CHAPTER 1
Summary

1.1 Project Description

GSW Arena LLC (GSW), an affiliate of Golden State Warriors, LLC, which owns and operates the Golden State Warriors National Basketball Association (NBA) team, proposes to construct a multi-purpose event center and a variety of mixed uses, including office, retail, open space and structured parking on an approximately 11-acre site on Blocks 29-32 within the Mission Bay South Redevelopment Plan Area of San Francisco. See **Figure 1-1** for an aerial photograph of the project site within the Mission Bay South Redevelopment Plan Area. The project site is bounded by South Street on the north, Third Street on the west, 16th Street on the south, and by the future planned realigned Terry A. Francois Boulevard on the east. The proposed event center would host the Golden State Warriors basketball team during the NBA season, and provide a year-round venue for a variety of other uses, including concerts, family shows, other sporting events, cultural events, conferences, and conventions.

1.1.1 Background

The San Francisco Office of Community Investment and Infrastructure (OCII), successor to the San Francisco Redevelopment Agency, is the lead agency responsible for administering the environmental review for private projects in the Mission Bay North and South Redevelopment Plan Area of San Francisco, and has determined that an environmental impact report (EIR) is required for the proposed project in compliance with the requirements of the California Environmental Quality Act (CEQA). This EIR is a public information document for use by governmental agencies and the public to identify and evaluate potential environmental impacts of the proposed project, to recommend mitigation measures to lessen or eliminate significant adverse impacts, and to examine feasible alternatives to the project. The information contained in the EIR must be reviewed and considered by the OCII and by any responsible agencies (as defined in CEQA) prior to a decision to approve, disapprove, or modify the proposed project.

This document is a Subsequent EIR (SEIR), tiered from the certified *Mission Bay Final Subsequent Environmental Impact Report* (Mission Bay FSEIR),[1] which provided programmatic environmental review of the overall Mission Bay Redevelopment Plan (consisting of the Mission Bay North

1 City and County of San Francisco and San Francisco Redevelopment Agency, 1998. *Final Mission Bay Subsequent Environmental Impact Report*. Planning Department File No. 96.771E, San Francisco Redevelopment Agency Case No. ER 919-97, State Clearinghouse No. 97092068. Certified September 17, 1998.

OCII Case No. ER 2014-919-97; Planning Department Case No. 2014.1441E: Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 1-1
Aerial Photograph of Mission Bay

Redevelopment Plan and Mission Bay South Redevelopment Plan). The Mission Bay FSEIR evaluated the potential environmental effects of the overall development of the approximately 300-acre Mission Bay plan area (see **Figure 1-2** for an illustration of land uses in the Mission Bay Redevelopment Plan). The proposed project at Blocks 29-32 is a subsequent activity allowed under and consistent with the Mission Bay South Redevelopment Plan. This SEIR provides detailed, project-level environmental review of the proposed Event Center and Mixed-Use Development at Blocks 29-32, within the context of the certified Mission Bay FSEIR.

On November 19, 2014, OCII issued a Notice of Preparation (NOP) to notify and inform agencies and interested parties about the proposed project and to initiate the CEQA environmental review process for the project. The NOP included an Initial Study, which described and analyzed environmental resource areas that would not be significantly affected by the proposed project and included mitigation measures to reduce certain impacts to less than significant. This SEIR addresses the remaining environmental resources areas upon which the proposed project could result in significant, physical environmental impacts as well as identifies and analyzes alternatives to the proposed project. The NOP and Initial Study are included in Appendix NOP-IS of this SEIR.

1.1.2 Project Objectives

The Golden State Warriors currently play their home games at Oracle Arena, located at 7000 Coliseum Way in Oakland, California and lease their management offices and practice facility at the Oakland Convention Center at 1011 Broadway in downtown Oakland. The proposed project would consolidate these facilities in one location. Oracle Arena, built in 1966 and remodeled in 1996, is the oldest facility still in use by the NBA.

The project sponsor's objectives for the proposed Event Center and Mixed-Use Development at Blocks 29-32 are to:

- Construct a state-of-the-art multi-purpose event center in San Francisco that meets NBA requirements for sports facilities, can be used year-round for sporting events and entertainment and convention purposes with events ranging in capacity from approximately 3,000-18,500, and expands opportunities for the City’s tourist, hotel and convention business.

- Provide sufficient complementary mixed-use development, including office and retail uses, to create a lively local and regional visitor-serving destination that is active year-round, promotes visitor activity and interest during times when the event center is not in use, provides amenities to visitors of the event center as well as the surrounding neighborhood, and allows for a financially feasible project.

- Develop a project that meets high-quality urban design and high-level sustainability standards.

- Optimize public transit, pedestrian and bicycle access to the site by locating the project within walking distance to local and regional transit hubs, and adjacent to routes that provide safe and convenient access for pedestrians and bicycles.

Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 1-2
Land Uses in the Mission Bay Redevelopment Plan

- Provide adequate parking and vehicular access that meets NBA and project sponsor's reasonable needs for the event center and serves the needs of project visitors and employees, while encouraging the use of transit, bicycle, and other alternative modes of transportation.

- Provide the City with a world class performing arts venue of sufficient size to attract those events which currently bypass San Francisco due to lack of a world class 3,000-4,000 seat facility.

- Develop a project that promotes environmental sustainability, transportation efficiency, greenhouse gas reduction, stormwater management using green technology, and job creation consistent with the objectives of the California Jobs and Economic Improvement Through Environmental Leadership Act (AB 900),[2] as amended.

1.1.3 Project Characteristics

The proposed project would develop the currently vacant Blocks 29-32 with a multi-purpose event center and a variety of mixed uses, including office, retail, open space and structured parking on the approximately 11-acre site. **Figure 1-3** presents the conceptual project site plan, illustrating primary project features and associated building heights. **Table 1-1** provides a summary overview of the key characteristics of the project facilities.

The proposed roughly circular-shaped event center building would be located in the central-east portion of the site. The event center building would be approximately 135 feet at its roof peak, and would include multiple levels of varying elevations. The event center would be programmed with a capacity of 18,064 seats for basketball games, but could be reconfigured for concerts for a maximum capacity of about 18,500. The performance and seating areas could also be re-configured in a cut-down theater configuration to create a smaller venue space.

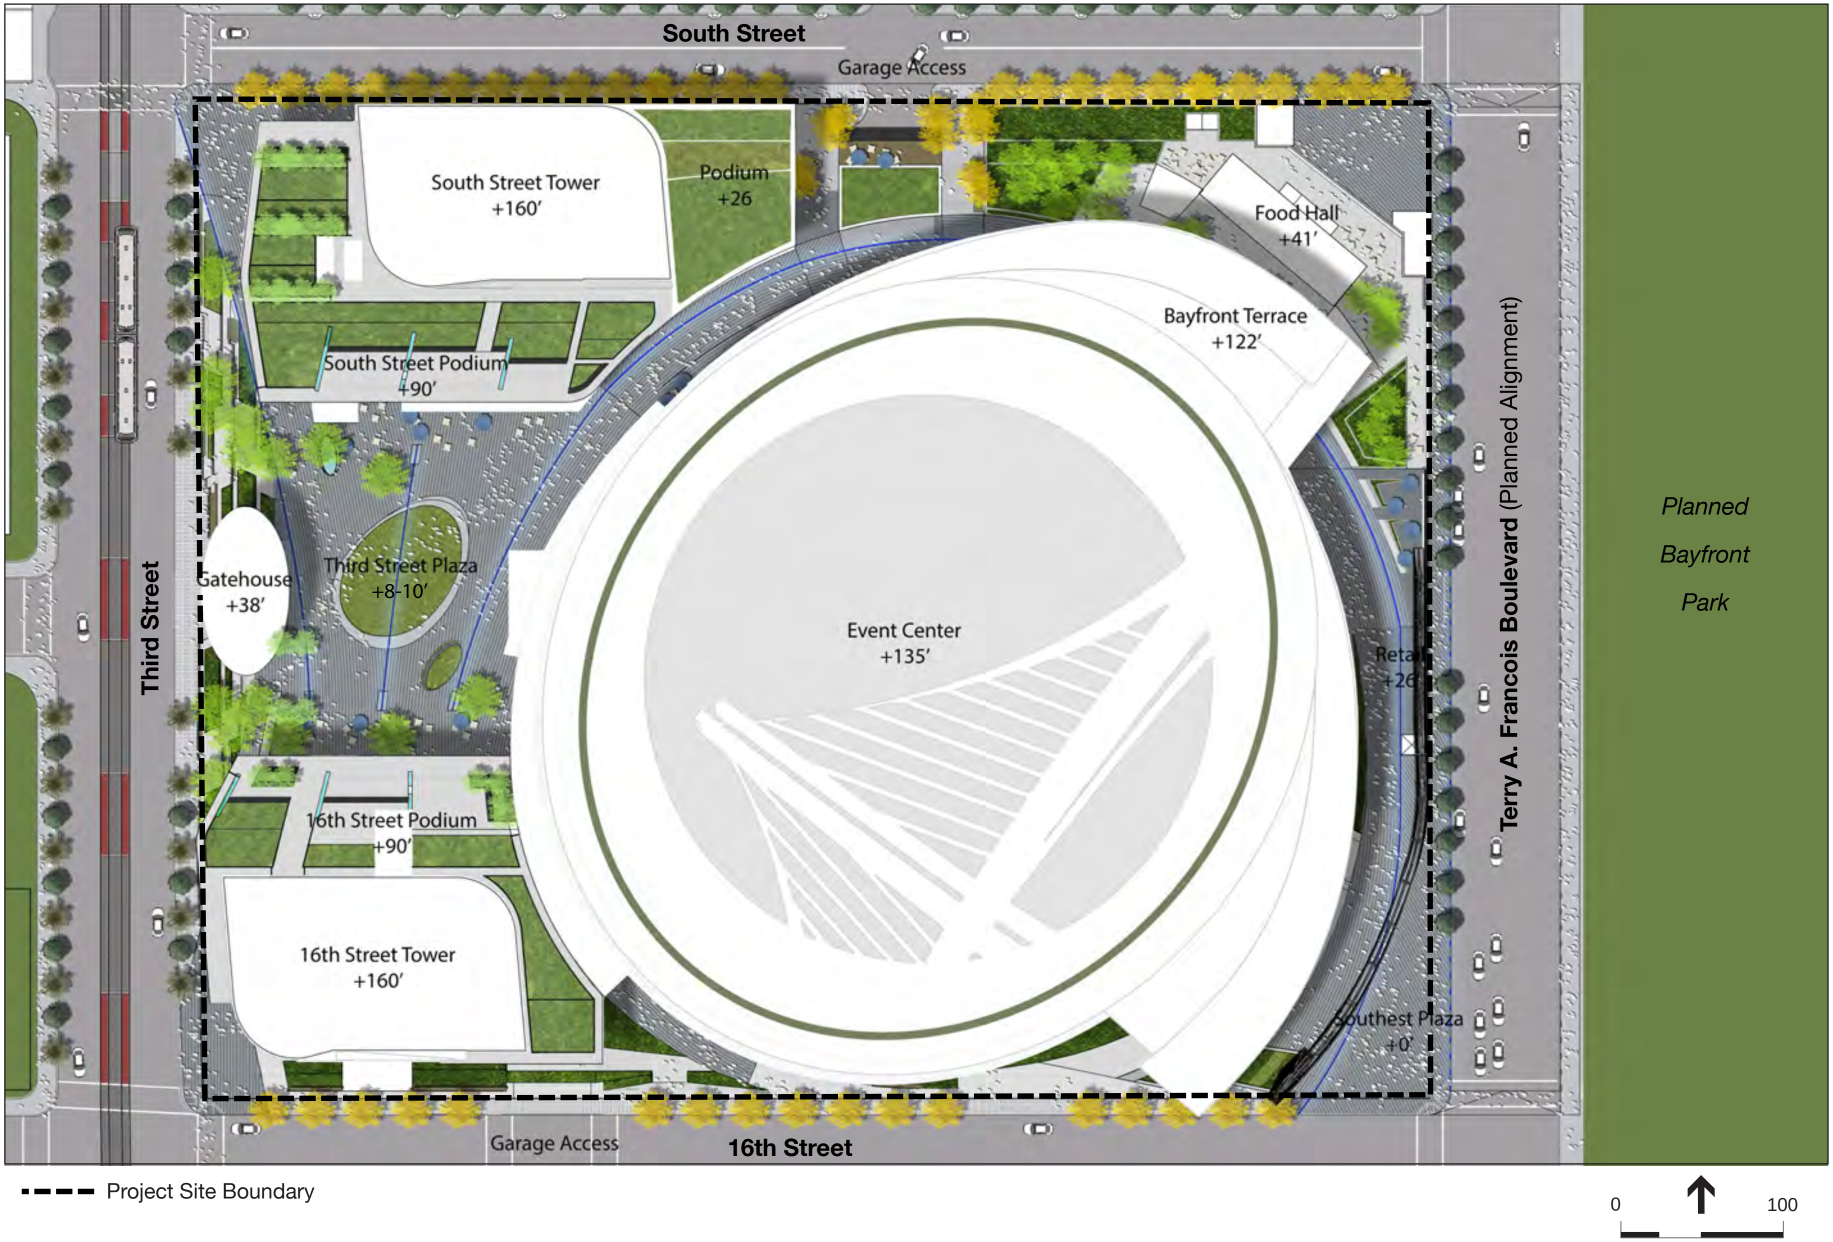
Two office and retail buildings would be located on the west side of the project site. These buildings would each be 11 stories (160 feet tall at building rooftop); each office and retail building would consist of a podium ground level plus 5 podium levels (90 feet tall), with a 5-story (70-foot tall) tower (with smaller floorplate than the podium) above. These buildings could serve a variety of office and/or research and development uses, with retail uses on the lower floor(s).

Additional retail uses would front on South Street and Terry A. Francois Boulevard, and a 2-story, 38-foot high "gatehouse" building located mid-point along Third Street would provide retail uses and house elevators/escalators connecting to parking facilities on lower floors. A 3-story, 41-foot high "food hall" would be located at the corner of Terry A. Francois Boulevard and South Street.

Approximately 3.2 acres of open space would be designed within the site, including a proposed Third Street Plaza (elevated at approximately 8 to 12 feet above Third Street) on the west side of the project site between the event center and Third Street, and a proposed ground-level Southeast Plaza in the southeastern corner of the site.

---

2 AB 900, effective January 1, 2012, provides streamlining benefits under CEQA for privately-financed projects located on an infill site that has been determined to generate thousands of jobs and include state-of-the-art pollution reductions.



SOURCE: Manica Architecture, 2015

Note: All building elevations were estimated per *Mission Bay South Design for Development* guidelines; please see text for additional description.

OCII Case No. ER 2014-919-97; Planning Department Case No. 2014.1441E:
Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 1-3
Conceptual Project Site Plan

TABLE 1-1
SUMMARY OF PROPOSED PROJECT FACILITIES AND DESIGN FEATURES

Project Component	Characteristic
Event Center Basketball Seating Capacity	18,064 seats[a]
Size	Total GSF
Event Center[b]	750,000
Golden State Warriors Office Space	25,000
Office Space	580,000
Retail Space[c]	125,000
Parking and Loading	475,000
Total Building Area	**1,955,000 GSF**[d]
Height[e,f]/Levels	
Event Center	135 feet
Office and Retail Buildings	160 feet (11 stories) total [90-foot (6-story) podiums with 70-foot (5-story) towers above]; retail uses within street level and plaza-level floors
Retail-only Buildings	41 feet in market hall building northeast corner of site; 38 feet in gatehouse building along Third Street
Parking/Loading Spaces	Blocks 29-32: 950 parking stalls below-grade or at-grade (concealed by Third Street Plaza) 13 truck docks below-grade Existing off-site at 450 South Street Parking Garage: 132 parking stalls
Vehicular Access	Access point for autos and all trucks on 16th Street at Illinois Street Access point for autos on South Street at Bridgeview Way
Open Space	3.2 acres

NOTES:

GSF = gross square feet.

a Presented maximum seating capacity is for basketball games. However, as discussed in Chapter 3, Project Description, there would other types of events at the event center, including certain concerts and conventions, that would be able to accommodate a maximum attendance of up approximately 18,500 patrons with the addition of floor seats and/or standing room-only spaces (see Table 3-3 in Chapter 3 for more detail).

b The event center would include a variety of supporting uses, including Golden State Warriors practice facility and management offices, bayfront terrace, retail, and other uses. For purposes of estimating areas, the Golden State Warriors management office space square footage is presented separately from square footage of the other event center uses.

c Proposed retail uses are approximately 51,500 GSF sit-down restaurant, 11,000 quick-service restaurant, and 62,500 GSF soft goods retail including food retail.

d The CEQA analyses are based on gross square footage. However, the Mission Bay South Redevelopment Plan permits development based on adjusted gross square footage and leasable square footage. Gross Square Footage and Leasable Square Footage as defined in the Mission Bay South Redevelopment Plan for this project would be less than the gross square footage presented in this environmental document.

e All building heights in this SEIR, unless otherwise noted, are measured from finished grade to top of building, consistent with the South Design for Development guidelines. Please note the project site would continue to be slightly sloped, as under existing conditions. Per the South Design for Development guidelines, building height measurements are taken at the median grade height for each building face, and the total building height is calculated by averaging the height of the individual building faces.

f Heights of proposed office and retail buildings exclude unoccupied top floor level with mechanical equipment. Mechanical equipment and associated enclosure may be up to 20 feet above the rooftop of building.

SOURCE: Manica Architecture, 2014, 2015

Three levels of enclosed on-site parking (two below grade and one at street level) would be located below the office and retail buildings and plaza areas, with a total of 950 vehicle parking spaces. Thirteen truck loading docks located on the lower parking level would serve the event center and office and retail uses. The project would also include 132 off-site parking spaces at the South Street garage, directly north of the project site, across South Street.

The project would be designed to Leadership in Energy and Environmental Design (LEED®) Gold standards and would incorporate a variety of design features to provide energy and water conservation and efficiency, encourage alternative transportation, promote a healthy indoor environment, minimize waste, and maximize recycling opportunities. The project would also implement a number of off-site roadway network and curb regulations, transit network, pedestrian and bicycle network improvements in the project site vicinity, including roadway restriping, intersection signalization, on-street parking, new perimeter sidewalks, bicycle lanes, signage and other improvements.

1.1.4 Proposed Operations

The event center would serve as the new venue for the Golden State Warriors home games, and provide a year-round venue for a variety of other uses, including concerts, family shows, other sporting events, cultural events, conferences and conventions. The event center would be used for up to approximately 225 events per year, with events ranging in capacity from approximately 3,000 patrons up to about 18,500 patrons. All existing Golden State Warriors operations, including management offices and practice facility, would relocate from their existing facilities in Oakland to the new event center. The proposed office and retail facilities on Blocks 29-32 would operate year-round, independent of the event center operations.

As part of the project, the project sponsor prepared and would implement a Transportation Management Plan (TMP). The TMP is a management and operating plan to facilitate multimodal access at the event center during project operation. The TMP includes various management strategies designed to reduce use of single-occupant vehicles and to increase the use of rideshare, transit, bicycle, and walk modes for trips to and from the project site.

1.1.5 Construction

Construction of the proposed project is anticipated to occur over an approximate 26-month period. Construction activities would include, but not be limited to: site demolition, clearing and excavation; temporary dewatering; pile installation and foundation construction; construction of all proposed development, including event center, podium structure, office towers and plazas; installation of associated utilities; interior finishing; and exterior hardscaping and landscaping improvements.

1.2 Environmental Impacts and Mitigation Measures

The Initial Study determined that the following topics were adequately analyzed in the Mission Bay FSEIR such that the proposed project would have no new significant impacts or no substantially more severe impacts previously found significant on these resources: Land Use; Population and Housing; Cultural and Paleontological Resources; Recreation; Air Quality (odors); Utilities and Services Systems (water supply and solid waste); Public Services (schools, parks, and other services); Biological Resources; Geology and Soils; Hydrology and Water Quality (groundwater, drainage, flooding, and inundation); Hazards and Hazardous Materials; Mineral and Energy Resources; and Agricultural and Forest Resources. Discussion and analysis of these impacts can be found in Appendix NOP-IS.

Impacts related to Aesthetics are not analyzed in the Initial Study or this SEIR because under CEQA (Public Resources Code Section 21099), aesthetics impacts of a mixed-use or employment center project on an infill site located within a transit priority area are not to be considered significant impacts.

Chapter 5 of the SEIR presents detailed discussion and analysis of the following resources: Transportation and Circulation; Noise and Vibration; Air Quality; Greenhouse Gas Emissions; Wind and Shadow; Utilities and Service Systems (wastewater and stormwater); Public Services (police and fire services); and Hydrology and Water Quality (wastewater, stormwater, and flood hazards).

Table 1-2 (at the end of this chapter) summarizes all of the impacts of the proposed project, identifies the significance determination of each impact, and presents the full text of the recommended mitigation measures and improvement measures. Mitigation measures are feasible measures that would avoid, lessen, or reduce significant impacts, and would be required to be implemented if the project is approved. Improvement measures would also lessen or reduce impacts, but unlike mitigation measures, implementation of improvement measures is not required under CEQA because they apply only to impacts determined to be less than significant. However, all improvement measures identified in this SEIR would be incorporated into conditions of approval and therefore would also be required to be implemented if the project is approved. The summary table includes all impacts and mitigation measures applicable to the proposed project, with the SEIR sections presented first, followed by the Initial Study sections.

As indicated on Table 1-2, the SEIR determined that the proposed project would result in significant and unavoidable impacts in the areas of transportation and circulation (traffic impacts at multiple intersections and freeway ramps, and transit demand on regional transit providers exceeding capacity); noise (substantial permanent increase in roadway noise and crowd noise affecting sensitive receptors); air quality (construction and operational emissions of ozone precursors exceeding thresholds), wind (substantial increase in wind hazard hours at off-site public areas); and utilities (construction of new or upgraded wastewater facilities, and determination by the San Francisco Public Utilities Commission that it currently has inadequate capacity to serve the project's wastewater demand).

1.3 Alternatives

An alternatives screening process was conducted to identify a reasonable range of alternatives that would avoid or lessen significant impacts of the proposed project, would meet most of the project objectives, and would be feasible. This process resulted in three alternatives selected for detailed analysis: the No Project Alternative, as required by CEQA; the Reduced Intensity Alternative based on its ability to attain the basic project objectives and its potential ability to avoid or substantially lessen transportation- and construction-related significant impacts; and the Off-site Alternative at Piers 30-32 and Seawall Lot 330 based on its ability to attain the basic project objective and its potential ability to avoid or substantially lessen wastewater capacity impacts, operational noise impacts, UCSF hospital helipad safety impacts, construction-related impacts, and water quality and hazardous materials impacts that were identified for the proposed project. In addition, analysis of a project variant requested by the project sponsor resulted in a fourth alternative, the Third Street Plaza Variant, which would lessen off-site wind hazard impacts of the proposed project. Numerous alternatives, including several off-site alternatives, were considered but eliminated from further consideration for one or more of the following reasons: the alternative would be infeasible, the alternative would result in the same or greater significant impacts than the proposed project, and/or the alternative would not meet most of the project objectives.

1.3.1 No Project Alternative

The No Project Alternative assumes that development at Blocks 29-32 could occur in the foreseeable future within the restrictions and controls established in the Mission Bay South Redevelopment Plan and the South Design for Development, as was envisioned in the Mission Bay FSEIR. While there is currently no such development proposal for Blocks 29-32, a hypothetical scenario was developed for the purposes of this SEIR. Under this scenario, the total mixed-use development would be 1,056,000 gross square feet (gsf) of commercial/ industrial uses, and 31,700 gsf of retail uses, with all buildings a maximum of 90 feet high except for a 160-foot high tower on Block 29, on-site above-grade structure parking with 1,050 stalls, and 132 spaces of off-site parking at the South Street garage. There would be no event center.

Impacts of the No Project alternative would be similar to those of the proposed project with respect to most resource areas. This is because most of these impacts would result from the conversion of a vacant parcel to a fully developed City block, regardless of the size of the development. However, unlike the proposed project which would result in significant and unavoidable air quality and noise impacts, the No Project Alternative would result in less-than-significant effects for the comparable impacts, due in large part to the removal of air pollutant emissions and noise from mobile sources associated with the event center. The No Project Alternative would avoid or substantially lessen a number of the project's significant and unavoidable impacts related to traffic, transit, crowd noise, roadway noise, and emissions of criteria air pollutants during construction and operation. However, the No Project Alternative would fail to meet the basic project objective of building an event center that can be used for NBA basketball games.

1.3.2 Reduced Intensity Alternative

The Reduced Intensity Alternative, developed as a hypothetical scenario for the purposes of this SEIR, would be the same as the proposed project with respect to the event center, but the office uses would be reduced from 580,000 to 373,000 gsf, retail uses would be reduced from 125,000 to 75,000 gsf, and on-site, subgrade parking reduced from 950 to 750 stalls. The total development would be reduced from 1,955,000 to 1,673,000 gsf, or a reduction of 282,000 gsf. In addition, the 16th Street tower would be reduced by seven floors, such that the height of the structure at Third and 16th Streets would be 55 feet instead of 160 feet.

Impacts of this alternative would be similar to those of the proposed project with respect to nearly all resource areas. This is because not only would the Reduced Intensity Alternative result in conversion of a vacant parcel to a fully developed City block, but with the inclusion of the event center, the Reduced Intensity Alternative would not avoid or substantially lessen any of the significant and unavoidable impacts identified for the proposed project. However, the reduced scale of the office and retail development would result in reducing the severity of a broad range of significant impacts. The Reduced Intensity Alternative would result in similar but slightly less severe impacts related to traffic, noise, air quality, and wastewater demand, and this alternative would meet all of the basic project objectives.

1.3.3 Off-site Alternative at Piers 30-32 and Seawall Lot 330

This alternative is based on a previous proposal by the same project sponsor, but was withdrawn and replaced by the currently proposed project. The Off-site Alternative at Piers 30-32 and Seawall Lot 330 would have an event center on Piers 30-32 with the same basketball seating capacity as the currently proposed project (18,064 seats), totaling 694,944 gsf (including the GSW offices), plus an event hall covering 25,946 gsf. Also located on Piers 30-32, this off-site alternative would include about 90,000 gsf of retail/restaurant uses, 13,172 gsf for services, about 252,554 gsf for parking and loading, and 1,820 gsf for Red's Java House, for a total building area of about 1,078,436 gsf. The height of the event center would be 128 feet high, with seven arena levels, height of the retail buildings 32 to 58 feet, with 1 to 3 levels, and the parking would be 31 feet high, with 3 levels. Red's Java House would be relocated from its current location in the northwest corner of Piers 30-32 to near the southwest corner. Other proposed facilities on Piers 30-32 would include a water taxi dock, a dolphin berthing structure, and over 7 acres of public open space on Piers 30-32. There would be 500 parking spaces at Piers 30-32. In addition to the development on Piers 30-32, the Off-site Alternative would include development on Seawall Lot 330, located directly across The Embarcadero from Piers 30-32, and consist of 208,844 gsf residential, 178,406 gsf hotel, 29,854 gsf retail, 106,339 gsf parking, and 11,447 gsf shared support areas. The development would include a four-story building with a 13-story residential tower above it (total height 175 feet) and a seven story hotel tower (total height 105 feet. Construction would require 32 months, compared to 26 months for the proposed project.

The Off-site Alternative would avoid or substantially lessen of the impacts of the proposed project related to roadway noise, criteria air pollutant emissions during project operations, wind hazards at off-site public areas, and wastewater utilities. However, this alternative would have substantially more severe impacts than the proposed project related to construction noise and vibration and exposure of sensitive receptors to health risks. Furthermore, this alternative would result in different significant and unavoidable impacts that would not occur under the proposed project in the areas of transportation (traffic impacts at different intersections and a greater number of intersections) and construction noise (impacts on special-status fish and marine mammals). This alternative would meet most of the basic project objectives.

1.3.4 Third Street Plaza Variant as an Alternative

The Third Street Plaza Variant, described below under Section 1.5, is a minor variation on the proposed project in which the gatehouse and elevated plaza along Third Street would be replaced with a plaza. It would meet all of the project objectives and would have all the same impacts as the proposed project, except that it would avoid the significant and unavoidable wind hazard impact that was identified for the proposed project.

1.3.5 Environmentally Superior Alternative

The Reduced Intensity Alternative would be considered the environmentally superior alternative because it would reduce the severity of adverse environmental effects across a broad range of resources and would not result in any new significant impacts that would not occur under the proposed project.

1.4 Areas of Controversy and Issues to Be Resolved

On November 11, 2014, the OCII issued a NOP of a SEIR on the proposed project. Individuals, groups, and agencies that received these notices included owners of properties within 300 feet of the project site and other potentially interested parties, including various regional, state, and local agencies. A scoping meeting was held on December 9, 2014, to solicit comments on the scope of the SEIR. Based on the comments received during the scoping period for the project, controversial issues for the proposed project, as expressed by community members, include the following:

- Site should be reserved for potential future expansion of the UCSF campus;
- Effect of project construction and operations on UCSF helipad operations;
- Why the project is analyzed under a Subsequent Environmental Impact Report;
- Which City ordinances, regulations, and approval requirements are superseded or otherwise different in the Mission Bay area;
- Aesthetic effects of the proposed development, including views through the project site and view easements, light and glare effects from construction, building lighting, and outdoor events;
- The approach to the transportation impact analysis, reasons for the assumptions incorporated (specifically into mode share), times of day and week studied, and cumulative projects considered;

- Impacts on transportation and circulation (including highways, arterial streets, local streets, pinch points, transit stations and service, and emergency response), as well as mitigation measures—specifically a Transportation Management Plan—that would reduce such impacts;
- Provision of sufficient bicycle and pedestrian circulation facilities and impacts to bicyclists and pedestrians;
- Parking supply and demand under both existing conditions and with the project;
- Financing, monitoring, and responsibility for implementation of mitigation measures;
- Noise from construction, outdoor events, crowds, operational traffic and generators;
- Impact from exposure to air pollutants during construction and operation;
- Effects on nearby infrastructure and facilities, including the Mariposa pump station and Bayfront Park;
- Security and crowd management, provision of public restrooms, provision of trash receptacles, littering, vermin, graffiti, and public intoxication;
- Economic effects of the project on the surrounding neighborhood and City; and
- Cumulative impacts of development of the project combined with development of other projects, and development under other plans, in the vicinity.

1.5 Third Street Plaza Variant

The project sponsor has requested that this SEIR include environmental analysis of a variant to the proposed project. The project variant, the Third Street Plaza Variant, is a minor variation of the proposed project at the same project site at Mission Bay Blocks 29-32, with all of the same objectives, background, and development controls, and with one exception, same approvals as the proposed project. The Third Street Plaza Variant is analyzed in this SEIR at an equal level of detail as the proposed project, and therefore the variant analysis satisfies all CEQA requirements, should this variant be selected for approval.

Under the Third Street Plaza Variant, all aspects of the design, uses, construction, and operation proposed project would be identical to that of the proposed project with one exception: the area of the proposed Third Street Plaza would be modified to be consistent with the design standards of the UCSF view easement on the project site. Consequently, the "gatehouse" building, located mid-block along Third Street under the proposed project, would be relocated and the elevated main plaza would be replaced with an at-grade "event space" with no above-grade structural development. The variant would not require approval by UCSF for termination of their view easement that extends east from Third Street onto the project site.

The Third Street Plaza Variant would have all the same environmental impacts as those identified for the proposed project, with the exception of Wind effects. Unlike the proposed project which would have significant and unavoidable wind hazard impacts at off-site public locations, the Third Street Plaza Variant would have less-than-significant wind hazard impacts.

TABLE 1-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Transportation and Circulation, SEIR Section 5.2		
Construction		
Impact TR-1: The proposed project would not result in construction-related ground transportation impacts because of their temporary and limited duration.	LS	No mitigation required. **Improvement Measure I-TR-1: Construction Management Plan and Public Updates** ***Construction Coordination*** – To reduce potential conflicts between construction activities and pedestrians, bicyclists, transit and vehicles at the project site, the project sponsor shall require that the contractor prepare a Construction Management Plan for the project construction period. The preparation of a Construction Management Plan could be a requirement included in the construction bid package. Prior to finalizing the Plan, the project sponsor/construction contractor(s) shall meet with DPW, SFMTA, the Fire Department, Muni Operations and other City agencies to coordinate feasible measures to include in the Construction Management Plan to reduce traffic congestion, including temporary transit stop relocations and other measures to reduce potential traffic, bicycle, and transit disruption and pedestrian circulation effects during construction of the proposed project. This review should consider other ongoing construction in the project vicinity, such as construction of the nearby UCSF LRDP projects and construction on Blocks 26 and 27. ***Carpool, Bicycle, Walk and Transit Access for Construction Workers*** – To minimize parking demand and vehicle trips associated with construction workers, the construction contractor could include as part of the Construction Management Plan methods to encourage carpooling, bicycle, walk and transit access to the project site by construction workers (such as providing transit subsidies to construction workers, providing secure bicycle parking spaces, participating in free-to-employee ride matching program from www.511.org, participating in emergency ride home program through the City of San Francisco (www.sferh.org), and providing transit information to construction workers. ***Construction Worker Parking Plan*** – As part of the Construction Management Plan that would be developed by the construction contractor, the location of construction worker parking could be identified as well as the person(s) responsible for monitoring the implementation of the proposed parking plan. The use of on-street parking to accommodate construction worker parking could be discouraged. All construction bid documents could include a requirement for the construction contractor to identify the proposed location of construction worker parking. If on-site, the location, number of parking spaces, and area where vehicles would enter and exit the site could be required. If off-site parking is proposed to accommodate construction workers, the location of the off-site facility, number of parking spaces retained, and description of how workers would travel between off-site facility and project site could be required. ***Project Construction Updates for Adjacent Businesses and Residents*** – To minimize construction impacts on access to nearby institutions and businesses, the project sponsor could provide nearby residences and adjacent businesses with regularly-updated information regarding project construction, including construction activities, peak construction vehicle activities (e.g., concrete pours), travel lane closures, and parking lane and sidewalk closures. A regular email notice could be distributed by the project sponsor that would provide current construction information of interest to neighbors, as well as contact information for specific construction inquiries or concerns.

Significance Determinations:
- NI = No Impact
- LS = Less-Than-Significant Impact (no mitigation required)
- LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
- SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
- SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Transportation and Circulation, SEIR Section 5.2 (cont.)		
Conditions Without a SF Giants Game at AT&T Park (Impacts TR-2 through TR-10)		
Impact TR-2: The proposed project would result in significant traffic impacts at multiple intersections that would operate at LOS E or LOS F under Existing plus Project conditions without a SF Giants game at AT&T Park.	SUM	**Mitigation Measure M-TR-2a: Additional PCOs during Events** As a mitigation measure to manage traffic flows and minimize congestion associated with events at the project site, the proposed project's TMP shall be modified to include four additional PCOs that shall be deployed to intersections where the proposed project would result in significant impacts, as conditions warrant during events. These could include the intersections of King/Fourth, Fifth/Harrison/I-80 westbound off-ramp, Fifth/Bryant/I-80 eastbound on-ramp, Seventh/Mission Bay Drive, and Seventh/Mississippi/16th. The PCO Supervisor shall make the determination where the additional PCOs would be located, based on field conditions during an event. **Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts** The project sponsor shall work with the City to pursue and implement, if feasible, additional strategies to reduce transportation impacts. In addition, the City shall pursue and implement, if feasible, additional strategies that could be implemented by the City or other public agency (e.g., Caltrans). These strategies could include the following: ***Strategies to Reduce Traffic Congestion*** • The City to work with Caltrans to install changeable message signs upstream of key entry points onto the street network, such as on I-280 northbound. • The City to provide coordinated outreach efforts to surrounding neighborhoods to explore the need/desire for new on-street parking management strategies, which could include implementation of time limits and Residential Parking Permit program areas. • The project sponsor to offer for pre-purchase substantially all available on-site parking spaces not otherwise committed to office tenants, retail customers or season ticket holders, and to cooperate with neighboring private garage operators to pre-sell parking spaces, as well as notify patrons in advance that nearby parking resources are limited and travel by non-auto modes is encouraged. • The project sponsor to create a smart phone application, or integrate into an existing smart phone application, transportation information that promotes transit first, allows for pre-purchase of parking and designates suggested paths of travel that best avoid congested areas or residential streets such as Bridgeview north of Mission Bay Boulevard and Fourth Street. • The City and the project sponsor to work to identify off-site parking lot(s) in the vicinity of the event center, if available, where livery and TNC vehicles could stage prior to the end of an event.

Significance Determinations:
NI = No Impact
LS = Less-Than-Significant Impact (no mitigation required)
LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Transportation and Circulation, SEIR Section 5.2 (cont.)		
Conditions Without a SF Giants Game at AT&T Park (Impacts TR-2 through TR-10) (cont.)		
Impact TR-2 (cont.)		• The City to include on-street parking spaces within Mission Bay in the expansion and permanent implementation of SF*park*, including installation of sensors, dynamic pricing, and smart phone application providing real-time parking availability and cost. • The City shall work to include the publicly accessible off-street facilities into the permanent implementation of SF*park*, and incorporate data into a smart phone application and permanent dynamic message signs. • If necessary to support achievement of non-auto mode shares for the project, the project sponsor shall cooperate with future City efforts for active interventions to effectively manage and price the parking supply in the project vicinity to reduce travel by automobile, thus improving traffic conditions. • The project sponsor to seek partnerships with car-sharing services. ***Strategy to Enhance Non-auto Modes*** • The project sponsor to provide a promotional incentive (e.g., show Clipper card or bike valet ticket for concession savings, chance to win merchandise or experience, etc.) for public transit use and/or bicycle valet use at the event center. ***Strategies to Enhance Transportation Conditions in Mission Bay and Nearby Neighborhoods*** • The project sponsor to participate as a member of the Mission Bay Ballpark Transportation Coordination Committee (MBBTCC) and to notify at least one month prior to the start of any non-GSW event with at least 12,500 expected attendees. If commercially reasonable circumstances prevent such advance notification, the GSW shall notify the MBBTCC within 72 hours of booking. • The City and the project sponsor to meet to discuss transportation and scheduling logistics following signing any marquee events (national tournaments or championships, political conventions, or tenants interested in additional season runs: NHL, NCAA, etc.). ***Strategies to Increase Transit Access*** • The City to coordinate with regional providers to encourage increased special event service, particularly longer BART and Caltrain trains, and increased ferry and bus service. • The City to work in good faith with the Water Emergency Transportation Agency, the project sponsor, UCSF, and other interested parties to explore the possibility of construction of a ferry landing at the terminus of 16th Street, and provision of ferry service during events.

Significance Determinations:
NI = No Impact
LS = Less-Than-Significant Impact (no mitigation required)
LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Transportation and Circulation, SEIR Section 5.2 (cont.)		
Conditions Without a SF Giants Game at AT&T Park (Impacts TR-2 through TR-10) (cont.)		
Impact TR-2 (cont.)		**Mission Bay FSEIR Mitigation Measure E.47: Transportation System Management Plan** Prepare a TSM Plan, which could include the following: *FSEIR Mitigation Measure E.47.a*: Shuttle Bus - Operate shuttle bus service between Mission Bay and regional transit stops in San Francisco (e.g., BART, Caltrain, Ferry Terminal, Transbay Transit Terminal), and specific gathering points in major San Francisco neighborhoods (e.g., Richmond and Mission Districts). *FSEIR Mitigation Measure E.47.b*: Transit Pass Sales - Sell transit passes in neighborhood retail stores and commercial buildings in the Project Area. *FSEIR Mitigation Measure E.47.c*: Employee Transit Subsidies - Provide a system of employee transportation subsidies for major employers. *FSEIR Mitigation Measure E.47.e*: Secure Bicycle Parking - Provide secure bicycle parking area in parking garages of residential buildings, office buildings, and research and development facilities. Provide secure bicycle parking areas by 1) constructing secure bicycle parking at a ratio of 1 bicycle parking space for each 20 automobile parking spaces, and 2) carry out an annual survey program during project development to establish trends in bicycle use and to estimate actual demand for secure bicycle parking and for sidewalk bicycle racks, increasing the number of secure bicycle parking spaces or racks either in new buildings or in existing automobile parking facilities to meet the estimated demand. Provide secure bicycle racks throughout Mission Bay for the use of visitors. *FSEIR Mitigation Measure E.47.f*: Appropriate Street Lighting - Ensure that streets and sidewalks in Mission Bay are sufficiently lit to provide pedestrians and bicyclists with a greater sense of safety, and thereby encourage Mission Bay employees, visitors and residents to walk and bicycle to and from Mission Bay. *FSEIR Mitigation Measure E.47.g*: Transit and Pedestrian and Bicycle Route Information - Provide maps of the local and citywide pedestrian and bicycle routes with transit maps and information on kiosks throughout the Project Area to promote multi-modal travel. *FSEIR Mitigation Measure E.47.h*: Parking Management Strategies - Establish parking management guidelines for the private operators of parking facilities in the Project Area. *FSEIR Mitigation Measure E.47i*: Flexible Work Hours/Telecommuting - Where feasible, offer employees in the Project Area the opportunity to work on flexible schedules and/or telecommute so they could avoid peak hour traffic conditions.

Significance Determinations:
- NI = No Impact
- LS = Less-Than-Significant Impact (no mitigation required)
- LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
- SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
- SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Transportation and Circulation, SEIR Section 5.2 (cont.)		
Conditions Without a SF Giants Game at AT&T Park (Impacts TR-2 through TR-10) (cont.)		
Impact TR-2 (cont.)		*FSEIR Mitigation Measure E.49*: Ferry Service - Make a good faith effort to assist the Port of San Francisco and others in ongoing studies of the feasibility of expanding regional ferry service. Make good faith efforts to assist in implementing feasible study recommendations.
Impact TR-3: The proposed project would result in significant traffic impacts at freeway ramps that would operate at LOS E or LOS F under Existing plus Project conditions without a SF Giants game at AT&T Park.	SUM	**Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts** (see Impact TR-2, above)
Impact TR-4: The proposed project would not result in a substantial increase in transit demand that could not be accommodated by adjacent Muni transit capacity such that significant adverse impacts to Muni transit service would occur under Existing plus Project conditions without a SF Giants game at AT&T Park.	LS	No mitigation required. **Improvement Measure I-TR-4: Operational Study of the Southbound Platform at the T Third UCSF/Mission Bay Station** As an improvement measure to enhance T Third operations at the UCSF/Mission Bay station for pre-event arrivals, the project sponsor shall fund a study of the effects of pedestrian flows on Muni's safety and operations prior to an event as well as the feasibility and efficacy of enlarging the southbound platform by extending it south towards 16th Street. The study shall include an assessment of exiting pedestrian flows from a fully occupied two-car light rail train on the platform and ramp to the crosswalk at South Street across Third Street, also taking into consideration the presence of non-event transit riders waiting to board the train, service frequency, and current traffic signal operations. The study shall be performed by a qualified transportation professional approved by SFMTA.
Impact TR-5: The proposed project would result in a substantial increase in transit demand that could not be accommodated by regional transit capacity such that significant adverse impacts to regional transit service would occur under Existing plus Project conditions without a SF Giants game at AT&T Park.	SUM	**Mitigation Measure M-TR-5a: Additional Caltrain Service** As a mitigation measure to accommodate transit demand to and from the South Bay for weekday and weekend evening events, the project sponsor shall work with the Ballpark/Mission Bay Transportation Coordinating Committee to coordinate with Caltrain to provide additional Caltrain service to and from San Francisco on weekdays and weekends. The need for additional service shall be based on surveys of event center attendees conducted as part of the TMP.

Significance Determinations:
- NI = No Impact
- LS = Less-Than-Significant Impact (no mitigation required)
- LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
- SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
- SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Transportation and Circulation, SEIR Section 5.2 (cont.)		
Conditions Without a SF Giants Game at AT&T Park (Impacts TR-2 through TR-10) (cont.)		
Impact TR-5 (cont.)		**Mitigation Measure M-TR-5b: Additional North Bay Ferry and/or Bus Service** As a mitigation measure to accommodate transit demand to the North Bay following weekday and weekend evening events, the project sponsor shall work with the Ballpark/Mission Bay Transportation Coordinating Committee to coordinate with Golden Gate Transit and WETA to provide additional ferry and/or bus service from San Francisco following weekday and weekend evening events. The need for additional service shall be based on surveys of event center attendees conducted as part of the TMP.
Impact TR-6: The proposed project could result in a substantial overcrowding on public sidewalks, or create potentially hazardous conditions for pedestrians, or otherwise interfere with pedestrian accessibility on the site and adjoining areas under Existing plus Project conditions without a SF Giants game at AT&T Park.	LSM	**Mitigation Measure M-TR-6: Active Management of Pedestrian Flows at the Intersection of Third/South** As a mitigation measure to accommodate pedestrians traveling to and from the event center through the intersection of Third/South, PCOs stationed at this location shall implement strategies to allow pedestrians to cross the street safely. The strategies and level of active management shall be tailored to the event size, and could include extending the green time for pedestrians crossing the street, manually overriding the traffic signal and directing pedestrians to cross, erecting temporary pedestrian crossing barriers, allowing use of the closed Third Street as a pedestrian access route, providing a defined passenger waiting area within the closed Third Street, shielding passengers waiting to board light rail from adjacent pedestrian traffic, and deploying additional PCOs to this intersection.
Impact TR-7: The proposed project would not result in potentially hazardous conditions for bicyclists, or otherwise substantially interfere with bicycle accessibility to the site and adjoining areas under Existing plus Project conditions without a SF Giants game at AT&T Park.	LS	No mitigation required.
Impact TR-8: The proposed project's loading demand would be accommodated within the proposed on-site loading facilities or proposed adjacent on-street commercial loading spaces, and would not create potentially hazardous conditions or significant delays for traffic, transit, bicyclists, or pedestrians under Existing plus Project conditions.	LS	No mitigation required. **Improvement Measure I-TR-8: Truck and Service Vehicle Loading Operations Plan** As an improvement measure to reduce potential conflicts between driveway operations, including loading activities, and pedestrians, bicycles and vehicles on South Street, Terry A. Francois Boulevard, and 16th Street, the project sponsor shall prepare a Loading Operations Plan, and submit the plan for review and approval by the OCII, or its designee, and the SFMTA. As appropriate, the Loading Operations Plan shall be periodically reviewed by the sponsor, the OCII or its designee, and SFMTA and revised if feasible to more appropriately respond to changes in street or circulation conditions.

Significance Determinations:
- NI = No Impact
- LS = Less-Than-Significant Impact (no mitigation required)
- LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
- SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
- SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Transportation and Circulation, SEIR Section 5.2 (cont.)		
Conditions Without a SF Giants Game at AT&T Park (Impacts TR-2 through TR-10) (cont.)		
Impact TR-8 (cont.)		The Loading Operations Plan shall include a set of guideline related to the operation of the on-site and on-street loading facilities, as well as large truck curbside access guidelines; it shall also specify driveway attendant responsibilities to minimize truck queuing and/or substantial conflicts between project-generated loading/unloading activities and pedestrians, bicyclists, transit and autos. Elements of the Loading Operations Plan shall include: • Commercial loading activities within on-street commercial loading spaces on South Street, Terry A. Francois Boulevard, and 16th Street should comply with all posted time limits and all other posted restrictions. • Double parking or any form of illegal parking or truck loading/unloading should not be permitted on any streets adjacent to the project site, and particularly on 16th Street which would include a bicycle lane. Working with the SFMTA Parking Control Officers, building management should ensure that no truck loading/unloading activities occur within the bicycle lanes on 16th Street. • All move-in and move-out activities for commercial office uses should be coordinated by building management, and, in the event that moving trucks cannot be accommodated within the below-grade loading area, building management should obtain a reserved curbside permit from the SFMTA in advance of move-in or move-out activities.
Impact TR-9a: Construction of the proposed project could temporarily obstruct UCSF helipad airspace surfaces.	LSM	**Mitigation Measure M-TR-9a: Crane Safety Plan for Project Construction** Prior to construction, the project construction contractor shall develop a crane safety plan for the project construction cranes that would be implemented during the construction period. The crane safety plan shall identify appropriate measures to reduce, and where possible, avoid, potential conflicts that may be associated with the operation of the construction cranes in the vicinity of the UCSF Benioff Children's Hospital helipad airspace. These safety protocols shall be developed in consultation and coordination with OCII (or its designated representative) and UCSF, and the crane safety plan shall be subject to approval by OCII or its designated representative. The crane safety plan may include, but not limited to the following measures: • Convey project crane activity schedule to UCSF and OCII • If other projects on adjacent properties are under construction concurrent with the proposed project and are using tower cranes, the project sponsor shall participate in joint coordination with those project sponsors and OCII or its designated representative to ensure any potential cumulative construction crane effects on the UCSF helipad would be minimized • use appropriate markings, flags, and/or obstruction lighting on all project construction cranes working in proximity to the helipad's airspace surfaces • light all construction crane structures at night (e.g., towers, arms, and suspension rods) to enhance a pilot's ability to discern the location and height of the cranes

Significance Determinations:
NI = No Impact
LS = Less-Than-Significant Impact (no mitigation required)
LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Transportation and Circulation, SEIR Section 5.2 (cont.)		
Conditions Without a SF Giants Game at AT&T Park (Impacts TR-2 through TR-10) (cont.)		
Impact TR-9a (cont.)		• inform crane operators of the location and elevation of the hospital helipad's Part 77 airspace surfaces and the need to minimize penetrations to the surfaces • use construction methods that minimize the duration of Part 77 airspace surface penetrations that may occur • to the extent possible, rotate crane arms away from the UCSF helipad's Part 77 airspace surfaces at night and when not in use • Issue a Notice to Airmen (NOTAM) to advise pilots in the area of the presence of construction cranes at the project site.
Impact TR-9b: Project construction lighting would not adversely affect UCSF helipad flight operations.	LS	No mitigation required.
Impact TR-9c: Development of the proposed project would not obstruct UCSF helipad airspace surfaces.	LS	No mitigation required.
Impact TR-9d: Certain project specialized exterior lighting could adversely affect UCSF helipad flight operations.	LSM	**Mitigation Measure M-TR-9d: Event Center Exterior Lighting Plan** The project sponsor shall develop an exterior lighting plan that incorporates measures to ensure specialized exterior lighting systems would not have an undue impact on helipad operations. Feasible measures shall be developed in consultation and coordination with SFO staff knowledgeable of the effects of lighting on pilots and safe air navigation, and OCII (or its designated representative), and the exterior lighting plan shall be subject to approval by OCII or its designated representative. Measures may include, but not be limited to the following: • prohibit the use of high-intensity lights that are directed towards the UCSF helipad • prohibit the use of high-intensity outdoor flashing lights or strobe lights in proximity to the hospital helipad's three approaches • prohibit the use of outdoor lasers directed upward, and laser light shows that have not been subject to prior review by OCII in consultation with SFO staff knowledgeable of the effects of lighting on pilots and safe air navigation and, if necessary the FAA • locate primary outdoor lighted displays and television/lighted screens away from the project property line at 16th Street, South Street, or Third Street, where feasible • advance notification and coordination of planned special event lighting with OCII and UCSF representatives • develop exterior specialized lighting guidelines and ensure event organizers are informed of the hospital helipad, its approaches, and safety concerns related to outdoor nuisance lighting

Significance Determinations:
NI = No Impact
LS = Less-Than-Significant Impact (no mitigation required)
LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Transportation and Circulation, SEIR Section 5.2 (cont.)		
Conditions Without a SF Giants Game at AT&T Park (Impacts TR-2 through TR-10) (cont.)		
Impact TR-10: The proposed project would not result in significant impacts on emergency vehicle access under Existing plus Project conditions without a SF Giants game at AT&T Park.	LS	No mitigation required. **Improvement Measure I-TR-10a**: **UCSF Emergency Vehicle Access and Garage Signage Plan** As an improvement measure to enhance access for emergency vehicles and other visitors to the UCSF Children's Hospital emergency room and parking facilities at the UCSF Medical Center, the project sponsor shall work with UCSF to develop and implement a UCSF emergency vehicle access and garage signage plan for I-280 and Mariposa, Owens, and 16th Streets to reflect desirable access routes for UCSF and event center access. **Improvement Measure I-TR-10b: Mariposa Street Restriping Study** As an improvement measure to enhance access to the UCSF Medical Center Children's Hospital, the project sponsor shall retain a qualified transportation professional approved by SMTA to conduct a traffic engineering study to evaluate potential changes to the travel lane configuration and related signage on Mariposa Street between the I-280 ramps and Fourth Street. The study, to be conducted in coordination with UCSF and SFMTA, would determine if the eastbound left turn lane into Fourth Street/UCSF passenger loading/unloading and emergency vehicle entrance to the UCSF Children's Hospital could be extended west from its existing length of about 150 feet to provide for additional queuing area.
Conditions With a SF Giants Evening Game at AT&T Park (Impacts TR-11 to TR-17)		
Impact TR-11: The proposed project would result in significant traffic impacts at multiple intersections that would operate at LOS E or LOS F under Existing plus Project conditions with an overlapping SF Giants evening game at AT&T Park.	SUM	**Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts** (see Impact TR-2, above) **Mitigation Measure M-TR-11a: Additional PCOs during Overlapping Events** As a mitigation measure to manage traffic flows and minimize congestion associated with overlapping events, the proposed project's TMP shall be expanded to include additional PCOs that shall be deployed to the following intersections where the proposed project would result in significant traffic impacts, as conditions warrant during events: King/Fifth/I-280 ramps, Fifth/Harrison/I-80 westbound off-ramp, Fifth/Bryant/I-80 eastbound on-ramp, Seventh/Mission Bay Drive, Fourth/16th, and Seventh/Mississippi/16th. The PCO Supervisor shall make the determination where the additional PCOs would be located, based on field conditions during an event. This measure shall be implemented in coordination with Mitigation Measure M-TR-2a: Additional PCOs during Events. **Mitigation Measure M-TR-11b: Participation in the Ballpark/Mission Bay Transportation Coordinating Committee** As a mitigation measure to optimize effectiveness of the transportation management strategies for day-to-day operations and events in the Mission Bay area, at AT&T Park, UCSF Mission Bay campus, and the proposed project, the project sponsor shall actively participate as a member of the Ballpark/Mission Bay Transportation Coordinating Committee in order to evaluate and

Significance Determinations:
NI = No Impact
LS = Less-Than-Significant Impact (no mitigation required)
LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Transportation and Circulation, SEIR Section 5.2 (cont.)		
Conditions With a SF Giants Evening Game at AT&T Park (Impacts TR-11 to TR-17) (cont.)		
Impact TR-11 (cont.)		plan for operations of all three facilities (i.e., AT&T Park, UCSF Mission Bay Campus, and the proposed event center). This committee would, among other roles, serve as a single point for coordination of transportation management strategies. The Transportation Coordinating Committee shall consult on changes to and expansion of transit services, and for developing and implementing strategies within their purview that address transportation issues and conflicts as they arise. In addition, the committee shall serve as a liaison for operation of the facilities, monitoring conditions, and addressing community issues related to events and the project sponsor shall make good faith efforts to notify the committee regarding events. **Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events** The project sponsor shall work with the City to pursue and implement, if feasible, additional strategies to reduce transportation impacts associated with overlapping events at AT&T Park and the proposed event center. These strategies could include the following: • The project sponsor shall exercise commercially reasonable efforts to avoid scheduling non-Golden State Warriors events of 12,500 or more event center attendees that start within 60 minutes of the start (respectively) of events at AT&T Park. • When overlapping non-Golden State Warriors events of 12,500 or more event center attendees and evening SF Giants games cannot be avoided through commercially reasonable efforts, the project sponsor shall negotiate with the event promoter as feasible to stagger start times such that the event headliner starts no earlier than 8:30 p.m. • The City shall identify one or more off-site parking lot(s) on Port of San Francisco or other lands to the south of the event center to provide approximately 250 additional parking spaces for all events and up to approximately 750 additional parking spaces for use during dual events of 12,500 or more event center attendees (for a total of approximately 1,000 additional off-site parking spaces). The project sponsor shall: (1) acquire sufficient rights for the use of such parking lot(s) through lease, purchase, or other means as necessary; (2) pay its fare-share contribution towards any improvements required for the use of such parking lot(s), including but not limited to grading, paving, striping, fencing, lighting, drainage, stormwater pollution prevention measures, curb cuts, and ramps; and (3) provide free shuttles to the event center from such off-site parking lot(s) that are more than ¼-mile from the event center on a maximum 10-minute headway before and after events.
Impact TR-12: The proposed project would result in significant traffic impacts at freeway ramps that would operate at LOS E or LOS F under Existing plus Project conditions with an overlapping SF Giants evening game at AT&T Park.	SUM	**Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts** (see Impact TR-2, above) **Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events** (see Impact TR-11, above)

Significance Determinations:
NI = No Impact
LS = Less-Than-Significant Impact (no mitigation required)
LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Transportation and Circulation, SEIR Section 5.2 (cont.)		
Conditions With a SF Giants Evening Game at AT&T Park (Impacts TR-11 to TR-17) (cont.)		
Impact TR-13: The proposed project could result in a substantial increase in transit demand that could not be accommodated by adjacent Muni transit capacity such that significant adverse impacts to Muni transit service would occur under Existing plus Project conditions with an overlapping SF Giants evening game at AT&T Park.	LSM	**Mitigation Measure M-TR-13: Additional Muni Transit Service during Overlapping Events** As a mitigation measure to accommodate Muni transit demand to and from the project site and AT&T Park on the T Third light rail line during overlapping evening events, the project sponsor shall work with the Ballpark/Mission Bay Transportation Coordinating Committee to coordinate with the SFMTA to provide additional Muni light rail service and/or shuttle buses between key Market Street locations and the project. Examples of the additional service include Muni bus shuttles between Union Square and/or Montgomery BART/Muni station and the project site. The need for additional Muni service shall be based on characteristics of the overlapping events (e.g., projected attendance levels, and anticipated start and end times).
Impact TR-14: The proposed project would result in a substantial increase in transit demand that could not be accommodated by regional transit such that significant adverse impacts to regional transit service would occur under Existing plus Project conditions with an overlapping SF Giants evening game at AT&T Park.	SUM	**Mitigation Measure M-TR-5a: Additional Caltrain Service during Events** (see Impact TR-5, above) **Mitigation Measure M-TR-5b: Additional North Bay Bus and Ferry Service during Events** (see Impact TR-5, above) **Mitigation Measure M-TR-14: Additional BART Service to the East Bay during Overlapping Events** As a mitigation measure to accommodate transit demand to the East Bay following weekday and weekend evening events, the project sponsor shall work with the Ballpark/Mission Bay Transportation Coordinating Committee to coordinate with BART to provide additional service from San Francisco following weekday and weekend evening events. The additional East Bay BART service could be provided by operating longer trains. The need for additional BART service shall be based on characteristics of the overlapping events (e.g., event type, projected attendance levels, and anticipated start and end times).
Impact TR-15: The proposed project could result in a substantial overcrowding on public sidewalks, or create potentially hazardous conditions for pedestrians, or otherwise interfere with pedestrian accessibility on the site and adjoining areas under Existing plus Project conditions with an overlapping SF Giants evening game at AT&T Park.	LSM	**Mitigation Measure M-TR-6: Active Management of Pedestrian Flows at the Intersection of Third/South** (See Impact TR-6, above)

Significance Determinations:
- NI = No Impact
- LS = Less-Than-Significant Impact (no mitigation required)

SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Transportation and Circulation, SEIR Section 5.2 (cont.)		
Conditions With a SF Giants Evening Game at AT&T Park (Impacts TR-11 to TR-17) (cont.)		
Impact TR-16: The proposed project would not result in potentially hazardous conditions for bicyclists, or otherwise substantially interfere with bicycle accessibility to the site and adjoining areas under Existing plus Project conditions with an overlapping SF Giants evening game at AT&T Park.	LS	No mitigation required.
Impact TR-17: The proposed project would not result in significant impacts on emergency vehicle access under Existing plus Project conditions with an overlapping SF Giants evening game at AT&T Park.	LS	No mitigation required. **Improvement Measure I-TR-10a: UCSF Emergency Vehicle Access and Garage Signage Plan** (see Impact TR-10, above) **Improvement Measure I-TR-10b: Mariposa Street Restriping** (see Impact TR-10, above)
Conditions Without Implementation of the Muni Special Events Transit Service Plan		
Impact TR-18: Without implementation of the Muni Special Event Transit Service Plan, the proposed project would result in additional significant traffic impacts at intersections that would operate at LOS E or LOS F under Existing plus Project conditions.	SUM	**Mitigation Measure M-TR-2a: Additional PCOs during Events** (see Impact TR-2, above) **Mitigation Measure M-TR-2b: Additional Measures to Reduce Transportation Impacts** (see Impact TR-2, above) **Mitigation Measure M-TR-18: Auto Mode Share Performance Standard and Monitoring** *Performance Standards and Strategies for Achieving Them* The project sponsor shall be responsible for implementing TDM measures intended to reach an auto mode share performance standard for different types of events. Specifically, the project sponsor shall work to achieve the following performance standards: 1. For weekday events that have 12,500 or more attendees, the project shall not exceed an arrival auto mode share of 53 percent. 2. For weekend events that have 12,500 or more attendees, the project shall not exceed an arrival auto mode share of 59 percent.

Significance Determinations:
- NI = No Impact
- LS = Less-Than-Significant Impact (no mitigation required)
- LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
- SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
- SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Transportation and Circulation, SEIR Section 5.2 (cont.)		
Conditions without Implementation of the Muni Special Event Transit Service Plan (cont.)		
Impact TR-18 (cont.)		The performance standards shall be achieved by the middle of the Golden State Warriors' third season at the event center, and for every Golden State Warriors season thereafter. The project sponsor may implement any combination of TDM strategies, including those identified in the proposed project's TMP, to achieve the above performance standards. Potential strategies include, but are not limited to: • Providing shuttle bus service between major transportation hubs such as Transbay Transit Terminal, BART stations, Caltrain stations and the event center. • Providing bus shuttles between park & ride lots, remote parking facilities, or other facilities or locations within San Francisco, and the event center. • Facilitating charter bus packages through the event sales department to encourage large groups to travel to and from the event center on charter buses. • Reducing the project parking demand through a variety of mechanisms, including pricing. • Offering high occupancy vehicle parking at more convenient locations than parking for the general public and/or at reduced rates. • Undertaking media campaigns, including in social media, that promote walking and/or bicycling to the event center. • Conducting cross-marketing strategies with event center businesses (e.g., 10 percent off merchandise/food if patrons arrive by transit and/or bike or on foot). • Carrying out public education campaigns. • Offering special event ferry service to the closest ferry station to the project site (similar to the existing service provided between AT&T Park and Alameda and Marin Counties by Golden Gate Transit, Alameda/Oakland and Vallejo ferry service). • Providing incentive for arrivals by bike. • Providing transit fare incentives to event ticket holders.

Significance Determinations:
NI = No Impact
LS = Less-Than-Significant Impact (no mitigation required)
LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Transportation and Circulation, SEIR Section 5.2 (cont.)		
Conditions without Implementation of the Muni Special Event Transit Service Plan (cont.)		
Impact TR-18 (cont.)		***Monitoring and Reporting*** The project sponsor shall retain a qualified transportation professional[1] to conduct travel surveys, as outlined below, and to document the results in a *Transportation Demand Management Report*. Prior to beginning the travel survey, the transportation professional shall develop the data collection methodology in consultation with and approved by OCII (or its designated representative such as the Environmental Review Officer (ERO)) and in consultation with SFMTA. It is anticipated that data collection would occur at least during four days for two different types of events, for a total of eight days. Specifically, data collection shall be conducted during at least two weekday and two weekend NBA basketball games with 12,500 or more attendees, and two weekday and two weekend non-basketball events with attendance of 12,500 or more attendees. The schedule of the travel surveys shall be as follows: • Comprehensive travel surveys of basketball game attendees shall be conducted between December and April of every season. • Comprehensive travel surveys of non-basketball event attendees (conventions events, concerts, family shows, etc.) could be collected any time during the year. The following data of event attendees shall be collected as part of the travel surveys: • Origin/destination of the trip (city, zip code, home/work/other) • Mode of travel to/from event center – If by transit, list mode and name of transit operator (AC Transit, BART, Caltrain, Muni, etc.) – If by rail, name of station trip started and ended – If by auto, number of people in the vehicle – If by auto, parking location and approximate walking time to event center – If by auto, ask if following trips would continue as auto, or if anticipate a mode shift. – If by bicycle or walking, name the origin of the trip. If a transfer from regional transit, name the origin and operator. – If by bike share, name the origin (i.e., the pick up location) of the trip. Note if trip is a "last mile" connection from regional transit, and include the origin and operator.

[1] The Transportation Demand Management Report shall be performed by a qualified transportation professional from the Planning Department's *Transportation Consultant Pool.*

Significance Determinations:
- NI = No Impact
- LS = Less-Than-Significant Impact (no mitigation required)
- LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
- SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
- SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Transportation and Circulation, SEIR Section 5.2 (cont.)		
Conditions without Implementation of the Muni Special Event Transit Service Plan (cont.)		
Impact TR-18 (cont.)		• Arrival and departure times at the event center The travel survey shall employ whatever methodology necessary, as approved by the OCII (or the ERO) in consultation with SFMTA, to collect the above described data including but not limited to: manual or automatic (e.g., video or tubes) traffic volume counts, intercept surveys, smart phone application-based surveys, and on-line surveys. The *Transportation Demand Management Report(s)* shall be submitted to OCII, or its designee, for review within 30 days of completion of the data collection. If the City finds that the project exceeds the stated mode share performance standard, the project sponsor shall revise the proposed project's Transportation Management Plan (TMP) to incorporate a set of measures that would lower the auto mode share. For basketball events, the TMP shall be revised by no later than August 15th of the calendar year to ensure adequate lead time to implement TDM measures prior to the start of the following basketball season. For non-basketball events, the proposed project's TMP shall be revised within 90 days of submittal of the *Transportation Demand Management Report* to incorporate a set of measure that would lower the auto mode share. If the project does not meet the stated performance standard, the project sponsor shall implement TDM measures and collect data on a semi-annual basis (i.e., twice during a calendar year) to assess their effectiveness for basketball games and other events. The implementation of TDM measures shall be intensified until the auto mode split performance standard is achieved. Upon achievement of the performance standard, the project sponsor may resume travel survey data collection for basketball and non-basketball events on an annual basis. If the sponsor demonstrates three consecutive years of meeting the auto mode share performance standard, the comprehensive data collection effort may occur every two years. The data collection plan described above may be modified by OCII (or the ERO) in coordination with SFMTA if field observations and/or other circumstances require data collection at different times and/or for different events than specified above. The modification of the data collection plan, however, shall not change the performance standards set forth in this mitigation measure.
Impact TR-19: Without implementation of the Muni Special Event Transit Service Plan, the proposed project would result in additional significant traffic impacts at freeway ramps that would operate at LOS E or LOS F under Existing plus Project conditions.	SUM	**Mitigation Measure M-TR-2b: Additional Measures to Reduce Transportation Impacts** (see Impact TR-2, above) **Mitigation Measure M-TR-18: Auto Mode Share Performance Standard and Monitoring** (see Impact TR-18, above)

Significance Determinations:
NI = No Impact
LS = Less-Than-Significant Impact (no mitigation required)
LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Transportation and Circulation, SEIR Section 5.2 (cont.)		
Conditions without Implementation of the Muni Special Event Transit Service Plan (cont.)		
Impact TR-20: Without implementation of the Muni Special Event Transit Service Plan, the proposed project would result in a substantial increase in transit demand that could not be accommodated by adjacent Muni transit capacity such that significant adverse impacts to Muni transit service would occur under Existing plus Project conditions.	SUM	**Mitigation Measure M-TR-18: Auto Mode Share Performance Standard and Monitoring** (see Impact TR-18, above)
Impact TR-21: Without implementation of the Muni Special Event Transit Service Plan, the proposed project would result in a substantial increase in transit demand that could not be accommodated by regional transit capacity such that significant adverse impacts to regional transit service would occur under Existing plus Project conditions.	SUM	**Mitigation Measure M-TR-5a: Additional Caltrain Service** (see Impact TR-5, above) **Mitigation Measure M-TR-5b: Additional North Bay Ferry and Bus Service** (see Impact TR-5, above)
Impact TR-22: Without implementation of the Muni Special Event Transit Service Plan, the proposed project could result in a substantial overcrowding on public sidewalks, nor create potentially hazardous conditions for pedestrians, or otherwise interfere with pedestrian accessibility on the site and adjoining areas under Existing plus Project conditions.	LSM	**Mitigation Measure M-TR-22: Provide Safe Pedestrian Access to Adjacent Transit and Parking Facilities and Monitoring** During events with 3,000 or more attendees, the project sponsor shall be responsible for providing trained personnel (e.g., off-duty SFPD staff) to control pedestrian, bicycle and vehicular flows to and from the event center at the intersections immediately adjacent to the project site and to ensure that Muni platforms serving the site are not over capacity. The trained personnel shall be provided during pre- and post-event periods. The project sponsor shall ensure that conflicts between various modes are reduced to the maximum extent possible through adequate staffing of trained personnel as well as other measures, as appropriate. Other pedestrian management measures that could be implemented include but are not limited to: installation of barricades, proper signage and announcements to disperse patrons to other streets around the project site, such as to Terry A. Francois Boulevard, and cross-marketing incentives such as 20 percent discount at the restaurant and retail establishments to extend the peak departure period. Through the implementation of various strategies, the project sponsor shall ensure that pedestrian conflicts with other modes are minimized by separating vehicles, bicycles, transit and pedestrian flows to the greatest extent possible, including ensuring that various modes are adequately instructed about when it is their turn to proceed. The project sponsor shall also ensure that Muni platforms are not overcrowded by staging event attendees on the adjacent sidewalks until there is sufficient space on the Muni platforms, which are proposed to be expanded as part of the project.

Significance Determinations:
- NI = No Impact
- LS = Less-Than-Significant Impact (no mitigation required)
- LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
- SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
- SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Transportation and Circulation, SEIR Section 5.2 (cont.)		
Conditions without Implementation of the Muni Special Event Transit Service Plan (cont.)		
Impact TR-22 (cont.)		At the intersection of Third/South, the trained personnel shall implement strategies to allow pedestrians to cross the street safely. The strategies could include manually overriding the traffic signal and directing pedestrians to cross, erecting temporary pedestrian crossing barriers, allowing use of the closed Third Street as a pedestrian access route, providing a defined passenger waiting area within the closed Third Street, and shielding passengers waiting to board light rail from adjacent pedestrian traffic. ***Monitoring and Reporting*** The project sponsor shall retain a qualified transportation professional[2] to conduct field observations of pedestrian hazards and safety conditions along Third Street adjacent to the project site, as outlined below, and to document the results in a *Pedestrian Access Report*. City staff shall verify the field data collection results. Prior to beginning field observations, the transportation professional shall develop the data collection methodology in consultation with and approved by OCII (or its designated representative such as the ERO) in coordination with SFMTA. The data collection methodology shall be reviewed and revised annually, if appropriate. Field observations shall be conducted during the following event types and attendance levels: • at least two weekday NBA basketball games with 12,500 or more attendees; • at least two weekend NBA basketball games with 12,500 or more attendees; • at least two weekday non-basketball game events with 12,500 or more attendees; • at least two weekend non-basketball game events with 12,500 or more attendees; • at least two weekday non-basketball game events with 3,000 to 9,000 attendees; and, • at least two weekend non-basketball game events with 3,000 to 9,000 attendees; and • at least two weekday convention events of 9,000 or more attendees. The pedestrian hazard and safety conditions field observations shall occur on an annual basis. The *Pedestrian Access Report* shall be submitted to SFMTA, OCII and Planning Department for review within 30 days of completion of the data collection. If the City finds that the project does not meet the performance standard outlined below, the Transportation Management Plan (TMP) shall be revised to incorporate techniques to minimize conflicts between pedestrians and other modes. The TMP shall be revised within 90 days of submittal of the *Pedestrian Access Report*. When the project is not meeting the stated performance standard, the project sponsor shall collect data on a semi-annual basis (i.e., twice during a calendar year) to assess the effectiveness of various measures incorporated into the revised TMP. The implementation of various measures shall be intensified until pedestrian access to and from the site occurs in a safe manner, as determined by OCII (or the ERO).

[2] The Transportation Demand Management Report shall be performed by a qualified transportation professional from the San Francisco Planning Department's *Transportation Consultant Pool*. Available online at *http://www.sf-planning.org/index.aspx?page=1886*. Accessed May 28, 2015.

Significance Determinations:
NI = No Impact
LS = Less-Than-Significant Impact (no mitigation required)
LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Transportation and Circulation, SEIR Section 5.2 (cont.)		
Conditions without Implementation of the Muni Special Event Transit Service Plan (cont.)		
Impact TR-22 (cont.)		The performance standard for safe pedestrian operations consists of the following: substantial numbers of pedestrians are not spilling onto the Muni right-of-way area, are not illegally crossing Third Street midblock, are not overcrowding the Muni platforms, and are not crossing intersections against the signal. Upon achievement of the performance standard, the project sponsor may resume field observations for basketball, non-basketball and convention events on an annual basis. If the sponsor demonstrates three consecutive years of meeting the performance standard, the comprehensive data collection effort may occur every two years. Further, in reviewing the *Pedestrian Access Report*, OCII (or the ERO) may adjust the size of the events for which this measure is applicable. For example, if small scale events (e.g., those with 5,000 attendees) do not result in crosswalk and/or Muni platform overcrowding or other similar pedestrian safety conditions, OCII (or the ERO) may revise this mitigation measure to apply to events of 5,001 or more attendees.
Impact TR-23: Without implementation of the Muni Special Event Transit Service Plan, the proposed project would not result in potentially hazardous conditions for bicyclists, or otherwise substantially interfere with bicycle accessibility to the site and adjoining areas under Existing plus Project conditions.	LS	No mitigation required.
Impact TR-24: Without implementation of the Muni Special Event Transit Service Plan, the proposed project would not result in significant impacts on loading under Existing plus Project conditions.	LS	No mitigation required. **Improvement Measure I-TR-8: Truck and Service Vehicle Loading Operations Plan** (see Impact TR-8, above)
Impact TR-25: Without implementation of the Muni Special Event Transit Service Plan, the proposed project would not result in significant impacts on emergency vehicle access under Existing plus Project conditions.	LS	No mitigation required. **Improvement Measure I-TR-10a: UCSF Emergency Vehicle Access and Garage Signage Plan** (see Impact TR-10, above) **Improvement Measure I-TR-10b: Mariposa Street Restriping** (see Impact TR-10, above)

Significance Determinations:
- NI = No Impact
- LS = Less-Than-Significant Impact (no mitigation required)
- LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Noise, SEIR Section 5.3		
Impact NO-1: Construction of the proposed project would not cause a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project	LS	No mitigation required. **Improvement Measure I-NO-1: Mission Bay Good Neighbor Construction Noise Policy** The project sponsor shall comply with the Mission Bay Good Neighbor Policy and limit all extreme noise-generating construction activities to 8:00 a.m. to 5:00 p.m., Monday through Friday. No pile driving or other extreme noise generating activity is permitted on Saturdays, Sundays, and holidays.
Impact NO-2: Construction of the proposed project would not expose people to or generate noise levels in excess of standards established in the local general plan, noise ordinance, or applicable standards of other agencies.	LS	No mitigation required.
Impact NO-3: Construction of the proposed project would not expose people and structures to or generate excessive groundborne vibration levels.	LS	No mitigation required. **Improvement Measure I-NO-3: Neighbor Notification of Vibration-Inducing Construction Activities** At least one week prior to the start of rapid impact compaction activities, the project sponsor shall notify owners and occupants within 500 feet of the project site of the dates, hours, and expected duration of such activities.
Impact NO-4: Operation of the proposed project could result in exposure of persons to or generation of noise levels in excess of standards established in the *San Francisco General Plan* or San Francisco Noise Ordinance.	LSM	**Mitigation Measure M-NO-4a: Noise Control Plan for Outdoor Amplified Sound** The project sponsor shall develop and implement a Noise Control Plan for operations at the proposed entertainment venues to reduce the potential for noise impacts from public address and/or amplified music. This Noise Control Plan shall contain the following elements: • The project sponsor shall comply with noise controls and restrictions in applicable entertainment permit requirements for outdoor concerts. • Speaker systems shall be directed away from the nearest sensitive receptors to the degree feasible. • Outdoor speaker systems shall be operated consistent with the restrictions of Section 2909 of the San Francisco Police Code, and conform to a performance standard of 8 dBA and dBC over existing ambient L90 noise levels at the nearest residential use.

Significance Determinations:
NI = No Impact
LS = Less-Than-Significant Impact (no mitigation required)
LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Noise, SEIR Section 5.3 (cont.)		
Impact NO-4 (cont.)		**Mitigation Measure M-NO-4b: Noise Control Plan for Place of Entertainment Permit** As part of the Place of Entertainment Permit process, the project sponsor shall develop and implement a Noise Control Plan for operations at the proposed entertainment venue to reduce the potential for noise impacts from interior event noise. This Noise Control Plan shall, at a minimum, contain the following elements: • The project sponsor shall comply with noise controls and restrictions in applicable entertainment permit requirements. • The establishment shall provide adequate ventilation within the structures such that doors and/or windows are not left open for such purposes resulting in noise emission from the premises. • There shall be no noise audible outside the establishment during the daytime or nighttime hours that violates the San Francisco Municipal Code Section 49 or 2900 et. seq. Further, absolutely no sound from the establishment shall be audible inside any surrounding residences or businesses that violates San Francisco Police Code section 2900. • Permit holder shall take all reasonable measures to insure the sidewalks adjacent to the premises are not blocked or unnecessarily affected by patrons or employees due to the operations of the premises and shall provide security whenever patrons gather outdoors. • Permit holder shall provide a cell phone number to all interested neighbors that will be answered at all times by a manager or other responsible person who has the authority to adjust volume and respond to other complaints whenever entertainment is provided.
Impact NO-5: Operation of the proposed project would cause a substantial permanent increase in ambient noise levels in the project vicinity.	SUM	**Mitigation Measure M-TR-2c: Additional Strategies to Reduce Transportation Impacts** (see Section 5.2, Transportation and Circulation, Impact TR-2) **Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events** (see Section 5.2, Transportation and Circulation, Impact TR-2)
Impact C-NO-1: Construction activities of the proposed project combined with cumulative construction noise in the project area could cause a substantial temporary or periodic increase in ambient noise levels in the project vicinity during construction.	LSM	**Mitigation Measure M-C-NO-1: Construction Noise Control Measures** Contractors shall employ site-specific noise attenuation measures during construction to reduce the generation of construction noise. These measures shall be included in a Noise Control Plan that shall be submitted for review and approval by the OCII or its designated representative to ensure that construction noise is reduced to the degree feasible. Measures specified in the Noise Control Plan and implemented during project construction shall include, at a minimum, the following noise control strategies: • Equipment and trucks used for construction shall use the best available noise control techniques (e.g., improved mufflers, equipment redesign, use of intake silencers, ducts, engine enclosures, and acoustically attenuating shields or shrouds).

Significance Determinations:
NI = No Impact
LS = Less-Than-Significant Impact (no mitigation required)
LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Noise, SEIR Section 5.3 (cont.)		
Impact C-NO-1 (cont.)		• Construction equipment with lower noise emission ratings shall be used whenever possible, particularly for air compressors. • Sound-control devices no less effective than those provided by the manufacturer shall be provided on all construction equipment. • Impact tools (e.g., jack hammers, pavement breakers, and rock drills) used for construction shall be hydraulically or electrically powered wherever possible to avoid noise associated with compressed air exhaust from pneumatically powered tools. Where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust shall be used; this muffler can lower noise levels from the exhaust by up to about 10 dBA. External jackets on the tools themselves shall be used where feasible; this could achieve a reduction of 5 dBA. Quieter procedures, such as use of drills rather than impact tools, shall be used where feasible. • Stationary noise sources such as material stockpiles and vehicle staging areas shall be located as far from adjacent receptors as possible. • Enclosures and mufflers for stationary equipment shall be provided, impact tools shall be shrouded or shielded, and barriers shall be installed around particularly noisy activities at the construction sites so that the line of sight between the construction activities and nearby sensitive receptor locations is blocked to the extent feasible. • Unnecessary idling of internal combustion engines shall be prohibited. • Construction-related vehicles and equipment shall be required to use designated truck routes to travel to and from the project sites as determined with consultation with the SFMTA as part of the permit process prior to construction (see **Improvement Measure I-TR-1**: **Construction Management Plan and Public Updates)**. • The project sponsor shall designate a point of contact to respond to noise complaints. The point of contact must have the authority to modify construction noise-generating activities to ensure compliance with the measures above and with the San Francisco Noise Ordinance.
Impact C-NO-2: Operation of the proposed project when considered with other cumulative development would cause a substantial permanent increase in ambient noise levels in the project vicinity.	SUM	**Mitigation Measure M-TR-2c: Additional Strategies to Reduce Transportation Impacts** (see Section 5.2, Transportation and Circulation, Impact TR-2) **Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events** (see Section 5.2, Transportation and Circulation, Impact TR-2)
Impact C-NO-3: Occupants of the proposed project would not be substantially affected by noise from future operations of the helipad at the adjacent UCSF Hospital.	LS	No mitigation required.

Significance Determinations:
- NI = No Impact
- LS = Less-Than-Significant Impact (no mitigation required)
- LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
- SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
- SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Air Quality, SEIR Section 5.4		
Impact AQ-1: Construction of the proposed project would generate fugitive dust and criteria air pollutants, which would violate an air quality standard, contribute substantially to an existing or projected air quality violation, or result in a cumulatively considerable net increase in criteria air pollutants.	SUM	**Mitigation Measure M-AQ-1: Construction Emissions Minimization** A. *Construction Emissions Minimization Plan.* Prior to issuance of a construction permit, the project sponsor shall submit a Construction Emissions Minimization Plan (Plan) to the OCII or its designated representative for review and approval by an Air Quality Specialist. The Plan shall detail project compliance with the following requirements: 1. All off-road equipment greater than 25 horsepower (hp) and operating for more than 20 total hours over the entire duration of construction activities shall meet the following requirements: a) Where access to alternative sources of power are available, portable diesel engines shall be prohibited. Where portable diesel engines are required because alternative sources of power are not available, the diesel engine shall meet the equipment compliance step-down schedule in **Table M-AQ-1-1**. (see Table M-AQ-1-1 below) b) All off-road equipment shall have engines that meet either U.S. Environmental Protection Agency (USEPA) or California Air Resources Board (CARB) Tier 4 off-road emission standards. If engines that comply with Tier 4 off-road emission standards are not commercially available, then the project sponsor shall provide the next cleanest piece of off-road equipment as provided by the step down schedules in Table M-AQ-1-1.

TABLE M-AQ-1-1
OFF-ROAD EQUIPMENT COMPLIANCE STEP-DOWN SCHEDULE

Compliance Alternative	Engine Emission Standard	Emissions Control
1	Tier 4 Interim	ARB NOx VDECS (40%)[3]
2	Tier 3	ARB NOx VDECS (40%)
3	Tier 2	ARB NOx VDECS (40%)

How to use the table: If the requirements of (A)(1)(b) cannot be met, then the project sponsor would need to meet Compliance Alternative 1. Should the project sponsor not be able to supply off-road equipment meeting Compliance Alternative 1, then Compliance Alternative 2 would need to be met. Should the project sponsor not be able to supply off-road equipment meeting Compliance Alternative 2, then Compliance Alternative 3 would need to be met.

3 http://www.arb.ca.gov/diesel/verdev/vt/cvt.htm

Significance Determinations:
NI = No Impact
LS = Less-Than-Significant Impact (no mitigation required)
LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Air Quality, SEIR Section 5.4 (cont.)		
Impact AQ-1 (cont.)		i. For purposes of this mitigation measure, "commercially available" shall mean the availability of Tier 4 equipment taking into consideration factors such as: (i) critical path timing of construction; (ii) geographic proximity to the Project site of equipment; and (iii) geographic proximity of access to off haul deposit sites. ii. The project sponsor shall maintain records concerning its efforts to comply with this requirement. 2. The project sponsor shall require the idling time for off-road and on-road equipment be limited to no more than two minutes, except as provided in exceptions to the applicable state regulations regarding idling for off-road and on-road equipment. Legible and visible signs shall be posted in multiple languages (English, Spanish, and Chinese) in designated queuing areas and at the construction site to remind operators of the two minute idling limit. 3. The project sponsor shall require that construction operators properly maintain and tune equipment in accordance with manufacturer specifications. 4. The Plan shall include estimates of the construction timeline by phase with a description of each piece of off-road equipment required for every construction phase. Off-road equipment descriptions and information may include, but are not limited to: equipment type, equipment manufacturer, equipment identification number, engine model year, engine certification (Tier rating), horsepower, engine serial number, and expected fuel usage and hours of operation. For VDECS installed: technology type, serial number, make, model, manufacturer, ARB verification number level, and installation date and hour meter reading on installation date. For off-road equipment using alternative fuels, reporting shall indicate the type of alternative fuel being used. The plan shall also include estimates of ROG and NOx emissions. 5. The project sponsor shall keep the Plan available for public review on site during working hours. The project sponsor shall post at the perimeter of the project site a legible and visible sign summarizing the requirements of the Plan. The sign shall also state that the public may ask to inspect the Plan at any time during working hours, and shall explain how to request inspection of the Plan. Signs shall be posted on all sides of the construction site that face a public right of way. The project sponsor shall provide copies of Plan to members of the public as requested. B. *Reporting*. Quarterly reports shall be submitted to the OCII or its designated representative indicating the construction phase and off-road equipment information used during each phase including the information required in A(4). In addition, for off-road equipment using alternative fuels, reporting shall include the actual amount of alternative fuel used. Within six months of the completion of construction activities, the project sponsor shall submit to the OCII or its designated representative a final report summarizing construction activities. The final report shall indicate the start and end dates and duration of each construction phase. For each phase, the report shall include detailed information required in A(4). In addition, for off-road equipment using alternative fuels, reporting shall include the actual amount of alternative fuel used.

Significance Determinations:
NI = No Impact
LS = Less-Than-Significant Impact (no mitigation required)
LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Air Quality, SEIR Section 5.4 (cont.)		
Impact AQ-1 (cont.)		C. *Certification Statement and On-site Requirements.* Prior to the commencement of construction activities, the project sponsor must certify (1) compliance with the Plan, and (2) all applicable requirements of the Plan have been incorporated into contract specifications.
Impact AQ-2: During project operations, the proposed project would result in emissions of criteria air pollutants at levels that would violate an air quality standard, contribute to an existing or projected air quality violation, or result in a cumulatively considerable net increase in criteria air pollutants.	SUM	**Mitigation Measure M-AQ-2a: Reduce Operational Emissions** The project sponsor shall implement the following measures as feasible: • Provision of outlets for electrically powered landscape equipment • **Mitigation Measure M-TR-2c: Additional Strategies to Reduce Transportation Impacts** (see Section 5.2, Transportation and Circulation, Impact TR-2) • **Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events** (see Section 5.2, Transportation and Circulation, Impact TR-11) **Mitigation Measure M-AQ-2b: Emission Offsets** Upon completion of construction, and prior to issuance of certificate of occupancy, the project sponsor shall pay a mitigation offset fee to the Bay Area Air Quality Management District's (BAAQMD) Strategic Incentives Division in an amount not to exceed $18,030 per weighted ton of ozone precursors plus a 5 percent administrative fee to fund one or more emissions reduction projects within the San Francisco Bay Area Air Basin (SFBAAB). This fee is intended to fund emissions reduction projects to achieve reductions of 17.0 tons per year of ozone precursors. Documentation of payment shall be provided to OCII or its designated representative. The project sponsor shall calculate the amount of emissions offset required from construction based on the reporting requirements of Mitigation Measure M-AQ-1 and the degree of compliance with off-road equipment types that were determined to be commercially available. If the calculated construction emissions of ozone precursors requires offsets in excess of 17.0 tons per year, then the applicant shall provide the additional offset amount commensurate with the calculated ozone precursor emissions exceeding 17.0 tons per year. Acceptance of this fee by the BAAQMD shall serve as an acknowledgment and commitment by the BAAQMD to: (1) implement an emissions reduction project(s) within one year of receipt of the mitigation fee to achieve the emission reduction objectives specified above; and (2) provide documentation to OCII or its designated representative and to the project sponsor describing the project(s) funded by the mitigation fee, including the amount of emissions of ROG and NOx

Significance Determinations:
- NI = No Impact
- LS = Less-Than-Significant Impact (no mitigation required)
- LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
- SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
- SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Air Quality, SEIR Section 5.4 (cont.)		
Impact AQ-2 (cont.)		reduced (tons per year) within the SFBAAB from the emissions reduction project(s). If there is any remaining unspent portion of the mitigation offset fee following implementation of the emission reduction project(s), the project sponsor shall be entitled to a refund in that amount from the BAAQMD. To qualify under this mitigation measure, the specific emissions retrofit project must result in emission reductions within the SFBAAB that would not otherwise be achieved through compliance with existing regulatory requirements.
Impact AQ-3: Construction and operation of the proposed project would generate toxic air contaminants, including diesel particulate matter, and could expose sensitive receptors to substantial air pollutant concentrations.	LSM	**Mitigation Measure M-AQ-1: Construction Emissions Minimization** (see Impact AQ-1, above)
Impact AQ-4: The proposed project could conflict with, or obstruct implementation of, the *2010 Clean Air Plan*.	LSM	**Mitigation Measure M-AQ-1: Construction Emissions Minimization** (see Impact AQ-1, above) **Mitigation Measure M-AQ-2a: Reduce Operational Emissions** (see Impact AQ-2, above) **Mitigation Measure M-AQ-2b: Emissions Offsets** (see Impact AQ-2, above)
Cumulative Impacts		
Impact C-AQ-1: The project, in combination with other past, present, and reasonably foreseeable future projects, would contribute to cumulative regional air quality impacts.	SUM	**Mitigation Measure M-AQ-1: Construction Emissions Minimization** (see Impact AQ-1) **Mitigation Measure M-AQ-2a: Reduce Operational Emissions** (see Impact AQ-2) **Mitigation Measure M-AQ-2b: Emission Offsets** (see Impacts AQ-1 and AQ-2)
Impact C-AQ-2: The project, in combination with other past, present, and reasonably foreseeable future projects, could generate toxic air contaminants, including diesel particulate matter, and could expose sensitive receptors to substantial air pollutant concentrations.	LSM	**Mitigation Measure M-AQ-1: Construction Emissions Minimization** (see Impact AQ-1)

Significance Determinations:
- NI = No Impact
- LS = Less-Than-Significant Impact (no mitigation required)
- LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
- SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
- SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Greenhouse Gas Emissions, SEIR Section 5.5		
Impact C-GG-1: The proposed project would generate greenhouse gas emissions, but not at levels that would result in a significant impact on the environment or conflict with any policy, plan, or regulation adopted for the purpose of reducing greenhouse gas emissions.	LS	No mitigation required. **Improvement Measure I-C-GG-1: Purchase Voluntary Carbon Credits** ***Construction Emissions*:** No later than six (6) months after the issuance of a Temporary Certificate of Occupancy for the project, the project sponsor shall provide to the Office of Community Investment and Infrastructure (OCII), a calculation of the net additional emissions resulting from the construction of the project, to be calculated in accordance with the methodology agreed upon by the California Air Resources Board (CARB) in connection with the AB 900 certification of the project. The project sponsor shall provide courtesy copies of the calculations to CARB and the Governor's office promptly following transmittal of the calculations to OCII. The project sponsor shall enter into one or more contracts to purchase voluntary carbon credits from a qualified greenhouse gas emissions broker in an amount sufficient to offset the construction emissions. The project sponsor shall provide courtesy copies of any such contracts to the ARB and the Governor's office promptly following the execution of such contracts. ***Operational Emissions*:** No later than six (6) months after project stabilization, to be defined as the date following project completion when the project is 90 percent leased and occupied (and with respect to the arena component, 90 percent of the available booking dates are utilized), the project sponsor shall submit to OCII a projection of operational emissions arising from the project, based on data accumulated to that date and reasonable projections of operational emissions for the useful life of the project (30 years), to be calculated in accordance with the methodology agreed upon by CARB in connection with the AB 900 certification of the project. The project sponsor shall provide courtesy copies of the calculations to CARB and the Governor's office promptly following transmittal of the calculations to OCII. The project sponsor shall enter into one or more contracts to purchase voluntary carbon credits from a qualified greenhouse gas emissions broker in an amount sufficient to offset the operational emissions, on a net present value basis in light of the fact that the project sponsor is proposing to acquire such credits in advance of any creation of the emissions subject to the offset. The project sponsor shall provide courtesy copies of any such contracts to CARB and the Governor's office promptly following the execution of such contracts.

Significance Determinations:
- NI = No Impact
- LS = Less-Than-Significant Impact (no mitigation required)
- LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
- SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
- SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Wind and Shadow, SEIR Section 5.6		
Wind		
Impact WS-1: The project would alter wind in a manner that would substantially affect off-site public areas.	SUM	**Mitigation Measure M-WS-1: Develop and Implement Design Measures to Reduce Project Off-site Wind Hazards** The project sponsor shall develop and implement design measures to reduce the identified project off-site wind hazards to the extent feasible. This may include on-site project design modifications or additions, additional on-site landscaping; and the implementation of potential additional off-site streetscape landscaping or other off-site wind-reducing features. Potential on- and/or off-site project site wind-reduction design measures developed by the sponsor would be coordinated with, and subject to review and approval, by OCII.
Impact C-WS-1: The project, in combination with cumulative development, would not alter wind in a manner that would substantially affect off-site public areas.	LS	No mitigation required.
Shadow		
Impact C-WS-2: The project, in combination with cumulative development, would create new shadow but not in a manner that would substantially affect the use of publicly accessible open space or outdoor recreational facilities or other public areas within the Mission Bay South plan area.	LS	No mitigation required.
Impact C-WS-3: The project, in combination with cumulative development, would create new shadow but not in a manner that would substantially affect the use of publicly accessible open space or outdoor recreational facilities or other public areas outside the Mission Bay South plan area.	LS	No mitigation required.

Significance Determinations:
- NI = No Impact
- LS = Less-Than-Significant Impact (no mitigation required)
- LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
- SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
- SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Utilities and Service Systems, Initial Study Section E11 and SEIR Section 5.7		
Impact UT-1: The City's water service provider would have sufficient water supply available to serve the project from existing entitlements and resources, and would not require new or expanded water supply resources or entitlements.	LS	No mitigation required.
Impact UT-2: The proposed project would not require or result in the construction of new water treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects.	LS	No mitigation required.
Impact UT-3: The proposed project would be served by landfills with sufficient permitted capacity to accommodate the project's solid waste disposal needs.	LS	No mitigation required.
Impact UT-4: The proposed project would comply with federal, state, and local statutes and regulations related to solid waste.	LS	No mitigation required.
Impact UT-5: The proposed project in itself would not require or result in the construction of new wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects.	LS	No mitigation required.
Impact C-UT-1: The project, in combination with other past, present, and reasonably foreseeable future projects, would not result in significant adverse cumulative utilities and service systems impacts (water supply and solid waste).	LS	No mitigation required.

Significance Determinations:
- NI = No Impact
- LS = Less-Than-Significant Impact (no mitigation required)
- LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
- SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
- SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Utilities and Service Systems, Initial Study Section E11 and SEIR Section 5.7 (cont.)		
Impact C-UT-2: The proposed project, in combination with past, present, and foreseeable future development in the Mission Bay South area, would require or result in the construction of new wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects.	SU	No feasible mitigation available that could be implemented by the project sponsor.
Impact C-UT-3: The proposed project, in combination with past, present, and foreseeable future development in the Mission Bay South area, would not require or result in the construction of new stormwater drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects.	LS	No mitigation required.
Impact C-UT-4: The project, in combination with past, present, and foreseeable future development in the Mission Bay South area, would result in a determination by the SFPUC that it has inadequate capacity to serve the project's projected wastewater demand in addition to its existing commitments.	SUM	**Mitigation Measure M-C-UT-4: Fair Share Contribution for Mariposa Pump Station Upgrades** The project sponsor shall pay its fair share for improvements to the Mariposa Pump Station and associated wastewater facilities required to provide adequate sewer capacity within the project area and serve the project as determined by the SFPUC. The contribution shall be in proportion to the wastewater flows from the proposed project relative to the total design capacity of the upgraded pump station(s). The project sponsor shall not be responsible for any share of costs to address pre-existing pump station deficiencies.

Significance Determinations:
NI = No Impact
LS = Less-Than-Significant Impact (no mitigation required)
LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Public Services, Initial Study Section E12 and SEIR Section 5.8		
Impact PS-1: The proposed project would not result in substantial adverse physical impacts associated with the provision of or the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for schools or other services.	LS	No mitigation required.
Impact PS-2: Construction of the proposed project would not result in substantial adverse physical impacts associated with the provision of or the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire protection, emergency medical services, or law enforcement.	LS	No mitigation required.
Impact PS-3: Operation of the proposed project would not result in substantial adverse physical impacts associated with the provision of or the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire protection or emergency medical services.	LS	No mitigation required.

Significance Determinations:
NI = No Impact
LS = Less-Than-Significant Impact (no mitigation required)
LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Public Services, Initial Study Section E12 and SEIR Section 5.8 (cont.)		
Impact PS-4: Operation of the proposed project would not result in substantial adverse physical impacts associated with the provision of or the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for law enforcement services.	LS	No mitigation required.
Impact C-PS-1: The project, in combination with other past, present, and reasonably foreseeable future projects, would not result in significant adverse cumulative impacts on schools or other services.	LS	No mitigation required.
Impact C-PS-2: The project, in combination with other past, present, and reasonably foreseeable future projects, would not result in significant adverse cumulative impacts on fire protection, emergency medical, and law enforcement services.	LS	No mitigation required.
Hydrology and Water Quality, Initial Study Section E15 and SEIR Section 5.9		
Impacts HY-1: The project would not violate water quality standards or otherwise substantially degrade water quality with respect to construction activities, including construction dewatering.	LS	No mitigation required.
Impact HY-1a: The project would not violate water quality standards or otherwise substantially degrade water quality with respect to construction-related dewatering.	LS	No mitigation required.

Significance Determinations:
- NI = No Impact
- LS = Less-Than-Significant Impact (no mitigation required)
- LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
- SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
- SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Hydrology and Water Quality, Initial Study Section E15 and SEIR Section 5.9		
Impact HY-2: The project would not substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level.	LS	No mitigation required.
Impact HY-3: The project would not alter the existing drainage pattern of the area in a manner that would result in substantial erosion, siltation, or flooding on- or off-site, and the project would not substantially increase the rate or amount of surface runoff that would result in flooding on- or off-site.	LS	No mitigation required.
Impact HY-4: The project would not expose people, housing, or structures, to substantial risk of loss due to existing flooding risks and would not redirect or impede flood flows.	LS	No mitigation required.
Impact HY-5: The project would not expose people or structures to a significant risk of loss, injury or death involving inundation by seiche or tsunami.	LS	No mitigation required.
Impact HY-6: Operation of the proposed project could exceed the wastewater treatment requirements of the NPDES permit for the SEWPCP, violate water quality standards or waste discharge requirements, otherwise substantially degrade water quality as a result of changes in wastewater and stormwater discharges to	LSM	**Mitigation Measure M-HY-6. Wastewater Sampling Ports** ***Mission Bay FSEIR Mitigation Measures K.2.*** Participate in the City's existing Water Pollution Prevention Program. Facilitate implementation of the City's Water Pollution Prevention Program by providing and installing wastewater sampling ports in any building anticipated to have a potentially significant discharge of pollutants to the sanitary sewer, as determined by the Water Pollution Prevention Program of the San Francisco Public Utilities Commission's Bureau of Environmental Regulation and Management, and in locations as determined by the Water Pollution Prevention Program.

Significance Determinations:
- NI = No Impact
- LS = Less-Than-Significant Impact (no mitigation required)
- LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
- SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
- SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Population and Housing, Initial Study Section E3 (cont.)		
Impact PH-6: Operation of the proposed project would not displace substantial numbers of people, necessitating the construction of replacement housing elsewhere.	NI	No mitigation required.
Impact C-PH-1: The project, in combination with other past, present, and reasonably foreseeable future projects, would not result in significant adverse cumulative impacts on population and housing.	LS	No mitigation required.
Cultural and Paleontological Resources, Initial Study Section E4		
Impact CP-1: The project would not cause a substantial adverse change in the significance of a historical resource as defined in §15064.5, including those resources listed in Article 10 or Article 11 of the San Francisco Planning Code.	LS	No mitigation required.
Impact CP-2: The project could cause a substantial adverse change in the significance of an archeological resource pursuant to §15064.5.	LSM	**Mitigation Measure M-CP-2a: Archaeological Testing, Monitoring and/or Data Recovery Program** Based on a reasonable presumption that archaeological resources may be present within the project site, the following measures shall be undertaken to avoid any potentially significant adverse effect from the proposed project on buried or submerged historical resources. The project sponsor shall retain the services of an archaeological consultant approved by OCII or its designated representative such as those from the rotational Department Qualified Archaeological Consultants List (QACL) maintained by the Planning Department archaeologist. The project sponsor shall contact the Department archaeologist to obtain the names and contact information for the next three archaeological consultants on the QACL. The archaeological consultant shall undertake an archaeological testing program as specified herein. In addition, the consultant shall be available to **conduct an archaeological monitoring and/or data recovery program if** required pursuant to this measure. The archaeological consultant's work shall be conducted in accordance with this measure at the direction of OCII or its designated representative. All plans and reports prepared by the consultant as specified herein shall be submitted first and directly to OCII or its designated representative for review and comment, and shall be considered draft reports subject to revision until final approval by OCII or its designated representative. Archaeological monitoring and/or data recovery programs required by this measure could suspend construction of the project for

Significance Determinations:
- NI = No Impact

- LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
- SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
- SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Cultural and Paleontological Resources, Initial Study Section E4 (cont.)		
Impact CP-2 (cont.)		up to a maximum of four weeks. At the direction of the OCII or its designated representative, the suspension of construction can be extended beyond four weeks only if such a suspension is the only feasible means to reduce to a less than significant level potential effects on a significant archaeological resource as defined in CEQA Guidelines Sect. 15064.5 (a)(c). ***Consultation with Descendant Communities*:** On discovery of an archaeological site4 associated with descendant Native Americans, the Overseas Chinese, or other descendant group an appropriate representative5 of the descendant group and OCII or its designated representative shall be contacted. The representative of the descendant group shall be given the opportunity to monitor archaeological field investigations of the site and to consult with OCII or its designated representative regarding appropriate archaeological treatment of the site, of recovered data from the site, and, if applicable, any interpretative treatment of the associated archeological site. A copy of the Final Archaeological Resources Report shall be provided to the representative of the descendant group. ***Archaeological Testing Program.*** The archaeological consultant shall prepare and submit to OCII or its designated representative for review and approval an archaeological testing plan (ATP). The archaeological testing program shall be conducted in accordance with the approved ATP. The ATP shall identify the property types of the expected archaeological resource(s) that potentially could be adversely affected by the proposed project, the testing method to be used, and the locations recommended for testing. The purpose of the archaeological testing program will be to determine to the extent possible the presence or absence of archaeological resources and to identify and to evaluate whether any archaeological resource encountered on the site constitutes an historical resource under CEQA. At the completion of the archaeological testing program, the archaeological consultant shall submit a written report of the findings to OCII or its designated representative. If based on the archaeological testing program the archaeological consultant finds that significant archaeological resources may be present, OCII or its designated representative in consultation with the archaeological consultant shall determine if additional measures are warranted. Additional measures that may be undertaken include additional archaeological testing, archaeological monitoring, and/or an archaeological data recovery program. No archaeological data recovery shall be undertaken without the prior approval of OCII or its designated representative. If OCII or its designated representative determines that a significant archaeological resource is present and that the resource could be adversely affected by the proposed project, at the discretion of the project sponsor either: A. The proposed project shall be re-designed so as to avoid any adverse effect on the significant archaeological resource; or

4 By the term "archaeological site" is intended here to minimally include any archaeological deposit, feature, burial, or evidence of burial.

5 An "appropriate representative" of the descendant group is here defined to mean, in the case of Native Americans, any individual listed in the current Native American Contact List for the City and County of San Francisco maintained by the California Native American Heritage Commission and in the case of the Overseas Chinese, the Chinese Historical Society of America. An appropriate representative of other descendant groups should be determined in consultation with the Department archaeologist.

Significance Determinations:
- NI = No Impact
- LS = Less-Than-Significant Impact (no mitigation required)
- LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
- SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
- SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Cultural and Paleontological Resources, Initial Study Section E4 (cont.)		
Impact CP-2 (cont.)		B. A data recovery program shall be implemented, unless OCII or its designated representative determines that the archaeological resource is of greater interpretive than research significance and that interpretive use of the resource is feasible. ***Archaeological Monitoring Program.*** If OCII or its designated representative in consultation with the archaeological consultant determines that an archaeological monitoring program shall be implemented the archaeological monitoring program shall minimally include the following provisions: • The archaeological consultant, project sponsor, and OCII or its designated representative shall meet and consult on the scope of the AMP reasonably prior to any project-related soils disturbing activities commencing. OCII or its designated representative in consultation with the archaeological consultant shall determine what project activities shall be archaeologically monitored. In most cases, any soils- disturbing activities, such as demolition, foundation removal, excavation, grading, utilities installation, foundation work, driving of piles (foundation, shoring, etc.), site remediation, etc., shall require archaeological monitoring because of the risk these activities pose to potential archaeological resources and to their depositional context; • The archeological consultant shall advise all project contractors to be on the alert for evidence of the presence of the expected resource(s), of how to identify the evidence of the expected resource(s), and of the appropriate protocol in the event of apparent discovery of an archaeological resource; • The archaeological monitor(s) shall be present on the project site according to a schedule agreed upon by the archaeological consultant and OCII or its designated representative until OCII or its designated representative has, in consultation with project archaeological consultant, determined that project construction activities could have no effects on significant archaeological deposits; • The archaeological monitor shall record and be authorized to collect soil samples and artifactual/ecofactual material as warranted for analysis; • If an intact archaeological deposit is encountered, all soils-disturbing activities in the vicinity of the deposit shall cease. The archaeological monitor shall be empowered to temporarily redirect demolition/excavation/pile driving/ construction activities and equipment until the deposit is evaluated. If in the case of pile driving activity (foundation, shoring, etc.), the archaeological monitor has cause to believe that the pile driving activity may affect an archaeological resource, the pile driving activity shall be terminated until an appropriate evaluation of the resource has been made in consultation with OCII or its designated representative. The archaeological consultant shall immediately notify the OCII or its designated representative of the encountered archaeological deposit. The archaeological consultant shall make a reasonable effort to assess the identity, integrity, and significance of the encountered archaeological deposit, and present the findings of this assessment to OCII or its designated representative.

Significance Determinations:
NI = No Impact
LS = Less-Than-Significant Impact (no mitigation required)
LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Cultural and Paleontological Resources, Initial Study Section E4 (cont.)		
Impact CP-2 (cont.)		Whether or not significant archaeological resources are encountered, the archaeological consultant shall submit a written report of the findings of the monitoring program to the OCII or its designated representative. ***Archaeological Data Recovery Program.*** The archaeological data recovery program shall be conducted in accord with an archaeological data recovery plan (ADRP). The archaeological consultant, project sponsor, and OCII or its designated representative shall meet and consult on the scope of the ADRP prior to preparation of a draft ADRP. The archaeological consultant shall submit a draft ADRP to OCII or its designated representative. The ADRP shall identify how the proposed data recovery program will preserve the significant information the archaeological resource is expected to contain. That is, the ADRP will identify what scientific/historical research questions are applicable to the expected resource, what data classes the resource is expected to possess, and how the expected data classes would address the applicable research questions. Data recovery, in general, should be limited to the portions of the historical property that could be adversely affected by the proposed project. Destructive data recovery methods shall not be applied to portions of the archaeological resources if nondestructive methods are practical. The scope of the ADRP shall include the following elements: • *Field Methods and Procedures*. Descriptions of proposed field strategies, procedures, and operations. • *Cataloguing and Laboratory Analysis*. Description of selected cataloguing system and artifact analysis procedures. • *Discard and Deaccession Policy*. Description of and rationale for field and post-field discard and deaccession policies. • *Interpretive Program*. Consideration of an on-site/off-site public interpretive program during the course of the archaeological data recovery program. • *Security Measures*. Recommended security measures to protect the archaeological resource from vandalism, looting, and non-intentionally damaging activities. • *Final Report*. Description of proposed report format and distribution of results. • *Curation*. Description of the procedures and recommendations for the curation of any recovered data having potential research value, identification of appropriate curation facilities, and a summary of the accession policies of the curation facilities. ***Human Remains and Associated or Unassociated Funerary Objects.*** The treatment of human remains and of associated or unassociated funerary objects discovered during any soils disturbing activity shall comply with applicable State and Federal laws. This shall include immediate notification of the Coroner of the City and County of San Francisco and in the event of the Coroner's determination that the human remains are Native American remains, notification of the California State Native

Significance Determinations:
NI = No Impact

Cultural and Paleontological Resources, Initial Study Section E4 (cont.)		
Impact CP-2 (cont.)		American Heritage Commission (NAHC) who shall appoint a Most Likely Descendant (MLD) (Pub. Res. Code Sec. 5097.98). The archaeological consultant, project sponsor, OCII or its designated representative, and MLD shall make all reasonable efforts to develop an agreement for the treatment of, with appropriate dignity, human remains and associated or unassociated funerary objects (CEQA Guidelines. Sec. 15064.5(d)). The agreement should take into consideration the appropriate excavation, removal, recordation, analysis, custodianship, curation, and final disposition of the human remains and associated or unassociated funerary objects. ***Final Archaeological Resources Report.*** The archeological consultant shall submit a Draft Final Archaeological Resources Report (FARR) to OCII or its designated representative that evaluates the historical significance of any discovered archaeological resource and describes the archaeological and historical research methods employed in the archaeological testing/monitoring/data recovery program(s) undertaken. Information that may put at risk any archaeological resource shall be provided in a separate removable insert within the final report. Once approved by OCII or its designated representative, copies of the FARR shall be distributed as follows: California Archaeological Site Survey Northwest Information Center (NWIC) shall receive one (1) copy and OCII or its designated representative shall receive a copy of the transmittal of the FARR to the NWIC. As requested by OCII, the Environmental Planning division of the Planning Department shall receive one bound, one unbound and one unlocked, searchable PDF copy on CD of the FARR along with copies of any formal site recordation forms (CA DPR 523 series) and/or documentation for nomination to the National Register of Historic Places/California Register of Historical Resources. In instances of high public interest in or the high interpretive value of the resource, OCII or its designated representative may require a different final report content, format, and distribution than that presented above. **Mitigation Measure M-CP-2b: Accidental Discovery of Archaeological Resources** The following mitigation measure is required to avoid any potential adverse effect from the proposed project on accidentally discovered buried or submerged historical resources as defined in *CEQA Guidelines* Section 15064.5(a)(c). The project sponsor shall distribute the Planning Department archaeological resource "ALERT" sheet to the project prime contractor; to any project subcontractor (including demolition, excavation, grading, foundation, pile driving, etc. firms); or utilities firm involved in soils disturbing activities within the project site. Prior to any soils disturbing activities being undertaken each contractor is responsible for ensuring that the "ALERT" sheet is circulated to all field personnel, including machine operators, field crew, pile drivers, supervisory personnel, etc. The project sponsor shall provide OCII officer or its designated representative with a signed affidavit from the responsible parties (prime contractor, subcontractor(s), and utilities firm) confirming that all field personnel have received copies of the Alert Sheet.

SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Cultural and Paleontological Resources, Initial Study Section E4 (cont.)		
Impact CP-2 (cont.)		Should any indication of an archaeological resource be encountered during any soils disturbing activity of the project, the project Head Foreman and/or project sponsor shall immediately notify OCII officer or its designated representative and shall immediately suspend any soils disturbing activities in the vicinity of the discovery until OCII officer or its designated representative has determined what additional measures should be undertaken. If OCII officer or its designated representative determines that an archaeological resource may be present within the project site, the project sponsor shall retain the services of an archaeological consultant from the pool of qualified archaeological consultants maintained by the Planning Department archaeologist. The archaeological consultant shall advise OCII officer or its designated representative as to whether the discovery is an archaeological resource, retains sufficient integrity, and is of potential scientific/historical/cultural significance. If an archaeological resource is present, the archaeological consultant shall identify and evaluate the archaeological resource. The archaeological consultant shall make a recommendation as to what action, if any, is warranted. Based on this information, OCII officer or its designated representative may require, if warranted, specific additional measures to be implemented by the project sponsor. Measures might include: preservation in situ of the archaeological resource; an archaeological monitoring program; or an archaeological testing program. If an archaeological monitoring program or archaeological testing program is required, it shall be consistent with the Environmental Planning (EP) division guidelines for such programs. OCII officer or its designated representative may also require that the project sponsor immediately implement a site security program if the archaeological resource is at risk from vandalism, looting, or other damaging actions. The project archaeological consultant shall submit a Final Archaeological Resources Report (FARR) to OCII officer or its designated representative that evaluates the historical significance of any discovered archaeological resource and describing the archaeological and historical research methods employed in the archaeological monitoring/data recovery program(s) undertaken. Information that may put at risk any archaeological resource shall be provided in a separate removable insert within the final report. Copies of the Draft FARR shall be sent to OCII officer or its designated representative for review and approval. Once approved by OCII officer or its designated representative, copies of the FARR shall be distributed as follows: California Archaeological Site Survey Northwest Information Center (NWIC) shall receive one (1) copy and OCII officer or its designated representative shall receive a copy of the transmittal of the FARR to the NWIC. OCII and the Environmental Planning division of the Planning Department shall each receive one bound copy, one unbound copy and one unlocked, searchable PDF copy on CD three copies of the FARR along with copies of any formal site recordation forms (CA DPR 523 series) and/or documentation for nomination to the National Register of Historic Places/California Register of Historical Resources. In instances of high public interest or interpretive value, OCII officer or its designated representative may require a different final report content, format, and distribution than that presented above.

Significance Determinations:
NI = No Impact

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Biological Resources, Initial Study Section E13		
Impact BI-1: The proposed project would not have a substantial adverse effect, either directly or through habitat modification, on any special status species.	LS	No mitigation required.
Impact BI-2: The proposed project would not have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations.	NI	No mitigation required.
Impact BI-3: The proposed project would not have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act or navigable waters as defined in Section 10 of the Rivers and Harbors Act through direct removal, filling, hydrological interruption, or other means.	LS	No mitigation required.
Impact BI-4: The proposed project could interfere substantially with the movement of native resident or migratory wildlife species resident or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.	LSM	**Mitigation Measure M-BI-4a: Preconstruction Surveys for Nesting Birds** To the extent practicable, vegetation removal and grading of the site in advance of new site construction shall be performed between September 1 and January 31 in order to avoid breeding and nesting season for birds. If these activities cannot be performed during this period, a preconstruction survey of onsite vegetation for nesting birds shall be conducted by a qualified biologist. In coordination with the OCII or its designated representative, pre-construction surveys of onsite vegetation shall be performed during bird breeding season (February 1 – August 31) no more than 14 days prior to vegetation removal, grading, or initiation of construction in order to locate any active passerine nests within 250 feet of the project site and any active raptor nests within 500 feet of the project site. Surveys shall be performed in accessible areas within 500 feet of the project site and include suitable habitat within line of sight as access is available. If active nests are found on either the project site or within the 500-foot survey buffer surrounding the project site, no-work buffer zones shall be established around the nests. Buffer distances will consider physical and visual barriers between the active nest and project activities, existing noise sources and disturbance, as well as sensitivity of the bird species to disturbance. Modification of standard buffer distances, 250 feet for active passerine nests and 500 feet for active raptor nests, will

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Geology and Soils, Initial Study Section E14 (cont.)		
Impact GE-4: The project would not create substantial risks to life or property as a result of location on expansive soils or other problematic soils**.**	LS	No mitigation required.
Impact GE-5: The project would not substantially change the topography or any unique geologic or physical feature of the project site**.**	LS	No mitigation required.
Impact C-GE-1: The project, in combination with other past, present, and reasonably foreseeable future projects, would not result in significant adverse cumulative impacts related to geologic hazards.	LS	No mitigation required.
Hazards and Hazardous Materials, Initial Study Section E16		
Impact HZ-1: The project could create a significant hazard through routine transport, use, or disposal of hazardous materials or result in a substantial risk of upset involving the release of hazardous materials.	LSM	**Mitigation Measure M-HZ-1a: Guidelines for Handling Biohazardous Materials** ***Mission Bay FSEIR Mitigation Measure I.1***. Require businesses that handle biohazardous materials and do not receive federal funding to certify that they follow the guidelines published by the National Research Council and the United States Department of Health and Human Services Public Health Service, National Institutes of Health, and Centers for Disease Control, as set forth in Biosafety in Microbiological and Biomedical Laboratories, Guidelines for Research Involving Recombinant DNA Molecules (NIH Guidelines), and Guide for the Care and Use of Laboratory Animals, or their successors, as applicable. ***Mission Bay FSEIR Mitigation Measure I.2.*** Require businesses handling biohazardous materials to certify that they use high efficiency particulate air (HEPA) filters or substantially equivalent devices on all exhaust from Biosafety Level 3 laboratories unless they demonstrate that exhaust from their Biosafety Level 3 laboratories would not pose substantial health or safety hazards to the public or the environment. Require such businesses to certify that they inspect or monitor the filters regularly to ensure proper functioning. ***Mission Bay FSEIR Mitigation Measure I.3.*** Require businesses handling biohazardous materials to certify that they do not handle or use biohazardous materials requiring Biosafety Level 4 containment (i.e., dangerous or exotic materials that pose high risks of life-threatening diseases or aerosol-transmitted infections, or unknown risks of transmission) in the Project Area.

Significance Determinations:
NI = No Impact
LS = Less-Than-Significant Impact (no mitigation required)
LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Hazards and Hazardous Materials, Initial Study Section E16 (cont.)		
Impact HZ-1 (cont.)		**Mitigation Measure M-HZ-1b: Geologic Investigation and Dust Mitigation Plan for Naturally Occurring Asbestos** The project sponsor shall conduct a geologic investigation in accordance with the guidelines of the California Geologic Survey to determine the naturally occurring asbestos content of fill materials to be excavated at the project site. If the investigation determines that the naturally occurring asbestos content of the fill materials is 0.25 percent or greater, the project sponsor or its construction contractor shall submit the appropriate notification forms and prepare an asbestos dust mitigation plan in accordance with the Asbestos ATCM. The plan shall specify measures that will be taken to ensure that no visible dust crosses the property boundary during construction. The plan must specify the following measures: • Prevent and control visible track-out from the property • Ensure adequate wetting or covering of active storage piles • Control disturbed surface areas and storage piles that would remain inactive for 7 days Control traffic on on-site unpaved roads, parking lots, and staging areas, including a maximum vehicle speed of 15 miles per hour • Control earthmoving activities • Control offsite transport of dust emissions that contain naturally-occurring asbestos-containing materials • Stabilize disturbed areas following construction The asbestos dust mitigation plan shall be submitted to and approved by the Bay Area Air Quality Management District (BAAQMD) prior to the beginning of construction, and the site operator must ensure the implementation of all specified dust mitigation measures throughout the construction project. In addition, if required by the BAAQMD, the project sponsor or a qualified third party consultant shall conduct air monitoring for offsite migration of asbestos dust during construction activities and shall modify the dust mitigation plan on the basis of the air monitoring results if necessary.
Impact HZ-2: The project would be located on a site identified on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5. Excavation could also require the handling of potentially contaminated soil and groundwater, potentially exposing workers and the public to hazardous materials, or resulting in a release into the environment during construction.	LSM	**Mitigation Measure M-HZ-2: RMP Provisions for Child Care Facilities** ***Mission Bay FSEIR Mitigation Measure J.2***. Carry out a site-specific risk evaluation for each site in a non-residential area proposed to be used for a public school or child care facility; submit to RWQCB for review and approval. If cancer risks exceed 1 x 10^{-5} and/or noncancer risk exceeds a Hazard Index of 1, carry out remediation designed to reduce risks to meet these standards or select another site that is shown to meet these standards.

Significance Determinations:
NI = No Impact
LS = Less-Than-Significant Impact (no mitigation required)
LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Hazards and Hazardous Materials, Initial Study Section E16 (cont.)		
Impact HZ-3: The project would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan or expose people or structures to a significant risk of loss, injury or death involving fires.	LS	No mitigation required.
Impact C-HZ-1: The project, in combination with past, present, and reasonably foreseeable future projects in the site vicinity, would not result in a considerable contribution to cumulative impacts related to hazardous materials.	LS	No mitigation required.
Minerals and Energy Resources, Initial Study Section E17		
Impact ME-1: The project would not result in the use of large amounts of fuel, water, or energy, or use these in a wasteful manner.	LS	No mitigation required.
Impact C-ME-1: The project, in combination with other past, present, and reasonably foreseeable future projects, would not result in significant adverse cumulative impacts on energy resources.	LS	No mitigation required.
Agriculture and Forest Resources, Initial Study Section E18		
Agricultural and forest resources are not applicable to the proposed project.	NI	No mitigation required.

Significance Determinations:
- NI = No Impact
- LS = Less-Than-Significant Impact (no mitigation required)
- LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
- SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
- SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

TABLE 1-2 (Continued)
SUMMARY OF IMPACTS AND MITIGATION MEASURES

IMPACT	Significance Determination	Mitigation Measure or Improvement Measure
Third Street Plaza Variant, SEIR Chapter 8		
Wind		
All impacts, significance determinations, mitigation measures, and improvement measures the same as listed above for the proposed project, except for Impact WS-1 and Impact C-WS-1, which are replaced with the impacts shown below.		
Impact V-WS-1: The variant would not alter wind in a manner that would substantially affect off-site public areas.	LS	No mitigation required.
Impact V-C-WS-1: The variant, in combination with cumulative development, would not alter wind in a manner that would substantially affect off-site public areas.	LS	No mitigation required.

Significance Determinations:
- NI = No Impact
- LS = Less-Than-Significant Impact (no mitigation required)
- LSM = Less-Than-Significant Impact with Mitigation (less than significant or potentially significant impact, but can be reduced to less than significant with mitigation)
- SUM = Significant and Unavoidable Impact with Mitigation (significant or potentially significant unavoidable impact, even with feasible mitigation)
- SU = Significant and Unavoidable Impact (Significant or potentially significant unavoidable impact, and no feasible mitigation available)

CHAPTER 2
Introduction

2.1 Purpose of This SEIR

This Subsequent Environmental Impact Report (SEIR) provides environmental review and analysis of the proposed multi-purpose event center and mixed-use development on Blocks 29-32 in the Mission Bay South Redevelopment Plan Area of San Francisco (proposed project). This chapter provides background information and an explanation of how this SEIR satisfies the requirements of the California Environmental Quality Act (CEQA), the governing legislation for this report. Details of the proposed project, including the project's location, objectives, and characteristics that form the basis of the SEIR environmental analysis, are presented in Chapter 3, Project Description.

The San Francisco Office of Community Investment and Infrastructure (OCII), as lead agency responsible for administering the environmental review for private projects in the Mission Bay North and South Redevelopment Plan Area of San Francisco, has determined that under CEQA, an environmental impact report (EIR) is required for the proposed project. CEQA requires the preparation of an EIR when a proposed project could result in significant, adverse effects on the physical environment. This SEIR has been prepared in compliance with CEQA (California Public Resources Code, Sections 21000 *et seq.*) and the *CEQA Guidelines*. It is an informational document for use by governmental agencies and the public to aid in the planning and decision-making process by disclosing the physical environmental effects of the project and identifying possible ways of reducing or avoiding its potentially significant impacts.

CEQA requires that before a decision can be made to approve a project that would pose potential adverse physical effects, an EIR must be prepared that fully describes the environmental effects of the project. The EIR is a public information document which identifies and evaluates potential environmental impacts of a project, recommends mitigation measures to lessen or eliminate significant adverse impacts, and examines feasible alternatives to the project. The information contained in the EIR must be reviewed and considered by the OCII and by any responsible agencies (as defined in CEQA) prior to a decision to approve, disapprove, or modify the proposed project.

The state *CEQA Guidelines* (California Code of Regulations, Title 14, Division 6, Chapter 3, Sections 15000 *et seq.*) help define the role and content of an EIR as follows:

- **Informational Document.** An EIR is an informational document that will inform public agency decision-makers and the public of the significant environmental effect(s) of a project, identify possible ways to minimize the significant effects, and describe reasonable alternatives to the project. The public agency shall consider the information in the EIR along with other information that may be presented to the agency (Section 15121[a]).

- **Standards for Adequacy of an EIR.** An EIR should be prepared with a sufficient degree of analysis to provide decision-makers with information that enables them to make an informed decision that takes account of environmental consequences. An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in light of what is reasonably feasible. Disagreement among experts does not make an EIR inadequate, but the EIR should summarize the main points of disagreement among the experts. The courts have looked not for perfection but for adequacy, completeness, and a good faith effort at full disclosure (Section 15151).

The *CEQA Guidelines*, Section 15382, define a significant effect on the environment as "a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project…." Therefore, in identifying the significant impacts of the project, this SEIR describes the potential for the project to result in substantial physical effects within the area affected by the project and identifies mitigation measures that would avoid, reduce, or otherwise alleviate those effects. See Chapter 5, Section 5.1, Impact Overview, for further description of the approach to analyzing environmental impacts and identifying mitigation measures presented in this SEIR.

OCII, as the CEQA lead agency, has entered into an agreement with the San Francisco Planning Department's Environmental Planning Division to assist in the preparation of the SEIR for this project.

2.2 CEQA Environmental Review

The CEQA Guidelines Section 15160 provides for variations in EIRs so that environmental documentation can be tailored to different situations and intended uses, and these variations are not exclusive. As described below, this SEIR relies on several variations of EIRs, including a *project* EIR, a *program* EIR, a *redevelopment plan* EIR, a *subsequent* EIR, and a *focused* EIR.

This SEIR is a *project* EIR that examines the environmental impacts of a specific development project, consistent with CEQA Guidelines Section 15161. This project EIR is tiered from a previously certified *program* EIR in accordance with the CEQA Guidelines Section 15168(c), which provides for environmental review of subsequent activities under the same program. The proposed project — the event center and mixed use development at Mission Bay Blocks 29-32 — is a subsequent activity under the Mission Bay South Redevelopment Plan. Environmental review of the Mission Bay South Redevelopment Plan was completed in the program EIR, *Mission Bay Final Subsequent Environmental Impact Report* (Mission Bay FSEIR),[1] certified in

---

[1] City and County of San Francisco and San Francisco Redevelopment Agency, 1998. *Final Mission Bay Subsequent Environmental Impact Report*. Planning Department File No. 96.771E, San Francisco Redevelopment Agency Case No. ER 919-97, State Clearinghouse No. 97092068. Certified September 17, 1998.

September 1998. The Mission Bay FSEIR is a *program* EIR under CEQA Guidelines Section 15168 and a *redevelopment plan* EIR under CEQA Guidelines Section 15180. The Mission Bay FSEIR analyzed the environmental impacts associated with the development program proposed for the entire Mission Bay Redevelopment Plan Area, including the program under the Mission Bay South Redevelopment Plan, which includes development in Blocks 29-32. Thus, under CEQA, the proposed project at Blocks 29-32 is considered a subsequent activity under the Mission Bay South Redevelopment program, and this SEIR evaluates the environmental effects of the proposed project relative to the program-level impact analysis in the certified Mission Bay FSEIR.

This SEIR is a *subsequent* EIR to the Mission Bay FSEIR pursuant to CEQA Guidelines Section 15162, which states that a subsequent EIR is required if the lead agency determines that the proposed project could result in any of the following conditions:

- Substantial changes are proposed in the project that will require major revisions of the previous EIR,
- Substantial changes have occurred with respect to the circumstances under which the project is undertaken, or
- New information of substantial importance, which was not known and could not have been known at the time of certification of the previous EIR, shows that the project could have one or more significant effects not discussed in the previous EIR, significant effects previously examined will be substantially more severe than shown in the previous EIR, mitigation measures or alternatives previously found not to be feasible would in fact be feasible and would substantially reduce one or more significant effects, or mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects.

OCII has determined that one or more of these conditions have been met for the proposed project, and that a *subsequent* EIR is therefore warranted, including the fact that the proposed project would result in new significant impacts and substantially more severe significant impacts than previously identified in the Mission Bay FSEIR.

Furthermore, this SEIR is a *focused* EIR, in accordance with CEQA Guidelines Sections 15063(b)(1)(C) and 15168(d)(1). An Initial Study on the proposed project was published on November 19, 2014 (see Appendix NOP of this SEIR), and it identifies which of the project's effects were adequately examined in the Mission Bay FSEIR and which topics warrant more detailed environmental analysis. Thus, this SEIR concentrates the environmental analysis on those topics identified in the Initial Study with the potential to have either new significant effects or substantially more severe significant impacts than were previously identified in the Mission Bay FSEIR under the currently proposed project at Blocks 29-32. The remaining environmental topics, as documented in the Initial Study, were determined to have no new or more severe significant environmental effects than what was previously identified in the Mission Bay FSEIR, and these topics are not analyzed in this SEIR.

2.3 Mission Bay Final Subsequent EIR

2.3.1 Mission Bay Redevelopment Plan Environmental Review

On August 23, 1990, the San Francisco Board of Supervisors certified the *Mission Bay Final Environmental Impact Report* (the "1990 FEIR").[2] The 1990 FEIR assessed the development program that was ultimately adopted as the *Mission Bay Plan, an Area Plan of the San Francisco General Plan*. This development program was never implemented. In 1996–1997, the former San Francisco Redevelopment Agency, with Catellus Development Corporation as project sponsor, proposed a new project for the Mission Bay area, consisting of two separate redevelopment plans (*Mission Bay North Redevelopment Plan* and *Mission Bay South Redevelopment Plan*, "North Plan" and "South Plan" or, collectively, the "Plans") in two redevelopment project areas separated by the China Basin Channel (also known as Mission Creek).

On September 17, 1998, the San Francisco Planning Commission and the Redevelopment Agency Commission certified the *Mission Bay Final Subsequent Environmental Impact Report* (Mission Bay FSEIR). The Mission Bay FSEIR analyzed reasonably foreseeable development under the Plans. It incorporated by reference information from the original 1990 FEIR that continued to be accurate and relevant for analysis of the Plans. Thus, the 1990 FEIR and the Mission Bay FSEIR together constitute the environmental documentation for the Plans. The 1990 FEIR and Mission Bay FSEIR are program EIRs under CEQA Guidelines 15168 and redevelopment plan EIRs under CEQA Guidelines Section 15180.

The former Redevelopment Agency Commission adopted the North and South Plans on September 17, 1998, along with the Mission Bay North Owner Participation Agreement (as subsequently amended, the "North OPA") and Mission Bay South Owner Participation Agreement (as subsequently amended, the "South OPA"), which are agreements between the former Redevelopment Agency, now OCII as successor to the Redevelopment Agency, and the Mission Bay Master Developer (originally Catellus Development Corporation and now FOCIL-MB, LLC, the successor to Catellus Development Corporation).[3]

The North and South OPAs incorporated into the Plan the mitigation measures identified in the Mission Bay FSEIR and adopted by the former Redevelopment Agency Commission at the time of Plan approval.[4] As authorized by the Plans, the former Redevelopment Agency Commission simultaneously adopted design guidelines and standards governing development, contained in companion documents, the Design for Development for the Mission Bay North Project Area (the "North Design for Development") and the Design for Development for the Mission Bay South Project Area (the "South Design for Development"), respectively.[5] The San Francisco Board of Supervisors adopted the North Plan on October 26, 1998, and the South Plan on November 2, 1998.[6]

2 Planning Department Case No. 86.505E.
3 Resolution No. 191-98, and No. 188-98, respectively.
4 North and South OPAs, Attachment L.
5 Resolution No. 191-98 and Resolution No. 186-98, respectively.
6 Ordinance No. 327098 North and South OPAs, Attachment L and Ordinance No. 335-98, respectively.

The South OPA has been amended four times, the first amendment dated February 17, 2004, the second dated November 1, 2005, the third dated May 21, 2013, and the fourth dated June 4, 2013.

The Redevelopment Agency has prepared nine addenda to the Mission Bay FSEIR (completed between 2000 and 2013) for specific developments within Mission Bay that required additional environmental review of specific issues beyond those that were covered in the Mission Bay FSEIR. These addenda are as follows:

- The first addendum, dated March 21, 2000, analyzed the ballpark parking lots.
- The second addendum, dated June 20, 2001, addressed Infrastructure Plan revisions related to the 7th Street bike lanes and relocation of a storm drain outfall.
- The third addendum, dated February 10, 2004, addressed revisions to the South Design for Development with respect to the maximum allowable number of towers, tower separation, and required setbacks.
- The fourth addendum, dated March 9, 2004, addressed revisions to the South Design for Development with respect to the permitted maximum number of parking spaces for biotechnical and similar research facilities, and specified certain changes to the North OPA to reflect a reduction in permitted commercial development and associated parking.
- The fifth addendum, dated October 4, 2005, addressed revisions to the University of California San Francisco (UCSF) Long Range Development Plan and the Final Environmental Impact Report for the Long Range Development Plan.
- The sixth addendum, dated September 10, 2008, addressed revisions of the UCSF Medical Center at Mission Bay.
- The seventh addendum, dated January 7, 2010, analyzed the development of a Public Safety Building on Mission Bay Block 8 to accommodate the headquarters of the San Francisco Police Department, a local Police Station, and new San Francisco Fire Department station, and adaptive reuse of historic Fire Station 30, along with parking for these uses.
- The eighth addendum, dated May 15, 2013, analyzed amendments to the South Plan and South OPA to allow a mix of hotel, residential, and retail use on Block 1.
- The ninth addendum, dated May 30, 2013, addressed development on Block 7E for a facility housing extended stay bedrooms and associated facilities to support families of patients receiving medical treatment primarily at UCSF's medical facilities.

In all of these cases, an addendum was sufficient to satisfy CEQA environmental review requirements. The proposed event center and mixed use development at Blocks 29-32 is the first development project under the adopted Plans in which conditions triggering a Subsequent or Supplemental EIR are met. This SEIR is the first project-level environmental impact report tiering from the Mission Bay FSEIR.

2.3.2 Successor Agency/Oversight Board Jurisdiction

The former San Francisco Redevelopment Agency, along with all 400 redevelopment agencies in California, was dissolved on February 1, 2012, by order of the California Supreme Court in a decision issued on December 29, 2011 (*California Redevelopment Association et al. v. Ana Matosantos*). On June 27, 2012, the California Legislature passed and the Governor signed Assembly Bill (AB) 1484, a bill making technical and substantive changes to AB 26, which was the original bill that resulted in the dissolution of all redevelopment agencies. (Together, AB 26 and AB 1484 are referred to as "Dissolution Law," which is codified at California Health and Safety Code Sections 34161 – 34191.5). In response to the Dissolution Law, the San Francisco Office of Community Investment and Infrastructure (OCII) became the Successor Agency to the Redevelopment Agency of the City and County of San Francisco. Pursuant to state and local legislation, OCII is governed by two bodies, the Oversight Board of the Successor Agency and the Commission on Community Investment and Infrastructure.

On January 24, 2012, the Board of Supervisors of the City and County of San Francisco adopted Resolution No. 11-12 in response to the Supreme Court's December 29, 2011 decision upholding AB 26. On September 25, 2012, the Board of Supervisors adopted Ordinance No. 215-12 in response to the Governor's approval of AB 1484. Together, these two local laws ("Successor Agency Legislation") create the governing structure of the OCII. Pursuant to the Successor Agency Legislation, the Commission on Community Investment and Infrastructure exercises certain land use, development and design approval authority for the Mission Bay North and Mission Bay South Plan areas (and other major approved development projects), and the Oversight Board exercises certain fiscal oversight and other duties required under the Dissolution Law (see Chapter 3 for a discussion on project approvals). As the public agency responsible for carrying out or approving a project under the Successor Agency Legislation, OCII is the designated lead agency under CEQA for this SEIR.

2.3.3 Summary of the Mission Bay FSEIR

As described above, this SEIR is a *subsequent* EIR to the Mission Bay FSEIR certified in 1998, as supplemented by the nine addenda issued from 2000 to 2013. The Mission Bay FSEIR evaluated the potential environmental effects of the development of the Mission Bay plan area, approximately 303 acres in size and located near the eastern shoreline of San Francisco, generally south of Townsend Street, east of Seventh Street and Interstate 280, and north of Mariposa Street and straddling China Basin Channel. As discussed above, the Mission Bay FSEIR analyzed the combined North and South Plans (the Plans).

In general, the combined Plans defined as the project description and analyzed in the Mission Bay FSEIR consisted of the following: 1.5 million gross square feet of retail space; 43-acre new site for the University of California San Francisco (UCSF) containing 2.65 million gross square feet of instruction, research and support space, and a space to be donated for a public school; a mix of 5.56 million gross square feet of research and development, light manufacturing, and office space surrounding the UCSF site to the west, south, and east; a 500-room hotel between Third and

Fourth Streets south of China Basin Channel; police and fire stations; off-street parking accessory to most uses; about 47 acres of open space, including 8 acres within the UCSF site; and approximately 6,090 residential units (located on the north and south sides of China Basin Channel). The project site at Blocks 29-32 was identified as proposed commercial industrial/retail uses under the South Plan. The Plans included expansion and/or improvement of infrastructure in the Plan area, including a revised transportation network, new east-west streets, extension of Owens Street north and east to connect to Third Street, realignment and extension of Fourth Street south to Mariposa; expansion of the high- and low-pressure water systems; expansion of the combined sewer system and creation of a separate stormwater-only system for the central part of Mission Bay South; realignment of railroad tracks accessing Pier 80; improvement of rail crossings; and a pedestrian bridge across China Basin Channel. As described below, the Mission Bay North Plan and Mission Bay South Plan ultimately adopted reflected a mix of land uses covered by a combination of variants analyzed in the Mission Bay FSEIR. As a result, the adopted Plans vary from the original project description described in this paragraph.

The Mission Bay FSEIR analyzed the environmental impacts associated with implementation of the Plans and identified a suite of mitigation measures for avoiding or reducing significant environmental impacts. A topic-by-topic summary of impacts and mitigation measures presented in the Mission Bay FSEIR is included under each respective environmental topic in this SEIR and associated Initial Study. (Appendix MIT of this SEIR lists all of the mitigation measures from the FSEIR and indicates those applicable to the proposed project.)

In addition to analyzing the impacts of the proposed Plans, the Mission Bay FSEIR analyzed six variants and one combination of various components of the variants and the Plans. The variants were slight modifications to the Plans that were under consideration by the project sponsor and typically modified one limited area or aspect of the Plans. The variants analyzed in the FSEIR consisted of the following: Terry A. Francois Boulevard Variant; Esprit Commercial Industrial/Retail Variant; No Berry Street Crossing Variant; Modified No Berry Street Crossing Variant; Mission Bay North Retail Variant; and Castle Metals Block Commercial Industrial/Retail Variant. It also covered a combination of variants to the Plans (described below).

As required under CEQA, the Mission Bay FSEIR identified and analyzed alternatives that would reduce or avoid identified significant impacts of the Plans and meet most of the Plans objectives. The three alternatives analyzed included: No Project Alternative; Redevelopment North of Channel/Expected Growth South of Channel Alternative; and Residential/Open Space Alternative. The FSEIR determined that all of the alternatives would result in the same significant unavoidable adverse impacts identified for the Plans (i.e., traffic, vehicular air pollution emissions, potential combined toxic air contaminants, cumulative hazardous waste generation and disposal, and cumulative water quality), but the severity of the impacts would be somewhat lessened although not to a less-than-significant level. The Residential/Open Space Alternative was identified as the environmentally superior alternative in the Mission Bay FSEIR.

Following certification of the Mission Bay FSEIR and as part of the approval process for the Mission Bay Plans, CEQA Findings were adopted by the City and County of San Francisco.[7] The CEQA Findings describes the land use program that was ultimately adopted by the former Redevelopment Agency Commission. The adopted Mission Bay Plan was developed from a combination of the proposed Plans as described in the Mission Bay FSEIR plus a combination of plan variants. Specifically, the adopted Mission Bay Redevelopment Plan was based on the plan description in the Mission Bay FSEIR, plus Variant 1 (Terry A. Francois Boulevard Variant/Expanded Bayshore Open Space Proposal), Variant 2 (Esprit Commercial Industrial/Retail Variant), Variant 3A (Modified No Berry Street Crossing Variant), and Variant 5 (Castle Metals Block Commercial Industrial/Retail Variant). The adopted plan was described in the Mission Bay FSEIR Chapter III, Project Description, and Section VII.G, Combination of Variants Currently under Consideration by the Project Sponsors. The Mission Bay FSEIR concluded that the environmental effects of the combination of plan variants would be similar to those of the proposed plan, and consequently, would not result in any new or substantially more severe significant effects identified in the Mission Bay FSEIR for the proposed plan.

2.4 CEQA Process

Consistent with CEQA Guidelines Sections 15080 to 15097, the CEQA process has multiple phases, many of which require notification to and comments from the public. The main steps in this process are described below.

2.4.1 Previous Project Proposal for an Event Center and Mixed-Use Development at Piers 30-32 and Seawall Lot 330

On December 5, 2012, the San Francisco Planning Department issued a Notice of Preparation (NOP) of an EIR on an event center and mixed-use development on Piers 30-32 and Seawall Lot 330 (Case No. 2012.0178E) as proposed by GSW Arena LLC, the same project sponsor as for the currently proposed project in Mission Bay. The San Francisco Planning Department held a public scoping meeting on Tuesday, January 15, 2013 at the Delancy Street Foundation at 600 The Embarcadero, San Francisco on this project, and numerous comments were received. However, a Draft EIR was never issued on this project, and the project sponsor has withdrawn its application for the project on Piers 30-32 and Seawall Lot 330. The currently proposed project at Mission Bay Block 29-32 replaces this previous proposal. See Chapter 7, Alternatives, for further description of this previous proposal.

2.4.2 Notice of Preparation and Public Scoping

On November 19, 2014, the OCII sent a NOP to governmental agencies, organizations, and persons interested in the proposed project to initiate the 30-day public scoping period for this SEIR, which ended on December 19, 2014 (see Appendix NOP-IS). The NOP notified and

7 City and County of San Francisco, Board of Supervisors Resolution No. 854-98, October 30, 1998.

informed agencies and interested parties about the proposed project and the OCII's decision to prepare an SEIR; it included a request for agencies and the public to comment on environmental issues that should be addressed in the SEIR. The NOP is included as Appendix NOP-IS of this SEIR. The OCII held a public scoping meeting on Tuesday, December 9, 2014 at the Mission Creek Senior Community, 225 Berry Street, San Francisco to receive oral comments on the scope of the SEIR. The comments received in response to the NOP during the public scoping period, both written and oral, are available for review at the San Francisco Planning Department as part of Case File No. 2014.1441E. The OCII has considered all comments made by the public and agencies in preparing the Draft SEIR for the proposed project. See Section 2.5 below for a summary of the scoping comments received since publication of the NOP.

2.4.3 Draft SEIR Public Review

This Draft SEIR is being circulated to governmental agencies and to interested organizations and individuals that may wish to review and comment on the document. *CEQA Guidelines* Sections 15086(c) and 15096(d) call for responsible agencies or other public agencies to provide comment on those project activities within an agency's area of expertise or project activities that are required to be carried out or approved by the agency, and the agency should support those comments with either oral or written documentation. Publication of the Draft SEIR marks the beginning of a 45-day public review period, during which time the OCII and San Francisco Planning Department will accept comments on the Draft SEIR. The public review period for the Draft SEIR on the Event Center and Mixed-use Development at Mission Bay Blocks 29-32 is from June 5, 2015 through July 20, 2015.

Copies of the Draft SEIR are available for public review at the following locations: (1) Office of Community Investment and Infrastructure, One South Van Ness Avenue, San Francisco, California; (2) San Francisco Planning Department, 1660 Mission Street, 1st Floor, Planning Information Counter, San Francisco, California; (3) San Francisco Main Library, 100 Larkin Street, San Francisco, California and (4) Mission Bay Library, 960 Fourth Street, San Francisco, California. The Draft SEIR is also available on the OCII's website at http://www.sfocii.org/index.aspx?page=61 or the Planning Department's website at http://www.sf-planning.org/sfceqadocs.

All documents referenced in this Draft SEIR are available for review at the San Francisco Planning Department, 1650 Mission Street, Suite 400, San Francisco, CA 94103 as part of case file number 2014.1441E; the documents can also be accessed at the following website: http://gsweventcenter.com/. The distribution list for the Draft SEIR is also available for review at this location.

Written comments on the Draft SEIR should be sent by mail to: Tiffany Bohee, OCII Executive Director, c/o Brett Bollinger, San Francisco Planning Department, 1650 Mission Street, Suite 400, San Francisco, CA 94103; or by email to: warriors@sfgov.org.

During the 45-day public review period for the Draft SEIR, the OCII will conduct a public hearing to receive oral comments on the Draft SEIR. The public hearing is scheduled to be held before the OCII Commission on June 30,2015 at City Hall, Room 416, 1 Dr. Carlton B. Goodlett Place, San Francisco, California beginning at 1 p.m. or later.

2.4.4 Responses to Comments Document and Final SEIR

Following the close of the public review period on the Draft SEIR, the OCII will prepare a Responses to Comments document. Written and oral comments received on the Draft SEIR will be addressed in the Responses to Comments document, which will be released for public review and circulated to all persons, organizations, and agencies submitting comments on the Draft SEIR. The Responses to Comments document together with the Draft SEIR constitute the Final SEIR. The OCII Commission will hold a public hearing to consider the adequacy of the Final SEIR in complying with the requirements of CEQA. If the OCII Commission finds that the Final SEIR complies with CEQA requirements, it will certify the Final SEIR.

The OCII must consider the certified Final SEIR before making a decision to approve, disapprove, or modify the project. CEQA requires the adoption of findings prior to approval of a project for which a certified EIR identifies significant environmental effects (*CEQA Guidelines*, Sections 15091 and 15092). If the SEIR identifies significant adverse impacts that cannot be mitigated to less-than-significant levels, the findings must include a statement of overriding considerations for those impacts (*CEQA Guidelines*, Section 15093[b]). See Chapter 5, Section 5.1 for a description of impact significance determinations.

2.5 Public Participation

The *CEQA Guidelines* encourage public participation in the planning and environmental review processes. As part of the CEQA process, OCII provides formal opportunities for the public to present comments and concerns regarding the planning and environmental review process as follows: (1) during the public scoping period after publication of the NOP and before publication of the Draft SEIR, (2) during the Draft SEIR public review period after publication of the Draft SEIR, and (3) at a public hearing before the OCII Commission after publication of the Final SEIR when the Commission is considering certification of the Final SEIR. Written public comments may be submitted to the OCII directly, or on their behalf through the San Francisco Planning Department during the specified public review and comment periods, and both written and oral comments may be presented at public hearings held specifically for the proposed project. This CEQA public participation process is separate from any public participation or citizen advisory meetings conducted by the project sponsor or other Mission Bay activities.

2.6 Summary of Scoping Comments

Summaries of relevant comments received during the public scoping period are presented in **Tables 2-1** and **2-2**. Table 2-1 includes comments that are addressed within each chapter or section of the SEIR, as indicated in the first column of the table. Table 2-2 includes comments that are addressed in the Initial Study (see Appendix NOP-IS).

TABLE 2-1
SUMMARY OF SCOPING COMMENTS ADDRESSED IN THE SEIR

SEIR Section	Comment
Chapter 3, Project Description	The Project Description should include explanation and/or descriptions of: • Retail Gatehouse: Present additional design and programmatic information about the Gatehouse site element including the location of doors, vertical circulation elements, public restrooms (if any), solid vs. void elements, lighting and signage, as it will be located within the UCSF view easement. • Parking: Describe parking in sufficient detail including comprehensive discussion regarding parking operations during events. Identify how many on-site parking spaces would be available to event patrons vs. to the users of the office and retail space. • Outdoor Events: Include information on daily/annual event dates and time schedule for outdoor events; decibel limits and monitoring; exterior lighting locations and light levels, audio/visual design including any exterior monitors/LED panels, and other environmental elements with potential to impact occupants of the UCSF campus, including sensitive receptors in nearby campus housing, medical facilities or operations. • Exterior Lighting Plan: Discuss the project's exterior site and building lighting plan, including illuminated exterior signage (i.e., LED) billboards, event panels and other light producing elements. • Project Approvals: More explanation concerning the approvals sought should be provided in the SEIR. Clarify what specific amendments would be sought to the Mission Bay South Design for Development, and what modifications to Mission Bay South Signage Master Plan and Mission Bay South Streetscape Plan would be needed. Regarding modifications to the Mission Bay South Design for Development, the proposed project would seek: (1) a height increase for the event center to be located on Blocks 30 and 32, (2) a second 160-foot-tall tower on the site where only one 160-foot tower is allowed; (3) exceptions to the bulk limits and tower separation for many of the structures on the site; (4) exceptions to the required view corridor in the center of the project site, east of Campus Way; and (5) exceptions to parking and loading requirements. • Project Approvals: The SEIR should state that approval is needed from the University of California to release the Warriors from a view easement located along the Campus Way axis, extending 100 feet into the site from Third Street, to enable the Warriors to develop within this view easement. • Project Approvals: Explain the "Governor's approval of project sponsor's Assembly Bill 900 (AB 900) application," its purpose, practical application, its benefit to the project, and any consequences for member of the public, including UCSF.
Chapter 4, Plans and Policies	• Identify City Ordinances that are superseded. SEIR should identify all planning ordinances since 1998 with which the project will not comply and explain the consequences of non-compliance so that the deficiencies in the project are clear.
Section 5.1, Impact Overview	The SEIR should include an analysis of: • Approach: Explain in detail the basis for this proposed approach, and to ensure the project SEIR fully discloses and analyzes all new or more severe significant environmental effects than those analyzed in the previous environmental documentation. • Cumulative: In Initial Study, the following plans were not discussed: Western SOMA Community Plan, Central Corridor Plan, Hunters Point Redevelopment Plan. Need to be incorporated in order to make sure the plan works not just for the people who will be coming into and out of the arena, but the people that surround the arena. • Cumulative: Consider all residential and commercial projects in Environmental Planning's pipeline and planned to be in construction during time of the Warriors project. Daggett Place will have over 400 units, and proposed residential housing at the Corovan site and at 1601 Mariposa; in total over a 1,000 residential units.

TABLE 2-1 (Continued)
SUMMARY OF SCOPING COMMENTS ADDRESSED IN THE SEIR

SEIR Section	Comment
Section 5.2, Transportation and Circulation	The SEIR/ Traffic Impact Study should include: • Vicinity, regional, and site plan and site circulation maps. • Project related trip generation, distribution, and assignment, with assumptions supported with appropriate documentation. • Average daily traffic, a.m. and p.m. peak hour volumes, and LOS on all roadway where impacts may occur for existing, existing plus project, cumulative, and cumulative plus project. • Cumulative analysis should consider all existing plus future traffic generating developments. • Identify project contribution to area traffic and degradation to existing/cumulative LOS. • Include turning traffic per study intersection for all scenarios both during game and commute traffic periods. • Event center should assume year round operation at full seat capacity during both game and commute traffic periods. • Schematic illustration of traffic conditions including project site and area roadways, trip distribution percentages and volumes as well as intersection geometrics for all scenarios. • Evaluation of project consistency with the General Plans Circulation Element and Congestion Management Agency's Congestion Management Plan (CMP).
	The Transportation Management Plan (TMP) component of the Project Description should address the following: • TMP should be required as a condition of approval. • TMP should include discussion about traffic management, traffic routing, use of PCOs, location of parking facilities, and parking operations management. • Parking, traffic and transit assumptions used to develop TMP analyses. • Specific measures to reduce traffic, planned traffic management of pre- and post-events, traffic routing, lane closures, use of Parking Control Officers (PCOs) and other measures to ensure project traffic and transit impacts will not affect operations at critical facilities, including UCSF. • Identify when operational measures are triggered. • Include locations and quantities of parking spaces needed to serve GSW project. • Don't assume use of UCSF's parking facilities by the GSW project since there is no agreement. UCSF facilities should not be listed in TMP unless an agreement with UCSF is reached. • TMP does not presently consider traffic flow of event patrons parked at locations other than the event center. The TMP should consider how traffic will be managed at other parking locations. • TMP/SEIR should consider how traffic will be managed to facilitate traffic, transit, pedestrian and bicycle flow for adjacent and nearby uses that are not destined for the event center, including UCSF patients, visitors, employees and residents and other nearby residents and visitors to nearby uses. • UCSF encourages smart parking management (e.g., patrons likely to arrive from north receive parking spaces to north of project site; patrons likely to arrive from south receive parking spaces to south of project site). • TMP should identify mechanisms for monitoring traffic impacts to surrounding streets and impacts to UCSF campus, including impacts to private vehicles, transit, emergency vehicles, UCSF shuttles, pedestrians and bicyclists.

TABLE 2-1 (Continued)
SUMMARY OF SCOPING COMMENTS ADDRESSED IN THE SEIR

SEIR Section	Comment
Section 5.2, Transportation and Circulation (cont.)	• Any modifications to the TMP should require a public process for stakeholders, including UCSF, to comment. • Measures contained in the TMP that are relied upon as mitigation for the project's impacts must be binding and enforceable. • Any road closures to vehicle or pedestrian traffic must have provisions to allow residents of the Madrone and Radiance communities (on Mission Bay Boulevard North) to get in and out of the general area. • The easement area between the Madrone building and Radiance building, into which Bridgeview [Way] runs must have traffic management control in place to close off vehicle and pedestrian traffic except to residents of these two communities. • Bridgeview [Way] north of the arena must be closed off to all foot traffic and enforced to avoid late night noise problems. • PCOs supporting the Giants games are ineffective on Third Street currently, so hearing that PCO are a big part of the solution to the traffic issues on Third Street is not encouraging. PCOs need to be qualified and aggressively control vehicle and foot traffic with ability to change lights when necessary. • Need more details on new shuttles from Van Ness, Ferry Building and 16th Street (how big and will they be of a sufficient number/size to make a difference?). Who is paying for the shuttles, MUNI, tax payers, Warriors fans, or Warriors? • Mission Bay Master Plan has no provision for resident parking stickers. Residents living on Mission Bay Boulevard North need an exception on resident parking stickers. • Warriors plan does not address the needs of the people living in the area to get in and out; people living in the area will be trapped, as they are when the Giants have a ball game.
	The SEIR should use the Transportation Management Plan (TMP) and analyze: • SEIR should include parking, traffic and transit assumptions used to develop TMP and SEIR analyses. • SEIR should include the traffic, parking and transit assumptions used to develop the TMP and SEIR analyses, and include specifics about measures to reduce traffic, planned traffic management of pre- and post-events, traffic routing, lane closures, use of Parking Control Officers (PCOs) and other measures to ensure project traffic and transit impacts will not affect operations at critical facilities, including UCSF. • TMP and SEIR should identify when operational measures are triggered. • SEIR should analyze whether measures in the TMP would be effective in reducing vehicle trips, managing traffic and circulation impacts, whether modifications to the TMP should be made, or whether the project should be modified to eliminate or minimize significant impacts. • SEIR should analyze the effect of any TMP-proposed lane closures on vehicle, transit, pedestrian, and bicycle circulation. • SEIR should evaluate effectives of the TMP; identify what significance standard applies in evaluating the effectiveness of the TMP and in determining whether mitigation measures are needed.
	The SEIR analysis should include: • Construction Impacts on State Highway System: Include impacts from construction traffic on state highway system. • Construction Effects on Transportation: Removal of 350,000 cubic yards of soil from the site will add approximately 10,000 – 20,000 heavy truck trips to the neighboring streets, depending on the capacity of the dump trucks used for hauling. The traffic and safety impacts of these trips should be analyzed in SEIR.

TABLE 2-1 (Continued)
SUMMARY OF SCOPING COMMENTS ADDRESSED IN THE SEIR

SEIR Section	Comment
Section 5.2 Transportation and Circulation (cont.)	The SEIR analysis should include: • Construction Assumptions: Construction-related assumptions should be based on conservative assumptions that disclose impacts, including for road closures, staging, construction employee parking, etc. on surrounding streets. • Cumulative Construction: Construction associated with electrification of Caltrain and construction of new commercial space will impact traffic well past the targeted Warriors opening date. • Identify what Transportation Demand Management (TDM) measures are proposed to reduce vehicular travel in the area. • TDM measures should be required as mitigation measures and as conditions of approval. • Secondary impacts to pedestrian and bicyclists from any traffic impact mitigation measures should be analyzed. • Parking, Traffic and Transit Assumptions: Include parking, traffic and transit assumptions used to develop traffic analyses. • Project Traffic at Off-site Parking Locations: TMP does not consider traffic flow of event patrons parked at locations other than at the event center. SEIR should consider how traffic will be managed at other parking locations. • Non-Project Traffic/Transit/Pedestrian/Bicycle Flow: Consider how traffic will be managed to facilitate traffic, transit, pedestrian and bicycle flow for adjacent and nearby uses that are not destined for the event center, including UCSF patients, visitors, employees and residents and other nearby residents and visitors to nearby uses. • Transportation/Circulation Impacts to FibroGen [409 and 499 Illinois Street]: Disclose transportation and circulation impacts to FibroGen, given the primary GSW access for cars and trucks is via 16th Street, as is FibroGen's main artery for access to its own parking garage. • Project Impacts to Public Transit: Disclose impacts to public transit, given currently constrained nature, and consider any existing and future system constraints. • Avoid 16th Street. UCSF encourages east/westbound event traffic to be routed to the south of the UCSF Mission Bay campus site to the extent possible – i.e., onto Mariposa Street, rather than onto 16th Street which bisects the UCSF Mission Bay campus site and which will have a reduced vehicular capacity given the planned public transit-only lanes on 16th Street in the future. Avoid 16th Street during the 5 p.m. to 7 p.m. peak period when UCSF employees are leaving the site and an employee shift change occurs at the hospitals. • Off-Peak Period Traffic: Given the atypical characteristics of the proposed project, whereby a large number of vehicles is expected to arrive/leave the area in a relatively short amount of time, and the greatest amount of traffic generated by the Event Center is likely to occur outside of the 4 p.m. to 6 p.m. period, clearly identify the peak periods and what significance standard is appropriate to apply in this situation to determine the significance of traffic impacts. • Cumulative Impacts at MB South Intersections UCSF's recently certified 2014 LRDP FEIR identified potentially significant and unavoidable cumulative traffic impacts at several key intersections in the Mission Bay South Area that could result from events at the Warriors' Event Center. These impacts should be further analyzed in the SEIR.
	The SEIR cumulative analysis of UCSF/Mission Rock Project/AT&T events/Warriors project should include: • Identify the basis for assumptions regarding the frequency and times of day of dual events (i.e., events at Warriors' Event Center concurrent with events at AT&T Park). • Disclose cumulative impacts of use of UCSF hospital or other facilities when either or both Giants/Warriors games or other events occur at the same time.

TABLE 2-1 (Continued)
SUMMARY OF SCOPING COMMENTS ADDRESSED IN THE SEIR

SEIR Section	Comment
Section 5.2, Transportation and Circulation (cont.)	• Consider traffic volume increases associated with the Mission Rock project and future closure of Terry François Boulevard (when it is reconfigured when Mission Rock project is completed. • There will be increase in GSW project traffic on Mission Bay Blvd North with future closure of Terry François Boulevard when it is reconfigured when the Mission Rock project is completed.
	The SEIR analysis should include: • Taxi/Valet Exiting Plan. Provide comprehensive pedestrian exiting plan illustrating how taxi and valet parking along Terry François Blvd. will be accessed and announced. The elevator cores near the corners of South St. and Terry François Blvd. are not easily visible from the sidewalk. Unclear access to and from taxi and valet parking areas may result in patrons finding other locations to find taxis which may cause pedestrian flows through UCSF campus. • Quantitative Pedestrian Flow/Circulation Modeling: Conduct quantitative pedestrian flow/circulation modeling to validate the required size and location of pedestrian routes approaching and within the site to ensure that pedestrians will not spill over sidewalks into roadways and/or the UCSF campus, impacting campus operations, vehicular access or otherwise. • Pedestrian Barrier on 3rd Street. Request a pedestrian barrier along 3rd street within the central median be studied to mitigate pedestrian jay-walking across 3rd street onto the UCSF Mission Bay campus site. • Bicycle Facilities: Evaluate whether the event center will provide adequate bicycle facilities to promote access by bike, including wayfinding signage, valet service, bikeshare, and promotion of the Bay Trail for arena access. • Bicycle Parking Requirements: Current Planning Code for arena calls for bicycle parking spaces for 5% of venue capacity, of which 75% must be attended. If bicycle mode share assumptions are changed to 5-6%, which is plausible, there will be insufficient parking available under the terms of the 1998 FSEIR. The GSW design at Mission Bay should comply with current code by providing parking comparable to the earlier Piers 30-32 design. • Bicycle Parking and Pedestrian Improvements: Project should be encouraged to mitigate any transportation impacts through bicycle and pedestrian improvements and infrastructure, including new crosswalks, wider sidewalks, special signals, bike lanes or paths with color treatment or protection, signal synchronization and priority for users other than motorists, and on-site bicycle parking commensurate with expected bicycle mode share. SEIR should study project variants that consider a robust bicycle transportation plan in line with the City's own mode share goals. • Central Subway and Caltrain Electrification: SEIR will assume completion of the Central Subway and Caltrain electrification by the time the Warriors' proposed project is completed in 2018. This may be a faulty assumption, as the Central Subway is not scheduled for completion until 2019, and Caltrain Electrification is not scheduled to be completed until late 2020 at the earliest. Therefore, the potential impacts of the proposed project before these improvements are in place needs to be analyzed. • Travel Demand Assumptions: For the estimates of travel demand of Warriors games, data from Oracle Arena should not be used exclusively. Oracle Arena is located a distance from major employment centers, is accessed via a congested freeway, and has limited on-site pre-game dining options. Conversely, the proposed project is located adjacent to downtown San Francisco and will be providing thousands of square feet of new restaurant space. As such, it is likely that game patrons traveling to the project will arrive several hours prior to events and thus will overlap with the evening peak commute hours. Additional data from similar urban arenas (such as Staples Center in Los Angeles) should be reviewed.

TABLE 2-1 (Continued)
SUMMARY OF SCOPING COMMENTS ADDRESSED IN THE SEIR

SEIR Section	Comment
Section 5.2, Transportation and Circulation (cont.)	The SEIR analysis should include: • Travel Demand Assumptions: Given the proliferation of Uber and other so-called "ride-sharing" services, these modes of travel need to be accounted for in the trip generation and the site planning. • Mode Share: GSW indicate mode share will be 35% transit, 55% auto, 2% bike, 4% walk and 4% taxi/shuttle/etc., derived from Giants and Kings, however, Kings arena is located well outside downtown, and Giants ballpark seats more than twice and operates at different times in different seasons. Provide evidence for assumptions. Consider split data from SFMTA 2011 mode share survey for Zone 1 (5% bike mode share). • Mode Share: When Giants came, they said it was going to be a commuter-only park, with no parking - we all know what happened. So, recommend setting a lower goal on parking load (e.g., reduce from 55% to 25%) because you are going to go over it no matter what you do. • Bicycle Mode Share: The TMP assumes a 2% bicycle mode share for the GSW 2018 opening, despite Mission Bay's 5% bicycle mode share and City goals for 8% bicycle mode share by 2018 and 20% by 2020. SEIR should resolve the TDM mode share assumptions with existing data for the City and neighborhood and the City's goals for growing bicycle mode share by 2020. • Bicycle Mode Share: To account for more accurate mode share, rely on the Waterfront Transportation Assessment (WTA). WTA Phase 2 (SOMA/Mission Bay/Central Waterfront Transportation Needs and Solutions Analysis) should be used to determine real transportation impacts across all modes to achieve more realistic bicycle mode share. WTA estimates a 30% increase in total trips in Mission Bay, 20% of which are predicted to be by bike. • Caltrain Station: Recognize importance of Caltrain Station at 22nd Street. Trip from this station to the arena is roughly as long as trip from Montgomery BART to Giants ballpark. • Traffic Analysis to Account for UCSF Peak Evening Shifts. The analysis should consider the number of UCSF employees leaving/arriving from the UCSF campus, especially the employee shift change at the UCSF hospitals which would be coincident with Event Center patron arrivals for peak (evening) events. • Traffic Pinch Points in Mission Bay: Mission Bay has limited street capacity, with certain pinch points at the I-280 on/off ramps, the 16th Street / 7th Street intersection at the Caltrain crossing, and the Fourth Street and Third Street bridges. Interventions at these pinch points are critical to facilitating traffic flow in and out of Mission Bay. • Traffic Pinch Points: I-280/Mariposa interchange already challenging; addition of traffic from UCSF, and an additional traffic light between I-280 and 3rd Street will make this additionally difficult. • Impacts on I-80/I-280: Concerned about impacts on I-80 and I-280 on-ramp and off-ramp locations; suggest updated counts at on- and off-ramp locations, including special event data counts. • Project Impact on Emergency Vehicle Access/Response: Evaluate the extent to which patients in private vehicles and public transit to the UCSF Mission Bay campus site may be delayed or otherwise encounter difficulties reaching the hospital or emergency room due to Event Center traffic congestion on roadways, or queues on the I-280 off-ramp to Mariposa Street. Evaluate the extent to which emergency vehicles may be delayed reaching the hospital emergency room. Mitigation measures and/or improvement measures should be identified. • Project Impact on Emergency Vehicle Access/Response: The SEIR should evaluate the potential impacts on emergency response in the area, particularly given the project's proposal to close a portion of Third Street to through traffic after events, and given vehicular queues and traffic congestion that are likely to occur both before and after events. Even with parking control officers to direct traffic, UCSF is concerned that traffic

TABLE 2-1 (Continued)
SUMMARY OF SCOPING COMMENTS ADDRESSED IN THE SEIR

SEIR Section	Comment
Section 5.2, Transportation and Circulation (cont.)	The SEIR analysis should include: congestion may inhibit the movement of emergency vehicles needing to access the UCSF Children's Hospital emergency room, due to vehicular queues on streets as well as queues on the I-280 off-ramp to Mariposa Street. In addition, patients who need to each the hospital or emergency room may be in private vehicles, which would not have the benefit of sirens/lights to facilitate their movement through congested traffic. For these reasons, the potential for delay to hospital/emergency room access needs to be considered, as access must be unimpeded 24/7. • Event Center Light Impact on Operation of UCSF Helipad: Outdoor animated lighting, strobe lighting, or Hollywood-style search lights during special events, should be discussed and impacts on adjacent land uses analyzed, including potential impacts on operations of the new helipad located atop the Medical Center at Mission Bay. • Construction Effects on UCSF Helicopter Use. Analyze the potential for construction cranes to interfere with air medical access to the UCSF hospital helipad. Construction cranes for the proposed Warriors' project would be in or in close proximity to the UCSF helicopter flight paths as the UCSF hospital and helipad will be operational in February 2015. • Ferry Terminal: Addition of a new ferry terminal to support the event center worth considering; would relieve vehicular traffic and crowded MUNI system. • UCSF Parking Facilities: Do not assume use of UCSF's parking facilities by the GSW project since there is no agreement. • Parking Demand: Identify the parking demand resulting from the proposed project, particularly during events, and whether parking demand would be met by on- and off-site parking facilities. • On-Site Parking Supply: Lack of on-site parking will create the circulation of several thousand private vehicles with no place to park. • On-Site Parking Management/Use: Use smart parking management (patrons likely to arrive from north receive parking spaces to north of project site; patrons likely to arrive from south receive parking spaces to south of project site). • On-Site Parking Management/Use: Identify how many on-site parking spaces would be available to event patrons vs. to the users of the office and retail space. • Parking Supply/Demand Assessment: CEQA does not foreclose a detailed parking supply/demand study for planning and informational purposes, as well as analysis of queuing for parking spaces. EIR should include a parking supply/demand assessment and disclose any parking shortfalls, review area-wide parking conditions, the effects of vehicles circling looking for parking, and queues at all designed event parking facilities.
	The SEIR mitigation measures should include: • Project's fair share contribution, financing, scheduling, implementation responsibilities and lead agency monitoring should be fully disclosed for all proposed mitigation measures. • Required roadway improvements should be completed prior to issuance of Certificate of Occupancy. • Consider mitigation measures to reduce project impacts on I-80 and I-280. • Describe any pedestrian and bicycle mitigation measures and safety countermeasures needed to maintain and improve access to transit facilities and reducing vehicle trips and traffic impacts on State Highways. • Contraflow Lane Mitigation: Should traffic congestion warrant, the analysis should consider contraflow lanes as mitigation or improvement measures. One possibility is the coning of westbound Mariposa Street to temporarily enable three lanes westbound, rather than two lanes, to facilitate traffic flow onto I-280. This should be considered along with possible interventions on the I-280 onramp to facilitate traffic flow.

TABLE 2-1 (Continued)
SUMMARY OF SCOPING COMMENTS ADDRESSED IN THE SEIR

SEIR Section	Comment
Section 5.3, Noise	The SEIR should include an analysis of: • General: The SEIR should identify noise mitigation measures to reduce potentially significant noise impacts, including impacts on sensitive receptors at UCSF's residential and medical facilities. • Outdoor Event Noise: Analyze impacts from amplified sound equipment to be used for outdoor events in the main plaza nearby facilities. The SEIR should include information on outdoor events, including decibel limits and monitoring, audio/visual design with potential to impact occupants of the UCSF campus, including sensitive receptors in nearby campus housing, medical facilities or operations. Include mitigation measures designed to prevent any potentially significant noise impacts. • Event Center Noise: Analyze the potential for noise leakage from the Event Center structure, particularly during concerts, and associated impacts on adjoining land uses. • Operational Traffic and Emergency Generator Noise Effects on FibroGen: FibroGen should be treated as sensitive noise receptor; SEIR should disclose noise impacts from traffic and circulation from GSW patrons, employees and deliveries; and diesel generators (in event of power outage). • Construction Noise and Vibration Effects on FibroGen: FibroGen operations, sensitive instrumentation, laboratories, and chemicals are highly sensitive to noise and vibration. Project should be conditioned so that pile driving is prohibited and driller augers are instead required; and SEIR should analyze noise and vibration impacts of drilled augers. • Cumulative Construction Noise: UCSF's recently certified 2014 LRDP FEIR identified a potentially significant and unavoidable cumulative noise impact from concurrent UCSF/Warriors' construction projects. This should be further analyzed in the Draft EIR.
Section 5.4, Air Quality	The SEIR should include an analysis of: • Air Pollutant Exposure: Neighborhoods adjacent to freeways (as indicated in BAAQMD and SFDPH maps), through which project traffic will travel, will experience exacerbated levels of particulate matter and other pollutants, worsening an already dangerous health situation. City will be reducing capacity further on many streets; lines of congestion will stretch further; dispersing particulates through residential and work areas. This must be studied, quantified, and an abatement plan discussed. • Construction Air Quality Effects on FibroGen: FibroGen has had to significantly increase the frequency with which it changes its air filters, and has experienced significant amounts of dust and dirt on its windows and walls throughout the UCSF hospital construction. GSW project to be even more impactful to FibroGen. SEIR should conservatively analyze construction air quality impacts. • Operational Air Quality Effects on FibroGen: Analyze traffic-related air quality effects on FibroGen. • Cumulative Construction Air Quality Effects: UCSF's recently certified 2014 LRDP FEIR identified potentially significant and unavoidable cumulative air quality impacts from concurrent construction projects and concurrent operations of the UCSF Mission Bay campus site and the Warriors' Event Center. These impacts should be further analyzed in the Draft EIR.
Section 5.6, Wind and Shadow	The SEIR should include an analysis of: • Wind and shadow impacts on UCSF facilities should be analyzed, particularly in areas heavily used by pedestrians, such as Gene Friend Way near Third, and the 16th/4th Streets campus gateway. • Proposed height increase exceptions, if granted, would have impacts on wind and shadows.

TABLE 2-1 (Continued)
SUMMARY OF SCOPING COMMENTS ADDRESSED IN THE SEIR

SEIR Section	Comment
Section 5.7, Utilities and Service Systems	The SEIR should include an analysis of: • Impact on Mariposa Pump Station: The UCSF 2014 LRDP FEIR identified an issue with the Mariposa Pump Station that has yet to be resolved with the San Francisco Public Utilities Commission staff (see UCSF 2015 LRDP EIR, pp. 7-98 through 7-100 and pg. 10-15). The proposed Warriors' project may contribute to a cumulative impact and this should be analyzed in the SEIR. • Operational Impacts to Other Utilities: Analyze operational impacts to public infrastructure within streets right-of-way. • Construction Impacts to Other Utilities: Analyze construction impacts to public infrastructure within streets right-of-way.
Section 5.8, Public Services	The EIR should include an analysis of: • Security/Crowd Management/Quality of Life Issues: The SEIR should discuss the project's plan for crowd management, nighttime hours of operation, and provisions for sufficient on-site and off-site security and maintenance personnel, public restrooms and trash receptacles. • Security/Crowd Management/Quality of Life Issues: The SEIR should discuss project impacts to law enforcement service ratios/response times; assess fan violence, proliferation of alcohol-related uses, riots; and solid waste management. • Public Intoxication: Consideration must be given to control unorderly behavior, such as intoxication and public urination (e.g., Giants fans using China Basin Channel (also known as Mission Creek) for restroom. • Litter: Consideration must be given to the handling of event related materials that can be littered around the area (not just adjacent streets) • Graffiti: Project may result in increases in graffiti/damage in area buildings. • Evacuation Plan for Emergency Response. SEIR should discuss evacuation plan for emergency response, including law enforcement, and make that plan an enforceable mitigation measure. • Construction Effects on Public Services. Evaluate construction effects on law enforcement, fire, emergency services and solid waste (displacement of vermin, handling of construction materials).
Section 5.9, Hydrology and Water Quality	The SEIR should include an analysis of: • Project Trash Impact to Stormwater Quality: The SEIR should identify mitigation, such as additional trash receptacles and post-event trash pick-up radius exterior to the Warriors property line sufficient to avoid impacts on the water quality of the storm drain system.
Chapter 7, Alternatives	The SEIR should include an analysis of: • Modified Site Plan: Evaluate alternatives that incorporate potential design changes that may be necessary to address significant traffic and circulation impacts (e.g., a reconfigured site plan that provides additional vehicular access s on Third Street and Terry A. François Blvd; additional modifications to freeway access; and modifications to existing public transportation to alleviate traffic concerns).

TABLE 2-2
SUMMARY OF SCOPING COMMENTS ADDRESSED IN THE INITIAL STUDY

Initial Study Section	Comment
Section E.1, Land Use	The EIR should include an analysis of: • Potential land use impacts should be included in the Draft SEIR, as the proposed Event Center would require a secondary use finding, multiple amendments to the applicable Design for Development and other variances. • Given GSW project's significant scope and sensitivity of FibroGen use and operations, combined with other uses in the vicinity that have been constructed, disclose any potential land use incompatibilities with surrounding land uses.
Section E.2, Aesthetics	The EIR should include an analysis of: • Increased Height/Massing Visual Impact: The numerous modifications proposed to the Mission Bay South Design for Development standards which would increase the height limit, the number of allowed towers on the site, increase building bulk beyond current limits, and eliminate a view corridor, warrants the analysis of aesthetic and view corridor impacts resulting from the proposed project, at least for the purpose of providing information to the public and decision makers. • Exterior Lighting Impacts: Given the proximity of the proposed entertainment venue to sensitive receptors (i.e., UCSF hospital and residents), information about nighttime lighting at the Event Center, including the potential for outdoor animated lighting, strobe lighting, or Hollywood-style search lights during special events, should be discussed and impacts on adjacent land uses analyzed, including potential impacts on operations of the new helipad located atop the Medical Center at Mission Bay. • Plaza and Retail Visual Impact: Visual impact of the Third Street Plaza and associated retail space being elevated above Third Street, 16th Street and South Street, rather than at street level where activation of the street is encouraged, and the expanse of blank parking garage walls fronting those streets. • Retail Gatehouse Visual Impact: Retail Gatehouse is located in UCSF view easement and will have a visual impact. • Construction Nighttime Lighting Effects: Construction-period nighttime lighting and impacts on adjacent land uses should be analyzed, and mitigation measures imposed as appropriate.
Section E.3, Population and Housing	The EIR should include an analysis of: • Construction Employment Data: Construction job data presented in Initial Study probably dates back from the end of 2013; construction has gone up greatly over the last year; need to make sure outdated data is not used.
Section E.4, Cultural and Paleontological Resources	The EIR should include an analysis of: • Mitigation for Cultural Resources: Contact appropriate regional archaeological Information Center. If archaeological inventory survey is required, prepare report detailing the findings and recommendations of the records search and field survey. Contact NAHC for a Sacred Lands File Check, and a list of appropriate Native American contacts for consultation concerning the project site and to assist in mitigation measures. Include in mitigation plan provisions for identification and evaluation of accidentally discovered archaeological resources, per CEQA Section 16064.5(f). Include in mitigation plan provisions for disposition of recovered cultural items that are not burial associated, which are addressed in PRC 5097.98, in consultation with culturally affiliated Native Americans. Include provisions for discovery of Native American human remains in mitigation plan (see Health and Safety Code 7050.5, PRC 5097.98, and CEQA Guidelines 15064.5(e)).
Section E.10, Recreation	The EIR should include an analysis of: • Project Increase in Use of Bayfront Park. Initial Study indicated there would not be any substantial increase in the use of existing parks and recreational facilities and would not lead to physical deterioration of existing recreational resources. However, plan for Bayfront Park never contemplated having 20,000 additional people coming into the neighborhood to use these parks.

TABLE 2-2 (Continued)
SUMMARY OF SCOPING COMMENTS ADDRESSED IN THE INITIAL STUDY

Initial Study Section	Comment
Section E.11, Utilities and Service Systems (Solid Waste only)	The EIR should include an analysis of: • Solid Waste. There is a significant increase in solid waste handling as a result of the Giants; the burden of cleanup ends up on Mission Bay and not the City's general fund. Analysis of Warriors project should reflect the increase burden on Mission Bay community from increased solid waste.
Section E.15, Hydrology and Water Quality	The EIR should include an analysis of: • Groundwater: Site is too wet; will not be able to successfully build underground parking.
Section E.16, Hazards and Hazardous Materials	The EIR should include an analysis of: • Cumulative Construction-Related Hazardous Materials Impacts: Concerned about hazardous waste releases from all the cumulative construction that will be going on in the project area (within a 3 to 4 block radius) at the same time as the Warriors project.

2.7 Assembly Bill 900

The Jobs and Economic Improvement through Environmental Leadership Act (Assembly Bill 900 or AB 900)[8], signed by the Governor in September 2011 and effective on January 1, 2012, provides streamlining benefits under CEQA for "environmental leadership development projects (leadership projects)." One of the categories that meets the definition of a leadership project is a project that is residential, retail, commercial, sports, cultural, entertainment, or recreational in nature; upon completion, will qualify for LEED silver certification; will achieve at least 10 percent greater transportation efficiency than comparable projects; and for projects within a metropolitan planning organization's jurisdiction for which a sustainable communities strategy or alternative planning strategy is in effect, the project is consistent with the general use designation, density, building intensity and applicable policies specified for the project area in either the sustainable communities strategy or an alternative planning strategy.[9]

The Governor may certify a leadership project for streamlining if all the following conditions are met: (1) the project would result in a minimum investment of $100 million dollars in California upon completion of construction; (2) the project would create high-wage, highly skilled jobs that pay prevailing wages and living wages and provide construction jobs and permanent jobs for Californians, and help reduce unemployment; (3) the project would not result in any net additional emission of greenhouse gases, including greenhouse gas emissions (GHGs) from employee transportation, as determined by the State Air Resources Board; (4) the project applicant has entered into a binding and enforceable agreement that all mitigation measures required pursuant to the law to certify the project under this chapter shall be conditions of

8 California Public Resources Code 21178 et. seq.
9 The Governor's Office of Planning and Research, California Jobs, *Governor's Guidelines for Streamlining Judicial Review Under the California Environmental Quality Act*, available online at http://opr.ca.gov/s_californiajobs.php, accessed January 6, 2015 and California Public Resources Code Section 21180(b).

approval of the project, and those conditions will be fully enforceable by the lead agency or another agency designated by the lead agency, and in the case of environmental mitigation measures, the applicant agrees, as an ongoing obligation, that those measures will be monitored and enforced by the lead agency for the life of the obligation; (5) the project applicant agrees to pay the costs of the Court of Appeal in hearing and deciding any case, including payment of the costs for the appointment of a special master if deemed appropriate by the court, in a form and manner specified by the Judicial Council; and (6) the project applicant agrees to pay the costs of preparing the administrative record for the project concurrent with review and consideration of the project pursuant to this division, in a form and manner specified by the lead agency for the project.

The project sponsor (GSW Arena LLC, an affiliate of the Golden State Warriors LLC) applied to the governor of California for certification of the proposed project as a leadership project under AB 900, and the application was subject to public review from March 2, 2015 through April 1, 2015. On March 21, the California Air Resources Board issued Executive Order G-15-022 determining that the proposed project would not result in any net additional GHGs for purposes of certification under AB 900. On April 30, 2015, Governor Jerry Brown certified the proposed project as an eligible project under AB 900, and the Governor's Office of Planning and Research forwarded the Governor's determination to the Joint Legislative Budget Committee. On May 22, 2015, the State Legislative Analyst's Office indicated that the project aligns with the intent of AB 900, and recommended to the Joint Legislative Budget Committee that they concur with the Governor's determination. On May 27, 2015, the Joint Legislative Budget Committee concurred with the Governor's determination that the project is an eligible project under AB 900.

Pursuant to Public Resources Code Section 21187, within 10 days of the Governor certifying the proposed project as an environmental leadership development project, the OCII issued a public notice on May 7, 2015 stating that the applicant has elected to proceed under Chapter 6.5 (commencing with Section 21178) of the Public Resources Code, which provides, among other things, that any judicial action challenging the certification of the EIR or the approval of the project described in the EIR is subject to the procedures set forth in Sections 21185 to 21186, inclusive, of the Public Resources Code. The OCII issued a second public notice on June 3, 2015 stating the aforementioned information as well.

The OCII has prepared an administrative record for the proposed project and associated CEQA review process in accordance with the requirements of AB 900. All documents and other materials placed in the administrative record have been posted on, and are downloadable from, the following website http://gsweventcenter.com/, commencing with the date of the release of the Draft SEIR. The administrative record includes the Draft SEIR and all other documents submitted to, or relied on by, the lead agency in the preparation of the Draft SEIR. In addition, a document prepared by the lead agency or submitted by the applicant after the date of the release of the Draft SEIR that is a part of the record of the proceedings will be made available to the public in a readily accessible electronic format within the timeframes specified by this act.

Section 21185 of the Public Resources Code requires that the Judicial Council adopt a rule of court to establish procedures applicable to actions or proceedings brought to attack, review, set aside, void or annul the certification of the environmental impact report for an environmental leadership development project certified by the Governor or the granting of any project approvals that require the actions or proceedings, including any potential appeals therefrom, be resolved within 270 days of certification of the record of proceedings pursuant to Public Resources Code 21186. This creates an accelerated timeframe for CEQA litigation. It applies to projects that have a certified EIR and are certified by the Governor as "environmental leadership development projects" by January 1, 2016. AB 900 remains effective until January 1, 2017, and as of that date, is repealed unless a later enacted statute extends or repeals that date.

2.8 Senate Bill 743

On September 27, 2013, Governor Jerry Brown signed SB 743 (Chapter 386 of the 2013 California Legislation Session), which became effective on January 1, 2014.[10] Among other provisions, SB 743 amends the California Environmental Quality Act (CEQA) by adding Public Resources Code Section 21099 regarding analysis of aesthetics and parking impacts for urban infill projects and modifies AB 900 as discussed above.

Public Resources Code Section 21099(d), effective January 1, 2014, provides that, "aesthetics and parking impacts of a residential, mixed- use residential, or employment center project on an infill site located within a transit priority area shall not be considered significant impacts on the environment."[11] Accordingly, aesthetics and parking are no longer to be considered in determining if a project has the potential to result in significant environmental effects for projects that meet all of the following three criteria:[12]

a) The project is in a transit priority area; and
b) The project is on an infill site; and
c) The project is residential, mixed-use residential, or an employment center.

The proposed project meets each of the above three criteria: the project is located in proximity to several transit routes, including SFMTA Muni Metro stops; the project is located on an infill site that has previously been developed with industrial and commercial uses, is surrounded by areas of either recently completed or planned urban development, and is zoned for commercial uses with a floor area ratio (FAR) greater than 0.75; and the project would be an employment center

10 SB 743 can be found on-line at: http://leginfo.legislature.ca.gov/faces/billNavClient.xhtml?bill_id=201320140SB743.
11 A "transit priority area" is defined in as an area within one-half mile of an existing or planned major transit stop. A "major transit stop" is defined in Section 21064.3 of the California Public Resources Code as a rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods.
12 See Public Resources Code Section 21099(d).

supporting a range of commercial uses.[13] Thus, this SEIR does not consider either aesthetics or the adequacy of parking in determining the significance of project impacts under CEQA.

Public Resources Code Section 21099(d) states that a Lead Agency maintains the authority to consider aesthetic impacts pursuant to local design review ordinances or other discretionary powers and that aesthetics impacts do not include impacts on historical or cultural resources. As such, there will be no change in the standard protocol used by OCII related to design and historic review for this project. The applicable urban design standards and guidelines governing the project site and proposed project — which are contained in the Mission Bay South Plan, Mission Bay South Design for Development and Mission Bay South Signage Master Plan — would apply to the proposed project. Furthermore, the project would be subject to all applicable design review approvals under the South OPA, including Major Phase approval for Blocks 29-32 and Schematic Designs for each building and private open spaces. The design review process would consider relevant design and aesthetic issues. Project impacts on historical and cultural resources are addressed in the Initial Study (see Appendix NOP-IS).

The OCII recognizes that the public and decision makers nonetheless may be interested in information pertaining to the aesthetic and parking effects of a proposed project and may desire that such information be provided as part of the environmental review process. Therefore, Chapter 3, Project Description, includes graphic depictions of the project. However, this information is provided solely for informational purposes and is not used to determine the significance of the environmental impacts of the project, pursuant to SB 743. Similarly, Chapter 5, Section 5.2, Transportation and Circulation, of this SEIR presents a parking demand analysis for informational purposes and considers any secondary physical impacts associated with constrained supply (e.g., queuing by drivers waiting for scarce onsite parking spaces that affects the public right-of-way) as applicable in the transportation analysis.

2.9 Contents and Organization of the EIR

This SEIR describes the proposed project and required approvals, analyzes potential environmental impacts of the proposed project and a project variant, identifies mitigation measures where those impacts are significant, identifies cumulative adverse impacts to which the proposed project could make a substantial contribution, and evaluates alternatives to the project that could avoid or reduce significant impacts while still meeting most of the project's objectives.

This SEIR is organized as follows:

- **Chapter 1, Summary.** This chapter summarizes the contents of the entire SEIR by presenting a concise overview of the project description and providing in a tabular format a summary of the environmental impacts that would result from the project, mitigation

[13] San Francisco Planning Department, Transit-Oriented Infill Project Criteria Checklist: Event Center and Mixed-Use Development at Mission Bay Blocks 29-32, November 10, 2014. This document is available for review at the Planning Department, 1650 Mission Street, Suite 400, in Case File No. 2014.1441E.

measures identified to reduce or avoid significant impacts. It also briefly describes the project variant and its impacts, and the alternatives to the proposed project.

- **Chapter 2, Introduction.** This chapter describes the environmental review process, the previous environmental review of the Mission Bay Redevelopment Plans, the public and agency comments received on the scope of the SEIR, and the organization of the SEIR.

- **Chapter 3, Project Description.** This chapter discusses the project's background, objectives, and location; describes the physical characteristics of the project, including both the construction and operational phases; and identifies required project approvals.

- **Chapter 4, Plans and Policies.** This chapter provides a summary of the applicable plans, policies, and regulations of the local, regional, state, and federal agencies that have policy and regulatory control over the project site, and discusses the proposed project's consistency with those plans, policies, and regulations.

- **Chapter 5, Environmental Setting, Impacts and Mitigation Measures.** This chapter describes the project's existing setting and environmental impacts with respect to transportation and circulation, noise and vibration, air quality, greenhouse gas emissions, wind and shadow, utilities and service systems, public services, and hydrology and water quality. Each environmental topic is discussed in a separate section within this chapter, and each section identifies the thresholds of significance used to assess the severity of the impacts. Within each section, there is a summary of the relevant sections of the Mission Bay FSEIR, descriptions of the setting and regulatory framework, and impact analyses of both project-specific and cumulative impacts of the proposed project and a determination of the significance of each impact. For impacts determined to be significant, mitigation measures that would reduce or avoid those impacts are presented.

- **Chapter 6, Other CEQA Issues.** This chapter addresses any growth-inducing impacts that would result from the proposed project, the significant environmental effects of the project that cannot be mitigated to a less-than-significant level, and areas of known controversy.

- **Chapter 7, Alternatives.** This chapter presents and evaluates alternatives to the proposed project that could feasibly attain most of the project's objectives as well as reduce identified significant adverse impacts of the project. It also identifies the environmentally superior alternative and describes other alternatives that were considered but rejected.

- **Chapter 8, Third Street Plaza Variant.** This chapter describes and analyzes a variant to the proposed project at an equal level of detail as the proposed project.

- **Chapter 9, Report Preparers.** This chapter identifies the SEIR authors and consultants; project sponsor and consultants; and agencies and persons consulted.

- **Appendices.** The appendices include the Notice of Preparation, the complete Initial Study, and supporting technical information for the SEIR.

CHAPTER 3
Project Description

3.1 Project Overview

GSW Arena LLC (GSW), an affiliate of Golden State Warriors, LLC, which owns and operates the Golden State Warriors National Basketball Association (NBA) team, proposes to construct a multi-purpose event center and a variety of mixed uses, including office, retail, open space and structured parking on an approximately 11-acre site (Blocks 29-32) within the Mission Bay South Redevelopment Plan Area of San Francisco (see **Figure 3-1** for aerial photograph and **Figure 3-2** for existing roadway network in Mission Bay). The project site is bounded by South Street on the north, Third Street on the west, 16th Street on the south, and by the future planned realigned Terry A. Francois Boulevard on the east. The proposed event center would host the Golden State Warriors basketball team during the NBA season, and provide a year-round venue for a variety of other uses, including concerts, family shows, other sporting events, cultural events, conferences and conventions. GSW has entered into an agreement to purchase the project site from the current site owner, an affiliate of salesforce.com.

Development is allowed within the Mission Bay South Redevelopment Plan Area, including Blocks 29-32, consistent with the land use program and subject to the development controls of the *Mission Bay South Redevelopment Plan*, *Mission Bay South Design for Development*, and other related documents (see *Background*, below). No amendment to the *Mission Bay South Redevelopment Plan* would be required, although the proposed project at Blocks 29-32 would require certain amendments and/or variations to other documents (see *Intended Uses of this EIR and Approvals Required*, below).

This Project Description is organized as follows: Section 3.2 presents the project objectives; Section 3.3 provides background information, including the development context for Mission Bay; Section 3.4 describes characteristics of the existing project site and vicinity; Section 3.5 provides a brief history of the Golden State Warriors and describes their existing operations and facilities; Section 3.6 present project characteristics, including a description of the proposed development plans at the project site, discussion of the proposed project operations and employment, and description of project construction details; Section 3.7 presents a number of graphic exhibits that have been prepared for the proposed development, and Section 3.8 describes the intended uses of this Subsequent EIR (SEIR) and lists the required approvals for the project.

3.2 Project Objectives

The Office of Community Investment and Infrastructure (OCII, formerly the San Francisco Redevelopment Agency) and FOCIL-MB, LLC (formerly Catellus Development Corporation) are the co-sponsors of the Mission Bay Redevelopment Plan. The primary objectives of the Mission Bay Redevelopment Plan project sponsors as presented in the *Mission Bay Final Subsequent Environmental Impact Report* (Mission Bay FSEIR), certified in September 1998, were:[1]

- Eliminating blighting influences and the correction of environmental deficiencies in the Project Area, including, but not limited to, abnormally high vacancies, abandoned buildings, incompatible land uses, depreciated or stagnant property values, and inadequate or deteriorated public improvements, facilities, and utilities.
- Retaining and promoting, within the City and County of San Francisco, academic and research activities associated with the University of California San Francisco, which seeks to provide space for existing and new programs and consolidate academic and support units from many dispersed sites at a single major new site which can accommodate the 2,650,000-gross sq. ft. program analyzed in the UCSF 1996 LRDP.
- Assembling of land into parcels suitable for modern, integrated development with improved pedestrian and vehicular circulation in the Project Area.
- Replanning, redesigning, and developing of undeveloped and underdeveloped areas which are improperly utilized.
- Providing flexibility in the development of the Project Area to respond readily and appropriately to market conditions.
- Providing opportunities for participation by owners in the redevelopment of their properties.
- Strengthening the community's supply of housing by facilitating economically feasible, affordable housing through the installation of needed site improvements and expansion and improvement of the housing supply by the construction of approximately 6,090 market-rate units, including 1,700 units of very low-, low- and moderate-income housing.

[1] The land use program in the adopted Mission Bay plan was developed from the proposed plan plus a combination of plan variants described and analyzed in the Mission Bay FSEIR. The Mission Bay FSEIR concluded that the environmental effects of the combination of plan variants would be similar to those of the proposed plan, and consequently, would not result in any new or substantially more severe significant effects identified in the Mission Bay FSEIR for the proposed plan. In addition, subsequent to plan adoption, the Mission Bay plan was subject to a number of minor revisions to the land use program. Addendums to the Mission Bay FSEIR similarly found that these revisions would not result in any new or substantially more severe significant effects identified in the Mission Bay FSEIR for the proposed plan. Also, subsequent to plan adoption, UCSF is increasing planned development on the UCSF campus, which has been the subject of separate CEQA review. Consequently, the specific estimates of land use development in the adopted Mission Bay plan are slightly different from that in the Mission Bay FSEIR Project Objectives presented here. However, the overall project objectives originally presented in the Mission Bay FSEIR are still substantively representative of the proposed Mission Bay plan. Please see Chapter 2, Introduction for additional detail.

- Strengthening the economic base of the Project Area and the community by strengthening retail and other commercial functions in the Project Area through the addition of approximately 1.5 million gross sq. ft. of retail space, a major hotel, and about 5,557,000 gross sq. ft. of mixed office, research and development, and light manufacturing uses.

- Facilitating emerging commercial-industrial sectors, including those expected to emerge or expand due to their proximity to the UCSF new site, such as research and development, biotechnical research, telecommunications, business service, multi-media services, and related light industrial through improvement of transportation access to commercial and industrial areas, improvement of safety within the Project Area, and the installation of needed site improvements to stimulate new commercial and industrial expansion, employment, and economic growth.

- Facilitating public transit opportunities to and within the Project Area to the extent feasible.

- Providing land in an amount of approximately 47 acres for a variety of open spaces.

- Achieving the objectives described above in the most expeditious manner feasible.

Consistent with the overall objectives of the Mission Bay Redevelopment Plan, GSW's objectives for the proposed Event Center and Mixed-Use Development at Blocks 29-32 are to:

- Construct a state-of-the-art multi-purpose event center in San Francisco that meets NBA requirements for sports facilities, can be used year-round for sporting events and entertainment and convention purposes with events ranging in capacity from approximately 3,000-18,500, and expands opportunities for the City's tourist, hotel and convention business.

- Provide sufficient complementary mixed-use development, including office and retail uses, to create a lively local and regional visitor-serving destination that is active year-round, promotes visitor activity and interest during times when the event center is not in use, provides amenities to visitors of the event center as well as the surrounding neighborhood, and allows for a financially feasible project.

- Develop a project that meets high-quality urban design and high-level sustainability standards.

- Optimize public transit, pedestrian and bicycle access to the site by locating the project within walking distance to local and regional transit hubs, and adjacent to routes that provide safe and convenient access for pedestrians and bicycles.

- Provide adequate parking and vehicular access that meets NBA and project sponsor's reasonable needs for the event center and serves the needs of project visitors and employees, while encouraging the use of transit, bicycle, and other alternative modes of transportation.

- Provide the City with a world class performing arts venue of sufficient size to attract those events which currently bypass San Francisco due to lack of a world class 3,000-4,000 seat facility.

- Develop a project that promotes environmental sustainability, transportation efficiency, greenhouse gas reduction, stormwater management using green technology, and job creation consistent with the objectives of the California Jobs and Economic Improvement Through Environmental Leadership Act (AB 900),[2] as amended.

3.3 Background

A detailed discussion of the Mission Bay Redevelopment Plan approval process (including OCII and OCII Commission), prior environmental review of the Mission Bay Redevelopment Plan (including the Mission Bay FSEIR), and the relationship of this SEIR to the Mission Bay FSEIR is presented in Chapter 2, Introduction. The following provides a description of applicable development controls in the Mission Bay South Redevelopment Plan, including those for the project site.

3.3.1 South Plan Area Development Controls

The land uses in the adopted Mission Bay Redevelopment Plan are generally illustrated in **Figure 3-3**. The primary development controls for the Mission Bay South Redevelopment Plan Area ("South Plan Area") are the South Plan and the South Design for Development, which together specify development standards for the project site at Blocks 29-32, including standards and guidelines for height, setbacks, and coverage. In accordance with the California Community Redevelopment Law, when the Board of Supervisors approved the South Plan in 1998, land use and zoning approvals within Mission Bay came under the jurisdiction of the former Redevelopment Agency, now OCII[3]; see Chapter 2, Introduction for additional detail. Together, the South Plan and South Design for Development constitute the regulatory land use framework for the project site, and they supersede the City's *Planning Code*, except as otherwise specifically provided in those documents and associated documents for implementing the Plans.

The master developer, FOCIL-MB, LLC, is responsible for the infrastructure serving the South Plan area, consistent with the South Owner's Participation Agreement (South OPA), including implementation of the Mission Bay South Infrastructure Plan (Attachment D to the South OPA). The South OPA includes triggers for the phasing of required infrastructure improvements based on adjacency, ratios, and performance standards to ensure that the master developer phases the required infrastructure to match the phasing of private development occurring on adjacent blocks. In addition to the South Plan and South Design for Development, the other major development controls that apply to the project site include:

- Mitigation measures included in the Mission Bay FSEIR and which OCII has identified as required to be implemented by the developer of the project site;

2 AB 900, effective January 1, 2012, provides streamlining benefits under CEQA for privately-financed projects located on an infill site that has been determined to generate thousands of jobs and include state-of-the-art pollution reductions.

3 This was reaffirmed by the San Francisco Board of Supervisors in 2012 (as part of the Successor Agency Legislation - Resolution No. 11-12 and Ordinance No. 214-12).

Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 3-3
Land Uses in the Mission Bay Redevelopment Plan

- All other associated adopted plans and documents that apply in the South Plan area under the South Plan and South OPA, such as the 1999 Mission Bay Risk Management Plan, with amendments (including Article 22A of the San Francisco Health Code for analyzing soils for hazardous waste), Mission Bay South Streetscape Master Plan, and Mission Bay South Signage Master Plan; and

- Other adopted City plans and regulations that apply in the South Plan area, such as the San Francisco Building Code; Chapter 7 of the San Francisco Environment Code, "Resource Efficiency Requirements," and any engineering requirements applicable under City Code to the development.

The mitigation measures in the Mission Bays FSEIR are provided in Appendix MIT of this SEIR, which also indicates the specific measures applicable to the proposed project. Relevant portions of the South Plan and South Design for Development as they pertain to Blocks 29-32 are described below.

South Plan Development Controls for Blocks 29-32

In addition to providing overall planning objectives for the plan area, the South Plan designates land uses for specific parcels. Proposed land uses to be permitted for Blocks 29-32 are designated as Commercial Industrial/Retail (Attachment 3 of the South Plan), and the plan provides for either principal or secondary uses at this site. Primary uses are permitted in accordance with the plan's provisions, and secondary uses are permitted provided that such use generally conforms with redevelopment objectives and planning and design controls established pursuant to this plan. The OCII Executive Director must make a determination that secondary uses make a positive contribution to the character of the plan area, and that the secondary use "will provide a development that is necessary or desirable for, and compatible with, the neighborhood or the community."

The South Plan identifies the following principal uses under the Commercial Industrial/Retail land use designation applicable to Blocks 29-32: manufacturing; institutions; retail sales and services; arts activities and spaces; office use; home and business services; animal care; wholesaling; automotive; and other uses (e.g., greenhouse, nursery, open recreation and activity areas, parking and certain telecommunications-related facilities). The following secondary uses are identified: institutions, assembly and entertainment, and other uses (public structure or use of a nonindustrial character).

The South Plan also describes general controls and limitations for development, and sets limits on leasable square footages of various uses within defined zones within the plan area, including the project site. The plan sets a maximum floor area ratio of 2.9 to 1 for the commercial industrial and commercial industrial/retail uses averaged over the entire area of these two land use districts, and the maximum building height within the entire plan area is 160 feet. The plan further indicates that within the limits, restrictions and controls established in the plan, OCII is authorized to establish heights of buildings, land coverage, density, setback requirements, design and signage criteria, traffic circulation and access standards, and other development and design controls in the South Design for Development.

South Design for Development Controls for Blocks 29-32

The Mission Bay South Design for Development, a companion document to the South Plan, contains the design standards and design guidelines applicable to Blocks 29-32. The project site is within Height Zone 5, which specifies that 7 percent of the developable area (within the entire height zone) may be occupied by a maximum of three towers up to 160 feet in height, and the remaining 93 percent of the development could be at a maximum of 90 feet. However, buildings along Terry A. Francois Boulevard, including Blocks 30 and 32, may not exceed 90 feet in height, and no towers are permitted on Blocks 30 and 32.

Within this Height Zone 5, the South Design for Development also establishes bulk limits for development at a height greater than 90 feet (i.e., towers). The maximum tower length above 90 feet is 200 feet, and the maximum floor plate is 20,000 square feet. Further, the South Design for Development identifies setback requirements applicable to Blocks 29-32, with a minimum of 5 feet along Third Street and 20 feet along 16th Street; these setbacks are in addition to specified sidewalk widths on these streets and may be used for paved pathways and landscaping as appropriate. The minimum streetwall height is 15 feet.

Design guidelines for Commercial/Industrial buildings along the Bayfront Park (adjacent to the project site) indicate that homogeneous and unrelieved façades should be avoided. Design guidelines for city-serving retail uses at Blocks 29-32 include guidance that: street level frontage should provide visually interesting features; the block façade line should be consistent with block development throughout Mission Bay; and curb cuts are strongly discouraged along Third Street.

3.4 Project Site Location

3.4.1 Mission Bay

The approximate 300-acre Mission Bay Redevelopment Plan area is located along San Francisco's central Bay waterfront, straddling Mission Creek Channel. In general, the plan area is bounded by Townsend Street to the north, Interstate 280 and Seventh Street to the west, Mariposa Street to the south, and San Francisco Bay to the east.

Before 1998, Mission Bay was characterized by low-intensity industrial development and vacant land. Since adoption of the North and South Plans in 1998, Mission Bay has undergone redevelopment into a mixture of residential, commercial (light industrial, research and development, labs and offices), retail, and educational/institutional uses and open space. As of 2014, 4,067 housing units (including 822 affordable units) of the planned 6,400 housing units within Mission Bay (roughly 64 percent) were complete, with another 900 (including 150 affordable units) under construction. Regarding office and laboratory space, approximately 1.7 million square feet of the 4.4 million square feet in the Mission Bay plan area (approximately 39 percent) was complete. Approximately 82 percent of the previously-approved 2.65 million-square-foot UCSF North Campus has been developed, including six research buildings, an academic/office building, a campus community center, and a university housing development. The first phase of the UCSF Mission Bay Medical Center opened in early 2015. In addition, in November 2014, UCSF approved the Final UCSF 2014 Long Range Development Plan, which provides for additional planned development on the UCSF campus at Mission Bay through 2035. The City's new Public Safety Building at Third and Mission Rock Streets also became operational in April 2015. More than 15 acres of new non-UCSF parks and open space within Mission Bay have also been completed.

3.4.2 Project Site and Existing Uses

Figure 3-4 presents an aerial map of the project site vicinity. The approximate 11-acre project site encompasses Blocks 29, 30, 31, and 32 within the Mission Bay South Redevelopment Plan area. The project site consists of the majority of Assessor's Block 8722, Lot 001, and all of Assessor's Block 8722, Lot 008. The project site is bounded by South Street on the north, Third Street on the west, 16th Street on the south, and by the future planned realigned Terry A. Francois Boulevard on the east. The City has designated the Mission Bay South Redevelopment Plan Area as a Priority Development Area (PDA). The project site is also located in the southeast corner of the City's South of Market neighborhood, and just north of the City's Potrero Hill and Dogpatch neighborhoods.

The ground surface elevations at the project site range between approximately -1 foot to +3 feet San Francisco City Datum (SFD),[4] roughly equivalent to 6½ to 10½ feet above mean sea level. The existing site slopes gently down from west to east towards the Bay.[5] Paved surface metered parking facilities currently operate in the west and north portions of the site. Parking Lot E, accessed from 16th Street, contains 289 parking spaces; and Parking Lot B, accessed from South Street, contains 316 parking spaces, for a total of 605 parking spaces. These parking facilities contain night lighting. Immediately east of, and adjacent to, Parking Lot B is a depressed area (measuring approximately 320 feet by 280 feet) created by an excavation and backfill associated with a prior environmental cleanup of that portion of the site. A surface swale extends west within this portion of the site to allow for drainage of surface water into the depression.[6] Chain link fencing is installed on the perimeter of the project site and around Parking Lots B and E within the site.

3.4.3 Surrounding Uses

The University of California at San Francisco (UCSF) Mission Bay campus is located west, northwest, southwest, and partially south of the project site. Fronting on Third Street directly west of the project site is an eight-story UCSF parking structure (Third Street Garage), and the UCSF Global Health and Clinical Sciences Building (Mission Hall). To the northwest of the

---

4 For purposes of this SEIR, existing ground elevations are as measured relative to San Francisco City Datum (SFD). SFD establishes the City's zero point for surveying purposes at approximately 8.6 feet above the mean sea level established by 1929 U.S. Geological Survey datum, and approximately 11.3 feet above the current 1988 North American Vertical Datum.

5 Along the north site border, the site slopes down approximately 2 feet between Third Street and Terry A. Francois Boulevard. Along the site south border, the site slopes down approximately 3.5 feet between Third Street and Terry A. Francois Boulevard.

OCII Case No. ER 2014-919-97; Planning Department Case No. 2014.1441E: Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 3-4
Aerial Photograph of Project Site Vicinity

project site fronting along Third Street is UCSF Hearst Tower, a 14-story building containing student housing; and to the north of that, the UCSF Helen Diller Family Cancer Research building. To the southwest of the project site fronting along Third Street is the UCSF Energy Center, Betty Irene Moore Women's Hospital, Bakar Cancer Hospital, and Benioff Children's Hospital, which opened in February 2015. The UCSF Benioff Children's Hospital helipad, located atop the roof of the UCSF Ron Conway Gateway Medical Building at 1825 4th Street, also began operating in February 2015. Directly south of the project site across 16th Street, between Third Street and Illinois Street, is a vacant lot recently acquired by UCSF (Blocks 33 and 34), which is planned for office space development starting in 2016.

Directly south of the project site across 16th Street, between Illinois Street and Terry A. Francois Boulevard, is a recently-constructed six-story office building (409 Illinois Street) housing FibroGen Life Science and other biotech/high tech companies, and south of that another recently-constructed six-story office building (499 Illinois Street) with biotech and UCSF clinical uses. Directly north of the project site across and fronting on South Street are (from west to east) a vacant lot (recently acquired by Uber Technologies and Alexandria Real Estate Equities) and planned for development of office space in 2015, a six-story parking garage (450 South Street), and a six-story office building housing the Old Navy corporate headquarters. Immediately east of the project site and west of Terry A. Francois Boulevard are City-owned parcels containing covered stockpiled materials.

The planned Bayfront Park is located on Mission Bay Plan parcels P21 through P24, located northeast, east and partially south of the project site. The north portion of the park (P21, located east of Terry A. Francois Boulevard, between Mission Bay Boulevard South and just south of Pierpoint Lane) is complete, and includes a landscaped parking lot and boat launch. The currently undeveloped central portion of the Bayfront park is located east of the project site across Terry A. Francois Boulevard (on P22, from just south of Pierpoint Lane to just south of 16th Street). This portion of the park presently includes a paved trail (which constitutes a segment of the Bay Trail), surface parking lot, and unimproved open space. Construction of the south portion of Bayfront Park (on P23 and P24), located west of Terry A. Francois Boulevard between 16th Street and Mariposa Street, is currently underway in 2015 and scheduled for completion in 2016.

Third Street, a north-south major arterial roadway defined as a Transit Important Street in the San Francisco General Plan, extends along the west project site boundary providing access to and from downtown San Francisco to the north and the Bayview neighborhood to the south. Third Street contains two vehicular travel lanes in each direction, separated by a paved median and Muni light rail tracks. Muni light rail lines K-Ingleside and T-Third Street operate along Third Street, with the Muni UCSF/Mission Bay Station located at South Street and the Muni Third & Mariposa Street Station located one block south of the project site. Muni bus routes 91 and T-Owl operate along Third Street, with a Muni bus stop located north of the project site on Third Street. Campus Lane, a two-lane east-west local street, terminates at the intersection with Third Street, directly across from and west of the project site.

Sixteenth (16th) Street extends east of Third Street along a portion of the south project site boundary, terminating just east of Illinois Street. There are two vehicular travel lanes on 16th Street adjacent to the project site, increasing to four lanes west of Third Street. Bollards installed on

16th Street east of Illinois Street prevent through vehicular travel between Third Street and Terry A. Francois Boulevard. 16th Street is defined as a secondary arterial west of Third Street in the San Francisco General Plan. 16th Street contains a Class III bicycle route between Illinois Street and Third Street, and two Class II bike lanes west of Third Street. Illinois Street, a two-lane north-south local street, terminates at the intersection with 16th Street, directly across from and south of the project site. Illinois Street contains a Class II bicycle lanes between 16th Street and Mariposa Street.

Terry A. Francois Boulevard roughly follows the Bay shoreline east of the project site. There are currently two vehicular travel lanes and a Class II bicycle lane in each direction. Terry A. Francois Boulevard is signed as a Tsunami Evacuation Route.

South Street extends along the north boundary of the project site between Third Street and Terry A. Francois Boulevard. South Street contains two vehicular travel lanes in each direction.

Bridgeview Way, a two-lane north-south local street, terminates at the intersection with South Street, directly across from and north of the project site.

Vehicle parking is currently provided along 16th Street and Terry A. Francois Boulevard adjacent to the project site.

See description of South Plan improvements planned in the vicinity of the project site, including the realignment of Terry A. Francois Boulevard and public access improvements at Bayfront Park, below.

3.5 Golden State Warriors Background

3.5.1 History and Relationship to San Francisco Bay Area

The Warriors were founded in 1946 as the Philadelphia Warriors, one of the 11 original teams of the Basketball Association of America (BAA). The Warriors are one of only three charter members of the BAA still in existence, along with the Boston Celtics and the New York Knickerbockers (Knicks). The Warriors hold the distinction of winning the BAA's first ever championship, claiming the title in the inaugural 1946–47 season by defeating the Chicago Stags. The BAA merged with the National Basketball League (NBL) in 1949, forming the National Basketball Association (NBA). The Warriors won their first NBA championship in Philadelphia in the 1955–56 season, beating the Fort Wayne Pistons.

In 1962, the Warriors franchise was relocated to San Francisco and renamed the San Francisco Warriors. The Warriors played most of their home games at the Cow Palace in Daly City (just south of the San Francisco city limit) from 1962–64 and at the San Francisco Civic Auditorium[7] from 1964–66, as well as several home games in 1966 at the University of San Francisco War Memorial Gymnasium. The Warriors also played home games at several other Bay Area locations in the 1960s, including Richmond, San Jose, Stockton and Sacramento. When the Oakland-

7 The San Francisco Civic Auditorium is now named the Bill Graham Civic Auditorium.

Alameda County Coliseum Arena (Coliseum Arena) opened in 1966, the Warriors began scheduling an increasing number of home games at that facility. The Warriors reached the NBA playoffs in 1964, 1967 through 1969, and 1971 (their final season as the San Francisco Warriors).

The San Francisco Warriors changed their name to the Golden State Warriors for the 1971–72 season, in part to acknowledge the team's fan base that had extended throughout Northern California, and played the majority of their home games that season at the Coliseum Arena. The Warriors made the NBA playoffs every season from 1972 to 1977 (excluding 1974), and won their first NBA championship on the West Coast in the 1974–75 season. The Warriors have since reached the playoffs nine additional times (1987, 1989, 1991, 1992, 1994, 2007, and 2013 through 2015). The Warriors have played home games exclusively in the Coliseum Arena since 1972, with the exception of a one-year hiatus (1996–97 season) in which they played at the San Jose Arena[8] while the Coliseum Arena was remodeled.[9] In 2014-15, the Warriors celebrated their 54th season in the Bay Area.

3.5.2 Existing Golden State Warriors Basketball Operations and Facilities

The Golden State Warriors are one of 30 franchised basketball teams in the NBA. The current league organization divides the teams into two conferences of three divisions with five teams each. The Golden State Warriors play within the Western Conference, Pacific Division.

Typically, the NBA preseason runs approximately two weeks in mid-October, the NBA regular season between late October and mid-April, and NBA playoff season runs from mid-April through mid-June. The Golden State Warriors currently play approximately 8 preseason games per season, 2 to 3 of which are home games. The Warriors play 82 regular season games per season, consisting of 41 home games and 41 away games. In the event of reaching the playoffs, the Golden State Warriors would play in up to four best-of-seven series playoff rounds (i.e., First Round, Semi-Conference Finals, Conference Finals, and NBA Finals), with approximately half of the playoff games in their home court.

As indicated above, the Golden State Warriors currently play their home games at Oracle Arena, located at 7000 Coliseum Way in Oakland. Oracle Arena is owned by the Oakland-Alameda County Coliseum Authority (City of Oakland and Alameda County) and operated by Anschutz Entertainment Group (AEG). The Golden State Warriors currently maintain a lease agreement to play their basketball games at Oracle Arena through the NBA 2016–17 season. Oracle Arena's maximum seating occupancy is 19,596 for basketball games, including 72 luxury suites. Oracle Arena also includes 3 exclusive clubs, 5 concourses, a box office, and team stores. Oracle Arena is located adjacent to the Oakland–Alameda County Coliseum (O.co Coliseum), and collectively, this complex offers parking for 10,000 vehicles.

8 The San Jose Arena is now named the SAP Center.
9 The Coliseum Arena was renamed The Arena in Oakland in 1997, the Oakland Arena in 2004, and Oracle Arena (present name) in 2006.

The Golden State Warriors organization maintains approximately 150 full-time employees, consisting of the team's basketball players, basketball operations staff (including General Manager, coaching and training staff, and scouts); medical team; an executive board and executive management; media and broadcasting staff; and numerous operations and support services, including but not limited to, marketing, finance, ticket sales/operations/services, public and community relations, hospitality services, and administration.

The Golden State Warriors currently lease their management offices and practice facility at the Oakland Convention Center at 1011 Broadway in downtown Oakland (these facilities are built atop the Convention Center's parking garage). These facilities provide approximately 16,000 square feet of office space, 2½ full length basketball courts, and supporting facilities (e.g., weight room, locker rooms, and lounge).

3.6 Project Characteristics

This section describes the characteristics of the proposed project, including detailed descriptions of the proposed facilities and operations, as well as project construction.

3.6.1 Proposed Facilities

Development Plan Overview

Under the project, Blocks 29-32 would be developed with a multi-purpose event center and a variety of mixed uses, including office, retail, open space and structured parking on the approximately 11-acre site. **Figure 3-5** presents the conceptual project site plan, illustrating primary project features and associated building heights. **Table 3-1** provides a summary overview of the key characteristics of the project facilities.

Event Center

The proposed roughly circular-shaped event center building would be located in the central-east portion of the site. The event center building would be approximately 135 feet[10] tall at its roof peak, and would include multiple levels of varying heights. The event center building would consist of nine levels (Event, Ground, Mezzanine, Main Concourse, Suite, Theater/Loge, Upper Concourse, Bayfront Terrace and Mechanical). The event center would include a wide variety of facilities, including spectator seating and suites, restaurants/bars and clubs, meeting rooms; spectator support facilities such as food service/kitchens, concessions, merchandising and restrooms; Golden State Warriors management offices, practice facility and locker rooms; command center and operations space for police/security, fire protection services and traffic control; media support facilities; and event center operations such as loading, staging and marshaling areas, mechanical/electrical/plumbing space and storage and maintenance facilities.

[10] All building heights in this SEIR measured from finished grade to top of building. Please see footnote "e" in Table 3-1 for additional detail.

Note: All building elevations were estimated per *Mission Bay South Design for Development* guidelines; please see text for additional description.

OCII Case No. ER 2014-919-97; Planning Department Case No. 2014.1441E:
Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 3-5
Conceptual Project Site Plan

TABLE 3-1
SUMMARY OF PROPOSED PROJECT FACILITIES AND DESIGN FEATURES

Project Component	Characteristic
Event Center Basketball Seating Capacity	18,064 seats[a]
Size	Total GSF
Event Center[b]	750,000
Golden State Warriors Office Space	25,000
Office Space	580,000
Retail Space[c]	125,000
Parking and Loading	475,000
Total Building Area	**1,955,000 GSF**[d]
Height[e,f]/Levels	
Event Center	135 feet
Office and Retail Buildings	160 feet (11 stories) total [90-foot (6-story) podiums with 70-foot (5-story) towers above]; retail uses within street level and plaza-level floors
Retail-only Buildings	41 feet in market hall building northeast corner of site; 38 feet in gatehouse building along Third Street
Parking/Loading Spaces	Blocks 29-32: 950 parking stalls below-grade or at-grade (concealed by Third Street Plaza) 13 truck docks below-grade Existing off-site at 450 South Street Parking Garage: 132 parking stalls
Vehicular Access	Access point for autos and all trucks on 16th Street at Illinois Street Access point for autos on South Street at Bridgeview Way
Open Space	3.2 acres

NOTES:

GSF = gross square feet.

[a] Presented maximum seating capacity is for basketball games. However, as discussed under *Proposed Operations and Employment*, below, there would other types of events at the event center, including certain concerts and conventions, that would be able to accommodate a maximum attendance of up approximately 18,500 patrons with the addition of floor seats and/or standing room-only spaces (see Table 3-3 for more detail).

[b] The event center would include a variety of supporting uses, including Golden State Warriors practice facility and management offices, bayfront terrace, retail, and other uses. For purposes of estimating areas, the Golden State Warriors management office space square footage is presented separately from square footage of the other event center uses.

[c] Proposed retail uses are approximately 51,500 GSF sit-down restaurant, 11,000 quick-service restaurant, and 62,500 GSF soft goods retail including food retail.

[d] The CEQA analyses are based on gross square footage. However, the Mission Bay South Redevelopment Plan permits development based on adjusted gross square footage and leasable square footage. Gross Square Footage and Leasable Square Footage as defined in the Mission Bay South Redevelopment Plan for this project would be less than the gross square footage presented in this environmental document.

[e] All building heights in this SEIR, unless otherwise noted, are measured from finished grade to top of building, consistent with the South Design for Development guidelines. Please note the project site would continue to be slightly sloped, as under existing conditions. Per the South Design for Development guidelines, building height measurements are taken at the median grade height for each building face, and the total building height is calculated by averaging the height of the individual building faces.

[f] Heights of proposed office and retail buildings exclude unoccupied top floor level with mechanical equipment. Mechanical equipment and associated enclosure may be up to 20 feet above the rooftop of building.

SOURCE: Manica Architecture, 2014, 2015

The event center would be programmed with a capacity of 18,064 seats for basketball games, approximately 70 percent of which would be general assigned seating. The remaining seating would consist of loge, club and suite seating, courtside seating, and seating for media and officials. A portion of the event center lower bowl would contain retractable seating to accommodate certain non-Golden State Warriors events requiring a larger floor area. In addition, for non-Golden State Warriors events with small attendance, the event center performance and seating areas could be re-configured in a cut-down theater configuration, and event patron access managed to create the impression of a smaller venue space and more intimate experience for the performances. The event center would also include an ice slab to accommodate a range of ice-related events such as hockey games and Disney on Ice.[11]

The event center would also include a "bayfront terrace," an extension of the event center (pedestrian deck would be 97 feet in height, and terrace roof would be 122 feet in height), that would provide views of the San Francisco skyline, Bay Bridge, Bay waters and East Bay shoreline. Portions of the bayfront terrace would connect to the interior of event center, and other portions of the terrace would connect to the main pedestrian path at the base of the event center, and to a lobby located on Terry Francois Boulevard, via elevators.

(See Section 3.5.2, *Proposed Operations*, below, for a detailed description of proposed Golden State Warriors games and non-Golden State Warriors events at the event center).

Office and Retail Buildings

Two office and retail buildings would be located on the west side of the project site, at the corner of Third and South Streets (northwest corner of site) and at the corner of Third and 16th Streets (southwest corner of the site). These buildings would each be 11 stories (160 feet tall at building rooftop[12]); each office and retail building would consist of a podium ground level plus 5 podium levels (90 feet tall), with a 5-story (70-foot tall) tower (with smaller floorplate than the podium) above. The South Street office and retail building would be approximately 345,000 gsf, and the 16th Street office and retail building would be approximately 300,000 gsf. These buildings could serve a variety of office and/or research and development uses. Retail uses would occupy the lower floor(s) of the office and retail buildings.

Gatehouse, Food Hall and Other Retail Amenities

Additional retail uses would front on South Street and Terry A. Francois Boulevard, located within or adjacent to certain plaza-facing areas of the event center, and along the main pedestrian path. A 2-story, 38-foot high[13], 11,550 gsf "gatehouse" building located mid-point along Third Street would provide retail uses and house elevators/escalators connecting to parking facilities on lower floors. A 41-foot high, approximately 32,000 gsf "food hall" would be located at the corner of Terry A.

[11] The ice slab would consist of an ice floor, ice pits and trenches, and refrigeration equipment. For non-ice related events at the arena, insulated fiberglass panels would first be installed above the ice layer, after which wood parquet panels (to create the basketball court) or other appropriate flooring would be installed depending on type of event.

[12] Please see footnotes "e" and "f" in Table 3-1 for additional detail on building heights.

[13] Height at the gatehouse building's sloping roof peak.

Francois Boulevard and South Street. The food hall would house stalls for local vendors of food and beverage offerings or artisanal goods.

Plazas/Open Space

Approximately 3.2 acres of open space would be designed within the site, including a proposed Third Street Plaza (elevated at approximately 8 to 10 feet above Third Street) on the west side of the project site between the event center and Third Street, and a proposed ground-level Southeast Plaza in the southeastern corner of the site. These plazas would be connected by a pedestrian ramp wrapping around the exterior of the north and eastern sides of the event center. On the east side of the event center, the pedestrian path would offer a "bayfront overlook" to provide eastward views across the Bay. Another pedestrian path would wrap around the southwest portion of the event center.

Vehicle Parking Facilities

Table 3-2 summarizes proposed on-site vehicular parking facilities. Three levels of enclosed on-site parking (two below grade: Lower Parking Levels 1 and 2, and one at street level: Upper Parking Level) would be located below the office and retail buildings and plaza areas. A total of 950 vehicle parking spaces are proposed on-site. Of the 950 vehicle parking spaces, the sponsor would provide 21 Fuel Efficient Vehicle (FEV) spaces, 30 Vehicle Charging System (VCS) parking spaces, and 51 spaces for carpool vehicles. In the event that 30 VCS parking spaces are not feasible the sponsor would provide 51 FEV and 51 carpool spaces.

Parking is proposed to be provided for specialized groups including office parkers, patrons of the event center, retail and restaurant valet and self-parkers. Under the project, the South Design for Development, as amended, would specify the minimum and maximum number of parking spaces that would be provided for the event center and office uses, by building. The number of parking spaces provided for the event center would be reserved for event patrons at all times. The number of parking spaces provided for the office buildings may be made available for use by event patrons on a shared-parking basis (i.e., as available). The truck loading dock area (described under *Loading Facilities*, below) may also be used for a small number of parkers during events.

TABLE 3-2
ON-SITE VEHICLE PARKING, BY LEVEL

	Vehicular Parking		
Parking Level	**Parking Spaces**	**ADA[a] Spaces**	**Total Spaces**
Upper Parking Level (street level)	113	4	117
Lower Parking Level 1 (below grade)	370	13	383
Lower Parking Level 2 (below grade)	442	8	450
Total	**925**	**25**	**950**

[a] ADA = American's with Disabilities Act accessible spaces

SOURCE: Manica Architecture, 2014

For Golden State Warriors games, prepaid parking is proposed for patrons to access the parking garage, where the parking attendant would scan a prepaid barcode hang tag on vehicles (prepaid credentials would be sold through the Golden State Warriors ticketing process). An Automatic Vehicle Identification System (AVI) system may also be used for a limited number of vehicles to access the garage. During non-event periods, a more traditional system using ticket-issuing machines paired with a pay-on-foot ticket kiosks would be utilized for self-parkers, while an AVI system would be available for on-site employees. Valet parking would also be available during event and non-event periods. Additional information on proposed parking areas, by level, and vehicular access to proposed on-site parking facilities is described under *Building Floor Plans*, and *Vehicular Access and Circulation*, below.

As part of the project, the sponsor has also acquired the use of 132 existing off-site parking spaces in the 450 South Street parking garage, primarily accessed from South Street directly north of the project site, to provide additional parking to serve the project employees.

Loading Facilities

Thirteen on-site truck loading docks are proposed to serve the event center and office and retail uses. The loading and service areas, including 13 truck loading docks, would be located on the Lower Parking Level 1. The dimensions of each loading space would be at least 10-feet wide and 35-feet long, with 14 feet of vertical clearance. Additional information on vehicular access to proposed loading areas is described under *Building Floor Plans*, and *Vehicular Access and Circulation*, below. In addition to the 13 on-site below grade loading area, 17 on-street commercial loading spaces would be provided on South Street (8 spaces), Terry A. Francois Boulevard south of South Street (8 spaces), and 16th Street (1 space) to serve the office uses, and the restaurant and retail uses at Market Hall. Overall, the proposed project would have 30 commercial loading spaces serving the project uses.

Building Floor Plans

Figures 3-6 through **3-11** present project building floor plans for several representative floors for the site's buildings, from low to high in height.[14] Figure 3-6 presents the floor plan for the subgrade Lower Parking Level 2. This level would be situated within the north and west sides of the project site and would provide 450 vehicle parking spaces. Auto vehicular ramps located on the north and south sides of the parking garage would provide access between this level and the Lower Parking Level 1 above. This level would also contain stairs and elevators for pedestrian access to/from upper floors.

[14] Certain levels discussed here contain a range of heights, depending on location and use. However, they are grouped, as feasible.

Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 3-11

Floor Plan - Event Center AHU Mezzanine / Office Tower Level
(Shows Representative Floor Plate for the Office and Retail Building Towers)

Figure 3-7 presents the floor plan for the subgrade Event Center Event Level/Lower Parking Level 1. The Event Level would contain the event center's main exhibition floor, courtside and VIP seating, suites, lounge/club space, team practice facilities, and a variety of spectator and operations support facilities. The team practice facilities would also be located primarily on this level in the northeast corner of the event center, and include two full-size basketball courts and supporting facilities. Separate truck loading and vehicle parking facilities would be provided on Lower Parking Level 1, with access to/from the Upper Parking Level by separate auto and truck ramps located on the south side of the site. Lower Parking Level 1 would provide 383 vehicle parking spaces distributed in the north, west, and southeast area portions of the site. A second truck ramp would provide direct access between the main loading area and the event floor for loading/unloading at this location. Additional auto ramps (for use primarily by valet) would be located on the north side of the parking garage to provide access for autos between this level and the parking levels above and below.

Figure 3-8 presents the floor plan for the Ground Level / Upper Parking Level. Several street-level pedestrian entrances would be located on the Ground Level to access project buildings, including the "theater" entrance to the event center (as described above, this entrance would provide exclusive access to smaller capacity events, as well as tertiary access to full-arena events), and entrances to the bayfront terrace lobby and elevator, office and retail building lobbies, retail gatehouse building, and food hall. Additional team practice facilities and offices would also be located on this level. The Upper Parking Level would provide 117 vehicle parking spaces situated in the north and west portions of the site. The project driveway entrance on 16th Street at Illinois Street would provide separate auto and truck vehicle ramps (two lanes for autos, and two lanes for trucks) to provide access to/from the parking and loading areas on the Lower Parking Level 1 below. The project driveway entrance on South Street at Bridgeview Lane would provide access to parking spaces located on the north side of this Upper Parking Level; access to the parking spaces on the west side of this level would be accessed by a separate auto vehicular ramp from the Lower Parking Level 1 below. In addition, auto ramps (for use primarily by valet) would be located on the north side of the parking garage to provide vehicular access between this level and the Lower Parking Level 1 below.

Figure 3-9 presents the floor plan for the Event Center Mezzanine / Plaza Level. The primary event patron ingress/egress for large attendance events at the event center would occur at the northwest entrance on this level. A separate VIP entrance to the event center would also be located on this level. Event center facilities on the Mezzanine level would include team management office space, additional practice team facilities, clubs, spectator and operations support uses, and fixed seating. Lobbies and various retail uses would be located within the office and retail podiums on this level, and additional retail uses would be within the gatehouse and food hall.

Figure 3-10 presents the floor plan for the Event Center Main Concourse / Office and Retail Building Level 1. The secondary event patron ingress/egress for large attendance events would occur at the southeast entrance to the event center on this level. Event center facilities on this level would include the main concourse, retail space, spectator support uses, and fixed seating. Office and retail space would be provided within the office and retail podiums on this level, with additional retail uses in the food hall.

The Event Center Suite Level would primarily contain suites, spectator support facilities, and a concourse. The Event Center Loge Level would contain primarily loge boxes, spectator support facilities, and a concourse. The Event Center Upper Concourse Level would contain fixed seating, spectator support facilities, and concourse.

Figure 3-11 presents the floor plan for the Event Center AHU (Air Handling Unit) / Office Tower Level. This figure presents a representative floor plan for the towers of the proposed office and retail buildings, showing the smaller floorplate of the towers in comparison to the podium structures, below. The Event Center Mechanical Level would provide private access to event center mechanical equipment located on this floor, including accommodation for heating, ventilation, and air conditioning.

Building Elevations

Figure 3-12 and **3-13** present elevation massing drawings of the proposed development for the east and north, and south and west perspectives, respectively.

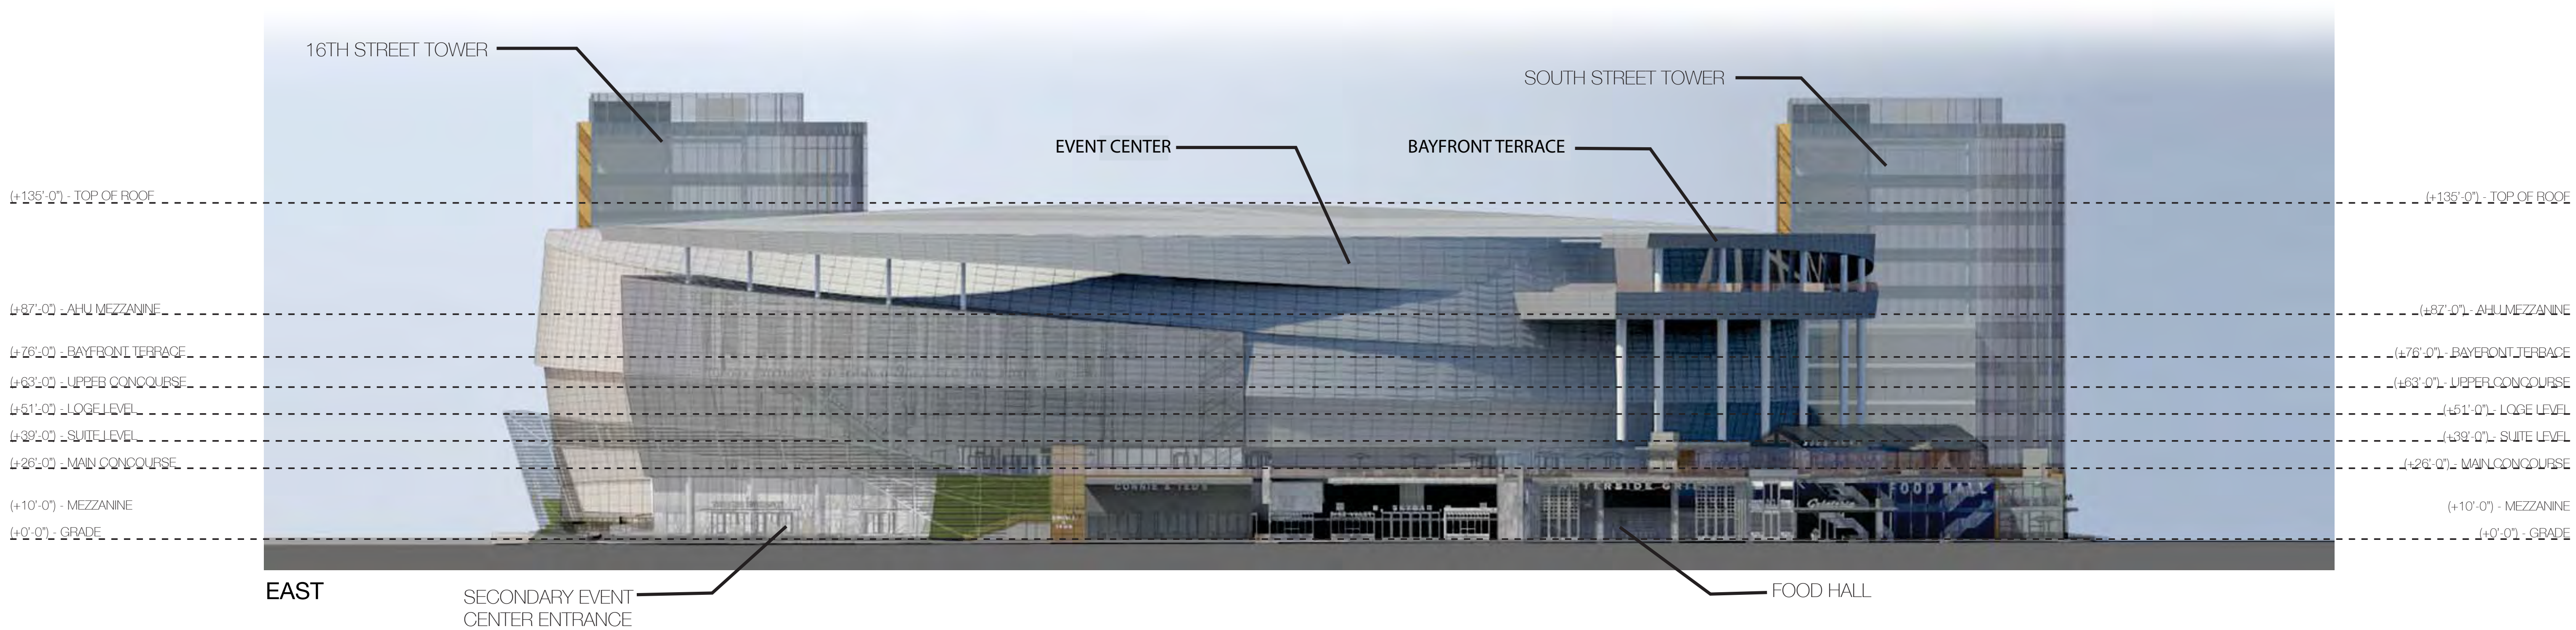
Figure 3-12, top illustration, presents the east elevation (looking west towards Blocks 29-32 from Terry A. Francois Boulevard). The proposed event center, including its elevated bayfront terrace that would extend off the northeast side of the building, and the food hall fronting on Terry A. Francois Boulevard, are prominent in the foreground, behind which the proposed office and retail buildings would rise. The ground-level "theater" entrance to the event center is also visible in this illustration. Figure 3-12, bottom illustration, presents the north elevation (looking south towards Blocks 29-32 from South Street). In this illustration, the event center including its bayfront terrace, and the food hall (fronting on South Street) are visible, as well as the north parking garage entrance on South Street, and on the right-hand side are the two office and retail buildings.

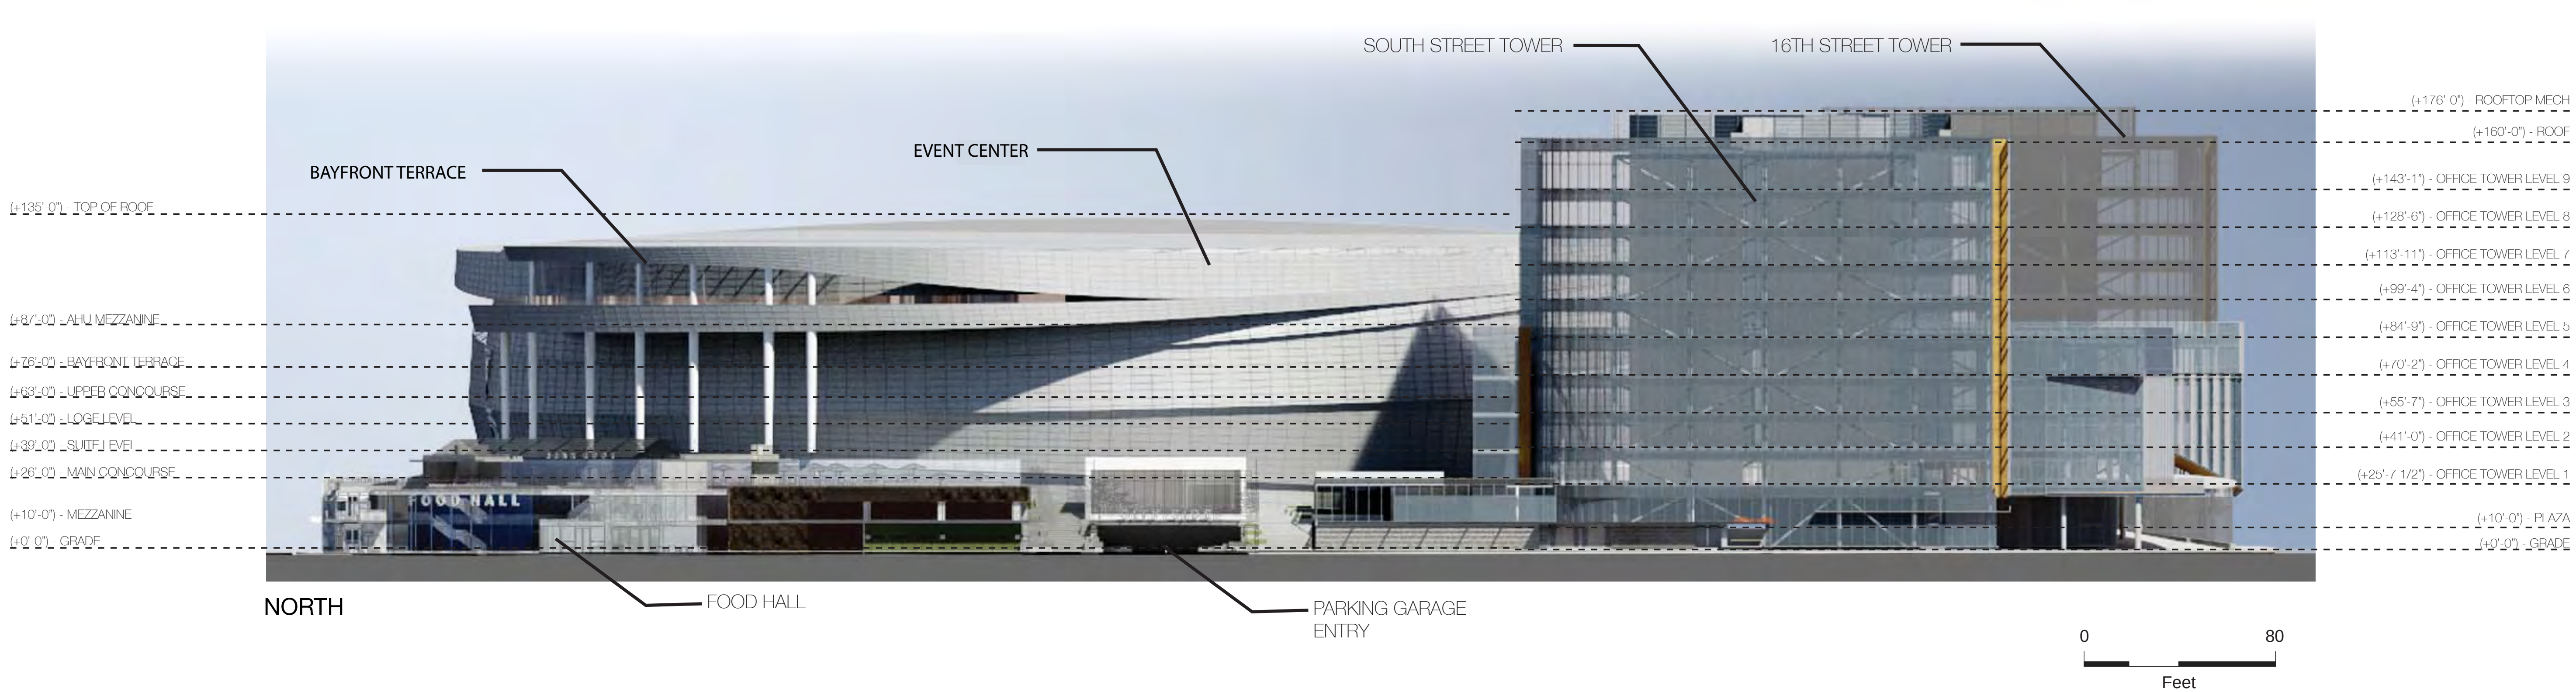
Figure 3-13, top illustration, presents the south elevation (looking north towards Blocks 29-32 from 16th Street). The proposed event center, and the office and retail building at the corner of 16th and Third Streets dominate the foreground, and both the main garage/service entry and the event center theater entrance are visible from this perspective.

Figure 3-13, bottom illustration, presents the west elevation (looking east towards Blocks 29-32 from Third Street). In this illustration, the event center is visible behind the two office and retail buildings, gatehouse building, and the elevated Third Street Plaza.

Bird-Safe Design

The project sponsor proposes to incorporate bird-safe design measures that would reduce the potential effects of the proposed buildings, signage and lighting on birds.





SOURCE: Manica Architecture, 2015

Note: • All building elevations were estimated per *Mission Bay South Design for Development* guidelines; please see text for additional description.

• These drawings show massing for the proposed development, but are not intended to show ideas for building facades, skin or materials

OCII Case No. ER 2014-919-97; Planning Department Case No. 2014.1441E: Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Note: • All building elevations were estimated per *Mission Bay South Design for Development* guidelines; please see text for additional description.

• These drawings show massing for the proposed development, but are not intended to show ideas for building facades, skin or materials

OCII Case No. ER 2014-919-97; Planning Department Case No. 2014.1441E:
Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 3-13
Project South and West Elevations

Vehicular Access and Circulation

As shown in the project site plan in Figure 3-5, all vehicular ingress/egress for the garage would occur at 16th Street (at Illinois Street) or South Street (at Bridgeview Way). The 16th Street driveway would serve as the primary vehicular access point for autos to the parking garage, and the sole access point for trucks to the below-grade loading docks. The 16th Street driveway would be 48 feet wide and accommodate four 12-foot wide lanes (2 lanes dedicated for autos and 2 lanes dedicated for trucks). The South Street driveway would provide a secondary access for autos to the garage. The South Street driveway would be 30 feet wide and accommodate three 10-foot wide lanes.

Event ingress would be only from the 16th Street driveway, while event egress would be through both the 16th and South Streets driveways. Office ingress/egress would be via the 16th Street driveway. Retail and restaurant ingress/egress would be via the South Street driveway. (See *Parking Facilities and Loading Facilities*, above for additional detail on vehicular access to and within those facilities; see also *Proposed Operations and Employment*, below, for a description of the proposed *Transportation Management Plan* that the sponsor would implement as part of the project.)

Pedestrian and Bicycle Access

Figure 3-14 presents the proposed pedestrian circulation at the project site. Pedestrian access to the project site uses, including buildings and plazas, would be available from multiple locations along all four perimeter streets. Within the project site, a 40-foot wide curving pedestrian path would lead from the elevated Third Street Plaza (ranging between 8 and 10 feet above Third Street) around the north and east sides of the event center, past retail uses and a proposed bayfront overlook, and terminate on the southeast side of the event center at 26 feet above ground level. Another pedestrian path would extend from ground level on 16th Street curving around the southwest side of the event center to the Third Street Plaza.

The primary pedestrian access to the event center for large attendance events would be on the northwest side of the event center via the elevated Third Street Plaza. A secondary access point to the event center for large-attendance events would be on the southeast side of the event center via the elevated pedestrian path. The primary pedestrian access to the event center for smaller-attendance events, and tertiary access point to the event center for large-attendance events, would be at the ground-level "theater" entrance on the southeast side of the event center, via the Southeast Plaza.

Pedestrian access to the two office and retail building lobbies would be available on South and 16th Streets and from the Third Street Plaza, with additional access to ground-floor retail uses within those buildings available via South and Third Streets and from the Third Street Plaza. The food hall in the northeast corner of the site would be accessed directly via Terry A. Francois Boulevard and South Street, and also from the elevated pedestrian path within the project site. The gatehouse would provide direct access for pedestrians between the Third Street Plaza and the on-site garage.

OCII Case No. ER 2014-919-97; Planning Department Case No. 2014.1441E:
Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 3-14
Proposed Pedestrian Circulation

New sidewalks would be constructed along the perimeter of the project site (see description of proposed off-site pedestrian network improvements, below). The estimated sidewalk widths for the perimeter sidewalks are 15 feet on Third Street, 12½ feet on South Street and Terry A. Francois Boulevard, and 15 feet on 16th Street. The proposed project would provide on-site bicycle storage rooms accommodating 111 Class 1 bicycle parking spaces within the proposed office and retail/restaurant buildings. In addition, an enclosed bicycle parking center would be provided on 16th Street that could accommodate 300 Class 2 bicycle parking spaces on days without an event. On event days, the bicycle parking center would be valet staffed, which would then convert the 300 spaces to Class 1; an additional 100 Class 1 bicycle parking spaces would be provided as needed in temporary bicycle corrals within the Third Street Plaza, Southeast Plaza, for a total of up to 400 bicycle parking spaces on an event day. The bicycle valet is proposed to be staffed by a partner such as the San Francisco Bicycle Coalition for evening uses during peak events such as NBA games and concerts. The valet parking would be attended from two hours prior to the start of the game/event, to approximately an hour after the event ends. The proposed project would also provide 75 Class 2 bicycle parking space via bicycle racks on the adjacent sidewalks (per the Mission Bay Infrastructure Plan) and on-site at key locations (see **Figure 3-15**).

Infrastructure Improvements

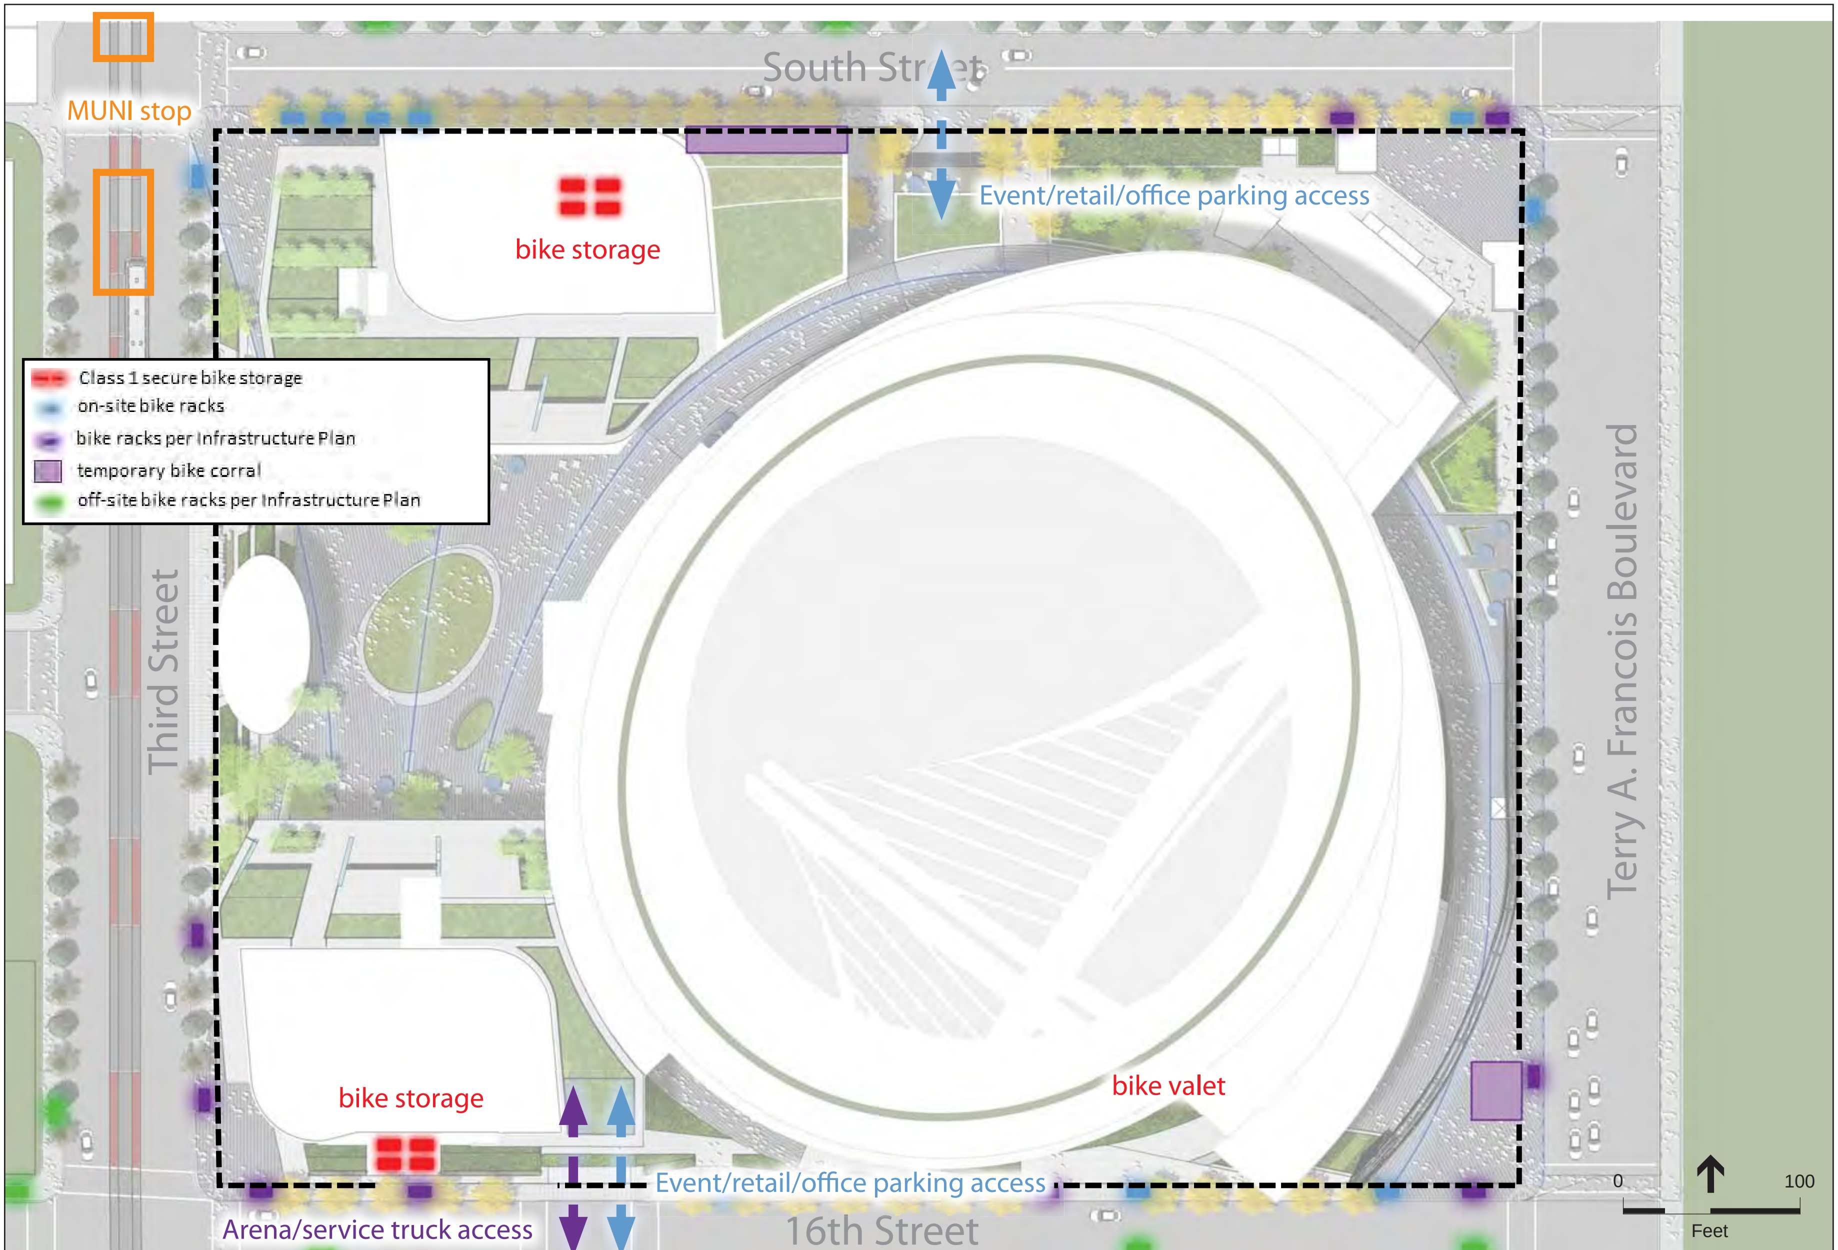
The project proposes to construct all new utility infrastructure facilities on-site, including water supply (low- and high-pressure water lines and recycled water lines); wastewater collection; storm drainage; electrical/gas, and communications. Infrastructure and utilities within adjacent streets that serve the project site are or will be provided by the master developer, FOCIL-MB, LLC, as part of the Mission Bay South Infrastructure Plan.

Stormwater Improvements

Stormwater flows from the project site would drain to a new separate stormwater collection system being constructed as part of the Mission Bay Plan. The project would be subject to the San Francisco Stormwater Guidelines developed by the San Francisco Public Utilities Commission (SFPUC), including a requirement that the project implement best management practices (BMPs) to reduce the flow rate and volume of stormwater and improve the quality of stormwater going into the stormwater drainage system. The stormwater management approach for the proposed project would be required to capture and treat rainfall from the design storm of 0.75 inches. The project would utilize Low Impact Development (LID) strategies to achieve the requirements for capture and treatment of stormwater: green roofs on several proposed buildings (including the office and retail podiums, and food hall), rainwater harvesting, and flow-through biotreatment planters. Treated water from these facilities would be directed to proposed on-site storm drains, which would connect to the separate stormwater collection system beneath the adjacent streets.

Domestic Water and Fire Protection Water

New domestic water and emergency suppression fire water infrastructure would be installed on Blocks 29-32 to serve the proposed uses. All buildings would be equipped with internal fire sprinkler systems as required. Emergency fire water lines and/or fire hydrants would be installed



Project Site Boundary

SOURCE: Manica Architecture, 2015

OCII Case No. ER 2014-919-97; Planning Department Case No. 2014.1441E:
Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 3-15
Proposed Bicycle Parking Facilities

on-site where required. Proposed domestic and fire water lines would connect to existing City water infrastructure located beneath adjacent streets.

Wastewater Collection

New wastewater collection infrastructure would be installed on Blocks 29-32 to serve the proposed uses. Proposed wastewater lines would connect to existing City sanitary sewer lines located beneath adjacent streets.

Electrical and Gas Service

New electrical and gas infrastructure would be installed on Blocks 29-32 to serve the proposed uses. Proposed electrical and gas lines on the project site would connect to existing PG&E infrastructure located beneath adjacent streets.

The project also anticipates installing on-site generators capable of providing up to three megawatts (MW) of emergency, standby and optional power to the event center in the case of temporary loss of normal utility power.[15] In addition, each office and retail building would have an on-site generator capable of approximately 0.75 MW, and the proposed food hall would have a generator capable of approximately 0.5 MW, to provide fire and life safety emergency power in the case of temporary loss of normal utility power in those uses. All emergency generators would be located within the parking structure on Lower Parking Level 1.

Sustainability

The proposed development would be subject to a number of sustainability requirements, including the California CalGreen Code, City of San Francisco Green Building Code, South Design for Development for the Mission Bay South Area, and the 2012 NBA Arena Design Standards – Sustainability Requirements. The project would be designed to Leadership in Energy and Environmental Design (LEED®) Gold standards using a campus approach, whereby each individual proposed structure as well as the overall site would qualify for individual Gold ratings.[16] This would be achieved through incorporation of a variety of design features and implementation of practices during construction and operation to provide energy and water conservation and efficiency, encourage alternative transportation, promote a healthy indoor environment, minimize waste, and maximize recycling opportunities.

---

15 Under such circumstance, the generators would provide power for fire alarms, fire command room, emergency lighting, elevators, smoke control and pressurization, fire pumps, audio system, and certain scoreboard equipment.

16 The Leadership in Energy and Environmental Design (LEED®) is a program developed and administered by the U.S. Green Building Council that provides third-party verification of green building projects. LEED® uses a green building rating system designed to reduce the negative environmental impacts of buildings and improve occupant health and well-being. Building projects satisfy prerequisites and earn points to achieve different levels of certification.

Proposed Off-Site Roadway Network, Transit Network, Pedestrian Network, and Bicycle Network Improvements

The City and sponsor would implement a number of off-site roadway network and curb regulations, transit network, pedestrian and bicycle network improvements in the project site vicinity, including, but not limited to, roadway restriping, intersection signalization, on-street parking, new perimeter sidewalks, bicycle lanes, signage and other improvements, as discussed below.

Roadway Network Improvements and Curb Regulations

- South Street currently has two travel lanes in each direction, with no on-street parking. Under the proposed project, South Street would have one lane in each direction, turn lane improvements, and on-street parking on portions of both sides of the street.

- 16th Street is currently only built out between Third and Illinois Streets. Under the proposed project, 16th Street would be rebuilt and extended to the planned realigned Terry A. Francois Boulevard, and a number of restriping and turn lane improvements would be installed on the intersection approaches and the proposed garage driveway.

- The intersection of Terry A. Francois Boulevard/South Street would be converted from a stop sign controlled intersection to a signalized intersection; the existing uncontrolled intersection of Bridgeview Way/South Street would be converted to a side-street stop sign controlled intersection; the new intersection of Terry A. Francois Boulevard/16th Street would be a signalized intersection; and the existing uncontrolled intersection of Illinois Street/16th Street would be converted to an all-way stop-controlled intersection.

- Adjacent to the site, a Mission Bay Transportation Management Association (TMA) shuttle stop, taxi zone, commercial loading spaces and metered parking spaces would be provided on South Street; commercial loading spaces, a paratransit stop, and metered parking spaces would be located on Terry A. Francois Boulevard; a commercial loading space and metered parking spaces would be provided on 16th Street.

Transit Network Improvements

- The elevated northbound passenger platform at the Muni UCSF/Mission Bay light rail stop on Third Street would be extended from 160 feet in length to 320 feet in length to allow for two two-car light rail trains to simultaneously board or alight passengers along the platform. In addition, crossover tracks would be constructed on Third Street near South Street within the light rail median to enable light rail vehicles to move from one set of tracks to another to reverse travel direction.

- The existing painted median area adjacent to the northbound track between South and 16th Streets would be raised 6 inches. This improvement would allow for staging of two two-car northbound light rail trains.

- As part of the light rail station improvements, fencing would be placed adjacent to the light rail tracks in such a manner as to discourage pedestrian crossings midblock between the intersection of Campus Way with southbound Third Street and the event center on the east side of the street, directly across from Campus Way.

Pedestrian Network Improvements

- New sidewalks would be constructed along the perimeter of the project site on South Street (12.5-feet wide), on Terry A. Francois Boulevard (12.5-feet wide), on 16th Street (15 feet wide), and widening of the existing sidewalk on Third Street from 12 to 16 feet.

- Pedestrian crosswalks (continental design) would be installed at the following intersections: South Street/Bridge View Way, South Street/Terry A. Francois Boulevard (currently there is a crosswalk on the north and west legs of the intersection, not the south), 16th Street/Illinois Street/Project garage driveway, 16th Street/Terry A. Francois Boulevard, and Illinois/Mariposa.

Bicycle Network Improvements

- Class II bicycle lanes would be installed on 16th Street between Third Street and Terry A. Francois Boulevard. Bicycle signals would be installed at the intersections of Terry A. Francois/16th and Illinois/Mariposa, and bicycle turn queue boxes would be installed at the intersection of Terry A. Francois/16th.

A complete description of proposed off-site roadway network and curb regulation, transit network, and pedestrian network improvements is presented in Section 5.2, Transportation and Circulation. See description of the planned realignment of Terry A. Francois Boulevard that would occur pursuant to the Mission Bay South Plan, below. See also proposed Mission Bay TMA Shuttle Program improvements, Special Event Transit Service Plan, and Transportation Management Plan, under Section 3.6.2, *Proposed Operations*, below.

South Plan Improvements Planned in the Vicinity of the Project Site: Terry A. Francois Boulevard Realignment and Public Access Improvements at Bayfront Park

Pursuant to the Mission Bay South Plan and the Mission Bay BCDC Permit No. 5-00, as amended, and independent of the proposed project, development of Blocks 29-32 would trigger the realignment of Terry A. Francois Boulevard to extend adjacent to the east side of Blocks 29-32, and the construction of public access improvements at Bayfront Park east of this realigned roadway. The realigned Terry A. Francois Boulevard would contain four travel lanes (two northbound and two southbound) plus two parking lanes; and - on the east side of the roadway – a two-way cycletrack (bike path) separated from the roadway by a raised buffer.

As discussed above, Bayfront Park is a planned linear park comprising Mission Bay plan parcels P21 through P24, and when completed, will extend from Mission Bay Boulevard south to Mariposa Street. The north portion of the park (P21, located east of Terry A. Francois Boulevard, between Mission Bay Boulevard South and just south of Pierpoint Lane) is complete, and includes a landscaped parking lot and boat launch. Construction is underway in 2015 for the south portion of Bayfront Park (P23 and P24, located west of Terry A. Francois Boulevard, between 16th Street and Mariposa Street), including stormwater infrastructure improvements, and construction of this portion of the park will be complete by the end of 2016. Following realignment of Terry A. Francois Boulevard, the central portion (P22) of Bayfront Park located east of the project site and consisting of approximately 5.5 acres will be developed. Potential park uses for this portion of Bayfront Park being considered at this time include, but are not limited to, pathways, outdoor performance area, kiosks, outdoor dining areas, and informal playing field(s). Both the realignment of Terry A. Francois Boulevard and Bayfront Park public access improvements on P22 are triggered by development on Block 29-32 and would be implemented by the master developer, FOCIL-MB, LLC, prior to occupancy of buildings at the project site.

3.6.2 Proposed Operations

Under the project, the event center at Blocks 29-32 would serve as the new venue for the Golden State Warriors home games, and provide a year-round venue for a variety of other uses, including concerts, family shows, other sporting events, cultural events, conferences and conventions. The event center would be used for up to approximately 225 events per year, with events ranging in capacity from approximately 3,000 patrons up to about 18,500 patrons. All existing Golden State Warriors operations, including management offices and practice facility, would relocate from their existing facilities in Oakland to the new event center. The proposed office and retail facilities on Blocks 29-32 would operate year-round, independent of the event center operations. The following provides additional information for each of the proposed new operational components at Blocks 29-32.

Event Center Programming

Table 3-3 presents a summary of characteristics of proposed events at the event center, including anticipated types and number of Golden State Warriors games and non-Golden State Warriors events, average/maximum game/event attendance, estimated event center day-of-game/event employment, and temporal description of games/events.

Golden State Warriors Games at Event Center

Under the project, all Warriors home basketball games that presently occur at Oracle Arena in Oakland would be played at the proposed event center. The Golden State Warriors would host two to three preseason basketball games (in mid- to late October) and 41 regular season basketball games (from late October to mid-April) at the event center. If the Golden State Warriors reach the postseason, they would host anywhere from 2 to 16 playoff games (from mid-April to mid-June). The large majority of Golden State Warriors home basketball games would start at 7:30 p.m. and conclude between 10:00 p.m. and 10:30 p.m. The home game schedule at the proposed event center would be similar to the Warriors schedule at Oracle Arena, the team's existing home venue in Oakland.

As shown in **Table 3-3**, the maximum basketball seating capacity at the event center would be 18,064, less than the maximum basketball seating capacity of approximately 19,600 at Oracle Arena. Based on historical data for ticket sales and "no-show" rates, the average basketball attendance level at the proposed event center is estimated to be approximately 17,000 during the regular season, with regular season and post-season attendance reaching the maximum capacity of 18,064.

TABLE 3-3
EVENT CHARACTERISTICS AT PROPOSED EVENT CENTER

Event Type	Annual Number of Games/Events at Event Center	Attendance		Event Center Day-of-Game/Event Employment Characteristics	Season	Game/Event Temporal Characteristics
		Average	Maximum			
Golden State Warriors Basketball Home Games	2 to 3 preseason home games	11,000	18,064	1,100[a]	2 weeks mid-October	Regular Season game time: 7:30 p.m. to ~ 9:40 p.m.[c] Preseason/Postseason game time: start time variable Monthly Distribution: ~7 homes games per month Weekly Distribution: 50%/50% weekdays/weekends Monday-Thursday: 2 to 6 home games/month Friday: 1 to 3 home games/month Saturday: 1 to 3 home games/month Sunday: 0 to 1 home games/month
	41 regular season home games	17,000	18,064	1,100[a]	late October to mid-April	
	0 to16 post season home games	18,000	18,064	1,100[a]	mid-April to mid-June	
Concerts	Approximately 30	12,500	14,000 to 18,500[d]	775[b]	major concert season is Fall, Winter and early Spring; Summer is the slow season	Concert time: typically 7:30 p.m. to 10:30 p.m. Weekly Distribution: primarily Friday and Saturday evenings
	Approximately 15	3,000	4,000	675[b]		
Family Shows[e]	Approximately 55	5,000	8,200	675[b]	distributed throughout the year	Family Show characteristics: typically 10 shows over 5 days (Wednesday to Sunday): Wednesday: 1 show, 7:30 p.m. to 9:00 p.m. Thursday: 1 show, 7:30 p.m. to 9:00 p.m. Friday: 2 shows, 10:30 a.m. to 12:00 p.m.; and 7:30 p.m. to 9:00 p.m. Saturday: 3 shows, 11:00 a.m. to 12:30 p.m.; 3:00 p.m. to 4:30 p.m.; and 7:00 p.m. to 8:30 p.m. Sunday: 3 shows, 11:00 a.m. to 12:30 p.m.; 3:00 p.m. to 4:30 p.m.; and 7:00 p.m. to 8:30 p.m.
Other Sporting Events[f]	Approximately 30	7,000	18,064	675[b]	distributed throughout the year; times variable	
Conventions/Corporate Events[g]	Approximately 31	9,000	18,500[h]	675[b]	distributed throughout the year; times variable	

NOTES:

[a] This estimate includes approximately 1,000 event center day-of-game non-Warriors employees, and approximately 100 Warriors employees that would work at the Warriors games. This estimate does not include, however, Warriors employees that would work in the Warriors management offices in the event center during the day (described under *Golden State Warriors Operations*, below), non-Warriors employees of the proposed office and retail uses within the office and retail buildings (described under *Office and Retail Uses*, below), or the visiting team and their support staff at the event center.

[b] This estimate includes event center day-of-event non-Warriors employees. This estimate does not include, however, Warriors employees that would work in the Warriors management offices in the event center during the day (described under *Golden State Warriors Operations*, below), non-Warriors employees of the proposed office and retail uses, and cinema within the mixed-use buildings (described under *Office and Retail Uses*, below), or the visiting event performers and their support staff at the event center.

TABLE 3-3 (Continued)
EVENT CHARACTERISTICS AT PROPOSED EVENT CENTER

NOTES (cont.)

[c] The large majority of Golden State Warriors regular season home games would start at 7:30 p.m. For example, over the course of the most recent full three NBA regular seasons (2010-11, 2012-13, and 2013-14; the 2011-12 NBA season was shortened due to delays in signing of a collective bargaining agreement between NBA owners and players, and consequently is not included), 90 percent of Golden State Warriors home games started at 7:30 p.m., 6 percent of homes games started at 6:00 p.m., and the balance (accounting for one home game or less per season) started at either 1:00 p.m. (on Martin Luther King Jr. holiday), 5:00 p.m., or 7:00 p.m.

[d] Nearly 90 percent of annual concerts at the event center would be in the end-stage concert configuration (14,000 maximum capacity), and the remaining 10 percent (no more than four annually) would be with a 360-degree configuration (18,500 maximum attendance).

[e] Examples of family shows include Disney on Ice, Disney Live, Harlem Globetrotters, and Sesame Street Live.

[f] Examples of Other (non-Warriors) Sporting Events examples include college basketball, hockey, boxing, figure skating, arena football, gymnastics, lacrosse, tennis, and mixed martial arts. These could be professional, collegiate, or amateur competitions.

[g] Examples of Conventions/Corporate Events examples include conventions, conferences, cultural events, civic events and corporate events. It is anticipated that the event center would act as a satellite venue for conventions/conferences held primarily at the Moscone Center when an event or speaker requires more space than can be accommodated at that location.

[h] The maximum number of conference attendees that could be accommodated at the event center is 18,500. This requires a configuration similar to a center stage concert (see footnote d). It is anticipated, however, that average attendance for Convention/Corporate Events would be 9,000 people.

SOURCE: Golden State Warriors, based on data from Oracle Arena (Oakland), SAP Center (San Jose), Toyota Center (Houston), and Barclays Center (Brooklyn, New York City), 2014

It is estimated that approximately 1,000 day-of-game non-Warriors employees[17] would be required on game days at the event center to work in various operations and jobs, including security guards, ushers, ticket takers, team store staff, food service staff, cleaning crew, scoreboard/video operators and staff for other event-related operations. In addition, up to 100 Golden State Warriors' employees (e.g., representatives from Warriors sales, services, marketing and game operations) would work at the games at the event center (please see additional detail of Golden State Warriors employment under *Golden State Warriors Operations*, below).

Non-Golden State Warriors Events at Event Center

The event center would serve as a venue for a variety of non-Golden State Warriors events throughout the year, including concerts, family shows, other sporting events, and conventions/corporate events. Approximately 160 non-Golden State Warriors game events would occur annually at the event center, which could typically include the following:

- **Family Shows:** It is estimated that the event center would host 55 family shows per year. Examples of family shows include Disney on Ice, Disney Live, Harlem Globetrotters, and Sesame Street Live. Family show series would typically occur over a five-day block of time (Wednesday through Sunday) during which time as many as 10 total performances would occur in the daytime and evening periods. Estimated average attendance would be approximately 5,000 patrons, and estimated maximum attendance would be approximately 8,200 patrons.

- **Full Arena Concerts:** It is estimated that the event center would host 30 full arena concerts per year. These concerts would typically occur on Friday and Saturday evenings within a 7:30 p.m. to 10:30 p.m. window. Attendance would vary depending on the artist and stage configuration. Estimated average attendance for full arena concerts would be approximately 12,500 patrons with a maximum capacity of about 18,500.[18]

- **Arena Theater Concerts:** It is estimated that the event center would host 15 arena "theater" (cut-down arena) concerts per year. These concerts typically occur on Friday and Saturday evenings within a 7:30 p.m. to 10:30 p.m. window. Attendance would vary depending on the artist and cut-down configuration. Estimated average attendance for arena theater concerts would be approximately 3,000 patrons with a maximum capacity of approximately 4,000 attendees.

- **Other Sporting Events:** It is estimated that the event center would host 30 non-Warriors sporting events per year. Examples of non-Warriors sporting events include college basketball, hockey, boxing, figure skating, arena football, gymnastics, lacrosse, tennis, and

---

17 This event center day-of-game employee estimate does not include Warriors employees that would occupy the management offices in the event center and employees of the proposed office and retail uses on the project site, both of which are described separately, below.

18 The event center design would allow for an end-stage concert configuration that would accommodates up to 14,000 patrons. It is estimated that nearly 90 percent of concerts would use the end stage configuration. Occasionally, concerts would occur in a 360-degree center-stage configuration which would accommodate a maximum attendance of approximately 18,500 patrons. However, no more than four center-stage concerts are expected per year.

mixed martial arts. These events could be professional, collegiate, or amateur competitions. Estimated average attendance for other sporting events would be 7,000 patrons per event, and estimated maximum attendance of 18,064 (consistent with maximum seating capacity for Warriors games). These events would be distributed throughout the year and have variable start times.

- **Conventions, Conferences and Other Events:** It is estimated that the event center would host 31 events annually related to conventions, conferences, cultural events, civic events, corporate events, and other gatherings, with an estimated average attendance level of 9,000 patrons and maximum attendance of 18,500 patrons. For smaller events, the event center would be configured to reduce the perceived bowl volume to create a more intimate experience. These events would be distributed throughout the year and have variable start times; however, the majority of events are expected to occur during day time hours, consistent with typical events at the Moscone Convention Center.

It is estimated that day-of-event employees for non-Golden State Warriors events at the event center would range from 675 to 775, depending on the specific event and anticipated attendance levels.

(Please see also *Golden State Warriors Operations* and *Office and Retail Uses,* below, for a description of operations and additional employment associated with the Golden State Warriors, and for office and retail uses.)

Potential Outdoor Events at the Project Site

The proposed Third Street Plaza would provide opportunities for public gatherings and events, such as spring festivals, a summer film series, fall festivals/pumpkin patch, and a winter tree lighting ceremony/ice skating rink.

Golden State Warriors Operations

As discussed under Section 3.5.2, *Existing Golden State Warriors Operations*, the Golden State Warriors organization currently includes approximately 150 full-time equivalent (FTE) employees, and associated operations are based in Oakland. Under the project, all existing Golden State Warriors employees and operations, including management offices and practice facility, would relocate to the project site at Mission Bay. Furthermore, the Golden State Warriors estimate that up to 105 additional FTE employees would be required for year-round event center and site management, for a total estimated Golden State Warriors employment of 255 FTE employees.

Office and Retail Uses

The proposed office uses on the site would be expected to operate similar to other existing office developments within Mission Bay, and it is estimated to generate approximately 2,100 FTE employees.[19] The proposed retail uses, including restaurants and other food and beverage

[19] Based on San Francisco Planning Department's Transportation Impact Analysis Guidelines rate of 350/240/350 (Sit-down/QSR/In-line) gross square feet per FTE employee.

service, would operate seven days a week, year-round, independently of the event center operations. It is estimated that the uses within the retail areas would require approximately 370 FTE employees.[20]

Table 3-4, below summarizes all estimated full-time employment under the project.

TABLE 3-4
ESTIMATED FULL-TIME EQUIVALENT EMPLOYEES[a]

Project Component	Full-Time Equivalent (FTE) Employees
Golden State Warriors (Team Operations and Event Center Management)	255
Office Uses[b]	2,101
Retail Uses[c]	372
Total	**2,728**

a See also *Golden State Warriors Operations* discussion, above, for how this estimate was developed. In addition, please also see *Golden State Warriors Games at Event Center* and *Non-Golden State Warriors Events at Event Center* discussion for separate estimates of event center day-of-game/event staff.
b Based on San Francisco Planning Department's *Transportation Impact Analysis Guidelines* office rate of 276 square feet per FTE employee.
c Based on San Francisco Planning Department's *Transportation Impact Analysis Guidelines* restaurant rate of 350/240/350 (Sit-down/Quick Service Restaurant/In-line) gross square feet per FTE employee.

SOURCE: Golden State Warriors, 2014

Transportation Management Plan

As part of the project, the project sponsor prepared and would implement a Transportation Management Plan (TMP). The TMP is a management and operating plan to facilitate multimodal access at the event center during project operation. The TMP includes various management strategies designed to reduce use of single-occupant vehicles, minimize conflicts between modes in the project vicinity, and to increase the use of rideshare, transit, bicycle, and walk modes for trips to and from the project site. The TMP program was developed by the project sponsor in consultation with the SFMTA, OCII and the Planning Department. The TMP is a working document that would be expanded and refined over time by the project sponsor and City agencies involved in implementing the plan. As described below, a monitoring and refinement process is included as part of the TMP. The TMP includes the appointment of an Event Center Transportation Coordinator whose responsibilities would include, but not be limited to, distributing information related to temporary travel lane and/or street closures to event center attendees, emergency service providers, UCSF, and other neighbors prior to events.

20 Based on San Francisco Planning Department's Transportation Impact Analysis Guidelines rate of 276 gross square feet per FTE employee.

The following elements of the TMP are summarized below:

- Muni Special Event Transit Service Plan
- Mission Bay TMA Shuttle Event Express Routes
- Event Transportation Management Strategies
- Travel Demand Management Strategies
- Communication
- Monitoring, Refinement, and Performance Standards

Muni Special Event Transit Service Plan

In addition to the existing scheduled transit service in the project vicinity, the SFMTA would provide additional service to accommodate incremental event-driven transit demand. Under the Muni Special Event Transit Service Plan, light rail service on the T Third line would be increased, and three special event shuttles would be implemented by Muni, including a 16th Street BART Shuttle, Van Ness Avenue Shuttle, and Transbay Terminal/Ferry Building Shuttle.

Expansion of Mission Bay TMA Shuttle Program

The existing Transportation Management Association (TMA) shuttle service program would be expanded during evenings and weekends, and a new TMA shuttle stop would be located on South Street east of Third Street adjacent to the project site. The expanded service would include the following:

- Existing TMA shuttle routes would be revised to provide more frequent service, plus extended service to late evenings and on Saturdays. In addition to the expanded service hours on the East route, the route would be modified to travel on South Street and stop at the new TMA shuttle stop. The Mission Bay Loop service would be expanded from 6:00 to 7:00 a.m. to 6:00 to 10:00 a.m., and from 4:00 to 6:00 p.m.

- Three new regular routes (a Fourth/King Caltrain loop route, a 16th Street BART route, and a Transbay Terminal route) would operate throughout the day, similar to the existing shuttle service, but would have extended hours and operate on weekends.

- One Event Express route (the Fourth/King Caltrain route) with limited stops, would be provided prior to and following a peak event (i.e., events with more than 14,000 attendees).

Event Transportation Management Strategies

The TMP identifies event transportation management strategies that would be implemented to accommodate travel to and from the event center during games/events by all modes to enhance safety through reduction of conflicts between modes, facilitate ingress and egress to the project site and vicinity, and minimize traffic congestion and delays to vehicles, including transit. Transportation management strategies include, but are not limited to the following: providing for Muni ticket or Clipper Card sales at the event center box office; designating taxi zones on Terry A. Francois Boulevard and South Street; designating commercial loading zones; dedicating TMA, charter bus, and paratransit stops; assigning a parking control officer supervisor and using of PCOs at key locations throughout the surrounding transportation network; planning for post-peak event temporary lane closures; and coordination with BART, Caltrain, Muni and Giants staff as well as emergency services providers and neighbors.

Three permanent Variable Message Signs (VMS) would be installed to provide traffic alerts, messages, and alternate driving routes for drivers traveling to the event center, to destinations in the vicinity, or through the area. The VMSs would be used during large events. The proposed locations for the new VMSs include westbound 16th Street east of I-280, southbound Third Street south of the Lefty O'Doul Bridge, and eastbound Mariposa Street east of the I-280 ramps.

In circumstance when events at the proposed event center partially or completely overlap with baseball games or other events at AT&T Park, adjustments to the transportation management plan for the proposed event center would be made, including adjusting PCO staffing to eliminate duplication of effort, and directing event center attendees to travel southbound on Terry A. Francois Boulevard, and then westbound on 16th Street to access locations to the north and west.

Travel Demand Management (TDM) Strategies

The TMP includes TDM strategies for both on-site employees and event center visitors. TDM strategies for office, retail, restaurant, or event center employees include, but are not limited to: participation in the federal pre-tax commuter benefits; promoting use of Mission Bay TMA shuttles and the proposed on-site and bicycle parking facilities; providing employee shower locker facilities in each building; allowing work flexible schedules and telecommuting; supporting an employee ride-matching program; and encouraging carpooling, vanpooling and use of electric vehicles (EVs) by reserving certain on-site garage spaces/charging equipment for vehicles using those modes. TDM strategies for visitors include: rewarding or incentivizing patrons arrival via transit; promoting transit access through trip planning tools and transit maps; displaying transit information at the event center; promoting the use of the on-site bicycle valet facility; and designating priority curb areas on-site for taxis and rideshare vehicles.

Communication

The TMP includes strategies related to distributing information on transportation management for various modes for pre-event and post-event conditions as part of the ticket purchase process, and installing wayfinding signage for multi-modal access and egress. The communication strategies would discourage use of private autos and encourage use of transit and other modes.

Monitoring, Refinement, and Performance Standards

The TMP outlines the process to monitor and refine the strategies within the TMP in conjunction with the City throughout the life of the project. Monitoring methods including field monitoring of operations during the first four years and an annual surveying and reporting program thereafter. Surveys of event attendees and event center employees would be conducted annually, and surveys of Mission Bay neighbors and UCSF staff and emergency providers would be conducted in the initial years of operation. The TMP also identifies performance standards that the project sponsor has committed to maintaining, including but not limited to auto mode share targets for event attendees, and maximum vehicle queuing limits on adjacent streets. Please see additional details on the proposed TMP in Section 5.2, Transportation and Circulation, and the full TMP in Appendix TR of this SEIR.

Proposed Event Center Site Management Practices

As part of the project, the sponsor would comply with all applicable City policies and regulations to minimize effects from the event center and associated event patrons on surrounding land uses, including those contained in the City noise regulations. The project would also be subject to the requirements of the San Francisco Entertainment Commission's Place of Entertainment permits, which includes a Good Neighbor Policy (see Chapter 5, Section 5.3, Noise, for further description). Moreover, as part of the project, the sponsor would develop and implement additional Event Center Site Management practices as needed to further minimize potential disruption associated with event center operations to the quality of life for the surrounding neighborhood. This would include contracting with Mission Bay Parks and the Mission Bay Management Corporation, or other provider, to provide certain off-site parks maintenance, garbage disposal, street sweeping, power washing and other services. The sponsor would implement procedures for addressing potential loitering, pedestrian queuing, illegal vendors, outdoor event patron noise, and other disruptions. The sponsor would also establish a central point of contact with real-time connection to the event center's Transportation Management Center, and would promote pre- and post-game pedestrian routes that would avoid residential streets such as Bridgeview Way north of Mission Bay Boulevard and Fourth Street.

3.6.3 Proposed Construction

Overview

Table 3-5 summarizes major construction tasks, and presents a preliminary construction schedule. Construction of the proposed project is anticipated to begin in late 2015 and occur over an approximate 26-month period. Construction activities would include, but not be limited to: site demolition, clearing and excavation; temporary dewatering; pile installation and foundation construction; construction of all proposed development, including event center, podium structure, office towers and plazas; installation of associated utilities; interior finishing; and exterior hardscaping and landscaping improvements.

The sponsor estimates that the maximum depth of excavation on-site (excluding perimeter cut-off wall, described below) would be approximately 30 feet below grade; this would require approximately 350,000 cubic yards of on-site soils to be excavated and removed from the site. Soil on the site would be compacted using rapid soil compaction over approximately 30 work days. The sponsor proposes to install augercast piles[21] using drilling, as opposed to impact pile driving, for

[21] Augercast piles, also known as continuous flight auger piles (CFA), are cast-in-place, and formed by drilling into the ground with a hollow stemmed continuous flight auger to the required depth or degree of resistance. A cement grout mix is then pumped down the stem of the auger. While the cement grout is pumped, the auger is slowly withdrawn, conveying the soil upward along the flights. A shaft of fluid cement grout is formed to ground level. Reinforcing steel is then lowered in to the wet cement grout.

TABLE 3-5
PRELIMINARY PROJECT CONSTRUCTION SCHEDULE

Location	Construction Period	Duration (weeks)
Demolition/Excavation		12 weeks
Demolition / Clear and Grub	Month 1	4
Cut-off Wall / Earth Retention / Excavation	Months 1 - 3	12
Event Center		94 weeks
Foundations	Months 3 - 19.5	70
Structure	Months 3.5 - 20	70
Roofing Systems	Months 12 - 19	32
Enclosure	Months 12 - 21	40
Interior Rough-in	Months 8 - 22	60
Event Level Service Loop	Months 9.5 – 14.5	20
Mechanical Equipment	Months 9.5 - 20	42
Elevators / Escalators	Months 12 - 23	48
Drywall and Interior Finishes	Months 16 – 24.5	38
Food Service Equipment	Months 17 - 23.5	30
Bowl Rough-in / Finishes	Months 19 – 23.5	22
Sports Equipment and Systems	Months 20.5 – 25.5	20
Commissioning / Project Closeout	Months 25.5 – 26.5	4
Parking Garage and Podium		44 weeks
Foundations	Months 3.5 - 9	22
Structure	Months 6 – 14.5	38
Southwest Tower		72 weeks
Structure	Months 9 - 18	40
Roofing Systems	Months 17.5 – 19.5	8
Enclosure	Months 16 - 20	20
Interior Rough-in	Months 15 - 22	32
Elevators / Escalators	Months 19.5 - 24	18
Drywall and Interior Finishes	Months 18 - 25	32
Commissioning / Project Closeout	Months 21.5 - 26	18
Northwest Tower		74 weeks
Structure	Months 6.5 - 16	38
Roofing Systems	Months 15.5 – 17.5	8
Enclosure	Months 14 - 18	20
Interior Rough-in	Months 12.5 - 20	30
Elevators / Escalators	Months 17.5 - 23	18
Drywall and Interior Finishes	Months 17 - 24	32
Commissioning / Project Closeout	Months 12 - 25	16
Gatehouse Retail Building		20 weeks
Structure	Month 21	4
Enclosure	Month 22 – 22.5	6
Service Loop	Months 22.5 – 23.5	4
Drywall and Interior Finishes	Months 23.5 – 24.5	4
Commissioning / Project Closeout	Month 25	4

TABLE 3-5 (Continued)
PRELIMINARY PROJECT CONSTRUCTION SCHEDULE

Location	Construction Period	Duration (weeks)
Northeast Retail Building		20 weeks
Structure	Month 18	16
Enclosure	Month 19 – 19.5	6
Service Loop	Months 19.5 – 20.5	4
Drywall and Interior Finishes	Months 20.5 – 21.5	4
Commissioning / Project Closeout	Month 22	4
Site Improvements		20 weeks
Site Improvements	Months 21 - 25	20
Total	**26 months**	**104 weeks**

SOURCE: Golden State Warriors, 2014

the deep foundation. It is estimated that approximately 1,400 2-foot diameter piles, at a depth of 110 feet, would be installed at the project site. Augercast pile installation would occur over approximately 60 work days.

Construction dewatering is expected to last approximately nine months. The three potential construction dewatering discharge options are: (1) directly discharging to the City's combined sewer system; (2) installing an on-site dewatering treatment system and discharging the treated water to the Bay if the capacity of the Mariposa Pump Station would be exceeded with the discharge; and (3) a combination of the first two options. (Please see Section 5.9, Hydrology and Water Quality, for additional detail.)

The sponsor is also considering multiple approaches to address potential groundwater infiltration to proposed below-grade facilities and potential localized flooding, including a permanent waterproofing design and implementation of adaptive management strategies (see Section 5.9, Hydrology and Water Quality for additional detail). The project design includes a soil-cement cut-off walls as part of the perimeter shoring and dewatering system for the site, which would support the excavation during construction and allow for excavation to occur.[22] The walls would be about 30 to 36 inches thick. Estimated average depths of the walls around the perimeter of the project site would be 35, 37, 54, and 37 feet along South Street, Terry A. Francois Boulevard, 16th Street, and Third Street, respectively. The sponsor indicates the proposed design would preclude the need to conduct any long-term dewatering of the project site during project operation.

22 A Cement Deep Soil Mixing (CDSM) wall would serve as the soil-cement cut off wall, and would be created by using drilled shallow-stem shafts with a cutting tool and mixing paddles to mix cementitious materials into the soil. H-Beams would be installed at an off-set designed by the engineer. After beams are installed and the wall is cured, the soil-cement wall creates a barrier to the surrounding horizontal groundwater flow. The wall would extend vertically into the underlying bay mud or bedrock depending on the thickness of bay mud where the wall is installed. The bay mud soil layer would act as secondary groundwater control.

The majority of the construction is proposed to occur Monday through Friday, although some construction activities would occur on nights and weekends. A typical work day shift would be between 7:00 a.m. and 6:00 p.m., and a typical second shift (i.e., for below-grade and interior work within buildings) would be between 4:00 p.m. and 12:30 a.m. There would also be the potential for overnight deliveries of materials and/or equipment.

All construction activities are proposed to be conducted within allowable construction requirements permitted by City code. The project would also be subject to the Mission Bay Good Neighbor Construction Noise Policy, which limits extreme noise-generating activities in Mission Bay to Monday to Friday from 8:00 a.m. to 5:00 p.m.[23]

Construction Staging

The proposed construction staging area for the majority of the project construction would take place between the existing alignment of Terry A. Francois Boulevard and the west face of the proposed event center. This staging area would be used until such time the planned realignment of Terry A. Francois Boulevard occurs. Any potential deliveries of materials that could not be accommodated within the above-described staging area would be staged on Terry A. Francois Boulevard between Piers 48 and 50. All construction equipment is proposed to be staged on-site. Tower cranes would be sized and used as appropriate in consideration of UCSF emergency helicopter flight paths. The construction contractor would be responsible for complying with all federal code, rules, and regulations, including those related to operation of the tower cranes in the vicinity of helicopter flight paths (please see Section 5.2, Transportation and Circulation, for additional information).

During construction, the southern-most eastbound lane on South Street adjacent to the project site; and the westbound curb lane on 16th Street between Third and Illinois Street adjacent to the project site would be temporarily closed. It is also anticipated that the sidewalk on Third Street adjacent to the project site would be temporarily closed during the building steel erection phase of work.

Terry A. Francois Boulevard would be the primary point of vehicular ingress/egress to/from the project site during construction. Third Street, Illinois Street, and Terry A. Francois Boulevard are the primary streets in the immediate project vicinity that are proposed to be used to connect to routes leading to/from Interstate 280, Interstate 80 and U.S. Highway 101 during construction. Truck access driveways at the project site would be from multiple locations on South Street (three driveways), Terry A. Francois Boulevard (two driveways), and 16th Street (two driveways). The location of the midblock driveway on South Street between Third Street and Bridgeview Way would shift as construction proceeds (i.e., the driveway would be closer to Third Street for the first three months of construction, and closer to Bridgeview Way for the remainder of the

[23] The Mission Bay Good Neighbor Policy specifies that pile driving or other noise generating activity (80 dBA at a distance of 100 feet) shall be limited to 8:00 am to 5:00 pm, Monday through Friday. No pile driving or other extreme noise generating activity is permitted on Saturday, Sundays and holidays.

construction period). The number of driveways that would be in use at any one time would depend on the construction phase.

Construction workers not utilizing available public transit options are expected to either carpool and/or use public parking in the project site vicinity.

Construction Employment

Table 3-6 summarizes the estimated project construction jobs. The number of construction workers present on-site daily would vary, depending on the specific construction activities being performed and overlap between construction phases. During peak overlapping construction periods, there would be between approximately 330 and 700 construction workers at the project site.

TABLE 3-6
PROJECT CONSTRUCTION EMPLOYMENT

Construction Work	Average / Peak Number of Workers
Entire Site	
Demolition	10 / 12
Excavation and Shoring	25 / 30
Event Center

Construction Equipment

It is expected that track-mounted cranes and track-mounted drill rigs would be used at the project site for drilling the soil-cement cut off wall, and for augercast pile installation for the deep foundations. Tower cranes, track-mounted cranes and tire-mounted mobile cranes would be used for building construction, including but not limited to, steel erection, precast erection, and building façades. Other mobile equipment such as backhoes, front-end loaders, dump trucks, and forklifts would be used at the project site for a range of other construction tasks on the project site, including excavation, site clearing and grading, building construction, and/or hardscape and landscape materials installation. Project construction would generate off-site truck trips for deliveries of concrete and other building materials, transportation of construction equipment to and from the site, hauling soils and debris from the site, and street sweepers. A variety of other smaller mechanical equipment would also be used at the project site during the construction period, such as saw cutters, chopping saws, tile saws, stud impact guns, impact drills, torque wrenches, welding machines, and concrete boom pumps.

3.7 Graphic Exhibits of Proposed Project

A number of graphic exhibits depicting the proposed project development are presented in **Figures 3-16** to **3-23** for informational purposes.

3.8 Intended Uses of this SEIR and Approvals Required

This is a project-specific SEIR, intended to provide information about the environmental consequences of the proposed project in accordance with the requirements of CEQA. In addition to describing the proposed project and required approvals, this SEIR analyzes potential environmental impacts of the proposed project, identifies feasible mitigation measures where those impacts are significant, addresses cumulative adverse impacts to which the proposed project could make a substantial contribution, and evaluates alternatives to the project that could avoid or substantially reduce significant impacts while still meeting most of the project's basic objectives. See Chapter 2, Introduction, for a more detailed description of CEQA requirements.

Approvals or permits from the following agencies for project construction and/or long-term operation are anticipated at this time:

- Certification of the Final SEIR by the OCII Commission
- Action by the Board of Supervisors on any appeals of the OCII Commission's certification of the FSEIR
- Approval by the OCII Executive Director of secondary use findings of consistency for the proposed event center
- Approval by the OCII Commission of a new Major Phase for Blocks 29-32, and related conditions of approval

- Approval by the OCII Commission of Combined Basic Concept and Schematic Designs (Schematic Designs) for the project
- Approval by the OCII Commission (and any other City departments as required under the Mission Bay South Plan, OPA, Interagency Corporation Agreement, and associated documents) of: amendments to the Mission Bay South Design for Development, and modifications to the Mission Bay South Signage Master Plan and Mission Bay South Streetscape Plan, and conditions of approval.
- Approval by Mayor, Department of Public Works Executive Director and OCII Executive Director of any non-material changes to Mission Bay South Infrastructure Plan
- Entertainment Commission approval of applicable entertainment permits, including, but not limited to, a Place of Entertainment permit
- Planning Commission approval of office building Schematic Designs related to Proposition M allocation
- Port of San Francisco staff approval of changes to waterfront infrastructure, including roadway striping
- San Francisco MTA/Department of Public Works approval for reconfiguration of adjacent streets
- San Francisco Department of Public Works and Board of Supervisors approval of subdivision maps, including street vacations, acceptance of public improvements and right-of-way dedications, and encroachment permits to the extent required
- Termination or relocation of existing City-reserved easements by applicable City departments, including the San Francisco Public Utilities Commission, to the extent required
- San Francisco Department of Building Inspection approval of a building/site permit, and related approvals from other City departments including the SFPUC for utility connections
- Approval from the University of California to terminate a view easement extending 100 feet within the project site along the Campus Way axis (Please see Chapter 8, Third Street Plaza Project Variant for a description and analysis of a project variant where no structural development would be proposed within this view easement.)

CHAPTER 4
Plans and Policies

4.1 Introduction and Overview

In accordance with CEQA Guidelines Section 15125(d), this chapter provides a summary of the plans and policies of the City and County of San Francisco Office of Community Investment and Infrastructure (OCII), City and County of San Francisco (CCSF), and regional, state, and federal agencies that have policy and regulatory control over the project site. Although some of the plans and policies relate to regulations under the jurisdiction of these agencies, the primary discussion of regulations pertinent to the proposed project and its environmental effects is included in Chapter 5, Environmental Setting, Impacts, and Mitigation Measures, under the regulatory framework subsection of each environmental topic.

Development of the project is subject to approvals by the primary agency with jurisdiction over the project site, which is OCII. Other agencies with plans and policies applicable to the project site include the Metropolitan Transportation Commission (MTC), San Francisco Bay Regional Water Quality Control Board (RWQCB), Bay Area Air Quality Management District (BAAQMD), and Association of Bay Area Governments (ABAG).

Policy conflicts do not, in and of themselves, indicate a significant environmental effect within the context of CEQA environmental review, in that the intent of CEQA is to determine physical environmental effects associated with a project. Many of the plans of OCII, CCSF, and the other relevant jurisdictions contain policies that address multiple goals pertaining to different resource areas. To the extent that physical environmental impacts of a proposed project may conflict with one of the goals related to a specific resource topic, such impacts are analyzed in this SEIR in that respective topical section in Chapter 5, such as Section 5.2 (Transportation and Circulation), Section 5.4 (Air Quality), Section 5.4 (Greenhouse Gas Emissions), and Section 5.9 (Hydrology and Water Quality).

4.2 San Francisco Plans and Policies

4.2.1 San Francisco General Plan

The *San Francisco General Plan* (*General Plan*) provides general policies and objectives to guide land use decisions. The General Plan contains 10 elements (Commerce and Industry, Recreation and Open Space, Housing, Community Facilities, Urban Design, Environmental Protection, Transportation, Air Quality, Community Safety, and Arts) that set forth goals, policies, and objectives for the physical development of the City.

On September 17, 1998, by Resolution No. 14702, the Planning Commission determined that the Mission Bay South Redevelopment Plan provides for a type, intensity, and location of development that is consistent with the overall goals, objectives, and policies of the *General Plan*. Therefore, the project's consistency with the Mission Bay South Redevelopment Plan (discussed below) would ensure that the project would not obviously or substantially conflict with *General Plan* goals, policies, or objectives. The *General Plan* elements that relate to the unique characteristics and considerations of the proposed project are discussed below.

Commerce and Industry Element. According to the *General Plan*, "the *Commerce and Industry Element* sets forth objectives and policies that address the broad range of economic activities, facilities and support systems that constitute San Francisco's employment and service base." The element calls for managing economic growth to ensure enhancement of the total city environment, maintaining a diverse economic base, and providing employment opportunities for city residents. Objective 8 specifically states that the City shall enhance its position as a national center for visitor trade because visitor trade employs, directly, and indirectly, more residents than any other economic sector. The proposed project would not obviously conflict with the Commerce and Industry Element.

Transportation Element. The Transportation Element comprises sections relating to General Transportation, Regional Transportation, Congestion Management, Vehicle Circulation, Transit, Pedestrians, Bicycles, Citywide Parking and Goods Movement. Each section consists of objectives and policies regarding a particular segment of the master transportation system and related maps which describe key physical aspects. The element specifically calls for the City to provide for a balanced, multi-modal transportation system that is consistent with planned land use. It states that the City shall encourage development that efficiently coordinates land use with transit service, establish frequent and convenient transit service for large sporting facilities and event centers, and provide bicycle parking for such centers. The proposed project would not obviously conflict with the Transportation Element.

Recreation and Open Space Element. The Recreation and Open Space Element (ROSE) indicates that the area surrounding the project site and vicinity has a "lesser need" for open space acquisition and renovation. This is due to the inclusion of proposed open spaces in the Mission Bay area, as well as the relatively low residential population compared to other areas of the City. The element specifically delineates Bayfront Park, east of the project site, as a "proposed open space," and it designates Terry A. François Boulevard as a "green connection." The proposed project would not obviously conflict with the ROSE.

Urban Design Element. As described in the *General Plan*, the Urban Design Element relates to the physical character and order of the city, and the relationship between people and their environment. The element specifically calls for centers of activity and major destination points to be made more prominent through design of street features and other means (Policies 1.6 and 1.8), and for local centers for shopping or congregations of people to stand out in their areas (Policy 4.6). The element also states that the City shall recognize the special urban design issues posed in development of larger properties (Policy 3.6).

The Urban Design Element also specifically addresses protection of major views in the City (Policy 1.1), and moderation of new development to complement the city pattern (Objective 3) by avoiding extreme contrasts in color, shape, and other characteristics (Policy 3.2). Under this objective, the element states that low buildings along the waterfront contribute to the gradual tapering of height from the hills to the water that is characteristic of the City. Larger building with civic importance, providing places of assembly and recreation, may be appropriate along the waterfront at important locations. The element states that building height should relate to the important attributes of the city pattern and to the height and character of existing development (Policy 3.5), and the bulk of buildings should not overwhelm or dominate in appearance (Policy 3.6). The proposed project heights would be within the maximum heights called for in the Mission Bay South Redevelopment Plan and Design for Development documents (discussed below). However, the project's event center would exceed the 90-foot height limit on Blocks 30 and 32 set forth in the Design for Development, which would be addressed through an amendment to the Design for Development. The proposed project would not obviously conflict with the Urban Design Element.

4.2.2 San Francisco Planning Code

As stated in Chapter 3, Project Description, the Mission Bay South Redevelopment Plan and Design for Development for Mission Bay South Project Area, together, constitute the regulatory land use framework for the project site, and they supersede the City's *Planning Code*, except as otherwise specifically provided for in those documents and associated documents for implementing the Mission Bay South Redevelopment Plan. The project would not require variances from or changes to the Planning Code or Zoning Map.

Planning Code Section 321

Section 321 implements the City's annual limit on office construction, which is set at 950,000 square feet per calendar year, with a subset of 75,000 square feet reserved for buildings smaller than 50,000 square feet. The limit applies to all office space of a certain size citywide, not just downtown. Buildings smaller than 25,000 square feet are excepted; however, OCII projects are included, as are projects within San Francisco that are under the jurisdiction of the State of California and federal agencies, including the Presidio Trust and National Park Service. Square footage not allocated during any given year is added to the overall allocation for succeeding years. The Mission Bay South Redevelopment Plan, described below, states that no office development shall be approved that would cause the applicable annual limitation to be exceeded. As of November 14, 2014, the Planning Department's inventory of office space showed 3.02 million square feet of space available for large projects (those 50,000 square feet and larger), with an additional 1.27 million square feet available for smaller projects (25,000 to 49,999 square feet).[1]

1 San Francisco Planning Department, "Office Development Annual Limitation (Annual Limit) Program Update November 14, 2014. Allocations in square feet of gross floor area, as defined in *Planning Code* Sec. 102.9 Available at: http://www.sf-planning.org/Modules/ShowDocument.aspx?documentID=9276; reviewed December 15, 2014.

As described further below under "Mission Bay South Redevelopment Plan," the Planning Commission adopted findings that the office development contemplated by the plan promotes public welfare, convenience and necessity. No office development contemplated under the plan may be disapproved for inconsistency with Planning Code Sections 320 – 325, provided that the annual office space limitation contained in Planning Code Section 321 is not exceeded.

In 2008, the Planning Commission established the Alexandria Mission Bay Life Sciences and Technology Development District (Alexandria District), with a pooled allocation of 1.12 million gross square feet (later modified to 1.35 million square feet) of office space to be used both by previously allocated office projects and future allocations at designated parcels in the district, in accordance with Planning Code Section 321. The Alexandria District generally includes properties along the east side of Third Street between Mission Bay Boulevard and Mariposa Street (Blocks 26, 27, 29–32, 33, and 34) as well as properties west of Owens Street (Blocks 41–43). Blocks 29–32 currently have an allocation of 677,020 square feet of office space, none of which has been built.[2,3] The proposed project's approximately 605,000 square feet of office space would be accommodated within this total.

The Accountable Planning Initiative

In November 1986, the voters of San Francisco approved Proposition M, the *Accountable Planning Initiative*, which added Section 101.1 to the *Planning Code* to establish the following eight priority policies:

- Preservation and enhancement of neighborhood-serving retail uses;
- Protection of neighborhood character (discussed in Appendix NOP-IS, Section E.1, Land Use and Land Use Planning, Question 1c);
- Preservation and enhancement of affordable housing (discussed in Appendix NOP-IS, Section E.3, Population and Housing, Question 3b, with regard to housing supply and displacement issues);
- Discouragement of commuter automobiles (discussed in Chapter 5, Section 5.2, Transportation and Circulation);
- Protection of industrial and service land uses from commercial office development and enhancement of resident employment and business ownership (discussed in Appendix NOP-IS, Section E.1, Land Use and Land Use Planning, Question 1c);
- Maximization of earthquake preparedness (discussed in Appendix NOP-IS, Section E.14, Geology and Soils, Questions 14a through 14d);
- Landmark and historic building preservation (discussed in Appendix NOP-IS, Section E.4, Cultural and Paleontological Resources, Question 4a); and

2 *Ibid*.
3 San Francisco Planning Department, "Letter RE: Property Transfers within the Alexandria Life Sciences & Technology District," March 21, 2011.

- Protection of open space (discussed in Chapter 5, Section 5.6, Wind and Shadow,; and in Appendix NOP-IS, Section E.10, Recreation, Questions 10a and 10c).

Through adoption of Resolution No 14702 in 1998, the Planning Commission determined that the Mission Bay South Redevelopment Plan provides for a type, intensity, and location of development that is consistent with these priority policies. Therefore, the proposed project's consistency with the Mission Bay South Redevelopment Plan (below) would ensure that the proposed project would not obviously conflict with the Accountable Planning Initiative.

4.2.3 Mission Bay South Redevelopment Plan

The Mission Bay South Redevelopment Plan (South Plan) establishes the basic land use controls for the Mission Bay South Plan Area. The major objectives of the South Plan are to eliminate blighting influences and correct environmental deficiencies; retain and promote academic and research activities associated with the University of California San Francisco (UCSF), Mission Bay campus; assemble land into parcels suitable for modern, integrated development; re-plan, redesign, and develop undeveloped and underdeveloped areas; provide flexibility to respond to market conditions; provide opportunities for participation by owners in redevelopment of their properties; strengthen the community's supply of housing; strengthen the economic base of the Plan Area; facilitate emerging commercial-industrial sectors; facilitate public transit opportunities; provide land for publicly accessible uses; and achieve the objectives expeditiously.

The South Plan includes the Redevelopment Land Use Map, which illustrates the location of Plan Area boundaries and proposed land uses to be permitted, generally consistent with the land uses presented in the 1990 Mission Bay Plan. See Figure 3-3, Land Uses in the Mission Bay Redevelopment Plan, in Chapter 3, Project Description. Pursuant to South Plan Section 302.4, the Commercial Industrial/Retail land use district that encompasses Blocks 29-32 principally permits office and retail uses, among other uses. Secondary assembly and entertainment uses are also permitted if the use generally conforms with redevelopment objectives and planning and design controls, as well as if the use is determined to make a positive contribution to the character of the Plan Area, based on a finding by the Executive Director of OCII that the use will provide a development that is necessary or desirable for, and compatible with, the neighborhood or community.

Regarding commercial industrial floor area controls, the South Plan limits floor area ratio (FAR) for commercial industrial and commercial industrial/retail to a maximum of 2.9 to 1, averaged over the entire area of those land use districts combined. The South Plan permits a maximum of 5 million square feet of leasable[4] mixed use office, research and development, and light industrial use space is permitted in "Zone A," which comprises Blocks 26–34, 36, and 38–43, (see Chapter 3, Figure 3-3). There are approximately 1,050,000 leasable square feet remaining after accounting for the approved and anticipated projects in Zone A. Using the calculation of leasable square feet

[4] The South Plan defines "leasable floor area" as the floor rentable area, as defined and calculated in the 1996 Building Owners and Managers Association International (BOMA) publication "Standard Method of Measuring Floor Area in Office Buildings."

required in the South Plan, the proposed project would entail construction of 1,010,400 leasable square feet, which would be accommodated within Zone A's remaining total permitted leasable square footage.

The South Plan also limits the total neighborhood-serving and city-serving retail space[5] to be developed in Zone A and sites designated Commercial or Mission Bay South Residential. Up to 180,000 leasable square feet of neighborhood-serving retail and city-serving retail is permitted in Zone A, of which 50,464 square feet remains. The project's proposed 29,732 leasable square feet of neighborhood-serving retail would be accommodated within this remaining total square footage. Zone A is permitted 20,700 leasable square feet of city-serving retail, none of which has been built or allocated. The project's 20,700 leasable square feet of city-serving retail would be accommodated within this remaining total square footage.

As stated above under "San Francisco Planning Code," the South Plan indicates that no office development in the South Plan shall be approved if it would cause the annual limitation on office space contained in Planning Code Section 321 to be exceeded. Blocks 29–32 currently have an allocation of 677,020 square feet of office space, none of which has been built.[6,7] The proposed project's approximately 605,000 square feet of office space would be accommodated within this total. Further, Mission Bay South Redevelopment Plan Section 304.11 states that no project may be disapproved for inconsistency with Planning Code Sections 320–325, provided that the annual office space limitation is not exceeded and that the Planning Commission considers the design of the particular office development project to confirm that it is consistent with the Commission's findings contained in Resolution 14702.

The South Plan indicates that the maximum height within the Plan Area is 160 feet. Within that height limit, OCII is authorized to establish height limits of buildings, land coverage, density, setbacks, design and sign standards, and other criteria, as set forth in the Design for Development document (discussed below).

---

5 The South Plan defines "local-serving business" as a "business provides goods and/or services which are needed by residents and workers in the immediately surrounding neighborhood to satisfy basic personal and household needs on a frequent and recurring basis, and which if not available would require trips outside of the neighborhood. Also referred to as 'neighborhood-serving' business." The South Plan does not specifically define "City-serving retail," but it is generally understood to include retail spaces patronized by customers from both inside and outside the neighborhood.

6 San Francisco Planning Department, "Office Development Annual Limitation (Annual Limit) Program Update, November 14, 2014. Allocations in square feet of gross floor area, as defined in *Planning Code* Sec. 102.9 Available at: http://www.sf-planning.org/Modules/ShowDocument.aspx?documentID=9276; reviewed December 15 2014.

7 San Francisco Planning Department, "Letter RE: Property Transfers within the Alexandria Life Sciences & Technology District," March 21, 2011.

4.2.4 Design for Development for the Mission Bay South Project Area

The Design for Development for Mission Bay South Project Area (South Design for Development) is the companion document to the South Plan. It contains design standards and design guidelines through establishment of height zones. Blocks 29-32 fall within Height Zone 5, which encompasses the area bounded by Mission Bay Boulevard to the north, Third Street to the west, Mariposa Street to the south, and the San Francisco Bay to the east. The proposed project would be generally consistent with the major development standards for Height Zone 5, including maximum tower height and developable area.

As described in Chapter 3, Project Description, due to the unique nature of the event center component of the project, amendments to the Design for Development are required to bring the proposed project into compliance. To the extent that such amendments would lead to physical environmental impacts related to a specific resource topic, such impacts are analyzed in this SEIR in that respective topical section in Chapter 5, such as Section 5.2, Transportation and Circulation, Section 5.4, Air Quality, Section 5.5, Greenhouse Gas Emissions, and Section 5.9, Hydrology and Water Quality. As noted in the Introduction (Section 2.8), the proposed project meets the criteria of Senate Bill 743 for which aesthetics and parking are no longer to be considered in determining if a project has the potential to result in significant environmental effects.

The proposed project would include amendments to the Design for Development that would define Arena, Arena Building, Arena Project, and the Blocks 29–32 Arena Overlay Zone (Overlay Zone), with associated design standards and guidelines. The discussion below describes the primary existing Design for Development standards and guidelines, and where applicable, proposed amendment to the standards to create the Blocks 29–32 Arena Overlay Zone that would be required to bring the proposed project into compliance with the Design for Development.

Height

Height Zone 5 has a maximum base height of 90 feet and a maximum tower height of 160 feet, and commercial/industrial uses must be one of those two heights. Further, towers (buildings taller than 90 feet) are not permitted on Blocks 30 and 32. The proposed event center would exceed 90 feet in height, and therefore would not meet this requirement. The proposed amendment would allow an Arena Building not to exceed 135 feet in height within the Overlay Zone. The existing limitations on base height, midrise height, and tower height would not apply to the Arena Building.

Towers

A maximum of three towers are permitted with a maximum height and bulk within Height Zone 5; towers must be separated by at least 100 feet when located on the same block, and tower widths on Third Street cannot exceed 160 feet. In addition, no intersection can have more than two towers within 50 feet of the corner.

To accommodate the proposed project, the Design for Development would be amended to allow an Arena Building in the Overlay Zone. The proposed amendment would allow an additional tower (for a maximum of four towers plus the Arena Building within Height Zone 5). The amendment would also clarify the tower separation requirements to accommodate the proposed distances between the towers and the Arena Building. The amendment would increase to three the number of towers allowed within 50 feet of the intersection of South Street and Third Street.

Bulk

Commercial/industrial buildings have a permitted maximum floor plate of 20,000 square feet, and a maximum length of 200 feet, for all floors above 90 feet. The proposed amendment would create a bulk allowance for the Arena Building.

Streetwalls and Setbacks

In Height Zone 5, a minimum of 70 percent of the block length frontage is required along Third and 16th Streets. A 5-foot setback is required along Third Street, and a 20-foot setback is required on 16th Street. Streetwalls must be at least 15 feet tall, and no more than 90 feet tall. The amendment would indicate that the minimum length, minimum height and maximum height streetwall standards shall not apply to the Arena Project, subject to findings by the OCII Commission that the Arena Project is, on balance, consistent with Overlay Zone Design Guidelines. The amendments would further state that the 5-foot setback requirement on the east side of Third Street would not be applied to the office tower at the northwest corner of Block 29, and the Arena Building, including minor landscape features, would be permitted to occupy a portion of the 20-foot required setback on the north side of 16th Street.

Other Amendment Provisions

Other proposed amendments to the South Design for Development may be required to accommodate final project design. Such amendments may include the following:

i. Allowing parking within 600 feet of the Arena Project entrance to qualify as off-site parking for an Arena Project;

ii. Allowing shared parking among Arena Project uses (for example, parking spaces provided for daytime office use may be used by the Arena Building on nights and weekends);

iii. Basing parking calculations within the Overlay Zone upon the total aggregate square footage by applicable structure (and in the case of the Arena, total number of seats) rather than applied to any single tenant;[8]

iv. The minimum and maximum number of parking spaces for the Arena Building will be established based on number of seats; and

v. Modifying the required loading requirements to accommodate the number and configuration of off-street loading spaces proposed by the project.

---

[8] Note that this is consistent with the existing Design for Development, but the amendment includes the reference to the calculation of Arena Building requirements based on number of Arena seats.

See Chapter 5, Section 5.2, Transportation and Circulation, for a discussion of the traffic and parking provisions.

4.3 Regional Plans and Policies

The *Plan Bay Area*, which includes the region's Sustainable Communities Strategy (SCS), is a collaboration led by the ABAG and the MTC, in partnership with the BAAQMD and the San Francisco Bay Conservation and Development Commission (BCDC). *Plan Bay Area*, adopted by ABAG and MTC in July 2013, is the region's first integrated land use and transportation plan, combining elements of ABAG's former *Projections* series of housing and employment growth forecasts and MTC's former stand-alone *Regional Transportation Plan*. The Plan calls for concentrating housing and job growth around transit corridors, particularly within areas identified by local jurisdictions as Priority Development Areas (PDAs). *Plan Bay Area* also specifies strategies and investments to maintain, manage, and improve the region's multi-modal transportation network and proposes transportation projects and programs to be implemented with reasonably anticipated revenue. The Plan will be updated every four years. The project site, like much of eastern San Francisco, is within a PDA, where growth is anticipated and planned for in proximity to transit (see also the discussion on Population and Housing, in Appendix NOP-IS, Initial Study, Section E.3). The proposed project would not conflict with any projects in the regional transportation plan. Therefore, the proposed project would be consistent with *Plan Bay Area*.

Other regional plans pertinent to the proposed project include:

- BAAQMD's *2010 Clean Air Plan* (2010 CAP) demonstrates how the San Francisco Bay Area will reduce emissions and decrease ambient concentrations of harmful pollutants, achieve compliance with the state ozone standards, and reduce the transport of ozone and ozone precursors to neighboring air basins. The proposed project would include appropriate transportation, energy, and sustainability measures to reduce automobile trips, energy usage, and associated emissions and would not disrupt or hinder implementation of control measures identified in the 2010 CAP. Furthermore, the project sponsor has agreed to implement mitigation measures that would reduce pollutant emissions, including offsetting emissions generated by construction and operations of the project. Therefore, as described in detail in Section 5.4, Air Quality, the project would not conflict with the 2010 CAP.
- The San Francisco RWQCB's *Water Quality Control Plan for the San Francisco Bay Basin* (commonly referred to as the *Basin Plan*) guides water quality control planning in the San Francisco Bay Basin. It designates beneficial uses and water quality objectives for waters of the State, including surface waters and groundwater. It also includes implementation programs to achieve water quality objectives. As described further in Chapter 5, Section 5.9, Hydrology and Water Quality, as well as Section E.14 of the Initial Study, the proposed project would not result in substantial water quality effects; thus the project would not conflict with the Basin Plan.

The project would not obviously or substantially conflict with any environmental plan or policy adopted for the purpose of avoiding an environmental effect.

CHAPTER 5
Environmental Setting, Impacts, and Mitigation Measures

5.1 Impact Overview

This chapter describes the environmental setting, assesses impacts, and identifies measures that would avoid or lessen the severity of impacts of the proposed multi-purpose event center and mixed-use development at Blocks 29-32 in the Mission Bay South Redevelopment Plan Area of San Francisco. The chapter focuses on those topics that were identified in the Initial Study (see Appendix NOP-IS) with the potential to have either new significant effects or substantially more severe significant impacts than were previously identified in the *Mission Bay Final Subsequent Environmental Impact Report* (Mission Bay FSEIR) due to implementation of the currently proposed project. Topics for which no new or more significant impacts were identified in the Initial Study are not analyzed in this chapter.

This Impact Overview section outlines the issues analyzed in this chapter, describes the overall approach to the impact analysis, explains the significance determinations and terminology used in the impact analysis, and provides the basis for the cumulative impact analysis.

5.1.1 Scope of Analysis, Issues Scoped Out in the Initial Study

The Initial Study (see Appendix NOP-IS) for the proposed project at Blocks 29–32 was prepared in accordance with the CEQA Guidelines Section 15063, which provides for preparation of an initial study to determine if a project may have a significant effect on the environment. The Initial Study determined that the following topics were adequately analyzed in the Mission Bay FSEIR such that the proposed project would have no new significant impacts or no substantially more severe significant impacts than those previously found significant on these resources: Land Use; Population and Housing; Cultural and Paleontological Resources; Recreation; Air Quality (odors); Utilities and Services Systems (water supply and solid waste); Public Services (schools, parks, and other services); Biological Resources; Geology and Soils; Hydrology and Water Quality (construction water quality, groundwater, drainage, flooding, and inundation); Hazards and Hazardous Materials; Mineral and Energy Resources; and Agricultural and Forest Resources.[1] In

[1] As described in Chapter 2, Introduction, and in the Initial Study, impacts related to Aesthetics are not analyzed in the Initial Study or this SEIR because under CEQA (Public Resources Code Section 21099), aesthetics impacts of a mixed-use or employment center project on an infill site located within a transit priority area are not to be considered significant impacts, and therefore, no impact analysis is required.

some cases, the Initial Study identified mitigation measures in these topic areas that would reduce potentially significant impacts to a less-than-significant level to support the determination that under these resource areas, the proposed project would have no new significant impacts or no substantially more severe significant impacts than those previously identified in the Mission Bay FSEIR. Therefore, none of the topics addressed in the Initial Study are analyzed in this chapter of the SEIR.

Chapter 5 is organized as follows and focuses on the environmental resource topics listed below:

- Section 5.1, Impact Overview
- Section 5.2, Transportation and Circulation
- Section 5.3, Noise and Vibration
- Section 5.4, Air Quality (air quality planning, criteria pollutant emissions, and health risk)
- Section 5.5, Greenhouse Gas Emissions
- Section 5.6, Wind and Shadow
- Section 5.7, Utilities and Service Systems (wastewater and stormwater systems)
- Section 5.8, Public Services (police and fire services)
- Section 5.9, Hydrology and Water Quality (wastewater, stormwater, and sea level rise).

5.1.2 Overall Approach to Impact Analysis

The impact analysis for all resource topics is based on the detailed, project-specific information presented in Chapter 3, Project Description. In general, the impact analysis is divided into two main groups: construction-related impacts and operational impacts. The first group covers impacts attributable to construction-related activities, all of which would be confined within the duration of the construction period; the second group, operational impacts, covers the long-term effects associated with the full use of the project structures and features following completion of construction. Further breakdown under these main groups varies for each resource topic, with the intent of focusing the impact analysis on those aspects of the project that would result in adverse physical effects on the environment.

As described in Chapter 2, Introduction, this SEIR is a project-level EIR that is tiered from a previously certified program-level EIR, namely the Mission Bay FSEIR. As a project-level EIR and consistent with CEQA Guidelines Section 15125(a), the impact analysis is generally based on potential physical effects of the project compared to existing or baseline conditions of the physical environment at the project site at the time of publication of the Notice of Preparation (NOP), which was in November 2014. In a few instances, the baseline conditions are extended to acknowledge projects or activities that were in progress at the time of publication of the NOP but expected to be completed prior to the scheduled start date of the proposed project. For example, the baseline conditions for the project setting assumes the operation of Phase 1 of the UCSF Medical Center at Mission Bay, which opened on February 1, 2015.

As required for a project-level EIR, the impact analysis addresses construction and operation of the proposed development at Mission Bay Blocks 29–32, and none of the other aspects of the Mission

Bay South Redevelopment program. For example, although development of the project site would trigger realignment of Terry A. Francois Boulevard as well as construction of Bayfront Park east of the project site, this chapter does not analyze the construction- or operational-related environmental effects of the street realignment or the park development (other than with respect to cumulative construction impacts) because the environmental impacts of these activities were analyzed in the Mission Bay FSEIR.

As a Subsequent EIR (SEIR) to the Mission Bay FSEIR certified in 1998, this SEIR identifies and considers all mitigation measures that were identified in the 1998 Mission Bay FSEIR and determines their applicability to the currently proposed project. In some cases, mitigation measures have already been implemented, either in their entirety or in part, in which case those measures are considered part of the existing conditions. Otherwise, the impact analysis in this SEIR does not assume that mitigation measures from the Mission Bay FSEIR would be implemented as part of the proposed project. Instead, the SEIR impact analysis determines if the mitigation measures from the Mission Bay FSEIR would apply to the proposed project and would still be considered appropriate, in which case those Mission Bay FSEIR mitigation measures are re-iterated as project-level mitigation measures for the proposed project. Appendix MIT of this SEIR lists all of the mitigation measures from the Mission Bay FSEIR and indicates which measures are applicable to the proposed project.

In addition, because this SEIR is also a subsequent EIR to the Mission Bay FSEIR, the impact analysis also considers: whether the proposed project includes substantial changes from what was analyzed in the Mission Bay FSEIR; whether substantial changes have occurred with respect to the circumstances under which the project is undertaken compared to what was assumed in the Mission Bay FSEIR; or whether new information of substantial importance, which was not known and could not have been known at the time of certification of the Mission Bay FSEIR, would affect the impact analysis. Thus, the project impacts are also analyzed with regard to the potential for the proposed project to contribute to *new* significant impacts or substantially *more severe* significant impacts than those identified as significant in the Mission Bay FSEIR.

5.1.3 Organization of the Impact Analyses

Each topical section of this chapter is organized with the following elements:

- **Introduction.** This subsection summarizes the applicable topic analysis and its relevance to the proposed project.
- **Summary of Mission Bay FSEIR Section.** This section summarizes how the topic was addressed in the Mission Bay FSEIR as it related to Blocks 29-32, including identifying any applicable mitigation measures from the Mission Bay FSEIR and conclusions reached regarding significance of effects.
- **Setting.** This subsection describes the existing physical environmental conditions or the baseline condition in the project area with respect to each resource topic at an appropriate level of detail to allow the reader to understand the impact analysis.

- **Regulatory Framework.** This subsection, where applicable, describes the relevant laws and regulations that apply to protecting the environmental resources within the project area and the governmental agencies responsible for enforcing those laws and regulations.

- **Impacts and Mitigation Measures.** This subsection evaluates the potential for the proposed project to result in adverse effects on the physical environment described in the setting. It identifies the significance of each impact (see definitions below) based on topic-specific significance criteria and thresholds. For impacts determined to be significant, the impact analysis identifies feasible mitigation measures that would avoid or reduce the severity of the identified impact. The analysis describes all mitigation measures applicable to the proposed project, whether they are the same as those specified in the Mission Bay FSEIR, are updated measures, or new mitigation measures. The project sponsor— GSW Arena LLC (GSW)—has reviewed the identified mitigation measures and has agreed to implement them if the project is approved.

  In some cases, when an impact is determined to be less than significant, the analysis identifies *improvement* measures. Similar to mitigation measures, improvement measures would reduce the severity of identified impacts. Unlike mitigation measures, however, improvement measures are not required under CEQA, but this SEIR identifies improvement measures as feasible ways to ameliorate less-than-significant impacts. All improvement measures identified in this SEIR would be incorporated into conditions of project approval by OCII (see Chapter 3, Project Description, Approvals Required), and the project sponsor has agreed to implement them if the project is approved.

  The Impacts and Mitigation Measures subsection is further subdivided into the following:

  - ***Significance Thresholds*** for evaluating the environmental impacts are defined at the beginning of each impact analysis section and are specific to each environmental resource topic. The impact significance criteria used in this SEIR are based on San Francisco Planning Department protocol and CEQA Guidelines Appendix G. Significance criteria used in the Initial Study to focus out certain issues are not included; but the reader is referred to the Initial Study in Appendix NOP-IS for those criteria and associated impact analyses.

  - ***Approach to Analysis*** describes the general approach and methodology used to apply the significance thresholds in evaluating the impacts of the project. The methodology for applying significance thresholds provides the basis for the impact analysis, which could be either qualitative or quantitative, depending on the specific impact. The methodology identifies use of applicable regulatory guidelines, thresholds, standards, or accepted professional practices or protocols used to assess the nature and severity of environmental impacts. This section also explains the approach to the analysis of cumulative impacts under this impact section.

  - ***Impact Evaluation*** presents the project-specific analyses of impacts of the proposed project, with specific impact areas discussed under individually numbered impact statements. Each of the numbered impact statements is followed by a discussion and analysis of the various components of the proposed project with potential for physical environmental effects. The conclusion of each impact analysis is expressed in terms of the impact significance, which is discussed below. For significant or potentially significant impacts, the impact discussion identifies feasible mitigation measures, numbered corresponding to the impact number. In some cases, for impacts determined to be less than significant, *improvement* measures are recommended to reduce or avoid impacts. Unlike mitigation measures, implementation of improvement measures is not required under CEQA because they only apply to impacts determined to be less than significant. However, as stated above, all improvement measures identified in this SEIR would be incorporated into conditions of approval if the project is approved. The numbering of the mitigation and improvement measures corresponds with the number of the impact statement to which the measure applies, with a prefix of "M" or "I" for mitigation and improvement measures, respectively.

Following the impact evaluation, there is a qualitative comparison of the impact conclusions in this SEIR with the comparable impact conclusion from the Mission Bay FSEIR.

– ***Cumulative Impacts*** considers the effects of the proposed project together with potential effects of other past, present, or reasonably foreseeable future projects within the same geographic scope as the project's impacts. The analysis of cumulative impacts under each resource topic is based on the same setting, regulatory framework, and significance thresholds as the direct impacts. Additional mitigation measures are identified if the analysis determines that the project's contribution to a cumulative, adverse impact would be considerable (i.e., significant). The overall assumptions to the cumulative impact analysis for all topics are described in Section 5.1.5, below.

5.1.4 Significance Determinations

One of the main purposes of an EIR is to identify the *significant* effects on the environment of a project and to indicate the manner in which those significant effects can be mitigated or avoided.[2] Mitigation measures are not required for effects that are not found to be significant.[3] As defined by CEQA Guidelines section 15382, "significant effect on the environment" means a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including the land, air, water, or ambient noise at or near the project site. The significance criteria and thresholds identified under each resource topic, based on San Francisco Planning Department protocol and CEQA Guidelines Appendix G, are used to determine whether or not an effect would be substantial or potentially substantial. In accordance with CEQA, an economic or social change by itself is not considered a significant effect on the environment, although a social or economic change related to a physical change may be considered in determining whether the physical change is significant.

The conclusion of each impact analysis provides a significance determination to indicate if mitigation measures are warranted. The categories used to designate impact significance are as follows:

- **No Impact (NI).** An impact is considered not applicable (no impact) if there is no potential for impacts, or if the environmental resource does not occur within the project area or the

2 Public Resources Code section 21002.1(a)
3 California Code of Regulations section 15126.4(3)

area of potential effect. For example, there would be no impacts related to residential uses if there are no residential uses at or near the proposed project site.

- **Less-than-Significant Impact (LS).** This determination applies if there is a potential for some limited adverse impact, but not a substantial adverse effect that qualifies under the significance thresholds as significant. No mitigation is required for impacts determined to be LS.

- **Less-than-Significant Impact with Mitigation (LSM).** This determination applies if the project would or could result in a significant or potentially significant adverse effect when evaluated with respect to one or more significance thresholds, but feasible mitigation is available that would effectively reduce the impact to a less-than-significant level.

- **Significant Unavoidable Impact with Mitigation (SUM).** This determination applies if the project would result in a significant adverse effect when evaluated with respect to one or more significance thresholds, and there is feasible mitigation that could reduce the severity of the impact. However, for any of a number of reasons, the mitigation would not reduce the impact to a less-than-significant level, so the impact is considered significant and unavoidable even with mitigation. For example, there might be a feasible mitigation measure that would lessen the severity of an impact, but the residual effect after implementation of the measure would remain above the significance threshold. Another example would be a feasible mitigation measure with an unknown level of effectiveness.

- **Significant Unavoidable Impact (SU).** This determination applies if the project would result in a significant adverse effect when evaluated with respect to one or more significance thresholds, but no feasible mitigation is available, or implementation of the mitigation measure is not within the control of the project sponsor. Therefore, the impact is considered significant and unavoidable.

5.1.5 Approach to Cumulative Impact Analysis

5.1.5.1 CEQA Requirements for Cumulative Impact Analysis

Cumulative impacts, as defined in Section 15355 of the CEQA Guidelines, refer to two or more individual effects that, when taken together, are "considerable" or that compound or increase other environmental impacts. A cumulative impact from several projects is the change in the environment that would result from the incremental impact of the project added to the impacts of other closely related past, present, or reasonably foreseeable future projects. Pertinent guidance for cumulative impact analysis is provided in Section 15130 of the CEQA Guidelines:

- An EIR shall discuss cumulative impacts of a project when the project's incremental effect is "cumulatively considerable" (e.g., the incremental effects of an individual project are considerable when viewed in connection with the effects of past, current, and probable future projects, including those outside the control of the lead agency, if necessary).

- An EIR should not discuss impacts that do not result in part from the project evaluated in the EIR.

- A project's contribution is less than cumulatively considerable, and thus not significant, if the project is required to implement or fund its fair share of a mitigation measure or measures designed to alleviate the cumulative impact.

- The discussion of impact severity and likelihood of occurrence need not be as detailed as for effects attributable to the project alone.

- The focus of analysis should be on the cumulative impact to which the identified other projects contribute, rather than on attributes of the other projects that do not contribute to the cumulative impact.

The cumulative impact analysis for each individual resource topic is described in each subsection of this chapter, immediately following the description of the direct project impacts and identified mitigation measures. Cumulative impacts are numbered sequentially, starting with the number '1' and preceded by "C-" (such as "Impact C-TR-1" for the first cumulative transportation impact).

Similar to the project impacts, cumulative impacts are also analyzed with regard to the potential for the proposed project to contribute to *new* significant cumulative impacts or substantially *more severe* cumulative impacts than those identified as significant in the Mission Bay FSEIR. The Mission Bay FSEIR used the year 2015 for the analysis of the full buildout of the Mission Bay Redevelopment Plan as well as for the cumulative impacts analysis, and cumulative impacts were assessed on the basis of regional population and employment projections for the year 2015 as determined by the Association of Bay Area Governments.

Two approaches to a cumulative impact analysis are provided in CEQA Guidelines Section 15130(b)(1): (a) the analysis can be based on a list of past, present, and probable future projects producing related or cumulative impacts; or (b) a summary of projections contained in a general plan or related planning document can be used to determine cumulative impacts. The projections model includes individual projects and applies a quantitative growth factor to account for other growth that may occur in the area.

The analyses in this SEIR employ both the list-based approach and a projections-based approach, depending on which approach best suits the individual resource topic being analyzed. For instance, the Wind analysis considers individual projects that are anticipated in the project site vicinity that may alter wind conditions in public spaces. By comparison, the Transportation and Circulation analysis relies on a citywide growth projection model that also encompasses many individual projects anticipated in and surrounding the project site vicinity, which is the typical methodology the San Francisco Planning Department applies to analysis of transportation impacts.

For the list-based approach, projects or plans that are relevant to the cumulative analysis include those that could contribute incremental effects on the same environmental resources and would have similar environmental impacts as those discussed in this SEIR. The following factors were used to determine an appropriate list of projects to be considered in the near-term cumulative impact analysis:

- **Similar Environmental Impacts.** A relevant project contributes to effects on resources that are also affected by the proposed project. A relevant future project or plan is defined as one that is "reasonably foreseeable," such as a proposed project for which an application has been filed with the approving agency or has approved funding, or an approved plan that amended the land use controls applicable to an adjacent neighborhood.

- **Geographic Scope and Location.** A relevant project is located within the defined geographic scope for the cumulative effect.

- **Timing and Duration of Implementation.** Effects associated with activities for a relevant project (e.g., short-term construction or demolition, or long-term operations) would likely coincide in timing with the effects of the proposed project.

5.1.5.2 Cumulative Projects for Operational Impacts

For topics using the list approach, in addition to those projects considered in the Mission Bay FSEIR cumulative analysis, the projects/programs listed below were not anticipated in the Mission Bay FSEIR and are considered in the cumulative analysis for operational impacts in this SEIR.

- **University of California at San Francisco (UCSF), 2014 Long Range Development Plan (LRDP), Mission Bay Campus.** UCSF recently updated its LRDP to guide future campus growth and development over the next 20 years. The 2014 LRDP updates information that was assumed in the Mission Bay FSEIR. The existing 60.2-acre UCSF Mission Bay campus site is located adjacent to Blocks 29-32, generally bounded by Mission Bay Boulevard South to the north, Owens Street to the west, Mariposa Street to the south, and Illinois and Third Streets to the east. Under the 2014 LRDP, the development capacity for the North Campus (see Figure 3-3, UCSF areas north of 16th Street) increases from 2,650,000 to 3,641,800 gsf. The 2014 LRDP would increase the square footage of the North Campus by 1,450,300 gsf, which includes 458,500 gsf of existing remaining entitlement from the 1996 LRDP, plus 991,800 gsf of new entitlement. On the South Campus (see Figure 3-3, UCSF areas south of 16th Street and west of Third Street), construction of a 170,000-gsf cancer outpatient building is anticipated by 2019, which will complete Phase 1 of the UCSF Medical Center at Mission Bay. This will bring the total space for Phase 1 to 993,500 gsf. Phase 2 facilities will be located on the west side of the South Campus, across the Fourth Street Public Plaza. Phase 2 of the Medical Center at Mission Bay is planned for after 2035 as a 261-bed hospital with additional outpatient space, totaling 793,500 gsf. Development of the East Campus (see Figure 3-3, UCSF areas east of Third Street) would accommodate 500,000 gsf. As a result, the total anticipated development through 2035 with the proposed expansion of the Mission Bay campus site (North, South, and East campuses) would be 5,928,800 gsf. The Board of Regents of the University of California certified the Final EIR on the UCSF LRDP in November 2014.

- **Eastern Neighborhoods Program.** The Eastern Neighborhoods Program included changes in zoning controls and General Plan amendments for an approximately 2,200-acre area on the eastern side of the City. It is intended to encourage new housing while preserving sufficient land for light industrial and service industry (referred to collectively as "Production, Distribution, and Repair," or "PDR," uses) in four neighborhoods: the Mission, Showplace Square/Potrero Hill, the Central Waterfront, and the eastern portion of the South of Market ("East SoMa"). In conjunction with the rezoning, the General Plan was amended to include Area Plans for the neighborhoods (including revisions to the existing Central Waterfront and

South of Market Area Plans). A key goal of the rezoning process was to encourage the creation of cohesive neighborhoods, particularly where new housing is being encouraged. The plans also propose public benefits and other implementation programs, particularly the creation of affordable housing. The program introduced new zoning districts, including districts that permit at least some PDR uses in combination with commercial uses, districts mixing residential and commercial uses, and areas where only PDR uses would be permitted, with residential use prohibited to alleviate development pressure on PDR uses. The Showplace Square/Potrero Hill Area Plan is located immediately to the west of the Mission Bay Plan (across Interstate 280), the Central Waterfront Area Plan is located immediately to the south of the Mission Bay plan area (south of Mariposa Street), and the East SoMa Area Plan is located immediately to the north (across China Basin and east of Fourth Street). The Final EIR on the Eastern Neighborhoods Program was certified in August 2008. Projects pursuant to the Eastern Neighborhoods Program are currently under construction, including several residential and mixed-used developments south of Mariposa Street.

- **Seawall Lot 337 and Pier 48 Mixed-Use Project (Mission Rock).** This possible future project is located about one-third of a mile north of Blocks 29-32 adjacent to the northeast side of the Mission Bay South Plan area. The project would include a mixed-use, multi-phase waterfront development on Seawall Lot 337, rehabilitation and reuse of Pier 48, and construction of approximately 5.4 acres of net new open space, for a total of 8 acres of open space on the site. Overall, the project would involve construction of up to approximately 3.7 million gsf of residential, commercial, and retail uses, and a public parking garage on the project site. Both Seawall Lot 337 and Pier 48 are owned by the Port of San Francisco. This project is currently in the environmental review phase.

- **Pier 70 Mixed-Use Development**: This possible future project is located less than a half mile south of Blocks 29-32, on 35 acres located south of 20th Street and east of Illinois Street. This project includes up to approximately 3,040,000 gsf (excluding parking) of above-grade construction in new buildings, and improvements to historic buildings. The project allows for a flexible land use program, including a maximum residential-use and maximum commercial-use scenarios for the Pier 70 Special Use District. Option 1 - maximum residential scenario, would consist of approximately 2,000 dwelling units within 1,605,000 gsf, including up to 904,000 gsf of commercial and office space, plus up to 365,700 gsf of manufacturing, local retail, creative uses and arts that is designated as an “Innovative Industries Zone.” Option 2 - maximum office scenario, would consist of approximately 1,052 dwelling units within approximately 903,616 gsf, including up to approximately 1,810,000 gsf of commercial and office space, plus up to 327,700 gsf of manufacturing, local retail, creative uses and arts that is designated as an “Innovative Industries Zone.” This project is currently in the environmental review phase.

- **400-600 20th Street, Pier 70 (20th Street Historic Core)**: This project is located along the northern and southern portions of 20th Street between Illinois and Louisiana Streets, about a half mile south of Blocks 29-32, within the greater Pier 70 area. The project site includes four parcels containing ten buildings, referred to as the “20th Street Historic Core.” The 20th Street Historic Core currently contains approximately 270,000 gsf of largely vacant industrial and office space. The project would include: 1) historic renovations to satisfy current seismic, structural, and code requirements; 2) remediation of hazardous materials; 3) reuse of the buildings as primarily light industrial and commercial uses; 4) the addition of approximately 69,000 gsf of new building space, primarily in interior mezzanines; 5) removal of approximately 5,000 gsf of previous additions to two of the buildings;

6) creation of an outdoor publically accessible plaza, and 7) roadway, sidewalk, and parking lot improvements. In total, the project would include approximately 334,000 gsf of existing and new building space. The Community Plan Exemption was published in May 2014, and the project has a 24-month construction schedule.

It should be noted that the reasonably foreseeable future projects are subject to independent environmental review and consideration by approving agencies. Consequently, it is possible that some of the projects will not be approved or will be modified prior to approval (e.g., as a result of the CEQA alternatives process). For the purposes of assessing worst-case cumulative impacts, however, the cumulative impact analysis assumes approval and construction of the identified projects.

5.1.5.3 Cumulative Construction Projects

The cumulative impact analysis also considers the combined effects of multiple construction projects occurring within the project vicinity during the same timeframe as the proposed construction schedule. Even though all of these projects were considered in the overall impact analysis in the Mission Bay FSEIR, the specific timing and location of construction of individual developments were unknown at that time. They are included in this SEIR only as part of the project-level impact analysis of the proposed project with respect to the potential to contribute to cumulative construction-related impacts. Construction projects in the vicinity of Blocks 29-32 anticipated to occur between 2015 and 2017 include the following (see Chapter 3, Figure 3-3 for location of Mission Bay block numbers):

- **Uber/ARE Project, Mission Bay Blocks 26/27.** Located directly north of the project site across South Street, this project consists of 423,000 gsf of office space. Construction is estimated to start by the end of 2015, and continue for 18 to 24 months.

- **UCSF Research Building, Block 23A**. Located directly west of the project site across Third Street, this project consists of about 307,000 gsf and is expected to be under construction before 2017.

- **Cancer Outpatient Building on Medical Center site**. Located at the southwest corner of Third and 16th Street, directly kitty corner from the project site, this project consists of about 170,000 gsf and is expected to be under construction before 2017.

- **UCSF East Campus, Blocks 33/34**. Located directly south of the project site across 16th Street, the project consists of 500,000 gsf of office space. The project will be built in two phases, with the first phase on Block 33, about 340,000 gsf, to begin construction in 2016 and continue for about 18 to 24 months. Block 34 construction would occur in the 2020 to 2025 timeframe.

- **Realignment of Terry A Francois Boulevard and Mission Bay Park P22**. P22 is located directly east of the project site, across from the realigned Terry A. Francois Boulevard, and construction of both is estimated to be completed by 2018. It is likely that Terry A. Francois Boulevard will need to be constructed first, requiring about 12 months, followed by 12 months for construction of Bayfront Park at P22.

- **Mission Bay Parks, Blocks P23, and P24**. P23, directly south of the project site across 16th Street, and P24, about 750 feet south of the project site, are planned to begin construction in 2015 with preliminary work underway for some of the stormwater infrastructure within the park. Construction should be completed by the end of 2016.

- **The Exchange, Mission Bay Block 40**. Located approximately 1,200 feet southwest of the project site, the project consists of 664,00 gsf of office and 15,000 gsf of retail. Construction is estimated to start by late summer/fall 2015 and continue for 18 to 24 months.

- **Family House, Block 7 East**. Located approximately 1,300 feet northwest of the project site, the project consists of 80 guest suites for families receiving treatment at UCSF and other San Francisco medical facilities. Construction is currently underway and is expected to continue after November 2015.

- **Affordable Housing, Blocks 3, 6 and 7**. Located approximately 1,700, 1,300, and 1,000 feet, respectively, northwest of the project site, the Blocks 3, 6 and 7 project consists of 958 affordable housing units. Block 7 West is expected to start construction in summer 2015, Block 6 east to start construction in 2016, and Block 3 East starting late 2016/early 2017.

- **Block 1, Residential and Hotel Sites**. Located approximately 2,400 feet northwest of the project site, the project consists of 350 market rate units, 25,000 leasable square feet of retail, and a 250-room hotel. Construction is anticipated to start in 2015 and continue for about 18 to 24 months.

- **Block N4P3, 360 Berry Street**. About 3,000 feet north west of the project site, construction of 129 residential units at this site is expected to start in 2015 and continue for about 18 to 24 months.

5.1.6 Impacts of Mitigation Measures

CEQA Guidelines Section 15126.4 states that "if a mitigation measure would cause one or more significant effect in addition to those that would be caused by the project as proposed, the effects of the mitigation measure shall be discussed but in less detail than the significant effects of the project as proposed."

Chapter 5 identifies mitigation measures for all potentially significant and significant impacts where feasible. In most cases, implementation of the mitigation measure would reduce or avoid the magnitude, duration, and/or overall severity of the identified impact with no additional secondary effects. However, in a few cases, implementation of a mitigation measure could result in other environmental impacts in addition to those that would be caused by the project, and further explanation is provided to explain how the additional significant effects caused by the mitigation measure would or would not change the overall impact conclusion(s). In most cases, implementation of the full suite of project mitigation measures would reduce or avoid impacts of mitigation measures.

5.2 Transportation and Circulation

5.2.1 Introduction

This section analyzes the potential project-level and cumulative impacts on transportation and circulation during construction and operation of the proposed project. Transportation-related issues of study include transit, vehicle traffic on local and regional roadways, bicycles, pedestrians, loading, emergency vehicle access, parking, and construction-related transportation activities. This section provides a summary of the Mission Bay FSEIR transportation section, an overview of existing transportation conditions, a description of the applicable transportation regulations and policies, methodologies and assumptions used in the impact analysis, and impact assessment and mitigation measures. Information and analysis related to project impacts on UCSF helipad operations is presented in its entirely in Section 5.2.6, Project Impacts on UCSF Helipad Operations. Supporting detailed technical information is included in **Appendix TR**.

5.2.2 Summary of Mission Bay FSEIR Transportation Section

5.2.2.1 Mission Bay FSEIR Setting

The transportation and circulation setting section of the Mission Bay FSEIR provided information on the transportation facilities and system serving the Mission Bay North and South Redevelopment Plan areas at that time, using data collected in 1995 and 1996, and reflecting 1997 conditions. The transportation network included the system of local streets, ramps and freeways, local and regional bus and rail lines, ferry service, bicycle and pedestrian facilities, parking areas, and truck loading areas, and described the freeway and local circulation patterns in 1997, as they had changed substantially in the SoMa/Mission Bay area following the 1989 Loma Prieta earthquake.

5.2.2.2 Mission Bay FSEIR Impacts and Mitigation Measures

Transportation and circulation impacts assessed in the Mission Bay FSEIR included Mission Bay Blocks 29-32 as part of numerous other blocks analyzed in the Mission Bay South Redevelopment Plan. The Mission Bay FSEIR identified 28 transportation mitigation measures that were also included in the Plan's project description and assumed in the impact analysis (FSEIR Mitigation Measures E.1 through E.28). These measures included transportation infrastructure improvements, including new or upgraded traffic signals and/or lane reconfigurations at 20 study intersections, construction of six new street segments, and rerouting of the 22 Fillmore and 30 Stockton or 45 Union-Stockton Muni bus routes into the Mission Bay South Plan area.

The transportation impact analysis identified significant traffic impacts at 11 of the 41 study intersections for the overall Plan area. Traffic impacts were identified as less than significant with mitigation at four intersections (Brannan/Seventh, Townsend/Seventh, Townsend/Eight, 16th/Vermont), and as significant and unavoidable traffic impacts at seven intersections adjacent to I-80 freeway ramps (Brannan/Sixth/I-280 ramps, Bryant/Second, Bryant/Fifth/I-80 eastbound on-ramp, Harrison/First, Harrison/Second, Harrison/Fremont/I-80 westbound off-ramp, and

Harrison/Essex). The Mission Bay FSEIR found the impacts related to regional and local transit capacity utilization, pedestrians and bicycle circulation, loading conditions, rail, and transportation-related construction impacts to be less than significant.

The cumulative impact analysis addressed future year 2015 plus project conditions (2015 being assumed as the project build-out year), and indicated that 17 of the 41 study intersections would operate at LOS E or LOS F conditions. In addition, cumulative development would result in a lengthening of the p.m. peak commute period, and the Mission Bay project would contribute considerably to this cumulative impact. The additional project-related transit trips were found to result in a significant contribution to cumulative impacts on Alameda-Contra Costa Transit District (AC Transit), on the Northeast screenline of the Muni downtown screenlines[1], and on light rail service on King Street and on The Embarcadero. The Mission Bay FSEIR found cumulative impacts related to pedestrian and bicycle circulation, loading conditions, rail, and transportation-related construction impacts to be less than significant.

The Mission Bay FSEIR identified 22 additional mitigation measures beyond those incorporated into the project description (i.e., FSEIR Mitigation Measures E.29 through E.50). These measures included ten additional intersection improvements and improvements on four street segments (FSEIR Mitigation Measure E.29 through E.42), encouraging increasing Bay Bridge tolls for single-occupant vehicles during commute hours (FSEIR Mitigation Measure E.43), encouraging AC Transit to expand service to downtown San Francisco (FSEIR Mitigation Measure E.44), and providing additional light rail capacity to serve the Mariposa Street stop from downtown (FSEIR Mitigation Measure E.45). In addition, five Transportation System Management measures were identified, including establishing a Transportation Management Organization (FSEIR Mitigation Measure E.46)[2], developing and implementing a Transportation System Management Plan (FSEIR Mitigation Measure E.47), constraining parking within the University of California San Francisco (UCSF) campus (FSEIR Mitigation Measure E.48), encouraging ferry service (FSEIR Mitigation Measure E.49), and providing flexible work hours/telecommuting (FSEIR Mitigation Measure E.50). FSEIR Mitigation Measures E.20, E.37, E.39, E.40 related to intersection improvements, and FSEIR Mitigation Measure E.48 related to constraining parking within the UCSF campus, were rejected by the Board of Supervisors and are not part of the 1998 Mission Bay Mitigation Monitoring and Reporting Program. The measures, their current status, and their applicability to the proposed project are described in **Appendix TR** and **Appendix MIT**.

At 10 of the 17 study intersections that would operate at LOS E or LOS F conditions, Mission Bay FSEIR Mitigation Measures E. 29 through E.42 were found to reduce the Plan-level cumulative impacts to less than significant levels. However, even with implementation of the transportation mitigation measures, the project traffic was found to contribute to significant cumulative impacts

[1] The concept of screenlines is used to describe the magnitude of travel to or from the greater downtown area, and to compare estimated transit ridership to available capacities. Screenlines are hypothetical lines that would be crossed by persons traveling between downtown and its vicinity (i.e. the Northeast, Northwest, Southeast, and Southwest screenlines) and other parts of San Francisco and the region (i.e., the East Bay, North Bay, and South Bay screenlines).

[2] The Mission Bay Transportation Management Association (Mission Bay TMA) is the non-profit organization that was formed to meet the requirements of the Mission Bay FSEIR Mitigation Measure E.46: Transportation Management Organization.

at seven intersections at or near freeway ramps (Brannan/Sixth/I-280 ramps, Bryant/Second, Bryant/Fifth/I-80 eastbound on-ramp, Harrison/First, Harrison/Second, Harrison/Fremont/I-80 Westbound Off-ramp, and Harrison/Essex), and on the Bay Bridge and its approaches during the p.m. peak hour. Mission Bay FSEIR Mitigation Measure E.44 to encourage AC Transit to expand service and Mission Bay FSEIR Mitigation Measure E.45 to provide additional T Third light rail to the Mariposa Street stop were found to reduce Plan-level cumulative transit impacts to less than significant levels.

5.2.3 Setting

5.2.3.1 Regional and Local Roadways

Regional Access

Interstate 280 (I-280) provides the primary regional access to the Mission Bay area from southwestern San Francisco, the Peninsula and the South Bay. I-280 has an interchange with U.S. 101 south of the Mission Bay. Nearby northbound and southbound on- and off-ramps are located at Mariposa Street (northbound off-ramp and southbound on-ramp) and at 18th Street (southbound off-ramp and northbound on-ramp). The northern terminus of I-280 is on King Street at Fifth Street.

Interstate 80 (I-80) and **U.S. Highway 101 (U.S. 101)** provide regional access to the Mission Bay area. U.S. 101 serves San Francisco and the Peninsula/South Bay, and extends north via the Golden Gate Bridge to the North Bay. Van Ness Avenue serves as U.S. 101 between Market Street and Lombard Street. I-80 connects San Francisco to the East Bay and points east via the San Francisco-Oakland Bay Bridge. U.S. 101 and I-80 merge west of the project site. Northbound access is provided via an off-ramp at Mariposa Street (at Vermont Street), on-ramps at Cesar Chavez Street, and on-ramps and off-ramps at Bryant and Harrison Streets.

Local Access

Terry A. Francois Boulevard is a two-way, north-south roadway to the east of Third Street, extending between Third Street and Mariposa Street (at Illinois Street). The roadway generally has two travel lanes each way, with on-street parking on both sides of the street. As part of the Mission Bay Plan, Terry A. Francois Boulevard will be realigned to the west to be adjacent to the east side of Blocks 30 and 32, and a buffered two-way cycle track (Class II)[3] will be provided as part of the San Francisco Bay Trail on the east side of the street. A bicycle lane (Class II facility) currently runs on each side of Terry A. Francois Boulevard between Illinois Street and Third Street.

[3] Class I bikeways are bike paths with exclusive right-of-way for use by bicyclists. Class II bikeways are bike lanes striped within the paved areas of roadways and established for the preferential use of bicycles. Class III bikeways are signed bike routes that allow bicycles to share the travel lane with vehicles. A cycle track is a Class II bikeway, and is an exclusive bicycle facility that is separated from vehicle traffic and parked cars by a buffer zone. Cycle tracks offer safer and calmer cycling conditions for a much wider range of cyclists and cycling purposes, especially on street with greater traffic volumes traveling at relatively high speeds.

Bridgeview Way is a two-way, north-south public street, privately maintained, that extends between Mission Bay Boulevard South and South Street. The roadway has one travel lane each way with on-street parking on both sides of the street.

Illinois Street is a two-way, north-south roadway to the east of Third Street that extends between 16th Street and Cargo Way. The roadway primarily has one lane each way with on-street parking on both sides of the street. Bicycle Route 5 runs both ways along Illinois Street, with bicycle lanes between Cesar Chavez and 16th Streets (Class II).

Third Street is the principal north-south arterial in the southeast part of San Francisco, extending from its interchange with U.S. 101 and Bayshore Boulevard, to its intersection with Market Street. In the Mission Bay area, Third Street has two travel lanes each way. In the *San Francisco General Plan*, Third Street is designated as a Major Arterial in the Congestion Management Program (CMP) network, a Metropolitan Transportation System (MTS) Street, a Primary Transit Preferential Street (Transit Important Street between Market and Townsend Streets, and between Mission Rock Street and Bayshore Boulevard), a Citywide Pedestrian Network Street and Trail (between 24th Street and Yosemite Avenue), and a Neighborhood Commercial Pedestrian Street. South of China Basin, the T Third light rail operates in a semi-exclusive center median right-of-way, with the exception of the segment between Kirkwood Avenue and Thomas Avenue, where the light rail runs within a mixed-flow lane. Third Street between China Basin and Townsend Street is also part of Bicycle Route 536 (Class III).

Fourth Street is a principal north-south arterial between Market and Mariposa Streets. Between Market and King Streets, Fourth Street runs southbound and has four southbound travel lanes. From King Street to Berry Street, Fourth Street has two lanes each way. Between Berry and 16th Streets, Fourth Street is two-way and has one travel lanes each way. South of 16th Street, Fourth Street provides local access to the UCSF Medical Center; there is no through motor-vehicle access between 16th and Mariposa Streets. Fourth Street is classified as a Congestion Management Network Major Arterial and a part of the Metropolitan Transportation System. Fourth Street is designated as a Primary Transit Important Preferential Street; is a part of the Citywide Pedestrian Network from Market Street to Folsom Street; is part of the Bay Trail between King and Mission Streets; and is designated as a Neighborhood Commercial Pedestrian Street. The T Third Street light rail line runs northbound on Fourth Street within mixed-flow lanes between Channel and Berry Streets, and in a semi-exclusive center median right-of-way between Berry and King Streets. Fourth Street has bicycle lanes (Class II) both ways between Channel and 16th Streets.

Owens Street is currently a two-way north-south Local Street with one lane each way that extends between 16th Street and the Mission Bay Circle on the western edge of Mission Bay. On-street parking is prohibited on both sides of the street. Owens Street will be extended between 16th and Mariposa Streets and restriped to two lanes each way as part of the Mission Bay Plan.

Seventh Street is a north-south roadway that extends between Market and 16th Streets. In the vicinity of the Mission Bay area, Seventh Street has one lane each way; on-street parking is provided on both sides of the street between Irwin and 16th Streets. Seventh Street has Class II bike lanes (Route 23) between Brannan and 16th Streets.

Mississippi Street is a north-south roadway that runs discontinuously between 16th/Seventh and Cesar Chavez Streets. In the vicinity of the Mission Bay area, Mississippi Street has one travel lane each way and on-street parking is provided on both sides of the street. Bicycle Route 23 runs on Mississippi Street (Class II) between 16th and Mariposa Streets.

King Street is a four-lane east-west roadway with a semi-exclusive center median for light rail operations. King Street connects the I-280 northern terminus on- and off-ramps at Fifth Street with The Embarcadero. Bicycle Route 5 (Class II and Class III) runs on King Street east of Third Street with a bicycle lane (Class II) on the north side of the street between The Embarcadero and Fourth Street, and on the south side of the street between Fourth and Fifth Streets. King Street is designated in the Transportation Element of the *San Francisco General Plan* as a Major Arterial in the CMP Network (between Second Street and Fourth Street), a MTS Street (between Second Street and Fourth Street), a Primary Transit Preferential Street (Transit Important Street), and a Neighborhood Pedestrian Network Connection Street. Muni lines N Judah and T Third operate along the median along King Street east of Fourth Street. Bicycle Route 5 (Class II and Class III) runs on King Street east of Third Street.

Channel Street is an east-west roadway that currently starts at Third Street and dead-ends west of Fourth Street. Channel Street has two travel lanes each way, and on-street parking is prohibited on both sides of the street between Third and Fourth Streets. West of Fourth Street, Channel Street has one lane each way and parking is permitted on both sides. The T Third Street light rail line operates in a semi-exclusive center median right-of-way on Channel Street between Third and Fourth Streets. Channel Street is planned to be extended to the Mission Bay Circle in the future as a two-lane roadway with on-street parking permitted on the north side, as part of the Mission Bay Plan.

Mission Rock Street is a two-lane east-west roadway that extends between Terry A. Francois Boulevard and Fourth Street. It has one travel lane each way; on-street parking is provided on both sides of the street.

Mission Bay Drive is a east-west roadway that runs between Mission Bay Circle and Seventh Street (under I-280 and across the Caltrain railroad tracks). Two travel lanes and a bicycle lane (Class II) are provided each way, separated by a landscaped median. On-street parking is prohibited on both sides of the street.

South Street is an east-west roadway that runs for two blocks between Third Street and Terry A. Francois Boulevard. Two travel lanes are currently provided each way, and on-street parking is prohibited on both sides of the street. A sidewalk is not currently provided on the south side of the street (i.e., adjacent to the undeveloped project site blocks).

Sixteenth (16th) Street is an east-west arterial that runs between Illinois and Castro Streets. In the Mission Bay area, 16th Street has two travel lanes each way, and on-street parking is prohibited on both sides of the street; dedicated left turn lanes are provided at all intersections. Sixteenth

Street is classified as a Primary Transit Oriented Preferential Street between De Haro and Church Streets and a Neighborhood Commercial Pedestrian Street between Bryant and Church Streets. As part of the Mission Bay Plan, 16th Street will be extended east of Illinois Street to connect with Terry A. Francois Boulevard. Bicycle Route 40 runs between Illinois and Kansas Streets with bicycle lanes (Class II) on both sides of the street.

Part of the 22 Fillmore Transit Priority Project[4] extends along 16th Street between Third and Church Street. In the segment between Third and Seventh Streets, side-running transit-only lanes will be implemented on 16th Street by converting a mixed-flow lane to a transit-only lane. West of Seventh Street, two options are still under consideration – either side-running or center-running transit-only lanes will be provided by converting a mixed-flow lane to a transit-only lane. The 22 Fillmore Transit Priority Project will also include corridor-wide transit network improvements such as transit bulbs, new traffic signals, pedestrian signals, sidewalk widening, and upgrading of the bicycle infrastructure on 17th Street between Church and Seventh Streets to provide a parallel, contiguous, and safe bicycle route for traveling in the east-west direction. The implementation of the side-running transit-only lanes is assumed in the intersection analysis of 2015 conditions.

Mariposa Street is an east-west roadway that runs between Illinois and Harrison Streets. The I-280 northbound off-ramp and southbound on-ramp are located immediately east of the intersection of Mariposa/Pennsylvania. In the Mission Bay area, Mariposa Street currently has one to two lanes each way and on-street parking is provided on Mariposa Street west of Tennessee Street. Bicycle Routes 23 and 7 run both ways on Mariposa Street with sharrows (Class III) between Illinois and Mississippi Streets. Mariposa Street is planned to be widened in the future to a five-lane roadway (two-lanes each way with exclusive center left-turn lanes at major intersections) as part of the Mission Bay Plan.

The following roadway infrastructure improvements are being implemented by the Mission Bay Development Group (i.e., MBDG, the infrastructure master developer) as part of the opening of Phase One of the UCSF Medical Center at Mission Bay, consistent with the 1998 Mission Bay South Area Plan, and are assumed in the intersection analyses of 2015 conditions:

- Owens Street is being extended between 16th and Mariposa Streets, to connect with the I-280 on- and off-ramps and to create a new intersection at Mariposa Street. The existing

[4] The 22 Fillmore Transit Priority Project is part of the TEP – Transit Effectiveness Project. The TEP included two alternatives for a Travel Time Reduction Proposal (TTRP) along 16th Street (of which one or a combination of the two could be implemented), to make the 22 Fillmore more frequent, reliable, and effective along 16th Street. The TTRP treatments are referred to as the Moderate and Expanded Alternatives. The Moderate Alternative includes a number of physical changes to the portion of the rerouted 22 Fillmore in the vicinity of Mission Bay, including, but not limited to, new transit stops, relocated transit stops, and transit bulbs, as well as new traffic signals. The Expanded Alternative includes most of the same features as the Moderate Alternative, as well as the conversion of a mixed-flow lane to a transit-only lane on both sides of 16th Street between Church and Third Streets, as well as the prohibition of left turns at Bryant, Potrero, Utah, San Bruno, Kansas, Rhode Island, De Haro, Carolina, Wisconsin, Arkansas, Connecticut, and Missouri Streets. The 22 Fillmore Transit Priority Project reflects a combination of the two proposals. (Available online at http://www.sfmta.com/projects-planning/projects/tep-transit-effectiveness-project. Accessed April 7, 2015.)

signal at the intersection of Mariposa Street and the I-280 northbound off-ramp is being upgraded to accommodate the new Owens Street approach.

- Mariposa Street is being widened on the north side by approximately 15 feet, and left turn lanes striped at major intersections. The Mariposa Street Bridge over the Caltrain tracks is being restriped to provide two exclusive westbound left turn lanes for a total of three lanes, and create a new signalized intersection with Owens Street.
- The northbound I-280 off-ramp is being widened to the east to provide an additional lane and better align with Owens Street. Mariposa Street between the I-280 southbound on-ramp and Pennsylvania Avenue is being re-striped to accommodate the lane configurations described above.
- The existing stop-controlled intersection of Mariposa Street and the I-280 southbound on-ramp (with the eastbound approach stop-controlled) is being signalized.
- The existing side-street stop-controlled intersection of Mariposa Street and Minnesota Street/Fourth Street is being signalized.

Intersection Operations

Existing conditions at 21 study intersections were analyzed for the following analysis hours:

- Weekday p.m. peak hour - generally 5:00 to 6:00 p.m. which coincides with the existing evening commute,
- Weekday evening peak hour - generally 6:00 to 7:00 p.m. which coincides with arrivals for weekday evening events,
- Weekday late p.m. peak hour - generally 10:00 to 11:00 p.m. which coincides with departures for weekday evening events, and
- Saturday evening peak hour – generally 7:00 to 8:00 p.m. which coincides with arrivals for Saturday evening events.

The 21 study intersections were selected either because they represent access points to the regional highway system (e.g., King Street, Cesar Chavez Street, freeway ramp touchdown locations), are located along major street corridors serving the Mission Bay Area (e.g., Third Street, Fourth Street, Seventh Street, 16th Street, Owens Street, Mariposa Street), or are located in the immediate vicinity of the project site (e.g., South Street, Terry A. Francois Boulevard, Illinois Street), and because they are the intersections most likely to be potentially impacted by traffic generated by the proposed project. In general, many of the same intersections were also evaluated as part of previous environmental studies that include the Mission Bay Area such as the Mission Bay SEIR (1998), UCSF Medical Center at Mission Bay EIR (2008), SFMTA Transit Effectiveness Project EIR (2014), and UCSF 2014 LRDP EIR (2014).[5]

---

[5] Mission Bay SEIR A copy of this document is available for review at the San Francisco Planning Department, 1650 Mission Street, Suite 400, as part of Case File No. 96.771E. The Final EIR for UCSF Medical Center at Mission Bay is available online at http://campusplanning.ucsf.edu/physical/RFEIRHospital.php. Final EIR for the 2014 UCSF Long Range Development Plan is available online at http://www.ucsf.edu/content/lrdp-environmental-impact-report-downloads.

Intersection traffic volume counts were conducted for conditions without and with a SF Giants evening game at AT&T Park. Transportation conditions with a SF Giants evening game at AT&T Park are presented in Section 5.2.3.8.

Intersection turning movement counts were collected at the study intersections on multiple midweek days (Tuesday, Wednesday, or Thursday) and on Saturdays in October, November, December 2013, June and July 2013, and May and June 2014, both with and without a San Francisco Giants (SF Giants) game at AT&T Park (on King Street, between Second and Third Streets). Existing turning movement volume summaries tables and figures are included in **Appendix TR**. Traffic volumes are highest during the weekday p.m. peak hour, and the weekday evening peak hour volumes are approximately 10 percent lower than the p.m. peak hour. The weekday late evening peak hour is about 40 percent of the weekday p.m. peak hour. Traffic volumes at the study intersections are about half as much on Saturdays as on weekdays.

During 2013 and 2014, when the intersection counts were being conducted, the UCSF Medical Center Phase 1 and Public Safety Building were under construction. Both facilities opened in early 2015. The vehicular travel demand associated with these uses was added to the counts conducted in 2013 and 2014 to reflect full occupancy and operation of these facilities. The travel demand associated with these uses was based on the travel demand for the weekday p.m. peak hour identified in the UCSF 2014 LRDP EIR, as well as information on existing weekday and Saturday parking occupancy (a proxy for level of activity at UCSF facilities) at other UCSF parking facilities in order to estimate the vehicle trips for the weekday evening, weekday late evening, and Saturday evening peak hours.[6] Vehicle trips associated with the Public Safety Building were based on travel demand estimates conducted as part of that project.[7] Thus, the travel demand for UCSF includes the UCSF facilities and the Public Safety Building in Mission Bay open by spring of 2015.

In addition, a portion of the UCSF Mission Bay campus traffic as well as existing traffic accessing the Mission Bay campus was rerouted as appropriate to use the new Owens Street extension between 16th and Mariposa streets. Furthermore, minor adjustments were made to the traffic counts to balance intersection inbound and outbound traffic flows between intersections, where necessary.

Weekday peak hour traffic volume counts were conducted during the p.m., evening and late evening peak hours at the intersections of Third/16th, Fourth/16th, and Fourth/Mariposa in April 2015, and compared to the corresponding 2013/2014 traffic volumes adjusted to reflect the UCSF Medical Center Phase 1 and Public Safety Building used in the intersection analysis. These spot-check counts were performed in order to confirm that the results of traffic analyses accurately predicted traffic volumes and patterns associated with these newly opened facilities. The April 2015 data indicated that the actual counts were similar to the adjusted 2013/2014 volumes, and no additional adjustments were made. In general, the adjusted volumes used in the analysis are

6 UCSF 2014 LRDP EIR Source; UCSF 2014 parking occupancy data for Parnassus and Mt Zion campus sites.
7 Mission Bay Public Safety Building Transportation Assessment-Final Report, prepared for the City and County of San Francisco Department of Public Works by Adavant Consulting January 6, 2010.

higher than those collected in the field in April 2015. Some counts collected in the field along Mariposa Street, as well as the turns in and out of the UCSF Medical Center via Fourth Street, were higher than those estimated for the analysis, but this is attributed to the fact that the main vehicular entrance to the UCSF Medical Center via the new extension of Owens Street between Mariposa Street and 16th Street has not yet been built (it is expected to open in the fall 2015), and current access to the facility is only via Fourth Street. Once the Owens Street extension is opened, most of the traffic accessing the Medical Center garage and parking lot will shift from Fourth Street to Owens Street, as it is a more direct and convenient route.

The roadway segments and intersection configurations for the study intersections reflect the build out of the roadway network within Mission Bay as development proceeds, such as the extension of Channel Street and Mission Bay Boulevard from the Mission Bay Circle to Fourth Street, and implementation of Mission Bay FSEIR mitigation measures that were adopted by the City as part of the Mission Bay Plan. These include Mission Bay FSEIR Mitigation Measures E.1 through E.18, E.21 through E.24, and partial implementation of Mission Bay FSEIR Mitigation Measure E.25 (Channel Street) and Mission Bay FSEIR Mitigation Measure E.26 (North and South Mission Bay Boulevard and Mission Bay Drive). In addition, Mission Bay FSEIR Mitigation Measures E.29 to E.34 and Mission Bay FSEIR Mitigation Measures E.36 to E.41 related to intersections and roadways have been implemented.

Traffic conditions at the study intersections were evaluated using level of service (LOS), and were evaluated using the *Highway Capacity Manual* 2000 *(HCM 2000)* methodology for signalized and unsignalized intersection conditions.[8] Level of service is a qualitative description of operating conditions ranging from LOS A (i.e., free-flow conditions with little or no delay) to LOS F (i.e., jammed conditions with excessive delays). Section 5.2.5.3, under "Approach to Impact Analysis Methodology," presents the analysis methodology and the LOS definitions for signalized and unsignalized intersections; it defines each of the levels of service and shows the correlation between average control delay and LOS.

Existing levels of service at the study intersections are presented in **Table 5.2-1** for the weekday p.m., weekday evening, weekday late evening, and the Saturday evening peak hours. **Figure 5.2-1** presents the existing LOS conditions at the study intersections for the weekday p.m. peak hour, **Figure 5.2-2** presents the intersection LOS conditions for the weekday evening peak hour, **Figure 5.2-3** presents the intersection LOS conditions for the weekday late evening peak hour, and **Figure 5.2-4** presents the intersection LOS conditions for the Saturday evening peak hour. The figures present the intersection LOS for a day without a SF Giants game at AT&T Park, and for a day with a SF Giants evening game at AT&T Park. A description of transportation conditions on days with a SF Giants evening game at AT&T Park is presented in Section 5.2.3.8.

Figure 5.2-4
Existing Intersection LOS-Saturday Evening Peak Hour

As indicated in **Table 5.2-1**, during the analysis hours, most study intersections currently operate at LOS D or better. The exceptions are the intersections of King/Third and King/Fifth/I-280 ramp that operate at LOS E during the weekday p.m. and weekday evening peak hours, and the intersection of Fifth/Bryant/I-80 eastbound on-ramp that operates at LOS F during the weekday p.m. and weekday evening peak hours. The poor operating conditions at these intersections are a result of high volumes destined to I-80 and I-280. In addition, with implementation of the transit-only lane on 16th Street (i.e., as part of the 22 Fillmore Transit Priority Project), the intersection of Seventh/Mississippi/16th operates at LOS E during the weekday p.m. and weekday evening peak hours.

Level of service conditions at the study intersections are generally less congested during the weekday evening peak hour than during the weekday p.m. peak hour, although intersection LOS designations are similar at the intersections at the approaches to the I-80 and I-280 ramps. During the weekday late evening and Saturday evening peak hours, traffic volumes decrease substantially from weekday p.m. peak hour conditions and all intersections operate at LOS C or better. Intersection conditions in Mission Bay are affected by traffic associated with special events and during baseball season when the SF Giants have home games at AT&T Park. Transportation impacts associated with game day conditions are most severe prior to games and after the conclusion of games. The greatest impact occurs after weekday afternoon sellout events, during the 3:30 to 4:40 p.m. period when traffic, transit, and pedestrian flows exiting the ballpark (and game-day street closures near the park) coincide with the evening commute traffic already on the transportation network. As a result, on days when the SF Giants play home games at AT&T Park, existing service levels at the study intersections would generally be worse than those presented in **Table 5.2-1**. Intersection LOS at the study intersections for conditions with a SF Giants evening game at AT&T Park are presented in Section 5.2.3.8.

Ramp Operations

Ramp operations were analyzed for three ramps serving I-80 and three ramps serving I-280 for the same analysis hours presented above for intersection conditions (four on-ramps and two off-ramps in total). These freeway ramps were selected for analysis as they represent the regional highway facility most likely to be impacted by traffic generated by the proposed project. Traffic volumes used for the ramps analyses were obtained from turning movement counts where the ramps touch down to the local street network (conducted in 2013 and 2014, as described above), and freeway mainline volumes were obtained from Caltrans PeMS data.

Similar to intersections, the operating characteristics of freeway ramps are evaluated using the concept of LOS, and were evaluated using the *HCM 2000* methodology for ramp merge and diverge conditions. Freeway ramp LOS is based on vehicle density (passenger cars per lane-mile), and in San Francisco, LOS A through D is considered acceptable; LOS E and LOS F are considered unsatisfactory service levels. Section 5.2.5.3, under "Approach to Impact Analysis Methodology," presents the analysis methodology and the LOS definitions for the freeway ramp junctions (i.e., ramp merges and diverges). The results of the ramp analysis for the four analysis hours are presented in **Table 5.2-2**.

TABLE 5.2-2

d Saturday evening peak hour of 6 to 9 p.m. peak hour.
e Density of vehicles per segment. Measured in passenger cars per mile per lane. Density value is not presented for segments where the demand volume exceeds the capacity, per *2000 Highway Capacity Manual*.
f Segments operating at LOS E or LOS F conditions highlighted in **bold**.

SOURCE: Adavant Consulting/LCW Consulting, 2015

During the analysis hours, all of the ramp merge and diverge sections currently operate at LOS D or better, except for the I-80 eastbound Sterling Street on-ramp which operates at LOS E during the weekday p.m. peak hour, and the I-80 eastbound Fifth/Bryant on-ramp which operates at LOS F during the weekday p.m. and evening peak hours, and LOS E during the Saturday evening peak hour. The LOS E and LOS F conditions at the I-80 ramps reflect the congestion associated with traffic attempting to leave downtown San Francisco that is constrained by the limited capacity of the Bay Bridge ramps onto the bridge, causing queues to form on surface streets leading to the bridge. The I-280 southbound on-ramp merge at Pennsylvania Street also experiences LOS E conditions due to the high volume of southbound vehicles on I-280 during the weekday p.m. peak hour.

5.2.3.2 Transit Service

Local service in San Francisco is provided by the San Francisco Municipal Railway (Muni), the transit division of the San Francisco Municipal Transportation Agency (SFMTA). Muni bus, cable car and light rail lines can be used to access regional transit operators. Service to and from the East Bay is provided by Bay Area Rapid Transit District (BART), AC Transit, and Water Emergency Transportation Authority (WETA) ferries; service to and from the North Bay is provided by Golden Gate Transit buses and ferries, as well as Blue & Gold, and WETA ferries;

and service to and from the Peninsula and the South Bay is provided by Caltrain, SamTrans, BART, and WETA ferries. **Figure 5.2-5** presents the existing transit route network in the project vicinity.

The project site is located approximately 2.0 miles southeast of the Ferry Building and the Embarcadero Muni Metro and BART station, about 1.6 miles southeast of the temporary Transbay Terminal, about 0.8 miles south of the Caltrain terminal at Fourth/King and 0.9 miles northeast of the Caltrain station at 22nd Street, and adjacent to the T Third UCSF/Mission Bay stop at South Street. The project site is about 1.7 miles east of the 16th Street BART station, and about 1.7 miles southeast of the Powell BART/Muni Metro station.

Local Muni Service

Muni service in the project vicinity includes the T Third light rail line that runs along Third Street with the closest stop at South Street (i.e., the UCSF/Mission Bay stop), as well as the 22 Fillmore route that runs east/west along 16th Street. **Table 5.2-3** presents the existing service frequency for the two routes.

TABLE 5.2-3
EXISTING MUNI ROUTES IN PROJECT VICINITY

	Headways						
	Weekday			Weekend			
Line/Route	PM (4 to 6 p.m.)	Evening (6 to 10 p.m.)	Late Evening (After 10 p.m.)	Evening (6 to 8 p.m.)	Late Evening (After 10 p.m.)	General Hours of Operation	Neighborhoods Served
T Third	9	15	20	20	20	4:00 to 1:00 a.m.	Downtown, Visitacion Valley
22 Fillmore	8	15	15	15	15	24 hours	Marina, Dogpatch

SOURCE: SFMTA, Adavant Consulting/Fehr & Peers/LCW Consulting, 2015.

In January 2015, the SFMTA implemented a temporary "55 16th Street" motor coach service to coincide with the opening of the Phase One Medical Center at Mission Bay between the campus site and the 16th Street BART Station until the 22 Fillmore trolley buses are extended into Mission Bay. The temporary 55 16th Street route and the extension of the 22 Fillmore (see description of the 22 Fillmore Transit Priority Project below) into Mission Bay will be implemented as part of Mission Bay FSEIR Mitigation Measure E.27. The 55 16th Street route runs on 16th Street between Valencia and Third Streets, and Third Street between 16th Street and Mission Bay Boulevard North, and a turnaround loop is provided via Mission Bay Boulevard North, Fourth Street, and Mission Bay Boulevard South. The new bus stops for this service in the vicinity of the project site are on 16th Street at Fourth Street (near side stop both ways), on Third Street northbound at South Street (near side stop), on Mission Bay Boulevard South eastbound between Fourth Third Streets (line terminal), and on Third Street southbound at Gene Friend Way.

Figure 5.2-5
Existing Transit Network

Planned changes to transit service in the project vicinity include the Central Subway project, which is currently under construction, and the Transit Effectiveness Project (renamed Muni Forward).

Central Subway Project. The Central Subway Project is the second phase of the Third Street light rail line (i.e., T Third), which opened in 2007. Construction is currently underway, and the Central Subway will extend the T Third light rail line northward from its current terminus at 4th and King Streets to a surface station south of Bryant Street and go underground at a portal under U.S. 101. From there it will continue north to stations at Moscone Center, Union Square—where it will provide passenger connections to other Muni light rail lines and BART at the Powell station —and in Chinatown, where the line will terminate at Stockton and Clay Streets. Construction of the Central Subway is scheduled to be completed in 2017, and revenue service is scheduled for 2019.

Muni Forward. The following changes are proposed by Muni Forward for routes in the proposed project vicinity.

- **T Third** – The number of light rail vehicles per train will increase from one to two, and headways between trains will be reduced from 9 to 8 minutes.
- **10 Townsend** – The 10 Townsend motor coach line will be renamed the 10 Sansome, with a new alignment within Mission Bay. Service would be rerouted off of Townsend down Fourth Street. From Fourth Street the route will extend through Mission Bay to new proposed street segments on Seventh Street between Mission Bay Boulevard and Irwin Street, on Irwin Street between Seventh and 16th Streets, on 16th Street between Irwin and Connecticut Streets, and on Connecticut Street between 16th and 17th Streets. Peak period headways will be reduced from 20 to 6 minutes. Midday headways will be reduced from 20 to 12 minutes. The 10 Townsend improvements represent an alternate improvement to extend transit service into Mission Bay, as required by Mission Bay FSEIR Mitigation Measure E.28.
- **22 Fillmore** – As part of the 22 Fillmore Transit Priority Project[9], the 22 Fillmore trolley bus line will be rerouted to continue along 16th Street east of Kansas Street, creating new connections to Mission Bay from the Mission neighborhood. The route change will add transit to 16th Street between Kansas and Third Streets, and to Third Street between 16th Street and Mission Bay Boulevard North. Muni Forward will change the a.m. peak period headway on the 22 Fillmore from 9 minutes to 6 minutes between buses. The service improvements will require upgrading and extending the overhead wire system on 16th Street between Potrero Avenue and Third Street. In addition to the service improvements, side-running transit-only lanes will be implemented on 16th Street between Seventh and Third Streets, and either side-running or center-running transit-only lanes will be implemented between Church and Seventh Streets by converting a mixed-flow lane to a transit-only lane. The 22 Fillmore Transit Priority Project will also include corridor-wide transit network improvements such as transit bulbs, new traffic signals, pedestrian signals,

9 The TEP included two alternatives for a Travel Time Reduction Proposal (TTRP) along 16th Street (of which one or a combination of the two could be implemented), to make the 22 Fillmore more frequent, reliable, and effective along 16th Street. The TTRP treatments are referred to as the Moderate and Expanded Alternatives. The Moderate Alternative includes a number of physical changes to the portion of the rerouted 22 Fillmore in the vicinity of Mission Bay, including, but not limited to, new transit stops, relocated transit stops, and transit bulbs, as well as new traffic signals. The Expanded Alternative includes most of the same features as the Moderate Alternative, as well as the conversion of a mixed-flow lane to a transit-only lane on both sides of 16th Street between Church and Third Streets, as well as the prohibition of left turns at Bryant, Potrero, Utah, San Bruno, Kansas, Rhode Island, De Haro, Carolina, Wisconsin, Arkansas, Connecticut, and Missouri Streets.

sidewalk widening, and upgrading of the bicycle infrastructure on 17th Street between Church and Seventh Streets to provide a parallel, contiguous, and safe bicycle route for traveling in the east-west direction.

- **33 Stanyan –** When the 22 Fillmore trolley bus service is extended into Mission Bay, the 33 Stanyan will be rerouted to follow the current alignment of the 22 Fillmore from Kansas Street to the route terminal on 20th Street at Third Street.

- **58 24th Street –** The 58 24th Street service will replace the alignment of the current 48 Quintara that terminates on 20th Street at Third Street when its service is realigned to serve Candlestick Point.

Regional Service Providers

East Bay: Transit service to and from the East Bay is provided by BART, AC Transit, and WETA. BART operates regional rail transit service between the East Bay (from Pittsburg/Bay Point, Richmond, Dublin/Pleasanton and Fremont) and San Francisco, and between San Mateo County (Millbrae and San Francisco Airport) and San Francisco. The nearest BART stations to the project site are the 16th Street and Powell stations, both about 1.7 miles east and northwest of the project site, respectively. AC Transit is the primary bus operator for the East Bay, including Alameda and western Contra Costa Counties. AC Transit operates 37 routes between the East Bay and San Francisco, all of which terminate at the (temporary) Transbay Terminal. WETA ferries provide service to between San Francisco and Alameda and between San Francisco and Oakland from the Ferry Building.

South Bay: Transit service to and from the South Bay is provided by BART, SamTrans, Caltrain, and WETA. SamTrans provides bus service between San Mateo County and San Francisco, including 14 bus lines that serve San Francisco (12 routes serve the downtown area). In general, SamTrans service to downtown San Francisco operates along South Van Ness Avenue, Potrero Avenue, and Mission Street to the Transbay Terminal. SamTrans cannot pick up northbound passengers at San Francisco stops. Similarly, passengers boarding in San Francisco (and destined to San Mateo) may not disembark in San Francisco. SamTrans routes stop at the eastbound and westbound bus stops on Mission Street at Fifth Street. WETA ferries provide service between South San Francisco and the San Francisco Ferry Building.

Caltrain provides commuter heavy-rail passenger service between Santa Clara County and San Francisco. Caltrain currently operates 38 trains each weekday, with a combination of express and local service. Two Caltrain stations are located approximately one mile from the project site, the 22nd Street station and the terminus at Fourth and King Streets; approximately 30 percent of all the weekday trains stop at the 22nd Street station.

North Bay: Transit service to and from the North Bay is provided by Golden Gate Transit buses and ferries, and WETA ferries. Between the North Bay (Marin and Sonoma Counties) and San Francisco, Golden Gate Transit operates 22 commute bus routes, nine basic bus routes and 16 ferry feeder bus routes, most of which serve the Van Ness Avenue corridor or the Financial District. In the vicinity of the project site, Golden Gate Transit bus service to downtown San Francisco operates along Mission, Howard and Folsom Streets. Golden Gate Transit routes stop at the westbound bus stop on Mission Street at Fifth Street. Golden Gate Transit also operates ferry service between the North Bay and San Francisco. During the morning and evening peak periods, ferries run between Larkspur and San Francisco and between Sausalito and San Francisco. WETA ferries provide service between Vallejo and San Francisco.

Mission Bay TMA Shuttle Service

The Mission Bay Transportation Management Association (Mission Bay TMA) provides two shuttle bus routes between Mission Bay and the Powell Muni/BART station, one shuttle bus route to Caltrain and the temporary Transbay Terminal, and a Mission Bay loop route. The shuttle service is free of charge and available for use by all employees, residents, and visitors to the Mission Bay area and the China Basin building at 185 Berry Street. The Powell Muni/BART shuttle routes operate every 15 minutes between 7:00 and 10:00 a.m. and 3:45 and 8:15 p.m. The Caltrain Transbay route operates between 6:50 and 9:00 a.m., and 3:45 and 6:40 p.m., and runs every 20 to 30 minutes. The Mission Bay loop route runs once between 6:23 and 7:05 a.m. **Figure 5.2-6** presents the existing routes serving Mission Bay. The Mission Bay TMA and shuttle service were implemented as part of Mission Bay FSEIR Mitigation Measures E.46 and E.47.

Local and Regional Transit Analysis

The assessments of existing and future transit conditions for proposed projects in San Francisco is typically performed through the analysis of local transit (Muni) and regional transit (BART, AC Transit, Golden Gate Transit, SamTrans, Caltrain, and ferry service) screenlines.[10] Each screenline is further subdivided into major transit corridors (Muni) or service provider (regional transit). Screenline values represent service capacity, ridership and utilization at the maximum load point according to the direction of travel for each of the lines that comprises the transit corridor.

Four screenlines have been established in San Francisco to analyze potential impacts of projects on Muni service: Northeast, Northwest, Southwest, and Southeast, with subcorridors within each screenline. Three regional screenlines have been established around San Francisco to analyze potential impacts on the regional transit agencies: East Bay (BART, AC Transit, ferries), North Bay (Golden Gate Transit buses and ferries), and the South Bay (BART, Caltrain, SamTrans).

Downtown screenlines examine the overall utilization of Muni transit capacity into and out of downtown San Francisco from the Northeast, Northwest, Southeast, and Southwest of San Francisco because transit travel into downtown San Francisco in the a.m. and out of downtown in the p.m., travel across the screenlines tends to be the most congested transit flow in the City. The Muni screenline analysis for the weekday p.m. peak hour focuses on transit trips in the outbound direction, i.e., trips from downtown San Francisco to other parts of the City and the region; this is because, as a major employment center, travel in downtown San Francisco during the weekday p.m. peak hour is heaviest in the outbound direction, as is the amount of transit service and capacity provided by Muni.

[10] The concept of screenlines is used to describe the magnitude of travel to or from the greater downtown area, and to compare estimated transit ridership to available capacities. Screenlines are hypothetical lines that would be crossed by persons traveling between downtown and its vicinity and other parts of San Francisco and the region.

Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 5.2-6
Existing Mission Bay TMA Shuttle Routes

In addition, a capacity utilization analysis was also conducted for the two Muni routes that serve the project site: the T Third light rail line and the 22 Fillmore bus route. Because the Central Subway and 22 Fillmore Transit Priority Projects are approved, funded, and planned to be in place by 2020, the transportation impact analysis is based on the ridership projections for 2020, as well as the planned capacity assuming implementation of these projects.[11] The transit analysis is conducted by calculating the existing capacity utilization (riders as a percentage of capacity) at the maximum load point (the point of greatest demand). Muni has established a capacity utilization standard of 85 percent for weekday peak hour analyses. Section 5.2.5.3, under "Approach to Impact Analysis Methodology," presents the analysis methodology for the transit capacity utilization and screenline analysis.

For the purpose of this analysis, the ridership and capacity at the three regional screenlines represent the peak direction of travel and patronage loads, which correspond with the evening commute in the outbound direction from downtown San Francisco to the region. As a means to determine the amount of available space for each regional transit provider, capacity utilization is also used. For all regional transit operators, the capacity is based on the number of seated passengers per vehicle. All of the regional transit operators have a one-hour load factor standard of 100 percent, which would indicate that all seats are full.

Table 5.2-4 presents the ridership and capacity utilization at the maximum load point (MLP) for the T Third and 22 Fillmore routes serving the project site for the four analysis time periods. As indicated in **Table 5.2-4,** capacity utilization during the four analysis periods is less than Muni's established 85 percent capacity utilization standard.

Table 5.2-5 presents the Muni downtown and regional transit screenlines for weekday p.m. peak hour (outbound) conditions. Overall, all screenlines and corridors are currently operating below the 85 percent capacity utilization standard, and could accommodate additional passengers.

5.2.3.3 Pedestrian Network

The project site is currently undeveloped, except for two surface parking lots. There currently are no sidewalks on South Street, Terry A. Francois Boulevard, or 16th Street adjacent to the project. On Third Street between 16th and South Streets, a 12-foot wide sidewalk is provided. Pedestrian crosswalks and pedestrian countdown signals are provided at the intersections of Third/South and Third/16th. Pedestrian crosswalks are provided at the west and north legs of the unsignalized intersection of Terry A. Francois/South.

---

[11] Focusing on the year 2020 is appropriate because it corresponds to the time frame within which the proposed project would become operational; it is therefore appropriate to consider improvements to the transit system that will be in place and operational as of that year. The Central Subway and 22 Fillmore Transit Priority Project are approved and funded, and will be in operation by the time the proposed project becomes operational.

SOURCE: San Francisco Planning Department Memorandum, Transit Data for Transportation Impact Studies, June 2013.

In the vicinity of the project site, existing pedestrian volumes are low throughout the day. Pedestrian conditions were quantitatively assessed for the crosswalks at the adjacent intersections of Third/South and Third/16th, and on the sidewalk on both sides of the street on Third Street between South and 16th Streets. Pedestrian counts were conducted in May and June 2014 (prior to the opening of the UCSF Medical Center Phase 1) for the weekday p.m., weekday evening, and Saturday evening peak hours. Due to the low pedestrian volumes in the area, weekday late evening pedestrian counts were not conducted, as they would be less than the weekday evening peak hour counts. The pedestrian volumes collected in the field were adjusted upwards to reflect the projected increase in pedestrians associated with the UCSF Medical Center Phase 1 and the Public Safety Building, similar to that described above for traffic volumes (weekday p.m. peak hour pedestrian volume counts at the crosswalks at Third/16th and on the sidewalk on Third Street between South and 16th Streets conducted in April 2015 indicated similar pedestrian volumes to the adjusted May/June 2014 volumes to reflect the UCSF Medical Center Phase 1 and Public Safety Building). For all analysis hours, pedestrian volumes are greater at the intersection of Third/South than Third/16th due to the T Third UCSF/Mission Bay light rail stop at South Street.

Existing pedestrian conditions were evaluated using LOS. Section 5.2.5.3, under "Approach to Impact Analysis Methodology," which presents the analysis methodology and the LOS definitions for crosswalks and sidewalks. **Table 5.2-6** presents the pedestrian volumes and LOS for the crosswalk and sidewalk locations for the analysis hours. Due to the low pedestrian volumes in the project vicinity, all study locations operate satisfactorily at LOS A conditions during all analysis hours.

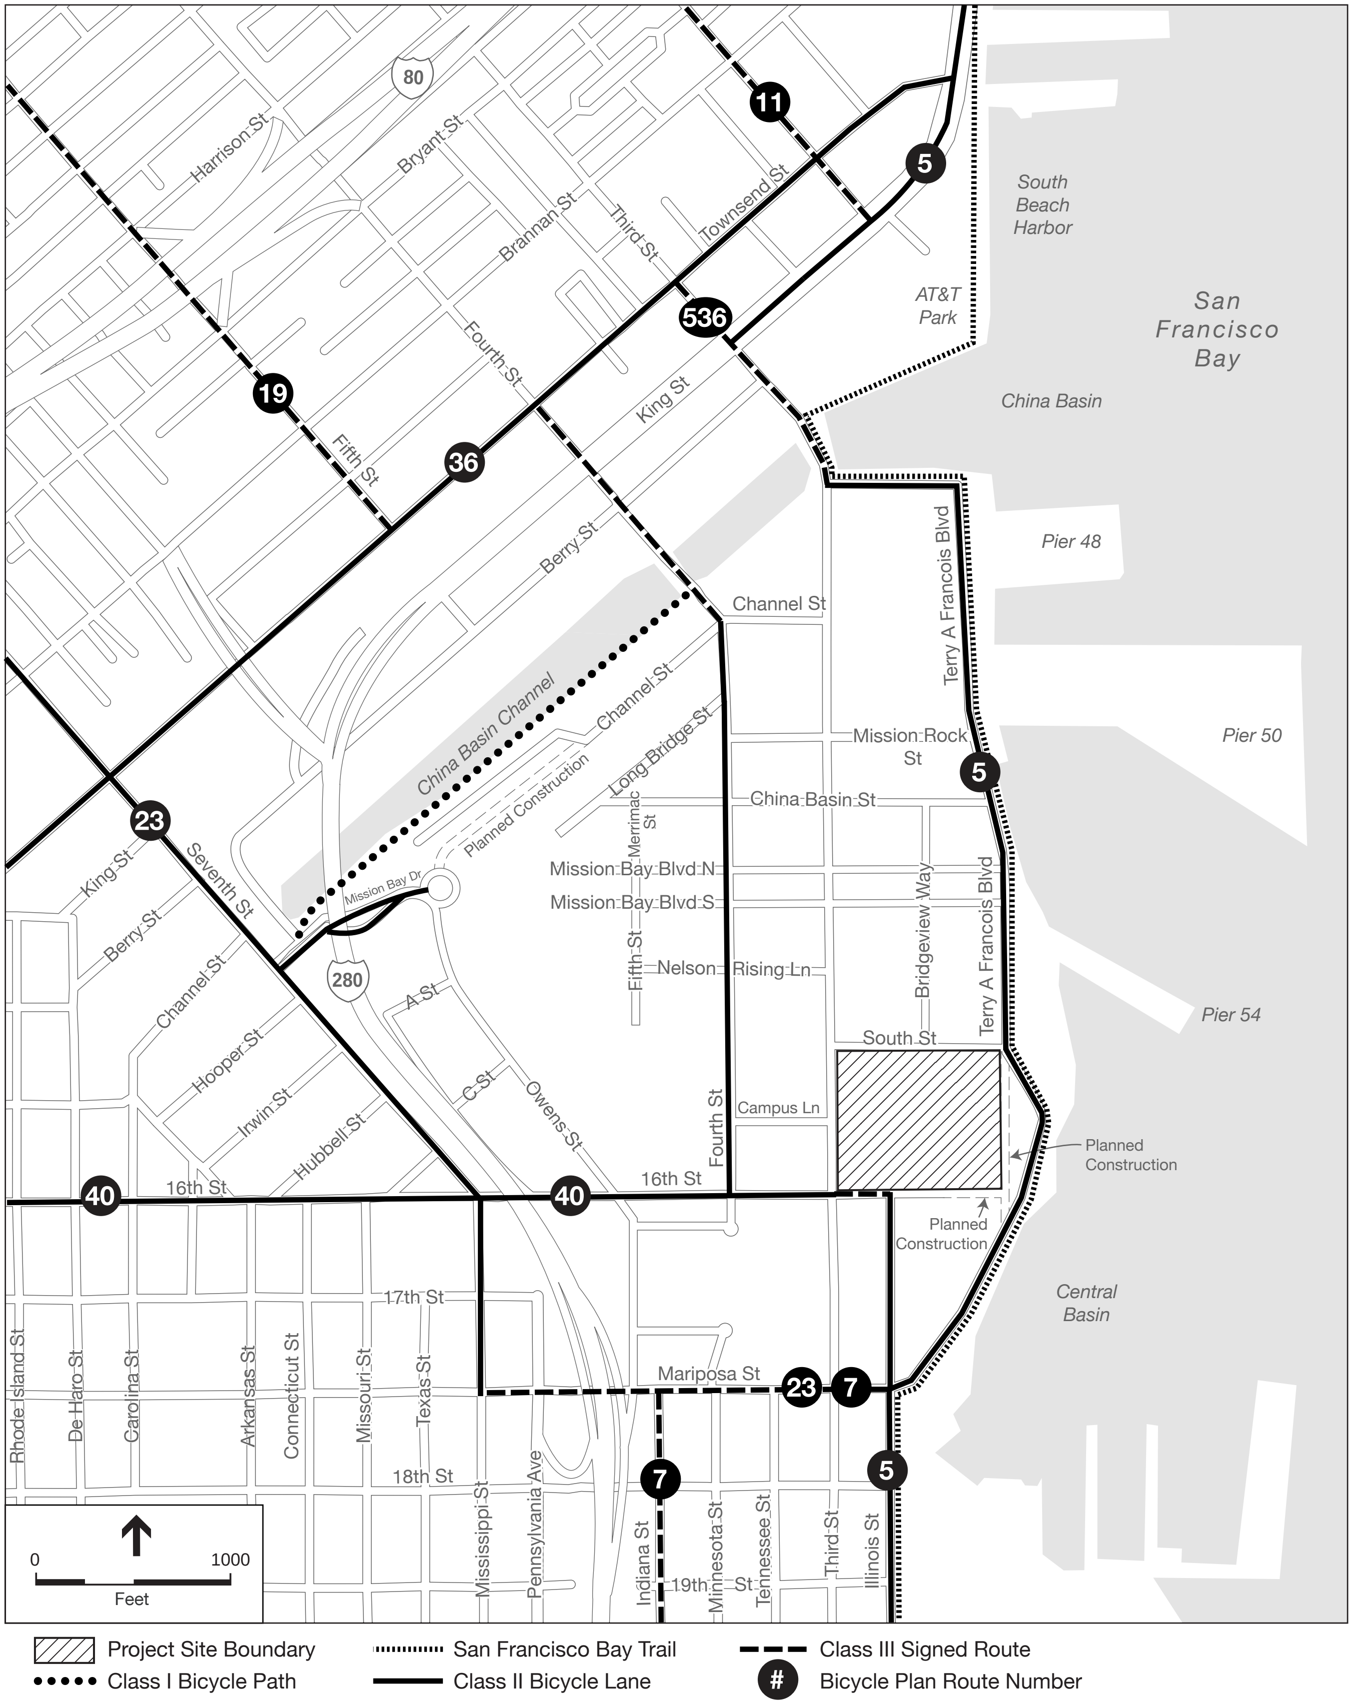
5.2.3.4 Bicycle Network

The majority of the Mission Bay area is flat, with minimal changes in grades, facilitating bicycling within and through the area. A number of existing bicycle routes are located in the project vicinity. These include City routes that are part of the San Francisco Bicycle Network, routes developed as part of the Mission Bay Plan, and regional routes that are part of the San Francisco Bay Trail system. **Figure 5.2-7** presents the bicycle routes and facilities within the study area, as identified in the *San Francisco Bike Map and Walking Guide*.



SOURCE: Adavant Consulting/Fehr & Peers/LCW Consulting, 2015

OCII Case No. ER 2014-919-97; Planning Department Case No. 2014.1441E:
Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 5.2-7
Existing Bicycle Route Network

Bikeways are typically classified as Class I, Class II, or Class III facilities.[12] Class I bikeways are bike paths with exclusive right-of-way for use by bicyclists or pedestrians. Class II bikeways are bike lanes striped with the paved areas of roadways and established for the preferential use of bicycles, and include separate bicycle lanes. Separate bicycle lanes provide a striped, marked and signed bicycle lane buffered from vehicle traffic. These facilities are located on roadways and reserve four to five feet of space for exclusive bicycle traffic. Class III bikeways are signed bike routes that allow bicycles to share travel lanes with vehicles. Designated bicycle routes in the project vicinity include:

Bicycle Route 5 connects to the study area from the north at King/Third and runs north and south along Third Street, Terry A. Francois Boulevard, and Illinois Street as a Class II bicycle facility.

Bicycle Route 7 runs on Indiana Street between Cesar Chavez and Mariposa Streets as a route with a Class II facility. Bicycle Route 7 also runs along Mariposa Street between Mississippi and Third Streets as a Class III bicycle facility.

Bicycle Route 23 runs north along Seventh Street between Townsend and 16th Streets, and along Mississippi Street between 16th and Mariposa Streets as a Class II facility. Bicycle Route 23 also runs along Mariposa Street between Mississippi and Illinois Streets as a Class III bicycle facility.

Bicycle Route 40 runs east-west on 16th Street between Kansas and Third Streets as a Class II bicycle facility. As part of the Mission Bay South Infrastructure Plan, Class II bicycle lanes will be implemented on 16th Street between Third Street and Terry A. Francois Boulevard at the time when Terry A. Francois Boulevard is realigned to the west and 16th Street is extended from Illinois Street to Terry A. Francois Boulevard.

Figure 5.2-7 also presents the San Francisco Bay Trail. The San Francisco Bay Trail is designed to create recreational pathway links to the various commercial, industrial and residential neighborhoods that surround the San Francisco Bay. In addition, the trail connects points of historic, natural and cultural interest; recreational areas such as beaches, marinas, fishing piers, boat launches, and numerous parks and wildlife preserves. At various locations, the Bay Trail consists of paved multi-use paths, dirt trails, bike lanes, sidewalks or city streets signed as bicycle routes. In the project vicinity, an improved Bay Trail path follows the shoreline of San Francisco Bay, east of Terry A. Francois Boulevard within the area that will be developed as part of the Mission Bay Plan as the Bayfront Park.

Bicycle volume counts were conducted during the weekday p.m., weekday evening, and Saturday evening peak periods in May and June 2014 on Third Street and on 16th Street, and counts on Terry A. Francois Boulevard were conducted in October 2014 (weekday p.m. peak hour bicycle volume counts conducted on Third Street between South and 16th Streets in April 2015 indicated similar bicycle volumes to those conducted in October 2014). **Table 5.2-7** presents the existing hourly bicycle volumes. The highest bicycle volumes were observed on Terry A. Francois Boulevard during the weekday p.m. and evening peak hours, although a number of bicyclists

[12] Bicycle facilities are defined by the State of California in the California Streets and Highway Code Section, 890.4. Available online at http://ca.regstoday.com/law/shc/ca.regstoday.com/laws/shc/calaw-shc_DIVISION1_CHAPTER8.aspx. Accessed May 28, 2015.

were observed traveling within the mixed-flow lanes on Third Street. Bicycle volumes during the Saturday evening peak hour are substantially lower than during the weekday p.m. or weekday evening peak hours. Overall, on weekdays and weekends bicycle conditions were observed to be operating acceptably, with no conflicts between bicyclists, pedestrians and vehicles.

NOTES:
[a] Bicycle counts on Third and 16th Streets conducted in May and June 2014, and bicycle counts on Terry A. Francois Boulevard conducted in September and October 2014.

SOURCE: Adavant Consulting/Fehr & Peers/LCW Consulting, 2015.

There are no on-street bicycle racks on Third Street adjacent to the project site, however, there are bicycle racks on the sidewalk on the north side of South Street and on the east sidewalk of Terry A. Francois Boulevard north of South Street, and west of the project site within the UCSF research campus; additional bicycle racks are provided at the recently opened UCSF Medical Center campus site. The closest Bay Area Bike Share stations in the project vicinity are on Townsend Street between Seventh and Eighth Streets (accommodating eight bicycles), and at the Caltrain station at King and Fourth Streets (accommodating 42 bicycles).

As part of the 22 Fillmore Transit Priority Project described above, the existing bicycle lanes on 16th Street (Bicycle Route 40) between Seventh and Kansas Streets, will be relocated to 17th Street between Seventh and Kansas Streets. On 17th Street at Kansas Street, the relocated bicycle lane will connect with the existing bicycle lane on the same street to the west, while at the east end, the bicycle lane will connect with the existing bicycle lane on Mississippi Street that runs between Mariposa and 16th Streets.

5.2.3.5 Loading Conditions

There are no on-street commercial loading spaces or passenger loading/unloading zones adjacent to, or in the vicinity of the project site. Some loading operations were observed to occur within the curb lane of South Street adjacent to the office building at 550 Terry A. Francois Boulevard (i.e., in the vicinity of its off-street loading facility).

5.2.3.6 Emergency Vehicle Access

The project site has frontages on four streets – South Street, Terry A. Francois Boulevard, 16th Street, and Third Street. Emergency vehicle access to the project site is primarily from Third Street, which has two travel lanes each way. The nearest fire stations to the project site are Station 8 at 36 Bluxome Street between Fourth and Fifth Streets (about one mile to the northwest of the project site), and Station 29 at 299 Vermont Street between 15th and 16th Streets (about 0.85 miles west of the project site). A new Public Safety Building located on Third Street at Mission Rock Street was completed in 2014, and became operational in early 2015. This new facility accommodates the headquarters of the San Francisco Police Department, the new Southern District police station, and a new fire station (i.e., Station 4). The fire station has access on Mission Rock Street between Third Street and Terry A. Francois Boulevard (less than half a mile north of the project site).

The UCSF Medical Center Phase 1 hospitals opened in February 2015. The Children's Hospital Emergency room and urgent care facility is located on Fourth Street at Mariposa Street. Emergency vehicle access to this facility is via Mariposa Street and via Owens Street and the South Connector Road. The San Francisco General Hospital (SFGH), located approximately 1.75 miles southeast of the project site (via 16th Street and Potrero Avenue), is the only designated trauma center in San Francisco.[13]

5.2.3.7 Parking Conditions

Off-street Parking

The existing parking conditions were examined within the parking study area, which is bounded by Townsend to the north, Seventh and Mississippi Streets to the west, 18th Street to the south, and San Francisco Bay to the east (see **Figure 5.2-8**). The parking study area was defined to include those off-street parking facilities located within a reasonable walking distance from the project site for an event, up to 0.5 miles, with easy access from the major street corridors that provide access to the Mission Bay Area.

13 A trauma center is a hospital equipped and staffed to provide comprehensive emergency medical services to patients suffering traumatic injuries.

Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 5.2-8
Existing Off-Street Public Parking Facilities

Existing off-street parking supply and utilization data were obtained from available studies conducted in Mission Bay for the UCSF LRDP EIR (with surveys conducted in March and September 2013), and supplemented with additional field surveys in March 2013 and September and October 2014. **Table 5.2-8** lists the public parking facilities within the study area, indicates whether the facility is a garage or a surface parking lot, and notates the days and hours of operation. **Figure 5.2-8** presents the location of each facility. As noted in **Table 5.2-8**, two surface parking lots currently operate in the west and north portions of the project site. Parking Lot E, accessed from 16th Street, contains 289 parking spaces; and Parking Lot B, accessed from South Street, contains 316 parking spaces, for a total of 605 parking spaces.

TABLE 5.2-8
EXISTING OFF-STREET PUBLIC PARKING FACILITIES WITHIN PARKING STUDY AREA

Parking Facility[a] (Keyed to Figure 5.2-8)	Facility	Spaces	Days/Hours/Terms of Operation
1. 185 Berry Street	Garage	270	M-F 6:30 a.m. to 7 p.m./extended during events

[b] Reflects reduction in parking supply due to development associated with The Yard.
[c] Reflects closure of 1000 Third Street (Lot D) with 320 spaces, and Lot C – Block 7 with 300 spaces, and increase in capacity at Lot C Blocks 3E and 4E (increase of 160 spaces).
[d] New parking facilities associated with UCSF Medical Center Phase 1 operations.
[e] Assuming all facilities open at the same time.

SOURCE: Adavant Consulting/LCW Consulting, 2015

The parking supply and demand survey data from 2013 and 2014 were adjusted to reflect changes in the parking conditions since the surveys were conducted. Specifically, the parking supply includes the new garage and surface lot associated with the recently-opened UCSF Medical Center Phase 1 (a total of 1,050 parking spaces), and the elimination of 320 spaces in the surface parking lot at 1000 Third Street (referred to as Lot D on Block 1 through Block 4), elimination of 300 spaces in the surface parking lot at Lot C South (Block 7), and reduction of 100 spaces in Lot A where development projects are pending in early 2015, and an increase in parking supply on Lot C (physically two lots located at Blocks 3E and 4E) from 160 to 320 spaces. The weekday parking occupancy for the analysis hours for the new UCSF Medical Center Phase 1 garage and lot was based on the parking demand at full occupancy identified in the UCSF LRDP EIR as well as information on parking utilization at other UCSF parking facilities; this assumption was later confirmed by parking occupancy surveys conducted in April 2015. Because the UCSF LRDP EIR did not include an analysis of Saturday conditions, the Saturday parking occupancy for the analysis hours for the new UCSF Medical Center Phase 1 garage and lot was based on surveys of UCSF facilities conducted in April 2015. The parking demand associated with the eliminated parking spaces was redistributed to other nearby facilities. Detailed parking supply and occupancy information for the unadjusted and adjusted conditions are included in **Appendix TR**.

There are 15 off-street parking facilities that were observed for parking occupancies in the parking study area, containing a total of approximately 9,135 parking spaces, with the greatest number of spaces at Lot A (i.e., 2,400 spaces or 26 percent of the total supply). **Table 5.2-9** presents the parking occupancy for weekdays and Saturdays, for midday and evening conditions. Midday represents the period between 11:30 a.m. and 1:30 p.m., and the evening represents the period between 7:00 and 8:30 p.m.

SOURCE: Adavant Consulting/LCW Consulting, 2015

On weekdays without a SF Giants game at AT&T Park, off-street parking facilities during the weekday midday period range in occupancy between 40 percent and fully occupied, with an average of 52 percent occupancy. Parking demand in the study area is lower during the weekend midday peak period, with an average of 22 percent occupancy. Since many parking facilities in the study area serve the medical and office uses in the area, the occupancy of the off-street facilities is substantially lower during weekday evenings (about 36 percent occupied) and Saturday evenings (about 18 percent occupied). Parking occupancies on days with a SF Giants evening game at AT&T Park are presented in Section 5.2.3.8 below.

On-street Parking

Existing on-street parking conditions were qualitatively assessed during field observations, and from previously-collected data for streets within and in the vicinity of the UCSF Mission Bay campus from field surveys conducted as part of the UCSF LRDP EIR.

Adjacent to the project site, parking is prohibited on Third Street, as the northbound travel lane runs adjacent to the curb. Adjacent to the project site, on-street parking is currently not permitted on South and 16th Streets, while on Terry A. Francois Boulevard on-street parking is permitted, and is currently unrestricted.

Elsewhere in the project vicinity, on-street parking is primarily metered one-hour, four-hour and unlimited time restricted parking spaces. Exceptions include portions of Terry A. Francois Boulevard, Mission Bay Boulevard North, Mission Bay Boulevard South, 16th Street, and Mariposa Street. Parking is prohibited on 16th Street west of Third Street. Metered parking regulations are in effect Monday through Saturday between 9:00 a.m. and 10:00 p.m., and between 9:00 a.m. and 6:00 p.m. on Sundays. The SFMTA and the Port of San Francisco have established Mission Bay as a metered district, and installation of meters is ongoing, as street construction and parcel development is completed. In February 2012, the Port Commission reconfirmed its approval for parking meters in Mission Bay. These new meters will have no time limit, thereby removing the two-hour time limited parking restrictions currently in effect in much of Mission Bay. Thus, streets with unrestricted and unmetered parking spaces, such as Terry A. Francois Boulevard, South Street, and 16th Street adjacent to the project site, will be metered. Special event pricing is in effect for all parking meters within Mission Bay South; rates are higher for meters located closer to AT&T Park.

On-street parking is well utilized during the daytime hours, with higher occupancies near completed and occupied buildings. Midday occupancy on streets within the UCSF Mission Bay campus are about 90 percent occupied, as is Terry A. Francois Boulevard. Parking utilization during the evening (about 25 percent) and overnight hours is low due to the limited evening uses in the area. On-street parking during the evening hours increase on days with a SF Giants evening game at AT&T Park (about 60 percent). See Section 5.2.3.8 for information on conditions with a SF Giants evening game.

Residential Permit Parking (RPP) regulations generally restrict on-street parking to a time-limited period, but vary on the days of the week and time of day that the regulations are in effect.[14] South of the project site, there is an Area "X" RPP regulation that restricts on-street parking Monday through Friday, to a two- or four-hour period between the hours of 8:00 a.m. and 4:00 p.m. unless an RPP "X" permit is displayed, in which case there is no time limit enforced. East of I-280, Area "X" extends south of Mariposa Street between Indiana and Third Streets, and west of I-280 it extends south of 16th Street. Thus, within the parking study area, the streets between Mariposa and 18th Streets, between Indiana and Third Streets are subject to the RPP "X' regulation.

5.2.3.8 Conditions with a SF Giants Evening Game at AT&T Park

AT&T Park, which is home to the San Francisco Giants Major League Baseball team, is located south of King Street between Second and Third Streets, approximately 0.7 miles north of the project site. AT&T Park has a capacity of approximately 42,000 attendees. San Francisco Giants regular season baseball games occur generally from April through September, and there are about 81 regular season home games during the baseball season. There are typically two pre-season baseball games. Up to 12 post-season games are possible, generally in October. AT&T also hosts occasional non-baseball events such as concerts, soccer games, and private parties.

- AT&T Park provides a Transportation Management Center (TMC) that contains access to video cameras positioned at several key intersections north of the channel. A Parking Control Officer (PCO)[15] Supervisor is stationed at the TMC, and there are two PCO supervisors in the field (one for the area north of the channel, and one for the area south of the channel) that manage the 22 to 24 other PCOs that are typically assigned to a baseball game. The PCOs are deployed and relocated based on real-time information from video cameras and radio and telephone communications with PCOs. Flashing beacons and signs can also be activated from the TMC. These beacons are designed to notify motorists when there is an event at AT&T Park and direct them to alternate routes. There are flashing beacons facing southbound traffic on The Embarcadero between Folsom and Harrison Streets, facing eastbound traffic on 16th Street east of Seventh Street, and on northbound I-280 approaching the Mariposa Street exit.[16]

- Eastbound King Street between Third and Second Streets is closed to vehicular traffic starting at the seventh inning, and is reopened after traffic dissipates, typically about 45 minutes to an hour following the end of the game. However, weekday games can partially overlap with the evening peak commute period, which can extend the temporary eastbound road closure on King Street and associated post-game congestion. There are about 10 weekday baseball games per year.

[14] The preferential residential parking system (i.e., the Residential Permit Parking program) was established in 1976 to preserve neighborhood living within a major urban center. The main goal of the program is to provide more parking spaces for residents by discouraging long-term parking by people who do not live in the area. Local regulations regarding the establishment of permit areas and requirements for permits can be found in the San Francisco Transportation Code, Division II, Article 900. Available online at https://law.resource.org/pub/us/code/city/ca/SanFrancisco/0-snapshots/S-44/Transportation.html. Access May 28, 2015.

[15] In San Francisco, Parking Control Officers (PCOs), also known as Traffic Control Officers, are deployed to manage and direct vehicular, transit, bicycle, and pedestrian flows, in an effort to increase safety and reduce congestion.

[16] There is an existing flashing beacon on Third Street north of Mariposa Street. The permanent changeable message sign at this location installed by the SFMTA as part of SFgo will replace the beacon and associated signage, and the beacon and signage will be removed.

- The two easternmost travel lanes on Third Street between Terry A. Francois Boulevard and Berry Street are closed to vehicular traffic from approximately two hours prior to a game through about one hour after the end of the game to provide pedestrians additional walkway area. The three remaining lanes remain open to vehicular traffic; pre-game there are two southbound lanes and one northbound lane, while post-game there are two northbound lanes and one southbound lane.

- Fourth Street between Channel and Berry Streets is restricted to transit vehicles, taxis and bicycles only starting at the seventh inning, and is reopened after traffic dissipates.

- The northern portion of Terry A. Francois Boulevard is closed to vehicular traffic approximately two to three hours prior to a game, and is reopened when most vehicles have exited the parking lot (i.e., Lot A containing approximately 2,400 spaces).

- Vehicles exiting the parking facilities and traveling southbound on Terry A. Francois Boulevard are not permitted to turn right onto Mariposa Street westbound. Instead, drivers are directed south on Illinois Street. Tow-away regulations are in effect on game days on the west side of Illinois Street between Mariposa and 18th Streets to allow for two southbound lanes to continue on Illinois Street (i.e., Terry A. Francois Boulevard contains two southbound travel lanes, while Illinois Street contains one southbound travel lane, and without additional travel lane capacity this location would become a bottleneck). South of 18th Street one southbound travel lane is provided, as a substantial number of vehicles on Illinois Street turn right onto 18th Street westbound.

- Additional walking area for pedestrians is provided before and after games on the Lefty O'Doul (Third Street) Bridge, and on the closed portion of Terry A. Francois Boulevard. After games, pedestrians are permitted on the closed portion of King Street (i.e., the eastbound lanes) between Third and Second Streets. This area is used to stage Muni Metro riders in order to prevent the transit boarding island on King Street west of Second Street from getting overcrowded.

- At the intersection of Third Street/King Street, pedestrians are sometimes permitted to cross diagonally during the post-game surge. Otherwise, pedestrians are directed by PCOs to stay on the sidewalks and within crosswalks, crossing on the WALK indication, or when PCOs direct pedestrians to cross; in this fashion, pedestrians are prevented from shutting down the intersection to transit and traffic flow, and from obstructing Muni Metro tracks. Some sidewalks such as the east side of Third Street between King and Townsend Streets become very congested, and, as a result, some pedestrians walk in the traffic lanes on northbound Third Street. Right turns are prohibited during the post-game periods at several locations, such as northbound Third Street at Townsend Street, where conflicts between right turning traffic and pedestrians in the east crosswalk can cause delays to traffic on northbound Third Street.

- There are currently three taxi stands for AT&T Park on game days: west side of Second Street just south of Townsend Street, west side of Second Street north of Townsend Street (post-game period only), and west side of Third Street just north of King Street. Taxi operations work well before and during games. However, during the post-game period, taxis have difficulty leaving the ballpark area without getting stuck in post-game traffic congestion. Left turns are not allowed from southbound Second Street onto eastbound King Street/The Embarcadero because of conflicts with Muni Metro operations. Post-game traffic on westbound King Street between Second and Third Streets is typically very congested due to heavy traffic and pedestrian volumes at the intersection of Third/King. The post-game only taxi stand on the west side of Second Street north of Townsend Street is designed to allow taxis on southbound Second Street to exit the area by turning either left on right onto Townsend Street, which is generally not congested with post-game traffic. However, this zone is often illegally occupied by limousines or TNC vehicles, instead of taxis. PCOs are regularly dispatched to enforce the taxi-only restriction.[17]

- Attendees arriving by auto are directed to two parking facilities north of the channel (i.e., the Pier 30 lot and the Bayside lot at Seawall Lot 330 containing a total of about 1,300 spaces), and six surface parking lots south of the channel (Lot A, Lot B, Lot C North, Lot C South, and Lot D, as well as Pier 48, with the six lots containing a total of 4,250 parking space. Lot B is located on the project site). Parking in Lot A is mainly reserved for pre-paid and ADA parking only. Event parking is also provided in other publicly-accessible off-street parking facilities north and south of the ballpark.

- Special event pricing is in effect at on-street parking meters within the area generally bounded by Bryant Street to the north, Fifth and Seventh Streets to the west, Mariposa Street to the south, and the San Francisco Bay to the east. In addition, evening hours at meters are extended to 10:00 p.m. Monday through Sunday. Special event meter rates are generally $7 per hour north of the channel and south to Mission Bay Boulevard South, $5 per hour between Mission Bay Boulevard South and 16th Street, and $3 per hour between 16th and Mariposa Streets.[18]

- On game days, the SFMTA provides additional KT Ingleside-Third light rail service in order to increase light rail capacity. Two-car shuttle trains run continuously before and during the games between West Portal and the intersection of Fourth/King. Prior to the end of the game, the trains stage within the King Street median west of Fourth Street in order to facilitate loading of passengers and departure of trains from the ballpark area. The extra shuttle trains continue to run until all transit passengers leaving the ballpark are served.

- Special AT&T Ballpark ferry service is provided between the ballpark and Alameda, Marin and Solano Counties. The Golden Gate Bridge Highway and Transportation District provides service between AT&T Park and the Larkspur Ferry Terminal following a game. The Alameda/Oakland Ferry provides ferry service between the Oakland and Alameda ferry terminals and AT&T Park for most games. Vallejo Ferry provides service to and from the ballpark for all Saturday and Sunday games, and return service from the ballpark to Vallejo is also provided for select weeknight games Monday through Friday. In 2014, Caltrain provided regularly scheduled inbound trains on game day afternoons before the start of the game. Caltrain also provides two special trains departing San Francisco at the end of each game. These include an express train to San Carlos leaving approximately 15 minutes after the last out, or when full; this express train then makes all weekday local stops between San Carlos and the San Jose Diridon station. A second train departs San Francisco 25 minutes after the end of the game, or when full, serving all weekday local stops between San Francisco and San Jose Diridon.

[17] Transportation Network Company (TNC) is a company or organization that provides transportation services using an online-enabled platform to connect passengers with drivers using their personal vehicles (e.g., Lyft, SideCar, Uber).

[18] Parking meters also are in effect on Sundays at Fisherman's Wharf, The Embarcadero, five off-street parking facilities, and in the Special Event Zone if there is an event. Meters on Terry A. Francois Boulevard are subject to the Special Event Zone hours.

Intersection Operations. Table 5.2-10 presents the intersection LOS conditions at the study intersections for days with a SF Giants evening game at AT&T Park. **Figure 5.2-1** through **Figure 5.2-4** present a graphical comparison of the intersection LOS for the analysis hours for conditions without and with a SF Giants evening game at AT&T Park. As noted above, congestion in Mission Bay is affected by traffic associated with special events and during baseball season when the SF Giants have home games at AT&T Park. Transportation impacts associated with game day conditions are most severe prior to games and after the conclusion of games.

During the analysis hours, most study intersections currently operate at LOS D or better. The exceptions are the intersections of King/Third and King/Fifth/I-280 ramp that operate at LOS E during the weekday p.m. and weekday evening peak hours, and the intersection of Fifth/Bryant/I-80 eastbound on-ramp that operates at LOS F during the weekday p.m. and weekday evening peak hours. The poor operating conditions at these intersections are a result of high volumes destined to I-80 and I-280. In addition, with implementation of the transit-only lane on 16th Street as part of the 22 Fillmore Transit Priority Project, the intersection of Seventh/Mississippi/16th operates at LOS F during the weekday p.m. peak hour and LOS E during the weekday evening peak hour.

Intersection LOS cannot be calculated at the intersections where PCO's are currently deployed and direct traffic flow prior to or follow a SF Giants games (i.e., at the intersection of King/Third, King/Fourth, Third/Channel, Fourth/Channel, Illinois/Mariposa, and Third/Mariposa), and are therefore not presented in **Table 5.2-10**.[19]

Ramp Operations. Table 5.2-11 presents the ramp LOS conditions at the study locations for days with a SF Giants evening game at AT&T Park. During the analysis hours, all of the ramp merge and diverge sections currently operate at LOS D or better, except for the I-80 eastbound Sterling Street on-ramp which operates at LOS E during the weekday p.m. peak hour, and the I-80 eastbound Fifth/Bryant on-ramp which operates at LOS F during all the weekday p.m., weekday evening, and Saturday evening peak hours. The LOS E and LOS F conditions at the I-80 ramps reflect the congestion associated with traffic attempting to leave downtown San Francisco that is constrained by the limited capacity of the Bay Bridge ramps onto the bridge, causing queues to form on surface streets leading to the bridge. In addition, as for conditions without a SF Giants evening game, the I-280 southbound on-ramp merge at Pennsylvania Street also experiences LOS E conditions due to the high volume of southbound vehicles on I-280 during the weekday p.m. peak hour.

---

19 The *HCM* methodology (see Section 5.2.5.3, under "Approach to Impact Analysis Methodology") used to calculate intersection LOS at signalized intersections is based on the peak 15-minute period of the one hour with the greatest traffic volume, and it assumes that during the analysis period, the traffic signal operation and traffic movements and flow would generally operate under a regular pattern. This is not the case at intersections managed by PCOs after events at AT&T Park. At those locations, the normal operation of the traffic signal is interrupted due to travel lane or roadway closures, PCOs providing longer crossing times for pedestrians, PCOs halting traffic flow temporarily to clear out the intersection or to allow transit to move, among other event-related transportation management strategies. For these reasons, an intersection LOS is not presented for those locations where PCOs actively manage intersection operations.

Transit Conditions. About 43 to 47 percent of SF Giants game attendees take transit to games on weekdays, and about 36 to 37 percent take transit on weekends.[20] As described above, on game days, SFMTA provides additional KT Ingleside-Third light rail service in order to increase light rail capacity. Two-car shuttle trains run continuously before and during the games between West Portal and the intersection of Fourth/King. Prior to the end of the game, the trains stage within the King Street median west of Fourth Street in order to facilitate loading of passengers and departure of trains from the ballpark area. The extra shuttle trains continue to run until all transit passengers leaving the ballpark are served. Additional regional ferry service is provided between the ballpark and Alameda, Marin and Solano Counties. In addition, Caltrain provides two outbound trains at the end of the game.

Pedestrian Conditions. Pedestrian volumes at the analysis locations on days with a SF Giants evening game are slightly higher, but similar to those on days without a SF Giants game. The higher pedestrian volumes in the project vicinity are associated with SF Giants game attendees parking on the existing surface lots on the project site and at other nearby UCSF parking garages. **Table 5.2-12** presents the hourly pedestrian volumes and LOS conditions for the crosswalk and sidewalk analysis locations. Similar to conditions without a SF Giants evening game at AT&T Park, all crosswalk and sidewalk analysis locations operate at LOS A conditions. On days with a SF Giants evening game, substantially heavier pedestrian flow conditions occur to the north, away from the project site, particularly on the section of Third Street north of Mission Rock Street

20 Surveys of game attendees at AT&T Park conducted by the SF Giants in 2012, supplemented with similar data collected in 2007. More detailed survey results are provided in **Appendix TR**.

and on the Third Street Bridge, which is used by SF Giants game attendees as they walk between parking Lot A and AT&T Park.

NOTES:
[a] The measure of effectiveness for crosswalks is density – pedestrians per square foot. The measure of effectiveness for sidewalks is the flow rate – pedestrians per minute per foot.

SOURCE: Adavant Consulting/LCW Consulting, 2015

Bicycle Conditions. Table 5.2-8 in Section 5.2.3.7 presents the hourly bicycle volumes for conditions without and with a SF Giants evening game at AT&T Park. Overall, bicycle volumes in the project vicinity on days with a SF Giants evening game are slightly higher, but similar to those on days without a SF Giants game. Overall, on weekdays and weekends bicycle conditions were observed to be operating acceptably, with no conflicts between bicyclists, pedestrians and vehicles.

Parking Conditions. Table 5.2-13 presents the parking occupancy at the study area off-street facilities for a day with a SF Giants evening game at AT&T Park. In general, on days with a SF Giants evening game, weekday midday parking occupancy is lower at many facilities than on days without a SF Giants game, likely due to increase parking rates on game days at many facilities resulting in drivers destined to the area to change travel modes from auto to transit, bicycle, and/or walk modes. On SF Giants game days, a number of existing facilities open for event parking. These include 185 Berry Street (weekday evenings only), Piers 48 Sheds A and B and 1050 Third Street/Mission Rock (on both weekday and weekend evenings). Even accounting for the additional capacity provided in these facilities (1,090 spaces on weekday evenings and 830 spaces on weekend evenings), the overall parking occupancy for the study area facilities increases from less than 40 percent on days without a SF Giants game to more than 70 percent on days with a SF Giants evening game. On days with a SF Giants game, there are lower weekday midday parking occupancy rates compared to typical weekdays, since facilities managed by SF Giants (Lot A, 455 South St, 1725 Third St, etc.) would charge higher game-day rates. It should be noted that additional facilities north of King Street accommodate parking demand associated with SF Giants games, including 1,000 spaces at the Pier 30 surface lot and 300 spaces on the Bayside surface lot across from Pier 30. In addition, numerous parking garages serving commercial uses accommodate game day parking.

TABLE 5.2-13
OFF-STREET PARKING SUPPLY AND OCCUPANCY
EXISTING CONDITIONS – WITH A SF GIANTS EVENING GAME
WEEKDAY AND SATURDAY

	Occupancy[b]			
	Weekday		**Saturday**

5.2.4 Regulatory Framework

This section provides a summary of the plans and policies of the City and County of San Francisco, and regional, state and federal agencies that have policy and regulatory control over the proposed project site.

5.2.4.1 Federal and State Regulations

There are no federal or state transportation regulations applicable to the proposed project.

5.2.4.2 Regional Regulations

Water Emergency Transportation Authority's Water Transportation System Management Plan

WETA is a regional agency authorized by the State to operate a comprehensive San Francisco Bay Area public water transit system. In 2009, the WETA adopted the Emergency Water Transportation System Management Plan, which complements and reinforces other transportation emergency plans that will enable the Bay Area to restore mobility after a regional disaster.

San Francisco Bay Trail Plan

The Association of Bay Area Governments (ABAG) administers the San Francisco Bay Trail Plan (Bay Trail Plan). The Bay Trail is a multi-purpose recreational trail that, when complete, would encircle San Francisco Bay and San Pablo Bay with a continuous 400-mile network of bicycling and hiking trails; to date, 338 miles of the alignment have been completed. The 2005 Gap Analysis Study, prepared by ABAG for the entire Bay Trail area, attempted to identify the remaining gaps in the Bay Trail system; classify the gaps by phase, county, and benefit ranking; develop cost estimates for individual gap completion; identify strategies and actions to overcome gaps; and present an overall cost and timeframe for completion of the Bay Trail system.

5.2.4.3 Local Regulations and Plans

Transit First Policy

In 1998, the San Francisco voters amended the City Charter (Charter Article 8A, Section 8A.115) to include a Transit-First Policy, which was first articulated as a City priority policy by the Board of Supervisors in 1973. The Transit-First Policy is a set of principles that underscore the City's commitment that travel by transit, bicycle, and foot be given priority over the private automobile. These principles are embodied in the policies and objectives of the Transportation Element of the San Francisco General Plan. All City boards, commissions, and departments are required, by law, to implement transit-first principles in conducting City affairs.

San Francisco General Plan

The Transportation Element of the San Francisco General Plan is composed of objectives and policies that relate to the eight aspects of the citywide transportation system: General Regional

Transportation, Congestion Management, Vehicle Circulation, Transit, Pedestrian, Bicycles, Citywide Parking, and Goods Management. The Transportation Element references San Francisco's Transit First Policy in its introduction, and contains objectives and policies that are directly pertinent to consideration of the proposed project, including objectives related to locating development near transit investments, encouraging transit use, and traffic signal timing to emphasize transit, pedestrian, and bicycle traffic as part of a balanced multimodal transportation system. The San Francisco General Plan also emphasizes alternative transportation through positioning of building entrances, making improvements to the pedestrian environment, and providing safe bicycle parking facilities.

San Francisco Bicycle Plan

The *San Francisco Bicycle Plan (Bicycle Plan)* describes a City program to provide the safe and attractive environment needed to promote bicycling as a transportation mode. The San Francisco *Bicycle Plan* identifies the citywide bicycle route network, and establishes the level of treatment (i.e., Class I, Class II or Class III facility) on each route. The *Bicycle Plan* also identifies near-term improvements that could be implemented within the next five years, as well as policy goals, objectives and actions to support these improvements. It also includes long-term improvements, and minor improvements that would be implemented to facilitate bicycling in San Francisco.

Better Streets Plan

The *San Francisco Better Streets Plan (Better Streets Plan)* focuses on creating a positive pedestrian environment through measures such as careful streetscape design and traffic calming measures to increase pedestrian safety. The *Better Streets Plan* includes guidelines for the pedestrian environment, which it defines as the areas of the street where people walk, sit, shop, play, or interact. Generally speaking, the guidelines are for design of sidewalks as crosswalks; however, in some cases, the *Better Streets Plan* includes guidelines for certain areas of the roadway, particular at intersections.

5.2.5 Impacts and Mitigation Measures

5.2.5.1 Significance Thresholds

The project would have a significant impact related to transportation and circulation if the project were to:

- Conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation, including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit;
- Conflict with an applicable congestion management program, including but not limited to level of service standards and travel demand measures, established by the county congestion management agency for designated roads or highways (unless it is practical to achieve the standard through increased use of alternative transportation modes);

- Result in a change in air traffic patterns, including either an increase in traffic levels, obstructions to flight, or a change in location, that causes substantial safety risks;
- Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses;
- Result in inadequate emergency access; or
- Conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., conflict with policies promoting bus turnouts, bicycle racks, etc.) regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities, or cause a substantial increase in transit demand which cannot be accommodated by existing or proposed transit capacity or alternative travel modes.

Below is a list of significance criteria that the Office of Community Investment and Infrastructure (OCII), in consultation with the San Francisco Planning Department, uses to assess whether the proposed project would result in significant transportation impacts. These criteria are organized by mode to facilitate the transportation impact analysis; however, the transportation significance criteria are essentially the same as the ones presented above.

- The project would have a significant effect on the environment if it would cause a substantial increase in transit demand that could not be accommodated by adjacent transit capacity, resulting in unacceptable levels of transit service; or cause a substantial increase in delays or operating costs such that significant adverse impacts in transit service levels could result. With the Muni and regional transit screenline analyses, the project would have a significant effect on the transit provider if project-related transit trips would cause the capacity utilization standard to be exceeded during the peak hour;
- The operational impact on signalized intersections is considered significant when project-related traffic causes the intersection level of service to deteriorate from LOS D or better to LOS E or LOS F, or from LOS E to LOS F. The operational impacts on unsignalized intersections are considered potentially significant if project-related traffic causes the level of service at the worst approach to deteriorate from LOS D or better to LOS E or LOS F and peak hour signal warrants[21] would be met, or would cause peak hour signal warrants to be met when the worst approach is already operating at LOS E or LOS F. The project may result in significant adverse impacts at intersections that operate at LOS E or LOS F under existing conditions depending upon the magnitude of the project's contribution to the worsening of the average delay per vehicle. In addition, the project would have a significant adverse impact if it would cause major traffic hazards or contribute considerably to cumulative traffic increases that would cause deterioration in levels of service to unacceptable levels;

---

[21] A signal warrant is a condition that an intersection must meet to justify a signal installation. There are different warrants, which examine factors such as the volume of vehicles, bicyclists, and pedestrian, the signal system, collision statistics, as well as the geometric/physical configuration of the intersection. Even if a signal warrant is not met under the strictest interpretation, the determination to signalize an intersection could be made based upon the city traffic engineer's professional judgment of intersection operations.

- The project would have a significant effect on the environment if it would result in substantial overcrowding on public sidewalks and crosswalks, create potentially hazardous conditions for pedestrians, or otherwise interfere with pedestrian accessibility to the site and adjoining areas;

- The project would have a significant effect on the environment if it would create potentially hazardous conditions for bicyclists or otherwise substantially interfere with bicycle accessibility to the site and adjoining areas;

- A project would have a significant effect on the environment if it would result in a loading demand during the peak hour of loading activities that could not be accommodated within proposed on-site loading facilities or within convenient on-street loading zones, and would create potentially hazardous conditions or significant delays affecting traffic, transit, bicycles, or pedestrians; or

- A project would have a significant effect on the environment if it would result in inadequate emergency access.

Construction-related impacts generally would not be considered significant due to their temporary and limited duration.

5.2.5.2 Project Transportation Improvements Assumptions

Chapter 3, Project Description, summarizes the elements of the project description related to transportation features (e.g., on-site vehicle and bicycle parking spaces and truck loading spaces)[22] and circulation improvements, including proposed vehicular access and on-site circulation, pedestrian and bicycle access, off-site streetscape improvements, changes to the Mission Bay shuttle service, and the project Transportation Management Plan (TMP); these elements are re-iterated and expanded upon in this section. The project TMP is included in its entirety in **Appendix TR**.

This section is organized as follows:

1. Roadway Network Improvements and Curb Regulations
2. Transit Network Improvements
3. Pedestrian Network Improvements
4. Bicycle Network Improvements
5. Mission Bay TMA Shuttle Program Improvements
6. Muni Special Event Transit Service Plan
7. Transportation Management Plan

[22] Because the project site is located within the *Mission Bay South Redevelopment Plan* Area, it is not subject to the *San Francisco Planning Code* requirements, unless specifically noted. Instead, the proposed project is subject to the *Mission Bay South Design for Development* requirements. **Appendix TR** includes a comparison of the proposed project elements to the *Mission Bay South Design for Development* requirements. Because the *Mission Bay South Design for Development* does not contemplate off-street parking and loading standards for a multipurpose event center, the proposed project includes amendments to the *Mission Bay South Design for Development* to accommodate revised requirements for this land use.

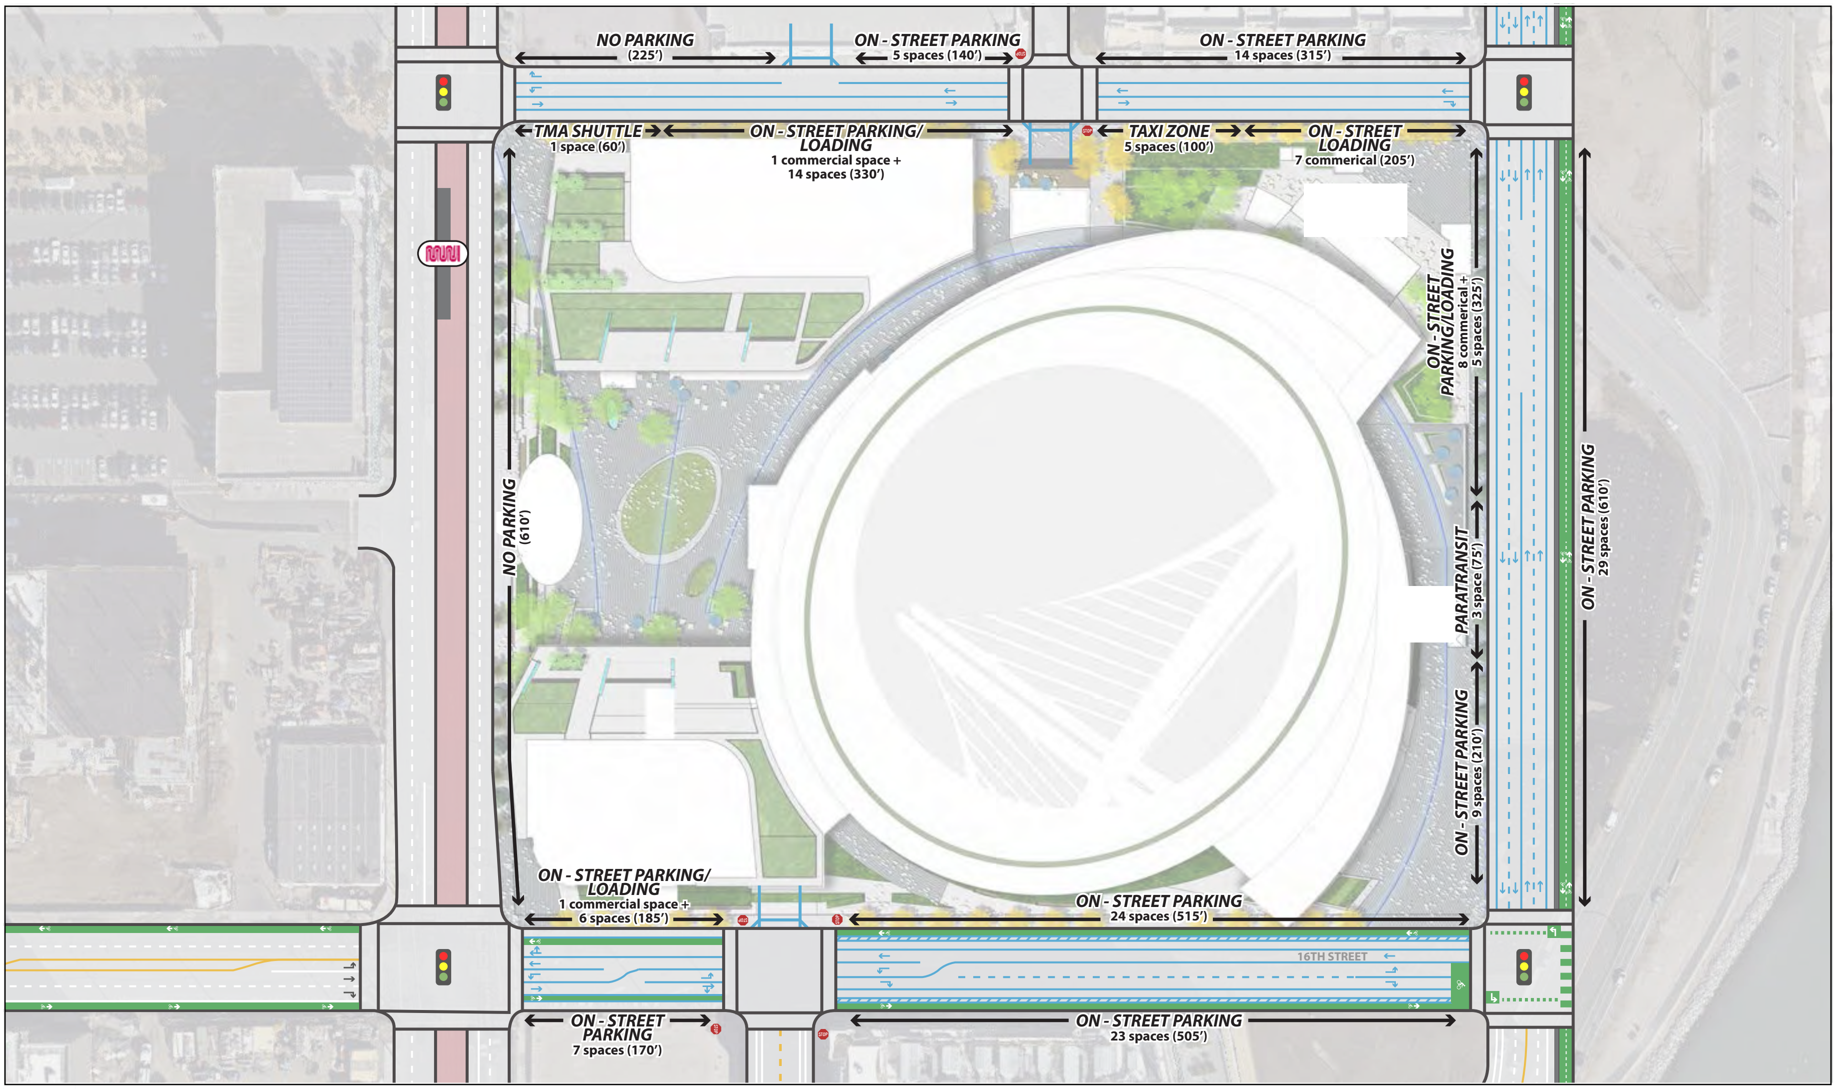
1. *Roadway Network Improvements and Curb Regulations*

The proposed project includes completion of the roadway network adjacent to the project site. **Figure 5.2-9** presents the travel lane striping for the streets adjacent to the project site, subject to SFMTA review and approval.

- Adjacent to the project site, the number of travel lanes on Third Street and Terry A. Francois Boulevard would not change from existing conditions (i.e., two lanes each way without dedicated left-turn lanes). As part of the Mission Bay South Infrastructure Plan, Terry A. Francois Boulevard between South and 16th Streets would be relocated to align with the eastern edge of Blocks 29 and 30 (i.e., to the west of its current alignment).
- South Street currently has two travel lanes each way, with no on-street parking. With implementation of the proposed project, South Street would have one lane each way and on-street parking permitted on both sides of the street. At the westbound approach to Third Street, on-street parking would be prohibited for about 225 feet to provide for an additional right-turn only lane.
- 16th Street is currently open between Third and Illinois Streets, and with implementation of the proposed project, 16th Street would be rebuilt and extended to connect with the realigned Terry A. Francois Boulevard. Between Third and Illinois Streets, 16th Street would have one eastbound lane and one left-turn only lane (80 feet in length) into the project garage. In order to accommodate the single eastbound lane on 16th Street east of Third Street, one of the two eastbound lanes on the west leg of the intersection of Third Street/16th Street would be restriped as an eastbound right-turn only lane. East of Illinois Street, 16th Street would have two eastbound lanes which would become separate left turn and right turn only lanes about 100 feet east of Terry A. Francois Boulevard. Westbound 16th Street between Terry A. Francois Boulevard and Illinois Street would have one through travel lane and one left-turn only lane (about 80 feet in length) at the intersections with Illinois and Third Streets. On both sides of 16th Street between Illinois Street and Terry A. Francois Boulevard, a 6-foot wide bicycle lane would be provided adjacent to the curb, and a 4-foot wide buffer would separate the bicycle lane from the adjacent 8-foot wide parking lane.

In addition to the changes in travel lanes, the following intersection controls would be implemented as part of the proposed project:

- The intersection of Terry A. Francois Boulevard/South Street is currently stop-controlled at the eastbound approach to the intersection. This intersection would be signalized.
- The intersection of Bridgeview Way/South Street is currently uncontrolled. This intersection would be made a side-street stop-controlled intersection with southbound vehicles on Bridgeview Way and cars exiting the project garage on South Street required to stop.
- The new intersection of Terry A. Francois Boulevard/16th Street would be signalized.
- The intersection of Illinois Street/16th Street is currently uncontrolled. This intersection would be made an all-way stop-controlled intersection with northbound vehicles on Illinois Street, east- and westbound vehicles on 16th Street, and vehicles exiting the project garage required to stop. Conditions at this intersection would be monitored, and if determined by the SFMTA that a traffic signal is warranted, the intersection would be signalized.
- The intersection of Illinois Street/Mariposa Street is currently all-way stop-controlled. This intersection would be signalized.



SOURCE: Final Transportation Management Plan for the Warriors San Francisco Event Center, April 2015

OCII Case No. ER 2014-919-97; Planning Department Case No. 2014.1441E: Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 5.2-9

Proposed Roadway Configuration and Curb Management

Figure 5.2-9 also presents the proposed curb regulations for the streets adjacent to the project site, subject to SFMTA and Port Commission review and approval. Overall, adjacent to the project site, the proposed project would provide 17 on-street commercial loading spaces and 58 parking spaces, as well as a TMA shuttle stop, a taxi zone, and a paratransit[23] stop. Curb regulations on days with events are described in subsequent sections.

- On South Street, a Mission Bay TMA shuttle stop approximately 60 feet in length would be provided directly east of Third Street, and a taxi zone approximately 100 feet in length would be provided east of the project garage entrance/exit. Seven metered commercial loading spaces would be provided directly west of Terry A. Francois Boulevard and one metered commercial loading space would be provided between the TMA shuttle stop and the project garage driveway. The remaining curb would be dedicated to 14 metered parking spaces.
- On Terry A. Francois Boulevard, approximately eight metered commercial loading spaces would be provided directly south of South Street and a 75-foot wide paratransit stop would be provided midblock. The remaining curb would be dedicated to 14 metered parking spaces.
- On 16th Street, one metered commercial loading space and 30 metered parking spaces would be provided. On the segment of 16th Street between Illinois Street and Terry A. Francois Boulevard, the parking spaces would be located to the south of the curbside bicycle lane. The parking would be separated from the bicycle lane by a 4-foot wide buffer. On the segment between Third and Illinois Streets, the parking spaces would be adjacent to the curb, and the proposed bicycle lane would be adjacent to the curb parking lane.
- On Third Street, parking is currently prohibited at all times. As part of the proposed project, signage would be placed on the east sidewalk prohibiting stopping at all times, including passenger loading/unloading at all times.

On-street metered parking would be provided on the curbs across from the project site as part of SFMTA's Mission Bay Parking Management plan, including those under the Port of San Francisco's jurisdiction.[24] These include installation of new metered spaces on the north side of South Street (19 spaces), on the east side of Terry A. Francois Boulevard (29 spaces), and on the south side of 16th Street (30 spaces).

2. *Transit Network Improvements*

As part of the proposed project, the elevated northbound passenger platform at the UCSF/Mission Bay light rail stop would be extended. The existing northbound platform located in the median of Third Street north of South Street would be extended to the north away from South Street from 160 feet in length to 320 feet in length. This extension would allow for two two-car light rail trains to simultaneously board or alight passengers along the platform prior to or following a large event at

[23] Paratransit is a specialized, door-to-door transport service for people with disabilities who are not able to ride fixed-route public transit. This may be due to a disability or a disabling health condition. SF Paratransit, a service of the SFMTA, provides van and taxi paratransit service.

[24] SFMTA, *Mission Bay Parking Management Implementation*, July 2012. A copy of this report is available for review at the San Francisco Planning Department, 1650 Mission Street, Suite 400, San Francisco as part of Case File No. 2014.1441E. Available online at http://sfpark.org/wp-content/uploads/2012/07/MissionBayParkingStrategy_July2012.pdf. Accessed May 28, 2015.

the project site. Passenger access to the expanded northbound platform would continue to be provided from a single point at the south end of the platform closest to South Street. The existing painted median area adjacent to the northbound track between South and 16th Streets would be raised 6 inches. This improvement would allow for staging of two, two-car northbound light rail trains. Fencing would also be placed in such a manner as to discourage pedestrian crossings midblock between the intersection of Campus Way with southbound Third Street, and the event center which would be located directly across from Campus Way.

In addition, crossover tracks would be constructed on Third Street near South Street within the light rail median to enable light rail vehicles to move from one set of tracks to another to reverse travel. The exact location (i.e., north and/or south of the UCSF/Mission Bay station) and the configuration of the crossover tracks (i.e., a single crossover, a double crossover, or a diamond crossover) have not been identified.

3. Pedestrian Network Improvements

Consistent with the Mission Bay South Infrastructure Plan, the proposed project includes construction of new sidewalks along the perimeter of the project site on South Street (12.5 feet wide), on Terry A. Francois Boulevard (12.5 feet wide), on 16th Street (15 feet wide), and widening of the existing sidewalk on Third Street from 12 to 16 feet. As required by the Mission Bay South Design for Development Guidelines, a 20-foot wide setback would be provided along the 16th Street frontage, and a 5-foot wide setback would be provided for buildings fronting South Street and Terry A. Francois Boulevard. The exceptions would be at the South Street Tower, where a setback in excess of 5 feet would be provided at grade to create a cantilever over the site's northwest corner, and on 16th Street at approximately midblock, where the event center curves slightly closer to the street. In addition, as shown on Figure 3-5 in Chapter 3, Project Description, buildings on the project site would be set back from all four corners to provide for a corner queuing/waiting area.

New pedestrian crosswalks, consistent with the continental design recommendations in the *Better Streets Plan*,[25] would be installed at the following intersections:

- South Street/Bridgeview Way (two-way stop-controlled)
- South Street/Terry A. Francois Boulevard (signalized)
- Illinois Street/Mariposa Street (signalized)
- 16th Street/Illinois Street (all-way stop-controlled)
- 16th Street/Terry A. Francois Boulevard (signalized)

In addition, the existing crosswalks at the signalized intersections of Third/South and Third/16th would be restriped with the continental design.

[25] Crosswalks with a continental design have parallel markings that are the most visible to drivers. Use of continental design for crosswalk marking also improves crosswalk detection for people with low vision and cognitive impairments. FHWA, Part Ii of II: Best Practices Design Guide, Designing Sidewalks and Trails for Access, Available online at http://www.fhwa.dot.gov/environment/bicycle_pedestrian/publications/sidewalk2/contents.cfm. Accessed May 28, 2015.

At the intersections of Terry A. Francois/South, Terry A. Francois/16th, and Illinois/Mariposa, where new traffic signals are proposed, pedestrian countdown signals would also be provided.

4. *Bicycle Network Improvements*

With implementation of the proposed project, 16th Street between Illinois Street and Terry A. Francois Boulevard would be completed, and Class II bicycle lanes on 16th Street (i.e., Bicycle Route 40) would be extended east to the reconfigured Terry A. Francois Boulevard. On both sides of 16th Street between Third and Illinois Streets, a 6-foot wide bicycle lane would be located adjacent to the 8-foot wide curb parking lane. On both sides of 16th Street between Illinois Street and Terry A. Francois Boulevard, a 6-foot wide bicycle lane would be provided adjacent to the curb, and a 4-foot wide buffer would separate the bicycle lane from the adjacent 8-foot wide parking lane.

In addition, with relocation of Terry A. Francois Boulevard between South and 16th Streets as part of the Mission Bay South Infrastructure Plan, the existing bicycle lanes on both sides of the street would be replaced with a 13-foot wide two-way protected bicycle lane, known as cycle track,[26] on the east side of the street. A 4-foot wide raised buffer would separate the bicycle lane from the adjacent 8-foot wide parking lane. As described in Chapter 3, the Mission Bay master developer would implement the realignment of Terry A. Francois Boulevard and associated improvements prior to occupancy of buildings at the project site.

At the intersections of Terry A. Francois/16th and Illinois/Mariposa, where new traffic signals are proposed, bicycle signals would be provided, and at the intersection of Terry A. Francois/16th two-stage turn queue boxes[27] would be installed to facilitate turns between the bicycle lanes on 16th Street and the two-way cycle track on the east side of Terry A. Francois Boulevard.

5. *Mission Bay TMA Shuttle Program Improvements*

With implementation of the project, the existing Mission Bay TMA shuttle service would be expanded with more frequent service, and a new TMA shuttle stop would be located on South Street east of Third Street adjacent to the project site. The project sponsor would join the Mission Bay TMA and the project's required contributions to the association would enable the expanded shuttle service. The additional service would enable office employees and retail visitors to access the site from key transit locations. All standard shuttle service funded in part by the proposed project would be an integrated part of the Mission Bay TMA network and would continue to be free of charge for all residents and employees in Mission Bay, regardless of their origin or destination. If the project sponsor chooses to fund incremental event-only shuttle service in partnership with the Mission Bay TMA, such service would be supported exclusively by the project sponsor and provided for the use by event attendees only. **Table 5.2-14** summarizes the headways between shuttles for the existing routes, and proposed service improvements.

[26] A cycle track is an exclusive bicycle facility that is separated from vehicle traffic and parked cars by a buffer zone. Cycle tracks offer safer and calmer cycling conditions for a much wider range of cyclists and cycling purposes, especially on street with greater traffic volumes traveling at relatively high speeds.

[27] Two-stage turn queue boxes offer bicyclists a safe way to make left turns at multi-lane signalized intersections from a right side cycle track or bicycle lane, or right turns from a left side cycle track or bicycle lane.

- The existing routes would be revised to provide additional service (i.e., more frequent service), plus extended service to late evenings and on Saturdays. In addition to the expanded service hours on the East route, the route would be modified to travel on South Street and stop at the new Mission Bay TMA shuttle stop. The Mission Bay TMA Mission Bay Loop service would be expanded from 6:00 to 7:00 a.m. to 6:00 to 10:00 a.m., and from 4:00 to 6:00 p.m.

- Three new regular routes (a Fourth/King Caltrain loop route, a 16th Street BART route, and a Transbay Terminal route) would operate throughout the day, similar to the existing shuttle service, but would have extended hours and operate on weekends.

- One Event Express route (the Fourth/King Caltrain route) with limited stops, would be provided prior to and following a peak event (i.e., events with more than 14,000 attendees).

TABLE 5.2-14
EXISTING MISSION BAY TMA HEADWAYS AND PROPOSED REVISIONS TO EXISTING ROUTES AND NEW ROUTES

Existing and Proposed Routes	Weekday Headways[a]					Saturday Headways	
	Early Morning (6 to 7 a.m.)	AM Peak (7 to 10 a.m.)	PM Peak (4 to 6 p.m.)	Evening (6 to 8 p.m.)	Late Evening (9 to 11 p.m.)	Evening (6 to 8 p.m.)	Late Evening (9 to 11 p.m.)
Existing Routes[b]							
East	--	10	15	15	--	--	--
West	--	15	15	20	--	--	--
Caltrain & Transbay	18	18	40	--	--	--	--
Mission Bay Loop	30	--	--	--	--	--	--
Revised Existing Routes[c]							
East	--	10	12	12	60	60	--
West	--	15	15	15	60	60	--
Mission Bay Loop	30	30	30	30	--	--	--
New Regular Routes[d]							
Caltrain	--	--	60	--	30	30	--
16th Street BART	--	--	30	30	30	30	--
Transbay Terminal	--	--	30	60	--	--	--
Event Express Routes[e]							
Caltrain	--	--	20	15	10	10	--

NOTES:
[a] Headways between shuttle buses in minutes.
[b] Existing Mission Bay TMA shuttle routes operate Monday through Friday, generally between 7:00 and 10:00 a.m., and 4:00 and 8:00 p.m. Mission Bay Loop operates between 6:00 and 7:00 a.m. only.
[c] With the proposed project, current service on the existing Mission Bay routes would be extended to 11:00 p.m. on weekdays, and would operate between 6:00 and 8:00 p.m. on Saturdays.
[d] Proposed new routes would operate on weekdays between 7:00 and 10:00 a.m., and between 4:00 and 11:00 p.m., and on Saturdays between 6:00 and 8:00 p.m.
[e] Event express routes would operate on weekday and weekend event days generally between 4 and 11 p.m. for weekday events and between 6:00 and 8:00 p.m. for weekend events.

SOURCE: Mission Bay TMA, Golden State Warriors, 2015

6. Muni Special Event Transit Service Plan

In addition to the existing scheduled transit service in the project vicinity, the SFMTA would provide additional service to accommodate large evening events. The Muni Special Event Transit Service Plan was developed by the SFMTA based on the estimated number of attendees taking transit, their origins and destinations, and arrival and departure patterns, as well as Muni's experience with providing shuttle services for special events (e.g., at Golden Gate Park, and for the 49ers stadium at Candlestick Park). The Muni Special Event Transit Service Plan includes increasing light rail service on the T Third, adding a Muni Metro shuttle via The Embarcadero, and three Muni special event shuttles. The three Muni Special Event Shuttles are presented in **Figure 5.2-10** and described below:

- **Muni Special Event 16th Street BART Shuttle** would run on 16th Street between the event center and the 16th Street BART station. This shuttle would primarily serve attendees originating from and destined to the East Bay and South Bay and the Mission district. Pre-event, the bus stop for the 16th Street BART shuttle would be located on the south side of 16th Street between Third and Illinois Streets, and post-event the bus stop would be located on the east side of Illinois Street south of 16th Street.

- **Muni Special Event Van Ness Avenue Shuttle** would run between the event center and Fort Mason. The shuttle would run on 16th Street, Mission Street, and Van Ness Avenue, with limited stops at key transfer locations (e.g., at Market Street to connect with Muni Metro and at Geary Boulevard to connect with the 38 Geary and 38L Geary Limited). Pre-event, the bus stop for the Van Ness Avenue shuttle would be located on the south side of 16th Street between Third and Illinois Streets, and post-event the bus stop would be located on the north side of 16th Street between Illinois Street and Terry A. Francois Boulevard.

- **Muni Special Event Transbay Terminal/Caltrain/Ferry Building Shuttle** would loop between the event center, the new Transbay Terminal, and the Ferry Building via Fourth, King, Third, Folsom, Fremont, and Mission Streets. Pre-event, the bus stop for the Transbay Terminal/Caltrain/Ferry Building shuttle would be located on the south side of South Street between Third Street and Bridgeview Way, and post-event the bus stop would be located on the east side of Third Street north of South Street.

Table 5.2-15 presents the proposed service for the T Third and the Muni Special Event Shuttles for large events (18,000 attendees), medium events (7,500 to 13,000 attendees), and small events (less than 7,500 attendees). The service levels are representative, and the actual service that would be provided would be appropriately scaled to respond to the projected attendance level for the event. For events with more than 13,000 attendees increases in T Third service and the three Muni Special Event Shuttles would be provided, while for events with fewer than 13,000 attendees increases in T Third service and only the Muni Special Event 16th Street BART Station Shuttle route would be provided.

The proposed project includes the procurement of up to four light rail vehicles to increase the Muni light rail capacity on the T Third line as part of the Muni Special Event Transit Service Plan.

For Medium Events (7,500 to 12,500 attendees)				
T Third/Central Subway with Special Event Shuttles	3	5	5	5
Muni Metro Shuttle via The Embarcadero	--	--	On demand[g]	On demand[g]
16th Street BART Station Shuttle	13	13	15	15
For Small Events (less than 7,500 attendees)				
T Third/Central Subway with Special Event Shuttles	--	--	On demand[d,e]	On demand[d,e]
16th Street BART Station Shuttle	--	--	On demand[d,f]	On demand[d,f]

NOTES:
[a] Headways between shuttle buses in minutes.
[b] The service plan by event size is representative, and the actual service that would be provided would be appropriately scaled to respond to the projected attendance level for the event.
[c] Service plan for large event presented for an event with 18,000 attendees.
[d] Post event, the light rail or bus shuttles would depart as soon as the vehicles are full, rather than operate on a preset headway.
[e] T Third/Central Subway with Special Event Shuttles - between three and seven two-car trains, depending on attendance level.
[f] 16th Street BART Station Shuttle - between one and two shuttle buses, depending on attendance levels.
[g] Muni Metro Shuttle via The Embarcadero – about three three-car trains.

SOURCE: SFMTA, 2015

7. *Transportation Management Plan*

As part of the proposed project operations, the project sponsor prepared and would implement a Transportation Management Plan (TMP) to serve as a management and operating plan to provide multi-modal access during events at the project site. See **Appendix TMP**. The TMP includes various management strategies designed to reduce use of single-occupant vehicles and to increase the use of rideshare, transit, bicycle and walk modes for trips to and from the project site. The TMP program was developed in consultation with the SFMTA and the Planning Department. The TMP is a working document that would be expanded and refined over time by the project sponsor and City agencies involved in implementing the plan. As described below, a monitoring and refinement process is included as part of the TMP.

The TMP includes the appointment of a full-time Event Center Transportation Coordinator to manage the transportation needs of employees and event attendees. In addition, an in-building and crowd-sourced smart phone application would be developed that would provide multi-modal travel information and real-time advisories on the status of the transportation system and provide options to event center employees, event attendees, and anyone working in, living near, or visiting Mission Bay. The Event Center Transportation Coordinator would be responsible for distributing information related to temporary travel lane and/or street closures to event center attendees, emergency service providers, UCSF, and other neighbors prior to events. The following elements of the TMP are summarized below:

- Muni Special Event Transit Service Plan and Platform Improvements
- Mission Bay TMA Shuttle Event Express Routes
- Event Transportation Management Strategies
- Travel Demand Management Strategies
- Communication
- Monitoring, Refinement, and Performance Standards

Muni Special Event Transit Service Plan and Light Rail Platform and Track Improvements

As described above, in addition to the existing scheduled transit service in the project vicinity, the SFMTA would provide additional service (i.e., the Muni Special Event Transit Service Plan) to accommodate peak evening events such as basketball games and sold-out concerts, as presented in **Table 5.2-16**. Also, as described above, light rail platform and track improvements would also be made in order to support the additional light rail service, particularly for post-event conditions.

Expansion of Mission Bay TMA Shuttle Program

As described above, with implementation of the project, the existing Mission Bay TMA shuttle service would be expanded (see **Table 5.2-14**). The revised existing routes, new regular routes, and event express would generally operate on weekday evenings between 4:00 and 11:00 p.m., and on Saturdays between 6:00 and 8:00 p.m.

Event Transportation Management Strategies

The TMP identifies the additional strategies that would be implemented to accommodate travel to and from the event center during events by all modes to enhance safety through reduction of conflicts between modes, to facilitate ingress and egress to the project site and vicinity, and to minimize traffic congestion and delays to vehicles, including transit. **Table 5.2-16** below presents a summary of the transportation management strategies that would be implemented during the various types of events, as presented in the TMP. The transportation management strategies for small and convention events, and for large concerts and basketball games, are summarized below.

For all events, a PCO Supervisor would be located within the Event Center Command Center, and would manage the PCOs assigned to the event. The PCO Supervisor would have radio contact with the Field Supervisor and all PCOs on the street and phone contact with relevant city agencies and departments (Muni, SFMTA Signal Shop, SFPD, SFFD), transit operators (Muni, BART, Caltrans) and event center staff (security, valet attendants, etc.). The PCO Supervisor would also have authority and discretion in how PCOs are deployed, and may adjust the controls described below as conditions warrant. Transportation conditions during various-sized events would be monitored during the first year of operations to refine the appropriate number of PCOs and/or locations for the various event types.

TABLE 5.2-16
SUMMARY OF TRANSPORTATION MANAGEMENT STRATEGIES BY EVENT TYPE

	Event Type			
Management Strategy	**Convention/ Small Event (Weekday Daytime)[a]**	**Arena Concert (Evening)[b]**	**Peak Event/ NBA Game (Evening)**	**Overlapping Peak Event with AT&T Park Event**
Coordinate with SFMTA and Mission Bay Ballpark Transportation Coordinating Committee (MBBTCC)	√	√	√	√
Muni Ticket Sales at Event Center Box Office	√	√	√	√
Taxi Zone on Terry A. Francois Boulevard	√	√	√	√
Taxi Zone on South Street	√	√	√	√
Designated Commercial loading zone (non-event hours)	√	√	√	√
Dedicated TMA Shuttle Stop	√	√	√	√
Dedicated Charter Bus Stop on 16th Street	√			
Dedicated Shuttle Zone for Connection to 16th BART Station		√	√	√
Dedicated Paratransit Stop on Terry A. Francois Blvd	√	√	√	√
Dedicated Media Truck Zone			√	√
PCO Supervisor at Event Center Command Center		√	√	√
PCOs positioned at key locations throughout the surrounding intersections and transportation network	√	√	√	√
Event Center staff positioned at key locations throughout the site to facilitate crowd control, wayfinding, and curb management.	√	√	√	√
Post-Event Temporary Lane Closure: Northbound lanes on Third Street between 16th Street and Mission Bay Boulevard South		√	√	√
Post-Event Temporary Lane Closure: South Street between Third Street and 450 South Street garage entrance		√	√	√
Post-Event Temporary Lane Closure: Northbound lanes on Illinois Street between Mariposa and 16th Streets, except for local traffic and shuttle staging and loading		√	√	√
Post-Event Temporary Lane Closure: Westbound lanes on 16th Street between Terry A. Francois Blvd and Illinois Street, and eastbound lanes on 16th Street between Third Street and Illinois Street, Except for Shuttle staging and loading		√	√	√
Coordinate with BART, Caltrain, Muni	√	√	√	√
Coordinate with SF Giants/AT&T Park Special Events Staff	√	√	√	√

NOTES:
[a] The 55 family shows held each year, with an average of 5,000 attendees, are expected to require similar controls to the small event.
[b] Refers to an evening concert with more than 14,000 attendees.

SOURCE: *Final Transportation Management Plan for the Warriors San Francisco Event Center*, April 2015

Small Events and Convention Events. Prior to an event, up to six PCOs would be stationed at the following intersections: Third Street/South Street, Third Street/16th Street, Terry A. Francois Boulevard/South Street, Terry A. Francois Boulevard/16th Street, and Illinois Street/16th Street.

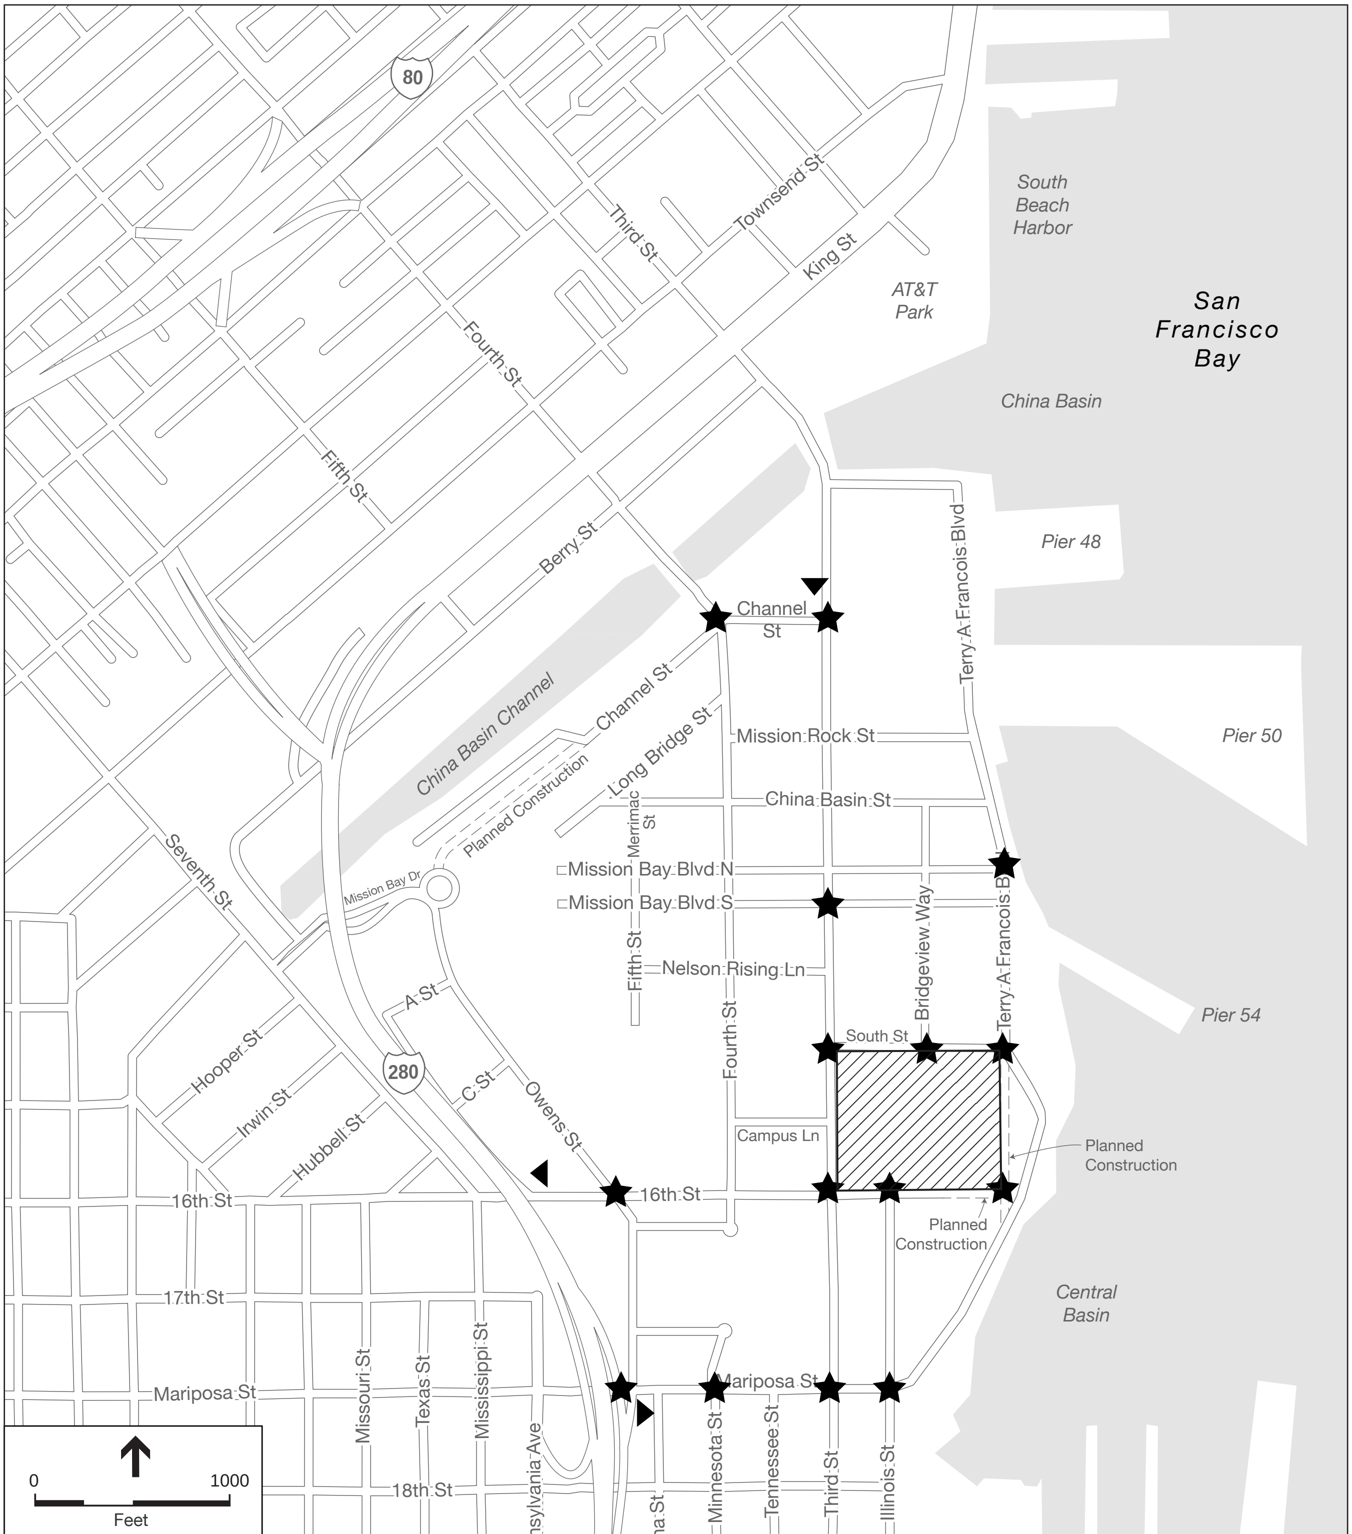
The following temporary curb regulations on the curb frontages adjacent to the project site would be initiated about two hours prior to the event start time, and would continue until about 1.5 hours following the end of the event. Only changes to the proposed curb regulations from conditions without an event (as described above) are noted.

- Two taxi zones would be provided: on South Street between Bridgeview Way and Terry A. Francois Boulevard (300 feet), and on Terry A. Francois Boulevard south of South Street (200 feet). Event center crowd control staff would be assigned to taxi zones to facilitate coordinated passenger loading/unloading and departure of taxis.
- A passenger loading/unloading zone approximately 340 feet in length would be provided on Terry A. Francois Boulevard and would accommodate private vehicles and TNC vehicles.[28] The proposed permanent 60-foot wide paratransit stop on Terry A. Francois Boulevard would not be affected during events. Event center crowd control staff would be assigned to passenger loading/unloading zones to ensure coordinated curb access, and to facilitate passenger loading/unloading, as well as departure of vehicles.
- A charter bus zone about 500 feet in length (accommodating about six buses) would be provided along the north curb of 16th Street west of Terry A. Francois Boulevard.

Basketball Games and Large Concert Events. The transportation management strategies for concerts with about 12,500 or more attendees and basketball games (with about 18,000 attendees) would be similar. During events with more than 12,500 attendees, up to 17 PCOs would be stationed in the project vicinity, managing vehicular, transit, bicycle and pedestrian flows, as shown in **Figure 5.2-11**. The exact locations would be determined by the PCO Supervisor, but it is anticipated that PCOs would be stationed at the following intersections pre-event and/or post-event:

- Fourth Street/Channel Street
- Third Street/Channel Street
- Terry A. Francois Boulevard/Mission Bay Boulevard North
- Third Street/Mission Bay Boulevard South
- Third Street/South Street
- Bridgeview Way/South Street
- Terry A. Francois Boulevard/South Street
- Third Street/16th Street
- Owens Street/16th Street
- Illinois Street/16th Street
- Terry A. Francois Boulevard/16th Street
- I-280 northbound ramps/Owens Street/Mariposa Street
- Fourth Street/Mariposa Street
- Third Street/Mariposa Street
- Illinois Street/Mariposa Street

28 Transportation Network Company (TNC) is a company or organization that provides transportation services using an online-enabled platform to connect passengers with drivers using their personal vehicles (e.g., Lyft, SideCar, Uber).



Project Site Boundary

Parking Control Officer (PCO) Location

Variable Message Sign (VMS) Location

OCII Case No. ER 2014-919-97; Planning Department Case No. 2014.1441E: Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 5.2-11

Proposed Locations of PCOs and VMSs

PCOs would also be stationed at the light rail platforms to facilitate pedestrian crossings, and to minimize conflicts between pedestrians, light rail, and vehicular traffic. In addition, it is anticipated that there would be roving PCO(s) in adjacent neighborhoods, as necessary, to monitor general parking issues and respond to calls during the events. Passenger loading onto the light rail vehicles would be monitored by SFMTA Transit Fare Inspectors and Passenger Assistance Program Staff, who would also be stationed at the light rail platforms.

Three permanent Variable Message Signs (VMS) would be installed to provide traffic alerts, messages, and alternate driving routes for drivers traveling to the event center, to destinations in the vicinity, or through the area. These would be in addition to the existing VMS located on northbound Third Street south of 16th Street, and all four VMSs would be used during large events. The proposed locations for the new VMSs include:

- Westbound 16th Street east of I-280
- Southbound Third Street south of the Lefty O'Doul Bridge
- Eastbound Mariposa Street east of the I-280 ramps

As shown on **Figure 5.2-12** and **Figure 5.2-13**, the following temporary curb regulations on the curb frontages adjacent to the project site would be initiated about two hours prior to the event start time, and would continue until about 1.5 hours following the end of the event:

- Two taxi zones would be provided: on South Street between Bridgeview Way and Terry A. Francois Boulevard (300 feet), and on Terry A. Francois Boulevard south of South Street (200 feet). Event center crowd control staff would be assigned to taxi zones to facilitate coordinated passenger loading/unloading and departure of taxis.

- Two passenger loading/unloading zones with a total of about 535 feet in length would be provided on Terry A. Francois Boulevard. The proposed permanent 75-foot wide paratransit stop on Terry A. Francois Boulevard would not be affected during events.

- Media trucks would park on 16th Street adjacent to the project site, between Third Street and the entrance into the parking garage. About 185 feet of curb would be dedicated for media trucks.

- Prior to an event, the Muni Special Event Transbay Terminal/Caltrain/Ferry Building Shuttle stop would be on South Street adjacent to the project site, west of the proposed Mission Bay TMA shuttle stop, while the shuttle stop for the Muni Special Event 16th Street BART Shuttle route and the Muni Van Ness Avenue Shuttle route would be on the south side of 16th Street (i.e., across the street from the project site) between Third and Illinois Streets.

- Prior to the end of the event, temporary travel lane closures (except for emergency vehicles) would be implemented on Third Street between Mariposa Street and Mission Bay Boulevard South, on South Street between Third Street and Bridgeview Way, on 16th Street between Third Street and Terry A. Francois Boulevard, and on Illinois Street between Mariposa and 16th Streets. The temporary lane closures are anticipated to be in place for approximately 30 to 45 minutes after the end of the event, or until vehicular traffic dissipates and most event attendees taking transit have boarded. Southbound traffic flow on Third Street would not be affected by these temporary northbound travel lane closures. These travel lane closures would involve the following:

OCII Case No. ER 2014-919-97; Planning Department Case No. 2014.1441E:
Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 5.2-13
Post-Event Controls for Large Events

- On northbound Third Street between Mariposa and 16th Streets, one of the two northbound travel lanes (i.e., the curb lane) would be temporarily closed, and all northbound traffic on this segment would be directed to turn left onto westbound 16th Street (i.e., about 140 vehicles during the late evening peak hour). On Third Street between 16th and South Streets, both of the northbound travel lanes would be closed to all vehicular traffic and bicycles. On Third Street between South Street and Mission Bay Boulevard South, both travel lanes would be closed to vehicular traffic, with the exception of the Muni Special Event Transbay Terminal/Caltrain/Ferry Building Shuttle route, which would have a bus stop/unloading zone on Third Street north of South Street.

- On Illinois Street between Mariposa and 16th Streets, the northbound lane would be temporarily closed, with the exception of the Muni Special Event 16th Street BART Shuttle and local access into the buildings at 409/499 Illinois Street (a vehicle entrance to the building is located approximately midblock). As noted above, the Muni Special Event 16th Street BART Shuttle would have a bus stop/loading zone on the east side of Illinois Street south of 16th Street. Southbound traffic flow on Illinois Street (i.e., from the project garage) would not be affected by these temporary northbound travel lane closures.

- On 16th Street, travel lanes on the segment between Illinois Street and Terry A. Francois Boulevard would be closed to vehicular traffic both ways, with the following exceptions: Muni Special Event Van Ness Avenue Shuttle would have a bus stop/loading zone on the north side of 16th Street (westbound travel) adjacent to the project site; a black car loading zone would be provided on the south side of 16th Street (eastbound travel) between a driveway to the 409/499 Illinois Street building and Terry A. Francois Boulevard (about 150 feet in length); vehicles exiting the 409/499 Illinois Street building on the south side of 16th Street would be permitted access onto eastbound 16th Street towards Terry A. Francois Boulevard; and bicyclists would be permitted with some on-street controls.

- Left turns would be restricted from westbound 16th Street onto Third, Owens and Mississippi Streets through signage, temporary barriers, and/or PCOs.

- On the segment of 16th Street between Third and Illinois Streets, the eastbound travel lane would be closed to vehicular traffic except transit and bicyclists, while the westbound lanes would remain open to accommodate: vehicles exiting the project garage; the Muni Special Event 16th Street BART Shuttle that would travel northbound on Illinois Street, and turn left onto 16th Street westbound to continue towards the 16th Street BART station; and the Muni Special Event Van Ness Avenue Shuttle that would travel westbound on 16th Street after loading passengers at the north curb of 16th Street between Illinois Street and Terry A. Francois Boulevard.

- On South Street, all travel lanes (both ways) on the segment between Third Street and the entrance/exit to the 450 South Street parking facility would be closed to vehicular traffic, except for the Mission Bay TMA shuttle routes, which would have a stop in this section of South Street. Taxis would be directed to arrive at the taxi zone on South Street prior to the temporary closure of South Street at Third Street, and to stage until the end of an event. Taxis arriving post-event would access this taxi zone on South Street from Bridgeview Way.

- Tow-away regulations, similar to those implemented following a SF Giants baseball game at AT&T Park, would be implemented on the west side of Illinois Street between Mariposa and 18th Streets to allow for two southbound lanes to continue on Illinois Street. Additional signage would be added at tow-away locations.

Garage Operations. Attendees with pre-sold parking passes for the project garage would access the garage at 16th Street from the left turn pocket on eastbound 16th Street at the approach to Illinois Street, from westbound 16th Street, or from northbound Illinois Street to self-park. Event center staff would check parking passes before vehicles enter the garage. PCOs would be stationed at the project garage driveway to facilitate vehicle egress (office employees leaving on weekday evenings) and ingress (event attendees entering the garage), minimize conflicts with pedestrians and bicycles on 16th Street, and to coordinate with PCOs positioned at nearby intersections. PCOs stationed at the intersection of Illinois/16th Street would provide priority to the eastbound left turn movements from 16th Street into the garage to ensure that queues for the garage do not extend upstream onto Third Street. PCOs would also work with event center staff that would be checking attendees' tickets for valid access to the garage. Drivers who attempt to access the garage without a valid parking pass would be redirected eastbound on 16th Street to Terry A. Francois Boulevard to other nearby garages or parking lots.

Following an event, PCOs would manage alternating flows of vehicle traffic exiting the garage with pedestrian and bicycle flows along and crossing 16th Street, manage alternating flows of vehicle traffic exiting the garage with the Muni Special Event 16th Street BART shuttles accessing 16th Street eastbound from Illinois Street northbound and with the Muni Special Event Van Ness Avenue shuttles traveling westbound on 16th Street, and coordinate with PCOs along 16th Street that would be managing pedestrian flows across 16th Street.

Vehicles exiting the project garage on South Street, vehicles exiting the 450 South Street garage, and vehicles traveling southbound on Bridgeview Way would be directed eastbound on South Street to Terry A. Francois Boulevard.

Overlap between events at the proposed Event Center and at AT&T Park. In circumstance when events at the proposed event center partially or completely overlap with baseball games or other events at AT&T Park, additional adjustments to the Transportation Management Plan for the proposed event center would be made, specifically:

- Because PCOs would be stationed at some of the same intersections where PCOs are stationed during SF Giants evening games, staffing would be adjusted to eliminate duplication of efforts, and to address the overlapping impacts.

- Because the Fourth Street bridge is closed to northbound travel (transit and taxis excepted) and the Third Street bridge is congested following a SF Giant game, event center attendees would generally be directed to travel southbound on Terry A. Francois Boulevard, and then westbound on 16th Street to access locations to the west and north via Seventh Street. Some vehicles, depending on where they have parked, would access Seventh Street via Mission Bay Boulevard and Mission Bay Drive.

Transportation Demand Management (TDM) Strategies

The TMP includes TDM strategies for employees and for event center visitors. TDM strategies for office, retail, restaurant and event center employees:

TDM strategies for all on-site employees:

Policy/Operations

- Participate in and promote pre-tax commuter benefits, a federal program that allows employees to reduce their commuting costs by up to 40 percent using tax-free dollars to pay for their commuting expenses.
- Enroll in free-to-employees ride-matching program through www.511.org.
- Enroll in free-to-employers Emergency Ride Home Program through the City of San Francisco.
- If applicable, comply with California's parking cash-out program.[29]
- Contribute to the Mission Bay TMA shuttle program.
- Provide indoor secure bicycle parking facilities for employees.
- Provide shower and locker facilities for employee use.
- Identify potential tenants who may provide on-site amenities (such as fitness and exercise centers, food and beverage options, and/or automated banking resources) to encourage employees to stay on-site during the workday.
- Encourage tenants to allow certain employees to work flexible schedules and telecommute, to the extent reasonable.
- Designate parking spaces for carpool/vanpool participants.

Marketing/Communications

- Promote use of Mission Bay TMA shuttles to employees; notify them that they are eligible to ride the Mission Bay TMA shuttles for free; and provide information about routes, stop locations, and schedule.
- Encourage employees and visitors to participate in public events that promote bicycling such as the annual "Bike to Work" day.
- Organize and publicize community efforts, such as Spare the Air days (as declared for the Bay Area region) or a Rideshare Week.

Capital

- Sponsor a Bay Area Bike Share station in the project vicinity.
- Designate priority curb areas on-site for TMA shuttles.

TDM strategies for event center employees:

- Provide non-event day access to the enclosed bicycle valet facility (approximately 300 bike spaces; valet operations during events only.

[29] In accordance with California's parking cash-out law – Assembly Bill 2109, Katz; Chapter 554, Statutes of 1992. Available online at http://www.arb.ca.gov/planning/tsaq/cashout/cashout_guide_0809.pdf. Accessed May 28, 2015.

TDM strategies for event center visitors:

Policies/Operations

- Work with the City to identify arena event patrons arriving via transit and reward those patrons with promotional incentives that may include discounted food or beverage, team or venue merchandise, raffle entry, access to a "fast-track" security line or one or more other options. Market these incentives with a robust communications strategy prior to an event day so that visitors can make choices accordingly.

- Identify and reward patrons of the bike valet with promotional incentives that may include discounted food or beverage, team or venue merchandise, raffle entry, access to a "fast-track" security line or one or more other options. Market these incentives with a robust communications strategy prior to an event day so that visitors can make choices accordingly.

- Distribute GSW-branded Clipper Cards to encourage patrons to associate event attendance with transit usage during attendee's trip planning process.

- Work with the SFMTA to determine the market feasibility and benefits of bundling the cost of a round-trip Muni fare ($4.50) into the cost of all ticketed events.

- If parking is not bundled with ticket purchases for arena events (i.e., select event days and types), charge market-rate fees for on-site parking in connection with such arena events. Encourage off-site partners to charge market-rate parking fees for all arena events.

- Designate a TDM/TMP coordinator to develop and implement marketing/communications/ incentive programs, and coordinate with facility on policies and capital needs to support sustainable trip making by GSW employees and event center visitors.

- Establish an annual TDM budget for all components of the TDM program applying to GSW employees and event center visitors.

Communications/Marketing

- At point of ticket purchase, encourage patrons to use sustainable modes of transportation via communications on the internet and through the ticket vendor.

- Design a "Getting There" page for the venue website that lists multi-modal options and comparisons before showing preferred driving routes or available parking. Promote transit access to the project site by providing: interactive trip-planning tools; transit maps with recommended stops/stations for accessing site and best routes to the event center; and walking directions from transit stations/stops. Promote transit information on event center website, mobile apps, websites of events taking place at the site (to be required as a standard part of event contract) and in event literature and advertisements, when appropriate.

- Provide real-time transit information, including train or bus arrivals and departures, in key event center locations (exit areas, gathering areas, etc.), inside the building (on TVs and other screens), and/or via mobile applications.

- Make available additional communication of transit options and wayfinding during playoff games for non-season pass holders who may be coming from out of town by providing information to, and encouraging displays within, hotels and local businesses in the event center vicinity.

- Promote use of the enclosed on-site bicycle valet facility (approximately 300 bike spaces). Provide a bicycle map, showing routes to the project site, on the event center web site, mobile applications, and in event literature and advertisements, when appropriate.
- Create schedules of upcoming events for display on electronic message boards, to discourage auto use and parking in the Event Center vicinity.

Capital

- Work with SFMTA to brand transit stops/stations near the project site, covering any costs associated with re-branding.
- Provide outdoor bicycle racks for visitors to the office, retail, and restaurant uses.
- If and when peak event bicycle storage demand exceeds the 300 space enclosed valet facility and on-site bike rack capacity, provide additional temporary outdoor bike valet parking areas.
- Sponsor a Bay Area Bike Share station(s) in the project vicinity.
- Designate priority curb areas on-site for taxis, charter buses, and rideshare vehicles. Explore partnership options with rideshare/carpool/TNC[1] companies to offer discounts to event attendees and/or employees.

Communication

The TMP includes strategies related to distributing information on transportation management for the various modes at the event center for pre-event and post-event conditions as part of the ticket purchase process, and wayfinding signage for multi-modal access and egress. The communication strategies would discourage use of private autos and encourage use of transit and other modes.

Monitoring, Refinement, and Performance Standards

The TMP outlines the process to monitor and refine the strategies within the TMP in conjunction with the City throughout the life of the project. Monitoring methods include field monitoring of operations during the first four years and an annual surveying and reporting program, thereafter. Surveys of event attendees and event center employees would be conducted annually, and visitor surveys of Mission Bay neighbors and UCSF staff and emergency providers would be conducted in the initial years of operation.

The TMP also identifies performance standards for events that the project sponsor has committed to maintaining:

- Weekday Auto Mode Share: Implement measures intended to reach a goal of on average, attendees for peak events do not exceed a 53 percent auto mode share for weekday peak event arrivals (i.e., 6:00 to 8:00 p.m.). The performance standard is based on the mode of travel results shown in **Table 5.2-24** in Section 5.2.5.3, Approach to Analysis.

[1] Transportation Network Company (TNC) is a company or organization that provides transportation services using an online-enabled platform to connect passengers with drivers using their personal vehicles (e.g., Lyft, SideCar, Uber).

- Weekend Auto Mode Share: Implement measures intended to reach a goal of on average, attendees for peak events do not exceed a 59 percent auto mode share for weekend peak event arrivals (i.e., 6:00 to 8:00 p.m.). The performance standard is based on the mode of travel results shown in **Table 5.2-24** in Section 5.2.5.3, Approach to Analysis.
- Vehicle Queuing on City Streets: Traffic entering the parking garage from eastbound 16th Street does not spill back from the eastbound left turn lane on 16th Street into the intersection with Third Street.
- Vehicle Queuing on City Streets: Event traffic does not block access to the UCSF emergency room entrance for emergency vehicles or patients on Mariposa Street between I-280 and Third Street.
- Pedestrian Flows: Pedestrians do not spill out of sidewalks onto streets with moving vehicles, or out of crosswalks when crossing the street.
- Bicycle Parking: Signage is clearly visible to direct bicyclists to event valet and other bicycle parking, and ensure that adequate bicycle parking supply is provided to accommodate a typical peak event.
- Transit Mode Share: All Muni light rail and special event shuttle passengers are able to board their transit vehicle within 45 minutes[30] following an event, if desired.
- Good Neighbor: Mission Bay TMA shuttles continue to run and maintain capacity for simultaneous neighborhood use.

In the event that ongoing monitoring shows at any time that the performance standards outlined above are not being met, the project sponsor would explore additional travel demand strategies, operational efforts, or design refinements to meet the goals identified in the TMP. Revisions to this policy would be brought before the Mission Bay CAC, or its successor body, for approval. A representative list of possible strategies is as follows:

- Increase project sponsor contribution to the Mission Bay TMA to directly fund incremental, event-only service, which may include additional shuttle bus purchases and/or expanded hours of operation.
- Establish a partnership with a private shuttle provider for incremental, event-only service to and from satellite parking locations (if designated) or transit centers.
- Facilitate charter bus/private shuttle program purchases for group ticket sales and/or suite purchases for events.
- Reduce the project parking demand through a variety of mechanisms, including pricing.
- Explore partnerships with car-sharing services (e.g., Zipcar, City CarShare) for spaces on-site to reduce car ownership amongst employees.

[30] The 45 minutes for boarding of all passengers was determined to be an appropriate period of time given the anticipated time attendees would spend exiting the building, crossing the plaza, and traveling to the appropriate shuttle stop. It reflects anticipated delay by some attendees who may remain within the event center following an event's end to take advantage of promotions, watch post-game interviews, etc. and by other attendees who may patronize the retail businesses located on-site following an event by prior to leaving Mission Bay.

- Undertake media campaigns, including in social media, which promote walking and/or bicycling to the event center.
- Conduct cross-marketing strategies with event center businesses (e.g., 10 percent off merchandise/food if patrons arrive by transit and/or bicycle or on foot).
- Carry out public education campaigns.
- Offer special event ferry service to the closest ferry station to the project site (similar to the existing service provided between AT&T Park and Alameda, Marin and Solano Counties by Golden Gate Transit, Alameda/Oakland and Vallejo ferry service).
- Provide transit fare subsidies to event ticket holders.
- In consultation with the SFMTA, remove any street furniture or landscaping obstructing pedestrian paths of travel or Muni staging areas.

5.2.5.3 Approach to Analysis

This section presents the methodologies for analyzing and organizing the transportation impacts and information considered in the travel demand and impact analysis. This section is organized in the following order:

1. Approach to impact analysis, including analysis scenarios, analysis periods, analysis years, and analysis methodology.
2. Organization of impacts and overarching scenario assumptions.
3. Methodology and results of travel demand forecasts for the proposed project.
4. Methodology for development of 2040 cumulative traffic, transit, and pedestrian forecasts.

1. Approach to Impact Analysis Methodology

This section presents the methodology for analyzing transportation impacts and information considered in developing travel demand for the proposed project. The impacts of the proposed project on the surrounding transportation network were analyzed using the *Transportation Impact Analysis Guidelines* issued by the Planning Department in 2002 (*SF Guidelines 2002)*, which provides direction for analyzing transportation conditions and in identifying the transportation impacts of a proposed project.

As described in Chapter 3, Table 3-3, the event center would have up to 225 events per year, of which up to 60 would be Golden State Warriors basketball games. Other events would include about 45 small and large concert events, about 55 family shows, and about 61 convention, civic, and other sporting events. Average and maximum attendance estimates by type of event for the proposed event center were prepared by the project sponsor and are summarized in **Table 3-3** in Chapter 3. The expected attendance would vary depending on the type of event held (e.g., basketball game, concert, other non-Golden State Warriors sporting event), but would be expected to be similar on weekdays and on weekends. In the case of other non-Golden State Warriors sporting events, the expected attendance would also depend on the interest in competing teams, and, in the case of concerts, on the popularity of the performing artists.

Average visitor attendance for the proposed event center is projected to range between 5,000 attendees for a family show event, to between 17,000 and 18,000 attendees for a regular season or post season basketball game; concert average attendance is estimated to range between 3,000 attendees for arena theater concerts to 12,500 attendees for the typical end-stage full arena configuration, and average convention attendance is estimated at 9,000 attendees. Overall, it is estimated that there would be up to 225 event days in any given year.

Event Scenarios

For purposes of the transportation analysis, three analysis scenarios were analyzed as representative of the range of project impacts, depending on the type of activity at the event center.

- ***No Event*** **–** The No Event scenario reflects conditions associated with the 605,000 gross square feet (gsf) of office uses, the 62,500 gsf of retail uses, and 62,500 gsf of restaurant uses on days when there are no events scheduled at the event center.
- ***Convention Event*** **–** The Convention Event scenario reflects conditions for a convention-type event with an average attendance of about 9,000 attendees. For convention/corporate events, a 9,000-attendee event was analyzed, as this attendance level represents the average attendance for about 50 percent of the events that would occur at the proposed event center (i.e., the convention events, family shows, and other sporting events).[31] This scenario assesses the impacts of a daytime event at the project site.
- ***Basketball Game*** **–** The Basketball Game scenario reflects sell-out conditions for a Golden State Warriors evening basketball game, as it would be the most conservative approach that assumes that the event center would be filled to capacity (i.e., 18,064 attendees). It also represents conditions for a sold-out evening concert.

Analysis Periods

Per the *SF Guidelines*, the weekday p.m. peak hour is the standard analysis period for development projects in San Francisco and was analyzed for the proposed project. In addition to the weekday p.m. peak hour typically studied, three additional analysis hours were selected for analysis of transportation impacts. These three additional analysis hours were selected to address impacts of the event center. Each project scenario was evaluated for the particular time periods during which the specific conditions would occur. For example, convention events are not anticipated to occur in the weekday evening and late evening peak hours or on weekends, and therefore, analysis of convention events during these time periods was not conducted. **Table 5.2-17** summarizes the time periods analyzed for each scenario.

- The weekday p.m. peak hour (the peak hour of the 4:00 to 6:00 p.m. peak commute period) was selected because it represents the period during which weekday background traffic volumes and transit demand are the greatest. The weekday p.m. peak hour was analyzed for the No Event, Convention Event, and Basketball Game scenarios.

---

[31] The event center is expected to typically serve as a satellite venue for conventions/conferences held primarily at the Moscone Center, with an attendance of 9,000 people. The maximum attendance of 18,500 shown in Table 2 represents the maximum number of conference attendees that could be accommodated in a 360-degree center stage configuration, which would be infrequent.

TABLE 5.2-17
ANALYSIS HOURS FOR PROPOSED PROJECT SCENARIOS

Proposed Project Scenario	Weekday			Saturday
	PM Peak Hour	Evening Peak Hour	Late Evening Peak Hour	Evening Peak Hour
No Event	X	--	--	X
Convention Event	X	--	--	--
Basketball Game[a]	X	X	X	X

NOTE:
[a] The Basketball Game scenario represents conditions for a sold out evening concert.

- The weekday evening peak hour (the peak hour of the 6:00 to 8:00 p.m. period) was analyzed only for the Basketball Game scenario because basketball games typically start at 7:30 p.m. and therefore, a higher percentage of inbound event attendees would travel to the event center during the 6:00 to 8:00 p.m. period than during the 4:00 to 6:00 p.m. commute peak period.

- The weekday late evening peak hour (the peak hour of the 9:00 to 11:00 p.m. period) was analyzed only for the Basketball Game scenarios. For evening period the Basketball Game scenario, it represents the period during which the highest number of outbound event trips would occur after a basketball game or concert event.

- The Saturday evening peak hour (the peak hour of the 7:00 to 9:00 p.m. period) was analyzed for the No Event and Basketball Game scenarios. For the Basketball Game scenario it represents the period during which the highest number of inbound event trips would occur. Approximately 68 percent of attendees are projected to arrive at the event center during the 7:00 to 8:00 p.m. peak hour.

Analysis of weekday a.m. peak hour conditions was not conducted because travel demand associated with the proposed project would be greater during the p.m. peak hour than during the a.m. peak hour. For example, the retail and restaurant uses would generate substantially fewer trips in the a.m. peak hour than during the p.m. peak hour, as most would not be open during the a.m. Most events, including family shows, would not overlap with the a.m. peak hour, and daytime convention events would generate fewer trips in the a.m. peak hour than during the p.m. peak hour. Furthermore, comparison of a.m. and p.m. peak hour LOS conditions at intersections in the vicinity of the project site, as presented in the UCSF 2014 LRDP EIR, demonstrate that intersections operate similarly during both peak hours. Therefore, because the proposed project would generate more trips in the p.m. peak hour than in the a.m. peak hour, analysis of potential traffic impacts would be adequately addressed in the p.m. peak hour analysis.

The travel demand for concerts, family shows and other sporting events was not estimated quantitatively because, as shown in **Table 3-3** in Chapter 3, these types of events are expected to attract a lower attendance and require fewer employees than a basketball game. In addition, arrival and departure travel patterns for these types of events would also be expected to be similar to those of basketball game. As such, the transportation infrastructure (roadways, transit vehicles, stations, sidewalks, etc.) would be expected to operate similar to or better before and after concerts than before or after a sold-out basketball game of the same attendance level. As noted above, the Basketball Game scenario also represents maximum impact conditions for a sold out evening concert. However, evening concerts could start later than basketball games, generally between 8:00 and 9:00 p.m., and have a more spread out arrival period than basketball games due to opening act performances before the featured headliner.

The analysis of the proposed project was conducted for existing and 2040 cumulative conditions. "Existing plus Project" conditions assess the near-term impacts of the proposed project, while "2040 Cumulative plus Project" conditions assess the long-term impacts of the proposed project in combination with other reasonably foreseeable development. Year 2040 was selected as the future analysis year because 2040 is the latest year for which travel demand forecasts were available from the San Francisco County Transportation Authority (SFCTA) travel demand forecasting model.

As discussed in Section 5.2.3 above, the data collected in 2013/2014 for the quantitative existing conditions analysis was adjusted upwards to reflect the opening of the UCSF Medical Center Phase 1 and Public Safety Building in early 2015. The travel demand associated with these two projects was determined from previous studies conducted by UCSF and the SF Department of Public Works, respectively.

Construction Analysis Methodology

Potential short-term construction impacts were assessed based on preliminary construction information for the proposed project. The construction impact evaluation addresses the staging and duration of construction activity, truck routings, estimated daily truck volumes, roadway and/or sidewalk closures, and evaluates the effect of construction activities on sidewalks, bicycle lanes, or travel lanes.

Vehicular Traffic Analysis Methodology

The traffic impact assessment for the proposed project was conducted for 23 study intersections and six freeway ramp locations in the vicinity of the project site. The study intersections were evaluated using the *HCM 2000* methodology. For signalized intersections, this methodology uses various intersection characteristics (e.g., traffic volumes, lane geometry, and signal phasing and timing) to estimate the capacity for each lane group approaching the intersection, and to calculate the average control delay experienced by motorists traveling through the intersection. The level of service (LOS) is based on average delay (in seconds per vehicle) for the various movements within the intersection. A combined weighted average delay and LOS is presented for the intersection. For unsignalized intersections, average delay and LOS operating conditions are calculated by approach (e.g., northbound) and movement (e.g., northbound left-turn), for those movements that are subject to delay. For purposes of this analysis, the operating conditions (LOS and delay) for unsignalized intersections are presented for the worst approach (i.e., the approach with the highest average delay per vehicle). **Table 5.2-18** presents the LOS descriptions and associated delays for signalized and unsignalized intersections.

TABLE 5.2-18
LEVEL OF SERVICE DEFINITIONS FOR SIGNALIZED AND UNSIGNALIZED INTERSECTIONS

Control/LOS	Description of Operations	Average Control Delay (seconds per vehicle)
Signalized		
A	Insignificant Delays: No approach phase is fully used and no vehicle waits longer than one red indication.	≤ 10
B	Minimal Delays: An occasional approach phase is fully used. Drivers begin to feel restricted.	> 10.0 and ≤ 20
C	Acceptable Delays: Major approach phase may become fully used. Most drivers feel somewhat restricted.	> 20.0 and ≤ 35
D	Tolerable Delays. Drivers may wait through no more than one red indication. Queues may develop but dissipate rapidly without excessive delays.	> 35.0 and ≤ 55
E	Significant Delays: Volumes approach capacity. Vehicles may wait through several signal cycles and long queues form upstream.	> 55.0 and ≤ 80
F	Excessive Delays: Represents conditions at capacity, with extremely long delays. Queues may block upstream intersections.	> 80
Unsignalized		
A	No delay for STOP-controlled approach.	≤ 10
B	Operations with minor delays.	> 10.0 and ≤ 15
C	Operations with moderate delays.	> 15.0 and ≤ 25
D	Operations with some delays.	> 25.0 and ≤ 35
E	Operations with high delays and long queues.	> 35.0 and ≤ 50
F	Operations with extreme congestion, with very high delays and long queues unacceptable to most drivers.	> 50

NOTE: LOS – Level of Service

SOURCE: Transportation Research Board, 2000. Highway Capacity Manual, Washington, DC.

It should be noted that at some of the study intersections, the average delay per vehicle would remain the same, or slightly reduced, with the addition of project-related traffic. Using the *HCM 2000* methodology, the level of service is calculated based on an average of the total vehicular delay per approach, weighted by the number of vehicles at each approach. Increases in traffic volumes at an intersection usually result in increases in the overall intersection delay. However, if there are increases in the number of vehicles at movements with low delays, the average weighted delay per vehicle may remain the same or decrease.

Under existing plus project conditions, the proposed project was determined to have a significant traffic impact at a signalized intersection if it would cause an intersection operating at LOS D or better under existing conditions to operate at LOS E or LOS F, or intersections operating at LOS E under existing conditions to deteriorate to LOS F conditions. At signalized intersections that operate at LOS E or LOS F under existing conditions and would continue to operate at LOS E or LOS F under existing plus project conditions, the change in traffic volumes was reviewed at the critical movements to determine whether a resulting increase in traffic volumes would contribute considerably to unacceptable levels of service (i.e., a contribution of 5 percent or more to the traffic volumes at the critical movements operating at LOS E or LOS F).

Under 2040 cumulative conditions, the proposed project was also determined to have a significant cumulative impact if it would cause an intersection operating at LOS D or better to operate at LOS E or LOS F, or intersections operating at LOS E to deteriorate to LOS F conditions. At signalized intersections that operate at LOS E or LOS F under 2040 cumulative conditions and would continue to operate at LOS E or LOS F under 2040 cumulative plus project conditions, the proposed project would have a significant impact if it would contribute considerably to delays at intersections operating at LOS E or LOS F. The increases in project-related vehicle trips were reviewed at the critical movements to determine whether these increases would contribute considerably to the critical movements (i.e., a contribution of 5 percent or more to the traffic volumes at the critical movements operating at LOS E or LOS F).

Under existing plus project conditions and 2040 cumulative conditions, the proposed project was determined to have a significant traffic impact at an unsignalized intersection if project-related traffic causes the level of service at the worst approach to deteriorate from LOS D or better to LOS E or LOS F and peak hour signal warrants[32] would be met, or would cause peak hour signal warrants to be met when the worst approach is already operating at LOS E or LOS F.

In addition, if it was determined that the proposed project would have a significant project-specific traffic impact at a signalized or unsignalized intersection under existing plus project conditions, then the impact would also be considered a significant cumulative impact under 2040 cumulative conditions.

Similar to intersections, the operating characteristics of freeway ramps are evaluated using the concept of LOS. Freeway ramp LOS is based on vehicle density (passenger cars per lane-mile) and service volume (passenger cars per hour). In San Francisco, LOS A through D is considered acceptable; LOS E and LOS F are considered unsatisfactory service levels. **Table 5.2-19** presents the level of service designation and associated maximum densities for ramp merge and diverge operations.

For freeway ramp merge and diverge analyses, the proposed project was determined to have a significant impact on ramp operations if it would cause a ramp operating at LOS D or better under existing conditions to operate at LOS E or LOS F, or a ramp operating at LOS E under existing conditions to deteriorate to LOS F conditions. At ramps that operate at LOS E or LOS F under existing conditions and would continue to operate at LOS E or LOS F under existing plus project conditions, the change in traffic volumes on the ramp was reviewed to determine whether a resulting increase in traffic volumes would contribute considerably to unacceptable levels of service (i.e., a contribution of 5 percent or more to the traffic volumes on the ramp).

[32] A signal warrant is a condition that an intersection must meet to justify a signal installation. There are different warrants, which examine factors such as the volume of vehicles, bicyclists, and pedestrian, the signal system, collision statistics, as well as the geometric/physical configuration of the intersection. Even if a signal warrant is not met under the strictest interpretation, the determination to signalize an intersection could be made based upon the city traffic engineer's professional judgment of intersection operations.

TABLE 5.2-19
LEVEL OF SERVICE DEFINITIONS FOR FREEWAY RAMP JUNCTIONS

LOS	Maximum Density (passenger cars per mile per lane)
A	< 10
B	> 11 to 20
C	> 20 to 28
D	> 28 to 35
E	> 35
F	Demand exceeds capacity

NOTE: LOS – Level of Service

SOURCE: Transportation Research Board, 2000. Highway Capacity Manual – Special Report, Washington, DC

Under 2040 cumulative conditions, the proposed project was also determined to have a significant cumulative impact if it would cause a ramp operating at LOS D or better to operate at LOS E or LOS F, or a ramp operating at LOS E to deteriorate to LOS F conditions. For ramps that operate at LOS E or LOS F under 2040 cumulative conditions and would continue to operate at LOS E or LOS F under 2040 cumulative plus project conditions, the proposed project would have a significant impact if it would contribute considerably to the ramp volumes (i.e., a contribution of 5 percent or more to the traffic volumes on the ramp. In addition, if it was determined that the proposed project would have a significant project-specific traffic impact at a ramp under existing plus project conditions, then the impact would also be considered a significant cumulative impact under 2040 cumulative conditions.

Transit Analysis Methodology

The impact of additional transit ridership generated by the proposed project on local and regional transit providers was assessed by comparing the projected ridership to the available transit capacity at the maximum load point. Transit "capacity utilization" refers to transit riders as a percentage of the capacity of the transit line, or group of lines combined and analyzed as screenlines across which transit lines travel. The transit analyses were conducted for the peak direction of travel for each of the analysis time periods.

- For the weekday p.m. peak hour analyses, the transit capacity utilization was conducted at the Planning Department's three regional screenlines (for transit trips from the East Bay, North Bay, and South Bay), and at the four Muni downtown screenlines. In addition, transit capacity utilization was conducted for the T Third light rail line and the 22 Fillmore bus route that serve the project site. Weekday p.m. peak hour analysis was conducted for the outbound direction of travel (i.e., away from the project site). The weekday p.m. peak hour coincides with the peak evening commute period, and with the time when most employees at the site would be departing work.
- For the weekday evening peak hour, the transit analysis was conducted for the T Third light rail line and the 22 Fillmore bus route and for the regional screenlines in the inbound direction of travel (i.e., towards the project site, and into San Francisco). The weekday evening peak hour coincides with the period when most attendees would be traveling to the event center for a weekday evening event.

- For the weekday late evening peak hour, the transit analysis was conducted for the T Third light rail line and the 22 Fillmore bus route and for the regional screenlines in the outbound direction of travel (i.e., away from the project site). The weekday late evening peak hour coincides with the period when attendees would be leaving the event center following a weekday evening event.
- For the Saturday evening peak hour, the transit analysis was conducted for the T Third light rail line and the 22 Fillmore bus route and for the regional screenlines in the inbound direction of travel (i.e., towards the project site, and into San Francisco). The Saturday evening peak hour coincides with the period when most attendees would be traveling to the event center for a Saturday evening event.

The existing peak hour ridership and capacity data were obtained from Muni and reflect conditions that would occur following completion of the Central Subway project and the 22 Fillmore Transit Priority Project. (As explained below, both of these projects have been approved and are funded and are scheduled to become operational in the near future.) For service provided by Muni, the capacity includes seated passengers and an appreciable number of standing passengers per vehicle (the number of standing passengers is between 30 and 80 percent of the seated passengers depending upon the specific transit vehicle configuration). Muni has established a capacity utilization standard of 85 percent, which was applied for assessment of weekday p.m. peak hour conditions. For analysis of events at the project site, a capacity utilization standard of 100 percent was used, since more congested conditions on transit are acceptable for temporary special event conditions.

Weekday p.m. peak hour ridership and capacity for the regional transit service providers at the three regional screenlines were based on the *SF Guidelines* regional screenline data. Weekday evening, weekday late evening, and Saturday evening ridership and capacity were obtained from the regional transit providers, including AC Transit, BART, Caltrain, WETA, SamTrans, and Golden Gate Transit. All regional transit providers have a peak hour capacity utilization standard of 100 percent.

Because the Central Subway is anticipated to be operational in 2019, the existing plus project transit impact analysis was conducted assuming the additional light rail capacity in the project vicinity that would be provided via the Central Subway. Similarly, the 22 Fillmore Transit Priority Project is anticipated to be operational in 2020, and was also included in the existing plus project transit analysis. The ridership at the maximum load point and capacity of the 22 Fillmore and the T Third conditions reflect 2020 conditions for the Central Subway (i.e., conditions for the year following the start of revenue service on the light rail line and when the 22 Fillmore Transit Priority Project is completed and replaces the 55 16th Street route).[33]

The proposed project was determined to have a significant transit impact if project-generated transit trips would cause downtown or regional screenlines, and, where applicable, directly affected routes, operating at less than its capacity utilization standard under existing conditions,

[33] Ridership and capacity for year 2020 was used in the analysis of existing transit conditions, as it is the year for which near-term transit ridership forecasts that include implementation of the Central Subway and Muni Forward projects (e.g., the 22 Fillmore Transit Priority Project) are available.

to operate at more than capacity utilization standard. For Muni, the capacity utilization standard is 85 percent for conditions without an event at the project site, and 100 percent for conditions with an event at the project site. For regional operators, the capacity utilization standard is 100 percent for conditions without and with an event at the project site.

Under 2040 cumulative conditions, the proposed project was determined to have a significant cumulative impact if its implementation would cause the capacity utilization at the Muni and regional screenlines and/or corridors within the screenlines to exceed the capacity utilization standard noted above for conditions without and with an event at the project site, or if its implementation would contribute considerably to a screenline or corridor projected to operate at greater than the capacity utilization standard under 2040 cumulative plus project conditions (i.e., a contribution of 5 percent or more to the transit ridership on the screenline or route). In addition, if it was determined that the proposed project would have a significant project-specific transit impact under existing plus project conditions, then the impact would also be considered a significant cumulative impact under 2040 cumulative conditions.

Pedestrian Analysis Methodology

Pedestrian conditions were assessed qualitatively and quantitatively. Quantitative analysis of operating characteristics of the pedestrian sidewalk and crosswalk locations was conducted using the *HCM 2000* methodology. Sidewalk operating conditions are measured by average pedestrian flow rate, which is defined as the average number of pedestrians that pass a specific point on the sidewalk during a certain period (pedestrians per minute per foot or p/m/f). The width of the sidewalk at this point is considered the "effective width", which accounts for reduction in amount of sidewalk available for travel due to street furniture and the side of buildings. The level of service for sidewalks is presented for "platoon" conditions, which represents the conditions when pedestrians are walking together in a group. Pedestrian level of service conditions were calculated at the most restrictive sidewalk location (i.e., at the "pinch point") along a given block face.

Crosswalk LOS are measurements of the amount of space (square feet) each pedestrian has in the crosswalk or corner. These measurements depend on pedestrian volumes, signal timing, corner dimensions, crosswalk dimensions and roadway widths.

With the HCM methodology, an upper limit for acceptable conditions is LOS D, which equals approximately 15 to 24 square feet per pedestrian for crosswalks, and approximately 10 to 15 pedestrians per minute per foot for sidewalks. LOS E and LOS F represent unacceptable conditions. At LOS E normal walking gaits must be adjusted due to congested conditions, and independent movements are difficult; at LOS F walking speeds are severely restricted. **Table 5.2-20** shows the LOS criteria for pedestrians based on the 2000 HCM methodology.

Under existing plus project and 2040 cumulative conditions, the proposed project was determined to have a significant pedestrian impact at a sidewalk or crosswalk location if it would cause the analysis location to deteriorate from LOS D or better to LOS E or LOS F, or from LOS E to LOS F conditions. In addition, if it was determined that the proposed project would have a significant project-specific pedestrian impact under existing plus project conditions, then the impact would also be considered a significant cumulative impact under 2040 cumulative conditions.

TABLE 5.2-20
PEDESTRIAN LEVEL OF SERVICE CRITERIA

LOS	Crosswalks Density (sq ft per pedestrian)	Sidewalk Flow Rate (pedestrians per minute per foot)
A	> 13	< 0.5
B	> 10 – 13	> 0.5 – 3
C	> 6 – 9.9	> 3 – 6
D	> 3 – 5.9	> 6 – 11
E	> 2 – 2.9	> 11 – 18
F	< 2	> 18

SOURCE: Transportation Research Board, 2000. Highway Capacity Manual – Special Report, Washington, DC

Bicycle Analysis Methodology

The project impact analysis includes a qualitative assessment of bicycle conditions. Bicycle conditions are assessed as they related to the proposed project area, including bicycle routes, safety and right-of-way issues, and potential conflicts with traffic.

Loading Analysis Methodology

Loading analysis for the proposed project was conducted by comparing the loading supply that would be provided to the projected demand that would be generated.

Emergency Vehicle Access Analysis Methodology

Potential changes to emergency vehicle access were assessed qualitatively. Specifically, the analysis assessed whether any of the event center transportation management strategies would impair adequate emergency vehicle access.

Parking Conditions

As discussed in Chapter 2, Introduction, Section 2.8, Senate Bill 743 amended CEQA by adding Public Resources Code §21099 regarding the analysis of parking impacts for certain urban infill projects in transit priority areas.[34] Public Resources Code §21099(d), effective January 1, 2014, provides that "… parking impacts of a residential, mixed-use residential, or employment center project on an infill site located within a transit priority area shall not be considered significant impacts on the environment." Accordingly, parking is no longer to be considered in determining if a project has the potential to result in significant environmental effects for projects that meet all three criteria established in the statute. The proposed project meets all of the criteria, and thus the

[34] A "transit priority area" is defined as an area within one-half mile of an existing or planned major transit stop. A "major transit stop" is defined in California Public Resources Code §21064.3 as a rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods. A map of San Francisco's Transit Priority Areas is available online at http://sfmea.sfplanning.org/Map%20of%20San%20Francisco%20Transit%20Priority%20Areas.pdf. Accessed May 28, 2015.

transportation impact analysis does not consider the adequacy of parking in determining the significance of project impacts under CEQA. However, the OCII acknowledges that parking conditions may be of interest to the public and the decision-makers. Therefore, this SEIR presents a parking demand analysis for informational purposes only, and considers any secondary physical impacts associated with constrained supply (e.g., queuing by drivers waiting for scarce on-site parking spaces that affects the public right-of-way) as applicable in the following transportation impact analysis.

Furthermore, SB 743 requires that the State Office of Planning and Research (OPR) develop revisions to the *CEQA Guidelines* establishing criteria for determining the significance of transportation impacts of projects within transit priority areas that promote a reduction in greenhouse gas emissions and do not use automobile delay (level of service) in determining significance (see p. 4.A.3). These provisions of SB 743 have not yet been established and currently are only available in preliminary draft form. Therefore, as directed by OCII, this SEIR analyzes the traffic-related impacts of the project as they pertain to LOS.

A parking assessment was conducted by comparing the proposed parking supply to the parking demand generated by the proposed project uses. An assessment of cumulative parking conditions at build-out of the Mission Bay Area was also conducted.

2. *Organization of Impacts and Overarching Scenario Assumptions*

The general organization of the impact analysis is construction impacts, followed by operational impacts, followed by cumulative impacts, and ending with a discussion of parking conditions. Construction impacts are discussed in **Impact TR-1**. Operational impacts are covered in **Impact TR-2** through **Impact TR-25**, under three overarching scenarios, described below. Cumulative impacts are described in **Impact C-TR-1** through **Impact C-TR-10.** These impact evaluations are then followed by a discussion of parking conditions under proposed project conditions, but not in terms of a CEQA impact, as described above.

For the operational impacts, the impact evaluations uses the methodologies described above to address each of the following topics: vehicular traffic; transit; pedestrian; bicycle; loading; air traffic; and emergency vehicle access. These topics are all analyzed under each of three overarching scenario assumptions that represent the range of potential project impacts, including the reasonable worst-case scenarios. The three overarching scenario assumptions are:

- Conditions *without* a SF Giants game at AT&T Park ("Without a SF Giants Game"), **Impact TR-2** through **Impact TR-10**. This represents the most typical conditions expected to occur if the project were to be implemented.
- Conditions *with* an overlapping SF Giants evening game at AT&T Park ("With a SF Giants Evening Game"), **Impact TR-11** through **Impact TR-17**. As described further below, there is the likelihood that some events at the proposed event center could overlap with SF Giants evening games, with the potential to exacerbate transportation effects as analyzed in the first group of impacts.
- Conditions *without* implementation of the Muni Special Event Transit Service Plan, **Impact TR-18** to **Impact TR-24.** The two overarching scenarios above assume

implementation of the Muni Special Event Transit Service Plan, as described above in Section 5.2.5.2 and on Table 5.2-15, which indicate that the SFMTA intends to provide additional transit service to accommodate peak evening events, including basketball games and concerts with more than 14,000 attendees. The City and County of San Francisco fully anticipates implementation of this plan and has identified sufficient funding.[35] However, in order to provide a conservative CEQA analysis as well as information to the public and decision-makers, this group of impacts discloses the impacts of the proposed project if for some unknown reasons in the future, the City is unable to implement the Muni Special Event Transit Service Plan. This group of impacts analyzes only the Basketball Game scenario as the representative worst-case scenario.

For the conditions *with* an overlapping SF Giants evening game at AT&T Park, it is estimated that there would be a potential for about 32 overlapping events per year, but in rare circumstances there could be as many as 40 events (with varying combined total attendance) in one year. These estimates are based on the following assumptions, which are conservative because they rely on current scheduling information and do not account for any advanced coordination between the SF Giants and the Golden State Warriors, or internal schedule coordination at the event center:

- Overlap with Golden State Warriors games. The regular NBA (late October through mid-April) and regular baseball seasons (April through September) overlap slightly in the first half of April, and for both teams, only half of the games are home games. Conservatively, about 2 games per year could overlap during the regular season. If either or both of the Warriors and SF Giants were to move on to the post season, there would be increased likelihood of overlapping events, with up to approximately 5 additional overlapping events if both teams were to advance to their respective championship final series in the same year.

- Overlap with concerts. As indicated in Chapter 3, Project Description, Table 3-3, the major concert season is fall, winter, and early spring. Thus, of the 45 yearly concerts, about 20 could overlap with the regular baseball season, but at most, only half of these (10) are estimated to occur on the same day as a SF Giants home game.

- Overlap with family shows. As indicated in Chapter 3, Project Description, Table 3-3, the approximate 55 family shows would be distributed throughout the year on Wednesday through Sunday. Since the SF Giants play for 6 months of the year during the regular season, it is assumed that half of the family shows (27) would occur during the baseball season (April through September), but the SF Giants only play home games at AT&T Park for half of that time, leaving 14 days of possible overlap. However, the SF Giants also play games on Monday and Tuesday when there would be no family shows. So, about 10 of the family shows are estimated to occur on the same day as a SF Giants home game.

- Overlap with other non-Golden State Warriors sporting events. Of the approximate 30 other non-Golden State Warriors sporting events that would be held at the event center, it is assumed that half could occur during baseball season, and half of those could overlap with SF Giants home games, or about 7 events.

- Overlap with conventions/corporate events. Of the approximate 31 conventions or corporate events, it is assumed that half could occur during baseball season, and half of

[35] Letter to Tiffany Bohee, Executive Director, OCII, from Edward D. Reiskin, Director of Transportation, SFMTA, Re: SFMTA Transit Service Plan, Enforcement Support and Capital Investment Funding for the Golden State Warriors Multipurpose Arena, dated May 15, 2015.

those could overlap with SF Giants home games. However, these events would almost exclusively be during the day, and only about 35 percent of the SF Giants games are day games; this indicates the potential for an estimated 3 overlapping events.

Based on league schedules and concert scheduling as described above and in Chapter 3, Project Description, Table 3-3, it is anticipated that in a regular year, on average, there is a possibility of about nine large events (about 12,500 or more attendees) at the event center overlapping with a SF Giants evening game at AT&T Park (i.e., two basketball games and seven concerts) annually. If either or both teams make it to their respective championships, the number of large events overlapping could moderately increase; however, it is unlikely that this scenario would occur on a regular basis.

3. *Travel Demand Methodology and Results*

The memorandum containing the detailed methodology and information used to calculate the project travel demand is included in **Appendix TR**. This section summarizes the information and analysis contained in the travel demand memorandum.[36] As described above, travel demand estimates for the Basketball Game scenario assume that the SFMTA would provide additional transit service to accommodate peak evening events. However, travel demand estimates for the Basketball Game scenario for conditions without implementation of the Muni Special Event Transit Service Plan are also included in this section.

Introduction

Travel demand refers to the new vehicle, transit, pedestrian and bicycle trips generated by the proposed project. The methods commonly used for forecasting travel demand for development projects in San Francisco are based on person-trip generation rates, trip distribution information, and mode splits data described in the *SF Guidelines*, and which are based on a number of detailed travel behavior surveys conducted within San Francisco. The data in the *SF Guidelines* are generally accepted as more appropriate for use in transportation impact analyses for San Francisco development projects than conventional transportation planning data because of the unique mix of uses, density, availability of transit, and cost of parking in San Francisco.

However, the *SF Guidelines* do not include travel demand characteristics for the specialized uses (e.g., sports events, conventions, and other events) that would take place at the proposed event center. Similarly, standard trip generation resources, such as the Institute of Transportation Engineer's *Trip Generation Manual*, do not include sufficiently detailed trip generation data for such specialized uses. Therefore, the travel demand for the event center component of the proposed project was based on the estimated attendance, as well as information on current travel characteristics of Golden State Warriors basketball attendees at the Oracle arena in Oakland. In addition, the trips generation rates presented in the *SF Guidelines* and ITE's *Trip Generation Manual* cannot be directly applied to some development projects, such as the proposed project, because of its large scale, unique location, and mixed-use character (restaurant and retail uses

[36] Travel, Parking, and Loading Demand Estimates for the Proposed Event Center & Mixed-Use Development at Mission Bay Blocks 29-32 – Case No. 2014.1441E, Final Memorandum, May 2015. See **Appendix TR**.

supporting an event center as an anchor use). Thus, adjustments have been made to account for these factors. See **Appendix TR**.

The weekday daily p.m. peak hour travel demand for standard project land uses, such as office, retail, and restaurant uses were developed in accordance with the *SF Guidelines*, which provides p.m. peak hour trip generation rates and modal split, trip distribution, and average vehicle occupancy data specific to the southeast quadrant of San Francisco (Superdistrict 3, referred to as SD 3) where the project site is located.[37] The modal split and trip distribution assumptions presented in the *SF Guidelines* for work trips into and out of SD 3 were further refined using more recent travel pattern data of existing Mission Bay employees collected by the Mission Bay TMA. Travel demand was also determined for weekday evening and late evening and for Saturday daily and evening conditions based on adjusted trip generation rates developed for the office, retail, and restaurant uses using information obtained from ITE's *Trip Generation Manual*, the *Urban Land Institute's Shared Parking (2nd Edition)*, and Pushkarev and Zupan's, *Urban Space for Pedestrians*. See **Appendix TR**.

The No Event scenario reflects travel demand associated with the office uses, retail, and restaurant uses for the weekday p.m. commute peak hour of analysis and the Saturday evening peak hour. The Convention Event scenario reflects the travel demand of the office, retail and restaurant uses, plus a daytime convention event.

The Basketball Game scenario reflects the travel demand of the office, retail and restaurant uses, plus an evening basketball game. The transportation impact analysis of the Basketball Game scenario was conducted for four analysis hours (weekday p.m., weekday evening, weekday late evening, and Saturday evening), for conditions without and with an overlapping SF Giants evening game at AT&T Park.

Table 5.2-21 presents the expected temporal distribution of arrival and departure patterns for basketball game attendees of the proposed project. The data are based on information provided by the Golden State Warriors for their current facility, which was then adjusted to provide for earlier arrival patterns based on comparable information collected at similar NBA facilities to account for the increased availability of retail and restaurant uses at the proposed project site compared to Oracle Arena in Oakland. A summary of this data is provided in the travel demand technical memorandum included in **Appendix TR**. Based on this information, it was be assumed that approximately 5 percent of arrivals to a basketball game would occur during the p.m. peak hour (5:00 to 6:00 p.m.), and up to 66 percent of arrivals would occur during the evening peak hour (7:00 to 8:00 p.m.). Similarly, up to 70 percent of the departures would occur during the late evening peak hour (9:00 to 10:00 p.m.). Event staff for basketball games would be expected to arrive between 4:30 and 5:00 p.m. and would be on post prior to the gate opening time; event staff would leave between 11:00 and 11:30 p.m.

[37] Superdistricts are travel analysis zones established by the Metropolitan Transportation Commission (MTC). These Superdistricts provide geographic subareas for planning purposes in San Francisco; a map with the Superdistrict boundaries is included in **Appendix TR**).

Trip Generation

The person-trip[38] generation for the proposed project includes trips made by event attendees, employees, and other visitors to the project site and are based on the appropriate trip generation rates as described in a previous section, and which were then applied, as appropriate, to the number of expected event attendees, 1,000 gross square feet (GSF) of office, retail and restaurant uses in order to obtain the number of person trips generated by each land use. See **Appendix TR** for additional details.

The trip generation rates represent the number of person trips that would be generated by each project component as a stand-alone use. Some of the visitor trips entering/exiting the project retail and restaurant uses would be made by individuals destined to other components of the proposed project (referred to as visitor linked trips), such as the event center or the office uses. Thus, to account for the linked visitor trips, based on studies of non-work (visitor) trips conducted along the San Francisco waterfront and the type of retail and restaurant uses accessory to the event center, a daily 67 percent linked trips reduction was applied to non-work (visitor) trips for retail and restaurant uses during an event day (i.e., 33 percent of the visitor trips are considered new trips to the area unrelated to other nearby uses). On the other hand, because it is likely that more people would come to the area to specifically visit the project retail and restaurant uses on a non-event day, the daily linked trip factor was reduced to 33 percent for the sit-down restaurant and retail uses when no events are planned to take place at the site (i.e., 67 percent of the visitor trips are new trips to the site and to the area on non-event days). These assumptions are consistent with and more conservative (i.e., generates more trips) than the data obtained from a survey of shoppers conducted in the vicinity of the San Francisco Center at Powell and Market Streets, which found a

[38] A person trip is a trip made by one person by any means of transportation (auto, transit, walk, etc.).

linked trip factor of 67 percent for retail uses. Higher visitor linked trip ratios were assumed for the evening and late evening periods during an event when the percent of visitors unrelated to nearby project uses would be expected to be lower. It was assumed that the visitor linked trip factor would generally be constant throughout the day during non-event days. For event days, however, it was assumed that the linked trip factor would progressively increase as the event start time approaches. No linked trip factors were assumed under any scenario for visitors to the office uses.

Table 5.2-22 presents the number of person trips generated by the proposed project uses for the weekday and Saturday daily and peak hour analysis periods.

No Event. As shown in **Table 5.2-22**, the overall daily person trip generation would be lower on a Saturday than on a weekday, due to the higher trip generation associated with the office use on a weekday. On a weekday without an event, the proposed project would generate 26,998 daily person trips (inbound plus outbound), and 2,796 person trips during the weekday p.m. peak hour. On a Saturday without an event, the proposed project would generate 21,883 daily person trips and 3,130 person trips during the Saturday evening peak hour.

TABLE 5.2-22
PROPOSED PROJECT PERSON TRIP GENERATION BY LAND USE AND TIME PERIOD[a]

Convention Event	49,097	5,169	N.A.[c]	N.A.[c]	N.A.[c]	N.A.[c]

NOTES:
[a] Numbers may not sum to total due to rounding to the nearest person-trip.
[b] 105 employees would work at the event center on no-event days.
[c] Not applicable; not part of the travel demand analysis.
[d] Includes linked trip reductions as appropriate.

SOURCE: *Technical Memorandum - Travel, Parking and Loading Demand Estimates for the Proposed Event Center & Mixed-Use Development at Mission Bay Blocks 29-32*, May 2015. See **Appendix TR.**

Basketball Game. The total number of daily person trips generated on a weekday event day with a basketball game would be 58,538 person trips. Of these, 3,859 person trips would occur during the p.m. peak hour, 12,285 person trips would occur during the evening peak hour, and 13,218 person trips would occur during the weekday late evening peak hour. The total number of daily person trips generated on a Saturday with a basketball game would be 52,098 for a basketball game, of which 12,252 person trips would occur during the evening peak hour.

Convention Event. Convention events would generate fewer daily person trips than a basketball game (38,128 person trips for a basketball game versus 28,688 person trips for a convention event). However, because convention events would typically occur during the weekday, the proportion of convention event trips during the weekday p.m. peak hour would be greater than during a basketball game. This is because it is anticipated that many people would leave the convention event during the weekday p.m. peak hour while the majority of basketball fans arrive after the end of the p.m. peak hour (i.e., after 6:00 p.m.). The total number of daily person trips generated on a weekday event day with a convention event would be 49,097 trips, of which 5,169 person trips would occur during the p.m. peak hour.

Trip Distribution

The directional distribution is based on the origins and destinations of trips for each specific land use, which are then assigned to the four quadrants of San Francisco (Superdistricts 1 through 4), East Bay, North Bay, South Bay and Out of Region. The trip distribution percentages are summarized in **Table 5.2-23**.

The directional distribution of visitor trips for the proposed office, restaurant, and retail uses was obtained from the *SF Guidelines* for SD 3, in which the project is located. The distribution of convention/corporate events attendees was based on data provided by the Moscone Center Operator and documented in the Moscone Center Expansion EIR. The distribution of basketball game attendees was derived from information provided by Golden State Warriors (based on a market study assessment conducted by the project sponsor for the previously-proposed project location at Piers 30-32 in San Francisco). The directional distribution of employee trips for all proposed project uses was obtained from information provided by the Mission Bay TMA derived from transportation surveys of residents and employees in Mission Bay conducted in 2012, 2013, and 2014.

For worker trips to all land uses, the majority would be to/from San Francisco (47.3 percent), with the greatest proportion within SD 3 (22.3 percent), followed by East Bay (27.7 percent), and then South Bay (19.0 percent) origins/destinations. For visitor trips to a basketball game, the majority of trips would be to/from East Bay origins/destinations (31.1 to 33.0 percent), followed by the South Bay (26.7 to 28.0 percent), and then San Francisco (22.0 to 29.3 percent) origins/destinations.

The origin/destination distribution range for a weekday basketball game reflects an adjustment for event attendees who would travel to the event center directly from work rather than from their place of residence. The adjustment was based on a survey of Golden State Warriors season ticket holders (see **Appendix TR**). As shown in **Table 5.2-23**, the number of trips starting in

TABLE 5.2-23
PROPOSED PROJECT TRIP DISTRIBUTION PATTERNS BY LAND USE[a]

Place of Trip Origin/Destination	Basketball Game			Convention Event		Retail		Office/Restaurant	
		Visitors							
	Workers	Weekday Inbound	All Other	Workers	Visitors	Workers	Visitors	Workers	Visitors

Total	**100.0%**	**100.0%**	**100.0%**	**100.0%**	**100.0%**	**100.0%**	**100.0%**	**100.0%**	**100.0%**

NOTES:

[a] Percentages may not sum to 100 due to rounding.

SOURCE: *Technical Memorandum - Travel, Parking and Loading Demand Estimates for the Proposed Event Center & Mixed-Use Development at Mission Bay Blocks 29-32*, May 2015. See **Appendix TR**.

San Francisco on a weekday is projected to be about 7.5 percentage points greater than on a weekend, with the corresponding reductions in trips arriving from the East Bay (2 percentage points), North Bay (4 percentage points), and South Bay (1.5 percentage points) areas.

The majority of visitor trips to a convention event, retail, office, and restaurant uses would be from within San Francisco (70 to 81 percent), followed by South Bay (9 to 10 percent), and then East Bay (3 to 9 percent) origins/destinations.

Mode of Travel

The estimated daily, p.m. peak hour, evening peak hour, and late evening peak hour person trips were allocated to travel modes in order to determine the number of auto, transit, taxi, TNC vehicles, motor coaches, bicycle, walk, and other trips. For event center basketball games, the "other" category includes motorcycles and non-conventional travel modes such as pedicabs, while for the non-event related uses of the proposed project (office, retail, and restaurant) "other" includes bicycles, motorcycles, taxis, and TNC vehicles. The bicycle trips generated by a basketball game were calculated as a separate mode of travel, but have been aggregated with those under the "other" category in the summary tables presented in this technical memorandum.

Travel mode splits of visitor trips for the non-event related uses were estimated from information in the *SF Guidelines* to the southeastern waterfront (i.e., SD 3), where the project site is located. Travel mode splits of all employee trips (including event employees at basketball games and conventions) were estimated from information provided by the Mission Bay TMA based on transportation surveys conducted in 2012, 2013, and 2014.

Mode split assumptions for convention/corporate events attendees were based on data provided by the Moscone Center Operator and documented in the Moscone Center Expansion EIR, with some adjustments to account for the SD 3 location of the proposed project. Specifically, it was assumed that the overall auto usage would be twice the Moscone Center (20 percent at the proposed project site versus 10 percent at the Moscone Center), with minimal walk trips (2 percent at the proposed project site versus 30 percent at the Moscone Center). Taxi and shuttle bus trips would continue to represent about half of all the trips, while transit trips would increase to 23 percent. The modal split allocation for each major origin/destination was estimated by using the *SF Guidelines* data for visitor trips to SD 3 as a guide and proportionally shifting walk trips from SD 1, SD 2 and SD 4 to transit trips and shifting walk trips starting or ending outside of San Francisco to auto trips; no adjustments were made for walk trips within SD 3.

The estimation of the mode of travel assumptions for the basketball game attendees and the configuration of the Muni Special Event Transit Service Plan presented in Section 5.2.5.2, Project Transportation Improvements Assumptions, were developed concurrently. On one side, the modal splits for basketball game attendee trips were derived from similar data obtained from surveys conducted in 2012 by the SF Giants.[39] The transit utilization for an event at the project

[39] The overall modal split to a SF Giants game on a weekday was 38 percent auto, 45 percent transit, and 17 percent by other means of travel, including walking. The overall modal split to a weekend game was 45 percent auto, 40 percent transit, and 15 percent by other means of travel, including walking.

site was assumed to be lower than for a baseball game given that transit access to the project site is more limited than at AT&T Park. Similarly, given that the project site is located further away from downtown and the Market Street corridor (approximately 0.6 additional miles to the south of AT&T Park), the component of event attendees either walking to the event center or taking transit to downtown and then walking to the project site would also be lower than at AT&T Park. In addition, the area surrounding the proposed project would be expected to have larger parking availability concentrated in a relatively small number of large easy to locate facilities, making it more appealing to drive to the proposed event center than to AT&T Park. Parking near the event center would be closer to, more prominent, and easier to find, and with more availability than the parking facilities near AT&T Park.

The number of attendees taking transit to and from the event center was also compared against the transit service that could reasonably be provided by Muni prior to and following the largest event that could be accommodated at the proposed event center. The T Third light rail line and the 22 Fillmore bus route are the only existing Muni routes providing close transit access to the project site's immediate vicinity. The operation of the T Third is constrained by the length of the station platforms along the line, both above and within the planned subway, which are designed to accommodate trains that are no longer than two cars. In addition, the number of trains that can be accommodated on the subway where they have to be turned around at the end of the line also limits the maximum frequency of the T Third service that can be offered. Similarly, the frequency of operation of the 22 Fillmore line is constrained by the maximum number of trolley buses that can be operated on a given segment of the line, traffic congestion along other portions of the line, and the need to provide reasonable minimum headways to avoid bunching of transit vehicles.

Given these limitations, a supplemental system of transit shuttles (i.e., the Muni Special Event Transit Service Plan) was developed to operate during the evening period immediately prior to events and after events, thereby providing additional transit options for attendees. A system of three event-oriented shuttle bus line was developed by SFMTA to provide attendees with additional transit access along 16th Street (supplementing the 22 Fillmore), and to/from the Van Ness corridor and the Transbay/Ferry Building area (supplementing the T Third). The sizing of these three supplemental Muni shuttle bus services considered, in addition to the potential event transit ridership, the need to provide reasonable accommodation adjacent to the site for buses to pick up passengers, the estimated travel time from the site to its destination, and the potential for some buses to turnaround at the end of their trip and return to the event center to pick up passengers.

As a result of this combination of potential basketball game attendee transit demand with Muni's modified transit capacity under conditions with the Muni Special Event Transit Service Plan, and in consultation with SFMTA, the estimated modes of travel assumptions were developed, in consultation with SFMTA. The overall auto share for a basketball game at the project site was estimated to be 54 percent (weekdays) and 60 percent (weekends), which is 16 and 8 percentage points higher than at AT&T Park (38 and 52 percent, respectively). At the same time, the overall auto share for a basketball game at the project site, would be 3 to 10 percentage points lower than a similar average for the proposed project location (64 percent for retail and 57 percent for other uses for proposed developments within SD 3) per information within the *SF Guidelines*. Similarly, the overall transit mode share was estimated to be about 35 percent, compared to 45 percent (weekdays) and 36 percent (weekends) at AT&T Park, and 19 percent (retail uses) to 22 percent (other uses) for projects within SD 3. Thus, the overall transit mode share of 35 percent reflects the anticipated additional transit service to and from the event center during large events, as well as the TDM strategies in the proposed project's TMP designed to encourage use of non-auto modes by event attendees.

Table 5.2-24 summarizes the trip generation by mode of travel for the proposed project land uses for the standard weekday p.m. peak hour, as well for the weekday evening and late evening peak hours, and for the Saturday evening peak hour. The overall percentage of trips shown in **Table 5.2-24** as arriving to the event center for the Basketball Game scenario by automobile during the weekday evening peak hour (i.e., 53 percent) and during the Saturday evening peak hour (i.e., 59 percent) were used to establish the weekday and weekend evening auto mode share minimum performance standards committed to by the project sponsor in the proposed project's TMP (see description of the TMP above in Section 5.2.5.2, Project Transportation Improvements Assumptions).

The resulting weekday and Saturday basketball game attendee transit demand was then assigned to the various Muni lines depending on their origins and destinations so that the initial Muni Special Event Transit Service Plan could be refined by SFMTA. The resulting plan was then incorporated into the proposed project as an intrinsic element of the design. Mode split assumptions and travel demand estimates for the Basketball Game scenario for conditions without implementation of the Muni Special Event Transit Service Plan (i.e., without the incorporation of this design feature) are included at the end of this section.

To determine the number of vehicle trips generated by the proposed project under various scenarios, an average vehicle occupancy rate was applied to the number of person trips by automobile mode. Average vehicle occupancies for a convention event as well as for standard project land uses, such as office, retail, and restaurant uses were estimated in accordance with the methodologies in the *SF Guidelines*. Vehicle occupancy data for the basketball games at the event center were developed based on information from surveys conducted by the SF Giants in 2007; data from 2007 were used because the 2012 SF Giants survey used to derive the modal split ratios did not include information about vehicle occupancy. The average vehicle occupancy for attendees for a weekday and Saturday evening event derived from the SF Giants survey (2.7 passengers per vehicle) is comparable to data obtained from other similar transportation planning studies for arenas in urban settings, which estimated average vehicle occupancies between 2.35 and 2.8 passengers per vehicle, with the higher values being observed on weekends. When combined with employee trips and trips to/from other on-site uses, the overall average vehicle occupancy during a convention event and a basketball would range between 1.5 and 3.6 passengers per vehicle, depending on the type, day of the event, and peak hour. It should be noted that the trips made by rideshare, such as taxis, shuttle buses, Uber and similar other smart phone application-based transportation services, were included in the vehicle trips as two vehicle trips during the analysis hour (i.e., one inbound and one outbound trip).

The overall number of vehicle trips generated by the proposed project by origin and destination is also presented in **Table 5.2-25**, while the number of transit trips is presented in **Table 5.2-26**.

SOURCE: *Technical Memorandum - Travel, Parking and Loading Demand Estimates for the Proposed Event Center & Mixed-Use Development at Mission Bay Blocks 29-32*, May 2015. See **Appendix TR**.

No Event Scenario. On a weekday with no event, the proposed project would generate 1,344 person trips by automobile (48 percent), 881 person trips by transit (32 percent), and 570 person trips by other modes (20 percent) during the p.m. peak hour. On a Saturday with no event, the proposed project would generate 1,707 person trips by automobile (55 percent), 673 person trips by transit (22 percent), and 750 person trips by other modes (24 percent) during the evening peak hour.

During the weekday p.m. peak hour without an event, the proposed project land uses would generate 702 vehicle trips. On Saturdays without an event, the number of vehicle trips during the Saturday evening peak hour (785 vehicle trips) would be higher but comparable to those occurring during the weekday p.m. peak hour (702 vehicle trips). The number of vehicle trips would be higher because trip generation associated with the office uses would be minimal on a Saturday, and the reduction in office trip generation (with a higher transit than auto mode split) would be offset by a greater trip generation for the retail and restaurant uses (with a higher auto than transit mode split) on a Saturday than on a weekday.

Basketball Game Scenario. The person trips by mode generated by the proposed project on a weekday with a basketball game would be as follows:

- The overall project would generate 1,645 person trips by automobile (43 percent), 1,625 person trips by transit (42 percent), and 590 person trips by other modes (15 percent) during the weekday p.m. peak hour.
- The overall project would generate 6,546 person trips by automobile (53 percent), 4,371 person trips by transit (36 percent), and 1,368 person trips by other modes (11 percent) during the weekday evening peak hour.
- The overall project would generate 7,280 person trips by automobile (55 percent), 4,680 person trips by transit (35 percent), and 1,258 person trips by other modes (10 percent) during the weekday late evening peak hour.

On weekdays with a basketball game, the proposed project would generate 886 vehicle trips during the p.m. peak hour, and the number of vehicle trips would increase to 2,752 vehicle trips during the evening peak hour (mostly arrivals to the event center), and to 3,018 vehicle trips during the late evening peak hour (mostly departures from the event center). More vehicle trips would be generated by a basketball game during the weekday late evening peak hour than during the p.m. peak hour because arrivals (inbound trips) tend to be spread out over a longer period of time as sport fans shop, buy food or meet on their way to their seats, whereas departures (outbound trips) are typically concentrated within the one hour immediately following the conclusion of an event.

On a Saturday with a basketball game, the proposed project would generate 7,261 person trips by automobile (59 percent), 4,310 person trips by transit (35 percent), and 681 person trips by other modes (6 percent). On a Saturday event day during the evening peak hour, the project would generate a higher percentage of auto trips than on a weekday event day (59 percent on a Saturday, as compared to 53 percent on a weekday), as a result of the typically lower transit service available, combined with a greater number of attendees arriving from outside San Francisco.

On Saturdays with a basketball game, the proposed project would generate 2,815 vehicle trips during the evening peak hour. As indicated in **Table 5.2-25**, there would be a somewhat greater vehicle trip generation for a Saturday basketball game (2,815 vehicle trips) than for a weekday basketball game (2,752 vehicle trips) as more people tend to drive on weekends because of the typically lighter traffic, more parking availability, and less transit service (e.g., fewer routes and/or longer headways between buses on Saturdays than on weekdays). In addition, retail, and restaurant uses would generate more vehicle trips on a Saturday than on a weekday.

Convention Event Scenario. On a weekday with a convention event, during the p.m. peak hour the proposed project would generate a relatively low percentage of weekday auto trips (30 percent for a convention event compared to 43 percent for a basketball game), since about 80 percent of the convention trips would be expected to arrive by transit, taxi, TNC vehicles, or convention shuttle bus service. Approximately 2 percent of the convention attendees are expected to walk to the site.

On a weekday with a convention event, the proposed project would generate 919 vehicle trips during the p.m. peak hour, slightly more than those generated by a basketball game during the same period (886 vehicle trips). Although a convention event would generate fewer weekday p.m. peak hour private vehicles trips than a basketball game, the addition of vehicle trips made by taxis and shuttle buses, (which are counted twice - once arriving and once departing the event center) would result in more trips being generated by convention events.

Vehicle Assignment

The trip distribution presented in **Table 5.2-25** was used as the basis for assigning project generated vehicle trips to the local streets in the study area during the analysis periods. **Figure 5.2-14A** and **Figure 5.2-14B** graphically depict the assignment paths for the vehicles accessing and departing the project site, respectively, for the No Event and Convention Event scenarios for the weekday p.m. peak hour, **Figure 5.2-14C** and **Figure 5.2-14D** present the inbound and outbound paths, respectively, for the No Event scenario for the Saturday evening peak hour, while **Figure 5.2-14E** and **Figure 5.2-14F** present the inbound and outbound paths, respectively for the Basketball Game scenario for the weekday and Saturday peak hours for conditions without an overlapping SF Giants evening game. For the analysis of No Event and Convention Event scenarios, vehicles were assumed to arrive at or depart from the proposed project garage or the 450 South Street garage. For the analysis of the Basketball Game scenario, vehicles were assumed to arrive/depart from the proposed project garage as well as other public parking facilities in the vicinity of the project site, such as Lot A, or various UCSF garages in the Mission Bay Area. Lot A (on Mission Rock Street) and other SF Giants-managed parking facilities such as Pier 48 and Lot C were assumed to be unavailable to basketball game attendees when evaluating overlapping baseball-basketball game conditions. Thus, for purposes of this analysis, all off-street parking facilities that are open to the paying public were assumed to be available for patrons of the event center in order to analyze the most conservative distribution of arriving vehicles (i.e., assigning more vehicles to parking facilities closer to the project site and through the greatest number of study intersections).

Weekday Late Evening Peak Hour-
Basketball Game Without a SF Giants Evening Game

As discussed below in Section 5.2.5.6, and quantified in **Table 5.2-69** and **Table 5.2-70**, it is possible that some parking facilities (such as the 450 South Street Parking Garage or UCSF parking facilities) may not be made available (e.g., permit parking after 7 p.m.) for weekday and weekend evening events at the project site. In this case, the vehicle assignment paths graphically depicted in **Figure 5.2-14E** and **Figure 5.2-14F** would still be applicable, except that project-generated vehicles that were assumed to park at those facilities would instead park at Lot A, or at other parking facilities outside of the study area. Thus, while in the future, more existing and planned parking facilities may have limited public access, the approach described above represents a reasonable assignment of project-generated vehicle trips to the study intersections.

As discussed below in Section 5.2.5.4, parking facilities in the study area would be expected to be full during overlapping SF Giants and basketball evening games. In those instances, drivers would have to park farther away, most likely outside of the study area, and then walk the rest of the way to the event center; as a result, they would not drive through many of the study intersections in the project vicinity. However, for a more conservative traffic impact analysis, it has been assumed that in those instances when parking facilities in the vicinity of the proposed project would be full, vehicles would still arrive at the vicinity of the project site.

For conditions without and with a SF Giants evening game at AT&T Park, it was assumed that the vehicles currently traveling to and from the two surface parking lots on the project site (610 parking spaces) that would be eliminated with the project would park instead at nearby garages (e.g., UCSF Third Street Garage, 450 South Street Garage), following similar travel paths to these alternate parking facilities. Thus, no vehicle assignment credit was applied to the project, and therefore the project-generated trips would be in addition to those vehicles already traveling to and from the parking facilities on the project site.

Freight Delivery and Service Vehicle Demand

The *SF Guidelines* methodology for estimating commercial vehicle and freight loading demand was used to calculate the daily truck/service vehicle trips and the average hour and peak hour loading space demand for the office, retail, and restaurant uses. Daily truck trips generated per 1,000 square feet were calculated based on the rates contained within the *SF Guidelines*, then converted to hourly demand based on a 9-hour day and a 25-minute average stay. Average hour loading space demand was converted to a peak hour demand by applying a peaking factor, as specified in the *SF Guidelines*. For the event center, information from the project sponsor on the loading activity for the Golden State Warriors at the Oracle Arena in Oakland, and event loading activity at the Toyota Center in Houston, Texas and at the Barclays Center in Brooklyn, New York was used to estimate the event center loading demand.

Table 5.2-27 presents the number of trucks generated on a daily basis, and the demand for loading dock spaces during the average hour and peak hour of loading activity. The office, retail, and restaurant uses would generate about 360 delivery and service vehicle trips per day, which corresponds to a demand for 17 loading spaces during the average hour of loading activity and 21 loading spaces during the peak hour of loading activity. In addition, as indicated in **Table 5.2-27**, the event center would generate a demand of up to 30 delivery and service vehicle trips on the day prior to an event. Non-Golden State Warriors events would generate a greater number of delivery and service vehicle trips associated with show components (e.g., stage, sound equipment and controls, video equipment and controls, and props), as well as food and beverage trucks, than basketball games. As indicated in **Table 5.2-27**, the event center would generate a loading space demand for seven loading spaces during the average and peak hour of loading activity. The loading space demand for seven loading spaces takes into consideration that the loading demand would occur over a shorter period (i.e., over a period of about four hours, rather than 9-hour period for the office, retail, and restaurant uses), and some loading spaces would be occupied for one or more days (e.g., TV crew trucks).

TABLE 5.2-27
PROPOSED PROJECT DELIVERY/SERVICE VEHICLE TRIPS AND LOADING SPACE DEMAND

Land Use	GSF	Daily Trucks/ Service Vehicle Trip Generation	Loading Space Demand	
			Average Hour Loading Spaces	Peak Hour Loading Spaces
Event Center[a]	750,000	30	7	7
Office	605,000	127	6	7

Vehicle Parking Demand

Weekday and Saturday parking demand for the proposed project was determined based on methodologies presented in the *SF Guidelines*, supplemented with data obtained from the Urban Land Institute[40] and the project sponsor on the characteristics of the event center. Parking demand consists of both long-term demand (typically employees) and short-term demand (typically visitors). Peak parking demand was estimated for the midday period (1:00 to 3:00 p.m.) when parking occupancy is typically greatest for office and retail uses, and for the late evening (7:00 to 9:00 p.m.) period when parking demand is greater for the evening events and restaurant uses. Long-term parking demand for the office, retail, and restaurant uses was estimated by applying the average mode split and vehicle occupancy from the trip generation estimation to the number of employees for each of the proposed land uses. Short-term parking for these uses was estimated based on the total daily vehicle visitor trips and an average daily parking turnover rate of 5.5 vehicles per space per day for the office, retail, and restaurant uses.[41]

40 Shared Parking, Urban Land Institute, Second Edition, 2005.
41 A turnover of 5.5 means that each parking space is utilized by an average of 5.5 vehicles during the day.

Parking demand for attendees at a basketball game and convention event were estimated based on the total number of attendee vehicle trips expected at each event (i.e., the maximum number of vehicles arriving for the event, not just during the analysis hours) and an average daily parking turnover rate (1 vehicle per space per day for all basketball games on weekdays and Saturdays, and 1.5 vehicles per space per day for convention events). Event employee parking demand was estimated by applying the average mode split and vehicle occupancy from the trip generation estimation described in the previous sections to the number of employees expected at each event. **Table 5.2-28** summarizes the estimated weekday and Saturday parking demand for the proposed project during the midday and late evening periods.

TABLE 5.2-28

SOURCE: *Technical Memorandum - Travel, Parking and Loading Demand Estimates for the Proposed Event Center & Mixed-Use Development at Mission Bay Blocks 29-32*, May 2015. See **Appendix TR**.

No Event. On weekdays without an event, the proposed project would generate a maximum parking demand for 1,049 spaces during weekday midday period and 489 spaces during the late evening period. The parking demand on Saturday (589 spaces during the midday and 462 spaces during the late evening period) would be lower because the parking demand associated with the office use would be substantially less on a Saturday than on a weekday, particularly at midday, and the reduction in the office parking demand would not be offset by the higher Saturday parking demand associated with the retail and restaurant uses.

With Event. On weekdays with an event, the proposed project would generate a maximum parking demand for 1,906 spaces during weekday midday period during a convention event, and 4,270 spaces during the late evening period with a basketball game.

On a Saturday with a basketball game, the midday parking demand would be similar to conditions with no event because basketball games start at 7:30 p.m. and game attendees would not have had arrived during the midday period. Thus, on Saturdays with a basketball game the midday parking demand associated with the event center would be somewhat greater, but similar to conditions without an event (i.e., 598 spaces with an event, as compared to the parking demand for 589 spaces without an event). The late evening parking demand on Saturday with a basketball game (4,573 spaces) would be greater than on weekdays (4,270 spaces) due to the higher auto mode share for basketball game attendees on Saturdays than on weekdays. As discussed above, concerts are anticipated to have a similar travel mode characteristics as a basketball game, and therefore, parking demand for sell-out event concerts would be similar to a basketball game.

Travel Demand for Conditions without Implementation of the Muni Special Event Transit Service Plan

The project sponsor is working with the City to secure funding for the Muni Special Event Transit Service Plan described above as part of the project improvements, and which would be implemented by the SFMTA before, during, and immediately after large events at the project site. The transportation impact analysis assumes that the special event transit service would be provided during basketball games to accommodate the transit demand. However, in the event that the SFMTA would not be able to provide all or a portion of the Muni Special Event Transit Service Plan, it is expected that transit would be less convenient for event attendees, and, therefore, that fewer attendees would travel to the site by transit. In order to determine the impact of not providing additional transit service during large events, the travel demand estimates were recalculated for conditions assuming the existing and planned (i.e., Central Subway) transit serving the project site.

Because the Muni Special Event Transit Service Plan was assumed only for analysis of a basketball game at the event center (i.e., the analysis did not assume that additional service would be provided for the Convention Event or No Event analysis scenarios), the travel demand and subsequent analysis of conditions without the Muni Special Event Transit Service Plan was conducted only for the Basketball Game scenario for the weekday p.m., evening and late evening and for Saturday evening hours of analysis.

The travel mode for attendees for conditions without the Muni Special Event Transit Service Plan for the Basketball Game scenario was estimated from information in the *SF Guidelines* for SD 3, similar as described above for non-event related project land uses, with some adjustments to account for availability of transit service. With these adjustments for no additional transit service specifically for the game or concert, the mode split for attendees was estimated to be 63 percent auto, 20 percent transit, and 17 percent walk/other (as compared to 54 percent auto, 35 percent transit, and 11 percent walk/other for conditions with the Muni Special Event Transit Service Plan). This shift in the mode choice for attendees reflects the conservative assumption that the SFMTA would not provide any additional transit service during a large event, though it is anticipated that the SFMTA would provide some additional transit service, as they currently do for large events throughout San Francisco.

Table 5.2-29 presents the trip generation by mode, by land use, and by time period for the Basketball Game scenario without implementation of the Muni Special Event Transit Service Plan. **Table 5.2-30** presents the vehicle trips by origin and destination, while **Table 5.2-31** presents the transit trips by origin and destination. **Table 5.2-32** presents a summary comparison for the Basketball Game scenario for conditions with and without the Muni Special Event Transit Service Plan. The complete set of travel demand calculations are included in **Appendix TR**.

Overall, without implementation of the Muni Special Event Transit Service Plan for a basketball game, during the weekday p.m. peak hour the number of vehicle trips would increase by 54 trips, while the number of transit trips would decrease by 136 trips. During the weekday and Saturday evening peak hours (i.e., the peak hour of arrivals to the event center), the number of vehicle trips would increase by 697 vehicles, while the number of transit trips would decrease by 1,762 trips. During the weekday late evening peak hour (i.e., departures from the event center), the number of vehicle trips would increase by 742 vehicles, while the number of transit trips would decrease by 1,878 trips. The number of pedestrian/other trips would remain similar for conditions with and without implementation of the Muni Special Event Transit Service Plan.

Because more attendees would be driving to the event center, the parking demand would also increase over conditions with the Muni Special Event Transit Service Plan, particularly during the late evening period when parking demand would be greatest. **Table 5.2-32** also presents the parking demand comparison. During the late evening the parking demand would increase by 606 spaces on weekdays and 669 spaces on a Saturday.

These travel demand estimates were used in the assessment of transportation impacts of conditions without implementation of the Muni Special Event Transit Service Plan, as presented in Section 5.2.5.5, **Impact TR-18** to **Impact TR-24**.

4. Development of 2040 Cumulative Traffic and Transit Forecasts Methodology

Foreseeable Nearby Development Projects

In addition to full build-out of the Mission Bay South area and associated roadway infrastructure improvements, other reasonably foreseeable development projects that were considered in the cumulative transportation analysis include the following, which are described in Section 5.1.5.

- University of California at San Francisco (UCSF), 2014 Long Range Development Plan (LRDP), Mission Bay Campus
- Eastern Neighborhoods Program
- Seawall Lot 337 and Pier 48 Mixed-Use Project (Mission Rock Project)
- Pier 70 Mixed-Use Development

Cumulative Transportation Network Changes

The following transportation network changes, some of which were originally identified in the Mission Bay FSEIR, are incorporated into the cumulative analysis:

Improvements identified in Mission Bay FSEIR

- **Mission Bay FSEIR Mitigation Measure E.19b**. Restripe the I-280 off-ramp touchdown and narrow the median on the south side of King Street for a distance of about 300 feet beginning at the intersection with Fifth Street, to increase the number of eastbound lanes from the existing two to three.

- **Mission Bay FSEIR Mitigation Measure E.27.** Reroute the Muni 22-Fillmore trolleybus line to travel on 16th Street to Third Street, and then north on Third Street to The Common. If not already accomplished, install trolleybus wire support poles and/or eyebolts on buildings along the new route, and complete North Common Street and South Common Street east of Third Street. Prohibit parking on North Common and South Common Streets at trolleybus stops.

Central Subway Project. The Central Subway Project is the second phase of the Third Street light rail line (i.e., T Third), which opened in 2007. Construction is currently underway, and the Central Subway will extend the T Third line northward from its current terminus at Fourth and King Streets to a surface station south of Bryant Street and go underground at a portal under U.S. 101. From there it will continue north to stations at Moscone Center, Union Square—where it will provide passenger connections to the Muni/BART Powell station — and in Chinatown, where the line will terminate on Stockton Street at Clay Street. Construction of the Central Subway is scheduled to be completed in 2017, and revenue service is scheduled for 2019.

Central SoMa Plan. The San Francisco Planning Department is in the process of developing an integrated community vision for the southern portion of the Central Subway rail corridor. This area is located generally between Townsend and Market Streets along Fourth Street, between Second and Sixth Streets. The plan's goal is to integrate transportation and land uses by implementing changes to the allowed land uses and building heights. The plan also includes a strategy for improving the pedestrian experience in this area. These changes will be based on a synthesis of community input, past and current land use efforts, and analysis of long-range regional, citywide, and neighborhood needs. This project is currently under environmental review.

The Central SoMa Plan includes two different options for the couplet of Howard and Folsom Streets. Howard Street would be modified between 11th and Third Streets, while Folsom Street would be modified between 11th Street and The Embarcadero. Under the Howard/Folsom One-way Option, both streets would retain a one-way configuration (except Folsom Street east of Second Street which would retain its existing two-way operation). Under the Howard/Folsom Two-way Option, both streets would be converted into two-way operation, and some modifications to Harrison Street would also occur. The 2040 cumulative conditions assume implementation of the Howard/Folsom One-way Option.

Muni Forward. As indicated in Section 5.2.3.2, Muni Forward anticipates service changes to routes in the vicinity of the proposed project. Year 2040 cumulative analysis assumes changes to the capacity as identified by route changes and headway changes indicated within Muni Forward.

Railyard Alternatives and I-280 Boulevard Feasibility Study (RAB). The San Francisco Planning Department is currently conducting the Railyard Alternatives and I-280 Boulevard Feasibility Study (RAB) to holistically study transportation and land use alternatives within southeast

San Francisco that affect the City as a whole. The RAB is made up of five distinct components of analysis: (1) Reconfigure and/or relocate portions of the Fourth/King railyard storage and maintenance functions (service to the Fourth/King would remain), (2) Verify and/or potentially modify the proposed Downtown Rail Extension (DTX) (e.g., alignment, construction methods, etc.), (3) Create a loop track out of east side of Transbay Transit Center (TTC), (4) Replace the elevated portion of I-280 north of Mariposa or 16th Streets with a surface boulevard, similar to The Embarcadero or Octavia Boulevard, including improved circulation and connections throughout the area, and (5) Create opportunities for new public spaces, housing and jobs at the existing Caltrain railyard and along the freeway/rail alignment between Townsend and Mariposa Streets, including the potential to raise additional revenue to realize the transportation infrastructure.[42]

The Phase I feasibility assessment of options for each of the five components is currently underway; a future Phase II alternatives development phase will focus on developing and defining alternatives from those options. A substantial amount of additional discussion and analysis is required before the details of the feasibility and potential design and removal of I-280 and construction of California's planned high-speed rail network and related components within San Francisco are developed to a level at which that project's effects on the transportation system in Mission Bay could be understood. If a study to determine the environmental impacts of such a project is initiated, members of the public, City, State, and Federal agencies, among others, would be given a period to provide comment on the scope of the analysis. Funding has not been secured to study these identified options beyond the Phase II alternatives development phase, or to undertake or implement any aspect of this project, and thus the project is speculative and not reasonably foreseeable. Therefore, the transportation analysis of 2040 cumulative conditions does not include changes to the existing I-280 or Caltrain alignments within Mission Bay, and the RAB study is described in this section for informational purposes only.

Cumulative Traffic, Transit and Pedestrian Demand

Future 2040 cumulative traffic volumes were estimated based on cumulative development and growth identified by the San Francisco County Transportation Authority SF-CHAMP travel demand model, using model output that represents Existing conditions and model output for 2040 cumulative conditions. The SF-CHAMP model is an activity-based travel demand model that has been validated to represent future transportation conditions in San Francisco and is updated regularly. The model predicts person travel for a full day based on assumptions of growth in population, housing units, and employment. Future year 2040 intersection turning movement volumes were developed by applying growth factors calculated from traffic volume growth between existing and 2040 conditions, obtained from the SF-CHAMP model to actual traffic volumes collected in the field. The 2040 cumulative traffic volumes take into account cumulative development projects in the project vicinity, such as the build-out of the Mission Bay Area, completion of the UCSF Research Campus and the UCSF Medical Center, the Mission Rock Project at Seawall Lot 337, Pier 70, etc., as well as the additional vehicle trips generated by the proposed project.

42 San Francisco Planning Department, Railway Alternatives and I-280 Boulevard Feasibility Study. Available online at: http://www.sf-planning.org/index.aspx?page=3717 Accessed May 12, 2015.

The 2040 cumulative transit analysis accounts for ridership and/or capacity changes associated with Muni Forward, the Central Subway Project (which is scheduled to open in 2019), the new Transbay Transit Center, the electrification of Caltrain, the extension of Caltrain to the new Transbay Transit Center, expanded Water Emergency Transportation Authority (WETA) ferry service, and additional capacity planned by BART, AC Transit, SamTrans, and Golden Gate Transit. The 2040 cumulative Muni routes and Muni and regional screenline analysis was developed by the SFMTA based on the SF-CHAMP model analysis conducted as part of the ongoing Central SoMa Plan EIR.

Future 2040 cumulative pedestrian volumes were estimated based on cumulative development and growth identified by the SFCTA SF-CHAMP travel demand model, using model output that represents Existing conditions and model output for 2040 cumulative conditions. The 2040 cumulative pedestrian volumes include the additional pedestrian trips generated by the growth associated with the proposed project.

Since the SF-CHAMP model is a weekday travel demand model, future year Saturday evening peak hour conditions were estimated based on the net growth developed for the weekday p.m. condition. This approach is consistent with the methodology used on previous analyses of weekend conditions in San Francisco and provided conservative results, since in addition to the expected growth of visitor-oriented uses such as retail and restaurant, it includes additional growth from standard uses, such as office, that would not generate as many trips on a weekend as they would on a weekday.

5.2.5.4 Impact Evaluation

Project Impacts: Construction

Impact TR-1: The proposed project would not result in construction-related ground transportation impacts because of their temporary and limited duration. (Less than Significant)

The construction impact assessment is based on currently available information from the project sponsor, as described in Chapter 3, Project Description, and professional knowledge of typical construction practices citywide. Prior to construction, as part of the construction application phase, the project sponsor and construction contractor(s) would be required to meet with San Francisco Department of Public Works (DPW) and SFMTA staff to develop and review truck routing plans for disposal of excavated materials, materials delivery and storage, as well as staging for construction vehicles. The construction contractor would be required to meet the City of San Francisco's Regulations for Working in San Francisco Streets, the Blue Book, including those regarding sidewalk and lane closures, and would meet with SFMTA staff to determine if any special traffic permits would be required.[43] Prior to construction, the project contractor would coordinate with Muni's Street Operations and Special Events Office to coordinate construction activities and avoid impacts to transit operations. In addition to the regulations in the Blue Book,

[43] The SFMTA Parking and Traffic Regulations for Working in San Francisco Streets (The Blue Book), 8th Edition, is available online at http://www.sfmta.com/services/streets-sidewalks/construction-regulations. Accessed May 28, 2015.

the contractor would be responsible for complying with all City, State and federal codes, rules and regulations.

Construction of the proposed project is anticipated to begin in late 2015, and occur over an approximate 26-month period. Construction activities would include, but not be limited to: site demolition, clearing and excavation; dewatering; pile installation and foundation construction; construction of all proposed development, including event center, podium structure, office towers and plazas; installation of associated utilities; interior finishing; and exterior hardscaping and landscaping improvements.

The majority of the construction is proposed to occur Monday through Friday, although some construction activities would occur on nights and weekends. A typical work day shift would be between 7:00 a.m. and 6:00 p.m., and a typical second shift (i.e., for below-grade and interior work within buildings) would be between 4:00 p.m. and 12:30 a.m. There would also be the potential for overnight deliveries of materials and/or equipment. All construction activities are proposed to be conducted within allowable construction requirements permitted by City code. The project would also be subject to the Mission Bay Good Neighbor Policy, which limits extreme noise-generating activities in Mission Bay to Monday to Friday from 8:00 a.m. to 5:00 p.m.[44]

Table 3-5 in Chapter 3 summarizes major construction tasks, and presents a preliminary construction schedule. **Table 5.2-33** presents a summary of the major construction phases and duration, as well as the average and peak hour number of construction trucks and workers by phase. Construction duration of the event center is anticipated to be about 24 months, about 18 months each for the north and south office towers, and about 10 months for the parking garage and podium. Because construction of each of these project components would overlap, construction activities would be expected to concentrated and intensive for the entire 26-month construction period.

The proposed construction staging area for the majority of the project construction would take place between the existing alignment of Terry A. Francois Boulevard and the west face of the proposed event center. This staging area would be used until such time the planned realignment of Terry A. Francois Boulevard occurs. Any deliveries of materials that could not be accommodated within the above-described staging area would be staged on Terry A. Francois Boulevard between Piers 48 and 50. All construction equipment is proposed to be staged on-site. Refer to Section 5.2.6, Project Impacts on UCSF Helipad Operations for the discussion of construction-related impacts related to temporary effects of construction tower cranes on the UCSF emergency helicopter operations.

During construction, the southern-most eastbound lane on South Street adjacent to the project site; and the westbound curb lane on 16th Street between Third and Illinois Streets adjacent to the project site would be temporarily closed. On South Street one eastbound and two westbound travel lanes would be maintained for local circulation throughout the construction period.

---

44 The Mission Bay Good Neighbor Policy specifies that pile driving or other extreme noise-generating activity shall be limited to 8:00 am to 5:00 pm, Monday through Friday.

TABLE 5.2-33
SUMMARY OF CONSTRUCTION PHASES AND DURATION AND DAILY CONSTRUCTION TRUCKS AND WORKERS BY PHASE

Construction Work	Duration (months)	Daily Construction Trucks		Daily Construction Workers

SOURCE: Mortenson Clark Joint Venture, 2014

It is also anticipated that the sidewalk on Third Street adjacent to the project site between 16th and South Streets would be temporarily closed during the building steel erection phase in this area, and pedestrians between 16th and South Streets would be directed to use the west side of Third Street for north/south travel. Existing pedestrian volumes on the east side of Third Street between South and 16th Streets are low, less than 60 pedestrians per hour on days without a SF Giants game and less than 50 pedestrians per hour on days with a SF Giants evening game. Pedestrian volumes on the west side of Third Street between 16th and South Streets are slightly higher (about 100 pedestrians per hour on days without and with a SF Giants evening game), and therefore, the sidewalk would be able to accommodate the additional pedestrians during the temporary sidewalk closures. Sidewalks on South Street, 16th Street and Terry A. Francois Boulevard adjacent to the project site are currently not provided, and sidewalks would be constructed as part of the project.

Construction activities on the project site would not affect access to the existing portion of the Bay Trail that runs along the shoreline east of Terry A. Francois Boulevard. However, it should be noted that the realignment of Terry A. Francois Boulevard and expansion and improvements at the Bayfront Park would overlap with a portion of construction on the project site. The Mission Bay master developer will be constructing the Bayfront Park.

Terry A. Francois Boulevard would be the primary vehicular ingress/egress to/from the project site during construction. Third Street, Illinois Street and Terry A. Francois Boulevard are the primary streets in the immediate project vicinity that are proposed to be used to connect to routes leading to/from I-280, I-80 and U.S. 101 during construction.

During the construction period, there would be a flow of construction-related trucks into and out of the site, with the greatest number occurring over a three-month period during the excavation and shoring phase (see **Table 5.2-33**). Truck access driveways at the project site would be from multiple locations on South Street (three driveways), Terry A. Francois Boulevard (two driveways), and 16th Street (two driveways). The location of the midblock driveway on South Street between Third Street and Bridgeview Way would shift as construction proceeds (i.e., the driveway would be closer to Third Street for the first three months of construction, and closer to Bridgeview Way for the remainder of the construction period). The number of driveways that would be in use at any one time would depend on the construction phase. The impact of construction truck traffic would be a temporary lessening of the capacities of streets due to the slower movement and larger turning radii of trucks, which may affect both traffic and Muni operations.

Access from I-280 northbound would be via the I-280 off-ramp at the intersection of Mariposa/ Owens, continuing on Mariposa Street to Third Street or Terry A. Francois Boulevard, then to 16th Street or South Street, or from the off-ramp continuing on the new Owens Street segment to 16th Street. Alternately, trucks would exit I-280 northbound at the Cesar Chavez Street, and continue north on Third Street to 16th Street, Terry A. Francois Boulevard, and South Street.

Access to I-280 southbound would be via South Street, Third Street, 16th Street, to the new Owens Street segment and onto the on-ramp, or Third Street to Mariposa Street to the I-280 on-ramp at Owens Street. Alternately, trucks could access the I-280 southbound via South Street, Third Street, 25th Street, to the on-ramp at Pennsylvania Street. Access from I-80 westbound would be via the Eighth Street off-ramp at Harrison Street, continuing on Eighth Street, Bryant Street, and Seventh Street to 16th Street. Access to I-80 eastbound would be via South Street, Third Street, 16th Street, Seventh Street, Bryant Street to the on-ramp at Fifth Street. Truck access routes would be reviewed with the SFMTA as part of the permit process prior to construction. Construction vehicles (i.e., construction trucks and construction workers driving to and from the project site) would not substantially affect peak period intersection conditions, as the construction traffic would be less than the vehicle trips associated with operation of the project (see Impact TR-2), and because construction work schedules do not typically overlap with peak commute periods.

The proposed project also includes extension of the existing northbound Muni light rail platform and associated track work within the median of Third Street north and south of South Street. The extension of the light rail platform would occur over a 14-month period, although construction activities would not be continuous for the entire period. Construction of the track crossovers would occur over a three-day period. Construction activities would require temporary travel lane closure of one of the two northbound lanes on Third Street, depending on the phase of construction activity. On Third Street, the temporary lane closures would reduce the roadway capacity and require all vehicles to use the remaining lane. Temporary lane closures would result in additional vehicle delay, and some drivers might shift to Terry A. Francois Boulevard to access their destinations. Construction activities that involve track work or staging within the track area would require motor coach substitution. To the extent feasible, this work would be scheduled on weekends when impacts on light rail service would be less than during the weekdays.

As presented in **Table 5.2-33**, during peak overlapping construction periods, there would be between 330 and 705 construction workers at the project site. The trip distribution and mode split of construction workers are not known. In San Francisco, some construction workers use transit or carpool to a site, particularly when located downtown, to reduce traffic and parking problems during construction. However, it is anticipated that the addition of the worker-related vehicle- or transit-trips would not substantially affect transportation conditions, as any impacts on local intersections or the transit network would be similar to, or less than, those associated with the proposed project and would be temporary in nature. Construction workers who drive to the site would cause a temporary parking demand. Nearby parking facilities, such as Lot A, the 450 South Street Garage, and UCSF's Third Street Garage, currently have availability during the day, and it is anticipated that construction worker parking demand could be accommodated without substantially affecting areawide parking conditions.

It is anticipated that construction at the project site over the 26-month construction period would overlap with the construction activity of other projects in the area, notably the UCSF LRDP projects, planned for construction between 2015 and 2019. These include 523 residential units, about 440,000 gsf of research, clinical and medical space, and a parking garage containing 500 vehicle parking spaces. Detailed construction schedules for these projects are not currently known, however, it is anticipated that a portion of the construction schedules would overlap with the project construction period. In particular, the UCSF East Campus project on Blocks 33/34, located directly south of the project site across 16th Street, consists of 500,000 gsf of office space, but may include up to 250,000 gsf of clinical space with the remainder dedicated to research/office uses.[45] The project will be built in two phases, with the first phase (about 250,000 gsf) starting construction in 2016 and continuing for about 18 to 24 months. The UCSF projects are projected to generate about 40 daily truck trips on average, and these trucks would enter/exit the UCSF campus via Mission Bay Boulevard North, Nelson Rising Lane, Owens Street, 16th Street, and Fourth Street. In addition, the Uber/ARE project on Mission Bay Blocks 26/27, located directly north of the project site across South Street, consists of 423,000 gsf of office space. Construction on this project is

[45] Clinical uses are considered a "secondary use" under the Mission Bay South Plan and would require a finding of consistency with the Plan by OCII.

estimated to start by the end of 2015 and continue for 18 to 24 months. Impact C-TR-1 presents the cumulative construction-related transportation impact analysis.

The construction activities associated with overlapping projects would affect traffic operations in the nearby vicinity, however, it is not anticipated that construction activities would substantially affect pedestrian movements. It is anticipated that the construction manager for each project would be required to work with the various departments of the City to develop a detailed and coordinated plan that would address construction vehicle routing, traffic control and pedestrian movement adjacent to the construction area for the duration of the overlap in construction activity. See **Impact C-TR-1** for discussion on cumulative construction-related construction impacts.

Overall, because construction activities would be temporary and limited in duration, and are required to be conducted in accordance with City requirements, construction-related ground transportation impacts of the proposed project would be *less than significant.*

Mitigation: Not required

While the proposed project's construction-related transportation impacts would be less than significant, the following improvement measure may be recommended for consideration by City decision makers to further reduce the proposed project's less-than-significant impacts related to construction activities.

Improvement Measure I-TR-1: Construction Management Plan and Public Updates

Construction Coordination – To reduce potential conflicts between construction activities and pedestrians, bicyclists, transit and vehicles at the project site, the project sponsor shall require that the contractor prepare a Construction Management Plan for the project construction period. The preparation of a Construction Management Plan could be a requirement included in the construction bid package. Prior to finalizing the Plan, the project sponsor/construction contractor(s) shall meet with DPW, SFMTA, the Fire Department, Muni Operations and other City agencies to coordinate feasible measures to include in the Construction Management Plan to reduce traffic congestion, including temporary transit stop relocations and other measures to reduce potential traffic, bicycle, and transit disruption and pedestrian circulation effects during construction of the proposed project. This review should consider other ongoing construction in the project vicinity, such as construction of the nearby UCSF LRDP projects and construction on Blocks 26 and 27.

Carpool, Bicycle, Walk and Transit Access for Construction Workers – To minimize parking demand and vehicle trips associated with construction workers, the construction contractor could include as part of the Construction Management Plan methods to encourage carpooling, bicycle, walk and transit access to the project site by construction workers (such as providing transit subsidies to construction workers, providing secure bicycle parking spaces, participating in free-to-employee ride matching program from www.511.org, participating in emergency ride home program through the City of San Francisco (www.sferh.org), and providing transit information to construction workers.

Construction Worker Parking Plan – As part of the Construction Management Plan that would be developed by the construction contractor, the location of construction worker parking could be identified as well as the person(s) responsible for monitoring the implementation of the proposed parking plan. The use of on-street parking to accommodate construction worker parking could be discouraged. All construction bid documents could include a requirement for the construction contractor to identify the proposed location of construction worker parking. If on-site, the location, number of parking spaces, and area where vehicles would enter and exit the site could be required. If off-site parking is proposed to accommodate construction workers, the location of the off-site facility, number of parking spaces retained, and description of how workers would travel between off-site facility and project site could be required.

Project Construction Updates for Adjacent Businesses and Residents – To minimize construction impacts on access to nearby institutions and businesses, the project sponsor could provide nearby residences and adjacent businesses with regularly-updated information regarding project construction, including construction activities, peak construction vehicle activities (e.g., concrete pours), travel lane closures, and parking lane and sidewalk closures. A regular email notice could be distributed by the project sponsor that would provide current construction information of interest to neighbors, as well as contact information for specific construction inquiries or concerns.

Comparison of Impact TR-1 to Mission Bay FSEIR Impact Analysis

The Mission Bay FSEIR did not identify any significant impacts related to construction-related transportation impacts within Mission Bay, and did not require any mitigation measures. Consequently, no new or different mitigation measures or alternatives to reduce project impacts related to construction activities are identified or required with respect to the currently proposed project. On the basis of the facts discussed above, the project would not have any new or substantially more severe effects than those identified in the Mission Bay FSEIR related to construction-related transportation impacts.

Project Impacts: Operations

Conditions Without a SF Giants Game at AT&T Park

Traffic Impacts

Impact TR-2: The proposed project would result in significant traffic impacts at multiple intersections that would operate at LOS E or LOS F under Existing plus Project conditions without a SF Giants game at AT&T Park. (Significant and Unavoidable with Mitigation)

Impact TR-2 presents the traffic impact analysis at the study intersections for the No Event, Convention Event, and Basketball Game scenarios for conditions without an overlapping SF Giants evening game at AT&T Park for the four analysis hours. As described in Section 5.2.5.3, each project scenario was evaluated for the particular time period(s) during which the specific conditions would occur. **Table 5.2-34**, **Figure 5.2-15** and **Figure 5.2-16** present the weekday p.m. peak hour intersection LOS conditions for the three scenarios, **Table 5.2-35** and **Figure 5.2-17** present the weekday evening and late evening peak hour conditions for the Basketball Game scenario, and **Table 5.2-36** and **Figure 5.2-18** present the Saturday evening peak hour conditions for the No Event and Basketball Game scenarios.

Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 5.2-18

Existing Plus Project Intersection LOS-Without a SF Giants Game - Saturday Evening Peak Hour - No Event and Basketball Game Scenarios

No Event Scenario

The No Event scenario would generate 702 new vehicle trips during the weekday p.m. peak hour (255 inbound and 477 outbound), and 785 vehicle trips during the Saturday evening peak hour (367 inbound and 418 outbound). All project-generated vehicles were assigned to the on-site project garage. Intersection LOS for the No Event scenario are presented in **Table 5.2-34** for the weekday p.m. peak hour, and in **Table 5.2-36** for the Saturday evening peak hour. For both weekday p.m. and Saturday evening peak hour conditions under the No Event scenario, the proposed project would result in a significant impact at the study intersection of Seventh/Mississippi/16th. With the addition of project-generated vehicle trips, the intersection LOS would worsen from LOS E under existing conditions to LOS F. All other study intersections would continue to operate at LOS D or better, with the exception of the three intersections that currently operate at LOS E or LOS F during the weekday p.m. peak hour and would continue to operate at the same LOS with the proposed project (i.e., King/Third, King/Fifth/I-280 ramps, and Fifth/Bryant/ I-80 eastbound on-ramp). At these three intersections, the proposed project’s vehicle trips were reviewed to determine whether the project’s contribution to the intersection’s overall LOS E or LOS F operating conditions would be considerable.

The vehicle trips associated with the No Event scenario was determined not to contribute considerably to the existing LOS E or LOS F conditions, and the project's traffic impacts at these intersections would not be considered significant. Detailed calculations and percent contributions to critical movements[46] operating at LOS E or LOS F conditions are included in **Appendix TR**.

Convention Event Scenario

The Convention Event scenario would generate 919 new vehicle trips during the weekday p.m. peak hour (256 inbound and 663 outbound). Because the on-site garage would not accommodate the daily parking demand associated with a convention event, some vehicles would be expected to park at other public parking facilities, primarily Lot A which would accommodate approximately 50 percent of the overall convention event parking demand. However, the convention event parking demand during the p.m. peak hour represents about one third of the maximum parking demand. This level of parking demand can be accommodated at the project site. In other words, the p.m. peak hour coincides with a period when the on-site parking garage can accommodate all of the parking demand generated by the project under this scenario. For this reason, all of the weekday p.m. peak hour vehicles generated by the convention event were assigned to travel to and from the project garage. Weekday p.m. peak hour intersection LOS for the Convention Event scenario are presented in **Table 5.2-34**. During the weekday p.m. peak hour, with the additional vehicle trips generated under the Convention Event scenario, the LOS

[46] The critical movement with respect to an intersection analysis, is the movement or lane for a given signal phase (for example, northbound/southbound versus eastbound/westbound) that requires the most green time, and is determined for each phase based on flow ratios calculated using the HCM2000 intersection operations methodology. The movement or lane with the highest flow ratio for each phase is the critical movement. The critical movements are determined in the quantitative calculations conducted for the study intersections, taking into consideration the available geometric conditions (for example, number of lanes), signalization conditions (for example, cycle length, green time), and traffic conditions (for example, traffic volumes, pedestrian flows, heavy vehicle percentages). The critical movements, using the HCM2000 methodology, were identified by the Synchro intersection analysis software/traffic model developed for this analysis. Poorly operating critical movements are those operating at LOS E or LOS F conditions.

at the intersection of King/Fourth would worsen from LOS D to LOS E, and at the intersection of Seventh/Mississippi/16th would worsen from LOS E to LOS F, and this would be considered a significant traffic impact. All other study intersections would continue to operate at LOS D or better, with the exception of the three intersections that currently operate at LOS E or LOS F during the weekday p.m. peak hour and would continue to operate at the same LOS (i.e., King/Third, King/Fifth/I-280 ramps, and Fifth/Bryant/I-80 eastbound on-ramp). The Convention Event scenario was determined not to contribute considerably to the LOS E or LOS F conditions, and traffic impacts at these three intersections would not be considered significant.

Basketball Game Scenario

Because the on-site garage would be reserved for attendees with pre-issued on-site parking passes, and would be limited to 950 parking spaces, a substantial portion of the vehicle trips associated with attendees driving to the event center were assigned to other public parking facilities, taking into account their proximity to the project site and existing parking occupancy. For all analysis peak hours, event-related vehicle trips would travel, in addition to the project site garage, to and from other nearby parking facilities such as the 450 South Street garage and Lot A. Approximately 20 percent of the weekday p.m. peak hour vehicles were assigned to the project garage, about 30 percent were assigned to the 450 South Street garage, which was assumed to remain open to the general public on basketball game days, and 35 percent were assigned to Lot A; the remaining 15 percent were assigned to UCSF parking garages and lots. The analysis of conditions prior to and following a basketball game at the project site assumes implementation of the proposed project's TMP, which is described in Section 5.2.5.2. Specifically, the TMP specifies that for all events with more than 14,000 attendees, up to 17 PCOs would be stationed in the project vicinity to manage vehicular, transit, bicycle and pedestrian flows (see **Figure 5.2-11**), including at the intersections of Fourth/Channel, Third/Channel, Third/South, Bridgeview/South, Terry A. Francois/South, Third/16th, Illinois/16th, Terry A. Francois/16th, I-280 northbound ramps/Owens/Mariposa, Fourth/Mariposa, Third/Mariposa, and Illinois/Mariposa.

- During the weekday p.m. peak hour, the Basketball Game scenario would generate 886 new vehicle trips (524 inbound and 362 outbound). Weekday p.m. peak hour intersection LOS for the Basketball Game scenario are presented in **Table 5.2-34**. During the weekday p.m. peak hour, with the additional vehicle trips generated under the Basketball Game scenario, the LOS at the intersection of King/Fourth would worsen from LOS D to LOS E conditions, and the LOS at the intersection of Seventh/Mississippi/16th would worsen from LOS E to LOS F. These changes would be considered significant traffic impacts. All other study intersections would continue to operate at LOS D or better, with the exception of the three intersections that currently operate at LOS E or LOS F during the weekday p.m. peak hour (i.e., King/Third, King/Fifth/I-280 ramps, and Fifth/Bryant/I-80 eastbound on-ramp) and would continue to operate at the same LOS. The Basketball Game scenario was determined not to contribute considerably to the existing LOS E or LOS F conditions, and traffic impacts at these three intersections would not be considered significant.

- No travel lane closures are proposed for the weekday evening pre-event conditions. During the weekday evening peak hour, the Basketball Game scenario would generate 2,752 new vehicle trips (2,553 inbound and 198 outbound). Weekday evening intersection LOS for the Basketball Game scenario are presented in **Table 5.2-35**. During the weekday evening peak hour, with the additional vehicle trips associated with event attendees arriving to the study area parking facilities, average delays at most study intersections would increase from existing conditions. The LOS at the intersections of King/Fourth, Fifth/Harrison/I-80 westbound off-ramp, Third/Channel (PCO location), Fourth/Channel (PCO location), and Seventh/Mission Bay Drive (PCO location) would worsen from LOS D or better to LOS E or LOS F conditions, and would worsen from LOS E to LOS F conditions at the intersection of Seventh/Mississippi/16th, and this would be considered a significant traffic impact. All other signalized study intersections would continue to operate at LOS D or better, with the exception of the three intersections that currently operate at LOS E or LOS F during the weekday p.m. peak hour (i.e., King/Third, King/Fifth/I-280 ramps, and Fifth/Bryant/I-80 eastbound on-ramp) and would continue to operate at the same LOS with the project. The Basketball Game scenario was determined not to contribute considerably to the existing LOS E or LOS F conditions, and traffic impacts at these three intersections would not be considered significant.

- Prior to the end of an event under the Basketball Game scenario, temporary travel lane closures would be implemented on Third Street between Mariposa Street and Mission Bay Boulevard South, on South Street between Third Street and Bridgeview Way, on 16th Street between Third Street and Terry A. Francois Boulevard, and on Illinois Street between Mariposa and 16th Streets. These temporary lane closures are anticipated to be in place for approximately 30 to 45 minutes after the end of the event, or until vehicular traffic dissipates and most event attendees taking transit have boarded. As a result of the northbound lane closures, approximately 140 vehicles currently traveling northbound on Third Street and continuing north of 16th Street during the late evening peak hour would be rerouted westbound onto 16th Street (i.e., left turn only at the northbound approach to 16th Street). The 140 northbound vehicles that would be rerouted are based on existing volumes at the intersection, and the number of vehicles that would need to be diverted would likely be lower since drivers would likely avoid the area after an event (e.g., would use I-280, U.S. 101, or Potrero Avenue instead). Some of the rerouted vehicles would be expected to turn left at Mariposa Street, while others would continue to 16th Street where they would be rerouted. It is not expected that the rerouted vehicles would then travel north via Fourth Street, as it is a one-lane local street, but would instead chose Owens Street, Seventh Street, or other streets to the west to continue north. Southbound traffic flow on Third Street would not be affected by these temporary northbound travel lane closures. Additional details related to the travel lane closure are described in Section 5.2.5.2. During the weekday late evening peak hour, the Basketball Game scenario would generate 3,018 new vehicle trips (134 inbound and 2,883 outbound). Weekday late evening (post-event) intersection LOS for the Basketball Game scenario are presented in **Table 5.2-35**. During the weekday late evening peak hour, the additional vehicle trips would result in the LOS at the intersections of Fifth/Bryant/I-80 eastbound on-ramp, and Fourth Channel (PCO location) worsening from LOS D or better to LOS F conditions. This would be considered a significant traffic impact. All other study intersections would continue to operate at LOS D or better.

- No travel lane closures are proposed for the Saturday evening pre-event conditions. During the Saturday evening peak hour, the Basketball Game scenario would generate 2,815 new vehicle trips (2,687 inbound and 128 outbound). Saturday evening intersection LOS for the Basketball Game scenario is presented in **Table 5.2-36**. During the Saturday evening peak hour, with the additional vehicle trips generated, the intersection LOS at the intersections of Fifth/Harrison/I-80 westbound off-ramp, Third/Channel (PCO location), and Seventh/Mission Bay Drive (PCO location) would worsen from LOS D or better to LOS E or LOS F conditions, and this would be considered a significant traffic impact. All other study intersections would continue to operate at LOS D or better.

Other Events

Intersection LOS operating conditions during other events at the project site would be similar to or better than described above for the Basketball Game scenario which assessed the maximum attendance event for evening conditions, and which would also be representative of conditions for sell-out concert events. Intersection LOS operating conditions for daytime events during the weekday p.m. peak hour would be similar to or better than described above for the Convention Event scenario, which reflects the maximum impact during the weekday p.m. peak hour. TMP measures, such as street closures for events with more than 14,000 attendees, would not be required for many of the other events. See **Table 5.2-16** for the TMP measures associated with various events at the proposed event center.

Overall, under existing plus project conditions without a SF Giants game at AT&T Park, the proposed project would result in *significant* project-specific impacts at seven study intersections:

- King/Fourth (weekday p.m., weekday evening)
- Fifth/Harrison/I-80 westbound off-ramp (weekday evening, Saturday evening)
- Fifth/Bryant/I-80 eastbound on-ramp (weekday late evening)
- Third/Channel (weekday evening, Saturday evening)
- Fourth/Channel (weekday evening, weekday late evening)
- Seventh/Mission Bay Drive (weekday evening, Saturday evening)
- Seventh/Mississippi/16th (weekday p.m., weekday evening)

At the study intersections where project-specific impacts were identified, each intersection was reviewed to determine if mitigation measures could reduce the impact to less-than-significant levels or lessen the severity of the project's contribution to existing LOS E or LOS F conditions. Generally, to mitigate poor operating conditions of study intersections, additional travel lane capacity would be needed on one or more approaches to the intersection, particularly at intersections with the I-80 ramps. The provision of additional travel lane capacity by narrowing sidewalks, removal of on-street parking, and/or removal of transit lanes or bicycle lanes would generally be infeasible and inconsistent with the transit, bicycle, and pedestrian environment encouraged by the City's *Transit First* Policy by removing space dedicated to pedestrians, and/or bicycles and increasing the distances required for pedestrians to cross streets. As noted above, the proposed project includes a TMP for events at the project site, and which would minimize impacts of peak arrivals and departures.

Mitigation Measure M-TR-2a: Additional PCOs during Events

As a mitigation measure to manage traffic flows and minimize congestion associated with events at the project site, the proposed project's TMP shall be modified to include four additional PCOs that shall be deployed to intersections where the proposed project would result in significant impacts, as conditions warrant during events. These could include the intersections of King/Fourth, Fifth/Harrison/I-80 westbound off-ramp, Fifth/Bryant/I-80 eastbound on-ramp, Seventh/Mission Bay Drive, and Seventh/Mississippi/16th. The PCO Supervisor shall make the determination where the additional PCOs would be located, based on field conditions during an event.

Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts

The project sponsor shall work with the City to pursue and implement, if feasible, additional strategies to reduce transportation impacts. In addition, the City shall pursue and implement, if feasible, additional strategies that could be implemented by the City or other public agency (e.g., Caltrans). These strategies could include the following:

Strategies to Reduce Traffic Congestion

- The City to work with Caltrans to install changeable message signs upstream of key entry points onto the street network, such as on I-280 northbound.
- The City to provide coordinated outreach efforts to surrounding neighborhoods to explore the need/desire for new on-street parking management strategies, which could include implementation of time limits and Residential Parking Permit program areas.
- The project sponsor to offer for pre-purchase substantially all available on-site parking spaces not otherwise committed to office tenants, retail customers or season ticket holders, and to cooperate with neighboring private garage operators to pre-sell parking spaces, as well as notify patrons in advance that nearby parking resources are limited and travel by non-auto modes is encouraged.
- The project sponsor to create a smart phone application, or integrate into an existing smart phone application, transportation information that promotes transit first, allows for pre-purchase of parking and designates suggested paths of travel that best avoid congested areas or residential streets such as Bridgeview north of Mission Bay Boulevard and Fourth Street.
- The City and the project sponsor to work to identify off-site parking lot(s) in the vicinity of the event center, if available, where livery and TNC vehicles could stage prior to the end of an event.
- The City to include on-street parking spaces within Mission Bay in the expansion and permanent implementation of SF*park*, including dynamic pricing, and smart phone application providing real-time parking availability and cost.
- The City shall work to include the publicly accessible off-street facilities into the permanent implementation of SF*park*, and incorporate data into its platforms used to disseminate information to the public.
- If necessary to support achievement of non-auto mode shares for the project, the project sponsor shall cooperate with future City efforts for active interventions to effectively manage and price the parking supply in the project vicinity to reduce travel by automobile, thus improving traffic conditions.
- The project sponsor to seek partnerships with car-sharing services.

Strategy to Enhance Non-auto Modes

- The project sponsor to provide a promotional incentive (e.g., show Clipper card or bike valet ticket for concession savings, chance to win merchandise or experience, etc.) for public transit use and/or bicycle valet use at the event center.

Strategies to Enhance Transportation Conditions in Mission Bay and Nearby Neighborhoods

- The project sponsor to participate as a member of the Mission Bay Ballpark Transportation Coordination Committee (MBBTCC) and to notify at least one month prior to the start of any non-GSW event with at least 12,500 expected attendees. If commercially reasonable circumstances prevent such advance notification, the GSW shall notify the MBBTCC within 72 hours of booking.
- The City and the project sponsor to meet to discuss transportation and scheduling logistics following signing any marquee events (national tournaments or championships, political conventions, or tenants interested in additional season runs: NHL, NCAA, etc.).

Strategies to Increase Transit Access

- The City to coordinate with regional providers to encourage increased special event service, particularly longer BART and Caltrain trains, and increased ferry and bus service.
- The City to work in good faith with the Water Emergency Transportation Agency, the project sponsor, UCSF, and other interested parties to explore the possibility of construction of a ferry landing at the terminus of 16th Street, and provision of ferry service during events.

Mitigation Measure M-TR-2a: Additional PCOs during Events would reduce the proposed project's impacts related to event-related traffic conditions, and would not result in secondary transportation-related impacts, but would not reduce impacts to less-than-significant levels. **Mitigation Measure M-TR-2b: Additional Measures to Reduce Transportation Impacts** would require the project sponsor to continue to work with the City to seek additional feasible measures to reduce transportation impacts. The measures identified above would reduce traffic congestion in the project vicinity by providing drivers information on traffic conditions and alternate routes, providing information on on-street and off-street parking conditions, discouraging use of on-street parking through the Residential Permit Parking program, encouraging non-auto modes through parking pricing, and enhancing regional transit access to the area, and would not result in secondary transportation impacts. However, even with implementation of these measures, the arrival and departure peak of vehicle trips to and from the event center through these intersections would continue to occur, and therefore, the proposed project's significant traffic impacts at the seven intersections of King/Fourth, Fifth/Harrison/I-80 westbound off-ramp, Fifth/Bryant/I-80 eastbound on-ramp, Third/Channel, Fourth/Channel, Seventh/Mission Bay Drive, and Seventh/Mississippi/16th would remain *significant and unavoidable with mitigation.*

Comparison of Impact TR-2 to Mission Bay FSEIR Impact Analysis

The Mission Bay FSEIR identified significant and unavoidable traffic impacts at seven intersections, including the proposed project study intersection of Fifth/Bryant/I-80 eastbound on-ramp (which was also identified above as a significant impact for the proposed project). Because the proposed project would result in significant traffic impacts at additional intersections, the project would result in *new significant* impacts not previously identified in the Mission Bay FSEIR.

Mission Bay FSEIR Mitigation Measures 47a - 47c, and 47e – 47i were adopted to encourage use of alternate modes and reduce auto mode. A Mission Bay South Transportation Management Plan has been developed which incorporates these mitigation measures, and it is part of the Mission Bay South Owner Participation Agreement for development within Mission Bay. Because the project sponsor would be subject to the Owner Participation Agreement, these mitigation measures are assumed to be part of the proposed project.

Mission Bay FSEIR Mitigation Measure E.47: Transportation System Management Plan

Prepare a TSM Plan, which could include the following:

FSEIR Mitigation Measure E.47.a: Shuttle Bus - Operate shuttle bus service between Mission Bay and regional transit stops in San Francisco (e.g., BART, Caltrain, Ferry Terminal, Transbay Transit Terminal), and specific gathering points in major San Francisco neighborhoods (e.g., Richmond and Mission Districts).

FSEIR Mitigation Measure E.47.b: Transit Pass Sales - Sell transit passes in neighborhood retail stores and commercial buildings in the Project Area.

FSEIR Mitigation Measure E.47.c: Employee Transit Subsidies - Provide a system of employee transportation subsidies for major employers.

FSEIR Mitigation Measure E.47.e: Secure Bicycle Parking - Provide secure bicycle parking area in parking garages of residential buildings, office buildings, and research and development facilities. Provide secure bicycle parking areas by 1) constructing secure bicycle parking at a ratio of 1 bicycle parking space for each 20 automobile parking spaces, and 2) carry out an annual survey program during project development to establish trends in bicycle use and to estimate actual demand for secure bicycle parking and for sidewalk bicycle racks, increasing the number of secure bicycle parking spaces or racks either in new buildings or in existing automobile parking facilities to meet the estimated demand. Provide secure bicycle racks throughout Mission Bay for the use of visitors.

FSEIR Mitigation Measure E.47.f: Appropriate Street Lighting - Ensure that streets and sidewalks in Mission Bay are sufficiently lit to provide pedestrians and bicyclists with a greater sense of safety, and thereby encourage Mission Bay employees, visitors and residents to walk and bicycle to and from Mission Bay.

FSEIR Mitigation Measure E.47.g: Transit and Pedestrian and Bicycle Route Information - Provide maps of the local and citywide pedestrian and bicycle routes with transit maps and information on kiosks throughout the Project Area to promote multi-modal travel.

FSEIR Mitigation Measure E.47.h: Parking Management Strategies - Establish parking management guidelines for the private operators of parking facilities in the Project Area.

FSEIR Mitigation Measure E.47i: Flexible Work Hours/Telecommuting - Where feasible, offer employees in the Project Area the opportunity to work on flexible schedules and/or telecommute so they could avoid peak hour traffic conditions.

The proposed project would result in significant and unavoidable impacts at intersections not previously identified in the Mission Bay FSEIR due to event-related vehicles that would result in exceedance of the intersection LOS threshold. Mission Bay FSEIR Mitigation Measures 47a - 47c, and 47e – 47i would minimize but not reduce traffic impacts to less-than-significant levels, and traffic impacts would remain *significant and unavoidable with mitigation*.

Impact TR-3: The proposed project would result in significant traffic impacts at freeway ramps that would operate at LOS E or LOS F under Existing plus Project conditions without a SF Giants game at AT&T Park. (Significant and Unavoidable with Mitigation)

Table 5.2-37 presents the weekday p.m. peak hour ramp LOS conditions for the three scenarios, **Table 5.2-38** presents the weekday evening and late evening peak hour conditions for the Basketball Game scenario, and **Table 5.2-39** presents the Saturday evening peak hour ramp LOS conditions for the No Event and Basketball Game scenarios. At ramp locations currently operating at LOS E or LOS F, percent contributions to the freeway ramps were calculated to determine the project contribution to the existing LOS E and LOS F conditions, and are included in **Appendix TR**.

No Event Scenario

For the weekday p.m. peak hour condition, the proposed project would not result in any project-specific impacts at the ramp locations. In addition, under the No Event scenario, the proposed project would not contribute considerably to the three ramps operating at LOS E or LOS F under existing conditions (i.e., the I-80 eastbound on-ramp at Sterling Street during the weekday p.m. peak hour, the I-80 eastbound on-ramp at Fifth/Bryant during the weekday p.m. peak hour and Saturday evening peak hour, and the I-280 southbound on-ramp at Pennsylvania Street during the weekday p.m. peak hour), and therefore, under the No Event scenario, traffic impacts at these freeway ramp locations would be less than significant.

Convention Event Scenario

Similar to the No Event scenario, the Convention Event scenario would not result in any project-specific impacts at the ramp locations. In addition, under the Convention Event scenario, the proposed project would not contribute considerably to the three ramps operating at LOS E or LOS F under existing conditions (i.e., the I-80 eastbound on-ramp at Sterling Street during the weekday p.m. peak hour, the I-280 southbound on-ramp at Pennsylvania during the weekday p.m. peak hour, and the I-80 eastbound on-ramp at Fifth/Bryant during the weekday p.m. and Saturday evening peak hours), and therefore, under the Convention Event scenario, traffic impacts at these freeway ramp locations would be less than significant.

Basketball Game Scenario

The proposed project under the Basketball Game scenario would result in a significant traffic impact at the I-80 westbound off-ramp at Harrison Street during the weekday evening peak hour (i.e., attendees driving to San Francisco from the East Bay). The proposed project would not contribute considerably to the other ramps currently operating at LOS E or LOS F (i.e., the I-80 eastbound on-ramp at Sterling Street during the weekday p.m. peak hour, the I-80 eastbound on-ramp at Fifth/Bryant during the weekday p.m., weekday evening, and Saturday evening peak hours, or the I-280 southbound on-ramp at Pennsylvania Street during the weekday p.m. peak hour), and therefore, traffic impacts at these freeway ramp locations would be less than significant.

Other Events

Ramp LOS operating conditions during other events at the project site would be similar to or better than described above for the Basketball Game scenario, which assessed the maximum attendance event for evening conditions and which would be representative of conditions for sell-out concert events. Intersection LOS operating conditions for daytime events during the weekday p.m. peak hour would be similar to or better than described above for the Convention Event scenario, which reflects the maximum impact during the weekday p.m. peak hour.

Overall, under existing plus project conditions without a SF Giants game at AT&T Park, the proposed project would result in *significant* project-specific impacts at the I-80 westbound off-ramp at Fifth/Harrison during the weekday evening.

No feasible mitigations are available for the freeway ramp impacts because there is insufficient physical space for additional capacity without redesign of the I-80 and I-280 ramps and mainline structures, which may require acquisition of additional right-of-way. Moreover, any changes to the ramps would require approval of Caltrans, which operates the freeways and ramps. Potential demand-oriented measures to that could be applied to improve operations at the I-80 westbound off-ramp at Fifth/Harrison would involve reducing the traffic volumes on westbound I-80 by increasing tolls on the San Francisco-Oakland Bay Bridge, or other means, such as mainline traffic metering at the toll plaza in Oakland. Ramp metering, however, would likely exacerbate congestion on streets leading to the on-ramp, while tolling would need to be implemented as a system-wide improvement in order to prevent concentration of vehicular traffic and increased congestion on non-tolled facilities. **Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts** would encourage non-auto modes of travel to the event center through parking pricing and enhance regional transit access to the area, which would reduce the project traffic increase on regional freeway mainline and ramps. However, the reduction in project-generated vehicle trips would not reduce impacts to less-than-significant levels. Thus, for these reasons, the proposed project's impacts related to freeway ramp operations would be *significant and unavoidable with mitigation.*

> **Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts** (see Impact TR-2, above)

Comparison of Impact TR-3 to Mission Bay FSEIR Impact Analysis

The Mission Bay FSEIR did not address traffic impacts on freeway ramp facilities as a distinct transportation topic. The significant and unavoidable project impact at the I-80 westbound off-ramp at Fifth/Harrison would be a *new significant* effect not identified in the Mission Bay FSEIR. As explained above, no feasible mitigation measures are available to avoid this impact. The impact is therefore *significant and unavoidable with mitigation.*

Impact TR-4: The proposed project would not result in a substantial increase in transit demand that could not be accommodated by adjacent Muni transit capacity such that significant adverse impacts to Muni transit service would occur under Existing plus Project conditions without a SF Giants game at AT&T Park. (Less than Significant)

Capacity Utilization. Table 5.2-40 presents the Muni route analysis and regional screenline analysis for the existing plus project conditions for weekday p.m. peak hour conditions for the No Event, Convention Event, and Basketball Game scenarios. **Table 5.2-41** presents the transit analysis for the weekday evening and weekday late evening peak hours for the Basketball Game scenario, while **Table 5.2-42** presents the transit analysis for the Saturday evening peak hour for the No Event and Basketball Game scenario. It should be noted that depending on the origin and destination of the transit trip, the majority of the transit trips arriving from outside of San Francisco would also be required to take a Muni line to their destination, and these trips were included in the transit analysis. **Table 5.2-43** presents the weekday p.m. peak hour downtown screenlines for the No Event and Basketball Event scenarios.

NOTE:
[a] Muni downtown screenlines reflect outbound trips from downtown San Francisco.

SOURCE: Adavant Consulting/Fehr & Peers/LCW Consulting, 2015

No Event Scenario

Under the No Event scenario (i.e., the office, retail and restaurant uses), the proposed project would generate 881 new transit trips (157 inbound and 724 outbound) during the weekday p.m. peak hour. These new transit trips would utilize the nearby Muni lines and regional transit lines, and would include transfers to other Muni bus and light rail lines, or other regional transit providers. Based on the location of the project site and the anticipated origin/destination of the new employees and visitors to the office, retail and restaurant uses, the transit trips were assigned to Muni and the various regional transit operators.

Table 5.2-40 presents the transit analysis for the T Third light rail line and 22 Fillmore routes serving the project site, as well as the three regional screenlines for the weekday p.m. peak hour. **Table 5.2-42** presents the transit analysis for the Saturday evening peak hour, which typically has less transit capacity than during the weekday p.m. peak hour. During both the weekday p.m. and Saturday evening peak hours, the project-generated trips assigned to the T Third line and 22 Fillmore route would be accommodated during the weekday p.m. and Saturday evening peak hours without exceeding the 85 percent capacity utilization standard.

Table 5.2-43 presents the results of the Muni screenline analysis for the existing plus project conditions for weekday p.m. peak hour conditions for the No Event scenario. Based on the trip distribution patterns, it was estimated that out of the 724 outbound transit trips, about 355 would cross the Muni screenlines, 325 would cross the regional screenlines, and the remaining 44 would not cross any screenlines (i.e., would travel within the downtown area). The analysis of Muni screenlines assesses the effect of project-generated transit-trips on transit conditions in the <u>outbound</u> direction from downtown (and away from the project site) during the weekday p.m. peak hour. Based on the origins/destinations of the transit trips generated by the proposed project, the outbound transit trips within San Francisco were assigned to the four screenlines and the sub-corridors within each screenline. Overall, the addition of the project-generated riders to the four screenlines would not substantially increase the peak hour capacity utilization. Capacity utilization for all screenlines and corridors would remain similar to those under existing conditions, and below the capacity utilization standard of 85 percent.

Convention Event Scenario

During the weekday p.m. peak hour, the Convention Event scenario would generate 1,524 new transit trips (212 inbound and 1,312 outbound). **Table 5.2-40** presents the transit analysis for the T Third light rail line and the 22 Fillmore bus route serving the project site. During the weekday p.m. peak hour, the Convention Event Scenario would generate more outbound transit trips than the No Event scenario, with the majority of the increase using the T Third line. As indicated in **Table 5.2-40**, with the addition of the new transit trips associated with the Convention Event scenario, both the T Third line and 22 Fillmore route would continue to operate at less than the 85 percent capacity utilization standard.

Table 5.2-43 presents the Muni screenline analysis for the Convention Event scenario for weekday p.m. peak hour conditions. Based on the trip distribution patterns, it was estimated that out of the 1,312 outbound transit trips, about 572 would cross the Muni screenlines, 490 would cross the regional screenlines, and the remaining 250 would not cross any screenlines (i.e., would travel within the downtown area). Overall, the addition of the project-generated riders to the four screenlines would not substantially increase the peak hour capacity utilization. Capacity utilization for all screenlines and corridors would remain similar to those under Existing conditions, and below the capacity utilization standard of 85 percent.

Basketball Game Scenario

Capacity Utilization. As indicated in Section 5.2.5.2, in addition to the existing scheduled transit service in the project vicinity, the SFMTA would provide additional service to accommodate peak evening events, including basketball games and concerts with more than 14,000 attendees (see **Table 5.2-15** for the proposed frequencies). Light rail service on the T Third would be increased, and three Muni Special Event Shuttle routes would be implemented. The additional capacity that would be provided during the pre-event and post-event periods was incorporated into the transit analysis presented on **Table 5.2-41** for weekday evening (inbound to the project site) and weekday late evening (outbound from the project site) peak hours, and on **Table 5.2-42** for the Saturday evening peak hour (inbound towards the project site).

- During the weekday p.m. peak hour, the Basketball Game scenario would generate 1,625 new transit trips (944 inbound and 681 outbound). As indicated in **Table 5.2-40**, the additional outbound trips would be accommodated on the T Third line and 22 Fillmore.

- During the weekday evening peak hour, the Basketball Game scenario would generate 4,371 new transit trips (4,138 inbound and 232 outbound). About 64 percent of the inbound transit demand would be on the T Third (2,663 trips), about 28 percent on the Muni Special Event Shuttles (1,139 trips), 8 percent would walk from Caltrain (305 trips), and 1 percent would take the 22 Fillmore route (32 trips). As shown on **Table 5.22-41,** the additional trips would be accommodated within the available capacity. The Muni Special Event Shuttles would operate at about 94 percent, which would be below the 100 percent capacity utilization standard for event conditions.

- During the weekday late evening peak hour, the Basketball Game scenario would generate 4,680 new outbound transit trips. About 67 percent of the outbound transit demand would be on the T Third (3,157 trips), about 24 percent on the Muni Special Event Shuttles (1,133 trips), 8 percent would walk to Caltrain (359 trips), and 1 percent would take the 22 Fillmore route (31 trips). As presented in **Table 5.2-41,** the additional trips generated by the project would be accommodated within the proposed transit service plan.

- During the Saturday evening peak hour, the Basketball Game scenario would generate 4,310 new vehicle trips (4,134 inbound and 176 outbound). About 63 percent of the inbound transit demand would be on the T Third (2,611 trips), about 29 percent on the Muni Special Event Shuttles (1,188 trips), 7 percent would walk from Caltrain (308 trips), and 1 percent would take the 22 Fillmore route (27 trips). As presented in **Table 5.2-42,** the additional trips generated by the proposed project would be accommodated within the proposed transit service plan capacities.

Overall, the proposed Muni Special Event Transit Service Plan developed for large events would accommodate transit riders destined to and from the proposed event center during the weekday p.m., weekday evening, weekday late evening, and Saturday evening peak hour, and therefore, proposed project impacts on transit capacity would be less than significant.

Light Rail Platform Operations Assessment. During pre-event and post-event periods, when surges of Muni Metro riders generated by a high attendance event would be arriving or departing the UCSF/Mission Bay station at South Street, there is the potential for crowding to occur on the two raised platforms, northbound and southbound. Such crowding on the Muni platforms, if it were to occur, would be considered a significant transit impact. Therefore, an assessment of conditions at both platforms at the UCSF/Mission Bay Muni Metro station was conducted for event conditions. Overall, it was determined that the proposed project's impacts on light rail platform conditions would be less than significant.

- **Pre-event Operations.** The assessment of pre-event conditions was conducted by comparing the available effective platform area to the pedestrian density required to accommodate passengers within acceptable conditions during pre-event conditions. The methodology used in the analysis was developed by the Transportation Research Board, and is presented in the platform and waiting areas section of Chapter 10 of the *TCRP Transit Capacity and Quality of Service Manual*.[47] See **Appendix TR** for information on methodology and calculations.

  The majority of attendees taking Muni's T Third Metro line to the project site would travel from downtown and would exit the train at the southbound platform, located in the median of Third Street, immediately south of South Street; they would then proceed down the ramp towards the south crosswalk to cross Third Street and arrive at the project site. Thus, the assessment looked at whether passengers exiting a Muni train and having to stop at the crosswalk for a red signal immediately after their arrival could be accommodated within the available area on the ramp and platform. The Muni Metro southbound rail platform is about 9 feet wide and 160 feet in length, and the ramp is about 4 feet wide and 50 feet in length. Combined, accounting for obstacles and a waiting area buffer (i.e., the buffer zone at the east edge of the platform adjacent to the tracks; a fence is provided at the west edge of the platform), the effective area available to disembarking transit riders to queue would be about 950 square feet. The area required to accommodate the maximum passenger demand arriving on a Muni Metro train (i.e., a two-car train) that would serve the platform was estimated based on the capacity of a full two-car train, plus some additional passengers waiting at the platform for the southbound train (i.e., a total of about 250 passengers). The total number of passengers was then multiplied by the passenger density standard (square feet per passenger) established by the TCRP for queuing area expected to operate at a LOS D. The typical design LOS used for station platforms is LOS C to LOS D, and LOS D is considered an acceptable level of crowding during short periods (e.g., to be reached while passengers move away from the platform, but not for the 10- to 15-minute period while waiting for the next train to arrive), and would be considered acceptable for event conditions. The minimum queuing space required to accommodate the expected number of exiting passengers from a full two-car train is about 750 square feet. Therefore, the existing southbound platform, which has approximately 950 square feet, would be able accommodate the expected demand project at LOS D or better conditions. In the event that a following Muni Metro train arrives at the platform while train riders are still queued on the ramp and/or platform waiting to cross Third Street, per standard operating practice, the train operator would not to open the doors until the queue would be cleared from the ramp. The proposed project's TMP includes PCOs that would be

[47] *TCRP Report 165. Transit Capacity and Quality of Service Manual, Third Edition*, Chapter 10: Station Capacity. Available online at http://www.trb.org/Main/Blurbs/169437.aspx. Accessed May 28, 2015.

stationed at the entrances to the light rail platforms on South Street to facilitate pedestrian crossings, and to minimize conflicts between pedestrians, light rail, and southbound vehicular traffic. Nevertheless, **Improvement Measure I-TR-4: Operational Study of the Southbound Platform at the T Third UCSF/Mission Bay Station**, presented below, is identified to further reduce the proposed project's less than significant impacts related to potential crowding conditions at the platform. This measure would study the feasibility and efficacy of enlarging the southbound platform by extending it south towards 16th Street in order to provide additional queuing area for passengers on the platform.

- **Post-event Operations.** As described above in Section 5.2.5.2, as part of the proposed project, the elevated northbound passenger platform at the UCSF/Mission Bay T Third line stop would be extended to the north of South Street. The existing northbound platform located in the median of Third Street immediately north of South Street would be extended to the north from 160 feet in length to 320 feet in length. This extension would allow for two, two-car light rail trains to simultaneously board or alight passengers along the platform prior to or following a large event at the project site. Passenger access to the expanded northbound platform would continue to be provided from a single point, the end of the platform closest to South Street. The existing painted median area adjacent to the northbound track between South and 16th Streets would be raised 6 inches. This improvement would allow for staging of two, two-car northbound light rail trains.

  Following an event, northbound Third Street would be closed to vehicular traffic between 16th Street and Mission Bay Boulevard South. As noted above, PCOs would also be stationed at the entrances to the light rail platforms on South Street to facilitate pedestrian crossings, and to minimize conflicts between pedestrians, light rail, and southbound vehicular traffic. PCOs would stage passengers at a defined passenger waiting area within the closed portion of Third Street, and would allow them to enter the northbound platform as soon as a train departs until the platform becomes reasonably full. Passenger loading onto the trains would be monitored by SFMTA Transit Fare Inspectors and Passenger Assistance Program Staff, who would be stationed at the light rail platforms. This technique is currently employed at AT&T Park following SF Giants games to ensure that no overcrowding of transit riders occurs near the train tracks, and would be effective following events at the proposed project site. For these reasons, the platforms would not become too crowded.

Other Events

Transit conditions during other events at the project site would be similar to or better than described above for the Basketball Game scenario which assessed the maximum attendance event for evening conditions, and which would also be representative of conditions for sell-out concert events. The proposed Muni Special Event Transit Service Plan would be provided for other large events (i.e., with more than 14,000 attendees), and the service levels of the additional service would be adjusted to reflect the anticipated attendance level.

Summary of Impact TR-4, Muni Transit Impacts

Overall, the proposed Muni Special Event Transit Service Plan developed for large events would accommodate transit riders destined to and from the proposed event center during the weekday p.m., weekday evening, weekday late evening, and Saturday evening peak hours. In addition, with implementation of the TMP, operations at the T Third light rail platforms would not become overcrowded during events. For these reasons, the proposed project's impacts on transit would be *less than significant.*

Mitigation: Not required

While the proposed project's transit impacts would be less than significant, the following improvement measure may be recommended for consideration by City decision makers to further reduce the proposed project's less-than-significant transit impacts.

Improvement Measure I-TR-4: Operational Study of the Southbound Platform at the T Third UCSF/Mission Bay Station

As an improvement measure to enhance T Third operations at the UCSF/Mission Bay station for pre-event arrivals, the project sponsor shall fund a study of the effects of pedestrian flows on Muni's safety and operations prior to an event as well as the feasibility and efficacy of enlarging the southbound platform by extending it south towards 16th Street. The study shall include an assessment of exiting pedestrian flows from a fully occupied two-car light rail train on the platform and ramp to the crosswalk at South Street across Third Street, also taking into consideration the presence of non-event transit riders waiting to board the train, service frequency, and current traffic signal operations. The study shall be performed by a qualified transportation professional approved by SFMTA.

Implementation of **Improvement Measure I-TR-4: Operational Study of the Southbound Platform at the T Third UCSF/Mission Bay Station** would study the need for and feasibility of physical improvements to the existing light rail platform, and would not result in any secondary transportation-related impacts.

Comparison of Impact TR-4 to Mission Bay FSEIR Impact Analysis

The Mission Bay FSEIR did not identify any significant impacts related to transit within Mission Bay, and did not require any mitigation measures. Consequently, no new or different mitigation measures or alternatives to reduce project impacts related to transit impacts are identified or required with respect to the currently proposed project. On the basis of the facts discussed above, the project would result in no new or substantially more severe significant effects than those identified in the Mission Bay FSEIR related to transit impacts.

Impact TR-5: The proposed project would result in a substantial increase in transit demand that could not be accommodated by regional transit capacity such that significant adverse impacts to regional transit service would occur under Existing plus Project conditions without a SF Giants game at AT&T Park. (Significant and Unavoidable with Mitigation)

Table 5.2-40 above presents the regional screenline analysis for the existing plus project conditions for weekday p.m. peak hour conditions for the No Event, Convention Event, and Basketball Game scenarios. **Table 5.2-41** above presents the regional screenline analysis for the weekday evening and weekday late evening peak hours for the Basketball Game scenario, while **Table 5.2-42** above presents the regional screenline analysis for the Saturday evening peak hour for the No Event and Basketball Game scenario.

No Event Scenario

Similar to the Muni screenline analysis presented in Impact TR-4, the analysis of regional transit screenlines assess the effect of project-generated transit-trips on transit conditions in the outbound direction during the weekday p.m. peak hour. Under the No Event scenario, the proposed project would generate 349 new transit trips (24 inbound and 325 outbound) during the weekday p.m. peak hour and 163 new transit trips (41 inbound and 122 outbound) during the Saturday evening peak hour. Of the 325 outbound trips during the weekday p.m. peak hour, 218 would be destined to the East Bay, 17 to the North Bay, and 90 to the South Bay. Of the 41 inbound trips during the Saturday evening peak hour, 35 would be arriving from the East Bay and 6 from the South Bay. **Table 5.2-40** presents the existing plus project screenline analysis for the regional transit carriers for the weekday p.m. peak hour, while **Table 5.2-42** presents the analysis for the Saturday evening peak hour. In general, the additional project-related passengers would not have a substantial effect on the regional transit providers during the analysis hours, as the capacity utilization for all screenlines would remain similar to those under existing conditions. In addition, the capacity utilization for all regional transit providers would be under their capacity utilization standards of 100 percent.

Convention Event Scenario

During the weekday p.m. peak hour, the Convention Event scenario would generate 545 new transit trips (56 inbound and 489 outbound) to and from outside of San Francisco. Based on the trip distribution patterns, it was estimated that during the weekday p.m. peak hour there would be 346 transit trips destined to the East Bay, 18 transit trips to the North Bay, and 126 transit trips to the South Bay. **Table 5.2-40** presents the existing plus project screenline analysis for the regional transit carriers. In general, the addition of the 489 project-related passengers would not have a substantial effect on the regional transit providers during the weekday p.m. peak hour, as the capacity utilization for all screenlines would remain similar to those under existing conditions. In addition, the capacity utilization for all regional transit providers would be under their capacity utilization standards of 100 percent.

Basketball Game Scenario

The proposed project's TMP does not include any provisions for additional regional transit service during events at the project site. Therefore, the regional screenline analysis conducted for the project assumes existing capacities, as identified by the regional transit service providers.

- During the weekday p.m. peak hour, the Basketball Game scenario would add 324 outbound trips to the regional screenlines. As indicated in **Table 5.2-40** above, the additional outbound trips would not substantially affect the capacity utilization of the regional service providers.

- During the weekday evening peak hour, the Basketball Game scenario would add 2,697 new transit trips to the regional screenlines (i.e., about 59 percent destined to the East Bay, 11 percent to the North Bay, and 30 percent to the South Bay). While the majority of trips would be from the East Bay, the additional trips on Caltrain would increase the capacity utilization to more than 100 percent, and this would be considered a significant impact. See **Table 5.2-41,** above.

- During the weekday late evening peak hour, the Basketball Game scenario would add about 5,496 new outbound transit trips to the regional screenlines (i.e., about 57 percent destined to the East Bay, 14 percent to the North Bay, and 29 percent to the South Bay). As presented in **Table 5.2-41** above, this additional demand would exceed the capacity of the existing service provided on the Golden Gate Transit and WETA buses and ferries to the North Bay, and on Caltrain to the South Bay, and this would be considered a significant impact.

- During the Saturday evening peak hour, the Basketball Game scenario would add about 2,867 new inbound transit trips to the regional screenlines (i.e., about 57 percent from the East Bay, 14 percent from the North Bay, and 29 percent from the South Bay). As presented in **Table 5.2-42** above, this additional demand would exceed the capacity of the existing service provided on Caltrain from the South Bay, and this would be considered a significant impact.

Other Events

Conditions for the regional transit operators during other events at the project site would be similar to or better than described above for the Basketball Game scenario, which assessed the maximum attendance event for evening conditions, and which would also be representative of conditions for sell-out concert events.

Summary of Impact TR-5, Regional Transit Impacts

Overall, under existing plus project conditions without a SF Giants game at AT&T Park, the proposed project would result in *significant* project-specific regional transit impacts, as follows:

- On Caltrain to and from the South Bay during the weekday evening, weekday late evening, and Saturday evening peak hours for the Basketball Game scenario.

- On WETA and Golden Gate Transit service to the North Bay during the weekday late evening peak hours.

In order to accommodate the additional transit demand to the South Bay during weekday and Saturday evening conditions, one additional train car (average capacity of 130 passengers per car) on at least one inbound train per hour would be needed. For the weekday late evening period, two additional train cars (average capacity of 130 passengers per car) on at least one outbound train per hour would be needed. Alternatively, the transit demand could be accommodated within one special outbound train (total capacity up to 650 passengers) at the end of the basketball game, similar to the service currently being offered for SF Giants home games (two special outbound trains).

In order to accommodate the additional transit demand to the North Bay, four additional Golden Gate Transit buses (40 passengers per bus) plus one ferry boat (250 to 320 passengers per boat) per hour, or alternatively seven additional buses per hour would need to be provided.

Implementation of **Mitigation Measure M-TR-5a: Additional Caltrain Service** and **Mitigation Measure M-TR-5b: Additional North Bay Ferry and/or Bus Service** would reduce or minimize the severity of the capacity utilization exceedances for the regional transit service providers, and would not result in secondary transportation impacts. However, since the provision of additional

South Bay and North Bay service is uncertain and full funding for the service has not yet been identified, implementation of both mitigation measures remain uncertain. Accordingly, the proposed project's significant impacts to Caltrain, Golden Gate Transit and WETA transit capacity would remain *significant and unavoidable with mitigation.*

Mitigation Measure M-TR-5a: Additional Caltrain Service

As a mitigation measure to accommodate transit demand to and from the South Bay for weekday and weekend evening events, the project sponsor shall work with the Ballpark/Mission Bay Transportation Coordinating Committee to coordinate with Caltrain to provide additional Caltrain service to and from San Francisco on weekdays and weekends. The need for additional service shall be based on surveys of event center attendees conducted as part of the TMP.

Mitigation Measure M-TR-5b: Additional North Bay Ferry and/or Bus Service

As a mitigation measure to accommodate transit demand to the North Bay following weekday and weekend evening events, the project sponsor shall work with the Ballpark/Mission Bay Transportation Coordinating Committee to coordinate with Golden Gate Transit and WETA to provide additional ferry and/or bus service from San Francisco following weekday and weekend evening events. The need for additional service shall be based on surveys of event center attendees conducted as part of the TMP.

Comparison of Impact TR-5 to Mission Bay FSEIR Impact Analysis

The Mission Bay FSEIR did not identify any significant regional transit impacts for existing plus project conditions, and did not require any mitigation measures. Because the proposed project would result in significant impacts to Caltrain, Golden Gate Transit, and WETA transit capacity, the project would result in *new significant* impacts not previously identified in the Mission Bay FSEIR.

Pedestrian Impacts

Impact TR-6: The proposed project could result in a substantial overcrowding on public sidewalks, or create potentially hazardous conditions for pedestrians, or otherwise interfere with pedestrian accessibility on the site and adjoining areas under Existing plus Project conditions without a SF Giants game at AT&T Park. (Less than Significant with Mitigation)

Pedestrian Improvements

The proposed project includes numerous sidewalk network and traffic control improvements that would improve and define the pedestrian environment adjacent to the project site. Specifically, the proposed project includes construction of new sidewalks along the perimeter of the project site on South Street (12.5 feet wide), on Terry A. Francois Boulevard (12.5 feet wide), on 16th Street (15 feet wide), and widening of the existing sidewalk on Third Street from 12 to 16 feet. A 20-foot wide setback would generally be provided along the 16th Street frontage, and a 5-foot wide setback would be provided for buildings fronting South Street, Third Street, and

Terry A. Francois Boulevard. These setbacks, as well as additional ground floor building setbacks on all four corners as shown on **Figure 3-5** in the Project Description, and additional midblock queuing area on 16th Street in the vicinity of the proposed Muni Special Event Van Ness Avenue Shuttle stop (see **Appendix TR**), would allow for additional queuing space at the corners for pedestrians waiting to cross the street and for pedestrians waiting to load onto shuttle buses on 16th Street.

Additional project pedestrian improvements include signalization of the intersections of Terry A. Francois Boulevard/16th Street, Terry A. Francois Boulevard/South Street, and Illinois Street/Mariposa Street, including installation of pedestrian countdown signals. New pedestrian crosswalks, consistent with the continental design recommendations in the *Better Streets Plan*, would be installed at the intersections of Bridgeview Way/South Street, Terry A. Francois Boulevard/South Street, Terry A. Francois Boulevard/16th Street, Illinois Street/16th Street, Terry A. Francois Boulevard/16th Street, and Illinois/Mariposa. In addition, the existing crosswalks at the signalized intersections of Third Street/South Street and Third Street/16th Street would be restriped to the continental design.

As part of the light rail station improvements that would be made as part of the proposed project, fencing would be placed adjacent to the light rail tracks in such a manner as to discourage pedestrian crossings midblock between the intersection of Campus Way with southbound Third Street and the event center on the east side of the street, directly across from Campus Way. The exact location of the fencing (i.e., either the east side or west side of the light rail tracks) and the configuration of the fencing have not been identified.

Pedestrian Access

Figure 3-14 in Chapter 3 presents the proposed pedestrian circulation at the project site. Pedestrian access to the project site uses, including buildings and plazas, would be available from multiple locations along all four perimeter streets. Within the project site, a 40-foot wide curving pedestrian path would lead from the elevated Third Street Plaza around the north and east sides of the event center, past retail uses and a proposed bayfront overlook, and terminate on the southeast side of the event center. An outdoor, glass covered passageway would extend from ground level on 16th Street curving around the southwest side of the event center to the Third Street Plaza.

The primary pedestrian access to the event center for large-attendance events would be on the northwest side of the event center via the elevated Third Street Plaza. A secondary access point to the event center for large-attendance events would be on the southeast side of the event center via the elevated pedestrian path. The primary pedestrian access to the event center for smaller-attendance events would be at the ground-level theater entrance on the southeast side of the event center, via the Southeast Plaza. As noted above, ground floor building setbacks would be provided on all four corners of the project site to allow for additional queuing space at the corners.

Pedestrian access to the two office and retail building lobbies and the ground-floor retail/restaurant uses would be from South and 16th Streets and from the Third Street Plaza. The food hall in the northeast corner of the site would be accessed directly via Terry A. Francois Boulevard and South Street, and also from the elevated pedestrian path within the project site.

Pedestrian Demand

Pedestrians trips generated by the proposed project would include walk trips to and from the project site, walk trips to and from transit stops (e.g., the Caltrain station at Fourth/King and Muni bus and light rail transit stops), and walk trips between the project site and nearby parking facilities. As noted above, pedestrians would access the buildings on the project site from multiple streets, with the greatest proportion of pedestrians traveling through the intersection of Third/South.

- No Event – During the weekday p.m. peak hour, the No Event scenario would add about 1,452 new pedestrian trips to the surrounding streets, which includes 882 person trips to and from nearby transit stops and 570 walk/other trips. During the Saturday evening peak hour, the No Event scenario would add about 1,423 new pedestrian trips to the surrounding streets, which includes 673 person trips to and from nearby transit stops and 750 walk/other trips.
- Convention Event – During the weekday p.m. peak hour, the Convention Event scenario would add about 4,396 new pedestrian trips to the surrounding streets, which includes 1,524 person trips to and from nearby transit stops, 774 person trips to and from nearby parking facilities and 2,098 walk/other trips. The Convention Event scenario would add the greatest number of pedestrian trips to the adjacent street network during the weekday p.m. peak hour (i.e., attendees leaving the convention event during the weekday p.m. peak hour).
- Basketball Game – During the weekday p.m. peak hour, the Basketball Game scenario would add about 3,531 new pedestrian trips to the surrounding streets, which includes 1,625 person trips to and from nearby transit stops, 1,316 person trips to and from nearby parking facilities and 590 walk/other trips.

  During the weekday evening peak hour (i.e., per-game), the Basketball Game scenario would add about 10,976 new pedestrian trips to the surrounding streets, which includes 4,371 person trips to and from nearby transit stops, 5,237 person trips to and from nearby parking facilities, and 1,368 walk/other trips. During the weekday late evening peak hour (i.e., post-game), the Basketball Game scenario would add about 11,762 new pedestrian trips to the surrounding streets, which includes 4,680 person trips to and from nearby transit stops, 5,824 person trips to and from nearby parking facilities and 1,258 walk/other trips.

  During the Saturday evening peak hour (i.e., pre-game), the Basketball Game scenario would add about 10,800 new pedestrian trips to the surrounding streets, which includes 4,310 person trips to and from nearby transit stops, 5,809 person trips to and from nearby parking facilities and 681 walk/other trips.

The new pedestrian peak hour trips were distributed to the streets in the project vicinity based on the location of the transit/event shuttle stops, location of parking facilities (for event scenarios when associated parking demand would not be accommodated within the on-site garage), and nearby attractions. The resulting project-generated pedestrian trips were then added to the existing sidewalk and crosswalk volumes (i.e., as described in Section 5.2.3.3, the existing pedestrian volumes counted in 2014 were adjusted to reflect to reflect the recent completion of the UCSF Medical Center Phase 1 and Public Safety Building projects) to determine the existing plus project pedestrian volumes at the study locations.

Pedestrian LOS at Crosswalks and Sidewalks

Table 5.2-44 presents the existing plus project pedestrian LOS conditions for the weekday p.m. peak hour for the three analysis scenarios. **Table 5.2-45** presents the existing plus project pedestrian LOS for the weekday evening and late evening conditions for the Basketball Game scenario, while **Table 5.2-46** presents the pedestrian LOS for Saturday evening No Event and Basketball Game scenarios.

SOURCE: Adavant Consulting/Fehr & Peers/LCW Consulting, 2015

No Event Scenario. As shown on **Table 5.2-44** and **Table 5.2-46**, with the addition of the new pedestrian trips associated with the office, retail and restaurant uses during the weekday p.m. and Saturday evening peak hours, the pedestrian LOS conditions for the No Event scenario would be LOS A or LOS B at the crosswalk and sidewalk locations.

Convention Event Scenario. As shown on **Table 5.2-44**, with the addition of the new pedestrian trips during the weekday p.m., the pedestrian LOS conditions for the Convention Event scenario would be LOS C or better at the crosswalk and sidewalk locations. The greatest number of new pedestrians would be at the intersection of Third/South, accessing the light rail platform within the median of Third Street. During convention events, PCOs would be stationed at the intersections of

Third/South and Third/16th to facilitate pedestrian travel through these intersections and to minimize conflicts. During convention events when Moscone Center event shuttle buses would be used to transport attendees between the event center and downtown locations, a shuttle bus zone would be provided along the north curb of 16th Street between Illinois Street and Terry A. Francois Boulevard. The proposed 15 foot wide sidewalk, with additional midblock setbacks along 16th Street, would be adequate to accommodate pedestrians walking to and from the shuttle buses, as well as pedestrians waiting for shuttle buses and pedestrians traveling along 16th Street.

Basketball Game Scenario. Analysis of pedestrian conditions for the Basketball Game scenario was conducted for the weekday p.m. peak hour, as well as for the peak arrival (weekday evening) and peak departure (late evening) hours for a weekday evening game, and for the Saturday evening peak hour for peak arrivals for a Saturday evening game. During the weekday p.m. peak hour, the number of pedestrians on crosswalks and sidewalks would increase over the No Event scenario, as basketball game attendees would start arriving to the event center during the p.m. peak hour for an evening event which would typically start at 7:30 p.m. With the increase in pedestrians, the pedestrian LOS conditions would be LOS A or LOS B at all study locations, with the exception of the south crosswalk at the intersection of Third/South, which would operate at LOS D. The LOS D conditions for the south crosswalk reflect the increased number of pedestrians traveling to the event center via the T Third during the p.m. peak hour, and getting off at the UCSF/Mission Bay station.

During the weekday evening peak hour, pedestrians in the project vicinity would increase substantially (i.e., about 11,000 new pedestrians during the weekday evening peak hour, as compared to 3,500 new pedestrians during the weekday p.m. peak hour), and include arrivals via the existing T Third light rail line and 22 Fillmore bus route as well as attendees arriving via the Muni Special Event Shuttles. For pre-event conditions, the Muni Special Event Shuttle stops would be located adjacent to the project site on South Street (i.e., the Muni Special Event Ferry Building/Transbay Terminal Shuttle) and on the south side of 16th Street between Third and Illinois Streets (i.e., the Muni Special Event Van Ness Avenue Shuttle and the Muni Special Event 16th Street BART Station Shuttle). During the weekday evening peak hour, pedestrian LOS conditions would worsen from weekday p.m. peak hour, however, the sidewalks and crosswalks would be able to accommodate the increased pedestrian volumes.

During the weekday evening and Saturday evening peak hours during pre-event conditions, all analysis locations would operate at LOS D or better, except for the north (LOS E) and south (LOS F) crosswalks at the intersection of Third/South. These poor operating conditions would be due to the high volume of transit riders leaving the T Third light rail platforms and crossing Third Street. Post-event, Muni Special Event Shuttle stops would be located adjacent to the project site on 16th Street, and on the east side of Illinois Street south of 16th Street and on the east side of Third Street north of South Street.

During the weekday late evening, reflecting conditions with pedestrians leaving the event center, crosswalks and sidewalks would also operate at LOS D or better, with the exception of all three crosswalks at the intersection of Third/South which would operate at LOS E or LOS F. The LOS E and LOS F conditions at the intersection of Third/South during the weekday evening and late evening, and Saturday evening peak hours would be considered a significant pedestrian impact. Following an event, the proposed 15-foot wide sidewalk, with additional setbacks along 16th Street to provide for midblock queuing area in the vicinity of the proposed Muni Special Event Van Ness Avenue Shuttle stop, would be adequate to accommodate pedestrians walking to the Muni Special Event Van Ness Avenue Shuttle, as well as pedestrians waiting for shuttle buses and pedestrians traveling along 16th Street.

Mitigation Measure M-TR-6: Active Management of Pedestrian Flows at the Intersection of Third/South (presented below) would implement strategies to facilitate pedestrian travel to and from the light rail platforms, including extending the green time for pedestrians crossing the street, manually overriding the traffic signal and directing pedestrians to cross, and allowing use of the closed Third Street as a pedestrian access route. These strategies would complement the proposed project's TMP protocols for event operations that include posting of PCOs at this and other nearby intersections (see **Figure 5.2-11**) for pre-event and post-event to facilitate pedestrian flows and minimize conflicts. With the travel lane closures and active management of pedestrian flows, pedestrians would be able to cross outside of the designated crosswalk (i.e., disperse over a greater crossing area) and pedestrian crossing conditions would improve to LOS D or better. For these reasons, implementation of **Mitigation Measure M-TR-6: Active Management of Pedestrian Flows at the Intersection of Third/South** would mitigate the significant pedestrian impacts for the crosswalks at the intersection of Third/South to less than significant.

At the intersection of Illinois/16th Street, PCOs would manage alternating flows of vehicle traffic exiting the garage with pedestrian and bicycle flows along and crossing 16th Street, manage alternating flows of vehicle traffic exiting the garage with the Muni Special Event 16th Street BART shuttles accessing 16th Street eastbound from Illinois Street northbound and with the Muni Special Event Van Ness Avenue shuttles traveling westbound on 16th Street, and coordinate with PCOs along 16th Street that would be managing pedestrian flows across 16th Street.

Other Events

Pedestrian LOS conditions at the sidewalk and crosswalk locations during other smaller events at the project site would be similar to or better than described above for the Convention Event and Basketball Game scenarios, which assessed the maximum attendance event, and which would be representative of conditions for sell-out concert events (i.e., the Basketball Game scenario), and a daytime event with about 9,000 attendees (i.e., the Convention Event scenario). Pedestrian travel associated with smaller events would be accommodated within the nearby sidewalks and crosswalks without requiring temporary lane closures to accommodate pedestrian flows, however, similar to large events, during smaller events PCOs would be posted at nearby intersections to manage pedestrian flows and reduce conflicts (see **Table 5.2-16** for a list of the TMP transportation management strategies by event type).

Pedestrian Corner Conditions

The three buildings on the project site (i.e., the South Street Tower, the 16th Street Tower, and the event center) would be set back at all four corners of the project site to provide for corner queuing area to accommodate pedestrians waiting during the red signal phase, and for an area for pedestrians to congregate. These areas are shown on **Figure 3-5** in the Project Description, and the additional on-site areas that would be provided would be about 11,000 gsf at the northwest corner of the site (at the intersection of Third/South), 4,700 gsf would at the northeast corner of the site (at the intersection of Terry A. Francois/South), 2,700 gsf at the southwest corner of the site (at the intersection of Third/16th), and 13,200 gsf at the southeast corner of the site (at the intersection of Terry A. Francois/16th). These building setbacks would provide generous queuing space for pedestrians exiting the project site and waiting to cross either South Street or Third Street (e.g., the on-site area at the northeast corner could accommodate about 3,700 pedestrians queuing at one time), and therefore, it is not anticipated that pedestrians would spill out into the adjacent travel lanes.

Pedestrian Safety

Under the No Event scenario, there would be an increased potential for pedestrian-vehicle and pedestrian-bicycle conflicts as traffic, pedestrian, and bicycle volumes would increase from existing conditions. There are a number of factors that contribute to increased pedestrian-vehicle and pedestrian-bicycle conflicts, and the number of collisions at an intersection is a function of the vehicle and bicycle volumes, traffic control, vehicle speeds, types of pedestrian facilities, surrounding land uses, location, and the number of pedestrians. The project's numerous pedestrian network improvements described above, including new sidewalks, building setbacks, continental crosswalks, and new traffic signals with pedestrian countdown signals, would define the pedestrian network and would offset risks associated with increased pedestrian-vehicle and pedestrian-bicycle conflicts. The enhanced roadway, bicycle and pedestrian network, as well as an increased pedestrian presence, would cause drivers to expect and adapt to increased interactions with pedestrians.

As described in Impact TR-4, when a full two-car T Third light train arrives at the southbound platform prior to an event, exiting pedestrians on the southbound platform and ramp would experience queued conditions, and more than one signal cycle may be needed to clear the platform of pedestrians. While queuing on the platform and ramp would occur, this condition would be expected for peak arrivals to the event center, and would not be considered a significant pedestrian impact.

As noted above, the proposed project includes installation of fencing along the existing light rail right-of-way in the center of Third Street to deter pedestrians from crossing southbound Third Street near Campus Way.

During event days at the event center there would be increased potential for pedestrian-vehicle and pedestrian-bicycle conflicts compared to the No Event scenario. However, as described above, the proposed project's TMP would be in effect, and PCOs would be posted at key nearby locations to manage pedestrian flows and minimize potential conflicts with vehicles and bicycles, and proposed project impacts related to pedestrian safety would be less than significant.

Summary of Impact TR-6, Pedestrian Impacts

Overall, the proposed project would implement numerous improvements that would enhance pedestrian conditions and safety in the project vicinity. The existing and proposed pedestrian facilities would be adequate to meet the pedestrian demand associated with the project uses. The exception would be the crosswalks at the intersection of Third/South, which would operate at LOS E or LOS F conditions during the weekday evening and late evening, and Saturday evening conditions for sell-out events (i.e., the Basketball Game scenario). **Mitigation Measure M-TR-6: Active Management of Pedestrian Flows at the Intersection of Third/South** and the proposed project's TMP protocols for events would manage short-term peak pedestrian flows at adjacent intersections and would mitigate pedestrian impacts to less-than-significant levels. At all other locations and project conditions, the addition of project-generated pedestrian trips would not substantially affect pedestrian flows, create potentially hazardous conditions for pedestrians or otherwise interfere with pedestrian accessibility to the site and adjoining areas.

Mitigation Measure M-TR-6: Active Management of Pedestrian Flows at the Intersection of Third/South

As a mitigation measure to accommodate pedestrians traveling to and from the event center through the intersection of Third/South, PCOs stationed at this location shall implement strategies to allow pedestrians to cross the street safely. The strategies and level of active management shall be tailored to the event size, and could include extending the green time for pedestrians crossing the street, manually overriding the traffic signal and directing pedestrians to cross, erecting temporary pedestrian crossing barriers, allowing use of the closed Third Street as a pedestrian access route, providing a defined passenger waiting area within the closed Third Street, shielding passengers waiting to board light rail from adjacent pedestrian traffic, and deploying additional PCOs to this intersection.

Mitigation Measure M-TR-6: Active Management of Pedestrian Flows at the Intersection of Third/South[48] would reduce the proposed project's pedestrian impacts at the intersection of Third/South to less-than-significant levels, and would not result in secondary transportation-related impacts. Therefore, the proposed project's impact on pedestrians would be *less than significant with mitigation.*

Comparison of Impact TR-6 to Mission Bay FSEIR Impact Analysis

The Mission Bay FSEIR did not identify any significant impacts related to pedestrians within Mission Bay, and did not require any mitigation measures. Because the proposed project would result in significant pedestrian impacts at the crosswalks at the intersection of Third/South, the project would result in *new significant impacts* not previously identified in the Mission Bay FSEIR.

---

[48] As an example, PCOs actively manage pedestrian flows at the intersections of Third/King and Second/King prior to and following a SF Giants game at AT&T Park.

Bicycle Impacts

Impact TR-7: The proposed project would not result in potentially hazardous conditions for bicyclists, or otherwise substantially interfere with bicycle accessibility to the site and adjoining areas under Existing plus Project conditions without a SF Giants game at AT&T Park. (Less than Significant)

Bicycle Improvements

The proposed project would provide bicycle storage rooms accommodating 111 Class 1 bicycle parking spaces within the proposed office and retail/restaurant buildings (i.e., 55 bicycle parking spaces in the South Street office and retail building, 52 spaces in the 16th Street office and retail building, and 4 spaces in the Food Hall).[49] In addition, an enclosed bicycle parking center would be provided at the southeast plaza area near 16th Street, and would accommodate up to 300 Class 2 bicycle parking spaces for employees and visitors on days without an event. This bicycle parking center would be conveniently located and easily accessible from the bicycle lanes on 16th Street and Terry A. Francois Boulevard. On event days, this facility would be valet staffed, which would then convert the 300 spaces to Class 1; an additional 100 Class 1 bicycle parking spaces would be provided when necessary in a temporary bicycle corral within the main plaza or southeast plaza areas, for a total of 400 Class 1 bicycle parking spaces on event days. The bicycle valet is proposed to be staffed by a partner such as the San Francisco Bicycle Coalition for evening uses during peak events, such as NBA games and concerts, and may also be staffed during smaller events. The entrance to the valet parking would face east to direct departing bicyclists towards the signalized intersection of Terry A. Francois/16th Street, where they can safely mount their bicycles. The valet parking would be attended from two hours prior to the start of the event, to approximately an hour after the event ends. The proposed project would also provide 75 Class 2 bicycle parking spaces via bicycle racks on adjacent sidewalks and on-site at key locations. **Figure 3-15** in Chapter 3 presents the general location of the proposed bicycle parking spaces.

The proposed project would include sponsorship of a Bay Area Bike Share station on or near the project site. The location of the station would be determined through coordination between the project sponsor, the SFMTA, the Port of San Francisco, and the bicycle share operator.

With implementation of the proposed project, and as part of the Mission Bay Infrastructure Plan, 16th Street would be built out between Illinois Street and Terry A. Francois Boulevard. Class II bicycle lanes on 16th Street would be extended in both directions east of Third Street to Terry A. Francois Boulevard. On both sides of 16th Street between Third and Illinois Streets, a 6-foot wide bicycle lane would be located adjacent to the 8-foot wide curb parking lane. On both sides of 16th Street between Illinois Street and Terry A. Francois Boulevard a 6-foot wide bicycle lane would

[49] Per Planning Code Section 155.1, Bicycle Parking Definitions and Standards, Class 1 bicycle parking facilities are those that protect the entire bicycle and accessories against theft and inclement weather. Examples of Class 1 facilities include lockers, check-in facilities, monitored parking, restricted access parking, and personal storage. Class 2 bicycle racks permit the bicycle frame and one wheel to be locked in the rack (with one u-shaped lock), and provide support to bicycles without damage to the wheels, frame, or components. Available online at http://planning.sanfranciscocode.org/1.5/155.1/. Accessed May 28, 2015.

be provided adjacent to the curb, and a 4-foot wide buffer would separate the bicycle lane from the adjacent 8-foot wide parking lane. The extension of the bicycle lanes on 16th Street to the intersection of Terry A. Francois Boulevard/16th Street would facilitate access to the planned cycle track and the Bay Trail that runs along the shoreline parallel to Terry A. Francois Boulevard. The incorporation of appropriate bicycle crossing markings and signals to transition between bicycle lanes on 16th Street and cycle track on Terry A. Francois Boulevard would ensure efficient operation of the intersection and would reduce potential conflicts between bicycles, pedestrians, and automobiles.

The relocation of Terry A. Francois Boulevard as part of the Mission Bay Infrastructure Plan (and constructed by the master developer) will include replacing the existing bicycle lane in each direction with a 13-foot wide two-way separated bicycle lane (i.e., a cycle track) on the east side of the street, and the existing bicycle lane on the west side of Terry A. Francois Boulevard will be removed. A 4-foot wide raised buffer will separate the bicycle lane from the adjacent 8-foot wide parking lane. With the provision of a cycle track, and as Mission Bay gets built out along Terry A. Francois Boulevard to the north and south of the project site, it is anticipated that some bicyclists currently traveling on Third Street would instead travel on the improved bicycle facility on Terry A. Francois Boulevard (Third Street is not a designated bicycle route, and on Third Street bicyclists share the travel lane with vehicles).

Bicycle Conditions

No Event Scenario. With implementation of the proposed project, bicycle volumes would increase on the adjacent roadways and bicycle facilities. A portion of the walk/other trips generated by the proposed project uses, as presented in **Table 5.2-24**, would be bicycle trips. The bicycle demand would be accommodated within the 111 Class 1 and 375 Class 2 bicycle parking spaces (i.e., the 300 Class 2 spaces within an enclosed bicycle parking center for employees, and 75 spaces on the adjacent sidewalks) that would be available on the project site and adjacent sidewalks. During the weekday p.m. peak hour, about 150 of the 570 walk/other trips would be bicycle trips, and during the Saturday evening peak hour, about 230 of the 750 walk/other trips would be bicycle trips.

Proposed Class II bicycle lanes on 16th Street between Third Street and Terry A. Francois Boulevard would connect to existing bicycle lanes to the west, as well as to the planned bicycle track on Terry A. Francois Boulevard. The entrance to the project's parking garage and loading area on 16th Street would be located at the all-way stop-controlled intersection of Illinois/16th, which would minimize the potential for conflicts between bicyclists traveling on 16th Street and vehicles entering and exiting the garage.

Convention Event Scenario. Similar to the No Event scenario, bicycle parking demand would be accommodated within the proposed 111 Class 1 and 375 Class 2 bicycle parking spaces. During the weekday p.m. peak hour, a portion of the 2,098 walk/other person trips would be bicycle trips, with 1,484 of these being convention event shuttle/taxi trips, 614 being walk trips, and 265 being other trips, including bicycles, with the majority being bicycle trips**.** Depending on the size of the convention event, the enclosed bicycle parking center may be staffed, and therefore the

300 bicycle parking spaces within the enclosed bicycle parking center would be considered Class 1 spaces. Bicycle circulation and access would be similar to the No Event scenario. For convention events, when Moscone Center event shuttle buses are anticipated to transport attendees to and from the project site, passenger loading/unloading would occur on 16th Street between Illinois Street and Terry A. Francois Boulevard, adjacent to the north curb within the westbound bicycle lane. When the north curb of 16th Street is used for passenger loading/unloading, the on-street parking located between the curb bicycle lane and the travel lane would be subject to tow-away restrictions, and bicyclists would travel between the stopped buses and the travel lane (i.e., within the area designated for parking) and bicyclists would be permitted full use of the adjacent travel lane.

Basketball Game Scenario. The number of bicycle trips was estimated for the basketball game (i.e., bicycle modes as a separate mode is not available for other project uses). For weekday evening basketball games, there would be about 360 attendees accessing the site by bicycling, while on Saturdays, there would be about 270 attendees accessing the site by bicycling. This would be in addition to the bicycle trips generated by the office, retail, and restaurant uses (about 50 to 80 person trips during the peak hours).

Prior to an event, bicycle access to the project site would be similar to the No Event scenario, and would occur primarily from Terry A. Francois Boulevard and 16th Street. A basketball game would result in an increase in vehicles, bicycles, and pedestrians in the project area, which would result in an increased potential for conflicts. Implementation of the TMP strategies, such as posting of PCOs, would reduce potential conflicts. Nevertheless, prior to and following events, bicycle access may become more difficult due to heavier vehicle and pedestrian volumes, and some bicyclists may shift to other streets (e.g., from Third Street to Fourth Street or to the planned cycle track on Terry A. Francois Boulevard), however, bicycle access would be maintained. During events, PCOs would be stationed at key intersections adjacent to the project site to facilitate vehicle, bicycle, and pedestrian flows. Specifically, PCOs are proposed to be stationed at the intersection of 16th Street at Third, Illinois and Terry A. Francois Boulevard, and on South Street at Third, Bridgeview Way and Terry A. Francois Boulevard.

Before the end of the game, temporary lane or street closures would be implemented on Third Street and 16th Street that would affect bicycle access. The northbound travel lanes on Third Street would be closed to vehicles and bicycles in order to facilitate pedestrian access to the Third Street light rail platforms within the median, and to reduce conflicts between vehicles on Third Street and the Muni Special Event shuttles traveling on 16th Street from the project site. Bicyclists traveling on northbound Third Street would need to detour to Terry A. Francois Boulevard or Fourth Street to continue northbound.

Sixteenth Street between Third Street and Terry A. Francois Boulevard would be closed to vehicular traffic to facilitate Muni Special Event Shuttle operations. On-street parking would not be permitted, with the exception of media trucks on the north curb of 16th Street between Third and Illinois Streets. As bicycle valet parking would be accessed from the north sidewalk along this segment of 16th Street, a plan would be developed to direct departing bicyclists towards the signalized intersection of Terry A. Francois/16th Street, where they can safely mount their bicycles. On the section of 16th Street between Illinois Street and Terry A. Francois Boulevard, the north curb (i.e., the proposed bicycle lane) would be utilized for staging of the Muni Special Event Van Ness Avenue Shuttle, and therefore bicyclists traveling westbound on 16th Street in this section would not have access to the bicycle lane. On these event days, a temporary bicycle lane would be provided within the street, delineated with cones, that would provide a clear path of travel for bicyclists on this section of 16th Street.

At the intersection of Illinois/16th, vehicles would be exiting the project garage and would be continuing southbound on Illinois Street or turning right onto westbound 16th Street, the Muni Special Event Van Ness Avenue Shuttle would be traveling westbound on 16th Street, and the Muni Special Event 16th Street BART Shuttle would be turning left from northbound Illinois Street onto 16th Street westbound (passenger loading for the Muni Special Event 16th Street BART Shuttle would occur on the east side of Illinois Street south of 16th Street). A PCO would be stationed at this location to facilitate these vehicle movement, as well as direct pedestrians across 16th Street. At the approach to Third Street, all transit shuttles, vehicles, and bicyclists would be directed to continue westbound across Third Street (i.e., no left or right turns would be permitted). Bicyclists traveling in this section between Illinois and Third Streets would be within the bicycle lane, and would continue through into the existing bicycle lane on 16th Street west of Third Street. As noted above, vehicles and bicyclists would not be permitted to turn right into the closed portion of Third Street north of 16th Street. It is not anticipated that the media trucks parked within the north curb parking lane between Third and Illinois Streets during events would affect bicycle lane operations in this section as media trucks typically leave the event center between 11:30 p.m. and midnight (i.e., after most attendees would have departed the event center). As noted above, on this segment of 16th Street between Third and Illinois Streets, the 6-foot wide bicycle lane would be located adjacent to the 8-foot wide curb parking lane. Media trucks would likely depart the staging area after most event attendees depart the event center.

Other Events. Bicycle conditions during other events at the project site would be similar to or better than described above for the Basketball Game scenario, which assessed the maximum attendance event, and which is also representative of conditions for sell-out evening concert events. TMP measures, such as street closures for events with more than 14,000 attendees, would not be required for many of the other events. For small events when charter buses are anticipated to bring attendees to the project site, charter bus loading/unloading would occur on the north curb of 16th Street between Illinois Street and Terry A. Francois Boulevard. On-street parking would be restricted in this segment, and bicyclists would travel within the parking lane, or would share the adjacent travel lane with vehicles. Bicycle travel in the project vicinity would be accommodated within the existing, planned, and proposed bicycle facilities. As for large events, during smaller events PCOs would be posted at nearby intersections to manage vehicle, bicycle, and pedestrian flows and reduce conflicts.

Overall, it is anticipated that the existing, planned, and proposed bicycle facilities would be well utilized, and it is not expected that the additional vehicle, bicycle or pedestrian trips associated with the proposed project would result in significant impacts on bicyclists. It is possible that increased congestion associated with the proposed project, primarily during post-event conditions, could result in an increased potential for vehicular-bicycle and pedestrian-bicycle conflicts, however, it would not increase to a level that would adversely affect bicycle facilities in the area. At some locations, bicycle access may become more difficult due to heavier vehicle and pedestrian volumes, however bicycle access would be maintained. Implementation of proposed TMP measures during events would facilitate bicycle access and minimize conflicts. Thus, for these reasons, the impacts of the proposed project on bicycle facilities and circulation would be *less than significant.*

Mitigation: Not required

Comparison of Impact TR-7 to Mission Bay FSEIR Impact Analysis
The Mission Bay FSEIR did not identify any significant impacts related to bicycles within Mission Bay, and did not require any mitigation measures. Consequently, no new or different mitigation measures or alternatives to reduce project impacts related to bicycle conditions are identified or required with respect to the currently proposed project. On the basis of the facts discussed above, the project would result in no new or substantially more severe significant effects than those identified in the Mission Bay FSEIR related to bicycle impacts.

Loading Impacts

Impact TR-8: The proposed project's loading demand would be accommodated within the proposed on-site loading facilities or proposed adjacent on-street commercial loading spaces, and would not create potentially hazardous conditions or significant delays for traffic, transit, bicyclists, or pedestrians under Existing plus Project conditions. (Less than Significant)

Truck Freight and Service Vehicle Loading/Unloading
Proposed project truck and service vehicle loading impacts would be the same for conditions without and with an overlapping SF Giants evening game at AT&T Park.

Loading Supply. The proposed project includes 13 truck loading spaces with a loading area in the first below-grade level of the garage, separate from the vehicle parking garage, as shown on **Figure 3-7** in Chapter 3. The loading area would be accessed via a dedicated 24-foot wide driveway on 16th Street at Illinois Street (adjacent to the driveway into the vehicle parking garage). Four loading spaces would serve the two commercial towers (i.e., two loading spaces per tower), two loading spaces would serve the retail and restaurant uses, and seven loading spaces would serve the event center. The loading spaces would be 10 feet wide by 35 feet in length and with a 14-foot vertical clearance, with the exception of five of the seven event center loading spaces that would be 75 feet in length to accommodate semi-trailer trucks. The number and size of the loading spaces for the event center was based on experience at the existing arena in Oakland. Separate trash compactor areas for the various components of the project would be provided within the loading area.

Trucks, including semi-trailer trucks, would access the driveway to the below-grade loading area from eastbound or westbound 16th Street, or from northbound Illinois Street. A truck turnaround area would be provided at the northern portion of the below-grade loading area to allow for trucks to maneuver and back into the event center loading spaces, as well as to turn around to readily exit the project site head first onto 16th Street.

In addition to the on-site below-grade loading area, 17 on-street commercial loading spaces would be provided on South Street (eight spaces), on Terry A. Francois Boulevard south of South Street (eight spaces), and on 16th Street (one space) to serve the office uses and the restaurant and retail uses at the Market Hall. Overall, the proposed project would have 30 commercial loading spaces serving the project uses.

Loading Demand. As indicated in **Table 5.2-27**, the proposed project would generate about 400 truck trips per day, with the majority of the trips related to the office and restaurant uses. The office, retail, and restaurant uses would generate a loading space demand of 17 loading spaces during an average hour, and 21 loading spaces during the peak hour. The peak loading space demand would be met by the six on-site loading spaces dedicated to office, retail and restaurant uses, and the 17 on-street commercial loading spaces on South Street (eight spaces), on Terry A. Francois Boulevard (eight spaces), and on 16th Street (one space).

During events, the event center would generate an additional demand for seven loading spaces during the average and peak hour of loading activities. As noted in **Table 5.2-27,** this loading demand is for non-Golden State Warriors events, which would generate a greater number of delivery and service vehicle trips. Based on information obtained from the project sponsor for the existing Oracle arena, truck deliveries would occur a day before a game, and would be distributed over the entire day. Television trucks would arrive in advance of events to allow for appropriate set-up and to avoid peak travel periods. Television trucks staging would be located on the north curb (i.e., within the parking lane) of 16th Street adjacent to the project side, between Third Street and the driveway into the project garage. The staging area would be used for loading/unloading on the days leading to a game.

The loading demand would be accommodated within the seven loading spaces dedicated to the event center. The majority of these delivery trucks would make their deliveries in advance of events to avoid peak travel periods. Vendors would be notified by the arena management of appropriate delivery times.

As noted above, separate trash, recycling and compost areas for the various components (e.g., South Street Tower, 16th Street Tower, event center, Market Hall) of the project would be provided within the below-grade loading area in the vicinity of the loading spaces. Trash associated with all land uses, including the ground floor retail and restaurant uses, would be accommodated within these on-site trash area, and Recology collection trucks would access the on-site loading area for pickup (i.e., no trash bins would be taken to the edge of the sidewalk).

During the daytime hours when most loading activities occur, pedestrian and bicycle volumes on 16th Street adjacent to the project site are expected to be relatively low, except around midday, and truck access into and out of the below-grade loading area is not anticipated to substantially conflict with pedestrians on the sidewalk or bicyclists within the bicycle lane on the north side of 16th Street between Third Street and Terry A. Francois Boulevard. No Muni bus routes would operate on 16th Street between Third Street and Terry A. Francois Boulevard, and therefore truck access into and out of the project site would not affect Muni operations. The majority of event-related loading would occur in advance of events, and therefore would not overlap with pre-event or post-event vehicle, pedestrians, bicycle, and Muni Special Event Shuttles circulation on 16th Street.

The proposed loading facilities would be sufficient to accommodate projected demand, and would not result in significant delays affecting traffic, transit, bicycles, or pedestrians, and therefore, the impacts related to loading would be *less than significant.*

Passenger Loading/Unloading

Proposed accommodation for passenger loading/unloading for conditions without and with an event at the project site are included in the proposed project's TMP. **Figure 5.2-9** presents the curb regulations for No Event conditions. In general, the curb adjacent to the project site on South Street, Terry A. Francois Boulevard, and 16th Street would have metered on-street parking, with areas reserved for the Mission Bay TMA shuttle stop, taxi zones, commercial loading/unloading spaces, and a paratransit stop. On days with events at the project site, on-street parking would be restricted at certain locations prior the start of the event to accommodate the Muni Special Event Transit Service Plan and passenger loading/unloading demand.

No Event. Under the No Event scenario, passenger loading/unloading would be accommodated within a taxi zone approximately 100 feet in length on South Street east of the parking garage entrance/exit. The Mission Bay TMA shuttle stop (about 60 feet in length) would also be located on South Street east of Third Street.

Convention and Small Events. During conventions and small events, passenger loading/ unloading would be accommodated in multiple locations: taxi zones would be provided adjacent to the project site on South Street between Bridgeview Way and Terry A. Francois Boulevard (about 300 feet in length) and on Terry A. Francois Boulevard south of South Street (about 200 feet in length). On Terry A. Francois Boulevard, a dedicated passenger loading/unloading zone about 140 feet in length would be provided midblock for private auto drop-off and pick-up. The designated Moscone Center event shuttle bus loading/unloading, and charter buses loading/unloading for other events, would be on the north curb of 16th Street between Illinois Street and Terry A. Francois Boulevard (about 600 feet in length). About six buses could be accommodated within this zone at any one time. The Moscone Center event shuttle buses operate on a "bump system" in which a waiting bus leaves the curb when another bus from the same route arrives. Six event shuttle bus routes currently serve the Moscone Center. It is not anticipated that more than the maximum level of event shuttle buses for the Moscone Center would be required to accommodate attendees arriving by event shuttle buses. In the event that additional curb is needed for event shuttle bus or charter bus loading/unloading activities, additional curb frontage on 16th Street between Third and Illinois Streets could be made available by temporarily restricting on-street parking.

Basketball Game and Large Events. During large events, the roadway and curb management controls depicted on **Figure 5.2-12** for pre-event condition, and **Figure 5.2-13** for post-event conditions would be implemented. In particular, the following temporary curb regulations would be implemented about two hours prior to the event to accommodate the projected passenger loading/unloading demand:

- Two taxi zones would be provided: on South Street between Bridgeview Way and Terry A. Francois Boulevard (300 feet), and on Terry A. Francois Boulevard south of South Street (200 feet).
- Passenger loading/unloading zone approximately 340 feet in length would be provided on Terry A. Francois Boulevard for passenger loading/unloading. The proposed permanent paratransit stop (75 feet in length) on Terry A. Francois Boulevard would not be affected during events.
- Prior to an event, the Muni Special Event Transbay Terminal/Caltrain/Ferry Building Shuttle stop would be on South Street adjacent to the project site, west of the proposed Mission Bay TMA shuttle stop, while the shuttle stop for the Muni Special Event 16th Street BART and Van Ness Avenue shuttle routes would be on the south side of 16th Street (i.e., across the street from the project site) between Third and Illinois Streets.
- A pedicab passenger loading/unloading area would be provided on the east side of Terry A. Francois Boulevard adjacent to the planned two-way cycletrack and immediately south of 16th Street.

Before the end of an event, temporary travel lane closures would be implemented on northbound Third Street between Mariposa Street and Mission Bay Boulevard South, on South Street between Third Street and the entry to the 450 South Street parking garage, on 16th Street between Third Street and Terry A. Francois Boulevard, and on northbound Illinois Street between Mariposa and 16th Streets. The temporary lane closures are anticipated to be in place for approximately 30 to 45 minutes after the end of the event, or until vehicular traffic dissipates and most event attendees taking transit have boarded.

The proposed traffic lane closures would facilitate passenger transit boardings on Third Street (Muni Metro and Muni bus shuttles), South Street (TMA bus shuttles), Illinois Street (Muni bus shuttles), and 16th Street (Muni bus shuttles) in a safe and expeditious manner, avoiding conflicts with vehicles.

Thus, passenger loading/unloading demand would be distributed to Third Street (including the two northbound traffic lanes at the end of an event), South Street, Terry A. Francois Boulevard, and 16th Street, which would reduce potential for crowding at the adjacent sidewalks and walkways. As noted in **Impact TR-6,** the proposed project would include setbacks along all four sides of the project site that would further reduce the potential for pedestrian crowding. Therefore, impacts on passenger loading/unloading would be less than significant.

Summary of Impact TR-8, Loading Impacts

Overall, the proposed project would implement numerous improvements that would facilitate freight/service vehicle and pedestrian loading/unloading conditions and promote safety in the project vicinity. The number of proposed on-site loading spaces would be adequate to meet the expected freight/service vehicle demand associated with the project uses, and would not result in significant delays affecting traffic, transit, bicycles, or pedestrians. The proposed project TMP for event conditions would manage pre- and post-event pedestrian loading/unloading operations along Third, South, 16th and Illinois Streets, as well as along Terry A. Francois Boulevard. As a result, the proposed project's impact related to freight/service vehicles and passenger loading/unloading operations would be *less than significant*.

Mitigation: Not required

While the proposed project's impacts related to freight/service vehicles and passenger loading/unloading operations would be less than significant, **Improvement Measure I-TR-8, Truck and Service Vehicle Loading Operations Plan** is provided for consideration by City decision makers to further reduce the proposed project's less-than-significant impacts related to potential conflicts between proposed project-generated loading/unloading activities and pedestrians, transit, bicyclists, and autos.

Improvement Measure I-TR-8: Truck and Service Vehicle Loading Operations Plan

As an improvement measure to reduce potential conflicts between driveway operations, including loading activities, and pedestrians, bicycles and vehicles on South Street, Terry A. Francois Boulevard, and 16th Street, the project sponsor shall prepare a Loading Operations Plan, and submit the plan for review and approval by the OCII, or its designee, and the SFMTA. As appropriate, the Loading Operations Plan shall be periodically reviewed by the sponsor, the OCII or its designee, and SFMTA and revised if feasible to more appropriately respond to changes in street or circulation conditions.

The Loading Operations Plan shall include a set of guideline related to the operation of the on-site and on-street loading facilities, as well as large truck curbside access guidelines; it shall also specify driveway attendant responsibilities to minimize truck queuing and/or substantial conflicts between project-generated loading/unloading activities and pedestrians, bicyclists, transit and autos. Elements of the Loading Operations Plan shall include:

- Commercial loading activities within on-street commercial loading spaces on South Street, Terry A. Francois Boulevard, and 16th Street should comply with all posted time limits and all other posted restrictions.
- Double parking or any form of illegal parking or truck loading/unloading should not be permitted on any streets adjacent to the project site, and particularly on 16th Street which would include a bicycle lane. Working with the SFMTA Parking Control Officers, building management should ensure that no truck loading/unloading activities occur within the bicycle lanes on 16th Street.
- All move-in and move-out activities for commercial office uses should be coordinated by building management, and, in the event that moving trucks cannot be accommodated within the below-grade loading area, building management should obtain a reserved curbside permit from the SFMTA in advance of move-in or move-out activities.

Implementation of **Improvement Measure I-TR-8: Truck and Service Vehicle Loading Operations Plan** would reduce the potential for conflicts between proposed project-generated loading/unloading activities and pedestrians, bicyclists, transit and autos, and would not result in any secondary transportation-related impacts.

Comparison of Impact TR-8 to Mission Bay FSEIR Impact Analysis
The Mission Bay FSEIR did not identify any significant impacts related to loading within Mission Bay, and did not require any mitigation measures. Because the project was determined to have a less-than-significant impact related to freight/service vehicles or passenger loading impacts, no new or different mitigation measures or alternatives to reduce project impacts related to loading are identified or required with respect to the currently proposed project. On the basis of the facts discussed above, the project would result in no new or substantially more severe significant effects than those identified in the Mission Bay FSEIR.

Impacts on UCSF Helipad Operations

Impact TR-9a to TR-9d: The proposed project could result in significant impacts on UCSF Helipad operations under Existing plus Project conditions. (Less than Significant with Mitigation)

See Section 5.2.6, Project Impacts on UCSF Helipad Operations regarding impacts of the proposed project on the UCSF helipad operations.

Emergency Vehicle Access Impacts

Impact TR-10: The proposed project would not result in significant impacts on emergency vehicle access under Existing plus Project conditions without a SF Giants game at AT&T Park. (Less than Significant)

No Event
Emergency vehicle access to the project site would remain similar to existing conditions. With implementation of the proposed project, 16th Street would be extended from Illinois Street to Terry A. Francois Boulevard (generally two westbound and two eastbound lanes), and emergency vehicle access from the west and south to the project site would be enhanced. In addition, as part of the Mission Bay Infrastructure Plan, Terry A. Francois Boulevard will be relocated to the west, to be directly adjacent to the project (two northbound and two southbound travel lanes, a two-way cycle track on the east side of the street, and on-street parking on both sides of the street), which would also enhance emergency vehicle access to the site. Emergency vehicles would continue to access the site from Third Street from north and south of the site, including from the new fire station at Mission Rock Street via either Third Street or Terry A. Francois Boulevard, as well as from the west via 16th Street. With implementation of the

22 Fillmore Transit Priority Project, one of the two mixed-flow lanes in each direction on 16th Street between Seventh and Third Streets will be converted to a curbside transit-only lane, and emergency vehicles are permitted to use transit-only lanes, if needed.

Development of the project site, and associated increases in vehicles, pedestrians, and bicycle travel would not substantially affect emergency vehicle access to other buildings and areas within Mission Bay, including the UCSF campus. The new UCSF Medical Center Phase 1 opened in February 2015, and contains an emergency room and urgent care center for the UCSF Children's Hospital at the southern end of the hospital complex, with access from Fourth Street, north of Mariposa Street. Access to the Fourth Street urgent care center is directly from Mariposa Street, or from Owens Street via the Southern Connector Road (an internal road within the Medical Center campus site that provides access between the south Medical Center entrance and the parking facilities). Owens Street can be accessed from 16th Street, the I-280 northbound off-ramp, and Mariposa Street. As part of Phase 1 of the UCSF Medical Center, a number of roadway improvements were implemented, that will enhance access to UCSF and the critical hospital services, including extending Owens Street between Mariposa and 16th Streets, widening of Mariposa Street to five lanes, installation of a new signal at the Mariposa Street and Owens Street intersection, an additional lane on the I-280 northbound off-ramp at Mariposa Street, and a new signal at Mariposa Street at the I-280 northbound off-ramp. On Mariposa Street, if necessary, emergency vehicles and other persons accessing the emergency room and urgent care center in their personal vehicles during an emergency would be able to travel within the center left-turn lane to access the intersection of Fourth/Mariposa. As described in **Impact TR-2**, under existing plus project conditions for the No Event scenario, the majority of the study intersections in the vicinity of the project site and the UCSF Medical Center Phase 1 are projected to operate at the same LOS as under existing conditions, and would operate at LOS D or better (the exception would be the intersection of Seventh/Mississippi/16th which would change from LOS E to LOS F conditions). Therefore, for these reasons, the proposed project would not result in a substantial increases in vehicle delay for emergency vehicles or other persons accessing the emergency room and urgent care center in their personal vehicles.

With Event

Pre-event and post-event vehicular traffic destined to the on-site garage containing 950 parking spaces would be managed to minimize impacts on UCSF facilities. The TMP for the event center includes strategies to provide attendees with suggested driving routes to and from the garage. Examples of strategies include website, emails, and smart phone applications. For example, during pre-game conditions, attendees driving from the south of the project site exiting at the I-280 northbound off-ramp would be directed to use Mariposa Street, rather than Owens Street and 16th Street, to reduce congestion during UCSF's shift changes. For post-event, attendees destined to the south would be encouraged to use Mariposa, Illinois or Third Streets, and not 16th or Owens Streets, to access the I-280 southbound on-ramp. As specified in the TMP, the pre-event and post-event recommended routes would be subject to revision based on monitoring during the first year of operation.

Event attendees driving to the site would park within the on-site parking garage containing 950 spaces, as well as in multiple parking facilities in the vicinity of the project site. The majority of the parking spaces available to event attendees would be located to the north of the project site, with the majority located in Lot A. However, it is anticipated that event attendees may also park within UCSF facilities to the west and southwest of the project site. Thus, travel to and from the event center would be dispersed over a broader area, reducing the effect of traffic associated with an event, particularly following an event.

During pre-event and post-event conditions, up to 17 PCOs would be stationed at up to 17 locations to direct and facilitate vehicular and pedestrian travel. Locations where PCOs would be stationed in the vicinity of the UCSF Children's Hospital emergency room and urgent care facility include the intersections of Third/16th, Mariposa/I-280 northbound off-ramp/Owens (pre-game only), Mariposa/Third, Mariposa/Illinois, and 16th/Owens (post-game only). No roadway closures are proposed for pre-event conditions for any events. For events that necessitate closure of the northbound travel lanes of Third Street between 16th and South Streets (generally events with 14,000 or more attendees) for post-game conditions for a period of one to two hours depending on the size of the event, emergency vehicles traveling on Third Street southbound would not be affected, and if necessary, emergency vehicles traveling northbound on Third Street would be permitted to continue through the closed segment between 16th and South Streets, as PCOs would be able to remove the temporary barriers. If necessary, emergency vehicles would also be able to travel on Muni's light rail right-of-way in the median or northbound within the southbound lanes on Third Street. The Event Center Transportation Coordinator would provide emergency service providers, including the fire stations and UCSF facilities, with a list of dates and times during which temporary closure of Third Street would be required following an event. Furthermore, all drivers must comply with the California Vehicle Code § 21806, which requires that drivers yield right-of-way to authorized emergency vehicles, drive to the right road curb or edge, stop, and remain stopped until the emergency vehicle has passed.

In addition, as described above, with implementation of the planned 22 Fillmore Transit Priority Project, transit-only lanes will be implemented adjacent to the curb on 16th Street west of Third Street, and emergency vehicles will be permitted use of the transit-only lanes. The transit-only lanes on 16th Street would have fewer vehicles in them than the adjacent mixed-flow lanes, and would not be subject to any turn restrictions. Persons accessing the UCSF Medical Center emergency room and urgent care center in their personal vehicles during an emergency would, if necessary, also be able to utilize the transit-only lanes to bypass congested segments on 16th Street. As described above, on Mariposa Street, emergency vehicles and other persons accessing the emergency room and urgent care center in their personal vehicles during an emergency would be able to travel within the center left-turn lane to access the intersection of Fourth/Mariposa. For smaller events, PCOs would be stationed at key intersections, monitoring traffic conditions, and could be reassigned to respond to conflicts between event center traffic and UCSF hospital access. In addition, when PCOs are deployed for an event, they would have the capability to radio ahead to other PCOs down the street regarding the approaching vehicle requiring emergency access.

Also see **Impact TR-2** regarding traffic conditions at study intersections for pre-game and post-game conditions.

Summary of Impact TR-10, Emergency Vehicle Access Impacts
Roadway improvements adjacent to the project site would facilitate emergency vehicle access to the site. Before and after events emergency vehicle access to the project site and nearby hospital uses would be maintained, as would emergency access for persons traveling to the emergency room and urgent care center in their personal vehicles. For these reasons, the proposed project would not inhibit emergency vehicles access to the project site and nearby vicinity; therefore, the proposed project impact on emergency vehicle access would be *less than significant.*

Mitigation: Not required

While the proposed project's impact on emergency vehicle access would be less than significant, the following improvement measures are provided for consideration by City decision makers to further reduce the proposed project's less-than-significant impacts related to emergency vehicle access.

Improvement Measure I-TR-10a: **UCSF Emergency Vehicle Access and Garage Signage Plan**

As an improvement measure to enhance access for emergency vehicles and other visitors to the UCSF Children's Hospital emergency room and parking facilities at the UCSF Medical Center, the project sponsor shall work with UCSF to develop and implement a UCSF emergency vehicle access and garage signage plan for I-280 and Mariposa, Owens, and 16th Streets to reflect desirable access routes for UCSF and event center access.

Improvement Measure I-TR-10b: Mariposa Street Restriping Study

As an improvement measure to enhance access to the UCSF Medical Center Children's Hospital, the project sponsor shall retain a qualified transportation professional approved by SMTA to conduct a traffic engineering study to evaluate potential changes to the travel lane configuration and related signage on Mariposa Street between the I-280 ramps and Fourth Street. The study, to be conducted in coordination with UCSF and SFMTA, would determine if the eastbound left turn lane into Fourth Street/UCSF passenger loading/unloading and emergency vehicle entrance to the UCSF Children's Hospital could be extended west from its existing length of about 150 feet to provide for additional queuing area.

Implementation of **Improvement Measure I-TR-10a: UCSF Emergency Vehicle Access and Garage Signage Plan** and **Improvement Measure I-TR-10b: Mariposa Street Restriping** would provide advance direction for drivers and would reduce the potential for conflicts between vehicles destined to the emergency room and vehicles traveling eastbound on Mariposa Street, and would not result in any secondary transportation-related impacts.

Comparison of Impact TR-10 to Mission Bay FSEIR Impact Analysis

The Mission Bay FSEIR did not address emergency vehicle access as a distinct transportation topic. However, as discussed in the Initial Study, the Mission Bay FSEIR Community Services and Utilities impacts section determined that the Mission Bay Plan would potentially significantly increase demand for fire protection services in the Mission Bay Plan area, and that a new fire station and additional fire department personnel and equipment, including a Hazardous Materials Unit, would be required in the Mission Bay South Plan area at build-out in order to facilitate access in the event of a major emergency, and maintain adequate levels of service. The Mission Bay FSEIR also indicated the Mission Bay Plan would increase demand for a new police station and additional police protection personnel. The Mission Bay Plan included the provision of land at the corner of Third Street and Mission Rock Street in the Mission Bay Plan area for a new police/fire station. The Mission Bay FSEIR determined that with implementation of Mitigation Measures M.6a (Construct New Fire Station) and M.6b (Provide New Engine Company) to ensure funding for additional fire protection personnel, equipment and fire station, impacts to fire protection services would be less than significant. Construction of the new Public Safety Building at Third and Mission Rock Streets is complete and the facility began operations in early 2015, which satisfies the requirements of these mitigation measures.

Also please refer to Initial Study Impact HZ-3 regarding the project's impact on the City's Emergency Response Plan in an event of a catastrophic event (e.g., and earthquake), and Section 5.12, Public Services, in this SEIR regarding potential impacts on law enforcement and fire protection services.

Conditions With a SF Giants Evening Game at AT&T Park

Impacts TR-11 through TR-17 present the impact evaluation for traffic, transit, pedestrian, bicycle, and emergency vehicle access for conditions with an event at the proposed event center overlapping with a SF Giants evening game at AT&T Park. At the time of preparation of the Mission Bay FSEIR, the San Francisco Giants ballpark was under construction, and therefore, the Mission Bay FSEIR did not include a separate analysis of conditions with baseball games. Instead, the Mission Bay FSEIR summarized the transportation impact analysis as contained within the San Francisco Giants Ballpark at China Basin EIR. The Mission Bay FSEIR indicated that the Ballpark EIR determined that the mitigation measures to address significant transportation impacts before and after games would be defined as part of a Ballpark Transportation Management Plan prepared by the Giants in coordination with a Ballpark Transportation Coordinating Committee. Therefore, this group of impacts does not include a comparison of impact conclusions with the Mission Bay FSEIR.

The proposed project would result in an increase in the number of large events occurring in the Mission Bay area, and some of these events would overlap with the SF Giants baseball games at AT&T Park that occur generally between April and the end of September. This would result in about 32 days per year—and up to about 40 days under rare circumstances— with intersection LOS as described below for weekday and Saturday conditions (the SF Giants season has

46 weekday and 6 weekend evening games scheduled for the 2015 season). Based on league schedules and concert scheduling as described above and in Chapter 3, Project Description, Table 3-3, it is estimated that in a typical year, on average, about nine *large* events at the event center (i.e., two basketball games and seven concerts with average attendance of 12,500 or more attendees) could overlap with a SF Giants evening game at AT&T Park. If either or both teams make it to their respective championships, the number of large events overlapping could moderately increase; however, it is unlikely that this scenario would occur on a regular basis. See Section 5.2.5.3 above for discussion of potential overlap of proposed project events with a SF Giants evening game.

Traffic Impacts

Impact TR-11: The proposed project would result in significant traffic impacts at multiple intersections that would operate at LOS E or LOS F under Existing plus Project conditions with an overlapping SF Giants evening game at AT&T Park. (Significant and Unavoidable with Mitigation)

Because a portion of the events at the proposed event center would overlap with SF Giants evening games, the traffic impact analysis at the study intersections was also conducted for the Basketball Game scenario for conditions with an overlapping SF Giants evening game at AT&T Park for the four analysis hours. The analysis represents conditions for high attendance events at both the proposed event center and at AT&T Park, which are estimated to occur, an average of nine times a year. For the remaining 23 days during which events at both facilities could overlap, the average attendance levels for the event center events is anticipated to be less than 12,500 attendees, and therefore, the number of vehicle trips generated by the smaller event would be less, as would the impact on intersection operating conditions. **Table 5.2-47** and **Figure 5.2-19** present the weekday p.m. and Saturday evening intersection LOS conditions, while **Table 5.2-48** and **Figure 5.2-20** present the weekday evening and late evening peak hours. As indicated in the tables and figures, a number of intersections currently are controlled by PCOs pre-game and post-game, and it is assumed that these intersections would continue to be PCO controlled during SF Giants games. These would be in addition to the PCOs that are currently deployed during SF Giants games. See Section 5.2.3.8 for a description of the existing transportation management measures that are in force during SF Giants games. Due to the restricted access on the Third and Fourth Street bridges, no project-generated vehicles were assumed to travel northbound on the Third and Fourth Street bridges during overlapping events. Project-generated vehicles would instead be directed west and south to avoid roadway closures and congestion on Third Street near Lot A and AT&T Park. During overlapping events, the TMP indicates that a PCO would be stationed at the intersection of Fourth/16th to discourage use of this street except for local access.

Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 5.2-20

Existing Plus Project Intersection LOS-With a SF Giants Evening Game - Weekday Evening and Late Evening Peak Hour - Basketball Game Scenarios

During the weekday p.m. peak hour with an overlapping SF Giants evening game, the additional vehicle trips generated under the Basketball Game scenario would worsen the intersection LOS conditions at the intersections of Seventh/Mission Bay Drive, Fourth/16th, and Owens/16th from LOS D or better to LOS E conditions, and this would be considered a significant traffic impact. All other study intersections would continue to operate at LOS D or better, with the exception of the four intersections that currently operate at LOS E or LOS F during the weekday p.m. peak hour with a SF Giants evening game (i.e., Fifth/King/I-280, Fifth/Harrison/I-80 westbound off-ramp, Fifth/Bryant/I-80 eastbound on-ramp, and Seventh/Mississippi/16th). At the intersections of King/Fifth/I-280 and Fifth/Bryant/I-80 eastbound on-ramp, the Basketball Game scenario was determined not to contribute considerably to the existing LOS E or LOS F conditions, and project-related traffic impacts at these intersections would be considered less than significant. At the intersections of Fifth/Harrison/I-80 westbound off-ramp and Seventh/Mississippi/16th, the proposed project would contribute to the LOS E or LOS F conditions, and this would be considered a significant traffic impact.

During the weekday evening peak hour with overlapping evening events, the additional vehicle trips associated with the proposed project would worsen the intersection LOS at the intersections of King/Fifth/I-280 ramps, Fifth/Harrison/I-80 westbound off-ramp, and Seventh/Mission Bay Drive, Third/South, Seventh/Mississippi/16th, Mariposa/I-280 northbound off-ramp from LOS D or better to LOS E or LOS F conditions, or from LOS E to LOS F conditions, and this would be considered a significant traffic impact. All other study intersections would continue to operate at LOS D or better, with the exception of the intersection of Fifth/Bryant/I-80 eastbound on-ramp that currently operates at LOS F during the weekday evening peak hour with a SF Giants evening game; at this intersection, the Basketball Game scenario would not contribute considerably to the existing LOS F conditions, and project-related traffic impacts at this intersection would be considered less than significant.

During the weekday late evening peak hour with overlapping evening events, the additional project vehicle trips would worsen the intersection LOS at the intersections of Fifth/Bryant/I-80 eastbound on-ramp and Seventh/Mission Bay Drive from LOS D or better to LOS F conditions, and this would be considered a significant traffic impact. All other study intersections would continue to operate at LOS D or better, with the exception of the intersection of Fifth/Bryant/I-80 eastbound on-ramp which currently operate at LOS F during the weekday late evening peak hour with a SF Giants evening game; at this intersection, the Basketball Game scenario would not contribute considerably to the existing LOS F conditions, and project-related traffic impacts at this intersection would be considered less than significant

During the Saturday evening peak hour with overlapping evening events, with the additional vehicle trips generated, the intersection LOS at the intersections of Fifth/Harrison/I-80 westbound off-ramp, Seventh/Mission Bay Drive, and Seventh/Mississippi/16th would worsen from LOS D or better to LOS F conditions, and this would be considered a significant traffic impact. All other signalized study intersections would continue to operate at LOS D or better.

Thus, with overlapping evening events, additional study intersections from those identified in Impact TR-2 for conditions without an overlapping SF Giants game, would operate at LOS E or LOS F conditions. Existing plus project conditions for the Basketball Game scenario with a SF Giants evening game at AT&T Park would result in *significant* traffic impacts at ten study intersections not currently subject to PCO control during a SF Giants evening game. These intersections are:

- King/Fifth/I-280 ramps (weekday evening)
- Fifth/Harrison/I-80 westbound off-ramp (weekday p.m., weekday evening, Saturday evening)
- Fifth/Bryant/I-80 eastbound on-ramp (weekday late evening)
- Third/South (weekday evening)
- Seventh/Mission Bay Drive (weekday p.m., weekday evening, weekday late evening, Saturday evening)
- Fourth/16th (weekday p.m.)
- Owens/16th (weekday p.m.)
- Seventh/Mississippi/16th Street (weekday p.m., weekday evening, and Saturday evening)
- Illinois/Mariposa (weekday evening)
- Mariposa/I-280 northbound off-ramp (weekday evening)

The four study intersections of Fifth/Harrison/I-80 westbound off-ramp, Fifth/Bryant/I-80 eastbound on-ramp, Seventh/Mission Bay Drive, and Seventh/Mississippi/16th were identified as project-specific impacts in **Impact TR-2** for existing plus project conditions without an overlapping evening event, while the six intersections of King/Fifth/I-280 ramps, Third/South, Fourth/16th, Owens/16th, Illinois/Mariposa, and Mariposa/I-280 northbound off-ramp would be additional significant impacts resulting from overlapping evening events. The proposed project's TMP identifies PCOs at the intersections of Third/South, Owens/16th, Illinois/Mariposa, and Mariposa/I-280 ramps for pre-event and post-event conditions to manage traffic (see **Figure 5.2-11**).

Overall, on days with overlapping evening events at the project site and at AT&T Park, intersections in the project vicinity would become more congested prior to and following the events, and the proposed project would result in significant traffic impacts at the following ten study intersections: King/Fifth/I-280 ramps, Fifth/Harrison/I-80 westbound off-ramp, Fifth/Bryant/I-80 eastbound on-ramp, Third/South, Seventh/Mission Bay Drive, Fourth/16th, Owens/16th, Seventh/Mississippi/16th Street, Illinois/Mariposa, Mariposa/I-280 northbound off-ramp. Implementation of **Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts, Mitigation Measure M-TR-11a: Additional PCOs During Overlapping Events** and **Mitigation Measure M-TR-11b: Regular Participation in Ballpark/Mission Bay Transportation Coordinating Committee** would minimize the severity of traffic impacts at these intersections and would not result in secondary transportation impacts, but would not improve intersection LOS to LOS D or better. Thus, traffic impacts at the ten study intersections would remain *significant and unavoidable with mitigation.*

In addition to the mitigation measures describe above, **Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events,** would require the project sponsor to continue to work with the City to seek additional feasible mitigation measures to reduce transportation impacts. The feasibility of these measures has not been determined. One strategy involves using off-site parking lot(s) south of the event center and providing shuttles to the event center if the location of off-site parking is not within walking distance to the event center. If this strategy were to become feasible, the City would identify one or more off-site parking lot(s) on Port of San Francisco or other lands to the south of the event center to provide approximately 250 additional parking spaces for all events and up to an approximately 750 additional parking spaces (for a total of approximately 1,000 spaces) during dual events of 12,500 or more event center attendees or for other circumstances if needed, and the project sponsor shall provide free shuttles from such off-site parking lot(s) to the event center on a maximum 10-minute headway (i.e., six shuttles per hour) before and after events. Preliminary discussions with the Port have identified potential parking lot locations at an area northwest of Pier 70 in the vicinity of the intersection of Illinois/19th and an area near Pier 80 referred to as the Western Pacific site. These locations are approximate only and subject to change based on a variety of factors including, but not limited to, proximity to the event center, infrastructure and development cost, and availability. In addition, any specific locations identified for this purpose would be subject to subsequent review, design, and approvals that may involve both local and State agencies.

Given the current uncertainties regarding the availability, location, and size of one or more off-site parking lots, the effectiveness of this strategy cannot be quantified at this time. If such an off-site parking lot(s) were to be determined to be feasible, it is possible that use of this off-site parking could reduce traffic impacts in the project vicinity. However, drivers who may use these potential additional parking facilities could travel along different routes, which could result in significant traffic impacts south of the project site such as along Third Street, Cesar Chavez Street, 25th Street or other streets that may be used as access to or from affected freeway on-ramps and off-ramps and approaches in the vicinity of the parking lot(s). Mitigation for such traffic impacts may be available depending on the areas affected. Standard mitigation techniques that could be employed involve temporary or permanent removal of on-street parking to accommodate traffic flow, addition of stop signs or traffic signals, adjustment to signal timing where signals exist, addition of dedicated turn lanes or turning lane traffic indicators if the physical constraints of the intersection or adjoining streets could accommodate such changes, and other available traffic control devices. These measures could be implemented where feasible to maintain a LOS D or better. Similar physical or geometric constraints to fully mitigating traffic impacts may also be applicable at affected freeway on-ramps, off-ramps and approaches. However, due to the physical limitations of the City's street grid, land may not be available for City purchase that would allow for the expansion of street width to accommodate additional travel lanes or other design techniques to achieve the standard of LOS D or better, and City policies disfavor expansion of roadway capacity in order to achieve the City's Transit First and other goals that attempt to limit private vehicle use. Consequently, until a site-specific analysis of the identified parking lot(s) is conducted, it cannot be determined what mitigation measures may be available for affected areas, and then whether the measures would be feasible given the physical constraints of the street network and the availability of funding to implement the measures. Under the circumstances, the City would implement those measures that it deems feasible to achieve a LOS D or better in the affected areas, but regardless, secondary traffic impacts associated with Mitigation Measure M-TR-11c, Additional Strategies to Reduce Transportation Impacts of Overlapping Events, involving the use of one or more off-site parking lot(s) at this time would be considered potentially *significant and unavoidable with mitigation.*

Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts (see Impact TR-2, above)

Mitigation Measure M-TR-11a: Additional PCOs during Overlapping Events

As a mitigation measure to manage traffic flows and minimize congestion associated with overlapping events, the proposed project's TMP shall be expanded to include additional PCOs that shall be deployed to the following intersections where the proposed project would result in significant traffic impacts, as conditions warrant during events: King/Fifth/I-280 ramps, Fifth/Harrison/I-80 westbound off-ramp, Fifth/Bryant/I-80 eastbound on-ramp, Seventh/Mission Bay Drive, Fourth/16th, and Seventh/Mississippi/16th. The PCO Supervisor shall make the determination where the additional PCOs would be located, based on field conditions during an event. This measure shall be implemented in coordination with Mitigation Measure M-TR-2a: Additional PCOs during Events.

Mitigation Measure M-TR-11b: Participation in the Ballpark/Mission Bay Transportation Coordinating Committee

As a mitigation measure to optimize effectiveness of the transportation management strategies for day-to-day operations and events in the Mission Bay area, at AT&T Park, UCSF Mission Bay campus, and the proposed project, the project sponsor shall actively participate as a member of the Ballpark/Mission Bay Transportation Coordinating Committee in order to evaluate and plan for operations of all three facilities (i.e., AT&T Park, UCSF Mission Bay Campus, and the proposed event center). This committee would, among other roles, serve as a single point for coordination of transportation management strategies.

The Transportation Coordinating Committee shall consult on changes to and expansion of transit services, and for developing and implementing strategies within their purview that address transportation issues and conflicts as they arise. In addition, the committee shall serve as a liaison for operation of the facilities, monitoring conditions, and addressing community issues related to events and the project sponsor shall make good faith efforts to notify the committee regarding events.

Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events

The project sponsor shall work with the City to pursue and implement, if feasible, additional strategies to reduce transportation impacts associated with overlapping events at AT&T Park and the proposed event center. These strategies could include the following:

- The project sponsor shall exercise commercially reasonable efforts to avoid scheduling non-Golden State Warriors events of 12,500 or more event center attendees that start within 60 minutes of the start (respectively) of events at AT&T Park.
- When overlapping non-Golden State Warriors events of 12,500 or more event center attendees and evening SF Giants games cannot be avoided through commercially reasonable efforts, the project sponsor shall negotiate with the event promoter as feasible to stagger start times such that the event headliner starts no earlier than 8:30 p.m.
- The City shall identify one or more off-site parking lot(s) on Port of San Francisco or other lands to the south of the event center to provide approximately 250 additional parking spaces for all events and up to approximately 950 additional parking spaces for use during dual events of 12,500 or more event center attendees (for a total of approximately 1,000 additional off-site parking spaces). The project sponsor shall: (1) acquire sufficient rights for the use of such parking lot(s) through lease, purchase, or other means as necessary; (2) pay its fare-share contribution towards any improvements required for the use of such parking lot(s), including but not limited to grading, paving, striping, fencing, lighting, drainage, stormwater pollution prevention measures, curb cuts, and ramps; and (3) provide free shuttles to the event center from such off-site parking lot(s) that are more than ¼-mile from the event center on a maximum 10-minute headway before and after events.

Impact TR-12: The proposed project would result in significant traffic impacts at freeway ramps that would operate at LOS E or LOS F under Existing plus Project conditions with an overlapping SF Giants evening game at AT&T Park. (Significant and Unavoidable with Mitigation)

Table 5.2-49 presents the ramp LOS conditions for the Basketball Game scenario for the weekday p.m. and Saturday evening peak hours for conditions with an overlapping SF Giants evening game at AT&T Park, while **Table 5.2-50** presents the weekday evening and late evening peak hour conditions. The analysis represents conditions for high attendance events at both the proposed event center and at AT&T Park, which are estimated to occur, an average of nine times a year. For the remaining 23 days during which events at both facilities could overlap, the average attendance levels for the event center events is anticipated to be less than 12,500 attendees, and therefore, the number of vehicle trips generated by the smaller event would be less, as would the impact on intersection operating conditions.

SOURCE: Adavant Consulting/Fehr & Peers/LCW Consulting, 2015

The proposed project under the Basketball Game scenario with an overlapping SF Giants evening game at AT&T Park would result in a significant impact at the I-80 westbound off-ramp at Fifth/Harrison Street during the weekday evening and Saturday evening peak hours (i.e., attendees driving to San Francisco from the East Bay), and at the I-280 northbound off-ramp at Mariposa Street during the weekday evening peak hour (i.e., attendees driving to the event center and AT&T Park from the south of the project site). The proposed project would also result in a significant impact at the I-80 eastbound on-ramp at Fifth/Bryant Street during the weekday late evening peak hour (i.e., attendees returning to the East Bay).

The proposed project would not contribute considerably to the other ramps operating at LOS E or LOS F under existing conditions (i.e., the I-80 eastbound on-ramp at Sterling Street during the weekday p.m. peak hour, the I-280 southbound on-ramp at Pennsylvania Street during the weekday p.m. peak hour, or the I-80 eastbound on-ramp at Fifth/Bryant during the weekday p.m., weekday evening, and Saturday evening peak hours), and therefore, traffic impacts at these ramp locations would be considered less than significant.

Overall, under existing plus project conditions with a SF Giants evening game at AT&T Park, the proposed project would result in *significant* project-specific impacts at the following three freeway ramp locations:

- I-80 eastbound on-ramp at Fifth/Bryant (weekday late evening)
- I-80 westbound off-ramp at Fifth/Harrison (weekday evening, Saturday evening)
- I-280 northbound off-ramp at Mariposa Street (weekday evening)

As discussed in **Impact TR-3** for conditions without an overlapping SF Giants evening game, no feasible mitigations are available for the freeway ramp impacts because there is insufficient physical space for additional capacity without redesign of the I-80 and I-280 ramps and mainline structures, and which may require acquisition of additional right-of-way, and other potential measures would not adequately address the short-term peak travel patterns associated with special events. **Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts** and **Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events** would encourage non-auto modes of travel to the event center through parking pricing, provide additional off-site parking facilities to the south of the project site, and enhance regional transit access to the area, which would reduce the project traffic increase on regional freeway mainline and ramps. However, the feasibility of **Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events** is uncertain, and the reduction in vehicle trips would not reduce impacts related to freeway ramp operations to less-than-significant levels. Thus, for these reasons, the proposed project's impacts related to freeway ramp operations would be *significant and unavoidable with mitigation*.

Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts (see Impact TR-2, above)

Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events (see Impact TR-11, above)

Transit Impacts

Impact TR-13: The proposed project could result in a substantial increase in transit demand that could not be accommodated by adjacent Muni transit capacity such that significant adverse impacts to Muni transit service would occur under Existing plus Project conditions with an overlapping SF Giants evening game at AT&T Park. (Less than Significant with Mitigation)

The transit analysis represents conditions for overlapping high attendance events at both the proposed event center and at AT&T Park, which are estimated to occur, an average of nine times a year. For the remaining 23 days during which events at both facilities could overlap, the average attendance levels for the event center events is anticipated to be less than 12,500 attendees, and therefore, the number of transit trips generated by the smaller event would be less, as would the impact on transit ridership and capacity utilization conditions. With overlapping evening events at the event center and AT&T Park, additional capacity on the T Third would be provided pre-game as currently occurs for SF Giants games, but overlapping evening events at both venues would cause the weekday evening capacity utilization of 93 percent for the Basketball Game scenario without a SF Giants game (see Impact TR-4) to increase further, and would exceed the 100 percent capacity utilization standard for special events, and this would be considered a significant impact. With overlapping evening events, the Muni Special Event Shuttles to the event center would continue to accommodate project demand as these shuttles would exclusively serve the proposed event center attendees.

During the weekday evening peak hour with overlapping evening events, it is anticipated that if overlapping events end at similar times, the demand for T Third service would exceed the available capacity, and this would be an additional impact for overlapping events (Impact TR-4 did not identify a significant impact on light rail operations during the weekday late evening).

During the Saturday evening peak hour with overlapping events, similar peak arrivals for similar start times (e.g., 7:15 p.m. for a SF Giants evening game, and 7:30 p.m. for a Golden State Warriors game), would result in the ridership demand exceeding the capacity of the T Third, and this would be considered a significant impact. While the analysis identifies a capacity shortfall during the Saturday evening peak hour for inbound trips, additional capacity would need to be provided for the late evening period for trips departing the event center and AT&T Park post-event.

Overall, on days with overlapping evening events at the project site and at AT&T Park, transit demand would exceed the capacity prior to and following the events, and the proposed project would result in significant transit impacts. Implementation of **Mitigation Measure M-TR-13: Additional Muni Transit Service During Overlapping Events** would minimize transit impacts. The additional Muni capacity would generally be within what is currently provided for SF Giants games and the additional capacity provided as part of the Muni Special Event Transit Service Plan for the proposed project. Implementation of the mitigation measure would ensure that Muni service would be provided to accommodate the T Third demand via Muni bus shuttles to AT&T Park and/or the proposed event center, and would not result in secondary transportation impacts. Thus, with implementation of this mitigation measure, the proposed project's transit impacts would be *less than significant with mitigation.*

Mitigation Measure M-TR-13: Additional Muni Transit Service during Overlapping Events

As a mitigation measure to accommodate Muni transit demand to and from the project site and AT&T Park on the T Third light rail line during overlapping evening events, the project sponsor shall work with the Ballpark/Mission Bay Transportation Coordinating Committee to coordinate with the SFMTA to provide additional shuttle buses between key Market Street locations and the project. Examples of the additional service include Muni bus shuttles between Union Square and/or Montgomery BART/Muni station and the project site. The need for additional Muni service shall be based on characteristics of the overlapping events (e.g., projected attendance levels, and anticipated start and end times).

Impact TR-14: The proposed project would result in a substantial increase in transit demand that could not be accommodated by regional transit such that significant adverse impacts to regional transit service would occur under Existing plus Project conditions with an overlapping SF Giants evening game at AT&T Park. (Significant and Unavoidable with Mitigation)

In general, during the weekday p.m. peak hour, because the peak direction of travel on regional transit operators is in the outbound direction (i.e., workers leaving downtown San Francisco), transit capacity would generally be available to accommodate inbound riders associated with the overlapping evening events. The number of attendees arriving for 7:15 or 7:30 p.m. start times during the weekday p.m. peak hour is low, as most attendees for both SF Giants and Golden State Warriors games arrive within an hour of the start time. As presented in **Table 5.2-40** and **Table 5.2-41** above, additional capacity is available on transit service providers from the East Bay and North Bay during the weekday p.m. and weekday evening peak hours, respectively.

As determined in Impact TR-5, during the weekday evening peak hour, the proposed project would exceed the Caltrain northbound capacity, and result in a significant transit impact. With a basketball game without an overlapping SF Giants game, the capacity utilization of Caltrain would exceed the 100 percent capacity utilization standard. With overlapping evening events, the transit demand from the South Bay would further increase, and thus increase the capacity utilization. Thus, similar to Impact TR-5, overlapping evening events would result in a significant impact to Caltrain capacity.

During the weekday late evening period, Caltrain currently provides an additional train for SF Giants evening games, and it is anticipated that this service would continue. The proposed project would add about 720 transit trips to Caltrain during the weekday late evening peak hour, which would not be accommodated within the existing and proposed special event service during overlapping evening events. Similar, as identified in Impact TR-5, overlapping evening events would further increase the capacity utilization of the North Bay service providers, resulting in significant impacts on Golden Gate Transit and WETA. During the weekday late evening following the end of a SF Giants evening game, BART occasionally provides additional capacity to accommodate the SF Giants post-game demand. With overlapping events, additional capacity would be required to accommodate the combined BART East Bay transit demand. Thus, the Basketball Game scenario, with an overlapping SF Giants evening game, would result in a significant transit impact at one additional regional transit service provider (i.e., BART) than for conditions without an overlapping evening event. Overall, under existing plus project conditions with an overlapping SF Giants evening game at AT&T Park, the proposed project would result in *significant* project-specific transit impacts on BART, Caltrain, Golden Gate Transit, and WETA.

Implementation of **Mitigation Measure M-TR-5a: Additional Caltrain Service, Mitigation Measure M-TR-5b: Additional North Bay Ferry and Bus Service, and Mitigation Measure M-TR-14: Additional BART Service to the East Bay during Overlapping Events** would reduce or minimize the severity of the capacity utilization exceedances for the regional transit service providers, and would not result in secondary transportation impacts. However, since the provision of additional East Bay, South Bay, and North Bay service is uncertain and full funding for the service has not yet been identified, implementation of these mitigation measures remain uncertain. Accordingly, the proposed project's significant impacts to BART, Caltrain, Golden Gate Transit and WETA transit capacity would be *significant and unavoidable with mitigation*.

Mitigation Measure M-TR-5a: Additional Caltrain Service during Events (see Impact TR-5, above)

Mitigation Measure M-TR-5b: Additional North Bay Bus and Ferry Service during Events (see Impact TR-5, above)

Mitigation Measure M-TR-14: Additional BART Service to the East Bay during Overlapping Events

As a mitigation measure to accommodate transit demand to the East Bay following weekday and weekend evening events, the project sponsor shall work with the Ballpark/Mission Bay Transportation Coordinating Committee to coordinate with BART to provide additional service from San Francisco following weekday and weekend evening events. The additional East Bay BART service could be provided by operating longer trains. The need for additional BART service shall be based on characteristics of the overlapping events (e.g., event type, projected attendance levels, and anticipated start and end times).

Pedestrian Impacts

Impact TR-15: The proposed project could result in a substantial overcrowding on public sidewalks, or create potentially hazardous conditions for pedestrians, or otherwise interfere with pedestrian accessibility on the site and adjoining areas under Existing plus Project conditions with an overlapping SF Giants evening game at AT&T Park. (Less than Significant with Mitigation)

A quantitative pedestrian analysis was conducted for the Basketball Game scenario assuming an overlapping SF Giants evening game at AT&T Park. Proposed project impacts on pedestrians for other evening events at the event center (e.g., concerts, family shows) would be similar to or less than those identified in this analysis for a basketball game, as the Basketball Game scenario reflects the maximum attendance level for evening events. In addition, as noted in **Impact TR-6** and **Table 5.2-16**, for small and large events at the proposed event center, PCOs would be posted at nearby intersections to manage pedestrian flows and reduce conflicts. **Table 5.2-51** presents the results of the pedestrian LOS analysis for overlapping SF Giants and basketball evening game conditions for the weekday p.m. and Saturday evening peak hours, while **Table 5.2-52** presents this information for the weekday evening and late evening peak hours.

SOURCE: Adavant Consulting/Fehr & Peers/LCW Consulting, 2015

The pedestrian analysis for overlapping events represents conditions for high attendance events at both the proposed event center and at AT&T Park, which are estimated to occur an average of nine times a year. For the remaining 23 days during which events at both facilities could overlap, the average attendance levels for the event center events is anticipated to be less than 12,500 attendees, and therefore, the number of pedestrian trips generated by the smaller event would be less, as would the impact on pedestrian conditions.

Pedestrian conditions in the vicinity of the project site for the Basketball Game scenario with an overlapping SF Giants evening game at AT&T Park would be similar to conditions without a SF Giants game presented above in **Impact TR-6**. The existing parking lots on the project site are currently available for SF Giants evening game parking, and, with implementation of the proposed project, would no longer be available (existing overall parking utilization at the two lots in the study area on a SF Giants evening game day is below 50 percent). SF Giants game attendees currently parking at those two lots would seek parking elsewhere, or would switch modes. The pedestrian analysis of conditions with overlapping evening events assumes that SF Giants attendees currently parking at the project site would seek parking in other nearby facilities (e.g., at the UCSF garage at 1650 Third Street, which currently has available capacity during SF Giants evening games), and would continue to walk along Third Street and through the crosswalks at adjacent intersections.

As presented in **Table 5.2-51**, during the weekday p.m. peak hour, LOS conditions on crosswalks and sidewalks in the project vicinity would remain at LOS D or better. Similarly, as pedestrian volumes associated with the event center increase during the weekday evening and Saturday evening peak periods, the pedestrian LOS at the north and south crosswalks at the intersection of Third/South would operate at LOS E or LOS F conditions. During the weekday late evening peak hour, as pedestrians leave the event center, all three crosswalks at this intersection would operate at LOS E or LOS F (as for the Basketball Game scenario without an overlapping evening event at AT&T Park). The LOS E and LOS F conditions would be considered a significant pedestrian impact. All other analysis locations would operate at LOS D or better.

As discussed in **Impact TR-6**, with implementation of **Mitigation Measure M-TR-6: Active Management of Pedestrian Flows at the Intersection of Third/South**, these significant pedestrian impacts would be reduced to less than significant levels. During post-event conditions, the northbound travel lanes on Third Street between 16th Street and Mission Bay Boulevard South, and South Street between Third Street and the entrance/exit to the 450 South Street Garage, would be closed to vehicular traffic in order to facilitate pedestrian egress from the event center and access to the light rail platforms within the Third Street median. With implementation of **Mitigation Measure M-TR-6: Active Management of Pedestrian Flows at the Intersection of Third/South**, PCOs stationed at this location would implement strategies to allow pedestrians to cross the street safely, including extending the green time for pedestrians crossing the street, manually overriding the traffic signal and directing pedestrians to cross, erecting temporary pedestrian crossing barriers, allowing use of the closed Third Street as a pedestrian access route, providing a defined passenger waiting area within the closed Third Street, and shielding passengers waiting to board light rail from adjacent pedestrian traffic.

Overall, on days with overlapping evening events at the project site and at AT&T Park, pedestrian conditions would become more crowded prior to and following the events, however, with the TMP transportation management strategies and implementation of **Mitigation Measure M-TR-6: Active Management of Pedestrian Flows at the Intersection of Third/South**, the impact of the proposed project on pedestrians during overlapping evening events would be *less than significant with mitigation.*

Mitigation Measure M-TR-6: Active Management of Pedestrian Flows at the Intersection of Third/South (See Impact TR-6, above)

Bicycle Impacts

Impact TR-16: The proposed project would not result in potentially hazardous conditions for bicyclists, or otherwise substantially interfere with bicycle accessibility to the site and adjoining areas under Existing plus Project conditions with an overlapping SF Giants evening game at AT&T Park. (Less than Significant)

A qualitative assessment of bicycle conditions was conducted for the Basketball Game scenario assuming an overlapping SF Giants evening game at AT&T Park. Bicycle conditions in the vicinity of the project site for the Basketball Game scenario with an overlapping SF Giants evening game at AT&T Park would be similar to conditions without a SF Giants game presented above in **Impact TR-7**. It is anticipated that bicyclists traveling to both facilities would be accommodated with the existing, planned and proposed bicycle lanes. However, with overlapping evening events, traffic volumes on streets leading to and from the off-site parking facilities would be greater, which could result in increased potential for bicycle-vehicle conflicts. During overlapping evening events, transportation management strategies for the proposed event center and AT&T Park would be coordinated to minimize congestion and conflicts between modes. Proposed project impacts on bicycle access and circulation for other evening events at the event center (e.g., concerts, family shows) would also be similar to or less than that for the Basketball Game scenario.

Overall, on days with overlapping evening events at the project site and at AT&T Park, the number of bicyclists traveling in the project vicinity would increase prior to and following the events, however, the coordinated TMP transportation management strategies for the proposed event center and AT&T Park, including posting of PCOs, would ensure that the impact of the proposed project on bicyclists during overlapping evening events would be *less than significant.*

Mitigation: Not required

Emergency Vehicle Access Impacts

Impact TR-17: The proposed project would not result in significant impacts on emergency vehicle access under Existing plus Project conditions with an overlapping SF Giants evening game at AT&T Park. (Less than Significant)

Emergency vehicle access impacts under existing plus project conditions with a SF Giants evening game at AT&T Park would be similar to those described above in Impact TR-10 for conditions with an event but without an overlapping SF Giants evening game. The proposed project's TMP includes measures to manage pre-event and post-event vehicle traffic destined to the project parking garage and other parking facilities serving the event center, in order to minimize congestion and reduce potential conflicts between event center traffic and nearby UCSF hospital operations. During overlapping evening events, the 17 PCOs that would be stationed to direct and facilitate vehicular, bicycle, transit, and pedestrian traffic during large events at the project site would be supplemented by the PCOs that are currently deployed during SF Giants evening games. For smaller events, PCOs would be stationed at key intersections and would be monitoring conditions, and could be reassigned to respond to conflicts between event center traffic and UCSF hospital access. With implementation of the planned 22 Fillmore Transit Priority Project, transit-only lanes will be implemented on 16th Street, and emergency vehicles will be permitted use of the transit-only lanes. The transit-only lanes on 16th Street would have fewer vehicles in them than the adjacent mixed-flow lanes, and would not be subject to any turn restrictions. Persons accessing the UCSF Medical Center emergency room and urgent care center in their personal vehicles during an emergency would, if necessary, also be able to utilize the transit-only lanes to bypass congested segments on 16th Street. On Mariposa Street, if needed, emergency vehicles and other persons accessing the emergency room and urgent care center in their personal vehicles during an emergency would be able to travel within the left-center turn lane to access the intersection of Fourth/Mariposa. When PCOs are deployed for an event, they would have the capability to radio ahead to other PCOs down the street regarding the approaching vehicle requiring emergency access. In addition, the transportation management measures currently implemented during SF Giants games would minimize congestion on area roadways. Implementation of **Mitigation Measure M-TR-11a: Additional PCOs During Overlapping Events** and **Mitigation Measure M-TR-11b: Participation in Ballpark/Mission Bay Transportation Coordinating Committee** would minimize the severity of traffic congestion prior to and following events. As discussed in Impact TR-10, implementation of **Improvement Measure I-TR-10a: UCSF Emergency Vehicle Access and Garage Signage Plan** and **Improvement Measure I-TR-10b: Mariposa Street Restriping** would enhance emergency vehicle access to UCSF emergency facilities.

Furthermore, all drivers must comply with the California Vehicle Code § 21806, which requires that drivers yield right-of-way to authorized emergency vehicles, drive to the right road curb or edge, stop, and remain stopped until the emergency vehicle has passed.

Overall, roadway improvements adjacent to the project site would facilitate emergency vehicle access to the site. Before and after events emergency vehicle access to the project site and nearby hospital uses would be maintained with overlapping evening events at the project site and AT&T Park. For these reasons, the proposed project would not inhibit emergency vehicles access to the project site and nearby vicinity; therefore, the proposed project impact on emergency vehicle access even with overlapping basketball and SF Giants evening games would be *less than significant.*

Mitigation: Not required

Improvement Measure I-TR-10a: UCSF Emergency Vehicle Access and Garage Signage Plan (see Impact TR-10, above)

Improvement Measure I-TR-10b: Mariposa Street Restriping (see Impact TR-10, above)

Conditions Without Implementation of the Special Events Transit Service Plan

As described in Section 5.2.5.3, the project sponsor is working with the City to secure funding for the Muni Special Event Transit Service Plan as part of the project improvements, and which would be implemented by the SFMTA during large evening events with more than 14,000 attendees at the project site. The transportation impact analysis presented in **Impact TR-2** through **Impact TR-17** assumes that the special event transit service would be provided during basketball games to accommodate the transit demand. **Impact TR-18** through **Impact TR-24** below present a qualitative assessment of potential transportation impacts of the proposed project without implementation of the Muni Special Events Transit Service Plan.

Impact TR-18: Without implementation of the Muni Special Event Transit Service Plan, the proposed project would result in additional significant traffic impacts at intersections that would operate at LOS E or LOS F under Existing plus Project conditions. (Significant and Unavoidable with Mitigation)

In the event that the SFMTA would not be able to provide all or a portion of the Muni Special Event Transit Service Plan, it is expected that transit would be less convenient for event attendees, and, therefore, that fewer attendees would travel to the site by transit. Because the Muni Special Event Transit Service Plan was assumed only for analysis of a basketball game at the event center (i.e., the analysis did not assume that additional service would be provided for the Convention Event or No Event analysis scenarios), the transportation impact assessment focuses on the Basketball Game scenario for the weekday p.m., evening and late evening and for Saturday evening hours of analysis, but would be applicable for all large events (i.e., concerts, other sporting events, and conventions/corporate events) for which the Muni Special Event Transit Service Plan would be needed to serve attendees traveling to the event center.

Without implementation of the Muni Special Event Transit Service Plan for a basketball game, during the weekday p.m. peak hour the number of project-generated vehicle trips would increase by 54 trips. During the weekday and Saturday evening peak hours (i.e., the peak hour of arrivals to the event center), the number of vehicle trips would increase by 697 vehicles, while during the weekday late evening peak hour (i.e., departures from the event center), the number of vehicle trips would increase by 742 vehicles. During the weekday p.m. peak hour, the additional 54 vehicle trips could increase delay at some study intersections, however, it is anticipated that the intersection LOS would remain the same as presented in **Impact TR-2** for weekday p.m. peak hour conditions, and would not result in additional significant traffic impacts at intersections during the weekday p.m. peak hour.

Table 5.2-53 and **Table 5.2-54** present a comparison of the intersection LOS conditions for the Basketball Game scenario with and without the Muni Special Event Transit Service Plan for the weekday p.m. and Saturday evening peak hours (Table 5.2-53) and for the weekday evening and weekday late evening (Table 5.2-54) peak hours, respectively. During the weekday evening and late evening, and Saturday evening peak hours, the additional 700 to 750 vehicle trips could increase or exacerbate delay at intersection such that the intersection LOS becomes unacceptable (i.e., LOS E or LOS F), or could substantially worsen existing LOS E or LOS F conditions, beyond those identified in **Impact TR-2**.

NOTES:
[a] Delay presented in seconds per vehicle. For unsignalized intersections, delay and LOS presented for worst approach. Worst approach indicated in ( ).
[b] Intersections operating at LOS E or LOS F conditions highlighted in **bold**. Significant project impacts shaded.
[c] All-way stop-controlled intersection. The intersections of Terry A. Francois/South and Illinois/Mariposa would be signalized as part of the proposed project.
[d] The traffic signal at the intersection of Mariposa/I-280 southbound on-ramp is part of the roadway improvements on Mariposa Street between the I-280 northbound off-ramp and I-280 southbound on-ramp and the extension of Owens Street between 16th and Mariposa Streets, and is currently planned to be operational by fall 2015.
[e] Includes implementation of the 22 Fillmore Transit Priority Project, which includes converting one mixed-flow lane in each direction to a side-running transit-only lane.
[f] Under the Basketball Game scenario, a PCO would be stationed at this study intersection during pre-event and/or post-event periods, and, as necessary, would manually direct vehicles, pedestrians, transit, and bicyclists through the intersection. LOS reflects conditions without PCO intervention.

SOURCE: Adavant Consulting/Fehr & Peers/LCW Consulting, 2015

The proposed project without implementation of the Muni Special Event Transit Service Plan would result in *significant* traffic impacts at the following additional study intersections, or analysis periods:

- Third/Channel (weekday late evening)
- Fourth/Channel (Saturday evening)
- Seventh/Mission Bay Drive (weekday late evening)
- Illinois/Mariposa (weekday evening, Saturday evening)
- Owens/16th (weekday late evening)

Impacts at these five intersections would be in addition to the significant impacts identified for the proposed project with implementation of the Muni Special Event Transit Service Plan in Impact TR-2 for conditions without an overlapping SF Giants evening game, and in Impact TR-11 for conditions with an overlapping SF Giants evening game. **Mitigation Measure M-TR-2a: Additional PCOs during Events**, and **Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts** may reduce the severity of traffic impacts.

As discussed in Section 5.2.5.2, the City fully anticipates implementation of the Muni Special Event Transit Service Plan and has identified sufficient funding to deliver the additional transit service. As described above, in order to provide a conservative CEQA analysis as well as information to the public and decision makers, the discussion above discloses the impacts of the proposed project if for some unknown reasons in the future, the City is unable to implement the Muni Special Event Transit Service Plan. The analysis shows that without the additional transit service, the proposed project would result in additional significant traffic impacts. In order to reduce the severity of these impacts, the project sponsor shall implement **Mitigation Measure M-TR-18: Auto Mode Share Performance Standard and Monitoring**, which would ensure that the severity of Impact TR-18 through Impact TR-24 would be the same as the corresponding Impact TR-2 through Impact TR-17 irrespective of whether the Muni Special Event Transit Service Plan was implemented, and would not result in secondary transportation impacts. With implementation of this mitigation measure, the proposed project's traffic impacts would remain ***significant and unavoidable with mitigation***.

Mitigation Measure M-TR-2a: Additional PCOs during Events (see Impact TR-2, above)

Mitigation Measure M-TR-2b: Additional Measures to Reduce Transportation Impacts (see Impact TR-2, above)

Mitigation Measure M-TR-18: Auto Mode Share Performance Standard and Monitoring

Performance Standards and Strategies for Achieving Them

The project sponsor shall be responsible for implementing TDM measures intended to reach an auto mode share performance standard for different types of events. Specifically, the project sponsor shall work to achieve the following performance standards:

1. For weekday events that have 12,500 or more attendees, the project shall not exceed an arrival auto mode share of 53 percent.

2. For weekend events that have 12,500 or more attendees, the project shall not exceed an arrival auto mode share of 59 percent.

The performance standards shall be achieved by the middle of the Golden State Warriors' third season at the event center, and for every Golden State Warriors season thereafter.

The project sponsor may implement any combination of TDM strategies, including those identified in the proposed project's TMP, to achieve the above performance standards. Potential strategies include, but are not limited to:

- Providing shuttle bus service between major transportation hubs such as Transbay Transit Terminal, BART stations, Caltrain stations and the event center.
- Providing bus shuttles between park & ride lots, remote parking facilities, or other facilities or locations within San Francisco, and the event center.
- Facilitating charter bus packages through the event sales department to encourage large groups to travel to and from the event center on charter buses.
- Reducing the project parking demand through a variety of mechanisms, including pricing.
- Offering high occupancy vehicle parking at more convenient locations than parking for the general public and/or at reduced rates.
- Undertaking media campaigns, including in social media, that promote walking and/or bicycling to the event center.
- Conducting cross-marketing strategies with event center businesses (e.g., 10 percent off merchandise/food if patrons arrive by transit and/or bike or on foot).
- Carrying out public education campaigns.
- Offering special event ferry service to the closest ferry station to the project site (similar to the existing service provided between AT&T Park and Alameda and Marin Counties by Golden Gate Transit, Alameda/Oakland and Vallejo ferry service).
- Providing incentive for arrivals by bike.
- Providing transit fare incentives to event ticket holders.

Monitoring and Reporting

The project sponsor shall retain a qualified transportation professional[50] to conduct travel surveys, as outlined below, and to document the results in a *Transportation Demand Management Report*. Prior to beginning the travel survey, the transportation professional shall develop the data collection methodology in consultation with and approved by OCII (or its designated representative such as the Environmental Review Officer (ERO)) and in consultation with SFMTA. It is anticipated that data collection would occur at least during

[50] The Transportation Demand Management Report shall be performed by a qualified transportation professional from the Planning Department's *Transportation Consultant Pool.*

four days for two different types of events, for a total of eight days. Specifically, data collection shall be conducted during at least two weekday and two weekend NBA basketball games with 12,500 or more attendees, and two weekday and two weekend non-basketball events with attendance of 12,500 or more attendees.

The schedule of the travel surveys shall be as follows:

- Comprehensive travel surveys of basketball game attendees shall be conducted between December and April of every season.
- Comprehensive travel surveys of non-basketball event attendees (conventions events, concerts, family shows, etc.) could be collected any time during the year.

The following data of event attendees shall be collected as part of the travel surveys:

- Origin/destination of the trip (city, zip code, home/work/other)
- Mode of travel to/from event center
  - If by transit, list mode and name of transit operator (AC Transit, BART, Caltrain, Muni, etc.)
  - If by rail, name of station trip started and ended
  - If by auto, number of people in the vehicle
  - If by auto, parking location and approximate walking time to event center
  - If by auto, ask if following trips would continue as auto, or if anticipate a mode shift.
  - If by bicycle or walking, name the origin of the trip. If a transfer from regional transit, name the origin and operator.
  - If by bike share, name the origin (i.e., the pick up location) of the trip. Note if trip is a "last mile" connection from regional transit, and include the origin and operator.
- Arrival and departure times at the event center

The travel survey shall employ whatever methodology necessary, as approved by the OCII (or the ERO) in consultation with SFMTA, to collect the above described data including but not limited to: manual or automatic (e.g., video or tubes) traffic volume counts, intercept surveys, smart phone application-based surveys, and on-line surveys.

The *Transportation Demand Management Report(s)* shall be submitted to OCII, or its designee, for review within 30 days of completion of the data collection. If the City finds that the project exceeds the stated mode share performance standard, the project sponsor shall revise the proposed project's Transportation Management Plan (TMP) to incorporate a set of measures that would lower the auto mode share. For basketball events, the TMP shall be revised by no later than August 15th of the calendar year to ensure adequate lead time to implement TDM measures prior to the start of the following basketball season. For non-basketball events, the proposed project's TMP shall be revised within 90 days of submittal of the *Transportation Demand Management Report* to incorporate a set of measure that would lower the auto mode share.

If the project does not meet the stated performance standard, the project sponsor shall implement TDM measures and collect data on a semi-annual basis (i.e., twice during a calendar year) to assess their effectiveness for basketball games and other events. The implementation of TDM measures shall be intensified until the auto mode split performance standard is achieved. Upon achievement of the performance standard, the project sponsor may resume travel survey data collection for basketball and non-basketball events on an annual basis. If the sponsor demonstrates three consecutive years of meeting the auto mode share performance standard, the comprehensive data collection effort may occur every two years.

The data collection plan described above may be modified by OCII (or the ERO) in coordination with SFMTA if field observations and/or other circumstances require data collection at different times and/or for different events than specified above. The modification of the data collection plan, however, shall not change the performance standards set forth in this mitigation measure.

Impact TR-19: Without implementation of the Muni Special Event Transit Service Plan, the proposed project would result in additional significant traffic impacts at freeway ramps that would operate at LOS E or LOS F under Existing plus Project conditions. (Significant and Unavoidable with Mitigation)

As described in Impact TR-18, without implementation of the Muni Special Event Transit Service Plan for large events, the number of event-related vehicle trips would increase over conditions with implementation of the Muni Special Event Transit Service Plan. For the Basketball Game scenario, the increase in the number of vehicles would be 54 vehicle trips during the weekday p.m. peak hour, 697 vehicles during the weekday evening and Saturday evening peak hours, and 742 during the weekday late evening peak hour. A portion of these vehicles would travel on I-80 and I-280, and may increase traffic volumes on the study ramp locations. Thus, without implementation of the Muni Special Event Transit Service Plan, the additional vehicle trips may increase or exacerbate the density at the ramp merge and diverge locations, such that the ramp LOS becomes unacceptable (i.e., LOS E or LOS F), or could substantially worsen existing LOS E or LOS F conditions.

Table 5.2-55 and **Table 5.2-56** present a comparison of the ramp LOS conditions for the Basketball Game scenario with and without the Muni Special Event Transit Service Plan for the weekday p.m. and Saturday evening peak hours (Table 5.2-53) and for the weekday evening and weekday late evening (Table 5.2-54) peak hours, respectively.

SOURCE: Adavant Consulting/Fehr & Peers/LCW Consulting, 2015

The proposed project without implementation of the Muni Special Event Transit Service Plan would result in *significant* traffic impacts at the following three additional freeway ramp locations:

- I-80 eastbound on-ramp at Fifth/Bryant (weekday late evening)
- I-80 westbound off-ramp at Fifth/Harrison (Saturday evening)
- I-280 northbound off-ramp at Mariposa Street (weekday evening)

Impacts at these three freeway ramps would be in addition to the significant impacts identified for the proposed project with implementation of the Muni Special Event Transit Service Plan in Impact TR-3 for conditions without an overlapping SF Giants evening game, and in Impact TR-12 for conditions with an overlapping SF Giants evening game.

Mitigation Measure M-TR-2b: Auto Mode Share Performance Standard and Monitoring and **Mitigation Measure M-TR-18: Auto Mode Share Performance Standard and Monitoring,** described above, would also be applicable to address the freeway ramp impacts. Implementation of these measure would ensure that the severity of **Impact TR-18** would be the same as the corresponding Impact TR-3, irrespective of whether the Muni Special Event Transit Service Plan was implemented or not. With implementation of this mitigation measure, the proposed project's impacts related to freeway ramp operations would remain *significant and unavoidable with mitigation.*

Mitigation Measure M-TR-2b: Additional Measures to Reduce Transportation Impacts (see Impact TR-2, above)

Mitigation Measure M-TR-18: Auto Mode Share Performance Standard and Monitoring (see Impact TR-18, above)

Impact TR-20: Without implementation of the Muni Special Event Transit Service Plan, the proposed project would result in a substantial increase in transit demand that could not be accommodated by adjacent Muni transit capacity such that significant adverse impacts to Muni transit service would occur under Existing plus Project conditions. (Significant and Unavoidable with Mitigation)

Without implementation of the Muni Special Event Transit Service Plan, the transit capacity for the Basketball game scenario would decrease from those presented in **Table 5.2-41** (weekday evening and late evening) and **Table 5.2-42** (Saturday evening) in **Impact TR-4**. Without the additional T Third light rail service and the Muni Special Event Shuttles, the hourly capacity for the Muni service to the project site would decrease from about 6,700 passengers per hour to 2,900 passengers per hour during the weekday evening peak hour (i.e., inbound to the site), from 6,300 to 2,000 passengers per hour during the late evening peak hour (i.e., outbound from the project site, and from 6,100 to 2,100 passengers per hour during the Saturday evening peak hour (i.e., inbound to the site).

Table 5.2-57 presents the capacity utilization analysis for weekday p.m. and Saturday evening peak hours for the Basketball Game scenario without implementation of the Muni Special Event Transit Service Plan, while **Table 5.2-58** presents this information for the weekday evening and weekday late evening peak hours. Without implementation of the Muni Special Event Transit Service Plan for large events at the project site, the number of attendees arriving by transit is expected to decrease. Overall, without implementation of the Muni Special Event Transit Service Plan for a basketball game, during the weekday and Saturday evening peak hours (i.e., the peak hour of arrivals to the event center), the number of transit trips would decrease by 1,762 trips. During the weekday late evening peak hour the number of transit trips would decrease by 1,878 trips.

NOTES:

[a] For pre-event and post-event conditions, capacity utilization exceeding 100 percent highlighted in **bold.** Significant project impacts shaded.

[b] Ridership and capacity for the T Third and 22 Fillmore reflect implementation of the Central Subway and 22 Fillmore Transit Priority Project.

SOURCE: Adavant Consulting/Fehr & Peers/LCW Consulting, 2015

Without the three additional Muni Special Event Shuttles, the number of attendees accessing the project site via the T Third would increase, and, because the additional capacity would also not be provided on the T Third, the capacity utilization on the T Third would increase during the weekday evening and weekday late evening peak hours, and would exceed the 100 percent capacity utilization standard for special events. In addition, more attendees would use the 22 Fillmore (e.g. to access the 16th Street BART station), and the capacity utilization of the 22 Fillmore during the weekday late evening would increase from less than 85 percent to more than 100 percent capacity utilization. Thus, during the weekday late evening peak hour, conditions without the Muni Special Event Transit Service Plan would result in additional significant impacts on the T Third and 22 Fillmore during the weekday late evening peak hour.

During the Saturday evening peak hour, without the additional Muni light rail and special event shuttle capacity, the capacity utilization on the T Third and 22 Fillmore would increase to more than the 100 capacity utilization standard. Thus, during the Saturday evening peak hour, conditions without the Muni Special Event Transit Service Plan would result in an additional significant impact on the T Third and 22 Fillmore during the Saturday evening peak hour.

Overall, under existing plus project conditions without the Muni Special Event Transit Service Plan, the proposed project would result in *significant* project-specific transit impacts, as follows:

- T Third during the weekday evening, weekday late evening, and Saturday evening peak hours.
- 22 Fillmore during the weekday late evening, and Saturday evening peak hours.

Mitigation Measure M-TR-18: Auto Mode Share Performance Standard and Monitoring would also be applicable to address the impact on Muni service. Implementation of this measure would ensure that the severity of Impact TR-20 would be the same as the corresponding Impact TR-13, irrespective of whether the Muni Special Event Transit Service Plan was implemented or not. With implementation of this mitigation measure, the proposed project's impacts related to transit operations would remain *significant and unavoidable with mitigation.*

> **Mitigation Measure M-TR-18: Auto Mode Share Performance Standard and Monitoring** (see Impact TR-18, above)

Impact TR-21: Without implementation of the Muni Special Event Transit Service Plan, the proposed project would result in a substantial increase in transit demand that could not be accommodated by regional transit capacity such that significant adverse impacts to regional transit service would occur under Existing plus Project conditions. (Significant and Unavoidable with Mitigation)

As described in **Impact TR-20,** without implementation of the Muni Special Event Transit Service Plan for large events at the project site, the number of attendees arriving by transit, including those from the East Bay, North Bay, and South Bay, is projected to decrease, as more attendees would chose to drive to the event center because Muni service between the regional transit stops and the event center would be limited and operating at overcapacity conditions. Overall, without implementation of the Muni Special Event Transit Service Plan for a basketball game, during the weekday and Saturday evening peak hours (i.e., the peak hour of arrivals to the event center), the number of transit trips traveling to and from outside of San Francisco would decrease by 1,121 trips during the weekday evening peak hour, by 1,329 trips during the weekday late evening peak hour, and by 1,221 trips during the Saturday evening peak hour.

As presented in **Table 5.2-57** weekday p.m. and Saturday evening peak hours and **Table 5.2-58** for the weekday evening and weekday late evening peak hours, without implementation of the Muni Special Event Transit Service Plan for the Basketball Game scenario, the number of attendees arriving via Caltrain would decrease, which would result in a reduction in the capacity utilization on Caltrain such that the proposed project would not result in the significant impacts on Caltrain during the weekday evening, weekday late evening, and Saturday evening peak hours, as reported in **Impact TR-5** and **Impact TR-14**.

The reduction in project transit demand on regional transit operators would also reduce the capacity utilization for service to the North Bay buses and ferries. However, capacity utilization would still exceed 100 percent during the weekday late evening, and therefore, without implementation of the Muni Special Event Transit Service Plan, impacts to WETA and Golden Gate Transit capacity would remain significant and unavoidable.

Overall, under existing plus project conditions without a SF Giants game at AT&T Park and without the Muni Special Event Transit Service Plan, the proposed project would result in *significant* project-specific transit impacts on WETA and Golden Gate Transit service during the weekday late evening peak hours.

Implementation of **Mitigation Measure M-TR-5a: Additional Caltrain Service** and **Mitigation Measure M-TR-5b: Additional North Bay Ferry and Bus Service** would reduce or minimize the severity of the capacity utilization exceedances for the regional transit service providers. However, as noted in Impact TR-5, since the provision of additional Caltrain and North Bay service is uncertain and full funding for the service has not yet been identified, implementation of this mitigation measures is uncertain. Accordingly, the proposed project's significant impacts to Caltrain, Golden Gate Transit, and WETA transit capacity would remain *significant and unavoidable with mitigation.*

Mitigation Measure M-TR-5a: Additional Caltrain Service (see Impact TR-5, above)

Mitigation Measure M-TR-5b: Additional North Bay Ferry and Bus Service (see Impact TR-5, above)

Impact TR-22: Without implementation of the Muni Special Event Transit Service Plan, the proposed project could result in a substantial overcrowding on public sidewalks, nor create potentially hazardous conditions for pedestrians, or otherwise interfere with pedestrian accessibility on the site and adjoining areas under Existing plus Project conditions. (Less than Significant with Mitigation)

Without implementation of the Muni Special Event Transit Service Plan for large events at the project site, the number of attendees arriving by transit is expected to decrease, while the number of attendees arriving by auto mode would increase. Overall, without implementation of the Muni Special Event Transit Service Plan for a basketball game, during the weekday p.m. peak hour the number of vehicle trips would increase by 54, while the number of transit trips would decrease by 136 trips. During the weekday and Saturday evening peak hours (i.e., the peak hour of arrivals to the event center), the number of vehicle trips would increase by 697 vehicles, while the number of transit trips would decrease by 1,762 trips. During the weekday late evening peak hour (i.e., departures from the event center), the number of vehicle trips would increase by 742 vehicles, while the number of transit trips would decrease by 1,878 trips. In general, the number of pedestrian trips traveling to and from the event center would not change, however, the direction of travel to and from the project site may change depending on where the increased parking demand is accommodated. As a result, the number of pedestrians at the intersection of Third/South may decrease somewhat, and increase at the intersection of Third/16th as event attendees seek and find parking farther east and south of the project site.

During all events, the proposed project's TMP assumes that PCOs would be stationed at intersections adjacent to the proposed site (and elsewhere) to manage pedestrian flows and minimize conflicts, and that a similar level of management would be needed via police officers or PCOs regardless of whether the Muni Special Event Transit Service Plan is implemented. The increase in auto mode and project vehicle trips without implementation of the Muni Special Event Transit Service Plan and associated PCOs at the intersection of Third/South could result in overcrowding on the sidewalks and light rail platforms, and may result in potentially hazardous conditions for pedestrians, which would be considered a significant pedestrian impact.

Mitigation Measure M-TR-22: Provide Safe Pedestrian Access to Adjacent Transit and Parking Facilities and Monitoring

During events with 3,000 or more attendees, the project sponsor shall be responsible for providing trained personnel (e.g., off-duty SFPD staff) to control pedestrian, bicycle and vehicular flows to and from the event center at the intersections immediately adjacent to the project site and to ensure that Muni platforms serving the site are not over capacity. The trained personnel shall be provided during pre- and post-event periods. The project sponsor shall ensure that conflicts between various modes are reduced to the maximum extent possible through adequate staffing of trained personnel as well as other measures, as appropriate.

Other pedestrian management measures that could be implemented include but are not limited to: installation of barricades, proper signage and announcements to disperse patrons to other streets around the project site, such as to Terry A. Francois Boulevard, and cross-marketing incentives such as 20 percent discount at the restaurant and retail establishments to extend the peak departure period. Through the implementation of various strategies, the project sponsor shall ensure that pedestrian conflicts with other modes are minimized by separating vehicles, bicycles, transit and pedestrian flows to the greatest extent possible, including ensuring that various modes are adequately instructed about when it is their turn to proceed. The project sponsor shall also ensure that Muni platforms are not overcrowded by staging event attendees on the adjacent sidewalks until there is sufficient space on the Muni platforms, which are proposed to be expanded as part of the project.

At the intersection of Third/South, the trained personnel shall implement strategies to allow pedestrians to cross the street safely. The strategies could include manually overriding the traffic signal and directing pedestrians to cross, erecting temporary pedestrian crossing barriers, allowing use of the closed Third Street as a pedestrian access route, providing a defined passenger waiting area within the closed Third Street, and shielding passengers waiting to board light rail from adjacent pedestrian traffic.

Monitoring and Reporting

The project sponsor shall retain a qualified transportation professional[51] to conduct field observations of pedestrian hazards and safety conditions along Third Street adjacent to the project site, as outlined below, and to document the results in a *Pedestrian Access Report*. City staff shall verify the field data collection results. Prior to beginning field observations, the transportation professional shall develop the data collection methodology in consultation with and approved by OCII (or its designated representative such as the ERO) in coordination with SFMTA. The data collection methodology shall be reviewed and revised annually, if appropriate. Field observations shall be conducted during the following event types and attendance levels:

- at least two weekday NBA basketball games with 12,500 or more attendees;
- at least two weekend NBA basketball games with 12,500 or more attendees;
- at least two weekday non-basketball game events with 12,500 or more attendees;
- at least two weekend non-basketball game events with 12,500 or more attendees;
- at least two weekday non-basketball game events with 3,000 to 9,000 attendees; and,
- at least two weekend non-basketball game events with 3,000 to 9,000 attendees; and
- at least two weekday convention events of 9,000 or more attendees.

The pedestrian hazard and safety conditions field observations shall occur on an annual basis. The *Pedestrian Access Report* shall be submitted to SFMTA, OCII and Planning Department for review within 30 days of completion of the data collection. If the City finds that the project does not meet the performance standard outlined below, the Transportation Management Plan (TMP) shall be revised to incorporate techniques to minimize conflicts between pedestrians and other modes. The TMP shall be revised within 90 days of submittal of the *Pedestrian Access Report*. When the project is not meeting the stated performance standard, the project sponsor shall collect data on a semi-annual basis (i.e., twice during a calendar year) to assess the effectiveness of various measures incorporated into the revised TMP. The implementation of various measures shall be intensified until pedestrian access to and from the site occurs in a safe manner, as determined by OCII (or the ERO).

The performance standard for safe pedestrian operations consists of the following: substantial numbers of pedestrians are not spilling onto the Muni right-of-way area, are not illegally crossing Third Street midblock, are not overcrowding the Muni platforms, and are not crossing intersections against the signal. Upon achievement of the performance standard, the project sponsor may resume field observations for basketball, non-basketball and convention events on an annual basis. If the sponsor demonstrates three consecutive years of meeting the performance standard, the comprehensive data collection effort may occur every two years.

---

[51] The Transportation Demand Management Report shall be performed by a qualified transportation professional from the San Francisco Planning Department's *Transportation Consultant Pool.* Available online at *http://www.sf-planning.org/index.aspx?page=1886.* Accessed May 28, 2015.

Further, in reviewing the *Pedestrian Access Report,* OCII (or the ERO) may adjust the size of the events for which this measure is applicable. For example, if small scale events (e.g., those with 5,000 attendees) do not result in crosswalk and/or Muni platform overcrowding or other similar pedestrian safety conditions, OCII (or the ERO) may revise this mitigation measure to apply to events of 5,001 or more attendees.

Mitigation Measure M-TR-22: Provide Safe Pedestrian Access to Adjacent Transit and Parking Facilities and Monitoring would ensure that the pedestrian impacts would remain the same as those identified in **Impact TR-6** for pedestrian conditions without an overlapping SF Giants evening game and **Impact TR-15** for pedestrian conditions with an overlapping SF Giants evening game irrespective of whether SFMTA PCOs were available during various events, and would not result in secondary transportation impacts. With implementation of **Mitigation Measure M-TR-22: Provide Safe Pedestrian Access to Adjacent Transit and Parking Facilities,** project-generated pedestrian demand during large events would not substantially affect pedestrian flows, create potentially hazardous conditions for pedestrians or otherwise interfere with pedestrian accessibility to the site and adjoining areas. Therefore, without implementation of the Muni Special Event Transit Service Plan, the proposed project's impact on pedestrians would be *less than significant with mitigation.*

Impact TR-23: Without implementation of the Muni Special Event Transit Service Plan, the proposed project would not result in potentially hazardous conditions for bicyclists, or otherwise substantially interfere with bicycle accessibility to the site and adjoining areas under Existing plus Project conditions. (Less than Significant)

Without implementation of the Muni Special Event Transit Service Plan for large events at the project site, the number of attendees arriving by bicycle is expected to increase by about 25 percent compared to conditions with the Muni Special Event Transit Service Plan. About 60 additional bicycle trips could be expected during the peak hour arriving or departing a large event. With the additional bicycle trips, bicycle conditions in the vicinity of the project site without the Muni Special Event Transit Service Plan would be similar to those presented above in Impact TR-7. However, because more event center attendees would be arriving by auto, traffic volumes on streets leading to and from the off-site parking facilities would be greater, which could result in increased potential for bicycle-vehicle conflicts. Project TMP measures, such as PCOs and post-event temporary lane closures, would serve to minimize congestion and conflicts between modes.

Overall, without implementation of the Muni Special Event Transit Service Plan, the number of attendees arriving by vehicle would increase prior to and following a large event, which may increase vehicle-bicycle conflicts, however, the proposed project TMP measures would minimize the potential for conflicts. Therefore, without implementation of the Muni Special Event Transit Service Plan, the proposed project's impact on bicyclists would be *less than significant.*

Mitigation: Not required

Impact TR-24: Without implementation of the Muni Special Event Transit Service Plan, the proposed project would not result in significant impacts on loading under Existing plus Project conditions. (Less than Significant)

Impacts related to passenger loading/unloading activities without implementation of the Muni Special Event Transit Service Plan would be similar to those identified above for Impact TR-8. Without implementation of the Muni Special Event Transit Service Plan, the number of event attendees arriving by transit would decrease, which would in turn reduce the passenger loading/unloading demand associated with passengers alighting and boarding the proposed Muni Special Event Shuttles on South, 16th, Illinois, and Third Streets. However, with fewer light rail vehicles serving the event center transit demand at the UCSF Mission Bay station, it would take longer for all attendees taking transit to board and depart the area. Therefore conditions on the sidewalks on Third and South Streets would become more congested. During all events, the proposed project's TMP assumes that PCOs would be stationed at intersections adjacent to the proposed site (and elsewhere) to manage pedestrian flows and minimize conflicts, and that a similar level of management would be provided via police officers or PCOs regardless of whether the Muni Special Event Transit Service Plan is implemented. The increase in auto mode and project vehicle trips without implementation of the Muni Special Event Transit Service Plan could lead to additional traffic circling in the area seeking parking, which could result in increased pedestrian-vehicle conflicts associated with passenger loading/unloading activity on Terry A. Francois Boulevard and South Street. Project TMP information on parking facilities and real-time information on availability would serve to minimize the impact of additional vehicles on passenger loading/unloading activities. Thus, similar to pedestrian conditions described above in Impact TR-8 for conditions that assume implementation of the Muni Special Event Transit Service Plan, proposed passenger loading/unloading facilities would be adequate to meet the demand associated with the project uses even without the Muni Special Event Transit Service Plan.

Impacts related to truck and service vehicle loading/unloading activities, which would not occur immediately before or after events at the project site, would be the same as those described above for Impact TR-8. Freight deliveries would occur prior to events, and would be accommodated on-site with the loading area, and at the curb adjacent to the project site on South Street and Terry A. Francois Boulevard. **Improvement Measure I-TR-8: Truck and Service Vehicle Loading Operations Plan** would reduce the potential for conflicts between proposed project-generated loading/unloading activities and pedestrians, transit, bicyclists, and autos.

For the reasons noted above, the truck/service vehicle and passenger loading/unloading activities adjacent to the project site would not be substantially affected, and therefore, without implementation of the Muni Special Event Transit Service Plan, impacts related to loading would be *less than significant.*

Mitigation: Not required

Improvement Measure I-TR-8: Truck and Service Vehicle Loading Operations Plan (see Impact TR-8, above)

Impact TR-25: Without implementation of the Muni Special Event Transit Service Plan, the proposed project would not result in significant impacts on emergency vehicle access under Existing plus Project conditions. (Less than Significant)

Impacts related to emergency vehicle access without implementation of the Muni Special Event Transit Service Plan would be similar to those identified in **Impact TR-10**. The additional vehicle trips resulting from the projected shift from transit to auto mode would be dispersed over a broader area, as more drivers would have to park at off-street facilities located further away from the project site (most likely north of the Mission Creek Channel), reducing the effect of the increased vehicle traffic on the roadway network. Some increase in vehicles on Terry A. Francois Boulevard would be anticipated at the proposed passenger loading/unloading zones, as it is anticipated that without implementation of the Muni Special Event Transit Service Plan more attendees would be dropped off and picked up at the passenger loading/unloading zone. However, this increase in vehicles adjacent to the project site would be accommodated without a substantial increase in vehicle conflicts as adequate project frontage would be available to accommodate the increase passenger loading/unloading demand. The proposed roadway improvements that are planned to be built as part of the Mission Bay South Infrastructure Plan in the vicinity of the project site (i.e., extension and widening of 16th Street between Illinois and Terry A. Francois Boulevard, realignment of Terry A. Francois Boulevard, widening of Mariposa Street, implementation of the transit-only lane on 16th Street) would facilitate emergency access to the site such that before and after events, emergency vehicle access to the project site and nearby hospital uses would be maintained. As discussed in Impact TR-10, implementation of **Improvement Measure I-TR-10a: UCSF Emergency Vehicle Access and Garage Signage Plan** and **Improvement Measure I-TR-10b: Mariposa Street Restriping** would enhance emergency vehicle access to UCSF emergency facilities. For the reasons noted above, the emergency vehicle access to the site or to the surrounding area would not be substantially affected, and therefore, without implementation of the Muni Special Event Transit Service Plan, impacts related to emergency vehicle access would be *less than significant.*

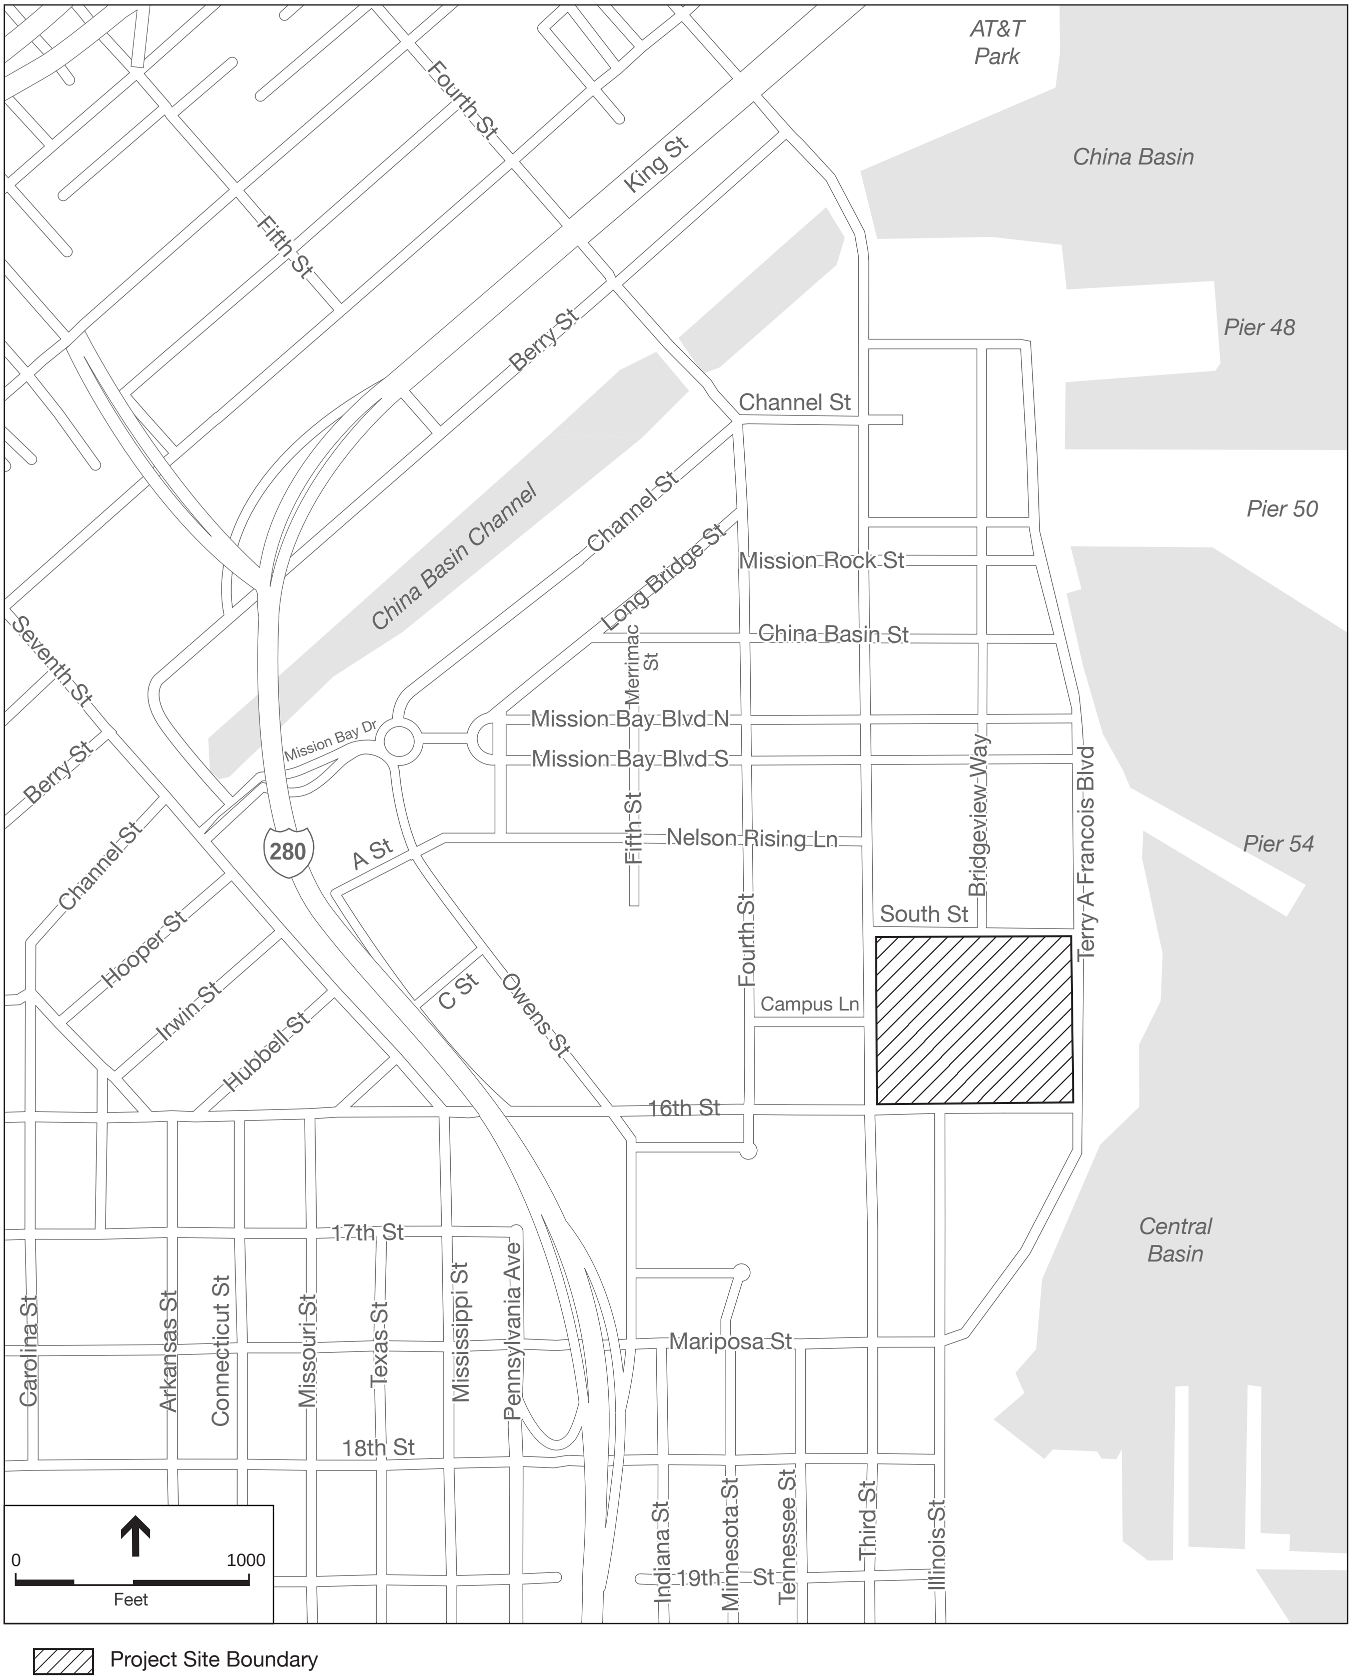
Mitigation: Not required

Improvement Measure I-TR-10a: UCSF Emergency Vehicle Access and Garage Signage Plan (see Impact TR-10, above)

Improvement Measure I-TR-10b: Mariposa Street Restriping (see Impact TR-10, above)

5.2.5.5 Cumulative Impacts

This section discusses the cumulative impacts to transportation that could result from the project, in conjunction with past, present, and reasonably foreseeable future projects. The geographic context for the analysis of cumulative transportation impacts includes the sidewalks and roadways adjacent to the project site, and the local roadway and transit network in the vicinity of the project. The cumulative analysis reflects the completion of the roadway network within Mission Bay, as presented in **Figure 5.2-21**. The discussion of cumulative transportation impacts



SOURCE: OCII, 2015

OCII Case No. ER 2014-919-97; Planning Department Case No. 2014.1441E:
Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 5.2-21
2040 Cumulative Roadway Network in Mission Bay

assesses the degree to which the project would affect the transportation network in conjunction with other reasonably foreseeable projects. Detailed calculations are included in **Appendix TR**.

As described in Section 5.2.5.3 above, future 2040 cumulative traffic, transit and pedestrian forecasts were estimated based on cumulative development and growth identified by the SFCTA SF-CHAMP travel demand model.

Cumulative Construction Impacts

Impact C-TR-1: The project, in combination with other past, present, and reasonably foreseeable future projects, would not result in significant adverse cumulative construction-related ground transportation impacts. (Less than Significant)

The construction of the proposed project may overlap with the construction of other reasonably foreseeable projects listed in Section 5.1.3 above, including the UCSF LRDP Mission Bay campus projects, Seawall Lot 337 and Pier 48 Mixed-Use Project (Mission Rock Project), the Kaiser Medical Offices at 1600 Owens Street (currently under construction), Uber/ARE project on Mission Bay Blocks 26/27, The Exchange project on Mission Bay Block 40, the Family House project on Mission Bay Block 7 East, affordable housing projects on Mission Bay Blocks 3, 6, and 7, the Residential and Hotel project on Mission Bay Block 1, and 360 Berry Street project on Mission Bay Block N4/P3. In addition, project construction would overlap with construction activities associated with realignment of Terry A. Francois Boulevard to the east of the project site, and construction of the Bayfront Park, as well as other parks on Mission Bay Blocks P23 and P24.

The Uber/ARE project on Mission Bay Blocks 26/27, located directly north of the project site across South Street, consists of 423,000 gsf of office space. Construction on this project is estimated to start by the end of 2015 and continue for 18 to 24 months.

The buildout of Mission Bay has been ongoing since 1999, and as of 2014, roughly 64 percent of the housing units have been completed and close to 40 percent of the planned office and laboratory space is complete. In 2013 and 2014 when the transportation data was collected for this EIR for the existing setting conditions, about 1.13 million gsf of development were under construction at the Mission Bay Campus. The majority of the remaining construction is included as part of the UCSF LRDP and would be constructed over the next 20 years.[52] The timing of construction of other development projects noted above is not currently known. As discussed in Impact TR-1, it is anticipated that construction at the project site over the 26-month construction period would overlap with the construction activity of other projects in the area, notably the UCSF LRDP projects, planned for construction between 2015 and 2019. These include 523

52 When the LRDP in Mission Bay is completed, there will be approximately 3 million gsf of UCSF-occupied space, excluding structure parking and temporary childcare. The 2014 Plan-level analysis of the UCSF LRDP determined that although construction activities would be temporary, construction impacts would be considered potentially significant given the magnitude of the LRDP development over the course of many years (over 20 plus years), and need for ongoing coordination and monitoring. However, with implementation of mitigation measures, the UCSF LRDP construction-related transportation impacts would be reduced to less than significant levels. UCSF LRDP, pp. 3-39 and 7-89.

residential units, about 440,000 gsf of research, clinical and medical space, and a parking garage containing 500 vehicle parking spaces. In particular, the UCSF East Campus project on Blocks 33/34, located directly south of the project site across 16th Street, consists of 500,000 gsf of office space, but may include up to 250,000 gsf of clinical space with the remainder research/office space. The project will be built in two phases, with the first phase (about 250,000 gsf) starting construction in 2016 and continuing for about 18 to 24 months. Detailed construction schedules of other UCSF projects are not currently known, however, it is anticipated that a portion of the construction schedules would overlap with the 26-month project construction period. These UCSF projects are projected to generate about 40 daily truck trips on average, and these trucks would enter/exit the UCSF campus via Mission Bay Boulevard North, Nelson Rising Lane, Owens Street, 16th Street, and Fourth Street.

In addition, construction of the planned Bayfront Park east of a realigned Terry A. Francois Boulevard (on Mission Bay Block P22), a neighborhood park located along the west side of Terry A. Francois Boulevard south of 16th Street (on Mission Bay Block P23), as well as a neighborhood park on the north side of Mariposa Street east of Owens Street (on Mission Bay Block P24) would overlap with construction of the proposed project. Construction on the parks on Mission Bay Blocks P23 and P24 has been initiated, with construction completed by the end of 2016. Construction on the Bayfront Park (P22) directly to the east of the project site would begin following realignment of Terry A. Francois Boulevard, and would be completed by 2018.

The Exchange project on Mission Bay Block 40 is located about 1,200 southwest of the project site, while the Family House project on Mission Bay Block 7 East, affordable housing projects on Mission Bay Blocks 3, 6, and 7, the Residential and Hotel project on Mission Bay Block 1, and 360 Berry Street project on Mission Bay Block N4/P3 are located between 1,000 and 3,000 feet to the northwest of the project site, respectively. Construction truck traffic associated with these projects traveling between the sites and I-80 and I-280 may travel on the same roadways and at the same time as project-generated construction traffic further from the project site and on the regional facilities.

If Caltrain adopts the electrification project and funding remains available, construction of the Peninsula Corridor Electrification Project could start in 2016, and the first electrically-powered trains would be in service by 2020 or 2021.[53] Construction activities would occur primarily within the Caltrain right-of-way to the west of the project site.

Localized cumulative construction-related transportation impacts could occur as a result of reasonably foreseeable projects in the vicinity of the project site that would generate increased traffic at the same time and on the same roads as the proposed project. As part of the construction permitting process, each development project would be required to work with the various departments of the City to develop a detailed and coordinated plan that would address

[53] Peninsula Corridor Electrification Project FAQ Update December 2014. Available online at http://www.caltrain.com/projectsplans/CaltrainModernization/Modernization/PeninsulaCorridorElectrificationProject.html. Accessed May 28, 2015.

construction vehicle routing, traffic control, and pedestrian movement adjacent to the construction area. The cumulative construction-related transportation impacts of the multiple nearby construction projects would occur over an extended duration, and the project sponsor would coordinate with various City departments such as SFMTA and DPW through the SFMTA Transportation Advisory Committee (TASC), a multi-agency review body, to develop coordinated plans that would address construction-related vehicle routing and pedestrian movements adjacent to the construction area for the duration of construction overlap.

Overall, because proposed project's construction activities would be temporary and limited in duration, and are required to be conducted in accordance with City requirements, the proposed project would not contribute considerably to the cumulative construction-related transportation impacts. Furthermore, proposed project **Improvement Measure I-TR-1: Construction Management Plan and Public Updates** would further reduce the proposed project's less-than-significant impacts related to potential conflicts between construction activities and pedestrians, transit, and autos, and includes provisions for construction truck traffic management, construction worker parking plan, project construction updates for adjacent businesses and residents, and carpool and transit access for construction workers.

Therefore, for the above reasons, the proposed project, in combination with past, present and reasonably foreseeable development in San Francisco, would not contribute considerably to the significant cumulative construction-related transportation impacts, and the project's cumulative impact would be *less than significant*.

Mitigation: Not required

Comparison of Impact C-TR-1 to Mission Bay FSEIR Impact Analysis

The Mission Bay FSEIR did not identify any significant cumulative impacts related to construction-related transportation impacts. Consequently, no new or different mitigation measures or alternatives to reduce project impacts related to construction activities are identified or required with respect to the currently proposed project. On the basis of the above, the project would result in no new or substantially more severe significant effects than those identified in the Mission Bay FSEIR related to construction-related transportation impacts.

Cumulative Traffic Impacts

Impact C-TR-2: The project, in combination with other past, present, and reasonably foreseeable future projects, would result in significant cumulative traffic impacts at multiple intersections in the project vicinity under 2040 Cumulative conditions. (Significant and Unavoidable with Mitigation)

Under 2040 cumulative conditions, proposed project impacts were assessed by calculating the project-generated traffic conditions at intersections that are projected to operate at LOS E or LOS F under 2040 cumulative conditions for the No Event scenario for the weekday p.m. and

Saturday evening peak hours. Because the SF-CHAMP travel demand model does not include the travel demand associated with events, the proposed project cumulative impacts for events at the project site (i.e., the Convention Event and Basketball Game scenarios) for the weekday p.m. peak hour were assessed by adding the event-related traffic volumes to the No Event scenario.

At intersections that are projected to operate at LOS E or LOS F under 2040 cumulative conditions, the increase in proposed project vehicle trips was reviewed to determine whether the increase would contribute considerably to critical movements operating at LOS E or LOS F. In addition, the intersections where project-specific significant impacts were identified for existing plus project conditions, the proposed project would also be considered to result in a cumulative impact under 2040 cumulative conditions. Supporting documentation regarding the cumulative contributions is included in **Appendix TR**.

Table 5.2-59, **Figure 5.2-22**, and **Figure 5.2-23** present the intersection LOS analysis for 2040 cumulative conditions for the weekday p.m. peak hour, while **Table 5.2-60** and **Figure 5.2-24** present the intersection LOS analysis for the Saturday evening peak hour.

As shown in **Table 5.2-59**, for 2040 cumulative weekday p.m. peak hour conditions with the proposed project (i.e., for the No Event, Convention Event, and Basketball Game scenarios), 10 of the 22 study intersections would operate at LOS E or LOS F conditions during the weekday p.m. peak hour, including the intersections of King/Third, King/Fourth, Fifth/Harrison/I-80 westbound off-ramp, Fifth/Bryant/I-80 eastbound on-ramp, Third/Channel, Seventh/Mission Bay Drive, Third/16th, Owens/16th, Seventh/Mississippi/16th, and Third/Cesar Chavez. The proposed project would result in project-specific impacts (i.e., from LOS D or better to LOS E or LOS F, or from LOS E to LOS F under either existing plus project or 2040 cumulative conditions), or contribute considerably (i.e., more than 5 percent) to the poorly operating critical movements at intersections that are projected to operate at LOS E or LOS F conditions at 9 of the 10 intersections that would operate at LOS E or LOS F under 2040 cumulative conditions: King/Third, King/Fourth, Fifth/Harrison/I-80 westbound off-ramp, Third/Channel, Seventh/Mission Bay Drive, Third/16th, Owens/16th, Seventh/Mississippi/16th, and Third/Cesar Chavez.

In addition, as shown in **Table 5.2-60**, for 2040 cumulative Saturday evening peak hour conditions with the proposed project, the intersection of Fifth/Harrison/I-80 westbound off-ramp is projected to operate at LOS E under the No Event scenario. For the Basketball Game scenario, 8 of the 22 study intersections would operate at LOS E or LOS F conditions, including the intersections of King/Third, King/Fourth, Fifth/Harrison/I-80 westbound off-ramp, Fifth/Bryant/I-80 eastbound on-ramp, Third/Channel, Fourth/Channel, and Seventh/Mission Bay Drive, and Seventh/Mississippi/16th. The proposed project would result in project-specific impacts, or contribute considerably to the poorly operating critical movements at all eight intersections that are projected to operate at LOS E or LOS F conditions.

OCII Case No. ER 2014-919-97; Planning Department Case No. 2014.1441E:
Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 5.2-24
2040 Cumulative Intersection LOS-Saturday Evening Peak Hour -
No Event and Basketball Game Scenarios

In addition, as discussed in under existing plus project conditions in **Impact TR-11**, the proposed project would result in significant traffic impacts at five additional study intersections during the weekday p.m. and weekday evening peak hours for conditions with an overlapping evening event at AT&T Park, including: King/Fifth/I-280 ramps (weekday evening), Third/South (weekday evening), Fourth/16th (weekday p.m.), Illinois/Mariposa (weekday evening), and Mariposa/I-280 northbound off-ramp (weekday evening), and project-specific traffic impacts at these intersection would be also considered significant cumulative impacts of the project.

Generally, to mitigate poor operating conditions of study intersections, additional travel lane capacity would be needed on one or more approaches to the intersection, particularly at intersections with the I-80 ramps. The provision of additional travel lane capacity by narrowing sidewalks, removal of on-street parking, and/or removal of bicycle lanes would generally be infeasible and inconsistent with the transit, bicycle, and pedestrian environment encouraged by the City's *Transit First* Policy by removing space dedicated to pedestrians, and/or bicycles and increasing the distances required for pedestrians to cross streets. Implementation of **Mitigation Measure M-TR-2a: Additional PCOs during Events, Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts, Mitigation Measure M-TR-11a: Additional PCOs During Overlapping Events, Mitigation Measure M-TR-11b: Participation in Ballpark/Mission Bay Transportation Coordinating Committee,** and **Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events** would reduce the proposed project's contribution to cumulative impacts related to event-related traffic conditions but would not reduce the contribution to less-than-significant levels.

Overall, combined for all analysis peak hours, the proposed project would result in cumulative impacts, or contribute to 2040 cumulative impacts at the following 16 study intersections: King/Third, King/Fourth, King/Fifth/I-280 ramps, Fifth/Harrison/I-80 westbound off-ramp, Fifth/Bryant/I-80 eastbound on-ramp, Third/Channel, Fourth/Channel, Seventh/Mission Bay Drive, Third/South, Third/16th, Fourth/16th, Owens/16th, Seventh/Mississippi/16th, Illinois/Mariposa, Mariposa/I-280 northbound off-ramp, and Third/Cesar Chavez. As noted above, the proposed project would result in project-specific impacts or contribute considerably to cumulative impacts at nine intersections during the weekday p.m. peak hour, and at the eight intersections during the Saturday evening peak hour, and these impacts would be *significant and unavoidable with mitigation.*

Mitigation Measure M-TR-2a: Additional PCOs during Events (see Impact TR-2, above)

Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts (see Impact TR-2, above)

Mitigation Measure M-TR-11a: Additional PCOs During Overlapping Events (see Impact TR-11, above)

Mitigation Measure M-TR-11b: Participation in Ballpark/Mission Bay Transportation Coordinating Committee (see Impact TR-11, above)

Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events (see Impact TR-11, above)

Comparison of Impact C-TR-2 to Mission Bay FSEIR Impact Analysis

Cumulative traffic impacts were identified as significant and unavoidable in the Mission Bay FSEIR, which was based on Plan-level contributions to significant cumulative impacts at seven intersections at or near freeway ramps (Brannan/Sixth/I-280 ramps, Bryant/Second, Bryant/Fifth/I-80 eastbound on-ramp, Harrison/First, Harrison/Second, Harrison/Fremont/I-80 westbound off-ramp, and Harrison/Essex), and on the Bay Bridge and its approaches during the weekday p.m. peak hour. The significant and unavoidable cumulative impacts at 15 of the 16 study intersections identified above would be a new significant effect not identified in the Mission Bay FSEIR (i.e., the intersection of Bryant/Fifth/I-80 eastbound on-ramp was identified as a significant and unavoidable impact in the Mission Bay FSEIR). Therefore, the proposed project would result in *new significant* cumulative traffic impacts not previously identified in the Mission Bay FSEIR.

Impact C-TR-3: The project, in combination with other past, present, and reasonably foreseeable future projects, would result in significant cumulative traffic impacts at multiple freeway ramps in the project vicinity under 2040 Cumulative conditions. (Significant and Unavoidable with Mitigation)

Similar to the analysis for 2040 cumulative intersection operations, proposed project impacts at the freeway ramps were assessed by calculating the project-generated traffic conditions at ramp locations that are projected to operate at LOS E or LOS F under 2040 cumulative conditions for the No Event scenario for the weekday p.m. and Saturday evening peak hours. Because the SF-CHAMP travel demand model does not include the travel demand associated with events, the proposed project cumulative impacts for events at the project site for the weekday p.m. peak hour were assessed by adding the event-related traffic volumes (i.e., the Convention Event and Basketball Game scenarios) to the No Event scenario. At freeway ramps that are projected to operate at LOS E or LOS F under 2040 cumulative conditions, the increase in proposed project vehicle trips was reviewed to determine whether the increase would contribute considerably to the ramp volumes. In addition, the freeway ramps where project-specific significant impacts were identified for existing plus project conditions, the proposed project would also be considered to result in a cumulative impact under 2040 cumulative conditions. Supporting documentation regarding the cumulative contributions is included in **Appendix TR**.

Table 5.2-61 presents the 2040 cumulative analysis for freeway ramp operations for the weekday p.m. peak hour, while **Table 5.2-62** presents this information for the Saturday evening peak hour. Under 2040 cumulative No Event conditions, ramp operations would worsen from existing conditions, and five of the six freeway ramps would operate at LOS E or LOS F. Because the proposed project would result in significant impacts at three ramp locations under existing plus project conditions (i.e., I-80 eastbound on-ramp at Fifth/Bryant, I-80 westbound off-ramp at Fifth/Harrison, and I-280 northbound off-ramp at Mariposa Street), these impacts under 2040 cumulative conditions would be considered significant cumulative impacts. The proposed project would contribute considerably to the LOS F conditions at the I-280 southbound on-ramp at

SOURCE: Adavant Consulting/Fehr & Peers/LCW Consulting, 2015

Mariposa Street during the weekday p.m. peak hour, and this would be considered a significant impact. The proposed project would have a cumulatively considerable contribution to the cumulative impacts at the two other freeway ramps that would operate at LOS E or LOS F under 2040 cumulative conditions (i.e., I-80 eastbound on-ramp at Sterling Street, and I-280 southbound on-ramp at Pennsylvania Street).

As described for existing plus project conditions, no feasible mitigations are available for the freeway ramp impacts because there is insufficient physical space for additional capacity without redesign of the I-80 and I-280 ramp and mainline structures, and which may require acquisition of additional right-of-way. Implementation of **Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts** and **Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events** would reduce the proposed project's contribution to cumulative impacts related to event-related traffic conditions but would not mitigate the contribution to less-than-significant levels. Therefore, for the above reasons, the proposed project, in combination with past, present and reasonably foreseeable development in San Francisco, would contribute considerably to cumulative traffic impacts at three freeway ramps (i.e., I-80 eastbound on-ramp at Fifth/Bryant, I-80 westbound off-ramp at Fifth/Harrison, and I-280 southbound on-ramp at Mariposa Street), and impacts would be ***significant and unavoidable with mitigation***.

> **Mitigation Measure M-TR-2b: Additional Strategies to Reduce Transportation Impacts** (see Impact TR-2, above)

> **Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events** (see Impact TR-11, above)

Comparison of Impact C-TR-3 to Mission Bay FSEIR Impact Analysis

The Mission Bay FSEIR did not address cumulative traffic impacts on freeway ramp facilities as a distinct transportation topic. The significant and unavoidable cumulative impacts at the I-80 westbound Harrison/Fremont off-ramp and Fifth Street on-ramp, the I-80 eastbound Seventh Street off-ramp, and the I-280 southbound Sixth Street on-ramp would be a *new significant* cumulative impact not identified in the Mission Bay FSEIR.

Cumulative Transit Impacts

Impact C-TR-4: The project, in combination with other past, present, and reasonably foreseeable future projects, could have significant transit impacts on Muni service under 2040 Cumulative conditions, and could contribute to significant cumulative transit impacts at Muni screenlines. (Less than Significant with Mitigation)

Proposed project transit impacts for 2040 cumulative conditions were assessed by calculating the project contribution to the Muni downtown screenlines operating at more than Muni's established 85 percent capacity utilization standard during the weekday p.m. peak hour. The ridership and capacity utilization for the T Third line and 22 Fillmore bus route was also assessed for 2040 cumulative conditions. In addition, where project-specific significant impacts were identified for the existing plus project transit analysis, the proposed project would also be considered to result in a cumulative impact under 2040 cumulative conditions.

Table 5.2-63A presents the ridership and capacity utilization for the T Third and 22 Fillmore for the weekday p.m. peak hour for 2040 cumulative conditions for the No Event and Convention Event scenarios. Under 2040 cumulative conditions, capacity on the T Third would increase over existing conditions, and capacity utilization would remain similar to existing plus project conditions. For weekday p.m. peak hour conditions, for both scenarios, the capacity utilization would be less than the 85 percent capacity utilization standard.

TABLE 5.2-63A

T Third	5,434	6,028	90.1%	3,880	5,046	76.9%
22 Fillmore	304	628	48.5%	212	252	84.1%
Muni Special Event Shuttles	1,139	1,218	93.5%	942	978	96.3%
Total	6,877	7,874	87.3%	5,034	6,276	80.2%

NOTES:

a For event conditions, a capacity utilization of 100 percent was used to determine significant impacts.
b 2040 cumulative ridership and capacity for the T Third and 22 Fillmore include implementation of the Central Subway and 22 Fillmore Transit Priority Project.

SOURCE: Adavant Consulting/Fehr & Peers/LCW Consulting, 2015

Table 5.2-64 presents the results of the Muni and regional screenline analysis for existing and 2040 cumulative conditions for the weekday p.m. peak hour. The 2040 cumulative transit screenline analysis accounts for ridership and/or capacity changes associated with the TEP, the Central Subway, the new Transbay Transit Center, the electrification of Caltrain, and expanded WETA service. During the weekday p.m. peak hour, the capacity utilization of some screenlines and corridors within the Muni downtown screenlines would exceed Muni's 85 percent capacity utilization standard. These exceedances of the capacity utilization standard would be considered a significant cumulative impact. Overall, the addition of the project-generated riders to the Muni downtown screenlines and corridors that exceed the 85 percent capacity utilization standard would be less than 5 percent, and therefore the proposed project would not contribute considerably to the cumulative impact.

By 2040, additional Muni transit service capacity is planned to become available on the T Third and 22 Fillmore routes to accommodate transit demand generated by the proposed project as well as nearby development. Therefore, with the increases in Muni capacity, as well as expansion of the Mission Bay TMA shuttle routes, capacity utilization for the analysis scenarios would not exceed the capacity utilization standard (i.e., 85 percent during non-event conditions and during the weekday p.m. peak hour, and 100 percent during events) during the weekday p.m., weekday late evening, and Saturday evening peak hours. The exception would be on the T Third on days with overlapping evening events at AT&T Park and at the event center where capacity utilization during the weekday evening, weekday late evening, and Saturday evening peak hours would exceed 100 percent, and this would be considered a significant cumulative impact of the project. However, Mitigation Measure M-TR-13: Additional Muni Transit Service During Overlapping Events would reduce the transit impacts on the T Third to a less-than-significant level, and therefore the proposed project's transit cumulative impacts would be *less than significant with mitigation.*

> **Mitigation Measure M-TR-13: Additional Muni Transit Service During Overlapping Events** (see Impact TR-13, above)

Comparison of Impact C-TR-4 to Mission Bay FSEIR Impact Analysis

Cumulative transit impacts on the T Third were identified as less than significant with mitigation in the Mission Bay FSEIR, which was based on Plan-level contributions to T Third ridership in 2015 cumulative conditions. Mission Bay FSEIR Mitigation Measure E.45 to provide additional T Third light rail to the Mariposa Street stop was found to reduce Plan-level cumulative transit impacts to less-than-significant levels. Consequently, no new or different mitigation measures or alternatives to reduce project impacts related to transit are identified or required with respect to the currently proposed project. On the basis of the above, the project would result in no new or substantially more severe significant effects than those identified in the Mission Bay FSEIR related to transit impacts.

[b] Muni Downtown screenlines or corridors operating at more than Muni's 85 percent capacity utilization standard are highlighted in **bold**.

SOURCE: SF Planning Department Memorandum, *Transit Data for Transportation Impact Studies*, June 2013 and Regional and Local 2040 Cumulative Transit Screenlines for Transportation Impact Studies, March 2014. Adavant Consulting/Fehr & Peers/LCW Consulting, 2015

Impact C-TR-5: The project, in combination with other past, present, and reasonably foreseeable future projects, would have significant transit impacts on regional transit under 2040 Cumulative conditions. (Significant and Unavoidable with Mitigation)

Proposed project transit impacts for 2040 cumulative conditions were assessed by calculating the project contribution to the weekday p.m. peak hour regional screenlines operating at more than the 100 percent capacity utilization standard. In addition, where project-specific significant impacts were identified for the existing plus project transit analysis, the proposed project would also be considered to result in a cumulative impact under 2040 cumulative conditions.

Table 5.2-64 presents the regional screenlines for the weekday p.m. peak hour. Under 2040 cumulative conditions, all regional transit service providers are projected to operate under the capacity utilization standard of 100 percent, and therefore, the proposed project would have less-than-significant transit impacts on regional transit service during the weekday p.m. peak hour.

However, as discussed in Impact TR-5, for the Basketball Game scenario without a SF Giants game at AT&T Park, the proposed project would result in *significant* project-specific transit impacts to Caltrain capacity during the weekday evening, weekday late evening, and Saturday evening peak hours, and to WETA and Golden Gate Transit ferry and bus capacity during weekday late evening peak hour. In addition, as discussed in Impact TR-14, for the Basketball Game scenario with an overlapping evening game at AT&T Park, the proposed project would result in an additional significant project-specific transit impact to BART capacity to the East Bay during the weekday late evening peak hour.

Overall, under 2040 cumulative conditions, the proposed project would result in *significant* cumulative transit impacts on BART, Caltrain, Golden Gate Transit, and WETA. Implementation of **Mitigation Measure M-TR-5a: Additional Caltrain Service, Mitigation Measure M-TR-5b: Additional North Bay Ferry and Bus Service, and Mitigation Measure M-TR-14: Additional BART Service to the East Bay during Overlapping Events** would reduce or minimize the severity of the capacity utilization exceedances for the regional transit service providers. However, since the provision of additional East Bay, South Bay, and North Bay service is uncertain, and full funding for the service has not yet been identified, implementation of these mitigation measures is uncertain. Accordingly, the proposed project's significant cumulative impacts to BART, Caltrain, Golden Gate Transit and WETA transit capacity would remain *significant and unavoidable with mitigation*.

Mitigation Measure M-TR-5a: Additional Caltrain Service (see Impact TR-5, above)

Mitigation Measure M-TR-5b: Additional North Bay Ferry and Bus Service (see Impact TR-5, above)

Mitigation Measure M-TR-14: Additional BART Service to the East Bay During Overlapping Events (see Impact TR-14, above)

Comparison of Impact C-TR-5 to Mission Bay FSEIR Impact Analysis

Cumulative transit impacts on AC transit was identified as less than significant with mitigation in the Mission Bay FSEIR, which was based on Plan-level contributions to the regional screenlines during the weekday p.m. peak hour for 2015 cumulative conditions. Mission Bay FSEIR Mitigation Measure E.44 to encourage AC Transit to expand service and Mission Bay FSEIR Mitigation Measure E.45 to provide additional T Third light rail to the Mariposa Street stop were found to reduce Plan-level cumulative transit impacts to less than significant levels.

Under the proposed project, no cumulative impacts on AC Transit are projected for 2040 cumulative conditions for the weekday p.m. peak hour. However, the proposed project's significant and unavoidable with mitigation cumulative impacts to BART, Caltrain, Golden Gate Transit and WETA would be a significant effect not identified in the Mission Bay FSEIR. Therefore, the proposed project would result in new *significant* cumulative transit impacts not previously identified in the Mission Bay FSEIR.

Cumulative Pedestrian Impacts

Impact C-TR-6: The project, in combination with other past, present, and reasonably foreseeable future projects, could result in significant adverse cumulative pedestrian impacts. (Less than Significant with Mitigation)

The pedestrian volumes in the project vicinity would increase between implementation of the proposed project and 2040 cumulative conditions due to buildout of planned Mission Bay developments in the project vicinity (e.g., UCSF Mission Bay Campus) and construction of the Bayfront Park east of the project site. As described in Impact TR-6, the proposed project includes numerous sidewalks network and traffic control improvements that would improve and define the pedestrian network adjacent to the project site. Some improvements, such as new sidewalks along 16th Street between Illinois Street and Terry A. Francois Boulevard and signalization of the intersections of Terry A. Francois Boulevard/South and Terry A. Francois Boulevard/16th would enhance pedestrian circulation and access to the planned Bayfront Park and Bay Trail. **Table 5.2-65** presents the 2040 cumulative pedestrian LOS conditions at the study locations for the weekday p.m. peak hour for the No Event, Convention Event, and Basketball Game scenarios, while **Table 5.2-66** presents the pedestrian LOS for the Saturday evening peak hour for the No Event and Convention Event scenarios. Under 2040 cumulative conditions, pedestrian LOS for the weekday p.m. peak hour would be LOS D or better for the three scenarios. The 2040 cumulative pedestrian LOS for the Saturday evening peak hour would be LOS B or better for the No Event scenario, but LOS D or better for the Basketball Game scenario. The exceptions are the south and east crosswalks at the intersection of Third/South, which would operate at LOS E or LOS F for the Basketball Game scenario. As for existing plus project conditions, the LOS E and LOS F conditions would be considered a significant pedestrian impact, and as under existing plus project conditions, with implementation of **Mitigation Measure M-TR-6: Active Management of Pedestrian Flows at the intersection of Third/South** would reduce the pedestrian impacts to less-than-significant levels.

TABLE 5.2-65
PEDESTRIAN LEVEL OF SERVICE – 2040 CUMULATIVE CONDITIONS – WEEKDAY PM PEAK HOUR

In addition, there would be a projected increase in background vehicle and bicycle traffic between existing plus project and 2040 cumulative conditions that could result in increased potential for pedestrian-vehicle and pedestrian-bicycle conflicts. However, the project's numerous pedestrian network improvements would define the pedestrian network adjacent to the project site and would offset the risks associated with increases in vehicle and bicycle volumes. For the above reasons, the proposed project's contribution to potential cumulative impacts on pedestrians would be *less than significant with mitigation.*

Mitigation Measure M-TR-6: Active Management of Pedestrian Flows at the Intersection of Third/South (see Impact TR-6, above)

[c] Under the Basketball Game scenario, a PCO would be stationed at this study intersection during the Saturday pre-event period, and, as necessary, would manually direct vehicles, pedestrians, transit, and bicyclists through the intersection. LOS reflects conditions without PCO intervention.

SOURCE: Adavant Consulting/Fehr & Peers/LCW Consulting, 2015

Comparison of Impact C-TR-6 to Mission Bay FSEIR Impact Analysis

The Mission Bay FSEIR did not identify any significant cumulative impacts related to pedestrians. Although the proposed project could result in significant pedestrian impacts at the crosswalks at the intersection of Third/South, this impact would be reduced to less than significant with identified mitigation measures. Therefore, the project would not result in new significant impacts from what was previously identified in the Mission Bay FSEIR.

Cumulative Bicycle Impacts

Impact C-TR-7: The project, in combination with other past, present, and reasonably foreseeable future projects, would not result in significant adverse cumulative bicycle impacts. (Less than Significant)

The proposed project would not considerably contribute to cumulative bicycle circulation or conditions. The proposed project would include on-site elements to accommodate bicyclists traveling to and from the project site. In addition, Class II bicycle lanes on 16th Street would be extended in both directions east of Third Street to Terry A. Francois Boulevard, which would facilitate access to the planned cycle track and the Bay Trail that runs along the shoreline parallel to Terry A. Francois Boulevard. The intersection of Terry A. Francois Boulevard/16th Street would be signalized, and a bicycle signal and two-stage turn queue boxes would be installed to facilitate turns between the bicycle lanes on 16th Street and the two-way cycle track on the east side of Terry A. Francois Boulevard. The proposed project improvements on 16th Street and at the intersection of Terry A. Francois Boulevard/16th Street would be in addition to the planned cycle track on Terry A. Francois Boulevard that would be made as part of the Mission Bay Plan. These bicycle improvements would enhance cycling conditions in the study area. As bicycling continues to increase throughout San Francisco, the number of bicyclists on the area bicycle facilities is also anticipated to increase. While there would be a general increase in vehicle traffic that is expected through the future 2040 cumulative conditions, the proposed project would not create potentially hazardous conditions for bicycles, or otherwise interfere with bicycle accessibility to the site and adjoining areas, or substantially affect the existing, planned, and proposed bicycle facilities in the project vicinity. Therefore, for the above reasons, the proposed project, in combination with past, present and reasonably foreseeable development in San Francisco, would result in *less-than-significant cumulative impacts on bicyclists.*

Mitigation: Not required

Comparison of Impact C-TR-7 to Mission Bay FSEIR Impact Analysis

The Mission Bay FSEIR did not identify any significant cumulative impacts related to bicycles. Consequently, no new or different mitigation measures or alternatives to reduce project impacts related to bicycles are identified or required with respect to the currently proposed project. On the basis of the above, the project would result in no new or substantially more severe significant effects than those identified in the Mission Bay FSEIR related to bicycle impacts.

Cumulative Loading Impacts

Impact C-TR-8: The project, in combination with other past, present, and reasonably foreseeable future projects, would not result in significant adverse cumulative loading impacts. (Less than Significant)

Loading impacts, like pedestrian impacts, are by their nature localized and site-specific, and would not contribute to impacts from other reasonably foreseeable projects in the vicinity of the project site. Moreover, the proposed project would not result in loading impacts related to freight/service vehicles and passenger loading/unloading activities, as the estimated loading demand would be met on-site at the proposed service area/truck loading area, and on South Street and Terry A. Francois Boulevard. **Improvement Measure I-TR-8: Truck and Service Vehicle Operations Plan** would reduce the potential for conflicts between proposed project freight and service vehicle activities and pedestrians, transit, bicyclists, and autos on the adjacent streets. Therefore, the proposed project, in combination with past, present and reasonably foreseeable future development in the project vicinity, would result in *less-than-significant cumulative loading impacts.*

Mitigation: Not required

Improvement Measure I-TR-8: Truck and Service Vehicle Operations Plan (see Impact TR-8, above)

Comparison of Impact C-TR-8 to Mission Bay FSEIR Impact Analysis

The Mission Bay FSEIR did not identify any significant cumulative impacts related to loading. Consequently, no new or different mitigation measures or alternatives to reduce project impacts related to loading/unloading activities are identified or required with respect to the currently proposed project. On the basis of the above, the project would result in no new or substantially more severe significant effects than those identified in the Mission Bay FSEIR related to loading impacts.

Cumulative Impacts on UCSF Helipad Operations

Impact C-TR-9: The project, in combination with other past, present, and reasonably foreseeable future projects, could result in significant adverse cumulative impacts to the UCSF helipad. (Less than Significant with Mitigation)

See Section 5.2.6, Project Impacts on UCSF Helipad Operations regarding cumulative impacts related to the UCSF helipad operations.

Cumulative Emergency Vehicle Access Impacts

Impact C-TR-10: The project, in combination with other past, present, and reasonably foreseeable future projects, would not result in significant adverse cumulative emergency vehicle access impacts. (Less than Significant)

The proposed project would not contribute considerably to cumulative emergency vehicle access impacts in the area. With implementation of the proposed project, emergency vehicle access to the project site would remain similar to existing conditions, however, as discussed in **Impact TR-10**, with implementation of the proposed project, 16th Street would be built out between Illinois Street and Terry A. Francois Boulevard. By 2040, the planned roadway network in Mission Bay would be completely built out, and would provide emergency vehicle access to planned development. With implementation of the planned 22 Fillmore Transit Priority Project, transit-only lanes will be implemented on 16th Street, and emergency vehicles will be permitted use of the transit-only lanes. The transit-only lanes on 16th Street would have fewer vehicles in them than the adjacent mixed-flow lanes, and would not be subject to any turn restrictions. Emergency vehicles may adjust travel routes to respond to incidents; however, emergency vehicle access in the area would not be substantially affected. As discussed in **Impact TR-10** and **Impact TR-17**, emergency vehicle access would be maintained during events at the event center, without and with overlapping events at AT&T Park. Persons accessing the UCSF Medical Center emergency room and urgent care center in their personal vehicles during an emergency would, if necessary, also be able to utilize the transit-only lanes to bypass congested segments on 16th Street. On Mariposa Street, emergency vehicles and other persons accessing the emergency room and urgent care center in their personal vehicles during an emergency would be able to travel within the center left-turn lane to access the intersection of Fourth/Mariposa.

During large events at the event center, including during overlapping events, PCOs would be stationed at the intersections of Fourth/Mariposa, Owens/Mariposa/I-280 northbound off-ramp, and Owens/16th, and would prevent queues from blocking access to the UCSF Medical Center. For smaller events, PCOs would be stationed at key intersections and would be monitoring conditions, and could be reassigned to respond to conflicts between event center traffic and UCSF hospital access. In addition, when PCOs are deployed for an event, they would have the capability to radio ahead to other PCOs down the street regarding the approaching vehicle requiring emergency access. **Improvement Measure I-TR-10a: UCSF Emergency Vehicle Access and Garage Signage Plan** and **Improvement Measure I-TR-10b: Mariposa Street Restriping** would enhance emergency vehicle access to UCSF emergency facilities. Therefore, for the above reasons, the proposed project, in combination with past, present and reasonably foreseeable development in San Francisco, would result in *less than significant* emergency vehicle access impacts.

Mitigation: Not required

Improvement Measure I-TR-10a: UCSF Emergency Vehicle Access and Garage Signage Plan (see Impact TR-10, above)

Improvement Measure I-TR-10b: Mariposa Street Restriping (see Impact TR-10, above)

Comparison of Impact C-TR-10 to Mission Bay FSEIR Impact Analysis

The Mission Bay FSEIR did not address cumulative emergency vehicle access impacts as a distinct transportation topic. Given that the project would have less than significant impacts on emergency vehicle access, the project would result in no new or substantially more severe significant effects than those identified in the Mission Bay FSEIR.

5.2.5.6 Parking Conditions

As discussed in Chapter 2, Introduction, SB 743 amended CEQA by adding Public Resources Code Section 21099 regarding the analysis of parking impacts for certain urban infill projects in transit priority areas. Public Resources Code Section 21099(d), effective January 1, 2014, provides that "parking impacts of a residential, mixed-use residential, or employment center project on an infill site located within a transit priority area shall not be considered significant impacts on the environment." The proposed project meets each of the above three criteria: it is in a transit priority area because of its location within ½ mile of a major transit stop; it is an infill site because it is located on a previously developed site in an urban area; and it is an employment center because it would be an expansion of existing commercial support uses, located in a transit priority area on a site already developed and zoned for commercial uses. Thus, this SEIR does not consider adequacy of parking in determining the significance of project impacts under CEQA. However, OCII acknowledges that parking conditions may be of interest to the public and the decision makers. Therefore, a parking demand analysis is presented for informational purposes and considers secondary physical impacts associated with constrained supply (e.g., queuing by drivers waiting for scarce onsite parking spaces that affects the public right-of-way).

The Mission Bay FSEIR did not identify any significant impacts related to the identified parking shortfall, and did not require any mitigation measures. The project would not have any new or substantially more severe significant effects than those identified in the Mission Bay FSEIR related to parking, although, as noted above, the discussion of parking conditions is presented for informational purposes only.

Proposed Project Parking Supply

The project site currently contains two surface metered parking facilities containing about 605 parking spaces. With implementation of the proposed project, the existing surface parking lots would be eliminated. The proposed project would provide a total of 950 on-site vehicle parking spaces, including 22 ADA accessible spaces within an on-site parking garage containing 899 spaces and 51 parking spaces within the separate loading center. With the exception of about six spaces, which would be tandem spaces, all vehicle parking spaces would be independently-accessible.[54] Vehicular access to the garage would be from both South Street and 16th Street, and 51 of the vehicle spaces would be located within the separate below-grade loading area within the parking garage. The 51 vehicle parking spaces within the loading area would be reserved for use by the Golden State Warriors. As part of the project, the sponsor has also acquired the right to park at 132 existing off-street parking spaces in the 450 South Street parking garage, accessed from South Street and Bridgeview Way directly north of the project site. Combined, the proposed project would have 1,082 vehicle parking spaces serving the project uses.

---

54 Independently-accessible parking spaces allow a vehicle to be accessed without having to move another vehicle.

During non-event periods, ticket-issuing machines paired with a pay-on-foot ticket kiosks[55] would be set up to manage project visitor parking, while an Automatic Vehicle Identification System (AVI)[56] would be implemented to control on-site employee parking. During Golden State Warriors basketball games, a prepaid parking system is proposed for patrons to access the parking garage, where the parking attendant would scan a prepaid barcode hang tag on vehicles (prepaid credentials would be sold through the Golden State Warriors season ticket process). An AVI system may also be used for members of the Golden State Warriors to access the garage.

With implementation of the proposed project, on-street parking adjacent to the project site would be provided on South Street, Terry A. Francois Boulevard, and 16th Street, as follows:

- On the south side of South Street, a Mission Bay TMA shuttle stop approximately 60 feet in length would be provided immediately east of Third Street, and a taxi zone approximately 100 feet in length would be provided east of Bridgeview Way, where the project garage entrance/exit is located. Seven metered commercial loading spaces would be provided directly west of Terry A. Francois Boulevard, and one metered commercial loading space would be located between the TMA shuttle stop and the project garage driveway. The remaining curb length would be dedicated to 14 metered parking spaces. Nineteen metered parking spaces would be located on the north side of South Street, between Terry A. Francois Boulevard and Third Street.

- On the west side of Terry A. Francois Boulevard, approximately eight metered commercial loading spaces would be provided immediately south of South Street and a 75-foot wide paratransit stop would be provided midblock. The remaining curb length would be dedicated to 14 metered parking spaces. Twenty-nine metered parking spaces would be located on the east side of Terry A. Francois Boulevard between 16th and South Streets.

- On the north side of 16th Street one metered commercial loading space and 30 metered parking spaces would be provided. On the segment of 16th Street between Illinois Street and Terry A. Francois Boulevard, 24 metered parking spaces would be located to the south of the curbside bicycle lane. The parking lane would be separated from the bicycle lane by a 4-foot wide buffer. On the segment between Third and Illinois Streets, seven metered parking spaces (including one commercial loading space) would be located adjacent to the curb, and the proposed bicycle lane would be adjacent to the curb parking lane. Thirty metered parking spaces would be located on the south side of 16th Street, between Terry A. Francois Boulevard and Third Street.

- On Third Street, no stopping or parking is allowed at any time on either side of the street, and the prohibition would be maintained as part of the proposed project. Additional signage would be placed as part of the proposed project on the east sidewalk to emphasize the existing stopping and parking prohibitions, including the prohibition of passenger loading/unloading at any time.

---

55 A machine that accepts payment and validates pay-parking access tickets without cashier assistance. These machines are also known as automatic pay stations.

56 An Automatic Vehicle Identification (AVI) system involves using radio frequency identification (RFID) system to automatically identify a vehicle when it enters a garage, so that it can be authorized and permitted to enter and exit. The system is able to identify a vehicle as it approaches the gate, allowing the parking system to authorize entry and open the gate, without the driver having to stop or open the window.

As discussed below, during post-event conditions, temporary parking restrictions would reduce vehicular travel on the affected streets, and would displace the existing parking demand to other streets or to off-street facilities in the nearby vicinity.

Project Parking Supply and Demand

Table 5.2-67 summarizes the proposed project parking demand and supply for the project scenarios for midday (between 11:30 a.m. and 1:30 p.m.) and evening (7:00 and 8:30 p.m.) conditions on weekdays and Saturdays. The proposed project parking supply of 1,082 parking spaces includes 950 parking spaces within the on-site parking garage, as well as 132 parking spaces off-site within the 450 South Street Parking Garage for which the project sponsor has acquired parking rights to serve the project.

TABLE 5.2-67
PROJECT PARKING SUPPLY AND DEMAND BY SCENARIO

	Weekday		Saturday	
Supply and Demand	**Midday**	**Evening**	**Midday**	**Evening**
Project Supply	1,082	1,082	1,082	1,082
Project Demand[a]				
No Event	1,049	489	589	462
Convention Event	**1,906**	669	--	--
Basketball Game	1,072	**4,270**	589	**4,573**

NOTE:
[a] Instances where the project demand exceeds the proposed supply are in **bold** and shaded.

SOURCE: Adavant Consulting/LCW Consulting, 2015

The project parking demand would change depending on the event condition, and would be greatest during the weekday midday on days with a convention event (1,906 spaces), on weekday evenings with a basketball game (4,270 spaces), and on Saturday evenings with a basketball game (4,573 spaces).

As highlighted in **Table 5.2-67**, for the No Event scenario, the project-generated parking demand would be accommodated within the proposed supply. For the Convention Event scenario[57], the parking demand would exceed the project supply during the weekday midday period, while for the Basketball Game scenario, the parking demand would exceed the project supply during both weekday and Saturday evenings. This unmet parking demand would need to be accommodated in other off-street parking facilities in the study area or by means of on-street parking.

As indicated in **Section 5.2.3.7** above, on-street parking within Mission Bay is well utilized during the daytime hours, with midday occupancies about 90 percent. Given this high level of

[57] Daytime convention event with about 9,000 attendees.

parking occupancy and the fact that all on-street spaces will be metered in the future as part of the SFMTA/Port parking management plan, no credit for on-street parking availability has been assumed for the analysis of midday parking conditions under any scenario.

Typical parking utilization in the area during the evening and overnight hours is about 25 percent due to the current limited evening uses in the area, increasing to 60 percent during on SF Giants evening game days. On days with evening events at the project site, some visitors may seek on-street parking, and parking occupancy would increase in the project vicinity during events at the project site. However, the SFMTA and Port of San Francisco are implementing special event rates in the general vicinity of AT&T Park during SF Giants games, which would also be applicable during events at the project site. Metered rates would be comparable to those charged at off-street parking facilities during events.

Thus, given that the availability of on-street parking in the evening would be relatively small (150 to 250 spaces overall) and that all on-street spaces would be metered and charge special event rates, no credit for on-street parking availability has been assumed for the analysis of evening parking conditions with a basketball game.

For these reasons, the analysis of parking supply and demand conditions focused on all the off-street facilities within the transportation study area (i.e., those facilities listed in **Table 5.2-8**) and presented in **Figure 5.2-8**). The following section presents the off-street parking supply for the project analysis scenarios for conditions without and with a SF Giants evening game at AT&T Park grouped by facility owner/operator.

Existing plus Project Study Area Off-street Parking Supply

Table 5.2-68 presents the midday and evening parking supply within the transportation study area for weekday and Saturdays for conditions without a SF Giants game at AT&T Park and for conditions with a SF Giants evening game at AT&T Park. Additional detail by parking facility is included in **Appendix TR**. A number of parking facilities currently open, or remain open, during games at AT&T Park to accommodate attendees driving to a baseball game. Specifically, parking facilities at 185 Berry Street, Pier 48 Sheds A and B, and Lot C with about 1,100 parking spaces overall are closed on no game days but become available for public parking during a SF Giants game on weekdays, while Pier 48 Sheds A and B and Lot C become available for public parking on Saturdays.[58] As a result of this variation in the operation of existing parking facilities during SF Giants games at AT&T Park, the parking supply would also vary for existing plus project conditions without and with an event at the project site, and without and with an overlapping SF Giants evening game at AT&T Park.

The transportation analysis assumes that current operating characteristics of the public parking facilities supporting the SF Giants evening game at AT&T Park do not change, and that the existing facilities currently open to the general public on weekdays and weekends would remain

[58] Lot A is only available to SF Giants parking permit holders on home game days.

TABLE 5.2-68
EXISTING PLUS PROJECT STUDY AREA PARKING SUPPLY BY SCENARIO

Parking Facility Grouping	No Event and Convention Event				Basketball Game[e]			
	Weekday		Saturday		Weekday		Saturday	
	Midday	Evening	Midday	Evening	Midday	Evening	Midday	Evening
Conditions without a SF Giants Game at AT&T Park

2 SF Giants Facilities[a]	2,530	2,530	2,530	2,530	2,530	2,530	2,530	2,530
3 UCSF Facilities[b]	2,590	2,590	2,590	2,590	2,590	2,590	2,590	2,590
4 Alexandria Facilities[c]	2,180	--	--	--	2,180	1,400	--	1,400
5 Other Facilities[d]	435	135	135	135	435	135	135	135
Total	8,685	6,205	6,205	6,205	8,685	7,605	6,205	7,605
Conditions with a SF Giants Evening Game at AT&T Park								
1 Project Site	950	950	950	950	950	950	950	950
2 SF Giants Facilities	2,530	3,350	2,530	3,350	2,530	3,530	2,530	3,350
3 UCSF Facilities	2,590	2,590	2,590	2,590	2,590	2,590	2,590	2,590
4 Alexandria Facilities	2,180	--	--	--	2,180	2,180	--	2,180
5 Other Facilities	435	405	135	135	435	405	135	435
Total	8,685	7,295	6,205	7,025	8,685	9,475	6,205	9,505

NOTES:
a SF Giants facilities include Pier 48 Sheds A and B and Lot C (Blocks 3E and 4E)
b UCSF facilities include 1650 Third Street, Block 23, 1625 Owens Street (Rutter Community Center), and Medical Center Phase 1 Garage and Lot
c Alexandria facilities include 450 South Street and 1670 Owens Street
d Other facilities include 601 Terry A. Francois Boulevard (Pier 52 boat launch) and a temporary Port lot on the east side of Terry A. Francois Boulevard.
e Basketball Game scenario assumes that about 1,200 parking spaces within 450 South Street would be available for event parking on weekday and weekend evening for conditions without a SF Giants game, and that 450 South Street, 1670 Owens Street and 185 Berry Street facilities would be available on Saturdays for conditions with a SF Giants evening game.

SOURCE: Adavant Consulting/LCW Consulting, 2015

available to the public (e.g., most UCSF parking facilities currently operate 24 hours a day every day), including employees and visitors to the proposed project site.

Thus, for existing plus project conditions for the No Event and Convention Event scenarios, the weekday parking supply would be about 8,700 spaces during the midday and 6,200 during the evening periods, and on Saturdays the parking supply would be about 6,200 spaces during the midday and evening periods (i.e., parking facilities at 185 Berry Street, 450 South Street, and 1670 Owens Street would remain closed on Saturdays, as under Existing conditions).

Study Area Parking Supply for Conditions without a SF Giants Game at AT&T Park

For purposes of the transportation analysis, it was assumed that in addition to the facilities currently available for parking by the general public, the 450 South Street garage containing approximately 1,400 spaces, which is currently closed to the general public after 7:00 p.m., would also be available to accommodate event-related parking during weekday and weekend evening events. This would be similar to what currently occurs at the 185 Berry Street garage on weekdays during a SF Giants evening game. Thus, as noted in **Table 5.2-68**, during the Saturday analysis period, the parking supply in the study area would increase from the current 6,200 parking spaces to 7,600 spaces.

It should be noted that the Mission Rock Project would eliminate the existing surface parking lot (i.e., Lot A), and replace it with a combination of residential, office, and commercial uses. The Mission Rock Project would provide approximately 3,100 parking spaces on-site, including construction of a structured parking garage that would also serve patrons of AT&T Park on a parcel at the south end of Seawall Lot 337 (i.e., Parcel D), with a capacity of about 2,300 vehicle spaces (the approximate capacity of Lot A). The preliminary construction-phasing plan calls for this parking garage to be built in the first phase as to maintain the maximum number of parking spaces for SF Giants games.[59] When the Mission Rock Project parking garage is under construction, about 1,600 vehicles (estimated at about two-thirds of the existing Lot A capacity based on the size of Parcel D as compared to the overall size of Lot A) would be accommodated in the remainder of Lot A. Under the Basketball Game scenario, between 1,500 and 2,000 attendees are estimated to park at Lot A, and, therefore, when the Mission Rock Project parking garage is under construction, approximately 400 project-generated vehicles would seek and find parking elsewhere (such as at the 450 Fourth Street Garage and UCSF's Third Street Parking Garage).

Study Area Parking Supply for Conditions with a SF Giants Evening Game at AT&T Park

The existing plus project parking supply for No Event and Convention Event scenarios during a baseball game at AT&T Park was assumed to be the same as for existing conditions (i.e., on weekdays about 8,700 spaces during the midday and 7,300 spaces during the evening periods, and on Saturdays about 6,200 spaces during the midday and 7,000 spaces during the evening periods).

For the Basketball Game scenario with a SF Giants evening game at AT&T Park, the transportation analysis assumes that additional facilities that currently remain closed during baseball games at AT&T Park would open during the evenings to accommodate the additional project event-related parking. Specifically, the supply assumes that both Alexandria facilities (i.e., 450 South Street and 1670 Owens Street) would open on weekday evening, and that on Saturday evenings, both Alexandria facilities, as well as the 185 Berry Street garage, would be also available.

Existing plus Project Conditions without a SF Giants game at AT&T Park

Table 5.2-69 presents the existing plus project parking demand and supply for the analysis scenarios for conditions without a SF Giants game at AT&T Park. The parking assessment assumes that the existing parking demand associated with the surface parking facilities on the project site without at SF Giants game at AT&T Park would be accommodated at other nearby facilities, and is, therefore, included in the existing areawide parking demand within the study

[59] Seawall Lot 337 and Pier 48 Mixed-Use Project, Notice of Preparation of an EIR, December 11, 2013. Case No. 2013.0208E. Available online at http://sfmea.sfplanning.org/2013.0208E_NOA.pdf. Accessed May 28, 2015.

TABLE 5.2-69
EXISTING PLUS PROJECT STUDY AREA PARKING DEMAND AND SUPPLY WITHOUT A SF GIANTS GAME AT AT&T PARK

Parking Facility Grouping	No Event		Convention Event		Basketball Game	
	Midday	Evening	Midday	Evening	Midday	Evening

area. The existing parking supply of 610 spaces within the two surface parking lots on the project site was remove from the areawide parking supply.

No Event Scenario

As noted above, under the No Event scenario (i.e., assuming the parking demand generated by the office, retail and restaurant uses) for both weekday and Saturday conditions, parking would be accommodated within the proposed project parking supply, and therefore would not affect other off-street parking facilities in the study area. Total areawide parking occupancy would be about 74 percent during the weekday midday and 42 percent during the weekday evening, and substantially lower (about 22 to 28 percent) on a Saturday. It should be noted that the weekday midday occupancy is greater at some nearby facilities, such as the UCSF garages which currently operate at 90 to 95 percent during the midday period; as such, it is possible that some of those vehicles parking at those facilities could migrate to the project garage, evening out the distribution of overall utilization.

Convention Event Scenario

Under the Convention Event scenario, the parking demand would exceed the total project parking supply, and a portion of the demand would need to be accommodated in other nearby off-street parking facilities, such as Lot A which contains approximately 2,400 spaces and is currently 30 to 40 percent occupied during the weekday midday period. Overall, weekday midday parking utilization within the study area would increase from 74 percent under the No Event scenario to 84 percent under the Convention Event scenario. Weekday evening occupancy within the study area under the Convention Event scenario would be similar to the No Event, below 50 percent occupied, as the daytime convention event would be practically over at that time.

Basketball Game Scenario

On weekdays under the Basketball Game scenario, the midday parking demand would be similar to the No Event scenario (i.e., primarily the parking demand associated with the office, retail, and restaurant uses), and would be accommodated on-site. During the weekday evening, however, the basketball game-generated parking demand would exceed the project supply, and would need to be accommodated at other nearby off-street parking facilities. It is anticipated that a substantial portion of the project-generated parking demand under the Basketball Game scenario would be accommodated in Lot A (about 1,500 vehicles), as well as in the 450 South Street Parking Garage (about 1,200 vehicles, and which the analysis assumes would be open). In addition, it is anticipated that about 600 vehicles would be accommodated within various UCSF parking facilities, including the 1650 Third Street, 1625 Owens Street, and Medical Center Phase 1 garages. On Saturday evenings, more vehicles would be parked at Lot A (about 2,100 vehicles, reflecting the lower current parking occupancy at Lot A), and slightly fewer at the UCSF facilities (about 500 vehicles). As indicated in **Table 5.2-69**, the overall weekday evening parking occupancy in the study area would increase from 42 percent under the No Event scenario to 64 percent under the Basketball Game scenario. On Saturdays, the overall parking occupancy would increase from 22 percent under the No Event scenario to 72 percent under the Basketball Game scenario.

In the event that the 450 South Street Parking Garage would not be made available for event parking during weekday and weekend evenings (i.e., only those parking facilities that are currently open in the evenings would be able to accommodate the proposed project parking demand), occupancy of other facilities (such as the nearby UCSF garages and lots) would increase to their capacity, and overall occupancy would increase from 84 percent to more than 100 percent on weekday evenings, and from 69 percent to 89 percent on Saturday evenings. As a result of the approximately 200-space parking shortfall on weekdays (about 3 percent of the project demand), individuals who would have preferred to drive may instead use transit to arrive at the site because the perceived convenience of driving is lessened by a shortage of parking. By promoting carpooling, providing parking attendant services, providing clear direction to alternative parking locations in advance of events, and adjusting event parking rates, the parking supply would likely be more efficiently utilized during the event days and the potential parking deficit would be eliminated.

In the event that the 450 South Street parking garage would not be made available for event parking during weekday evenings, and the proposed parking supply in the study area would not meet demand, and it is possible that some drivers may seek available parking in adjacent residential areas to the south. South of the project site within the study area, the streets between Mariposa and 18th Streets, between Indiana and Third Streets are subject to the RPP "X' regulation which restricts on-street parking Monday through Friday, to a two or four-hour period between the hours of 8:00 a.m. and 4:00 p.m. unless an RPP "X" permit is displayed, in which case there is no time limit enforced. On these streets, the RPP regulation is not in effect during the weekday evenings, thus residents arriving to these areas could have difficulty parking on-street. If residents in adjacent residential areas to the south perceive an increased challenge in finding on-street parking in their neighborhoods, residents can request to establish a new or expand existing RPP Area "X" through the SFMTA. They may also explore other possible parking management strategies to address spillover parking in residential areas. The extent of spillover into the nearby residential neighborhoods to the south could be minimized by extending the RPP regulations to a larger area, reducing all non-residential on-street parking to two hours, adding parking meters at key locations, and increasing weekday midday enforcement.

Table 5.2-69 also shows that in the event that the UCSF parking facilities would not be made available for event parking during weekday and weekend evenings, the expected project parking demand could still be accommodated among the remaining facilities (assuming that the 450 South Street parking garage is available), with the overall occupancy increasing from 84 percent to 91 percent on weekday evenings, and from 69 percent to 77 percent on Saturday evenings.

As part of post-event transportation management, temporary parking restrictions on South Street (34 spaces between Third Street and Terry A. Francois Boulevard), Terry A. Francois Boulevard (15 spaces between South and 16th Streets), 16th Street (61 spaces between Third Street and Terry A. Francois Boulevard), and Illinois Street (40 spaces between 16th and 18th Streets) would reduce vehicular travel on the affected streets, and would displace the existing parking demand to other streets or to off-street facilities in the nearby vicinity. As noted above, lack of available on-street parking may result in drivers looking for a parking space on other streets, primarily to the west and south of the project site. During the weekday and weekend evening periods, on-street parking occupancy is low, and the overall number of parking spaces that would be affected would be relatively low (less than 150 spaces), and would not be expected to substantially affect overall on-street parking conditions.

Overall, under existing plus project conditions without a SF Giants evening game at AT&T Park, the project-generated parking demand would be accommodated with the existing off-street and on-street supply during weekday and Saturday conditions, as long as the 450 South Street parking garage becomes available for event parking on weekday evenings.

Existing plus Project Conditions with a SF Giants Evening Game at AT&T Park

Table 5.2-70 presents the existing plus project parking demand and supply for the analysis scenarios for conditions with a SF Giants evening game at AT&T Park. The parking assessment assumes that the existing parking demand associated with the surface parking facilities on the project site with a SF Giants evening game at AT&T Park would be accommodated at other nearby facilities, and is, therefore, included in the areawide parking demand within the study area. The existing parking supply of 610 spaces within the two surface parking lots on the project site was removed from the areawide parking supply.

No Event Scenario

As shown in **Table 5.2-70**, under the No Event scenario for both weekday and Saturday conditions, parking would be accommodated within the proposed project parking supply, and therefore would not affect other off-street parking facilities in the study area. Thus, the No Event scenario with a SF Giants evening game at AT&T Park would be similar to existing conditions. Total areawide parking occupancy would be about 68 percent during the weekday midday and 80 percent during the weekday evening, while on a Saturday the total areawide parking occupancy would be about 31 percent during the midday and 78 percent during the evening. This occupancy reflects the parking demand associated with the SF Giants game attendees parking within the study area, as well as the additional parking supply typically provided by the SF Giants and others on baseball game days. For SF Giants evening game, 185 Berry Street, Piers 48, and Lot C are open to accommodate SF Giants parking demand on weekday evenings, and Piers 48 and Lot C are open to accommodate SF Giants parking demand on weekends. Lot A is only available to SF Giants permit parking holders on game days.

Convention Event Scenario

Under the Convention Event scenario with a SF Giants evening game at AT&T Park, parking occupancy during the weekday midday and evening would be similar to conditions without a SF Giants game. On days with a SF Giants evening game at AT&T Park, overall midday occupancy is currently somewhat lower than on days without a SF Giants game, and the demand associated with the convention event would be accommodated without substantially affecting overall parking conditions. During the weekday evening period, parking demand associated with the convention event would be low, and would also not substantially affect the overall parking conditions.

However, on weekdays when SF Giants games start at 12:05 p.m., 12:45 p.m., 1:15 p.m., or 1:35 p.m., the midday parking demand would be greater than that presented in **Table 5.2-70** for evening games, and therefore, there would be a parking shortfall in the area on those days. The number of SF Giants day games is limited, with about 11 of the 54 weekday games scheduled for the 2015 regular season (about two games per month between April and October). In those instances, the approximately 900 project vehicles that would otherwise park at Lot A would not be able to do so, as Lot A would only be available to SF Giants parking permit holders. It could be expected that convention event planners would provide additional shuttle bus service to the project site on those days, to minimize parking demand. In addition, promoting public transit and encouraging carpooling would further reduce parking demand, while providing parking attendant services could increase the parking supply.

Basketball Game Scenario

On weekdays with an evening basketball game, the midday parking demand would be similar to the No Event scenario (i.e., primarily the parking demand associated with the office, retail, and restaurant uses), and parking would be accommodated on-site. During the weekday evening, however, the project-generated parking demand, combined with the SF Giants parking demand, would exceed the project supply, and would need to be accommodated in other nearby facilities.

On weekday evenings, overall parking demand would increase from 84 percent on days without SF Giants games to a theoretical 101 percent (about 140-space parking deficit) on days with a SF Giants evening game. As a result of the approximately 140-space parking shortfall on weekdays (less than 3.5 percent of the project demand), individuals who would have preferred to drive may instead use transit to arrive at the site because the perceived convenience of driving is lessened by a shortage of parking. By promoting carpooling, providing parking attendant services, and adjusting event parking rates, the parking supply would likely be more efficiently utilized during the event days and the potential parking shortfall could be eliminated. If the additional spaces provided at 450 South Street and 1670 Owens Street facilities were not available as assumed to accommodate public parking on days with a SF Giants evening game, the unmet project parking demand would increase from about 140 spaces to about 2,300 spaces. Similarly, if UCSF parking facilities would not be made available for event parking during weekday evenings the unmet project parking demand would increase from about 140 spaces to about 1,070 spaces.

On Saturdays, the overall parking occupancy during the evening period would increase from 78 percent to a theoretical 101 percent (about 70-space parking deficit, which would be less than 1.6 percent of the project parking demand and well within the daily variation of traffic). If the additional parking spaces at 450 South Street, 1670 Owens Street, and 185 Berry Street garages were not available as assumed to accommodate public parking on days with a SF Giants evening game, the expected 70-space parking deficit would increase to about 2,520 spaces. Similarly, if UCSF parking facilities would not be made available for event parking during Saturday evenings the unmet project parking demand would increase from about 70 spaces to about 970 spaces.

Overall, under existing plus project conditions with a SF Giants evening game at AT&T Park, the project-generated parking demand would be accommodated with the existing off-street and on-street supply during weekday and Saturday conditions, as long as the 450 South Street and 1670 Owens Street and UCSF-owned parking garages become available for event parking on weekday and weekend evenings, and the 185 Berry Street garage becomes available for event parking on weekend evenings.

Existing plus Project Conditions without the Muni Special Event Transit Service Plan

As described in Section 5.2.5.3, this SEIR assessed conditions if the Muni Special Event Transit Service Plan for large events at the event center were not to be implemented as part of the project. **Table 5.2-29** through **Table 5.2-32** present the resulting change in travel modes of event attendees for a basketball game from transit to auto modes. Because more attendees would be driving, the event-related parking demand would also increase over conditions with implementation of the Muni Special Event Transit Service Plan, particularly during the late evening period when parking demand associated with events would be greatest. During the late evening the parking demand for the Basketball Game scenario would increase by 606 spaces on weekdays and 669 spaces on a Saturday.

On weekday and Saturday evening basketball games without an overlapping SF Giants evening game at AT&T Park, the additional parking demand would be accommodated within the study area parking supply, although parking occupancies would increase to close to capacity. On weekday and Saturday evening basketball games with an overlapping SF Giants evening game, the identified weekday and Saturday parking shortfalls in the study area would increase from approximately 140 spaces to 745 spaces, and from approximately 70 spaces to 740 spaces, respectively. It is likely that if the Muni Special Event Transit Service Plan is not implemented, additional parking facilities outside of the study area would be identified to accommodate the increased demand (e.g., potential parking lot(s) in the vicinity of Pier 70), and existing facilities would be more efficiently utilized during event days through the use of attendant parking. Parking utilization of existing parking facilities for the SF Giants to the north of the study area (e.g., the Pier 30 lot and the Bayside lot at Seawall Lot 330 containing a total of about 1,300 spaces, and are about 35 percent occupied on weekday evenings and 50 percent on weekend evenings during SF Giants evening games) would increase from existing conditions. In addition, because the proposed parking supply in the study area would not meet demand, it is possible that some drivers may seek available parking in adjacent residential areas to the south.

2040 Cumulative Parking Conditions

Considering cumulative parking conditions, over time, due to build-out of Mission Bay and particularly UCSF in the project vicinity, parking demand and competition for on-street and off-street parking would increase. **Table 5.2-71** provides a summary of the estimated planned cumulative increases in non-residential development and corresponding parking supply and demand changes in the Mission Bay South area. The 2040 cumulative non-residential parking supply and demand was based on data obtained from previous and ongoing studies being conducted in the Mission Bay area, including the UCSF 2014 LRDP EIR and the Seawall Lot 337 and Pier 48 Mixed-Use Project; more detailed information is provided in **Appendix TR**. As shown in the table, the proposed overall supply would accommodate about 40 percent of the estimated overall non-residential parking demand (weekday midday), and 70 percent of the weekday evening parking demand. **Figure 5.2-25** presents the location of the proposed off-street parking facilities associated with proposed and planned future development.

The estimates of future parking demand for planned Mission Bay projects was based on standard *SF Guidelines* methodologies that do not consider the likely long-term shift from auto to non-auto modes of travel that is likely to occur over the next 25 years as a result of the Mission Bay Plan providing parking at approximately half the rate of the estimated demand as well as improved transit service to Mission Bay in the future. A similar effect is likely to occur to the proposed project, as transit service to Mission Bay is improved, as the available parking supply on undeveloped parcels is eliminated, and as parking becomes more expensive, particularly during overlapping events. As such, the parking shortfalls presented in **Table 5.2-72**, which are based on existing travel patterns, can be considered conservative, that is, higher than could be expected for the above reasons.

TABLE 5.2-71
ADDITIONAL CUMULATIVE NON-RESIDENTIAL DEVELOPMENT PLANNED IN THE MISSION BAY SOUTH AREA - FROM EXISTING CONDITIONS TO YEAR 2040

Proposed Development	Net Change in Non-Residential Parking Supply[d]	Increase in Non-Residential Parking Demand			
		Weekday		Saturday

Mission Rock Project[a]	-350[e]	2,600	2,350	1,560	1,500
Remainder of the Mission Bay Plan[b]	875	1,810	475	490	290
Remainder of UCSF LRDP to 2040[c]	2,750	3,410	1,800	860	680
Total	3,275	7,820	4,625	2,910	2,470

NOTES:
a Mixed-use development project with 1.25 million to 1.6 million gsf of commercial/office/research and development (R&D) uses and 150,000 to 250,000 gsf of retail/entertainment/ancillary uses.
b Includes hotel/commercial development in Block 1 (250 rooms and 25,000 gsf retail), Kaiser Permanente at 1600 Owens St (220,000 gsf MOB), Parcel 1 at Block 26 (200,000 gsf office/research), Parcel 1 at Block 27 (300,000 gsf office/research), Block 40 (660,000 gsf office/research), and Parcel 7 at Blocks 41-43 (60,000 gsf office/research).
c Blocks 15, 16, 18A, 23A and 25B at the North Campus, Phase 2 of the Medical Center at the South campus, and Blocks 33-34 (500,00 gsf office/research, but may include up to 250,000 gsf clinical space with the remainder dedicated to research/office uses) at the East Campus.
d Includes removal of existing temporary parking spaces at currently undeveloped parcels, such as those used for SF Giants game parking (Lot A, Lot C, Pier 48, etc.).
e A net addition of 600 spaces on days when SF Giants do not play at AT&T Park.

SOURCE: Adavant Consulting/LCW Consulting, 2015

2040 Cumulative with Project Conditions without a SF Giants game at AT&T Park

Table 5.2-72 presents the 2040 cumulative with project parking demand and supply for the analysis scenarios for conditions without a SF Giants game at AT&T Park. A comparison between existing plus project (**Table 5.2-69**) and 2040 cumulative with project (**Table 5.2-72**) parking conditions shows that, under 2040 cumulative conditions, parking demand would exceed parking supply during the weekday midday period for all project scenarios (No Event, Convention Event, and Basketball Game), as opposed to existing plus project conditions where no shortfall was identified. The weekday midday parking shortfall, estimated to be between 1,370 and 2,225 spaces, would be a result of cumulative development and growth in Mission Bay. These planned developments would provide parking spaces at approximately 50 percent of the estimated peak parking demand.

As a result of the 2040 cumulative parking shortfall during the weekday midday period, individuals who would have preferred to drive may instead use non-auto modes of travel to arrive at Mission Bay. By promoting carpooling, providing parking attendant services, adjusting work schedules, and increasing parking rates, the cumulative parking supply would likely be more efficiently utilized during peak demand times (weekday midday), although the overall 2040 cumulative parking shortfall would likely not be eliminated.

SOURCE: Adavant Consulting/LCW Consulting, 2015

Because the proposed cumulative parking supply in Mission Bay would not meet cumulative demand on weekdays at midday, it is possible that some drivers may seek available parking in adjacent residential areas to the south, some of which are subject to the RPP "X' regulation (currently limits parking to two or four hours, depending on the block, between the hours of 8:00 a.m. and 4:00 p.m. unless an RPP "X" permit is displayed). Because some visitors might park for less than four hours, residents of these areas could find it more challenging to find parking on the street. Expansion of an existing RPP area, or altering the existing time limits and/or time-of-day of enforcement for an RPP zone, is typically a resident-driven process. As noted above, if residents in adjacent residential areas to the south perceive an increased challenge in finding on-street parking in their neighborhoods, residents can request to establish a new or expand existing RPP Area "X" through the SFMTA. They may also explore other possible parking management strategies to address spillover parking in residential areas. The extent of spillover into the nearby residential neighborhoods to the south could be minimized by extending the RPP regulations to a larger area, reducing all non-residential on-street parking to two hours, adding parking meters at key locations, and increasing weekday midday enforcement.

2040 Cumulative with Project with a SF Giants evening game at AT&T Park

Table 5.2-73 presents the 2040 cumulative with project parking demand and supply for the analysis scenarios for conditions with an overlapping SF Giants evening game at AT&T Park. A comparison between existing plus project (**Table 5.2-70**) and 2040 cumulative with project (**Table 5.2-73**) parking conditions with an overlapping SF Giants evening game shows that, under 2040 cumulative conditions, parking demand would exceed parking supply during the weekday midday period for all project scenarios (No Event, Convention Event, and Basketball Game), as opposed to existing plus project conditions where no shortfall has been identified. The weekday midday parking shortfall, estimated to be between 800 and 1,700 spaces, would be a result of cumulative development and growth in Mission Bay, which, as noted above, would provide parking spaces at approximately 50 percent of the estimated peak parking demand based on current travel characteristics.

The 2040 cumulative weekday midday parking shortfall with an overlapping SF Giants evening game at AT&T Park would be 60 to 75 percent of the shortfall that would be experienced without an overlapping SF Giants evening game at AT&T Park. This is because the daytime parking demand in Mission Bay on days when the SF Giants play in the afternoon is typically lower than on no-game days, as a result of the higher daily parking rates ($50 and higher) charged on game days at parking facilities managed by the SF Giants. As a result of the cumulative parking shortfall during the weekday midday period, individuals who would have preferred to drive may instead use non-auto modes of travel to arrive at Mission Bay, and as noted above, the cumulative parking supply would likely be more efficiently utilized during peak demand times, but the overall cumulative parking shortfall would likely not be eliminated.

Because the projected 2040 cumulative parking supply in Mission Bay would not meet 2040 cumulative demand during the weekday midday, it is possible that some drivers may seek available parking in adjacent residential areas to the south. Because some cumulative visitors might park for less than four hours, residents of these areas could find it difficult to park on the street. The extent of spillover into the nearby residential neighborhoods to the south could be minimized by extending the RPP regulations to a larger area, reducing all non-residential on-street parking to two hours, and increasing weekday midday enforcement.

A 2,000-space larger parking shortfall would also be experienced on weekday evenings with overlapping evening games at the event center and at AT&T Park (about 150 spaces under existing plus project conditions compared to 2,150 spaces under 2040 cumulative conditions). Similarly, a 230-space larger parking shortfall would also be experienced on Saturday evenings with an overlapping event at the event center and at AT&T Park (about 70 spaces under existing

SOURCE: Adavant Consulting/LCW Consulting, 2015

plus project conditions compared to 310 spaces under 2040 cumulative conditions). The parking supply shortfall would be due to a combination of several factors: the unavailability of existing baseball-oriented parking during an SF Giants game, an increase of cumulative parking at a lower rate than the estimated cumulative demand for the Mission Bay area, and an increase in evening demand as a result of new retail and restaurant uses associated cumulative development.

The project sponsor of the Mission Rock development project is currently developing a Transportation Demand Management (TDM) Program as part of the Mission Rock project that would include a plan to coordinate and facilitate parking and traffic at and around the Mission

Rock site on SF Giant game days. One of the key elements of the TDM program would be to manage and optimize the shared parking opportunities between office, retail, commercial, and AT&T Park users on game days. Based on preliminary information on the TDM program, approximately 2,000 of the spaces located at the proposed 2,300-space parking structure stalls would be dedicated to the visitors AT&T Park. This would be accomplished through a combination of promotion of carpooling, increased provision of parking attendant services, adjustment of work schedules, and increased event day parking rates. It would be expected that as a result of the robust TDM program for the Mission Rock project, approximately 2,000 vehicles unrelated to the SF Giants game would not be parked within the study area on weekday evenings during a overlapping basketball game at the project site and SF Giants evening game at AT&T Park, thus increasing the parking supply available to event center attendees and reducing or potentially eliminating the future cumulative parking shortfall.

5.2.6 Project Impacts on the UCSF Helipad Operations

This section of the SEIR addresses potential impacts associated with the implementation of the proposed project in consideration of the helipad operations that occur at the nearby UCSF Benioff Children's Hospital. This section documents available information on the existing UCSF hospital helipad facilities and operations, describes applicable regulations governing helipad operations and development in the vicinity of helipads, and addresses potential safety issues associated with construction and operation of the proposed project in the vicinity of the helipad.

5.2.6.1 Summary of the Mission Bay FSEIR and Other Applicable Environmental Review Documents in Mission Bay Plan Area

While the Mission Bay FSEIR assumed the development of a range of UCSF land uses in the Mission Bay Plan area, no helipad was specifically proposed by UCSF in the Plan area at that time of preparation of the Mission Bay FSEIR, and consequently, the Mission Bay FSEIR did not address potential impacts associated with development or operation of a helipad in the Plan area.

On March 17, 2005, The Regents of the University of California ("The Regents") certified the *Long Range Development Plan Amendment No. 2 – Hospital Replacement Final Environmental Impact Report*[60] (UCSF LRDP Amendment No. 2 Final EIR), which preliminarily addressed potential public safety impacts associated with the development of a potential helipad for medical helicopter transports on one of two possible sites: Block 16 (North Site) and Block 36 (South site) in the Mission Bay South Plan area. The UCSF LRDP Amendment No. 2 Final EIR determined that although there were no existing surrounding structures in the Mission Bay South Plan area that constituted an obstruction based upon Federal Aviation Administration (FAA) or California Department of Transportation Division of Aeronautics (DOA) final approach and takeoff area (FATO) standards, the maximum building heights from future development within the Mission Bay South Plan are could have the potential to create a flight path obstruction for a future helipad. The UCSF LRDP Amendment No. 2

60 UCSF, *Long Range Development Plan (LRDP) Amendment No. 2 – Hospital Replacement Final Environmental Impact Report*, certified March 17, 2005, SCH No. 2004072067.

Final EIR Hazards and Hazardous Materials section noted; however, that approval of a helipad at that site would be subject to future project-specific environmental review, including safety conflicts for the helipad, and concluded that compliance with future CEQA requirements for individual UCSF projects in Mission Bay, together with FAA and DOA review and approval for any subsequent Mission Bay South Plan area projects that could create an obstruction, would reduce this potential impact to a less-than-significant level.

On September 30, 2005, the former San Francisco Redevelopment Agency approved an Addendum to the Mission Bay FSEIR (Addendum No. 5)[61] determining that the UCSF LRDP Amendment No. 2 did not entail any substantial changes that would require major revisions to the Mission Bay FSEIR, nor would new significant impacts or a substantial increase in the severity of previously-identified significant effects occur, and no new information had emerged that would materially change any of the analyses or conclusions in the Mission Bay FSEIR.

On September 17, 2008, The Regents certified the *UCSF Medical Center at Mission Bay Final Environmental Impact Report*[62] (UCSF Medical Center Final EIR), which also addressed potential environmental impacts associated with the development and operation of a helipad on the roof of the proposed medical center's outpatient building on Block 36 in the Mission Bay South Plan area. The UCSF Medical Center Final EIR analyzed 1.4 average daily helicopter transports and 3 daily helicopter transports on a busy day. The UCSF Medical Center Final EIR Aeromedical Helicopter Flight Operations and Public Safety section, relying in part on the results of a Risk Assessment for Helicopter Operations prepared in support of the EIR, determined that the helipad operations would result in a negligible risk to human safety in the vicinity of the helipad site. Furthermore, the UCSF Medical Center Final EIR determined that the operation of the proposed helipad in conjunction with another potential future helipad in the same general area (i.e., San Francisco General Hospital) would result in a less-than-significant cumulative public safety risk.

The former San Francisco Redevelopment Agency approved an Addendum to the Mission Bay FSEIR (Addendum No. 6)[63] on September 10, 2008 determining that UCSF Medical Center Draft EIR did not entail any substantial changes that would require major revisions to the Mission Bay FSEIR, nor would new significant impacts or a substantial increase in the severity of previously-identified significant effects occur, and no new information had emerged that would materially change any of the analyses or conclusions in the Mission Bay FSEIR.

The Regents approved construction of the helipad as part of its approval of Phase 1 of the Medical Center at Mission Bay on September 17, 2008. However, it deferred approval of operation of the helipad until the development of a residential sound reduction program (RSRP), which was identified as a mitigation measure in the 2008 Medical Center at Mission Bay Final EIR. In 2009, an

61 San Francisco Redevelopment Agency, *Mission Bay Subsequent EIR Addendum, ER 919-97 Addendum No. 5,* approved September 20, 2005.

62 UCSF, *UCSF Medical Center at Mission Bay Final Environmental Impact Report*, certified September 17, 2008, SCH No. 2008012075.

63 San Francisco Redevelopment Agency, *Mission Bay Subsequent EIR Addendum, ER 919-97 Addendum No. 6,* approved September 10, 2008.

RSRP was developed with community involvement. The effectiveness of the RSRP in mitigating helicopter noise was analyzed in the Final Supplemental Environmental Impact Report for the UCSF Medical Center at Mission Bay – Residential Sound Reduction Program for Helicopter Operations, which was certified by the Regents on April 20, 2009, followed by UC approval of helipad operations.[64] On July 28, 2009, the San Francisco Board of Supervisors, as a responsible agency for the helipad project under CEQA, considered the UCSF Medical Center at Mission Bay Final EIR adequate as supplemented and amended, and approved the proposed UCSF helipad.[65]

On November 20, 2014, The Regents certified the *UCSF 2014 Long Range Development Plan Final EIR*[66] (UCSF 2014 LRDP Final EIR) which addressed additional planned development on the UCSF campus in Mission Bay South. The 2014 UCSF LRDP Final EIR Hazards and Hazardous Materials section addressed potential public safety impacts associated with additional land use development proposed under the 2014 LRDP in the helipad vicinity in the Mission Bay South Plan area, and determined that the implementation of the 2014 LRDP would have a less-than-significant impact for people residing or working near the helipad.

5.2.6.2 Setting

UCSF Benioff Children's Hospital Helipad

UCSF Helipad Overview

The UCSF Benioff Children's Hospital helipad began operating in February 2015, and is currently the only operating hospital helipad in San Francisco. Helicopter access to the hospital is limited to children and pregnant women with critical and life-threatening conditions.[67] All patients with less serious conditions are transported by ground ambulance. The helipad is not used for routine transport of stable patients, transport of patients to other UCSF facilities, or for any non-patient related travel. The hospital is not a trauma center; and consequently, is not used for trauma scene transport.[68]

UCSF Helipad Location and Design

Figure 5.2-26 presents the location of the UCSF Benioff Children's Hospital helipad with respect to the project site. The helipad is located atop the roof of the UCSF Ron Conway Gateway Medical Building at 1825 4th Street, on Block 36 in the Mission Bay South Plan area. The helipad is located approximately 500 horizontal feet west of the southwest corner of the project site. The

64 UCSF, *UCSF Medical Center at Mission Bay - Residential Sound Reduction Program for Helicopter Operations Final Supplemental EIR*, certified April 20, 2009, SCH No. 2008012075.

65 San Francisco Board of Supervisors, Resolution No. 310-09, *Resolution Approving the Proposed Helipad at the UCSF Medical Center at Mission Bay under California Public Utilities Code Section 21661.5 and Adopting Environmental Findings under the California Environmental Quality Act, including a Mitigation Monitoring and Reporting Program and a Statement of Overriding Considerations,* adopted July 28, 2009.

66 UCSF, *UCSF 2014 Long Range Development Plan Final EIR,* November 20, 2014, SCH No. 2103092047.

67 Examples of life-threatening conditions include a baby born with a life-threatening birth defect, a child with septic shock and organ failure that may die within hours, or a pregnant woman with a condition threatening her life and/or the life of her baby.

Mission Bay Redevelopment Plan Area Boundary

Project Site Boundary

SOURCE: UCSF, 2014; ESA, 2015; Google Maps, 2014

OCII Case No. ER 2014-919-97; Planning Department Case No. 2014.1441E: Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 5.2-26
UCSF Benioff Children's Hospital Helipad and Designated Flight Paths

helipad deck is located at an elevation of approximately 140 feet above ground level (agl) [156 feet above mean sea level (msl)]. The helipad facility contains applicable design and safety features, including a raised landing area with required markings, perimeter lighting, safety netting, lighted windcone, and rooftop obstruction lighting.[69]

UCSF Helipad Existing Operations

As was assumed in the UCSF Medical Center at Mission Bay Final EIR, UCSF projects the hospital will experience approximately 500 annual medical transports per year to the helipad, amounting to about 42 monthly transports, or 1.4 average daily transports and 3 daily transports on a busy day. UCSF contracts with medical companies that base their medical transport teams and helicopters in Oakland. Helicopter daily average arrival times are 7:00 a.m. to 3:00 p.m. (42 percent), 3:00 p.m. to 11:00 p.m. (40 percent) and 11:00 p.m. to 7:00 a.m. (18 percent).[70]

Figure 5.2-26 presents the designated helicopter arrival and departure flight paths for the helipad. These flight paths were developed through extensive coordination with the City and local community considering a number of factors, including wind conditions and a goal of minimizing noise effects to residential uses in the area. As shown in Figure 5.2-26, the primary arrival/departure route is from/to the east along 16th Street and over the Bay. Alternate and secondary flight paths are only used if the primary flight path is not desirable due to wind conditions or safety considerations. One alternate arrival/departure route is from/to the west along 16th Street, along Interstate 280, Mission Bay Commons, and over the Bay; another alternate arrival/departure route is from/to the north for a short distance, hence east-west along South Street and over the Bay. The secondary departure route is along 16th Street to points west.

UCSF estimates the flight time for UCSF helicopters from the Bay shoreline to the helipad is approximately one to two minutes, and the estimated descent-to-landing and ascent-to-departure is approximately 30 seconds. Helicopter hovering is not a routine part of helicopter landing operations at the helipad.[71]

UCSF service contracts with air medical companies require that all pilots be routinely trained to ensure that optimum arrival and departure flight paths are followed for each helicopter type that serves UCSF.

UCSF Helipad Airspace and Obstruction Clearance Surfaces

The airspace surfaces for a heliport[72] are prescribed in Title 14 *Code of Federal Regulations* (CFR) Part 77, *Safe, Efficient Use, and Preservation of the Navigable Airspace*. Section 77.23 defines imaginary airspace surfaces for civil (non-military) heliports. The applicable airspace surfaces for the UCSF helipad are described below and illustrated in **Figure 5.2-27**.

69 Heliplanners, Exhibit HP-1, UCSF Medical Center at Mission Bay Heliport Layout Plan, revised September 25, 2014

NOTE: Airspace contours are expressed in mean feet above sea level (msl).

OCII Case No. ER 2014-919-97; Planning Department Case No. 2014.1441E:
Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 5.2-27
UCSF Benioff Children's Hospital Helipad Airspace Surfaces

Primary Surface – The Primary Surface is a horizontal plane at the elevation of the established heliport elevation (approximately 156 feet msl). The Primary Surface for the UCSF helipad is 98 feet by 98 feet square, which coincide with the location and dimensions of the facility's Final Approach and Takeoff Area (FATO).

Approach Surface – Each Approach Surface associated with a heliport begins at the edge of the heliport's Primary Surface and the inner width of the surface is the same width as the Primary Surface. The Approach Surface then extends outward and upward for a horizontal distance of 4,000 feet where its outer width is 500 feet. The slope of the Approach Surface for civil heliports is 8:1 (one foot upward for every eight feet outward).

Transitional Surfaces – The Transitional Surfaces extend outward and upward from the lateral boundaries of the Primary Surface and the Approach Surface(s) at a slope of 2:1. The Transitional Surfaces extend for a lateral distance of 250 feet measured horizontally from the centerline of the Primary Surface and Approach Surfaces.

FAA Order 8260.3B, United States Standard for Terminal Instrument Procedures (TERPS), contains the criteria used to formulate, review, approve, and publish procedures for instrument flight procedures to and from civil and military airports. The Order identifies Obstacle Clearance Surfaces required for different types of instrument approach procedures (i.e., night time straight-in instrument approach). The UCSF Medical Center helipad operates under Visual Flight Rules. There are no published instrument approach procedures for the UCSF Medical Center helipad. Therefore, TERPS Obstacle Clearance Surface criteria are not applicable to the hospital's helipad. However, UCSF indicates it is currently developing a GPS instrument approach procedure.

5.2.6.3 Regulatory Framework

Federal Regulations

Federal Aviation Administration

The Federal Aviation Administration (FAA) is the agency of the U.S. Department of Transportation that is charged with (1) regulating air commerce to promote its safety and development; (2) achieving the efficient use of navigable airspace of the United States; (3) promoting, encouraging, and developing civil aviation; (4) developing and operating a common system of air traffic control and air navigation for both civilian and military aircraft; and (5) promoting the development of a national system of airports.

Heliport Design Standards

FAA Advisory Circular (AC) 150/5390-2C, *Heliport Design*, provides standards, guidelines, and specifications for the siting, design, and construction of heliports.[73] Chapter 4 of AC 5390-2C provides information and guidance for the layout and design of hospital heliports. These standards are required for projects funded by the FAA, but are the FAA's recommendations for all heliports.

[73] It should be noted that at the time the UCSF helipad was designed, FAA AC 150/5390-2B (published September 30, 2004) was in effect. FAA AC 150/5390-2C (published April 24, 2012) cancels FAA AC 150/5390-2B.

Notice of Landing Area Proposal

14 CFR Part 157, *Notice of Construction, Alteration, Activation and Deactivation*, requires persons proposing to construct, activate, deactivate, or alter a heliport to give advance notice of their intent to the FAA. Pursuant to Federal Regulation 14 CFR Part 157, prior to construction of the UCSF helipad, the FAA conducted an aeronautical study that evaluated the effects the helipad would have on existing or future traffic patterns of neighboring airports; the effects on the existing airspace structure and projected programs of the FAA; the effects it would have on the safety of persons and property on the ground; and the effects that existing or proposed manmade objects (on file with the FAA) and natural objects within the affected area would have on the helipad. The FAA aeronautical study and determination do not consider environmental or land use compatibility impacts.

Following the study, the FAA issued an advisory airspace determination that the helipad would not adversely affect the safe and efficient use of the navigable airspace by aircraft, provided among other stipulations, that all operations are conducted in Visual Flight Rules (VFR) weather conditions, and routes of ingress and egress are established and maintained obstruction-free. UCSF obtained its airspace determination from the FAA on June 1, 2011. As discussed above, UCSF is currently developing a GPS instrument approach procedure; a followup FAA airspace study and airspace determination would be required to convert the facility from VFR only to both VFT and IFR.

Hazards to Air Navigation

14 CFR Part 77 establishes requirements for notification to the FAA of objects that may affect navigable airspace. It sets standards for determining obstructions to navigable airspace and provides for aeronautical studies of such obstructions to determine their effect on the safe and efficient use of airspace. Although the requirements of 14 CFR Part 77 only applies to public airports and heliports, it provides meaningful criteria for the protection of navigable airspace associated with private heliports.

Part 77 defines objects that are obstructions to imaginary airspace surfaces. The FAA presumes these obstructions to be a hazard to air navigation unless an FAA study determines otherwise. Objects presumed to affect navigable airspace may be mitigated by: 1) removing the object, 2) altering (i.e., lowering) the object, or 3) marking and/or lighting the object (providing it would not be a hazard if marked or lighted).

Outdoor Lighting / Nuisance Lighting

FAA Advisory Circular 70-1, *Outdoor Laser Operations*, provides information for outdoor laser operations that may affect aircraft operations. The Advisory Circular describes how to notify the FAA of planned laser operations and what action the FAA will take to respond to such notifications.[74]

[74] FAA also issued Advisory Circular 70/7460-1K which provides guidance on lighting and/or marking obstructions.

Airspace Management

FAA Order JO 7400.2K, *Procedures for Handling Airspace Matters*, prescribes policy, criteria, guidelines, and procedures applicable to the Air Traffic (ATO) division of the FAA in regard to airspace management. The Order also prescribes the methods for conducting aeronautical studies and making determinations as to whether or not an obstruction constitutes a hazard to air navigation.

Chapter 30 of Order 7400.2K prescribes policy and guidelines for determining the potential effect of "high intensity light operations"[75] on users of the national airspace system (NAS). The Order outlines the methods by which the FAA would conduct an aeronautical study and issue a determination on the effect of a proposal to use a HIL. FAA policy on this topic notes that consideration must be given to commercial and general aviation requirements as well as to the public right of "freedom of transit" through the airspace. The FAA policy states that "while a sincere effort must be made to negotiate equitable solutions to conflicts over the use of the NAS for non–aviation purposes, aviation must receive primary emphasis." Chapter 29 of the Order also addresses the process of conducting an aeronautical study for outdoor laser operations.

State Regulations

California Department of Transportation

Heliport Permit

State Heliport Permit requirements are promulgated in the California Public Utilities Code (PUC), Section 21001 et seq., otherwise known as the State Aeronautics Act, and the California Code of Regulations (CCR), Title 21, Sections 3525-3560, Airports and Heliports. The California Department of Transportation (Caltrans) Division of Aeronautics (DOA) issues permits for all helipads in the State of California. Helipads must meet the FAA's FATO standards in order to obtain a Caltrans operating permit.

Pursuant to Public Utilities Commission (PUC) Section 21666, among other requirements, before issuing a State Heliport Permit:

1. The site meets or exceeds the minimum heliport standards specified by Caltrans in its rules and regulations
2. Safe air traffic patterns have been established for the proposed heliport and all existing airports/heliports and approved airport/heliport sites in its vicinity.
3. Safe "zones of approach" for the heliport have been engineered in conformity with the provisions of PUC 21403 (i.e., compliance with FAR Part 77).

[75] A High Intensity Light (HIL) is defined in Order 7400.2K as a "lighting system other than laser designed to penetrate the navigable airspace. A sky searchlight is an example of an HIL.

On November 24, 2009, UCSF received a Heliport Site Approval Permit issued by the Caltrans DOA which effectively authorized helipad construction. On September 18, 2013, UCSF received a Heliport Permit for a special-use heliport issued by the Caltrans DOA, which authorized startup of flight operations.

Local Regulations

As discussed above, UCSF obtained approval from the San Francisco Board of Supervisors in July 2009 for the construction and operation of a helipad within City limits.

5.2.6.4 Impacts and Mitigation Measures

Significance Threshold

As discussed in the Initial Study, Hazards and Hazardous Materials section (see Appendix NOP-IS), the project site is not located within an airport land use plan, within two miles of a public airport or public use airport, or within the vicinity of private airstrip. Consequently, these criteria are not applicable to the proposed project. The project is, however, within the vicinity of a private helipad and its operational flight paths. Furthermore, the Initial Study, Transportation and Circulation section indicated that the project's effect on the helipad's air traffic patterns could be affected and merited analysis in the SEIR.

Consequently, for purposes of this SEIR, the construction and/or operation of the project would have a significant impact related to air safety and hazards if the project were to:

- Involve features that would result in substantial air safety risk and/or create a safety hazard for people residing or working in the project area.

Buildings or structures that penetrate Part 77 airspace surfaces associated with the UCSF Benioff Children's Hospital helipad would be considered "obstructions" to air navigation and assumed to be a potential hazard. Although a hazard determination is made by the FAA only for public airports and private facilities with published instrument approaches, penetrations to the airspace surfaces associated with the private UCSF helipad would be considered a significant impact to the safe operation and utility of the helipad.[76]

Substantial light emissions and/or glare from potential nuisance light sources could adversely affect the vision of pilots using the UCSF helipad and interfere with executing visual approaches to the helipad and landing and takeoff maneuvers. Although a specific threshold indicating a significant impact is not established, a potential to adversely affect the vision of pilots and interfere with the execution of a visual approach to the hospital helipad would indicate a significant impact.

---

[76] It is anticipated that instrument approach procedures for the private UCSF helipad would not be published for public use. Further, it is unknown at this time whether or not the FAA would make a hazard determination for the UCSF helipad with a "private" instrument approach procedure. However, for the purpose of this study, a conservative approach was applied in which an apparent obstruction to the helipad's airspace was assumed to be a hazard.

Approach to Analysis

Methodology for Analysis of Direct Impacts

Airspace

The impact analysis in this SEIR determines whether or not the proposed project's temporary and permanent structures would penetrate the Part 77 Approach and Transitional airspace surfaces established for the UCSF Benioff Children's Hospital helipad. If potential obstructions are identified, the amount by which one or more airspace surfaces would be penetrated was evaluated to determine whether measures may be needed to eliminate or minimize the impact.

Information used to conduct the analysis included:

- aerial photography obtained from the City of San Francisco (DataSF.org)
- the UCSF Benioff Children's Hospital Helipad Layout Plan prepared by Heliplanners, Inc. for UCSF, which depicts the location of the hospital's helipad and its airspace surfaces and elevations
- site plans for the proposed project development, including building heights, provided by the project sponsor
- preliminary construction tower crane plan details, including type, size, and location of tower cranes, provided by the project sponsor
- ALTA/ACSM Land Title Survey for the project site, prepared by Martin M. Ron Associates, provided by the project sponsor

First, a base map was prepared depicting the helipad's existing airspace surfaces in the vicinity of the proposed project. The location and heights of the principal proposed permanent structures, including proposed office and retail building podium and towers, and the event center, were added to the base map to depict the location and approximate elevation of the structures in relation to the existing airspace surfaces. In addition, the location and heights of the temporary project construction cranes, as provided by the project sponsor, were separately added to the base map to illustrate the location and approximate elevations of the construction cranes in relation to the existing airspace surfaces.[77]

As a conservative approach in evaluating the proposed buildings, the average post-construction ground elevation at the project site was assumed to be equal to the highest existing curb elevation adjacent to the project site (southwest corner). The curb elevations on the land survey referenced in Mission Bay Datum values were adjusted in reference to North American Vertical Datum of 1988 (NAVD 88), which is commonly used for airport and heliport drawings and for conducting airspace evaluations. Consistent with the *Mission Bay South Design for Development* guidelines, the maximum heights of the proposed office and retail buildings included an additional 20 feet above

[77] It should be noted that both the sponsor's proposed site plans and preliminary construction tower crane plan details are not design level plans, and consequently, reported elevations and effects on airspace are considered approximate.

the building rooftops to account for assumed rooftop mechanical equipment and enclosures. The maximum building heights were then added to the post-construction ground elevation to obtain the maximum building elevations. The analysis then compared the elevation data to determine if the proposed buildings would penetrate the airspace surfaces. The analysis evaluated representative test points for the proposed buildings and estimated the approximate clearance or penetration for each test point.

As a conservative approach in evaluating the temporary project construction cranes, the crane maximum working elevation (ground elevation plus crane height) within each crane's working radius was assumed. This accounts for some mobility of the cranes during construction. The crane maximum working elevations were then assessed to determine if they had the potential to penetrate the airspace surfaces associated with the helipad.

Light Emissions

No proposed exterior lighting details are currently available for the proposed project. Due to the lack of specific information regarding specific proposed exterior lighting, including temporary construction lighting, and long-term operational lighting, this SEIR provides a qualitative evaluation of potential associated lighting impacts.

Methodology for Analysis of Cumulative Impacts

Foreseeable past, present, and probable future projects in the project area that could result in cumulative construction or operational impacts in combination with the proposed project are described in Section 5.1, Impact Overview. The analysis considers whether or not there would be a significant, adverse cumulative impact associated with the helipad operations in combination with past, present, and probable future projects in the immediate vicinity, and if so, whether or not the project's contribution to the cumulative impact would be significant (i.e., cumulatively considerable).

Impact Evaluation—Construction

Airspace

Impact TR-9a: Construction of the proposed project could temporarily obstruct helipad airspace surfaces. (Less than Significant with Mitigation)

As described in detail in Chapter 3, Project Description, construction of the proposed project is anticipated to begin in late 2015 and occur over an approximate 26-month period. Construction activities would include, among other activities, construction of all proposed development, including event center, podium structure, office towers, and plazas. Building erection would require the use of tower cranes, which may be used throughout the construction duration. Tower cranes are comprised of a fixed vertical mast (or tower), a long horizontal jib arm, a shorter horizontal machinery arm, operators cab, and slewing unit (engine).

The preliminary project construction plan as proposed by the sponsor anticipates the placement and use of multiple construction cranes on the project site during construction. Four cranes are anticipated to be required between months 3 through 5 of construction, and five cranes would be used starting in month 6 and used through to approximately to the end of construction period. The maximum crane heights would be either 200 or 240 feet agl, depending on crane and its location. **Figure 5.2-28** illustrates the proposed construction crane locations, crane maximum working elevations (msl) and crane working radii.[78] As shown in Figure 5.2-28, the estimated maximum working elevation of the cranes would be either 214 or 254 feet msl, with a working radii of between 201 and 267 horizontal feet, depending on the crane and its location.

Using the approach and methodology discussed under *Approach to Analysis* above, the project construction cranes were assessed to determine if they would have the potential to penetrate the Part 77 Approach and Transitional airspace surfaces established for the UCSF helipad. **Figure 5.2-28** shows the UCSF helipad and illustrates its existing airspace surfaces in relation to the proposed construction cranes and their maximum working elevation. Based on the information provided and the evaluation of potential obstructions conducted for this study, the following observations can be made:

- The working radii of the central-west project construction crane would penetrate the helipad's Transitional Surface adjacent to primary Approach Surface (i.e., the westbound approach from the Bay) by up to approximately 23 feet (see Point No. 2 in Figure 5.2-28). The penetration would occur if this construction crane were to work over the southwest corner of the project site at an elevation of between approximately 232 to 254 feet msl. The potential penetration in this area would be a temporary obstruction to the helipad's Transitional Surface.

- The working radii of the two southern project construction cranes would extend under the helipad's primary Approach Surface and adjacent Transitional Surface, with minimum vertical clearances of 5 and 7 feet, respectively (see Points No. 3 and 8 in Figure 5.2-28)

- None of project construction crane masts would be located under the helipad's Approach Surfaces. However, the masts of the two southernmost project construction cranes would be located under the helipad's Transitional Surface adjacent to primary Approach Surface, but with vertical clearances of 81 and 91 feet, respectively.

- As shown in Figure 5.2-26, one of UCSF's alternative arrival/departure flight paths follows along the alignment of South Street. As shown in Figure 5.2-28, while the working radii of two project construction cranes would extend over South Street, they are not located under any of the Part 77 Approach or Transitional Surfaces. Assuming that an 8:1 "curved" Approach Surface was established along this segment of the alternate flight path and it intercepted the existing northern approach surface for a 90 degree turn[79] at an elevation of approximately 250 feet msl, the minimum amount of clearance over the construction crane in the northwest corner of the project site would be approximately 44 feet; and the minimum amount of clearance over the clearance over the construction crane in the northeast corner of the project site would be approximately 64 feet.

[78] Crane "heights" are expressed feet above ground level (agl). "Elevations" in Figure 5.2-28 are expressed in mean feet above sea level (msl) referencing NAVD 88 datum, which is commonly used for airport and heliport drawings and conducting airspace evaluations.

[79] Curved approach/departure surfaces have not been established for the helipad. Although FAA criteria for curved approach/departure surfaces would require a wider turn radius, this analysis assumed a tighter turn radius based on the use of existing approach/departure flight paths.

OCII Case No. ER 2014-919-97; Planning Department Case No. 2014.1441E:
Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 5.2-28
Project Construction Cranes and UCSF
Benioff Children's Hospital Helipad Airspace Surfaces

In summary, based on the preliminary project construction plan for the project construction cranes, one of the project construction cranes would have the potential to result in a temporary penetration of a Part 77 Transitional Surface associated the helipad, which would be considered a potentially significant impact. If the preliminary project construction plan details were to change with respect to proposed tower crane size, location, or other factors, then the project would have the potential to result in greater and/or less airspace penetration effects than those reported above. **Mitigation Measure M-TR-9a**, **Crane Safety Plan for Project Construction**, identifies feasible measures that would reduce potential temporary impacts associated with the use of cranes during the construction period to less than significant. The objective of the crane safety plan is to ensure the safe use of the UCSF Benioff Children's Hospital helipad, and the safety for people residing or working in the project area during construction. Therefore, with implementation of Mitigation Measure M-TR-9a, this impact would be *less than significant with mitigation*.

Mitigation Measure M-TR-9a: Crane Safety Plan for Project Construction

Prior to construction, the project construction contractor shall develop a crane safety plan for the project construction cranes that would be implemented during the construction period. The crane safety plan shall identify appropriate measures to reduce, and where possible, avoid, potential conflicts that may be associated with the operation of the construction cranes in the vicinity of the UCSF Benioff Children's Hospital helipad airspace. These safety protocols shall be developed in consultation and coordination with OCII (or its designated representative) and UCSF, and the crane safety plan shall be subject to approval by OCII or its designated representative. The crane safety plan shall include, but may not be limited to, the following measures:

- Convey project crane activity schedule to UCSF and OCII
- If other projects on adjacent properties are under construction concurrent with the proposed project and are using tower cranes, the project sponsor shall participate in joint coordination with those project sponsors and OCII or its designated representative to ensure any potential cumulative construction crane effects on the UCSF helipad would be minimized.
- Use appropriate markings, flags, and/or obstruction lighting on all project construction cranes working in proximity to the helipad's airspace surfaces.
- Light all construction crane structures at night (e.g., towers, arms, and suspension rods) to enhance a pilot's ability to discern the location and height of the cranes.
- Inform crane operators of the location and elevation of the hospital helipad's Part 77 airspace surfaces and the need to minimize penetrations to the surfaces.
- Use construction methods that minimize the duration of Part 77 airspace surface penetrations that may occur.
- Issue a Notice to Airmen (NOTAM) to advise pilots in the area of the presence of construction cranes at the project site.

Comparison of Impact TR-9a to Mission Bay FSEIR Impact Analysis

At the time the Mission Bay FSEIR was prepared, no helipad was specifically proposed by UCSF in the Plan area. As such, the Mission Bay FSEIR did not discuss potential construction-related impacts from new development in the Plan area on a helipad. Addenda to the Mission Bay FSEIR were prepared in 2005 and 2008 that analyzed potential impacts associated with operation of a UCSF helipad (explained further above), however, those addenda also did not address potential construction-related impacts from new development in the Plan area on the helipad operations. However, because project construction impacts to the UCSF helipad airspace discussed in this SEIR would be less than significant with mitigation, the project would result in no new or substantially more severe significant impacts than was previously identified in the Mission Bay FSEIR, as addended.

Lighting

Impact TR-9b: Project construction lighting would not adversely affect helipad flight operations (Less than Significant)

As discussed in Chapter 3, Project Description, some construction activities would occur at night. Potential exterior nighttime construction would use temporary lighting to illuminate work areas immediately surrounding construction equipment and work site. This type of lighting is normally shielded to direct the light downward to the work area and/or diffused to reduce glare to workers and equipment operators. Given the proposed project's urban setting, the use of this type of lighting would be noticeable to pilots using the hospital helipad, but would not be expected to have a significant impact. Consequently this impact is determined to be *less than significant*.

Mitigation: Not required.

Comparison of Impact TR-9b to Mission Bay FSEIR Impact Analysis

As discussed above, Mission Bay FSEIR as addended did not address potential construction-related impacts from new development in the Plan area on the helipad operations. However, because project construction lighting impacts to UCSF helicopter pilots discussed in this SEIR would be less than significant, the project would result in no new or substantially more severe significant impacts than was previously identified in the Mission Bay FSEIR, as addended.

Impact Evaluation—Operation

Airspace

Impact TR-9c: Development of the proposed project would not obstruct UCSF helipad airspace surfaces. (Less than Significant)

As described in detail in Chapter 3, Project Description, the project development would include a multi-purpose event center on the east side of the project site, two office and retail buildings on the west side of the project site, and miscellaneous other structures, such as a food hall and gatehouse building. The proposed 11-story office and retail buildings would be the tallest buildings on the project site, with each building comprised of 6-story podiums (90 feet) and 5-story (70-foot) towers above. When accounting for up to an additional 20 feet for rooftop mechanical enclosures, the maximum heights of the proposed office and retail buildings would be 180 feet agl. The proposed event center building would be approximately 135 feet agl at its roof peak, and other locations on the roof up to 126 feet agl (e.g., at southeast corner at 16th Street). **Figure 5.2-29** illustrates the proposed location of the proposed tallest project buildings (i.e., the two office and retail buildings, and the event center) and their corresponding elevations (msl).[80,81]

Using the approach and methodology discussed under *Approach to Analysis* above, the project buildings were assessed to determine if they have the potential to penetrate the Part 77 Approach and Transitional airspace surfaces established for the UCSF Benioff Children's Hospital helipad. Figure 5.2-29 shows the UCSF helipad and illustrates its existing airspace surfaces in relation to the proposed project buildings. Based on the information provided by the project sponsor and the evaluation of potential obstructions conducted for this study, the following observations can be made:

- None of the proposed project structures, including the office and retail buildings and the event center, are located directly under any of the helipad's Approach Surfaces. Portions of the 16th Street tower/podium and event center are located under the Transitional Surface adjacent to the primary Approach Surface (the westbound approach from San Francisco Bay).
- None of the proposed project structures would penetrate the helipad's Approach or Transitional Surfaces.

---

80 As discussed in Chapter 4, Plans and Policies, to accommodate the proposed project, the South Design for Development would be amended to allow an event center not to exceed 135 feet agl (building height limit is currently 90 feet); and to allow for two 160-foot agl towers (exclusive of rooftop mechanical enclosures) – the limit is currently one tower.

81 Building "heights" are expressed feet above ground level (agl). "Elevations" in Figure 5.2-19d are expressed in mean feet above sea level (msl) referencing NAVD 88 datum, which is commonly used for airport and heliport drawings and conducting airspace evaluations.

Project Development and UCSF Benioff Children's Hospital Helipad Airspace Surfaces

Table 5.2-74 provides the estimated vertical clearance between the helipad's Transitional Surface and the underlying proposed principal structures (16th Street tower/podium and event center). As shown, the minimum vertical clearance between the 16th Street tower and the helipad Transitional Surface would be 81 feet at the southwest corner of the proposed 16th Street tower roof (Point #3; see location in Figure 5.2-29). The minimum vertical clearance between the proposed event center and the helipad Transitional Surface would be 141 feet (Point #10; see location in Figure 5.2-29).

SOURCE: Golden State Warriors Site Plan information, 2015; UCSF Mission Bay Medical Center Helipad Layout Drawing, 2015; ESA, 2015

Because the proposed buildings would not penetrate the helipad's Part 77 airspace surfaces and would not be obstructions to air navigation, the impact is determined to be *less than significant*.

Mitigation: Not required.

Comparison of Impact TR-9c to Mission Bay FSEIR Impact Analysis

At the time the Mission Bay FSEIR was prepared, no helipad was specifically proposed by UCSF in the Plan area. As such, the Mission Bay FSEIR did not address potential impacts associated with operation of a helipad in the Plan area. However, Addendum No. 5 to the Mission Bay FSEIR (September 2005) analyzed operation of a potential helipad contemplated under the UCSF Long Range Development Plan Amendment No. 2 – Hospital Replacement project; and Addendum No. 6 to the Mission Bay FSEIR (September 2008) further analyzed operation of this helipad as part of the UCSF Medical Center project.[82] Addenda No. 5 and 6 to the Mission Bay FSEIR determined that the UCSF hospital project, including operation of a proposed helipad, did not entail any substantial changes that would require major revisions to the Mission Bay FSEIR, nor would new significant impacts or a substantial increase in the severity of previously-identified significant effects occur, and no new information had emerged that would materially change any of the analyses or conclusions in the Mission Bay FSEIR. As discussed above, the impact of the proposed project buildings on the UCSF helipad airspace would be less than significant. Therefore, the project would result in no new or substantially more severe significant impacts than those previously identified in the Mission Bay FSEIR, as addended.

Lighting

Impact TR-9d: Certain project specialized exterior lighting could adversely affect UCSF helipad flight operations (Less than Significant with Mitigation)

A project lighting plan is not currently available for this analysis. However, for the purposes of this analysis, it is assumed the exterior lighting for the proposed project would include lighting on the event center façade and roof, lighting at the office and retail buildings, lighting in the proposed plazas, green roofs, and along walkways, and signage lighting. Nightlighting would also be emitted from certain interior areas of the office and retail buildings and the event center. In addition, headlights from project-generated vehicles would also be visible in the evening at project vehicular entrances and on surrounding roadways. As identified in the Project Description, the project would require an amendment to the Mission Bay South Signage Master Plan; this would provide guidelines for proposed exterior lighting for the event center. In the absence of information regarding specific proposed exterior lighting, this analysis provides a qualitative evaluation of potential impacts by discussing different types of possible exterior lighting and their potential to affect helipad flight operations.

Mixed-Uses Lighting

In general, the exterior lighting associated with the proposed mixed uses (i.e., non-event center uses) on the site, including the office and retail buildings would be typical of other mixed-use developments in the Mission Bay Plan area and elsewhere in the City. Given the likely common light sources and lighting intensity for these uses, and the existing urban setting of the site, the exterior lighting associated with non-event center uses, and any incidental interior lighting from these uses that may be visible, would be noticeable but would not expected to have a significant impact on helicopter pilots approaching or departing from the UCSF helipad.

[82] Please also see *Summary of the Mission Bay FSEIR and Other Applicable Environmental Review Documents in Mission Bay Plan Area* in the Setting for a discussion of environmental review conducted by UCSF for the helipad operations.

Event Center Lighting

Routine Lighting - Based on the operation of other enclosed arenas and event centers, it is likely that during routine night games and events at the event center, additional outdoor lighting could be used at the project site to illuminate walkways, event center entrances, and other potential miscellaneous outdoor structures like sponsor tents and concession areas, in the immediate vicinity of the event center. These lights would be typically building or pole mounted and shielded to direct light downward, or may include muted embedded pavement or stair lighting that would not emit bright light past ground level. Outdoor lighted signs announcing the event and/or associated programming could also be used. Given these common light sources and the urban setting of the proposed project, the outdoor lighting associated with the routine use of the enclosed event center would be noticeable, but would not be expected to have a significant impact on pilots using the UCSF helipad.

Specialized Lighting – The event center and/or certain games and/or events at the event center, or occasional outdoor events/performances in the proposed plazas, could incorporate specialized outdoor lighting systems and large display screens that may have the potential to adversely affect a pilot’s vision and may interfere with visual nighttime approaches and departures to/from the UCSF helipad. Although no specific information currently exists indicating the use of specialized exterior lighting systems at the proposed event center or for outdoor events/performances, potential lighting could include lights that are directed upward or may be of such intensity to affect pilots arriving to or departing from the helipad. These types of temporary or permanent lighting systems may include:

- high-intensity area and/or building exterior lighting
- outdoor stage lighting (that may be directed upward)
- large outdoor lighted displays and television/lighted screens
- high-intensity lights that may be directed upward (i.e., spot lights, rotating search lights, klieg lights)
- high-intensity flashing or strobe lights
- laser and laser displays (that may be directed upward)
- projection lighting
- fireworks
- light configurations that may unintentionally be similar to those associated with the hospital heliport landing area

The effect of nuisance light on a pilot can vary due to numerous factors (i.e., intensity, light direction, type, and distance of the light source), and the effect reported by pilots can also be somewhat subjective. In some cases, the effects can be distracting to the pilot. In other cases (i.e., lasers and spot lights directed at an aircraft), the effects can constitute a hazard.

Based on these facts, the use of certain specialized lighting systems identified above would have the potential to adversely affect a pilot’s vision and execution of a visual night time approach or departure to/from the UCSF helipad. Lights that adversely affect the night vision of pilots and interfere with the execution of a visual nighttime approach to the helipad would endanger the pilot, passengers, and people on the ground. Therefore, the possible use of these specialized lighting systems would be considered a potentially significant impact. **Mitigation Measure M-TR-9d**, **Event Center Exterior Lighting Plan**, identifies feasible measures that would reduce potential impacts associated with potential specialized lighting systems to less than significant. Therefore, this impact would be *less than significant with mitigation*.

Mitigation Measure M-TR-9d: Event Center Exterior Lighting Plan

The project sponsor shall develop an exterior lighting plan that incorporates measures to ensure specialized exterior lighting systems would not have an undue impact on helipad operations. Feasible measures shall be developed in consultation and coordination with San Francisco International Airport (SFO) staff knowledgeable of the effects of lighting on pilots and safe air navigation, and OCII (or its designated representative), and the exterior lighting plan shall be subject to approval by OCII or its designated representative. Measures shall include, but may not be limited to, the following:

- prohibit the use of high-intensity lights that are directed towards the UCSF helipad
- prohibit the use of high-intensity outdoor flashing lights or strobe lights in proximity to the hospital helipad's three approaches
- prohibit the use of outdoor lasers directed upward, and laser light shows that have not been subject to prior review by OCII in consultation with SFO staff knowledgeable of the effects of lighting on pilots and safe air navigation and, if necessary the FAA
- avoid outdoor fireworks proximate to flight paths unless (1) the SFFD approves the proposed use of fireworks, and (2) notice of the event is provided to UCSF
- avoid the use of light configurations similar to those associated with the UCSF helipad landing area locate primary outdoor lighted displays and television/lighted screens away from the project property line at 16th Street, South Street, or Third Street, where feasible
- advance notification and coordination of planned special event lighting with OCII and UCSF representatives
- develop exterior specialized lighting guidelines and ensure event organizers are informed of the hospital helipad, its approaches, and safety concerns related to outdoor nuisance lighting

Comparison of Impact TR-9d to Mission Bay FSEIR Impact Analysis

As discussed above under Impact TR-9c, while the Mission Bay FSEIR did not address potential impacts associated with operation of a helipad in the Plan area, Addenda No. 5 and 6 to the Mission Bay FSEIR did address operation of the UCSF helipad, and determined that the proposed helipad did not entail any substantial changes that would require major revisions to the Mission Bay FSEIR, nor would new significant impacts or a substantial increase in the severity of previously-identified significant effects occur, and no new information had emerged that would materially change any of the analyses or conclusions in the Mission Bay FSEIR. As discussed above, the impact of the project's exterior lighting on UCSF helicopter pilots would be less than significant with mitigation. Therefore, the project would result in no new or substantially more severe significant impacts than those previously identified in the Mission Bay FSEIR, as addended.

Cumulative Impacts

Impact C-TR-9: The project, in combination with other past, present, and reasonably foreseeable future projects, could result in significant adverse cumulative impacts to the UCSF helipad. (Less than Significant with Mitigation)

Under cumulative conditions, past, present, and reasonably foreseeable future development in the immediate project vicinity would have the potential to result in cumulative effects on the UCSF helipad airspace surfaces, and night lighting effects on the UCSF pilots.

In the immediate project vicinity, cumulative building development is anticipated on the currently undeveloped portions of Blocks 27, 25, X3, and 33, located north, west, southwest and south of the project site, respectively. As with the proposed site, these parcels are located in the vicinity of the UCSF helipad airspace surfaces and/or its arrival/departure flight paths. Of these, Blocks 25, X3, and 33 are planned for development by UCSF under its 2014 LRDP. As discussed above, the 2014 UCSF LRDP Final EIR determined that the implementation of the 2014 LRDP, including new UCSF development immediately west, southwest, and south of the project site, would have a less than significant impact for people residing or working near the helipad. It is also reasonable to assume that UCSF, as operator of its helipad, would design, construct, and operate all of its other planned development on its Mission Bay campus in consideration of ensuring safety operating conditions for the helipad and helicopter pilots. Furthermore, none of the planned development on Blocks 27, 25, X3, and 33 would include outdoor entertainment facilities, such that there would be no cumulative impact related to exterior specialized lighting.

However, depending on the construction schedules for the planned developments on Blocks 27, 25, X3, and 33, the construction of the proposed project in combination with other planned development could result in a cumulative adverse impact to the UCSF helipad. Mitigation Measure M-TR-9a would require that the project’s crane safety plan include a measure to coordinate the project crane activity schedule with UCSF and OCII. Furthermore, Mitigation Measure M-TR-9a would require that if other projects on adjacent properties are under construction concurrent with the proposed project and are using tower cranes, the sponsor would participate in joint coordination with those project sponsors and OCII to ensure any potential cumulative construction crane effects on the UCSF helipad would be minimized. With implementation of Mitigation Measures M-TR-9a, the contribution to cumulative impacts by the project would not be considerable, and the impact would be *less than significant with mitigation*.

Mitigation Measure M-TR-9a: Crane Safety Plan for Project Construction (see Impact TR-9)

Comparison of Impact C-TR-9 to Mission Bay FSEIR Impact Analysis

At the time the Mission Bay FSEIR was prepared, no helipad was specifically proposed by UCSF in the Plan area. As such, the Mission Bay FSEIR did not address potential impacts, including cumulative impacts, associated with operation of a helipad in the Plan area. Addenda No. 5 and 6 to the Mission Bay FSEIR did consider cumulative effects associated with operation of the UCSF helipad, and determined that the proposed helipad did not entail any substantial changes that would require major revisions to the Mission Bay FSEIR, nor would new significant impacts or a substantial increase in the severity of previously-identified significant effects occur, and no new information had emerged that would materially change any of the analyses or conclusions in the Mission Bay FSEIR.

As discussed above, the proposed project's contribution to cumulative construction impacts of the project on the UCSF helipad operations would be less significant with mitigation. Therefore, the project would result in no new or substantially more severe significant impacts than those previously identified in the Mission Bay FSEIR, as addended.

CHAPTER 5 (continued)

Environmental Setting, Impacts, and Mitigation Measures

5.3 Noise and Vibration

5.3.1 Introduction

This section describes the existing noise environment in the project area and identifies the potential for noise and vibration associated with implementation of the proposed project to adversely affect established sensitive land uses or land use activities. The impact analysis evaluates the potential noise and vibration impacts of the proposed project and identifies mitigation measures to avoid or reduce adverse impacts.

5.3.2 Summary of Mission Bay FSEIR Noise Section

5.3.2.1 Mission Bay FSEIR Setting

The noise setting for the Mission Bay area discussed in the Mission Bay FSEIR differs from the existing setting today primarily in terms of the number of noise sources that exist in the area. Specifically, at the time of the Mission Bay FSEIR much of the Mission Bay area was underdeveloped. Since 1998, the development of the UCSF Mission Bay campus, AT&T Park and residential towers in North Mission Bay have introduced new noise sources to the area, particularly vehicle traffic. Additionally, the Muni Third Street light rail line has been constructed which is a new noise source along that corridor in front of the project site.

Another aspect of the noise setting that has changed since adoption of the 1998 SEIR is the number of noise sensitive uses that now exist in the Mission Bay area. In 1998 the Mission Bay area was developed primarily with industrial uses. Since that time residential uses have been developed including residential housing at the UCSF Mission Bay campus as well as in the north Mission Bay area. There have been no significant changes to the regulatory environment with regard to noise since certification of the 1998 FSEIR.

5.3.2.2 Mission Bay FSEIR Impacts and Mitigation Measures

Noise impacts assessed in the Mission Bay FSEIR included all of the Mission Bay plan area, including Blocks 29-32. The construction noise impact was identified as less than significant in the 1998 FSEIR for standard construction equipment. Noise from pile driving was identified as a significant impact mitigated to less than significant with Mitigation Measure G.1 to implement noise-reducing pile driving techniques.

The construction vibration impact was identified as less than significant in the 1998 FSEIR. Although the analysis acknowledged the potential existence of noise sensitive equipment in the area, it was determined that vibration from pile driving did not represent a physical impact on people or the environment, and was therefore less than significant under CEQA. A potential operational vibration impact was identified for the westernmost block of North Mission Bay due to proximity to the Caltrain tracks, which was mitigated to a less than significant level by implementation of Mitigation Measure G.2 to assess vibration levels and, if necessary, employ vibration-reducing foundation construction techniques for structure in that block.

Amplified sound was addressed in the 1998 FSEIR with respect to concert events at the San Francisco Giants ballpark. This impact was identified as less than significant with mitigation (implementation of a plan that limits concert events per year and limits the noise generated by these events to a 3 dBA increase over existing ambient levels) that was identified in the *San Francisco Giants Ballpark at China Basin Final EIR*.

Traffic noise increases were identified as less than significant in the 1998 FSEIR and no mitigation measures were required. Crowd noise from the Giants ballpark such as applause and cheering was assessed in combination with concert noise and found to be less than significant, and no mitigation measures were required for that impact.

5.3.3 Setting

5.3.3.1 Noise Background

Sound is characterized by various parameters that describe the rate of oscillation (frequency) of sound waves, the distance between successive troughs or crests in the wave, the speed that it travels, and the pressure level or energy content of a given sound. The sound pressure level has become the most common descriptor used to characterize the loudness of an ambient sound, and the decibel (dB) scale is used to quantify sound intensity. Because sound can vary in intensity by over one million times within the range of human hearing, a logarithmic loudness scale is used to keep sound intensity numbers at a convenient and manageable level. Since the human ear is not equally sensitive to all sound frequencies within the entire spectrum, human response is factored into sound descriptions in a process called “A-weighting,” expressed as “dBA.” The dBA, or A-weighted decibel, refers to a scale of noise measurement that approximates the range of sensitivity of the human ear to sounds of different frequencies. On this scale, the normal range of human hearing extends from about 0 dBA to about 140 dBA. An increase of 10-dBA in the level of a continuous noise represents a perceived doubling of loudness. The noise levels presented herein are expressed in terms of dBA, unless otherwise indicated. **Table 5.3-1** shows some representative noise sources and their corresponding noise levels in dBA.[1]

Planning for acceptable noise exposure must take into account the types of activities and corresponding noise sensitivity in a specified location for a generalized land use type. Some general guidelines are as follows: sleep disturbance can occur at levels above 35 dBA; interference with human speech begins at about 60 dBA; and hearing damage can result from prolonged exposure to noise levels in excess of 85 to 90 dBA.[2]

TABLE 5.3-1
TYPICAL SOUND LEVELS MEASURED IN THE ENVIRONMENT

Examples of Common, Easily Recognized Sounds	Decibels (dBA) at 50 feet	Subjective Evaluations
Near Jet Engine	140	Deafening
Threshold of Pain (Discomfort)	130	
Threshold of Feeling – Hard Rock Band	120	
Accelerating Motorcycle (at a few feet away)	110	
Loud Horn (at 10 feet away)	100	Very Loud
Noisy Urban Street	90	
Noisy Factory	85	
School Cafeteria with Untreated Surfaces	80	Loud
Near Freeway Auto Traffic	60	Moderate
Average Office	50	
Soft Radio Music in Apartment	40	Faint
Average Residence Without Stereo Playing	30	
Average Whisper	20	Very Faint
Rustle of Leaves in Wind	10	
Human Breathing	5	
Threshold of Audibility	0	

NOTE: Continuous exposure above 85 dBA is likely to degrade the hearing of most people. Range of speech is 50 to 70 dBA.

SOURCE: United States Department of Housing and Urban Development, *The Noise Guidebook*, 1985.

Attenuation of Noise

Line sources of noise, such as roadway traffic, attenuate (lessen) at a rate of 3.0 to 4.5 dBA per doubling of distance from the source, based on the inverse square law and the equation for cylindrical spreading of noise waves over hard and soft surfaces.

Point sources of noise,[3] including stationary mobile sources such as idling vehicles or onsite construction equipment, attenuate at a rate of 6.0 to 7.5 dBA per doubling of distance from the source, based on the inverse square law and the equations for spherical spreading of noise waves over hard and soft surfaces. For the purposes of this analysis, it is assumed that noise from line

[3] Point sources and line sources are further defined by the California Department of Transportation (Caltrans) as follows:

> Sound from a small localized source (approximating a "point" source) radiates uniformly outward as it travels away from the source in a spherical pattern. The sound level attenuates or drops off at a rate of 6 dBA for each doubling of the distance (6 dBA/DD). This decrease, due to the geometric spreading of the energy over an ever increasing area, is referred to as the inverse square law. However, highway traffic noise is not a single, stationary point source of sound. The movement of the vehicles makes the source of the sound appear to emanate from a line (line source) rather than a point when viewed over some time interval. This results in cylindrical spreading rather than the spherical spreading of a point source. (Source: Caltrans, *Technical Noise Supplement*, November 2009.)

and point sources to a distance of 200 feet attenuates at rates of between 3.0 and 6.0 dBA per doubling of distance, and the noise from line and point sources at a distance greater than 200 feet attenuates at a rate of 4.5 to 7.5 dBA per doubling of distance, to account for the absorption of noise waves due to ground surfaces such as soft dirt, grass, bushes, and intervening structures.[4]

Noise Descriptors

Time variations in noise exposure are typically expressed in terms of a steady-state energy level (L_{eq}) that represents the acoustical energy of a given measurement. L_{eq} is used to describe noise over a specified period of time, in terms of a single numerical value. The L_{eq} is the constant sound level that would contain the same acoustic energy as the varying sound level, during the same time period (i.e., the average noise exposure level for the given time period).The L_{90} is also a noise metric that can be used to describe existing ambient noise levels. Because community receptors are more sensitive to unwanted noise intrusion during the evening and at night, state law requires that, for planning purposes, an artificial dBA increment be added to "quiet time" noise levels to form a 24-hour noise descriptor called the day-night noise level (DNL). DNL adds a 10-dBA penalty during the night hours (10:00 p.m. to 7:00 a.m.). The maximum noise level (L_{max}) is the maximum instantaneous noise level measured during the measurement period of interest.

Health Effects of Environmental Noise

The World Health Organization (WHO) is perhaps the best source of current knowledge regarding the health effects of noise impacts because European nations have continued to study noise and its health effects, while the United States Environmental Protection Agency all but eliminated its noise investigation and control program in the 1970s.[5] According to WHO, sleep disturbance can occur when continuous indoor noise levels exceed 30 dBA or when intermittent interior noise levels reach 45 dBA, particularly if background noise is low. With a bedroom window slightly open (a reduction from outside to inside of 15 dB), the WHO criteria suggest that exterior continuous (ambient) nighttime noise levels should be 45 dBA or below, and short-term events should not generate noise in excess of 60 dBA. WHO also notes that maintaining noise levels within the recommended levels during the first part of the night is believed to be effective for the ability of people to initially fall asleep.[6]

Other potential health effects of noise identified by WHO include decreased performance for complex cognitive tasks, such as reading, attention span, problem solving, and memorization; physiological effects such as hypertension and heart disease (after many years of constant exposure, often by workers, to high noise levels); and hearing impairment (again, generally after long-term occupational exposure, although shorter-term exposure to very high noise levels, for

5 The *San Francisco General Plan* Land Use Compatibility Guidelines for Community Noise, presented below in Figure 5.3-2, were created during the same era.

6 World Health Organization, Guidelines for Community Noise, Geneva, 1999, http://www.who.int/docstore/peh/noise/guidelines2.html, accessed July 9, 2013. A copy of this document is available for public review at the San Francisco Planning Department, 1650 Mission Street, Suite 400, in Case File No. 2007.0903E.

example, exposure several times a year to concert noise at 100 dBA, can also damage hearing). Finally, noise can cause annoyance and can trigger emotional reactions like anger, depression, and anxiety. WHO reports that, during daytime hours, few people are seriously annoyed by activities with noise levels below 55 dBA or moderately annoyed with noise levels below 50 dBA.

Vehicle traffic and continuous sources of machinery and mechanical noise contribute to ambient noise levels. Short-term noise sources, such as truck backup beepers, the crashing of material being loaded or unloaded, car doors slamming, and engines revving outside a nightclub, contribute very little to 24-hour noise levels but are capable of causing sleep disturbance and severe annoyance. The importance of noise to receptors depends on both time and context. For example, long-term high noise levels from large traffic volumes can make conversation at a normal voice level difficult or impossible, while short-term peak noise levels, if they occur at night, can disturb sleep.

5.3.3.2 Existing Noise Environment

Long-term environmental noise in urbanized areas is primarily dependent on vehicle traffic volumes and the mix of vehicle types. The existing ambient noise environment within the project area is dominated by vehicular traffic on Third Street and 16th Street. The San Francisco Municipal Railway (Muni) operated light rail service along Third Street contributes to the local noise environment. Sporting events and occasional outdoor concerts at AT&T Park totaling more than 82 events per year generate vehicle traffic that is routed south along Third Street, Illinois Street (south of Mariposa Street), and Terry A. Francois Boulevard in the area, resulting in increased periods of traffic-related noise before and particularly after events. Additionally, the newly operational UCSF Hospital, southwest of the project site on Third Street operates a helipad to accept transfers of critically ill persons from community hospitals to UCSF for the medical care. Neither the Muni light rail nor the AT&T Park were in operation at the time of certification of the Mission Bay FSEIR in 1998, although both were discussed in the cumulative noise analysis.

The San Francisco Department of Public Health (DPH) has mapped transportation noise throughout the City and County of San Francisco, based on modeled baseline traffic volumes derived from the San Francisco County Transportation Authority travel demand model.[7] DPH maps indicate the areas subject to noise levels over 60 dBA (DNL) and the range of DNL noise levels that occur on every street in San Francisco. The portions of these maps that cover the project area indicate that areas nearest Third Street between Channel Street and 16th Street experience roadway noise levels in excess of 70 dBA (DNL), while noise levels along Terry A. Francois Boulevard and 16th Street are generally between 65 and 70 dBA (DNL).

Ambient Noise Measurements

Ambient long-term (24-hour) and short-term (15-minute) noise measurement data were collected in October of 2014 and April of 2015 in the project area to characterize noise conditions at locations in the project area; noise measurement locations are shown in **Figure 5.3-1**. To characterize ambient noise in the project area, short-term measurement data were collected at locations where residential and hospital land uses exist near the project site (Madrone Mission Bay residential towers on Mission Bay Boulevard North; and the new UCSF hospital southwest of the project site on Third Street), as described in **Table 5.3-2**. Long-term noise data were collected for the residential land use nearest the project site—the UCSF housing development (Hearst Tower)—located northwest of the project site on Third Street, and are presented in **Table 5.3-3**.

TABLE 5.3-2
SHORT-TERM AMBIENT NOISE LEVEL DATA IN THE PROJECT AREA

Measurement Location	Time	Noise Levels in dBA		
		Hourly L_{eq}	L_{90}	L_{max}
1. Madrone Mission Bay Residential Towers Nearby residential receptor 800 feet north of project site	3:10- 3:35 p.m.	70.1	59	88.9
2. UCSF Hospital 560 feet southwest of the Project site	8:56 – 9:11 a.m.	67.0	61	81.2

NOTE: See Figure 5.3-1 for noise measurement locations. L_{eq} represents the constant sound level; L_{max} is the maximum noise level. L90 is the background noise level. Time of day of short term monitoring reflect daytime hours during which construction activities could occur.

Figure 5.3-1
Noise Monitoring Locations

The long term measurements were collected over a two-day period reflecting conditions both with and without a San Francisco Giants baseball game occurring at AT&T Park. As indicated in Table 5.3-3, the occurrence of the SF Giants game did not meaningfully affect the noise levels averaged over the 15 daytime hours (7:00 a.m. to 10:00 p.m.) or the 9 nighttime hours (10 p.m. to 7:00 a.m.). Data indicate that the SF Giants game traffic predominantly affects the hour after the end of the game by increasing noise levels approximately 2.9 dBA, while noise levels for the hours prior to the game are not noticeably increased.

5.3.3.3 Vibration Background

Vibration is an oscillatory motion through a solid medium in which the motion's amplitude can be described in terms of displacement, velocity, or acceleration. Several different methods are used to quantify vibration. The peak particle velocity (PPV) is defined as the maximum instantaneous peak of the vibration signal. The PPV is most frequently used to describe physical vibration impacts on buildings. Typically, groundborne vibration generated by human activities attenuates rapidly with distance from the source of the vibration. Sensitive receptors to vibration include people (especially residents, the elderly, and sick people), structures (especially older masonry structures), and vibration-sensitive equipment.

Another useful vibration descriptor is known as vibration decibels or VdBs. VdBs are generally used when evaluating human response to vibration, as opposed to structural damage (for which PPV is the more commonly used descriptor). Vibration decibels are established relative to a reference quantity, typically 1×10^{-6} inches per second.[8]

Sources of vibration in the project area primarily consist of Muni streetcars traveling along Third Street. Most motor vehicles and trucks have independent suspension systems that substantially reduce if not eliminate vibration generation, barring discontinuities in the roadway.

5.3.3.4 Sensitive Receptors

Sensitive receptors for noise are generally considered to include hospitals, nursing homes, senior citizen centers, schools, churches, libraries, and residences. The sensitive receptors nearest to the project site are residential and hospital uses, as identified in **Table 5.3-4**. The nearest library to the project site is 1,300 feet away on Owens Street; the nearest church is 3,100 feet away, and the closest school (El-Hi) is 2,800 feet away. The future Mission Bay school site is 1,900 feet away.

5.3.4 Regulatory Framework

5.3.4.1 Federal Regulations

HUD Noise Abatement and Control

The U.S. Department of Housing and Urban Development (HUD) environmental noise regulations are set forth in 24 CFR, Part 51, Subpart B, Noise Abatement and Control. According to the regulations, "It is HUD's general policy to provide minimum national standards applicable to HUD programs to protect citizens against excessive noise in their communities and places of residence."[9] These regulations include criteria for assessing whether a HUD project is suitable for a particular site, given the background noise levels. HUD has defined the suitability of a site for new housing construction based on existing noise levels as follows:

- Acceptable—65 dB day-night average sound level (DNL) or less;
- Normally unacceptable—Exceeding 65 dB DNL but not exceeding 75 dB DNL; and
- Unacceptable—Exceeding 75 dB DNL.

The HUD regulations also include a goal (not a standard) that interior noise levels not exceed 45 dB DNL.[10] Sound attenuating features such as barriers or sound attenuating building materials shall be used to achieve the interior noise goal where feasible. Standard building construction generally provides 20 dB DNL of sound attenuation; therefore, if the exterior noise environment is classified as "acceptable," according to HUD standards, the interior noise environment should not exceed 45 dB DNL. The HUD regulations also encourage the use of quieter construction equipment and methods.[11]

9 HUD, Noise Abatement and Control, 24 CFR, Part 51, Subpart B.
10 24 CFR, Section 51.103(c)
11 24 CFR, Section 51.101(7)

Federal Aviation Administration

The Federal Aviation Administration (FAA) develops noise exposure maps that use average annual DNL noise contours around the airport as the primary noise descriptor. The FAA states that all land uses are considered compatible when aircraft noise effects are less than 65 decibels (dB) DNL. San Francisco International Airport is approximately seven miles south, and Oakland International Airport is approximately nine miles east, of the project site. The project site is outside the 55 dB CNEL noise contour of both airports.[12]

5.3.4.2 State Regulations

State regulations include requirements for the construction of new hotels, motels, apartment houses, and dwellings other than detached single-family dwellings that are intended to limit the extent of noise transmitted into habitable spaces. These requirements are collectively known as the California Noise Insulation Standards and are found in Title 24 of the California Code of Regulations.

The State of California updated its Building Code requirements with respect to sound transmission, effective January 2014. Section 1207 of the California Building Code (Title 24 of the California Code of Regulations) establishes material requirements in terms of sound transmission class (STC) [13] rating of 50 for all common interior walls and floor/ceiling assemblies between adjacent dwelling units or between dwelling units and adjacent public area. The previous code requirements (before 2014) set an interior performance standard of 45 dBA from exterior noise sources. This requirement will be re-instated in July of 2015.

5.3.4.3 Local Regulations

San Francisco General Plan

Land Use Compatibility Guidelines for Community Noise

The Environmental Protection Element of the *San Francisco General Plan* contains Land Use Compatibility Guidelines for Community Noise.[14] These guidelines, which are similar to but differ somewhat from state guidelines promulgated by the Governor's Office of Planning and Research, indicate maximum acceptable exterior noise levels for various newly developed land uses. The City's guidelines, which are presented in **Figure 5.3-2**, indicate exterior noise levels that might be inappropriate for sensitive land uses and would therefore require additional noise insulation considerations beyond standard practices. Though this figure presents a range of noise

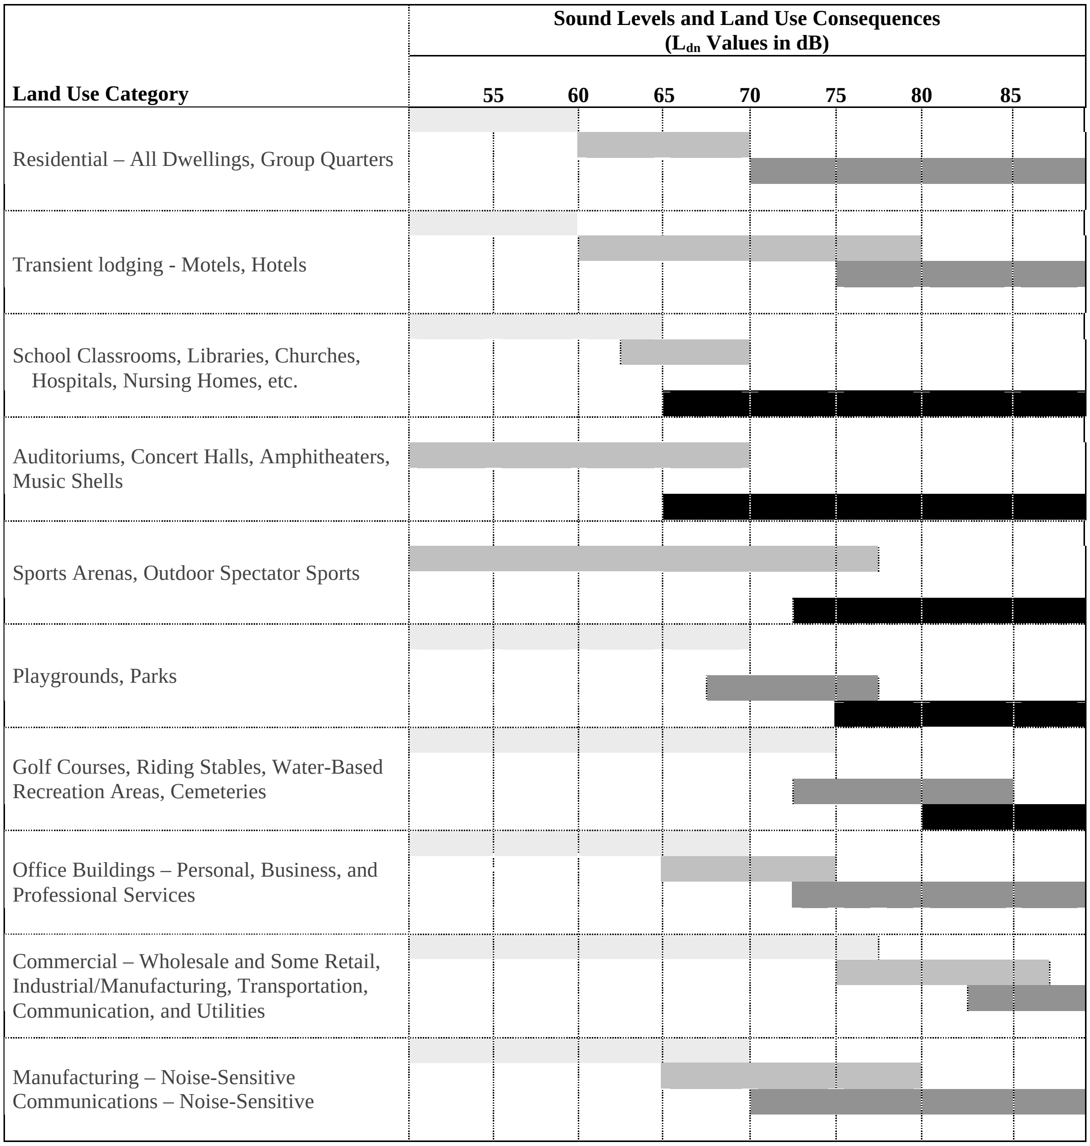
Internet website: http://www2.oaklandairport.com/noise/pdfs/2008_Annual_Noise_Contour_Map.pdf, accessed July 9, 2013, March 2009.

[13] The STC is used as a measure of a materials ability to reduce sound. The STC is equal to the number of decibels a sound is reduced as it passes through a material.

[14] City and County of San Francisco, *San Francisco General Plan*, adopted on June 27, 1996, http://www.sf-planning.org/ftp/General_Plan/index.htm, accessed July 9, 2013.



Satisfactory, with no special noise insulation requirements.

New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design.

New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.

New construction or development should generally not be undertaken.

SOURCE: San Francisco, 1996.
San Francisco General Plan,
adopted on June 27, 1996

OCII Case No. ER 2014-919-97; Planning Department Case No. 2014.1441E:
Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 5.3-2
San Francisco Land Use Compatibility Chart for Community Noise

levels that are considered compatible or incompatible with various land uses, the maximum "satisfactory" noise level is 60 dBA (DNL) for residential and hotel uses; 65 dBA (DNL) for school classrooms, libraries, churches, and hospitals; 70 dBA (DNL) for playgrounds, parks, office buildings, retail commercial uses, and noise-sensitive manufacturing/communications uses; and 77 dBA for other commercial uses such as wholesale, some retail, industrial/manufacturing, transportation, communications, and utilities. If these uses are proposed to be located in areas with noise levels that exceed these guidelines, a detailed analysis of noise reduction requirements will normally be necessary prior to final review and approval.

Noise-Related Policies

The following policies of the *San Francisco General Plan* Environmental Protection Element that relate to noise issues are relevant to the proposed project:

> ***Policy 10.1*:** Promote site planning, building orientation and design and interior layout that will lessen noise intrusion. Because sound levels drop as distance from the source increases, building setbacks can play an important role in reducing noise for the building occupants. Buildings sited with their narrower dimensions facing the noise source and sited to shield or be shielded by other buildings also help reduce noise intrusion. Although walls with no windows or small windows cut down on noise from exterior sources, in most cases it would not be feasible or desirable to eliminate wall openings. However, interior layout can achieve similar results by locating rooms whose use require more quiet, such as bedrooms, away from the street noise.

> ***Policy 10.2*:** Promote the incorporation of noise insulation materials in new construction. State-imposed noise insulation standards apply to all new residential structures except detached single-family dwellings. Protection against exterior noise and noise within a building is also important in many nonresidential structures. Builders should be encouraged to take into account prevailing noise levels and to include noise insulation materials as needed to provide adequate insulation.

> ***Policy 11.1*:** Discourage new uses in areas in which the noise level exceeds the noise compatibility guidelines for that use. New development should be examined to determine whether background and/or thoroughfare noise level of the site is consistent with the guidelines for the proposed use. If the noise levels for the development site….exceed the sound level guidelines established for that use, as shown in the accompanying land use compatibility chart, then either needed noise insulation features should be incorporated in the design or else the construction or development should not be undertaken.

> ***Policy 11.3*:** Locate new noise-generating development so that the noise impact is reduced. Developments which will bring appreciable traffic into or through noise-sensitive areas should be discouraged, if there are appropriate alternative locations where the noise impact would be less. For those activities—such as a hospital—that need a quiet environment, yet themselves generate considerable traffic, the proper location presents a dilemma. In those cases, the new development should locate where this traffic will not present a problem and, if necessary, incorporate the proper noise insulation.

San Francisco Noise Ordinance

In San Francisco, regulation of noise is stipulated in Article 29 of the Police Code (Regulation of Noise), which states that the City's policy is to prohibit unnecessary, excessive, and offensive noises from all sources subject to police power. Sections 2907 and 2908 of Article 29 regulate construction equipment and construction work at night, while Section 2909 provides for limits on stationary-source noise from machinery and equipment. Sections 2907 and 2908 are enforced by the Department of Building Inspection, and Section 2909 is enforced by the Department of Public Health. Summaries of these and other relevant sections are presented below.

Sections Regulating Construction Noise

Sections 2907(a) and (b) of the Police Code state that it shall be unlawful for any person, including the City and County of San Francisco, to operate any powered construction equipment, regardless of age or date of acquisition, if the operation of such equipment emits noise at a level in excess of 80 dBA when measured at a distance of 100 feet from such equipment, or an equivalent sound level at some other convenient distance. Exemptions from this requirement include:

- Impact tools and equipment with intake and exhaust mufflers recommended by the manufacturers and approved by the Director of Public Works as best accomplishing maximum noise attenuation; and

- Pavement breakers and jackhammers equipped with acoustically attenuating shields or shrouds recommended by the manufacturers and approved by the Director of Public Works as best accomplishing maximum noise attenuation.

Section 2908 prohibits any person, between the hours of 8:00 p.m. of any day and 7:00 a.m. of the following day, from erecting, constructing, demolishing, excavating for, altering, or repairing any building or structure if the noise level created is in excess of the ambient noise level by 5 dBA at the nearest property line unless a special permit has been applied for and granted by the Director of Public Works.

Sections Regulating Operational Noise

Section 2909 establishes a not-to-exceed noise standard for fixed sources of noise, such as building mechanical equipment and industrial or commercial processing machinery. Unlike the state building code (Title 24) standard, which is applicable to interior living space only, the standards in Section 2909(a), (b), and (c) are applicable outdoors, at the property line of the affected use, and vary based on the residential or commercial nature of the noise generator's use. For example, the noise limits for commercial and industrial properties (Section 2909(b)) provide that no person shall produce or allow to be produced a noise level more than 8 dBA above the local ambient level at the property plane. If the noise generated from commercial and industrial properties is generated from a licensed place of entertainment or other location subject to regulation by the Entertainment Commission, such use shall not produce or allow to be produced a noise level more than 8 dBC[15] above the local ambient level at the property plane in addition to the 8 dBA standard.

[15] C-weighted decibels include low-frequency sounds that are more common to amplified sound/concerts.

For noise generated by residential properties, the noise limits are 5 dBA above the ambient level at any point outside of the property plane of a residential use. The noise limits for public property provide that no person shall produce a noise level more than 10 dBA above the local ambient level at a distance of 25 feet or more on public property.

As is common for noise standards, the permitted noise level for fixed residential interior noise limits identified in Section 2909(d) is lower at night than during the day. For example, maximum noise levels at any sleeping or living room in any dwelling unit located on residential property must not exceed 45 dBA between 10:00 p.m. and 7:00 a.m., and 50 dBA between 7:00 a.m. and 10:00 p.m. None of the noise limits set forth in this section apply to activity for which the City and County of San Francisco has issued a permit that contains noise limit provisions that are different from those set forth in this article. Additionally, the Directors of Public Health, Public Works, or Building Inspection, or the Entertainment Commission, or the Chief of Police may grant variances to noise regulations, over which they have jurisdiction pursuant to Section 2916.

Article 1, Section 47.2 of the Police Code regulates the use of any sound amplifying equipment, whether truck-mounted or otherwise, within the City and County of San Francisco and consists of the following regulations:

1. The only sounds permitted are music or human speech.

2. Hours of operation permitted shall be between 9:00 a.m. and 10:00 p.m.; operation after 10:00 p.m. is permitted only at the location of a public event or affair of general public interest or as otherwise permitted by the Entertainment Commission.

3. Except as permitted by the Entertainment Commission, sound shall not be issued within 450 feet of hospitals, schools, churches, courthouses, public libraries, or mortuaries.

4. No sound truck with its amplifying device in operation shall traverse any one block in the City and County more than four times in any one calendar day.

5. Amplified human speech and music shall not be unreasonably loud, raucous, jarring, or disturbing to persons of normal sensitiveness within the area of audibility, nor louder than permitted in Subsections (6) and (7) hereof.

6. When the sound truck is in motion, the volume of sound shall be controlled so that it will not be audible for a distance in excess of 450 feet from its source; provided, however, that when the sound truck is stopped by traffic, the said sound amplifying equipment shall not be operated for longer than one minute at such a stop.

7. Except as permitted by the Entertainment Commission for public gatherings, in all cases where sound amplifying equipment remains at one location or when the sound truck is not in motion, the volume of sound shall be controlled so that it will not be audible for a distance in excess of 250 feet from the periphery of the attendant audience.

8. No sound amplifying equipment shall be operated unless the axis of the center of any sound reproducing equipment used shall be parallel to the direction of travel of the sound truck; provided, however, that any sound reproducing equipment may be so placed upon said sound truck as to not vary more than 15 degrees on either side of the axis of the center of the

> direction of travel and, provided further, that radial, nondirectional type of loudspeakers may be used on said sound trucks either alone or in conjunction with sound reproducing equipment placed within 15 degrees of the center line of the direction of travel.

San Francisco Entertainment Commission Permits

Section 90.1 of the San Francisco Administrative Code establishes the role of the San Francisco Entertainment Commission to regulate, promote and enhance the field of entertainment in San Francisco. The seven-member commission has powers to accept, review, and gather information to conduct hearings for entertainment-related permit applications and rule upon and issue, deny, condition, suspend, revoke or transfer entertainment-related permits in accordance with applicable laws and regulations. Additionally, the Entertainment Commission plans and coordinates the provision of City services for major events for which there is no recognized organizer, promoter, or sponsor.

The Entertainment Commission has permit authority over a variety of different permit types including Place of Entertainment permits, Outdoor Amplified Sound/Loudspeaker permits, and Limited Live Performance permits. Permit hearings require the applicant to provide proof of neighborhood outreach to the Commission. Such outreach must consist of at least two of four types of outreach: (1) presentation to a neighborhood, community or residential group; (2) presentation to the leadership of a local not-for-profit that deals with community support such as housing, at risk youth, health, or mental services; (3) a petition including an appropriate number of neighbor signatures according to the applicants business address; and/or (4) presentation to a business association if no community organization or not-for-profit exists near the venue.

The Commission also establishes Good Neighbor Policies for entertainment venues within the City. Applicable policies may include public notices urging patrons to leave the establishment and neighborhood in a quiet fashion, provision of employees at exit points, provision of adequate ventilation within venues, operation consistent with the requirements of San Francisco Municipal Code Sections 49 and 2900, and provision of a neighborhood liaison to address noise complaints.

Mission Bay Good Neighbor or Construction Noise Policy

The Mission Bay Good Neighbor Policy regarding construction noise is a standard policy of the Office of Community Investment and Infrastructure (OCII) that applies to all development within the Mission Bay Redevelopment Plan area. It specifies that:

> Pile driving or other extreme noise-generating activity (80 dBA at a distance of 100 feet) shall be limited to 8:00 a.m. to 5:00 p.m., Monday through Friday. No pile driving or other extreme noise-generating activity is permitted on Saturdays, Sundays, and holidays. Requests for pile driving on Saturdays may be considered on a case-by-case basis by the Office of Community Investment and Infrastructure (OCII) with approval at the sole discretion of the OCII Executive Director.

City holidays recognized under this policy include New Years Day, Dr. Martin Luther King Jr. Day, President's Day, Memorial Day, Independence Day, Labor Day, Columbus Day, Veterans Day, Thanksgiving Day, the day after Thanksgiving, and Christmas Day.

5.3.5 Impacts and Mitigation Measures

5.3.5.1 Significance Thresholds

For the impacts analyzed in this section, the project would have a significant impact related to noise and vibration if it were to:

- Result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;
- Result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels;
- Result in a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project;
- Result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project;

The complete list of CEQA significance criteria used in the noise analysis is included in the Initial Study (see Appendix NOP-IS, page 59), which also explains that criteria related to public airports are not applicable to the proposed project and why the proposed project would not be substantially affected by existing noise levels. No further analysis of these subjects is presented in this section. However, the potential impacts of noise from the operation of the private helipad at the UCSF hospital are addressed with regard to potential impacts on the project.

5.3.5.2 Approach to Analysis

Methodology for Analysis of Direct Impacts

Construction Impact Methodology – Noise

To assess potential short-term construction noise impacts, sensitive receptors and their relative exposure (considering structural barriers and distance) were identified. Combined intermittent noise levels from the simultaneous operation of onsite equipment expected to be used in project construction were estimated based on equipment noise data published by the Federal Highway Administration (FHWA), as shown in **Table 5.3-5**. The sources assessed were identified by the project sponsor as likely equipment to be used during project construction. The roadway noise construction model of the FHWA was then used to predict noise levels at the nearest receptors during both pile driving activity and non-impact construction activity.

Proposed construction activities would be required to comply with the San Francisco Noise Ordinance and the Mission Bay Good Neighbor Construction Noise Policy. The San Francisco Noise Ordinance prohibits construction activities between 8:00 p.m. and 7:00 a.m. and limits noise from any individual piece of construction equipment, except impact tools approved by the Department of Public Works, to 80 dBA at 100 feet. The Mission Bay Good Neighbor Construction Noise Policy limits pile driving or other extreme noise generating activity (80 dBA at a distance of

100 feet) to 8:00 a.m. to 5:00 p.m., Monday through Friday. As long as project construction activities comply with the noise ordinance, construction noise impacts from non-impact equipment would be considered less than significant. If construction activities using non-impact equipment would exceed these standards and the restrictions of the Mission Bay Good Neighbor Policy, then the noise effects would be potentially significant and mitigation measures would be required. The San Francisco Noise Ordinance does not identify any quantitative noise limit standard for impact equipment. To assess the potential impacts related to rapid impact compaction, this analysis employs the general construction noise assessment methodology and criteria suggested by the Federal Transit Administration (FTA).[16] This guidance identifies a 1-hour L_{eq} of 90 dBA for daytime and 80 dBA for nighttime construction noise exposure at residential uses. Commercial and industrial land use exposure to construction noise of 100 dBA is suggested as an assessment criterion.

In addition to the above criteria, to determine if the proposed project would result in a substantial temporary increase in noise levels in the project vicinity above levels existing without the project, persistent construction equipment noise related to an increase of 10 dBA over the existing noise

[16] U.S. Department of Transportation, Federal Transit Administration (FTA), Transit Noise and Vibration Impact Assessment, May 2006.

levels would represent a perceived doubling of loudness and is considered a substantial temporary increase in noise levels warranting implementation of construction noise control measures. Consistent with FTA and FHWA methodology, this increase in construction noise is assessed relative to an hourly L_{eq} and also accounts for equipment percentage uses as inventoried by FHWA.

Construction Impact Methodology –Vibration

Vibration impacts are considered significant if they would either result in levels substantial enough to result in damage to nearby structures or buildings, or result in vibration levels generally accepted as an annoyance to sensitive land uses. Groundborne noise occurs when vibrations transmitted through the ground result in secondary radiation of noise. Groundborne noise is generally associated with transit trains through tunnels and underground blasting activities, neither of which is proposed as part of this project, and therefore, this analysis is focused on groundborne vibration.

The local regulations of the affected jurisdictions in the project area do not address vibration or provide numerical thresholds for identifying groundborne vibration impacts. In the absence of local regulatory significance thresholds for vibration from construction equipment, this evaluation uses the Caltrans-identified peak particle velocity (PPV) thresholds for adverse human reaction and risk of architectural damage to buildings. For adverse human reaction, this analysis applies the "strongly perceptible" threshold of 0.1 inches per second (in/sec) PPV.[17] For building damage, the threshold depends on the architectural characteristics of the potentially affected structure (see **Table 5.3-6**).

TABLE 5.3-6
CALTRANS GUIDELINE VIBRATION DAMAGE POTENTIAL THRESHOLD CRITERIA

Structure Type and Condition	Transient Vibration Sources[a]	Continuous Frequent Intermittent Vibration Sources[b]
	Maximum Peak Particle Velocity (PPV), inches per second (in/sec)	
Extremely fragile historic buildings, ruins, ancient monuments	0.12	0.08
Fragile buildings	0.2	0.1
Historic and some old buildings	0.5	0.25
Older residential structures	0.5	0.3
New residential structures	1.0	0.5
Modern industrial/commercial buildings	2.0	0.5

NOTES:
[a] Transient sources create a single isolated vibration event, such as blasting or drop balls.
[b] Continuous/frequent intermittent sources include impact pile drivers, pogo-stick compactors, crack-and-seat equipment, vibratory pile drivers, and vibratory compaction equipment.

SOURCE: Caltrans, 2013.

[17] Caltrans, *Transportation and Construction Vibration Guidance Manual*, September 2013.

Operational Impact Methodology

Operational noise issues evaluated in this section include (1) noise generated by automobile and bus traffic that would occur during typical daily conditions with the project and during event conditions; and (2) compatibility of potential future uses with San Francisco Land Use Compatibility Guidelines for Community Noise. Traffic noise modeling was completed using the Federal Highway Administration Traffic Noise Model.

Traffic noise level significance is determined by comparing the increase in noise levels (traffic contribution only) to increments recognized by Caltrans as representing a perceptible increase in noise levels. Additionally, it is widely accepted methodology by both FTA[18] and the Federal Interagency Committee on Noise (FICON)[19] that thresholds should be more stringent for environments that are already noise impacted. Consequently, for noise environments where the ambient noise level is 65 dBA DNL or less, the significance threshold applied is an increase of 5 dBA or more, which Caltrans recognizes as a readily perceptible increase. In noise environments where the ambient noise level exceeds 65 dBA DNL, the significance threshold applied is an increase of 3 dBA or more, which Caltrans recognizes as a barely perceptible increase.[20]

Operational noise from non-transportation sources such as egress of patrons from events or sound amplification equipment in common areas are assessed based on noise increases of 8 dBA (for noise generated by commercial uses) over existing ambient (L_{90}) levels and any applicable restrictions of the City's noise ordinance and Police Code. Although these operational noise increases would be of limited duration, they would be expected to occur throughout the life of the project and are therefore considered permanent changes in noise conditions.

The proposed project would not introduce new operational vibration sources (e.g., impact equipment, streetcar and rail operations, and blasting activities), and therefore, there would be no operational vibration impacts, and operational vibration is not discussed further.

Methodology for Analysis of Cumulative Impacts

Cumulative Construction Impact Methodology

Cumulative construction noise impacts are assessed by review of the cumulative project list for proposed projects that could be constructed at the same time as the proposed project and are within close enough proximity (within 1,000 feet) to make a meaningful contribution to the construction noise impact of the proposed project. An approximation is made of the cumulative construction sound levels based on the Roadway Noise Construction Model and compared to FTA criteria for construction discussed above.

20 Caltrans, *Technical Noise Supplement to the Traffic Noise Analysis Protocol*, September 2013, p. 2-44.

Cumulative Operations Impact Methodology

Cumulative operational noise impacts are assessed by modeling cumulative plus project roadside noise levels and comparing the results with existing modeled roadside noise levels and to Caltrans perceptibility criteria discussed above.

5.3.5.3 Impact Evaluation

Project Impacts: Construction

Impact NO-1: Construction of the proposed project would not cause a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project. (Less than Significant)

Construction activities for the proposed project are expected to occur over a 26-month period between 2015 and 2017. Construction phases would include demolition, site preparation, excavation and soil stabilization, augering and casting of piles, placement of infrastructure, placement of foundations for structures, and fabrication of structures. Demolition and construction activities would require the use of heavy trucks, material loaders, cranes, concrete saws, and other mobile and stationary construction equipment listed in Table 5.3-5 above. Piles would be cast in place into augured holes and would not require use of an impact or vibratory pile driver.

Other Construction Activities. Soil stabilization of the project site would involve rapid impact compaction. Rapid impact compaction is a ground improvement technique that densifies shallow, loose granular soils, using a hydraulic hammer which repeatedly strikes an impact plate. The energy is transferred to the underlying loose granular soils and rearranges the particles into a denser configuration. The impact locations are typically located on a grid pattern, the spacing of which is determined by the subsurface conditions and foundation loading and geometry.

Other construction activities such as general building construction would be less noise intrusive, involving cranes, forklifts saws, and nail guns. Trucks would be used to off-haul demolition wastes, which would also marginally increase hourly noise levels on Third Street, Mariposa Street, and Caesar Chavez Street.

Effect on Sensitive Receptors. Construction noise would be similar in magnitude to existing L_{eq} noise levels along Third Street, which are elevated due to relatively high traffic volumes on Third Street, operations of the Muni light rail line, and ongoing construction in the area, but greater than existing L_{eq} noise levels along the waterfront. However, land uses along the waterfront are recreational and are not considered noise-sensitive land uses. Thus, temporary construction noise impacts would not cause substantial increase in noise levels at nearby sensitive receptors; this impact would be *less than significant*.

Demolition/Mass Excavation. Demolition and mass excavation activities at the project site would involve three excavators, three loaders, three scrapers, and two bulldozers as well as two street sweepers and trucks to off-haul material. Noise levels at surrounding sensitive receptors from simultaneous operation of this equipment were calculated using the Roadway Noise

Construction Model. **Table 5.3-7** presents the resultant noise levels at each of the receptors. As can be seen from the Table 5.3-7, the contribution of excavation noise at residential receptors and the hospital would be less than 10 dBA over existing levels.

TABLE 5.3-7
NOISE LEVELS FROM CONSTRUCTION ACTIVITIES AT SENSITIVE RECEPTORS IN THE PROJECT AREA

	Noise Levels in dBA (Hourly Leq)					
Location	**Existing Leq**	**Mass Excavation**	**Compaction**	**Pile Installation**	**Shoring**	**Building Construction**
1. Madrone Mission Bay Residential Towers Nearby residential receptor 800 feet north of project site	70.1	63.8	64.0	67.7	61.6	66.0
2. UCSF Mission Bay Housing (Hearst Tower) Nearby residential receptor 200 feet from the project site	71.2	75.9	75.7	79.8	73.6	78.0
3. UCSF Hospital Nearby receptor 560 feet from the project site	67.0	66.9	66.8	70.8	64.6	69.1

NOTE: See Figure 5.3-1 for noise measurement locations. L_{eq} represents the constant sound level

SOURCE*:* Environmental Science Associates, 2015.

Rapid Impact Compaction. Construction of the proposed project would involve use of rapid impact compaction to stabilize soils on the project site. Up to three tractors with compactor attached could operate at a given time over a 3-month period. Using an estimated noise level of 90 dBA,[21] a mounted impact hammer (which is also rated at 90 dBA) was used as a proxy in the Roadway Noise Construction Model to estimate noise levels from simultaneous operation of the compactors. As can be seen from the Table 5.3-7, the contribution of compaction noise at residential receptors and the hospital would be less than 10 dBA over existing levels. Actual noise levels would likely be up to 10 dBA less than indicated in the table, as compaction would occur within an excavation pit and surrounding earth walls would provide additional attenuation of compaction noise, particularly at the western site perimeter where excavation would be deepest. Predicted noise levels from impact compaction would also be less than 80 dBA at any residential receptor and less than 100 dBA at any commercial receptor, which are thresholds suggested by FTA guidance and applied here for impact equipment (since they are not subject to the noise limit restrictions of the San Francisco construction noise ordinance).

[21] Dietmar, et.al., *Rapid Impact Compactor – An Innovative Dynamic Compaction Device for Soil Improvement*, June 2007.

Pile Installation. Piles for the proposed project would not be driven with an impact hammer, but rather cast in place with drilled auger holes. Pile installation activities at the project site would involve four drill rigs, four crawler cranes, two forklifts, four excavators, and concrete saws. Noise levels at surrounding sensitive receptors from simultaneous operation of this equipment were calculated using the Roadway Noise Construction Model. As can be seen from Table 5.3-7, the contribution of pile installation noise at residential receptors and the hospital would be less than 10 dBA over existing levels.

Shoring. Shoring activities at the project site would involve two drill rigs, cranes, two grout mixing plants, and two excavators. Noise levels at surrounding sensitive receptors from simultaneous operation of this equipment were calculated using the Roadway Noise Construction Model. As can be seen from Table 5.3-7, the contribution of shoring activity noise at residential receptors and the hospital would be less than 10 dBA over existing levels.

Building Construction. Building construction at the project site would involve operation of two concrete pumps, two bobcats, four excavators, eight cranes, eight grandall lifts, and a variety of small tools and equipment (e.g., chop saws, nail guns, etc.). This would be the longest phase of construction, occurring over a 21-month period. As can be seen from Table 5.3-7, the noise contribution of building construction activities at residential receptors and the hospital would be less than 10 dBA over existing levels.

Cumulative Project Construction Noise. The construction schedule indicates that excavation, compaction, pile installation, and shoring activities could take place concurrently during two months of the construction schedule. This would represent the worst case scenario in terms of cumulative construction noise from the project.

However, it would be impossible for all four activities to occur simultaneously at the same location (e.g., the nearest distance to a given receptor) and therefore, the cumulative noise level would not be the acoustical sum of these noise levels. To account for the geographic distribution of these potential simultaneous activities, only the noisiest activity (pile installation, due to the number of pieces of equipment) was assumed to occur at the nearest distance to a given receptor. All other activities were assumed to occur at a farther distance of 200 feet from pile installation activities. This adjustment was only meaningful for receptors No. 2 and 3 which are the closest to the project site. Predicted cumulative project construction noise levels are presented in **Table 5.3-8**, which shows that noise levels from concurrent construction activities would not exceed 10-dBA over the noise level criterion for any receptor. Therefore, this impact would be *less than significant.*

Other Construction Activities. During peak excavation activities, up to 400 truck trips could be generated to and from the site per day. These truck trips would increase hourly noise levels on Third Street, Mariposa Street, and Caesar Chavez Street. Assuming a 10-hour work day, the addition of 40 heavy duty truck trips to the existing peak hour traffic would increase traffic noise contributions by 2.3 dBA along Third Street during peak excavation activities. This would be a *less than significant* contribution to roadway noise levels.

TABLE 5.3-8
CUMULATIVE WORST CASE NOISE LEVELS FROM CONSTRUCTION ACTIVITIES AT SENSITIVE RECEPTORS IN THE PROJECT AREA

SOURCE: Environmental Science Associates, 2015.

Summary of Impact NO-1

Construction activities at the project site over a 26-month period would result in temporary increases in noise levels in the project vicinity, which could be noticeable at nearby residential and hospital land uses. Peak cumulative construction activities would occur during a 3-month period in 2015–2016 and during this time, the increase in noise levels over existing conditions would be less than 10 dBA (without mitigation). All other periods of construction would similarly be under 10 dBA. Therefore, this impact would be *less than significant.* Nevertheless, human annoyance associated with the temporary increases in noise levels during construction could be reduced with implementation of **Improvement Measure I-NO-1**, compliance with the Mission Bay Good Neighborhood Construction Noise Policy.

Mitigation: Not required.

Improvement Measure I-NO-1: Mission Bay Good Neighbor Construction Noise Policy

The project sponsor shall comply with the Mission Bay Good Neighbor Policy and limit all extreme noise-generating construction activities to 8:00 a.m. to 5:00 p.m., Monday through Friday. No pile driving or other extreme noise generating activity is permitted on Saturdays, Sundays, and holidays.

Comparison of Impact NO-1 to Mission Bay FSEIR Impact Analysis

The Mission Bay FSEIR identified construction-related noise impact as less than significant with Mission Bay FSEIR Mitigation Measure G.1 to address noise from impact pile driving. Mission Bay FSEIR Mitigation Measure G.1 requires use of noise-reducing pile driving techniques and restricting the hours of operation. Because the proposed project would be installing piles using drilling and cast-in-place techniques, the project would be implementing Mission Bay FSEIR Mitigation Measure G.1 as part of the project, and as described above, construction noise impacts would be less than significant. Thus, Mission Bay FSEIR Mitigation Measure G.1 is neither warranted nor applicable to the proposed project.

Therefore, the project would result in no new or substantially more severe significant impacts related to construction noise than was previously identified in the Mission Bay FSEIR.

Impact NO-2: Construction of the proposed project would not expose people to or generate noise levels in excess of standards established in the local general plan, noise ordinance, or applicable standards of other agencies. (Less than Significant)

Proposed construction would be required to comply with the San Francisco Noise Ordinance, which prohibits construction activities between 8:00 p.m. and 7:00 a.m. and limits noise from any individual piece of construction equipment, except impact tools approved by the Department of Public Works, to 80 dBA at 100 feet. Table 5.3-5, above, presents the maximum noise levels generated by construction equipment identified by the project sponsor as likely to be used during construction. All non-impact equipment would be consistent with the San Francisco Noise Ordinance. Consequently, the project would not generate noise levels in excess of standards established in the local, noise ordinance, and this impact would be *less than significant*.

Mitigation: Not required.

Comparison of Impact NO-2 to Mission Bay FSEIR Impact Analysis

The construction-related noise impact with respect to consistency with the San Francisco Noise Ordinance was identified as less than significant in the Mission Bay FSEIR. Consequently, the project would result in no new or substantially more severe significant impacts related to consistency with established noise standards than was previously identified.

Impact NO-3: Construction of the proposed project would not expose people and structures to or generate excessive groundborne vibration levels. (Less than Significant)

Groundborne vibration from construction activities that involve impact activities, primarily rapid impact compaction, could produce detectable vibration at nearby sensitive buildings and sensitive receptors unless proper precaution is followed.

There are no adopted state or local policies or standards for groundborne vibration. Vibration intensity is expressed as peak particle velocity (PPV), the maximum speed at which the ground moves while it temporarily shakes. Since groundshaking speeds are very slow, PPV is measured in inches per second. The average person is quite sensitive to ground motion and levels as low as 0.02 inch per second can be detected by the human body when background noise and vibration levels are low and levels of 0.1 inches per second are considered "strongly perceptible." The Federal Transit Administration has published guidance relative to vibration impacts (see

Table 5.3-6, above). According to Caltrans, new structures can be exposed to groundborne vibration PPV levels of up to 0.5 inch per second without experiencing structural damage.[22]

Building Damage

Rapid impact compaction activities are proposed during the first two to three months of construction. The magnitude of vibration caused by rapid impact compaction is a function of distance from the receptor or structure of concern and the nature of surrounding soils. Groundborne vibration from activities that involve impact tools could produce significant vibration. A recent study of vibration induced by rapid impact compaction indicates that compliance with a safe level of vibration with respect to building damage can be achieved provided that the activity occur no closer than 10 meters (33 feet) from a structure.[23] The nearest structure north, across South Street, and to the south, across 16th Street would be located farther than 75 feet away, while the nearest structure to the west would be over 100 feet away. Consequently, proposed compaction activities would result in *less than significant* vibration impacts with respect to building damage.

Human Annoyance

Vibration levels can also result in interference or annoyance impacts at residences or other land uses where people sleep, such as hotels and hospitals. Vibration impact criteria published by Caltrans relative to these land uses are stated in terms of PPV, in inches per second. For adverse human reaction, this analysis applies the "strongly perceptible" threshold of 0.1 inches per second PPV.[24]

The closest residence would be the UCSF Mission Bay Housing (Hearst Tower), approximately 200 feet from the project site while the nearest hospital would be approximately 560 feet away. A recent study of vibration induced by rapid impact compaction indicated that at a distance of 30 meters (100 feet), cumulative vibration energy results in maximum vibration level of 2.3 millimeters per second (0.09 inches per second).[25] Because sensitive land uses would be more than 100 feet away, worst-case cumulative vibration levels generated by rapid impact compaction would be below the strongly perceptible threshold. Therefore, due to the distance of receptors from the project site, impacts from vibration with respect to human annoyance would be *less than significant*.

Vibration-Sensitive Equipment

Land uses with operations that could be considered to have high sensitivity to vibrations include vibration-sensitive research and manufacturing, hospitals with vibration-sensitive equipment, and university research operations. The degree of sensitivity to vibration depends on the specific

[22] Caltrans, *Transportation and Construction Vibration Guidance Manual*, September 2013.
[23] Lauzon, Marc et.al., *Ground Vibrations Induced by Dynamic compaction and Rapid Impact Compaction*; submittal to the 2011 CGS Geotechnical Conference, 2011.
[24] Caltrans, *Transportation and Construction Vibration Guidance Manual*, September 2013
[25] Lauzon, Marc et.al., *Ground Vibrations Induced by Dynamic compaction and Rapid Impact Compaction*; submittal to the 2011 CGS Geotechnical Conference, 2011.

equipment that would be affected by the vibration as well as on the design of the specific building in which the equipment is located. Equipment such as electron microscopes and high resolution lithographic equipment can be very sensitive to vibration, and even normal optical microscopes can sometimes be difficult to use when vibration is well below the human annoyance level. Existing medical or research uses adjacent to the project site that contain vibration-sensitive equipment could experience vibration levels during construction that exceed 0.008 inches per second (65 VdB) and potentially disturb the operation of sensitive medical equipment. As discussed in the 1998 FSEIR, construction vibration effects on sensitive equipment would be a concern for users of research buildings and could be an inconvenience. However, these users are not considered sensitive receptors, and therefore, construction vibration effects are not considered a significant environmental effect under CEQA. Nevertheless, human annoyance associated with the temporary increases in noise levels during construction could be reduced with implementation of **Improvement Measure I-NO-2**, Neighbor Notification of Vibration-Inducing Construction Operations.

Summary of Impact NO-3

Rapid impact compaction during construction at the project site would not result in excessive vibration levels that would result in structural damage or human annoyance at nearby structures or at residential or hospital receptors. All other construction activity would generate lesser vibration levels and project construction vibration-related impacts would be *less than significant*. However, implementation of Improvement Measure I-NO-3, Neighbor Notification of Vibration-Inducing Construction Operations, could reduce the temporary human annoyance associated with land uses involving vibration-sensitive equipment during construction.

Mitigation: Not required.

Improvement Measure I-NO-3: Neighbor Notification of Vibration-Inducing Construction Activities

At least one week prior to the start of rapid impact compaction activities, the project sponsor shall notify owners and occupants within 500 feet of the project site of the dates, hours, and expected duration of such activities.

Comparison of Impact NO-3 to Mission Bay FSEIR Impact Analysis

The construction-related vibration impact was identified as less than significant in the Mission Bay FSEIR as a result of modern building design and equipment installation techniques. Similarly, as described above, the proposed project would result in less than significant vibration impacts. Therefore, the project would result in no new or substantially more severe significant impacts related to vibration than was previously identified in the Mission Bay FSEIR.

Project Impacts: Operations

Impact NO-4: Operation of the proposed project could result in exposure of persons to or generation of noise levels in excess of standards established in the *San Francisco General Plan* or San Francisco Noise Ordinance. (Less than Significant with Mitigation)

Operation of the event center and mixed-use development would result in the introduction of new noise sources, both stationary and mobile, to the project area. Stationary noise sources would include the operation of five back-up diesel generators for maintenance purposes and mechanical equipment as well as the operation of public address systems and amplification equipment not only interior to the event center but also for occasional outdoor performances and events at the proposed Third Street plaza. Mobile noise sources would include increased traffic and crowd egress noise on local streets.

The San Francisco Noise Ordinance contains restrictions on noise from stationary sources, whereas noise from mobile sources is regulated at the state and federal level, generally through manufacturer specification requirements. The San Francisco Noise Ordinance does not address or establish restrictions on mobile sources. Therefore, the potential for adverse noise effects from stationary sources is addressed in this impact, which is specific to the standards of the *San Francisco General Plan* or San Francisco Noise Ordinance. The potential impact of mobile source operations generated by the project is addressed below under Impact NO-5 with respect to permanent increases in hourly traffic noise levels in the project vicinity and not in this impact.

This impact also addresses land use compatibility of the proposed office and retail land uses with respect to the noise standards of the *San Francisco General Plan.* The *San Francisco General Plan* establishes land use compatibility standards for land uses throughout the City for determining the compatibility of new land uses with an existing or future noise environment. Additionally, the nearby UCSF Hospital has recently constructed a helipad, the noise impacts of which are addressed as a cumulative impact under Impact C-NO-3, below.

Stationary Noise Sources – Generators and Mechanical Equipment

The project anticipates installing on-site generators capable of providing up to three megawatts (MW) of emergency, standby and optional power to the event center in the case of temporary loss of normal utility power.[26] In addition, each office and retail building would have an on-site generator capable of approximately 0.75 MW, and the proposed food hall would have a generator capable of approximately 0.5 MW, to provide fire and life safety emergency power in the case of temporary loss of normal utility power to those uses.

Section 2909 of the City's Police Code establishes a not-to-exceed noise standard for fixed sources of noise, such as building mechanical equipment and industrial or commercial processing machinery.

---

[26] Under such circumstance, the generators would provide power for fire alarms, fire command room, emergency lighting, elevators, smoke control and pressurization, fire pumps, audio system, and certain scoreboard equipment.

Unlike the state building code (Title 24) standard, which is applicable to interior living space only, the standards in Section 2909(a), (b), and (c) are applicable outdoors, at the property line of the affected use, and the standards vary based on the residential or commercial nature of the noise generator's use. The limits for noise generated by commercial and industrial properties such as the proposed project provide that no person shall produce or allow to be produced a noise level more than 8 dBA above the local ambient level at the property plane.

As is common for noise standards, the permitted noise level for fixed residential interior noise limits identified in Section 2909(d) is lower at night than during the day. For example, maximum noise levels at any sleeping or living room in any dwelling unit located on residential property must not exceed 45 dBA between 10:00 p.m. and 7:00 a.m., and 50 dBA between 7:00 a.m. and 10:00 p.m.

Under the proposed project, all emergency generators would be located within the parking structure on Lower Parking Level 1 and would be enclosed within dedicated rooms inside the lower level parking garage. Consequently, engine noise from generator testing is not expected to generate audible noise at receptors located outside of the event center and office structures. With the exception of emergency conditions during which these sources would be exempt from restrictions of the Noise Ordinance, all of these generators would be tested approximately once a week for less than one hour for maintenance purposes.

The majority of the mechanical equipment would be located on the rooftops of each office building tower. All mechanical equipment would be either fully screened or located within a fully enclosed penthouse room enclosure. At the lower levels for the office buildings, mechanical equipment would be located within fully enclosed equipment rooms. For the event center, all mechanical equipment would be located indoors within fully enclosed equipment rooms located on various levels of the building. The only mechanical equipment on the roof would be the cooling tower, which would be fully screened on all four sides. Consequently, all proposed mechanical equipment would be screened and located sufficiently distant from receptors to be operated within the restrictions of the noise ordinance.

Under the proposed project, the generators would be located in a subgrade parking garage at a distance of approximately 300 feet from the nearest existing residential land use and are not expected to increase ambient noise levels because of their protected, subgrade location. Thus, maintenance operations of the backup generators and other mechanical equipment would not result in noise levels in excess of standards established in the *San Francisco General Plan* or San Francisco Noise Ordinance, and the operational noise impacts from generators and other mechanical equipment would be *less than significant*.

Stationary Noise Source – Amplified Sound

For certain events, portions of the proposed outdoor plazas may be equipped with video screens and speakers, which would result in increased sound-level generation. This equipment could operate prior to and/or after some basketball games or events at the event center to generate excitement. In addition, as described in Chapter 3, Project Description, the proposed Third Street plaza would provide opportunities for public gatherings and events that may also involve amplified sound.

Promoters of any proposed outdoor events on the site's outdoor plaza that would use amplified sound or music would be required to obtain a permit from the City prior to the event. Section 1060.1 of the Police Code requires a permit to conduct, operate, or maintain a place of entertainment, limited live performance locale or one-time event within the City and County of San Francisco. Concerts on the plaza would require the promoter to obtain a Limited Live Performance Permit from the San Francisco Entertainment Commission, and this permit process would require a public hearing and include a neighborhood outreach requirement as discussed in the Setting section.

Article 1, Section 47.2 of the Police Code, while generally focused on truck-mounted amplification equipment, regulates the use of <u>any</u> sound amplifying equipment, whether truck-mounted or otherwise. Hours of operation are restricted to between 9:00 a.m. and 10:00 p.m., unless permitted by the San Francisco Entertainment Commission. As basketball games generally start at 7:30 p.m., operation of video screens and speakers on the plazas <u>prior</u> to basketball games would be consistent with these time restrictions of Article 1, Section 47.2. Operation of outdoor speakers on the plaza would require the applicant to obtain an Outdoor Amplified Sound/Loudspeaker Permit from the Entertainment Commission, and this permit process would require a public hearing as discussed in the Setting section. Notwithstanding this consistency with the Police Code, due to the as yet unknown nature of future outdoor events at the project site, the use of amplified sound equipment would still have the potential for *significant* noise impacts in excess of standards established in the San Francisco General Plan or San Francisco Noise Ordinance. Consequently, **Mitigation Measure M-NO-4a (Noise Control Plan for Outdoor Amplified Sound)** is identified to ensure that sound levels generated by amplified equipment would be consistent with Section 2909 of the City's Police Code, which establishes a not-to-exceed (except through a variance) noise standard for fixed sources of noise and from licensed place of entertainment or other location subject to regulation by the Entertainment Commission. For noise generated from a commercial property, the relevant noise limits are 8 dBA above the ambient L_{90} level at any point outside of the property plane of the commercial use. For a Place of Entertainment, the low-frequency dBC criterion would additionally apply, where no noise or music shall exceed the low frequency ambient criterion by more than 8 dBC.

The proposed event center would also host approximately 45 concerts a year, in addition to other events (see Chapter 3, Table 3-3), which would operate amplified sound equipment within the event center. The proposed arena would be considered a place of entertainment and the applicant would be required to obtain a Place of Entertainment permit from the Entertainment Commission, and this permit process would require a public hearing and include a neighborhood outreach requirement as discussed in the Setting section. The Entertainment Commission Good Neighbor Policy for nighttime entertainment activities requires permit holders to provide a cell phone point of contact to all interested neighbors that will be answered at all times by a manager or other responsible person who has the authority to adjust volume and respond to other complaints whenever entertainment is provided. Design of the proposed event center includes layers of doors and an intervening concourse, which would serve to minimize leakage of concert/event noise within the event center to the outside areas. Additionally, the proposed 160-foot office towers with 90-foot podium structure, and the proposed gatehouse building located on the west side of the site would provide a barrier between the event center and sensitive land uses to the northwest and southwest, which would further attenuate any potential leakage of interior concert/event noise. However, due to uncertainties as to the nature and extent of future events within the arena and lack of available details of interior acoustical treatments at the time of this planning-level CEQA review, implementation **of Mitigation Measure M-NO-4b (Noise Control Plan for Place of Entertainment Permit)** would ensure that noise levels from concerts, basketball games, and other events would comply with the noise ordinance, and this impact would be *less than significant with mitigation*.

Noise Exposure of Proposed Event Center and Office Uses

The project proposes development of office and retail land uses, which are generally not considered noise-sensitive uses. Noise monitoring in the project area indicates existing noise levels to be 75 DNL (day-night noise level) at the setback of Third Street (see Table 5.3-3 above). These levels represent the noise exposure levels which the proposed uses at the site would be subject to.

Policy 11.1 of the *San Francisco General Plan* identifies use of sound level guidelines established for a particular land use, as shown in the land use compatibility chart (see Figure 5.3-2, above). For sports event centers, an exterior sound level of 77 DNL or less is conditionally acceptable but that conventional construction with closed windows and fresh air supply systems will normally suffice. For office land uses such as those proposed under the project, the land use compatibility chart indicates that noise exposure of 75 DNL or less is conditionally acceptable but that conventional construction with closed windows and fresh air supply systems will normally suffice. Because both the event center and office and retail buildings would be constructed using modern materials and techniques which include ventilation systems and non-operable windows, these land uses would be consistent with the compatibility standards of the General Plan. Consequently, exposure to noise levels in excess of standards in the local general plan would be *less than significant*.

Summary of Impact NO-4, Operational Noise from Stationary Sources

Operation of the proposed project would introduce new stationary noise sources that would be subject to the requirements of the San Francisco Noise Ordinance. These new sources include generators and mechanical equipment, as well as the potential for amplified sound within the Third Street plaza. Due to the proposed enclosed and subgrade location for generators, enclosed location for majority of the event center mechanical equipment, and the rooftop locations and proposed mechanical screens for mechanical equipment for the office and retail buildings, predicted noise levels from proposed new stationary sources would not meaningfully contribute to the existing monitored ambient noise levels in the project area, and the project would therefore be consistent with the restrictions of the noise ordinance.

The proposed project would also introduce new land uses, and these new uses would be exposed to noise levels of up to 75 DNL. However, modern building techniques and materials as well as inclusion of non-operable windows and ventilation systems would be sufficient to ensure that the project would comply with land use compatibility requirements of the *San Francisco General Plan*, and this impact would be less than significant.

With respect to amplified sound, either interior to the event center or in open-air plazas on the project site, the predicted sound levels and hours of occurrence would be consistent with the noise ordinance. However, due to uncertainties as to the nature and extent of future outside events at the Third Street plaza, implementation **of Mitigation Measure M-NO-4a (Noise Control Plan for Outdoor Amplified Sound)** would ensure that noise levels from amplified sound exterior to the event center would comply with the noise ordinance. In addition, implementation of **Mitigation Measure M-NO-4b, Noise Control Plan for Place of Entertainment Permit,** would ensure that noise levels from concerts, basketball games, and other events would comply with the noise ordinance, regardless of current unknowns as to the nature of future events within the arena. Therefore, this impact would be *less than significant with mitigation*.

Mitigation Measure M-NO-4a: Noise Control Plan for Outdoor Amplified Sound

The project sponsor shall develop and implement a Noise Control Plan for operations at the proposed entertainment venues to reduce the potential for noise impacts from public address and/or amplified music. This Noise Control Plan shall contain the following elements:

- The project sponsor shall comply with noise controls and restrictions in applicable entertainment permit requirements for outdoor concerts.
- Speaker systems shall be directed away from the nearest sensitive receptors to the degree feasible.
- Outdoor speaker systems shall be operated consistent with the restrictions of Section 2909 of the San Francisco Police Code, and conform to a performance standard of 8 dBA and dBC over existing ambient L_{90} noise levels at the nearest residential use.

Mitigation Measure M-NO-4b: Noise Control Plan for Place of Entertainment Permit

As part of the Place of Entertainment Permit process, the project sponsor shall develop and implement a Noise Control Plan for operations at the proposed entertainment venue to reduce the potential for noise impacts from interior event noise. This Noise Control Plan shall, at a minimum, contain the following elements:

- The project sponsor shall comply with noise controls and restrictions in applicable entertainment permit requirements.
- The establishment shall provide adequate ventilation within the structures such that doors and/or windows are not left open for such purposes resulting in noise emission from the premises.
- There shall be no noise audible outside the establishment during the daytime or nighttime hours that violates the San Francisco Municipal Code Section 49 or 2900 et. seq. Further, absolutely no sound from the establishment shall be audible inside any surrounding residences or businesses that violates San Francisco Police Code section 2900.
- Permit holder shall take all reasonable measures to insure the sidewalks adjacent to the premises are not blocked or unnecessarily affected by patrons or employees due to the operations of the premises and shall provide security whenever patrons gather outdoors.

- Permit holder shall provide a cell phone number to all interested neighbors that will be answered at all times by a manager or other responsible person who has the authority to adjust volume and respond to other complaints whenever entertainment is provided.

Comparison of Impact NO-4 to Mission Bay FSEIR Impact Analysis

The operational noise impact with respect to noise from generators and mechanical equipment was not specifically addressed in the Mission Bay FSEIR. However, this project impact would be less than significant, so under the project, there would be no new or substantially more severe impacts from what were disclosed in the Mission Bay FSEIR.

The operational noise impact with respect to amplified sound was addressed in the Mission Bay FSEIR with respect to outdoor concert events at the AT&T ballpark. This impact was identified as less than significant with mitigation in the *San Francisco Giants Ballpark at China Basin Final EIR*, which included implementation of a plan limiting the frequency of events and establishing a 3 dBA increase over existing ambient noise levels as a performance standard. As described above, the proposed project impact would be similar, so there would be no new or substantially more severe impacts from what were disclosed in the Mission Bay FSEIR.

Impact NO-5: Operation of the proposed project would cause a substantial permanent increase in ambient noise levels in the project vicinity. (Significant and Unavoidable with Mitigation)

As described in Impact NO-4, above, this impact addresses the introduction of new mobile noise sources with respect to the potential for permanent, long-term increases in ambient noise levels in the project vicinity. Mobile noise sources include vehicular traffic noise and crowd noise.

Mobile Noise Source – Vehicular Traffic Noise with Transit Service Plan

Increased vehicular traffic associated with the proposed project would increase noise levels along existing roadways. Under the Muni Special Event Transit Service Plan included as part of the project, light rail service on the T Third line would be increased, and three special event shuttles would be implemented, including a 16th Street BART Shuttle, Van Ness Avenue Shuttle, and Transbay Terminal/Ferry Building Shuttle. Increases in noise from traffic on existing roadways are assessed by modeling existing and future roadway noise levels and comparing the resulting increase to standards published by FICON. For noise environments where the ambient noise level is 65 dBA DNL or less, the applicable significance threshold is an increase of 5 dBA or more, which Caltrans recognizes as a readily perceptible increase. In noise environments where the ambient noise level exceeds 65 dBA DNL, the applicable significance threshold is an increase of 3dBA or more, which Caltrans recognizes as a barely perceptible increase.

Increased traffic noise with the Muni Special Event Transit Service Plan was assessed for four separate scenarios, consistent with those analyzed in Section 5.2, Transportation and Circulation. First, roadside noise levels were modeled for existing conditions (year 2015 inclusive of traffic from foreseeable development that would be operational by the time of project completion) during the weekday peak hour (4 to 6 p.m.) and compared to conditions with the addition of proposed project traffic inclusive of a convention event at the arena. Second, roadside noise levels were modeled for existing conditions during the weekday "evening" hour (6 to 8 p.m.) and compared to conditions with the addition of pre-basketball game traffic. A third scenario assessed roadside noise levels with and without basketball game traffic during the weekday "late" hour (9 to 11 p.m.) reflecting the contributions of post basketball game traffic. Lastly, a scenario assessed roadside noise levels with and without basketball game traffic during the Saturday evening peak hour (7 to 9 p.m.).

Noise levels were determined for this analysis using the Federal Highway Administration (FHWA) Traffic Noise Prediction Model based on baseline and future traffic projections developed as part of the transportation analysis (see Section 5.2, Transportation and Circulation). Modeled weekday and weekend traffic noise level estimates for the six roadway segments are presented in **Table 5.3-9**. Noise levels in Table 5.3-9 represent conditions with and without the project for all four analyzed project scenarios.

As shown in Table 5.3-9, weekday traffic noise level increases would be less than significant for receptors along Third Street where noise levels would increase by less than 3 dBA for all scenarios analyzed. Roadside noise levels along 16th Street and Mariposa Street would increase by as much as 4.9 dBA. However, the existing traffic noise levels along these streets is below 65 dBA and therefore the applicable threshold would be 5 dBA, which would not be met or exceeded. Thus, the roadside noise impact along these two streets would be less than significant.

Roadside noise levels at multi-family receptors adjacent to Illinois Street and Terry Francois Boulevard would increase by more than 5 dBA under several scenarios. Specifically, during the "late night" (9 to 11 p.m.) scenario post-basketball game traffic would increase roadside noise levels along Illinois Street and Terry Francois Boulevard by 10.0 and 6.8 dBA, respectively. Finally, under the Saturday "evening" scenario, basketball game traffic would increase roadside noise levels along Illinois Street by 7.2 dBA. Consequently, roadside noise level increases at multi-family receptors adjacent to Illinois Street and Terry Francois Boulevard would be a significant noise impact. While this impact would occur only for a few hours per event, given that there would be up to 225 events per year, this impact is considered a *significant* permanent increase in noise levels.

Physical noise mitigation (i.e., installation of noise barriers) does not represent a feasible mitigation measure for these event-driven noise impacts. Section 5.2, Transportation and Circulation, of this EIR identifies transportation-related mitigation measures, which would likely not reduce potential noise impacts at most of these roadway segments, where traffic volumes would need to be reduced by half of the projected volumes for noise levels to be reduced below thresholds. Mitigation in terms of rerouting project traffic would have the potential to result in secondary traffic-related impacts or transfer of noise impacts from one roadway to another. Consequently, operational noise impacts during events with implementation of the Muni Special Event Transit Service Plan would be *significant and unavoidable*, with no feasible mitigation that would reduce roadside noise levels even with implementation of transportation mitigation measures identified under Impact TR-2 in Section 5.2, Transportation and Circulation.

TABLE 5.3-9
MODELED TRAFFIC NOISE LEVELS,
PROPOSED PROJECT WITH MUNI SPECIAL EVENT TRANSIT SERVICE PLAN [a]

Roadway Segment	Existing (2015)	Existing plus Convention	dBA Difference	Significant Increase?
Weekday Peak Hour Noise Levels (4 PM – 6 PM)				
Third Street between South Street and China Basin Street	69.1	69.8	0.7	No
Third Street between 16th Street and Mariposa Street[b]	69.9	69.9	<0.1	No
Illinois Street between Mariposa Street and 20th Street	60.3	64.2	3.9	No
Terry Francois Boulevard between South Street and China Basin Street	59.8	59.8	<0.1	No
16th Street between Third Street and I-280	66.4	67.5	1.1	No
Mariposa Street between Third Street and I-280	65.5	66.7	1.2	No
Roadway Segment	**Existing (2015)**	**Existing plus Basketball Game**	**dBA Difference**	**Significant Increase?**
Weekday Evening Noise Levels (6 PM – 8 PM)				
Third Street between South Street and China Basin Street	68.5	69.7	1.2	No
Third Street between 16th Street and Mariposa Street[b]	69.1	69.1	<0.1	No
Illinois Street between Mariposa Street and 20th Street	58.2	63.1	4.9	No
Terry Francois Boulevard between South Street and China Basin Street	57.5	57.9	0.4	No
16th Street between Third Street and I-280	65.6	67.0	1.4	No
Mariposa Street between Third Street and I-280	65.4	67.6	2.2	No
Roadway Segment	**Existing (2015)**	**Existing plus Basketball Game**	**dBA Difference**	**Significant Increase?**
Weekday Late Noise Levels (9 PM – 11 PM)				
Third Street between South Street and China Basin Street	63.4	62.5	-0.9[c]	No
Third Street between 16th Street and Mariposa Street[b]	63.7	63.7	<0.1	No
Illinois Street between Mariposa Street and 20th Street	52.1	62.2	**10.1**	**Yes**
Terry Francois Boulevard between South Street and China Basin Street	53.4	60.2	**6.8**	**Yes**
16th Street between Third Street and I-280	60.2	63.3	3.1	No
Mariposa Street between Third Street and I-280	59.7	64.4	4.7	No
Roadway Segment	**Existing (2015)**	**Existing plus Basketball Game**	**dBA Difference**	**Significant Increase?**
Saturday Evening Noise Levels (6 PM – 8 PM)				
Third Street between South Street and China Basin Street	64.7	67.1	2.4	No
Third Street between 16th Street and Mariposa Street[b]	65.1	65.2	0.1	No
Illinois Street between Mariposa Street and 20th Street	54.7	61.9	**7.2**	**Yes**
Terry Francois Boulevard between South Street and China Basin Street	54.0	54.9	0.9	No
16th Street between Third Street and I-280	61.4	64.0	2.6	No
Mariposa Street between Third Street and I-280	60.4	64.9	4.5	No

NOTES:

[a] Road center to receptor distance is assumed to be 50 feet for values shown in this table. Noise levels were determined using the Federal Highway Administration (FHWA) traffic noise model. The average speed on these segments is assumed to be 25, 30 or 35 miles per hour, depending on the roadway. For all other assumptions, refer to Appendix NO. In an existing ambient noise environment of 65 dBA or greater, an incremental increase is considered significant if the noise increase is equal to or greater than 3.0 dBA. In an existing ambient noise environment below 65 dBA, an incremental increase is considered significant if the noise increase is equal to or greater than 5.0 dBA.

[b] This portion of Third Street would not see meaningful increases in traffic volumes during events due to project access limitations and egress routing during events.

[c] Traffic routing during event egress would be conducted such that volumes on Third Street would be reduced compared to a non-event scenario.

SOURCE: ESA 2015

Mobile Noise Source – Vehicular Traffic Noise, Without the Muni Special Event Transit Service Plan

Under this project scenario, it is assumed that the proposed Muni Special Event Transit Service Plan is not implemented, thus resulting in higher vehicle trip generation (see Section 5.2, Transportation and Circulation, for discussion of the rationale for analyzing this scenario). Increased vehicular traffic associated with the proposed project would further increase noise levels along roadways used to access the project site beyond the levels identified above.

Modeled weekday and weekend traffic noise level estimates for the six roadway segments without the Muni Special Event Transit Service Plan are presented in **Table 5.3-10**. Noise levels in Table 5.3-10 represent conditions with and without the project for all four analyzed project scenarios.

As shown in Table 5.3-10, without the Muni Special Event Transit Service Plan weekday traffic noise level increases would be less than significant for receptors along 3rd Street where noise levels would increase by less than 3 dBA for all scenarios analyzed. Roadside noise levels along Mariposa Street would increase by more than 5 dBA during the weekday late and Saturday evening hours which would be a significant increase that would not occur under the with Muni Special Event Transit Service Plan scenario.

Roadside noise levels at multi-family receptors adjacent to Illinois Street and Terry Francois Boulevard would increase by more than 5 dBA under several scenarios. Specifically, under the weekday p.m. peak hour and evening hours, roadside noise levels along Illinois Street would increase by more than 5 dBA with the addition of convention event traffic, the latter of which would not occur under the with- Muni Special Event Transit Service Plan scenario. During the “late night” (9 to 11 p.m.) scenario, post-basketball game traffic would increase roadside noise levels along Illinois Street and Terry Francois Boulevard by 9.8 and 6.7 dBA, respectively. Finally, under the Saturday “evening” scenario, basketball game traffic would increase roadside noise levels along Illinois Street by 7.8 dBA. Consequently, roadside noise level increases at multi-family receptors adjacent to Illinois Street and Terry Francois Boulevard would be a significant noise impact.

Physical noise mitigation (i.e., installation of noise barriers) does not represent a feasible mitigation measure for these event-driven noise impacts. Mitigation in terms of rerouting project traffic would have the potential to result in secondary traffic-related impacts or transfer of noise impacts from one roadway to another. Consequently, operational noise impacts during events without implementation of the Muni Special Event Transit Service Plan would be significant, with no feasible mitigation that would reduce roadside noise levels even with implementation of transportation mitigation measures identified under Impact TR-2 in Section 5.2, Transportation and Circulation.

While this impact would occur only for a few hours per event, given that there would be up to 225 events per year, the increased traffic associated with project operations would result in a *significant and unavoidable* permanent increase in noise levels along certain local roadway under conditions either with or without implementation of the Muni Special Event Transit Service Plan.

TABLE 5.3-10
MODELED TRAFFIC NOISE LEVELS,
PROPOSED PROJECT WITHOUT MUNI SPECIAL EVENT TRANSIT SERVICE PLAN[a]

Roadway Segment	Existing (2015)	Existing plus Convention	dBA Difference	Significant Increase?
Weekday Peak Hour Noise Levels (4 PM – 6 PM)

Illinois Street between Mariposa Street and 20th Street	54.7	62.5	**7.8**	**Yes**
Terry Francois Boulevard between South Street and China Basin Street	54.0	55.0	1.0	No
16th Street between Third Street and I-280	61.4	64.4	3.0	No
Mariposa Street between Third Street and I-280	60.4	65.5	**5.1**	**Yes[b]**

NOTES:
[a] Road center to receptor distance is assumed to be 50 feet for values shown in this table. Noise levels were determined using the Federal Highway Administration (FHWA) traffic noise model. The average speed on these segments is assumed to be 25 or 30 miles per hour, depending on the roadway. For all other assumptions, refer to Appendix NO. In an existing ambient noise environment of 65 dBA or greater, an incremental increase is considered significant if the noise increase is equal to or greater than 3.0 dBA. In an existing ambient noise environment below 65 dBA, an incremental increase is considered significant if the noise increase is equal to or greater than 5.0 dBA.
[b] This is a significant impact under the no Muni Special Event Transit Service Plan scenario that would not occur under the with Muni Special Event Transit Service Plan scenario.
[c] Traffic routing during event egress would be conducted such that volumes on Third Street would be reduced compared to a non-event scenario.

SOURCE: ESA 2015

Mobile Noise Source – Crowd Noise

Noise generated by event patrons and retail customers could result in increased noise along surrounding streets, particularly during the evening and nighttime hours (depending on the event timing) and at the end of scheduled games/events when large numbers of people would be departing the event center and walking on local streets to access their transit connections or access their vehicles at local parking locations. The proposed arena would be considered a place of entertainment and the applicant would be required to obtain a Place of Entertainment permit from the San Francisco Entertainment Commission, and this permit process would require a public hearing and include a neighborhood outreach requirement as discussed in the Setting section. The Commission has established a good neighbor policy for entertainment venues within the City that includes eight policies that address noise generation (see Regulatory Framework, above).

A variety of transit options would be available to event patrons under the Muni Special Event Transit Service Plan. Section 5.2, Transportation and Circulation, indicates that during the late evening egress hours (9 to 11 p.m.) of a weekday basketball or concert event, over 4,500 people would take transit options and that over 3,000 people would be using the northbound Muni T-Line platform, which is approximately 70 feet from and facing the UCSF Hearst Tower housing building. Observations of current platform occupancy during these hours indicate that fewer than 10 persons are typically present on the platform at any one time. Consequently, the proposed project would result in a substantial increase in people gathering in the median of Third Street across from the UCSF Hearst Tower housing complex during the targeted 45-minute post-event egress period for approximately 45 basketball games per year and up to 60 additional full capacity concerts and other sporting events per year (see Table 3-3 of the Project Description). In addition to this, there could be smaller capacity family events or daytime conventions.

To estimate noise levels from departing crowds after an event, noise monitoring of crowd egress to the Muni T-Line platform after a San Francisco Giants baseball game at AT&T Park was conducted in April 2015. Short-term noise monitoring was located at a setback of approximately 70 feet from the 2nd and King Street (Ballpark) platform. Although the 320-foot-long Ballpark platform is longer than the existing 160-foot T-Line platform across from the project site, the proposed project would include extension of this platform from 160 to 320 feet (see Section 5.2, Transportation and Circulation); therefore this noise measurement would be representative of future project conditions. However, it should be noted that the measured data from the Ballpark platform also included vehicle traffic on King Street and crowd noise on the north side of the street; consequently, these noise measurements may overestimate the magnitude of the potential impact at the project site.

Monitored noise levels during the egress period when the game ended averaged 69 dBA, L_{90}, with an L_{max} of 90.2 dBA. These noise levels may be compared to the existing noise level that was monitored in 2014 during the 10:00 p.m. hour at the UCSF Housing (Hearst Tower) (with no game at AT&T Park), which was 55 dBA, L_{90} and L_{max} of 89.8 dBA. The L_{90} data indicates that existing noise levels at the UCSF Hearst Tower residential building during quieter periods would be substantially increased by crowds gathering to board northbound Muni service on event days.

Given that the residential units in this building are elevated up to 15 stories, shielding does not represent a feasible option to mitigating this crowd noise impact. Relocating the northbound platform away from Hearst Tower would also likely be an infeasible option due to resultant secondary impacts to Muni operations of the T-Line. Consequently, the noise impact resulting from the increase in noise levels from crowds gathering at the Muni T-Line platform during quieter nighttime periods would be *significant and unavoidable.* Under the scenario where the proposed Muni Special Event Transit Service Plan is not implemented, it is likely that greater numbers of patrons would seek access to the Muni T-Line platform resulting in exacerbation of this significant and unavoidable impact.

Nevertheless, it should be noted that these noise increases at the Muni platform would be of limited duration, with post game dispersion rate of about 45 minutes and would only occur on event nights. The project sponsor, as part of its site management practices, would implement the San Francisco Entertainment Commission's Good Neighbor Policy for nighttime entertainment activities, urging patrons to respect the quiet of the neighborhood as they leave the area and providing a phone number to all interested neighbors to respond to complaints. Furthermore, it is assumed that the Hearst Towers have been designed to Title 24 noise insulation standards to mitigate exterior noise levels to a 45 dBA interior performance standard, although this standard would likely not be met if the windows are open.

Other than Hearst Tower, the UCSF Hospital is located approximately 900 feet from the southbound Muni platform and would not be expected to experience a substantial noise increase from crowd egress. An additional UCSF housing building is proposed for Block 15, west of Fifth Street, but this location, while quieter is located over 1,000 feet away from the proposed arena and transit platform and would be shielded by intervening buildings, including the Sandler Neuroscience Building, Arthur and Toni Remberock Hall, and Hearst Tower.

Summary of Impact NO-5, Operational Noise from Mobile Sources

Noise levels generated by crowds prior to, during, and after events is expected to result in a substantial increase in noise levels at the receptor adjacent to the northbound Muni T-Line transit platform, particularly during nighttime egress hours of 9 p.m. to 11 p.m., and this impact would be *significant and unavoidable*.

Operation of the proposed project would introduce new mobile noise sources that would contribute to ambient noise levels in the project vicinity. Increases in roadway traffic noise would be *significant and unavoidable* during events either with or without implementation of the Muni Special Event Transit Service Plan, even with implementation of **Mitigation Measure M-TR-2c, Additional Strategies to Reduce Transportation Impacts** and **Mitigation Measure M-TR-11c, Additional Strategies to Reduce Transportation Impacts of Overlapping Events**, as described in Section 5.2, Transportation and Circulation. These measures identify additional transportation demand management strategies beyond those already incorporated in the proposed project that the project sponsor would pursue in collaboration with the City.

Mitigation Measure M-TR-2c: Additional Strategies to Reduce Transportation Impacts (see Section 5.2, Transportation and Circulation, Impact TR-2)

Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events (see Section 5.2, Transportation and Circulation, Impact TR-2)

Comparison of Impact NO-5 to Mission Bay FSEIR Impact Analysis

The Mission Bay FSEIR identified traffic noise increases as less than significant and no mitigation was required. The FSEIR also assessed crowd noise in combination with outdoor concert noise (cheering within the outdoor ballpark). Noise from patron egress was not assessed.

Consequently, the significant and unavoidable traffic and crowd noise impact identified in Impact NO-5 would be a *new significant and unavoidable* impact of the proposed project not previously identified in the Mission Bay FSEIR. This is a result not only of traffic generated by events at the proposed arena but also because of new sensitive receptors subsequently developed along Illinois Street and adjacent to Terry Francois Boulevard. In addition, neither the UCSF Hearst Tower housing building nor the Muni T-line platform were constructed at the time of the Mission Bay FSEIR impact analysis.

Cumulative Impacts

Impact C-NO-1: Construction activities of the proposed project combined with cumulative construction noise in the project area could cause a substantial temporary or periodic increase in ambient noise levels in the project vicinity during construction. (Less than Significant with Mitigation)

The geographic scope of analysis for cumulative noise and vibration construction impacts encompasses sensitive receptors within approximately 500 feet of the proposed project site. Beyond 500 feet, the contributions of noise from other projects would be greatly attenuated through both distance and intervening structures and their contribution would be expected to be minimal. Section 5.1, Impact Overview, presents the list of reasonably foreseeable future projects in the vicinity that could contribute to cumulative construction noise, which in particular would include the construction activities associated with implementation of the University of California, San Francisco (UCSF) Long Range Development Plan (LRDP) for the Mission Bay campus and other nearby Mission Bay development projects with construction schedules that could overlap with project construction. Some of the listed cumulative projects are sufficiently distant to not meaningfully contribute to construction noise impact.

Mission Bay Blocks 33/34 is identified as a variant in the 2014 UCSF LRDP and was analyzed as a pre-2020 project. Phase 1 of this 500,000 gsf office development is scheduled to start construction in 2016, which would occur simultaneously with construction of the proposed project. The UCSF LRDP EIR found that at the Mission Bay campus site, proposed construction activities between 2015 and 2019 include new construction at Block 15 housing, Block 33 research building, Block 33/34 parking garage, and the cancer outpatient building. These construction projects, which could occur concurrently, were identified as resulting in a significant cumulative impact on the noise environment in the site vicinity, largely as a result of pile driving activities. Construction of the proposed project would contribute to this already identified cumulative impact, either through compounding the extent and/or magnitude of construction noise in the project vicinity or through extending the duration of construction noise in the project vicinity. UCSF development located at Block 25B (across Third Street) is scheduled for construction in 2023. Additionally, the Cancer Outpatient Building is scheduled for construction starting 2018. Consequently, both of these cumulative projects would occur after completion of proposed project construction and would not combine with the proposed project in a cumulative construction noise impact.

The Uber/ARE project on Blocks 26/27 is estimated to start construction by the end of 2015, and construction could be concurrent with the proposed project. This project is immediately north of the project site, across South Street, and immediately across Third Street from the nearest sensitive receptor to the project site, the UCSF Mission Bay housing at Hearst Tower. Construction of the proposed project would contribute to cumulative construction noise from this adjacent project.

Additionally, as described in Chapter 3, Project Description, the realignment of Terry A. Francois Boulevard and development of Bayfront Park, both directly east of the project site are expected to be completed by the time the proposed project is in operation. Therefore, construction activities associated with the roadway realignment and park would likely overlap with construction of the proposed project, further contributing to cumulative construction noise. Thus, even though construction noise generated by the proposed project alone would not result in a significant noise impact, the proposed project's contribution to the cumulative noise impact from overlapping construction activities in the immediate project vicinity could be cumulatively considerable, and a potentially significant impact. However, implementation of **Mitigation Measure M-C-NO-1, Construction Noise Control Measures**, would reduce the project's contribution to cumulative construction noise impacts to a less-than-significant level. Given that this measure would implement construction-related noise control measures for a project that does not include impact pile-driving, which was the principal activity and focus of the significant and unavoidable finding of the UCSF LRDP EIR, the cumulative contribution of the proposed project's construction noise impact would be *less than significant with mitigation*.

Mitigation Measure M-C-NO-1: Construction Noise Control Measures.

Contractors shall employ site-specific noise attenuation measures during construction to reduce the generation of construction noise. These measures shall be included in a Noise Control Plan that shall be submitted for review and approval by the OCII or its designated representative to ensure that construction noise is reduced to the degree feasible. Measures specified in the Noise Control Plan and implemented during project construction shall include, at a minimum, the following noise control strategies:

- Equipment and trucks used for construction shall use the best available noise control techniques (e.g., improved mufflers, equipment redesign, use of intake silencers, ducts, engine enclosures, and acoustically attenuating shields or shrouds).

- Construction equipment with lower noise emission ratings shall be used whenever possible, particularly for air compressors.

- Sound-control devices no less effective than those provided by the manufacturer shall be provided on all construction equipment.

- Impact tools (e.g., jack hammers, pavement breakers, and rock drills) used for construction shall be hydraulically or electrically powered wherever possible to avoid noise associated with compressed air exhaust from pneumatically powered tools. Where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust shall be used; this muffler can lower noise levels from the exhaust by up to about 10 dBA. External jackets on the tools themselves shall be used where feasible; this could achieve a reduction of 5 dBA. Quieter procedures, such as use of drills rather than impact tools, shall be used where feasible.

- Stationary noise sources such as material stockpiles and vehicle staging areas shall be located as far from adjacent receptors as possible.

- Enclosures and mufflers for stationary equipment shall be provided, impact tools shall be shrouded or shielded, and barriers shall be installed around particularly noisy activities at the construction sites so that the line of sight between the construction activities and nearby sensitive receptor locations is blocked to the extent feasible.

- Unnecessary idling of internal combustion engines shall be prohibited.

- Construction-related vehicles and equipment shall be required to use designated truck routes to travel to and from the project sites as determined with consultation with the SFMTA as part of the permit process prior to construction (see **Improvement Measure I-TR-1**: **Construction Management Plan and Public Updates)**.

- The project sponsor shall designate a point of contact to respond to noise complaints. The point of contact must have the authority to modify construction noise-generating activities to ensure compliance with the measures above and with the San Francisco Noise Ordinance.

Comparison of Impact C-NO-1 to Mission Bay FSEIR Impact Analysis

The Mission Bay FSEIR did not contain an analysis of cumulative construction noise impacts *per se*, although as a program EIR, the Mission Bay FSEIR analyzed the construction noise impact of the Mission Bay Redevelopment Plan as a whole, covering development throughout an area over 300 acres in size, which is essentially a cumulative analysis. As described above in Impact NO-1, the FSEIR identified construction-related noise impacts as less than significant with mitigation to address noise from impact pile driving. Consequently, the cumulative construction noise analysis for the proposed project would have the same significance conclusions as identified in the Mission Bay FSEIR, and there would be no new or substantially more severe significant impact than previously identified.

Impact C-NO-2: Operation of the proposed project when considered with other cumulative development would cause a substantial permanent increase in ambient noise levels in the project vicinity. (Significant and Unavoidable with Mitigation)

Operational noise impacts of the proposed project would primarily result from increased traffic on the local roadway network. Cumulative plus project traffic data were used to estimate the cumulative operational noise increases shown in **Table 5.3-11**. Significant cumulative increases in ambient roadside noise levels are predicted to occur at three of the six road segments analyzed.

While cumulative noise levels are predicted to increase by 3 dBA or more along Third Street, as can be seen from Table 5.3-10, the project contribution to this increase is less than 1.5 dBA which would not be considered a cumulatively considerable contribution, based on FICON guidance for transportation noise which indicates that noise increases of 1.5 dBA warrant further analysis. Therefore, this cumulative increase along Third Street is not a cumulative noise increase of the proposed project.

However, a significant cumulative noise increase would occur along Illinois Street during Saturday basketball events. Additionally, cumulative noise levels along Mariposa Street during Saturday basketball events would increase by more than 5 dBA with the project contributing more than 1.5 dBA of this increase. This would result in a cumulatively considerable noise impact of the proposed project. Noise from crowds gathering at the Muni T-Line platform across from Hearst Tower following the end of events would also contribute to cumulative, long-term increases in noise levels.

Operation of the proposed project would contribute to ambient noise levels in the project vicinity. Cumulative increases in roadway traffic noise would be *significant and unavoidable* during events even with implementation of transportation mitigation measures identified in Section 5.2, Transportation and Circulation.

> **Mitigation Measure M-TR-2c: Additional Strategies to Reduce Transportation Impacts** (see Section 5.2, Transportation and Circulation, Impact TR-2)
>
> **Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events** (see Section 5.2, Transportation and Circulation, Impact TR-2)

Comparison of Impact C-NO-2 to Mission Bay FSEIR Impact Analysis

Traffic noise increases were identified in the Mission Bay FSEIR as less than significant and no mitigation was required. Consequently, the significant and unavoidable cumulative traffic noise impact identified in Impact C-NO-2 would be a new significant and unavoidable impact of the proposed project not previously identified in the 1998 FSEIR. This is a result not only of traffic generated by events at the proposed arena but also because of new sensitive receptors subsequently developed along Illinois Street and Mariposa Street.

TABLE 5.3-11
MODELED CUMULATIVE TRAFFIC NOISE LEVELS

Roadway Segment	Existing	Cumulative without Project	Cumulative plus Convention Event	Project Contribution	dBA Difference Over Existing	Significant Increase?
Weekday Peak Hour Noise Levels (4 PM – 6 PM)						
Third Street between South Street and China Basin Street	69.1	71.8	72.2	0.4	3.1	No[a]
Third Street between 16th Street and Mariposa Street	69.9	71.8	71.8	<0.1	1.9	No
Illinois Street between Mariposa Street and 20th Street	60.3	61.2	64.6	3.4	4.3	No
Terry Francois Boulevard between South Street and China Basin Street	59.8	61.9	61.9	<0.1	2.1	No
16th Street between Third Street and I-280	66.4	67.2	68.2	1.0	1.8	No
Mariposa Street between Third Street and I-280	65.5	67.1	68.0	0.9	2.5	No
Roadway Segment	**Existing**	**Cumulative without Project**	**Cumulative plus Basketball Event**	**Project Contribution**	**dBA Difference Over Existing**	**Significant Increase?**
Weekday Peak Hour Noise Levels (4 PM – 6 PM)						
Third Street between South Street and China Basin Street	69.1	71.8	72.1	0.3	3.0	No[a]
Third Street between 16th Street and Mariposa Street	69.9	71.8	71.9	0.1	2.0	No
Illinois Street between Mariposa Street and 20th Street	60.3	61.2	63.6	2.4	3.3	No
Terry Francois Boulevard between South Street and China Basin Street	59.8	61.9	62.0	0.1	2.2	No
16th Street between Third Street and I-280	66.4	67.2	67.9	0.7	1.5	No
Mariposa Street between Third Street and I-280	65.5	67.1	67.8	0.7	2.3	No
Roadway Segment	**Existing**	**Cumulative without Project**	**Cumulative plus Basketball Event**	**Project Contribution**	**dBA Difference Over Existing**	**Significant Increase?**
Saturday Evening Noise Levels (6 PM – 8 PM)						
Third Street between South Street and China Basin Street	64.7	67.5	68.9	1.4	4.2	No[a]
Third Street between 16th Street and Mariposa Street	65.1	67.3	67.5	0.2	2.4	No
Illinois Street between Mariposa Street and 20th Street	54.7	57.8	62.7	4.9	8.0	**Yes**
Terry Francois Boulevard between South Street and China Basin Street	54.0	58.2	58.5	0.3	4.5	No
16th Street between Third Street and I-280	61.4	62.4	64.6	0.2	3.2	No
Mariposa Street between Third Street and I-280	60.4	62.7	65.9	3.2	5.5	**Yes**

NOTES: Road center to receptor distance is assumed to be 50 feet for values shown in this table. Noise levels were determined using the Federal Highway Administration (FHWA) traffic noise model. The average speed on these segments is assumed to be 25, 30 or 35 miles per hour, depending on the roadway. For all other assumptions, refer to Appendix NO. The incremental increase is considered significant if the noise increase is equal to or greater than 3 dBA with an ambient noise environment greater than 65 dBA.

[a] Although a cumulative noise impact would occur along Third Street, because the projects would contribute less than 1.5 dBA to this increase, the projects contribution is not considered cumulatively considerable.

SOURCE: ESA 2015

Impact C-NO-3: Occupants of the proposed project would not be substantially affected by noise from future operations of the helipad at the adjacent UCSF Hospital. (Less than Significant)

Beginning in 2015, the UCSF Medical Center began operating a helipad that has occasional helicopter operations. Because helicopter overflights would be isolated occurrences, their single event instantaneous noise level would be of brief duration and would be greater than ambient noise levels noise contributions, with a maximum noise level of 85 dBA expected (based on a 95 dB single event noise exposure level[27]). The relative infrequency and acoustical nature of a helicopter overflight noise varies distinctly from traffic generation and other steady-state project noise sources such that the summing of the acoustical energy of ambient noise and helicopter operations is not a meaningful cumulative analysis. In other words, during the brief periods of helicopter overflight, helicopter noise will dominate over the ambient noise levels, rendering the cumulative contribution of other ambient sources insignificant. Therefore, future helicopter noise is assessed as an isolated event.

Noise modeling for helicopter operations at the UCSF Medical Center at Mission Bay was presented as part of the *Final EIR, UCSF Medical Center at Mission Bay*.[28] This modeling indicated that the 65 dB CNEL[29] noise contour during average day and busy-day helicopter operations extends to the east across Third Street, but does not include the project site. Because the event center, office and retail land uses proposed by the project are not considered noise sensitive land uses and because the 65 dB CNEL contour does not extend onto the project site, the cumulative noise impacts of operations of the UCSF Medical Center helipad would be *less than significant*.

Mitigation: Not required.

Comparison of Impact C-NO-3 to Mission Bay FSEIR Impact Analysis

An addendum to the Mission Bay FSEIR was prepared in 2008 that addressed the noise impacts of operations of the UCSF Medical Center helipad. This analysis only identified operational noise impacts to residential areas to the south and east of the hospital helipad and mitigation measures were identified to address these impacts. However, the residual noise impact, after mitigation, was determined to be significant and unavoidable for residential uses. The proposed project would not include residential or other noise sensitive land uses, so there would be no new or substantially more severe significant impacts from what were disclosed in the FSEIR and associated addenda.

[27] The single event noise exposure level, or SENEL is a noise metric that normalizes the sound energy of a single event such as an aircraft fly-over over the period when the sound level is within 10 dB of the Lmax. As stated on Page 19 of the cited report (UCSF, *UCSF Medical Center at Mission Bay—Residential Sound Reduction Program for Helicopter Operations, Final Supplemental Environmental Impact Report*, 2009), the SENEL is typically 10 dB higher than the Lmax for aircraft noise.,

[28] UCSF, *UCSF Medical Center at Mission Bay—Residential Sound Reduction Program for Helicopter Operations, Final Supplemental Environmental Impact Report*, 2009.

[29] CNEL is roughly equivalent to DNL, usually within 1 dBA

5.4 Air Quality

5.4.1 Introduction

This section discusses the existing air quality conditions in the project area, presents the regulatory framework for air quality management, and analyzes the potential for the proposed project to affect existing air quality conditions, both regionally and locally, due to activities that emit criteria and non-criteria air pollutants. It also analyzes the types and quantities of emissions that would be generated on a temporary basis due to proposed construction activities as well as those generated over the long term due to proposed operation of project elements. The analysis determines whether those emissions are significant in relation to applicable air quality standards and identifies feasible mitigation measures for significant adverse impacts. The section also includes an analysis of cumulative air quality impacts. The potential for odor impacts was addressed in the Initial Study (Appendix NOP-IS, page 60), which found that the proposed project would not result in new significant impacts or substantially increase the severity of impacts on air quality with respect to odors. Therefore, odor impacts are not addressed in this SEIR. Emissions of greenhouse gases resulting from the proposed project's potential impacts on climate change and the state's goals for greenhouse gas emissions pursuant to Assembly Bill 32 are presented and discussed in Section 5.5, Greenhouse Gas Emissions.

The analysis in this section is based on a review of existing air quality conditions in the region and air quality regulations administered by the United States Environmental Protection Agency (USEPA), the California Air Resources Board (CARB), and the Bay Area Air Quality Management District (BAAQMD). This analysis includes methodologies identified in the updated BAAQMD *CEQA Air Quality Guidelines* (May 2012).

5.4.2 Summary of Mission Bay FSEIR Section

5.4.2.1 Mission Bay FSEIR Setting

The air quality setting for the Mission Bay area discussed in the Mission Bay FSEIR differs from the existing setting today in terms of air quality conditions, the regulatory environment, and in the level of available information with respect to health risks and hazards. Specifically, at the time of the Mission Bay FSEIR, localized concentrations of criteria air pollutants were higher than what are monitored today as many of the regulatory improvements implemented since then have improved air quality conditions. As an example, the FSEIR reported that carbon monoxide standards were occasionally exceeded in San Francisco and that particulate emission standards were regularly exceeded in San Francisco. Since 1998, the effect of reformulated gasoline and other regulatory changes has resulted in no carbon monoxide violations in the past 15 years and a reduction in the number of violations of the particulate matter standard despite subsequent strengthening of the ambient particulate standards.

In 1998 when the Mission Bay FSEIR was certified, the BAAQMD had published CEQA Air Quality Guidelines, however, those guidelines differed substantially from the BAAQMD guidelines published in 2012 and used in this SEIR. For example, the earlier guidelines did not recommend quantification of construction-related emissions of criteria pollutants.

5.4.2.2 Mission Bay FSEIR Impacts and Mitigation Measures

Air quality impacts assessed in the Mission Bay FSEIR included Mission Bay Blocks 29-32 as a part of the over 300-acre area analyzed in the Redevelopment Plan. The Mission Bay FSEIR identified a significant and unavoidable impact from operational vehicle emissions, while criteria pollutant emissions from stationary sources were identified as less than significant due to new source review requirements. Mitigation Measure F.1 was identified to reduce vehicle trips associated with development, although the Mission Bay FSEIR acknowledged that reduction of vehicle emissions below thresholds was not reasonably attainable because projected emissions were so far above the thresholds. Mitigation Measure F.1 essentially implemented Mitigation Measures E.46 through E.50 of the Mission Bay FSEIR Transportation analysis:

- E.46: Establishment of Transportation Management Organizations—This measure has already been implemented. See Section 5.2, Transportation and Circulation.
- E.47: Transportation System Management Plan—These measures, as applicable to the proposed project, have been incorporated into the Mission Bay South Owner Participation Agreement, and thus are assumed to be part of the project. See Section 5.2, Transportation and Circulation
- E.48: Constrain parking at UCSF—This measure was not adopted.[1]
- E.49: Good faith efforts to assist in implementation of ferry service—This measure does not apply to the proposed project, as it is currently being implemented by the Water Emergency Transportation Authority.
- E.50: Telecommuting/flexible hours—This measure was incorporated into Measure E.47.

The impact analysis also included modeling of carbon monoxide (CO) concentrations for 13 intersections in the project area. While modeling indicated that several of these intersections would potentially experience CO concentrations in excess of state and federal standards under existing plus project conditions, modeling under future year (2015) plus project conditions indicated that these violations would not be realized in the future due to planned improvements in the vehicle fleet and reformulated gasoline.

The Plan-level impact analysis conducted in the Mission Bay FSEIR assessed the consistency of population increases from development under the entire proposed plan with the growth assumptions of the applicable Clean Air Plan at the time, the *'97 Clean Air Plan*. This analysis

[1] Mission Bay FSEIR Mitigation Measure E.48 was not adopted by the San Francisco Board of Supervisors. See CEQA Findings, October 14, 1998. San Francisco Board of Supervisors Resolution No. 854-98, regarding adopting environmental findings (and a statement of overriding considerations) pursuant to the California Environmental Quality Act and State guidelines in connection with adoption of the Mission Bay North and Mission Bay South Redevelopment Plans and various other actions necessary to implement such plans.

identified a significant Plan-level air quality impact as population growth under the Plan would have exceeded that of the *'97 Clean Air Plan*.

The Mission Bay FSEIR also identified air pollutant emissions from construction and demolition activities as a less-than-significant air quality impact with implementation of Mitigation Measure F.2, which requires a menu of 14 particulate emission control measures.

Operational health risk impacts were identified as potentially significant in the Mission Bay FSEIR and mitigation was identified, but because of lack of a specific development proposal, this impact was identified as significant and unavoidable with mitigation.

The Mission Bay FSEIR mitigation measures for impacts due to emissions of toxic air contaminants (TAC) during project operations include the following:

- F.3: Require applicant to demonstrate receipt of BAAQMD permit for stationary TAC sources.
- F.4: Establish meteorological station in Mission Bay.
- F.5: Reduce exposure to dry cleaning facilities in the area that use perchloroethylene[2] and other toxic contaminants.
- F.6: Creation of buffer zones for pre-school and child care centers from TAC sources.

5.4.3 Setting

5.4.3.1 Climate and Meteorology

The project area is located within the San Francisco Bay Area Air Basin (SFBAAB). The air basin's moderate climate steers storm tracks away from the region for much of the year, although storms generally affect the region from November through April. San Francisco's proximity to the onshore breezes stimulated by the Pacific Ocean provide for generally very good air quality in the project area.

Temperatures in the project area average in the mid-50s annually, generally ranging from the low 40s on winter mornings to mid-70s during summer afternoons. Daily and seasonal oscillations of temperature are small because of the moderating effects of the nearby San Francisco Bay. In contrast to the steady temperature regime, rainfall is highly variable and confined almost exclusively to the "rainy" period from November through April. Precipitation may vary widely from year to year as a shift in the annual storm track of a few hundred miles can mean the difference between a very wet year and drought conditions.

Atmospheric conditions such as wind speed, wind direction, and air temperature gradients interact with the physical features of the landscape to determine the movement and dispersal of air

[2] In 2006, USEPA updated its air toxics rule for dry cleaners that requires operators to control percloroethylene (perc) emissions at individual dry cleaners. The rule includes a phase-out of perc use at dry cleaners located in residential buildings by December 21, 2022, along with requirements that already have reduced perc emissions at other dry cleaners.

pollutants regionally. The project area lies within the Peninsula climatological subregion. Marine air traveling through the Golden Gate is a dominant weather factor affecting dispersal of air pollutants within the region. Wind measurements collected on the San Francisco mainland indicate a prevailing wind direction from the west and an average annual wind speed of 10.3 miles per hour.[3] Increased temperatures create the conditions in which ozone formation can increase.

5.4.3.2 Ambient Air Quality – Criteria Air Pollutants

As required by the 1970 federal Clean Air Act, the USEPA initially identified six criteria air pollutants that are pervasive in urban environments and for which state and federal health-based ambient air quality standards have been established. USEPA calls these pollutants "criteria air pollutants" because the agency has regulated them by developing specific public-health-based and welfare-based criteria as the basis for setting permissible levels. Ozone, carbon monoxide (CO), particulate matter (PM), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), and lead are the six criteria air pollutants originally identified by USEPA. Since that time, subsets of particulate matter have been identified for which permissible levels have been established. These include particulate matter of 10 microns in diameter or less (PM_{10}) and particulate matter of 2.5 microns in diameter or less ($PM_{2.5}$).

The BAAQMD is the regional agency with jurisdiction for regulating air quality within the nine county SFBAAB. The region's air quality monitoring network provides information on ambient concentrations of criteria air pollutants at various locations in the San Francisco Bay Area. **Table 5.4-1** presents a five-year summary for the period 2010 to 2014 of the highest annual criteria air pollutant concentrations, collected at the air quality monitoring station operated and maintained by the BAAQMD at 16th and Arkansas Streets (Potrero Hill), approximately one half mile west of the project site. Table 5.4-1 also compares measured pollutant concentrations with the most stringent applicable ambient air quality standards (state or federal). Concentrations shown in bold indicate an exceedance of the standard.

Ozone

Ozone is a secondary air pollutant produced in the atmosphere through a complex series of photochemical reactions involving reactive organic gases (ROG, also sometimes referred to as volatile organic compounds or VOC by some regulating agencies) and nitrogen oxides (NOx). The main sources of ROG and NOx, often referred to as ozone precursors, are combustion processes (including motor vehicle engines) and the evaporation of solvents, paints, and fuels. In the Bay Area, automobiles are the single largest source of ozone precursors. Ozone is referred to as a regional air pollutant because its precursors are transported and diffused by wind concurrently with ozone production through the photochemical reaction process. Ozone causes eye irritation, airway constriction, and shortness of breath and can aggravate existing respiratory diseases, such as asthma, bronchitis, and emphysema.

TABLE 5.4-1
SUMMARY OF SAN FRANCISCO AIR QUALITY MONITORING DATA (2010–2014)

Pollutant	Most Stringent Applicable Standard	Number of Days Standards Were Exceeded and Maximum Concentrations Measured[a]				
		2010	2011	2012	2013	2014
Ozone						
- Days 1-Hour Standard Exceeded		0	0	0	0	0
- Maximum 1-Hour Concentration (pphm)	>9 pphm[b]	8	7	7	7	8
- Days 8-Hour Standard Exceeded		0	0	0	0	0
- Maximum 8-Hour Concentration (pphm)	>7 pphm[c]	5	5	5	6	7
Carbon Monoxide (CO)						
- Days 1-Hour Standard Exceeded		0	0	0	0	0
- Maximum 1-Hour Concentration (ppm)	>20 ppm[b]	1.8	1.8	2.0	1.8	1.8
- Days 8-Hour Standard Exceeded		0	0	0	0	0
- Maximum 8-Hour Concentration (ppm)	>9 ppm[b]	1.4	1.2	1.2	1.4	1.0
Suspended Particulates (PM_{10})						
- Days 24-Hour Standard Exceeded[d]		0	0	1	0	0
- Maximum 24-Hour Concentration (μg/m^3)	>50 μg/m^3 [b]	40	46	**51**	44	36
Suspended Particulates ($PM_{2.5}$)						
- Days 24-Hour Standard Exceeded[d]		1	3	2	1	2
- Maximum 24-Hour Concentration (μg/m^3)	>35 μg/m^3 [e]	**36**	**45**	**47**	**36**	**49**
- Annual Average (μg/m^3)	>12 μg/m^3 [b, c]	9.7	10.5	9.5	8.2	10.1
Nitrogen Dioxide (NO_2)						
- Days 1-Hour Standard Exceeded		0	0	1	0	0
- Maximum 1-Hour Concentration (pphm)	>10 pphm[c]	9	9	**12**	7	8

NOTES:
Bold values are in excess of applicable standard.
ppm = parts per million; pphm = parts per hundred million
μg/m^3 = micrograms per cubic meter
ND = No data or insufficient data.

[a] Number of days exceeded is for all days in a given year, except for particulate matter. PM_{10} and $PM_{2.5}$ are monitored every six days and therefore the number of days exceeded is out of approximately 60 annual samples.
[b] State standard, not to be exceeded.
[c] Federal standard, not to be exceeded.
[d] Based on a sampling schedule of one out of every six days, for a total of approximately 60 samples per year.
[e] Federal standard was reduced from 65 μg/m^3 to 35 μg/m^3 in 2006.

SOURCE: BAAQMD, Bay Area Air Pollution Summary, 209 – 2014. Available online at: http://www.baaqmd.gov/Divisions/Communications-and-Outreach/Air-Quality-in-the-Bay-Area/Air-Quality-Summaries.aspx. Accessed April 21, 2015.

Table 5.4-1 shows that, according to published data, the most stringent applicable standards for ozone (state 1-hour standard of 9 parts per hundred million [pphm] and the federal 8-hour standard of 8 pphm) were not exceeded in San Francisco between 2010 and 2014.

Carbon Monoxide (CO)

CO is an odorless, colorless gas usually formed as the result of the incomplete combustion of fuels. The single largest source of CO is motor vehicles; the highest emissions occur during low travel speeds, stop-and-go driving, cold starts, and hard acceleration. Exposure to high concentrations of

CO reduces the oxygen-carrying capacity of the blood and can cause headaches, nausea, dizziness, and fatigue; impair central nervous system function; and induce angina (chest pain) in persons with serious heart disease. Very high levels of CO can be fatal. As shown in Table 5.4-1, the more stringent state CO standards were not exceeded between 2010 and 2014. Measurements of CO indicate hourly maximums ranging between 9 to 10 percent of the more stringent state standard, and maximum 8-hour CO levels that are approximately 11 to 16 percent of the allowable 8-hour standard.

Particulate Matter (PM_{10} and $PM_{2.5}$)

Particulate matter is a class of air pollutants that consists of heterogeneous solid and liquid airborne particles from man-made and natural sources. Particulate matter is measured in two size ranges: PM_{10} for particles less than 10 microns in diameter, and $PM_{2.5}$ for particles less than 2.5 microns in diameter. In the Bay Area, motor vehicles generate about one-half of the air basin's particulates, through tailpipe emissions as well as brake pad and tire wear. Wood burning in fireplaces and stoves, industrial facilities, and ground-disturbing activities such as construction are other sources of such fine particulates. These fine particulates are small enough to be inhaled into the deepest parts of the human lung and can cause adverse health effects. According to the CARB, studies in the United States and elsewhere "have demonstrated a strong link between elevated particulate levels and premature deaths, hospital admissions, emergency room visits, and asthma attacks," and studies of children's health in California have demonstrated that particle pollution "may significantly reduce lung function growth in children." The CARB also reports that statewide attainment of particulate matter standards could prevent thousands of premature deaths, lower hospital admissions for cardiovascular and respiratory disease and asthma-related emergency room visits, and avoid hundreds of thousands of episodes of respiratory illness in California.[4] Among the criteria pollutants that are regulated, particulates appear to represent a serious ongoing health hazard. As long ago as 1999, the BAAQMD was reporting, in its *CEQA Air Quality Guidelines*, that studies had shown that elevated particulate levels contribute to the death of approximately 200 to 500 people per year in the Bay Area. High levels of particulate matter can exacerbate chronic respiratory ailments, such as bronchitis and asthma, and have been associated with increased emergency room visits and hospital admissions.

Table 5.4-1 shows that an exceedance of the state PM_{10} standard occurred on one monitored occasion between 2010 and 2014 in San Francisco. It is estimated that the state 24-hour PM_{10} standard of 50 micrograms per cubic meter ($\mu g/m^3$) was exceeded on up to 6 days per year between 2010 and 2014.[5] It is estimated that the state 24-hour $PM_{2.5}$ standard was exceeded on up to 48 days per year between 2010 and 2014.[4] The federal state annual average standard was not exceeded between 2010 and 2014.

4 California Air Resources, Board, "Recent Research Findings: Health Effects of Particulate Matter and Ozone Air Pollution," November 2007. A copy of this document is available for public review at the San Francisco Planning Department, 1650 Mission Street, Suite 400, in Case File No. 2014.1441E

5 PM_{10} and $PM_{2.5}$ are sampled every sixth day; therefore, actual days over the standard can be estimated to be six times the numbers listed in the table.

$PM_{2.5}$ is of particular concern because epidemiologic studies have demonstrated that people who live near freeways and high-traffic roadways have poorer health outcomes, including increased asthma symptoms and respiratory infections and decreased pulmonary function and lung development in children.[6]

Nitrogen Dioxide (NO_2)

NO_2 is a reddish brown gas that is a byproduct of combustion processes. Automobiles and industrial operations are the main sources of NO_2. Aside from its contribution to ozone formation, NO_2 can increase the risk of acute and chronic respiratory disease and reduce visibility. NO_2 may be visible as a coloring component on high pollution days, especially in conjunction with high ozone levels. Table 5.4.1 shows that the current state standard for NO_2 is being met in San Francisco. In 2010, the USEPA implemented a new 1-hour NO_2 standard presented in **Table 5.4-2**. Currently, the CARB is recommending that the Bay Area air basin be designated as an attainment area for the new standard.[7] This new federal standard was exceeded on one day at the San Francisco station between 2010 and 2014.

The USEPA has also established requirements for a new monitoring network to measure NO_2 concentrations near major roadways in urban areas with a population of 500,000 or more. Sixteen new near-roadway monitoring sites are required in California, three of which will be in the Bay Area. These monitors are planned for Berkeley, Oakland, and San Jose. The Oakland station commenced operation in February 2014 and the San Jose station commenced in March of 2015 while the Berkeley station is expected to be operational in summer 2015. The new monitoring data may result in a need to change area designations in the future. The CARB will revise the area designation recommendations, as appropriate, once the new monitoring data become available.

Sulfur Dioxide (SO_2)

SO_2 is a colorless acidic gas with a strong odor. It is produced by the combustion of sulfur-containing fuels such as oil, coal, and diesel. SO_2 has the potential to damage materials and can cause health effects at high concentrations. It can irritate lung tissue and increase the risk of acute and chronic respiratory disease.,[8] Pollutant trends suggest that the air basin currently meets and will continue to meet the state standard for SO_2 for the foreseeable future.

TABLE 5.4-2
STATE AND FEDERAL AMBIENT AIR QUALITY STANDARDS AND ATTAINMENT STATUS

Pollutant	Averaging Time	State (SAAQs[a]) Standard	State (SAAQs[a]) Attainment Status	Federal (NAAQS[b]) Standard	Federal (NAAQS[b]) Attainment Status
Ozone	1 hour	0.09 ppm	**N**	NA	See Note c
	8 hour	0.07 ppm	**N**[d]	0.075 ppm	**N**/Marginal
Carbon Monoxide (CO)	1 hour	20 ppm	A	35 ppm	A
	8 hour	9 ppm	A	9 ppm	A
Nitrogen Dioxide (NO_2)	1 hour	0.18 ppm	A	0.100 ppm	U
	Annual	0.030 ppm	NA	0.053 ppm	A
Sulfur Dioxide (SO_2)	1 hour	0.25 ppm	A	0.075	A
	24 hour	0.04 ppm	A	0.14	A
	Annual	NA	NA	0.03 ppm	A
Particulate Matter (PM_{10})	24 hour	50 μg/m³	**N**	150 μg/m³	U
	Annual[e]	20 μg/m³ [f]	**N**	NA	NA
Fine Particulate Matter ($PM_{2.5}$)	24 hour	NA	NA	35 μg/m³	**N**
	Annual	12 μg/m³	**N**	12 μg/m³	U/A
Sulfates	24 hour	25 μg/m³	A	NA	NA
Lead	30 day	1.5 μg/m³	A	NA	NA
	Cal. Quarter	NA	NA	1.5 μg/m³	A
Hydrogen Sulfide	1 hour	0.03 ppm	U	NA	NA
Visibility-Reducing Particles	8 hour	See Note g	U	NA	NA

NOTES:
A = Attainment; **N** = Nonattainment; U = Unclassified; NA = Not Applicable, no applicable standard; ppm = parts per million; μg/m³ = micrograms per cubic meter.

[a] SAAQS = state ambient air quality standards (California). SAAQS for ozone, carbon monoxide (except Lake Tahoe), sulfur dioxide (1-hour and 24-hour), nitrogen dioxide, particulate matter, and visibility-reducing particles are values that are not to be exceeded. All other state standards shown are values not to be equaled or exceeded.
[b] NAAQS = national ambient air quality standards. NAAQS, other than ozone and particulates, and those based on annual averages or annual arithmetic means, are not to be exceeded more than once a year. The 8-hour ozone standard is attained when the three-year average of the fourth highest daily concentration is 0.08 ppm or less. The 24-hour PM10 standard is attained when the three-year average of the 99th percentile of monitored concentrations is less than the standard. The 24-hour PM2.5 standard is attained when the three-year average of the 98th percentile is less than the standard.
[c] The United States Environmental Protection Agency (USEPA) revoked the national 1-hour ozone standard on June 15, 2005.
[d] This state 8-hour ozone standard was approved in April 2005 and became effective in May 2006.
[e] State standard = annual geometric mean; national standard = annual arithmetic mean.
[f] In June 2002, the California Air Resources Board (CARB) established new annual standards for PM2.5 and PM10.
[g] Statewide visibility-reducing particle standard (except Lake Tahoe Air Basin): Particles in sufficient amount to produce an extinction coefficient of 0.23 per kilometer when the relative humidity is less than 70 percent. This standard is intended to limit the frequency and severity of visibility impairment due to regional haze and is equivalent to a 10-mile nominal visual range.

SOURCE: Bay Area Air Quality Management District (BAAQMD), Standards and Attainment Status, 2015, http://hank.baaqmd.gov/pln/air_quality/ambient_air_quality.htm, accessed October 13 2014; and U.S. EPA National Ambient Air Quality Standards, 2012, http://www.epa.gov/air/criteria.html, accessed October 13, 2014.

In 2010, the USEPA implemented a new 1-hour SO_2 standard presented in Table 5.4-2. The USEPA has initially designated the SFBAAB as an attainment area for SO_2. Similar to the new federal standard for NO_2, the USEPA has established requirements for a new monitoring network to measure SO_2 concentrations beginning in January 2013.[9] No additional SO_2 monitors are required for the Bay Area because the BAAQMD jurisdiction has never been designated as non-attainment for SO_2 and no State Implementation Plans or maintenance plans have been prepared for SO_2.[10]

Lead

Leaded gasoline (phased out in the United States beginning in 1973), paint (on older houses, cars), smelters (metal refineries), and manufacture of lead storage batteries have been the primary sources of lead released into the atmosphere. Lead has a range of adverse neurotoxic health effects, which put children at special risk. Some lead-containing chemicals cause cancer in animals. Lead levels in the air have decreased substantially since leaded gasoline was eliminated. Ambient lead concentrations are only monitored on an as-warranted, site-specific basis in California. On October 15, 2008, the USEPA strengthened the national ambient air quality standard for lead by lowering it from 1.5 $\mu g/m^3$ to 0.15 $\mu g/m^3$. The USEPA revised the monitoring requirements for lead in December 2010.[11] These requirements focus on airports and large urban areas resulting in an increase in 76 monitors nationally.[12] Lead monitoring stations in the Bay Area are located at Palo Alto Airport, Reid-Hillview Airport (San Jose), and San Carlos Airport. Non-airport locations for lead monitoring are Redwood City and San Jose.

Air Quality Index

The USEPA developed the Air Quality Index (AQI) scale to make the public health impacts of air pollution concentrations easily understandable. The AQI, much like an air quality "thermometer," translates daily air pollution concentrations into a number on a scale between 0 and 500. The numbers in the scale are divided into six color-coded ranges, with numbers 0-300 as outlined below.

- Green (0-50) indicates "good" air quality. No health impacts are expected when air quality is in the green range.
- Yellow (51-100) indicates air quality is "moderate." Unusually sensitive people should consider limited prolonged outdoor exertion.
- Orange (101-150) indicates air quality is "unhealthy for sensitive groups." Active children and adults, and people with respiratory disease, such as asthma, should limit outdoor exertion.

11 U.S. EPA, 2010b, *Fact Sheet Revisions to Lead Ambient Air Quality Monitoring Requirements*, http://www.epa.gov/air/lead/pdfs/Leadmonitoring_FS.pdf, accessed October 13, 2014.

12 U.S. EPA, Fact Sheet Revisions to Lead Ambient Air Quality Monitoring Requirements, http://www.epa.gov/air/lead/pdfs/Leadmonitoring_FS.pdf, accessed May 6, 2015.

- Red (151-200) indicates air quality is "unhealthy." Active children and adults, and people with respiratory disease, such as asthma should avoid prolonged outdoor exertion; everyone else, especially children, should limit prolonged outdoor exertion.
- Purple (201-300) indicates air quality is "very unhealthy." Active children and adults, and people with respiratory disease, such as asthma, should avoid prolonged outdoor exertion; everyone else, especially children, should limit outdoor exertion.

The AQI numbers refer to specific amounts of pollution in the air. They are based on the federal air quality standards for ozone, carbon monoxide, nitrogen dioxide, sulfur dioxide, PM_{10}, and $PM_{2.5}$. In most cases, the federal standard for these air pollutants corresponds to the number 100 on the AQI chart. If the concentration of any of these pollutants rises above its respective standard, it can be unhealthy for the public. In determining the air quality forecast, local air districts, including the BAAQMD, use the anticipated concentration measurements for each of the major pollutants, convert them into AQI numbers, and determine the highest AQI for each zone in a district.

Readings below 100 on the AQI scale would not typically affect the health of the general public (although readings in the moderate range of 50 to 100 may affect unusually sensitive people). Levels above 300 rarely occur in the United States, and readings above 200 have not occurred in the Bay Area in decades.[13] Historical BAAQMD data indicate that the SFBAAB experienced air quality in the Red level (unhealthy) on two days between the years 2009 to 2013. As shown in **Table 5.4-3**, the SFBAAB had a total of 19 orange-level (unhealthy for sensitive groups) days in 2009, 14 days in 2010, 12 days in 2011, 8 days in 2012, and 15 days 2013.

5.4.3.3 Toxic Air Contaminants and Local Health Risks and Hazards

In addition to criteria air pollutants, individual projects may emit toxic air contaminants (TACs). TACs collectively refer to a diverse group of air pollutants that are capable of causing chronic (i.e., of long duration) and acute (i.e., severe but short term) adverse effects to human health, including carcinogenic effects. Human health effects of TACs include birth defects, neurological damage, cancer, and death. There are hundreds of different types of TACs with varying degrees

13 Bay Area Air Quality Management District, 2014. Website: sparetheair.org/Stay-Informed/Todays-Air-Quality/Air-Quality-Index.aspx, accessed May 15, 2015.

of toxicity. Individual TACs vary greatly in the health risk they present; at a given level of exposure, one TAC may pose a hazard that is many times greater than another.

Unlike criteria air pollutants, TACs do not have ambient air quality standards but are regulated by the BAAQMD using a risk-based approach to determine which sources and pollutants to control as well as the degree of control. A health risk assessment (HRA) is an analysis which estimates human health exposure to toxic substances, and when considered together with information regarding the toxic potency of the substances, provides quantitative estimates of health risks.[14]

Air pollution does not affect every individual in the population in the same way, and some groups are more sensitive to adverse health effects than others. Land uses such as residences, schools, children's day care centers, hospitals, and nursing and convalescent homes are considered to be the most sensitive to poor air quality because the population groups associated with these uses have increased susceptibility to respiratory distress or, as in the case of residential receptors, their exposure time is greater than for other land uses. Therefore, these groups are referred to as sensitive receptors. Exposure assessment guidance typically assumes that people in residences would be exposed to air pollution 24 hours per day, 350 days per year, for 70 years. Therefore, assessments of air pollutant exposure to residents typically result in the greatest adverse health outcomes of all population groups.

Exposures to fine particulate matter ($PM_{2.5}$) are strongly associated with mortality, respiratory diseases, and lung development in children, and other endpoints such as hospitalization for cardiopulmonary disease.[15] In addition to $PM_{2.5}$, diesel particulate matter (DPM) is also of concern. The California Air Resources Board (CARB) identified DPM as a TAC in 1998, primarily based on evidence demonstrating cancer effects in humans.[16] The estimated cancer risk from exposure to diesel exhaust is much higher than the risk associated with any other TAC routinely measured in the region.

San Francisco Modeling of Air Pollutant Exposure Zones

In an effort to identify areas of San Francisco most adversely affected by sources of TACs, San Francisco partnered with the BAAQMD to inventory and assess air pollution and exposures from vehicles, stationary, and area sources within San Francisco. Citywide dispersion modeling was conducted using AERMOD[17] to assess the emissions from the following primary sources:

---

14 In general, a health risk assessment is required if the BAAQMD concludes that projected emissions of a specific air toxic compound from a proposed new or modified source suggest a potential public health risk. The applicant is then subject to a health risk assessment for the source in question. Such an assessment generally evaluates chronic, long-term effects, estimating the increased risk of cancer as a result of exposure to one or more TACs.

16 California Air Resources Board (ARB), Fact Sheet, "The Toxic Air Contaminant Identification Process: Toxic Air Contaminant Emissions from Diesel-fueled Engines," October 1998.

17 AERMOD is the USEPA's preferred/recommended steady state air dispersion plume model. For more information on AERMOD and to download the AERMOD Implementation Guide see www.epa.gov/ttn/scram/dispersion_prefrec.htm#aermod (accessed May 20, 2014).

roadways, permitted stationary sources, port and maritime sources, and Caltrain. Emissions of PM_{10} (DPM is assumed equivalent to PM_{10}), $PM_{2.5}$, and total organic gases (TOG) were modeled on a 20 meter by 20 meter receptor grid covering the entire City. The results represent a comprehensive assessment of existing cumulative exposures to air pollution throughout the City. The methodology and technical documentation for modeling citywide air pollution is available in the document entitled, *The San Francisco Community Risk Reduction Plan: Technical Support Documentation*.[18]

Model results identified areas in the City with poor air quality, termed "Air Pollutant Exposure Zones," based on the following health-protective criteria: (1) cumulative $PM_{2.5}$ concentrations greater than 10 $\mu g/m^3$, and/or (2) excess cancer risk from the contribution of emissions from all modeled sources greater than 100 per one million population. An additional health vulnerability layer was incorporated in the Air Pollutant Exposure Zone for those San Francisco ZIP codes in the worst quintile of Bay Area Health Vulnerability scores (ZIP Codes 94102, 94103, 94105, 94124, and 94130). In these areas, the standard for identifying areas as being within the zone were lowered to: (1) excess cancer risk from the contribution of emissions from all modeled sources greater than 90 per one million population, and/or (2) cumulative $PM_{2.5}$ concentrations greater than 9 $\mu g/m^3$. Lastly, all parcels within 500 feet of a major freeway were also included in the Air Pollutant Exposure Zone, consistent with findings in CARB's *Air Quality and Land Use Handbook: A Community Health Perspective*, which suggests air pollutant levels decrease substantially at about 500 feet from a freeway.[19]

The proposed project at Mission Bay Blocks 29-32 is not located within an Air Pollutant Exposure Zone.

Fine Particulate Matter

In April 2011, the USEPA published *Policy Assessment for the Particulate Matter Review of the National Ambient Air Quality Standards*. In this document, USEPA staff concludes that the then-current federal annual $PM_{2.5}$ standard of 15 $\mu g/m^3$ should be revised to a level within the range of 13 to 11 $\mu g/m^3$, with evidence strongly supporting a standard within the range of 12 to 11 $\mu g/m^3$. Air Pollutant Exposure Zones for San Francisco are based on the health protective $PM_{2.5}$ standard of 11 $\mu g/m^3$, as supported by the USEPA's Particulate Matter Policy Assessment, although lowered to 10 $\mu g/m^3$ to account for uncertainty in accurately predicting air pollutant concentrations using emissions modeling programs.

Excess Cancer Risk

The 100 per one million persons (100 excess cancer risk) criterion discussed above is based on USEPA guidance for conducting air toxic analyses and making risk management decisions at the facility and community-scale level.[20] As described by the BAAQMD, the USEPA considers a cancer risk of 100 per million to be within the "acceptable" range of cancer risk. Furthermore, in the 1989 preamble to the benzene National Emissions Standards for Hazardous Air Pollutants (NESHAP) rulemaking,[21] the USEPA states that it "…strives to provide maximum feasible protection against risks to health from hazardous air pollutants by (1) protecting the greatest number of persons possible to an individual lifetime risk level no higher than approximately one in one million and (2) limiting to no higher than approximately one in ten thousand [100 in one million] the estimated risk that a person living near a plant would have if he or she were exposed to the maximum pollutant concentrations for 70 years." The 100 per one million excess cancer cases is also consistent with the ambient cancer risk in the most pristine portions of the Bay Area based on BAAQMD regional modeling.[22]

In addition to monitoring criteria pollutants, both the BAAQMD and CARB operate TAC monitoring networks in the SFBAAB. These stations measure 10 to 15 TACs, depending on the specific station. The TACs selected for monitoring are those that have traditionally been found in the highest concentrations in ambient air and therefore tend to produce the most significant risk. The nearest BAAQMD ambient TAC monitoring station to the project area is the station at 16th and Arkansas Streets in San Francisco. **Table 5.4-4** shows ambient concentrations of carcinogenic TACs measured at the Arkansas Street station, approximately one half mile west of the project site. The estimated cancer risk from a lifetime exposure (70 years) to these substances is also reported in the table. When TAC measurements at this station are compared to ambient concentrations of various TACs for the Bay Area as a whole, the cancer risks associated with mean TAC concentrations in San Francisco are similar to those for the Bay Area as a whole. Therefore, the estimated average lifetime cancer risk resulting from exposure to TAC concentrations monitored at the San Francisco station do not appear to be any greater than for the Bay Area as a region.

Roadway-Related Pollutants

Motor vehicles are responsible for a large share of air pollution, especially in California. Vehicle tailpipe emissions contain diverse forms of particles and gases, and vehicles also contribute to particulates by generating road dust through tire wear. Epidemiologic studies have demonstrated that people living in proximity to freeways or busy roadways have poorer health outcomes, including increased asthma symptoms and respiratory infections and decreased pulmonary function and lung development in children. Air pollution monitoring conducted in conjunction

TABLE 5.4-4
2013 ANNUAL AVERAGE AMBIENT CONCENTRATIONS OF CARCINOGENIC TOXIC AIR CONTAMINANTS MEASURED AT BAAQMD MONITORING STATION, 10 ARKANSAS STREET, SAN FRANCISCO

Substance	Concentration	Cancer Risk per Million[a]
Gaseous TACs	**(ppb)**	
Acetaldehyde	0.56	3
Benzene	0.20	19
1,3-Butadiene	0.036	13
Carbon Tetrachloride	0.085	23
Formaldehyde	1.37	10
Perchloroethylene	0.012	0.5
Methylene Chloride	0.124	0.4
Chloroform	0.023	0.6
Trichloroethylene	0.01	0.1
Particulate TACs	**(ng/m^3)**	
Chromium (Hexavalent)	0.053	8
Total Risk for All TACs		**77.6**

NOTES:
TACs = toxic air contaminants; BAAQMD = Bay Area Air Quality Management District; ppb = part per billion; ng/m^3 = nanograms per cubic meter.

[a] Cancer risks were estimated by applying published unit risk values to the measured concentrations.

SOURCE: California Air Resources Board, *Ambient Air Toxics Summary-2013*, available online at: http://www.arb.ca.gov/adam/toxics/sitesubstance.htmlAccesssed February 25, 2015.

with epidemiologic studies has confirmed that roadway-related health effects vary with modeled exposure to particulate matter and nitrogen dioxide. In traffic-related studies, the additional non-cancer health risk attributable to roadway proximity was seen within 1,000 feet of the roadway and was strongest within 300 feet.[23] As a result, the CARB recommends that new sensitive land uses not be located within 500 feet of a freeway or urban roads carrying 100,000 vehicles per day. In 2008, the City and County of San Francisco (CCSF) adopted amendments to the Health Code (discussed below under "Regulatory Framework"), by adding Article 38 (amended in 2014) requiring urban infill sensitive use projects within the Air Pollutant Exposure Zone to address air pollution hazards through design and ventilation requirements.

Diesel Particulate Matter (DPM)

The CARB identified diesel particulate matter (DPM) as a toxic air contaminant in 1998, primarily based on evidence demonstrating cancer effects in humans. The exhaust from diesel engines includes hundreds of different gaseous and particulate components, many of which are toxic. Mobile sources such as trucks and buses are among the primary sources of diesel emissions, and concentrations of DPM are higher near heavily traveled highways. The CARB estimated average

[23] California Air Resources Board, *Air Quality and Land Use Handbook: A Community Health Perspective*, April 2005 (hereinafter "ARB Air Quality and Land Use Handbook"). Available at http://www.arb.ca.gov/ch/handbook.pdf. Accessed February 25, 2015.

Bay Area cancer risk from exposure to diesel particulate, based on a population-weighted average ambient diesel particulate concentration, is about 480 in one million, as of 2000, which is much higher than the risk associated with any other toxic air pollutant routinely measured in the region. The statewide risk from DPM as determined by the CARB declined from 750 in one million in 1990 to 570 in one million in 1995; by 2000, CARB estimated the average statewide cancer risk from DPM at 540 in one million.[24,25]

In 2000, the CARB approved a comprehensive Diesel Risk Reduction Plan to reduce diesel emissions from both new and existing diesel-fueled vehicles and engines. Subsequent CARB regulations apply to new trucks and diesel fuel. With new controls and fuel requirements, 60 trucks built in 2007 would have the same particulate exhaust emissions as one truck built in 1988.[26] The regulation is anticipated to result in an 80-percent decrease in statewide diesel health risk in 2020 as compared with the diesel risk in 2000. Despite notable emission reductions, the CARB recommends that proximity to sources of DPM emissions be considered in the siting of new sensitive land uses. The CARB notes that these recommendations are advisory and should not be interpreted as defined "buffer zones," and that local agencies must balance other considerations, including transportation needs, the benefits of urban infill, community economic development priorities, and other quality of life issues. With careful evaluation of exposure, health risks, and affirmative steps to reduce risk where necessary, the CARB's position is that infill development, mixed use, higher density, transit-oriented development, and other concepts that benefit regional air quality can be compatible with protecting the health of individuals at the neighborhood level.[27]

Contaminated Soil

The Mission Bay FSEIR Contaminated Soil and Groundwater section included Mitigation Measures J.1a through J.1k requiring preparation of a Risk Management Plan or Plans (RMP) incorporating specific measures that would provide for the management of risks associated with exposure to contaminated soil and groundwater and would be protective of human health and the aquatic environment. The potential for exposure impacts from contaminated soil was addressed in the Initial Study (Appendix NOP-IS, page 120), which found that compliance with the RMP, as required by the deed restriction, would ensure that human health and environmental risks during and after development of the proposed project would be within acceptable levels.

---

24 CARB, *California Almanac of Emissions and Air Quality - 2009 Edition*, Table 5-44 and Figure 5-12, http://www.arb.ca.gov/aqd/almanac/almanac09/chap509.htm, accessed May 16, 2011.

25 This calculated cancer risk value from ambient air exposure in the Bay Area can be compared against the lifetime probability of being diagnosed with cancer in the United States, from all causes, which for men is more than 40 percent (based on a sampling of 17 regions nationwide), or greater than 400,000 in one million, according to the American Cancer Society. (American Cancer Society, " last revised October. 1, 2014, available online at http://www.cancer.org/cancer/cancerbasics/lifetime-probability-of-developing-or-dying-from-cancer.)

Naturally Occurring Asbestos

The potential for exposure impacts from naturally occurring asbestos was addressed in the Initial Study (Appendix NOP-IS, page 115), which found that this impact would be potentially significant because no sampling has been conducted to establish the asbestos content in the fill materials that would be excavated during construction. This impact would be reduced to a less-than-significant level with implementation of Mitigation Measure M-HZ-1b, identified in the Initial Study, requiring the project sponsor to implement a geologic investigation to assess the naturally occurring asbestos content of the fill materials. This mitigation also requires the project sponsor to implement the requirements of the asbestos Air Toxics Control Measure (ATCM), including implementation of a Dust Mitigation Plan for naturally-occurring asbestos, if the investigation determines that the asbestos content of the fill is 0.25 percent or greater. Implementation of this measure would ensure that if naturally occurring asbestos is present, no visible dust crosses the project boundaries, and the measure could also require air monitoring to demonstrate compliance with this criterion if deemed necessary by the BAAQMD. Rock containing naturally occurring asbestos that would be disposed of off-site would not be considered a hazardous waste under California regulations.[28]

5.4.3.4 Sensitive Receptors

Air quality does not affect every individual in the population in the same way, and some groups are more sensitive to adverse health effects than others. Population subgroups sensitive to the health effects of air pollutants include: the elderly and the young; population subgroups with higher rates of respiratory disease, such as asthma and chronic obstructive pulmonary disease; and populations with other environmental or occupational health exposures (e.g., indoor air quality) that affect cardiovascular or respiratory diseases. The BAAQMD defines sensitive receptors as children, adults, and seniors occupying or residing in residential dwellings, schools, day care centers, hospitals, and senior-care facilities. Workers are not considered sensitive receptors because all employers must follow regulations set forth by the Occupation Safety and Health Administration (OSHA) to ensure the health and well-being of their employees.[29]

The proximity of sensitive receptors to motor vehicles is an air pollution concern, especially in San Francisco where building setbacks are limited and roadway volumes are higher than most other parts of the Bay Area. Vehicles also contribute to particulates by generating road dust and through tire wear.

The closest (within 1,000 feet) sensitive receptors to the project site are inventoried in **Table 5.4-5**. As shown in Table 5.4-5, sensitive receptors include residential uses north and west of the project site (including UCSF Hearst Tower) and the new UCSF Hospital located to the southwest. The nearest day care facility is on the UCSF Mission Bay campus 1,300 feet to the west. Other residential uses to the south are over 1,000 feet away, south of Mariposa Street. None of the receptors in

Table 5.4-5 are located within an Air Pollutant Exposure Zone, nor are there any sensitive receptors within 1,000 feet of the project site that are located within an Air Pollutant Exposure Zone.

TABLE 5.4-5
SENSITIVE RECEPTORS IN THE PROJECT SITE VICINITY

Receptor Type	Distance and Direction from the Project Site
Residential: UCSF Mission Bay Housing (Hearst Tower), Block 22	200 feet northwest
Residential: Madrone Mission Bay Residential Towers	800 feet to the north, on Mission Bay Boulevard North
Hospital: UCSF Benioff Children's Hospital facility at Mission Bay, plus the UCSF Betty Irene Moore Women's Hospital and the UCSF Bakar Cancer Hospital	300 feet southwest

SOURCE: Environmental Science Associates, 2015

5.4.3.5 Existing Stationary Sources of Air Pollution

The BAAQMD's inventory of permitted stationary sources of emissions show eight permitted stationary emission facilities present within or near the 1,000-foot zone of influence of the project site. The sources at these permitted facilities are made up of boilers, stationary diesel engines for back-up power generators or fire water pump engines, which are for emergency use only, and one body shop. The UCSF Mission Bay Campus has the largest number of permitted sources (34) which, besides generators and boilers, also include an ethylene oxide sterilizer. Additionally UCSF has two exempt sources (fume hoods and a methane gas blower).

5.4.3.6 Major Roadways Contributing to Air Pollution

Third, 16th Street and Mariposa Streets are arterial streets in the existing local roadway system within 1,000-feet of the project site that carry at least 10,000 vehicles in annual average daily traffic based on the City's SF CHAMP roadway model.[30] This traffic contributes to concentrations of $PM_{2.5}$, DPM, and other air contaminants emitted from motor vehicles near the street level. Both Interstate 280 and the Caltrain rail line are located over 1,000 feet from the project site. Aside from the surrounding major roadways, no other areas of mobile-source activity or otherwise "non-permitted" sources (e.g., railyards, trucking distribution facilities, and high-volume fueling stations) are located within 1,000 feet of the project site.

[30] San Francisco Metropolitan Transportation Agency, Chained Activity Modeling Process version 4.3.0, Average Daily Traffic Volumes, provided to ESA August 2, 2012.

5.4.4 Regulatory Framework

5.4.4.1 Federal Regulations

The 1970 Clean Air Act (last amended in 1990) requires that regional planning and air pollution control agencies prepare a regional air quality plan to outline the measures by which both stationary and mobile sources of pollutants will be controlled in order to achieve all standards by the deadlines specified in the act. These ambient air quality standards are intended to protect the public health and welfare, and they specify the concentration of pollutants (with an adequate margin of safety) to which the public can be exposed without adverse health effects. They are designed to protect those segments of the public most susceptible to respiratory distress, including asthmatics, the very young, the elderly, people weak from other illness or disease, or persons engaged in strenuous work or exercise. Healthy adults can tolerate occasional exposure to air pollution levels that are somewhat above ambient air quality standards before adverse health effects are observed.

The current attainment status for the SFBAAB, with respect to federal standards, is summarized above in Table 5.4-2. In general, the SFBAAB experiences low concentrations of most pollutants when compared to federal standards, except for ozone and particulate matter (PM_{10} and $PM_{2.5}$), for which standards are exceeded periodically (see Table 5.4-1).

There have been changes to the federal regulatory environment with respect to air quality since certification of the Mission Bay FSEIR in 1998. In June 2004, the Bay Area was designated as a marginal nonattainment area of the national 8-hour ozone standard.[31] The USEPA lowered the national 8-hour ozone standard from 0.080 to 0.075 parts per million (ppm) effective May 27, 2008. In April 2012, the USEPA designated the Bay Area as a marginal nonattainment region for the 0.075 ppm ozone standard established in 2008 (USEPA, 2012b). The Bay Area Air Basin is in attainment for other criteria pollutants, with the exception of the 24-hour standards for PM_{10} and $PM_{2.5}$, for which the Bay Area is designated as "Unclassified." "Unclassified" is defined by the Clean Air Act as any area that cannot be classified, on the basis of available information, as meeting or not meeting the national primary or secondary ambient air quality standard for the pollutant.

5.4.4.2 State Regulations

California Clean Air Act

While the federal Clean Air Act established national ambient air quality standards, individual states retained the option to adopt more stringent standards and to include other pollution sources. California had already established its own air quality standards when federal standards were established, and because of the unique meteorological problems in California, there is considerable diversity between the state and national ambient air quality standards, as shown in Table 5.4-2. California ambient standards tend to be at least as protective as national ambient standards and are

[31] "Marginal nonattainment area" means an area that has a design value of 0.076 up to but not including 0.086 ppm. A design value is the mathematically determined pollutant concentration at a particular site that must be reduced to, or maintained at or below the National Ambient Air Quality Standard to assume attainment.

often more stringent. Since certification of the Mission Bay FSEIR in 1998, the state has adopted an ambient air quality standard for $PM_{2.5}$ and strengthened the ambient ozone standards.

In 1988, California passed the California Clean Air Act (California Health and Safety Code Sections 39600 et seq.), which, like its federal counterpart, called for the designation of areas as attainment or nonattainment, but based on state ambient air quality standards rather than the federal standards. As indicated in Table 5.4-2, the Bay Area Air Basin is designated as "nonattainment" for state ozone, PM_{10}, and $PM_{2.5}$ standards. The Bay Area Air Basin is designated as "attainment" for other pollutants.

Toxic Air Contaminants

In 2005, the CARB approved a regulatory measure to reduce emissions of toxic and criteria pollutants by limiting the idling of new heavy-duty diesel vehicles. The regulations generally limit idling of commercial motor vehicles (including buses and trucks) within 100 feet of a school or residential area for more than five consecutive minutes or periods aggregating more than five minutes in any one hour. Buses or vehicles also must turn off their engines upon stopping at a school and must not turn their engines on more than 30 seconds before beginning to depart from a school. Also, state law Senate Bill 352 (SB 352) was adopted in 2003 and limits locating public schools within 500 feet of a freeway or busy traffic corridor (Section 17213 of the Education Code; Section 21151.8 of the Public Resources Code).

The Carl Moyer Memorial Air Quality Standards Attainment Program (Carl Moyer Program)

The Carl Moyer Program is a grant program that reduces air pollution from vehicles and equipment by providing funds to replace or retrofit older equipment or engines with cleaner-than-(U.S. EPA) required engines, equipment, and other sources of air pollution such as ground support equipment at airports. Money collected through the Carl Moyer Program complements California's regulatory program by providing incentives to effect early or extra emission reductions, especially from emission sources in environmental justice communities and areas disproportionately impacted by air pollution. The Carl Moyer Program funds clean air projects involving a wide variety of vehicles and equipment, including:

- Repower: The replacement of an in-use engine with another, cleaner engine.
- Retrofit: An emission control system employed exclusively with an in-use engine, vehicle or piece of equipment.
- New purchases: Vehicles or equipment certified to optional, lower emission standards.
- Fleet modernization or equipment replacement: The replacement of an older vehicle or piece of equipment that still has remaining useful life with a newer, cleaner vehicle or piece of equipment. The old vehicle/equipment is scrapped. Equipment may include on-road heavy-duty vehicle and off-road equipment replacement as well as emergency vehicles (Fire Apparatus) and lawn and garden equipment replacement.

- Vehicle retirement (or car scrap): Paying owners of older, more polluting vehicles that still have remaining useful life to voluntarily retire those vehicles earlier than they would have otherwise

The Carl Moyer program establishes a cost effectiveness standard that a proposed clean air project must meet in order to receive funding under the program. On March 27, 2015, the cost effectiveness limit was updated to $18,030 per weighted ton of ROG, NOx and PM in resulting emissions reductions.[32] The program has established guidelines and criteria for the funding of emissions reduction projects. The BAAQMD administers the Carl Moyer program within the SFBAAB.

5.4.4.3 Regional and Local Regulations and Plans

Bay Area Air Quality Management District

The BAAQMD is the regional agency with jurisdiction over the nine-county region located in the SFBAAB. The Association of Bay Area Governments (ABAG), Metropolitan Transportation Commission (MTC), county transportation agencies, cities and counties, and various non-governmental organizations also participate in the efforts to improve air quality through a variety of programs. These programs include the adoption of regulations and policies, as well as implementation of extensive education and public outreach programs. BAAQMD is responsible for attaining and/or maintaining air quality in the region within federal and state air quality standards. Specifically, BAAQMD has the responsibility to monitor ambient air pollutant levels throughout the region and to develop and implement strategies to attain the applicable federal and state standards.

BAAQMD does not have authority to regulate emissions from motor vehicles. Specific rules and regulations adopted by the BAAQMD limit the emissions that can be generated by various stationary sources, and identify specific pollution reduction measures that must be implemented in association with various activities. These rules regulate not only emissions of the six criteria air pollutants, but also TAC emissions sources are subject to these rules and are regulated through the BAAQMD's permitting process and standards of operation. Through this permitting process, including an annual permit review, the BAAQMD monitors the generation of stationary emissions and uses this information in developing its air quality plans. Any sources of stationary emissions constructed as part of the project would be subject to the BAAQMD Rules and Regulations. Both federal and State ozone plans rely heavily upon stationary source control measures set forth in BAAQMD's Rules and Regulations.

Per its Policy and Procedure Manual, the BAAQMD requires implementation of Best Available Control Technology for Toxics and would deny an *Authority to Construct* or a *Permit to Operate* for any new or modified source of TACs that exceeds a cancer risk of 10 in one million or a chronic or acute hazard index of 1.0. The permitting process under BAAQMD Regulation 2 Rule 5 requires a

[32] California Air Resources Board. Memorandum Re: Carl Moyer Program: Review and Update of the Cost-Effectiveness Limit and Capital Recovery Factors for 2015. March 27, 2015. Available online at: http://www.arb.ca.gov/msprog/mailouts/msc1509/msc1509.pdf. Accessed April 24, 2015.

Health Risk Screening Analysis, the results of which are posted on the District's website. These permitting requirements would ensure that the health risks of the project on the environment would be less than significant.

BAAQMD's Strategic Incentives Division (SID) provides incentive funding for projects that improve air quality, reduce air quality health impacts and protect the climate. Funding is primarily focused on mobile source projects that reduce or eliminate pollution from cars, trucks, marine vessels, locomotives, agricultural equipment or construction equipment. Since 1992, the SID division has awarded over $400 million in grant funding for cost-effective emission reduction projects and the program oversees approximately 1,000 projects funded by state, federal and local monies every year.

One such program administered by the SID is its Vehicle Buy Back Program (VBB). The VBB Program is a voluntary program that takes older vehicles off the road. Under this program, BAAQMD pays $1,000 for an operating and registered 1994 and older vehicle. The vehicles are then scrapped by vehicle dismantlers contracted by BAAQMD. Each vehicle removed from Bay Area roads results in an estimated reduction of 75 pounds of air pollution annually. The VBB Program is funded through the Air District's Carl Moyer, Mobile Source Incentive Fund and Transportation Fund for Clean Air (TFCA) programs. Eligibility requirements for the Vehicle Buy Back Program include:

- Vehicle must be 1994 model year or older;
- Vehicle must be currently registered as operable and must be drivable;
- Vehicle must have been registered in the Bay Area for the past 24 months;
- Vehicles within 60 days of a required smog check must take and pass their smog check.

Bay Area Air Quality Planning Relative to State and Federal Standards

Air quality plans developed to meet federal requirements are referred to as State Implementation Plans. The federal and state Clean Air Acts require plans to be developed for areas designated as nonattainment (with the exception of areas designated as nonattainment for the state PM_{10} standard). Since certification of the Mission Bay FSEIR in 1998, the most recent Bay Area ozone plan prepared in response to federal air quality planning requirements is the 2001 Ozone Attainment Plan. The State ozone plan has been updated multiple times since certification of the FSEIR.

The *2010 Bay Area Clean Air Plan* was adopted on September 15, 2010, by the BAAQMD, in cooperation with the Bay Area MTC, the Bay Conservation and Development Commission (BCDC), and ABAG. The primary objectives of the plan are to improve local and regional air quality, protect public health, and minimize climate change impacts. The *2010 Clean Air Plan* updates and replaces the *2005 Ozone Strategy* in accordance with the requirements of the California Clean Air Act to implement "all feasible measures" to reduce ozone; provide a control strategy to reduce ozone, particulate matter, toxic air contaminants, and greenhouse gases in a single, integrated plan; review progress in improving air quality in recent years; and establish emission control measures to be adopted or implemented in the 2010–2012 time frame. The control strategy includes stationary-source control measures to be implemented through

BAAQMD regulations; mobile-source control measures to be implemented through incentive programs and other activities; and transportation control measures to be implemented through transportation programs in cooperation with the MTC, local governments, transit agencies, and others. The *2010 Clean Air Plan* also represents the Bay Area's most recent triennial assessment of the region's strategy to attain the state one-hour ozone standard.[33]

San Francisco General Plan Air Quality Element

The *San Francisco General Plan* (General Plan) includes the 1997 Air Quality Element.[34] The objectives specified by the City include the following:

> ***Objective 1*****:** Adhere to state and federal air quality standards and regional programs.
>
> ***Objective 2*****:** Reduce mobile sources of air pollution through implementation of the Transportation Element of the General Plan.
>
> ***Objective 3*****:** Decrease the air quality impacts of development by coordination of land use and transportation decisions.
>
> ***Objective 4*****:** Minimize particulate matter emissions from road and construction sites.
>
> ***Objective 5*****:** Link the positive effects of energy conservation and waste management to emission reductions.

San Francisco Construction Dust Control Ordinance

Since certification of the Mission Bay FSEIR in 1998, the City has adopted San Francisco Health Code Article 22B and San Francisco Building Code Section 106.A.3.2.6, which collectively constitute the Construction Dust Control Ordinance (adopted in July 2008). The ordinance requires that all site preparation work, demolition, or other construction activities within San Francisco that have the potential to create dust or to expose or disturb more than 10 cubic yards or 500 square feet of soil comply with specified dust control measures whether or not the activity requires a permit from the Department of Building Inspection (DBI). For projects over one-half acre, the Dust Control Ordinance requires that the project sponsor submit a Dust Control Plan for approval by the San Francisco Department of Public Health (DPH) prior to issuance of a building permit by the DBI.

Building permits will not be issued without written notification from the Director of Public Health that the applicant has a site-specific Dust Control Plan, unless the Director waives the requirement. The Construction Dust Control Ordinance requires project sponsors and contractors responsible for construction activities to control construction dust on the site or implement other practices that result in equivalent dust control that are acceptable to the Director of Public Health.

[34] San Francisco Planning Department, Air Quality Element of the *San Francisco General Plan*, July 1997, updated in 2000.

Dust suppression activities may include watering of all active construction areas sufficiently to prevent dust from becoming airborne; increased watering frequency may be necessary whenever wind speeds exceed 15 miles per hour. Reclaimed water must be used if required by Article 21, Section 1100 et seq. of the San Francisco Public Works Code.

The project site is over 11 acres in size, and therefore the project sponsor would be required to prepare a Dust Control Plan.

San Francisco Health Code Provisions for Urban Infill Development (Article 38)

San Francisco adopted Article 38 of the San Francisco Health Code in 2008, with revisions taking effect in December 2014. The revised code requires that sensitive land use developments within the Air Pollutant Exposure Zone incorporate Minimum Efficiency Reporting Value (MERV) 13 equivalent ventilation systems to remove particulates from outdoor air. This regulation also applies to conversion of uses to a sensitive use (e.g., residential, senior care-facilities, day care centers, etc.). Article 38 would not be applicable to the proposed project because it does not include any sensitive uses.

5.4.5 Impacts and Mitigation Measures

5.4.5.1 Significance Thresholds

For the impacts analyzed in this section, the project would have a significant impact related to air quality if it were to:

- Conflict with or obstruct implementation of the applicable air quality plan;
- Violate any air quality standard or contribute substantially to an existing or projected air quality violation;
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in nonattainment under an applicable federal or state ambient air quality standard (including releasing emissions that exceed quantitative thresholds for ozone precursors);
- Expose sensitive receptors to substantial pollutant concentrations; or
- Result in a cumulative air quality impact in combination with past, present and reasonably foreseeable future projects in the vicinity.

The complete list of CEQA significance criteria relevant to the air quality analysis is included in the Initial Study (see Appendix NOP-IS, page 60), which also explains why the proposed project would not result in new significant impacts or substantially increase the severity of impacts on air quality with respect to odors. Therefore, odors are not addressed in this SEIR.

5.4.5.2 Approach to Analysis

Air quality analysis conducted for this impact assessment employs the emission factors, models and tools distributed by a variety of agencies including CARB, the California Air Pollution Officers Association (CAPCOA), the California Office of Environmental Health Hazard Assessment (OEHHA) and USEPA. Additionally, the analysis includes methodologies identified in the BAAQMD *CEQA Air Quality Guidelines* (May 2012).

Methodology for Analysis of Impacts

In general, the proposed project would result in two types of air quality impacts. First, the project would result in air pollution through construction activity. Second, the project would generate air pollutants during project operations, due to increased vehicle travel and new stationary sources (i.e., five new diesel emergency generators). This section describes the methodology used to evaluate project impacts related to consistency with the Clean Air Plan, emissions of criteria pollutants, and local health risks and hazards.

Each of these types of direct impacts are in turn separated into impacts from criteria air pollutant emissions, which are generally regional in nature, and impacts associated with exposure to toxic air contaminants (TACs) and $PM_{2.5}$, which is a localized health risk. The assessment of criteria air pollutant impacts addresses the second and third bulleted significance thresholds identified above. The assessment of localized health risk and exposure impacts addresses the fourth bulleted significance thresholds identified above.

Air Quality Plan

The applicable air quality plan is the BAAQMD's 2010 Clean Air Plan, which identifies measures to reduce emissions and ambient concentrations of air pollutants; safeguard public health by reducing exposure to air pollutants that pose the greatest health risk, with an emphasis on protecting the communities most heavily affected by air pollution; and reduce greenhouse gas emissions. Consistency with the Clean Air Plan can be determined if the project supports the goals of the Clean Air Plan, includes applicable control measures from the Clean Air Plan, and if the project would not disrupt or hinder implementation of any control measures from the Clean Air Plan. Consistency with this plan is the basis for determining whether the proposed project would conflict with or obstruct implementation of an applicable air quality plan, the first bulleted significance criterion identified above.

Criteria Air Pollutants

As described above under Regulatory Framework, the SFBAAB experiences low concentrations of most pollutants when compared to federal or State standards and is designated as either in attainment or unclassified for most criteria pollutants, with the exception of ozone, $PM_{2.5}$, and PM_{10}, for which these pollutants are designated as non-attainment for either the State or federal standards.

By definition, regional air pollution is largely a cumulative impact in that no single project is sufficient in size to, by itself, result in non-attainment of air quality standards. Instead, a project's individual emissions are considered to contribute to the existing, cumulative air quality conditions. If a project's contribution to cumulative air quality conditions is considerable, then the project's impact on air quality would be considered significant.[35]

Table 5.4-6 identifies criteria air pollutant significance thresholds followed by a discussion of each threshold. Projects that would result in criteria pollutant emissions below these significance thresholds would not violate an air quality standard, contribute substantially to an air quality violation, or result in a cumulatively considerable net increase in criteria air pollutants within the SFBAAB.

TABLE 5.4-6
CRITERIA AIR POLLUTANT THRESHOLDS

Pollutant	Construction Thresholds Average Daily Emissions (pounds per day)	Operational Thresholds	
		Average Daily Emissions (pounds per day)	Maximum Annual Emissions (tons per year)
ROG	54	54	10
NOx	54	54	10
PM_{10}	82 (exhaust)	82	15
$PM_{2.5}$	54 (exhaust)	54	10
Fugitive Dust	Construction Dust Ordinance or other Best Management Practices	Not applicable	

SOURCE: BAAQMD, CEQA Air Quality Guidelines. June 2011. Available at www.baaqmd.gov

The potential for a project to result in a cumulatively considerable net increase in criteria air pollutants that may contribute to an existing or projected air quality violation is based on the State and federal Clean Air Acts emissions limits for stationary sources. To ensure that new stationary sources do not cause or contribute to a violation of an air quality standard, BAAQMD Regulation 2, Rule 2 requires that any new source that emits criteria air pollutants above a specified emissions limit must offset those emissions. For ozone precursors ROG and NOx, the offset emissions level is an annual average of 10 tons per year (or 54 pounds (lbs.) per day).[36] These levels represent emissions below which new sources are not anticipated to contribute to an air quality violation or result in a considerable net increase in criteria air pollutants that could result in increased health effects.

[35] Bay Area Air Quality Management District, *CEQA Air Quality Guidelines*, May 2012.
[36] Bay Area Air Quality Management District, *Revised Draft Options and Justification Report, California Environmental Quality Act Thresholds of Significance*, page 17, October 2009.

The federal New Source Review (NSR) program was created under the federal Clean Air Act to ensure that stationary sources of air pollution are constructed in a manner that is consistent with attainment of federal health-based ambient air quality standards. For PM_{10} and $PM_{2.5}$, the emissions limit under NSR is 15 tons per year (82 lbs. per day) and 10 tons per year (54 lbs. per day), respectively. These emissions limits represent levels at which a source is not expected to have a significant impact on air quality.[37]

Although the regulations specified above apply to new or modified stationary sources, land use development projects generate ROG, NO_x, PM_{10}, and $PM_{2.5}$ emissions as a result of increases in vehicle trips, energy use, architectural coating, and construction activities. Therefore, the identified thresholds can be applied to the construction and operational phases of land use projects. Those projects that would result in emissions below these thresholds would not be considered to contribute to an existing or projected air quality violation or result in a considerable net increase in ozone precursors or particulate matter. Due to the temporary nature of construction activities, only the average daily thresholds are applicable to construction phase emissions.

Fugitive dust emissions are typically generated during construction phases. Studies have shown that the application of best management practices (BMPs) at construction sites significantly control fugitive dust[38]and individual measures have been shown to reduce fugitive dust by anywhere from 30 to 90 percent.[39] The BAAQMD has identified a number of BMPs to control fugitive dust emissions from construction activities.[40] San Francisco's Construction Dust Control Ordinance requires a number of fugitive dust control measures to ensure that construction projects do not result in visible dust. This analysis assumes that the project would implement the requirements of the Construction Dust Control Ordinance, which is the basis for determining the significance of air quality impacts due to fugitive dust emissions.

Other Criteria Pollutants

Regional concentrations of CO in the Bay Area have not exceeded the state standards in the past 11 years and SO_2 concentrations have never exceeded the standards. The primary source of CO emissions from development projects is vehicle traffic. Construction-related SO_2 emissions represent a negligible portion of the total basin-wide emissions and construction-related CO emissions represent less than five percent of the Bay Area total basin-wide CO emissions. As discussed previously, the Bay Area is in attainment for both CO and SO_2. Furthermore, the BAAQMD has demonstrated, based on modeling, that in order to exceed the California ambient air quality standard of 9.0 ppm (8-hour average) or 20.0 ppm (1-hour average) for CO, project traffic in addition to existing traffic would need to exceed 44,000 vehicles per hour at affected intersections (or 24,000 vehicles per hour where vertical and/or horizontal mixing is limited). The transportation analysis indicates that the intersection in the project area with the greatest volumes would be Fifth

38 Western Regional Air Partnership, *WRAP Fugitive Dust Handbook,* September 7, 2006. Available online at wrapair.org/forums/dejf/fdh/content/FDHandbook_Rev_06.pdf (accessed February 16, 2012).
39 Bay Area Air Quality Management District, *Revised Draft Options and Justification Report, California Environmental Quality Act Thresholds of Significance*, October 2009, page 27.
40 Bay Area Air Quality Management District, *CEQA Air Quality Guidelines*, May 2011.

and Harrison Streets with hourly volumes of 5,432 in year 2040 with the project and convention traffic, which is less than 24,000. Therefore, given the Bay Area's attainment status and the limited CO and SO_2 emissions that could result from the project, the project would not result in a cumulatively considerable net increase in CO or SO_2, and quantitative analysis is not required.

Local Health Risks and Hazards

In addition to criteria air pollutants, individual projects may emit TACs. As part of this project, Ramboll Environ conducted a health risk assessment (HRA) for the proposed project to provide quantitative estimates of health risks from exposures to TACs.

The threshold of significance used to evaluate health risks from new sources of TACs associated with the project is based on the potential for the proposed project to substantially affect the extent and severity of the Air Pollutant Exposure Zone[41] at sensitive receptor locations. The health protective standards used for determining the Air Pollutant Exposure Zone and evidence supporting these standards are discussed in the Setting section above and were developed in consultation with BAAQMD staff as part of the preparation of a Community Risk Reduction Plan.[42] The project site is not within an identified health vulnerable zip code; therefore the Air Pollutant Exposure Zone criteria for this location is based on: (1) cumulative $PM_{2.5}$ concentrations greater than 10 $\mu g/m^3$, and/or (2) excess cancer risk from the contribution of emissions from all modeled sources greater than 100 per one million population. For projects that could result in sensitive receptor locations meeting the Air Pollutant Exposure Zone criteria that otherwise would not occur without the project, a proposed project that would emit $PM_{2.5}$ concentration above 0.3 $\mu g/m^3$ or result in an excess cancer risk greater than 10.0 per million would be considered a significant impact. The 0.3 $\mu g/m^3$ $PM_{2.5}$ concentration and the excess cancer risk of 10.0 per million persons exposed are the levels below which the BAAQMD considers new sources not to make a considerable contribution to cumulative health risks.[43] For those locations already meeting the Air Pollutant Exposure Zone criteria, a lower significance standard is required to ensure that a proposed project's contribution to existing health risks would not be significant. Since the project is not within an Air Pollutant Exposure Zone, the above thresholds apply to the proposed project.

---

41 San Francisco, in partnership with BAAQMD, has modeled and assessed air pollutant impacts from mobile, stationary, and area sources within the City. This assessment identified areas with poor air quality under existing conditions—Air Pollutant Exposure Zones—which are based on health protective criteria PM2.5 and excess cancer risk. These areas warrant special attention when siting land uses that either emit toxic air contaminants (TACs) or uses that are considered sensitive to air pollution.

42 San Francisco is currently in the process of preparing a Community Risk Reduction Plan. Extensive modeling has been conducted and is documented in *The San Francisco Community Risk Reduction Plan: Technical Support Documentation.* This modeling provides the technical basis for development of the Community Risk Reduction Plan.

43 Bay Area Air Quality Management District, *California Environmental Quality Act Guidelines Update, Proposed Air Quality CEQA Thresholds of Significance*, May 3, 2010. Available online at www.baaqmd.gov/~/media/Files/Planning%20and%20Research/CEQA/Proposed_Thresholds_Report_%20May_3_2010_Final.ashx?la=en (accessed November 20, 2014).

Methodology for Analysis of Cumulative Impacts

As described in Section 5.1, Impact Overview, the following projects/programs listed below were not anticipated in the Mission Bay FSEIR and are considered in the cumulative impact analysis in this SEIR: University of California at San Francisco (UCSF), 2014 Long Range Development Plan (LRDP), Mission Bay Campus; Eastern Neighborhoods Program; Seawall Lot 337 and Pier 48 Mixed-Use Project (Mission Rock); and Pier 70 Mixed-Use Development.

While air quality analyses (both criteria air pollutants and health risk) have been conducted in the completed CEQA documentation for UCSF LRDP and the Eastern Neighborhoods Program, these analyses have not yet been completed for the other two identified projects. However, cumulative air quality analysis may be addressed by assessing whether a project's contribution is cumulatively considerable.

The contribution of a project's individual air emissions to regional air quality impacts is by its nature, a cumulative effect. Emissions from past, present and future projects in the vicinity also have or will contribute to adverse regional air quality impacts on a cumulative basis. No single project by itself would be sufficient in size to result in nonattainment of ambient air quality standards. Instead, a project's individual emissions contribute to existing cumulative air quality conditions.[44] As described above, the project-level thresholds for criteria air pollutants are based on levels by which new sources are not anticipated to contribute to an air quality violation or result in a considerable net increase in criteria air pollutants. Therefore, if a project's emissions are below the project-level thresholds, the project would not be considered to result in a considerable contribution to cumulative regional air quality impacts.

Similarly, the HRA takes into account the cumulative contribution of localized health risks to sensitive receptors from sources included in the Citywide modeling plus the proposed project's sources. Other future projects, whose emissions have not been incorporated into the existing Citywide health risk modeling, such as Pier 70 and Seawall Lot 337/Pier 48 would similarly be subject to CEQA requirements to analyze the health risk impact of their project. However, health risk impacts are localized, and health risks from sources decrease substantially with increasing distance.[45] Thus cumulative impacts from the Pier 70 and Seawall Lot 337/Pier 48 would not combine with the proposed project's emissions to substantially increase health risks within the project vicinity. Thus, because the project-level analysis includes health risks from all known existing sources, the project-level analysis is also a cumulative health risk analysis.

5.4.5.3 Impact Evaluation

Construction

Impact AQ-1: Construction of the proposed project would generate fugitive dust and criteria air pollutants, which would violate an air quality standard, contribute substantially to an existing or projected air quality violation, or result in a cumulatively considerable net increase in criteria air pollutants. (Significant and Unavoidable with Mitigation)

Construction activities would result in emissions of ozone precursors and particulate matter in the form of dust (fugitive dust) and exhaust (e.g., vehicle tailpipe emissions). Emissions of ozone precursors and particulate matter are primarily a result of the combustion of fuel from on-road and off-road vehicles. However, ROGs are also emitted from activities that involve painting, other types of architectural coatings, or asphalt paving. Construction phases would include demolition, excavation and site preparation, pile installation, placement of infrastructure, placement of foundations for structures, and fabrication of structures. Demolition and construction activities would require the use of drill rigs heavy trucks, excavators, material loaders, cranes, and other mobile and stationary construction equipment. During the project's approximately 26-month construction period, construction activities would result in emissions of ozone precursors and particulate matter, as discussed below.

Fugitive Dust

Project-related demolition, excavation, grading, and other construction activities may cause wind-blown dust that could contribute particulate matter into the local atmosphere. Despite the established federal standards for air pollutants and ongoing implementation of state and regional air quality control plans, air pollutants continue to have impacts on human health throughout the country. California has found that particulate matter exposure can cause health effects at lower levels than national standards. The current health burden of particulate matter demands that, where possible, public agencies take feasible available actions to reduce sources of particulate matter exposure. According to the CARB, reducing ambient particulate matter from 1998–2000 levels to natural background concentrations in San Francisco would prevent over 200 premature deaths.

Dust can be an irritant causing watering eyes or irritation to the lungs, nose, and throat. Demolition, excavation, grading, and other construction activities can cause wind-blown dust that adds particulate matter to the local atmosphere. Depending on exposure, adverse health effects can occur due to this particulate matter in general as well as due to specific contaminants such as lead or asbestos that may be constituents of dust.

In response to these concerns, the San Francisco Board of Supervisors approved a series of amendments to the San Francisco Building and Health Codes, generally referred hereto as the Construction Dust Control Ordinance (Ordinance 176-08, effective July 30, 2008), with the intent of reducing the quantity of dust generated during site preparation, demolition, and overall construction work in order to protect the health of the general public and onsite workers, to minimize public nuisance complaints, and to avoid orders to stop work by the Department of Building Inspection (DBI).

The ordinance requires that all site preparation work, demolition, or other construction activities within San Francisco that have the potential to create dust or to expose or disturb more than 10 cubic yards or 500 square feet of soil comply with specified dust control measures whether or not the activity requires a permit from DBI. The Director of DBI may waive this requirement for activities on sites less than one-half acre that are unlikely to result in any visible wind-blown dust.

To comply with the Construction Dust Control Ordinance, the project sponsor and the contractor responsible for construction activities at the project site would be required to use the following practices to control construction dust on the site or other practices that result in equivalent dust control that are acceptable to the Director of DBI. Dust suppression activities may include watering all active construction areas sufficiently to prevent dust from becoming airborne; increased watering frequency may be necessary whenever wind speeds exceed 15 miles per hour (mph). Reclaimed water must be used for dust suppression watering, as required by Article 21, Section 1100 et seq. of the San Francisco Public Works Code. Even if not required, reclaimed water should be used whenever possible. Contractors shall provide as much water as necessary to control dust (without creating run-off in any area of land clearing, and/or earth movement). During excavation and dirt-moving activities, contractors shall wet sweep or vacuum the streets, sidewalks, paths, and intersections where work is in progress at the end of the workday. Inactive stockpiles (where no disturbance occurs for more than seven days) greater than 10 cubic yards or 500 square feet of excavated material, backfill material, import material, gravel, sand, road base, and soil shall be covered with a 10 mil (0.01 inch) polyethylene plastic (or equivalent) tarp, braced down, or use other equivalent soil stabilization techniques.

For projects over one-half acre, such as the proposed project, the Dust Control Ordinance requires that the project sponsor submit a Dust Control Plan for approval by DPH. DBI will not issue a building permit without written notification from the Director of Public Health that the applicant has a site-specific Dust Control Plan, unless the Director waives the requirement. Interior-only tenant improvement projects that are over one-half acre in size that will not produce exterior visible dust are exempt from the site-specific Dust Control Plan requirement.

The site-specific Dust Control Plan would require the project sponsor to: submit a map to the Director of Public Health showing all sensitive receptors within 1,000 feet of the site; wet down areas of soil at least three times per day; provide an analysis of wind direction and install upwind and downwind particulate dust monitors; record particulate monitoring results; hire an independent, third-party to conduct inspections and keep a record of those inspections; establish shut-down conditions based on wind, soil migration, etc.; establish a hotline for surrounding community members who may be potentially affected by project-related dust; limit the area subject to construction activities at any one time; install dust curtains and windbreaks on the property lines, as necessary; limit the amount of soil in hauling trucks to the size of the truck bed and securing with a tarpaulin; enforce a 15 mph speed limit for vehicles entering and exiting construction areas; sweep affected streets with water sweepers at the end of the day; install and utilize wheel washers to clean truck tires; terminate construction activities when winds exceed 25 mph; apply soil stabilizers to inactive areas; and sweep off adjacent streets to reduce particulate emissions. The project sponsor would be required to designate an individual to monitor compliance with these dust control requirements.

Implementation of dust control measures in compliance with the regulations and procedures set forth by the San Francisco Dust Control Ordinance would ensure that potential dust-related construction air quality impacts of the proposed project would be *less than significant*.

Criteria Air Pollutants

As discussed above, construction activities would result in emissions of criteria air pollutants from the use of off- and on-road vehicles and equipment. Criteria and ozone precursor pollutant (NOx, ROG, PM_{10}, and $PM_{2.5}$) emissions from exhaust from construction equipment and truck and vehicle trips would incrementally add to the regional atmospheric loading of these pollutants during project construction. The BAAQMD *CEQA Air Quality Guidelines* recommend the quantification of project-related criteria pollutant exhaust emissions from construction, separate from operational emissions, and comparison with significance thresholds. Daily engine exhaust emissions from construction activities associated with the proposed project are compared with significance thresholds in **Table 5.4-7**. Total construction emissions were calculated using the latest emission factors available at the time of the Notice of Preparation (NOP) publication (EMFAC 2011 and OFFROAD 2011 equivalent), and total emissions were divided by the number of construction days to derive average daily emissions for comparison against applicable significance thresholds. The construction significance thresholds for criteria pollutants are established in terms of average daily emissions, which is how emissions are reported in Table 5.4-7.

TABLE 5.4-7
AVERAGE DAILY CONSTRUCTION-RELATED EMISSIONS

	Average Daily Construction Emissions (pounds/day)			
	ROG	**NOx**	**PM_{10}**	**$PM_{2.5}$**
Off-road Equipment Emissions	13	175	7.1	7.1
Truck and Vehicle emissions	7.4	51	0.84	0.77
Architectural Coating Emissions	39	0	0	0
Total[a]	59	226	8.0	7.9
Significance Threshold	54	54	82	54
Above Threshold?	**Yes**	**Yes**	No	No

NOTES:
[a] The total emissions may not sum precisely due to rounding of subtotals.
SOURCE: Ramboll Environ, 2015

The emissions presented in Table 5.4-7 would be generated by many different construction sources including the following: off-road construction equipment such as excavators, loaders, backhoes, drill rigs, and cranes; and on- road trucks. As shown in the table, the predominant source of emissions of NOx, PM_{10}, and PM $_{2.5}$ would be off-road equipment, which would generate more than three times the emissions of on-road vehicles and trucks.

Construction of the proposed project would result in emissions of PM_{10} and $PM_{2.5}$ that would be below the thresholds of significance. However, the estimated construction emissions of ROG and NOx would exceed the applicable significance threshold, which would be a *significant* air quality impact. Consequently, **Mitigation Measure M-AQ-1 (Construction Emissions Minimization)** is identified to reduce ROG and NOx emissions associated with construction.

ROG and NOx are ozone precursors, and the main health concern of exposure to ground-level ozone is effects on the respiratory system, especially on lung function. Several factors influence these health impacts, including the concentrations of ground-level ozone in the atmosphere, the duration of exposure, average volume of air breathed per minute, the length of intervals between short-term exposures, and the sensitivity of the person to the exposure.[46,47] The concentration of ground-level ozone in the atmosphere is influenced by the volume of air available for dilution, the temperature, and the intensity of ultraviolet light. In the Bay Area, the worst case conditions for ozone formation occur in the summer and early fall on warm, windless, sunny days.[48]

Given these various factors, it is difficult to predict the magnitude of health effects from the project's exceedance of significance criteria for regional ROG and NOx emissions. The increase in emissions associated with the proposed project represents a fraction of total SFBAAB regional ROG emissions (59 pounds per day compared to 265 tons per day in the SFBAAB region in 2012)[49] and NOx emissions (226 pounds per day compared to 318 tons per day in the SFBAAB region in 2012). Although Table 5.4-1 indicates that the most stringent applicable ozone standards were not exceeded at the Potrero Hill monitoring station between 2010 and 2014, the SFBAAB region experienced an average of 8.4 days of exceedance per year between 2010 and 2014.[50] The proposed project's ROG and NOx increases could contribute to new or exacerbated air quality violations in the SFBAAB region by contributing to more days of ozone exceedance or result in AQI values that are unhealthy for sensitive groups and other populations. As shown in Table 5.4-3, the SFBAAB has averaged between 8 and 19 days per year that are considered unhealthy for sensitive groups and had 2 unhealthy (red) days in the last five years. On unhealthy days, persons are recommended to avoid both prolonged and heavy exertion outdoor activities.[51]

Implementation of **Mitigation Measure M-AQ-1 (Construction Emissions Minimization)** would substantially reduce construction-related emissions of ROG and NOx. The measure would require use of off-road equipment to meet minimum emission standards, and construction-related emissions of ROG and NOx would be reduced commensurate with the degree of compliance achieved (i.e., Tier 4 or Tier 4 interim or Tier 2 with 40 percent NOx VDECS). Mitigated daily engine

exhaust emissions from construction activities associated with the proposed project are compared with emission significance thresholds in **Table 5.4-8,** assuming both the maximum level and the minimum level of compliance (Tier 4 and Tier 2 with NOx VDECS). As can be seen in Table 5.4-8, construction-related emissions would be reduced to the applicable threshold for ROG with both the maximum and minimum levels of compliance. However, while NOx emissions would be reduced by as much as 68 percent with fully compliant mitigation and 36 percent with minimally compliant mitigation, project emissions of NOx would still be significant (73 pounds per day) even with maximum compliance with Mitigation Measure M-AQ-1.

A mitigation measure was considered to reduce the contribution of on-road truck emissions by restricting contractors to utilizing haul trucks manufactured in year 2010 or later (year 2007 trucks would not result in decreased emissions over the existing truck fleet). However, recent communications with contractors indicate that there is a limited supply of available trucks for off-hauling soil. Given the high excavation volumes and short construction phase of the proposed project, it is probable that not enough qualified trucks would be available to implement such a measure. Thus, the feasibility of this mitigation is uncertain at this time. Consequently, emission offsets represent the only available additional mitigation option to address construction-related NOx emissions.

Because construction-related emissions of NOx would remain significant even with implementation of Mitigation Measure M-AQ-1, Mitigation Measure M-AQ-2b (Emissions Offsets) is also identified to reduce the residual pollutant emissions (see Impact AQ-2). Mitigation Measure M-AQ-2 (Emissions Offsets) would require the project sponsor to offset remaining emissions to below significance thresholds by funding the implementation of an offsite emissions reduction project in an amount sufficient to mitigate both residual construction pollutant emissions and operational pollutant emissions described below in Impact AQ-2. As specified in Mitigation Measure M-AQ-2b, offsetting of construction emissions would follow completion of construction activities, and the mitigation offset fee would be determined by the amount of emissions to be calculated based on reporting requirements of Mitigation Measure M-AQ-1 and the degree of compliance with off-road equipment types that are determined to be reasonably commercially available. The emissions offset fee is expressed in tons per year; therefore, under the minimum level of compliance with Mitigation Measure M-AQ-1, the remaining construction emissions offset required is 11.7 tons per year of ozone precursors and under the maximum level of compliance, the construction emissions offset required is reduced to 2.5 tons per year of ozone precursors. However, as described in Impact AQ-2 below, offset of operational emissions required would be 17.0 tons per year, which is greater than the amount estimated to be required for construction emissions offset. Therefore, emissions reduction projects funded through Mitigation Measure M-AQ-2b would offset the regional criteria pollutant emissions generated by construction of the proposed project that would remain in excess of the applicable thresholds after implementation of the project-specific emission reductions required under Mitigation Measures M-AQ-1. However, upon completion of construction, if the calculated emissions based on the reporting requirements of Mitigation Measure M-AQ-1 requires offsets are in excess of 17.0 tons per year, then the applicant shall provide the additional offset fees in an amount commensurate with the calculated ozone precursor emissions exceeding 17.0 tons per year. Because implementation of the emissions reduction project would be conducted by the BAAQMD and is not fully within the control of the project sponsor (see discussion of **Impact AQ-2**), the residual impact of construction emissions is conservatively considered *significant and unavoidable with mitigation*, acknowledging the assumption that the project sponsor would implement Mitigation Measures M-AQ-1 (Construction Emissions Minimization) and Mitigation Measure M-AQ-2b (Emission Offsets).

Summary of Impact AQ-1, Construction Emissions

Construction of the proposed project would generate emissions of fugitive dust and criteria air pollutants. The project sponsor, through its contractors, would be required to implement dust control measures in compliance with the requirements of the Construction Dust Control Ordinance, which would ensure that the construction-related impacts due to fugitive dust would be *less than significant*.

Estimated emissions of criteria air pollutants indicate that average daily construction emissions of PM_{10} and $PM_{2.5}$ would be below the applicable thresholds. Emissions of ROG and NOx, however, would exceed the applicable significance thresholds. Implementation of Mitigation Measure M-AQ-1 (Construction Emissions Minimization) would reduce ROG and NOx emissions but additional implementation of Mitigation Measure M-AQ-2b (Emission Offsets) would be further required to reduce NOx emissions to below the applicable threshold. However, because implementation of emissions offsets is dependent in part on the actions of a third party, this measure is not fully within the control of the project sponsor. As such, the residual impact related to regional emissions of criteria pollutants during construction is conservatively considered *significant and unavoidable with mitigation.*

Mitigation Measure M-AQ-1: Construction Emissions Minimization

A. *Construction Emissions Minimization Plan.* Prior to issuance of a construction permit, the project sponsor shall submit a Construction Emissions Minimization Plan (Plan) to the OCII or its designated representative for review and approval by an Air Quality Specialist. The Plan shall detail project compliance with the following requirements:

1. All off-road equipment greater than 25 horsepower (hp) and operating for more than 20 total hours over the entire duration of construction activities shall meet the following requirements:

a) Where access to alternative sources of power are available, portable diesel engines shall be prohibited. Where portable diesel engines are required because alternative sources of power are not available, the diesel engine shall meet the equipment compliance step-down schedule in **Table M-AQ-1-1**.

TABLE M-AQ-1-1
OFF-ROAD EQUIPMENT COMPLIANCE STEP-DOWN SCHEDULE

Compliance Alternative	Engine Emission Standard	Emissions Control
1	Tier 4 Interim	ARB NOx VDECS (40%)[52]
2	Tier 3	ARB NOx VDECS (40%)
3	Tier 2	ARB NOx VDECS (40%)

How to use the table: If the requirements of (A)(1)(b) cannot be met, then the project sponsor would need to meet Compliance Alternative 1. Should the project sponsor not be able to supply off-road equipment meeting Compliance Alternative 1, then Compliance Alternative 2 would need to be met. Should the project sponsor not be able to supply off-road equipment meeting Compliance Alternative 2, then Compliance Alternative 3 would need to be met.

b) All off-road equipment shall have engines that meet either U.S. Environmental Protection Agency (USEPA) or California Air Resources Board (CARB) Tier 4 off-road emission standards. If engines that comply with Tier 4 off-road emission standards are not commercially available, then the project sponsor shall provide the next cleanest piece of off-road equipment as provided by the step down schedules in Table M-AQ-1-1.

i. For purposes of this mitigation measure, "commercially available" shall mean the availability of Tier 4 equipment taking into consideration factors such as: (i) critical path timing of construction;

[52] http://www.arb.ca.gov/diesel/verdev/vt/cvt.htm, January 7, 2015.

(ii) geographic proximity to the Project site of equipment; and
(iii) geographic proximity of access to off haul deposit sites.

ii. The project sponsor shall maintain records concerning its efforts to comply with this requirement.

2. The project sponsor shall require the idling time for off-road and on-road equipment be limited to no more than two minutes, except as provided in exceptions to the applicable state regulations regarding idling for off-road and on-road equipment. Legible and visible signs shall be posted in multiple languages (English, Spanish, and Chinese) in designated queuing areas and at the construction site to remind operators of the two minute idling limit.

3. The project sponsor shall require that construction operators properly maintain and tune equipment in accordance with manufacturer specifications.

4. The Plan shall include estimates of the construction timeline by phase with a description of each piece of off-road equipment required for every construction phase. Off-road equipment descriptions and information may include, but are not limited to: equipment type, equipment manufacturer, equipment identification number, engine model year, engine certification (Tier rating), horsepower, engine serial number, and expected fuel usage and hours of operation. For VDECS installed: technology type, serial number, make, model, manufacturer, ARB verification number level, and installation date and hour meter reading on installation date. For off-road equipment using alternative fuels, reporting shall indicate the type of alternative fuel being used. The plan shall also include estimates of ROG and NOx emissions.

5. The project sponsor shall keep the Plan available for public review on site during working hours. The project sponsor shall post at the perimeter of the project site a legible and visible sign summarizing the requirements of the Plan. The sign shall also state that the public may ask to inspect the Plan at any time during working hours, and shall explain how to request inspection of the Plan. Signs shall be posted on all sides of the construction site that face a public right of way. The project sponsor shall provide copies of Plan to members of the public as requested.

B. *Reporting.* Quarterly reports shall be submitted to the OCII or its designated representative indicating the construction phase and off-road equipment information used during each phase including the information required in A(4). In addition, for off-road equipment using alternative fuels, reporting shall include the actual amount of alternative fuel used.

Within six months of the completion of construction activities, the project sponsor shall submit to the OCII or its designated representative a final report summarizing construction activities. The final report shall indicate the start and end dates and duration of each construction phase. For each phase, the report shall include detailed information required in A(4). In addition, for off-road equipment using alternative fuels, reporting shall include the actual amount of alternative fuel used.

C. *Certification Statement and On-site Requirements.* Prior to the commencement of construction activities, the project sponsor must certify (1) compliance with the Plan, and (2) all applicable requirements of the Plan have been incorporated into contract specifications.

Comparison of Impact AQ-1 to Mission Bay FSEIR Impact Analysis

The Mission Bay FSEIR identified construction-related air quality impact as less than significant with implementation of Mitigation Measure F.2, dust control measures. Currently, however, Mitigation Measure F.2 of the Mission Bay FSEIR to control fugitive dust would effectively be implemented through compliance with the requirements of the Construction Dust Control Ordinance, which was adopted in 2008. Therefore, Mission Bay FSEIR Mitigation Measure F.2 is not applicable to the proposed project.

Criteria air pollutants from construction were not calculated or used as an assessment tool in the Mission Bay FSEIR, as BAAQMD did not recommend quantification of criteria air pollutant emissions at that time. Consequently, the proposed project would result in a *new* significant impact that was not previously identified in the Mission Bay FSEIR due to the calculated construction emissions of ozone precursors that would exceed significance thresholds.

Operational Impacts

Impact AQ-2: During project operations, the proposed project would result in emissions of criteria air pollutants at levels that would violate an air quality standard, contribute to an existing or projected air quality violation, or result in a cumulatively considerable net increase in criteria air pollutants. (Significant and Unavoidable with Mitigation)

The proposed project would generate operational emissions from a variety of sources, including the following: new vehicle trips; maintenance operation of standby diesel generators and boilers; and area sources such as landscape equipment and use of consumer products. Some of the motor vehicle trips that would be generated by Golden State Warriors basketball games at the proposed event center would be regional trips similar to those currently generated by basketball games occurring at the Oracle Arena in Oakland, and as a result, the emissions associated with these regional trips would not represent new emissions to the air basin. While it is reasonable to assume that a percentage of non-Golden State Warriors events (i.e., concerts, family shows etc.) would be transferred to the proposed event center in San Francisco without replacement at Oracle Arena, this analysis assumes that the Oracle Arena maintains its current levels of non-Golden State Warriors events and therefore is based on a conservative (i.e., higher) estimate of net new vehicle trips to the air basin.

Consequently for the purposes of this CEQA analysis, the project operational emissions do not consider regional VMT-related emissions from basketball game events due to relocation of all Golden State Warriors basketball games from Oracle Arena in Oakland to the proposed event center in San Francisco. Marketing analysis indicates that the average trip length (25 miles) is the same for either arena location. It is unlikely that there would be another NBA franchise in the Bay Area, so all of the professional basketball games occurring in the region would likely be played at the new event center. This assumption is consistent with that of the City of Oakland in its CEQA-related analyses.[53] All other project operational vehicle trips associated with the proposed land uses are considered to be "new" vehicle trips for the purposes of this analysis.

This scenario also assumes successful implementation of the proposed Muni Special Event Transit Service Plan as part of the proposed project, or implementation of Mitigation Measure M-TR-18 (Auto Mode Share Performance Standard), if the Muni Special Event Transit Service Plan is not implemented. As described in Chapter 3, Project Description and also in more detail in Section 5.2, Transportation and Circulation, as part of the proposed project, the San Francisco Municipal Transportation Agency (SFMTA) would provide additional service over existing conditions to accommodate peak evening events for basketball games and concerts with more than 14,000 attendees. Under the Muni Special Event Transit Service Plan, light rail service on the T Third line would be increased, and three special event shuttles would be implemented, including a 16th Street BART Shuttle, Van Ness Avenue Shuttle, and Transbay Terminal/Ferry Building Shuttle. However, as also discussed in Section 5.2, Transportation and Circulation, Impact TR-18, if the Muni Special Event Transit Service Plan is not fully implemented in the future due to SFMTA fiscal constraints, Mitigation Measure M-TR-18 (Auto Mode Share Performance Standard) would require the project sponsor to implement additional transportation demand management strategies as necessary to achieve a similar arrival auto mode share as with the Muni Special Event Transit Service Plan, which is no more than 53 percent for weekday events that have 12,500 or more attendees and 59 percent for weekend events that have 12,500 or more attendees.

Criteria air pollutant emissions were calculated for all project operational emission sources, including mobile sources (vehicles), generators, natural gas boilers, and area sources. USEPA emission factors were used for generators and boilers. Vehicle trip emissions were calculated using EMFAC2011 emissions factors from the CARB[54] (the latest emissions factors available at the time of the NOP publication), based on vehicle trip generation rates developed for this project (see Section 5.2, Transportation and Circulation). The proposed project would include a number of measures that would reduce criteria air pollutant emissions. For example, the project's trip generation takes into account the project's proximity to transit service. The project would also include: bicycle and pedestrian infrastructure; provision of bicycle parking; increased energy efficiency beyond Title 24; meeting Green Building Code standards; and installation of low-water use appliances and fixtures. Calculated air pollutant emissions for the proposed project have already incorporated emission reductions associated with these measures.

The results of the project operational criteria air pollutant emissions calculations are presented in **Table 5.4-9**. Details on calculations and methodology are provided in Appendix AQ. Table 5.4-9 indicates that operational criteria air pollutant emissions of the proposed project would result in emission of criteria pollutants and precursors that would be at levels below the thresholds of significance for PM_{10} and $PM_{2.5}$. However, the estimated operational emissions of ROG and NOx would exceed the significance threshold, resulting in a *significant* air quality impact.

[53] City of Oakland, Draft Environmental Impact Report for Coliseum Area Specific Plan August 22, 2014.
[54] Although an updated versions of EMFAC (EMFAC2014) has been released by CARB, EMFAC2011 is still the currently USEPA approved version of EMFAC. (e-mail from CARB Mobile Source emissions inventory list serve, May 15,2015).

The main health concern of exposure to ground-level ozone, for which ROG and NOx are ozone precursors, is effects on the respiratory system, especially on lung function. Several factors influence these health impacts, including the concentrations of ground-level ozone in the atmosphere, the duration of exposure, average volume of air breathed per minute, the length of intervals between short-term exposures, and the sensitivity of the person to the exposure.[55,56] The concentration of ground-level ozone in the atmosphere is influenced by the volume of air

55 The World Bank Group, *Pollution Prevention and Abatement Handbook 1998: Toward Cleaner Production*, pp. 227–230, 1999. Available online at www.ifc.org/wps/wcm/connect/dd7c9800488553e0b0b4f26a6515bb18/Handbook GroundLevel Ozone.pdf?MOD=AJPERES (accessed July 10, 2014)

available for dilution, the temperature, and the intensity of ultraviolet light. In the Bay Area, the worst case conditions for ozone formation occur in the summer and early fall on warm, windless, sunny days.[57]

Given these various factors, it is difficult to predict the magnitude of health effects from the project's exceedance of significance criteria for regional ROG and NOx emissions. The increase in emissions associated with the proposed project represents a fraction of total SFBAAB regional ROG and NOx emissions (79 pounds of ROG per day compared to 265 tons per day in the SFBAAB region in 2012, and 124 pounds of NOx per day compared to 318 tons per day in the SFBAAB region in 2012).[58] Although Table 5.4-1 indicates that the most stringent applicable ozone standards were not exceeded at the Potrero Hill monitoring station between 2010 and 2014, the SFBAAB region experienced an average of 8.4 days of exceedance per year between 2010 and 2014.[59] The proposed project's ROG and NOx increases could contribute to new or exacerbated air quality violations in the SFBAAB region by contributing to more days of ozone exceedance or result in AQI values that are unhealthy for sensitive groups and other populations. As shown in Table 5.4-3, the SFBAAB has averaged between 8 and 19 days per year that are considered unhealthy for sensitive groups and had 2 unhealthy (red) days in the last five years. On unhealthy days, persons are recommended to avoid both prolonged and heavy exertion outdoor activities.[60]

Mitigation Measure M-AQ-2a (Reduce Operational Emissions) and **Mitigation Measure M-AQ-2b (Emission Offsets)** are identified to reduce ROG and NOx emissions associated with project operations.

Mitigation Measure M-AQ-2a would reduce operational emissions of ROG and NOx primarily through reduction in mobile sources through implementation of additional transportation demand measures (TDM) beyond those already included as part of the proposed project. Section 5.2, Transportation and Circulation, provides a detailed analysis regarding strategies to reduce transportation impacts, which form the basis for Mitigation Measure M-AQ-2a. However, as described in Section 5.2, Transportation and Circulation, the feasibility of the additional TDM measures listed in Mitigation Measures M-AQ-2a is currently unknown. Even though the California Air Pollution Control Officers Administration estimates that "commute trip reduction" strategies can result in a commuter trip reduction of 1.0 to 6.2 percent,[61] the specific TDM strategies identified for this project address more than just commute trips, and it is unknown if a higher percentage reduction of overall vehicle trips is attainable. Notwithstanding these estimated reductions, it is assumed that specific quantitative reduction of vehicle trips associated with the additional TDM would be difficult to quantify and the success of any one measure variable; therefore, no emissions

reduction are attributed to Mitigation Measure M-AQ-2a. The analysis in Section 5.2, Transportation and Circulation, also addresses Mission Bay FSEIR Mitigation Measure F.1, which essentially reiterated the transportation-related mitigation measures related to transportation demand management that, if implemented, would reduce vehicular air pollutant emissions; as described above in Section 5.4.2.2, these Mission Bay FSEIR mitigation measures are either completed, incorporated as part of the project, or not applicable to this project.

To address operational emission levels of ROG and NOx exceeding the SEIR's significance thresholds, **Mitigation Measure M-AQ-2b, Emission Offsets,** is identified to offset project operational emissions by funding the implementation of one or more emission reduction projects within the air basin. As discussed above under "Regulatory Setting," the BAAQMD administers the Carl Moyer program within the SFBAAB, which establishes the cost-effectiveness criteria for funding emissions reduction projects at $18,030 per weighted ton of ROG, NOx and PM emissions.[62] The Carl Moyer guidelines can be used to evaluate other emissions reduction projects within the SFBAAB that are administered by the Strategic Incentive Division of BAAQMD. Based on the current Carl Moyer cost effectiveness criteria and a 5 percent administrative fee, payment of $321,646 to the Strategic Incentives Division of the BAAQMD to implement emission reduction projects within the SFBAAB would be sufficient to offset the regional criteria pollutant emissions generated by operation of the proposed project that would remain in excess of the applicable thresholds, based on 4.4 tons per year of ROG and 12.6 tons per year of NOx, as shown in Table 5.4-9, or a total of 17.0 tons per year of ozone precursors; as indicated in Impact AQ-1 above, estimated emissions offsets for construction emissions is less than 17.0 tons per year, so this payment would also mitigate for the project's construction emissions.

Mitigation Measure M-AQ-2b would require the project sponsor to pay an offset mitigation fee to the BAAQMD to fund emissions reduction projects that would reduce emissions of ozone precursors to below the applicable thresholds. Mitigation Measure M-AQ-2b also assumes that the BAAQMD would report to the lead agency the final emissions reductions funded by the mitigation fee and that the BAAQMD would refund the project sponsor for any unspent mitigation fees upon meeting the required emissions reductions indicated in Table 5.4-9 above.

The project sponsor has agreed to fund Mitigation Measure M-AQ-2b as part of its overall commitment to implement all mitigation measures identified in this SEIR. However, because implementation of an emissions offset project would be conducted by the BAAQMD and is dependent in part on the actions of a third party, this measure is not fully within the control of the project sponsor. As such, the impact related to regional emissions of criteria pollutants associated with project operations is conservatively considered *significant and unavoidable with mitigation*, acknowledging the assumption that the project sponsor would implement Mitigation Measures M-AQ-2a (Reduce Operational Emissions) and Mitigation Measure M-AQ-2b (Emission Offsets).

62 The following equation is used to calculated the Weighted Emissions Reductions: Weighted Emissions Reductions= NOx reductions (tons/year)+ROG Reductions (tons/year) +(20 x (PM Reductions (tons/year))).

Summary of Impact AQ-2, Operational Emissions

Operation of the proposed project would include a variety of sources that would contribute to long term emissions of criteria air pollutants (ROG, NOx, PM_{10}, and $PM_{2.5}$). These sources would include new vehicle trips, maintenance and operation of standby diesel generators, boilers, and area sources such as landscape equipment and use of consumer products. Calculations of average daily and maximum annual emissions indicate that under the proposed project without mitigation, levels of ROG and NOx would exceed significance thresholds; this would be a significant impact. With implementation of Mitigation Measures M-AQ-2a (Reduce Operational Emissions), operational emissions of ROG and NOx would still be significant due to the as yet unknown feasibility of the mitigation strategies. Consequently, emission offsets, Mitigation Measure M-AQ-2b, represent the only available mitigation option to address operations-related emissions. However, this impact is conservatively considered *significant and unavoidable with mitigation* because implementation of an emissions offset project is dependent in part on the actions of a third party, beyond the control of the project sponsor.

Mitigation Measure M-AQ-2a: Reduce Operational Emissions

The project sponsor shall implement the following measures as feasible:

- Provision of outlets for electrically powered landscape equipment
- **Mitigation Measure M-TR-2c: Additional Strategies to Reduce Transportation Impacts** (see Section 5.2, Transportation and Circulation, Impact TR-2)
- **Mitigation Measure M-TR-11c: Additional Strategies to Reduce Transportation Impacts of Overlapping Events** (see Section 5.2, Transportation and Circulation, Impact TR-11)

Mitigation Measure M-AQ-2b: Emission Offsets

Upon completion of construction, and prior to issuance of certificate of occupancy, the project sponsor shall pay a mitigation offset fee to the Bay Area Air Quality Management District's (BAAQMD) Strategic Incentives Division in an amount not to exceed $18,030 per weighted ton per year of ozone precursors plus a 5 percent administrative fee to fund one or more emissions reduction projects within the San Francisco Bay Area Air Basin (SFBAAB). This fee is intended to fund emissions reduction projects to achieve reductions of 17.0 tons per year of ozone precursors. Documentation of payment shall be provided to OCII or its designated representative.

The project sponsor shall calculate the amount of emissions offset required from construction based on the reporting requirements of Mitigation Measure M-AQ-1 and the degree of compliance with off-road equipment types that were determined to be commercially available. If the calculated construction emissions of ozone precursors requires offsets in excess of 17.0 tons per year, then the applicant shall provide the additional offset amount commensurate with the calculated ozone precursor emissions exceeding 17.0 tons per year.

Acceptance of this fee by the BAAQMD shall serve as an acknowledgment and commitment by the BAAQMD to: (1) implement an emissions reduction project(s) within one year of receipt of the mitigation fee to achieve the emission reduction objectives specified above; and (2) provide documentation to OCII or its designated representative and to the project sponsor describing the project(s) funded by the mitigation fee, including the amount of emissions of ROG and NOx reduced (tons per year) within the SFBAAB from the emissions reduction project(s). If there is any remaining unspent portion of the mitigation offset fee following implementation of the emission reduction project(s), the project sponsor shall be entitled to a refund in that amount from the BAAQMD. To qualify under this mitigation measure, the specific emissions retrofit project must result in emission reductions within the SFBAAB that would not otherwise be achieved through compliance with existing regulatory requirements.

Comparison of Impact AQ-2 to Mission Bay FSEIR Impact Analysis

The Mission Bay FSEIR identified the operational air quality impact with respect to criteria air pollutants as significant and unavoidable due to NOx emissions in excess of 16 times greater than the 1998 threshold, ROG emissions in excess of 10 times the 1998 threshold and PM_{10} emissions in excess of 24 times the 1998 threshold. Thus, the impact conclusion for the proposed project is essentially the same as that in the Mission Bay FSEIR for the entire Mission Bay plan area for ROG and NOx, though unlike the conclusions of the FSEIR, the proposed project's operational emissions would not exceed the PM_{10} threshold. Therefore, the project would not result in a new or substantially more severe significant impact than was previously identified. As described above in Section 5.4.2.2, Mission Bay FSEIR Mitigation Measure F.1 (which is the same as Mission Bay FSEIR Transportation Measures E.46 through E.50), has either already been implemented, is incorporated as part of the proposed project, or is not applicable to the proposed project.

Toxic Air Contaminants, Construction and Operation

Impact AQ-3: Construction and operation of the proposed project would generate toxic air contaminants, including diesel particulate matter, and could expose sensitive receptors to substantial air pollutant concentrations. (Less than Significant with Mitigation)

As discussed above, San Francisco, in partnership with BAAQMD, has modeled and assessed air pollutant impacts from mobile, stationary, and area sources within the City. As described above in Section 5.4.2.3, this assessment identified areas with poor air quality under existing conditions—Air Pollutant Exposure Zones—which are based on significance thresholds for $PM_{2.5}$ and excess cancer risk, or areas within the City that warrant special attention when siting land uses that either emit TACs or uses that are considered sensitive to air pollution. The project site is not located within an Air Pollutant Exposure Zone. Under existing conditions, sensitive land uses exist in the project vicinity, as indicated in Table 5.4-5; in addition, there is the potential that planned future development in the project vicinity could include sensitive uses, such as the planned Uber/ARE development at Blocks 26-27, north of the project site (see Section 5.1, Impact Overview, for description of planned and proposed project in the vicinity). Thus, because construction and operation of the proposed project would result in emissions of TACs and $PM_{2.5}$, this analysis evaluates the potential to expose sensitive receptors in the project vicinity to substantial air pollutant concentrations.

Construction TAC Emissions

Regarding construction emissions, off-road equipment (which includes construction-related equipment) is a large contributor to diesel particulate matter (DPM) emissions in California, although since 2007, the CARB has found the emissions to be substantially lower than previously expected.[63] Newer and more refined emission inventories have lowered the estimates of DPM emissions from off-road equipment such that off-road equipment is now considered the sixth largest source of DPM emissions in California.[64] For example, CARB's revised estimates of particulate matter (PM) emissions (of which DPM is a major component) for the SFBAAB for the year 2010 have decreased by 83 percent from previous 2010 emissions estimates.[65] Approximately half of the reduction in emissions can be attributed to the economic recession and half to updated methodologies used to better assess construction emissions.[66]

Additionally, a number of federal and state regulations are requiring cleaner off-road equipment. Specifically, both the USEPA and California have set emissions standards for new off-road equipment engines, ranging from Tier 1 to Tier 4. Tier 1 emission standards were phased in from 1996 to 2000, and Tier 4 interim and final emission standards for all new engines will be phased in between 2008 and 2015. To meet the Tier 4 emission standards, engine manufacturers will be required to produce new engines with advanced emission-control technologies. Although the full benefits of these regulations will not be realized for several years, the USEPA estimates that by implementing the federal Tier 4 standards, NO_x and PM emissions will be reduced by more than 90 percent.[67] Furthermore, California regulations limit maximum idling times to five minutes, which further reduces public exposure to NO_x and PM emissions.[68]

Furthermore, construction activities do not lend themselves to analysis of long-term health risks because of their temporary and variable nature. As explained in the BAAQMD's *CEQA Air Quality Guidelines*:

> "Due to the variable nature of construction activity, the generation of TAC emissions in most cases would be temporary, especially considering the short amount of time such equipment is typically within an influential distance that would result in the exposure of sensitive receptors to substantial concentrations. Concentrations of mobile-source diesel PM emissions are typically reduced by 70 percent at a distance of approximately 500 feet (CARB 2005). In addition, current models and methodologies for conducting health risk

67 USEPA, "Clean Air Nonroad Diesel Rule: Fact Sheet," May 2004.

68 California Code of Regulations, Title 13, Division 3, § 2485.

> assessments are associated with longer-term exposure periods of 9, 40, and 70 years, which do not correlate well with the temporary and highly variable nature of construction activities. This results in difficulties with producing accurate estimates of health risk."[69]

Therefore, project-level analyses of construction activities have a tendency to overestimate assessments of long-term health risks. However, a health risk assessment (HRA) was conducted for the proposed project's 26-month construction period. The primary construction TAC emissions of concern, DPM and $PM_{2.5}$, would be emitted by diesel-powered construction equipment and truck trips hauling excavated materials. Equipment used would include cranes, excavators, loaders and backhoes. The project-specific HRA was based on the use of these and other high-powered non-standardized diesel equipment, as provided by the project sponsor.

Operational TAC Emissions

The sources of TAC emissions that would occur during the operational phase of the project include emissions from mobile sources (passenger vehicles and delivery vehicles) and five stationary sources (diesel generators). Mobile source air toxics are compounds emitted from highway vehicles, which are known or suspected to cause cancer or other serious health and environmental effects. Examples of mobile source air toxics include benzene, 1,3-butadiene, formaldehyde, acetaldehyde, acrolein, polycyclic organic matter (POM), naphthalene, and diesel particulate matter.

Under the project, the five proposed diesel back-up generators would all be located within the parking structure on Lower Parking Level 1. Diesel generators, if larger than 50 horsepower, must obtain a permit from the BAAQMD and comply with the Air Toxic Control Measure (ATCM) for Stationary Compression Ignition Engines. As a practical matter, the BAAQMD will not issue a permit for a new generator that results in an operational cancer risk greater than 10 in one million.

Health Risk Assessment

A heath risk assessment was conducted to asses both increased cancer risk and localized $PM_{2.5}$ concentrations from both construction and operational sources. Localized $PM_{2.5}$ concentrations are assessed based on annual average concentrations, and hence, separate evaluations are performed for construction and operations. Conversely, cancer risk is assessed based on the probability of contracting cancer over a person's lifetime, evaluated as 70 years. Therefore the probability of an increased cancer risk is determined by evaluating a sensitive receptor's exposure to both construction and operational emissions. Both the $PM_{2.5}$ and cancer risk assessments account for background (existing) concentrations and risk levels. The cumulative (project plus background) $PM_{2.5}$ and cancer risk results are compared to significance thresholds of 10 $\mu g/m^3$ and 100 per one million, respectively.

Sources considered in the HRA include un-mitigated and mitigated emissions from construction equipment and trucks, operational traffic generated by the full build out of the proposed development, and maintenance operations of the proposed diesel generators. Under California

[69] BAAQMD, *CEQA Air Quality Guidelines,* May 2011, page 8-6.

regulatory guidelines, DPM is used as a surrogate measure of carcinogen exposure for the mixture of chemicals that make up diesel exhaust as a whole.

To evaluate TAC and $PM_{2.5}$ impacts from the proposed project, near-field air dispersion modeling of DPM and $PM_{2.5}$ from project construction emission sources was conducted using the USEPA's American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD), version 14134,[70] as recommended by the BAAQMD *CEQA Air Quality Guidelines*. Air dispersion modeling applications used meteorological data from the Mission Bay meteorological site operated by the BAAQMD to provide the most representative data set for this analysis.

The ambient concentrations obtained through dispersion modeling were subsequently used in the risk assessment to quantify cancer health risk impacts and to evaluate $PM_{2.5}$ impacts. Air dispersion models such as AERMOD require a variety of inputs such as source parameters, meteorological parameters, topography information, and receptor parameters, which are discussed below.

To evaluate TAC and $PM_{2.5}$ impacts from operational sources, a screening level assessment was conducted. Emissions from the proposed emergency generators were assumed to comply with BAAQMD permitting requirements. The permitting process under BAAQMD Regulation 2, Rule 5 requires a Health Risk Screening Analysis, the results of which are posted on the District's website. Per its Policy and Procedure Manual, the BAAQMD requires implementation of Best Available Control Technology for Toxics and would deny an *Authority to Construct* or a *Permit to Operate* for any new or modified source of TACs that exceeds a cancer risk of 10 in one million. As a worst case analysis, it was conservatively assumed the two generators each associated with the retail and office buildings, respectively, could potentially be permitted by a separate entity than the permit held by the arena operator and that therefore three separate permits could be required, each allowing an increased cancer risk of up to 10 in one million. Therefore, it was conservatively assumed that increased cancer risk associated with the five proposed generators could be up to 30 in one million and no refined health risk modeling was conducted for the emergency generators.

Meteorological Data. Air dispersion modeling applications require the use of meteorological data that ideally are spatially and temporally representative of conditions in the immediate vicinity of the site under consideration. For the HRA, meteorological data collected and processed by BAAQMD[71] at the Mission Bay station were used.[72] The Mission Bay station is less than 1 mile west of the project site.

Source Configurations – Construction. Emitting activities were modeled between 7 a.m. and 1 a.m., seven days a week to reflect the duration of construction activities.

---

70 U.S. Environmental Protection Agency, *User's Guide for the AMS/EPA Regulatory Model (AERMOD)*, Office of Air Quality Planning and Standards, Emissions Monitoring and Analysis Division, Research Triangle Park, North Carolina, EPA-454/B-03-001, September 2004.
71 BAAQMD processed the data using AERMET 12345.
72 The ESA Air Quality Technical Report Scope of Work approved by the San Francisco EP suggested using this meteorological station.

Source Configurations – Operation. Emissions from project-generated traffic were modeled 24 hours a day, with an hour-of-day temporal profile reflecting the fluctuation of traffic volume in San Francisco County, extracted from EMFAC 2011. Actual emission factors were generated by EMFAC2011 for the project-generated traffic increment.

Source Parameters – Construction. At any given time there would be multiple emissions sources associated with construction equipment within the construction zone. Each construction phase was modeled as a series of adjacent area sources, the dimensions of which varied depending on the sources considered. Off-site vehicles (trucks and worker trips going to and from construction zones) were included in the area sources.

Source Parameters – Operation. The proposed project would include new natural gas-fired boilers to provide heating to the proposed arena. According to the BAAQMD,[73] non-diesel boilers are regarded as minor, low-impact sources that can be excluded from the CEQA process. The project would also include five stationary emergency diesel engines which would require stationary source permits. These generators would require stationary source permits from the BAAQMD. BAAQMD Rule 2-5-302 limits project risks to 10 in one million, so for screening purposes incremental risk from the generators is assumed to be 10 in one million. In the worst case, the generators might have up to three different owners, resulting in three separate permits with risks of up to 10 in one million each, for a total potential risk of 30 in one million associated with project generators.

$PM_{2.5}$ impacts were modeled using the USEPA SCREEN3 model. SCREEN3 is a Gaussian air dispersion model that uses a worst-case, not site-specific, meteorological dataset to estimate maximum impacts. Using the concentration estimates from SCREEN3, a human health risk analysis was conducted at distances from the project site representing the residential and hospital receptors.

More specific details on the health risk and $PM_{2.5}$ calculations and methodology are provided in Appendix AQ.

Exposure to $PM_{2.5}$

Table 5.4-10 shows the results of the risk assessment for exposure to $PM_{2.5}$ during construction at the maximally impacted receptor. The Air Pollutant Exposure Zone standard for $PM_{2.5}$ is an annual average standard, and because construction and operational activities would not overlap, only the construction $PM_{2.5}$ concentrations are added to the background $PM_{2.5}$ concentrations to determine whether construction of the project would result in the project vicinity meeting the Air Pollutant Exposure Zone criteria. As shown in Table 5.4-10, cumulative $PM_{2.5}$ levels at the maximally impacted sensitive receptor would be 8.9 $\mu g/m^3$, and would not exceed the 10 $\mu g/m^3$ significance threshold. Thus, localized $PM_{2.5}$ impacts from construction activities at sensitive receptor locations would be *less than significant*.

73 BAAQMD. 2012. Recommended Methods for Screening and Modeling Local Risks and Hazards. Available online at : http://www.baaqmd.gov/~/media/Files/Planning%20and%20Research/CEQA/Risk%20Modeling%20Approach%20May%202012.ashx?la=en

TABLE 5.4-10

Above Threshold?	No	No

NOTES:
[a] The total concentrations may not sum precisely due to rounding of subtotals.

SOURCE: Ramboll Environ, 2015

Following completion of construction activities, the proposed project's operational sources would also generate $PM_{2.5}$ emissions, which are quantified in Table 5.4-10. As shown in this table, maximum cumulative (background plus project) $PM_{2.5}$ concentrations during project operations would be 9.0 $\mu g/m^3$ for the proposed project. Furthermore, at no off-site location, during construction or operations, would cumulative $PM_{2.5}$ concentrations exceed 10 $\mu g/m^3$. Therefore, the proposed project would not result in sensitive receptor locations meeting the Air Pollutant Exposure Zone criteria for $PM_{2.5}$, and construction and operational $PM_{2.5}$ emissions would be *less than significant*.

Cancer Risk

The results of the risk assessment are presented in **Table 5.4-11** below for both the unmitigated and mitigated scenarios, the latter of which assumes the minimum level of compliance (Tier 2 engines with NOx VDECS) with implementation of **Mitigation Measure M-AQ-1 (Construction Emissions Minimization)** described above under Impact AQ-1. Table 5.4-11 shows that under unmitigated conditions, the excess cancer risk for a child resident at the UCSF Hearst Tower and Hospital would exceed the significance threshold of 100 per one million persons exposed. More specifically, a resident child at the UCSF Hearst Tower could be exposed to an excess cancer risk of up to 117 per one million under unmitigated project conditions, a significant impact. The proposed project's unmitigated construction emissions would account for an excess cancer risk of 54 in one million,

TABLE 5.4-11
LIFETIME EXCESS CANCER RISK AT OFF-SITE RECEPTORS

Source	Excess Cancer Risk (in one million)		
	UCSF Hearst Tower Receptor		UCSF Hospital Receptor
	Child Resident	Adult Resident	(Child Resident)
Background at the maximally impacted receptor	26	26	44
Unmitigated Construction Contribution	54	2.8	28
Mitigated (Tier 2 + NOx VDECS) Construction Contribution	9.2	0.48	4.8
Project Operations – Generators	30	30	30
Project Operations – Mobile Sources	7.2	7.2	7.2
Cumulative Total (Unmitigated/with Mitigation)[a]	117 / 72	66 / 64	109 / 86
Significance Threshold	100	100	100
Above Threshold? (Unmitigated/with Mitigation)	**Yes** / No	No / No	**Yes** / No

NOTES:
[a] The total risks may not sum precisely due to rounding of subtotals.

SOURCE: Ramboll Environ, 2015

and unmitigated operational emissions would account for an excess cancer risk of 37 in one million at this receptor location. Implementation of Mitigation Measure M-AQ-1 (Construction Emissions Minimization) would reduce the impacts from standardized construction equipment for which "tiered" equipment is available, as shown in Table 5.4-11. With the minimum level of compliance with this mitigation measure (Tier 2 plus NOX VDECS), increased cancer risk as a result of project construction activities at the maximally impacted receptor would be approximately 9.2 in one million and cumulative excess cancer risk at all receptor locations would be reduced to below the significance threshold of 100 per one million.

While unmitigated increased cancer risk at the maximally impacted receptors would exceed the threshold of 100 in one million, with implementation of Mitigation Measure M-AQ-1 (Construction Emissions Minimization), increased cancer risk at the maximally impacted receptors would be below the threshold of 100 in one million. Furthermore, at no off-site location would cumulative excess cancer risk exceed 100 per one million persons exposed with implementation of Mitigation Measure M-AQ-1. Therefore, the proposed project would not result in sensitive receptor locations meeting the Air Pollutant Exposure Zone criteria for excess cancer risk, and construction and operational cancer risk would be *less than significant with mitigation*.

Summary of Impact AQ-3, Exposure to Toxic Air Contaminants

Both construction and operation of the proposed project would generate emissions of $PM_{2.5}$ and toxic air contaminants, including DPM. The project-specific HRA conducted indicated that without mitigation, the project—including both construction and operational impacts added to the existing background levels— would exceed significance thresholds for increased cancer risk for off-site receptors; concentrations of $PM_{2.5}$ emissions would not exceed significance thresholds. With implementation of Mitigation Measure M-AQ-1 (Construction Emissions Minimization) described above for Impact AQ-1, impacts related to increased cancer risk would be reduced to less than significant. Therefore, this impact is *less than significant with mitigation*.

> **Mitigation Measure M-AQ-1: Construction Emissions Minimization** (see Impact AQ-1, above)

Comparison of Impact AQ-3 to Mission Bay FSEIR Impact Analysis

The Mission Bay FSEIR qualitatively assessed operational health risk impacts and identified this impact as potentially significant. The FSEIR identified four mitigation measures (Mitigation Measures F.3, F.4, F.5, and F.6) to reduce impacts due to emissions of toxic air contaminants, but in the absence of specific development proposals at that time, this impact was determined to be significant and unavoidable with mitigation.

Only one of the four FSEIR mitigation measures are applicable to the proposed project. Mission Bay FSEIR Mitigation Measure F.3 requires the applicant to demonstrate receipt of BAAQMD permit for stationary TAC sources. As a permit will be required for the five proposed backup diesel generators, the applicant would be required to comply with FSEIR Mitigation Measure F.3.

Mission Bay FSEIR Mitigation Measure F.4 requires establishing a meteorological station in Mission Bay; this measure has already been implemented and information from this meteorological station was used in to conduct the HRA prepared for this SEIR. Mission Bay FSEIR Mitigation Measure F.5 requires reducing exposure to dry cleaning facilities in the area that use perchloroethylene and other toxic contaminants. Dry cleaning operations primarily emit evaporative emissions of perchloroethylene. However, BAAQMD Regulation 11, Rule 16 required that all co-residential (sharing a wall, floor, ceiling or is in the same building as a residential unit) dry cleaners cease use of perchloroethylene on July 1, 2010. Additionally, all other dry cleaners must phase out use of perchloroethylene by January 1, 2023. Therefore, due to current regulations, dry cleaning facilities are not anticipated to result in substantial, long term health risks to sensitive populations in San Francisco, and this measure is no longer applicable.

Mission Bay FSEIR Mitigation Measure F.6 requires the creation of buffer zones for pre-school and child care centers from TAC sources; this measure does not apply to the proposed project because although only TAC sources (diesel generators) would be located in the garage, the nearest child care facility (UCSF Child Care Center) is located over 1,300 feet to the west and the nearest school (Daniel Webster Elementary) is located over 2,000 feet to the southwest of the proposed project. Additionally a potential San Francisco Unified School District school site is located at Block 14, approximately 1,500 feet west of the project site. BAAQMD generally recognizes a buffer distance of 1,000 feet from standard TAC sources as sufficient to avoid health impacts relative to CEQA. At this time, there is a planned development at Blocks 26/27, directly north of Blocks 29-32 (see Section 5.1, Impact Overview, for description) which could include sensitive receptors such as a day care facility. Since this facility could be located within 1,000 feet of the project during a portion of the construction period (8 months) and during operations, the potential impacts are analyzed in Impact C-AQ-2, below.

Therefore, because the project's impacts would be less than significant with mitigation, the project would not result in new or substantially more severe significant impacts than was previously identified in the Mission Bay FSEIR.

Consistency with Clean Air Plan

Impact AQ-4: The proposed project could conflict with, or obstruct implementation of, the *2010 Clean Air Plan*. (Less than Significant with Mitigation)

The most recently adopted air quality plan in the San Francisco Bay Area Air Basin is the BAAQMD's 2010 Clean Air Plan (2010 CAP) (BAAQMD, 2010). The 2010 CAP is a roadmap showing how the San Francisco Bay Area will achieve compliance with the State one-hour ozone standard as expeditiously as practicable, and how the region will reduce transport of ozone and ozone precursors to neighboring air basins. The control strategy includes stationary source control measures to be implemented through BAAQMD regulations; mobile source control measures to be implemented through incentive programs and other activities; and transportation control measures to be implemented through transportation programs in cooperation with the Metropolitan Transportation Commission (MTC), local governments, transit agencies, and others. The 2010 CAP also represents the Bay Area's most recent triennial assessment of the region's strategy to attain the State one-hour ozone standard.

BAAQMD guidance states that lead agencies should consider three questions in assessing consistency with the 2010 CAP: (1) Would the project support the primary goals of the Clean Air Plan? (2) Does the project include applicable control measures from the Clean Air Plan? and (3) Does the project disrupt or hinder implementation of control measures identified in the Clean Air Plan?

Support the Primary Goals of the CAP. The first of these questions is whether a project would support the primary goals of the 2010 CAP, which include:

- Attainment of air quality standards;
- Reducing population exposure and protecting public health in the Bay Area; and
- Reducing greenhouse gases and protecting the climate.

With respect attainment of air quality standards, several mitigation measures are identified to reduce criteria air pollutants from both construction and operations. These include Mitigation Measure M-AQ-1, Construction Emissions Minimization, which would reduce construction-related ozone precursor NOx emissions by 62 percent. Mitigation Measure M-AQ-2a (Reduce Operational Emissions) would promote additional transportation demand strategies beyond those included in the proposed project, while Mitigation Measure M-AQ-2b (Emission Offsets) would offset both construction-related and operational ROG and NOx emissions to below significance thresholds. Additionally, as addressed in Impact AQ-3, Mitigation Measure M-AQ-1 (Construction Emissions Minimization) would reduce increased cancer risks from construction such that these risks would be below significance thresholds, thereby reducing population exposure and protecting public health in the Bay Area.

The proposed project's impact with respect to GHGs is discussed in Section 5.5, Greenhouse Gas Emissions. As stated in that discussion, the proposed project would be compliant with the City's Greenhouse Gas Reduction Strategy and as part of the project's status as an environmental leadership development project under AB 900, the project would result in no net increase in GHGs. Thus, the project would not result in any significant impacts associated with an increase in GHGs or conflict with measures adopted for the purpose of reducing such emissions.

The other two questions to be considered are:

- Does the project include applicable control measures from the air quality plan?
- Does the project disrupt or hinder implementation of any air quality plan control measures?

Applicable Control Measures from the CAP. To meet the primary goals, the Clean Air Plan recommends specific control measures and actions. These control measures are grouped into various categories and include stationary- and area-source measures, mobile-source measures, transportation control measures, land-use measures, and energy and climate measures. The Clean Air Plan recognizes that, to a great extent, community design dictates individual travel mode and that a key long-term control strategy to reduce emissions of criteria pollutants, air toxics, and greenhouse gases from motor vehicles is to channel future Bay Area growth into communities where goods and services are located nearby and people have a range of viable transportation options. To this end, the Clean Air Plan includes 55 control measures aimed at reducing air pollutants in the SFBAAB.

The measures most applicable to the proposed project are transportation control measures and energy and climate control measures.

The compact urban development of the proposed project and high availability of viable transportation options would ensure that event center attendees and employees could bicycle, walk, and ride transit to and from the project site instead of taking trips via private automobile. These features ensure that the project would avoid substantial growth in automobile trips and vehicle miles traveled. The proposed project's 13,691 net new daily vehicle trips (weekday with concert event) during the operational phase would result in an increase in air pollutant emissions.

Transportation control measures that are identified in the Clean Air Plan are implemented by the *San Francisco General Plan* and the Planning Code,[74] for example, through the City's Transit First Policy, the bicycle parking requirements, and transit impact development fees.

Additionally, as described in Chapter 3, Project Description, the project would incorporate a TDM program. Compliance with these requirements would ensure the project includes relevant transportation control measures specified in the Clean Air Plan. Therefore, the proposed project would include applicable control measures identified in the Clean Air Plan and supports the Clean Air Plan's primary goals. Furthermore, Mitigation Measure M-AQ-2a, Reduce Operational Emissions, and Mission Bay FSEIR Mitigation Measure F.1 would promote additional strategies to reduce vehicle trips beyond those incorporated in the project, further supporting the Clean Air Plan's goals.

The proposed project includes sustainability measures that would serve to implement control measures of the 2010 CAP, including the land use/local impact measures and energy/climate measures of the 2010 CAP. The proposed development would be subject to a number of sustainability requirements, including the California CalGreen Code, City of San Francisco Green Building Code, Design for Development for the Mission Bay South Area, and the 2012 NBA Arena Design Standards – Sustainability Requirements. The project would be designed to Leadership in Energy and Environmental Design (LEED®) Gold standards. This would be achieved through incorporation of a variety of design features and implementation of practices during construction and operation to provide energy and water conservation and efficiency, encourage alternative transportation, promote a healthy indoor environment, minimize waste, and maximize recycling opportunities.

Disruption or Hindrance of CAP Control Measures. Examples of a project that could cause the disruption or delay of Clean Air Plan control measures are projects that would preclude the extension of a transit line or bike path or projects that propose excessive parking beyond City parking requirements. The proposed project would maintain the existing character of the project site, which is a dense, walkable urban area near a concentration of local transit service. It would not preclude the extension of a transit line or a bike path or any other transit improvement. The realigned Terry A. Francois Boulevard would contain — on the east side of the roadway — a two-way cycletrack (bike path). Thus, the project would not disrupt or hinder implementation of control measures identified in the Clean Air Plan.

Therefore, the proposed project would not conflict with, or obstruct implementation of the *2010 Clean Air Plan*, particularly with implementation of Mitigation Measure M-AQ-1 (Construction Emissions Minimization), Mitigation Measure M-AQ-2a (Reduce Operational Emissions), and Mitigation Measure M-AQ-2b (Emission Offsets), and this impact would be *less than significant with mitigation*.

[74] Although the Planning Code is not applicable within the Mission Bay Area, similar requirements are implemented pursuant to the Mission Bay South Design for Development.

Summary of Impact AQ-4

The project would be consistent with the 2010 CAP, assuming implementation of mitigation measures, which include offsetting emissions to below significance thresholds in addition to project-specific measures to reduce pollutant emissions. Additionally, the project would be consistent with the 2010 CAP by virtue of incorporation of control measures of the CAP, including land use/local impact measures and energy/climate measures as well as the transportation demand management measures incorporated in the proposed project. The proposed project would also not hinder implementation of the 2010 CAP. Therefore, the proposed project would not conflict with, or obstruct implementation of the *2010 Clean Air Plan*, and this impact would be *less than significant with mitigation*.

> **Mitigation Measure M-AQ-1: Construction Emissions Minimization** (see Impact AQ-1, above)
>
> **Mitigation Measure M-AQ-2a: Reduce Operational Emissions** (see Impact AQ-2, above)
>
> **Mitigation Measure M-AQ-2b: Emissions Offsets** (see Impact AQ-2, above)

Comparison of Impact AQ-4 to Mission Bay FSEIR Impact Analysis

The Mission Bay FSEIR identified Clean Air Plan consistency as a significant and unavoidable impact. This conclusion was based on: (1) the increase in population (819,500) would exceed that assumed in the Clean Air Plan at the time (795,800 in 2015); and (2) the increase in VMT was greater than the increase in population. No mitigation measures were identified with respect to this impact but presumably these would be the same as the operational air pollutant measures.

Based on the updated approach to analysis for the proposed project, the impact conclusion for the proposed project would have a less severe impact than what was identified in the FSEIR (i.e., less than significant with mitigation), and the project would not result in a new or substantially more severe significant impact than was previously identified.

Cumulative Impacts

Impact C-AQ-1: The project, in combination with other past, present, and reasonably foreseeable future projects, would contribute to cumulative regional air quality impacts. (Significant and Unavoidable with Mitigation)

As discussed above, regional air pollution is by its very nature a cumulative impact. Emissions from past, present, and future projects contribute to the region's adverse air quality on a cumulative basis. No single project by itself would be sufficient in size to result in regional nonattainment of ambient air quality standards. Instead, a project's individual emissions contribute to existing cumulative adverse air quality impacts.[75] The project-level thresholds for

[75] BAAQMD, *CEQA Air Quality Guidelines*, May 2011, page 2-1.

criteria air pollutants are based on levels by which new sources are not anticipated to contribute to an air quality violation or result in a considerable net increase in criteria air pollutants.

With implementation of Mitigation Measures M-AQ-1, M-AQ-2a, and M-AQ-2b, the proposed project's construction and operational emissions (Impacts AQ-1 and AQ-2) could be mitigated to below the project-level thresholds for criteria air pollutants (ROG and NOx). Mitigation Measure M-AQ-2b represents the lead agency's efforts to use offsets as air quality mitigation, and although offsets would be implemented through a known verifiable program well established by the BAAQMD, implementation of the mitigation measure is beyond the control of the project sponsor. Thus, the impact is conservatively considered *significant and unavoidable with mitigation*, and therefore, the proposed project would also be considered to result in a cumulatively considerable contribution to regional air quality impacts even with implementation of mitigation measures identified for Impacts AQ-1 and AQ-2, and the cumulative impact is also considered *significant and unavoidable with mitigation*.

Summary of Impact C-AQ-1

The analysis of construction-related and operational criteria pollutant impacts (Impact AQ-1 and Impact AQ-2, respectively) assess whether the proposed project would be considered to result in a cumulatively considerable contribution to regional and localized air quality impacts. The proposed project would result in significant and unavoidable air quality impacts after implementation of feasible mitigation measures identified in Impacts AQ-1 and AQ-2, and consequently, would result in a cumulatively considerable contribution to regional or local air quality impacts. Therefore, this impact would be *significant and unavoidable with mitigation*.

> **Mitigation Measure M-AQ-1: Construction Emissions Minimization** (see Impact AQ-1)
>
> **Mitigation Measure M-AQ-2a: Reduce Operational Emissions** (see Impact AQ-2)
>
> **Mitigation Measure M-AQ-2b: Emission Offsets** (see Impacts AQ-1 and AQ-2)

Comparison of Impact C-AQ-1 to Mission Bay FSEIR Impact Analysis

Cumulative criteria air pollutant emissions were identified as significant and unavoidable in the Mission Bay FSEIR. This was based on the significant and unavoidable finding at a project level.

Since the impact conclusion for the proposed project is the same, the project would not result in a new or substantially more severe significant impact than was previously identified in the Mission Bay FSEIR.

Impact C-AQ-2: The project, in combination with other past, present, and reasonably foreseeable future projects, could generate toxic air contaminants, including diesel particulate matter, and could expose sensitive receptors to substantial air pollutant concentrations. (Less than Significant with Mitigation)

As discussed above, the project site is not located in an Air Pollutant Exposure Zone. Impact AQ-3 addresses health risk exposures from TACs resulting from both construction and operation of the proposed project and adds them to the cumulative existing contributions of risks from TACs and $PM_{2.5}$ concentrations. The analysis then compares these cumulative totals to thresholds developed for the purposes of a cumulative impacts analysis. The HRA takes into account the cumulative contribution of localized health risks to sensitive receptors from sources included in the Citywide modeling plus the proposed project's sources.

The geographic scope of analysis for cumulative localized air pollutant exposure impacts encompasses potential new sensitive land uses or emissions sources that could be developed within approximately 1,000 feet of the proposed project site. Beyond 1,000 feet, CARB has found that ground-level TAC emissions to return to background levels.[76] This is because the contribution of project emissions would be greatly dispersed through both distance and intervening structures and their contribution would be expected to be minimal.

Section 5.1, Impact Overview, presents the list of reasonably foreseeable future projects in the vicinity, which in particular would include implementation of the University of California, San Francisco (UCSF) Long Range Development Plan (LRDP) for the Mission Bay campus and other nearby Mission Bay development projects. The UCSF LRDP EIR proposes new housing at Block 15 which is over 1,000 feet from the project site and would have impacts substantially less than those identified in Impact AQ-3 for both the UCSF Hospital Receptors and UCSF Hearst Tower receptor, both of which were identified as less than significant with mitigation.

Other future projects, whose emissions have not been incorporated into the existing Citywide health risk modeling, such as the proposed Pier 70 and Seawall Lot 337/Pier 48 mixed use developments would similarly be subject to CEQA requirements to analyze the health risk impact of their project. However, health risk impacts are localized and health risks from sources decrease substantially with increasing distance. Thus, cumulative impacts from the proposed Pier 70 and Seawall Lot 337/Pier 48 developments would not combine with the proposed project's emissions to substantially increase health risks within the project vicinity.

The Uber/ARE project on Blocks 26/27 is estimated to start construction by the end of 2015, and construction could be concurrent with the proposed project. This project is immediately north of the project site, across South Street, and immediately across Third Street from the nearest sensitive receptor to the project site, the UCSF Mission Bay housing at Hearst Tower. Although primarily designated as office use this development and any development in Mission Bay could include child care facilities and therefore have the potential to represent a future sensitive

76 California Air Resources Board, *Air Quality and Land Use Handbook: A Community Health Perspective, Page C-3,* April 2005 (hereinafter "ARB Air Quality and Land Use Handbook"). Available at http://www.arb.ca.gov/ch/handbook.pdf.

receptor. Occupancy of this cumulative, offsite project would likely not occur until 2017 at which time the construction of the proposed project would be in its third and final year. Consequently, sensitive receptors at this site would be exposed to at most eight months of the construction emissions, resulting in an excess cancer risk of about 12 in one million assuming minimum compliance with **Mitigation Measure M-AQ-1, Construction Emissions Minimization**. Adding this exposure to existing levels modeled by the City and the project contributions from generators and vehicles results in a cumulative exposure of 70 in a million, which would be below the cumulative threshold of 100 in one million. In addition the Uber/ARE project would be subject to Mission Bay FSEIR Mitigation Measure J.2: Child Care Development, which sets forth the Mission Bay Risk Management Plan requirements for child care facilities to ensure that human health and environmental risks are within acceptable limits. Consequently, the project's contribution to cumulative TAC exposure to receptors potentially proposed by future cumulative projects would be *less than significant with mitigation*.

Mitigation Measure M-AQ-1: Construction Emissions Minimization (see Impact AQ-1)

Comparison of Impact C-AQ-2 to Mission Bay FSEIR Impact Analysis

Cumulative impacts regarding TACs were identified as less than significant with mitigation in the Mission Bay FSEIR. This was based on the less than significant with mitigation finding at a project level. Since the impact conclusion for the proposed project is the same, the project would not result in a new or substantially more severe significant impact than was previously identified in the Mission Bay FSEIR.

5.5 Greenhouse Gas Emissions

5.5.1 Introduction

This section describes greenhouse gas (GHG) emissions and global climate change, the existing regulatory framework governing GHG emissions, and the potential impacts related to GHGs associated with implementation of the proposed project. The proposed project is evaluated for compliance with San Francisco's *Strategies to Address Greenhouse Gas Emissions*, recognized by the Bay Area Air Quality Management District (BAAQMD) as meeting the criteria of a qualified GHG Reduction Strategy.

5.5.2 Summary of Mission Bay FSEIR Greenhouse Gas Emissions Section

The Mission Bay FSEIR did not address GHG emissions as a distinct environmental topic. However, the Air Quality section of the Mission Bay FSEIR did acknowledge the effects of GHG emissions under the Setting section as well as the potential for the Mission Bay Redevelopment Plan to contribute to GHG emissions. The discussion indicated that the nature and extent of GHG emissions could not be quantified at that time, but because their effects on climate change occur on a global level, the Plan would not be expected to significantly alter the global atmospheric concentrations of GHG.

5.5.3 Setting

5.5.3.1 Greenhouse Gas Emissions and Climate Change

Gases that trap heat in the atmosphere are referred to as greenhouse gases (GHGs) because they capture heat radiated from the sun as it is reflected back into the atmosphere, much like a greenhouse does. The accumulation of GHGs contributes to global climate change. The primary GHGs, or climate pollutants, are carbon dioxide (CO_2), black carbon, methane (CH_4), nitrous oxide (N_2O), ozone, and water vapor.

Individual development projects contribute to the cumulative effects of climate change by emitting GHGs during demolition, construction, and operational phases. While the presence of the primary GHGs in the atmosphere is naturally occurring, CO_2, CH_4, and N_2O are also emitted from human activities, accelerating the rate at which these compounds occur within the earth's atmosphere. Emissions of CO_2 are largely by-products of fossil fuel combustion, whereas CH_4 results from off-gassing associated with agricultural practices and landfills. Black carbon has emerged as a major contributor to global climate change, possibly second only to CO_2. Black carbon is produced naturally and by human activities as a result of the incomplete combustion of fossil fuels, biofuels, and biomass.[1] N_2O is a byproduct of various industrial processes. Other

[1] Center for Climate and Energy Solutions. *What is Black Carbon?,* April 2010. Available online at: http://www.c2es.org/docUploads/what-is-black-carbon.pdf. Accessed January 24, 2015.

GHGs include hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride, and are generated in certain industrial processes. GHGs are typically reported in "carbon dioxide-equivalent" measures (CO_2E).[2]

There is international scientific consensus that human-caused increases in GHGs contribute to climate change. Many impacts resulting from climate change, including sea level rise, increased fires, floods, severe storms, and heat waves, already occur and will only become more severe and costly in the future. Secondary effects of climate change likely include impacts to agriculture, the state's electricity system, and native freshwater fish ecosystems; an increase in the vulnerability of levees such as in the Sacramento-San Joaquin Delta; changes in disease vectors; and changes in habitat and biodiversity.[3]

5.5.3.2 Greenhouse Gas Emission Estimates and Energy Providers in California

The California Air Resources Board (CARB) estimated that in 2010 California produced about 451.60 million gross metric tons of CO_2E (million $MTCO_2E$).[4] The CARB found that transportation is the source of 38 percent of the state's GHG emissions, followed by electricity generation (both in-state generation and imported electricity) at 21 percent, and industrial sources at 19 percent. Commercial and residential fuel use (primarily for heating) accounted for 10 percent of GHG emissions.[5] In San Francisco, motorized transportation and natural gas sectors were the two largest sources of GHG emissions, accounting for approximately 40 percent (2.1 million $MTCO_2E$) and 29 percent (1.5 million $MTCO_2E$) respectively, of San Francisco's 5.3 million $MTCO_2E$ emitted in 2010.[6] Electricity consumption (building operations and transit) accounts for approximately 25 percent (1.3 million $MTCO_2E$) of San Francisco's GHG emissions.[7]

Electricity in San Francisco is primarily provided by the Pacific Gas and Electricity Company (PG&E) and the San Francisco Public Utilities Commission (SFPUC). In 2010, electricity consumption in San Francisco was approximately 6.1 million megawatt-hours (MWh). Of this total, PG&E produces approximately 73 percent of the electricity distributed (4.5 million MWh; about 79 percent of San Francisco's electricity-driven GHG emissions), and the SFPUC produces approximately 14 percent of the electricity distributed (0.9 million MWh; about 0.01 percent of San Francisco's electricity-driven GHG emissions).[8]

---

2 Because of the differential heat absorption potential of various GHGs, GHG emissions are frequently measured in "carbon dioxide-equivalents," which present a weighted average based on each gas's heat absorption (or "global warming") potential.

7 *Ibid*.

8 *Ibid*. Note: the remainder of the electricity consumption is derived from third party generators or other suppliers.

The majority of land use projects in San Francisco are provided power by PG&E, whose 2010 power mix was as follows: 20 percent natural gas, 24 percent nuclear, 16 percent eligible renewables (described below), 16 percent large hydroelectric, 23 percent unspecified power, one percent coal, and one percent other fossil fuels.[9,10]

Muni, city buildings, and a limited number of other commercial accounts in San Francisco are provided energy by the SFPUC, which operates three hydroelectric power plants that are part of San Francisco's Hetch Hetchy water supply and distribution system. This system has the lowest GHG emissions of any large electric utility in California.[11]

5.5.4 Regulatory Framework

5.5.4.1 State Regulations

Executive Orders S-3-05 and B-30-15

In 2005, Executive Order (EO) S-3-05, set forth a series of target dates by which statewide emissions of GHGs need to be progressively reduced, as follows: by 2010, reduce GHG emissions to 2000 levels (approximately 457 million $MTCO_2E$); by 2020, reduce emissions to 1990 levels (estimated at 427 million $MTCO_2E$); and by 2050 reduce emissions to 80 percent below 1990 levels (approximately 85 million $MTCO_2E$). As discussed in the Setting section above, California produced about 452 million $MTCO_2E$ in 2010, thereby meeting the 2010 target date to reduce GHG emissions to 2000 levels. In April 2015, Governor Jerry Brown issued EO B-30-15, which set an additional statewide GHG reduction target of 40 percent below 1990 levels to be achieved by 2030.

Assembly Bill 32 and California Climate Change Scoping Plan

In 2006, the California legislature passed Assembly Bill No. 32 (California Health and Safety Code Division 25.5, Sections 38500, et seq., or AB 32), also known as the California Global Warming Solutions Act. AB 32 requires ARB to design and implement emission limits, regulations, and other measures, such that feasible and cost-effective statewide GHG emissions are reduced to 1990 levels by 2020.

Pursuant to AB 32, the ARB adopted a Scoping Plan in December 2008, outlining measures to meet the 2020 GHG reduction limits. In order to meet the goals of AB 32, California must reduce its GHG emissions by 30 percent below projected 2020 business-as-usual emissions levels, about

15 percent below 2008 levels.[12] The Scoping Plan estimates a reduction of 174 million $MTCO_2E$ from transportation, energy, agriculture, forestry, and other high global warming sectors, as shown in **Table 5.5-1**.[13]

TABLE 5.5-1
GHG REDUCTIONS FROM THE AB 32 SCOPING PLAN SECTORS[14,15]

	GHG Reductions (million MT CO_2E)
GHG Reduction Measures By Sector	
Transportation Sector	62.3
Electricity and Natural Gas	49.7
Industry	1.4
Landfill Methane Control Measure (Discrete Early Action)	1

jurisdictions.[16] The Scoping Plan also relies on the requirements of Senate Bill (SB) 375 (discussed below) to align local land use and transportation planning for achieving GHG reductions.

The Scoping Plan must be updated every five years to evaluate AB 32 policies and ensure that California is on track to achieve the 2020 GHG reduction goal. In 2014, CARB released the First Update to the Scoping Plan, which builds upon the Initial Scoping Plan with new strategies and recommendations. The First Update identifies opportunities to leverage existing and new funds to further drive GHG emission reductions through strategic planning and targeted low carbon investments. This update defines CARB's climate change priorities for the next five years and sets the groundwork to reach long-term goals set forth in EO S-3-05. The update highlights California's progress toward meeting the "near-term" 2020 GHG emission reduction goals in the original 2008 Scoping Plan. It also evaluates how to align the State's "longer-term" GHG reduction strategies with other State policy priorities for water, waste, natural resources, clean energy, transportation, and land use.[17]

Senate Bill 375

The Scoping Plan also relies on the requirements of Senate Bill 375 (SB 375), known as the Sustainable Communities and Climate Protection Act of 2008, to reduce carbon emissions from land use decisions. SB 375 requires regional transportation plans developed by each of the State's 18 Metropolitan Planning Organizations (MPOs) to incorporate a "sustainable communities strategy" (SCS) in each regional transportation plan that will then achieve GHG emission reduction targets set by CARB. For the Bay Area, the per-capita GHG emission reduction target is a 7 percent reduction by 2020 and a 15 percent reduction by 2035 from 2005 levels. The Metropolitan Transportation Commission's 2013 Regional Transportation Plan, Plan Bay Area, adopted in July 2013, is the region's first plan subject to SB 375 requirements.

Senate Bill 1078, 107, and X1-2 and Executive Order S-14-08 and S-21-09

California established aggressive Renewable Portfolio Standards under SB 1078 (Chapter 516, Statutes of 2002) and SB 107 (Chapter 464, Statutes of 2006), which require retail sellers of electricity to provide at least 20 percent of their electricity supply from renewable sources by 2010. EO S-14-08 (November 2008) expanded the State's Renewable Portfolio Standard from 20 percent to 33 percent of electricity from renewable sources by 2020. In September 2009, then-Governor Schwarzenegger continued California's commitment to the Renewable Portfolio Standard by signing EO S-21-09, which directed CARB to enact regulations to help California meet the Reviewable Portfolio Standard goal of 33 percent renewable energy by 2020.[18]

To codify the GHG reduction goal of 33 percent by 2020 for energy suppliers, SB X1-2 (Chapter 1, Statutes of 2011) was signed by Governor Edmund G. Brown, Jr., in April 2011. This Renewable

[17] ARB, "First Update to the AB 32 Scoping Plan," May 27, 2014. Available online at: http://www.arb.ca.gov/cc/scopingplan/document/updatedscopingplan2013.htm. Accessed January 23, 2015.

[18] California Energy Commission, *Renewables Portfolio Standard (RPS).* Available online at: http://www.energy.ca.gov/portfolio/. Accessed January 24, 2015.

Portfolio Standard preempts CARB's 33 percent renewable sources electricity standard and applies to all electricity suppliers (not just retail sellers) in the state, including publicly owned utilities, investor-owned utilities, electricity service providers, and community choice aggregators. All of these entities must adopt the new Renewable Portfolio Standard goals of 20 percent of retail sales from renewable sources by the end of 2013, 25 percent by the end of 2016, and 33 percent by the end of 2020.[19] Eligible renewable sources include geothermal, ocean wave, solar photovoltaic, and wind, but exclude large hydroelectric (30 MW or more). Therefore, any non-hydroelectric sources of electricity provided by the SFPUC are required to be 100 percent renewable.[20]

Assembly Bill 900

The Jobs and Economic Improvement Through Environmental Leadership Act [Assembly Bill 900 (AB 900)], signed by the Governor in September 2011 and effective on January 1, 2012, provides streamlined environmental review for "environmental leadership development projects" (leadership projects). Leadership projects include all of the following:

1. The project is residential, retail, commercial, sports, cultural, entertainment, or recreational in nature;
2. The project, upon completion, will qualify for LEED silver certification or better.
3. The project will achieve at least 10 percent greater transportation efficiency than comparable projects.
4. The project is located on an infill site and in an urbanized area.
5. The project is within a metropolitan planning organization for which a sustainable communities strategy or alternative planning strategy is in effect, and the California Air Resources Board has accepted that the strategy meets the adopted greenhouse gas reduction targets.

The Governor may certify a leadership project for streamlining under AB 900 if a number of conditions are met. One of the conditions is that the project will not result in any net additional greenhouse gas emissions, as determined by CARB. The procedures for this determination require an applicant to submit a proposed methodology and documentation to CARB that no net additional greenhouse gas emissions would result from the project; this includes quantification of direct and indirect greenhouse gas emissions associated with the project's construction and operation, including the project's energy use and transportation related emissions; and quantification of net emissions of the project after accounting for any mitigation measures. As described in Chapter 2, Introduction, the project sponsor applied for certification of the proposed project under AB 900, and on April 20, 2015, the CARB determined that the proposed event center and mixed-use development would not result in any net additional GHG emissions for

purposes of certification under AB 900.[21] On April 30, 2015, Governor Jerry Brown certified the proposed project as a leadership project under AB 900.[22]

5.5.4.2 Regional and Local Regulations and Plans

Regional

The BAAQMD is responsible for attaining and maintaining federal and state air quality standards in the San Francisco Bay Area Air Basin (SFBAAB), as established by the federal Clean Air Act (CAA) and the California Clean Air Act (CCAA), respectively. The CAA and the CCAA require plans to be developed for areas that do not meet air quality standards, generally. The most recent air quality plan, the 2010 Clean Air Plan, includes a goal of reducing GHG emission to 1990 levels by 2020 and to 40 percent below 1990 levels by 2035.

In addition, the BAAQMD established a climate protection program to reduce pollutants that contribute to global climate change and affect air quality in the SFBAAB; the program includes GHG-reduction measures that promote energy efficiency, reduce vehicle miles traveled, and develop alternative energy sources.[23]

The BAAQMD also assists lead agencies in complying with the requirements of CEQA regarding potentially adverse impacts to air quality with respect to their CEQA Air Quality Guidelines. The BAAQMD advises lead agencies to consider adopting a Greenhouse Gas Reduction Strategy capable of meeting AB 32 goals and then reviewing projects for compliance with the Greenhouse Gas Reduction Strategy.[24] This is consistent with the approach to analyzing GHG emissions in the CEQA Guidelines, Section 15183.5.

Local

San Francisco Greenhouse Gas Reduction Ordinance

In May 2008, the City and County of San Francisco (CCSF) adopted Ordinance No. 81-08 amending the San Francisco Environment Code to establish GHG emissions targets and departmental action plans and to authorize the San Francisco Department of the Environment to coordinate efforts to meet these targets. The City ordinance establishes the following GHG emissions reduction limits and target dates by which to achieve them: determine 1990 Citywide GHG emissions by 2008, the baseline level, with reference to which target reductions are set; reduce GHG emissions by

[23] Bay Area Air Quality Management District (BAAQMD), *Climate Protection Program.* Available online at: http://www.baaqmd.gov/?sc_itemid=83004271-3753-4519-8B09-D85F3FC7AE70. Accessed January 24, 2015.

[24] Bay Area Air Quality Management District (BAAQMD), *California Environmental Quality Act Air Quality Guidelines*, May 2012. Available online at:http://www.baaqmd.gov/~/media/Files/Planning%20and%20Research/CEQA/BAAQMD%20CEQA%20Guidelines_Final_May%202012.ashx?la=en. Accessed January 24, 2015.

25 percent below 1990 levels by 2017; reduce GHG emissions by 40 percent below 1990 levels by 2025; and reduce GHG emissions by 80 percent below 1990 levels by 2050. The City's GHG reduction targets are consistent with—in fact, more ambitious than—those set forth in Governor Brown's recent Executive Order B-30-15 by targeting a 40 percent reduction by 2025 rather than a 40 percent reduction by 2030.

San Francisco Greenhouse Gas Reduction Strategy

San Francisco has developed a number of plans and programs to reduce the City's contribution to global climate change and to meet the goals of the City's Greenhouse Gas Reduction Ordinance. San Francisco's Greenhouse Gas Reduction Strategy documents its actions to pursue cleaner energy, energy conservation, and alternative transportation and solid waste policies. For instance, the City has implemented mandatory requirements and incentives that have measurably reduced GHG emissions including, but not limited to, increasing the energy efficiency of new and existing buildings, installation of solar panels on building roofs, implementation of a green building strategy, adoption of a zero waste strategy, a construction and demolition debris recovery ordinance, a solar energy generation subsidy, incorporation of alternative fuel vehicles in the City's transportation fleet (including buses), and a mandatory recycling and composting ordinance. The strategy also identifies 42 specific regulations for new development that would reduce a project's GHG emissions.

San Francisco's policies and programs have resulted in a reduction in GHG emissions to below 1990 levels, exceeding statewide AB 32 GHG reduction goals. San Francisco's GHG emissions in 2010 were 5.3 million $MTCO_2E$, which represents a 14.5 percent reduction in GHG emissions compared to 1990 levels (6.2 million $MTCO_2E$). The reduction is largely a result of reduced GHG emissions from the electricity sector, from 2.0 million $MTCO_2E$ (1990) to 1.3 million $MTCO_2E$ (2010), and waste sector, from 0.5 million $MTCO_2E$ (1990) to 0.2 million $MTCO_2E$ (2010).[25]

5.5.5 Impacts and Mitigation Measures

5.5.5.1 Significance Thresholds

The project would have a potentially significant impact related to GHG emissions if the project were to:

- Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment; or

- Conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

[25] San Francisco Department of Environment (DOE), *San Francisco Climate Action Strategy, 2013 Update*.

5.5.5.2 Approach to Analysis

GHG emissions and global climate change represent cumulative impacts of human activities and development projects locally, regionally, statewide, nationally, and worldwide. GHG emissions from all of these sources cumulatively contribute to the significant adverse environmental impacts of global climate change. No single project could generate enough GHG emissions to noticeably change the global average temperature; instead, the combination of GHG emissions from past, present, and future projects around the world have contributed and will continue to contribute to global climate change and its associated environmental impacts.

The BAAQMD has prepared guidelines and methodologies for analyzing the impacts associated with GHG emissions. These guidelines are consistent with CEQA Guidelines Sections 15064.4 and 15183.5, which address the analysis and determination of significant impacts from a proposed project's GHG emissions. CEQA Guidelines Section 15064.4 allows lead agencies to rely on a qualitative analysis to describe GHG emissions resulting from a project. CEQA Guidelines Section 15183.5 allows for public agencies to analyze and mitigate GHG emissions as part of a larger plan for the reduction of greenhouse gases and describes the required contents of such a plan. Accordingly, San Francisco has prepared its own Greenhouse Gas Reduction Strategy (described above), which the BAAQMD has reviewed and concluded that "Aggressive GHG reduction targets and comprehensive strategies like San Francisco's help the Bay Area move toward reaching the State's AB 32 goals, and also serve as a model from which other communities can learn."[26]

Given that the City's local greenhouse gas reduction targets are more aggressive than the State and region's 2020 and 2030 GHG reduction targets and consistent with the long-term 2050 reduction targets, the City's Greenhouse Gas Reduction Strategy is consistent with the goals of EO S-3-05, EO B-30-15, AB 32, and the Bay Area 2010 Clean Air Plan. Therefore, proposed projects that are consistent with the City's Greenhouse Gas Reduction Strategy would be consistent with the goals of EO S-3-05, EO B-30-15, AB 32, and the Bay Area 2010 Clean Air Plan, would not conflict with these plans, and would therefore not exceed the GHG significance threshold.

The following analysis of the proposed project's impact on climate change focuses on the project's contribution to cumulatively significant GHG emissions. Given the analysis is in a cumulative context, this section does not include an individual project-specific impact assessment.

---

26 BAAQMD. Letter from J. Roggenkamp, BAAQMD, to B. Wycko, San Francisco Planning Department, October 28, 2010. Available online at: http://www.sf-planning.org/ftp/files/MEA/GHG-Reduction_Letter.pdf. Accessed January 24, 2015.

5.5.5.3 Impact Evaluation

Impact C-GG-1: The proposed project would generate greenhouse gas emissions, but not at levels that would result in a significant impact on the environment or conflict with any policy, plan, or regulation adopted for the purpose of reducing greenhouse gas emissions. (Less than Significant)

Individual projects contribute to the cumulative effects of climate change by directly or indirectly emitting GHGs during construction and operational phases. Direct operational emissions include GHG emissions from new vehicle trips and area sources (natural gas combustion). Indirect emissions include emissions from electricity providers, energy required to pump, treat, and convey water, and emissions associated with waste removal, disposal, and landfill operations.

The proposed project would increase the activity onsite primarily by introducing occupants of the new office buildings and commercial businesses as well as event attendees. Therefore, the proposed project would contribute to annual long-term increases in GHGs as a result of increased vehicle trips (mobile sources) as well as event-related, commercial, and office operations that would result in an increase in energy use, water use, wastewater treatment, and solid waste disposal. Construction activities would also result in temporary increases in GHG emissions. However, as described above under Regulatory Framework, the proposed project is a certified environmental leadership project under AB 900 and CARB has determined that the project would not result in any net additional GHG emissions due in part to the voluntary purchase of carbon credits by the project sponsor (see Improvement Measure I-C-GG-1, below).

Moreover, the proposed project would be subject to and required to comply with several regulations adopted to reduce GHG emissions as identified in the GHG Reduction Strategy. The proposed project would comply with the following regulations or their equivalent: Commuter Benefits Ordinance; Emergency Ride Home Program; Transportation Management Programs (see Project Description and Appendix TMP); Transit Impact Development Fee to the extent applicable under the Mission Bay Redevelopment Plan; Jobs-Housing Linkage Program (residential uses less than ¼ -mile north of the project site); Bicycle Parking requirements (the project would exceed these requirements and provide a total of 586 bicycle parking spaces); Fuel Efficient Vehicle and Carpool Parking (providing 51 carpool spaces and 51 fuel efficient and vehicle charging stations); San Francisco Green Building Requirements (increased energy efficiency, purchase of renewable energy credits, reduction of potable water consumption by about 35 percent, enhanced energy commissioning); San Francisco Stormwater Management Ordinance (low impact development practices including filtration basins, rain gardens, and approximately 50,000 square feet of self-treating green roofs); San Francisco Water Efficient Irrigation Ordinance (the project's landscaped areas include low-water use planting selections, use of sedum and allium-based green roof materials, and soil mix design for a high available water holding capacity); Mandatory Recycling and Composting Ordinance (paper, glass, corrugated cardboard, plastic, and metals would be collected on site for recycling, and recycling bins and composting containers would be located throughout the buildings); San Francisco Construction and Demolition Debris Recovery Ordinance (to be included as part of the construction specifications); Street Tree Planting Requirements for New Construction (the project includes 79 new street trees); Light Pollution Reduction (exterior lighting fixture selections will have minimum backlight/uplight/glare ratings as allowed by required illuminance levels); Construction Site Runoff Control (site is served by a separate storm sewer system and construction contractors would implement best management practices to comply with conditions of a site-specific stormwater pollution prevention plan); Enhanced Refrigerant Management; Finished Material Pollutant Control; and Regulation of Diesel Backup Generators.

These regulations, as outlined in San Francisco's *Strategies to Address Greenhouse Gas Emissions*, have proven effective as San Francisco's GHG emissions have measurably reduced when compared to 1990 emissions levels, demonstrating that the City has met and exceeded the GHG reduction goals specified in EO S-3-05, EO B-30-15, AB 32, and the Bay Area 2010 Clean Air Plan for the year 2020. The proposed project was determined to be consistent with San Francisco's GHG Reduction Strategy.[27] Other existing regulations, such as those implemented through AB 32, will continue to reduce a proposed project's contribution to climate change.

In addition to compliance with the applicable provisions of the San Francisco's GHG Reduction Strategy or their equivalents, the project has been certified by Governor Brown as a leadership project under the Jobs and Economic Improvement Through Environmental Leadership Act of 2011 (AB 900). As discussed under Regulatory Framework above, on April 20, 2015, CARB determined that based on the documentation submitted by the project sponsor, the proposed project would not result in any net additional GHG emissions for purposes of certification under AB 900.[28]

As part of the AB 900 application, the project sponsor has committed to purchase carbon credits from a qualified GHG emissions broker in an amount sufficient to offset all GHG emissions from project construction and operations, as reiterated in **Improvement Measure I-C-GG-1, Purchase Voluntary Carbon Credits**. Net additional GHG emissions would be calculated in accordance with the methodology agreed upon by CARB in connection with the AB 900 certification of the project.[29] Thus, the Governor's certification of the proposed project as a leadership project further supports the determination that the proposed project would not have a significant impact on global climate change due to GHG emissions.

Therefore, the proposed project's GHG emissions would not conflict with state, regional, and local GHG reduction plans and regulations, and because the proposed project would not result in any net additional GHG emissions, the project would not contribute to cumulative GHG

27 Greenhouse Gas Analysis: Compliance Checklist, May 22, 2015. This document is on file and available for public review at the San Francisco Planning Department as part of Case File No. 2014.1441E.

28 Corey, Richard W., Executive Director, Air Resources Board, 2015. Air Resources Board Executive Order G-15-022, Relating to Determination of No Net Additional Greenhouse Gas Emissions Under Public Resources Code section 21183, subdivision (c) for Golden State Warriors Event Center and Mixed-Use Development at Mission Bay Blocks 29-32, dated April 20, 2015.

29 Golden State Warriors, 2015. *Application for Environmental Leadership Development Project, Golden State Warriors Event Center and Mixed-Use Development at Mission Bay Blocks 29-32*, February 2015, and Addenda dated March 6, 2015 and March 16, 2015.

emissions impacts. As such, the proposed project would result in a *less-than-significant* impact with respect to GHG emissions.

Mitigation: Not required.

Improvement Measure I-C-GG-1: Purchase Voluntary Carbon Credits

***Construction Emissions*:** No later than six (6) months after the issuance of a Temporary Certificate of Occupancy for the project, the project sponsor shall provide to the Office of Community Investment and Infrastructure (OCII), a calculation of the net additional emissions resulting from the construction of the project, to be calculated in accordance with the methodology agreed upon by the California Air Resources Board (CARB) in connection with the AB 900 certification of the project. The project sponsor shall provide courtesy copies of the calculations to CARB and the Governor's office promptly following transmittal of the calculations to OCII. The project sponsor shall enter into one or more contracts to purchase voluntary carbon credits from a qualified greenhouse gas emissions broker in an amount sufficient to offset the construction emissions. The project sponsor shall provide courtesy copies of any such contracts to the ARB and the Governor's office promptly following the execution of such contracts.

***Operational Emissions*:** No later than six (6) months after project stabilization, to be defined as the date following project completion when the project is 90 percent leased and occupied (and with respect to the arena component, 90 percent of the available booking dates are utilized), the project sponsor shall submit to OCII a projection of operational emissions arising from the project, based on data accumulated to that date and reasonable projections of operational emissions for the useful life of the project (30 years), to be calculated in accordance with the methodology agreed upon by CARB in connection with the AB 900 certification of the project. The project sponsor shall provide courtesy copies of the calculations to CARB and the Governor's office promptly following transmittal of the calculations to OCII. The project sponsor shall enter into one or more contracts to purchase voluntary carbon credits from a qualified greenhouse gas emissions broker in an amount sufficient to offset the operational emissions, on a net present value basis in light of the fact that the project sponsor is proposing to acquire such credits in advance of any creation of the emissions subject to the offset. The project sponsor shall provide courtesy copies of any such contracts to CARB and the Governor's office promptly following the execution of such contracts.

Comparison of Impact C-GG-1 to Mission Bay FSEIR Impact Analysis

The Mission Bay FSEIR did not specifically address impacts associated with GHG emissions. However, because the proposed project would have a less-than-significant impact on GHG emissions, the project would result in no new or substantially more severe significant impacts than those previously identified in the FSEIR.

5.6 Wind and Shadow

5.6.1 Introduction

This section of the SEIR analyzes potential wind and shadow impacts that could occur as a result of the proposed project, and assesses the potential for project implementation to adversely affect existing wind and shadow patterns. The analyses in this section are based in part on a wind study prepared by Rowan Williams Davies & Irwin Inc. (RWDI)[1], and a shadow analysis conducted by ESA (see Appendix WS).

5.6.2 Summary of Wind and Shadow Impacts in Mission Bay FSEIR

5.6.2.1 Summary of Wind Impacts in Mission Bay FSEIR Initial Study Air Quality/Climate Section

The Mission Bay FSEIR Initial Study Air Quality/Climate section discussed wind significance criteria and impacts. The Mission Bay FSEIR Initial Study Air Quality/Climate section reported that while the City Planning Code contained specific wind hazard and comfort criteria for evaluating wind effects of new buildings in the Downtown Commercial (C-3) District and the Rincon Hill, Van Ness Avenue and South of Market areas, there were no wind criteria in the City Planning Code that specifically applied to the Mission Bay Plan area.

The Mission Bay FSEIR Initial Study summarized the wind analysis from the Mission Bay FEIR, and reported that proposed buildings 100 feet or higher could generate pedestrian-level wind effects, including increased wind speeds and turbulence (i.e., variability in wind speed). The Mission Bay FSEIR Initial Study also reported that buildings up to 100 feet in height would not be expected to generate hazardous winds. Hazardous winds are defined in the City Planning Code Section 148 as an hourly average of 26 miles per hour (mph), for more than any single hour of the year. The Mission Bay FSEIR Initial Study reported that the extent and magnitude of wind effects attributable to new buildings developed within the Mission Bay Plan area would depend on the actual design, height, bulk and placement of each specific structure in relationship to adjacent buildings, streets and open space areas.

The Mission Bay FSEIR Initial Study indicated that while the standards of City Planning Code Section 148 do not apply to the Mission Bay plan area, Section 148's wind standards nonetheless provide an appropriate methodology and criteria for the analysis of wind effects in the Plan area. The Mission Bay FSEIR Initial Study included Mitigation Measure D.7, adapted from the Mission Bay FEIR, that required wind review, including wind tunnel testing, of proposed structures within the Mission Bay Plan area over 100 feet in height, which would have the potential to create wind hazards. The mitigation measure also provided for design-specific analysis of wind hazards of

[1] Rowan Williams Davies & Irwin Inc., *Warriors Arena, San Francisco California, Pedestrian Wind Study*, April 23, 2015.

individual projects and a basis to incorporate design modifications to reduce significant wind hazards. With implementation of this mitigation measure, the Mission Bay FSEIR concluded that Mission Bay plan wind impacts would be less than significant.

5.6.2.2 Summary of Shadow Impacts in Mission Bay FSEIR Initial Study Air Quality/Air Climate Section

The Mission Bay FSEIR Initial Study Air Quality/Climate section discussed shadow significance criteria and impacts. The Mission Bay FSEIR Initial Study Air Quality/Climate section reported that City Planning Code Section 295 (Sunlight Ordinance), which provides for the protection of public open spaces under the jurisdiction of the City Recreation and Parks Department from shadowing from new structures, did not apply to proposed development within the Mission Bay plan area.

The Mission Bay FSEIR Initial Study included a shadow analysis to assess potential shading effects of full development under the Mission Bay plan by using generalized buildings masses for the land uses and maximum height zones proposed by the Mission Bay plan. The shadow analysis revealed that proposed development under the Mission Bay plan would not shade any nearby City Recreation and Parks Department open space area at any time, and consequently, would have a less-than-significant effect on these facilities.

The shadow analysis also indicated that development under the Mission Bay plan would shade open space areas within the Mission Bay plan area, including proposed open space area near the waterfront of the Bay along the eastern plan area boundary, proposed open space along the China Basin Channel, and the proposed open space areas along Mission Bay Boulevard. The Mission Bay FSEIR Initial Study included Mitigation Measure D.8, adapted from the Mission Bay FEIR, which required analysis of potential shadows on existing and proposed open spaces during the building design and review process for any development that would exceed the design height and/or bulk criteria of the plan. With implementation of this mitigation measure, the Mission Bay FSEIR concluded that Mission Bay plan shadow impacts on open space within the Mission Bay plan area would be less than significant.

The Mission Bay FSEIR Initial Study also determined that Mission Bay plan shading effects on vegetation or wildlife within or near the Plan area, including along the Bay shore and at China Basin Channel, would be less than significant.

5.6.3 Setting

5.6.3.1 Wind

San Francisco's Existing Wind Environment

In San Francisco, average winds speeds are the highest in the summer and lowest in winter. However, the strongest peak wind speeds occur in winter. The highest average wind speeds occur in mid-afternoon and the lowest in the early morning. Based on over 40 years of recordkeeping, the highest mean hourly wind speeds (approximately 20 mph) occur mid-afternoon in July, while the lowest mean hourly wind speeds (in the range of 6 to 9 mph) occur throughout the day in November.

Meteorological data collected at the old San Francisco Federal Building at 50 United Nations Plaza over a 6-year period[2] show that westerly[3] through northwesterly winds are the most frequent and strongest winds during all seasons. Of the 16 primary wind directions, four have the greatest frequency of occurrence: these are northwest, west-northwest, west, and southwest. Analysis of the Federal Building wind data shows that during the hours from 6:00 a.m. to 8:00 p.m., about 70 percent of the winds blow from five adjacent directions of the 16 directions, as follows: northwest (10 percent of all winds), west-northwest (14 percent of all winds), west (35 percent of all winds), west-southwest (accounting for 2 percent of all winds), and southwest (9 percent of all winds). Over 90 percent of all measured winds with speeds over 13 mph blow from these five directions. The other 10 percent of winds over 13 mph are from storms and can come from any other direction.

Wind Effects on People

The comfort of pedestrians varies under different conditions of sun exposure, temperature, clothing, and wind speed.[4] Winds up to about 4 mph have no noticeable effect on pedestrian comfort. With speeds from 4 to 8 mph, wind is felt on the face. Winds from 8 mph to 13 mph will disturb hair, cause clothing to flap, and extend a light flag mounted on a pole. Winds from 13 to 19 mph will raise loose paper, dust, and dry soil, and will disarrange hair. For winds from 19 to 26 mph, the force of the wind will be felt on the body. With 26 to 34 mph winds, umbrellas are used with difficulty, hair is blown straight, there is difficulty in walking steadily, and wind noise is unpleasant. Winds over 34 mph and gusts can blow people over.

Wind Effects from Buildings

Tall buildings and exposed structures can strongly affect the wind environment for pedestrians. A building that stands alone or is much taller than the surrounding buildings can intercept and redirect winds that might otherwise flow overhead and bring them down the vertical face of the building to ground level, where they create ground-level wind and turbulence. These redirected winds can be relatively strong and turbulent, and may in some instances be incompatible with the intended uses of nearby ground-level spaces. Moreover, structure designs that present tall flat surfaces square to strong winds can create ground-level winds that can prove to be hazardous to pedestrians in the vicinity. Conversely, a building with a height that is similar to the heights of surrounding buildings typically would cause little or no additional ground-level wind acceleration and turbulence.

---

[2] Arens, E. *et al.*, "Developing the San Francisco Wind Ordinance and its Guidelines for Compliance," Building and Environment, Vol. 24, No. 4, p. 297-303, 1989.

[3] Wind directions are reported as directions from which the winds blow.

[4] Lawson, T.V. and A.D. Penwarden, "The Effects of Wind on People in the Vicinity of Buildings," Proceedings of the Fourth International Conference on Wind Effects on Buildings and Structures, London, 1975, Cambridge University Press, Cambridge, U.K., 605-622 1976.

Thus, wind impacts are generally caused by large building masses extending substantially above their surroundings, and by buildings oriented so that a large wall catches a prevailing wind, particularly if such a wall includes little or no articulation. In general, new buildings less than approximately 80 feet in height are unlikely to result in substantial adverse effects on ground-level winds such that pedestrians would be uncomfortable. Such winds may occur under existing conditions, but shorter buildings typically do not cause substantial changes in ground-level winds.

Wind Patterns in the Mission Bay Plan Area Vicinity

As discussed above, in San Francisco, including Mission Bay, over 90 percent of all measured winds with speeds greater than 13 mph blow from the northwest, west-northwest, west, and west-southwest. These are the directions of primary concern for potential wind effects of the proposed project.

The wind conditions for pedestrians in the Mission Bay Plan area are determined by the interactions between the higher-speed northwest, west-northwest, west and southwest winds, and the combined effects of the Mission Bay Plan street grid and the large footplate buildings within the Plan area. The west and the west-northwest winds, which in combination make up nearly half of all winds, align closely with the street grid and contribute to the strong winds that flow along the east-west-oriented streets within the Plan area. Although the northwest and southwest winds are misaligned with the street grid, both also contribute to winds flowing eastward along the east-west-oriented streets. Located on the eastern waterfront of San Francisco, the project site is fully exposed to storm winds that approach from over the Bay from the southeast through the east and northeast.

The existing pedestrian wind conditions on large vacant parcels of land in the Mission Bay South Plan area can be characterized as windy. However, prior wind tunnel testing conducted within Mission Bay South Plan area has demonstrated that existing wind conditions within the Plan area have improved over time as planned buildings have been constructed in accordance with the *Mission Bay South Design for Development* (see *Regulatory Framework,* below). Groups of buildings built according to these guidelines substantially slow winds in their vicinity.

5.6.3.2 Shadow

Background

In an urban environment, shadow is a function of the height, size, and massing of buildings and other elements of the built environment, and the angle of the sun. The angle of the sun varies due to the time of day (from rotation of the earth) and the change in seasons (due to the earth's elliptical orbit around the sun and the earth's tilted axis). The longer mid-day shadows are cast during the winter (when the mid-day sun is lowest in the sky) and the shorter mid-day shadows are cast during the summer (when the mid-day sun is higher in the sky). At the time of the summer solstice (which falls approximately on June 21 of every year), the mid-day sun is highest in the sky, and the longest day and shortest night occur on this date. Conversely, the shortest day and longest night occur on the winter solstice (which falls on approximately December 21 of every year). The vernal and fall equinoxes (when day and night are equal in length) represent the halfway point between solstices.

Existing/Planned Open Spaces Under Public Jurisdiction in the Vicinity of the Project Site

Bayfront Park is a planned linear park comprising Mission Bay plan parcels P21 through P24, and when completed, will extend from Mission Bay Boulevard south to Mariposa Street. The north portion of the park (P21, located east of Terry A. Francois Boulevard, between Mission Bay Boulevard South and just south of Pierpoint Lane) is complete, and includes a landscaped parking lot and boat launch. Construction is underway in 2015 for the south portion of Bayfront Park (P23 and P24, located west of Terry A. Francois Boulevard, between 16th Street and Mariposa Street), and construction of this portion of the park will be complete by the end of 2016. Following realignment of Terry A. Francois Boulevard, the central portion (P22) of Bayfront Park located east of the project site and consisting of approximately 5.5 acres will be developed. Potential park uses for this portion of Bayfront Park being considered at this time include, but are not limited to, pathways, outdoor performance area, kiosks, outdoor dining areas, and informal playing field(s). Both the realignment of Terry A. Francois Boulevard and Bayfront Park public access improvements on P22 are triggered by development on Block 29-32 and would be implemented by the master developer, FOCIL-MB, LLC, prior to occupancy of buildings at the project site.

Agua Vista Park is an existing shoreline landscaped area and fishing pier located east of the project site across from the existing alignment of Terry A. Francois Boulevard. Agua Vista Park is on Port of San Francisco property and is outside of the Mission Bay plan area. The Port is currently renovating Agua Vista Park, include new pathways, seating areas, interpretation and/or fishing facility improvements; these improvements are planned to be completed in August 2015.

5.6.4 Regulatory Framework

Development within the Mission Bay South Redevelopment Plan Area, including Blocks 29-32, is subject to the development controls of the South Plan, the *Mission Bay South Design for Development* (South Design for Development), as amended, and other related documents. The South Plan and South Design for Development supersede the City's *Planning Code*, except as otherwise specifically provided in those documents and associated documents for implementing the Plans. The regulatory framework discussion presented below focuses on the guidelines and design standards contained in the Mission Bay South Design for Development that are applicable to the proposed project.

5.6.4.1 Wind

Mission Bay South Design for Development

The Mission Bay South Design for Development includes *Wind Analysis* standards for new development in Mission Bay South. These standards were prepared with the objective to use all feasible means to eliminate wind hazards and to reduce adverse wind impacts, including potentially uncomfortable wind conditions. The Mission Bay South Design for Development states that wind review, including potential wind tunnel testing, is required for all projects that include buildings over 100 feet in height. The Mission Bay South Design for Development specifies that the wind analysis shall be conducted to assess wind conditions for the project in conjunction with the anticipated pattern of development on surrounding blocks.

The Mission Bay South Design for Development also provides design guidelines for new development within Mission Bay South on blocks that would be exposed to winds from the west or north-west, particularly if they front open space. Examples include modulation of western facades through the use of architectural devices (e.g., surface articulation, variation of planes, wall surfaces, and heights; and placement of stepbacks, courtyards, plazas, and other features); landscaping in appropriate locations and use of porous materials (vegetation, hedges, screens, latticework, perforated or expanded metal); avoidance of use of "breezeways" or notches at the upwind corners of the building, and use of building setbacks to reduce ground level wind accelerations.

5.6.4.2 Shadow

Mission Bay South Design for Development

The Mission Bay South Design for Development includes *Sunlight Access to Open Space* design standards. These standards were prepared with the objective of encouraging new developments to ensure sunlight access to public open spaces and limit the extent and duration of shadows on these public open spaces. The South Design for Development notes that shadow studies have determined that development complying with the design standards will reasonably limit areas of shadow on public open spaces during the active months of the year (March to September) and during the most active times of the day (10:00 a.m. to 4:00 p.m.). The South Design for Development requires that additional shadow analysis be conducted for a project that would need a variance from South Design for Development's design standards for height, bulk and coverage and streetwall.

5.6.5 Impacts and Mitigation Measures

5.6.5.1 Significance Thresholds

Wind

The proposed project would have a significant impact related to wind if it were to:

- Alter wind in a manner that substantially affects public areas.

As discussed above, while City Planning Code Section 148 does not apply to the Mission Bay Plan area, Section 148's wind standards nonetheless provide an appropriate methodology and criteria for the analysis of wind effects in the Plan area. Consequently, for the purposes of CEQA review, an exceedance of the Planning Code's wind hazard criterion is used in this SEIR as the standard for determining whether the project would alter pedestrian winds in a manner that would substantially alter public areas.

Shadow

The proposed project would have a significant shadow impact if it were to create new shadow in a manner that would:

- Substantially affect the use of publicly accessible open space or outdoor recreation facilities or other public areas.

5.6.5.2 Approach to Analysis

Wind

The methodology and the criteria for analyzing potential project wind impacts in this SEIR are derived from Section 148 of the Planning Code. Section 148 establishes a wind hazard criterion, whereby project buildings may not cause wind speeds that meet or exceed 26 mph, averaged for a full hour for any hour of the year.[5] Potential project exceedance of this hazard criterion in off-site public areas would be a significant environmental impact. Wind effects on on-site publically accessible areas are not considered a significance threshold.

Section 148 also establishes wind comfort criterion, whereby a project shall not cause ground-level wind currents to exceed, more than 10 percent of the time, 11 mph in areas of substantial pedestrian use, and 7 mph in public seating areas.[6] The Section 148 wind comfort criterion is not used to judge significance of project wind impacts in the Mission Bay Plan area and in this SEIR. Accordingly, exceedance of wind speeds[7] that exceed wind comfort criteria but do not reach hazard levels would not be a significant impact, and accordingly, would not require mitigation. Nevertheless, project effects on wind comfort are presented in this SEIR for informational purposes.

A wind tunnel test was conducted by RWDI in April, 2015 to characterize the pedestrian wind environment that currently exists and to determine future wind conditions on sidewalks and open spaces around the project site should the project be constructed. A one-inch-to-25-foot scale model of the project site and vicinity was constructed in order to simulate existing and existing-plus-project wind conditions. The wind model included all relevant surrounding buildings within a 1,200 foot radius of the center of the project site, including both existing and cumulative conditions.

The wind tunnel test measured wind speeds for the existing setting and the existing-plus-project scenarios, as well as a project-plus-cumulative scenario. Pedestrian-level wind speeds were measured at up to 142 on- and off-site locations (depending on the test scenario), that were selected for the study area to quantify resulting pedestrian-level winds on sidewalks and in other publically accessible spaces where the project would be expected to have the most effect on winds. Locations for wind speed sensors, or study test points, were selected to indicate how the general flow of winds would be directed around the new buildings. Consistent with Section 148, the locations of interest are public sidewalks and public parks, including areas of substantial pedestrian use and/or public seating areas. As a result, test points were included along sidewalks,

---

5 The wind hazard criterion is derived from the wind condition that would generate a 3-second gust of wind at 20 meters per second, a commonly used guideline for wind safety. This wind speed, on an hourly basis, is a 26 mph average for a full hour. Because the original Federal Building wind data were collected at one-minute averages, the 26 mph hourly average is converted to a one-minute average of 36 mph, which is used to determine compliance with the 26 mph one-hour hazard criterion in the *Planning Code*. (Arens, E. *et al.*, "Developing the San Francisco Wind Ordinance and its Guidelines for Compliance," Building and Environment, Vol. 24, No. 4, p. 297-303, 1989.)

6 The wind comfort criteria are defined in terms of *equivalent wind speed*, which is an average wind speed (mean velocity), adjusted to include the level of gustiness and turbulence. *Equivalent wind speed* is defined as the mean wind velocity, multiplied by the quantity (one plus three times the turbulence intensity) divided by 1.45. This calculation magnifies the reported wind speed when turbulence intensity is greater than 15 percent.

7 Throughout this document, unless otherwise stated, use of the term "wind speeds" in connection with the wind-tunnel tests refers to equivalent wind speeds that are exceeded 10 percent of the time.

near existing/planned open space and other areas of substantial pedestrian use. Consistent with City guidance, the wind analysis results presented for the various scenarios in this SEIR do not consider existing or planned landscaping.

In accordance with the protocol for wind tunnel testing under Section 148, the three scenarios were tested for each of four prevailing wind directions: northwest, west-northwest, west, and west-southwest. These winds are the most common in San Francisco, including within Mission Bay, and are therefore most representative for evaluation of the proposed project.

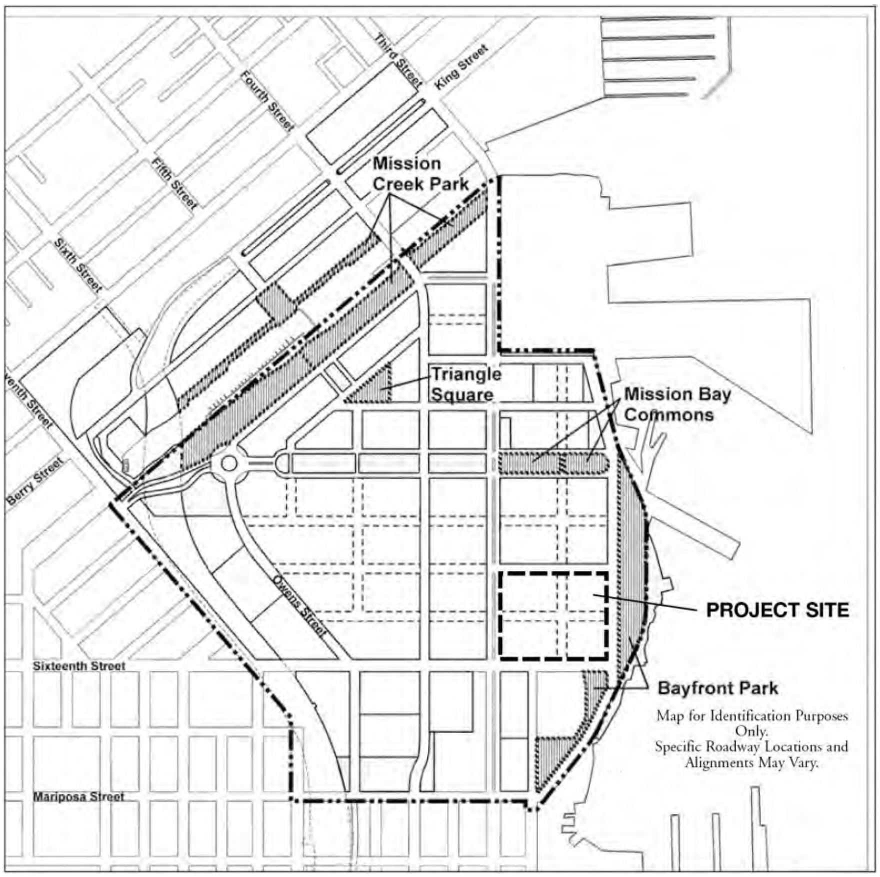
Shadow

For projects subject to a shadow analysis per the South Design for Development, the amount of area shadowed, the duration of the shadow, and the importance of sunlight to the use patterns of open spaces are taken into account when determining the impact of shadows from development. The South Design for Development provides the following methodology:

- For the purposes of assessing the impact of shadows on Mission Bay open spaces, open spaces have been divided into four areas: Mission Creek Park (which includes both North and South), Bayfront Park, Triangle Square, and the section of Mission Bay Commons, between Third Street and Terry Francois Boulevard. (See **Figure 5.6-1,** below, for project location in relation to the existing/planned Mission Bay South open spaces.)
- Shadow analysis should study the area of public open space in continuous shadow for periods of one hour, during the most active months of the year (March to September) and during the most active times of the day (10:00 a.m. to 4:00 p.m.).
- Analysis for a specific development proposal should take into account aggregate shadow impacts from all buildings over 40 feet in height adjacent to the public open space. For the purpose of shadow analysis, undeveloped parcels should be analyzed using either approved plans for future development or a plan that resembles the maximum allowable building envelope for that parcel.
- The total area of each of the described public open spaces should be the basis for shadow calculation. To reasonably limit areas of open space in continuous shadow for extended periods of time, the area of public open space in continuous shadow for a period of one hour from March to September between 10:00 a.m. and 4:00 p.m. should not exceed the following percentages:

Mission Creek Park:	13 percent
Bayfront Park:	20 percent
Triangle Square	17 percent
Mission Bay Commons	11 percent

As shown in **Figure 5.6-1**, given the proposed project's location, the purpose of this shadow analysis within the Mission Bay South plan area is to evaluate the potential shadow impacts on the planned Bayfront Park, a linear park that will extend from Mission Bay Boulevard south to Mariposa Street. No other existing or planned open space in the Mission Bay South plan area, including Mission Bay Commons, Mission Creek Park, Triangle Square, or Mariposa Park would be shadowed by the proposed project.



SOURCE: South Design for Development, 2004

Figure 5.6-1
Existing/Planned Public Open Space in Mission Bay South

To evaluate the shadow impact of the proposed project, ESA prepared an up-to-date three-dimensional (3-D) model of the Mission Bay South plan area, which included the following:

- Current ground and roadway elevations for the study area in the 3-D model using the maps provided by the Office of Community Investment and Infrastructure (OCII).
- The digital 3-D model of the proposed event center and mixed-use development as provided by the sponsor.
- Cumulative development in the study area consistent with the maximum dimensions and bulks provided for in the South Design for Development.

ESA conducted a shadow screening study for the proposed project by casting shadows on the hour starting at noon and 4:00 p.m. continuing through the 21st of each month of concern – March, April, May, June, July, August, and September. (As discussed in the Setting, the equinoxes and solstices occur on approximately the 21st of the month, and consequently, are representative of the entire month). Given the project site's location relative to Bayfront Park, there is no potential for project shadows to be cast on Bayfront Park between 10:00 a.m. and noon, and consequently, no shadow screening images were needed for times before noon.

Images of the resulting shadows cast for the study months/times are presented in **Appendix WS**.

Given that this shadow analysis follows the methodology from the South Design for Development, which requires the analysis "take into account shadow impacts from all building development over 40 feet in height adjacent to public open space," the shadow analysis for this SEIR is essentially a cumulative analysis and project-specific impacts are addressed within the cumulative context.

5.6.5.3 Impact Evaluation

Wind

Wind Hazards at Off-site Public Areas

Impact WS-1: The project would alter wind in a manner that would substantially affect off-site public areas. (Significant and Unavoidable with Mitigation)

The proposed project would include development of an event center, office and retail buildings, and other structures that would have the potential to alter winds off-site, including at pedestrian use areas such as public walkways and public open space in the project vicinity.

As discussed in the Setting, prior wind tunnel tests conducted within the Mission Bay South Plan area have demonstrated that historical wind conditions within the Plan area have improved over time as planned buildings have been constructed in accordance with the *Mission Bay South Design for Development.* This general trend is expected to continue as more buildings are constructed in the Plan area. Accordingly, as more buildings are built and fill in vacant sites in the Plan area, wind speeds in pedestrian areas around the buildings will generally continue to decrease.

As discussed under Section 5.6.5.2, Approach to Analysis, a wind tunnel test was conducted to define the pedestrian wind environment that currently exists, and to determine future wind conditions on public use areas around the project site with implementation of the project. **Table 5.6-1** presents the wind analysis results, namely the 10-percent exceeded equivalent wind speeds and the number of hours per year the wind hazard criterion would be exceeded at 46 off-site study test points located on public walkways along the site perimeter and vicinity for the existing and existing-plus-project wind scenarios. **Figure 5.6-2** presents a map showing the location of the off-site wind test points, including the location of wind hazards for the existing-plus-project scenario.

Existing Wind Hazard Conditions. Under existing conditions, the wind hazard criterion is exceeded at seven test locations on public walkways in the project vicinity. Currently, five test locations with wind hazards occur along 16th Street at test points adjacent to, across the street from, or upwind of the project site, one wind hazard location occurs along Gene Friend Way upwind of the project site, and one wind hazard location occurs on South Street adjacent to the project site. The total duration of the existing wind hazards at the seven locations on public walkways in the project vicinity is 106 hours per year, with 101 of those hours occurring at the five test points along 16th Street.

OCII Case No. ER 2014-919-97; Planning Department Case No. 2014.1441E:
Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 5.6-2
Existing Plus Project Wind Hazard Conditions

Existing-Plus-Project Wind Hazard Conditions at Off-site Public Use Areas. Development of the proposed project would alter wind speeds among individual study test points at off-site public walkways. Under existing-plus-project conditions, the total net number of off-site study test points at which wind speed would exceed the wind hazard criterion would be reduced from 7 to 6. However, there would also be a net increase in the total duration of wind hazards on the off-site public walkways in the project vicinity, increasing from 106 hours per year under existing conditions to 139 hours per year under existing-plus-project conditions (an increase of 33 hours).

When considering individual wind test points, the proposed project would result in the following changes to the wind environment in the project vicinity compared to existing conditions (see Figure 5.6-2 for test point locations):

- Create new exceedances of the wind hazard criterion at two test points: at the southeast corner of Third Street and 16th Street (Test Point No. 6: 39 hours per year); and on the north side of South Street between Third Street and Bridgeview Way across from the project site (Test Point No. 50: 5 hours per year);
- Increase the duration of two existing wind hazard exceedances: at the southeast corner of 16th Street and Illinois Street (Test Point No. 99: 6 hour increase per year); and at the southwest corner of Third Street and 16th Street (Test Point No. 106: 7 hour increase per year);
- Decrease the duration of two existing wind hazards: at the northwest corner of Third Street and 16th Street (Test Point No. 1: 1 hour decrease per year); and on 16th Street between Third and Fourth Streets (Test Point No. 105: 13 hour decrease per year) and
- Eliminate three existing exceedances of the wind hazard criterion: at the northeast corner of Third Street and 16th Street (Test Point No. 7: 6 hours eliminated per year); on South Street adjacent to the site (Test Point No. 54: 3 hours eliminated per year); and on Gene Friend Way adjacent to UCSF Hearst Tower (Test Point No. 103: 1 hour eliminated per year).

It should be noted that the wind test results indicate that under existing-plus-project conditions, no wind hazard exceedances would occur on public walkways located on the east side of the project site. Given that the planned Bayfront Park is located even further east, it can also be inferred from the wind test data that the project would not cause a new wind hazard within the planned Bayfront Park.

In summary, the project would result in a net increase in the total duration of the wind hazard exceedance at off-site public walkways in the project vicinity. Consequently, the project would alter wind in a manner that would substantially affect off-site public areas, and accordingly, the impact would be significant. **Mitigation Measure M-WS-1**, identified below, describes potential design measures that would serve to reduce or avoid related project wind hazards. Preliminary evaluation by the project sponsor of certain potential on-site design modifications indicate such modifications would be effective in reducing the project wind hazard impact to a less than significant level. However, given that the project design is not yet finalized, the impact is conservatively identified as *significant and unavoidable with mitigation*. It should be noted that the project impact discussed above is identified only for the interim conditions prior to implementation of planned cumulative development in the project vicinity. As described in

Impact C-WS-1, below, under cumulative-plus-project conditions, wind hazard impacts would be less than significant.

Mitigation Measure M-WS-1: Develop and Implement Design Measures to Reduce Project Off-site Wind Hazards

The project sponsor shall develop and implement design measures to reduce the identified project off-site wind hazards to the extent feasible. This may include on-site project design modifications or additions, additional on-site landscaping; and the implementation of potential additional off-site streetscape landscaping or other off-site wind-reducing features. Potential on- and/or off-site project site wind-reduction design measures developed by the sponsor would be coordinated with, and subject to review and approval, by OCII.

Comparison of Impact WS-1 to Mission Bay FSEIR Impact Analysis

As discussed under Summary of Impacts in the Mission Bay FSEIR, the Mission Bay FSEIR reported that proposed buildings 100 feet or higher could generate pedestrian-level wind effects, including increased wind speeds and turbulence. The Mission Bay FSEIR determined that with implementation of Mitigation Measure D.7, which required wind review, including wind tunnel testing, of proposed structures over 100 feet in height, and provided for design-specific analysis of wind hazards and a basis to incorporate design modifications to reduce significant wind hazards, that Mission Bay plan wind impacts would be less than significant.

Consistent with Mission Bay FSEIR Mitigation Measure D.7 (and the South Design for Development *Wind Analysis* standards), wind tunnel testing and analysis was conducted for the proposed project. As discussed above, project wind hazard impacts at off-site public areas are conservatively determined to be significant. If implementation of Mitigation Measure M-WS-1 does not effectively mitigate the project off-site wind hazard to a less than significant level, then the project would result in a substantially more severe significant wind impact than was previously identified in the Mission Bay FSEIR. As discussed above, this would be an interim significant wind impact, and under cumulative-plus-project conditions, wind hazard impacts would be less than significant.

Supplemental Information – Project Wind Comfort Effects at Off-site Public Areas

As discussed under Section 5.6.5.2, above, the wind comfort criterion is not used to judge significance of project wind impacts in the Mission Bay Plan area and in this SEIR. Nonetheless, project effects on wind comfort at off-site public areas may be of interest to members of the public and to decision-makers, and are therefore presented herein for informational purposes.
Table 5.6-2 presents the pedestrian comfort analysis results, namely the average wind speeds that are exceeded 10 percent of the time, and the percentage of time that the 11-mph comfort criterion is exceeded for each off-site study test location, including the test points located on public walkways along the site perimeter and vicinity, for the existing and existing-plus-project wind scenarios. **Figure 5.6-3** presents a map showing the location of the off-site wind test points, and summarizes wind comfort speed results for the existing-plus-project scenario.

OCII Case No. ER 2014-919-97; Planning Department Case No. 2014.1441E:
Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 5.6-3
Existing Plus Project Wind Comfort Conditions

Existing Wind Comfort Conditions. Under existing conditions, the average wind speed exceeded 10 percent of the time at the off-site study test points on public walkways is 15.8 mph. 41 of the 46 study test points currently experience existing wind speeds that exceed the 11-mph pedestrian comfort criterion. The windiest public areas in the study area are along the 16th Street and Gene Friend Way corridors.

A review of additional study test points located within the vacant project site revealed similarly windy conditions, where the average wind speed exceeded 10 percent of the time across the site was 15.3 mph (i.e., similar to, but slightly less than the average of the off-site study test points).

Existing-Plus-Project Wind Comfort Conditions at Off-site Public Use Areas. Development of the proposed project would alter wind speeds at individual study test points, but would not result in an overall substantial change in wind comfort conditions at off-site public walkways and open space. Under existing-plus-project conditions, the average wind speed exceeded 10 percent of the time on public walkways in the project site vicinity would decrease by 1.4 mph, from 15.8 to 14.4 mph, and the average percentage of time the wind speed would exceed the wind comfort criterion would be reduced from 29 to 23 percent.

Furthermore, the project would result in a net reduction in the total number of off-site exceedances of the 11-mph pedestrian comfort criterion, from 41 to 33 test points. When considering individual wind test points, the proposed project would:

- Create one new exceedance of the 11-mph pedestrian comfort criterion: on Third Street adjacent to site at southwest corner of proposed South Street office and retail building (Test Point No. 11);
- Create a new exceedance of the 7-mph seating comfort criterion on Third Street across from site (Test Point No. 4);
- Further increase wind speeds at eight existing exceedances of the 11-mph pedestrian comfort criterion on Third, 16th and South Streets adjacent to, across or upwind from site (Test Point Nos. 6, 7, 9, 50, 53, 56, 93, 99 and 104-106);
- Reduce wind speeds, but not eliminate existing exceedances of the 11-mph pedestrian comfort criterion, at 18 locations on Third Street, 16th Street, South Street, and Terry A. Francois Boulevard adjacent to and/or across from site (Test Point Nos. 1, 2, 5, 8, 10, 13, 14,51, 52, 54, 55, 85, 90-92, 95, 97, and 101-103);
- Eliminate nine existing exceedances of the 11-mph pedestrian comfort criterion on Third Street, 16th Street, South Street, and Terry A Francois Boulevard adjacent to and/or across from site (Test Point Nos. 3, 49, 57, 59, 82-84, 86, and 94); and
- Result in minor or no change in wind speeds at four test points (Test Point Nos. 12, 58, 96 and 100).

The majority of locations that would experience project-associated increases or decreases in off-site wind speeds exceeded 10 percent of the time would be in the ±1 to 5 mph range. However, larger reductions in off-site wind speeds exceeded 10 percent of the time would occur on Terry A. Francois Boulevard between the project site and the planned Bayfront Park (-1 to -11 mph).

Accordingly, the project would not be anticipated to result in substantial changes in wind comfort within the planned Bayfront Park

In conclusion, with respect to off-site wind comfort, the project would result in a net reduction in the average of wind speeds exceeded 10 percent of the time, a net reduction in the average percentage of time the wind speed would exceed the pedestrian comfort criterion, and a net reduction in the number of exceedances of the 11-mph pedestrian comfort criterion at off-site public areas. Consequently, the project would meet the wind comfort criterion at off-site public areas.

Supplemental Information – Project Wind Effects at On-site Publically Accessible Areas of Substantial Pedestrian Use

The project would include a variety of privately-owned, publically accessible on-site plazas and exterior walkways that would be located throughout and at varying elevations on the project site. These proposed publically accessible areas on the project site would experience wind effects resulting from proposed on-site development and surrounding off-site development in the project vicinity. On-site publically accessible areas that may be subject to periods of high pedestrian use, particularly prior to and following games/events at the event center, include the following:

- *Third Street Plaza (10 feet el.) and Approaches (0 to 10 feet el.):* This area includes the elevated Third Street Plaza and adjacent on-site pedestrian approaches from Third Street. The primary entrance to the event center is accessed via this plaza.
- *Event Center North Side Pedestrian Path (10 to 26 feet el.):* This proposed walkway would serve as the primary pedestrian pathway around the north side of the event center, and would connect the Third Street Plaza with the bayfront overlook and Southeast Plaza. This proposed walkway would provide access to the secondary entrance to the event center for large events.
- *Event Center Southwest Side Pedestrian Path (0 to 10 feet el.):* This proposed walkway would provide pedestrian access around the southwest side of the event center, and provide access between 16th Street and the Third Street Plaza.
- *Southeast Plaza (0 feet el.)*: This proposed ground-level plaza would be located in the southeast corner of the project site. The primary entrance to the event center for smaller "theater" events, and the secondary entrance for large events, would be via this plaza.
- *Bayfront Overlook (26 feet el.):* This elevated area is located on the east side of the site adjacent to the event center and would overlook the Bay.

As discussed above, wind effects on on-site publically accessible areas are not considered a significance threshold. Nonetheless, project wind effects at on-site publically accessible areas that would be subject to substantial pedestrian use may be of interest to members of the public and to decision-makers, and are therefore presented herein for informational purposes. A discussion of potential wind effects at the on-site areas of substantial pedestrian use identified above is presented herein for informational purposes.

Other outdoor areas within the project site that may offer private and/or public pedestrian access, include the office and retail building podium roofs (90 foot el.), the food hall roof (41-foot el.), and the event center bayfront terrace (pedestrian deck at approximate 100-foot el.). However, since the event center and/or office and retail building operators would have greater access control over these site areas so as to be able to restrict pedestrian access in the event of hazardous windy conditions, potential project wind effects at these specific areas are not discussed further.

Pedestrian-level winds were measured at numerous locations on-site for each of four prevailing wind directions for existing and existing-plus-project conditions. Since the existing project site form would be completely altered by the proposed development, many wind test points used for analysis of existing conditions were not applicable for the existing-plus-project conditions, and a number of additional wind test study points were used solely for existing-plus-project conditions. Consequently, while a broad comparison of existing and proposed on-site wind conditions can be discussed, direct comparisons of individual on-site test points for these conditions are neither applicable nor useful for the discussion of on-site wind comfort and wind hazard effects.

Project Wind Hazard Effects at On-Site Publically Accessible Areas of Substantial Pedestrian Use. Under existing-plus-project conditions, three on-site study test points at the proposed event center on the north side pedestrian path would exceed the wind hazard criterion, for a total of 31 hours per year. No exceedances of the wind hazard criterion would occur at any of the other areas of substantial pedestrian use at the project site.

Project Wind Comfort Effects at On-Site Publically Accessible Areas of Substantial Pedestrian Use. Under existing-plus-project conditions, the average wind speed exceeded 10 percent of the time across the site would be 8.3 mph, lower than the average wind speed exceeded 10 percent of the time across the site under existing conditions (15.3 mph).

Under existing-plus-project conditions, 15 on-site study test points in the areas of substantial pedestrian use would exceed the 11-mph pedestrian comfort criterion, including 8 of 16 wind study test points on the Third Street Plaza and approaches, the 5 wind study test points on the event center north-side pedestrian path, and 2 of the 3 wind test study points on the event center southwest side pedestrian path. No exceedances of the 11-mph pedestrian comfort criterion would occur at any of the other areas of substantial pedestrian use at the project site. The project sponsor would consider a range of feasible design refinements to effectively reduce on-site wind effects. Design refinements that could be incorporated into the project might include the proposed addition of landscaping within the plazas; and the potential installation of vertical porous screens, overhead protection such as tilted foils and archways, and/or other screening features on the event center perimeter walkway and other publicly accessible areas.

Cumulative Impact— Wind

Wind Hazards at Off-site Public Areas

Impact C-WS-1: The project, in combination with cumulative development, would not alter wind in a manner that would substantially affect off-site public areas. (Less than Significant)

Under cumulative conditions, past, present, and reasonably foreseeable future buildings 100 feet and taller within the project vicinity would have the potential to result in localized wind effects that could be adverse. As part of the wind tunnel testing, one test was conducted to evaluate the pedestrian wind environment that would exist with the project, in combination with reasonably foreseeable cumulative development, on public use areas around the project site. In the immediate project vicinity, this included assumed cumulative development on currently undeveloped portions of Blocks 27, 25, X3 and 33, located north, west, southwest and south of the project site, respectively (see Section 5.1 for discussion of cumulative projects).

Cumulative development would alter wind speeds among individual off-site study test points. The off-site wind hazards that would occur under cumulative-plus-project conditions would be fewer than would occur under both existing conditions (reduced from 7 to 3) and existing-plus-project conditions (reduced from 6 to 3). Furthermore, the duration of the wind hazards that would occur under cumulative-plus-project conditions -54 hours – would be less than would occur under existing conditions (106 hours) and existing-plus-project conditions (139 hours). Consequently, cumulative wind hazard impacts would be *less than significant*.

Mitigation: Not required.

Comparison of Impact WS-1 to Mission Bay FSEIR Impact Analysis. Consistent with Mission Bay FSEIR Mitigation Measure D.7 (and the South Design for Development *Wind Analysis* standards), wind tunnel testing and analysis was conducted for both project and cumulative conditions. As discussed above, cumulative impacts of wind hazards at off-site public areas would be less than significant. Therefore, the project would not result in any new or substantially more severe significant cumulative wind hazard impacts than those previously identified in the Mission Bay FSEIR.

Supplemental Information – Cumulative Wind Comfort Effects at Off-site Public Areas

As discussed above, the wind comfort criterion is not used to judge significance of project wind impacts in this SEIR; however, a discussion of potential cumulative effects on wind comfort is presented herein for informational purposes. Under cumulative-plus-project conditions, the average wind speed exceeded 10 percent of the time on public walkways in the project site vicinity – 12.2 mph - would be less than that which would occur under both existing conditions (15.8 mph) and existing-plus-project conditions (14.4 mph). In addition, the average percentage of time the wind speed would exceed the wind comfort criterion on public walkways – 16 percent - would be less than that which would occur under both existing conditions (29 percent) and existing-plus-project conditions (23 percent). Furthermore, the estimated 22 off-site exceedances of the 11-mph pedestrian comfort criterion that would occur under cumulative-plus-project conditions would be less than that which would occur under both existing conditions (41) and existing-plus-project conditions (33). Given these factors, cumulative wind comfort effects would not be substantial.

Supplemental Information – Cumulative Wind Effects at On-site Publically Accessible Areas of Substantial Pedestrian Use

For reasons discussed above, wind effects on on-site publically accessible areas are not considered a significance threshold; however, a discussion of potential cumulative wind effects at on-site areas of substantial pedestrian use is presented herein for informational purposes.

Cumulative Wind Hazard Effects at On-Site Publically Accessible Areas of Substantial Pedestrian Use. Under cumulative-plus-project conditions, one on-site study test point on the event center north side pedestrian path would exceed the wind hazard criterion, for a total of 20 hours; however, this would be less than the total duration of the exceedance that would occur on this pedestrian path under existing-plus-project conditions (31 hours). No exceedances of the wind hazard criterion would occur at any of the other areas of substantial pedestrian use at the project site.

Cumulative Wind Comfort Effects at On-Site Publically Accessible Areas of Substantial Pedestrian Use. Under cumulative-plus-project conditions, the average wind speed exceeded 10 percent of the time across the site would be 7.9 mph, lower than that which would occur under both existing conditions (15.3 mph) and existing-plus-project conditions (8.3 mph).

Under cumulative-plus-project conditions, 14 on-site study test points in the areas of substantial pedestrian use would exceed the 11-mph pedestrian comfort criterion, including 8 of 16 wind study test points on the Third Street Plaza and approaches, the 5 wind study test points on the event center north-side perimeter walkway, and 1 of the 3 wind test study points on the event center southwest side pedestrian path. This would be less than the 15 exceedances experienced at the areas of substantial pedestrian use within the project site under existing-plus-project conditions. No exceedances of the 11-mph pedestrian comfort criterion would occur in any of the other areas of substantial pedestrian use of the project site. The design refinements discussed under existing-plus-project conditions, above, that the project sponsor would consider would also be applicable for reducing on-site wind effects on cumulative-plus-project conditions.

Shadow

Impact C-WS-2: The project, in combination with cumulative development, would create new shadow but not in a manner that would substantially affect the use of publicly accessible open space or outdoor recreational facilities or other public areas within the Mission Bay South plan area. (Less than Significant)

The proposed project would include development of an event center, office and retail buildings, and other structures that would have the potential to cast shadows off-site, including on nearby public open space within the Mission Bay South plan area. The project also includes on-site public plazas, walkways and other open space that would be shadowed by proposed on-site development and existing and/or future off-site cumulative development in the project vicinity.

As discussed under Regulatory Framework above, the South Design for Development indicates that the prior shadow studies have determined that development within the Mission Bay South plan area complying with the design standards will reasonably limit areas of shadow on public open spaces during the active months of the year and during the most active times of the day. However, consistent with Mission Bay FSEIR Mitigation Measure D.8, the South Design for Development requires that additional shadow analysis be conducted for projects that would need a variance from the South Design for Development's design standards that establish the shape and location of buildings. Accordingly, the proposed project is subject to a shadow analysis per the South Design for Development *Sunlight Access to Open Space* methodology.

As described above under Approach to Analysis, the shadow analysis evaluated the potential shadow impacts on the planned Bayfront Park. Given the project site's location relative to the planned Bayfront Park, the project could not cast any shadows on Bayfront Park between 10:00 a.m. and noon during any of the seven-month study interval, given that the sun rises in the east and all morning shadows would be cast towards the west. Furthermore, review of the shadow screening study images (Appendix WS) shows that shadow coverage (either project or cumulative) of Bayfront Park would be well under 20 percent at any time between noon and 4:00 p.m. during the seven-month study interval. Therefore, the area of public open space in Bayfront Park that would be in continuous shadow for a period of one hour from March to September between 10:00 a.m. and 4:00 p.m. would be less than 20 percent, and consequently, the project design satisfies the South Design for Development criterion for sunlight access to open space. Accordingly, the project's shadow impact and its contribution to cumulative shadow impacts, on publicly accessible open space or outdoor recreation facilities or other public areas within the Mission Bay plan area would be less significant.

Mitigation: Not required.

Comparison of Impact C-WS-2 to Mission Bay FSEIR Impact Analysis

As discussed under Summary of Impacts in the Mission Bay FSEIR, the Mission Bay FSEIR included a shadow analysis that indicated that the Mission Bay plan would shade open space areas within the Mission Bay plan area, including proposed open space area near the waterfront of the Bay along the eastern plan area boundary. The Mission Bay FSEIR determined that with implementation of Mitigation Measure D.8, which required analysis of potential shadows on existing and proposed open spaces during the building design and review process for any development that would exceed the design height and/or bulk criteria of the plan, Mission Bay plan shadow impacts on open space within the Mission Bay plan area would be less than significant.

Consistent with Mission Bay FSEIR Mitigation Measure D.8, a shadow analysis was conducted for the proposed project per the South Design for Development *Sunlight Access to Open Space* methodology. As discussed above, the project's shadow impact and its contribution to cumulative shadow impacts, on publicly accessible open space or outdoor recreation facilities or other public areas within the Mission Bay plan area would be less significant. Therefore, the project would result in no new or substantially more severe significant impacts than those previously identified in the Mission Bay FSEIR.

Impact C-WS-3: The project, in combination with cumulative development, would create new shadow but not in a manner that would substantially affect the use of publicly accessible open space or outdoor recreational facilities or other public areas outside the Mission Bay South plan area. (Less than Significant)

As discussed in the Setting, Agua Vista Park, an existing public open space is located on Port of San Francisco land adjacent to, and outside of, the Mission Bay plan area boundary. (Agua Vista Park is not under the jurisdiction of the City Recreation and Parks Department, and consequently, not subject to Planning Code 295.)

The shadow analysis conducted for the project in support of this SEIR reveals that the project would not cast a shadow on any of Agua Vista Park during the study timeframe analyzed (March through September, 10:00 a.m. to 4:00 p.m.). The shadow analysis also determined the proposed project, and other existing and/or cumulative Mission Bay South plan development in the vicinity of Agua Vista Park would create shadows that would extend onto Agua Vista Park in late afternoons (after 4:00 p.m.) at or near the summer solstice. However, the design standards established for the Mission Bay South plan area ensure that development within Mission Bay South limit areas of shadow on public open spaces – including the adjacent Agua Vista Park - during the most active times of the day during the most active months. Accordingly, any project shadow effects, including project contribution to cumulative effects on publicly accessible open space or outdoor recreational facilities or other public areas outside the Mission Bay South plan area, would be less than significant.

Mitigation: Not required.

Comparison of Impact C-WS-3 to Mission Bay FSEIR Impact Analysis

As discussed under Summary of Impacts in the Mission Bay FSEIR, the Mission Bay FSEIR determined that development that would occur under the Mission Bay plan would not shade any City Recreation and Parks Department open space area located outside the Mission Bay plan area at any time, and consequently, would have a less-than-significant effect on these facilities. The Mission Bay FSEIR also determined that Mission Bay plan shading effects on vegetation or wildlife near the Mission Bay plan area, including along the Bay shore, would be less than significant. As discussed above, any project shadow effects, including project contribution to cumulative effects on publicly accessible open space or outdoor recreational facilities or other public areas outside the Mission Bay South plan area, would be less than significant. Therefore, the project would result in no new or substantially more severe significant impacts than those previously identified in the Mission Bay FSEIR.

5.7 Utilities and Service Systems

5.7.1 Introduction

This section addresses potential effects of the project on existing wastewater and stormwater systems. The existing wastewater and stormwater infrastructure at the time the Mission Bay FSEIR was published is described along with changes to the infrastructure constructed by the master developer in accordance with mitigation required by the Mission Bay FSEIR. The impact analysis considers whether project-generated wastewater and stormwater flows would result in the need to construct new or expanded facilities, the construction of which could cause significant environmental effects.

Utilities impacts related to water supply and solid waste are described in the Initial Study (see Appendix NOP-IS). The project's impacts related to exceeding the wastewater treatment requirements of the San Francisco Bay Regional Water Quality Control Board and on combined sewer discharges, are addressed in Section 5.9, Hydrology and Water Quality.

5.7.2 Summary of Mission Bay FSEIR Utilities Analysis

5.7.2.1 Mission Bay FSEIR Setting

Wastewater/Stormwater Collection and Treatment

The Mission Bay FSEIR described the City's combined wastewater and stormwater collection and treatment systems in two different sections of the document, the Community Services and Utilities section and the Hydrology and Water Quality section. The Mission Bay Plan area is located in the City's Bayside drainage basin, in which combined stormwater and sanitary sewage (wastewater) are collected, then conveyed to and treated at the Southeast Water Pollution Control Plant (SEWPCP) near Islais Creek. At the time the Mission Bay FSEIR was published, the entire Mission Bay Redevelopment Plan area was located in four sub-basins, with the project site at Blocks 29-32 draining to two of the sub-basins (see Mission Bay FSEIR, Figure V.K.1). The north and east portions of the Blocks 29-32 site drained to the Bay sub-basin, and stormwater from the Bay sub-basin drained directly to the Bay, not the combined sewer system. The balance of Blocks 29-32 drained to the Mariposa sub-basin. Wastewater flows from both basins were collected in the combined sewer system and conveyed to the SEWPCP for treatment. Wastewater flows from the Mariposa sub-basin were transported from the Mariposa dry-weather pump station to the SEWPCP via a 10-inch force main. This drainage system has since been completely reconfigured, as described in Section 5.7.2.2, Mission Bay FSEIR Impacts and Mitigation Measures, below.

Stormwater in the Mariposa sub-basin was directed to the Mariposa wet weather pump station via the Mariposa storage/transport sewer under Mariposa Street, and ultimately to the SEWPCP. During wet weather, the wet-weather pump station system transported combined storm runoff and sewage south to gravity sewers at 21st Street and Illinois Street via a 20-inch force main under Third Street. At the time the Mission Bay FSEIR was published, the existing Third Street sewer was inadequate to handle wet-weather flows and the City planned to construct the Illinois Street Auxiliary Sewer to accommodate the flows and transport them from the Mariposa Pump Station to the SEWPCP. As planned, this auxiliary sewer would be a 60-inch gravity sewer extending beneath Illinois Street, between 24th Street and the Islais Creek Transport Storage Structure located at the intersection of Third Street and Caesar Chavez Street. The auxiliary sewer was constructed in 1999.

North of Blocks 29-32, wastewater and stormwater generated in the Plan area drained to the Central sub-basin, which directed flows to the Channel and North-of-Channel storage sewers and ultimately to the Channel Pump Station. From there, flows were pumped to the SEWPCP through a 66-inch-diameter force main. Excess wet weather flows from this sub-basin were discharged to China Basin Channel (Mission Creek) via six combined sewer discharge structures.

The Mission Bay FSEIR reported the existing wastewater generation from the Mission Bay Plan area (based on the 1990 FEIR) was approximately 0.072 million gallons per day (mgd), and the existing wastewater volume treated at the SEWPCP was an average of 67 mgd.

5.7.2.2 Mission Bay FSEIR Impacts and Mitigation Measures

The Mission Bay FSEIR described major sewer upgrades within the Mission Bay Plan area that were proposed as part of the Mission Bay Plan. The proposed improvements included changes to both the Central/Bay and Mariposa sub-basins of the City's combined sewer system. As indicated in the Mission Bay FSEIR, the Central and Bay sub-basins would be reconfigured into one basin as shown on **Figure 5.7-1**. The reconfigured Central sub-basin would direct wastewater and stormwater flows into distinct, separate sanitary-sewer-only and storm-drainage–only lines, respectively. This sub-basin would extend from about 300 feet north of 16th Street to China Basin Channel (Mission Creek), and would include the northern portions of Blocks 29-32. Wastewater flows from the reconfigured Central sub-basin would drain to the Channel Street storage sewer.

The Mariposa sub-basin of the combined sewer system would also be reconfigured as shown on Figure 5.7-1. The planned reconfigured Mariposa sub-basin would extend from about 300 feet north of 16th Street south to Mariposa Street.[1] The Mission Bay FSEIR determined that the projected increases in wastewater generation and stormwater flows could be accommodated by the planned infrastructure, and the Mission Bay Plan's effects on wastewater and stormwater collection and treatment facilities would be less than significant.[2]

1 The original approach presented in the Draft Mission Bay SEIR was based on using the Mariposa sub-basin of the combined sewer system to collect both wastewater and stormwater. However, the Final SEIR revised this approach to include construction of a separate stormwater system in this area.

2 The original approach presented in the Draft Mission Bay SEIR was based on the assumption that the stormwater pump stations would direct the initial 80 percent of stormwater flows to the combined sewer system for ultimate treatment at the SEWPCP. The remainder of the stormwater flows, approximately 20 percent of the annual stormwater flows, would be discharged to China Basin Channel (Mission Creek) or the Bay through one of the four new stormwater outfalls adjacent to the new pump stations. This approach was revised in the Final SEIR and resulted in implementation of Mitigation Scenario B described in the text that follows, which does not include diverting any stormwater to the combined sewer system.

OCII Case No. ER 2014-919-97; Planning Department Case No. 2014.1441E:
Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 5.7-1
Combined Sewer Drainage Basins in Mission Bay South as Reconfigured Under Mission Bay Plan

However, the Mission Bay FSEIR determined that the Plan would result in a cumulatively considerable and significant contribution to combined sewer discharges during wet weather. Mitigation Measure K.3 of the Mission Bay FSEIR requires design and construction of sewer improvements to ensure that wastewater and stormwater flows from the Plan area to the City's combined sewer system do not contribute to combined sewer discharges. The master developer adopted Mitigation Scenario B described in the Summary of Comments and Responses of the Mission Bay FSEIR (in Volume III, beginning on p. XII.253). This scenario meets the requirements of Mitigation Measure K.3 by constructing a separate stormwater system throughout Mission Bay South, in both the reconfigured Mariposa and Central/Bay sub-basins. This system is included in the approved Mission Bay South Infrastructure Plan.[3]

The separate stormwater system for the Mission Bay South Plan area is currently being implemented by the master developer and includes four drainage zones within the geographic boundaries of the reconfigured Central sub-basin that have already been constructed and one drainage zone within the geographic boundaries of the reconfigured Mariposa sub-basin which is currently under construction. Stormwater in each of the drainage zones flows by gravity to one of five stormwater pump stations in the locations shown on **Figure 5.7-2**, including Pump Station SDPS-5 near the east end of 16th Street. When construction of the fifth drainage basin is completed (anticipated in 2015, prior to construction and operation of the proposed project), all stormwater runoff from Mission Bay South will be conveyed through the separate stormwater system and discharged to the Bay and China Basin Channel (Mission Creek).

The Mission Bay FSEIR identified Mitigation Measure M.5 requiring conveyance of all stormwater runoff from newly developed areas in the former Bay sub-basin to the combined sewer system as an interim measure to address potential sewer capacity and associated water quality impacts until the appropriate infrastructure would be completed. However, this mitigation measure is not applicable to the proposed project because stormwater from the project site would discharge to the separate stormwater system being constructed in accordance with the approved Mission Bay South Infrastructure Plan as described above.

Mission Bay FSEIR Estimates of Wastewater Flows

The Mission Bay FSEIR Community Services and Utilities impacts section estimated that the Mission Bay Plan would generate approximately 2.5 mgd of wastewater at build-out (average dry weather flow), or 3.7 percent of the volume of wastewater treated at the SEWPCP at the time of Mission Bay FSEIR publication. For Blocks 29-32, equal amounts of wastewater were expected to be routed to the Mariposa sub-basin via the City’s Mariposa Pump Station and to the reconfigured Central sub-basin via the City’s Mission Bay Sanitary Pump Station located at Park P15. The estimated peak wastewater flow to each sub-basin from the project site was 0.29 mgd, and the estimated average flow was 0.096 mgd.

Figure 5.7-2

Separate Stormwater Drainage Basins in Mission Bay South Constructed as Part of Mission Bay Plan

The Mission Bay FSEIR concluded that the effects on wastewater collection and treatment facilities would be less than significant because the proposed sewer system improvements under the Mission Bay Plan, including reconfiguration of the Central/Bay and Mariposa sub-basins, would accommodate the projected increases in wastewater generation. Similarly, the Mission Bay FSEIR concluded that the effects related to construction of new storm drainage facilities would be less than significant because the proposed sewer system improvements under the Mission Bay Plan, including reconfiguration of the Central/Bay and Mariposa sub-basins, would accommodate the projected changes in stormwater flows.

5.7.3 Setting

5.7.3.1 Combined Sewer System

Currently, the SEWPCP treats both dry and wet-weather flows from the eastside of the City—specifically the Bayside drainage basin of the City's combined sewer system (shown on Figure 5.9-1 in Section 5.9, Hydrology and Water Quality) — similar to what was described in the Mission Bay FSEIR (see Section 5.9, Hydrology and Water Quality, for a more detailed description). The plant has a dry-weather capacity of 84.5 mgd. During dry weather, wastewater flows consist mainly of municipal and industrial sanitary sewage and wastewater, and the annual average wastewater flow during dry weather is 60 mgd[4] (a reduction of 7 mgd from the 67 mgd reported by the Mission Bay FSEIR in 1998). The wet-weather facilities in the Bayside drainage basin have a combined capacity of 400 mgd, plus the 125-million gallon volume of storage and transport boxes that retain the combined stormwater and wastewater flows during wet weather. Flows in excess of the wet-weather capacity of the Bayside treatment facilities receive flow-through treatment in the storage and transport boxes that is the equivalent of primary treatment. The treated flows are discharged to the Bay through 29 combined sewer discharge structures located along the shoreline.

As discussed above, the Mission Bay Plan included reconfiguration of the combined sewer system drainage sub-basins in the Mission Bay South portion of the Bayside drainage basin. As reconfigured, the northern portion of the project site is located in the Central sub-basin, and wastewater flows to this sub-basin are conveyed to the SEWPCP via the Mission Bay Sanitary Pump Station. The southern portion of the project site is located in the Mariposa sub-basin, and wastewater flows to this sub-basin are conveyed to the SEWPCP via the Mariposa Pump Station. However, since the project site is currently undeveloped, except for a parking lot, there are no wastewater flows contributing to either sub-basin.

[4] San Francisco Water Power Sewer, *San Francisco's Wastewater Treatment Facilities*. June, 2014.

Mariposa Pump Station

The 240-acre reconfigured Mariposa sub-basin of the combined sewer system is divided into two tributary areas that direct flow to the Mariposa Pump Station. Tributary B includes Potrero Hill to the south of Mariposa Street and is outside of the Mission Bay Plan area; this tributary area directs both rainwater and wastewater to the pump station. Tributary A includes areas to the north of Mariposa Street that are located within the Plan area; in this area, stormwater flows are directed to the separate stormwater system constructed for the Mission Bay South development, and only wastewater flows are directed to the Mariposa Pump Station.

The Mariposa Pump Station consists of a dry-weather and wet-weather pump station. The dry-weather pump station was built in 1954 and has a capacity of 1.2 mgd. With the addition of peak wastewater flows from the planned and approved University of California, San Francisco (UCSF) developments in the Plan area, the SFPUC anticipates that peak flows would exceed the capacity of the dry-weather pump station. To address this need for additional capacity, the SFPUC is connecting the 10-inch dry weather force main to the 20-inch wet weather force main and upsizing the influent sewer, which will increase the capacity of the dry-weather pump station to 3.5 mgd in dry weather conditions on an interim basis until long term improvements can be constructed to permanently increase the capacity of the pump station.[5] Completion of this connection is expected by fall of 2015.

The 10 mgd wet-weather pump station and associated 0.7 million gallon transport/storage structure were built in 1993, and new chopper pumps were installed in 2014 to manage debris that accumulates at the pump station. In the event that wet weather flows in the Mariposa sub-basin exceed the combined capacity of the Mariposa pump station and transport/storage structure (11.2 mgd), the excess flows are discharged to the Bay as a combined sewer discharge after receiving flow-through treatment in the transport and storage structure. This system is designed to achieve an annual average of 10 combined sewer discharges per year, but has historically exceeded this average.[6]

Mission Bay Sanitary Pump Station

The Mission Bay Sanitary Pump Station was constructed by the master developer in 2011 and accepted by the City in 2012. This pump station receives only wastewater (dry-weather) flows from within the Mission Bay South area and is equipped with four submersible pumps. It is designed for average wastewater flows of 2.0 mgd and peak wastewater flows of 6.0 mgd; this design capacity allows for an average wastewater contribution of 0.1 mgd and peak contribution of 0.29 mgd from Blocks 29 and 30 at the project site.[7] Testing in 2010 indicated that the pump

7 San Francisco Department of Public Works, 2015. Hydraulic Assessment of Mission Bay Sanitary Pump Station. February 25.

station has the capability of pumping 6.7 mgd, but new testing would be needed to confirm this conclusion because the capacity of all pumps operating simultaneously was not measured during the 2010 test. Monitoring by the SFPUC in 2015 indicates that existing average wastewater flows to the pump station are 2.2 mgd and peak flows are 3.3 mgd.

5.7.3.2 Sewer System Improvement Program

The SFPUC is currently implementing the Sewer System Improvement Program (SSIP), a 20-year, multi-billion dollar citywide program to upgrade the City's aging sewer infrastructure and ensure a reliable and seismically safe sewer system. Bayside projects currently planned under this program include the Central Bayside System Improvement Project, which will include improvements to provide redundancy to the Channel force main (which transports flows from the Channel Pump Station to the SEWPCP); operational and seismic improvements to the SEWPCP; operational improvements to the North Point Wet Weather Facility; and green infrastructure projects to manage stormwater before it enters the combined sewer system.

5.7.3.3 San Francisco Municipal Separate Storm Sewer Systems (MS4s)

Municipal separate storm sewer systems (MS4s) within San Francisco are stormwater systems that carry stormwater in a separate set of pipes from the SFPUC's combined sewer system. These MS4 systems do not discharge to the combined sewer system and are operated in compliance with State Water Resources Control Board Water Quality Order No. 2013-001-DWQ, National Pollutant Discharge Elimination System (NPDES) General Permit for Waste Discharge Requirements for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems. The separate stormwater system constructed by the master developer in Mission Bay South is subject to this permit.

As described above, the separate stormwater system for the Mission Bay South area includes four drainage zones within the geographic boundaries of the reconfigured Central sub-basin and one drainage zone within the geographic boundaries of the reconfigured Mariposa sub-basin.[8] Stormwater in each of the drainage zones flows by gravity to one of five stormwater pump stations, as shown on Figure 5.7-2. Construction of this separate stormwater system is scheduled to be completed in 2015.

5.7.4 Regulatory Framework

Please see Section 5.9, Hydrology and Water Quality, Regulatory Framework, for descriptions of federal, state, and local regulations regarding wastewater and stormwater.

---

8 San Francisco Redevelopment Agency and Catellus Development Corporation, Mission Bay South Infrastructure Plan.

5.7.5 Impacts and Mitigation Measures

5.7.5.1 Significance Thresholds

For the impacts analyzed in this section, the project would have a significant impact related to utilities and service systems if it were to:

- Require or result in the construction of new wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects;
- Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects; or
- Result in a determination by the wastewater treatment provider that would serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments.

The complete list of CEQA significance criteria used in the utilities and service systems analysis is included in the Initial Study (see Appendix NOP-IS, pp. 64 through 72), which explains why the proposed project would have a sufficient water supply available to serve the project and would not require new or expanded water supply resources or entitlements (Impact UT-1). Similarly, the Initial Study explains why the project would not require or result in the construction of new water treatment facilities or expansion of existing facilities (Impact UT-2); would be served by landfills with sufficient capacity to accommodate the project's solid waste needs (Impact UT-3); and would comply with federal, state, and local statutes related to solid waste (Impact UT-4). Therefore, no further analysis of these subjects is presented in this section.

The criterion related to the potential to exceed the wastewater treatment requirements of the San Francisco Bay Region Regional Water Quality Control Board is addressed in Section 5.9, Hydrology and Water Quality, under Impact HY-1, in combination with the water quality criterion regarding the potential to violate any water quality standards or waste discharge requirements. The remaining significance criteria are addressed below.

5.7.5.2 Approach to Analysis

Construction Impact Methodology

The impact analysis in this section focuses on Utilities impacts related to operation of the project because the project construction's temporary increase in demand on wastewater and storm drainage services over the 26-month construction duration would not be substantial and would not warrant construction or expansion of existing wastewater or storm drainage facilities. However, as discussed in Section 5.9, Hydrology and Water Quality, Impact HY-1a, construction dewatering discharges would result in short-term increases in demand on the existing wastewater or storm drainage facilities but, proposed dewatering discharge methods would include options for direct discharge to the Bay under an existing general NPDES permit to ensure that any discharges to the combined sewer system would be within the capacity of existing facilities and would not require the construction or expansion of existing facilities. Therefore, construction-related impacts to wastewater and storm drainage facilities are not further addressed in the analysis below.

Operations Impact Methodology

In order to address the known capacity issues related to wastewater facilities, the project's direct impact on the capacity of existing facilities addresses whether the project's wastewater flows would be within the capacity of the existing facilities under existing conditions, while the cumulative impact analysis accounts for the long-term effects of wastewater flows of the project in combination with the flows from past, present, and foreseeable future projects served by the same infrastructure.

With respect to stormwater facilities, however, the stormwater system improvements already constructed and currently under construction address both the near-term and long-term needs. Therefore, the impact analysis accounts for the cumulative effects of stormwater flows of the project in combination with the flows from past, present, and foreseeable future projects within the drainage basin, and the project's direct impacts are analyzed in the context of cumulative impacts. A separate project impact analysis is not provided.

Methodology for Analysis of Direct Impacts

Require or result in the construction of new wastewater treatment facilities or expansion of existing facilities: This analysis compares the estimated peak wastewater flows from the proposed project to the remaining capacity of the Mariposa Pump Station and Mission Bay South Pump Station sewer drainage areas as well as downstream facilities. If the increase in wastewater flows is within the remaining capacity, the impact would be less than significant.

Methodology for Analysis of Cumulative Impacts

Cumulative impacts related to utilities systems result from past, present, and future projects that would utilize the same infrastructure. Accordingly, the geographic scope of cumulative wastewater impacts includes areas that drain to the reconfigured Mariposa and Central sub-basins of the combined sewer system. The geographic scope of cumulative stormwater impacts includes areas that drain to the same stormwater drainage basin.

The cumulative analysis utilizes a list-based approach to analyze the effects of the project in combination with past, present, and probable future projects in this geographic area, including wastewater and storm water flows resulting from full build-out of the Mission Bay South area and development of the Mission Bay Campus under the UCSF Long Range Development Plan (LRDP, described in Section 5.1.5.2, Cumulative Projects for Operational Impacts). The analysis evaluates future flows from these projects, then considers whether or not there would be a significant, adverse cumulative impact associated with project implementation in combination with past, present, and probable future projects in the geographical area, and if so, whether or not the project's contribution to the cumulative impact would be significant (i.e., cumulatively considerable).

Require or result in the construction of new wastewater treatment facilities or expansion of existing facilities: This analysis compares the estimated peak wastewater flows from the proposed project in combination with existing wastewater flows and wastewater flows from the Mission Bay South Plan area at full build out to the existing capacity of the Mariposa Pump Station and Mission Bay South Pump Station sewer drainage areas as well as downstream facilities. The analysis uses this information to determine whether new or upgraded wastewater treatment facilities, such as pump stations and sewer lines used to convey the wastewater, would be required. If the total wastewater flow is within the existing capacity, then the project's contribution to cumulative wastewater facilities impacts would be less than significant.

Require or result in the construction of new stormwater drainage facilities or expansion of existing facilities: The impact analysis assesses the stormwater flows from the proposed project site and considers whether these flows in combination with other Mission Bay South area flows would exceed the capacity of the separate stormwater system constructed in Mission Bay South by the master developer. If the anticipated combined stormwater flows at build out of Mission Bay South would be within the capacity of the stormwater system, then the project's contribution to cumulative stormwater facilities impacts would be less than significant.

Result in a determination by the wastewater treatment provider that it has inadequate capacity for the project flows in addition to existing commitments. This analysis compares the estimated peak wastewater flows from the proposed project in combination with existing and planned future flows to the capacity of the Mariposa Pump Station and Mission Bay Sanitary Pump Station sewer drainage areas as well as downstream facilities. If the SFPUC determines that no new wastewater treatment facilities would be required, then the project's contribution to this cumulative impact would be less than significant.

5.7.5.3 Impact Evaluation

Project Impacts

Impacts UT-1 to UT-4: See Initial Study (Appendix NOP-IS)

Impact UT-5: The proposed project in itself would not require or result in the construction of new wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects. (Less than Significant)

As discussed above in Section 5.7.2.2, Mission Bay FSEIR Impacts and Mitigation Measures, the Mission Bay Plan includes reconfiguration of the Central and Mariposa sub-basins of the City's combined sewer system to collect wastewater and stormwater in separate systems. The northern portion of the project site is now included in the reconfigured Central sub-basin, and the southern portion of the project site is now included in the reconfigured Mariposa sub-basin, although project-related wastewater flows could be directed to either sub-basin.

The sewer analysis for the proposed project conducted by BKF Engineers estimates that the daily average wastewater flow during an event at full capacity (e.g., a sold-out NBA basketball game) would be 0.164 mgd, and the daily peak wastewater flows would be 1.074 mgd.[9,10] The preliminary project design indicates that 0.844 mgd of the peak wastewater flows from the project site would be discharged to the sewer drainage area of the Mariposa Pump Station (within the reconfigured Mariposa sub-basin), and 0.230 mgd of the peak flows could be directed to the Mission Bay Sanitary Pump Station located at Park P15 (within the reconfigured Central sub-basin).[11]

Mariposa Pump Station

The SFPUC has indicated that with the recent addition of peak wastewater flows from UCSF planned developments, the total existing peak dry-weather flows to the Mariposa sub-basin would be up to 2.54 mgd[12] which would exceed the 1.2 mgd capacity of the Mariposa Pump Station. To address this, the SFPUC is constructing interim improvements to temporarily increase the dry-weather capacity of the pump station to 3.5 mgd by cross connecting the dry- and wet-weather force mains and upsizing the influent sewer, as discussed in Section 5.7.5.3, Combined Sewer System. With the proposed additional discharge of 0.844 mgd of peak wastewater flows from the project site to this pump station, the total peak wastewater flows would be increased to 3.38 mgd. This is within the 3.5 mgd capacity of the interim improvements.

Mission Bay Sanitary Pump Station

As discussed in Section 5.7.5.3, Combined Sewer System, the Mission Bay Sanitary Pump Station has the capability of pumping up to 6.7 mgd of wastewater and existing peak flows to the pump station are 3.3 mgd. The project's addition of 0.230 mgd would increase peak flows to 3.53 mgd, which would be within the 6.7 mgd capacity of the pump station.

Because the addition of project-related peak wastewater flows would be within the remaining capacity of the interim improvements already planned and currently under construction by the SFPUC for the Mariposa Pump Station and would be within the remaining capacity of the Mission Bay Sanitary Pump Station, the proposed project would not require the construction of new wastewater treatment facilities or expansion of existing facilities, and this project-level impact would be *less than significant*.

---

9 BKF Engineers, 2015. *Water and Sewer Analyses for Golden State Warriors Arena @ Mission Bay Blocks 29-32*. January 9.

10 As described in the Utilities and Service Systems section of the Initial Study (see Appendix NOP-IS), the *annual average* water demand for the project would be 0.100 mgd. For wastewater planning purposes, wastewater flows are directly related to water usage; however, for sizing of wastewater infrastructure, daily peak flows are used rather than annual average flows. While the daily average wastewater flow during an event at full capacity would be 0.164 mgd, events would not be held every day, and the annual average wastewater flows would be similar to the estimated 0.100 mgd water demand.

11 Moala, Tommy T., Assistant General Manager, Wastewater Enterprise, San Francisco Public Utilities Commission, 2015. Letter to Clarke Miller, Strada Investment Group. May 15.

12 Hydroconsult Engineers, Inc. 2015. Combined Sewer Impact Analysis, Golden State Warriors Arena EIR. February 18.

Comparison of Impact UT-5 to Mission Bay FSEIR Impact Analysis

As discussed in Section 5.7.2.2, Mission Bay FSEIR Impacts and Mitigation Measures, the FSEIR estimated that peak wastewater flows from the project site to the Mariposa Pump Station and the Mission Bay Sanitary Pump Station would be 0.29 mgd. The project's addition of 0.844 mgd of peak flows to the Mariposa Pump Station would exceed this amount, but the impact would remain less than significant because the additional flows would be within the capacity of interim improvements already planned by the SFPUC. The project's addition of 0.230 mgd of peak flows to the Mission Bay Sanitary Pump Station would be less than the originally estimated 0.29 mgd and would be within the remaining capacity of the pump station. Therefore, the project would not result in new or substantially more severe impacts related to wastewater facilities than was previously identified in the Mission Bay FSEIR.

Cumulative Impacts

Impact C-UT-1: See Initial Study (Appendix NOP-IS)

Impact C-UT-2: The proposed project, in combination with past, present, and foreseeable future development in the Mission Bay South area, would require or result in the construction of new wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects. (Significant and Unavoidable)

Mariposa Pump Station

As discussed above in Impact UT-5, total wastewater flows to the Mariposa Pump Station would be 3.38 mgd with the addition of flows from the proposed project. The SFPUC estimates that an additional 1.20 mgd of peak flows would result from UCSF planned developments that have not been constructed (including the Phase 2 Medical Center and developments on Blocks 25b and 33/34) as well as the mixed use development on Block 40.[13] This would increase peak flows to the pump station to 4.58 mgd and would exceed the 3.5 mgd capacity of the interim improvements planned by the SFPUC. Therefore, permanent improvements to the pump station and a long term increase in capacity would be needed to accommodate the proposed project in combination with other proposed and planned development in the Mission Bay South Plan area. In addition, as discussed in Section 5.9, Hydrology and Water Quality, the increased wastewater flows from the proposed project in combination with other foreseeable future projects could increase the volume of combined sewer discharges (CSDs) from the Mariposa Pump Station which could necessitate improvements to the Mariposa wet weather pump station.

---

13 Hydroconsult Engineers, Inc. 2015. Combined Sewer Impact Analysis, Golden State Warriors Arena EIR. February 18.

As the owner and operator of the combined sewer system, the SFPUC is responsible for construction of the needed improvements to the wastewater facilities in the Mariposa sub-basin. Engineering planning and design for these improvements or replacement have not been completed, and are preliminarily scheduled to commence by mid-2015. However, the SFPUC anticipates that improvements might include actions such as complete pump station replacement, enlarging or realigning the existing sewer main on Mariposa Street between 3rd Street and the Mariposa Pump Station; upgrading and adding dry weather pumps with potential temporary wet weather pump modifications; upgrading or replacing the dry-weather sump in the pump station; constructing new connections to the transport and storage box structure and rehabilitating the structure; and improving the hydraulic capacity of the downstream gravity sewers, if needed.[14] If a new dry weather pump station is required, it could potentially be constructed within approximately a quarter mile radius of the existing Mariposa Pump Station.

Construction of the permanent improvements to the wastewater facilities in the Mariposa sub-basin to accommodate increased peak flows from the proposed project in combination with other foreseeable projects in the Mission Bay South Plan area could potentially result in significant environmental effects. Therefore, this would be a *significant* cumulative impact and the project's contribution would be cumulatively considerable.

While the SFPUC has conducted flow monitoring to establish wastewater flows at the pump station and provided a conceptual description of the permanent improvements that could be required, the SFPUC has not completed the planning and design of specific improvements or replacement to these pump stations. However, regardless of the design of the specific improvements, it can be assumed that the pump station, force main, and conveyance system improvements would generally be built at or near the same location as the existing facilities (i.e., within the same sewage drainage sub-basin). Standard construction techniques would likely be used and confined within a limited area, with construction lasting for several months to a year. Construction could include activities such as construction staging, clearing and grubbing, limited excavation and grading, foundation work, and construction/installation of the new facilities. Depending on site-specific conditions, groundwater dewatering and material off-haul could be required as part of the construction activities. These construction activities would be expected to result in temporary increases in truck and construction employee traffic, noise, and air pollutant and greenhouse gas emissions. In addition, depending on the site-specific design and location, the pump station improvements could result in physical effects on cultural resources, biological resources, water quality, and hazardous materials. Most, if not all, of these potential impacts can generally be mitigated to a less-than-significant level with typical mitigation measures, similar to those identified in the Initial Study and the SEIR for this project. Long-term operational impacts would likely be less than significant because operation of the pump stations would be similar to existing operations of these facilities.

14 San Francisco Public Utilities Commission, 2014. Email to Chris Kern, San Francisco Planning Department and Elaine Warren, City Attorney's Office, Mariposa Pump Station Description for GSW Admin DEIR. December 24.

Prior to SFPUC's implementation of the required long term wastewater facilities improvements (e.g., permanent pump station, force main, and conveyance system improvements), project-level CEQA review would be required to identify potential impacts associated with construction and operation of these improvements and project-specific mitigation measures for any significant impacts. This analysis cannot be performed until the SFPUC identifies the specific improvements that will be constructed. CEQA environmental review of the future improvements/replacement of the Mariposa and/or Mission Bay Sanitary Pump Station, associated force mains, and conveyance system would ensure that measures to avoid or minimize impacts on the environment would be considered in the approval process for these improvements.

The SFPUC has not identified a timetable for completing these long term improvements.

Thus, in the absence of specific plans and design for pump station improvements and the completion of CEQA environmental review for those improvements, it is not possible to determine at this time whether impacts resulting from construction and/or operation of the required long term wastewater facilities improvements could be mitigated to a less than significant level. Furthermore, implementation of any improvements to the City's facilities is outside of the project sponsor's control. Lastly, there is uncertainty in timing as to when the SFPUC will be able to complete the necessary capacity improvements. Therefore, because the cumulative increase in wastewater flows would require the construction of new wastewater facilities or expansion of existing facilities, the construction of which could cause significant environmental effects, this impact would be *significant and unavoidable* and the project’s contribution would be cumulatively considerable.

While the system can currently accommodate project-related wastewater flows as discussed in Impact UT-5, the capacity of the Mariposa Sanitary Pump Station could be exceeded as future projects are implemented, including UCSF’s Phase 2 Medical Center. It is assumed that the SFPUC will implement the permanent pump station and associated force main and conveyance piping improvements at the Mariposa Pump Station as soon as feasible, but the schedule for these improvements is currently unknown and completion could occur after the proposed project is constructed and operational.[15] In the event that additional future wastewater flows would exceed the pump station capacities before the needed wastewater system improvements could be completed, it is assumed that the SFPUC would make internal operational or piping changes to accommodate the additional flows in the interim in order to remain in compliance with RWQCB permit requirements. The interim system modifications would be subject to the approval of the RWQCB under the terms of the Bayside NPDES permit. Approval by the RWQCB would ensure that water quality of the Bay would be protected during the interim period. Any interim system modifications are assumed to be operational or internal to the existing pump stations and therefore would not result in any physical environmental effects.

15 Note that the SFPUC is considering a design/build project delivery model which will expedite implementation of the pump station and force main improvements.

Mission Bay Sanitary Pump Station

As discussed above in Impact UT-5, total wastewater flows to the Mission Bay Pump Station would be 3.53 mgd with the addition of flows from the proposed project. UCSF has indicated to the SFPUC that under full build out of its recently approved LRDP, UCSF flows to this pump station would be 6.63 mgd, close to the most recently measured capacity of 6.7 mgd. To address this, the LRDP recommends replacing the existing pumps to increase the capacity to 7.34 mgd, although this recommendation has not been approved by the SFPUC. The SFPUC has indicated that potential upgrades and modifications might include actions such as replacing existing pumps with larger pumps; installing additional pumps; enlarging the pump station wet well and installing associated controls; and modifying or realigning the force main.[16] Operation of the larger pump station could result in greater maintenance needs, requiring additional visits by operations staff as well as additional trips by dump trucks to collect and dispose of accumulated debris.[17]

Construction of the permanent improvements to the Mission Bay Sanitary Pump Station and associated wastewater facilities to accommodate the projected cumulative increased peak flows from the proposed project could potentially result in significant environmental effects, similar to the improvements to the wastewater facilities in the Mariposa sub-basin. Therefore, this would be a significant cumulative impact. However, the projects contribution would not be cumulatively considerable (*less than significant*) because the Mission Bay Sanitary Pump Station was designed to accommodate 0.29 mgd of wastewater flows from the project site, and the project would discharge only 0.23 mgd to the pump station which is less than the design flow rate.

Summary of Impact C-UT-2, Wastewater Treatment Capacity

As discussed above, the SFPUC has determined that under the proposed project in combination with full build out of Mission Bay South, wastewater flows could exceed the capacity of the Mariposa Pump Station and associated force mains and conveyance piping. Therefore, improvements to the Mariposa Pump Station and associated facilities would be required to accommodate the cumulative wastewater flows. While temporary or interim measures to accommodate the flows would not result in significant environmental effects because they would be operational or internal to the pump stations, construction of the permanent improvements could potentially result in significant environmental effects. Because specific plans and design for permanent pump station improvements have not been finalized and CEQA environmental review has not been completed, it is not possible at this time to conclude whether impacts resulting from these improvements could be mitigated to a less than significant level. Furthermore, implementation of any improvements to the City's pump stations and force mains is outside of the project sponsor's control and there is uncertainty in timing as to when the SFPUC will be able to complete the necessary capacity improvements. Therefore, this

[16] Eickman, Kent, Technical Services Manager, San Francisco Public Utilities, 2015, Memorandum to Chris Kern, Senior Planner, San Francisco Planning Department, regarding Mission Bay Sanitary Pump Station. May 15, 2015.

[17] San Francisco Water Power Sewer, Memo from Irina Torrey, Bureau Manager, to Chris Kern, Environmental Planning Division, San Francisco Planning Department. Review of Screencheck Administrative Draft Supplemental Environmental Impact Report Sections 3.0 - Project Description, 5.7 - Utilities, and 5.9 - Hydrology and Water Quality for the Event Center and Mixed-Use Development at Mission Bay (Golden State Warriors Arena); Planning Department Case Number E 2014.1441E. May 15, 2015.

would be a *significant and unavoidable* impact related to requiring construction of new wastewater facilities or the expansion of existing wastewater facilities in the Mariposa sub-basin, with no feasible mitigation available to the project sponsor.

Cumulative wastewater flows would also exceed the capacity of the Mission Bay Sanitary Pump Station, resulting in a significant impact related to construction and/or expansion of related wastewater facilities. However, the project's the projects contribution would not be cumulatively considerable (*less than significant*) because the Mission Bay Sanitary Pump Station was designed to accommodate 0.29 mgd of wastewater flows from the project site, and the project would discharge only 0.23 mgd to the pump station which is less than the design flow rate, and the estimated wastewater flows from the previously entitled office space.[18]

Mitigation: None currently available.

Comparison of Impact C-UT-2 to Mission Bay FSEIR Impact Analysis

The Mission Bay FSEIR concluded that, as designed, the wastewater collection systems would have sufficient capacity for the estimated wastewater flows at full build out of Mission Bay South and the effects related to expansion of existing wastewater treatment facilities or construction of new facilities would be less than significant. As described above, the proposed project would generate an average daily wastewater flow of 0.164 mgd during an event at full capacity, which is less than what was identified in the Mission Bay FSEIR, but the peak flow is estimated to be 1.074 mgd, nearly twice what was estimated in the Mission Bay FSEIR.

The Mission Bay FSEIR Community Services and Utilities section (p. V.M.51) stated that if a specific development phase triggers the need for increased sewer capacity, upgraded sewer lines, or expanded sewer service, the proposed improvements would require the approval of the San Francisco Clean Water Program (now part of the SFPUC) staff. The proposed improvements would be based on the "adjacency" concept, meaning that the improvements would need to provide adequate conveyance and storage capacity for the phase under development and for expected future development to be served by the improved sewer facilities. Large scale improvements needed for cumulative effects of development phases would be reviewed by the Clean Water Program (i.e., SFPUC) staff and could include improvements such as installation of new sewer lines or a pump station. While the Mission Bay FSEIR acknowledged the potential for needed upgrades to the wastewater system, specific upgrades were not identified. Therefore, the project would result in a *substantially more* severe significant cumulative impact than was identified in the Mission Bay FSEIR.

---

[18] Moala, Tommy T., Assistant General Manager, Wastewater Enterprise, San Francisco Public Utilities Commission, 2015. Letter to Clarke Miller, Strada Investment Group. May 15.

Impact C-UT-3: The proposed project, in combination with past, present, and foreseeable future development in the Mission Bay South area, would not require or result in the construction of new stormwater drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects. (Less than Significant)

Currently, the project site contains a paved parking lot on the north and west portions of the site, and the remainder of the site consists of an undeveloped lot largely covered in gravel, with sparse ruderal vegetation and a depressed area that collects surface drainage. Implementation of the project would eliminate the undeveloped portions of the site and would increase the overall impervious surfaces at Blocks 29-32, thereby increasing the volume of stormwater runoff.

The project site would be served by the Mission Bay South storm drain infrastructure, as constructed and operated by the master developer,[19] which will include two separated stormwater systems within the perimeter streets. As described in the stormwater hydraulic analysis prepared for the project,[20] stormwater flows from the northern portion of the project site would be routed by gravity to Storm Drain Pump Station No. 1 (SDPS-1), which has been designed to handle stormwater flows generated from the planned build-out of the tributary drainage area. This pump station has five high-flow or wet weather pumps, with a combined design capacity of 27,810 gallons per minute.

Stormwater flows from the southern portion of the project site would be conveyed to Storm Drain Pump Station No. 5 (SDPS-5) located to the south of proposed project site, across from 16th Street within Park P23. This pump station will be equipped with five submersible wet weather only pumps, one submersible treatment pump, and two submersible dry weather pumps with a combined capacity of 32,500 gallons per minute. This system, including SDPS-5, is currently under construction and anticipated to be completed in 2015, prior to construction and operation of the proposed project.

The project stormwater analysis completed for the project sponsor concluded that the capacity of the separated stormwater system as built is adequate to serve the project as well as other development projects that would be constructed at full build out of Mission Bay South. Therefore, the project, either individually or cumulatively, would not require the construction of new stormwater drainage facilities nor expansion of the existing facilities, and this impact would be *less than significant*.

Mitigation: Not required.

[19] The initial stormwater infrastructure, including the pump station, is anticipated to be completed in fall 2015, although final completion, particularly the bioswales, is not expected to be completed until 2016.
[20] BKF, Mission Bay Blocks 29-32 – Stormwater Memorandum, January 6, 2015

Comparison of Impact C-UT-3 to Mission Bay FSEIR Impact Analysis

The Mission Bay FSEIR determined that with the sewer system improvements proposed as part of the plan, including reconfiguration of the Central and Mariposa sub-basins and construction of a separate stormwater system, the Mission Bay Plan would accommodate the projected changes to stormwater flows. The Mission Bay FSEIR concluded that the effects of implementation of the Mission Bay Plan on stormwater collection and treatment facilities would be less than significant.

Because project-related stormwater flows would be within the capacity of the Mission Bay South infrastructure and the project would be consistent with the projected build out condition, the project would not result in any new or substantially more severe significant impacts than those identified in the Mission Bay FSEIR.

Mitigation Measure M.5 in the Mission Bay FSEIR Community Services and Utilities section requires conveying all stormwater runoff from newly developed areas in the former Bay basin to the combined sewer system prior to completion of the initial-flow diversion system. However, this mitigation measure is not applicable to the proposed project because the Bay basin has been incorporated into the reconfigured Central sub-basin, and the project would discharge to the Mission Bay separate stormwater system that has already been constructed within the geographic boundaries of the Central sub-basin and is currently being constructed within the geographic boundaries of the Mariposa sub-basin. Construction of the separate stormwater system will be completed before construction of the proposed project is scheduled to begin.

Impact C-UT-4: The project, in combination with past, present, and foreseeable future development in the Mission Bay South area, would result in a determination by the SFPUC that it has inadequate capacity to serve the project's projected wastewater demand in addition to its existing commitments. (Significant and Unavoidable with Mitigation)

As discussed in Impact C-UT-2, Improvements to the Mariposa Pump Station as well as associated force mains and gravity sewers connecting to the SEWPCP would be required to accommodate cumulative wastewater flows.[21] As stated above, the capacity shortfall for this pump station is due to the proposed project in combination with the cumulative effects of increased wastewater flows from other projects in the sewer drainage area that have been identified subsequent to the publication of the Mission Bay FSEIR. In particular, existing and planned UCSF developments (including the existing Phase 1 Medical Center and the planned Phase 2 Medical Center and developments on Blocks 25b and 33/34) as well as the planned mixed use development on Block 40 contribute to the cumulative wastewater flows in the subbasin.[22]

21 San Francisco Department of Public Works, Memo to Manfred Wong and Bessie Tam of the San Francisco Public Utilities Commission, *Mariposa Pump Station (MPS) Dry Weather Flow Hydraulic Analysis*. February 3, 2015.

22 Hydroconsult Engineers, Inc. 2015. Combined Sewer Impact Analysis, Golden State Warriors Arena EIR. February 18.

The UCSF LRDP Final EIR also notes that average dry weather flows to the Mariposa Pump Station exceed previous projections and the existing capacity for dry weather flows at the time of Final EIR publication, even without flows from the Mission Bay campus. As stated in the UCSF LRDP Final EIR, the Mariposa Pump Station would need to be upgraded and the SFPUC is analyzing temporary measures (referred to as "interim improvements" in Impacts UT-5 and C-UT-2) to accommodate flows in the interim period between opening the Phase 1 Medical Center on February 1, 2015 and construction of a long-term solution to increase the dry-weather capacity of the Mariposa Pump Station.

Based on this, the UCSF LRDP EIR concluded that there would be a significant and unavoidable cumulative impact because improvements to the Mariposa Pump Station could be required to accommodate wastewater flows from the Mission Bay campus site; construction of the improvements could result in environmental effects; it was unknown whether the SFPUC would approve the upgrades or require additional modifications; and implementation of the necessary improvements is outside of the UCSF jurisdiction.

Because the SFPUC has determined that there is currently inadequate capacity to serve the project's wastewater demand (as well as UCSF's demand), this cumulative impact would be *significant*. Implementation of **Mitigation Measure M-C-UT-4, Fair Share Contribution for Pump Station Upgrades**, would offset the project's contribution to this impact. The measure would require the project sponsor to contribute its fair share to the SFPUC for the required improvements to the Mariposa Pump Stations and associated wastewater facilities. However, because the necessary improvements have not been completely defined and implementation of the improvements to the City's wastewater system is outside of the project sponsor's control, this impact would be *significant and unavoidable, with mitigation*.

Mitigation Measure M-C-UT-4: Fair Share Contribution for Mariposa Pump Station Upgrades

The project sponsor shall pay its fair share for improvements to the Mariposa Pump Station and associated wastewater facilities required to provide adequate sewer capacity within the project area and serve the project as determined by the SFPUC. The contribution shall be in proportion to the wastewater flows from the proposed project relative to the total design capacity of the upgraded pump station(s). The project sponsor shall not be responsible for any share of costs to address pre-existing pump station deficiencies.

Comparison of Impact C-UT-4 to Mission Bay FSEIR Impact Analysis

The Mission Bay FSEIR Community Services and Utilities impacts section estimated that the Mission Bay Plan would generate approximately 2.5 mgd of wastewater at build-out (average dry weather flow), and it concluded that as designed, the wastewater collection systems would have sufficient capacity for these estimated flows. The Mission Bay FSEIR determined that, based on anticipated land uses as offices, the estimated average wastewater flow to each sub-basin from the project site would be 0.096 mgd and the estimated peak flow would be 0.29 mgd; this corresponds to a total average flow of 0.192 mgd and a total peak flow of 0.578 mgd. At that time, the SFPUC had not indicated that there could be inadequate capacity to serve individual project's wastewater demand within the Mission Bay Plan area in addition to its other known commitments. Therefore, this impact was less than significant as analyzed in the Mission Bay FSEIR.

However, as described above, the project would result in a *new* significant impact not previously identified in the Mission Bay FSEIR because project-related peak wastewater flows would be greater than analyzed in the Mission Bay FSEIR and subsequent to publication of the Mission Bay FSEIR, the SFPUC has determined that the wastewater system would have inadequate capacity to serve the project's projected wastewater demand in the Mariposa sub-basin in combination with all development projects that would be constructed at full build out under the Mission Bay Plan.

5.8 Public Services

5.8.1 Introduction

This section of the SEIR addresses potential impacts associated with public services—including fire protection, emergency medical services, and law enforcement—due to implementation of the proposed project. The section evaluates whether the project would require new or physically altered governmental facilities to maintain adequate service ratios, response times, or other performance objectives, the construction of which would result in substantial adverse physical impacts on the environment. Potential project effects on other public services, including public school facilities, health services, childcare services, library services, and street maintenance services are addressed in the Initial Study, Section 12, Public Services, and potential project effects on public parks are addressed in the Initial Study, Section 10, Recreation (see Appendix NOP-IS).

5.8.2 Summary of Mission Bay FSEIR Public Services, and Community Services and Utilities Sections

The Mission Bay FSEIR Community Services and Utilities setting section characterized existing fire and police protection services serving the Mission Bay plan area and surrounding area at that time. The Mission Bay FSEIR noted that there were no San Francisco Fire Department (SFFD) fire stations operating within the Mission Bay plan area in 1998; however, the plan area was served by up to six surrounding fire stations. The Mission Bay FSEIR also reported that the Mission Bay South area was located within the San Francisco Police Department's (SFPD) Bayview District.

The Mission Bay FSEIR Community Services and Utilities impacts section determined that the Mission Bay plan would potentially result in a significant increase in demand for fire protection and associated emergency medical services in the Mission Bay plan area, and that a new fire station and additional fire department personnel and equipment would be required in the Mission Bay South plan area at build-out in order to facilitate access in the event of a major emergency and maintain adequate levels of service. The FSEIR also indicated the Mission Bay plan would increase demand for a new police station and additional police protection personnel.

The Mission Bay plan included the provision of land at the corner of Third Street and Mission Rock Street in the Mission Bay plan area for a new police/fire station. The Mission Bay FSEIR concluded that with implementation of Mitigation Measures M.6a (Construct New Fire Station) and M.6b (Provide New Engine Company) that would ensure funding for additional fire protection personnel, equipment and fire station, impacts to fire protection services would be less than significant. Furthermore, the Mission Bay FSEIR determined that the new police station proposed under the Mission Bay plan would increase community involvement and lower crime rates in the Mission Bay plan area and ensure impacts to police protection services would be less than significant. Potential impacts associated with the construction and operation of the new police/fire station itself were included in the overall analysis of the Mission Bay plan in the FSEIR.

As explained below, the new Public Safety Building at Third Street and Mission Rock Street in the Mission Bay plan area became operational in April 2015.

5.8.3 Setting

5.8.3.1 Fire Protection and Emergency Medical Services

San Francisco Fire Department

The SFFD provides fire protection and emergency medical services for the City and County of San Francisco. Emergency medical transportation to San Francisco hospitals is provided by a dynamically deployed fleet of both public and private ambulance services.

Currently, the nearest SFFD stations to the project site that would provide the first response for fire suppression, rescue, and emergency medical service include the following:

- Station 4 in Public Safety Building at Third Street and Mission Rock Street (one-third mile from the project site)
- Station 8 at 36 Bluxome Street and Fourth Street (one mile from the project site)
- Station 25 at 3305 Third Street at Cargo Way (1.3 miles from the project site)
- Station 29 at 299 Vermont Street at 16th Street (0.9 miles from the project site)

The City's Public Safety Building at Third and Mission Rock Streets, which includes Station 4, became operational in April 2015. The traffic signals at the intersection of Mission Rock Street with Third Street and Terry Francois Boulevard can be controlled by the SFFD for preemptive signal control to allow unimpeded travel by SFFD emergency vehicles through these intersections in an emergency.

Table 5.8-1 summarizes the existing SFFD staffing and equipment in the project area.

TABLE 5.8-1
SUMMARY OF EXISTING SFFD STAFFING AND EQUIPMENT IN PROJECT AREA

SFFD Fire Station	Staffing per Shift	Total Members	Special Unit	Fire Engines/ Trucks	Command Unit
No. 4: Third St. / Mission Rock St.	9	35		1 engine 1 truck	
No. 8: Bluxome St. / Fourth St.	10	40		1 engine 1 truck	Battalion Chief
No. 25: 3305 Third Street at Cargo Way	4	16		1 engine	
No. 29: 299 Vermont Street at 16th Street	4	16		1 engine	

SOURCE: San Francisco Fire Department, 2015

Table 5.8-2 summarizes the number of SFFD responses in the project area from December 2013 through November 2014 and the average response time.

TABLE 5.8-2
SUMMARY OF SFFD RESPONSES FOR FIRE STATIONS IN PROJECT AREA
(DECEMBER 2013 THROUGH NOVEMBER 2014[a])

SFFD Fire Station No.	Fire Responses	Medical Responses	Total Responses	Average Response Time (minutes)
4[b]	1,038	580	1,618	5.98
8	1,681	5,599	7,280	5.98
25	1,045	1,551	2,596	6.53
29	1,204	2,972	4,176	5.71

a SFFD data reported for December 1, 2013 through November 30, 2014.
b New SFFD Fire Station No. 4 at San Francisco Public Safety Building in Mission Bay became operational in April 2015. Reported response data presented in this table is from existing fire stations that currently serve Station 4's proposed response area.

SOURCE: San Francisco Fire Department, 2015

The SFFD formerly operated and maintained the Auxiliary Water Supply System (AWSS) used for fire protection use only, but since publication of the Mission Bay FSEIR, management of this system has been transferred to the San Francisco Public Utilities Commission's (SFPUC) City Distribution Division. This high pressure water supply system is distinct and separate from the City's domestic water and standard fire hydrant system. The AWSS consists of 150 miles of 8- to 20-inch diameter mains, 1,550 special fire hydrants, a high elevation water reservoir and two large water tanks, emergency saltwater pump stations, and series of underground cisterns. The two AWSS emergency saltwater pumping stations (located at Second Street/Townsend Street and at Fort Mason) each have a pumping capacity of 10,000 gallons per minute (gpm) to supplement the AWSS with saltwater. An existing AWSS water line extends along Third Street adjacent to the project site (see Initial Study, Section 11, Appendix NOP-IS for more discussion).

The SFFD fire boats the *Phoenix* and the *Guardian (*stationed at Station No. 35 at Pier 22½) can make those connections directly into the AWSS via five special manifolds installed along the Bay shoreline to serve as a backup to the City's landside saltwater pumping stations. The nearest SFFD fire boat manifolds to the project site are at Islais Creek/Third Street to the south, and at Pier 22½ to the north. The *Phoenix* has a pumping capacity of over 9,600 gpm, equal to that of one of the landside pumping stations. The *Guardian* has the largest pumping capacity of any fireboat in the world (24,000 gpm) and is the only fireboat that is outfitted with a 5½-inch monitor tip, capable of pumping 9,000 gpm onto a fire from just one of its monitors. The SFFD has also received federal grant money to procure a third fireboat, anticipated to be operational in summer 2015 and stationed at Pier 22½.[1]

1 San Francisco Fire Department, communications with Assistant Deputy Chief Ken Lombardi, January 11, 2015 and January 21, 2015.

5.8.3.2 Law Enforcement Services

San Francisco Police Department

The SFPD provides law enforcement services in the City and County of San Francisco. The SFPD is mandated by the City Charter to maintain a sworn staff of 1,971, excluding officers assigned to the San Francisco International Airport, and officers not available for field duty (e.g., due to on-duty injuries, temporary modified duty, medical leave, and administrative leave). During 2014, the Department averaged 1,715 total full-duty sworn officers. In 2012, the SFPD initiated a six-year hiring plan to gradually increase the number of SFPD officers (with an average of three recruit academies of 50 new hires planned per year) and the mandated SFPD staffing level goal is anticipated to be reached in mid-2018.[2]

The SFPD assigns its officers to ensure adequate staff are available to provide minimum safety services as well as to staff special events and deploy officers to meet unexpected needs when services require "all hands," such as during October of every year when multiple major events are held in the City.[3]

Patrol functions are performed by the police officers of the SFPD Field Operations Bureau from ten district stations. The project site is currently within the jurisdiction of the SFPD's Bayview District. The SFPD Bayview District currently covers an approximately 9.1-square mile area, extending south from the Mission Creek Channel covering all of Mission Bay South plan area, and continuing south through the Potrero Hill, Dogpatch and Bayview neighborhoods to the San Mateo County line. The SFPD Bayview District Station is located at 201 Williams Street, approximately 2½ miles south of the project site.

However, with the recent relocation of the SFPD headquarters and Southern District Station to the Public Safety Building at Third Street at Mission Rock Street, the SFPD district boundaries are being revised. By June 2015, the project site is anticipated to be within the jurisdiction of the SFPD's Southern District.[4] The SFPD Southern District currently covers an approximately 3-square mile area, from roughly Market Street on the north, The Embarcadero waterfront on the east, the Mission Creek Channel on the south, and Division Street on the west, but these boundaries are expected to be revised by June 2015 to include Mission Bay Blocks 29-32. The Southern District Station contains five patrol sectors on the mainland and one on Treasure Island, in addition to several foot beats and officers that patrol on bicycles.

The SFPD's Southern District is responsible for managing the law enforcement services for many events each year, including San Francisco Giants home games at AT&T Park, Oracle World, Macworld, Google Convention, St. Patrick's Day Parade, and Gay Pride Parade, and in 2013, the 34th America's Cup event. The SFPD routinely provides increased police protection for special

3 *Ibid*.

4 San Francisco Police Department, communications with Captain Michael Redmond, Commanding Officer, Southern District Station, January 5, 2015, January 6, 2015, and January 15, 2015.

events, including assigning additional SFPD personnel (police officers and on-site command/dispatch center) specifically for these events. The level of SFPD personnel required for a particular event is determined by the SFPD's Event Commander in coordination with the event sponsor in advance of the event as well as by levels established in event security/operations plans. The Department of Parking and Traffic typically provides traffic control services for special events.[5]

For example, for San Francisco Giants home games at AT&T Park, the SFPD typically provides on-duty officers from five or more SFPD district stations to provide police protection in the ballpark vicinity during games, along with motorized patrol support from the SFPD Honda unit and the SFPD Southern District Station's radio car as needed. In addition, the SFPD's Municipal Transportation Agency (MTA) Division provides officers to assist with facilitation of pedestrian traffic through Muni Metro areas for Giants games. Additional off-duty officers are used to provide additional police protection within the interior of the ballpark. Also, the SFPD maintains agreements with certain parking lot operators in Mission Bay, where SFPD bicycle officers provide security at lots used by ballgame patrons.[6]

Table 5.8-3 summarizes the average annual number and types of crimes that occurred within the Mission Bay Plan area between 2012 and 2014. The SFPD indicates that the crime rate within the immediate project site vicinity (e.g., one-half mile radius of the project site) is lower than elsewhere within the Bayview District, as well as lower than the City as a whole.[7]

TABLE 5.8-3
SUMMARY OF ANNUAL CRIMES IN
MISSION BAY PLAN AREA[a] (AVERAGE 2012-2014)

Crime	Number
Arson	1
Assault	20
Burglary	65
Larceny/Theft	489
Robbery	20
Sex Offense	2
Vehicle Theft	42
Total	**638**

[a] The area for which the SFPD collected statistics approximates, but does not match exactly, the Mission Bay Plan area.

5 *Ibid*.
6 *Ibid*.
7 *Ibid*.

Port of San Francisco Police

The Port of San Francisco employs one police officer based at Pier 26 who responds to complaints and actively patrols the Port property from Pier 90 to Aquatic Park (including the area directly east of the project site) from 7:00 a.m. to 4:00 p.m., Monday through Friday. SFPD provides backup to the Port's officer and law enforcement services after 4:00 p.m. and on weekends.

San Francisco Sheriff's Department

The San Francisco Sheriff's Department (SFSD) manages the San Francisco County Jail and protects City-owned critical infrastructure. In addition, the SFSD augments law enforcement at the request of the SFPD.

California Highway Patrol

The California Highway Patrol (CHP) provides law enforcement services on state highways, including the San Francisco-Oakland Bay Bridge. The nearest CHP station to the project site is Station 335, at 455 Eighth Street in San Francisco.

University of California Police Department

The University of California Police Department (UCPD) provides police protection services for University of California properties and facilities, including the University of California at San Francisco (UCSF) Mission Bay campus. The UCPD is comprised of the Field Services Division, which provides police and investigative services, the Professional Standards Division, and the Homeland Security and Emergency Management Division. The UCSF Police Department maintains its headquarters at 654 Minnesota Street, and a patrol substation at the Mission Bay campus.

5.8.4 Regulatory Framework

5.8.4.1 State Regulations

California Master Mutual Aid Agreement

The California Master Mutual Aid Agreement is a framework agreement between the State of California and local governments for aid and assistance by the interchange of services and facilities, including but not limited to fire, police, medical and health, communication, and transportation services and facilities to cope with the problems of rescue, relief, evacuation, rehabilitation, and reconstruction.

California Fire Code

State fire regulations are set forth in Sections 13000, et seq. of the California Health and Safety Code, which includes regulations concerning building standards (as set forth in Title 24 of the California Code of Regulations, the California Building Code), fire protection and notification systems, fire protection devices (such as fire extinguishers and smoke alarms), high-rise building and child care facility standards, and fire suppression training. California Fire Code Section 403.2

addresses public safety for both indoor and outdoor gatherings, including emergency vehicle ingress and egress, fire protection, emergency medical services, public assembly areas and the directing of both attendees and vehicles (including the parking of vehicles), vendor and food concession distribution, and the need for the presence of law enforcement and fire and emergency medical services personnel at the event.

5.8.4.2 Local Regulations

San Francisco General Plan

The *San Francisco General Plan* provides general policies and objectives to guide land use decisions and development throughout the city, as described in Chapter 4, Plans and Policies. The Community Facilities Element of the General Plan contains the following objectives and policies relevant to public services:

> ***Objective 1*****:** Distribute, locate and design police facilities in a manner that will enhance the effective, efficient and responsive performance of police functions.
>
> ***Policy 1.1*****:** Locate police functions that are best conducted on a centralized basis in a police headquarters building.
>
> ***Policy 1.2*****:** Provide the number of district stations that balance service effectiveness with community desires for neighborhood police facilities.
>
> ***Policy 1.3*****:** Enhance closer police/community interaction through the decentralization of police services that need not be centralized.
>
> ***Policy 1.4*****:** Distribute, locate, and design police support facilities so as to maximize their effectiveness, use, and accessibility for police personnel.
>
> ***Policy 1.6*****:** Design facilities to allow for flexibility, future expansion, full operation in the event of a seismic emergency, and security and safety for personnel, while still maintaining an inviting appearance that is in scale with neighborhood development.
>
> ***Policy 1.7*****:** Combine police facilities with other public uses whenever multi-use facilities support planning goals, fulfill neighborhood needs, and meet police service needs.
>
> ***Policy 2.1*****:** Provide expanded police/community relations and police services through outreach programs, primarily utilizing existing facilities.
>
> ***Policy 2.2*****:** Establish police district boundaries along natural neighborhood edges, and reinforce neighborhood identity by locating district stations near the centers of their service areas.
>
> ***Policy 2.3*****:** Design police facilities to maximize opportunities for promoting community/ police relations through dual use of facilities.
>
> ***Objective 5*****:** Development of a system of firehouses which will meet the operating requirements of the Fire Department in providing fire protection services and which will

be in harmony with related public service facilities and with all other features and facilities of land development and transportation provided for in other sections of the General Plan.

San Francisco Police Code

The San Francisco Police Code contains regulations for various types of activities such as automobile use, permitting and licensing, and disorderly conduct. The City's noise ordinance is also part of the Police Code (Article 29) – see Section 5.3, Noise Regulatory Framework.

San Francisco Fire Code

The San Francisco Fire Code was revised in 2007 to regulate and govern the safeguarding of life and property from fire and explosion hazards arising from the storage, handling, and use of hazardous substances, materials, and devices, and from conditions hazardous to life or property in the occupancy of buildings and premises; to provide for the issuance of permits, inspections, and other SFFD services; and to provide for the assessment and collection of fees for those permits, inspections, and services. The SFFD reviews building plans to ensure that fire and life safety is provided and maintained in the buildings that fall under its jurisdiction. SFFD building plan review applies to all of the following occupancy types:

- All Assembly Occupancies (including restaurants and other gathering places for 50 or more occupants)
- All Educational Occupancies (including commercial day care facilities)
- All Hazardous Occupancies (including repair garages, body shops, fuel storage, and emergency generator installation)
- All Storage Occupancies where potential exists for high-piled storage as defined by Fire Code
- All Institutional Occupancies
- All High-Rise Buildings of all occupancies
- Residential Occupancies, such as hotels, motels, lodging houses, residential care facilities, apartment houses, small- and large-family day care homes, and R-1 artisan buildings (excluding minor residential repairs such as kitchen and bath remodeling and dry rot repair)
- Certified family-care homes, out-of-home placement facilities, halfway houses, drug and/or alcohol rehabilitation facilities
- Tents, awnings, or other fabric enclosures used in connection with any occupancy
- All fire alarm and fire suppression systems

In coordination with the San Francisco Department of Building Inspection and the Port Building Department, the SFFD conducts plan checks to ensure that all structures, occupancies, and systems outlined above are designed in accordance with the San Francisco Building Code prior to the issuance of a building permit.

5.8.5 Impacts and Mitigation Measures

5.8.5.1 Significance Thresholds

The project would have a significant impact related to public services if the project were to:

- Result in substantial adverse physical impacts associated with the provision of or need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any public services such as fire protection, law enforcement, or other services.

Impacts regarding emergency vehicle access are addressed in Section 5.2, Transportation and Circulation.

5.8.5.2 Approach to Analysis

Methodology for Analysis of Direct Impacts

The proposed project could have a significant impact on public services if (1) it would require the construction of new or physically altered governmental facilities in order to maintain acceptable levels of public services, *and* (2) the construction or alteration of such facilities would result in one or more substantial adverse impacts on the environment. While the proposed project includes provision of space at the event center for the SFFD and SFPD to use during games/events (e.g., command center), the physical impacts related to construction and operation of those facilities are addressed as part of the proposed project and included within the analyses in the appropriate environmental resource topic sections of this SEIR.

Other effects that could result from the proposed project—such as the potential for an increase in crime, public drinking, outdoor crowd noise, building defacement, public urination, ticket scalping, pan-handling, vandalism, litter, graffiti, and other activities that may result in a diminished quality of life for neighborhood residents—are not considered impacts under CEQA unless such effects result in the need for the construction of new or physically altered governmental facilities in order to maintain acceptable levels of public services, *and* the construction of such facilities result in adverse physical environmental impacts. These quality of life issues would be considered as part of OCII and the City's project planning and approval processes, outside of the CEQA environmental review process.

Nevertheless, the proposed project would incorporate certain services, facilities, and site management practices that would minimize the project's effects on the quality of life for the surrounding neighborhood. These include: the provision of on-site space, including a command center at the event center for use by the sponsor's security personnel, SFPD, SFFD, and San Francisco Municipal Transportation Agency (SFMTA); provision of private security guards to regularly patrol buildings and grounds, and increased security for games/events to provide on-site crowd management and public safety; inclusion of applicable on-site security equipment; use of traffic control personnel and implementation of a transportation management plan for games/events to facilitate safe movement of, and minimize potential conflicts among pedestrians, bicyclists, and vehicles; use of maintenance and cleaning staff to regularly clean and maintain the buildings and grounds and provide litter control; incorporation of public restroom facilities in proposed buildings and open space areas; and installation of recycling/trash/compost receptacles as required by the City.

The impact analysis below first considers whether the project would require the construction of new or altered governmental facilities (beyond those included in the proposed project), in order to maintain acceptable performance standards for public services. If new or altered public service facilities are determined to be required to serve the project, then the analysis evaluates whether construction of such facilities would have a substantial adverse physical impact on the environment. For example, if the SFPD determined that a new police station would be required to be constructed to maintain adequate service levels for law enforcement, the impact analysis would evaluate whether construction or operation of the new police station would have significant impacts on the physical environment.

If the project were to result in increased demand for law enforcement, fire protection, and/or emergency medical services, there could be economic impacts that are unrelated to the construction of new or altered facilities. Costs incurred by the agencies that would provide law enforcement, fire protection, and emergency medical services would not be considered an environmental impact under CEQA, and as such, CEQA environmental review does not address mitigation measures to compensate public service agencies for such costs.

For purposes of the impact analysis, it is assumed that project improvements would be designed and constructed in compliance with all applicable building and fire codes, which include requirements for fire alarms, smoke detectors, sprinkler systems, fire extinguishers, and the number and location of exits.

Methodology for Analysis of Cumulative Impacts

The geographic scope of potential cumulative impacts on public services encompasses the areas served by the SFFD, SFPD, and other federal and state government facilities that provide fire protection, emergency medical, and law enforcement services in the project area.

Foreseeable past, present, and probable future projects in the project area that could result in cumulative impacts on public services in combination with the proposed project are described in Section 5.1, Impact Overview. For the public services cumulative impact analysis, future development projects considered in the analysis include those that would require law enforcement services and fire protection/emergency medical services. Similar to the analysis for project impacts, the cumulative impact analysis assumes that construction and operations of other projects in the immediate vicinity would also be completed in compliance with applicable regulations regarding the provision of public services. The analysis considers whether or not there would be a significant, adverse cumulative impact associated with project implementation in combination with past, present, and probable future projects in the immediate vicinity, and if so, whether or not the project's contribution to the cumulative impact would be significant (i.e., cumulatively considerable).

5.8.5.3 Impact Evaluation

Impact PS-1: See Initial Study (Appendix NOP-IS)

Construction

Fire Protection, Emergency Medical Services, and Law Enforcement

Impact PS-2: Construction of the proposed project would not result in substantial adverse physical impacts associated with the provision of or the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire protection, emergency medical services, or law enforcement. (Less than Significant)

As discussed in Chapter 3, Project Description, construction of the proposed project is anticipated to begin in late 2015, and occur over an approximate 26-month period. The number of construction workers present on-site daily would vary, depending on the specific construction activities being performed and the overlap between construction phases. During peak overlapping construction periods, there would be between approximately 330 and 700 construction workers at the project site. The presence of construction workers on-site could result in an incremental, temporary increase in demand for fire protection, emergency medical services, and law enforcement. As described in Section E.3, Population and Housing, in the Initial Study (see Appendix NOP-IS), it is expected that a portion of the construction labor needs would be met by residents of San Francisco, who are currently being served by these City services and therefore would not represent an increase in demand for City services. In any case, this incremental, temporary increase in demand for services during construction could be accommodated by the existing fire protection, emergency medical services, and law enforcement services and would not require construction of new or physically altered facilities to maintain services. Therefore, maintaining acceptable fire protection, emergency medical services, and law enforcement during construction of the proposed project would be *less than significant*, and no mitigation would be required.

Mitigation: Not required.

Comparison of Impact PS-2 to Mission Bay FSEIR Impact Analysis

The Mission Bay FSEIR did not specifically address potential construction-related impacts to fire protection, emergency medical, or law enforcement services. However, because project impacts would be less than significant, the project would result in no new or substantially more severe significant impacts than was previously identified in the FSEIR.

Operation

Fire Protection and Emergency Medical Services

Impact PS-3: Operation of the proposed project would not result in substantial adverse physical impacts associated with the provision of or the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire protection or emergency medical services. (Less than Significant)

An increase in population at the project site and vicinity, including patrons attending games and other events, customers frequenting proposed retail uses and restaurants; event center, office and retail employees; and visitors to the proposed public plazas would result in periodic increases in demand for fire protection and emergency medical services compared to existing conditions. Because the project does not include any residential uses, there would be no permanent increase in population at the project site. As discussed below, the periodic increases in demand for fire protection and emergency medical services would not require construction of new or physically altered fire protection or emergency medical facilities.

The population increases associated with the project would be minimal in comparison to the population served by the existing fire stations in the project area. The increase in calls for fire protection and medical emergency response would not be substantial in light of the existing demand and capacity for fire protection and emergency medical services in the City. The project site is located in an existing urban area and would not extend demand of the SFFD beyond the current limits of its service capabilities. The proposed development would neither adversely affect SFFD service standards nor require an increase in SFFD staff that would require the construction of new fire protection facilities.[8]

As discussed above in the Setting, the newly-operational Fire Station 4 operates within the Public Safety Building, approximately one-third mile north of the project site; this fire house would serve as a first responder to fire and emergency medical incidences at the project site. In addition, there are several other existing fire stations (e.g., Fire Stations No. 8, 25 and 29) located within the project site vicinity that would provide supplemental fire protection and emergency medical response personnel and equipment at the project site, if needed.[9]

A high pressure AWSS water line currently extends along Third Street adjacent to the project site that would serve the proposed project. There are no AWSS deficiencies in the project area, and if needed, existing emergency saltwater pump stations and/or the SFFD fire boats could provide a supplemental source for emergency water for the AWSS.[10]

---

8 Communications with Assistant Deputy Chief Ken Lombardi, San Francisco Fire Department, January 11, 2015 and January 21, 2015.
9 *Ibid*.
10 *Ibid*.

As part of project operations for games and large events at the event center, the Warriors or other event sponsors would provide on-site medical services, including a first aid station and on-site medical personnel to provide first aid to game/event patrons or employees that may require medical assistance, which would further reduce potential effects on general emergency medical response providers.

The proposed development would be designed to comply with the most up-to-date building and fire codes and include state-of-the-art fire safety measures and equipment, including but not limited to, use of fire retardant building materials, inclusion of emergency water infrastructure (fire hydrants and sprinkler systems), installation of smoke detectors and fire extinguishers, emergency response notification systems, and provision of adequate emergency access ways within the project site for emergency vehicles. Project fire safety plans would be subject to review and approval by the SFFD.

Furthermore, as part of the project, a proposed command center at the event center would be used prior to, during, and after games/events by the SFFD, SFPD, SFMTA, and/or the project's private security and emergency medical staff to coordinate incident response, facilitate communication and surveillance, implement the transportation management plan (TMP), and deploy parking control officers (PCOs).

The periodic increase in demand for fire protection services discussed above would not require construction of new or physically altered fire protection facilities. The existing SFFD fire stations in the project vicinity (including the newly-operational Fire Station 4, located one-third mile north of the site), in combination with the proposed provision for on-site emergency medical staff for games/events, and provision of on-site fire prevention/protection measures, equipment and facilities at the project site, are currently adequate to meet the increases in demand for fire protection and emergency medical response services associated with the proposed project. No additional new or physically altered facilities would be necessary. Therefore, the proposed project would have a *less than significant* impact related to the construction of new or physically altered fire protection facilities.

Mitigation: Not required.

Comparison of Impact PS-3 to Mission Bay FSEIR Impact Analysis

As discussed above, the Mission Bay FSEIR determined that the Mission Bay plan would potentially result in a significant increase in demand for fire protection services in the Mission Bay plan area, and that a new fire station and additional fire department personnel and equipment would be required in the Mission Bay South plan area at build-out in order to facilitate access in the event of a major emergency, and maintain adequate levels of service. The Mission Bay FSEIR concluded that with implementation of Mitigation Measures M.6a (Construct New Fire Station) and M.6b (Provide New Engine Company) to ensure funding for additional fire protection personnel, equipment and fire station, impacts to fire protection services would be less than significant. The City's Public Safety Building at Third and Mission Rock Streets, which includes SFFD Fire Station 4 became operational in April 2015, and consequently, Mission Bay

FSEIR Mitigation Measures M.6a and M.6b have been implemented and are not applicable to the proposed project.

Therefore, the project would not result in any new or substantially more severe significant impacts than those previously identified in the Mission Bay FSEIR.

Law Enforcement Services

Impact PS-4: Operation of the proposed project would not result in substantial adverse physical impacts associated with the provision of or the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for law enforcement services. (Less than Significant)

An increase in population at the project site and vicinity, including patrons attending games and events, customers frequenting proposed retail uses and restaurants, event center, office and retail employees, and visitors to the proposed public plazas would result in a periodic increase in demand for law enforcement services. Because the project does not include any residential uses, there would be no permanent increase in population at the project site. The periodic increases in demand for law enforcement services would not require construction of new or physically altered law enforcement facilities.

During non-event periods at the project site, the proposed project would require typical SFPD police protection services, which are expected to be similar to those services currently being provided to other mixed-use developments in the City. As discussed above, the newly-operational SFPD headquarters and Southern District police station are based in the Public Safety Building in Mission Bay, approximately one-third mile north of the project site. In addition, the event center, office and retail uses would provide their own on-site private security personnel and install proper security equipment (e.g., security nightlighting, CCTV system for video surveillance, and security gates/locks) similar to other mixed use developments in the City. The event center would also provide an on-site command center for on-site security personnel to monitor access to the site and provide communications resources seven days a week, 24 hours a day.

However, when games and other large capacity events would occur at the event center, an increased level of SFPD police protection personnel would be required on- and/or off-site for patrolling and responding to potential incidences associated with the temporary increases in visitors. The SFPD anticipates that for games/events at the proposed event center, typical police responses would be associated with actions such as citations, ejections of fans from the arena and arrests, public intoxication, thefts from vehicles, and low-level assaults.[11] The temporary

[11] San Francisco Police Department, communications with Captain Michael Redmond, Commanding Officer, Southern District Station, January 5, 2015, January 6, 2015 and January 15, 2015.

increases in project-related visitors within the immediate vicinity of the adjacent UCSF Mission Bay campus could also result in periodic incidences requiring response from the UCSF Police Department.

As discussed in the Setting, the SFPD routinely provides increased police protection for sports games (e.g., SF Giants baseball home games at AT&T Park) and other events in the City, and assigns and dedicates additional SFPD personnel specifically for these games/events. Accordingly, the SFPD would increase local staffing for the games/events at event center, as needed. The level of SFPD personnel required on- and/or off-site for games/events would be determined in advance of the game/event by the SFPD's Event Commander in coordination with the Warriors and/or event sponsor and would be specified in event security/operations plans.[12]

During games and events at the event center, the Warriors and/or event sponsor would also provide increased private security to assist in on-site crowd management and public safety during events, and would use traffic control personnel to assist in implementing the TMP to facilitate safe movement of, and minimize potential conflicts among pedestrians, bicyclists, and vehicles.

Furthermore, as part of the project, space within the event center would be provided for SFPD personnel to use during games/events for police administrative and operational functions, and could include police-related facilities typically included at sports arenas such as temporary detention facilities. In addition, as discussed in Impact PS-3, above, a separate proposed command center at the event center would be used prior to, during, and after games/events by the SFPD, SFFD, SFMTA and/or the project's private security and emergency medical personnel to coordinate incident response, facilitate communication and surveillance, and implement the TMP and PCOs. Consequently, adequate police protection services and facilities would be available and provided for the games/events at the project site, and such services would not detract from other SFPD police operations within the City.[13] See cumulative impacts below regarding impacts on SFPD personnel during concurrent events at the project site and AT&T Park.

The periodic increase in demand for law enforcement services discussed above would not require construction of new or physically altered police stations. The existing police protection facilities in the project site vicinity, including the newly-operational Southern District police station located one-third mile north of the site, in combination with proposed event security/operations plans, and provision of on-site security facilities and personnel for the project, are currently adequate to meet the increase in demand for service associated with the proposed project. No new or physically altered facilities would be necessary. Therefore, the proposed project would have a *less than significant* impact related to the construction of new or physically altered police protection facilities.

12 *Ibid*.
13 *Ibid*.

Mitigation: Not required.

Comparison of Impact PS-4 to Mission Bay FSEIR Impact Analysis

As discussed above, the Mission Bay FSEIR determined that the Mission Bay plan would increase demand for a new police station and additional police protection personnel, although not significantly. The Mission Bay FSEIR also concluded that a new police station proposed under the Mission Bay plan would increase community involvement and lower crime rates in the Mission Bay plan area and ensure impacts to police protection services would be less than significant. Consistent with the Mission Bay plan, the City's Public Safety Building at Third and Mission Rock Streets, which includes new SFPD headquarters and Southern Station, became operational in April 2015.

Therefore, the project would not result in any new or substantially more severe significant impacts than those previously identified in the Mission Bay FSEIR.

Cumulative Impacts

Impact C-PS-1: See Initial Study (Appendix NOP-IS)

Impact C-PS-2: The project, in combination with other past, present, and reasonably foreseeable future projects, would not result in significant adverse cumulative impacts on fire protection, emergency medical, and law enforcement services. (Less than Significant)

The geographic scope of the potential cumulative impacts of the proposed project related to public services includes the areas served by the fire and police stations and other facilities of the federal, state, and local government agencies that provide fire protection, emergency medical, and law enforcement services in the project area.

As stated above, the proposed project would increase demand for fire protection, emergency medical, and law enforcement services. The project could have a significant cumulative impact if (1) this increase in demand would make a cumulatively considerable contribution to the public service demands of other past, present, and future projects described in Section 5.1 in this SEIR that, in combination, would require the construction of new or physically altered governmental facilities (i.e., fire or police stations); *and* (2) the construction of such facilities would have a significant adverse impact on the environment.

Neither the SFPD nor SFFD have identified a citywide service gap. Therefore, the increased need for law enforcement or fire protection services resulting from the proposed project and reasonably foreseeable projects would not be above levels anticipated by the SFFD or SFPD. With respect to the potential need for SFPD police protection for multiple special events that may occur concurrently within the City (e.g., a game or event at the project site in combination with a SF Giants baseball home game at AT&T Park), the SFPD indicates that separate security/operations plans and dedicated SFPD personnel would be used concurrently for each individual event.[14] When considering that dedicated SFPD staff, in combination with each event sponsors' private security and public safety staff, would be available to serve the respective events, no delays in response times would be expected to occur for the individual events or for service in the City as a whole.

Given these factors, the contribution to cumulative impacts by the project would not be considerable, and the impact would be *less than significant*.

Mitigation: Not required.

Comparison of Impact C-PS-2 to Mission Bay FSEIR Impact Analysis

The 1998 Mission Bay FSEIR did not contain an analysis of cumulative impacts on fire protection, emergency medical, and law enforcement services *per se*, although as a program EIR, the FSEIR analyzed the fire protection, emergency medical, and law enforcement services impact of the Mission Bay North and South Redevelopment Plans as a whole, covering development throughout an area over 300 acres in size, which is essentially a cumulative analysis.

As described above, with completion of the City's Public Safety Building at Third and Mission Rock Streets, public services impacts of the Mission Bay Plan previously identified in the FSEIR have now been reduced to less than significant. Consequently, the cumulative impacts for the Plan area are now less than significant. Therefore, the project would not result in any new or substantially more severe significant impacts than those previously identified in the Mission Bay FSEIR.

5.9 Hydrology and Water Quality

5.9.1 Introduction

This section describes the potential effects of the project on the existing hydrology and water quality in the project area, with a focus on operational impacts associated with changes in stormwater and wastewater flows. The potential for flooding as a result of sea level rise is also addressed.

The impact evaluation in the Hydrology and Water Quality section of the Initial Study (see Appendix NOP-IS, pp. 86 through 98) explains why the proposed project would not result in new significant impacts or substantially increase the severity of impacts on hydrology and water quality with respect to depletion of groundwater and interference with groundwater recharge; alteration of drainage patterns; degradation of water quality; placement of housing within a 100-year flood zone; placement of structures within a 100-year flood zone; flooding as a result of failure of a levee or dam; and inundation by seiche, tsunami, or mudflow.

Project effects on the capacity of wastewater and stormwater systems, which are related to water hydrology and water quality impacts, are addressed in Section 5.7, Utilities and Service Systems, of this SEIR.

5.9.2 Summary of Mission Bay FSEIR Hydrology and Water Quality Analysis

Hydrology and water quality setting information and impact analyses were addressed in the Mission Bay FSEIR in the Hydrology/Water Quality and Community Services/Utilities sections as well as in the Mission Bay Initial Study Water and Geology/Topography sections. Those sections of the Mission Bay FSEIR discuss and analyze a preliminary approach to managing stormwater and wastewater in the Mission Bay South area. However, the approach that was ultimately adopted and implemented was described and analyzed as a Mitigation Scenario B in the Mission Bay FSEIR Summary of Comments and Responses (FSEIR Volume III, beginning on p. XII.253). Information from these sections relevant to the analysis of hydrology and water quality impacts is summarized below.

5.9.2.1 Mission Bay FSEIR Setting

Mission Bay Plan Stormwater Drainage Setting

The Mission Bay FSEIR Hydrology/Water Quality setting section characterized existing drainage patterns and municipal sewer treatment facilities serving the Mission Bay Plan area at the time of FSEIR publication. As presented in that description, the Mission Bay Plan area was located in the City's Bayside drainage basin, in which combined stormwater and sanitary sewage were collected in the same set of pipes, conveyed to and treated at the Southeast Water Pollution Control Plant (SEWPCP) near Islais Creek, and treated wastewater was then discharged to the

Bay in a deep water outfall at Pier 80. At that time, the Mission Bay Plan area was located in four sub-basins, with the project site draining to two of the sub-basins. The north and east portions of the Blocks 29-32 site drained to the Bay sub-basin, in which stormwater drained directly to the Bay, and the balance of Blocks 29-32 drained to the Mariposa sub-basin of the Bayside drainage basin of the combined sewer system. Stormwater collected in the Mariposa sub-basin was directed to the Mariposa Pump Station, and from there, to the SEWPCP.

As reported in the Mission Bay FSEIR, the annual average dry weather flows at the SEWPCP at that time were estimated at 67 million gallons per day (mgd). During wet weather, the SEWPCP could treat up to 150 mgd to a secondary level, and an additional 100 mgd to a primary level.[1] In addition, up to an additional 150 mgd of wet weather flows received primary treatment at the North Point Water Pollution Control Plant, increasing total wet weather treatment capacity for the Bayside drainage basin to 400 mgd. As also reported in the Mission Bay FSEIR, if rainfall resulted in total combined wastewater and stormwater flows exceeding the total capacity of the SEWPCP, the North Point facility, and storage/transport facilities, then excess flows are directed to combined sewer discharge (CSD) structures located along the City's bayside. These flows receive flow-through treatment (similar to primary treatment) and were discharged to the Bay in compliance with the City's National Pollutant Discharge Elimination System (NPDES) permit issued by the Regional Water Quality Control Board (RWQCB).

Mission Bay Plan Flooding Setting

The Mission Bay FSEIR Initial Study Water section summarized relevant information from the 1990 Mission Bay FEIR regarding the issue of potential flooding. The 1990 Mission Bay FEIR indicated that the elevation of the Mission Bay Plan area ranged from approximately +6 to -2 feet San Francisco City Datum (SFD)[2], or 17 to 9 feet based on the 1988 North American Vertical Datum (NAVD88). Groundwater in the Mission Bay Plan area was reported at 3.5 to 9 feet below ground surface, and contiguous with the mean sea level in the adjacent Bay. As referenced in the Mission Bay FSEIR Initial Study, the 1990 Mission Bay FEIR determined that proposed structures or roadways in Mission Bay placed at elevations at or below -2 feet SFD (9 feet NAVD88), after settling on the site, could be subject to tidal flooding during the 100-year flood event, and that if sea levels were to rise, groundwater levels in Mission Bay could also rise.

5.9.2.2 Mission Bay FSEIR Impacts and Mitigation Measures

As discussed in Section 5.7, Utilities and Service Systems, the Mission Bay Draft SEIR described major sewer upgrades within the Mission Bay Plan area that were proposed as part of the Mission Bay Plan. Additional improvements were planned as part of Mitigation Scenario B

---

1 Secondary treatment is the treatment of wastewater or sewage involving removal of organic matter using biological and chemical processes. This is a higher level of treatment than primary treatment, which is removal of floating and settleable solids using physical operations such as screening and sedimentation.

2 San Francisco City Datum (SFD) establishes the City's zero point for surveying purposes at approximately 8.6 feet above the mean sea level established by 1929 U.S. Geological Survey datum, and approximately 11.3 feet above the 1988 North American Vertical Datum.

described in the Comments and Responses of the Mission Bay FSEIR. The adopted approach included reconfiguring the Central and Mariposa sub-basins of the combined sewer system for the collection of wastewater and; constructing a separate stormwater collection system in the entire Mission Bay South Plan area. ; The separate stormwater system in the reconfigured Central sub-basin has been constructed, and the separate stormwater system in the reconfigured Mariposa sub-basin is currently under construction and anticipated to be completed in 2015, prior to construction and operation of the proposed project.

Mission Bay Plan Effects on Stormwater Drainage

The Mission Bay FSEIR Hydrology and Water Quality impacts section described the proposed Mission Bay Plan's drainage plan, which included reconfiguring the drainage basins of the combined sewer, as shown on Figure 5.7-1 in Section 5.7, Utilities and Service Systems. As part of Mitigation Scenario B, a new separate stormwater system was proposed in both the reconfigured Central and Mariposa sub-basins. With construction of this system, stormwater that previously discharged to the combined sewer system or directly to the Bay would drain into the new separate stormwater infrastructure. The reconfigured Central and Mariposa sub-basins of the combined sewer system would convey wastewater to the SEWPCP for treatment.

The separate stormwater system is currently being implemented by the master developer and includes four drainage zones within the geographic boundaries of the reconfigured Central sub-basin (construction completed) and one drainage zone within the geographic boundaries of the reconfigured Mariposa sub-basin (currently under construction). Stormwater in each of the drainage zones flows by gravity to one of five stormwater pump stations in the locations shown on Figure 5.7-2, including Pump Station SDPS-5 near the east end of 16th Street. When construction of the fifth drainage basin is completed (anticipated to be in 2015, prior to construction and operation of the proposed project), all stormwater runoff from Mission Bay South will be conveyed through the separate stormwater system and discharged to the Bay and China Basin Channel (Mission Creek).

The Mission Bay FSEIR Hydrology and Water Quality section indicated that implementation of the Mission Bay Plan would contribute pollutants to the Bay through: (1) the discharge to municipal wastewater effluent from the SEWPCP; (2) the discharge of treated combined sewer overflows (CSOs) (these events are now referred to as combined sewer discharges or CSDs); and (3) the discharge of untreated stormwater. As described below, the Mission Bay FSEIR found that these water quality impacts would be less than significant. As also discussed below, the Mission Bay FSEIR included Mitigation Measures K.3 and K.4 to address cumulative effects related to an increase in CSDs and water quality effects of untreated stormwater discharges, and these mitigation measures were implemented as part of Mitigation Scenario B of the FSEIR Comments and Responses.

Mission Bay Plan Effects on Volume and Quality of Municipal Wastewater Effluent

The Mission Bay FSEIR estimated that under the original Mission Bay Draft SEIR approach the Mission Bay Plan would generate municipal wastewater and increase the total effluent discharged from the SEWPCP to the Bay by about 3 percent, and result in an approximate 3 percent increase in the pollutant loading to the Bay from the City's municipal wastewater effluent discharges. The Mission Bay FSEIR reported that for the most part, the quality of municipal wastewater from the Mission Bay Plan area would not differ substantially from the quality of other City wastewater conveyed to the SEWPCP, and would not materially change the concentrations of pollutants in the effluent. The Mission Bay FSEIR determined that the effluent increases would be well within the City's treatment plant capacity, and would not cause a violation of the City's NPDES permit requirements for its discharge from the SEWPCP. The Mission Bay FSEIR also determined that the pollutant concentrations in the treated wastewater would be within water quality screening values, including water quality objectives adopted by the RWQCB.

However, the Mission Bay FSEIR determined that the University of California, San Francisco (UCSF) and some commercial or industrial operations could involve the discharge of some pollutants not typically associated with most other San Francisco wastewater, and these sources could potentially discharge chemicals, radioactive materials, and biohazardous materials to the SEWPCP. If improperly handled, these discharges could potentially result in a violation of the NDPES permit. The FSEIR identified Mitigation Measure K.2 in the Hydrology and Water Quality section, which required facilities with these discharges to install sampling ports to facilitate demonstration of compliance with discharge limitations. Implementation of this measure would reduce impacts related to municipal wastewater effluent to less than significant.

Mission Bay Plan Effects of Volume and Quality of Combined Sewer Discharges

The Mission Bay FSEIR estimated that under the Mission Bay Draft SEIR approach, the Mission Bay Plan would increase the average annual volume of CSDs (formerly referred to as combined sewer overflows, or CSOs) by approximately 0.2 percent, and increase the duration of each overflow event by a few minutes. The Mission Bay FSEIR reported that the Mission Bay Plan would not change the concentrations of pollutants in the treated CSDs. In addition, this slight increase in CSD volumes and duration would not cause a violation of the City's NPDES permit requirements for the CSDs, and thus, would not adversely affect existing near-shore aquatic biota or water-contact recreation in the Bay. Given these factors, the Mission Bay FSEIR concluded that Mission Bay Plan effects of CSDs on water quality would be less than significant.

Mission Bay Plan Effects of Volume and Quality of Direct Stormwater Discharge

The Mission Bay FSEIR reported that under the Mission Bay Draft SEIR approach, the Mission Bay Plan would increase the volume of stormwater directly discharged from the Plan area to the Bay by approximately 2 percent and would also change the concentration of pollutants in the stormwater discharge due to the intensification of land uses proposed in the Mission Bay Plan. However, the Mission Bay FSEIR concluded that any potential increase in pollutants from stormwater discharges would be very small relative to those associated with municipal wastewater and treated CSDs. The Mission Bay FSEIR determined that this increase in volumes and change in pollutant concentrations would not adversely affect existing aquatic biota in the Bay. Given these factors, the Mission Bay FSEIR concluded that Mission Bay Plan effects of direct stormwater discharge on water quality would be less than significant.

Mission Bay Plan Effects on Sediment Quality

The Mission Bay FSEIR reported that the RWQCB identified China Basin Channel (Mission Creek) and Islais Creek as candidate toxic hot spots for sediment quality. The Mission Bay FSEIR indicated under the original Mission Bay Draft SEIR approach, the Mission Bay Plan would increase the volume of CSDs from the combined sewer system to Islais Creek as well as the volume of direct stormwater discharges to China Basin Channel (Mission Creek). The Mission Bay FSEIR concluded that increased discharges would cause a corresponding increase in sediment deposition at these locations. However, the discharges would not measurably change the physical or chemical composition of the sediment layer, nor affect any determination by the RWQCB to designate China Basin Channel (Mission Creek) or Islais Creek as toxic hot spots. Given these factors, the Mission Bay FSEIR concluded that Mission Bay Plan effects on sediment quality in Islais Creek and China Basin Channel (Mission Creek) would be less than significant.

Mission Bay Plan Effects on Water Contact Recreation

The Mission Bay FSEIR reported that under the original Mission Bay Draft SEIR approach the Mission Bay Plan would increase CSDs from both the Mariposa and Islais Creek sub-basins of the City's combined sewer system, which could affect water quality as well as the use of these areas for water contact recreation. However, the Mission Bay FSEIR concluded that water contact recreation occurs infrequently on the Bayside, and there would be no impact related to water contact recreation.

Mission Bay Plan Contribution to Cumulative Effects

The Mission Bay FSEIR concluded that there were no significant cumulative impacts identified from the estimated increased volume and pollutant load of treated municipal wastewater effluent, treated CSDs, and direct stormwater discharges, because there would not be substantial degradation in water quality of the Bay or near-shore waters, no toxic effect on aquatic biota, and no substantial change in sediment quality or beneficial uses.

However, the Mission Bay FSEIR determined that due to the lack of conclusive evidence refuting a causal relationship between treated CSDs, stormwater discharges, and sediment quality, the Mission Bay Plan could contribute to a potentially significant cumulative impact on water quality of near-shore waters of the Bay from multiple sources of CSDs and direct stormwater discharges to China Basin Channel (Mission Creek) under the Mission Bay Draft SEIR approach. The Mission Bay FSEIR concluded that the estimated Plan contribution (0.2 percent) to the potential cumulative increase (11 percent) in Bayside CSD volumes, and the contribution of Plan-related stormwater discharges to possible cumulative impacts would be reduced to less than significant with the implementation of Mitigation Measures K.3 and K.4 regarding CSD volumes and alternative treatment technologies for treatment of direct stormwater discharges (described below).

Mission Bay Plan Phased Development Effects on Water Quality from Stormwater

The Mission Bay FSEIR discussed U.S. Environmental Protection Agency (U.S. EPA) Phase II stormwater regulations that had been proposed but not finalized at the time of publication of the Mission Bay FSEIR. These proposed regulations would require the City to develop and implement a stormwater management program to reduce the discharge of pollutants from stormwater to the maximum extent practicable and to protect water quality. The Mission Bay FSEIR indicated that the absence of adopted regulatory requirements for a stormwater management program that addressed Mission Bay stormwater quality, and a failure to implement other best management practices (BMPs) to minimize stormwater pollution, could potentially conflict with the intent of the proposed stormwater permit requirements and result in a significant impact.

Mitigation Measure M.5 in the Mission Bay FSEIR Community Services and Utilities section (see Section 5.7, Utilities and Service Systems) required conveying all stormwater runoff from newly developed areas in the Bay drainage basin to the combined sewer system prior to completion of the initial-flow diversion system. Mitigation Measure K.5 in the Mission Bay FSEIR Hydrology and Water Quality section identified implementation of an individual stormwater management program that utilizes BMPs for Mission Bay until the Phase II regulations become final and Mission Bay is included in the City’s stormwater management program. Implementation of this measure would reduce impacts to less than significant.

Mission Bay Plan Effects on Flooding

The Mission Bay FSEIR Initial Study included Mitigation Measures K.6a through K.6f, adapted from the 1990 Mission Bay FEIR that required structures in the Mission Bay area to be designed and located in a way to protect low-lying shoreline areas from the dangers of tidal flooding, including consideration of a rise in relative sea level. The mitigation specified that to address effects of sea level rise, specific flood protection and engineering and building analyses must be conducted by a licensed engineer where structures are proposed below an elevation of -1 foot SFD (10 feet NAVD88). Potential measures identified by the mitigation included setback from the water’s edge, installation of seawalls, dikes and/or berms during construction of infrastructure; reducing the amount of excavation for utilities or basements; and use of topsoil to raise the level of public open spaces. With implementation of this mitigation, the Mission Bay FSEIR determined that the Plan's effects related to flooding and sea level rise would be less than significant.

5.9.2.3 Mission Bay FSEIR Mitigation Approach

As discussed above, the Mission Bay FSEIR determined that the Mission Bay Plan could contribute to a potentially significant cumulative impact on the quality of near-shore waters of the Bay as a result of combined sewer discharges and direct stormwater discharges to China Basin Channel (Mission Creek). The Plan’s contribution to this cumulative impact would be reduced to less than significant with implementation of FSEIR Mitigation Measures K.3 and K.4 requiring the master developer and the City to design and construct sewer improvements and implement alternative technologies to avoid increases in CSD volumes and to reduce settleable solids and floatable materials in stormwater discharges to China Basin Channel (Mission Creek). As written in the FSEIR, Measure K.3 applies to the entire project area and Measure K.4 applies only to the planned separate stormwater system that would discharge stormwater flows directly to China Basin Channel (Mission Creek) and the Bay.

The Mission Bay FSEIR Summary of Comments and Responses (in Volume III, beginning on p. XII.253) identified Mitigation Scenario B, which included separating the stormwater collection system and sanitary sewer in the reconfigured Mariposa sub-basin as well as in the reconfigured Central sub-basin. All stormwater runoff from Mission Bay South would flow to one of five pump stations (shown on Figure 5.7-2, see Section 5.7, Utilities and Service Systems) via gravity and would be pumped to China Basin Channel (Mission Creek) or the Bay after vortex treatment to reduce the total settleable solid concentrations in the runoff. Other methods identified to reduce particulate matter in the stormwater discharges included street sweeping to remove particulates from streets and parking lots. Under this mitigation approach, the separate stormwater systems would no longer divert 80 percent of the initial stormwater flows to the combined sewer system, but instead, all stormwater from the Mission Bay South area would be directed to a separate stormwater system and discharged directly to the Bay. The master developer ultimately adopted and is currently implementing Mitigation Scenario B, as described in the Mission Bay South Infrastructure Plan.

The FSEIR estimated that by diverting all stormwater runoff from the combined sewer system, implementation of Mitigation Scenario B would increase direct stormwater discharges from Mission Bay South to the Bay by 107.2 million gallons per year. Because none of the stormwater from Mission Bay South would be discharged to the combined sewer system, this mitigation approach would reduce the total Bayside CSD volume by 33 million gallons per year relative to baseline conditions at the time of Mission Bay FSEIR publication. Implementation of this mitigation approach satisfies the requirements of Mission Bay FSEIR Mitigation Measures K.3 and K.4.

5.9.3 Setting

5.9.3.1 Combined Sewer System

The Bayside drainage basin covering the east side of San Francisco consists of three distinct regulatory receiving water CSD basins and their watershed associations: North Shore (North Shore watershed), Central (Channel watershed in its entirety and a portion of Islais Creek watershed), and South (remainder of the Islais Creek Watershed and the entirety of Yosemite and Sunnydale watersheds), as shown on **Figure 5.9-1**. As also described in the Mission Bay FSEIR, the SEWPCP continues to treat up to 150 mgd of wastewater from each of these CSD basins to a secondary level.[3] During dry weather, wastewater flows consist mainly of municipal and industrial sanitary sewage, and the annual average wastewater flow during dry weather is 60 mgd[4] (reduced by 7 mgd from the 67 mgd reported in the Mission Bay FSEIR in 1998). The average dry weather design flow capacity of the SEWPCP is 84.5 mgd; therefore the existing flows are about 71 percent of the treatment capacity, and all dry weather wastewater flow is

3 Secondary treatment is the treatment of wastewater or sewage involving removal of organic matter using biological and chemical processes. This is a higher level of treatment than primary treatment, which is removal of floating and settleable solids using physical operations such as screening and sedimentation. Secondary treatment is less intensive than tertiary treatment, in which additional chemical and biological treatment processes are used to remove additional compounds that may be required for discharge or reuse purposes.

Bayside Drainage Basin Urban Watersheds

treated to a secondary level at the SEWPCP. The treated wastewater is then discharged to the Bay through the deep water outfall at Pier 80, located immediately to the north of the Islais Creek Channel in compliance with the current NPDES permit.

In areas of the City without separate stormwater systems, the combined sewer system collects large volumes of stormwater runoff in addition to municipal and industrial sanitary sewage during wet weather (generally October through April). The combined wastewater and stormwater flow is conveyed to treatment facilities, including the SEWPCP and North Point Wet Weather Facility, before eventual discharge to the Bay. The combined flows that exceed the total 400 mgd capacity of the SEWPCP and the North Point Wet Weather Facility and the 125-million-gallon storage capacity of the transport and storage structures receive the equivalent of primary treatment in the structures; excess flows are directed to CSD structures located along the shoreline in compliance with the City's NPDES permit issued by the RWQCB.

The CSD structure for the reconfigured Mariposa sub-basin discharges to the Central Basin of Lower San Francisco Bay[5] at Mariposa Street when the 11.2 mgd wet weather capacity of the Mariposa Pump Station and 0.7 million gallon capacity of the Mariposa storage and transport box is exceeded (see Section 5.7, Utilities and Service Systems, for a description of these facilities). The Mariposa sub-basin is designed for a long-term average of 10 CSDs per year.[6] Although the system was designed and constructed based on meeting this long-term average, it is understood that some years are wetter than others. Therefore, the NPDES permit allows the 10-discharge annual average to be exceeded in any particular year as long as the long-term average is maintained at the appropriate level. Historically, the Mariposa sub-basin has exceeded an average of 10 overflows per year.[7]

The CSDs from the reconfigured Central sub-basin in the project vicinity are discharged to Mission Creek via six discharge structures when flows at the Channel Pump Station exceed 80 mgd, or when total flows to the SEWPCP from the Channel and Bruce Flynn Pump Stations and SEWPCP lift station exceed 250 mgd. The facilities in this basin are also designed for a long-term average of 10 overflows per year, and the basin has historically reported an average of 10 overflows per year.[8]

5.9.3.2 Flooding

Some low lying areas along San Francisco’s Bay shoreline are subject to flooding during periods of extreme high tides, storm surge and waves, although these occurrences are relatively rare in San Francisco compared to areas prone to hurricanes or other major coastal storms or to developed areas near or below sea level. In 2008, the City and County of San Francisco (CCSF)

---

adopted interim flood maps depicting the 100-year flood zone along the City's Bay shoreline; the identified flood zones in the project area are shown on **Figure 5.9-2**. The 100-year flood zone represents areas that are subject to flooding once every 100 years on average or that have a 1-percent chance of flooding in any single year. Flooding in these areas has the potential to damage buildings and infrastructure. Due to the continuing development of Mission Bay, some of the areas identified as being subject to flooding may no longer be flood prone when grading is completed to raise building sites above the 100-year floodplain.

As shown on Figure 5.9-2, the project site is not located within a currently identified 100-year flood zone based on the City's interim floodplain maps. Therefore, this section discusses the factors contributing to coastal flooding and the potential for increased flooding in the future as a result of sea level rise.

Factors Contributing to Coastal Flooding

Coastal areas are vulnerable to periodic flooding due to storm surge, extreme tides, and waves. Rising sea level due to climate change has the potential to increase the frequency, severity, and extent of flooding in coastal areas. These factors are described below.

Storm Surge. Storm surge occurs when persistent high winds and changes in air pressure push water towards the shore, which can raise the water level near the shoreline by several feet and may persist for several days. Along San Francisco's bay shoreline, storm surge typically raises the surface water elevation 2 to 3 feet during major winter storms several times a year. Extreme high tides in combination with storm surge can cause inundation of low-lying roads, boardwalks, and promenades; can exacerbate coastal flooding; and can interfere with stormwater and sewer outfalls.

The degree of storm surge depends on the severity of the storm as well as tidal levels at the time of the storm and is characterized using a return period which represents the expected frequency of a storm event occurring based on historical information. One-year storm surge is expected to occur each year while 100-year storm surge (which represents more extreme conditions) has a one percent chance of occurring in any year.

Tides. Diurnal (twice daily) high tides along San Francisco's bay shoreline typically range from approximately 5 to 7 feet (NAVD88), though annual maximum tides may exceed 7 feet. The twice yearly extreme high and low tides are called "king tides." These occur each year during the winter and summer when the earth, moon and sun are aligned, and may be amplified by winter weather. King tides and other high tides can result in temporary inundation of low-lying roads, boardwalks, and waterfront promenades. A portion of The Embarcadero Promenade near Pier 14 and the Marina area in San Francisco experience inundation under current king tide conditions.[9]

Figure 5.9-2
2008 Adopted Interim Flood Map of 100-Year Flood Zones

Waves. Waves and wave run-up primarily affect a narrow band along the shoreline where wave energy can damage structures and overtop both natural embankments and shoreline protection structures such as seawalls and levees. The influence of waves diminishes inland as wave energy dissipates. In addition, the Pacific Ocean waves which are generally larger than those originating in the Bay are substantially dampened along the Bay shoreline due to transformation processes within San Francisco Bay.

Sea Level Rise. Seas are rising globally due to climate change, and they are expected to continue to rise at an accelerating rate for the foreseeable future. The sea level at the San Francisco tidal gauge has risen 8 inches over the past century.

The National Research Council's (NRC) 2012 report, *Sea Level Rise for the Coasts of California, Oregon, and Washington: Past, Present, and Future* (the NRC Report) provides a scientific review of sea level rise for the West Coast and provides the most recent regional sea level rise predictions for 2030, 2050, and 2100, relative to the year 2000 sea level.[10] In this report, the NRC projects that sea levels in the San Francisco Bay area will rise 11 inches by 2050 and 36 inches by 2100 as presented in **Table 5.9-1**. As presented in the NRC Report, these sea level rise projections represent likely sea level rise values based on the current understanding of global climate change and assuming a moderate level of greenhouse gas (GHG) emissions[11] and extrapolation of continued accelerating land ice melt patterns, plus or minus one standard deviation.[12]

TABLE 5.9-1
SEA LEVEL RISE ESTIMATES FOR
SAN FRANCISCO BAY RELATIVE TO THE YEAR 2000

Year	Projection
2030	6 ± 2 inches
2050	11 ± 4 inches
2100	36 ± 10 inches

SOURCE: National Research Council, 2012

10 National Research Council, *Sea-Level Rise for the Coasts of California, Oregon, and Washington: Past, Present, and Future*. Washington, DC: The National Academies Press, 2012. Available on the internet at: http://www.nap.edu/catalog.php?record_id=13389. Accessed on October 1, 2014.

11 Future emissions of greenhouse gases depend on a collection of human decisions at local, regional, national, and international levels as well as potential unknown technological developments. For this reason, future changes in greenhouse gas emissions cannot be accurately estimated, and a range of emissions levels is considered in the NRC Report. Estimates of sea level rise relative to thermal expansion of the oceans were formulated using the mid-level, or moderate level, of predicted changes in greenhouse gas emissions (from a combination of fossil and non-fossil fuels), as well as an assumption of high economic growth; this represents scenario "A1B" as described by the Intergovernmental Panel on Climate Change (IPCC).

12 One standard deviation roughly corresponds to a 15 percent/85 percent confidence interval, meaning that there is approximately 15 percent chance the value will exceed the high-end projection (8 inches for the 2030 example) and a 15 percent chance the value will be lower than the low-end projection (4 inches in 2030).

The estimates represent the permanent increase in Mean Sea Level and the associated average daily high tide conditions (represented by Mean Higher High Water, or MHHW)[13] that could result from sea level rise; they do not take into account storm surge, extreme tides, or waves, all of which can result in water levels that are temporarily higher than MHHW as discussed above.

In March 2013, the California Ocean Protection Council updated its 2010 statewide sea level rise guidance to adopt the NRC Report as the current, best available science on sea level rise for California.[14] The California Coastal Commission supports the use of the NRC Report as the best science currently available in its 2013 Draft Sea-Level Rise Policy Guidance, which also emphasizes the importance of regularly updating sea level rise projections as the science continues to advance.[15] The San Francisco Bay Conservation and Development Commission (BCDC) also considers the NRC Report to be the best available science-based prediction of sea level rise for San Francisco Bay. Accordingly, this SEIR considers the NRC Report to be the best science currently available on sea level rise affecting San Francisco for both CEQA and planning purposes.

Although the NRC Report provides the best available sea level rise projections for San Francisco Bay at this time, scientific uncertainty remains regarding the rate and magnitude of sea level rise. Sea level rise projections beyond 2050 are highly dependent on assumptions regarding future global GHG emissions and future changes in the rate of land ice melting. As a result of the uncertainties inherent in these assumptions, the range of sea level rise predictions becomes substantially broader beyond 2050 (see Table 5.9-1). In recognition of this uncertainty, the State of California Sea-Level Rise Guidance recommends an adaptive management approach for development in areas that may be subject to sea level rise beyond 2050.

Sea Level Rise Inundation Mapping

The San Francisco Public Utilities Commission (SFPUC), as part of the planning for its Sewer System Improvement Program, has developed a series of maps published in 2014 that represent areas of inundation along both the Bay and Ocean shorelines of San Francisco. These maps use a 1-meter horizontal grid resolution[16] based on the 2010/2011 California Coastal Mapping Program LiDAR.[17] The inundation maps leverage data from the Federal Emergency Management Agency's (FEMA) California Coastal Mapping and Analysis Project, which includes detailed coastal engineering analyses and mapping of the San Francisco Bay shoreline.

---

13 Mean higher high water is the higher of each day's two high tides averaged over time.

14 *State of California Sea-Level Rise Guidance Document.* Developed by the Coastal and Ocean Working Group of the California Climate Action Team (CO-CAT), with science support provided by the Ocean Protection Council's Science Advisory Team and the California Ocean Science Trust. March 2013 Update. Available on the internet at http://www.opc.ca.gov/webmaster/ftp/pdf/docs/2013_SLR_Guidance_Update_FINAL1.pdf. Accessed on October 1, 2014.

15 California Coastal Commission *Draft Sea Level Rise Policy Guidance, Public Review Draft. October* 14, 2013. Available on the internet at: http://www.coastal.ca.gov/climate/SLRguidance.html. Accessed on October 1, 2014.

16 The horizontal grid resolution of a digital elevation model (DEM) defines the scale of the features that are modeled; this is generally the minimum resolution necessary to depict levees, berms, and other topographic features important to diverting floodwaters.

17 LiDAR (Light Detection and Ranging) is a remote sensing technology that measures distance by illuminating a target with a laser and analyzing the reflected light. LIDAR is commonly used to create high-resolution terrain models, topography data sets, and topographic maps.

The SFPUC inundation maps evaluate scenarios that represent the NRC projections of sea level rise in combination with the effects of storm surge. They represent permanent inundation that could occur as a result of total water level rises (over and above year 2000 MHHW) based on daily tidal fluctuations. Each scenario also addresses temporary inundation that could occur from extreme tides and from 1-year, 2-year, 5-year, 25-year, 50-year, and 100-year storm surge. Flooding as a result of storm surge would occur on a temporary basis, during and immediately after a storm event or extreme tide.

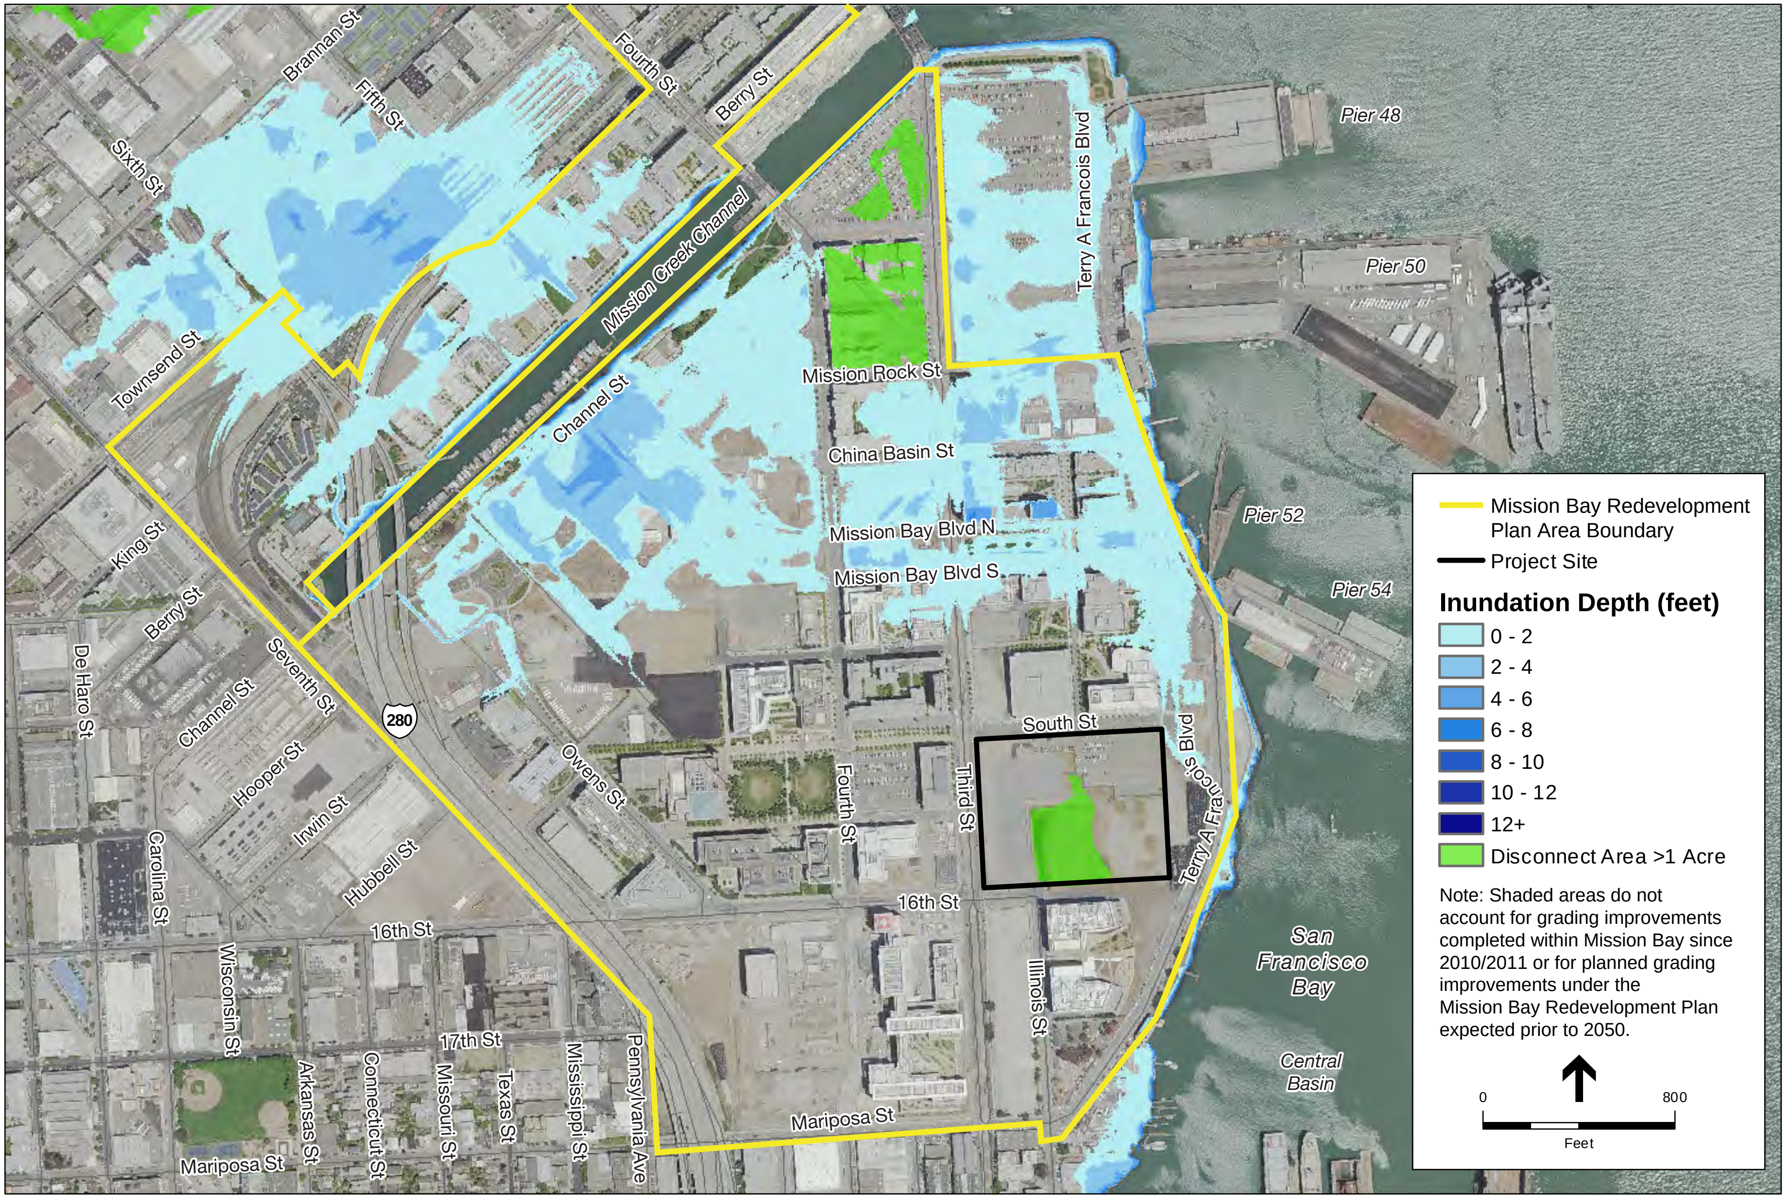
The scenarios used in this SEIR analysis, listed below, are representative of inundation that could occur by the year 2050 and the year 2100, based on the NRC's projected level of sea level rise and considering a 100-year storm surge:

- MHHW plus 12 inches of sea level rise (representative of NRC's projected sea level rise by 2050);
- MHHW plus 36 inches of sea level rise (representative of NRC's projected sea level rise by 2100);
- MHHW plus 52 inches of sea level rise (representative of NRC's projected sea level rise by the year 2050 in combination with a 100-year storm surge); and
- MHHW plus 77 inches of sea level rise (representative of NRC's projected sea level rise by the year 2100 in combination with a 100-year storm surge).

The SFPUC cautions that its maps represent a "do nothing" scenario, in which no measures are taken to prevent future flooding and no area-wide measures such as waterfront protection structures are constructed. In the event that the City undertakes area-wide measures to protect against inundation in the future, the mapping would need to be revised to reflect the modified inundation areas with construction of these measures. In addition, because the SFPUC sea level rise maps are based on 2010/2011 topographic mapping, they do not account for planned increases in the base elevation of sites within Mission Bay that are provided in the 1998 Mission Bay Redevelopment Plan to prevent future flooding due to sea level rise.

As shown on **Figure 5.9-3**, the SFPUC inundation maps indicate that the project site would not be inundated with water level rises of 12 inches, which is expected by 2050, even when the effects of 100-year storm surge are considered.[18] In addition, the project site would not be inundated with 36 inches of sea level rise which is expected by 2100. However, when the effects of a 100-year storm surge are considered in combination with 36 inches of sea level rise, the site could be flooded to depths of between 2 and 4 feet as shown on **Figure 5.9-4**.[19]

[18] Note that the green zone shown within the project site on Figure 5.9-3 is the open excavation that is not hydrologically connected to flooding zones and would be filled when the site is developed.
[19] Note that greater inundation depths are indicated on Figure 5.9-4 in the area of the open excavation, but this excavation would be filled when the site is developed.



Note: Inundated area within the project site shown in green color is an existing open excavation that is not hydrologically connected to the flooding zones and would be filled as part of the project when the site is developed.

SOURCE: USDA, 2014; San Francisco Public Utilities Commission, 2014; AECOM, 2014; ESA, 2015

Note: The flood zones depicted are based on topographic data from 2010/2011 and do not account for planned increases in the base elevation of sites within Mission Bay that are provided for in the Mission Bay Redevelopment Plan. Actual flood zones will be determined by topography under built out conditions, and the effects of area-wide flood protection measures that may be provided in the future.

Planning for Sea Level Rise in San Francisco

The City has convened an inter-agency Climate Adaptation Working Group to identify ways to make sure that it is prepared to adapt to effects of sea level rise. Participating agencies include the Department of the Environment, SFPUC, Planning Department, City Administrator's office, Port of San Francisco (Port), San Francisco International Airport (SFO), Department of Public Works (DPW), Municipal Transportation Agency (MTA), Department of Public Health, and Department of Recreation and Parks. The working group is focusing its effort on the City's most imminent adaptation concerns, including sea level rise along Ocean Beach and shores, flooding from storm surge and extreme rain events, an increased likelihood of extreme heat, and decreased fog that supports redwoods and local ecosystems. To address sea level rise and flooding, the working group is focusing on efforts to improve the existing coastal flood protection infrastructure in time to prevent significant flooding impacts from sea level rise. The working group will establish requirements addressing proper flood insurance for structures in low lying areas, flood-resilient construction of new developments within inundation areas, and a low-carbon foot print for new developments. The working group is also assessing the use of natural solutions such as wetlands to protect the shoreline.

On September 22, 2014, the City's Capital Planning Committee (CPC) adopted the *Guidance for Incorporating Sea Level Rise into Capital Planning in San Francisco: Assessing Vulnerability and Risk to Support Adaptation*, which was prepared by an inter-agency committee including the CPC, SFPUC, Port, SFO, DPW, MTA, and the Planning Department.[20] Accordingly, the City's capital planning program now requires the preparation of project-level sea level rise vulnerability and risk assessments for all City capital projects with a cost of $5 million or more that are located in areas potentially vulnerable to future flooding due to sea level rise.

Mayor Edwin M. Lee also established two interdepartmental committees to manage the City's efforts on addressing sea level rise: the Sea Level Rise (SLR) Coordinating and SLR Technical Committees. The SLR Coordination Committee was established in February of 2005 and is a director-level committee co-chaired by the Director of Citywide Planning at the Planning Department and the City Engineer and Deputy Director at the Department of Public Works. SLR Coordination Committee members also include the Chief Resiliency Officer, and senior staff from the Mayor's Office, the City Administrator's Office, SFO, the Port, the SFPUC, MTA, Department of Building Inspection (DBI), Office of Community Investment and Infrastructure (OCII), Office of Economic and Workforce Development (OEWD), and the Capital Planning Committee. The responsibilities of the Coordination Committee are as follows:

1. Coordinate the efforts of city departments and advise the Mayor's Office on policies, strategies, initiatives, and resolutions to deal with and plan for potential impact on San Francisco from sea level rise;

[20] City and County of San Francisco Sea Level Rise Committee, *Guidance for Incorporating Sea Level Rise into Capital Planning in San Francisco: Assessing Vulnerability and Risk to Support Adaptation*. September 22, 2014. Available online at http://onesanfrancisco.org/wp-content/uploads/San%20Francisco%20SLR%20Guidance%20Adopted%209.22.14%2012182014.pdf, accessed on February 5, 2015.

2. Coordinate local efforts and initiatives with the work of other governmental entities and various stakeholders at the regional, state, and national levels such as U.S. EPA, U.S. Department of Housing and Urban Development (HUD), Department of the Interior, California Coastal Commission, California Ocean Protection Council, Bay Conservation and Development Commission, etc.;
3. Provide guidance and specific recommendations to City departments with regard to land use and strategies to protect assets and communities along the shoreline;
4. Oversee and guide the existing SLR Technical Committee and implementation of the Capital Planning Guidance to address vulnerability and risks, and adaptability of the city's physical infrastructure; and
5. Promote coordination and collaboration among city departments, private utility providers, and other stakeholders.

The SLR Coordinating Committee is first charged with assessing the City's risk to sea-level rise. Once the data analysis phase is complete, the SLR Coordinating Committee will coordinate the City's SLR vulnerability assessment and adaptation planning efforts with local, regional, and national governmental and non-governmental organizations and with community stakeholders, as needed. Key to this effort will be determining how to best involve the community.

The SLR Technical Committee was established in February of 2015 and is comprised of the same membership that developed the Capital Planning Committee's Sea Level Rise Guidance, including the SFPUC, Port, DPW, SFO, SFMTA, SFMTA, Capital Planning, and the Planning Department. This committee is charged with assisting all city agencies with consistent implementation of the Guidance, revising the Guidance as needed, and assisting the SLR Coordinating Committee as requested.

The SFPUC is also addressing sea level rise as part of its Sewer System Improvement Program, and is conducting a detailed analysis of the potential for new and existing combined sewer infrastructure to be affected by sea level rise. [21] Accordingly, all new facilities will be built using a climate change criterion so the combined sewer system will be better able to respond to rising sea levels. Because rising sea levels and storm surge could potentially inundate the combined sewer system and exacerbate existing flooding from the sewer system, or cause new flooding, the SFPUC is also evaluating alternatives such as the installation of backflow preventers on the combined sewer discharge structures to restrict the intrusion of Bay water into the combined sewer system.

5.9.3.3 Trash in Waterways

Trash is of concern for San Francisco Bay because Lower San Francisco Bay is listed as an impaired water body under Section 303(d) of the Clean Water Act for trash. Plastic in the marine environment breaks into smaller and smaller pieces and it is eaten—often with fatal consequences—by fish,

[21] San Francisco Public Utilities Commission. *Bayside Drainage Basin Urban Watershed Opportunities, Final Draft Technical Memorandum.* July, 2014.

turtles, birds, and whales.[22] Aquatic debris threatens sensitive ecosystems and has been documented to kill or harm nearly 700 wildlife species. The debris also interferes with navigation, degrades natural habitats, costs millions of dollars in lost revenue, and is a threat to human health and safety. Most aquatic debris comes from land-based sources including littering, legal and illegal dumping, a lack of or poor waste management practices and recycling capacity, stormwater discharges, animal interference with garbage, and extreme natural events. The growing quantity of single-use plastic packaging contributes substantially to the amount of trash transported to waterways.

5.9.4 Regulatory Framework

5.9.4.1 Federal Regulations

Clean Water Act – Water Quality

In 1972, the Clean Water Act (CWA) established the basic structure for regulating discharges of pollutants into the waters of the United States and gave the U.S. EPA the authority to implement pollution control programs. The CWA sets water quality standards for contaminants in surface waters. The statute employs a variety of regulatory and non-regulatory tools to reduce direct pollutant discharges into waterways, to finance municipal wastewater treatment facilities, and to manage polluted runoff. The U.S. EPA has delegated responsibility for implementation of portions of the CWA, including water quality control planning and programs in California to the State Water Resources Control Board (SWRCB) and the nine RWQCBs. Water quality standards applicable to the project are listed in the *Water Quality Control Plan for the San Francisco Bay Basin* (Basin Plan), discussed further below under State Regulations.

Section 303(d) and Total Maximum Daily Loads

In accordance with Section 303(d) of the CWA, States must present the U.S. EPA with a list of "impaired water bodies," defined as those water bodies that do not meet water quality standards. The CWA requires the development of total maximum daily loads (TMDLs) to improve water quality of impaired water bodies. Implementation of this program in the project area is conducted by the RWQCB and is discussed below in Section 5.9.4.2, State Regulations.

Section 402

Section 402 of the CWA authorizes the U.S.EPA to establish a nationwide surface water discharge permit program for municipal and industrial point sources known as the NPDES program. Under Section 402, the San Francisco Bay RWQCB has set standard conditions for each permittee in the Bay Area, including effluent limitation and monitoring programs. Discharges of stormwater and wastewater from the proposed project would be subject to NPDES permits issued to the CCSF that are described in Section 5.9.4.2, State Regulations, below.

[22] National Resources Defense Council, *NRDC News Brief, Waste in our Water: The Annual Cost to California Communities of Reducing Litter That Pollutes our Waterways*. August, 2013.

Federal Combined Sewer Overflow Control Policy

In 1994, the U.S. EPA adopted the Combined Sewer Overflow Control Policy (CSO Control Policy), which became part of the CWA in December 2000. This policy establishes a consistent national approach for controlling discharges from combined sewers to the nation's waters. Using the NPDES permit program, the permittee is required to implement the following nine minimum controls that constitute the technology-based requirements of the CWA and can reduce the frequency of CSDs and their effects on receiving water quality:

1. Conduct proper operation and regular maintenance programs for the combined sewer system and CSD outfalls;
2. Maximize the use of the collection system for storage;
3. Review and modify pretreatment programs to minimize the effect of non-domestic discharges to the collection system;
4. Maximize flow to the SEWPC and North Point Facility for treatment;
5. Prohibit CSDs during dry weather;
6. Control solids and floatable materials in CSDs;
7. Develop and implement a pollution prevention program focused on reducing the effect of CSDs on receiving waters;
8. Notify the public of CSDs; and
9. Monitor to effectively characterize CSD effects and the efficacy of CSD controls.

The City is currently implementing these controls as required by the CSO Control Policy and has also developed a long-term control plan to optimize operations of the wastewater collection and treatment system and maximize pollutant removal during wet weather.

Consistent with the CSO Control Policy and the Long-Term Control Plan, the City captures and treats 100 percent of the combined sewage flow collected in the combined sewer system during precipitation events. Captured flows are directed first to the SEWPCP and North Point Facility for primary or secondary treatment. Flows in excess of the capacity of these facilities are diverted to storage and transport boxes constructed around much of the City, and receive the equivalent to primary treatment prior to discharge to San Francisco Bay. The Long-Term Control Plan specifies operational parameters that must be met in each drainage basin before a CSD can occur, and includes the following long-term average annual design goals for CSDs:

- Four CSD events along the North Shore
- Ten CSD events from the Central Basin
- One CSD event along the Southeast Sector

Although the Mariposa sub-basin has historically exceeded the long-term goal of ten CSD events per year as discussed above, the City is currently meeting these long-term average design goals for the overall Bayside drainage basin.

5.9.4.2 State Regulations

California Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act (Division 7 of the California Water Code) provides for protection of the quality of waters of the State of California for use and enjoyment by the people of California. The act also establishes provisions for a statewide program for the control of water quality, recognizing that waters of the state are increasingly influenced by interbasin water development projects and other statewide considerations, and that factors such as precipitation, topography, population, recreation, agriculture, industry, and economic development vary regionally within the state. The statewide program for water quality control is therefore administered most effectively on a local level with statewide oversight. Within this framework, the act authorizes the SWRCB and RWQCBs to oversee the coordination and control of water quality within California.

San Francisco Bay Water Quality Control Plan (Basin Plan)

San Francisco Bay waters are under the jurisdiction of the San Francisco Bay RWQCB which established regulatory standards and objectives for water quality in the Bay in the *Water Quality Control Plan for the San Francisco Bay Basin*, commonly referred to as the Basin Plan.[23] The Basin Plan identifies existing and potential beneficial uses for surface waters and provides numerical and narrative water quality objectives designed to protect those uses. The preparation and adoption of water quality control plans is required by the California Water Code (Section 13240) and supported by the federal CWA. Because beneficial uses, together with their corresponding water quality objectives, can be defined per federal regulations as water quality standards, the Basin Plan is a regulatory reference for meeting the state and federal requirements for water quality control. Adoption or revision of surface water standards is subject to the approval of the U.S. EPA.

The proposed project site is located adjacent to Lower San Francisco Bay which extends from approximately the Bay Bridge on the north to the Dumbarton Bridge on the south. The CSD structure for the Mariposa sub-basin of the City's combined sewer system discharges to Central Basin, an inlet of Lower San Francisco Bay along the City's bay shoreline. The CSD structures for the Central sub-basin of the combined sewer system discharge to Mission Creek which ultimately drains to Lower San Francisco Bay. Identified beneficial uses for Central Basin of Lower San Francisco Bay and Mission Creek include commercial and sport fishing, estuarine habitat, wildlife habitat, water contact recreation, noncontact water recreation, and navigation. Identified beneficial uses for Lower San Francisco Bay include industrial service supply, commercial and sport fishing, shellfish harvesting, estuarine habitat, fish migration, preservation of rare and endangered species, fish spawning, wildlife habitat, water contact recreation, noncontact water recreation, and navigation.

[23] San Francisco Bay Regional Water Quality Control Board (RWQCB), *Water Quality Control Plan for the San Francisco Bay Basin* (Basin Plan), June 29, 2013. Available online at http://www.swrcb.ca.gov/rwqcb2/water_issues/programs/planningtmdls/basinplan/web/docs/BP_all_chapters.pdf. Accessed February 5, 2015.

Impaired Water Bodies and Total Maximum Daily Loads

As described above under Section 303(d) of the CWA, States must present the U.S. EPA with a list of "impaired water bodies," defined as those water bodies that do not meet water quality standards. The proposed project is located approximately 230 feet inland from Lower San Francisco Bay. The RWQCB has listed Lower San Francisco Bay as an impaired water body for chlordane, DDT, dieldrin, dioxins, furan compounds, mercury, PCBs, invasive species, and trash.[24]

The Central Basin of Lower San Francisco Bay, where the CSD structure for the Mariposa sub-basin discharges, is listed as an impaired water body for the chlordane, DDT, dieldrin, dioxin compounds, furan compounds, polynuclear aromatic hydrocarbons, polychlorinated biphenyls, mercury, selenium, and invasive species. The sediments of the Central Basin are listed for mercury and polycyclic aromatic hydrocarbons.

Mission Creek, where the CSD structures for the reconfigured Central sub-basin of the combined sewer system discharge, is listed as an impaired water body for ammonia, hydrogen sulfide, and polycyclic aromatic hydrocarbons. The sediment of Mission Creek is listed for chlordane, dieldrin, lead, mercury, PCBs, silver, and zinc.

As required by the CWA, the U.S. EPA requires the development of TMDLs to improve water quality of impaired water bodies. The first step of the TMDL process is development of a TMDL report describing the water quality problem, detailing the pollutant sources, and outlining the solutions. An implementation plan, included in the TMDL report, describes how and when pollution prevention, control, or restoration activities will be accomplished and who will be responsible for these actions. The final step of the TMDL process is adopting and amending the Basin Plan to legally establish the TMDL and to specify regulatory requirements for compliance. As part of a Basin Plan amendment, waste load allocations are specified for entities that have permitted discharges.

TMDLs for polychlorinated biphenyls and mercury in San Francisco Bay have been approved by the U.S. EPA and officially incorporated into the Basin Plan. The RWQCB also adopted the San Francisco Bay Watershed Permit (Order No. R2-2012-0096) which addresses mercury and polychlorinated biphenyls (PCBs) in municipal and industrial wastewater discharges.[25]

NPDES Waste Discharge Regulations

As discussed above in Section 5.9.4.1, Federal Regulations, Section 402 of the federal CWA established the NPDES program to protect water quality of receiving waters. The NPDES program requires all facilities that discharge pollutants into waters of the United States to obtain a permit. The permit provides two levels of control – technology-based limits and water-quality-based limits – to control discharge of pollutants for the protection of water quality. Technology-based limits are based on the ability of dischargers in the same category to treat wastewater, while water quality-based limits are required if technology-based limits are not sufficient to protect the water body. Water quality-based effluent limitations required to meet water quality criteria in the receiving water are based on criteria specified in the National Toxics Rule, the California Toxics Rule, and the Basin Plan. NPDES permits must also incorporate TMDL wasteload allocations when they are developed. In California, the SWRCB and the RWQCBs implement and enforce the NPDES program.

Small MS4 General Stormwater Permit

In 2003, the SWRCB adopted the General Permit for the Discharge of Storm Water from Small Municipal Separate Storm Sewer System (MS4s), SWRCB Order No. 2003-0005-DWQ. An updated permit, Order No. 2013-001-DWQ, was adopted by the SWRCB on February 5, 2013 and became effective on July 1, 2013 (the updated Phase II General MS4 NPDES Permit). Areas that drain to separate stormwater collection systems in San Francisco are subject to this permit. The Mission Bay FSEIR was published in 1998, prior to passage of the first Phase II General MS4 NPDES Permit.

The updated Phase II General MS4 Permit identifies specific BMPs and management measures to be addressed and requires permittees to submit a guidance document to the SWRCB documenting their strategies for complying with permit requirements. The required program includes specific elements related to program management, education and outreach on stormwater impacts, public involvement/participation, illicit discharge detection and elimination, construction site stormwater runoff and control, pollution prevention/good housekeeping for permittee operations, post-construction stormwater management for new development and re-development, water quality monitoring requirements, program effectiveness assessment, and annual reporting. For renewal permittees such as the CCSF, the guidance document must identify and describe BMPs included in their previous Stormwater Management Plan that may be more protective of water quality than the minimum requirements of the updated permit, and identify whether the permittee proposes to maintain, reduce, or cease implementation of the BMP.

While the UCSF Mission Bay Campus utilizes the Mission Bay South separate stormwater system that has been constructed within the reconfigured Central sub-basin and will use the separate system under construction in the Mariposa sub-basin along with the rest of the development in Mission Bay South, the campus is considered a non-Traditional Small MS4 permittee under the updated Phase II General MS4 NPDES permit. In accordance with this permit, UCSF has implemented its own management program for stormwater discharges from campus facilities.

Southeast Plant, North Point, and Bayside Facilities NPDES Permit

The City currently holds an NPDES permit (RWQCB Order No.R2-2013-0029) adopted by the RWQCB in August 2013, that covers the SEWPCP, the North Point Wet Weather Facility, and all of the Bayside wet-weather facilities, including CSDs to the Bay.[26] The permit specifies discharge prohibitions, dry-weather effluent limitations, wet-weather effluent performance criteria, receiving water limitations, sludge management practices, and monitoring and reporting requirements. The permit prohibits overflows from the CSD structures during dry weather, and requires wet-weather overflows to comply with the nine minimum controls specified in the federal Combined Sewer Overflow Control Policy, described above, and the City's Long Term Control Plan. Areas in the Bayside drainage basin that drain to the City's combined sewer system are subject to this permit.

As discussed above in Section 5.9.4.2, Federal Regulations (Federal Combined Sewer Overflow Control Policy), the NPDES permit does not explicitly regulate the number, volume, duration, or frequency of CSDs from the combined sewer system, but instead requires that the system meets the long-term average annual design goals for CSDs from each sub-basin. Under the Long-Term Control Plan, the City must optimize operations of the combined sewer system to minimize CSD frequency, magnitude, and duration and maximize pollutant removal during wet weather and must also provide treatment of all discharges from the combined sewer system, including CSDs. The NPDES permit also requires the City to monitor the water quality of all CSDs and the efficacy of wet weather discharge controls. If the CSDs cause a violation of water quality standards in the receiving water, the City must evaluate its Long-Term Control Plan and combined sewer system operation to ensure compliance with water quality standards.

Volatile Organic Compound and Fuel General NPDES Permit

The RWQCB has issued Order Number R2-2012-0012 which is a general permit for the discharge of extracted and treated groundwater resulting from the cleanup of groundwater polluted by volatile organic compounds and fuels (VOC and Fuel General Permit).[27] The permit specifies water quality criteria for the discharges, receiving water limitations, and discharge prohibitions (including flow rate and restrictions on scouring and erosion). Monitoring requirements for demonstrating permit compliance are also specified. To obtain authorization to discharge under this permit, the discharger must submit a Notice of Intent describing the proposed discharge and treatment system and the RWQCB must issue an Authorization to Discharge once it is determined that the discharger is eligible to discharge under the permit.

[26] Regional Water Quality Control Board, San Francisco Bay Region, National Pollutant Discharge Elimination System (NPDES) Permit No. CA0037664, Order No.R2-2013-0029, for City and County of San Francisco Southeast Water Pollution Control Plant, North Point Wet Weather Facility, Bayside Wet Weather Facilities and Wastewater Collection System., adopted January 31, 2008.

[27] San Francisco Bay Regional Water Quality Control Board, General Waste Discharge Requirements for Discharge or Reuse of Extracted and Treated Groundwater Resulting from the Cleanup of Groundwater Polluted by Volatile Organic Compounds (VOC), Fuel Leaks and Other Related Wastes (VOC and Fuel General Permit). Order No. R2-2012-0012, NPDES No. CAG912002.

5.9.4.3 Local and Regional Regulations and Plans

Stormwater and Wastewater Management

SFPUC Storm Water Management Plan

San Francisco has obtained coverage under the updated Phase II General MS4 Permit described above for separate storm sewer systems under its jurisdiction. In accordance with this permit, the SFPUC is required to submit a guidance document to the SWRCB documenting its strategies for complying with permit requirements. San Francisco's Storm Water Management Plan (SWMP), prepared under the previous General MS4 Permit,[28] will remain in effect until the guidance document is completed. The SWMP is comprised of six program areas that address water quality: public education and outreach, public involvement/participation, illicit discharge detection and elimination, construction site stormwater runoff control, post-construction stormwater management in new development and redevelopment, and pollution prevention/good housekeeping for municipal operations. The SWMP thereby requires implementation of a variety of stormwater pollution reduction measures that mirror these six program areas, including the implementation of stormwater BMPs (such as construction period BMPs and post-construction BMPs).

The project area would drain to the new separate stormwater system and would be subject to all provisions and regulatory requirements set forth by the SFPUC, including compliance with the SWMP and the guidance document, once the SFPUC assumes jurisdiction over the storm sewer system.

Stormwater Design Guidelines

Development projects that discharge stormwater to either the combined sewer system or a separate stormwater system must comply with Article 4.2 of the San Francisco Public Works Code, Section 147, which was adopted in 2010 (subsequent to publication of the Mission Bay FSEIR). The SFPUC and the Port of San Francisco have developed *San Francisco Stormwater Design Guidelines* in accordance with the requirements of the Phase II General MS4 NPDES Permit and Article 4.2, Section 147. [29] The SFPUC is currently updating the guidelines to reflect changes in the updated Phase II General MS4 Permit.

The Stormwater Design Guidelines require compliance with specified stormwater management requirements and provide five tools to help project developers achieve compliance with stormwater management requirements:

- A step-by-step guide describing how to manage stormwater onsite
- A set of stormwater BMP fact sheets

---

[28] San Francisco Public Utilities Commission, *San Francisco Stormwater Management Plan, Annual Report 2009 (Year 6)*, March 30, 2010.

[29] San Francisco Public Utilities Commission and Port of San Francisco, *San Francisco Stormwater Design Guidelines, November 2009*, http://www.sfwater.org/modules/showdocument.aspx?documentid=2779, accessed on October 2, 2014.

- A vegetation palette to assist in BMP-appropriate plant selection
- Sizing calculators to determine the required size of each BMP
- Maintenance checklists explaining the types and frequencies of the maintenance activities associated with each BMP

In accordance with the San Francisco Stormwater Design Guidelines, developers of projects that disturb more than 5,000 square feet of ground and discharge to a separate stormwater system must implement BMPs to reduce the flow rate and volume and improve the quality of stormwater going into the separate stormwater system. For covered projects, the stormwater management approach must capture and treat rainfall from the design storm of 0.75 inches. These projects would reduce or eliminate downstream water pollution by reducing impervious cover, eliminating sources of contaminants, treating pollutants in stormwater runoff, or increasing onsite infiltration.

The SFPUC inspects stormwater BMPs once they are constructed, and any issues noted by the inspection must be corrected. The owner is responsible for completing an annual self-certification inspection, and must submit completed checklists and maintenance logs for the year to the SFPUC. In addition, the SFPUC inspects all stormwater BMPs every third year. Any issues identified by either inspection must be resolved before the SFPUC can renew the certificate of compliance.

Projects that are required to implement the *San Francisco Stormwater Design Guidelines* are also subject to review by the San Francisco Building Inspection Commission, and are subject to building codes that include provisions for managing drainage for new construction. Specifically, Section 1101.1.1 of the San Francisco Plumbing Code and Section 1503.4 of the San Francisco Building Code allow roofs and other building areas to drain to locations other than the combined sewer.

Wastewater Discharges to the Combined Sewer System

Discharges of non-sewage wastewater to the combined sewer system are subject to the permit requirements specified in Article 4.1 of the San Francisco Public Works Code and supplemented by Department of Public Works Order No. 158170. The permit requires development and implementation of a pollution prevention program and specifies discharge limitations for specific chemical constituents as well as general conditions for the discharge. In addition, the discharge must meet the pretreatment standards specified in Article 4.1 and the discharger must monitor the discharge quality for compliance with permit limitations. The discharger must also submit periodic reports to the SFPUC and the CCSF conducts periodic inspections to ensure compliance.

San Francisco Sea Level Rise Guidance

As noted above, the CCSF has developed guidance for incorporating sea level rise into the planning of capital projects in San Francisco.[30] The guidance presents a framework for considering the effects of sea level rise on capital projects implemented by the CCSF and selecting appropriate adaptation

---

[30] City and County of San Francisco Sea Level Rise Committee, *Guidance for Incorporating Sea Level Rise into Capital Planning in San Francisco: Assessing Vulnerability and Risk to Support Adaptation*. September 22, 2014. Available online at http://onesanfrancisco.org/wp-content/uploads/San%20Francisco%20SLR%20Guidance%20Adopted%209.22.14%2012182014.pdf, accessed on February 5, 2015.

measures based on site-specific information. The planning process described in the guidance includes six primary steps:

- Review sea level rise science
- Assess vulnerability
- Assess risk
- Plan for adaptation
- Implement adaptation measures
- Monitor

As of September 2014, the CCSF considers the NRC report as the best available science on sea level rise in California. However, the guidance acknowledges that the science of sea level rise is continually advancing and projections of sea level rise may need to be updated at some point to reflect the most updated science. Sea level rise inundation maps prepared by the SFPUC, described above in Section 5.9.3.2, Flooding, are considered the most up-to-date maps and take into account both water level rises and the temporary effects of storm surge along the shoreline based on existing topography and conditions. The guidance states that the review of available sea level science should determine whether the project site could be subject to flooding during the lifespan of the project.

For those projects that cost $5 million or more that could be flooded during their lifespan, the guidance requires a vulnerability assessment based on the degree of flooding that could occur, the sensitivity of the project to sea level rise, and the adaptive capacity of the project site and design (the ability to adjust to sea level rise impacts without the need for substantial intervention or modification). The risk assessment takes into consideration the likelihood that the project could be adversely affected by sea level rise and the related consequences of flooding. An adaptation plan is required for projects that are found to be vulnerable to sea level rise and have a potential for substantial consequences. The plan should focus on those aspects of the project that have the greatest consequences if flooded. It should include clear accountability and trigger points for bringing adaptation strategies online as well as a well-defined process to ensure that milestones are being met and the latest science is being considered.

The CCSF sea level rise guidance document also acknowledges that there is some flexibility in how to plan for adaptations, and it may not always be feasible or cost effective to design and build for long-term potential sea level rise scenarios that are of a highly uncertain nature, such as the upper end of the NRC report range for the year 2100 (66-inches of sea level rise). In this case, a capital project constructed by the City could be designed and constructed to be resilient to the likely mid-century sea level rise (11± 4 inches by 2050). Under this guidance, an alternative approach for a city capital project would be to build the project to be resilient to the *likely* sea level rise by 2100 (36 inches), while including adaptive capacity to be resilient to the *upper range* of sea level rise estimates for 2100 (66 inches).

Under CEQA, the CCSF considers city projects that could be vulnerable to 100-year flooding in combination with sea level rise during their lifespan to have a significant risk related to flooding.

San Francisco Floodplain Management

San Francisco's Floodplain Management requirements are specified in the San Francisco Administrative Code, Article XX, Sections 2A.280 through 2A.285. For buildings located within a flood-prone area, this code requires the following:

- The building must be adequately anchored to prevent flotation, collapse, or lateral movement.
- The building must be constructed with materials and utility equipment that is resistant to flood damage, and with methods and practices that minimize flood damage.
- Electrical, heating, ventilation, plumbing, and air conditioning equipment must be designed or located to prevent water from entering or accumulating within the components during flooding.
- All water supply and sanitary sewage systems must be designed to minimize or eliminate infiltration of flood waters into the system as well as discharges from the systems into floodwaters.

For projects located in areas that could be prone to flooding from the combined sewer system during wet weather, the SFPUC may require additional actions such as provision of a pump station for sewage flows, raised elevation of entryways, special sidewalk construction, and deep gutters.[31]

Trash Management

Article 6 of the San Francisco Health Code, Garbage and Refuse, requires that properties have appropriate containers placed in appropriate locations for the collection of refuse. In accordance with this article, the refuse containers must be constructed with tight fitting lids or sealed enclosures, and the contents of the container may not extend above the top of the rim. The property owner must also have adequate refuse collection service. Article 6 also prohibits the dumping of refuse onto any streets or lands within San Francisco.

5.9.5 Impacts and Mitigation Measures

5.9.5.1 Significance Thresholds

For the impacts analyzed in this section, the project would have a significant impact related to hydrology and water quality if it were to:

- Violate any water quality standards or waste discharge requirements;
- Create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff;
- Otherwise substantially degrade water quality; or

---

[31] San Francisco Planning Department, Planning Director Bulletin No. 4, Review of Project Identified in Areas Prone to Flooding.

- Expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam.

The analysis of violation of water quality standards or waste discharge requirements discussed in Impact HY-6 below also addresses the following significance criterion from Section 5.7, Utilities and Service Systems:

- Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board.

The complete list of CEQA significance criteria used in the hydrology and water quality analysis is included in the Initial Study (see Appendix NOP-IS, pp. 86 through 98), which also explains why the proposed project would not result in new significant impacts or substantially increase the severity of impacts previously identified in the 1998 FSEIR on hydrology and water quality with respect to degradation of water quality during construction (Impact HY-1); depletion of groundwater and interference with groundwater recharge (Impact HY-2); alteration of drainage patterns (Impact HY-3); placement of housing within a 100-year flood zone; placement of structures within a 100-year flood zone (Impact HY-4); and flooding as a result of failure of a levee or dam; and inundation by seiche, tsunami, or mudflow (Impact HY-5). Therefore, no further analysis of these subjects is presented in this section. The hydrology and water quality section of the Initial Study determined that all construction-related hydrology and water quality impacts of the proposed project would be less than significant.

5.9.5.2 Approach to Analysis

Methodology for Analysis of Direct Impacts

Construction Impacts

Subsequent to publication of the Initial Study, the project sponsor conducted additional evaluation of dewatering requirements during construction and provided additional information regarding construction dewatering discharge options. This section presents a revised analysis of the water quality impacts of groundwater discharges based on the additional information. The analysis assumes that construction dewatering activities would be conducted in compliance with all applicable regulations, and the impact would be considered less than significant if proposed dewatering activities would not violate any water quality standards or waste discharge requirements, or otherwise degrade water quality. All other construction-related impacts of the proposed project are unchanged from what is presented in the Initial Study (see Appendix NOP-IS).

Operational Impacts

This section addresses two impacts associated with long-term operation of the proposed project. The first impact analyzes the potential for project-related changes in wastewater and stormwater to result in water quality effects; this impact addresses related significance criteria and is broken down into various aspects of wastewater and stormwater management. The second impact analyzes the potential for flooding impacts as related to sea level rise. The approach to analyzing these impacts is shown below relative to the applicable significance criteria:

Exceed wastewater treatment requirements, violate water quality standard or waste discharge requirement, exceed the capacity of a storm drainage system, provide a substantial source of stormwater pollutants, or substantially degrade water quality**:** This analysis is related to the analysis presented in Section 5.7, Utilities and Service Systems, which evaluates impacts related to the *capacity* of wastewater or stormwater facilities, but this impact analysis focuses primarily on the potential to affect *water quality*. The impact analysis is broken down as described below.

- *Dry weather flows to combined sewer system:* The analysis considers whether the project would contribute additional wastewater to the City's combined sewer system to the extent that the contribution would cause the system to exceed the treatment requirements (with respect to volume and treatment level) or other permit requirements of the San Francisco Bay RWQCB NPDES permit for the SFPUC's Bayside wastewater facilities. The impact is considered less than significant if the increase in dry weather flows remains within the treatment capacity of the SEWPCP.

- *Wet weather flows to combined sewer system*: The impact analysis examines whether project-related increases in wastewater flows would contribute to combined sewer discharges during wet weather. The impact is considered less than significant if the increased flows would not increase the frequency of combined sewer discharges above the long-term average specified in the NPDES permit for the SEWPCP, the North Point Wet Weather Facility, and Bayside wet-weather facilities.

- *Effluent discharges from SEWPCP*: For the analysis of impacts related to changes in the quality of effluent discharges from the SEWPCP, the analysis considers whether discharges of wastewater to the combined sewer system would cause effluent quality to exceed the discharge limitations of the NPDES permit for the SEWPCP. If not, the impact is considered less than significant.

- *Direct discharges of stormwater runoff and storm drainage capacity*: The analysis considers whether the post-construction flows would be within the capacity of the newly constructed separate stormwater system in Mission Bay South or provide an additional source of stormwater pollutants that could degrade water quality. The impact is considered less than significant if the flows would be within the capacity of the stormwater system, and would not result in an additional source of stormwater pollutants.

- *Litter*: The analysis considers whether compliance with regulatory requirements for trash management would prevent substantial water quality degradation from litter that could be transported to the Bay via stormwater runoff or wind. If so, the impact is considered less than significant.

Expose people or structures to a significant risk from future flooding: The analysis considers whether people or structures on the project site could be exposed to a significant risk of loss, injury or death involving flooding as a result of sea level rise in combination with storm surge and extreme tides. The impact is considered less than significant if the project site would not be inundated during a 100-year coastal flood within the life of the project, or if the project would conform to flood resistant building standards and be capable of adapting to future flood hazard conditions.

Methodology for Analysis of Cumulative Impacts

Cumulative impacts related to combined sewer discharges and stormwater system inadequacies in the reconfigured Mariposa and Central sub-basins are operational impacts that could ultimately affect the water quality of Lower San Francisco Bay. Accordingly, the geographic scope of cumulative water quality impacts includes areas that drain to the reconfigured Mariposa and Central sub-basins. The cumulative analysis utilizes a list-based approach to analyze the effects of the project in combination with past, present, and probable future projects in this geographic area, including wastewater and stormwater flows resulting from full build-out of the Mission Bay South area and development of the Mission Bay Campus under the UCSF Long Range Development Plan (described in Section 5.1.5.2, Cumulative Projects for Operational Impacts), and assumes that operations of these projects would have to comply with the same regulatory requirements as the project. The analysis then considers whether or not there would be a significant, adverse cumulative impact associated with project implementation in combination with past, present, and probable future projects in the geographical area, and if so, whether or not the project's contribution to the cumulative impact would be significant (i.e., cumulatively considerable).

5.9.5.3 Impact Evaluation

Impacts HY-1 to HY-5: See Initial Study (Appendix NOP-IS), which includes all construction-related impacts of the proposed project, except that Impact HY-1 is modified below to account for new information regarding groundwater discharges during construction-related dewatering.

Project Impacts: Construction

Impact HY-1a: The project would not violate water quality standards or otherwise substantially degrade water quality with respect to construction-related dewatering. (Less than Significant)

Impact HY-1 of the Initial Study evaluated the potential for groundwater dewatering discharges during construction to violate water quality standards or waste discharge requirements or otherwise substantially degrade water quality. Subsequent to publication of the Initial Study, the project sponsor developed additional information regarding construction dewatering discharge options, and the discussion below augments the discussion in the Initial Study.

Water Quality Effects of Groundwater Dewatering During Construction

Construction dewatering is expected to last approximately nine months. The initial estimated and peak water discharge rate is 1,850 gallons per minute (gpm) and would last three to four days.[32] By the end of the first week, the discharge rate would decrease to about 300 gpm, and by the end of the second week, to about 100 gpm. By the end of the initial 45-day construction period, the

[32] Shipman, Dorinda and Kimbrel, Elizabeth, Langan Treadwell Rollo, 2015. Memorandum to Kate Aufhauser, Golden State Warriors and Clarke Miller, Strada Investment Group regarding Construction Dewatering Discharge Options, Golden State Warriors Arena, San Francisco, California. February 17, 2015.

discharge rate would decrease to approximately 30 to 40 gpm, and this rate is expected to last for the remaining duration of the dewatering period, approximately seven and a half months. The project sponsor has evaluated multiple options for discharge of groundwater produced during construction dewatering including the following: (1) directly discharging to the City's combined sewer system; (2) installing an on-site dewatering treatment system and discharging the treated water to the Bay through an existing outfall if the capacity of the Mariposa pump station would be exceeded with the discharge; and (3) a combination of the first two options.()

For water discharged from the construction site to the combined sewer system, the discharges would be subject to the City's Industrial Waste Ordinance, adopted in 1992. This ordinance is found in Article 4.1 of the Public Works Code, as supplemented by Order No. 158170, which regulates the quantity and quality of discharges to the combined sewer system. In accordance with Article 4.1 and Order No. 158170, the discharge permit would contain appropriate discharge standards and may require installation of meters to measure the volume of the discharge. Although the groundwater could contain contaminants related to past site activities, as well as sediment and suspended solids, the construction contractors would be required to treat the groundwater as necessary to meet permit requirements prior to discharge to the combined sewer system, and discharge rates would be controlled so that the capacity of the sewer system would not be exceeded.

If discharged directly to the Bay, the discharges would be subject to permitting requirements of the RWQCB under the VOC and Fuel General NPDES permit, described in Section 5.9.4.2, State Regulations, which specifies water quality criteria and monitoring requirements for discharges of extracted and treated groundwater. Accordingly, under this option, the project sponsor or its contractors would be required to submit a Notice of Intent to the RWQCB describing the proposed discharge and treatment system, and the RWQCB must issue an Authorization to Discharge once it is determined that the discharger is eligible to discharge under the permit. The contractors would install an on-site treatment system that includes settling tanks for removal of sediments and treatment for hydrocarbons and metals. A treatability study would be conducted prior to discharge to demonstrate that the treatment system can effectively meet the discharge limitations.[33] The treated water would likely be discharged through a stormwater swale or an existing outfall pipe. Regular influent and effluent water quality monitoring would be conducted to demonstrate permit compliance.

The combined option could include directing a portion of the initial discharges to the Bay as described above until flows have subsided to the point that they are within the capacity of and meet the influent constituent concentration requirements of the Mariposa Pump Station. Discharges to both the Bay and the combined sewer system would be subject to the same permitting requirements as described above. With discharge to the combined sewer system in accordance with the City's Industrial Waste Ordinance as supplemented by Order No. 158170, or discharge to the Bay in accordance with the VOC and Fuel General NPDES permit as authorized by the RWQCB, water quality impacts related to a violation of water quality standards or

33 *Ibid.*

degradation of water quality due to discharge of groundwater produced during construction-related dewatering would be *less than significant*.

Mitigation: None required.

Comparison of Impact HY-1 (revised) to Mission Bay FSEIR Impact Analysis

The Mission Bay FSEIR determined that water quality impacts associated with groundwater discharges during construction-related discharges would be less than significant with discharge to the combined sewer system in accordance with Article 4.1 of the Public Works Code, as supplemented by Order No. 158170. While the anticipated flow rates could temporarily exceed those analyzed in the Mission Bay FSEIR, the discharge would be subject to Article 4.1 of the Public Works Code, as supplemented by Order No. 158170 or the VOC and Fuel General NPDES permit, which would ensure that the discharges do not exceed water quality criteria or cause water quality degradation. Therefore, the project would not result in any new significant impacts or substantially more severe impacts on water quality from construction-related dewatering activities than previously identified in the Mission Bay FSEIR.

Project Impacts: Operation

Impact HY-6: Operation of the proposed project could exceed the wastewater treatment requirements of the NPDES permit for the SEWPCP, violate water quality standards or waste discharge requirements, otherwise substantially degrade water quality as a result of changes in wastewater and stormwater discharges to the Bay, or exceed the capacity of the separate stormwater system constructed in Mission Bay, or provide a substantial source of polluted runoff. Operation of the proposed project would not contribute to a substantial increase in combined sewer discharges. (Less than Significant with Mitigation)

This impact discussion covers multiple sources of potential effects on water quality and is broken down as follows: dry weather flows (sanitary sewage only) to the combined sewer system; wet weather flows (sanitary sewage and stormwater) to the combined sewer system; effluent discharges from the SEWPCP; direct discharges of stormwater runoff and storm drainage capacity; and litter.

Dry Weather Flows to the Combined Sewer System

The sewer analysis for the proposed project estimates that the total average wastewater flow would be 0.164 mgd and the peak wastewater flows would be 1.074 mgd.[34] During dry weather (typically, May 1 to October 15), all wastewater generated from the proposed project would be conveyed to and treated at the SEWPCP, which currently has available dry-weather treatment capacity of about 24.5 mgd, as described above in Section 5.9.3.1, Combined Sewer System. The

34 BKF Engineers, 2015. Water and Sewer Analyses for Golden State Warriors Arena @ Mission Bay Blocks 29-32. January 9.

average flow from the project would be less than 0.7 percent of the remaining dry-weather treatment capacity of the SEWPCP, and the peak daily flow would be approximately 4.4 percent of the available capacity. Therefore, during dry weather, impacts related to exceeding the wastewater treatment requirements of the San Francisco RWQCB would be *less than significant*.

Wet Weather Flows to the Combined Sewer System

During wet weather (typically October 15 to April 30), there is a wide variation in volume of flow to the combined sewer system due to the addition of stormwater flows from areas of the City without separate stormwater systems. During severe rainstorms, the increased wet weather flows can exceed the combined 400 mgd treatment capacity of the Bayside wet weather facilities and the 125 million gallon capacity of the transport and storage boxes, resulting in a combined sewer discharge. The combined sewer system is currently in compliance with applicable regulations and permits for discharges to the Bay and Mission Creek, including discharges from the Mariposa sub-basin, although discharges from this sub-basin have historically exceeded the long-term average design goal for CSDs.

Under the proposed project, stormwater at the project site would be diverted to the Mission Bay South separate stormwater system, which would be a decrease of stormwater flows to the combined sewer system compared to existing conditions. Wastewater would be conveyed to the combined sewer system during both wet and dry weather and as discussed in Section 5.7, Utilities and Service Systems, the preliminary project design indicates that 0.844 mgd of the peak wastewater flows from the project site would be discharged to the sewer drainage area of the Mariposa Pump Station (within the reconfigured Mariposa sub-basin), and 0.230 mgd of the peak flows could be directed to the Mission Bay Sanitary Pump Station located at Park P15 (within the reconfigured Central sub-basin).[35] The increase in wastewater would represent an incremental increase in wastewater volume from the project site compared to existing conditions that could affect the overall combined sewer system's wet weather operations in both sub-basins. The potential effect would be greatest in the reconfigured Mariposa sub-basin, which has a wet weather capacity of 12 mgd. Comparatively, CSDs in the reconfigured Central sub-basin occur when flows at the Channel Pump Station exceed 80 mgd, or when total flows to the SEWPCP from the Channel and Bruce Flynn Pump Stations and SEWPCP lift station exceed 250 mgd (see Section 5.9.3.1, above, regarding the existing conditions of the City's combined sewer system).

Existing average wastewater flows from development projects completed within the Mariposa sub-basin of the combined sewer system as of February 2015 are approximately 1.21 mgd, including 0.31 mgd of existing flows from UCSF and other developments as well as infiltration flows and flows from Basin B[36] Conservatively assuming that all of the wastewater flows from the project site would discharge to the Mariposa sub-basin, the incremental increase from the project site would be an average of 0.16 mgd and the total *average* flows to the Mariposa sub-

35 Moala, Tommy T., Assistant General Manager, San Francisco Public Utilities Commission, 2015. Letter to Clarke Miller, Strada Investment Group. May 15.

36 Hydroconsult Engineers, Inc. 2015. Combined Sewer Impact Analysis, Golden State Warriors Arena EIR. February 18.

basin and pump station would be 1.38 mgd. Conservatively assuming that all 1.074 mgd of the peak wastewater flows from the project site would discharge to the Mariposa sub-basin and pump station, the total combined flows could be up to 2.28 mgd.

Hydroconsult Engineers, Inc. analyzed the effect of project-related increases in wastewater discharges on CSDs from the Mariposa sub-basin using the DPW's Hydrocalc model.[37] The modeling report is included as Appendix HYD of this SEIR. Using the wastewater flows described above and standard rainfall assumptions used by the DPW, the model estimated the annual average frequency, volume, and duration of CSDs that would occur once the Mariposa wet- and dry-weather pump stations reach the combined capacity of 11.2 mgd under existing and project conditions. The model estimates that under existing conditions, CSDs from the Mariposa sub-basin occur approximately 10 times per year with an average volume of 5.34 million gallons and duration of 17.2 hours.

The model analyzed the effects of discharging the average flows from the proposed project in combination with the existing average flows in the drainage area. Under this scenario, the frequency of CSDs would not increase, but the volume of the CSDs would increase from 5.34 to 5.63 million gallons and the duration would increase from 17.2 to 17.3 hours. As a worst case, the model also assumed that peak project-related wastewater flows would occur during every large storm which is an unlikely scenario (i.e., the model assumed that there would be a capacity event at the event center at the exact same time as every large storm of the rainy season). However, even using this worst case scenario, there would be no increase in the frequency of CSDs with the addition of peak project-related flows, but the volume of the CSDs would increase from 5.34 to 7.20 million gallons and the duration would increase from 17.2 to 19.4 hours. Under all conditions, all CSDs would receive the equivalent of primary treatment in the Mariposa transport and storage structure prior to discharge to the Bay.

If a portion of the project-related wastewater flows were discharged to the reconfigured Central Basin (via the Mission Bay Sanitary Sewer Pump Station) as indicated by the preliminary project design, a portion of the above stated increase in CSD volumes and durations would likewise shift to the Channel transport storage structure in the reconfigured Central sub-basin. However, given the relatively larger storage and pumping capacities at Channel, the effect on CSD volumes and durations would be less than that estimated for the Mariposa sub-basin.

As discussed in Section 5.9.4.2, State Regulations, the NPDES permit for the SEWPCP, the North Point Wet Weather Facility, and all of the Bayside wet-weather facilities does not limit the specific annual number of CSD events. Instead, the permit acknowledges that some years are wetter than others and requires that the combined sewer system is designed and constructed based on meeting the specified long-term average number of CSDs from each sub-basin. Therefore, the NPDES permit allows the limitation of 10 CSDs for the Mariposa sub-basin to be exceeded in any particular year, as long as the long-term average of 10 CSDS per year is met. Because average and peak wastewater flows from the project site would not increase the frequency of CSD events from the

37 *Ibid.*

Mariposa sub-basin and would be consistent with the requirements of the NPDES permit, project-level water quality impacts related to contributions to an increase in CSD frequency would be *less than significant.*

Effluent Discharges from the SEWPCP

Consistent with what was identified in the Mission Bay FSEIR, some wastewater discharges associated with future uses at the project site could involve the discharge of some pollutants not typically associated with most other San Francisco discharges. If improperly handled, discharges of unusual chemicals such as radioactive materials and biohazardous materials to the SEWPCP could result in violation of the NPDES permit for the SEWPCP, which would be a potentially significant impact. While these discharges would be regulated under Article 4.1 of the San Francisco Public Works Code, the Mission Bay FSEIR included Mitigation Measure K.2 requiring facilities anticipated to have a potentially significant discharge of pollutants to the sanitary sewer to install sampling ports to facilitate sampling to monitor discharge quality. At this time, it is not known specifically what uses might occupy the proposed office development at Blocks 29-32, and the possibility of uses that would handle radioactive or biohazardous materials cannot be precluded. Thus, as identified in the Mission Bay FSEIR, in the event that there could be future activities that handle radioactive or biohazardous materials, implementation of FSEIR Mitigation Measure K.2 (same as Mitigation Measure M-HY-6) would reduce this impact to *less than significant with mitigation*.

Direct Discharges of Stormwater Runoff and Storm Drainage Capacity

Currently, approximately half of the project site is paved, and the rest is undeveloped. Runoff from portions of the paved and unpaved areas drain to perimeter streets, but a majority of runoff is contained in a low lying area within the site. There are no storm drains on the site. The runoff that drains to the perimeter streets currently flows to the combined sewer system.

Under the proposed project, all stormwater would be diverted to the separate stormwater system constructed by the master developer in the reconfigured Central sub-basin and under construction in the reconfigured Mariposa sub-basin. Discharges of stormwater from the project site to the separate stormwater system would be subject to the regulatory requirements of the updated Phase II General MS4 NPDES Permit, Section 147 of Article 4.2 of the San Francisco Public Works Code, and the City’s Stormwater Design Guidelines, all of which were adopted since publication of the Mission Bay FSEIR and are described in Section 5.9.4, Regulatory Framework. Accordingly, the project sponsor would be required to implement BMPs to improve the quality of stormwater entering the stormwater system. The stormwater management approach must capture and treat rainfall from the design storm of 0.75 inches and include measures to reduce or eliminate downstream water pollution by reducing impervious cover, eliminating sources of contaminants, treating pollutants in stormwater runoff, or increasing onsite infiltration. The project would primarily utilize two Low Impact Development (LID) strategies to achieve the requirements for capture and treatment of stormwater: green roofs on several buildings, rainwater harvesting, and flow-through biotreatment planters. Treated water from these facilities would be directed to proposed on-site storm drains, which would connect to the separate stormwater collection system in the adjacent streets.

Implementation of BMPs and other stormwater control measures required by the updated Phase II General MS4 NPDES Permit; Article 4.2 of the San Francisco Public Works Code, Section 147; and the City's Stormwater Design Guidelines would ensure that the project does not contribute to an increase in discharge of stormwater pollutants to the Bay in discharges from the separate stormwater system. Therefore, impacts related to degradation of water quality and providing an additional source of stormwater pollutants are *less than significant* in relation to direct stormwater discharges.

As described in Impact C-UT-3 in Section 5.7, Utilities and Service Systems, the Mission Bay South stormwater system is designed to convey runoff from a 5-year storm event under build-out conditions. While the project would increase runoff relative to existing conditions because the amount of impervious surfaces would be increased, the volume of offsite stormwater discharges would be consistent with the projected build-out condition that the Mission Bay South separate stormwater system was designed to serve. Therefore, stormwater runoff from the project would not exceed the capacity of the stormwater system and this impact would be *less than significant*.

Litter

The proposed public use of the project site as an event center could increase the potential for litter. In accordance with Article 6 of the San Francisco Health Code, Garbage and Refuse, the project sponsor would be required to place containers in appropriate locations for the collection of refuse. In accordance with this article, the refuse containers must be constructed with tight fitting lids or sealed enclosures, and the contents of the container may not extend above the top of the rim. The project sponsor must also have adequate refuse collection service. Further, Article 6 prohibits the dumping of refuse onto any streets or lands within San Francisco.

The project would also be required to comply with several City ordinances which would decrease the amount of non-degradable trash generated under the proposed project, as discussed in Section 11 of the Initial Study, Utilities and Service Systems (see Appendix NOP-IS). The San Francisco Mandatory Recycling and Composting Ordinance requires facilities to separate their refuse into recyclables, compostables, and trash, and the Food Service Waste Reduction Ordinance prohibits any establishment that serves food prepared in San Francisco from using polystyrene foam (Styrofoam) to-go containers. This ordinance also requires that any containers used in the City’s programs be either recyclable or compostable.

Compliance with Article 6 of the San Francisco Health Code and the City ordinances described above would reduce the amount of non-recyclable and non-compostable wastes produced during events, and would ensure that adequate containers and refuse service are provided. This would reduce the potential for transport of litter to the separate stormwater system (including the UCSF MS-4) and Bay via wind or stormwater runoff. Furthermore, as indicated in Chapter 3, Project Description, the project sponsor would implement a number of event center site management practices to minimize potential disruption associated with event center operations, including the

San Francisco Entertainment Commission's Good Neighbor Policy. This policy includes the following provision:

- Employees of the establishment shall walk a 100-foot radius from the premises sometime between 30 minutes after closing time and 8:00 a.m. the following morning, and shall pick up and dispose of any discarded beverage containers and other trash left by area nighttime entertainment patrons.

Therefore, for reasons stated above, water quality impacts related to littering would be *less than significant*.

Summary of Impact HY-6, Water Quality Impact Analysis

Impact HY-6 describes potential water quality impacts of the proposed project related to dry weather wastewater flows and compliance with the wastewater treatment requirements of the RWQCB; wet weather wastewater flows; effluent discharges from the SEWPCP; direct discharges of stormwater; and litter. The analysis determined that project-related effects on dry weather wastewater flows would be less than significant because the wastewater flows would be within the remaining capacity of the SEWPCP. Impacts related to wet weather flows and CSDs were determined to be less than significant because the discharge of project-related peak wastewater flows would not result in an increase in frequency of CSD events from the Mariposa sub-basin.

Potential impacts related to effluent discharges from the SEWPCP would be *less than significant with mitigation*, assuming implementation of FSEIR Mitigation Measure K.2 which requires implementation of measures to ensure that businesses that discharge pollutants that are not typically associated with most wastewater discharges to the City's combined sewer system do not cause a violation of the NDPES permit for the SEWPCP. Impacts related to direct discharges of stormwater and litter would be less than significant due to compliance with existing regulations and implementation of proposed event center site management practices.

Mitigation Measure M-HY-6. Wastewater Sampling Ports

Mission Bay FSEIR Mitigation Measures K.2. Participate in the City's existing Water Pollution Prevention Program. Facilitate implementation of the City's Water Pollution Prevention Program by providing and installing wastewater sampling ports in any building anticipated to have a potentially significant discharge of pollutants to the sanitary sewer, as determined by the Water Pollution Prevention Program of the San Francisco Public Utilities Commission's Bureau of Environmental Regulation and Management, and in locations as determined by the Water Pollution Prevention Program.

Comparison of Impact HY-6 to Mission Bay FSEIR Impact Analysis

Dry-Weather Flows to Combined Sewer System. The Mission Bay FSEIR determined that, based on anticipated land uses as offices, the estimated total wastewater flow from the project site would be an average of 0.192 mgd and a peak of 0.578 mgd. The average flows for the proposed project would be less than analyzed in the Mission Bay FSEIR, but the peak flows would be almost two times greater than previously anticipated. Although the project would result in a somewhat more severe impact than analyzed in the Mission Bay FSEIR, the impact would remain less than significant because the dry-weather flows would be within the capacity of the SEWPCP. Therefore, the project would not result in new or substantially more severe impacts related to dry weather flows to the combined sewer system than was previously identified in the Mission Bay FSEIR.

Wet Weather Flows to Combined Sewer System. The Mission Bay FSEIR anticipated that stormwater within the reconfigured Central sub-basin would be collected in a separate stormwater system and wastewater flows generated within this basin would be conveyed in the City's combined sewer system. The Mission Bay FSEIR also anticipated that both stormwater and wastewater flows generated in the Mariposa sub-basin would be conveyed to the combined sewer system. With this configuration, the Mission Bay FSEIR indicated that increases in combined sewer discharges and associated pollutants were anticipated in the Mariposa and Islais Creek discharge locations. The Mission Bay Plan's contribution to an increase in the frequency, volume, or duration of combined sewer discharges would be reduced to less than significant with implementation of FSEIR Mitigation Measure K.3 requiring the master developer and SFPUC to consider sewer improvements to avoid increases in CSD volumes.

The master developer has proceeded with implementation of Mitigation Scenario B described in the FSEIR Summary of Comments and Responses (in Volume III, beginning on p. XII.253) and described in Section 5.9.2.3 (FSEIR Mitigation Approach), above. This scenario includes separating the stormwater collection system and sanitary sewer in the reconfigured Mariposa sub-basin as well as in the reconfigured Central sub-basin as originally planned in the FSEIR. Because none of the stormwater from Mission Bay South would be discharged to the combined sewer system, the Mission Bay FSEIR estimated that this mitigation approach would reduce the total Bayside CSD volume by 33 million gallons per year.

As discussed above, under the worst case conditions analyzed, discharge of the peak wastewater flows from the project site could increase the volume of each CSD from the Mariposa sub-basin by about 1.9 million gallons but would not increase the frequency of CSD events from this sub-basin. While the project would result in slightly more severe effects than analyzed in the FSEIR, this impact would be less than significant because the existing frequency of CSD events would not be exceeded and would be within the limitations of the NPDES permit for the SEWPCP, the North Point Wet Weather Facility, and Bayside wet-weather facilities. Therefore, the project would not result in new or substantially more severe impacts related to CSD events than was previously identified in the Mission Bay FSEIR.

Effluent Discharges from SEWPCP. The FSEIR concluded that UCSF and some commercial or industrial operations may involve the discharge of some pollutants not typically associated with most other San Francisco discharges, and discharges from these businesses could potentially result in a violation of the NDPES permit. The FSEIR identified Mitigation Measure K.2 in the Hydrology and Water Quality section requiring facilities with these discharges to install sampling ports to facilitate demonstration of compliance with discharge limitations. The proposed project could involve some of the same land uses, but as discussed above would require implementation of Mitigation Measure K.2 from the FSEIR. Therefore, the project would not result in new or substantially more severe impacts related to effluent discharges from the SEWPCP than was previously identified in the Mission Bay FSEIR.

Direct Discharges of Stormwater Runoff and Storm Drainage Capacity. The Mission Bay FSEIR concluded that with the sewer system improvements proposed as part of the Plan, including reconfiguration of the Central and Mariposa sub-basins and construction of a separate stormwater system in the reconfigured Central sub-basin, the Mission Bay Plan would accommodate the projected changes to stormwater flows. Impacts related to exceeding the capacity of the stormwater system would be less than significant.

The Mission Bay FSEIR also determined that the direct stormwater discharges under the Mission Bay Plan could contribute to a potentially significant cumulative impact on the quality of near-shore waters of the Bay and China Basin Channel (Mission Creek). The project's contribution would be reduced to less than significant with implementation of Mitigation Measure K.4 requiring treatment of all separate stormwater discharges.

As described above, stormwater discharges from the project would discharge to the Mission Bay South stormwater system constructed in accordance with Mitigation Scenario B described in the FSEIR Summary of Comments and Responses (in Volume III, beginning on p. XII.253). This separate stormwater system provides treatment of stormwater discharges at each of the five outfalls. Further, stormwater discharges from the project site would be subject to the regulatory requirements of the SWRCB and City which require treatment of stormwater before it is discharged to a separate stormwater system. Therefore, the project would result in less severe water quality impacts than analyzed in the FSEIR related to direct stormwater discharges, and the project would not result in new or substantially more severe impacts related to stormwater runoff and discharges than was previously identified.

Mission Bay FSEIR Mitigation Measure K.5 requires implementation of an individual stormwater management program that utilizes BMPs for Mission Bay until the Phase II regulations become final and Mission Bay is included in the City's stormwater management program. However, subsequent to publication of the Mission Bay FSEIR, the SWRCB adopted the General Permit for the Discharge of Storm Water from Small Municipal Separate Storm Sewer Systems. The CCSF also adopted Section 147 of Article 4.2 of the San Francisco Public Works Code in 2010 and published the associated Stormwater Design Guidelines. Discharges of stormwater from the project site to the separate storm sewer would be required to comply with these regulatory requirements as further described above. Therefore, Mission Bay FSEIR Mitigation Measure K.5 is not applicable to the proposed project.

Mission Bay FSEIR Mitigation Measure M.5 in the Community Services and Utilities section required conveying all stormwater runoff from newly developed areas in the Bay drainage sub-basin to the combined sewer system prior to completion of the initial-flow diversion system. However, as discussed in Section 5.7 of this SEIR, Utilities and Service Systems, this mitigation measure is no longer warranted for the proposed project because the project would discharge stormwater to the separate stormwater system being constructed in accordance with the approved Mission Bay South Infrastructure Plan.

Impact HY-7: Operation of the proposed project would not expose people or structures to a significant risk of loss, injury, or death involving flooding. (Less than Significant)

Existing grades at the project site range from -1 to +3 feet SFD (10 to 14 feet NAVD88). As discussed in Impact HY-4 of the Initial Study (see pp. 102 to 103 of the Initial Study in Appendix NOP-IS), the project site is not located within a 100-year flood zone depicted on San Francisco's interim flood maps prepared in 2008. The project site is also generally above the projected 2050 flood elevation of -0.6 feet SFD (11 feet NAVD88), which combines 12 inches of sea level rise with the effects of a 100-year storm surge. Thus, as shown on Figure 5.9-3 and described in the Setting, the project site would not be subject to flooding in 2050 with projected sea level rise.[38] In addition, the project site would not be flooded during daily high tide conditions (MHHW) with the 36 inches of sea level rise that is expected by 2100.

However, when the effects of a 100-year storm surge are considered in combination with 36 inches of sea level rise, the flood elevation would be 1.5 feet SFD (13 feet NAVD88), and the site at its existing grade could be temporarily flooded to depths of up to about 2.5 feet. This is consistent with the SFPUC mapping depicted on Figure 5.9-4, which shows flooding depths at 2-foot intervals and indicates that the site could be temporarily flooded to depths of between 2 and 4 feet.[39] Thus, the project site could be prone to flooding by 2100 based on projected sea level rise in combination with the effects of storm surge.

However, as noted in the Setting, this flooding scenario is based on 2010/2011 topographic conditions and assumes that no site-specific flood protection measures such as filling to raise the grade of low lying areas or area-wide measures such as construction of berms, levees or seawalls would be implemented to protect the project site or surrounding area during the intervening period. As such, it is likely that the actual flood zone would be different by 2100 than what is illustrated on Figure 5.9-4 under built conditions, and the actual flood zone would include only those areas of the site with ground elevations below the flood elevation of 1.5 feet SFD (13 feet NAVD88) that are not protected by area-wide flood protection measures.

Development in the flood zone could expose people or structures to a significant risk of loss, injury or death unless designed and constructed in accordance with flood resistant building standards. San Francisco's Floodplain Management Ordinance (Chapter 2A, Article XX, Sections 2A.280 through 2A.285 of the San Francisco *Administrative Code*) provides standards for

---

38 Note that the green zone shown within the project site on Figure 5.9-3 is the open excavation that is not hydrologically connected to the Bay or flooding zones and would be filled when the site is developed.

39 Note that greater inundation depths are indicated on Figure 5.9-4 in the area of the open excavation, but this excavation would be filled when the site is developed.

building in flood prone areas. For building sites in flood prone areas, Section 2A.283 (b)(1) specifically requires that:

- The building must be adequately anchored to prevent flotation, collapse, or lateral movement.
- The building must be constructed with materials and utility equipment that is resistant to flood damage, and with methods and practices that minimize flood damage.
- Electrical, heating, ventilation, plumbing, and air conditioning equipment must be designed or located to prevent water from entering or accumulating within the components during flooding.
- All water supply and sanitary sewage systems must be designed to minimize or eliminate infiltration of flood waters into the system as well as discharges from the systems into floodwaters.

The Floodplain Management Ordinance is applicable only in areas that are designated by the City Administrator as susceptible to being inundated by a 100-year flood. At present, the City's designated 100-year flood zone is that shown on the 2008 interim flood map, which does not consider projected sea level rise and does not therefore include the project site. As such, the Floodplain Management Ordinance does not apply to the project site.

However, although it is not subject to the San Francisco Floodplain Management Ordinance, the project would be designed and constructed consistent with flood-resistant building standards or, in some cases, to be capable of adapting to meet these standards when needed in the future in recognition of future flood hazards due to sea level rise. These features or strategies that have been incorporated in the project design include:

- Locating the base of the main event center entry at an elevation of 10 feet SFD (21 feet NAVD88), which would be 8.5 feet above the projected flood elevation in 2100. Access to office and retail uses from the main plaza would be provided at this elevation.
- Raising pedestrian access and outdoor areas to an elevation of 10 feet SFD (21 feet NAVD88), which would be 8.5 feet above the projected flood elevation in 2100. These areas include the Third Street Plaza, main pedestrian path around the event center, Bayfront Overlook, and Bayfront Terrace. The project would also provide access to the upper floors of the Food Hall from the elevated pedestrian path.
- Locating the base of the secondary arena entry on the southeast portion of the event center at an elevation of 26 feet SFD (37 feet NAVD88), 24.5 feet above the projected flood elevation in 2100, and making it accessible from the elevated pedestrian path or stairs from the southeast plaza.
- Providing expanded height first floors in the retail uses and lobbies in the South Street and 16th Street buildings, Food Hall, and buildings fronting Terry Francois Boulevard which would provide space to raise the floor level above the projected flood elevation.
- Minimizing to the extent feasible the number of building wall penetrations below an elevation of 3.5 feet SFD (15 feet NAVD88), which is two feet higher than the projected flood elevation in 2100, to preclude inside flooding.

- Waterproofing the below ground features to address fluctuations in groundwater levels that may result from sea level rise.
- Designing the water supply and wastewater facilities to minimize or eliminate infiltration of flood waters as well as discharges from these systems into flood waters.

Three components of the proposed project would be constructed below ground, and would also be below the projected flood elevation in 2100. These include the team practice courts at an elevation of -14 feet SFD (-22.7 feet NAVD88), the below grade parking and loading dock at an elevation of -10.7 feet SFD (00.6 foot NAVD88), and the event level (floor of the basketball court) at an elevation of - 6 feet SFD (5.3 feet NAVD88). To prevent inundation of these areas by flood waters, the garage and loading dock entries would be designed to allow future installation of floodgates and a solid curb could be constructed alongside landscaped areas to prevent flood flows from encroaching onto the site. Sand bags could also be available to provide temporary protection from future flooding.

Mechanical systems for the event center that would be located in the below-grade parking could also be flooded by 2100. However, the project design includes providing space for emergency pumps in these areas, including the area adjacent to the mechanical systems. Further, the mechanical systems could be moved to areas of the site that are above future flood levels if necessary.

The project features described above would be consistent with San Francisco's Floodplain Management requirements specified in the San Francisco Administrative Code, Article XX, Sections 2A.280 through 2A.285 and discussed in the Setting. In addition, the stormwater bioretention areas and stormwater drain inlets located along the property perimeter would facilitate drainage of flood waters. Terry A. Francois Boulevard and the planned waterfront park to the east would also serve as a buffer for the project site against coastal flooding.

While the project site could be temporarily flooded at depths of up to 2.5 feet with 36 inches of sea level rise in combination with 100-year storm surge by 2100, the project would be designed and constructed to resist flood damage and provide for the safety of occupants and visitors in the event of flooding. Therefore, impacts related to flooding would be *less than significant*.

Mitigation: None required.

Comparison of Impact HY-7 to Mission Bay FSEIR Impact Analysis

As discussed above, the Mission Bay FSEIR concluded that portions of the Mission Bay Plan area could be subject to inundation as a result of sea level rise and included Mitigation Measures K.6a through K.6f for structures proposed below an elevation of -1 foot SFD (10 feet NAVD88). The mitigation required implementation of construction specifications to address effects of sea level rise that would be based on specific flood protection and engineering and building analyses by a licensed engineer where structures are proposed below an elevation of -1 foot SFD (10 feet NAVD88).

Elevations at the project site range from approximately -1 foot SFD (10 feet NAVD88) to +3 feet SFD (14 feet NAVD88),[40] however some of the project components would extend below grade. The SFPUC inundation maps completed in 2014 have provided a more detailed assessment of areas of the project site that could be inundated due to sea level rise and indicate an area greater than previously anticipated in the Mission Bay FSEIR. However, the above-described measures that are incorporated into the project design fulfill the requirements of FSEIR Mitigation Measure K.6, which is no longer warranted for the proposed project. Therefore, the proposed project would not result in new or substantially more severe significant impacts than those identified in the FSEIR regarding flooding from sea level rise.

Cumulative Impacts

Impact C-HY-1: See Initial Study (Appendix NOP-IS)

Impact C-HY-2: The proposed project, in combination with past, present, and reasonably foreseeable future projects in the site vicinity, would not exceed the wastewater treatment requirements of the NPDES permit for the SEWPCP; violate water quality standards or waste discharge requirements, or otherwise substantially degrade water quality as a result of changes in wastewater and stormwater discharges to the Bay; or exceed the capacity of the separate stormwater system constructed in Mission Bay, or provide a substantial source of polluted runoff. Cumulative wet weather flows would not contribute to an increase in combined sewer discharges. (Less than Significant)

Impacts related to the wastewater treatment requirements of the NDPES permit for the SEWPCP and contributions to CSDs could occur within the reconfigured Mariposa and Central sub-basins. Accordingly, the geographic scope of cumulative impacts related to these topics is the geographical area that drains to the reconfigured Mariposa and Central sub-basins. Regarding contributions to CSDs, the cumulative analysis considers wastewater and storm water flows resulting from full build-out of the Mission Bay South area and development of the Mission Bay Campus under the UCSF LRDP (described in Section 5.1.5.2, Cumulative Projects for Operational Impacts), and assumes that operations of these projects would have to comply with the same regulatory requirements as the project.

Impacts related to exceeding the capacity of the stormwater system and providing additional sources of stormwater pollutants could occur within the Mission Bay South separate stormwater system. Accordingly, the geographic scope of cumulative impacts related to this topic is the geographical area that drains to the same separate stormwater system.

---

40 Langan Treadwell Rollo, Preliminary Geotechnical Evaluation, Block 29-32 Mission Bay, San Francisco, California. March 28, 2014.

The geographical scope for littering includes all of Lower San Francisco Bay, which is listed as an impaired water body for trash.

Dry Weather Flows to Combined Sewer System

As discussed in Section 5.7, Utilities and Service Systems, the SFPUC estimates that under full build out of Mission Bay South, average wastewater flows to the Mariposa sub-basin would be 1.69 mgd and peak wastewater flows would total 4.8 mgd, including all of the flows from the proposed project.[41] During dry weather (typically, May 1 to October 15), all wastewater generated by the project would be conveyed to and treated at the SEWPCP, which currently has available dry-weather capacity of about 24.5 mgd, as described above in Section 5.9.3.1, Combined Sewer System. The average flow at full build out of Mission Bay South would be less than 7 percent of the available dry-weather capacity of the SEWPCP, and the peak daily flow would be approximately 20 percent. Therefore, during dry weather, cumulative impacts related to exceeding the wastewater treatment requirements of the San Francisco RWQCB would be *less than significant*.

Wet Weather Flow to Combined Sewer System

Existing average wastewater flows from development projects completed within the Mariposa sub-basin of the combined sewer system as of February 2015 are approximately 1.21 mgd, including 0.31 mgd of existing flows from UCSF and other developments as well as flows from infiltration and from Basin B.[42] Assuming the addition of all of the average flow from the proposed project and average flows from future developments at full build out of Mission Bay South, the average cumulative flows to the Mariposa sub-basin and pump station would be 1.69 mgd. Conservatively assuming that all 1.074 mgd of the peak wastewater flows from the project site would discharge to the Mariposa sub-basin and pump station, the combined flows would total approximately 2.6 mgd at full build out. As described in Impact HY-6, above, Hydroconsult Engineers, Inc. analyzed the effect of cumulative increases in wastewater discharges on CSDs from the Mariposa sub-basin using the San Francisco DPW's Hydrocalc model.[43] The modeling report is included as Appendix HYD of this SEIR. Using the wastewater flows described above and standard rainfall assumptions used by the DPW, the model estimated the annual average frequency, volume and duration of CSDs that would occur once the Mariposa wet and dry-weather pump stations reach the combined capacity of 11.2 mgd. Considering average flows within the Mariposa sub-basin and all of the project site, the model estimated that under cumulative conditions, the number of CSD events would not increase, but the volume of the CSDs would increase from 5.34 to 6.32 million gallons and the duration would increase from 17.2 to 18.2 hours. Considering peak flows from the project site, the frequency of CSDs would increase from 10 to 11, the average volume would increase from 5.34 to 7.98 million gallons, and the duration would increase from 17.2 to 21.8 hours.

---

41 Hydroconsult Engineers, Inc. 2015. Combined Sewer Impact Analysis, Golden State Warriors Arena EIR. February 18.
42 *Ibid.*
43 *Ibid.*

As noted in Impact HY-6, the model analyzed worst-case conditions assuming that all project-related peak wastewater flows would discharge to the Mariposa sub-basin and would occur concurrently with each large rainstorm. However, these conditions would not be expected to occur on a regular basis, if at all, and as discussed in Section 5.7, Utilities and Service Systems, a portion of the wastewater flows from the project site would be discharged to the reconfigured Central sub-basin. As discussed above, the NPDES permit for the SEWPCP, the North Point Wet Weather Facility, and all of the bayside wet-weather facilities does not limit the specific annual number of CSD events. Instead, the permit acknowledges that some years are wetter than others and requires that the combined sewer system is designed and constructed to meet the specified long-term average number of CSDs from each sub-basin. Thus, the NPDES permit allows an annual average of 10 CSDs for the Mariposa sub-basin to be exceeded in any particular year, as long as the long-term average is met. Because cumulative conditions would not likely result in exceeding the long-term annual average of 10 CSDs allowed for the Mariposa sub-basin in the NPDES permit for the SEWPCP, North Point Wet Weather Facility, and Bayside wet-weather facilities, cumulative impacts related to contributions to an increase in CSD frequency would be *less than significant.*

Further, as discussed in Section 5.7, Utilities and Service Systems, the SFPUC will be constructing future improvements to increase the capacity of the Mariposa Pump Station and associated facilities, and this would increase the amount of wastewater that could be conveyed to the SEWPCP and Northpoint Wet Weather facilities for treatment, resulting in a corresponding reduction in CSD volumes from the Mariposa sub-basin (see Impacts C-UT-2 and C-UT-4).

Effluent Discharges from SEWPCP

As discussed in Impact HY-6, if the proposed office space includes biotech uses, the project could result in discharge of biohazardous and radioactive materials that, if improperly handled, could result in violation of the NPDES permit for the SEWPCP. The cumulative effects of wastewater discharges containing such materials could result in an exceedance of the NPDES discharge limitations of the SEWPCP, resulting in a potentially significant cumulative impact. However, the project's contribution would not be cumulatively considerable (*less than significant*) with implementation of Mission Bay FSEIR Mitigation Measure K.2, which requires installation of wastewater sampling ports for business that discharge unusual materials to facilitate sampling.

Direct Discharges of Stormwater Runoff and Storm Drainage Capacity

As discussed in Impact HY-6, the project site would be served by the Mission Bay South separate stormwater infrastructure. As discussed in Impact C-UT-1 (see Section 5.7, Utilities and Service Systems), Storm Drain Pump Station No. 1 (SDPS-1) in the reconfigured Central sub-basin has been constructed and SDPS-5 in the Mariposa sub-basin is currently under construction. These stormwater pump stations and associated stormwater infrastructure would accommodate stormwater flows from the proposed project and have been designed to handle stormwater flows generated from the planned build-out of the entire tributary drainage area. Further, the project would conform to the City's *Stormwater Design Guidelines* for treatment of stormwater runoff to separate stormwater systems. Similar to the proposed project, all future projects in the vicinity that disturb greater than 5,000 square feet would be required to comply with the City's *Stormwater Design Guidelines*, which require capture and treatment of stormwater discharged to separate stormwater systems. Therefore, cumulative impacts within the Mission Bay South area related to exceeding the capacity of a stormwater system, providing additional sources of polluted runoff, and water quality degradation as a result of direct stormwater discharges would be *less than significant*.

Litter

As discussed in Impact HY-6, the project's water quality impacts related to littering would be less than significant through compliance with Article 6 of the San Francisco Health Code and the City ordinances addressing recycling and composting of wastes as well as the project's proposed event center site management practices (including implementation of the San Francisco Entertainment Commission's Good Neighbor Policy). Other projects in the area are also required to comply with these requirements. Therefore, the project's contribution to cumulative water quality impacts related to litter would not be cumulatively considerable (i.e., *less than significant*).

Comparison to FSEIR Significance Determination

Dry Weather Flow to Combined Sewer System. The Mission Bay FSEIR did not specifically address cumulative effects related to dry weather flows to the City's combined sewer system. However, the Mission Bay FSEIR Community Services and Utilities impacts section estimated that the Mission Bay Plan would generate approximately 2.5 mgd of wastewater at build-out (average dry weather flow), or 3.7 percent of the volume of wastewater treated at the SEWPCP at the time of FSEIR publication, and determined this to be a *less than significant* impact.

Under full build out of Mission Bay South, average wastewater flows in the Mariposa sub-basin would be 1.69 mgd, or less than 3 percent of the 60 mgd of wastewater currently treated at the SEWPCP. Therefore, the proposed project would not result in any new significant impacts or substantially severe impacts relative to those analyzed in the Mission Bay FSEIR.

Wet Weather Flow to Combined Sewer System. The Mission Bay FSEIR determined that the Plan's estimated 0.2 percent contribution to the 11 percent cumulative increase in Bayside combined sewer discharge volumes would be a significant impact. The Plan's contribution would be reduced to *less than significant with mitigation*, assuming implementation of FSEIR Mitigation Measure K.3 requiring design and construction of sewer improvements to ensure that wastewater and stormwater flows from the Plan area to the combined sewer do not contribute to combined sewer discharges.

As described in Section 5.9.2.3 (FSEIR Mitigation Approach) above, the master developer has implemented Mitigation Scenario B that includes separating the stormwater collection system and sanitary sewer in the reconfigured Central and Mariposa sub-basins in Mission Bay South. Implementation of this mitigation approach satisfies the requirements of Mission Bay FSEIR Mitigation Measure K.3 and is estimated to reduce total Bayside CSD volume by 33 million gallons per year, less than baseline conditions before the Mission Bay Plan was implemented.

As discussed above, under the worst case conditions analyzed, cumulative wastewater discharges to the Mariposa sub-basin could increase the volume of each CSD from the Mariposa sub-basin by about 7.98 million gallons but would not increase the long-term average frequency of CSD events from this sub-basin. While the cumulative wastewater flows would result in slightly more severe effects than analyzed in the FSEIR, this impact would be less than significant because the long-term average frequency of CSD events would not be exceeded and the system would remain in compliance with the NPDES permit for the SEWPCP, the North Point Wet Weather Facility, and Bayside wet-weather facilities. Therefore, the project would not result in new or substantially more severe cumulative impacts related to CSD events than was previously identified in the Mission Bay FSEIR.

Effluent Discharges from SEWPCP. Cumulative impacts related to exceeding the discharge limitations of the SEWPCP were not specifically addressed in the Mission Bay FSEIR. However, while the cumulative effects of wastewater discharges containing radioactive and biohazardous materials could be potentially significant, the contribution of both the project and the Mission Bay Plan would not be cumulatively considerable (*less than significant*) with implementation of Mission Bay FSEIR Mitigation Measure K.2. Therefore, the proposed project would not result in any new significant impacts or substantially more severe impacts relative to those analyzed in the FSEIR.

Direct Discharges of Stormwater Runoff and Storm Drainage Capacity. The Mission Bay FSEIR determined that the Mission Bay Plan could contribute to a *potentially significant* cumulative impact on the quality of near-shore waters of the Bay and China Basin Channel (Mission Creek) as a result of direct stormwater discharges. However, the Plan's contribution would be reduced to *less than significant with mitigation*, assuming implementation of FSEIR Mitigation Measure K.4. The Mission Bay South storm drain infrastructure was constructed in accordance with Mitigation Scenario B described in the Mission Bay FSEIR Summary of Comments and Responses and conforms to the requirements of this mitigation measure. The proposed project would not result in any new significant impacts or substantially more severe impacts relative to those analyzed in the Mission Bay FSEIR regarding this topic.

Litter. Cumulative impacts related to littering were not considered in the Mission Bay FSEIR. Regardless, the proposed project would not result in any new significant cumulative impacts or substantially more severe cumulative impacts relative to those analyzed in the Mission Bay FSEIR.

Impact C-HY-3: The proposed project, in combination with past, present, and reasonably foreseeable future projects in the site vicinity, would not result in a significant impact related to exposing people or structures to a significant risk of loss, injury, or death involving flooding. (Less than Significant)

As described in Section 5.9.3.2, Flooding, the City's Bay shoreline will be subject to an increased risk of flooding in the future due to sea level rise. Accordingly, the geographic scope for impacts related to flood risk includes those areas in the project vicinity that could be subject to flooding by 2100. Past, present, and foreseeable future development in such areas could expose people or structures to a cumulatively significant risk of loss, injury or death due to flooding. However, as described above, the proposed project would be designed and constructed in accordance with flood resistant building standards and could feasibly be adapted as necessary to respond to future flood hazards. Therefore, the proposed project's contribution to cumulative impacts related to future flood hazard risks due to sea level rise would not be cumulatively considerable (i.e., *less than significant*).

Comparison to FSEIR Significance Determination

Cumulative impacts related to future flooding were not considered in the Mission Bay FSEIR. Regardless, the proposed project would not result in any new significant cumulative impacts or substantially more severe cumulative impacts on future flooding relative to those analyzed in the FSEIR.

CHAPTER 6
Other CEQA Issues

6.1 Growth-Inducing Impacts

Section 15126.2(d) of the California Environmental Quality Act (CEQA) Guidelines requires that an environmental impact report (EIR) discuss "the ways in which the proposed project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment. Included in this are projects which would remove obstacles to population growth…. It must not be assumed that growth in any area is necessarily beneficial, detrimental, or of little significance to the environment."

As discussed in the Initial Study (Appendix NOP-IS), Section 3, Population and Housing, the project would not directly provide new housing or directly increase San Francisco's population. The project would generate about 3,578 new jobs. The Association of Bay Area Governments (ABAG) forecasts that San Francisco's population will increase by about 238,700 people between 2015 and 2040 and that the City will gain about 142,080 new jobs over this period.[1] New jobs at Mission Bay Blocks 29–32 would represent about 2.5 percent of citywide job growth. In addition, as stated in Appendix NOP-IS, the new jobs would represent about 0.7 percent of San Francisco's current labor force and 0.2 percent of the labor force in the five-county region. Thus, while development of the project would represent growth, the generation of new jobs would not encourage substantial new growth that is not currently projected for San Francisco.

The proposed development of Mission Bay Blocks 29–32 would be located within the Mission Bay Priority Development Area (PDA), one of 10 designated PDAs in San Francisco. PDAs are locally identified areas located near transit and having infill development opportunities; they are part of a regional planning initiative led by the ABAG and the Metropolitan Transportation Commission (MTC). The initiative links land use and transportation planning and promotes a connected and more compact land use pattern. Under the initiative, future growth in the region would be focused in the community-identified PDAs. Growth proposed at the project site would be consistent with the City's identification of Mission Bay as an area of San Francisco where future growth will be focused.

PDAs are also important components of "Plan Bay Area," which is the regional planning effort undertaken in response to the Sustainable Communities Strategy (Senate Bill 375), a state law passed in 2008. ABAG and MTC, the agencies leading the Bay Area's regional planning for the

---

1 Association of Bay Area Governments, Bay Area Plan Projections 2013, December 2013.

Sustainable Communities Strategy, released the final version of Plan Bay Area in December 2013. The plan focuses much of the region's projected growth within the PDAs. San Francisco elected officials and agency staff have participated in the Sustainable Communities Strategy development process since its inception, and in 2012 the San Francisco Planning Department updated the City's long-range land use allocation based on ABAG's forecast for the Sustainable Communities Strategy.

Based on this analysis, the project would not have a substantial growth-inducing impact, and no mitigation is required.

6.2 Significant and Unavoidable Impacts

In accordance with CEQA Section 21067 and Sections 15126(b) and 15126.2(b) of the CEQA Guidelines, the purpose of this section is to identify impacts that could not be eliminated or reduced to less-than-significant levels by mitigation measures included as part of the project, or by other mitigation measures that could be implemented, as identified in Chapter 5, Environmental Setting, Impacts, and Mitigation Measures. These findings are subject to final determination by the OCII Commission as part of the CEQA findings for the SEIR. If necessary, this chapter will be revised in the Final SEIR to reflect the findings of the Commission.

As described in Chapter 5, the impacts listed below would be considered significant and unavoidable, even with implementation of feasible mitigation measures. With the exception of the impacts listed below, all other project impacts would either be less than significant or reduced to less-than significant levels by implementation of the identified mitigation measures.

Transportation and Circulation

- The project would result in significant and unavoidable traffic impacts at multiple intersections in the project area that would operate at Level of Service (LOS) E or LOS F, under conditions without or with an overlapping SF Giants game at AT&T Park, and with or without implementation of the Muni Special Event Transit Service Plan, as well as under 2040 cumulative conditions, even with implementation of identified mitigation measures. Because the proposed project would result in significant traffic impacts at additional intersections, these would be new significant and unavoidable impacts not previously identified in the Mission Bay FSEIR. (Impacts TR-2, TR-11, TR-18, and C-TR-2)

- The project would result in significant and unavoidable traffic impacts at freeway ramps in the project area intersections that would operate at LOS E or LOS F, under conditions without or with an overlapping SF Giants game at AT&T Park, and with or without implementation of the Muni Special Event Transit Service Plan, as well as under 2040 cumulative conditions, even with implementation of identified mitigation measures. These would be new significant and unavoidable impacts not previously identified in the Mission Bay FSEIR. (Impacts TR-3, TR-12, TR-19, and C-TR-3)

- The project would result in a substantial increase in transit demand that could not be accommodated by adjacent Muni transit capacity such that significant adverse impacts to Muni transit service would occur, under conditions without implementation of the Muni

Special Event Transit Service Plan, even with implementation of identified mitigation measures. This would be a significant and unavoidable impact not previously identified in the Mission Bay FSEIR. (Impact TR-20)

- The project would result in a significant adverse increase in transit demand that could not be accommodated by regional transit capacity such that significant adverse impacts to regional transit service would occur, under conditions without or with an overlapping SF Giants game at AT&T Park, and with or without implementation of the Muni Special Event Transit Service Plan, as well as under 2040 cumulative conditions, even with implementation of identified mitigation measures. These would be new significant and unavoidable impacts not previously identified in the Mission Bay FSEIR. (Impacts TR-5, TR-14, TR-21, and C-TR-5)

Noise and Vibration

- Operation of the proposed project would cause a substantial permanent increase in ambient noise levels in the project site vicinity, due to increased roadway noise levels from increased traffic in the project area and due to crowd noise following events affecting nearby sensitive receptors, even with implementation of identified mitigation measures. This would be a significant and unavoidable impact not previously identified in the Mission Bay FSEIR. (Impact NO-5)

- Operation of the proposed project, when considered with other cumulative development, would cause a substantial permanent increase in ambient noise levels in the project site vicinity due to increased roadway noise levels from cumulative increases in traffic in the project area, even with implementation of identified mitigation measures. This would be a significant and unavoidable impact not previously identified in the Mission Bay FSEIR. (Impact C-NO-2)

Air Quality

- Construction of the proposed project would generate fugitive dust and criteria air pollutants, which would violate an air quality standard, contribute substantially to an existing or projected air quality violation, and result in a cumulatively considerable net increase in criteria air pollutants, even with implementation of identified mitigation measures. This would be a significant and unavoidable impact not previously identified in the Mission Bay FSEIR. (Impact AQ-1)

- During project operations, the proposed project would result in emissions of criteria air pollutants at levels that would violate an air quality standard, contribute to an existing or projected air quality violation, or result in a cumulatively considerable net increase in criteria air pollutants, even with implementation of identified mitigation measures. This would be a significant and unavoidable impact not previously identified in the Mission Bay FSEIR. (Impact AQ-2)

- The project, in combination with other past, present, and reasonably foreseeable future projects, would contribute to cumulative regional air quality impacts, even with implementation of identified mitigation measures. This would be a significant and unavoidable impact not previously identified in the Mission Bay FSEIR. (Impact C-AQ-1)

Wind

- The proposed project structures would alter wind in a manner that would substantially increase the number of wind hazard hours at off-site public areas, and while feasible mitigation measures have been identified, the design refinements required to reduce this impact to a less-than-significant level have not been finalized. This would be a significant and unavoidable impact not previously identified in the Mission Bay FSEIR. (Impact WS-1)

Utilities

- The project, in combination with past, present, and reasonably foreseeable future projects, would require the construction of new or upgraded wastewater facilities, the construction of which could cause significant environmental effects. This would be a significant and unavoidable impact with no feasible mitigation measures because mitigation is beyond the control of the project sponsor. This would be a significant and unavoidable impact not previously identified in the Mission Bay FSEIR. (Impact C-UT-2)

- The project, in combination with past, present, and reasonably foreseeable future developments in the Mission Bay South area, would result in the determination by the San Francisco Public Utilities Commission (SFPUC) that it has inadequate capacity to serve the project's projected wastewater demand in addition to the SFPUC's existing commitments, even with implementation of identified mitigation measures. This would be a significant and unavoidable impact not previously identified in the Mission Bay FSEIR. (Impact C-UT-4)

6.3 Effects Found Not to Be Significant

The NOP distributed for the proposed project included an Initial Study that analyzed resource topics that were determined either not to apply to the proposed project or to have no impact, a less-than-significant impact, or a less-than-significant impact with mitigation. These topics, listed below, are not analyzed in this SEIR:

- **Land Use and Land Use Planning—**The project would not physically divide an established community; conflict with land use plans, policies, or regulations adopted for the purpose of avoiding or mitigating an environmental effect; or have impacts on the existing character of the vicinity.

- **Population and Housing—** The project would not induce substantial population growth; displace a substantial amount of existing housing or create demand for additional housing; or displace substantial numbers of people, necessitating replacement housing elsewhere.

- **Cultural and Paleontological Resources—** The project would not cause an adverse change to historic architectural resources or archaeological resources; destruction of paleontological resources; or disturbance of remains.

- **Noise—** The project would not expose people to excessive noise levels in airport or airstrip areas; or be substantially affected by existing noise levels.

- **Air Quality—** The project would not create objectionable odors.

- **Recreation**— The project would not increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facilities would occur or be accelerated; include recreational facilities or require the construction or expansion of recreational facilities that might have an adverse physical effect on the environment; physically degrade existing recreational resources.

- **Utilities and Service Systems**— The project would not require the construction of new water facilities; affect the availability of water supply; exceed landfill capacity; or fail to comply with solid waste regulations.

- **Public Services**— The project would not create impacts associated with the need for new or altered schools, parks, or other services.

- **Biological Resources**— The project would not cause effects on special-status species, riparian habitat, wetlands, migratory wildlife corridors or sites, or conflict with plans or policies protecting resources, including habitat conservation plans.

- **Geology and Soils**— The project would not expose people or structures to geologic hazards; cause soil erosion or loss of topsoil; be affected by the presence of unstable soils or geologic units; be affected by the presence of expansive soils or soils incapable of adequately supporting wastewater disposal systems; or cause a substantial change of topography.

- **Hydrology and Water Quality**— The project would not deplete groundwater supplies; alter drainage patterns, resulting in erosion; place housing and/or structures within a 100-year flood zone; expose people and structures to hazards associated with flooding, failure of a levee or dam, seiche, tsunami, or mudflow; or cause construction-related water quality impacts.

- **Hazards and Hazardous Materials**— The project would not cause risk of upset and accident conditions involving release of hazardous materials; emit hazardous materials within 0.25 mile of a school; be located on a site listed on a hazardous materials database; be located on airport or air strip land use areas; impair implementation of emergency response or evacuation plan; expose people or structures to fire risk; or create construction-related hazards and hazardous materials impacts.

- **Mineral and Energy Resources**— The project would not cause the loss of known valuable mineral resources of the state or locally important resources; encourage activities that result in wasteful use of energy resources.

- **Agriculture and Forest Resources**— The project would not convert resources identified by the Farmland Mapping and Monitoring Program to nonagricultural use; conflict with existing zoning for agricultural use or Williamson Act contract; or involve changes that could result in Farmland of Statewide Importance to nonagricultural use.

Other topics determined to result in less-than-significant impacts or less-than-significant impact with mitigation, in Chapter 5 of this SEIR include the following:

- **Transportation and Circulation** — With implementation of identified mitigation measures, the project would not cause: construction-related ground transportation impacts; a substantial increase in transit demand that could not be accommodated by adjacent Muni transit capacity such that significant adverse impacts to Muni transit service would occur under conditions without or with an overlapping SF Giants game at AT&T Park, or under cumulative conditions; substantial overcrowding on public sidewalks, hazardous conditions for pedestrians, or pedestrian accessibility under conditions without or with an overlapping SF Giants Game at AT&T Park, and with or without implementation of the Special Event Transit Service Plan, or under cumulative conditions; cause hazardous conditions for bicyclists or bicycle accessibility under conditions without or with an overlapping SF Giants Game at AT&T Park, and with or without implementation of the Special Event Transit Service Plan, or under cumulative conditions; result in a loading demand that would create potentially hazardous conditions or significant delays for traffic, transit, bicyclists, or pedestrians under conditions without or with an overlapping SF Giants Game at AT&T Park, and with or without implementation of the Special Event Transit Service Plan, or under cumulative conditions; cause significant impacts on emergency vehicle access under conditions without or with an overlapping SF Giants Game at AT&T Park, and with or without implementation of the Special Event Transit Service Plan, or under cumulative conditions; and would not adversely affect UCSF helipad operations.

- **Noise and Vibration** — With implementation of identified mitigation measures, the project would not cause a substantial increase in ambient noise levels during construction, including under cumulative conditions; expose people to or generate noise levels in excess of established standards during construction or operation; expose people and structures to or generate excessive groundborne vibration levels; or be substantially affected by noise from future operations at the helipad at the adjacent UCSF hospital.

- **Air Quality** — With implementation of identified mitigation measures, the project would generate toxic air contaminants, including diesel particulate matter but would not expose sensitive receptors to substantial air pollutant concentrations under project or cumulative conditions; and would not conflict with, or obstruct implementation of, the *2010 Clean Air Plan*.

- **Greenhouse Gas Emissions** — With purchase of voluntary carbon credits, the project would result in no net increase in greenhouse gas emissions, and would be consistent with plans or policies adopted for the purpose of reducing emissions of greenhouse gases.

- **Shadow** — The project would not create new shadow in a manner that substantially affects outdoor recreation facilities or other public areas.

- **Utilities and Service Systems** — The project would not in itself require or result in the construction of new wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects; or require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects.

- **Public Services**—The project would not create impacts associated with the need for new or altered fire protection, emergency medical services, or law enforcement facilities during construction or operation, either directly or cumulatively.

- **Hydrology and Water Quality**—With implementation of identified mitigation measures, the project would not exceed the wastewater treatment requirements of the NPDES permit for the Southeast Water Pollution Control Plan; violate any water quality standards or waste discharge requirements; otherwise substantially degrade water quality as a result of changes in discharges to the Bay; exceed the capacity of the separate stormwater system; provide substantial additional sources of polluted runoff; or expose people or structures to a significant risk of loss, injury or death involving flooding due to sea level rise.

6.4 Irreversible and Irretrievable Commitments of Resources

In accordance with Section 21100(b)(2)(B) of CEQA, and Section 15126.2(c) of the CEQA Guidelines, an EIR must identify any significant irreversible environmental changes that could result from implementation of the proposed project. This may include current or future uses of non-renewable resources, and secondary or growth-inducing impacts that commit future uses of non-renewable resources, and secondary or growth-inducing impacts that commit future generations to similar uses. According to the CEQA Guidelines, irretrievable commitments of resources should be evaluated to assure that such current consumption is justified.

In general, such irreversible commitments include resources such as energy consumed and construction materials used in construction of a proposed project, as well as the energy and natural resources (notably water) that would be required to sustain a project and its inhabitants or occupants over the usable life of the project.

The project would use fossil fuel during demolition of existing parking lots where new buildings would be located, and during construction of the proposed new buildings. Construction would also require the commitment of construction materials, such as steel, aluminum, and other metals, concrete, masonry, lumber, sand and gravel, and other such materials, as well as water. The proposed project would commit future generations to an irreversible commitment of energy, primarily in the form of fossil fuels for heating and cooling of buildings, for automobile and truck fuel, and for energy production. The project would require an ongoing commitment of potable water for building occupants and landscaping.

However, all development would comply with *California Code of Regulations* Title 24 and the City's Green Building Ordinance and the project would be built to Leadership in Energy and Environmental Design (LEED©) Gold standards. Furthermore, with purchase of voluntary carbon credits, the project would result in no net increase in greenhouse gas emissions. Thus, overall, this development would be expected to use less energy and water over the lifetime of the proposed buildings than comparable structures not built to these same standards.

6.5 Areas of Known Controversy and Issues to Be Resolved

On November 11, 2014, the Office of Community Infrastructure and Investment issued a Notice of Preparation (NOP) of a Subsequent Environmental Impact Report (SEIR). Individuals, groups, and agencies that received these notices included owners of properties within 300 feet of the project site and other potentially interested parties, including various regional, state, and local agencies. A scoping meeting was held on December 9, 2014, to solicit comments on the scope of the SEIR. The NOP and Initial Study are included in Appendix NOP-IS of this document.

Based on the number of comments received, controversial issues for the proposed project, as expressed by community members, are the following:

- Site should be reserved for potential future expansion of the UCSF campus;
- Effect of project construction and operations on UCSF helipad operations;
- Why the project is analyzed under a Subsequent Environmental Impact Report;
- Which City ordinances, regulations, and approval requirements are superseded or otherwise different in the Mission Bay area;
- Aesthetic effects of the proposed development, including views through the project site and view easements, light and glare effects from construction, building lighting, and outdoor events;
- The approach to the transportation impact analysis, reasons for the assumptions incorporated (specifically into mode share), times of day and week studied, and cumulative projects considered;
- Impacts on transportation and circulation (including highways, arterial streets, local streets, pinch points, transit stations and service, and emergency response), as well as mitigation measures—specifically a Transportation Management Plan—that would reduce such impacts;
- Provision of sufficient bicycle and pedestrian circulation facilities and impacts to bicyclists and pedestrians;
- Parking supply and demand under both existing conditions and with the project;
- Financing, monitoring, and responsibility for implementation of mitigation measures;
- Noise from construction, outdoor events, crowds, operational traffic and generators;
- Impact from exposure to air pollutants during construction and operation;
- Effects on nearby infrastructure and facilities, including the Mariposa pump station and Bayfront Park;
- Security and crowd management, provision of public restrooms, provision of trash receptacles, littering, vermin, graffiti, and public intoxication;
- Economic effects of the project on the surrounding neighborhood and City; and
- Cumulative impacts of development of the project combined with development of other projects, and development under other plans, in the vicinity.

CHAPTER 7
Alternatives

7.1 Introduction

This chapter presents the alternatives analysis as required by the California Environmental Quality Act (CEQA) for the proposed multi-purpose event center and mixed-use development on Blocks 29-32 in the Mission Bay South Redevelopment Plan Area of San Francisco. The discussion includes a review of the alternatives analyzed in the 1998 Mission Bay Final Subsequent Environmental Impact Report (Mission Bay FSEIR), followed by the methodology used to select alternatives to the proposed project for detailed CEQA analysis, with the intent of developing potentially feasible alternatives that could avoid or substantially lessen the significant impacts identified for the proposed project while still meeting most of the project objectives. The chapter identifies a reasonable range of alternatives that meet these criteria, and these alternatives are evaluated for their comparative merits with respect to minimizing adverse environmental effects. For the alternatives selected for detailed analysis, the chapter evaluates the alternatives' impacts against existing environmental conditions and compares the potential impacts of the alternatives with those of the proposed project. Based on this analysis, this chapter then identifies the environmentally superior alternative. Finally, it describes other alternative concepts that were considered but eliminated from detailed consideration and reasons for their elimination.

7.1.1 CEQA Requirements for Alternatives Analysis

The CEQA Guidelines, Section 15126.6(a), state that an environmental impact report (EIR) must describe and evaluate a reasonable range of alternatives to the proposed project that would feasibly attain most of the project's basic objectives, but that would avoid or substantially lessen any identified significant adverse environmental effects of the project. An EIR is not required to consider every conceivable alternative to a proposed project. Rather, it must consider a reasonable range of potentially feasible alternatives that will foster informed decision-making and public participation.

CEQA, the CEQA Guidelines, and the case law on the subject have found that feasibility can be based on a range of factors and influences. CEQA Guidelines, Section 15364, defines "feasibility" as "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors." CEQA Guidelines Section 15126.6(f)(1) states that the factors that may be taken into account when addressing the feasibility of alternatives include site suitability, economic viability, availability of infrastructure, general plan consistency, other plans or regulatory limitations, jurisdictional boundaries (projects with a regionally significant impact should consider the regional context), and whether the proponent can reasonably acquire, control, or otherwise have access to the alternative site (or the site is already owned by the proponent).

CEQA Guidelines Section 15126.6(e) states that, "The specific alternative of 'no project' shall also be evaluated along with its impact."

The EIR must evaluate the comparative merits of the alternatives and include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project. Specifically, the CEQA Guidelines set forth the following criteria for selecting and evaluating alternatives:

- An EIR shall describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives. An EIR need not consider every conceivable alternative to a project. Rather it must consider a reasonable range of potentially feasible alternatives that will foster informed decisionmaking and public participation. An EIR is not required to consider alternatives which are infeasible. (Section 15126.6[a])

- [T]he discussion of alternatives shall focus on alternatives to the project or its location which are capable of avoiding or substantially lessening any significant effects of the project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly. (Section 15126.6[b])

- The range of potential alternatives shall include those that could feasibly accomplish most of the basic objectives of the project and could avoid or substantially lessen one or more of the significant effects. (Section 15126.6[c])

- The specific alternative of "no project" shall also be evaluated along with its impact. (Section 15126.6[e][1])

- The alternatives shall be limited to ones that would avoid or substantially lessen any of the significant effects of the project. Of those alternatives, the EIR need examine in detail only the ones that the lead agency determines could feasibly attain most of the basic objectives of the project. The range of feasible alternatives shall be selected and discussed in a manner to foster meaningful public participation and informed decision-making. (Section 15126.6[f])

7.1.2 Mission Bay FSEIR Alternatives Analysis

The Mission Bay FSEIR identified and analyzed alternatives to the Mission Bay North and Mission Bay South Redevelopment Plans (Plans). As required under CEQA, the selected alternatives would reduce or avoid identified significant impacts of the Plans as well as meet most of the Plans objectives. The Mission Bay FSEIR also analyzed the required No Project alternative. The three alternatives analyzed in the Mission Bay FSEIR included:

- **No Project/Expected Growth Alternative**—is a reasonable estimate of development within the Plan area that could occur through 2015 under 1998 zoning regulations. About half as much residential and non-residential development would occur compared to the proposed Plans.
- **Redevelopment North of Channel/Expected Growth South of Channel Alternative**—is a combination of the proposed North Plan and instead of the South Plan, the expected growth scenario for the South Plan area. About the same amount of residential but 80 percent less non-residential development would occur compared to the proposed Plans.
- **Residential/Open Space Alternative**—A new overall scenario with about 65 percent more housing and 80 percent less non-residential development compared to the proposed Plans.

The Mission Bay FSEIR determined that all of the alternatives would result in the same significant and unavoidable adverse impacts identified for the Plans (i.e., traffic, vehicular air pollution emissions, potential combined toxic air contaminants, cumulative hazardous waste generation and disposal, and cumulative water quality), but the severity of the impacts would be somewhat lessened though not to a less-than-significant level. The Residential/Open Space Alternative was identified as the environmentally superior alternative.

As a program-level EIR, the Mission Bay FSEIR analyzed program-level alternatives that addressed the overall objectives of the Plans for the entire Plan area, and thus, did not examine specific alternatives for individual blocks or parcels such as Blocks 29-32. This SEIR, as discussed below, addresses site-specific alternatives for Blocks 29-32.

7.1.3 Organization of this Chapter

Following this introductory section, Section 7.2 describes the basis for selecting the alternatives analyzed in this SEIR; it reviews the project objectives, summarizes the significant impacts of the project that were identified in Chapter 5, and describes the alternatives screening and selection process. Section 7.3 provides a detailed description of each of the selected alternatives, its ability to meet the project objectives, and an evaluation of its environmental impacts compared to those of the proposed project. Section 7.4 compares the impacts of the alternatives to the impacts of the proposed project and to one another, and it identifies the environmentally superior alternative. The alternative concepts considered but rejected from further study are then discussed in Section 7.5.

7.2 Alternatives Selection

This section describes the basis for determining the range of CEQA alternatives and identifies the specific alternatives that are analyzed in this SEIR.

7.2.1 Project Objectives

As presented in Chapter 3, the objectives of the project, reiterated below, are consistent with the objectives of the Mission Bay Redevelopment Plan (see Chapter 3, Section 3.2). These alternatives were used in the identification and selection of alternatives. As noted above, an EIR need only consider alternatives that would feasibly accomplish most of the project's basic objectives.

The project sponsor's objectives for the proposed project are to:

- Construct a state-of-the-art multi-purpose event center in San Francisco that meets NBA requirements for sports facilities, can be used year-round for sporting events and entertainment and convention purposes with events ranging in capacity from approximately 3,000-18,500, and expands opportunities for the City's tourist, hotel and convention business.
- Provide sufficient complementary mixed-use development, including office and retail uses, to create a lively local and regional visitor-serving destination that is active year-round, promotes visitor activity and interest during times when the event center is not in use, provides amenities to visitors of the event center as well as the surrounding neighborhood, and allows for a financially feasible project.
- Develop a project that meets high-quality urban design and high-level sustainability standards.
- Optimize public transit, pedestrian, and bicycle access to the site by locating the event center within walking distance to local and regional transit hubs, and adjacent to routes that provide safe and convenient access for pedestrians and bicycles.
- Provide adequate parking and vehicular access that meets NBA and project sponsor's reasonable needs for the event center and serves the needs of project visitors and employees, while encouraging the use of transit, bicycle, and other alternative modes of transportation.
- Provide the City with a world class performing arts venue of sufficient size to attract those events which currently bypass San Francisco due to lack of a world class 3,000-4,000 seat facility.
- Develop a project that promotes environmental sustainability, transportation efficiency, greenhouse gas reduction, stormwater management using green technology, and job creation consistent with the objectives of the California Jobs and Economic Improvement Through Environmental Leadership Act (AB 900), as amended.

7.2.2 Summary of Significant Impacts

As stated in the CEQA Guidelines, alternatives to a project must substantially lessen or avoid any of the significant environmental impacts associated with the project. The following summarizes the conclusions for potentially significant and significant impacts identified in Chapter 5 of this SEIR and in the Initial Study (see Appendix NOP-IS).

7.2.2.1 Significant and Unavoidable Impacts

The proposed project was determined to have the following significant and unavoidable impacts, as described in detail in Chapter 5 of this SEIR.

Transportation and Circulation

- The project would result in significant and unavoidable traffic impacts at multiple intersections in the project area that would operate at Level of Service (LOS) E or LOS F, under conditions without or with an overlapping SF Giants game at AT&T Park, and with or without implementation of the Muni Special Event Transit Service Plan, as well as under 2040 cumulative conditions, even with implementation of identified mitigation measures. (Impacts TR-2, TR-11, TR-18, and C-TR-2)

- The project would result in significant and unavoidable traffic impacts at freeway ramps in the project area intersections that would operate at LOS E or LOS F, under conditions without or with an overlapping SF Giants game at AT&T Park, and with or without implementation of the Muni Special Event Transit Service Plan, as well as under 2040 cumulative conditions, even with implementation of identified mitigation measures. (Impacts TR-3, TR-12, TR-19, and C-TR-3)

- The project would result in a substantial increase in transit demand that could not be accommodated by adjacent Muni transit capacity such that significant adverse impacts to Muni transit service would occur, under conditions without implementation of the Muni Special Event Transit Service Plan, even with implementation of identified mitigation measures. (Impact TR-20)

- The project would result in a significant adverse increase in transit demand that could not be accommodated by regional transit capacity such that significant adverse impacts to regional transit service would occur, under conditions without or with an overlapping SF Giants game at AT&T Park, and with or without implementation of the Muni Special Event Transit Service Plan, as well as under 2040 cumulative conditions, even with implementation of identified mitigation measures. (Impacts TR-5, TR-14, TR-21, and C-TR-5)

Noise and Vibration

- Operation of the proposed project would cause a substantial permanent increase in ambient noise levels in the project site vicinity, due to increased roadway noise levels from increased traffic in the project area and due to crowd noise following events affecting nearby sensitive receptors, even with implementation of identified mitigation measures. (Impact NO-5)

- Operation of the proposed project, when considered with other cumulative development, would cause a substantial permanent increase in ambient noise levels in the project site vicinity due to increased roadway noise levels from cumulative increases in traffic in the project area, even with implementation of identified mitigation measures. (Impact C-NO-2)

Air Quality

- Construction of the proposed project would generate fugitive dust and criteria air pollutants, which would violate an air quality standard, contribute substantially to an existing or projected air quality violation, and result in a cumulatively considerable net increase in criteria air pollutants, even with implementation of identified mitigation measures. (Impact AQ-1)

- During project operations, the proposed project would result in emissions of criteria air pollutants at levels that would violate an air quality standard, contribute to an existing or projected air quality violation, or result in a cumulatively considerable net increase in criteria air pollutants, even with implementation of identified mitigation measures. (Impact AQ-2)

- The project, in combination with other past, present, and reasonably foreseeable future projects, would contribute to cumulative regional air quality impacts, even with implementation of identified mitigation measures. (Impact C-AQ-1)

Wind

- The proposed project structures would alter wind in a manner that would substantially increase the number of wind hazard hours at off-site public areas, and while feasible mitigation measures have been identified, the design refinements required to reduce this impact to a less-than-significant level have not been finalized. (Impact WS-1)

Utilities

- The project, in combination with past, present, and reasonably foreseeable future projects, would require the construction of new or upgraded wastewater facilities, the construction of which could cause significant environmental effects. This would be a significant and unavoidable impact with no feasible mitigation measures because mitigation is beyond the control of the project sponsor. (Impact C-UT-2)

- The project, in combination with past, present, and reasonably foreseeable future developments in the Mission Bay South area, would result in the determination by the San Francisco Public Utilities Commission (SFPUC) that it has inadequate capacity to serve the project's projected wastewater demand in addition to the SFPUC's existing commitments, even with implementation of identified mitigation measures. (Impact C-UT-4)

7.2.2.2 Significant Impacts that can be Mitigated to Less than Significant

The proposed project was determined to have the following potentially significant impacts, all of which could be mitigated to a less-than-significant level with implementation of identified mitigation measures, as described in detail in Chapter 5 of this SEIR and in the Initial Study (see Appendix NOP-IS).

Transportation and Circulation

- The project could result in a significant adverse increase in transit demand that could not be accommodated by adjacent Muni transit capacity under the existing plus Muni Special Event Transit Service Plan, under conditions with an overlapping SF Giants game at AT&T Park and under 2040 cumulative conditions, but identified mitigation measures to provide supplemental Muni transit service during overlapping events would reduce these impacts to less than significant. (Impact TR-13 and Impact C-TR-4)

- The project could result in a substantial overcrowding on public sidewalks, create potentially hazardous conditions for pedestrians, or otherwise interfere with pedestrian accessibility on the site and adjoining areas, under conditions without or with an overlapping SF Giants game at AT&T Park and with or without implementation of the Muni Special Event Transit Service Plan, and under 2040 cumulative conditions, but identified mitigation measures to actively manage pedestrian flows at certain locations would reduce these impacts to less than significant. (Impacts TR-6, TR-15, TR-22, and C-TR-6)

- Construction of the project could temporarily obstruct helipad airspace surfaces under project or cumulative conditions, and operation of the project could affect helipad flight operations, but identified mitigation measures to prepare and implement a crane safety plan for project construction and an event center exterior lighting plan would reduce these impacts to less than significant. (Impact TR-9 and Impact C-TR-9)

Noise

- Operation of the project could result in exposure of persons to or generation of noise levels in excess of standards established in the San Francisco General Plan or San Francisco Noise Ordinance. Potentially significant operational noise impacts due to use of amplified sound in outdoor spaces at the project could be mitigated with implementation of a noise control plan for outdoor amplified sound, and potential noise impacts from interior event noise could be mitigated with implementation of a noise control plan for the San Francisco Entertainment Commissions' Place of Entertainment Permit. (Impact NO-4)

- Potentially significant construction noise impact due to the project's contribution to cumulative noise from construction of the project concurrent with other construction projects in the immediate vicinity could be mitigated to less than significant by implementing construction noise control measures. (Impact C-NO-1).

Air Quality

- Exposure of sensitive receptors to emissions of toxic air contaminants, including diesel particulate matter, from project construction and operation and under cumulative conditions, could result in a significant cancer risk but could be mitigated through implementation of construction emissions minimization measures. (Impact AQ-3 and C-AQ-2)

- The potential for the project to conflict with implementation of the *2010 Clean Air Plan* could be mitigated through implementation of construction minimization measures, reduction of operational emissions, transportation demand management measures, and purchase of emission offsets. (Impact AQ-4)

Hydrology and Water Quality

- Potentially significant impacts related to discharges of unusual chemicals such as radioactive materials and biohazardous materials to the Southeast Water Pollution Control Plant (SEWPCP) that could result in violation of the NPDES permit for the SEWPCP would be mitigated by providing sampling ports to facilitate sampling of wastewater discharges. (Impact HY-6)

Cultural Resources

- Project construction, both directly and cumulatively, could cause a substantial adverse change in the significance of archaeological resources, but implementation of archaeological testing, monitoring, data recovery, and accidental discovery measures would reduce this impact to less than significant. (Impact CP-2 and Impact C-CP-1, Initial Study)

Biological Resources

- Project construction could affect breeding birds which may nest within the project site, but implementation of preconstruction surveys for nesting birds would reduce this impact to less than significant. In addition, proposed structures could increase the risk of bird collisions with buildings, but implementation of bird safe building practices would reduce this impact to less than significant. (Impact BI-4, Initial Study)

Hazards and Hazardous Materials

- As identified in the Mission Bay FSEIR, site development could involve uses that handle biohazardous materials, but implementation of FSEIR mitigation measures providing guidelines for handling biohazardous materials would reduce this impact to less than significant. In addition, proposed construction could encounter naturally occurring asbestos, but implementation of geologic investigations and dust mitigation plans would reduce this impact to less than significant. (Impact HZ-1, Initial Study)

- As identified in the Mission Bay FSEIR, site development could include child care facilities that could be exposed to human health risks, but implementation of FSEIR mitigation measures providing risk management planning provisions for child care facilities would reduce this impact to less than significant. (Impact HZ-2, Initial Study)

7.2.3 Alternatives Screening and Selection

7.2.3.1 Alternatives Screening

In accordance with CEQA Guidelines Section 15126.6(a), this project-level SEIR examines a reasonable range of alternatives to the proposed project or to the location of the project. An alternative selected for analysis must meet three criteria: (1) the alternative would attain *most* of the project's basic objectives; (2) the alternative would *avoid or substantially lessen* the significant environmental impacts of the proposed project; and (3) the alternative must be potentially *feasible*.

An EIR need not consider an alternative whose impact cannot be reasonably ascertained and whose implementation is remote and speculative. Furthermore, an EIR need not consider every conceivable alternative, but must consider a reasonable range of alternatives that will foster informed decision-making and public participation.

Screening Process

The alternatives selection process for the proposed project was based on first identifying strategies that would avoid or lessen the significant and potentially significant impacts identified above, with particular focus on strategies that address significant and unavoidable impacts of the proposed project. In addition, potential alternatives, options, and strategies were identified from review of scoping comments received following issuance of the Notice of Preparation (see Chapter 2, Section 2.4.1, Notice of Preparation and Public Scoping, and Section 2.6, Summary of Scoping Comments). Mitigation measures identified for the proposed project were also considered in the context of the alternatives screening process as possible strategies to avoid or substantially lessen significant impacts. The alternative strategies were then screened for their feasibility, and the potentially feasible strategies were then screened for their ability to meet most of the project objectives. This process resulted in the final alternatives that were determined to represent a reasonable range of alternatives that are described and analyzed in this SEIR.

Identification of Strategies to Avoid or Lessen Significant Impacts

All of the significant and potentially significant impacts identified for the proposed project, as summarized above, can be broken down into the following categories with respect to strategies for avoiding or lessening impacts related to: traffic; wastewater treatment capacity impacts; crowd and amplified noise; UCSF hospital helipad safety; wind hazards; construction; water quality and hazardous materials; and bird collisions. These strategies were then used to formulate alternatives for analysis in this chapter.

Transportation-related Impacts

Increased traffic generated by the proposed project would result in multiple significant impacts on transportation, noise, and air quality, many of which would be significant and unavoidable. The proposed project already incorporates extensive transportation demand management strategies and a transportation management plan, and the Transportation analysis in Chapter 5, Section 5.2, identifies numerous mitigation measures to further reduce transportation impacts. However, beyond those already identified measures, potential alternative strategies to lessen transportation impacts could include further decreasing project-generated traffic through reducing the scale and intensity of the land uses proposed at the project site (either the mixed uses and/or the event center) or by relocating the project to an alternate site where fewer trips would occur by auto and/or where traffic generated from the proposed uses would result in less severe impacts. These strategies are discussed below.

Wastewater Treatment Capacity Impacts

As discussed further below, the only feasible approach to addressing the significant and unavoidable wastewater treatment capacity impact of the proposed project would be to re-locate the project to a different sewage drainage area where there is sufficient capacity for the projected wastewater demand.

Crowd and Amplified Sound Noise Impacts

As described in Chapter 3, Project Description, the event center would be designed as a year-round destination attraction for a wide variety of sports, entertainment, and convention purposes as well as to provide amenities to serve visitors and the surrounding neighborhood. Thus, by design, large numbers of people would congregate at the project site, resulting in crowd noise, which in turn would result in a significant, unavoidable impact on nearby sensitive receptors following evening events. Further, without appropriate mitigation, the event center could result in significant impacts related to amplified sound in outdoor spaces, noise leakage from the events within the event center, and overcrowding on public sidewalks. Beyond the mitigation measures identified in Chapter 5, alternative strategies to reduce or lessen these event-center related impacts would be either to reduce the size of the event center, thereby reducing the number of event attendees and associated crowding effects, or to relocate the event center away from sensitive receptors. These strategies are discussed below.

UCSF Hospital Helipad Safety Impacts

Chapter 5, Section 5.2, included an analysis of the impacts of the proposed project on the UCSF Hospital helipad. The analysis determined that operation of the proposed event center could affect helipad flight operations due to the potential for use of specialty exterior lighting. While the identified mitigation measure of preparing and implementing an event center exterior lighting plan would reduce this impact to less than significant, the only alternative strategy to avoid this impact would be to relocate the event center away from the UCSF Hospital helipad. This strategy is discussed below.

Wind Hazards Impacts at Off-site Public Areas

Chapter 5, Section 5.6, conservatively determined that the proposed project would result in significant and unavoidable wind hazard impacts, even with implementation of identified mitigation measures, because the wind effects of final design refinements have not yet been confirmed. The only feasible strategy to avoid or lessen wind hazards impacts, regardless of the location of the proposed project, would be to implement the identified mitigation measure, namely to develop and test design measures (using wind tunnel testing methodologies) to confirm site-specific changes in wind conditions attributable to the proposed project, as indicated in Mitigation Measure M-WS-1, Develop and Implement Design Measures to Reduce Off-site Wind Hazards. Thus, even though Impact WS-1 was identified as significant and unavoidable with mitigation, it is anticipated that during final project design and prior to construction, the project sponsor would implement Mitigation Measure M-WS-1 and develop appropriate project design refinements to reduce the wind hazard impact at off-site pubic areas to less than significant. Therefore, no specific alternative strategies are discussed in this alternatives analysis regarding avoiding or lessening wind hazard impacts. However, please see Chapter 8, Third Street Plaza Variant, which analyzes a variation of the proposed project that would result in less-than-significant wind hazards impacts without the need for mitigation.

Construction-related Impacts

Construction activities would result in a significant and unavoidable impact on air quality, as well as significant impacts that can be reduced to less than significant with identified mitigation measures related to the following: (1) UCSF helipad airspace surfaces, (2) cumulative noise in combination with other planned construction projects in the immediate vicinity, (3) exposure of sensitive receptors to toxic air contaminants, (4) archaeological resources, and (5) nesting birds.

Chapter 5, Section 5.4 identifies mitigation measures for construction air quality and toxic air contaminants, which include construction emissions minimization as well as emission offsets; these measure represent the only feasible strategies to lessen air quality impacts of a construction project of this magnitude within the San Francisco Bay Area Air Basin. However, reducing the scale of the project (either the event center and/or the mixed-use development) would represent a potential alternative strategy that could reduce these air quality impacts; this strategy is discussed below. With respect to construction-related cumulative noise and helipad impacts, Chapter 5 indicates that these impacts could be mitigated to a less-than-significant level with identified mitigation measures; however, alternative strategies to avoid or lessen these impacts would be either to reduce the size/scale of the project (to the extent that construction would not contribute substantially to cumulative construction noise) or to relocate the project to an alternate site where there is no adjacent private helipad and no other construction projects in the immediate vicinity. These strategies are discussed below.

Construction impacts related to the potential to encounter archaeological resources or nesting birds would be mitigated to less than significant with identified mitigation measures. These impacts would occur regardless of the size or scale of the project, and no on-site alternative strategies would reduce or lessen these mitigable effects. These impacts are associated with any project that involves grading or excavation activities. For this reason, off-site alternatives, depending on the location, would likely result in the same potential impacts and require the same mitigation measures if grading and excavation were required or if any vegetation is present on the site. Therefore, no alternative strategies are designed to specifically address these impacts.

Water Quality and Hazardous Materials Impacts

Potentially significant impacts associated with possible future uses at the project site include one water quality impact and two hazardous materials impacts; these impacts were all identified in the Mission Bay FSEIR with respect to the entire Plan area and would also apply to the proposed project at Blocks 29-32. The water quality impact is due to the possibility that proposed commercial uses, particularly research uses, could discharge unusual chemicals to the SEWPCP, and the hazardous materials impact is due to the possibility that certain future uses could involve handling of biohazardous materials. An additional hazardous materials impact is due to the potential for future child care facilities to be present in areas subject to a risk management plan for exposure to hazardous materials in soil and groundwater. The FSEIR identified feasible mitigation measures that would reduce these impacts to less than significant. All of these impacts apply to the proposed project and would apply to any proposed development at this site, because such potential uses are allowed under the Mission Bay South Plan. Therefore, no on-site alternative strategy would address these impacts, given that the identified mitigation measures would adequately mitigate this impact under any allowable development at this site. An off-site alternative strategy, which, depending on the location, could avoid these potentially significant impacts, is discussed below.

Bird Collisions Impact

The biological resources impact analysis in the Initial Study (see Appendix NOP-IS) identified the potential for the proposed project to result in increased risk for bird collisions with buildings due to the proximity of the site to the Bay and the fact that the proposed project is not subject to the City's *Standards for Bird-Safe Buildings* (Planning Code Section 139) because the site is within the Mission Bay Redevelopment Plan Area. However, the identified mitigation measure to implement bird safe building practices consistent with the City's *Standards for Bird-Safe Buildings* (Planning Code Section 139) would ensure that the project would result in a less-than-significant impact on birds. This mitigation measure would apply to any alternative development on the project site or elsewhere within the Plan area. For any off-site alternative located anywhere else in the City, the *Standards for Bird-Safe Buildings* (Planning Code Section 139) would apply and compliance with this regulation would result in no impact on bird collisions. Therefore, no alternative strategies are designed to address this impact.

Evaluation of Potential Strategies that Would Avoid or Lessen Significant Impacts

As described above, alternative strategies that could avoid or lessen the identified significant impacts of the proposed project include: (1) reducing the intensity of the mixed uses; (2) reducing the size/scale of the event center; and (3) relocating the project to an alternate site.

Alternative Strategy to Reduce the Intensity of the Mixed Uses

This strategy was determined to be potentially feasible and is the basis for one of the alternatives selected for detailed analysis, Alternative B, Reduced Intensity Alternative. Alternative B was developed with the intent of reducing transportation- and construction-related impacts, and Section 7.3, below, presents the assumptions and description of the Reduced Intensity Alternative, its ability to meet the project objectives, and a comparison of its environmental impacts compared to those of the proposed project.

Alternative Strategy to Reduce Size/Scale of the Event Center

As described above, this strategy could potentially reduce traffic-related and event-center impacts. The size and scale of the proposed event center is currently designed to meet the primary objective of meeting the NBA requirements for sports facilities, and specifically for use as the home court for the Golden State Warriors basketball team. The proposed capacity of 18,064 seats is nearly 1,600 fewer seats than the average capacity of all current NBA facilities (19,662 average capacity, 19,862 median capacity). The proposed 18,064-seat capacity is also well below the capacity of the Warriors' current home court at the Oracle Arena in Oakland (capacity 19, 956). However, while the event center is designed to meet the specific needs for NBA basketball games, it is also designed on balance to achieve the overall project objectives (see Section 7.2.1, above) of providing a year-round venue for a variety of sporting events, entertainment, and convention purposes that promotes environmental sustainability, transportation efficiency, greenhouse gas reduction, and job creation.

If the proposed event center were to open in 2015, the proposed 18,064-seat capacity would be the fourth lowest capacity in the NBA, despite the high current market demand for season tickets. Currently, the Warriors have 14,500 season ticket holders and there are over 13,000 people on the waiting list for season tickets. Therefore, the project sponsor has indicated that reducing the capacity of the event center below 18,064 is not feasible due to its already small size relative to other NBA facilities and the overwhelming market demand for season tickets.

Furthermore, as described above, most of the event center-related impacts could be mitigated with identified mitigation measures, and it is unlikely that reducing the size/scale of the event center could effectively or substantially lessen the project's significant transportation-related impacts.

Detailed traffic modeling of a smaller event center has not been performed. For this reason, it is not possible to determine exactly how small the event center would need to be in order to avoid some or all of the project’s significant and unavoidable traffic impacts. Based on the modeling that has been performed, however, it would be expected that a smaller event center would result in significant impacts at fewer intersections, but as indicated by the modeling conducted for the No Event scenario, an arena of any size would result in a significant impact at the intersection of 16th/Seventh/Mississippi. Thus, even a substantially smaller event center than the proposed 18,064-seat event center would still have a significant and unavoidable impact, would not meet NBA standards for an arena, and would not meet the basic project objectives.

Furthermore, reducing the scale of operations at the proposed event center—such as reducing the number or size of events—would reduce the frequency of the significant transportation-related impacts but would not lessen or avoid the magnitude of the impact of any individual event; the same transportation impacts would remain significant and unavoidable. Therefore, this alternative strategy would not effectively avoid or lessen transportation-related impacts. Thus, reducing the size and scale of the event center was screened from further consideration for detailed alternatives analysis. It should be noted, however, that reducing the size of project features other than the event center is included under Alternative B, Reduced Intensity Alternative, which is analyzed in this chapter of the SEIR.

Alternative Strategy to Relocate the Project to an Alternate Site

Relocating the project to an alternate site could potentially avoid or lessen significant transportation-related impacts, wastewater capacity impacts, operational noise impacts, UCSF Hospital helipad safety impacts, construction-related impacts, and/or future use-related impacts that were identified for the proposed project at Blocks 29-32. However, the feasibility of an alternate location is highly site-specific and dependent on numerous factors, including among other factors, site suitability, economic viability, availability of infrastructure, general plan consistency, and whether or not the project sponsor can reasonably acquire, control, or otherwise have access to the alternate site, per CEQA Guidelines Section 15126.6(f)(1). Furthermore, relocating the project to an alternate site could result in the same, greater, or different significant impacts than those identified for the proposed project. For the purposes of this SEIR, twelve alternate sites in San Francisco were examined as potential candidates for an off-site alternative based in part on scoping comments received, as described in more detail in Section 7.5 below. One site was selected to represent the alternative strategy of relocating the project.

Given the history of the proposed project and known objectives of the project sponsor, Alternative C, Off-site Alternative at Piers 30-32 and Seawall Lot 330, was identified as a potentially feasible option for an off-site alternative for analysis in this SEIR. As described in Chapter 2 of this SEIR, in 2012, the project sponsor submitted an application to the San Francisco Planning Department for a proposed event center and mixed-use development on Piers 30-32 and Seawall Lot 330. The project sponsor conducted a number of studies and investigations for a project at this site, including preparation of detailed site-specific plans and programming and conducting discussions and negotiations with responsible and approving agencies. Thus, Piers 30-32 and Seawall Lot 330 is considered to be a feasible location for an off-site alternative for the purposes of this SEIR due to its site suitability (based on the existing studies that have been conducted for this site), proximity to the downtown and local/regional transit services its previous history of potential economic viability, and the potential ability of the project sponsor to reasonably acquire, control, or otherwise have access to this site (based on previous negotiations and discussions with the Port of San Francisco).

Since the issuance of the Notice of Preparation for this previous proposal in November of 2012, a number of changes in circumstances have occurred, leading in part to the project sponsor's decision to withdraw its application for development of the previously proposed project at Piers 30-32 and Seawall Lot 330. The proposed project at Piers 30-32 and Seawall Lot 330 generated extensive public controversy. In addition, the voters of San Francisco approved Proposition B in June 2014, which requires voter approval for any increase in existing zoning heights along the waterfront. While there is currently a lawsuit challenging the validity of this proposition, if upheld in court, the ballot measure would require the Off-site Alternative at Piers 30-32 and Seawall Lot 330 to obtain approval of a zoning height change from the San Francisco voters. Many individuals credit this ballot measure along with increased project costs, lengthy regulatory approvals, and opposition to the project location as the basis for the project sponsor to relocate the project to Mission Bay. Yet, in November 2014, the San Francisco voters approved Proposition F to allow a height increase for a development project at Pier 70. The Seawall Lot 337 LLC, an affiliate of the San Francisco Giants, is currently collecting signatures to qualify for a ballot measure for the November 2015 election to approve height increases for a proposed development at Seawall Lot 337 (which incidentally is one of the off-site locations considered and eliminated from further consideration, as discussed in Section 7.5, below). These efforts indicate that while it is difficult to obtain approval at the ballot for height increases on waterfront property and may extend the project approval time horizon, it is not unreasonable to expect that public support for a ballot measure to approve a GSW project at this alternative location is possible and would represent a viable project. In addition, the San Francisco voters have historically approved certain aspects of a professional sports franchise at the ballot;

there have been successful prior ballot measures involving projects related to facilities for professional sports franchises: "Ballpark" (Proposition B) in March 1996 and "Candlestick Point Stadium Land Use" (Proposition F) in June 1997. Consequently, relocating the proposed project to its previously proposed location with many of the project elements as originally proposed constitutes a potentially feasible off-site alternative despite the abovementioned hurdles necessary for project approval.

Therefore, the Off-site Alternative at Piers 30-32 and Seawall Lot 330 was selected for detailed analysis in this SEIR, with the intent of reducing transportation-related impacts, wastewater capacity impacts, operational noise impacts, UCSF hospital helipad safety impacts, construction-related impacts, and water quality and hazardous materials impacts that were identified for the proposed project. Section 7.3, below, presents the assumptions and description of the Off-site Alternative at Piers 30-32 and Seawall Lot 330, its ability to meet the project objectives, and a comparison of its environmental impacts compared to those of the proposed project.

7.2.3.2 Alternatives Selected for Detailed Analysis

The following alternatives are analyzed in this chapter:

- Alternative A: No Project Alternative
- Alternative B: Reduced Intensity Alternative
- Alternative C: Off-site Alternative at Piers 30-32 and Seawall Lot 330

These three alternatives were determined to adequately represent the range of feasible alternatives required under CEQA for this project. These alternatives would lessen, and in some cases avoid, significant and potentially significant adverse impacts related to transportation, air quality, noise, utilities, water quality, and hazardous materials that were identified for the proposed project. Alternative A is included as required by CEQA Guidelines Section 15126.6(e), even though it would not meet the basic project objectives, but Alternatives B and C are potentially feasible options that would likely meet most of the project objectives. **Table 7-1** summarizes and compares the characteristics of the proposed project with those of Alternatives A, B, and C. Detailed descriptions of each alternative are presented in Section 7.3, below, along with an evaluation of their environmental impacts. **Table 7-2** summarizes the ability of the three alternatives to meet the project objectives. In addition, as noted in Chapter 8 of this SEIR, a project variant is analyzed in equal level of detail as the proposed project, and this variant incidentally reduces one of the significant impacts of the proposed project while meeting all of the project objectives. Thus, this variant represents a fourth alternative considered in detail in this alternatives analysis. Please refer to Chapter 8 for the description and analysis of the Third Street Plaza Variant (and the fourth project alternative).

Permits and Approvals				
		• San Francisco Department of Public Works and Board of Supervisors approval of subdivision maps, including acceptance of public improvements, and right-of-way dedications • Termination or relocation of existing City-reserved easements by applicable City departments to the extent required • San Francisco Department of Building Inspection approval of a building/site permit, and related approvals from other City departments include the SFPUC for utility connections	Same as Project	• California Department of Fish and Wildlife • San Francisco Regional Water Quality Control Board (RWQCB) • San Francisco Planning Commission • San Francisco Port Commission • San Francisco Board of Supervisors • Voter approval under Proposition B (June 2014)

TABLE 7-2
SUMMARY OF ABILITY OF ALTERNATIVES TO MEET PROJECT OBJECTIVES

Project Objective	Alternative A: No Project	Alternative B: Reduced Intensity	Alternative C: Off-site at Piers 30-32/SWL 330
	Would the alternative meet this objective?		
1. Construct a state-of-the-art multi-purpose event center in San Francisco that meets NBA requirements for sports facilities, can be used year-round for sporting events and entertainment and convention purposes with events ranging in capacity from approximately 3,000-18,500, and expands opportunities for the City's tourist, hotel and convention business.	No	Yes	Yes
2. Provide sufficient complementary mixed-use development, including office and retail uses, to create a lively local and regional visitor-serving destination that is active year-round, promotes visitor activity and interest during times when the event center is not in use, provides amenities to visitors of the event center as well as the surrounding neighborhood, and allows for a financially feasible project.	Potentially	Financial feasibility unknown	Financial feasibility unknown
3. Develop a project that meets high-quality urban design and high-level sustainability standards.	Yes	Yes	Yes
4. Optimize public transit, pedestrian, and bicycle access to the site by locating the event center within walking distance to local and regional transit hubs, and adjacent to routes that provide safe and convenient access for pedestrians and bicycles.	No	Yes	Yes
5. Provide adequate parking and vehicular access that meets NBA and project sponsor's reasonable needs for the event center and serves the needs of project visitors and employees, while encouraging the use of transit, bicycle, and other alternative modes of transportation.	No	Yes	Yes
6. Provide the City with a world class performing arts venue of sufficient size to attract those events which currently bypass San Francisco due to lack of world class 3,000 to 4,000 seat facility	No	Yes	Yes
7. Develop a project that promotes environmental sustainability, transportation efficiency, greenhouse gas reduction, stormwater management using green technology, and job creation consistent with the objectives of the California Jobs and Economic Improvement Through Environmental Leadership Act (AB 900), as amended.	Potentially	Yes	Yes

7.3 Alternatives Analysis

This section presents the detailed analysis of the impacts of the selected alternatives compared to the proposed project. For each of the three alternatives, this section presents a description of the alternative and assumptions used in analyzing that alternative, assesses the ability of the alternative to meet each of the project objectives, and analyzes the impacts of the alternative compared to those of the proposed project. The impact analysis is based on the same environmental setting and significance thresholds as presented for each resource topic in Chapter 5 and uses the same approach to analysis. Except as noted, the impact analysis of the alternatives is qualitative, relative to the identified impacts of the project, and the reader is referred to Chapter 5 and the Initial Study for the more detailed analysis. For transportation, noise, and air quality, however, the analyses are quantitative in order to provide a more refined comparison of the severity of impacts associated with the alternatives relative to those of the proposed project.

7.3.1 Alternative A: No Project

As required by CEQA Guidelines Section 15126.6(e), the No Project Alternative is evaluated to allow decision-makers to compare the environmental effects of approving the proposed project with the effects of not approving the project. The No Project Alternative represents what would reasonably be expected to occur in the foreseeable future if the project is not approved.

7.3.1.1 Description of the No Project Alternative

Under the No Project Alternative, the Golden State Warriors organization would not relocate to San Francisco, and Blocks 29-32 in the Mission Bay South Plan area would not be developed with the proposed event center and mixed-use development described in Chapter 3 of this SEIR. Instead, it is assumed that in the short term, the Warriors organization would exercise its option to stay in Oakland, and accordingly, the team would continue to play its home games at Oracle Arena and lease their management offices and practice facility at the Oakland Convention Center in Oakland. Oracle Arena, built in 1966 and remodeled in 1996, is the oldest facility still in use by the NBA. Therefore, under this alternative, it is likely that the Warriors organization would either build a new arena at its current location or relocate and build a new facility in the long term in the Bay Area or elsewhere.

Currently, there are no other development proposals pending at Blocks 29-32, but given its prime location, existing entitlement, and ongoing development on similar sites adjacent to or near to Blocks 29-32, it is reasonable to expect that development at Blocks 29-32 would occur in the foreseeable future. Thus, the No Project Alternative does not assume that Blocks 29-32 would remain under their current vacant conditions, but rather that the site would be developed as was proposed in the Mission Bay FSEIR. Consistent with CEQA Guidelines Section 15126.6(e)(2), this scenario represents what is reasonably expected to occur in the foreseeable future if the project were not approved, based on current plans, available infrastructure, and community services. Specifically, the No Project Alternative assumes that Blocks 29-32 would be developed consistent with the restrictions and controls established in the Mission Bay South Redevelopment Plan (South Plan) and the South Design for Development.[1]

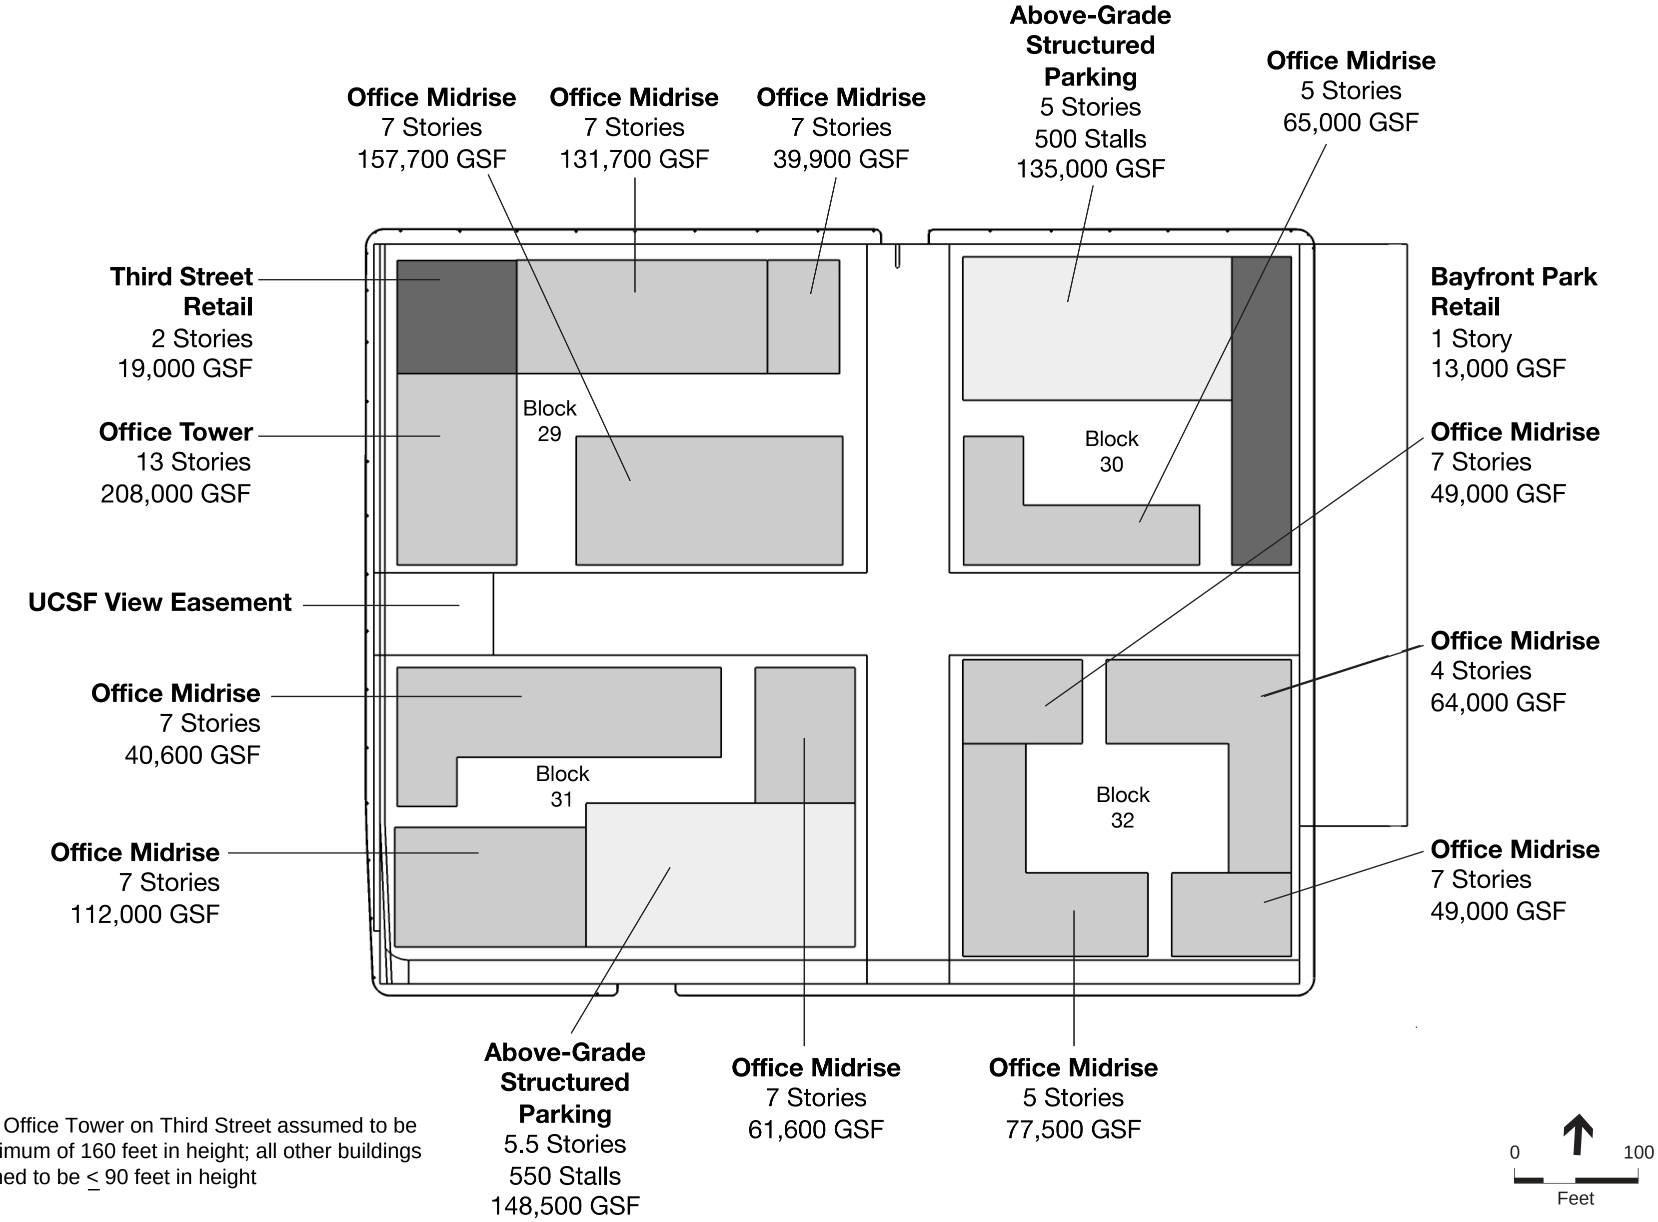
For the purposes of this SEIR, a hypothetical development scenario was developed that conforms to the South Plan and associated Design for Development, which allows all building to be a maximum of 90 feet in height, except for one 160-foot high tower on Block 29. As depicted in **Figure 7-1**, the No Project Alternative assumes that approximately 1,056,000 gross square feet (gsf) of commercial/industrial plus 31,700 gsf of retail uses would be developed at Blocks 29-32, for a total of 1,087,700 gsf. There would be no event center. The commercial/industrial uses would presumably consist of office and research/development uses, with a 13-story, 160-foot tall office tower located on Block 29 along Third Street and varying heights of office mid-rise buildings, all less than 90 feet in height, throughout Blocks 29, 30, 31, and 32. One- to two-story retail uses would be located at the corner of Third and South Streets on Block 29 and along the re-aligned Terry A. Francois Boulevard on Block 30. There would be two, above-grade, five- to five-and-a-half-story parking structures, one on South Street and one on 16th Street, with 1,050 parking stalls on-site, plus 132 spaces off-site at the South Street garage, for a total of 1,182 spaces.[2] It is assumed that publically accessible open spaces would be provided amidst the office buildings. Possible future uses for this hypothetical development scenario could include biotech uses, UCSF-related uses, or a wide variety of private or public uses that are allowed as primary uses under the Mission Bay South Redevelopment Plan.

This scenario assumes that no further CEQA environmental review would be required beyond the Mission Bay FSEIR and that no amendments to the South Plan or Design for Development would be needed, although OCII would make a final determination as to the need for supplemental CEQA environmental review or minor changes to Mission Bay planning documents on a project-specific basis.

---

[1] There have been two previously approved projects, or Major Phase approvals for Blocks 29-32. Similar to those projects, the No Project Alternative would be subject to the established protocols in the Mission Bay South Owner Participation Agreement (OPA), through the Design Review and Document Approval Procedure (DRDAP), and the Interagency Cooperation Agreement (ICA) between the OCII and City departments. Under these agreements, the sponsor of the No Project Alternative development would be required to submit its overall plans for development in "Major Phases" and in combined Basic Concept and Schematic Design (Schematic Design) applications. If each Major Phase and Schematic Design submission is consistent with the South Plan, the Design for Development, the Mission Bay South Infrastructure Plan, and other Plan documents, then the OCII Commission approves each Major Phase and Schematic Design. The OPA vests the rights of an applicant or project sponsor to develop a program of the number of square feet and intensity of uses described in the No Project Alternative.

[2] Based on the requirements of the South Plan and the Design for Development, a minimum of 1,061 and maximum of 1,081 spaces would be needed for a proposed development of this size. With the inclusion of the 132 spaces at the South Street garage, the requirements for on-site parking would range from 929 to 949 spaces. Thus, the parking estimates used for the No Project Alternative exceed the requirements, though would likely be adjusted should an actual development proposal be submitted.



Note: Office Tower on Third Street assumed to be a maximum of 160 feet in height; all other buildings assumed to be ≤ 90 feet in height

Event Center and Mixed-Use Development at Mission Bay Blocks 29-32

Figure 7-1
No Project Alternative, Conceptual Site Plan

7.3.1.2 Ability of the No Project Alternative to Meet Project Objectives

As shown in Table 7-2, the No Project Alternative could potentially meet three of the seven project objectives, depending on the proposed program. However, the No Project Alternative would fail to achieve the primary objective of the project sponsor of constructing a new event center and home court for the Golden State Warriors NBA basketball team. Consequently, this alternative would not optimize or provide public transit, pedestrian, parking, and vehicular and bicycle access to an event center, nor would it provide the City with a 3,000 to 4,000 seat performing arts venue. However, given that there is currently no specific design or proposal for the hypothetical No Project development scenario, it is reasonable to assume that the development could be designed to create a lively, year-round visitor-serving destination that meets high quality urban design and high-level sustainability standards. Furthermore, it can be assumed that the No Project Alternative could promote environmental sustainability, transportation efficiency, greenhouse gas reduction, and other green building technologies, though it would be unlikely that the project sponsor for the No Project Alternative would pursue AB 900 certification.

7.3.1.3 Impacts of the No Project Alternative

The No Project Alternative would result in similar impacts to those disclosed in the Mission Bay FSEIR and would be subject to all mitigation measures identified in the Mission Bay FSEIR applicable to Blocks 29-32. Impacts of the No Project Alternative would also be similar to those of the proposed project. This is because many of the impacts would result from the conversion of a vacant parcel at this same location to a fully developed City block, regardless of the size of the development, and the same or similar mitigation or improvement measures identified for the proposed project would apply to the No Project Alternative. The impacts of the No Project Alternative as compared to those of the proposed project are summarized below by resource topic. The reader is referred to Initial Study (Appendix NOP-IS) and Chapter 5 of this SEIR for the full analysis of impacts similar to those of the proposed project.

The environmental impact analysis of the No Project Alternative considers only the hypothetical development scenario on Blocks 29-32 described above and does not consider any effects associated with building a new arena for the Warriors basketball team at another location. However, it should noted that in March 2015, the City of Oakland certified a Final EIR on the Coliseum Area Specific Plan,[3] which discloses the environmental impacts of a new sports venue at the current location of Oracle Arena and the surrounding area.

Land Use

Like the proposed project, the No Project Alternative would not physically divide an established community, conflict with applicable land use plans, or have a substantial impact upon the existing character of the vicinity. The commercial/industrial/retail uses would occur within the boundary

[3] City of Oakland, 2015. Coliseum Area Specific Plan, Final Environmental Impact Report. State Clearing House #2013042066, City Case #ER13-0004, published February 20, 2015. Certified March 31, 2015.

of existing lot lines, would be consistent with the South Plan and associated Design for Development, and would be comparable in character to surrounding land uses. All land use impacts would be *less than significant* and no mitigation would be required.

Aesthetics

Like the proposed project, the No Project Alternative would be on an infill site, within a transit priority area, and an employment center, therefore under Public Resources Code Section 21099, aesthetics are not to be considered in determining significant environmental effects.

Population and Housing

Like the proposed project, the No Project Alternative would not induce substantial population growth, displace housing units, create substantial demand for additional housing, or displace substantial numbers of people. Employment projections for both construction and operation would be similar to or less than that for the proposed project, based on the reduced gross square footage of development, and could be met by the local and regional labor force. As described for the proposed project in the Initial Study, no housing would be displaced, and housing needs would be met by residents already living in the region. All population and housing impacts would be *less than significant* and no mitigation would be required.

Cultural and Paleontological Resources

Like the proposed project, the No Project Alternative would not affect the significance of a historical resource, not destroy a unique paleontological resource, and not disturb any human remains, assuming compliance with applicable regulations; these impacts would be *less than significant* and no mitigation would be required. Also, because construction of the No Project Alternative would be comparable to that of the proposed project, although excavation requirements would be less because parking would be above rather than below grade, this alternative, like the proposed project, could cause a substantial adverse change in the significance of an archaeological resource that could be mitigated to less than significant. Ground disturbance associated with grading and foundation work could affect unidentified archaeological resources, and the same mitigation measures, Mitigation Measure M-CP-2a, Archaeological Testing, Monitoring and/or Data Recovery Program, and Mitigation Measure M-CP-2b, Accidental Discovery of Archaeological Resource, would be applicable to the No Project Alternative and would make this impact *less than significant with mitigation*.

Transportation and Circulation

The No Project Alternative would include a greater amount of office uses than the proposed project (an additional 451,000 gsf), but 93,300 gsf less retail space, and no event center uses. Under the No Project Alternative, about 1,050 on-site vehicle parking spaces plus 132 spaces off-site at the South Street garage would be provided, compared to 1,082 vehicle parking spaces for the proposed project; vehicular ingress and egress from the proposed parking garage would be from South and 16th Streets, similar to the proposed project. Also similar to the proposed project, on-site loading spaces would be provided within the garage, and, it is anticipated that some additional on-street parking spaces adjacent to the project site would be designated as commercial loading spaces. However, because the No Project Alternative would not include an event center or restaurant uses, taxi and paratransit zones would not be provided on the curb adjacent to the project site. Under this alternative, 16th Street would be extended between Illinois Street and Terry A. Francois Boulevard with a configuration consistent with the Mission Bay South Infrastructure Plan, and Terry A. Francois Boulevard would be realigned to the west, adjacent to the project site.

Table 7-3 presents the travel demand for weekday p.m. and Saturday evening peak hours for the proposed project and the three alternatives. As indicated in **Table 7-3**, the number of weekday p.m. and Saturday evening person trips and vehicle trips generated by the No Project Alternative would be less than with the proposed project. The No Project Alternative would generate 1,917 person trips by all modes, compared to 2,796 person trips for the proposed project (i.e., 879 fewer person trips) during the weekday p.m. peak hour, and 199 person trips for the No Project Alternative compared to 3,130 person trips for the proposed project (i.e., 2,931 fewer person trips) during the Saturday evening peak hour. Because the No Project Alternative would not include an event center, the comparison of travel demand and transportation impacts are presented for the proposed project's No Event scenario. (See Chapter 5, Section 5.2, Table 5.2-24, which presents the travel demand for the proposed project for the Basketball Game and Convention Event scenarios.)

Construction Impacts. Construction-related ground transportation impacts would be similar to the proposed project and would be less than significant. Improvement Measure I-TR-1: Construction Management Plan and Public Updates, identified for the proposed project, would also be applicable to this alternative.

Traffic Impacts. The No Project Alternative would generate fewer vehicle trips than the proposed project. During the weekday p.m. peak hour, the No Project Alternative would generate about 445 vehicle trips compared to 702 vehicle trips for the proposed project, while during the Saturday evening peak hour the No Project Alternative would generate 60 vehicle trips compared to 785 vehicles for the proposed project (see **Table 7-3**, below). The intersection LOS for the proposed project and No Project Alternative are shown in **Table 7-4** and **Table 7-5** for the weekday p.m. and Saturday evening peak hours, respectively. With a reduction in the number of vehicles added to the study intersections, the increase in average vehicle delay during the peak hours compared to the existing conditions would be less than would occur under the proposed project. During the weekday p.m. peak hour, four study intersections would operate at LOS E or LOS F conditions, similar to the proposed project for both the No Event and Basketball Game scenarios, however the LOS at the intersection of Seventh/Mississippi/16th would remain at the existing LOS E, as compared to LOS F for the proposed project. Similar to the proposed project for the No Event and Basketball Game scenarios, the No Project Alternative's contribution to the existing LOS E and LOS F conditions at the intersections of King/Third, King/Fifth/I-280 ramps, and Fifth/Bryant/I-80 westbound off-ramp would not be considerable, and traffic impacts at these three intersections would therefore, be less than significant. The No Project Alternative's contribution to the existing LOS E conditions at the intersection of Seventh/Mississippi/16th would be considerable, and would

NOTES:

[a] Proposed Project includes 605,000 gsf of office use, 62,500 gsf of retail use, 11,000 gsf of quick service restaurant use, 51,500 gsf of sit-down restaurant use, and a 750,000 gsf event center.
[b] The No Project Alternative includes 1,056,000 gsf of office use, and 31,700 gsf of retail use.
[c] The Reduced Development Alt includes 373,000 gsf of office use, 37,500 gsf of retail use, 6,600 gsf of quick service restaurant use, 30,900 gsf of sit-down restaurant use, and a 750,000 gsf event center.
[d] The Off-site Alternative at Piers 30-32 and SWL 330 includes 35,600 gsf of office, 40,390 gsf of retail, 36,000 gsf of quick service and 43,464 gsf of sit-down restaurant, 176 residential units, 227-room hotel, and a 695,000 gsf event center.
[e] “Other” includes walk, bicycle, motorcycle, taxis, limousines, etc.
