures* for placement of riprap and stone size.		
	K.1.g.	Install and maintain sediment and oil and grease traps in local stormwater intakes during the construction period, or otherwise properly control oil and grease discharges.		
	K.1.h.	Clean wheels and cover loads of trucks carrying excavated soils before they leave the construction site.		
	K.1.i.	Implement a hazardous material spill prevention, control, and clean-up program for the construction period. As needed, the program would include measures such as constructing swales and barriers that would direct any potential spills away from the Channel and the Bay and into containment basins to prevent the movement of any materials from the construction site into water.		

		MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
K. HYDROLOGY AND WATER QUALITY (cont.)				
North/ South	K.2	**Changes in Sanitary Sewage Quality** In addition to developing and implementing a Stormwater Management Program for the Central/Bay Basin (see Mitigation Measure K.05), participate in the City's existing Water Pollution Prevention Program. Facilitate implementation of the City's Water Pollution Prevention Program by providing and installing wastewater sampling ports in any building anticipated to have a potentially significant discharge of pollutants to the sanitary sewer, as determined by the Water Pollution Prevention Program of the San Francisco Public Utilities Commission's Bureau of Environmental Regulation and Management, and in locations as determined by the Water Pollution Prevention Program.	Yes	Mission Bay FSEIR Mitigation Measure K.2 is included under SEIR Mitigation Measure M-H-6. Wastewater Sampling Ports.
North/ South	K.3	**Sewer Improvement Design** Design and construct sewer improvements such that potential flows to the City's combined sewer system from the project do not contribute to an increase in the annual overflow volume as projected by the Bayside Planning Model by providing increased storage in oversized pipes, centralized storage facilities, smaller dispersed storage facilities, or detention basins, or through other means to reduce or delay stormwater discharges to the City system.	Yes	Mission Bay FSEIR Mitigation Measure K.3 applies to the entire project area and Mission Bay FSEIR Mitigation Measure K.4 applies only to the planned separate stormwater system that would discharge stormwater flows directly to China Basin Channel (Mission Creek) and the Bay.
South	K.4	**Alternative Technologies to Improve Stormwater Discharge Quality** Implement alternative technologies or use other means to reduce settleable solids and floatable materials in stormwater discharges to China Basin Channel to levels equivalent to, or better than City-treated combined sewer overflows. Such alternative technologies could include one or more of the following: biofilter system, vortex sediment system, catch basin filters, and/or additional source control measures to remove particulates from streets and parking lots.		Implementation of Mitigation Scenario B (identified in Mission Bay FSEIR Summary of Comments and Responses in Volume III, beginning on p. XII.253) included separating the stormwater collection system and sanitary sewer in the reconfigured Mariposa sub-basin as well as in the reconfigured Central sub-basin. The master developer ultimately adopted and is currently implementing Mitigation Scenario B, as described in the Mission Bay South Infrastructure Plan. Implementation of this mitigation approach satisfies the requirements of Mission Bay FSEIR Mitigation Measures K.3 and K.4

	MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
K. HYDROLOGY AND WATER QUALITY (cont.)			
South	K.5 **Central/Bay Basin Stormwater Management Program** Develop and implement a Stormwater Management Program for the Central/Bay Basin applicable to new and interim development under the Redevelopment Plan if any are contributing to direct discharges of stormwater to near-shore waters. Develop the plan in coordination with City and County of San Francisco agencies such as the Water Pollution Prevention Program of the City and County of San Francisco Public Utilities Commission's (SFPUC) Bureau of Environmental Regulation and Management, and the Clean Water Program. Develop the Stormwater Management Program according to guidelines contained in California Municipal Storm Water Best Management Practice Handbook and in California Industrial/Commercial Storm Water Best Management Practice Handbook. In addition, design the program with Best Management Practices consistent with the minimum control measures pursuant to the proposed Phase II stormwater regulations. Implement the Stormwater Management Program until a city-wide stormwater management program is developed that includes any area contributing to direct discharges of stormwater to near-shore waters. If the City and County of San Francisco develops a city-wide stormwater management program, such a program would supersede the stormwater management program for the Project Area. Periodically prepare and submit a monitoring report to the City detailing progress on implementation of Best Management Practices. Modify the Stormwater Management Program, as necessary, to respond to changes in conditions, and record any changes made (additions or deletions) in the monitoring report.	No	Mission Bay FSEIR Mitigation Measure K.5 requires implementation of an individual stormwater management program that utilizes BMPs for Mission Bay until the Phase II regulations become final and Mission Bay is included in the City's stormwater management program. However, subsequent to publication of the Mission Bay FSEIR, the SWRCB adopted the General Permit for the Discharge of Storm Water from Small Municipal Separate Storm Sewer Systems. The CCSF also adopted Section 147 of Article 4.2 of the San Francisco Public Works Code in 2010 and published the associated Stormwater Design Guidelines. Discharges of stormwater from the project site to the separate storm sewer would be required to comply with these regulatory requirements as further described above. Therefore, Mission Bay FSEIR Mitigation Measure K.5 is not applicable to the proposed project.
North/ South	K.6 **Structure Placement and Design to Minimize Dangers of Flooding** Structures in the Project Area should be designed and located in such a way to assure the reasonable safety of structures and shoreline protective devices built in the Bay or in low-lying shoreline areas from the dangers of tidal flooding, including consideration of a rise in relative sea level. Detailed construction specifications to mitigate against impacts of a sea-level rise, however, would require specific flood protection engineering and building analysis by a licensed engineer where structures are proposed below a 99-foot elevation (Mission Bay Datum). Measures include: K.6.a. Setback from the water's edge K.6.b. Install seawalls, dikes, and/or berms during construction of infrastructure K.6.c. Provide for dewatering basements	No	Mission Bay FSEIR Mitigation Measure K.6 is no longer warranted for the proposed project. FSEIR Mitigation Measures K.6a through K.6f apply to structures proposed below an elevation of -1 foot SFD (10 feet NAVD88). Elevations at the project site range from approximately -1 foot SFD (10 feet NAVD88) to +3 feet SFD (14 feet NAVD88); however some of the project components would extend below grade. The SFPUC inundation maps completed in 2014 have provided a

	MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
K. HYDROLOGY AND WATER QUALITY (cont.)			
North/ South (cont.)	K.6.d. Construct streets and sidewalks above existing grades by reducing the amount of excavation for utilities or basements K.6.e. Use topsoil to raise the level of public open spaces K.6.f. Use half-basements and partially depressed garage levels to minimize excavation		more detailed assessment of areas of the project site that could be inundated due to sea level rise and indicate an area greater than previously anticipated in the Mission Bay FSEIR. However, the project incorporates into the project design measures that fulfill the requirements of FSEIR Mitigation Measure K.6. This includes designing the proposed project with flood-resistant building standards or, in some cases, to be capable of adapting to meet these standards when needed in the future in recognition of future flood hazards due to sea level rise.
L. CHINA BASIN CHANNEL VEGETATION AND WILDLIFE			
North/ South	L.1 **Salt Marsh Wetland Habitat Mitigation Plan** Prepare and implement a salt marsh wetland habitat mitigation plan in accordance with the San Francisco District, U.S. Army Corps of Engineers Habitat Mitigation Planning Guidelines. Determine the details of the plan through the Section 404 permit process. Nothing in this mitigation measure is intended to constrain the flexibility needed to meet permitting agency requirements, or adjust to variability in field conditions, new information or technology, or other factors. Similarly, this condition is not intended to conflict with or constrain use of more natural alternative Channel edge treatments that are determined feasible and consistent with adopted Redevelopment Agency standards and guidelines applicable to Mission Bay as contained in Design for Development documents.	No	Mission Bay FSEIR Mitigation Measure L.1 is only applicable to construction activities within the Mission Creek Channel, and not the project site. Consequently, Mission Bay FSEIR Mitigation Measure L.1 is not applicable to the proposed project.
North/ South	L.2 **Wetland Habitat Avoidance** Avoid salt marsh wetland habitat along the China Basin Channel shoreline during installation of suction inlets (and associated piping) used for fire-fighting water supply. Design the storm drain outfalls to minimize scouring and erosion of mudflats in coordination with relevant permitting agencies during the permitting process.	No	Mission Bay FSEIR Mitigation Measure L.2 is only applicable to construction activities within the Mission Creek Channel, and not the project site. Consequently, Mission Bay FSEIR Mitigation Measure L.2 is not applicable to the proposed project.

		MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
L. CHINA BASIN CHANNEL VEGETATION AND WILDLIFE (cont.)				
North/ South	L.3	**Construction During Pacific Herring Spawning Season** Do not conduct any construction activities (including movement of heavy equipment or structures by barge or tugboat) with the potential to cause turbidity in Channel or Bay waters during the spawning season of Pacific herring (December 1-March 1).	No	Mission Bay FSEIR Mitigation Measure L.3 is only applicable to construction activities (including movement of construction barges and tugboats) within the Mission Creek Channel. Consequently, Mission Bay FSEIR Mitigation Measure L.3 is not applicable to the proposed project.
North / South	L.4	**Turbidity Prevention** Require the construction contractor to use shallow-draft tugboats, to prevent turbidity and sediment resuspension caused by tugboat activity in the Channel. Shallow-draft tugboats float higher in the water than deep-draft tugboats. Because they float higher, the tugboat propellers are not as deep under the water surface, and therefore are farther away from the bottom of the Channel. This arrangement has less potential to disturb bottom sediments because the local currents created by the propellers would not extend as deeply into the water column. Require the construction contractor to operate the tugboats at the minimum speed necessary to maintain maneuverability of the barges. Slower speeds would reduce the spin of tugboat propellers, thus minimizing turbidity and sediment resuspension.	No	Mission Bay FSEIR Mitigation Measure L.4 is only applicable to use of construction tugboats within the Mission Creek Channel. Consequently, Mission Bay FSEIR Mitigation Measure L.4 is not applicable to the proposed project.
North / South	L.5	**Construction In Channel** Confine resuspended sediments from construction activities in the Channel or Bay waters to the work site using submarine silt curtains around pile-driving or outfall construction sites, or silt fences properly anchored and trenched in place at the toe of slope below any grading or rubble-removing activities.	No	Mission Bay FSEIR Mitigation Measure L.5 is only applicable to construction activities within the Mission Creek Channel, and not the project site. Consequently, Mission Bay FSEIR Mitigation Measure L.5 is not applicable to the proposed project.
North / South	L.6	**Removal and Disposal Plan** Prepare a written plan for removal and disposal, including a description of any methods incorporated to avoid or minimize potential surface water contamination shall be prepared prior to removing existing support piles from China Basin Channel for the proposed Channel-edge treatments. Submit the plan to the San Francisco Bay Regional Water Quality Control Board for approval before implementation. Implement the plan during construction and have a qualified specialist monitored the plan to ensure adequate performance. Implement this plan during removal of pilings under the direction of a qualified specialist.	No	Mission Bay FSEIR Mitigation Measure L.6 is only applicable to construction activities within the Mission Creek Channel, and not the project site. Consequently, Mission Bay FSEIR Mitigation Measure L.2 is not applicable to the proposed project.

	MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
M. COMMUNITY SERVICES AND UTILITIES			
South	M.1 **Transfer School Site** Transfer the 2.2 acre school site to the San Francisco Unified School District in a developable condition prior to issuance of building permits for residential units that will make the total combined number of dwelling units in Mission Bay North and Mission Bay South equal to or greater than 3,200 dwelling units.	No	Mission Bay FSEIR Mitigation Measure M.1 is only applicable to the 2.2-acre school site in the plan area, not the project site. Consequently, Mission Bay FSEIR Mitigation Measure M.1 is not applicable to the proposed project.
North / South	M.2 **Include Water Conservation in Buildings and Landscaping** Include methods of water conservation in Mission Bay buildings and landscaping. Water conservation methods include the following: M.2.a. Install water conserving dishwashers and washing machines in rental apartments and condominiums M.2.b. Install water conserving dishwashers and water efficient centralized cooling systems in office buildings M.2.c. Incorporate water efficient laboratory techniques in research facilities where feasible M.2.d. Provide information to residences and businesses advising methods to conserve water M.2.e. Install water conserving irrigation systems (e.g., drip irrigation) M.2.f. Design landscaping using drought resistant and other low-water use plants	No	Compliance with the 2013 California Green Building Code, 2013 San Francisco Green Building Code, San Francisco Water Efficient Irrigation Ordinance and the San Francisco Green Landscaping Ordinance would in effect implement FSEIR Mitigation Measures M.2a through M.2f. Therefore, Mission Bay FSEIR Mitigation Measures M.2a through M.2f are no longer required.
North / South	M.3 **Extend Auxiliary Water Supply System** Extend the Auxiliary Water Supply System (High-Pressure System) through the interior of the Project Area. The routing, design and implementation of the AWSS extensions shall be determined by the Fire Department and the Department of Public Works.	No	The AWSS has been extended through the interior of the plan area, and satisfies the requirements of Mitigation Measure M.3. Mission Bay FSEIR Mitigation Measure M.3 is not applicable to the proposed project.
South	M.4 **Sewers and Wastewater Treatment** Construct a fence around any interim surface detention basins.	No	There would be no interim stormwater detention ponds constructed on the site under the proposed project. Therefore Mission Bay FSEIR Mitigation Measure M.4 does not apply to the project.
South	M.5 **Stormwater Runoff Control and Drainage** Drain stormwater runoff (up to a 5-year event) from newly constructed buildings and permanently covered surfaces in the Bay Basin into the City’s combined sewer system until installation of a permanent sewer system.	No	Mission Bay FSEIR Mitigation Measure M.5 is not applicable to the proposed project because the Bay basin has been incorporated into the reconfigured Central sub-basin and the project would discharge to the Mission Bay separate stormwater system that has already been constructed.

	MISSION BAY FSEIR SECTION / MITIGATION MEASURE	MB FSEIR Mitigation Measure Applicability to Project	Notes
M. COMMUNITY SERVICES AND UTILITIES (cont.)			
South	M.6 **<u>Construct New Fire Station and Provide New Engine Company</u>** M.6.a. ***<u>Construct New Fire Station</u>*** Construct or pay for the construction of a new fire station in the Mission Bay South Redevelopment Area to house equipment and personnel serving the Project Area south of China Basin Channel, either in a new building or in the vacant Fire Station No. 30 after rehabilitation and expansion of that building. The San Francisco Fire Department shall review each proposed development phase to determine when land for the new fire station shall be transferred and when planning and design for the fire station shall be initiated.	No	The new Public Safety Building at Third Street and Mission Rock Street in Mission Bay South became operational in April 2015, and satisfies the requirements of Mission Bay FSEIR Mitigation Measure M.6a.
South	M.6.b. ***<u>Provide New Engine Company</u>*** Provide or pay for the provision of an engine company and associated Fire Department personnel and equipment, and a truck company and associated personnel and equipment, to serve the Project Area south of China Basin Channel. The San Francisco Fire Department shall review each proposed development phase to determine when the engine company and truck company and related personnel and equipment shall be provided.	No	SFFD Station 4 company currently operates in the Public Safety Building in Mission Bay South in April 2015, and satisfies the requirements of Mission Bay FSEIR Mitigation Measure M.6b.
