Appendix A Notice of Preparation (NOP) and NOP Comments

San Francisco Redevelopment Agency
San Francisco Planning Department

NOTICE OF PREPARATION OF AN ENVIRONMENTAL IMPACT REPORT

Project Title: BAYVIEW WATERFRONT PROJECT

(SFRA File No. ER06.05.07 Planning Department File No. 2007.0946E)

The Bayview Waterfront Project would include new plans for the Candlestick Point, Hunters Point Shipyard, and India Basin Shoreline areas of San Francisco. The Project encompasses an approximately 780-acre area east of US 101 in the southeast area of the City and occupies the waterfront area from India Basin to approximately Candlestick Point. The plans consists of a new stadium for the San Francisco 49ers and a mixed-use community with residential, retail, office/research & development(R&D)/industrial, civic and community uses, and parks and recreational open space. To implement the Project, the existing Bayview Hunters Point (BVHP) Redevelopment Plan and Hunters Point Shipyard (Shipyard) Redevelopment Plan would need to be amended and conforming changes made to zoning and the Design for Development for the Shipyard Redevelopment Plan. The Bayview Waterfront Project also would include rezoning of Area C of the BVHP Survey Area. That portion of the BVHP Survey Area was not incorporated in the Bayview Hunters Point Project Area adopted by the Agency in March 2006. Area C is also referred to as the India Basin Shoreline.

PROJECT LOCATION: The Project site is the Bayview Hunters Point (BVHP) Redevelopment Project Area B (Candlestick Point), the Shipyard Redevelopment Project Area, and Area C (India Basin Shoreline) of the BVHP Survey Area. The site is approximately 780-acres in area, occupying the waterfront from India Basin to approximately Candlestick Point, and extending inland from the waterfront. The BVHP and Shipyard areas are in the southeast portion of San Francisco, generally bounded by Cesar Chavez Avenue Street to the north, US 101 to the west, the Visitacion Valley and Executive Park neighborhoods and the City and County of San Francisco – San Mateo County line and the City of Brisbane to the south, and San Francisco Bay to the east. See Figures 1 and 2.

CURRENT LAND USE: The Candlestick Point area of the BVHP Project Area is immediately east of Executive Park, with the Hunters Point Shipyard to the north and east, and Candlestick Point State Park along the Bay frontage. See Figure 2. Current land uses at Candlestick Point include Monster Park, the stadium owned by the City and County used by the San Francisco 49ers National Football League team, and associated parking lots and access roadways. The stadium and parking are under the jurisdiction of the San Francisco Recreation & Park Department. The Candlestick Point area also includes the Alice Griffith Housing, owned by the San Francisco Housing Authority, and several private parcels near Gilman Street and Jamestown Avenue, to the north of the stadium.

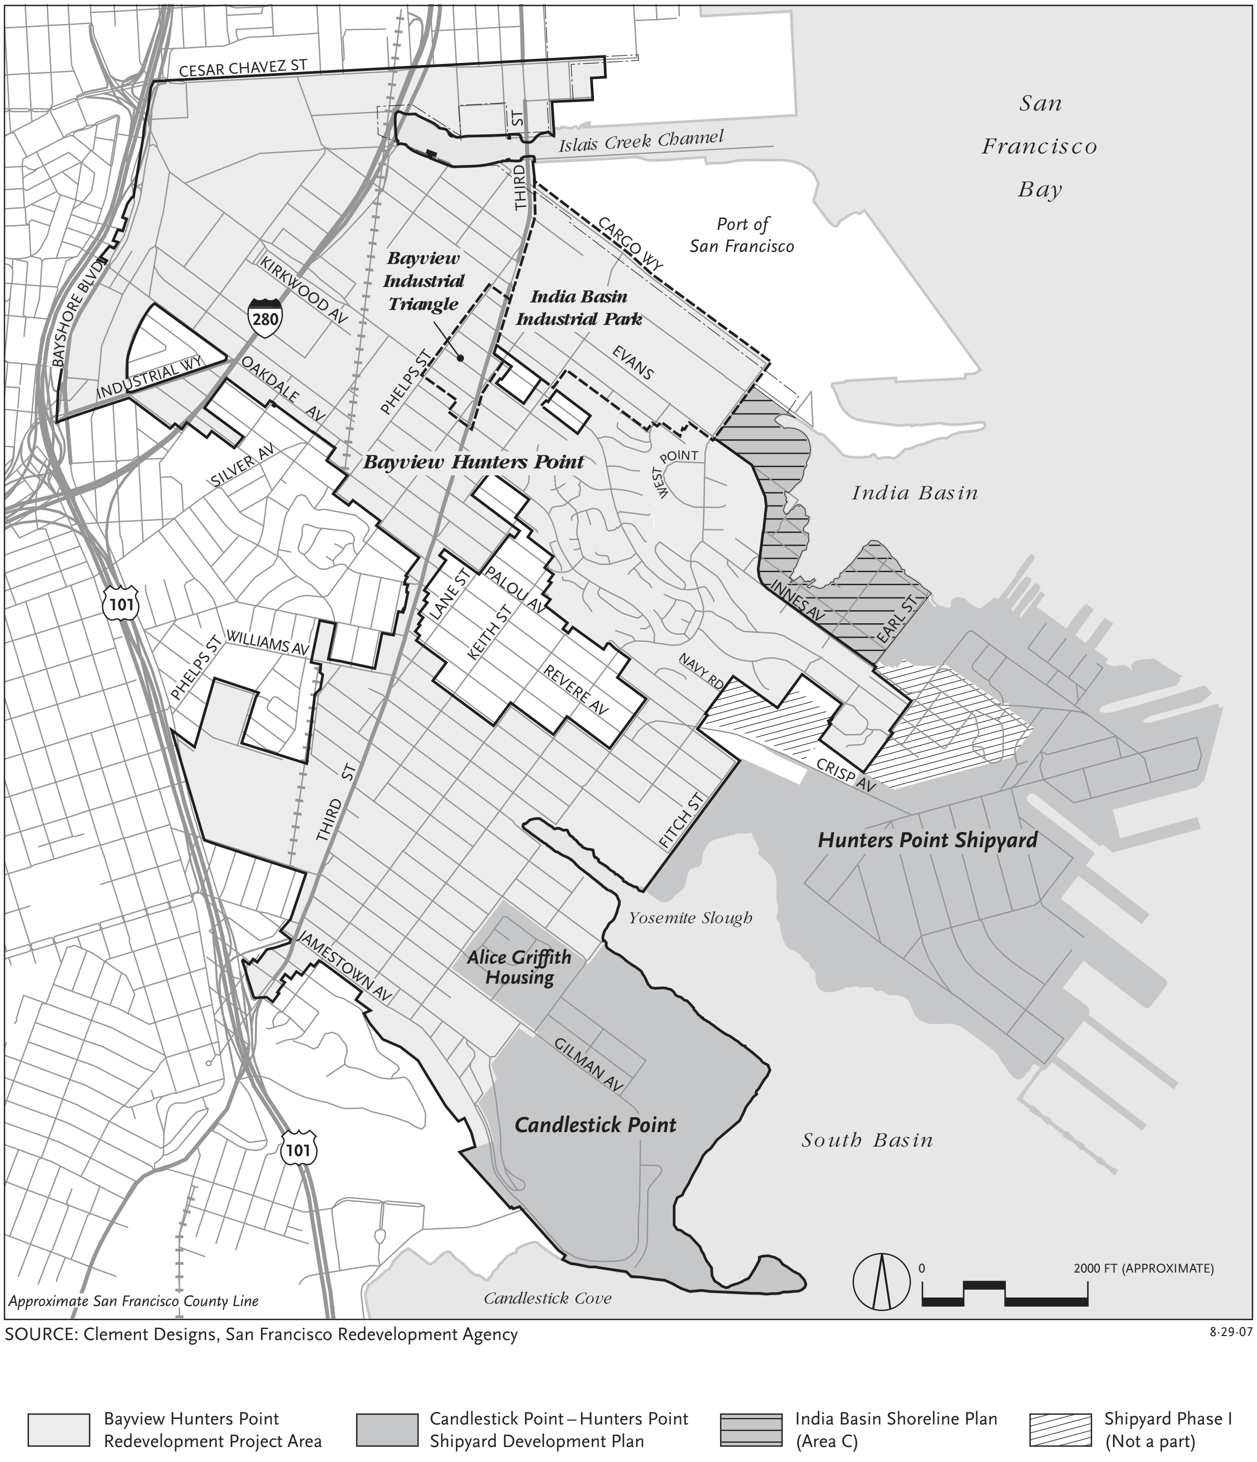
Bayview Waterfront Project EIR

FIGURE 1: PROJECT VICINITY



Bayview Waterfront Project EIR

FIGURE 2: BAYVIEW WATERFRONT PROJECT AREAS

The Shipyard, as shown on Figure 2, has extensive frontage on San Francisco Bay, and is bounded by the BVHP Project Area, and Area C of the BVHP Survey Area (India Basin Shoreline), to the west. The Shipyard includes many structures associated with ship repair, with piers and dry-docks, and ancillary storage, administrative, and other former Navy uses. Several former Navy buildings are currently leased and occupied as artist studios, and by light industrial tenants. In 1997, the Agency and City adopted a redevelopment plan for the Shipyard. Phase 1 of that redevelopment plan, a 75-acre portion of the Shipyard, is under construction with new housing on Parcel A. The Phase 1 area is not part of the proposed Project. Most of the Shipyard currently remains under the jurisdiction of the U.S. Navy.

The India Basin Shoreline area is northwest of the Shipyard, as shown on Figure 2. The India Basin Shoreline area currently contains residential uses and light industrial and boatyard operations along Innes Avenue, a 28-acre privately owned vacant parcel fronting the Bay east of Innes, India Basin Shoreline Park, and the former PG&E Hunters Point power plant, and an associated fuel tank farm, now being demolished.

PROJECT DESCRIPTION: The Bayview Waterfront Project to be evaluated in the EIR encompasses, as noted above, the new plans for the Candlestick Point, Hunters Point Shipyard and India Basin Shoreline areas of San Francisco. The Candlestick Point - Hunters Point Shipyard Development Plan portion of the project would consist of a new stadium for the San Francisco 49ers and a mixed-use community with residential, retail, office/R&D/industrial, civic and community uses and parks and recreational open space. This proposal also includes new infrastructure necessary to serve the development. The India Basin Shoreline Plan proposes to rezone a largely industrial zoned area to support a mix of residential, commercial and industrial uses.

Lennar is the lead developer for the Candlestick Point - Hunters Point Shipyard Development Plan. The EIR will provide project-level review of the development plan. The India Basin Shoreline Plan will be a programmatic plan expected to be developed by various private parties. The EIR will provide program-level review for India Basin Shoreline area.

Table 1 below identifies the land area of the Project sites, totaling about 780 acres.

The Candlestick Point - Hunters Point Shipyard Development Plan

The proposed Candlestick Point - Hunters Point Shipyard Development Plan would be a mixed-use community with residential, retail, office/R&D/industrial, civic/community, parks/recreation/open space, and a new stadium for the San Francisco 49ers, as shown in Figure 3, and outlined in Table 2, below.

At Hunters Point Shipyard, the Project would include approximately 2,500 new residential units, with a range of housing types that would include: stacked flats, attached townhomes, mid-rise and high-rise structures. The residential development would range from two to four story structures over parking, to buildings of 12 to18 stories. The Project may include residential towers up to 35 stories. The residential land density would range from 50 units per acre up to 170

FIGURE 3: CANDLESTICK POINT – HUNTERS POINT SHIPYARD DEVELOPMENT PLAN

TABLE 1
BAYVIEW WATERFRONT PROJECT SITE AREAS

	Existing Redevelopment Project Areas (acres)	Proposed Redevelopment Project Areas (acres)	Proposed Project (acres)
Bayview Hunters Point	1,499	1,499	
Candlestick Point [a]	[284]		284
India Basin Shoreline [b]		+76	+76
Total BVHP	***1,499***	***1,575***	***360***
Hunters Point Shipyard [c]	493	493	
Phase I [d]	[75]	-75	
		418	418
Total Project			**778**

Source: San Francisco Redevelopment Agency; Lennar.
Notes:
a. Candlestick Point is within total existing BVHP Project Area of 1,499 acres.
b. India Basin Shoreline Survey Area to be added to BVHP Project Area.
c. Land area only. Shipyard Project Area also includes 443 acres of submerged lands.
d. Phase I of the existing Shipyard Project Area now under construction would not be part of Bayview Waterfront Project.

TABLE 2
CANDLESTICK POINT –
HUNTERS POINT SHIPYARD DEVELOPMENT PLAN

	Shipyard	Candlestick Point	TOTAL	
Residential	2,500	6,500	9,000	dwelling units
Retail				
Regional	-	585,000	585,000	sq. ft.
Neighborhood	60,000		60,000	sq. ft.
Total Retail			645,000	sq. ft.
Office/R&D/Industrial[a]	2,000,000	150,000	2,150,000	sq. ft.
Football Stadium	69,000		69,000	seats
Arena/Performance Venue		8,000	8,000	seats

Source: Lennar.
Notes:
a. R&D: Research and Development

units per acre. The housing would be intended for a range of income levels, and would provide both rental and for-sale units.

Pursuant to the 1997 Shipyard Redevelopment Plan, development would include a mix of research and development space, possible biotechnology space, and other industrial uses. The commercial uses would also provide approximately 80,000 square feet of neighborhood-serving retail.

The Shipyard would accommodate a new approximately 69,000-seat National Football League stadium for the San Francisco 49ers. The stadium parking plan would include “green parking” surfaces that would accommodate parking for stadium events, and would serve public recreational uses such as playing fields at other times. The Shipyard would also include approximately 2 million square feet of office/R&D/industrial uses in three- to six-story buildings.

Additionally, the EIR may consider a Candlestick Point - Hunters Point Shipyard Development Plan option with up to 10,000 residential units.

The EIR will also consider a Candlestick Point - Hunters Point Shipyard Development Plan that would substitute other uses for the football stadium. Without the stadium, there would be additional R&D space and residential uses distributed across the Candlestick Point - Hunters Point Shipyard area.

The Candlestick Point area of the BVHP Project Area is approximately 284 acres. It includes Monster Park, the existing San Francisco 49ers home stadium (also known as Candlestick Park Stadium) on a 77-acre site; Candlestick Point State Recreation Area, totaling approximately 134 acres; the 20-acre San Francisco Housing Authority site of the Alice Griffith Housing; 12 acres of land owned by the Port of San Francisco; privately owned parcels totaling 21 acres; and approximately 20 acres of streets and roadways. See Figure 3, above.

At Candlestick Point, the proposed Project would include approximately 6,500 new residential units (in addition to the 2,500 units in the Hunters Point Shipyard) and a regional retail center. Approximately one-third of the units are planned to be low-rise apartments and townhomes concentrated on the easternmost portion of the Candlestick Point area. About one-third would be in mid-rise buildings and the remaining one-third of the units in high-rise towers. Residential development proposed near existing neighborhoods and the Candlestick Point State Recreation Area would be primarily three- to four-story buildings. Remaining areas would be mid-rise buildings ranging from seven to 18 stories; and taller high-rise buildings in certain locations. Figure 3 shows the location of the proposed uses.

The residential land density at Candlestick Point would range from approximately 40 units per acre up to 130 units per acre. The housing would be intended for a range of income levels, and would provide both rental and for-sale units.

The Project would redevelop the San Francisco Housing Authority’s Alice Griffith site (also known as Double Rock Housing), replacing the 263 existing units with a total of about 925 units, consisting of one-for-one replacement public housing, affordable homeownership/rental and market rate for-sale units. These homes would be a mix of townhomes, stacked townhomes and four-story stacked flats.

The proposed regional retail center at Candlestick Point would be approximately 735,000 square feet, of which 150,000 square feet would be office space. The center would also include an 8,000-seat arena/performance venue. The proposed retail program would also include neighborhood-serving uses such as a grocery store; entertainment uses such as a multi-screen movie theatre and clubs with live music; large format retail; and restaurants. The center would be oriented around a retail 'Main Street' and might include some housing above retail.

The Candlestick Point - Hunters Point Shipyard Development Plan would include open space improvements. Through a proposed land exchange with the California Department of Parks and Recreation, portions of the existing Candlestick Point State Recreation Area would be improved and new State park area would be created at the Shipyard. There would be a net increase in State park land. The Project open space improvements would also allow for realignment of the Bay Trail in the southeastern portion of San Francisco. The Project would include a number of recreation facilities and sports fields, and smaller, neighborhood-oriented parks. At the Hunters Point Shipyard, a heritage park is proposed that would focus on the Shipyard's past.

To implement the Project, the U.S. Navy may transfer the Shipyard property to the City or Agency for reuse after the Navy has completed remediation in accordance with the Comprehensive Environmental Response, Compensation, and Liability Act ("CERCLA"), Section 120, 42 U.S.C. Section 9620. Reuse may also occur concurrently with remediation under the provisions of CERCLA that authorize a title transfer prior to completion of remediation under certain conditions (referred to as an Early Transfer). Finally, CERCLA may authorize interim reuse activities to occur concurrently with remediation activities through a lease, either with or without provision for later deed transfer, provided the property is found suitable for the planned interim reuse activities.

It is anticipated that the Candlestick Point - Hunters Point Shipyard Development Plan would be under construction by the end of 2009 and that the 49ers football stadium would be completed by 2012. Full buildout of the plan is anticipated by 2025.

India Basin Shoreline Plan

The BVHP Survey Area included the "Hunters Point Shoreline Activity Node." Within that 131-acre Activity Node is an approximately 76-acre area that was not included in the adopted BVHP Project Area. See Figure 2, above. At the time of consideration of the BVHP plan in 2006, the Agency found that further land use analysis was needed before adoption of a future plan amendment and area-specific controls. This excluded portion of the BVHP Survey Area was designated Area C. Also referred to as the India Basin Shoreline, Area C, as noted above, has an existing mix of residential uses; a vacant parcel fronting the Bay; and the former PG&E Hunters Point power plant, currently being demolished. The India Basin Shoreline area is currently zoned for industrial use.

The Planning Department is considering rezoning to accommodate a mix of residential and commercial uses, along with some continued industrial use and development controls to facilitate mixed use development. The EIR will analyze an overall land use program for the India Basin Shoreline as a detailed site plan has yet to be undertaken. It is anticipated that the rezoning and other planning controls for the India Basin Shoreline would reflect community goals expressed earlier during BVHP planning to provide:

- New housing on available infill development sites northwest of Innes Avenue
- Mixed-use neighborhood southeast of Innes Avenue
- Small industrial or R&D businesses
- Neighborhood-serving retail and commercial services and some residential units
- Water-oriented neighborhood
- Space for artists
- New waterfront open space and recreational activities

Transportation Improvements

The Bayview Waterfront Project would require substantial transportation infrastructure to support new development. Transportation improvements related to or affecting the Project generally would fall into three categories including:

1. *Transportation improvements within the Project boundaries and necessary to serve the Project uses*. This category would encompass improvements such as new and improved streets and related circulation improvements including a new roadway on the Shipyard from the Innes gateway to the Crisp Road gateway and a new Candlestick Point arterial, transit-related improvements, and pedestrian and bicycle circulation improvements. Additionally, a new ferry terminal on the Hunters Point Shipyard shoreline to accommodate additional ferry service, and the construction of a bridge over Yosemite Slough are under consideration. A Hunters Point Shipyard Transit Center would be constructed adjacent to the new ferry terminal and a Candlestick Transit Center would be included in the Candlestick Point area. A traffic control center would be developed near the new stadium on the Shipyard to assist in managing game-day traffic. The transportation improvements in this category will be analyzed in the EIR.

2. *Transportation improvements that may be necessary to serve the Project and other local and regional development.* This category would include transportation improvements in the general area of the Project that would serve the Project but other local and regional development as well. Among transportation improvements that could be included in this category are, the widening of Harney Way from US 101 to Jamestown Avenue; Carroll Avenue improvements (reconstruction and re-striping); a Carroll Avenue extension from Third Street to Bayshore Boulevard; a Harney Way Bus Rapid Transit system from Bayshore Boulevard, possibly extending to the Shipyard, a Palou Transit Preferential Bus route, improvements on Illinois Street from Cesar Chavez to 25th Street and on 25th Street from Illinois to Pennsylvania Street, including the possible widening of the existing Illinois Street Bridge; and improvements to local intersections, including the intersection of Evans and Cesar Chavez. The EIR will evaluate whether, and the extent to

which, these or other improvements are necessary to serve the Project and other nearby development.

3. *Major transportation improvements proposed as separate projects.* Several major transportation projects are planned in the Project vicinity as part of local or regional transportation system improvements. Included in this category is a new US 101/Geneva/Harney interchange, with an extension of Geneva Avenue from Bayshore Boulevard, a Bayshore Transit Center, the Bayview Transportation Improvements Project (BTIP), and a new Oakdale Caltrain Station. The EIR will evaluate the implications of these transportation projects on the Project and other development in the area.

Infrastructure Improvements

The Project would require substantial new or improved utility infrastructure improvements, including but not be limited to, new water, sewer, drainage, and other services throughout the Project site:

- Low Pressure Water system – potable water and fire protection water from the University Mound Reservoir.
- Reclaimed Water – network of reclaimed water mains to serve future availability of reclaimed water used for dual plumbing in buildings and for irrigation of landscaped areas.
- High Pressure Water system – to serve fire flows and high-rise buildings.
- Separated Sanitary Sewer – to collect wastewater flows to be conveyed to the southeast Water Pollution Control Plant.
- Storm Drainage -- storm sewer system separate from the combined sewer system, designed to handle up to a five-year storm and ultimately discharge to San Francisco Bay.
- Overland Flow - for an event above a five-year storm and up to a 100-year storm, excess stormwater will be routed to San Francisco Bay by overland flow along the network of street gutters and roadway.
- Joint Trenches – to serve electrical, communications and gas utilities.

The EIR will evaluate the need for new or improved infrastructure and the proposed infrastructure improvements.

Redevelopment Plan Amendments

The Bayview Waterfront Project would require changes in the Redevelopment Area land use controls in the BVHP and Shipyard Redevelopment Plans. The adopted Shipyard Redevelopment Plan allows for a different mix of industrial and commercial uses on Shipyard Parcels C and D than the now-proposed Shipyard plan, either with or without the football stadium. The adopted BVHP Redevelopment Plan Candlestick Point Activity Node included a new San Francisco 49ers football stadium, and 1.2 million square feet of retail, instead of the now-proposed residential mixed-use plan. Accordingly, both the Shipyard and BVHP Redevelopment Plans would need to be amended to accommodate the proposed Project.

The BVHP Redevelopment Plan would be amended to add the India Basin Shoreline (Survey Area C) to the BVHP Project Area, and to add the zoning and land use controls resulting from the Planning Department rezoning efforts. The BVHP Plan would also be amended to allow public improvements to be financed and implemented.

PROJECT APPROVALS AND IMPLEMENTATION: The Bayview Waterfront Project requires numerous review and approval actions from the San Francisco Redevelopment Agency, the City and County of San Francisco, regional agencies, state agencies, and federal agencies, including:

San Francisco Redevelopment Agency Commission

City and County of San of San Francisco

Planning Commission
Municipal Transportation Agency
Recreation and Park Commission
Public Utilities Commission
San Francisco Housing Authority
Port Commission
Board of Supervisors

Regional Agencies

State Regional Water Quality Control Board
San Francisco Bay Conservation & Development Commission
Association of Bay Area Governments

State of California

Department of Parks & Recreation
Department of Fish & Game
Department of Transportation
State Lands Commission
Department of Toxic Substances Control

Federal Agencies

US Navy
US Army Corps of Engineers
US Fish & Wildlife Service
US Department of Housing & Urban Development

The Bayview Waterfront Project EIR will be a new EIR that will not supplement or tier off prior EIRs for the Bayview Hunters Point Redevelopment Plan or the Hunters Point Shipyard

Redevelopment Plan. The EIR will include a discussion of the projects compatibility with existing zoning and plans. Current public plans, policies and regulations pertinent to the Project site, based on the BVHP Plan, the Shipyard Plan, and nearby plans such as the proposed Executive Park General Plan Amendment, and the Visitacion Valley Project Area will be reviewed and summarized. The proposed Project will be evaluated in light of the General Plan, the Planning Code, and applicable City ordinances and regulations. Jurisdictions, regulations, policies, and guidelines of other City, regional, state, and federal agencies will be addressed. Plans for lands under the jurisdiction of Candlestick Point State Recreation Area will be reviewed.

PROBABLE ENVIRONMENTAL EFFECT TOPICS: The EIR will include the following topics, addressing existing conditions, Project-specific and cumulative effects, mitigation measures, and alternatives. The EIR will evaluate effects of a Candlestick Point-Hunters Point Shipyard Development Plan without a football stadium.

- Land Use and Zoning
- Visual Resources
- Population and Housing
- Cultural Resources
- Transportation and Circulation
- Noise
- Air Quality
- Wind
- Shadow
- Recreation
- Public Services and Utilities
- Biological Resources
- Geology and Soils
- Hydrology and Water Quality
- Hazards and Hazardous Materials
- Energy
- Growth Inducement

Subject Comment on the Bayview Waterfront NOP

I received a voice message on Friday, September 7 from Bill Graziano, a resident of Palou Avenue in Bayview Hunters Point, and followed up with a phone conversation today. Mr Graziano is concerned about three topics:

1. Accessibility to the [South Basin] waterfront. Currently, there are industrial businesses along and off of Ingalls with property fronting the waterfront area. Consequently, there is no public access to the waterfront.
2. Aesthetics/neighborhood character. Related to the concern about waterfront access, is the concern about neighborhood character along the waterfront area, and how inviting (uninviting) the area is, particularly at night.
3. Traffic along Palou, particularly before and after events at the new 49ers stadium.

I believe topics 1 and 2 are appropriate for the land use and urban design discussions in the EIR and topics 1 and 3 are appropriate for inclusion in the transportation discussion.

Thanks,
Stan

Re: EIR NOP- Cases ER06.05.07 and 2007.0946E (Bayview Waterfront Project)

Dear Mr. Muraoka:

Thank you for the opportunity to review the above-referenced Notice of Preparation. While the City of Brisbane generally concurs with the list of topics to be addressed in the forthcoming EIR, we have concerns with the characterization of certain transportation improvements on Pages 9 and 10 of the NOP.

Specifically, the new US 101/Geneva/Harney interchange and Geneva Avenue extension are referenced as "major transportation improvements which are proposed as separate projects" and that "The EIR will evaluate the implications of these transportation projects on the Project." This implies that the design and construction of these improvements are a given, when neither final designs nor funding strategies or commitments for implementation are currently in place, and construction timing is unknown. To more accurately reflect the relationship of the Project to these future transportation improvements, the City of Brisbane recommends that the Geneva interchange and Geneva extension projects be characterized as "transportation improvements that may be necessary to serve the Project and other local and regional development" and that the Project impacts be evaluated in this context.

Thank you for your consideration, and we look forward to reviewing the draft EIR when published. Should you have any questions regarding this letter, please contact me at 415.508.2120, or City Engineer Randy Breault at 415.508.2130.

Sincerely,

John A. Swiecki, AICP

RE: Bayview Waterfront Project Notice of Preparation of Draft Environmental Impact Report, SCH #2007082168

Dear Mr. Muraoka,

Thank you for the opportunity to comment on the Bayview Waterfront Project Notice of Preparation of Draft Environmental Impact Report, SCH #2007082168. Candlestick Point State Recreation Area (SRA) is of statewide significance because it is the first State Park System unit purposely acquired to bring State Park System values into an urban setting. In addition, Candlestick Point SRA provides critical open space and shoreline protection along the most significant estuarine system in California. Candlestick Point SRA provides open space and recreational opportunities to millions of citizens who live within the greater bay area urban context. Candlestick Point SRA includes approximately 134 acres, and was classified as a SRA by the State Park and Recreation Commission since it is capable of withstanding extensive human impact.

Candlestick Point SRA includes approximately three miles of bay shoreline. Of particular interest is the Yosemite Slough Habitat Restoration project, which is scheduled to begin during the spring of 2008. The Yosemite Slough project will restore tidal wetlands in a 34 acre parcel within the park unit, as well as providing interpretive trails and an interpretive center. State Parks is currently in talks with the United States Navy and looks forward to working with the Navy in their efforts to restore tidal and freshwater wetlands that are adjacent to Yosemite Slough. State Park staff has also been involved with the San Francisco Department of Public Works Third Street Bypass project.

The Candlestick Point SRA General Plan was adopted by the State park Commission on May 8, 1987. The Candlestick Point SRA General Plan provides guidance on all future and proposed development and management within the park unit. The Candlestick Point SRA General Plan includes the following objectives:

- Identify valuable land acquisition opportunities outside the existing park boundaries.

- •Determine the potential environmental impacts of visitor activities and land uses within the park unit.
- •Increase the quality of urban life, and install a sense of responsibility and pride in the environment around the city.
- •Identify and understand the ecological life styles of the San Francisco shoreline and its natural and cultural resources.
- •Identify the surrounding influences on the site and the recreational and human resources of the San Francisco Bay.
- •Provide public accessibility to the shoreline of San Francisco Bay.
- •Expand visitor opportunities for reflection, appreciation, and enjoyment of natural, cultural, recreational, and human resources.
- •Identify the need for paid and voluntary public participation in building, maintaining, and programming the unit facilities.
- •Establish policies for management, protection, and interpretation of the park resources.
- •Recommend additional studies beyond the scope of the Candlestick Point SRA.

In addition to the above listed objectives, the Candlestick point SRA General Plan identifies the following activities that could be developed within the SRA:

- •Concession facilities including a first class restaurant, bike rentals, small food service, bait and tackle shop, ferry service, and transient boat docking.
- •Trails for hiking, biking, jogging, wheelchair, and emergency vehicle service access.
- •Group and family picnic areas and campgrounds
- •Fishing piers
- •Non-powered boat rental and Wind surfing facilities
- •Boating center and boat access facility
- •Sand Beach and quiet areas
- •Cultural program center
- •Open grassy areas
- •Service area (maintenance and service yard)

The Bayview Waterfront Project has identified Candlestick Point SRA as part of the project area, as outlined in Figure 2 of the NOP. Candlestick Point SRA currently has an approved general plan for the park unit. Any redevelopment proposals targeted within the Candlestick Point SRA, that are not consistent with the purpose and scope of the existing Candlestick Point SRA General Plan may require the following:

1) Extensive public input and review
2) Adoption by State Parks and the public
3) Possible amendments to the general plan
4) Update the existing general plan with a new general plan
5) Regulatory review and permitting approval
6) State Park real property and acquisition review and or approval
7) State Park Commission review and approval
8) Special land use planning studies
9) Special landfill, natural, cultural and recreational studies

While moving through the planning process it is critical to bring forward the primary purpose of the candlestick Point SRA; which is to make available to the people recreational opportunities, both passive and active, that are offered by the shoreline, waters, and environment of the San Francisco Bay and the adjacent bay waters. The Lands and resources of the site may be modified or enhanced to achieve optimum realization of this recreation potential. When determining what recreational activities should be provided and or developed at Candlestick Point SRA, the primary concern should be to meet the needs of the people(primarily urban dwellers) in conformity with maintaining a desirable physical setting on the bayshore.

The design criteria for Candlestick Point SRA improvements should create an environment which supports the physical, social, psychological, economic, and esthetic needs of both the local and regional bay area communities that will use the park unit in the future.

On page 8 of the NOP there is mention of a possible land exchange with State Parks for lands currently owned by the US Navy, and that there would be a net increase in State Park land. While this may sound good in concept, State Parks is aware of the Navy's parcel E, E2, and F Remediation Investigation and Feasibility Studies and has concern over the location and extent of hazardous substances, ground water contamination, radiological contamination, and PCB contamination in the parcel E, F, and E2 shoreline areas, and has concern over US Navy full and partial remediation measures in areas to be considered or targeted as part of a future land exchange. State Park staff has additional concerns over current US Navy tidal wetland design plans and shoreline restoration designs that may pose management challenges if identified as part of a land exchange.

Page 9 of the NOP focuses on transportation improvements within the project boundaries and mentions construction of a bridge over Yosemite Slough as being under consideration. To date, State Parks has taken the position that the bridge options, which have been identified as part of the City's Third Street Bypass project, are not consistent with the current general plan. The Yosemite Slough bridge options may also compromise the Yosemite Slough tidal wetland restoration project as well as bisect an existing State Park. Through the planning process we look forward to identifying transportation alternatives.

Other concerns include storm water discharge into the bay from the project area. Storm water runoff should be collected and treated in accordance with all regulatory conditions, prior to being discharged into the bay and or shoreline areas within Candlestick Point SRA. While we understand there are runoff limits of capacity for long duration high intensity storm events, we also believe redevelopment is a prime opportunity to integrate state of the art engineering practices and options (such as bioswales, storm septors, underground collection systems and various forms of oil and grease separator systems), that can assist in the treatment process prior to being discharged into the bay and or shoreline areas of Candlestick Point SRA.

State Park staff have been actively involved with local planning issues that may directly or indirectly influence Candlestick Point SRA. State Park staff are aware of the Hunter's Point Redevelopment planning effort and are very excited to be part of this planning process. It is the sincere hope of State Parks that redevelopment efforts adopt plans that reflect local and regional interests. State Parks believes this is an excellent opportunity to create a state of the art urban park unit that will be a focal point of activity for decades to come. We look forward to being an integral part of the planning process.

Thank you for the opportunity to provide comment on the Bayview Waterfront Project Notice of Preparation of Draft Environmental Impact Report, SCH #2007082168. If you have any questions please contact me anytime.

Sincerely,

Stephen Bachman

RE: BAYVIEW WATERFRONT PROJECT NOTICE OF PREPARATION
SFRA File No. ER06.05.07

Dear Mr. Muraoka:

Thank you for the opportunity to submit our concerns about the Notice of Preparation referenced above. First I would like to acknowledge some promising features of the environmental review process as indicated by the NOP text:

- apparent effort to define a comprehensive project rather than to segment into separate EIRs;
- designation of all mandatory impact categories as potentially significant;
- decision not to supplement or tier this EIR off of previous EIRs;
- two scoping sessions.

Nonetheless, we have serious concerns about the NOP itself and its implications for adequate environmental review of this huge project – one that lacks the benefit of substantial public participation. The deficit of community involvement in the project's planning places a great burden on the environmental review process to devise alternatives that reflect the vision and goals of the Bayview-Hunters Point community. An NOP that reassures the public that they will ultimately have an opportunity to participate in planning a project that does not impose negative impacts on the surrounding community would help to gain public acceptance of a final project. Several features of the NOP and the EIR it promises would need to be modified to ensure such an outcome.

Our specific concerns fall into the following categories:

- NOP shortcomings
  - changes to the project since publication of the NOP
  - lack of an Initial Study
  - lack of a map of changes to the roadway system
  - public notice
- level of environmental review is unclear.
- non-mandatory impacts to analyze
- project alternatives
  - must bracket the uncertainties, conflicting views, and unresolved political questions about main features of the project (e.g., stadium, bridge over Yosemite Slough, conflicting State Park plan)
  - must provide for active public participation in their formation
  - need for full, rather than normal abbreviated environmental analysis

We request that you revise and recirculate the NOP, so that it provides

- a consistent project description that clearly distinguishes the project from potential mitigation measures;
- an Initial Study;
- a commitment to provide public notice to organizations and individuals that have participated in the planning and the environmental review processes for Bayview Hunters Point and the Hunters Point Shipyard redevelopment projects;
- a map of the changes to the roadway system within and serving the project;
- a commitment to prepare a Master EIR;
- a public participation process that will be used to develop project alternatives;
- a commitment to providing full environmental analysis of the project alternatives; and
- a commitment to analyze environmental justice, economic, and social impacts even though these are not required by CEQA.

Our concerns, described in greater detail, are attached.

Yours truly,

Eve Bach

ARC ECOLOGY CONCERNS ABOUT
THE BAYVIEW WATERFRONT PROJECT NOP

I.NOP Shortcomings

Unclear Project boundaries

The environmental review staff distributed a revised diagram of the project at the September 25th Scoping Meeting that slightly revised the boundaries of the India Basin Shoreline Plan (Area C). However, the NOP maps are inconsistent with the NOP text (page 9) that identifies the construction of a bridge over Yosemite Slough as a transportation improvement "**within the Project boundaries** and necessary to serve the Project uses." [emphasis added] In contrast, this text *is* consistent with maps displayed at the meeting, which included the area surrounding Yosemite Slough and the shoreline area along Candlestick Cove to the west of Candlestick Point as part of the project.

This inconsistency, and apparent official uncertainty about the definition of the Project is a symptom of a much bigger problem. The NOP currently treats the roadway changes,, including the much-debated bridge over Yosemite Slough as if it is merely a mitigation for the development of the three sites. Since on-going, extensive studies of the bridge predate the current project, it is apparent that the roadway changes themselves represent a major project. The scale and the potential impact of the roadway changes are obscured by this treatment by the NOP, which presumably foreshadows the EIR.

Lack of an Initial Study

It is unfortunate that this NOP does not include an Initial Study, or even discussion (as opposed to a listing) of the Project's potentially significant environmental impacts. Even though an Initial Study is not required since the EIR will analyze all of the required impact areas,[1] omitting it deprives the public of information about the City's preliminary thinking about the Project's impacts, and precludes us from identifying specific gaps, and from providing supplementary information.

In the case of this Project, which is not the product of a public planning process, transparency about the City's views of its environmental impacts is especially needed. One of the purposes of an Initial Study is to "facilitate environmental assessment early in the design of a project."[2]This early environmental assessment is also needed for further articulation of the preferred alternative, and for the design of project alternatives.

Lack of a map of changes to the roadway system

Greater transparency is also needed in the discussion of the major changes being considered to the neighborhood, city, and regional circulation system . The description of these changes is buried in the text of the NOP and is presented as if they are incidental to the Project rather than the major, highly controversial transportation project that has been under consideration for several years. A map of the changes is needed to inform the public as early as possible of a project that will have major impacts on their living environment.

Public notice

We are puzzled why Arc Ecology was not directly notified about this NOP, despite the fact that we have consistently participated in all planning processes for Shipyard redevelopment, and have commented extensively on all environmental review documents related to the Shipyard. A mailing list should be

1 PRC §15060
2 PRC § 15063(c)(4)

developed that notifies all members of the community who have demonstrated interest in this project, to be used to notify them of the availability of environmental review documents.

II.Level of environmental review is unclear.

> "An EIR for a redevelopment plan may be a Master EIR, a program EIR, or a project EIR. An EIR for a redevelopment plan must specify whether it is a Master EIR, a program EIR, or a project EIR." [3]

There appears to be some confusion or changes in the City's thinking about the level of environmental review that will be undertaken. The NOP states that the EIR will provide project-level review of the development plan and India Basin Shoreline area, and program level analysis for the India Base Shoreline Plan.[4] At the scoping session, Planning Department staff announced that that entire EIR would be programmatic.

Given the scale and many interlocking governmental decisions that comprise this Project (e.g., revision of several elements of the City's General Plan and zoning, amendments to two redevelopment plans, revision of the master plan for state parklands, at least three large scale development projects, reconfiguration of circulation patterns for the entire southeast quadrant of the city), it is premature for this EIR to attempt to provide project-level analysis for any of its components.

Instead, this EIR should be structured as a Master EIR[5] to provide an overview of the Project's combined environmental impacts, with subsequent project-level environmental review that thoroughly analyzes each of the components.

III.Non-mandatory impacts to analyze

Although CEQA does not mandate, neither does it prohibit the EIR from including an analysis of environmental justice impacts. Similarly, the economic and social impacts of the project should be thoroughly analyzed. This project is massive, and has the potential to irrevocably alter the demographics and economic base as well as the environmental conditions of the southeastern sector of the City. A holistic approach is needed.

IV.Project alternatives

Due to the unusually high level of uncertainty and public participation thus far associated with the sports stadium that is the central feature driving this Project, there is a greater than normal chance the a project alternative will ultimately be selected. The absence of public participation in the the design of the Project argues for alternatives that are the product of a community planning process. The controversy that has surrounded the proposed bridge across Yosemite Slough argues for environmental analysis of the alternative routes that have been elaborated in extensive studies over the past few years.

Since these alternatives could become preferred to the currently proposed Project, it is important that the EIR analyze them with the same level of rigor and detail as the proposed Project, instead of giving the perfunctory attention that is the fate of most EIR alternative projects.

MEMORANDUM

SAN FRANCISCO REDEVELOPMENT AGENCY

Date: October 9, 2007

To: File

From: Stanley Muraoka

RE: Bayview Waterfront Project EIR

Call received October 4, 2007:

Brad McCrea
Acting Chief of Permits
San Francisco Bay Conservation and Development Commission
50 California Street, Suite 2600
San Francisco, CA 94111
bradm@bcdc.ca.gov
415-352-3615

Mr. McCrea left the following voicemail message:

The project area shown in the NOP is within (1) BCDC priority use areas and the (2) 100 foot jurisdiction band; these should be shown on the map. Refer to the San Francisco Bay Plan at the BCDC website, particularly the plan maps that show recreation use areas at Candlestick Point and India Basin and a port priority use area [at the Shipyard]: http://www.bcdc.ca.gov/index.php?p=633.

[BCDC] will be commenting on the Draft EIR.

Subject: Bayview Waterfront Project Notice of Preparation of an EIR—Case #'s ER06.05.07 and 2007.0946E

Dear Mr. Muraoka:

Thank you for the opportunity to comment on the above referenced document. The Bay Trail Project is a nonprofit organization administered by the Association of Bay Area Governments (ABAG) that plans, promotes and advocates for the implementation of a continuous 500-mile bicycling and hiking path around San Francisco Bay. When complete, the trail will pass through 47 cities, all nine Bay Area counties, and cross seven toll bridges. To date, slightly more than half the length of the Bay Trail alignment has been developed.

Background

The Bay Trail in San Francisco is approximately 24 miles long. 12 miles are complete, with the majority of the incomplete segments located south of the Oakland-San Francisco Bay Bridge. Two main goals of the Bay Trail Project are to locate the trail as close as possible to the shoreline, and to provide a fully separated, multi-use bicycle/pedestrian facility. The redevelopment of the Hunters Point Shipyard, Candlestick Point and India Basin represent a phenomenal opportunity to provide these historically park/open space-poor neighborhoods with high-quality waterfront access.

Plans and Policies

In the DEIR, please discuss the ABAG Bay Trail Plan and its policies, and how the proposed development will address each relevant topic. We are pleased to note that the proposed Bay Trail alignment in the NOP announcement for the Hunter's Point /Candlestick areas appear to be located in large part directly adjacent to the shoreline—a key goal of the Bay Trail Plan. It is of the utmost importance that this shoreline alignment not be sacrificed or moved inland for any reason. There is only one Bay edge and the residents of southern San Francisco have been denied meaningful access to this scarce resource for decades.

Please describe in detail, through plans and/or artist rendering, the proposed width and location of the trail, and proposed trail furnishings. It appears as though there may be several opportunities for people to use existing or refurbished piers over the water—please describe these opportunities.

Administered by the Association of Bay Area Governments
P.O. Box 2050 • Oakland California 94604-2050
Joseph P. Bort MetroCenter • 101 Eighth Street • Oakland California 94607-4756
Phone: 510•464•7935
Fax: 510•464•7970

India Basin

While the Bay Trail is clearly depicted in Figure 3, "Hunters Point Shipyard Development Plan Area", Figure 2, "Bayview Waterfront Project Areas" does not show the Bay Trail alignment in any of the planning areas. The Bay Trail currently exists on the northern side of India Basin Shoreline Park, with a significant and long-standing gap along the waterfront between India Basin and India Basin Open Space Preserve where a boatyard and the paper street "Hudson" currently exist. Please review the attached map and describe how the proposed development will incorporate this alignment at India Basin.

Transportation Improvements

The announcement regarding the NOP references potential widening of Harney Way from US 101 to Jamestown Avenue, Carroll Avenue improvements and extension, and the possible widening of the Illinois Street Bridge. The long-term goal for the Bay Trail in this area is to secure and build a continuous, multi-use pathway directly adjacent to the shoreline and to eventually remove the on-street alignments on Keith, Phelps, Palou, Fitch, Carroll and Gilman streets. The Illinois Street Bridge and Harney Way will remain the spine alignment connecting Hunter's Point to the rest of the City to the north via Cargo Way, and to San Mateo County to the south via Harney Way. If any improvements are made to the recently-constructed Illinois Street Bridge, it will be important to ensure that bicycle and pedestrian facilities are provided as the Bay Trail recently supported the inclusion of these amenities with a $250,000 construction grant to the Port of San Francisco.

If you have any questions regarding the Bay Trail in the Bayview Hunters Point Redevelopment Area, please do not hesitate to contact me at (510) 464-7909, or by e-mail at maureeng@abag.ca.gov.

Sincerely,

Maureen Gaffney
Bay Trail Planner

SF-101
SCH#2007082168

Dear Mr. Muraoko:

Bayview Waterfront Project – Notice of Preparation (NOP)

Thank you for including the California Department of Transportation (Department) in the early stages of the environmental review process for the proposed project. The comments presented below are based on the NOP of an Environmental Impact Report (EIR) for the Bayview Waterfront Project. As lead agencies, the San Francisco Planning Department and the San Francisco Redevelopment Agency are responsible for all project mitigation, including improvements to state highways. The project's fair share contribution, financing, scheduling, implementation responsibilities and lead agency monitoring should be fully discussed for all proposed mitigation measures in the EIR. Any required roadway improvements should be completed prior to the issuance of a certificate of occupancy. While an encroachment permit is only required when the project involves work in the State Right of Way (ROW), the Department will not issue an encroachment permit until our concerns are adequately addressed. Therefore, we strongly recommend that the lead agencies ensure resolution of the Department's concerns prior to submittal of an encroachment permit application. Further comments will be provided during the encroachment permit process; see the end of this letter for more information regarding encroachment permits.

Traffic Impact Study

Our primary concern with the project is the potentially significant impact it may have to traffic volume and congestion on the State Highway System.

US 101 is a critical route for regional and interregional traffic in the San Francisco Bay Area. It is vital to commuting, goods movement, and recreational traffic and is one of the most congested freeways in the region. US 101 is a significant connection between San Francisco, the San Francisco International Airport, San Mateo and Santa Clara counties, as well as the Eastbay and Sacramento metropolitan regions. Although redevelopment and economic vitality are goals, consideration should be given to the impacts of recurrent traffic based primarily on the planned employment, residential, and retail development. The residential and employment population density per square mile should be determined.

Consider developing and applying pedestrian and bicycling performance measures as a means of evaluating project impacts on pedestrians and bicyclists. These could include sidewalk crowding, intersection crossing distances, and speed of traffic. Mitigation measures resulting from this analysis could improve pedestrian and bicycle access to transit, thereby reducing traffic impacts on US 101. Also, please analyze secondary impacts on pedestrians and bicyclists that may result from any mitigation measures for traffic impacts. Please describe any pedestrian and bicycle mitigation measures that would in turn be needed as a means of maintaining and improving access to transit and reducing traffic impacts on US 101 (for example, pedestrian treatments to counteract safety impacts from widening intersections to accommodate more traffic).

The traffic impact study should also include the following:

1. Information on the project's traffic impacts in terms of trip generation, distribution, and assignment. The assumptions and methodologies used in compiling this information should be addressed.

2. Average Daily Traffic (ADT) and AM and PM peak hour volumes on all significantly affected streets and highways, including crossroads and controlling intersections.

3. Schematic illustration of the traffic conditions for: 1) existing, 2) existing plus project, and 3) cumulative for the intersections in the project area.

4. Calculation of cumulative traffic volumes should consider all traffic-generating developments, both existing and future, that would affect the State Highway facilities being evaluated.

5. Mitigation measures should consider highway and non-highway improvements and services. Special attention should be given to the development of alternate solutions to circulation problems that do not rely on increased highway construction.

6. All mitigation measures proposed should be fully discussed, including financing, scheduling, implementation responsibilities, and lead agency monitoring.

We encourage the San Francisco Planning Department and the San Francisco Redevelopment Agency to coordinate preparation of the study with our office, and we would appreciate the opportunity to review the scope of work. Please see the Caltrans' *"Guide for the Preparation of Traffic Impact Studies"* at the following website for more information: http://www.dot.ca.gov/hq/traffops/developserv/operationalsystems/reports/tisguide.pdf

Please also address the impacts to noise and air quality in the EIR. What mitigation measures will be taken to offset the impacts? Also, include a detailed program to monitor the heavy metals and volatile organic compounds, if present.

We look forward to reviewing the traffic study, including Technical Appendices, and EIR for this project. Please send two copies to the address at the top of this letterhead, marked ATTN: Lisa Carboni, Mail Stop #10D.

Encroachment Permit

Any work or traffic control within the State ROW requires an encroachment permit that is issued by the Department. Traffic-related mitigation measures will be incorporated into the construction plans during the encroachment permit process. See the following website link for more information: http://www.dot.ca.gov/hq/traffops/developserv/permits/

To apply for an encroachment permit, submit a completed encroachment permit application, environmental documentation, and five (5) sets of plans which clearly indicate State ROW to the address at the top of this letterhead, marked ATTN: Michael Condie, Mail Stop #5E.

Should you have any questions regarding this letter, please call Lisa Carboni at (510) 622-5491.

Sincerely,

Timothy C. Sable

RE: Bayview Waterfront Project, SCH# 2007082168

Dear Mr. Muraoka:

As the state agency responsible for rail safety within California, we recommend that any development projects planned adjacent to or near the rail corridor in the County be planned with the safety of the rail corridor in mind. New developments may increase traffic volumes not only on streets and at intersections, but also at at-grade highway-rail crossings. This includes considering pedestrian circulation patterns/destinations with respect to railroad right-of-way (ROW).

Safety factors to consider include, but not limited to, improvements to existing at-grade highway-rail crossings due to the increase in traffic volumes and appropriate fencing to limit the access of trespassers onto the railroad right-of-way. Any project that includes a modification to an existing crossing or proposes a new crossing is legally required to obtain authority from the Commission. If the project includes a new proposed crossing, the Commission will be a responsible party under CEQA and the impacts of the crossing must be discussed within the environmental documents.

Of specific concern is that the unused tracks leading to the former Hunter Pont Shipyard be removed as mitigation for any development in the area.

The above-mentioned safety improvements should be considered when approval is sought for the new development. Working with Commission staff early in the conceptual design phase will help improve the safety to motorists and pedestrians in the County.

If you have any questions in this matter, please call me at (415) 703-2795.

Very truly yours,

Kevin Boles

CC:

Date: 4/10/2010

Re: Analysis of Project Development Schedule Modifications and Environmental Impact Report

---

Since publication of the Draft EIR, modifications have been made in the Project Development Schedule, as outlined in Section B.1 (Project Refinements) of the C&R document.

Total development remains the same as identified in the Draft EIR. Project Documents provide for the horizontal land development of the Project to be built out in four Major Phases, with vertical development occurring during that period and beyond. Specifically, Major Phase 1 (2011–2019) includes demolition and abatement between 2011 and 2015, utilities and infrastructure improvements from 2013 to 2017, and structural shoreline improvements from 2013 to 2017. The rebuilding of Alice Griffith, together with the development of 3,160 residential units, 84,000 sf of neighborhood retail, 583,000 of R&D, and 38,000 of community facilities would occur in Major Phase 1. Also, if the 49ers satisfy the Stadium Conditions, the Developer must build significant infrastructure for the new 49ers stadium in the first Major Phase. Major Phase 2 (2016–2021) would include development of 2,005 residential units, 635,000 sf of regional retail, 76,000 sf of neighborhood retail, 150,000 sf of office, 150,000 sf hotel, 842,000 sf R&D, the 10,000-seat performance venue, and 50,000 sf of community facilities in CP North, CP Center, HPS North, HPS Village Center, and the R&D District on HPS Phase II. Major Phase 3 (2020–2027) would include development of 2,505 residential units, 90,000 sf of neighborhood retail, and 1,075,000 sf in CP North, CP Center, CP South, and completion of the R&D District on HPS Phase II. Major Phase 4 would include development of 2,830 residential units and 12,000 sf of community facilities in the Jamestown District and CP South. Full build-out of HPS Phase II would occur by 2027 and full build-out of Candlestick Point would occur in 2031, with final occupancy in 2032. The following table provides a comparison of the original development schedule and the schedule as revised.

Appropriate text changes have been made throughout the EIR to correct information related to the development schedule, and a thorough review of each technical section of the EIR has been done to determine whether the schedule changes would affect the analysis contained in the EIR. The following determinations were made:

Comparison of Draft EIR and Revised Development Schedule (previous schedule shown shaded)

SOURCE: Lennar Urban, 2010.

The impacts of a revised development schedule for both the Project and the Variants would be the same for most resource areas (Land Use and Plans, Population, Housing, and Employment, Aesthetics, Wind, Shadow, Cultural Resources and Paleontological Resources, Hazards and Hazardous Materials, Geology and Soils, Hydrology and Water Quality, Public Services, Recreation, and Utilities) as identified in the Draft EIR with respect to all construction and operational impacts, because these resource areas are dependent on intensity and types of land uses, amount of land coverage, specific areas developed, and overall size of the Project, not on when or for how long development occurs. The changes in the Development Schedule are focused on spreading development of R&D over a longer period and more equally distributing development of residential units across the phases. Generally, the order of development on the site remains the same. The first phase focuses on development of the stadium, HPS North, and rebuilding Alice Griffith Housing, the same as analyzed in the EIR. Subsequent phases follow the same general development pattern as analyzed in the EIR, including scheduling development of retail and parks to correspond with the appropriate level of residential development to support these uses. HPS Village Center development would follow the development of HPS North, and the pattern of development on Candlestick Point would remain substantially the same as analyzed, only beginning and ending two years later.

Analysis of impacts with respect to Land Use focus on division of an established community, consistency with applicable land use plans, and secondary land use effects. Land Use thresholds of significance are not time-dependent, and impacts would be the same regardless of when or over what period of time a project is constructed.

With regard to Population, Housing, & Employment, growth projections to 2030 were used in the Draft EIR. These data remain the most up-to-date growth projections available, and the analysis of the Project with full build-out at 2032 instead of 2030 would not change the significance conclusions in the EIR. In the future, citywide household sizes are expected to stay relatively constant or shrink slightly as a result of changing demographic trends.[1] Factors contributing to a decrease in household size include smaller family size and lower birth rates, a greater prevalence of single-person households, longer life spans, greater geographic mobility, and greater independence for seniors. Relative to other parts of the City, the Bayview Hunters Point neighborhood experiences a higher number of residents per habitable room.[2] As new housing varying in affordability, type, and size is developed in the area, existing crowding is expected to be alleviated. The Project would provide a range of housing sizes, including studios to 4 bedrooms, and the average housing unit would be 2.5 bedrooms. As a result, the household size at the Project site is expected to decrease to 2.33 people per unit by 2032, consistent with the 2005 citywide average and the average identified in the General Plan Housing Element. Therefore, the analysis for Population, Housing, & Employment would remain unchanged from that analyzed in the Draft EIR irrespective of the change in final build-out date or interim phasing.

Visual impacts are not time-dependent, and the impacts analyzed in the EIR would remain the same whether the Project is completed in 2032 or 2030 and, additionally, whether R&D is developed in later phases. The impacts of the Project were analyzed against existing conditions as well as cumulatively with regard to completion of the Yosemite Slough Restoration Project. Construction

[1] City and County of San Francisco, Draft General Plan Housing Element, Part 1: Data and Needs Analysis, 2009.
[2] City and County of San Francisco, General Plan Housing Element, 2004.

impacts would be temporary visual distractions regardless of when they occur. The visual impacts of full build-out of the Project also would not change with completion in 2032 versus 2030.

Similarly, impacts related to Wind and Shadow have no relationship to timing of development, but, rather, to size and placement of buildings. This remains unchanged from what was analyzed in the Draft EIR.

With regard to Cultural Resources and Paleontological Resources, Hazards and Hazardous Materials, Geology and Soils, Hydrology and Water Quality, and Biological Resources, these resources would also not be affected by the timing of development, as impacts in these areas are dependent on extent of development, types of land uses, and location of activities, which remain unchanged from that analyzed in the Draft EIR. Mitigation measures would still be implemented at the appropriate stage of development, regardless of when that occurs.

With regard to Recreation, the only area that could be affected by a change in the Development Schedule is the provision of adequate parkland at the completion of each phase of development. Section F (Draft EIR Revisions) includes changes to the parkland provided at the end of each phase of development as reflected in the modified Development Schedule. As the text changes in Section F indicate, at no time would the parkland-to-population ratio drop below the recommended threshold of 5.5 acres per 1,000 residents.

Impacts to electricity, natural gas, and telecommunications are a function of the overall intensity of development and are not time-dependent. The impact analysis would not change whether the Project is built out in 2032 or 2030.

With regard to Greenhouse Gas Emissions, because the total number of equipment hours and overall development would not change, the calendar time span over which the construction takes place is not a factor in the Greenhouse Gas calculations. Therefore, the analysis would remain unchanged from that contained in the Draft EIR. Refer to Appendix T5 (ENVIRON, Updated Greenhouse Gas Emissions Calculation for Candlestick Point–Hunters Point Shipyard Phase II Development Plan, Variants 2A and 3 [Tower Variant D], Alternative 2, and Subalternative 4A, March 12, 2010), which contains corrections to the construction GHG emissions calculations.

Technical memoranda have been prepared with regard to transportation and roadway phasing by LCW Consulting (refer to Appendix A3 [LCW Consulting, CP-HPS Phase II Development Plan Transportation Study—Revised Project Phasing, March 23, 2010]) and Fehr & Peers (refer to Appendix A4 [Fehr & Peers, Roadway and Transit Phasing Plan, March 17, 2010]) that provide a detailed analysis of the proposed schedule modifications. A memorandum from ENVIRON has also been prepared analyzing the schedule changes relative to the impacts of the Project analyzed in the Draft EIR (refer to Appendix A5 [ENVIRON, Updated Project Phasing Effect on Air Quality and Climate Change Analyses Candlestick Point–Hunters Point Shipyard Phase II Development Plan, April 26, 2010]). PBS&J staff prepared a memorandum (refer to Appendix A2 [PBS&J, Analysis of Revised Development Schedule Compared to the Noise Impacts Analyzed in the Draft EIR, March 25, 2010]) that analyzes the revised development schedule with regard to Noise.

Re: Analysis of Revised Development Schedule Compared to the Noise Impacts Analyzed in the Draft EIR

Construction activities associated with the revised development phasing plan for the Project would be similar in duration, frequency and distance to existing residential neighborhoods adjacent to the site, with the construction activities beginning and ending later than was analyzed in the Draft EIR. In addition, construction would occur over a 20-year period rather than the 19-year period analyzed in the Draft EIR.

Under the revised phasing plan, construction of the R&D would occur later than as originally proposed. Thus, it is likely that a greater number of districts would be occupied by future residents at the time of construction of the R&D. The occupants of the Candlestick North district, the CP Center District, the HPS Village Center and HPS North would potentially be exposed to noise levels up to 101 dBA due to pile-driving activities, and approximately 92 dBA due to the use of heavy construction equipment. Construction activities would be required to comply with the City of San Francisco Noise Ordinance and all mitigation measures identified for the Project, which would reduce construction related noise impacts to less-than-significant levels. However, pile-driving and excavation activities would last throughout the 20-year construction phasing, and, therefore, this temporary increase in ambient noise levels would be noticeable and would likely be cause for human annoyance. Implementation of mitigation measures would reduce the noise levels associated with the loudest construction activities identified above, but not to a less-than-significant level. As such, construction-related temporary increases in ambient noise levels would be considered significant and unavoidable, which was identified in the Draft EIR.

Implementation of these measures would reduce vibration impacts, but not to a less-than-significant level, as vibration levels from pile-driving activities could be as high as 103 VdB for the residential uses within the Candlestick North District, the CP Center District, the HPS Village Center, and HPS North and South Districts when occupied. Vibration levels from construction activities would be as identified in the Draft EIR for the residential uses occupying the Project site during construction;

therefore, this impact would remain significant and unavoidable, unchanged from the previous analysis.

The noise assessment relies on the future transportation projections, which reflect the Project traffic and reasonably foreseeable background growth and development within the study area. Based upon the operational analysis contained in the March 23, 2010, CP-HPS Phase II Development Plan Transportation Study – Revised Project Phasing Memo from LCW Consulting (Appendix A3), the transportation impact analysis that was utilized for the noise assessment was conducted for future year 2030 conditions, assuming full build-out of the proposed development, roadway network, and transit operating plan. As indicated in Appendix A3, traffic volumes associated with the Project would not change as a result of the revised phasing; therefore, the Project's estimated contribution to roadway noise levels would not be different from that evaluated in the Draft EIR. As such, the Project's traffic related noise levels presented in Table III.I-14 (Modeled Noise Levels along Major Project Site Access Roads) would not change due to the revised phasing. Additionally, the Project's traffic-related noise levels would continue to contribute to cumulative increase in ambient noise levels as identified in Table III.I-18 (Modeled Cumulative Traffic Noise Levels along Major Project Site Access Roads) of the Draft EIR. After construction is complete, Project operation would create a substantial, permanent increase in traffic noise levels that would affect existing and future residential uses along all Project site access roads, the same as evaluated in the Draft EIR.

Re: CP-HPS Phase II Development Plan Transportation Study – Revised Project Phasing

---

This memorandum presents the changes to the transportation impact analysis contained in the *CP-HPS Phase II Development Plan Transportation Study Final Report* (November 2009) that are associated with the revised development phasing plan for the Project.

Operational Impacts

The transportation impact analysis was conducted for future year 2030 conditions, assuming full buildout of the proposed development, roadway network and transit operating plan. Therefore the changes in phasing of development would not affect the transportation impact analysis. In addition, none of the mitigation measures are affected by the changes in construction phasing.

No changes are therefore required to the transportation impact analysis discussion or mitigation measures in the EIR.

Construction Impacts

The revised development phasing schedule and the associated estimates of construction workers and construction truck trips would affect the construction assessment included in the Transportation Study and the EIR.

The revised section 6.10 Construction Impacts from the Transportation Study Final Report dated November 2009 (pages 316 to 323) reflects the updated construction worker and construction truck trip information provided by MACTEC, and the revised construction schedule for the Project, Variants and Alternatives, as presented in the Transportation Study. While the number of construction workers and truck trips changed based, the impact assessment remains unchanged, and conclusions of construction impacts as significant and unavoidable.

Edits to the EIR section to reflect these changes were provided to PBS&J under separate cover.

6.10 CONSTRUCTION IMPACTS

6.10.1 Project and Project Variants

Buildout of the Project would occur over a 20-year period between 2011 and 2032. Initial construction activities would include demolition of existing structures, utility relocation and site clearance and grading at Hunters Point Shipyard to make the land available for the new stadium. The new stadium and the Yosemite Slough bridge are anticipated to be completed by 2017 in time for the 2018 football season.

Buildout of the project would occur over about a 20-year period as part of four overlapping phases (see **Table 2** for development phasing). The duration of each phase would vary, depending on the type of development (e.g., residential, retail, office) and the amount of building space included in each phase. The majority of development would occur and be occupied by the end of the second phase, which has a scheduled completion date of 2023. The majority of the roadway network improvements would occur by 2019 (Phase I), and most transit improvements would be phased in by 2023 (within Phase I and Phase II). Construction impacts within the Project site would affect new residents, employees, and visitors to the area. Overall, throughout the construction period the addition of worker-related vehicles and transit trips would be less than those associated with Project conditions at full buildout.

During construction of the Project phases, building activities would generate traffic volumes from construction workers, truck deliveries of supplies and construction equipment, and the hauling of soils during Project grading and excavation. **Table 90** presents the phases and construction activity for the Hunters Point Shipyard and Candlestick Point development, the maximum number of construction workers that would be on-site on a daily basis, as well as the maximum number of construction truck trips that would travel to and from the sites on a daily basis. These truck trip estimates assume that approximately 40 percent of the required import fill materials would be brought onto the site via barge, with the remaining arriving by truck. **Table 91** presents the number of daily construction truck trips and construction workers, as well as the annual number of barge trips associated with improvements to the shoreline at both Hunters Point Shipyard and Candlestick Point.

The peak phases of construction activities would occur between 2013 and 2017, when grading and infrastructure improvements would be ongoing at both Candlestick Point and Hunters Point Shipyard. During this phase, there would be between 130 and 460 construction workers that would be on-site on a daily basis, and between 70 and 540 construction truck trips that would travel to and from the site on a daily basis. These truck trip estimates assume that about 40 percent of the required import fill materials would be brought onto the site via barge, with the remaining arriving by truck.

2027 Shoreline	4	5-7	3
2028 Shoreline	6	5-7	4

Note:
1. Includes stadium construction.
Source: MACTEC, 2010.

Shoreline improvements at both Hunters Point Shipyard and Candlestick Point would peak in 2017, and would require an additional 45 to 50 construction workers on-site.

Construction related activities would generally occur Monday through Saturday, between 7:00 A.M. and 8:00 P.M., and the typical work shift for most construction workers would be from 7:00 A.M. to about 3:30 P.M. Construction is not anticipated to occur on Sundays or major legal holidays, but may occur on an as-needed basis. The hours of construction would be stipulated by the Department of Building Inspection, and the contractor would be required to comply with the San Francisco Noise Ordinance.[1] Delivery and removal of extra long or wide bridge construction components, equipment, or materials may occur outside theses hours on an as-needed basis.

Construction staging would mostly occur within the individual sites under construction or along existing street right-of-way. Construction staging would involve staging of construction vehicles, storage of construction materials, construction worker vehicles, delivery, and hauling trucks. Due to the large amount of vacant land in the Project site, construction staging would occur on-site, and construction-worker vehicles would likely park near construction sites in the Project site during most phases, and would not occupy spaces on neighborhood streets.

While the exact routes that construction trucks would be using would depend on the location of individual construction sites, it is expected that Harney Way, Hunters Point Expressway, Innes Avenue, Evans Avenue, Cesar Chavez Street, and Third Street would be the primary haul routes between U.S. 101 and the various components of the Project.

In general, construction related transportation impacts would include impacts in the immediate vicinity of the development project under construction, on roadways within the Project site, and cumulative construction traffic impacts along the roadways in the Bayview Hunters Point neighborhood. Since the Project includes building construction as well as construction of a new street system and transit route extensions into the Project site, all Project construction operations would include plans for the closure of traffic/parking lanes and sidewalks adjacent to construction sites. The closure of sidewalks and parking lanes could last throughout the entire construction phase for each building or group of buildings. It is possible that more than one location within the Project site could be under construction at any one time and that multiple travel lane closures may be required.

During the construction period, temporary and intermittent disruption to existing and proposed transit routes and bus stops may occur, and some bus routes may need to be temporarily rerouted (for example, the 29-Sunset on Gilman Avenue and Giants Drive, the 54-Felton on Ingalls, the 23-Monterey and 44-O'Shaughnessey on Palou Avenue, and the 19-Polk on Innes Avenue. In addition, temporary and intermittent interference to transit operations caused by increased truck

[1] The San Francisco Noise Ordinance permits construction activities seven days a week, between 7:00 A.M. and 8:00 P.M.

movements to and from the construction sites may occur. Any change in transit routes and stops would have to be coordinated and approved by the SFMTA.

Due to the reduction in travel lanes, the remaining travel lanes would become more congested with automobiles, trucks and buses, which would pose a greater challenge for bicycle travel in the area. Since bicycle traffic in the Project vicinity is relatively low, this impact is not anticipated to be significant. Existing pedestrian volumes along the key access routes and at the proposed construction sites are low and, therefore, any sidewalk closures or rerouting of the walkway would not significantly affect pedestrian circulation. In general, temporary pedestrian walkways must be maintained in order to facilitate pedestrian movements.

The construction activities associated with the Project would overlap with construction activities of other development projects in the area, notably the HPS Phase I, Executive Park site, Brisbane Baylands, Visitacion Valley, India Basin Shoreline, and the Hunters View site. In addition, the Project construction activities would also overlap with nearby proposed transportation improvement projects, such as the U.S. 101/Harney interchange improvements, and the Geneva Avenue Extension. These overlapping construction activities would increase the number of construction worker vehicles and trucks traveling to and from the project sites along Harney Way and Jamestown Avenue for the Executive Park project and for development within Candlestick Point, and on Cesar Chavez Street and Evans Avenue for the India Basin Shoreline, Hunters View project, and development within Hunters Point Shipyard. For example, construction activities of one or more projects that adversely affect roadway capacity (e.g., Harney Way widening), combined with construction vehicle traffic traveling to and from the roadway project and nearby development projects under construction (e.g., Executive Park and Candlestick Point), could result in increased delays due to traffic diversions and substantial increases in truck traffic.

Given the magnitude of development proposed for the area, the Project's prolonged construction period, and the lack of certainty about the timing of the projects in the area, significant Project-related and significant Project contributions to cumulative traffic and circulation impacts could occur on some roadways, such as U.S. 101, Cesar Chavez Street, Evans Avenue, Harney Way, and Bayshore Boulevard. Cumulative impacts would include construction detours and increased travel times, although the extent and duration of delay would vary depending on individual driver’s origin and destination, time of travel and use of alternate routes. Implementation of individual traffic control plans would minimize impacts associated with each project and reduce each project’s contribution to cumulative impacts in overlapping areas. However, some disruption and increased delays could still occur even with implementation of traffic control plans, and it is possible that significant construction-related traffic impacts on local and regional roadways could still occur.

Project Mitigation Measure 16: The Project Applicant shall develop and implement a Candlestick Point–Hunters Point Shipyard Phase II Construction Traffic Management Program to minimize impacts of the Project and its contribution to cumulative impacts related to construction activities and construction traffic. The program shall provide necessary information to various contractors and agencies as to how to maximize the opportunities for complementing construction management measures and to minimize the possibility of conflicting impacts on the roadway system, while safely accommodating the traveling public in the area. The program shall supplement and expand, rather than modify or supersede any manual, regulations, or provisions set forth by SFMTA, DPW or other City departments and agencies.

Preparation of the Construction Management Program shall be the responsibility of the Project Applicant, and shall be reviewed and approved by SFMTA and DPW prior to initiation of construction. The Project Applicant shall update the program prior to approval of development plans for Phase 2, Phase 3 and Phase 4 of construction to reflect any change to Project development schedule, reflect transportation network changes, to update status of other development construction activities, and to reflect any changes to City requirements.

The program shall:

- Identify construction traffic management practices in San Francisco, as well as other jurisdictions that although not being implemented in the City could provide useful guidance for a project of this size and characteristics.
- Describe procedures required by different departments and/or agencies in the City for implementation of a construction management plan, such as reviewing agencies, approval process, and estimated timelines.
- Describe coordination efforts associated with the Navy remediation efforts and scheduling regarding construction vehicle routing via the Crisp gate.
- Identify construction traffic management strategies and other elements for the Project, and present a cohesive program of operational and demand management strategies designed to maintain acceptable levels of traffic flow during periods of construction activities in the Bayview Hunters Point area. These could include construction strategies, demand management strategies, alternate route strategies, and public information strategies.
- Coordinate with other projects in construction in the immediate vicinity, so that they can take an integrated approach to construction-related traffic impacts.
- Present guidelines for selection of construction traffic management strategies.

Implementation of Project Mitigation Measure 16 would help minimize the Project construction-related transportation impacts, and the Project’s contribution to cumulative-construction related transportation impacts. However, some disruption and increased delays could still occur even with implementation of Mitigation Measure 16, and it is possible that significant construction-related transportation impacts on local and regional roadways could still occur. Localized construction-related transportation impacts would therefore remain *significant and unavoidable*.

Project Variants: Construction activities associated with the Variant 1 and Variant 2 would be similar to the Project. These variants do not include construction of a new stadium at Hunters Point Shipyard, instead assume an additional 2,500,000 square feet of research and development uses under Variant 1, and reallocation of 1,350 residential units from Candlestick Point to Hunters Point Shipyard under Variant 2. Depending on the phasing of the additional development, the Variants 1 and 2 may result in fewer construction traffic impacts between future years 2012 and 2017 when the new stadium is proposed to be constructed, and somewhat greater impacts in the years the additional R&D space or housing units would be constructed. Implementation of a traffic control plan would reduce the project's contribution to significant cumulative impacts of overlapping construction traffic. However, as with the Project, cumulative transportation impacts associated with construction activities would be considered *significant and unavoidable.*

Implementation of Project Mitigation Measure 16 would be applicable to Project Variants 1 and 2. A Hunters Point Shipyard – Candlestick Point Construction Traffic Management Program would help minimize the Project Variants' construction-related transportation impacts and contribution to cumulative-construction related transportation impacts. However, since some disruption and increased delays could still occur even with implementation of the mitigation measure, and it is possible that significant construction-related transportation impacts on local and regional roadways could still occur. Localized construction-related transportation impacts would therefore remain *significant and unavoidable.*

6.10.2 Alternatives to the Project

Alternative 1 – No Project: Construction activities associated with Alternative 1 would be less than the Project. Alternative 1 assumes buildout of Hunters Point Shipyard Phase II per the Hunters Point Shipyard Redevelopment Plan and EIR (February 2000) and subsequent addendums dated November 19, 2003 and July 13, 2006. Under Alternative 1, the existing stadium would remain and no construction activities would occur within Candlestick Point. Due to the reduced level of development anticipated for Hunters Point Shipyard construction impacts associated with Alternative 1 would be *less than significant*.

Alternative 2 – No Bridge: The Alternative 2 development program is the same as the Project; however, Alternative 2 would not include construction of the Yosemite Slough bridge. Therefore, Alternative 2 would not include the construction impacts associated with the bridge and access roads (proposed to occur between 2015 and 2017). All other construction activities and impacts would be the same as described for the Project above. As with the Project, cumulative traffic impacts during construction would be considered *significant.*

Project Mitigation Measure 16 would be applicable to Alternative 2. Implementation of this measure would help minimize Alternative 2's construction-related transportation impacts, and contribution to cumulative-construction related transportation impacts. However, since some disruption and increased delays could still occur even with implementation of traffic control plans, and it is possible that significant construction-related transportation impacts on local and regional roadways could still occur. Localized construction-related transportation impacts would therefore remain *significant and unavoidable.*

Alternative 3 – 49ers stay at Candlestick: Construction activities associated with Alternative 3 would be less than for the Project within the Candlestick Point area. Construction within Hunters Point Shipyard would be similar to the Project; however, 1,350 residential units would be developed within Hunters Point Shipyard. Within Candlestick Point the existing stadium would remain, and only 1,210 residential units would be constructed. Overall construction activities and impacts would be somewhat less than identified for the Project, however, as with the Project cumulative traffic impacts during construction would be *significant*.

Project Mitigation Measure 16 would be applicable to Alternative 3. Implementation of this measure would help minimize Alternative 3's construction-related transportation impacts, and contribution to cumulative-construction related transportation impacts. However, since some disruption and increased delays could still occur even with implementation of traffic control plans, and it is possible that significant construction-related transportation impacts on local and regional roadways could still occur. Localized construction-related transportation impacts would therefore remain *significant and unavoidable.*

Alternative 4 – Lesser Build: Alternative 4 assumes a general reduction in development as compared to the Project (approximately a 30 percent reduction), and therefore construction activities and impacts would be similar to the Project, however, the extent and duration would likely be somewhat less than identified for the Project. As with the Project, cumulative traffic impacts during construction would be *significant*.

Project Mitigation Measure 16 would be applicable to Alternative 4. Implementation of this measure would help minimize Alternative 4's construction-related transportation impacts, and contribution to cumulative-construction related transportation impacts. However, since some disruption and increased delays could still occur even with implementation of traffic control plans, and it is possible that significant construction-related transportation impacts on local and regional roadways could still occur. Localized construction-related transportation impacts would therefore remain *significant and unavoidable.*

Alternative 5 – Park Agreement: The Alternative 5 development program is similar to Project Variant 2, which assumes 1,350 more residential units in Hunters Point Shipyard rather than in Candlestick Point. Alternative 5 does not include construction of a new stadium or a Yosemite Slough bridge, and therefore construction activities associated with these elements would not occur. As with the Project, cumulative traffic impacts during construction would be *significant.* As with the Project, cumulative traffic impacts during construction would be considered *significant.*

Project Mitigation Measure 16 would be applicable to Alternative 5. Implementation of this measure would help minimize Alternative 5's construction-related transportation impacts, and contribution to cumulative-construction related transportation impacts. However, since some disruption and increased delays could still occur even with implementation of traffic control plans, and it is possible that significant construction-related transportation impacts on local and regional roadways could still occur. Localized construction-related transportation impacts would therefore remain *significant and unavoidable.*

Appendix A4 Fehr & Peers, Roadway and Transit Phasing Plan, March 17, 2010

FEHR & PEERS
TRANSPORTATION CONSULTANTS

MEMORANDUM

Date: March 17, 2010

To: Candlestick Point / Hunters Point Shipyard Phase II Development Plan Team

From: Chris Mitchell, PE

Subject: Roadway and Transit Phasing Plan

SF08-0407

This memorandum is intended to summarize the roadway and transit service improvement phasing plan previously developed as part of the Project's Draft Infrastructure Plan. Further, this memo demonstrates the flexibility of the phasing plan to accommodate reasonable changes without creating a mis-match between the level of roadway and transit improvements constructed and the amount of development provided.

ROADWAY IMPROVEMENTS

The overall phasing plan calls for certain on- and off-site improvements to be constructed based on certain levels of development. First, specific auto trip generation rates were derived for each land use proposed by the Project, based on the forecasts in the *Candlestick Point – Hunters Point Shipyard Phase II Development Plan Transportation Study (LCW Consulting, Fehr & Peers, and CHS Consulting Group, November 2009)* ("Transportation Study"). **Tables 1 and 2** below present the effective automobile trip generation rates for each of the major land uses within the Candlestick Point and Hunters Point Shipyard development sites, respectively.

For those improvements that are required to increase capacity to accommodate Project traffic, the amount of traffic generated by the Project (and a proportional share of background traffic growth based on the Project's Transportation Study) that would cause facilities to deteriorate from acceptable levels of service (LOS D or better) to unacceptable levels of service (LOS E or F) was identified. That amount of traffic was deemed the "trigger" point at which improvements would be required to be implemented. Other improvements, such as streetscape enhancements and bicycle/pedestrian improvements would be implemented roughly at the same time as nearby development parcels were constructed, or based on the "Adjacency Principle" as described in the project's Infrastructure Plan.

Tables 3 and 4 present the implementation "triggers" for intersection and roadway segment improvements, respectively, for the Candlestick Point site. **Tables 5 and 6** present similar information for the Hunters Point Shipyard site. As shown, the key triggers for most improvements are construction of certain parcels, such as the Hunters Point Stadium. In other cases, the improvements are required based on a certain level and type of development that is forecasted to produce a certain amount of auto demand. As a result of this approach, the infrastructure improvements will be timed to match the appropriate level of development, regardless of whether changes are made to the current phasing plan.

Table 1
Effective PM Peak Hour Vehicle Trip Generation Rates – Candlestick Point

Land Use	Amount Provided	Unit	Effective PM Peak Hour Trip Generation Rate (Auto Trips Per Unit of Development)[a]
Residential	7,594	Dwelling Units	0.28
Retail	760	Ksf	3.22
Hotel	220	Rooms	0.32
Office	150	Ksf	1.25
Park	105	Acres	0.04
Community Services	50	Ksf	1.42

SOURCE: Fehr & Peers, 2009.

a. The effective rates are the total number of person trips forecasted to be generated by each use, with the mode split forecasts developed as part of the project's transportation impact study. Overall, the site was projected to experience a reduction, compared to standard rates from *Trip Generation* (ITE, 2007), of 32 percent based on the scale of development, the mix of uses, and the bicycle- and pedestrian-oriented design. For purposes of developing this table, the reduction was applied evenly to each use. Further, the number of auto trips generated per unit of development is dependent on both the size of development and the mix of uses proposed. As the project uses change, the vehicle trip generation rates per unit of development may not be constant. Thus, the rates presented in this table should be used cautiously.

Table 2
Effective PM Peak Hour Vehicle Trip Generation Rates – Hunters Point Shipyard

Land Use	Amount Provided	Unit	Effective PM Peak Hour Trip Generation Rate (Auto Trips Per Unit of Development)[a]
Residential	2,650	Dwelling Units	0.28
Retail	125	Ksf	2.57
R&D	2,500	Ksf	0.38
Stadium/Artists	--	--	--
Park	232	Acres	0.03
Community Services	50	Ksf	1.42

Further, the number of auto trips generated per unit of development is dependent on both the size of development and the mix of uses proposed. As the project uses change, the vehicle trip generation rates per unit of development may not be constant. Thus, the rates presented in this table should be used cautiously.

a. Refer to Figure 2.1.2A and 5.4.1 for configuration of Yosemite Slough Bridge.

b. The isolated intersection analysis conducted for this study shows that the two intersections along Harney Way would operate acceptably with the near-term configuration even with full buildout of the project. However, because Harney Way is part of a complex series of roadway improvements and due to the inherent uncertainty in traffic forecasts, a study will be conducted prior to construction of each development phase to determine whether conditions are better or worse than projected. The results of that study will indicate whether additional development can be accommodated under the near-term configuration while maintaining acceptable LOS or whether widening is required.

a. The Project will reconfigure the intersection by removing the southwest leg of Crisp Avenue and creating limited access for the eastern block of Palou Avenue. The Crisp Avenue westbound approach, which is a Project roadway, would be restriped to provide two approach lanes, a left turn lane and a shared left/through/right lane. The Project will also reconfigure the northbound Griffith Street approach to provide two lanes, a shared left/through/right turn lane and a dedicated right turn lane. The Project will also reconfigure the eastbound approach on Palou Avenue to provide two approach lanes, a left turn lane and a shared through/right turn lane.

b. The Project will reconfigure Carroll Avenue to provide two travel lanes and a bicycle lane in each direction. This will allow for a shared left turn and through lane, and a shared through and right turn lane at both the east- and westbound approaches. The southbound approach will be reconfigured to allow for two approach lanes: a left turn lane, and a shared through and right turn lane. The reconfiguration of the southbound approach will require displacement of about 200 feet of on-street parking/loading on the west side of Ingalls Street.

c. The Project will reconfigure the westbound approach of Thomas Avenue to Ingalls Street to provide two lanes, a left turn lane, and a shared through and right turn lane. Thomas Avenue will be reconfigured to provide two travel lanes in each direction and on-street parking on both sides of the street.

d. The Project will reconfigure the existing three travel lanes on Evans Avenue in both the eastbound and westbound approaches to provide a shared through/left turn lane, a through lane, and a right turn lane. The Project will also reconfigure the southbound approach on Jennings Street to provide a southbound left turn pocket, a shared southbound through lane, and a right turn lane.

e. Reconfigure the southbound approach to the intersection to provide one dedicated left-turn lane and one dedicated right turn lane. City is currently evaluating the feasibility of this mitigation measure.

f. Assumes other background traffic increases as same rate as buildout of the Project.

g. Combined total from CP and HP

TRANSIT PHASING

The transit phasing plan has been developed using a similar approach to the roadway phasing plan. However, in contrast to the roadway plan, which was designed to ensure that roadway facilities projected to operate at LOS D or better in the Project's Transportation Study remained at acceptable levels of service throughout the development process, the transit phasing has been designed to ensure that the level of transit service provided is generally substantially greater than the Project's transit demand. This will ensure that the Project maintains its "transit orientation" throughout the development horizon. Tables 7 and 8 present the effective transit trip generation rates per unit of land use for the Candlestick Point and Hunters Point Shipyard sites, respectively.

Table 7 Effective PM Peak Hour Transit Trip Generation Rates – Candlestick Point			
Land Use	**Amount Provided**	**Unit**	**Effective PM Peak Hour Trip Generation Rate (Transit Trips Per Unit of Development)**
Residential	7,594	Dwelling Units	0.13
Retail	760	Ksf	0.95
Hotel	220	Rooms	0.15
Office	150	Ksf	0.64
Park	105	Acres	0.02
Community Services	50	Ksf	0.72

Table 8 Effective PM Peak Hour Transit Trip Generation Rates - Hunters Point Shipyard Phase II			
Land Use	**Amount Provided**	**Unit**	**Effective PM Peak Hour Trip Generation Rate (Transit Trips Per Unit of Development)**
Residential	2,650	Dwelling Units	0.13
Retail	125	Ksf	0.75
R&D	2,500	Ksf	0.19
Stadium/Artists	--	--	--
Park	232	Acres	0.02
Community Services	50	Ksf	0.72

Table 9 presents the various levels of transit service expected to be provided at the site throughout various points of development, and the associated transit trip generation expected to "trigger" those levels of transit service. As shown, generally, each transit route would be extended into the site at approximately 20 percent buildout of Major Phase 1 (for routes serving Hunters Point Shipyard) or Major Phase 2 (for routes serving Candlestick Point). Service would be gradually increased until routes reach their maximum expected service frequencies at 50 percent buildout of the respective Major Phases in most cases.

SUMMARY

Based on this approach, the roadway and transit phasing would be tied to specific levels of development, such that if development happened more quickly or slowly than predicted, or if uses that generate more trips were initiated sooner than expected, the appropriate roadway infrastructure and transit service would be in place to accommodate the associated travel demand.

We hope this has clarified the approach to phasing, and demonstrated the flexibility of the phasing plan to accommodate reasonable modifications to development timing. Please note that this information has been included in the Project's Draft Infrastructure Plan, which is currently under review by various City agencies. As a result, based on comments from the City, some of the triggers in this plan may be revised; however, we do not expect the underlying principle of triggers based on expected travel demand (as opposed to specific years) to be modified.

Table 9 - Transit Improvement Phasing

Improvement	Headway (min.)	One-Way Capacity Serving Project Site (pax/hr)	Stadium Option		Non-Stadium Option

	5	768	2	838 [2]	2	838 [2]
Construct Hunters Point Shipyard Transit Center	N/A	N/A	1	Construction of HPS Stadium	1	288 [5]

Notes:

General: Note that triggers are based on total site transit trip generation; only a fraction of the "trigger" amount will travel on each transit route.

1. Initial route extensions based on 20% of buildout of Major Phase (based on Stadium Option land uses)

2. Based on 50% buildout of Major Phase (based on Stadium Option land uses)

3. Based on initiation of Major Phase. In the case of the CPX, this is because completion of Major Phase 1 will include some residential development that could be served by the CPX, but not likely enough until full buildout of Major Phase 1. In the case of the 48-Quintara, the route would be extended as part of the TEP. Initial route will depend on which streets are constructed.

4. Includes total of trips generated by CP and HP. In the case of the 28L, this means 20% buildout of Major Phase II.

5. Under Non-Stadium Option, implementation of Hunters Point Transit Center based on service improvements to HPX, 48-Quintara, and 44-O'Shaughnessy.

Subject: Updated Project Phasing Effect on Air Quality and Climate Change Analyses
Candlestick Point-Hunter's Point Shipyard Phase II Development Plan

---

On March 22, 2010, MACTEC, on behalf of Lennar Urban, provided ENVIRON with a comparison of phasing for construction activities on each sub-phase of the Candlestick Point-Hunter's Point Shipyard Phase II Development Plan ("Project"), included here as Attachment 1. Per your request, we have evaluated the impacts of the revised phasing on the air quality and climate change analyses we conducted as part of the Project's Draft Environmental Impact Report (DEIR).

Under the revised phasing schedule virtually all sub-phases start at the same time or later than that designated in the DEIR and in most cases, construction activities on each sub-phase will start later than what was evaluated under the DEIR. Based on the March 22 comparison, the only exceptions are Building 101 Artist Studios, a subset of the original HP-07 sub-phase, and a portion of the original CP-11 sub-phase known as the "Last Port" on the far eastern end of Candlestick Point. As shown in the attached phasing map (Attachment 2), Building 101 is located on the central portion of the Hunter's Point Shipyard (HPS), to the northeast of the stadium site. The Last Port is located on the eastern shore of Candlestick Point (CP),

Under the DEIR, construction activities for HP-07 were scheduled to commence in 2012; however, under the current phasing, construction activities at Building 101 are anticipated to start in 2011, one year earlier. Construction activities at the Last Port were scheduled to commence in 2022; however, under the current phasing, construction activities at the Last Port are anticipated to start in 2021, one year earlier. We also understand that while the phasing may shift, there will be no changes to the number of equipment resources required to complete horizontal and vertical construction for each subparcel area of the Project.

DPM emissions (as compared to the DEIR) would occur earlier as a result of construction activities at Building 101, and at the Last Port, however as both of these locations on HPS and CP are to the east (and therefore downwind) of the maximally exposed individual residents and workers identified in App. H1-I, the DPM associated with the construction activities, at these sites contribute little, if any, to the overall impacts at the maximally exposed receptors.

As discussed in the analysis we conducted as part of the DEIR (DEIR Appendix H1, Attachment I: Human Health Risk Assessment of Construction-Related Diesel Particulate Matter, herein referred to as “App. H1-I”), the California Resources Board (CARB) is currently in the process of implementing an In-Use Off-Road Diesel Vehicle Rule which sets increasingly stringent fleet-average emission rates year-by-year through 2021. Additionally, mitigation measure AQ-2.1 requires the Project to utilize construction equipment with emission control technology such that 50% of the fleet will meet USEPA Tier 2 standards outfitted with California ARB Level 3 VDECS (Verified Diesel Emission Control Strategies) for particulate matter control (or equivalent) during the first two years of construction activities, increasing to 75% of fleet in the third year and 100% of the fleet starting in the fourth year and for the duration of the Project. Because of the CARB rule and mitigation measure AQ-2.1, any delay in the onset in construction activities will result in lower diesel particulate matter (DPM) emissions than if the Project had started construction activities on the schedule initially considered in the DEIR. Because the duration of the project has been extended, there will be additional field management workers providing construction oversight and an increase in the use of small trucks because of these activities, however, construction oversight does not include the use of diesel fueled equipment and therefore will not result in any additional DPM emissions.

As such, the carcinogenic and noncarcinogenic health risks posed by DPM emissions during construction activities associated with development of Project with mitigation will continue to be below the risk thresholds, this impact will continue to be less than significant with mitigation.

Some of the hauling truck trips listed in the DEIR were not included in the original construction calculations. Attachment 3 shows the revised GHG construction emissions incorporating these trips along with the revised phasing information. This revised calculation shows an increase of 23,687 tonnes of GHG emissions compared to what had previously been reported. There is no threshold for construction emissions and the increase would continue to be insignificant in relation to the amount of construction GHG emissions that occur annually in the state and San Francisco Bay Area. Therefore, the conclusions reached in the DEIR with respect to climate change impacts remain valid.

In summary, as the equipment resources will not increase and the phasing of all sub-phases has generally been shifted to later years when lower emission construction equipment are available, the overall impacts from the revised phasing will be the <u>same as or negligibly higher</u> (for greenhouse gas emissions) or <u>lower</u> (for DPM) than those considered in the DEIR.

Notes:

1. The equipment resources required to complete horizontal and vertical construction of the project for each subparcel area have not changed.

2. While the quantity of construction workers required to complete horizontal and vertical construction for each subphase remains the same; the overall number of workers for the project has gone up due to the extended length of the project. With additional years of work comes more field management workers and more mobilizations and demobilizations. Even though this results in more workers the average length of time that they will be working each year has decreased.

ONSITE CONSTRUCTION PHASING BOUNDARY

STRUCTURAL SHORELINE IMPROVEMENTS (COLOR BASED ON PHASE OF COMPLETION)

NOTES:

1. PARK LANDSCAPING AND VERTICAL DEVELOPMENT IS NOT INCLUDED IN THE PHASING PLAN BUT IS TYPICALLY CONSTRUCTED WITHIN 2-3 YEARS OF THE HORIZONTAL INFRASTRUCTURE COMPLETION.
2. THE EQUIPMENT RESOURCES REQUIRED TO COMPLETE HORIZONTAL AND VERTICAL CONSTRUCTION OF THE PROJECT FOR EACH SUBPARCEL AREA HAVE NOT CHANGED.
3. WHILE THE QUANTITY OF CONSTRUCTION WORKERS REQUIRED TO COMPLETE HORIZONTAL AND VERTICAL CONSTRUCTION FOR EACH SUBPHASE REMAINS THE SAME; THE OVERALL NUMBER OF WORKERS FOR THE PROJECT HAS GONE UP DUE TO THE EXTENDED LENGTH OF THE PROJECT. WITH ADDITIONAL YEARS OF WORK COMES MORE FIELD MANAGEMENT WORKERS AND MORE MOBILIZATIONS AND DEMOBILIZATIONS. EVEN THOUGH THIS RESULTS IN MORE WORKERS THE AVERAGE LENGTH OF TIME THAT THEY WILL BE WORKING EACH YEAR HAS DECREASED.

Revised Construction GHG Emission Tables

Note: tables are numbered to correspond to ENVIRON's original technical report (*Climate Change Technical Report Candlestick Point–Hunters Point Shipyard Phase II Development Plan, October 2009*) which is Appendix S of the DEIR

Table 3-3
GHG Emissions from Worker Commutes
Candlestick Point-Hunters Point Shipyard Phase II Development Plan
San Francisco, California

Location	Worker Round Trips[1]	Trip Length [2]	EF^3_{LDA}		EF_{LDT2}		CO_2 Emissions[4]		Total CO_2 Emissions	Total CO_2e Emissions[5,6]
			Running	Startup	Running	Startup	Running	Startup		
		(miles)	(g/mile)	(g/trip)	(g/mile)	(g/trip)	(tonne)			
Candlestick Point	233,513	29.8	340	209	424	259	2,658	109	2,768	2,913
Hunter's Point Shipyard	219,130	29.8	340	209	424	259	2,494	103	2,597	2,734
Total									**5,365**	**5,647**

Notes:
1. Worker trips were calculated based on the average number of workers and duration of each project phase as provided by Mactech.
2. The roundtrip length is 29.8 miles based on the Home-Work trip lenth for San Francisco provided by Fehr and Peers.
3. The running emission factor depends on the speed of the vehicle. The emission factor used in this calculation refers to the URBEMIS 9.2.4 default vehicle speed: 30 MPH.
The startup emission factor depends on the settling period before driving. The startup emissions were conservatively calculated based on a 12 hour wait before each engine startup.
4. GHG Running Emission calculation formula: GHG Emission = Roundtrips x Trip Length x $(0.5 \times EF_{LDA} + 0.5 \times EF_{LDT2})_{Running}$
GHG Startup Emission calculation formula: GHG Emission = Worker Trips x $(0.5 \times EF_{LDA} + 0.5 \times EF_{LDT2})_{Startup}$
URBEMIS 9.2.4 assumes that LDA and LDT have a 50:50 mixing ratio.
5. $CO_2e = CO_2 / 0.95$: The United States Environmental Protection Agency (USEPA) recommends assuming that CH_4, N_2O, and HFCs account for 5% of GHG emissions from on-road vehicles, taking into account their global warming potentials.
6. The emission factor values of calendar year 2011, the anticipated start date of the project, were used for all calculations.

Abbreviations:
CH_4 - methane
CO_2 - carbon dioxide
CO_2e - carbon dioxide equivalent
g - gram
GHG - Greenhouse Gas
EF - Emission Factor
HFC - hydro fluorocarbons
hr - hour
LDA - Light Duty Auto
LDT - Light Duty Truck
MPH - Miles per hour
URBEMIS - Urban Emissions Model

Table 3-4
GHG Emissions from Hauling Trips
Candlestick Point-Hunters Point Shipyard Phase II Development Plan
San Francisco, California

Location	Hauling Round Trips[1]	Trip Length[2]	EF^{3}_{HHD}		CO_2 Emissions[4]		Total CO_2 Emissions	Total CO_2e Emissions[5,6]
			Running	Startup	Running	Startup		
		(miles)	(g/mile)	(g/trip)	(tonne)			
Candlestick Point	121,319	14.6	1,610	389	5,703	94	5,798	6,103
Hunter's Point Shipyard	362,306	14.6	1,610	389	17,033	282	17,314.6	18,226

Notes:
1. Hauling trips are calculated based on information provided by Mactech.
2. Trip length is based on URBEMIS default for San Francisco consumer non-work of 7.3 miles one way.
3. The running emission factor depends on the speed of the vehicle. The emission factor used in this calculation refers to the URBEMIS 9.2.4 default vehicle speed: 30 MPH.
   The startup emission factor depends on the settling period before driving. The startup emissions are conservatively calculated based on a 12 hour wait before each engine startup.
4. URBEMIS 9.2.4 assumes that all haulers drive heavy-heavy-duty trucks.
   CO_2 Running Emission calculation formula: CO_2 Emission = trips x trip length x $EF_{HHD\text{-}Running}$
   CO_2 Startup Emission calculation formula: CO_2 Emission = Hauler Trips x $EF_{HHD\text{-}Startup}$
5. $CO_2e = CO_2 / 0.95$: The United States Environmental Protection Agency (USEPA) recommends assuming that CH_4, N_2O, and HFCs account for 5% of GHG emissions from on-road vehicles, taking into account their global warming potentials.
6. The emission factor values of calendar year 2011, the anticipated start date of the project, are used for all calculations.

Abbreviations:
CH_4 - methane
CO_2 - carbon dioxide
CO_2e - carbon dioxide equivalent
g - gram
GHG - Greenhouse Gas
EF - Emission Factor
GVW - Gross Vehicle Weight
HFC - Hydro Fluorocarbons

Appendix B Bayview Jobs, Parks, and Housing Initiative (Proposition G), November 20, 2007

SAN FRANCISCO
FILED

2007 NOV 20 PM 3:05

DEPARTMENT OF ELECTIONS

BAYVIEW JOBS, PARKS AND HOUSING INITIATIVE

Section 1. Title.

This Initiative shall be known and may be cited as the "Bayview Jobs, Parks and Housing Initiative."

Section 2. Findings.

The People of the City and County of San Francisco (the "City") make the following findings:

(a) Improving the quality of life of the residents of the Bayview Hunters Point community (the "Bayview") is one of the City's highest priorities. Expediting the revitalization of the Bayview will provide long overdue improvements that also will benefit the City as a whole. Both the Hunters Point Shipyard (the "Shipyard") and Candlestick Point are part of the Bayview and together make up the largest area of underused land in the City. Combining planning and development for the remainder of the Shipyard that is not already underway (the "Shipyard Property") and Candlestick Point as an integrated revitalization project will provide hundreds of acres of much needed public parks and public open space, significant jobs and economic development opportunities, particularly for residents and businesses of the Bayview, and a substantial number of new affordable and market-rate housing units, including a mix of rental and for-sale units. Integrated development of these areas can also provide a world-class site for a new stadium for the San Francisco Forty Niners (the "49ers"), including improvements in transportation and other infrastructure. The Shipyard Property and Candlestick Point, subject to any final adjustments as described in Section 9, are referred to in this Initiative as the "Project Site." A map of these two areas is attached for reference as Exhibit A.

(b) The Shipyard was once a thriving, major maritime industrial center that employed generations of Bayview residents. Following World War II, the Shipyard was a leading hub of employment for the Bayview, providing logistics support, construction and maintenance for U.S. naval operations. At its peak, the Shipyard employed more than 17,000 civilian and military personnel, many of whom lived in the adjacent Bayview neighborhood. In 1974, the United States Department of the Navy (the "Navy") ceased operation of the Shipyard. The closure of the Shipyard had profoundly negative impacts on the economic base of the Bayview. In 1993, the United States Congress passed special legislation that gave the Navy authority to convey the Shipyard to the City.

(c) Candlestick Point includes: (i) the Alice Griffith Housing Development, also known as Double Rock ("Alice Griffith Housing"), which, although in need of repair or replacement for its residents, has few governmental resources for those repairs; (ii) the Candlestick Point State Recreation Area, much of which is severely under-improved, under-utilized and under-funded, and the restoration and improvement of which has been a long-term goal of the Bayview, the City and the State; and (iii) the City-owned stadium, named Monster Park, that is nearing the end of its useful life.

(d) The Yosemite Slough, which lies between Candlestick Point and the Shipyard Property, was once a pristine wetland area but has been subject to environmental distress caused by illegal dumping and neglect. The California State Parks Foundation and California State Parks are in the process of implementing the Yosemite Slough Restoration plan, which will reopen the Yosemite Slough to public access, create the largest contiguous wetland area in the City and make the wetlands pristine again.

(e) The City's lease of Monster Park to the 49ers is scheduled to expire in May 2013, although the 49ers have the right to extend that date by exercising certain extension options. In the fall of 2006, the 49ers announced their intention to explore relocating to Santa Clara. Since then, the 49ers have continued to evaluate the feasibility of building a new stadium both there and in San Francisco. Regardless of the 49ers' final decision, the City would like to proceed with the integrated revitalization of the Project Site, with or without a new stadium.

(f) Community and elected officials and San Francisco voters have consistently expressed their support for revitalizing the Project Site and demanded accountability from the federal government to clean up the Shipyard. In July 1997, the Board of Supervisors adopted and the Mayor approved a redevelopment plan for the Shipyard (the "Shipyard Redevelopment Plan"), and in June 2006, after a ten-year planning process, the Board of Supervisors adopted and the Mayor approved a redevelopment plan covering large portions of the Bayview, including most of Candlestick Point (the "Bayview Redevelopment Plan"). Both those redevelopment plans are designed to create economic development, affordable housing, parks and open space and other community benefits by developing underused lands like those comprising the Project Site. More recently, in May 2007 the Board of Supervisors and the Mayor approved a resolution endorsing a Conceptual Framework for the integrated development of the Project Site with a major mixed-use project, including hundreds of acres of new waterfront parks and open space, thousands of new units of housing, a robust affordable housing program, extensive job-generating retail and research and development space, permanent space for the artist colony that exists in the Shipyard and a site for a new stadium for the 49ers on the Shipyard Property.

(g) In furtherance of the Board's May 2007 resolution and in compliance with the California Environmental Quality Act ("CEQA"), on August 31, 2007 the Redevelopment

Agency of the City and County of San Francisco (the "Agency") and the San Francisco Planning Department published a Notice of Preparation of an Environmental Impact Report (the "NOP") and solicited public participation in determining the scope of an Environmental Impact Report ("EIR") for the development of the Project Site. Both the NOP and the Conceptual Framework contemplate that integrated development of the Project Site should proceed whether or not the 49ers elect to build a new stadium on the Project Site and contemplate that, if a new 49ers' stadium is not constructed because the 49ers move to Santa Clara or elsewhere, other uses, including additional green office, science and technology, research and development and industrial space or housing–or a combination of those uses–will be developed on the Project Site instead of the stadium and associated parking.

Section 3. Purpose.

In light of the findings set forth in Section 2 above, the purpose of this Initiative is to express the voters' intent that the City and other applicable agencies move forward with the revitalization of the Project Site to provide tangible benefits for the Bayview in particular and the City generally and a new stadium site for the 49ers. Toward that end, the voters wish to repeal Propositions D and F, establish policies to guide the revitalization planning efforts, authorize the lease or conveyance of City-owned park land at Candlestick Point under certain conditions and encourage all local, state and federal agencies with applicable jurisdiction to take all steps necessary to proceed with the development of the Project Site consistent with this Initiative.

More specifically, the People of the City declare their purposes in enacting this Initiative to be as follows:

(a) Improving and creating additional public parks and public open space in the Bayview, particularly along the waterfront. This Initiative will permit the City's park property at Candlestick Point, including land currently used for Monster Park and associated surface parking, to be transferred for development consistent with the objectives described in Section 4 below. At the same time, this Initiative requires that any park property transferred by the City be replaced with other public park and public open space property of at least the same size in the Project Site, all as provided in Section 6 below. It also encourages the improvement of the Candlestick Point State Recreation Area and the extension of the Bay Trail along the Project Site's waterfront.

(b) Improving the quality, availability and affordability of housing in the Bayview. This Initiative encourages the development of new housing in the Project Site with a mix of rental and for-sale units, both affordable and market-rate.

(c) Improving the quality of Alice Griffith Housing. This Initiative encourages the rebuilding of Alice Griffith Housing as a part of the development of the Project Site, subject to consultation with the residents of Alice Griffith Housing and to approval by applicable government agencies. If such approvals are obtained and Alice Griffith Housing is included in the integrated development project, such development must be consistent with the objectives in subsection (3) of Section 4 below that relate to Alice Griffith Housing.

(d) Elevating the Project Site into a regional center for green development and the use of green technology. This Initiative encourages the use of green building construction practices and the incorporation of environmental sustainability principles in the design and development of the Project Site, including the use of renewable energy. In addition, this Initiative encourages the inclusion of green development projects on the Project Site, such as green office, research and development or industrial projects, including a green office, science and technology, biotechnology or digital media campus.

(e) Providing commercial opportunities and jobs for the residents of the Bayview. This Initiative encourages and anticipates construction and permanent jobs for local economically disadvantaged residents, particularly in the Bayview, and a range of economic development opportunities, including retail and commercial space.

(f) Encouraging the 49ers to remain in San Francisco. The 49ers are an important source of civic pride and have contributed to the Bayview. They are closely identified with San Francisco, having played in San Francisco since the 1940s and in Candlestick Point since the 1970s. This Initiative encourages the 49ers to remain in San Francisco by providing a world-class site for a new stadium on the Shipyard Property, together with supporting infrastructure.

(g) Repealing the earlier stadium mall framework and financing propositions. In June 1997, the City's voters adopted two ballot measures—Proposition D and Proposition F—relating to stadium and mall development at Candlestick Point. Proposition D authorized the City to use lease financing to borrow up to $100 million toward building a new stadium at Candlestick Point. Proposition F changed various City zoning and other laws so that a new stadium, an entertainment and regional shopping center and new residential developments could be built. In the fall of 2006 the 49ers decided that the proposed stadium did not meet their needs. The plan envisioned by Propositions D and F for a stadium and adjoining retail and entertainment center partially financed through the use of a $100 million bond issuance by the City is no longer viable. Accordingly, this Initiative repeals both Propositions D and F.

Section 4. Policies.

It is the Policy of the People of the City that, consistent with the objectives set forth in this Section 4 and subject to the public review process generally described in Sections 5 and 9 below, the City shall encourage the timely development of the Project Site with a mixed-use project that includes the following major uses, together with supporting transportation and other infrastructure improvements (collectively, the "Project"): (i) over 300 acres of public park and public open space improvements, including the improvement of the existing Candlestick Point State Recreation Area, the establishment of a new State park area on the Shipyard Property, the creation of a number of recreation facilities, sports fields and neighborhood-oriented parks and the extension of the Bay Trail along the waterfront of the Project Site; (ii) between about 8,500 and 10,000 residential housing units across the Project Site, including a mix of rental and for-sale units, both affordable and market-rate; (iii) about 600,000 square feet of regional retail on Candlestick Point and about 100,000 square feet of neighborhood-serving retail on the Shipyard Property; (iv) about 2,000,000 square feet of green office, science and technology, biotechnology or digital media office, research and development and industrial uses on the Shipyard Property and about 150,000 square feet on Candlestick Point, with more of such uses on the Project Site if the stadium is not built on the Shipyard Property; (v) if practicable, a site for an arena or other public performance venue; (vi) if the 49ers and the City determine it is feasible to build a new stadium for the 49ers and the 49ers elect in a timely manner to do so, a site on the Shipyard Property for a new National Football League stadium for the 49ers, including green parking surfaces that would both accommodate parking for stadium events and serve as public playing fields at other times; and (vii) if a new stadium is not built, then additional green office, science and technology, research and development and industrial space, or housing–or a combination of those uses–instead of the stadium and associated parking. Development of the Project Site shall be consistent with the following objectives:

(1) **The integrated development should produce tangible community benefits for the Bayview and the City**, and in so doing should:

- Improve the Candlestick Point State Recreation Area to enhance public access to the waterfront and enjoyment of the Bay.
- Create new public recreational and public open spaces in the Project Site.
- Preserve the shoreline of the Project Site primarily for public park and public open space uses, including an extension of the Bay Trail along the Project Site's waterfront.
- Afford a range of job and economic development opportunities for local, economically disadvantaged individuals and business enterprises, particularly for residents and businesses located in the Bayview.
- Include neighborhood-serving retail.
- Subsidize the creation of permanent space on the Shipyard Property for the existing artists.
- Transform the contaminated portions of the Shipyard Property into economically productive uses or public open space, as appropriate.

- Encourage the timely development of the Project Site and its public benefits, whether or not the 49ers decide to remain in San Francisco, including developing alternate uses for the stadium site on the Shipyard Property that are consistent with the other objectives set forth in this Section 4, but recognizing that the overall financial feasibility of the development of the Project Site and the phasing of the integrated development depends on the 49ers' vacating the current site of Monster Park, whether to a new stadium on the Shipyard Property or elsewhere outside of the Project Site.

(2) **The integrated development should reunify the Project Site with the Bayview and should protect the character of the Bayview for its existing residents**, and in so doing should:

- Foster the creation of strong commercial, institutional, cultural and urban design ties between the development in the Project Site and the Bayview in particular and the City in general.

- Provide automobile, public transportation and pedestrian connections between the Shipyard Property and Candlestick Point to facilitate the integration of the Project Site and reunification with the Bayview.

- Afford substantial affordable housing, jobs and commercial opportunities for existing Bayview residents and businesses.

- Prohibit, in implementing the Project, the use of eminent domain to acquire any property that is currently residentially zoned, is improved with a building that contains one or more legally occupied dwelling units, is a church or other religious institution, or is publicly owned, including, without limitation, property owned by the Housing Authority of the City and County of San Francisco.

(3) **The integrated development should include substantial new housing in a mix of rental and for-sale units, both affordable and market-rate, and encourage the rebuilding of Alice Griffith Housing**, and in so doing should:

- Provide substantial opportunities for new affordable housing that is targeted to the lower income levels of the Bayview population, including new units that are suitable for families, seniors and young adults.

- Include housing at levels dense enough to: create a distinctive urban form and at levels sufficient to make the development of the Project Site financially viable, consistent with the objectives stated in subsection (6) below; attract and sustain neighborhood retail services and cultural amenities; create an appealing walkable urban environment served by transit; help pay for transportation and other infrastructure improvements; and achieve economic and public benefits for the Bayview in particular and the City generally.

- Subject to consultation with Alice Griffith Housing residents and the receipt of all required governmental approvals, rebuild Alice Griffith Housing to provide at least one-for-one replacement units targeted to the same income levels as those of the existing residents and ensure that eligible Alice Griffith Housing residents have the opportunity to move to the new, upgraded units directly from their existing Alice Griffith Housing units without having to relocate to any other area.

- Include a mix of stacked flats, attached town homes and–in appropriately selected locations–low-rise, mid-rise and high-rise towers, to help assure the economic feasibility of the development and provide a varied urban design.

(4) **The integrated development should incorporate environmental sustainability concepts and practices**, and in so doing should:

- Apply sustainability principles in the design and development of public open spaces, recreation facilities and infrastructure, including wastewater, storm water, utility and transportation systems.

- Apply green building construction practices.

- Include energy efficiency and the use of renewable energy.

- Encourage green development projects, such as green office, research and development or industrial projects, including a green technology, biotechnology or digital media campus.

(5) **The integrated development should encourage the 49ers—an important source of civic pride—to remain in San Francisco by providing a world-class site for a new waterfront stadium and supporting infrastructure**, and in so doing should:

- Provide parking, transportation, transit and other infrastructure necessary for the operation of the stadium, including automobile, public transit and pedestrian connections between the Shipyard Property and Candlestick Point in order to facilitate the efficient handling of game day traffic.

- Prohibit the issuance by the City of lease revenue bonds or other debt that will be secured by or repaid from revenues on deposit in the City's General Fund to finance development of the new stadium.

(6) **The integrated development should be fiscally prudent, with or without a new stadium**, and in so doing should:

- Minimize any adverse impact on the City's General Fund relating to the development of the Project Site by relying to the extent feasible on the development to be self-sufficient.

- Promote financial self-sufficiency by: encouraging substantial private capital investment; leveraging land value created through the entitlement process for the Project Site; allowing the City or the Agency, subject to the review process generally described in Section 5 below, to contribute real property in the Project Site, so long as the contribution is linked to the provision of public benefits consistent with the objectives in this Section 4 or to the grant of rights to the City or the Agency to share in surplus revenues from development of the Project Site; and permitting the use of certain tax exempt financing tools such as the allocation of property tax-increment from the Project Site, the issuance of tax allocation bonds based on such increment and the issuance of community facilities (Mello-Roos) bonds secured by private property in the Project Site.

- Allow the Agency to use its city-wide Affordable Housing Fund to help finance affordable housing projects in the Project Site.

- Except as provided immediately above, prohibit the use of property tax increment from any part of a redevelopment area outside of the

Project Site to finance construction of improvements in the Project Site.

- To the extent feasible, use state and federal funds to pay for environmental remediation on the Project Site and help pay for transportation and other infrastructure improvements, and provide ways for other development projects outside the Project Site to pay their fair share for new infrastructure improvements.

Section 5. Governmental and Public Review of Development Plan.

Any development plan proposed for the Project Site, including the Project, will be subject to extensive public review and input. For example, any development plan will require public approvals from the City and the Agency, including conforming amendments to the City's General Plan and the existing Bayview Redevelopment Plan and Shipyard Redevelopment Plan, following environmental review under CEQA. Further, under federal and state laws, aspects of the development plan may also be reviewed by various regional, state and federal agencies, which may include the State Department of Parks and Recreation, the San Francisco Bay Conservation and Development Commission, the State Lands Commission, the State Regional Water Quality Control Board and the Navy.

Section 6. Disposition of City Land at Candlestick Point.

Under San Francisco Charter Section 4.113, the voters of the City approve the following (each a "Permitted Transfer"): (1) the sale, conveyance or lease for non-recreational purposes of any of the park land that is under the jurisdiction of the San Francisco Recreation and Park Commission and located within the boundary of Candlestick Point, including the property currently used in connection with the existing stadium and related parking areas; and (2) the construction, maintenance and use for non-recreational purposes of any structure on such property. Each Permitted Transfer may be free from any restriction that the affected real property be used for park or recreation purposes, so long as: (a) the City's approval of such Permitted Transfer requires a binding obligation to create new public park or public open space land areas, at least equal in size to the real property subject to the Permitted Transfer, that are located in the Project Site; and (b) the Board of Supervisors finds in approving a Permitted Transfer at the conclusion of the review process generally described in Section 5 above, that: (i) new land areas are suitable for public park or public open space and will be dedicated for such uses; and (ii) the Permitted Transfer furthers development of the Project Site consistent with the objectives set forth in Section 4 above. The voters' approvals granted under this Section 6 are not intended to modify or abrogate any existing legal commitment of the City or to limit any other authority to sell, convey, lease or otherwise transfer any other City-owned land in the Project Site or to build, maintain or use any such land or structures on such land under any City ordinance or other applicable law.

Section 7. Repeal of Proposition D.

The approval of the voters to lease-finance a stadium development at Candlestick Point, in principal amount not exceeding $100 million, as more particularly set forth in Proposition D adopted in June 1997, a copy of which is attached for reference as Exhibit B, is repealed in its entirety. Accordingly, the City no longer has voter authority as required under its Charter to issue lease revenue bonds under Proposition D for a stadium development.

Section 8. Repeal of Proposition F.

Proposition F, adopted by the voters on June 3, 1997, a copy of which is attached for reference as Exhibit C, is repealed in its entirety.

Section 9. Implementing Actions.

The People of the City encourage the City, the Agency and other public agencies with applicable jurisdiction to proceed as expeditiously as possible to implement this Initiative, including, but not limited to, adopting land use controls for the Project Site consistent with the objectives set forth in Section 4 above and subject to the review process generally described in Section 5 above.

As a result of the public process generally described in Section 5 above and certain variables, including, for example and without limitation, market changes, economic feasibility and the timing of the 49ers departure from Monster Park, the final development plan for the Project Site may be materially different from the Project and the boundaries of the Project Site may be materially different from those identified on Exhibit A. The People of the City encourage the Board of Supervisors and other public agencies with applicable jurisdiction to approve such final development plans at the conclusion of the review process generally described in Section 5 above, so long as the Board of Supervisors and the Mayor then determine that such plans are generally consistent with the objectives set forth in Section 4 above.

Section 10. Interpretation.

The title of this Initiative and the captions preceding the sections of this Initiative are for convenience of reference only. Such title and captions shall not define or limit the scope or purpose of any provision of this Initiative. The use of the terms "including," "such as" or words of similar import when following any general term, statement or matter shall not be construed to limit such term, statement or matter to the specific items or matters, whether or not language of non-limitation is used. Rather, such terms shall be deemed to refer to all other items or matters that could reasonably fall within the broadest possible scope of such statement, term or matter. The use of the term "or" shall be construed to mean and/or.

Section 11. Severability.

If any provision of this Initiative or any application thereof to any person or circumstance is held invalid, such invalidity shall not affect any provision or application of this Initiative that can be given effect without the invalid provision or application. To this end, the provisions of this Initiative are severable.

EXHIBIT B

PROPOSITION D

SUBMITTING A BALLOT PROPOSITION FOR THIS YEAR'S JUNE 3RD SPECIAL ELECTION, AUTHORIZING THE CITY TO LEASE-FINANCE A STADIUM DEVELOPMENT AT CANDLESTICK POINT, IN PRINCIPAL AMOUNT NOT EXCEEDING $100,000,000, PROVIDED NO CITY TAXES ARE INCREASED OR NEWLY IMPOSED WITHOUT PROPOSITION 218 VOTER APPROVAL; AND FINDING THE LEASE-REVENUE BOND PROPOSITION IS IN CONFORMITY WITH THE EIGHT PRIORITY POLICIES OF PLANNING CODE SECTION 101.1 AND THE CITY'S GENERAL PLAN.

- RESOLVED, That pursuant to Charter Section 9.108, the Board of Supervisors hereby submits to the electorate of the City and County of San Francisco the following proposition:

Shall the City lease-finance a stadium development at Candlestick Point, in principal amount not exceeding $100,000,000, provided no City taxes are increased or newly imposed without Proposition 218 voter approval.

The proposition shall be submitted to the electorate at the Special Election to be held on June 3, 1997. The proposition shall be placed on the ballot as a separate proposition in the form set forth above; and, be it

- FURTHER RESOLVED, That the stadium development shall consist of the development, acquisition and/or construction of the stadium and related infrastructure, facilities, structures, equipment and furnishings, in whole or in part (collectively, the **"Stadium Development"**); and, be it

- FURTHER RESOLVED, That the term "infrastructure" shall mean the physical systems and services which support, in whole or in part, the Stadium Development and its users, including, but not limited to, parking, streets, highways, water systems and sewer systems; and, be it

- FURTHER RESOLVED, That the term "Candlestick Point" shall mean Candlestick Point, the adjacent land and any other lands deemed necessary by the Board of Supervisors for the completion of the Stadium Development; and, be it

- FURTHER RESOLVED, That the authorized principal amount of $100,000,000 shall be used to finance (1) a portion of the total cost of the Stadium Development; (2) cost of issuance; (3) capitalized interest; (4) reserve accounts; and (5) any other related cost designated by the Board of Supervisors; and, be it

- FURTHER RESOLVED, That the City shall not impose any new taxes or increase or extend any existing taxes for the Stadium Development without voter approval to the extent required by Proposition 218 passed by the voters on November 5, 1996; and, be it

• FURTHER RESOLVED, That the Board of Supervisors having reviewed the proposed legislature, finds and declares that the proposed lease-revenue bond proposition is, on balance, in conformity with the General Plan and is consistent with the Eight Priority Policies of the Planning Code Section 101.1 and hereby adopts the findings of the City Planning Department, as set forth in Planning Commission Resolution No. 14295, adopted February 6, 1997 and incorporates said finding by reference; and, be it

• FURTHER RESOLVED, That the City shall not issue the bonds until the following conditions have been negotiated and concluded with the Mayor's Office:

1. The Forty-Niners shall provide a written commitment to the City that it will play all of its home games in the stadium until the retirement of the City's bonds for the Stadium Development.

2. A certification from the Controller that the total net proceeds of bonds available for construction shall not exceed $100,000,000. The City's contribution for construction shall be reduced by any net proceeds received from any tax allocation bonds that the Redevelopment Agency elects to issue based on tax increment generated by the Project.

3. The City determines, through the Mayor's office, that sufficient financial commitments are in place to construct an adjacent retail shopping center.

4. A written commitment to comply with all the requirements of Administrative Code Sections 12B and 12C that are applicable to the Stadium Development, including nondiscrimination in benefits based on domestic partner status.

5. A written commitment to provide an opportunity for 1000 permanent jobs at the Project to recipients of general assistance who become eligible through a training program.

6. A written commitment to use good faith efforts to provide that 50% of the construction jobs will be held by residents of the Bay-View Hunters Point-South Bayshore Community and 25% of permanent jobs available at the Project will be held by the community residents.

7. A written commitment that the City will only be responsible for no more than 50% of football related operations and maintenance expenses of the stadium, based on a budget approved by the City and the Forty-Niners.

8. A written commitment that there will be adequate provision for labor union representation at the project, including a card check neutrality agreement.

9. A written commitment to pay any reduction in property tax revenues due to a reassessment to the extent necessary to service any tax allocation bonds issued for the Stadium Development.

10. The City, through the Mayor's office, has determined that the City's contribution towards construction of the Project will be provided on a 20/80 prorata basis.

11. For purposes of these conditions, Project shall be defined to mean both the Stadium Development and the proposed shopping retail center to be located at Candlestick Point. The Mayor shall deliver a certificate to the Board of Supervisors that the foregoing conditions have been met. Upon the Board of Supervisors approving the issuance of the bonds, such certificate shall be final and conclusive in all respects as to the satisfaction of all the foregoing conditions. Bonds includes bonds, lease-financing arrangements, and certificates of participation.

EXHIBIT C

PROPOSITION F

Be it ordained by the People of the City and County of San Francisco:

Section 1. [Policy, Purpose]

It shall be the Policy of the People that a new professional football stadium, retail shopping and entertainment center, and related open space and parking be constructed, developed and operated at Candlestick Point consistent with the following principles:

The San Francisco Forty Niners are an invaluable source of civic pride and an integral part of San Francisco's image as a world-class city. The City and County of San Francisco must take immediate action to ensure that the Forty Niners have a suitable stadium in which to play their home games after the current lease at the existing stadium known as 3COM Park at Candlestick Point (formerly known as Candlestick Park) expires.

The City and County of San Francisco should have a state-of-the-art professional football stadium suitable for hosting the National Football League's Super Bowl on a regular basis.

Candlestick Point and the surrounding area is the most suitable location within San Francisco for the construction of a new professional football stadium for the San Francisco Forty Niners and retail shopping and entertainment center that will assist in revitalizing the economy of the Bayview-Hunters Point-South Bayshore area and provide jobs.

The stadium shall be designed and constructed by the San Francisco Forty Niners, or an affiliate thereof, or a developer selected by the San Francisco Forty Niners or an affiliate thereof, through a combination of public and private financing.

The stadium shall be constructed in conjunction with the retail shopping and entertainment center.

The City and County of San Francisco shall retain ownership of the land upon which the stadium and retail shopping and entertainment center shall be built.

The City and County of San Francisco shall enter into one or more ground leases with the San Francisco Forty Niners, or an affiliate thereof, or the developer of the stadium and/or retail shopping and entertainment center, selected by the San Francisco Forty Niners or its affiliate, for the stadium and retail shopping and entertainment center site.

Development of the stadium and retail and entertainment center shall incorporate open space and shall be consistent with the purposes of the Candlestick Point State Recreation Area and the recreational opportunities presently available in that area, including shoreline trails and shoreline access to San Francisco Bay.

The existing stadium shall be demolished once the new stadium is completed and ready for occupancy, provided that the Giants baseball team has relocated to a new facility.

The stadium and retail stopping and entertainment center will produce substantial economic and public benefits for San Francisco residents generally and for the residents and business owners of the Bayview-Hunters Point-South Bayshore community specifically.

The stadium and retail shopping and entertainment center, and all related parking, will satisfy any public trust requirements and restrictions applicable to any portion of the site consisting of former tidelands and submerged lands.

Section 2. [Implementation]

Promptly following the effective date of this ordinance, the City and County of San Francisco, through the Board of Supervisors, the Planning Commission, Redevelopment Agency and other appropriate officials, boards or commissions, shall proceed to cooperate with the San Francisco Forty Niners, or its affiliate, in taking all action necessary to achieve the purposes of this ordinance, including but not limited to assisting in the negotiations for property acquisition and applying for conforming amendments to all applicable state and regional plans and regulations.

Section 3. [Election Under Charter Section 4.113]

Pursuant to San Francisco Charter Section 4.113, the electors of the City and County of San Francisco hereby approve the lease for non-recreational purposes of, and the construction, development, operation, maintenance, repair and replacement of structures for non-recreational purposes on, any and all of the park land presently under the jurisdiction of the City's Recreation and Park Commission and located within the boundaries of the Candlestick Point Special Use District as defined in this ordinance, including the property currently used for the existing stadium and paved stadium parking.

Section 4. [General Plan; Amendment]

The General Plan of the City and County of San Francisco is hereby amended as follows:

(a) Figure 3 ("Generalized Land Use and Density") of the South Bayshore Area Plan Element shall be amended to redesignate the property generally bounded by Jamestown Avenue Extension, Giants Drive, Gilman Avenue, Arelious Walker Drive (Fitch Street), Carroll Avenue, Griffith Street, and San Francisco Bay, as the "Candlestick Point Special Use District."

(b) Figure 4 ("Candlestick Point Perimeter Proposed Revitalization Area") of the South Bayshore Area Plan Element shall be amended to indicate that the property within the Candlestick Point Special Use District shall be devoted to "Stadium, Commercial, Parking and Open Space" uses.

(c) New Policy 7.4 shall be added to the South Bayshore Area Plan Element to read as follows:

POLICY 7.4

Encourage commercial development within the Candlestick Point Special Use District that will complement a new sports stadium and the other commercial areas within the South Bayshore Area and the City, and that will create job opportunities for South Bayshore residents.

The existing sports stadium within this district may be replaced with a new professional football stadium of a size and character suitable for hosting the National Football League's Super Bowl on a regular basis. The construction of a new football stadium should be accompanied by development of retail and entertainment uses complementary to the stadium that will assist in revitalizing the economy of the area and create employment opportunities for South Bayshore residents. The City should require developers of new uses within the district to make good faith efforts to provide both construction and permanent jobs to South Bayshore residents.

Commercial development within the district should consist primarily of destination-oriented uses that will supplement, and not substitute for, neighborhood-serving retail services within the South Bayshore area and particularly in the Third Street core commercial area. Structures to house retail and entertainment uses within the Candlestick Point Special Use District should be integrally linked to, and should be planned and developed as a comprehensive unit with, the stadium complex. The existing shoreline trail should be retained and enhanced. In addition, commercial development within the district should incorporate open space areas to the extent feasible. Transportation and transit improvements should be made in conjunction with development within the district. The City, with public input, should coordinate development within the Candlestick Point Special Use District with on-going revitalization efforts for the South Bayshore area.

(d) Map 1 of the Recreation and Open Space Element shall be amended so that all property within the Candlestick Point Special Use District that is shown as property owned by the "Recreation and Park Department" shall be shown instead as property owned by "Other City Departments".

(e) Maps 2, 4, 8 and 9 of the Recreation and Open Space Element shall be amended by deleting all property within the Candlestick Point Special Use District from the "Existing Public Open Space" designation on Maps 2 and 4; the "Public Open Space" designation on Map 8; and the "Public Recreation and Open Space" designation on Map 9.

(f) Map 2 of the Commerce and Industry Element shall be amended to add a notation for all property within the Candlestick Point Special Use District that states, "Candlestick Point Special Use District; see applicable Planning Code provisions."

(g) Map 4 of the Urban Design Element shall be amended to add a notation for all property within the Candlestick Point Special Use District that states, "Candlestick Point Special Use District; see applicable Planning Code provisions."

(h) The Land Use Index shall be amended to conform to the amendments made above in subsections (a) through (g) in this Section 4.

Section 5. [Special Use District].

Part II, Chapter II of the San Francisco Municipal Code (City Planning Code) is hereby amended by adding Section 249.19 to read as follows:

"Section 249.19 Candlestick Point Special Use District.

A Special Use District entitled the "Candlestick Point Special Use District," the boundaries of which are designated on Sectional Map No. 10 SU of the Zoning Maps of the City and County of San Francisco, and which is generally bounded by Jamestown Avenue Extension, Giants Drive, Gilman Avenue, Arelious Walker Drive (Fitch Street), Carroll Avenue, Griffith Street, and San Francisco Bay, is hereby established for the purposes set forth below. The following provisions shall apply within the Candlestick Point Special Use District:

(a) Purposes. The following controls, imposed in the Candlestick Point Special Use District, shall accommodate the development of a stadium suitable for professional football and the National Football League's Super Bowl ("Stadium") and a retail shopping and entertainment center ("Retail/Entertainment Center"), together with open space and related parking facilities (collectively, the "Combined Project"), as principal uses, and other uses as conditional uses.

(b) Controls. The specific controls set forth herein shall apply only to the principal uses and conditional uses described in this Section 249.19(b). Any other development not described herein shall be governed by the underlying zoning controls.

(1) Principal Uses. The following uses shall be permitted as principal uses in this Special Use District:

(i) Stadium: A stadium, primarily to be used for professional football, but which may also be used for other sporting events or outdoor entertainment events, and which may include other assembly and entertainment uses, and other uses related to the stadium, including retail sales and personal service uses, sports clubs, restaurants and office uses accessory to the stadium (which shall not be deemed an "office development" subject to the provisions of Planning Code Sections 309 through 325 et seq.).

(ii) Retail/Entertainment Center: A Retail/Entertainment Center which may include any type or size of retail establishment, restaurant, bar, entertainment use (including but not limited to movie theaters), amusement enterprise (including but not limited to arcades, nightclubs, bowling alleys, and skating rinks), and amusement park. Principal uses allowed under this subsection (ii) shall be limited to a total of 1,400,000 square feet of occupied floor area.

(iii) Open Space: Areas devoted to landscaping, shoreline access, shoreline trails, and active or passive recreational uses. The areas used for passive or active recreational uses may also be used as temporary parking areas to support stadium events, provided that such areas shall not be paved and shall include drainage and other improvements appropriate for both open space and temporary parking uses.

(iv) Parking: Off-street vehicle parking, provided by surface parking lots or underground or above ground parking garages to serve the Stadium and Retail/Entertainment Center.

(2) Conditional Uses. The Planning Commission may authorize the following uses within the Special Use District as a conditional use:

(i) Any principally permitted uses allowed under Section 249.19(b)(1)(ii) which exceed a total of 1,400,000 square feet of occupied floor area.

(ii) Any use not specified in subsection (b)(1) above and permitted in any C District, as that term is defined in Planning Code Section 102.5.

(3) Prohibited Uses. Adult entertainment establishments, as defined in Planning Code Section 790.36, massage establishments as defined in Planning Code Section 790.60 and any type of gaming, wagering or gambling establishment, shall not be permitted within the Special Use District.

(4) Floor Area Ratio. There shall be no floor area ratio limitation for the Combined Project or any approved conditional use.

(5) Design Review By Planning Commission. Any application for a new structure, or major alteration of an existing structure, to house a use permitted by this section as a principal use under Section 249.19(b)(1) shall be subject to design review and approval by the Planning Commission. The Planning Commission shall approve such application if it finds that the proposed development meets the applicable height, bulk, floor area limitation and parking standards of this Section 249.19(b), and is consistent with the Priority Policies set forth in Planning Code Section 101.1, and that the architectural design of the structures, the landscaping, and the quantity and design of usable open space are appropriate for the intended use, location and purpose of the structure(s). The Planning Commission shall take final action on any completed application for a development permitted by this section within 60 days of its first public hearing on the application. The procedures and criteria in this subsection shall govern in lieu of the discretionary review process set forth in Section 26 of Part III of the San Francisco Municipal Code. The fee for review of any application under this subsection shall be based on the cost of the time and materials (calculated at a rate of $77/hour as may be adjusted by the Consumer Price Index) up to a maximum fee of $14,800.

(6) Parking. Parking shall be governed by Article 1.5 of the Planning Code unless otherwise specified in this subsection.

(i) Planning Code Section 159 and subsections (a), (b), (h) and (p) of Planning Code Section 155 shall not apply to parking provided within the Special Use District. Planning Code Sections 155(i) and (j) shall apply only to the amount of parking required under Section 151.

(ii) For the purposes of calculating minimum required parking under Planning Code Section 151, in no case shall the total number of required parking spaces for the

Combined Project exceed the greater of either the parking spaces calculated for the Stadium or the parking spaces calculated for the Retail/Entertainment Center, standing alone.

(7) Appeal. The Planning Commission's determination on the design of the Combined Project pursuant to Section 249.19(b)(5) shall be a final determination on all design issues, except that the Arts Commission shall review the design, if required by Charter Section 5.103. Notwithstanding the provisions of Section 26 of Part III of the San Francisco Municipal Code, review by the Board of Appeals on the issuance of any demolition permit, building or site permit in this Special Use District shall be limited to compliance with the San Francisco Building Code, Health Code and Fire Code.

(c) State Park Land. To the extent any land owned or otherwise under the jurisdiction or control of the California Department of Parks and Recreation is included within the boundaries of the Special Use District, any development on such land shall be consistent with the purpose of the Candlestick Point State Recreation Area and shall continue to make available to the people the recreational opportunities that are offered by the shoreline, waters and environment of San Francisco Bay. To this end, no development shall be permitted within 120 feet of the shoreline of the San Francisco Bay, as measured at mean low tide.

Section 6. [Height Limit; Exceptions]

(a) Part II, Chapter II of the San Francisco Municipal Code (City Planning Code) is hereby amended by adding Section 263.14 to read as follows:

"Section 263.14. Height Restrictions for Candlestick Point Special Use District.

In the 60/150-200-X Height and Bulk District as designated on Sectional Map No. 10H of the Zoning Map, the height limit shall be 60 feet, except that heights up to 200 feet shall be permitted for any stadium use permitted within the Candlestick Point Special Use District. An exception to the 60 foot height limit may be granted by the Planning Commission as a conditional use within the Candlestick Point Special Use District, up to a maximum height of 150 feet. In the event any stadium constructed within the Special Use District is integrated into a retail shopping center or other structure, any transitional structures which connect or otherwise attach the stadium to the other structure shall be considered part of the stadium for purposes of determining the permissible height of the transitional structure. All structures within the Candlestick Point Special Use District shall be exempt from the provisions of Planning Code Section 295.

(b) Part II, Chapter II of the San Francisco Municipal Code (City Planning Code) is hereby amended by adding subsection (L) to Section 260(b)(1) to enact the following exemption from height limits otherwise established by the City Planning Code:

"(L) In the Candlestick Point Special Use District, light standards for the purpose of the lighting the stadium, scoreboards associated with the stadium, and flagpoles and other ornamentation associated with the stadium."

Section 7. [Signs]

Part II, Chapter II of the San Francisco Municipal Code (City Planning Code) is hereby amended by adding Section 608.51 to read as follows:

"Section 608.4A. Signs for Uses Within the Candlestick Point Special Use District.

Any sign that directs attention to a business, commodity, service, industry or other activity that is or will be sold, offered or conducted within the Candlestick Point Special Use District and that either is greater than 200 square feet in area or extends above the roofline of the building upon which the sign is located ("SUD Sign") shall be permitted within the Candlestick Park Special Sign District if approved by the Planning Commission as a conditional use. Planning Code Sections 608.4, 608.5 and 609.2, or any other regulation applicable to signs within the Candlestick Park Special Sign District, shall not apply to SUD Signs. SUD Signs shall conform to the restrictions set forth in Planning Code Section 607 for signs in C-3 Districts, except that there shall be no height limit for SUD Signs. The Planning Commission may authorize an SUD Sign as a conditional use if the design of the sign and any associated sign structure is appropriate for the intended use and location. This criterion shall be in lieu of the criteria set forth in Planning Code Section 303(c)(1) through (4). Any scoreboard or sign within a stadium located in the Candlestick Point Special Use District shall be exempt from regulation under Article 6 of the Planning Code. Principally permitted signs within the Special Use District shall be consistent with a sign program submitted and approved by the Planning Commission as part of the design review process for the Candlestick Point Special Use District.

Section 8. [Special Use District Boundaries; Zoning Maps]

(a) The boundaries of the Candlestick Point Special Use District created by this Ordinance are shown in Figure 1 attached hereto, which is provided for general orientation purposes only.

(b) Special Use Map. Part II, Chapter II of the San Francisco Municipal Code (City Planning Code) is hereby amended by amending Sectional Map No. 10 SU of the Zoning Maps of the City and County of San Francisco to include the Candlestick Point Special Use District, the boundaries of which are hereinafter described.

The Special Use District shall include property bounded as follows, with street boundaries following the centerline of the referenced streets: Beginning at the point which is the intersection of Giants Drive and Gilman Avenue (the point of beginning), along Gilman Avenue to Arelious Walker Drive (also known as Fitch Street), along Arelious Walker Drive to Carroll Avenue, along Carroll Avenue to Griffith Street (a mapped but unconstructed street), along Griffith Street to the San Francisco Bay shoreline, then continuing south along the San Francisco Bay shoreline to Alvord Street (a mapped but unconstructed street), then continuing south and west along a line extending from Alvord Street to the San Francisco Bay shoreline, continuing east along the San Francisco Bay shoreline to Coleman Street (a mapped but unconstructed street), then north and east along Coleman Street to Jamestown Avenue Extension, then along the Jamestown Avenue Extension to the farthest west point of Assessor's Block No. 5000, then along the north west border of Assessor's Block No. 5000 to Giants Drive, then along Giants Drive to the intersection of Giants Drive and Gilman Avenue (the point of beginning).

Existing Use Districts	Use District Hereby Approved
P, M-1, M-2, RH-2	To Existing Use Districts Add the Candlestick Point Special Use District Overlay

(c) Height and Bulk. Part II, Chapter II of the San Francisco Municipal Code (City Planning Code) is hereby amended by amending Sectional Map No. 10 H of the Zoning Maps to enact the following changes in the height and bulk classifications for the property within the Candlestick Point Special Use District, as more particularly described in subsection (b) in this Section 8.

Height and Bulk Districts to be Superseded	Height and Bulk District Hereby Approved
OS; 40-X	60/150-200-X

Section 9. [Waterfront Plan]

Chapter 61 of the San Francisco Administrative Code ("Waterfront Land Use"), adopted by the People of the City and County of San Francisco pursuant to Proposition H, is hereby amended as follows:

(a) Section 61.2(d) shall be amended by adding the following subsection:

"(3) This provision shall not be applicable to any new development within the Candlestick Point Special Use District."

(b) Section 61.4 shall be amended by adding the following subsection:

"(i) Within the Candlestick Point Special Use District, any use that is permitted as a principal or conditional use under Planning Code Section 249.19."

Section 10. [Public Contracting Provisions]

Notwithstanding any provision of the San Francisco Municipal Code (the "Municipal Code") or any other ordinance or regulation of the City and County of San Francisco to the contrary, the Stadium, Retail/Entertainment Center and related physical improvements and infrastructure to be constructed in the Candlestick Point Special Use District shall not be deemed to be a "public work or improvement" as that term or any similar term is used in any provision of the Municipal Code or any other ordinance or regulation of the City and County of San Francisco, including but not limited to, Chapter 6 of the San Francisco Administrative Code. No provision of the Municipal Code, nor any other ordinance or regulation of the City and County of San Francisco shall be deemed to require the person or entities, including the City and County of San Francisco, constructing any portion or all of the Stadium, Retail/Entertainment Center and related improvements and infrastructure, to follow any particular procedure, comply with any bidding or advertising requirements, or otherwise engage in any particular practice with respect to the selection of contractors or sub-contractors for the award of contracts or subcontracts for the design, construction, purchase of materials, management or operation of any portion or all of the stadium, retail shopping and entertainment center and associated improvements; provided, however, the design and construction of the Stadium, Retail/Entertainment Center and related improvements and infrastructure shall be subject to the applicable provisions of Chapter 12B, 12C and 12D of the San Francisco Administrative Code and to the terms and conditions of any public financing and the ground lease or leases. It is the intent of the people of the City and County of San Francisco, in adopting this section of this Ordinance, that the design and construction of the Stadium, Retail/Entertainment Center and related improvements and infrastructure shall be done in an expeditious manner, and shall not be undertaken as if such design and construction were the design and construction of conventional public work or improvement. This section shall be liberally construed to fulfill this intent.

Section 11. [Redevelopment Agency]

The Candlestick Point Special Use District is within the South Bayshore Redevelopment Survey Area. In the event that a Redevelopment Project Area is adopted which includes the Combined Project, the Combined Project shall be subject to the authority of the Redevelopment Agency of the City and County of San Francisco authority pursuant to state law.

Section 12. [Compliance With Laws]

Except as otherwise specified herein, the construction of the Combined Project shall be subject to all federal, state and local laws, ordinances and regulations (as the same may be amended), including but not limited to the California Environmental Quality Act (Public Resources Code Section 21000, et seq.).

Section 13. [Amendment]

Any provision of this ordinance may be amended by the Board of Supervisors and shall not require the vote of the electors of the City and County of San Francisco, provided that such amendments are consistent with the purpose and intent of this ordinance.

Section 14. [Severability]

If any provision of this ordinance, or any application thereof to any person or circumstance, is held invalid, such invalidity shall not affect any provision or application of this ordinance that can be given effect without the invalid provision or application. To this end, the provisions of this ordinance are severable.

Appendix C1 PBS&J Environmental Justice Report, November 2009

Appendix C1 Environmental Justice

A. INTRODUCTION

This Environmental Justice section discusses existing Environmental Justice (EJ) communities within and surrounding the Project site and examines the potential for construction or operation of the Project to result in disproportionately high and adverse human health or environmental effects on minority populations or low-income populations. Environmental Justice is not a required area of study under the *California Environmental Quality Act*. This analysis is being provided for informational purposes only and for Navy use in their supplemental Environmental Impact Statement for the Hunters Point Shipyard Base Reuse.

Environmental Justice

Executive Order (EO) 12898 (1994), "Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations," provides that "each Federal agency shall make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations." (Council of Environmental Quality [CEQ] 1997)

Federal agencies should consider the composition of the affected area to determine whether minority populations, low-income populations, or Indian tribes are present in the area affected by the proposed action, and if so whether there may be disproportionately high and adverse human health or environmental effects on minority populations, low-income populations, or Indian tribes (CEQ 1997).

An EJ community is defined when one or more of the following three criteria are met:

1. The minority population in the community is equal to or greater than 50 percent
2. The minority population in the community is 10 or more basis points higher than that of the "base" community (city or county, depending on location)
3. The poverty level in the community is 10 or more basis points higher than the "base" community

Protection of Children

EO 13045 (2007), "Protection of Children from Environmental Health Risks and Safety Risks" requires that "each Federal agency *(a)* shall make it a high priority to identify and assess environmental health risks and safety risks that may disproportionately affect children: and *(b)* shall ensure that its policies, programs, activities, and standards address disproportionate risks to children that result from environmental health risk or safety risks."

B. SETTING

Minority Populations

Ethnicity data were obtained from Claritas (2008), a company specializing in demographic data, United States Census Bureau (US Census) (2000) data, and from the California Department of Finance (DOF) (2007).

The study area for the Project includes 28 Block Groups within the Bayview neighborhood, as illustrated by Figure 1 (Environmental Justice Communities). As the name implies, Block Groups are a combination of census blocks. Census blocks are a subdivision of a census tract or block numbering area and are the smallest geographic entity for which the decennial census tabulates and publishes sample data.

The proportion of ethnic minorities were estimated for each community by dividing the total number of Black, Indian/Alaskan, Asian, Hawaiian/Pacific Islander, and Hispanic persons by the total number of persons per block group. Statistics for San Francisco, the San Francisco-Oakland-Fremont Metropolitan Statistical Area (MSA), and the State of California were included in this study for comparison purposes and to be used as the base community. Refer to Table 1 (Study Area Ethnic Profile) for a breakdown of ethnicity by block group and base community.

On average there is a larger percentage of ethnic minorities in the study area than in the larger base communities that consist of San Francisco, the San Francisco–Oakland-Fremont MSA, and the State of California. With respect to the Project site, the HPS Phase II site consists of the majority of Block Group 60750606001, which has a total minority population of 92 percent. The Candlestick Point site is made up predominantly of almost all of Block Group 60750610001, which has a total minority population of 84.3 percent, a portion of Block Group 60750234001, which has total minority population of 89.2 percent, and a sliver of Block Group 60750234002, which has a total minority population of 89.3 percent, as shown in Table 1.

The Block Groups in the study area combined have almost a 90 percent total minority population; only one Block Group in the study area has a total minority population less than 50 percent (Block Group 60750251003).The minority population of the study area and the Project site are well over 10 percentage points higher when compared to any of the base communities, which range from 54.3 percent to 57.0 percent minority population, as reflected in Table 1, and all but one Block Group is also equal to or greater than 50 percent minority. Therefore, the entire study area, including the Project site, is an EJ community based upon the minority population.

Child Population

Population data were obtained from Claritas (2008), for the child population by Block Group in 2004. The Claritas data contained a breakdown of population by age; all residents under the age of 18 years were counted to derive the child population in both the study area and Project site.

* Minority Environmental Justice Community
a. Total population of Project Site/Study Area Block Groups

The HPS Phase II site, which consists of the majority of Block Group 60750606001 has a total child population of 27.1 percent, while the three block groups that make up the Candlestick Point site; 60750610001, 60750234001 and 60750234002, has a child population 25.6 percent, 45.0 percent, and 21.9 percent respectively in 2004 (Clarita 2008). Overall, the child population in the study area in 2004 was 27.6 percent of the total population of 44,220 residents. Although children do not constitute a substantial percentage of the population within the study area, children are present in residential and recreational areas, and in certain institutions (e.g., schools, daycares, private schools). A substantial number of schools and daycares, as well as parks and playgrounds where children typically congregate, can be found in the study area.

Poverty Levels

Economic data were also obtained from Claritas (2008). The Claritas data contained household and poverty estimates by block group within the study area. City and county level data was obtained from the US Census (2008a and 2008b).

The US Census defines the average poverty level in the United States for a family of four as a maximum annual income of $21,203 or less for the year 2007 (US Census 2008b). Table 2 (Study Area Poverty Statistics) shows the percentage of the total number of households within the given Block Group that are below the poverty level. With respect to the criteria that determines whether a Block Group would be considered an EJ community, it must have a poverty level (in this case, expressed as a percent of total households below the poverty level) that is 10 or more basis points higher than the base community.

Table 2 Study Area Poverty Statistics

California State	12.4%	

SOURCE: Claritas 2008.

The poverty populations of the Block Groups in the study area range from zero to 53.4 percent. Using the City and County of San Francisco as the base community, any Block Group on Table 2 that reflects at least 20.6 percent of the total households below the poverty level (which is 10 percentage points above the percentage reflected for the City and County) would be considered an EJ community from the perspective of income. As shown in Table 2, there are six Block Groups identified as low-income EJ communities based on the percentage of households below the poverty level that are 10 or more basis points higher than the base community.

The HPS Phase II site, which consists of the majority of Block Group 60750606001, is not an EJ community based upon income because it has a poverty population level of only 16.7 percent, which is less than 10 percentage points higher than the base communities. Candlestick Point is made up of almost all of Block Group 60750610001, which has a poverty population level of 3.9 percent, a portion of Block Group 60750234001, which has a poverty population level of 40.1 percent, and a sliver of Block Group 60750234002, which has a poverty population level of 15.9 percent. As such, only a portion of Candlestick Point (Block Group 60750234001) is considered an EJ community based on income (refer to Table 2).

For informational purposes, the median household income of the Block Groups in the study area ranges from $14,537 to $91,146. The median household incomes of the base communities range from $59,928 for the State of California to $75,747 for the San Francisco-Oakland-Fremont MSA.

Indian Tribes and Trust Assets

There are 564 Indian Tribes recognized by the federal government.[1] This recognition establishes a tribe as an entity with the capacity to engage in government-to-government relations with the United States or individual states, and also as one eligible to receive federal services. Federal recognition is established as a result of historical and continued existence of a tribal government by EO or legislation, and through the federal recognition process recently established by Congress.

The relationship between the United States government and those tribes is characterized as one between sovereigns (i.e., between a government and a government). The federal government is obligated under the Federal-Tribal Trust to protect Tribal interests, a duty that is referred to as trust responsibility. This trust doctrine is further defined through laws, EOs, judicial decisions, and agreements (Bureau of Indian Affairs [BIA] 2009).

Indian trust assets (ITAs) are legal interests in assets that are held in trust by the United States Government for federally recognized Indian tribes or individuals. The trust relationship usually stems from a treaty, EO, or act of Congress. The Secretary of the interior is the trustee for the United States on behalf of federally recognized Indian tribes. "Assets" are anything owned that holds monetary value. "Legal interests" means there is a property interest for which there is a legal remedy, such a compensation or injunction, if there is improper interference. Assets can be real property, physical assets, or intangible property rights, such as a lease, or right to use something. Indian trust assets cannot be sold, leased, or otherwise alienated without United States' approval (Department of the Interior [DOI] 2007). Trust assets may include lands, minerals, and natural resources, as well as hunting, fishing, and water rights, Indian reservations, rancherias, and public domain. The Native American Heritage Commission (NAHC) did not indicate that ITAs exist in the vicinity of the project or study areas, as further discussed in Section III.J (Cultural Resources and Paleontological Resources) of the EIR.

No Native American tribes, groups, or individuals have identified any specific ITAs during the public participation process for this project. Refer to Section III.J for an extensive discussion of the history of Native Americans in the study area and steps taken to coordinate with local Indian Tribes.

C. IMPACTS

Significance Criteria

The purpose of EO 12898 and EO 13045 is to avoid placing a disproportionately high share of the adverse environmental or economic effects resulting from federal policies and actions on minority and low-income populations or children.

[1] Department of the Interior. www.doi.gov/bia (accessed on October 12, 2009).

The purpose of an EJ analysis is to determine whether adverse environmental impacts would disproportionately affect minority and low-income communities or children compared to other communities in the project area. Impacts related to EJ would be significant if a project-related activity would have a disproportionate effect on EJ populations. A disproportionate effect is defined as an effect that is predominantly borne, more severe, or of a greater magnitude in areas with EJ populations than in other areas (CEQ 1997).

Analytic Method

This section was prepared primarily by compiling and evaluating existing information, obtained from Claritas, the US Census, and DOF. An EJ community is defined when (1) the minority population in the community is equal to or greater than 50 percent; (2) the minority population in the community is 10 or more basis points higher than that of the base community (city or county, depending on location); or (3) the poverty level in the community is 10 or more basis points higher than the base community. Using this criteria it was determined that the entire study area, including the Project site, is an EJ community based upon the minority population and a portion of the study area is an EJ community based upon income levels. A review of the potential effects of the Project was conducted to identify if significant effects could disproportionately fall on minorities, low-income populations, or children.

Project Impacts

■ No Action

Under the No Action Alternative, the Project would not be constructed and no disturbance to populations in any of the Block Groups would occur. Therefore, no direct or indirect impacts to any of the populations within the Study Area Block Groups would occur. However, none of the beneficial impacts associated with the Project, as decribed in Chapter II (Project Description), such as the revilatization of the Bayview Hunters Point community through increased business and employment opportunities; housing options at a range of affordability levels; improved public recreation and open space amenities; an integrated transportation, transit, and infrastructure plan; and other economic and public benefits would occur. Blighted and impoverished conditions in the Bayview area would remain and the community could deteriorate further due to the lack of job opportunities, which can contribute to high unemployment rates and a high concentration of low-income residents. The lack of quality open space and recreation opportunities in the area, as well as the limited public transportation providing connections through the area, and the City as a whole, and the diminishing quality of affordable housing in the area would continue. Moreover, the improvements to the public recreation and open space amenities would not occur and the community would not benefit from the improvements to be constructed by the Project, such as the extension and enhancmenet of the Bay Trail. Similarly, the community would continue to have disconnected public transportation and pedestrian connectivity. In short, the Block Groups would continue to be disadvantaged.

Proposed Action

The Project proposes development of 10,500 residential units with an associated population of 24,465 residents; 885,000 gross square feet (gsf) of retail; 150,000 gsf of office; 2.5 million gsf of Research & Development uses; a 220-room, 150,000-gsf hotel; 255,000 gsf of artist/art center space; 100,000 gsf of community services; 240 acres of new parks, sports fields, and waterfront recreation areas, as well as 96.7 acres of new and improved State parkland; a 69,000-seat 49ers stadium; and a 75,000 gsf performance arena. The permanent employee population associated with the Project would be 10,730. Development would occur on two sites: Candlestick Point and HPS Phase II. Development on Candlestick Point would include demolition (and replacement on a 1:1 basis) of 256 public housing units, demolition of the 70,207-seat 49ers stadium, and a net reduction of CPSRA land. However, 96.7 acres of the 120.2-acre CPSRA would remain and the Project would provide significant funding for park improvements and ongoing operation and maintenance as described in Section III.P (Recreation). There is no existing housing in HPS Phase II. In addition, all of the vacant, and some leased, Navy buildings would be demolished, except for Buildings 140, 203, 204, and 205, which would be rehabilitated, and Drydocks 2 and 3.

According to EO 12898 an EJ analysis should identify whether a proposed federal action would result in "disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations." Similarly, EO 13045 states federal agencies must make it a priority to determine whether a proposed federal action would result in "environmental health risks and safety risks that may disproportionately affect children."

Chapter III (Environmental Setting, Impacts, and Mitigation Measures) of the EIR analyzes and discloses all of the adverse impacts of the Project. The environmental topics that could result in human health or environmental effects and are addressed in this EJ analysis include Section III.H (Air Quality), Section III.K (Hazards and Hazardous Materials), Section III.I (Noise), and Section III.M (Hydrology and Water Quality). Additional issues areas that could affect quality of life, and are also addressed in this EJ analysis, include: Section III.C (Population, Housing, and Employment), Section III.E (Aesthetics), and Section III.O (Public Services). The following paragraphs summarize the findings of the EIR with regard to these topics.

I.A AIR QUALITY (TOXIC AIR CONTAMINANTS)

The Project would include sources of hazardous or toxic air emissions including processes; vehicle use; and proximity to existing or relocated sources of diesel or other toxic air emissions, such as freeways and railroads and off-site industries and businesses, as discussed extensively in Section III.H of the EIR (and the associated air quality technical appendix). The Health Risk Assessment prepared for the Project estimated the cumulative excess lifetime cancer risk and chronic noncancer Hazard Index (HI)2 due to toxic air contaminants emissions and determined that the maximum estimated cumulative excess lifetime cancer risks and HIs within areas designated for residential use were found not to exceed the Bay Area Air Quality Management District current or proposed significance thresholds for carcinogenic and

[2] The Hazard Index reflects that standard or criteria above which an impact would occur. The specific HI assumed in the HRA for this Project is defined and described in Section III.H (Air Quality).

noncarcinogenic health risks. The HRA also concluded that during construction of the Project the maximum non-cancer hazard index (HI) would be below the BAAQMD's significance threshold of 1.0 and the proposed revised HI threshold of 0.5, and the Project would not result in the exposure of people to diesel particulate matter of airborne concentrations of contaminated dust In addition, the Project would not expose receptors to concentrations of $PM_{2.5}$, associated with increased vehicle trips and vehicle emissions along local roadways, in excess of the San Francisco Department of Public Health threshold. Implementation mitigation measure MM AQ-1.1 would reduce potentially significant impacts to a less-than-significant level.

One significant and unavoidable impact relating to air quality was identified. As a result of increased external motor vehicle trips, Project emissions of ROG, NO_X, PM_{10}, and $PM_{2.5}$ would exceed the BAAQMD thresholds. Although no feasible mitigation is available to reduce this impact, the Project would incorporate features intended to reduce motor vehicle trips, and would be designed as a dense, compact development with mixed land uses that would facilitate pedestrian, bicycle, and transit travel. Increased vehicle traffic is a direct result of increased development and densities in the area, as well as the increased availability of housing and employment opportunities, and is necessary for the revitilization of the Project site; these impacts would not fall disproportionately high or adversely on the EJ communities in the study area. Any development that would occur in the study area would result in similar impacts, which are not unique to this particular Project and would not disproportionately affect residents. As such, although this impact is considered significant and unavoidable, it would not disproportionately affect EJ communities located in the Bayview community. Refer to Section III.H for a greater discussion of air quality impacts.

I.B HAZARDS AND HAZARDOUS MATERIALS

Potentially adverse effects relating to hazardous materials and waste have been reduced through implementation of mitigation measures MM HZ-1 through MM HZ-23, which are identified in Section III.K of the EIR. The Project does not propose any uses that would require the handling of acutely hazardous materials. In the event that hazardous materials or previously unknown contamination are discovered during construction, implementation of the proposed mitigation measures, as well as adherence to applicable regulations would reduce the likelihood of contaminants being conveyed to people or near shore and aquatic habitats and associated species. Remediation of the HPS Phase II site is ongoing due to the presence of chemicals and radioactive materials in various locations, and would continue to be implementation with or without the Project. No significant and unavoidable impacts relating to hazards would occur. Therefore, no disproportionate impacts on the EJ populations would occur.

I.C NOISE

Construction of the Project would result in a significant and unavoidable impact relating to ground-borne vibration levels in residential neighborhoods; however, this is a temporary impact. Operation of the Project would result in an increase in local traffic volumes that would cause a substantial permanent increase in ambient noise levels in existing residential areas, as described in Section III.I of the EIR (and the associated stadium noise technical appendix). This impact is a direct consequence of increased development and densities, and would occur in any area targeted for growth and redevelopment. Although this impact is considered significant and unavoidable, it would not be considered a disproportionate effect on EJ communities located in the Bayview community, as the Project site was not selected in order to avoid impacts in other areas, but rather to improve the conditions of the Project site through revitalization and development. All other noise impacts have been reduced to a less than significant level through implementation of mitigation measures MM NO-1 through MM NO-5, which are identified in Section III.I of the EIR.

I.D HYDROLOGY AND WATER QUALITY

No significant and unavoidable impacts relating to hydrology and water quality would occur as a result of the proposed project, as discussed in Section III.M of the EIR. The Project would result in the introduction of additional impervious surfaces on the Project site causing more contaminates to flow through the sewer and stormwater system; however, through implementation of MM HY-1 through MM HY-14, which are identified in Section III.M, and compliance with all applicable regulations, all impacts would be reduced a less-than-significant level. Therefore, no disproportionate impacts on the EJ populations would occur.

I.E EMPLOYMENT

Development at the Project site would create approximately 10,730 permanent jobs by 2030 (refer to Table III.C-7 provided in Section III.C of the EIR). The increased availability of jobs in the Bayview community would address the needs of the community and would contribute to the revitalization of the neighborhood. Anticipated growth would not exceed the City's population projections, and would not result in any adverse impacts. Instead, the creation of jobs could be considered a beneficial impact for EJ communities and those households living below the poverty level. Therefore, no disproportionate impacts on the EJ populations would occur.

I.F AESTHETICS

The Project would not result in any significant impacts relating to the visual quality of the Project site or the Bayview area, as described in Section III.E of the EIR. The Project would replace degraded urban areas, vacant parcels, expanses of asphalt and dirt, and outdated residential development with new, well-designed urban development. The Project would improve the existing quality of the site by providing new areas of open space, enhanced connectivity to the shoreline, and pedestrian amenities such as outdoor plazas, walking paths, outdoor eating areas, sidewalks, street-side landscapes, and improved lighting. Therefore, the Project would not substantially degrade the visual character or quality of the Project site or its surroundings, rather the Project would improve the visual quality of the Project site, which contains vacant properties, expanses of parking lot, deteriorated structures, and piles of rubble. Therefore, no disproportionate impacts on the EJ populations would occur.

I.G POLICE AND FIRE SERVICES

The level of service provided by both the San Francisco Police Department and San Francisco Fire Department would not be reduced as a result of the Project, as described in Section III.O of the EIR. As part of the Project, up to 100,000 gsf divided equally between Candlestick Point and HPS Phase II would be designated for community serving uses, such as fire, police, healthcare, daycare, places of worship, senior centers, library, recreation center, community center, and/or performance center uses. A portion of the designated community serving uses could be utilized for a new SFPD facility (counter, storefront, or other configuration) and/or a new SFFP station to address increased demands created by the Project. Potential impacts associated with the construction of these facilities have been addressed and would not require further environmental review beyond the review provided in the Candlestick Point-Hunters Point Shipyard Phase II EIR. As such, the quality and level of police and fire services provided to the Project site would not be degraded, and the EJ communities would not be disproportionately affected as a result of the Project.

Conclusion

As described above under the Air Quality and Noise discussions, three significant and unavoidable impacts would occur. Temporary construction impacts associated with noise would occur; however, these effects are short-term in nature and effects would not fall disproportionately on an EJ community because they are a consequence of development intended to revitalize that community. Significant and unavoidable air quality and noise impacts occuring during operation of the Project are a result of increased vehicle traffic in the area due to the proposed increase in both residential and commercial development. As increased vehicle traffic is a direct result of increased development and densities in the area, as well as the increased availability of housing and employment opportunities, and is necessary for the revitilization of the Project site, these impacts would not fall disproportionately high or adversely on the EJ communities in the study area. Any development that would occur in the study area would result in similar impacts, which are not unique to this particular Project and would not disproportionately affect residents. Because the Project would meet the Project objectives, thereby beneficially affecting EJ communities in the study area and improving the quality of life for the residents, implementation of the Project would not pose disproportionately high or adverse impacts to minority or low-income populations or environmental health and safety risks to children.

■ Project Objectives/Proposition G

In May 2007, the Board of Supervisors and the Mayor approved a resolution endorsing a Conceptual Framework for the integrated planning of both Hunters Point Shipyard and Candlestick Point. The City's overarching goal for the Project is to revitalize the Bayview Hunters Point community by providing economic and public benefits. Subsequent to the Conceptual Framework, the San Francsico Redevelopment Agency and the Bayview Hunters Point Project Area Committee afforded the public and the local communities numerous opportunities to provide comments and be involved in the revitilization of the community via notices, meetings, internet website, and workshops. The Proposed Action was developed through extensive community involvement and input, which led to the creation of the

Bayview Jobs, Parks and Housing Intiative. Objectives of the Initiative (also known as Proposition G) have been incorporated into this EIR as the Project's objectives.

The redevelopment of Candlestick Point and HPS Phase II would be consistent with the following Project objectives, which would have beneficial effects to the EJ communities because it would:

- Create a range of job and economic development opportunities for local, economically disadvantaged individuals and business enterprises, particularly for residents and businesses located in the Bayview.
- Provide automobile, public transportation, and pedestrian connections between the Shipyard, Candlestick Point, and the larger Bayview neighborhood.
- Create substantial affordable housing, jobs, and commercial opportunities for existing Bayview residents and businesses.
- Provide new affordable housing that is targeted to the lower income levels of the Bayview population, including new units that are suitable for families, seniors, and young adults.
- Include housing at levels dense enough to create a distinctive urban form and at levels sufficient to make the CP-HPS Development Plan financially viable; attract and sustain neighborhood retail services and cultural amenities; create an appealing walkable urban environment served by transit; help pay for transportation and other infrastructure improvements; and achieve economic and public benefits for the Bayview in particular and the City generally.
- Upon consultation with Alice Griffith Housing residents and the receipt of all required governmental approvals, rebuild Alice Griffith Housing to provide one-for-one replacement units targeted to the same income levels as those of the existing residents and ensure that eligible Alice Griffith Housing residents have the opportunity to move to the new, upgraded units directly from their existing Alice Griffith Housing units without having to relocate to any other area.
- Create new public recreational and public open spaces in the CP-HPS Development Plan.
- Transform the contaminated portions of the Shipyard Property into economically productive uses or public open space, as appropriate.

In addition to creating job and economic development opportunities in the Bayview area, providing affordable housing, providing significant new and improved open space and recreational areas,and improving transportation and pedestrian connnectivity in the community, the Project would redevelop the SFHA's Alice Griffith site. The Project has committed to replacing the 256 existing units on the Alice Griffith site, with a total of about 1,210 units in the same area, consisting of one-for-one replacement of public housing (256 units) with for-sale and rental units of varying affordability levels. In addition, a total of 3,345 affordable and below-market units would be provided throughout the Project site. This would provide affordable housing to the current low-income residents, and create new housing opportunities for those eligible. The Alice Griffith public housing would be rebuilt to provide at least one-for-one replacement units targeted to the same income levels as those of the existing residents and ensure that eligible Alice Griffith Housing residents have the opportunity to move to the new, upgraded units directly from their existing Alice Griffith public housing units without having to relocate to any other area. The Proposed Action would also improve the neighborhood services, infrastructure, amenities, recreation opportunities, and aesthetics to the local communities.

Michael P. Carlin
Deputy General Manager, SFPUC
1155 Market St, 11th Floor
San Francisco, CA 94103

Subject: Projections of growth by 2030

Dear Michael:

Thank you for your letter dated March 11, 2009 requesting the Planning Department's projections of growth by 2030 in order to satisfy your mandates in connection with assessing water supply and demand in the years to come, and more specifically for preparing water supply assessments for individual projects moving forward.

The Planning Department routinely prepares projections for the purposes of analyzing impacts of plans and projects undergoing the environmental review process. While the assumptions of these sets may vary depending on the circumstances surrounding a specific project, the Department recently completed a citywide projection capturing citywide growth expectations by 2030 designed to closely match the recently adopted ABAG Projections 2009 target, but taking into account local knowledge of projects currently in various stages of the entitlement process, commonly referred to as the development pipeline. Table 1 shows the projections for 2030.

Table 1 Development Projections

	2000	2005	2030	Growth 2000-2030	Growth 2005-2030
Households	329,700	341,478	403,292	73,592	61,814
HH Population	756,976	783,441	916,800	159,824	133,359
Jobs	642,500	553,090	748,100	105,600	195,010

Source: ABAG, San Francisco Planning Department

As the question may arise whether particular projects were included, the Planning Department for the purposes of these numbers assumed full buildout over the course of the forecast period of three large development programs currently undergoing environmental review, namely Treasure Island, Bayview Waterfront, and Park Merced projects.

More generally, we included entitled pipeline projects, and projects larger than 500 units, or large commercial projects per criteria set forth in California Water Code §10912(a) as these are the projects for which individual water supply assessments would otherwise need to be made in the near future.

We are looking forward to continuing the larger regional growth dialogue with PUC and other regional stakeholders.

Sincerely,

John Rahaim
Director of Planning

TABLE OF CONTENTS

7.0 Mitigation Measures

Transportation Study Appendices

LIST OF FIGURES

LIST OF TABLES

Chapter 1
INTRODUCTION

This report documents the process and findings of the transportation analysis conducted for the Candlestick Point–Hunters Point Shipyard Phase II (CP-HPS Phase II) Development Plan (herein referred to as the "Project") in the City and County of San Francisco. The report includes a description of the Project, Project Variants and Alternatives to the Project, describes existing traffic, transit, pedestrian, bicycle and parking conditions in the study area, presents future year 2030 cumulative conditions without and with the Project and alternatives, and presents a transportation impact analysis of the various scenarios.

The following transportation elements are addressed in this study:

- Traffic impacts
- Transit impacts
- Parking impacts
- Pedestrian impacts
- Bicycle impacts
- Loading impacts
- Emergency vehicle access impacts
- Construction impacts

1.1 PROJECT OVERVIEW AND LOCATION

The CP-HPS Phase II Development Plan encompasses an approximately 702-acre area east of U.S. 101 in the southeast area of the City and occupies the waterfront area from south of India Basin to Candlestick Cove. The Project location is shown on **Figure 1.**

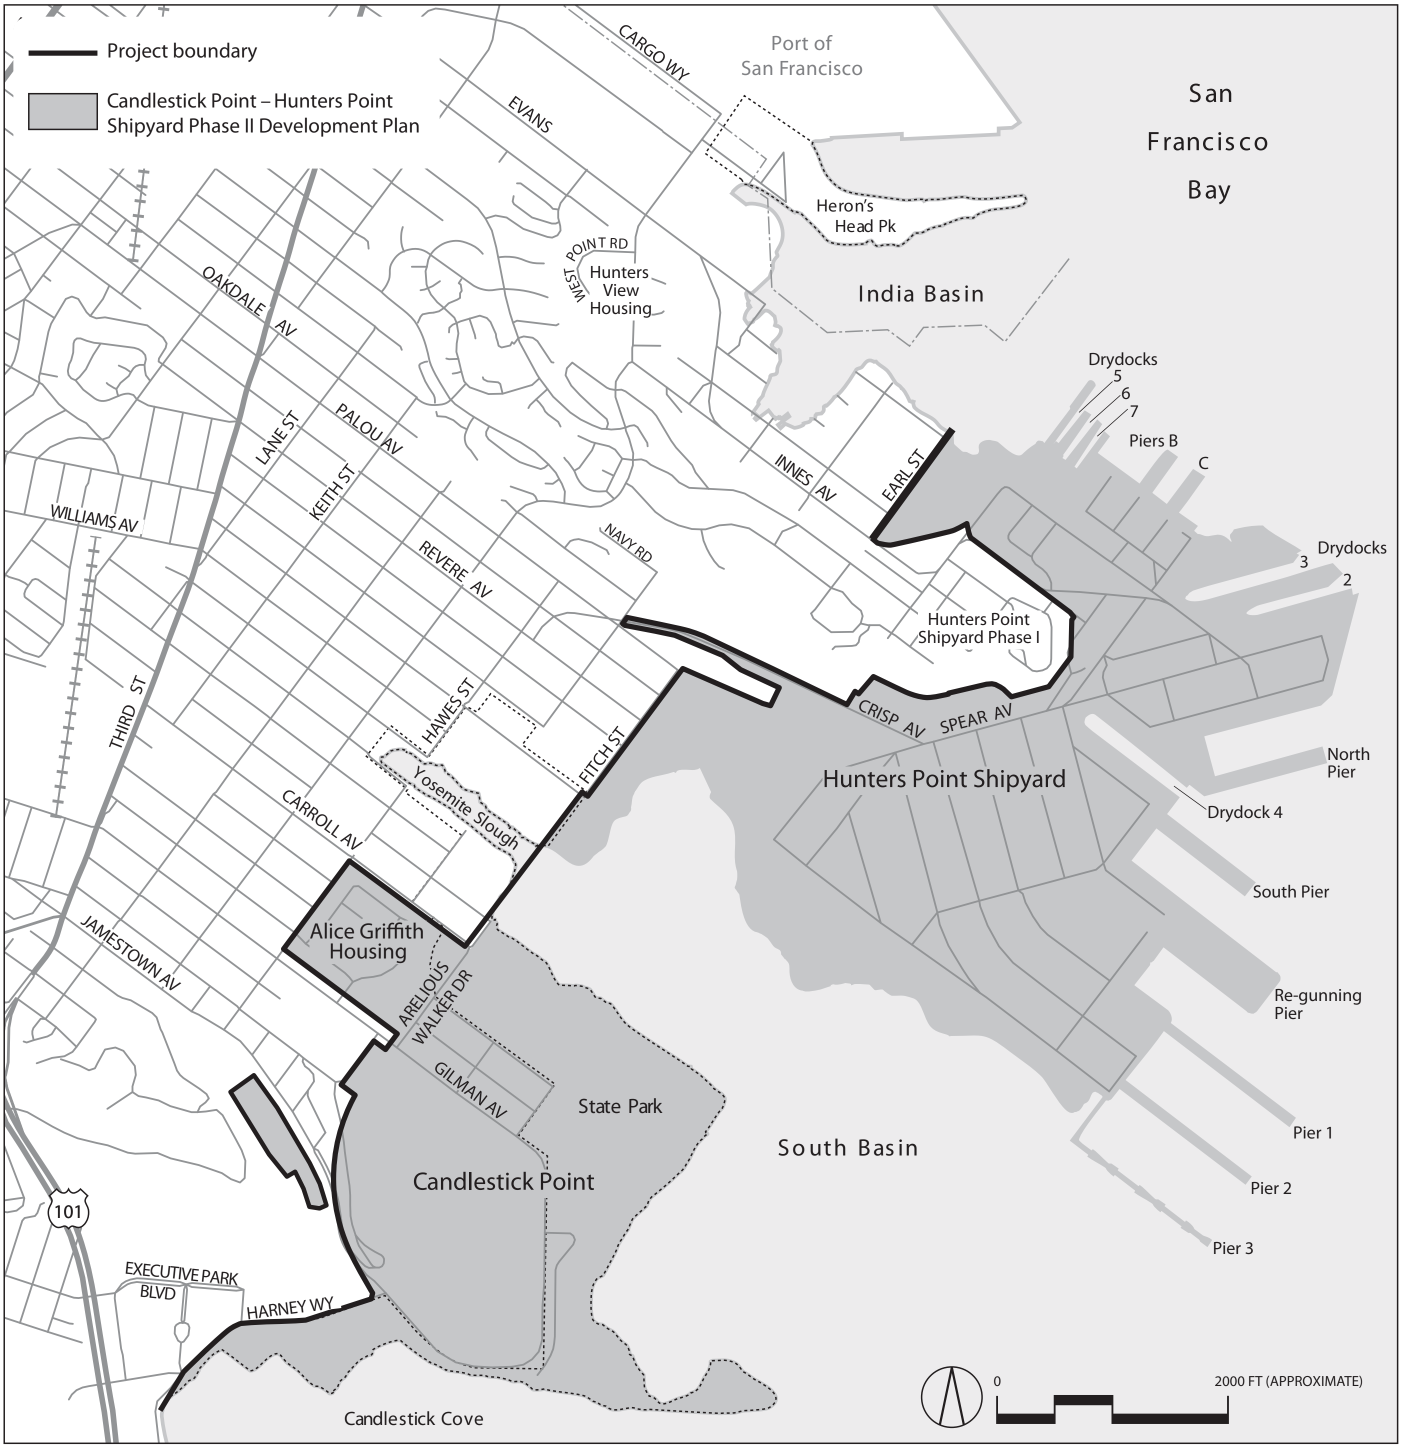
Candlestick Point and Hunters Point Shipyard comprise the southeasternmost portion of San Francisco; taken together, they are bordered by Heron's Head Park on the north, the San Mateo County line on the south, Bayview Hill, Yosemite Slough, and Hunters Point Hill on the west, and San Francisco Bay on the east. The Development Plan would comprise approximately 702 acres, with 281 in Candlestick Point and 421 in Hunters Point Shipyard Phase II. **Figure 2** presents the boundaries of the Project.

1.2 SCOPE OF ANALYSIS

The transportation study was conducted based on the scope of work developed by the Planning Department, which is included in Transportation Study Appendix A.

SOURCE: Fehr & Peers; AECOM

FIGURE 1: PROJECT LOCATION



SOURCE: San Francisco Redevelopment Agency, Lennar, 2008.

FIGURE 2: PROJECT SITE AND CONTEXT

The transportation study presents an assessment of the existing conditions within the defined transportation study area, as well as an assessment of future year 2030 conditions without and with the Project. Project impacts were determined by comparing the future year 2030 conditions with the Project, to those without the Project (i.e., 2030 No Project conditions).

Since the stadium is a special trip generator where football games do not affect typical weekday commute period traffic, Sunday conditions were also included for assessment of football game impacts[1].

1.3 REPORT ORGANIZATION

The remainder of the report is divided into six chapters that present the Project, the transportation analysis methodology, and the existing and future conditions.

- Chapter 2 presents the description of the Project, Project Variants and Alternatives to the Project.
- Chapter 3 presents the existing transportation network and operating conditions.
- Chapter 4 presents the analysis methods and assumption used in determining future travel demand and criteria for impact assessment.
- Chapter 5 presents the future baseline (No Project) conditions for year 2030.
- Chapter 6 presents the impact analysis for the Project, Project Variants and Alternatives to the Project.
- Chapter 7 summarizes the impacts and proposed mitigation measures.

The Transportation Study Appendix, included in the attached compact disc, includes additional transportation system descriptions, and analysis calculations. It also includes the May 2009 Fehr and Peers memorandum documenting the 4D Travel Demand Methodology used in Project trip generation, mode split and trip distribution, as well as the memoranda documenting the Muni operating plan for the Project.

[1] In rare circumstances, football games are played on Monday or Thursday nights; however, since this typically occurs no more than twice per season at most, the analysis of the football stadium impacts was conducted for more typical Sunday afternoon conditions.

Chapter 2
PROJECT DESCRIPTION

This chapter briefly presents the existing setting within Candlestick Point and Hunters Point Shipyard, and presents the land use program by area and the proposed transportation network improvements. This chapter summarizes the Transportation Plan as part of the CP-HPS Phase II Development Plan. Project Variants and Alternatives to the Project analyzed in this transportation study are also presented. A detailed Project description is included in Transportation Study Appendix B.

2.1 PROJECT SETTING

The Candlestick Point area is approximately 267 acres including the Alice Griffith Public Housing development. Current land uses in the Candlestick Point area include Candlestick Park stadium owned by the City and County, and used by the San Francisco 49ers National Football League team, and associated parking lots and access roadways. The stadium and parking lot areas are under the jurisdiction of the San Francisco Recreation and Park Department. The area includes several privately owned parcels near Gilman Avenue and Arelious Walker Drive, north of the stadium. That area is primarily vacant and used for stadium parking. A recreational vehicle park occupies a portion of the site on Gilman Avenue. The Candlestick Point area also includes the Alice Griffith public housing site, which is bounded by Gilman Avenue on its southwest, Hawes Street on the northwest, Carroll Avenue on the northeast and Arelious Walker Drive on the southeast (see **Figure 2**).

The existing Candlestick Park stadium typically hosts up to 12 games per year, including eight regular season games, two pre-season games, and for teams that qualify for playoffs, two post-season games. Professional football games on the west coast are typically scheduled for 1:00 p.m. on Sundays, from September through early December. The post-season runs into January and games can be played on either Saturday or Sunday. At the conclusion of the college football season in late November, a few NFL games are played on Saturdays, as are some pre-season games. Successful teams typically play at least one Monday night (6:00 p.m.) game, and the 49ers have had at least one such home game in each of the past several seasons. Occasionally (no more than once per year), Sunday games are held at 5:00 p.m.

HPS Phase II comprises 421 acres (dry-land) and includes many structures associated with ship repair, piers, dry-docks, ancillary storage, administrative, and other former U.S. Navy uses largely from the World War II era. Several former Navy buildings are currently leased and occupied as artist studios. The HPS Phase II area primarily consists of Navy Parcels B, C, D and E. The entire HPS Phase II development area is currently under the jurisdiction of the U.S. Navy.

2.2 PROJECT LAND USE PROGRAM

The CP-HPS Phase II Development Plan is a development being proposed by Lennar Urban, and is being analyzed at a project level of detail in the Project EIR. A wide range of uses are proposed, for a mixed-use community with residential, retail, office, research and development, civic and community uses, and parks and recreational open space. A major component would be a new stadium for the San Francisco 49ers, a National Football League team. The development program also includes a 10,000-seat arena. New infrastructure would be constructed to serve the development. **Figure 3** presents the proposed land use plan for Candlestick Point and Hunters Point Shipyard. As noted above, a detailed Project description is provided in Transportation Study Appendix B. **Table 1** summarizes the land use program that was assumed for Project analysis.

Table 1
Project Land Use Program Summary

	Proposed Project
Hunters Point Shipyard	
Residential (units)	2,650
Neighborhood Retail (gsf)	125,000
Research & Development (gsf)	2,500,000
Artists Studios (gsf) [1]	255,000
Community Services (gsf)	50,000
Park (acres)	231
Stadium (seats)	69,000
Marina (slips)	300
Candlestick Point	
Residential (units) [2]	7,850
Neighborhood Retail (gsf)	125,000
Regional Retail (gsf)	635,000
Office (gsf)	150,000
Hotel (rooms)	220
Community Services (gsf)	50,000
Park (acres)	105
Arena (seats)	10,000

Notes:
1. Project includes 225,000 sf of existing artist studio space that would be renovated and replaced.
2. Project include existing 256 units at Alice Griffith housing complex that would be replaced

SOURCE: Lennar, BVHP, LLC, 2009.

FIGURE 3: CANDLESTICK POINT - HUNTERS POINT SHIPYARD PHASE II PROPOSED LAND USE PLAN

Implementation of the Development Plan would require amendments to the *Bayview Hunters Point (BVHP) Redevelopment Plan* adopted in 2006 and the *Hunters Point Shipyard (HPS) Redevelopment Plan* adopted in 1997. The Candlestick Point Activity Node program allowed for a new San Francisco 49ers football stadium, and 1.2 million square feet of retail uses, both of which are not planned for in the current plan. The 1997 HPS Redevelopment Plan allows a different mix of industrial and commercial uses than the uses now proposed under the Development Plan.

Design for Development (D4D) documents that would apply in each of the redevelopment plan areas would accompany the Development Plan. The D4D document would include the standards for provision of off-street parking spaces and freight loading facilities, as well as bicycle parking and shower and locker facilities. In combination with the Development Plan, the D4D documents would supersede the San Francisco Planning Code for the CP-HPS Phase II Development Plan.

The Candlestick Point area of the Development Plan is immediately east of Executive Park, with the Bayview neighborhood to the north, the HPS to the north and east, and Candlestick Point State Recreation Area (SRA) along the Bay frontage, shown in **Figure 3.** The Candlestick Point area of the Development Plan is generally bounded by Hawes Street to the northwest, Candlestick Cove and the San Francisco Bay to the south, South Basin to the east, and Jamestown Avenue to the southwest. The northern boundary of Hawes Street is limited to the San Francisco Housing Authority's (SFHA) Alice Griffith public housing site between Gilman and Carroll Avenues, which extends north from Arelious Walker Drive.

The HPS Phase II area is to the southeast of the Bayview neighborhood. As shown in **Figure 3**, the HPS Phase II area is generally bounded by the San Francisco Bay to north, south and east. The south end of the western boundary extends from Yosemite Slough along Arelious Walker Drive to approximately Crisp Avenue, excluding the University of California San Francisco (UCSF) property. The northern boundary generally extends along Crisp and Spear Avenues. The northernmost end of the HPS Phase II area is contiguous with Earl Street and the southeastern boundary of the India Basin Shoreline area.

The 49ers Stadium subarea would provide a site for a new 69,000-seat National Football League stadium for the San Francisco 49ers. This subarea is on the southern half of HPS Phase II, with the stadium footprint on about 17 acres. The stadium would include about 1,860,000 gsf, with seating, ramps and stairs, office and administrative facilities, food service and retail areas, and access facilities for stadium visitors, players, and staff. Other secondary events could occur at the stadium including college football games, soccer games, concerts, festivals, antique and car shows, and other events. These secondary events would be limited to 20 total occurrences per year.

The parking areas surrounding the 49ers Stadium would serve stadium-related events. Dual-use fields adjacent to the proposed stadium and parking areas would serve as recreation and athletic fields when not used as parking for stadium events. The surface of the fields would be seeded grass above top soil with synthetic fibers and other base materials to support vehicle parking. The parking area and dual-use fields, on-site structures and street parking, and parking in the adjacent R&D park would provide approximately 16,415 parking spaces on game days. In addition, 1,000 spaces at Candlestick Center would be available for stadium parking on game-days. During non-game day activities, approximately 3,656 parking spaces would be available to serve the dual-use athletic fields and related events.

2.3 ROADWAY NETWORK IMPROVEMENTS

The Project would include a number of transportation improvements and the internal street network and roadway improvements were designed to support the transit, bicycle and pedestrian improvements. The Development Plan would improve existing roadways to serve Candlestick Point and Hunters Point Shipyard Phase II and surrounding the Bayview, South Basin, and Hunters Point neighborhoods. Roadway improvements would be within the CP-HPS Phase II Development Plan boundaries, and off-site as shown in **Figure 4**. Proposed roadway improvements would include the following:

Harney Way Widening: The existing four-lane Harney Way would widened to the north and south of its existing alignment, and would be rebuilt to contain between two and three travel lanes in each direction, turn pockets, two BRT-only lanes, Class I and Class II bicycle facilities, new sidewalks, as well as landscaped area. Initially, the roadway would be rebuilt as a new five-lane roadway (with right-of-way reserved for additional lane(s) to be built in the future as needed for increased traffic levels). There would be two lanes in each direction, with eastbound left-turn lanes at Thomas Mellon Circle and Executive Park Boulevard East and a westbound right-turn lane at the Executive Park Boulevard East intersection. **Figure 5** presents the initial phase of Harney Way widening. A Class II bicycle lane would be provided on the north side of the roadway, and a Class I bicycle path would be provided on the south side of the roadway. Two exclusive Bus Rapid Transit (BRT)[2] lanes would be constructed adjacent to the roadway on its north side. They would be separated from the roadway by a six-foot median that would widen to ten feet at the proposed BRT stops to allow for a passenger-loading platform. A BRT stop at the intersection of Harney Way and Thomas Mellon would serve the proposed Executive Park development. Six lanes would be constructed west of Thomas Mellon Drive to connect with the future modifications to the U.S. 101 interchange.

[2] Bus Rapid Transit (BRT) is an integrated system of facilities, services, and amenities that collectively improves the speed, reliability, and identity of bus rapid transit. BRT combines stations, vehicles, services, running ways (e.g., curb bus lanes, median busways, mixed-flow lanes), and Intelligent Transportation Systems (ITS) elements into an integrated system.

SOURCE: Fehr & Peers; AECOM

FIGURE 4: PROPOSED ROADWAY NETWORK IMPROVEMENTS

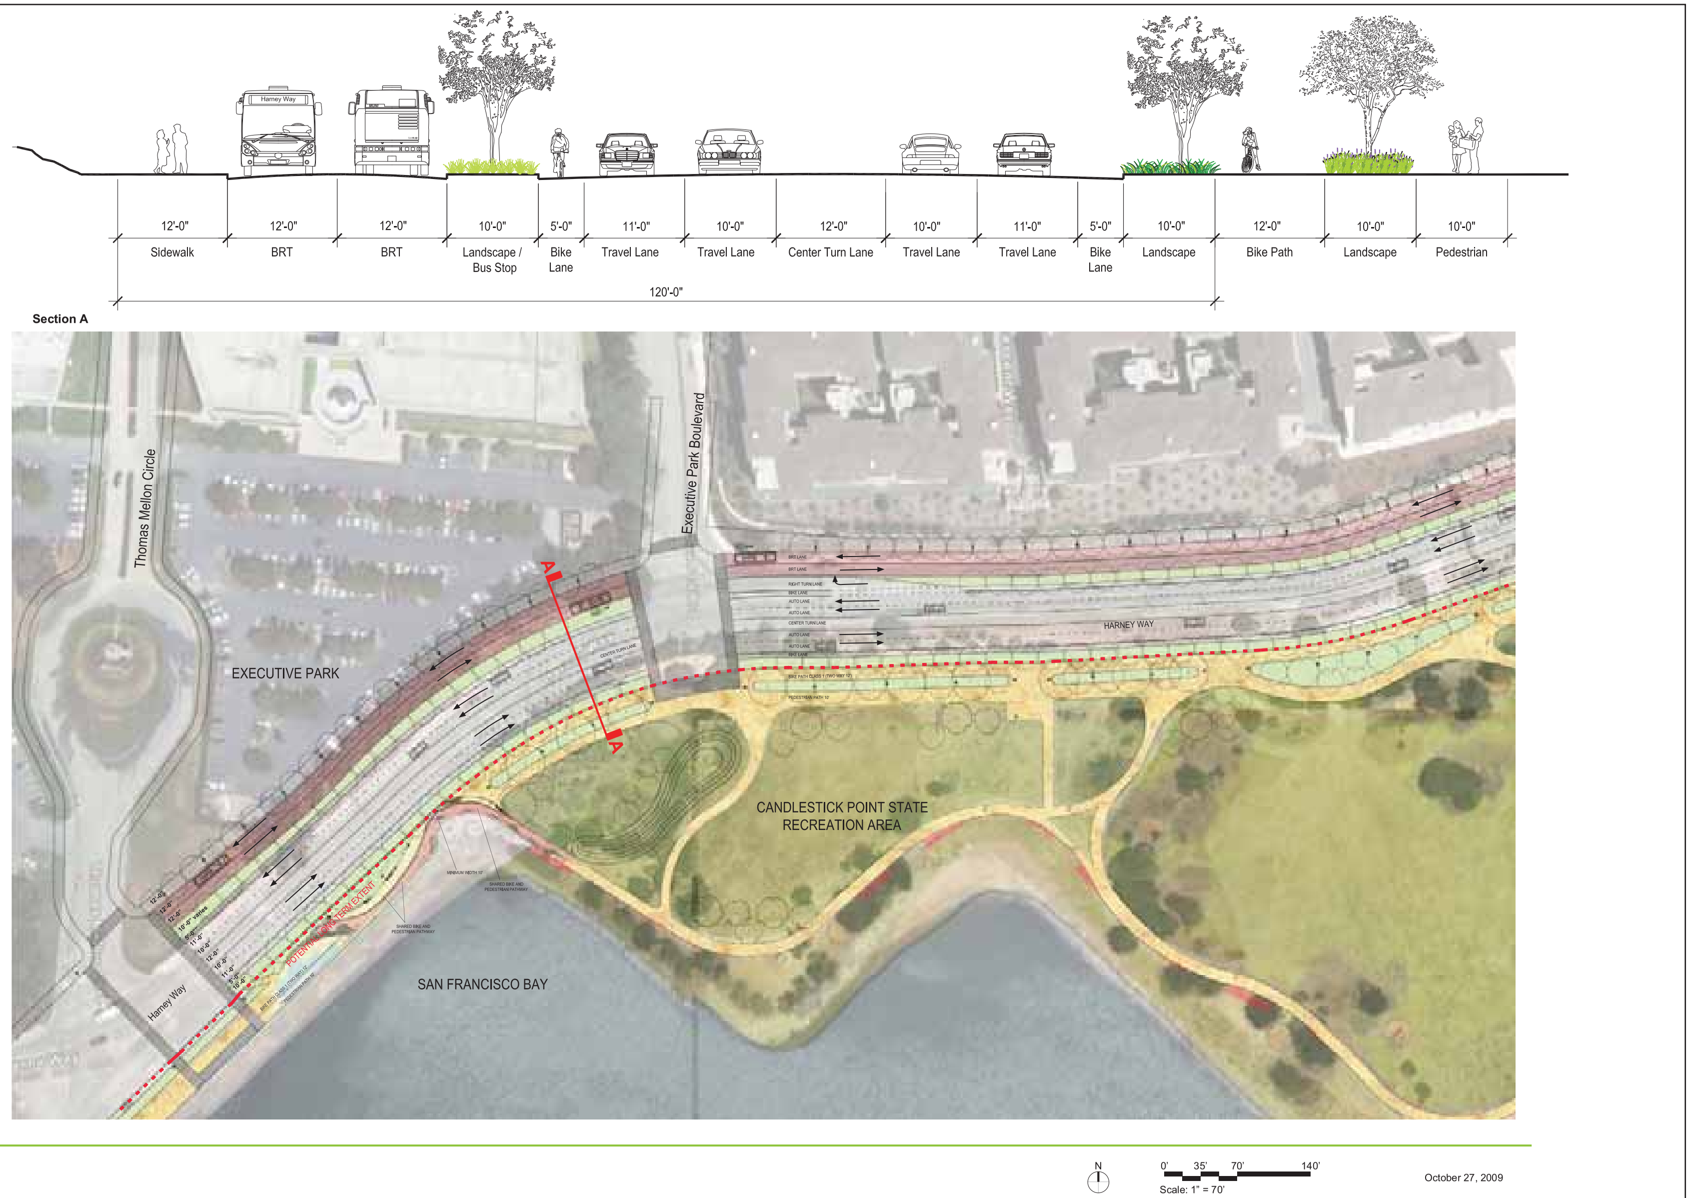

FIGURE 5: PROPOSED HARNEY WAY WIDENING - INITIAL CONFIGURATION

The BRT right-of-way has been designed to meet "rail ready" standards for future conversion to light rail, although such conversion is not contemplated in this Project. New traffic signals would be installed at these intersections. After games at the new 49ers stadium, left turns would be prohibited at the two Harney Way intersections with Thomas Mellon Drive and Executive Park Boulevard for a period to allow for the configuration of the roadway to change to four westbound auto lanes and one eastbound auto lane.

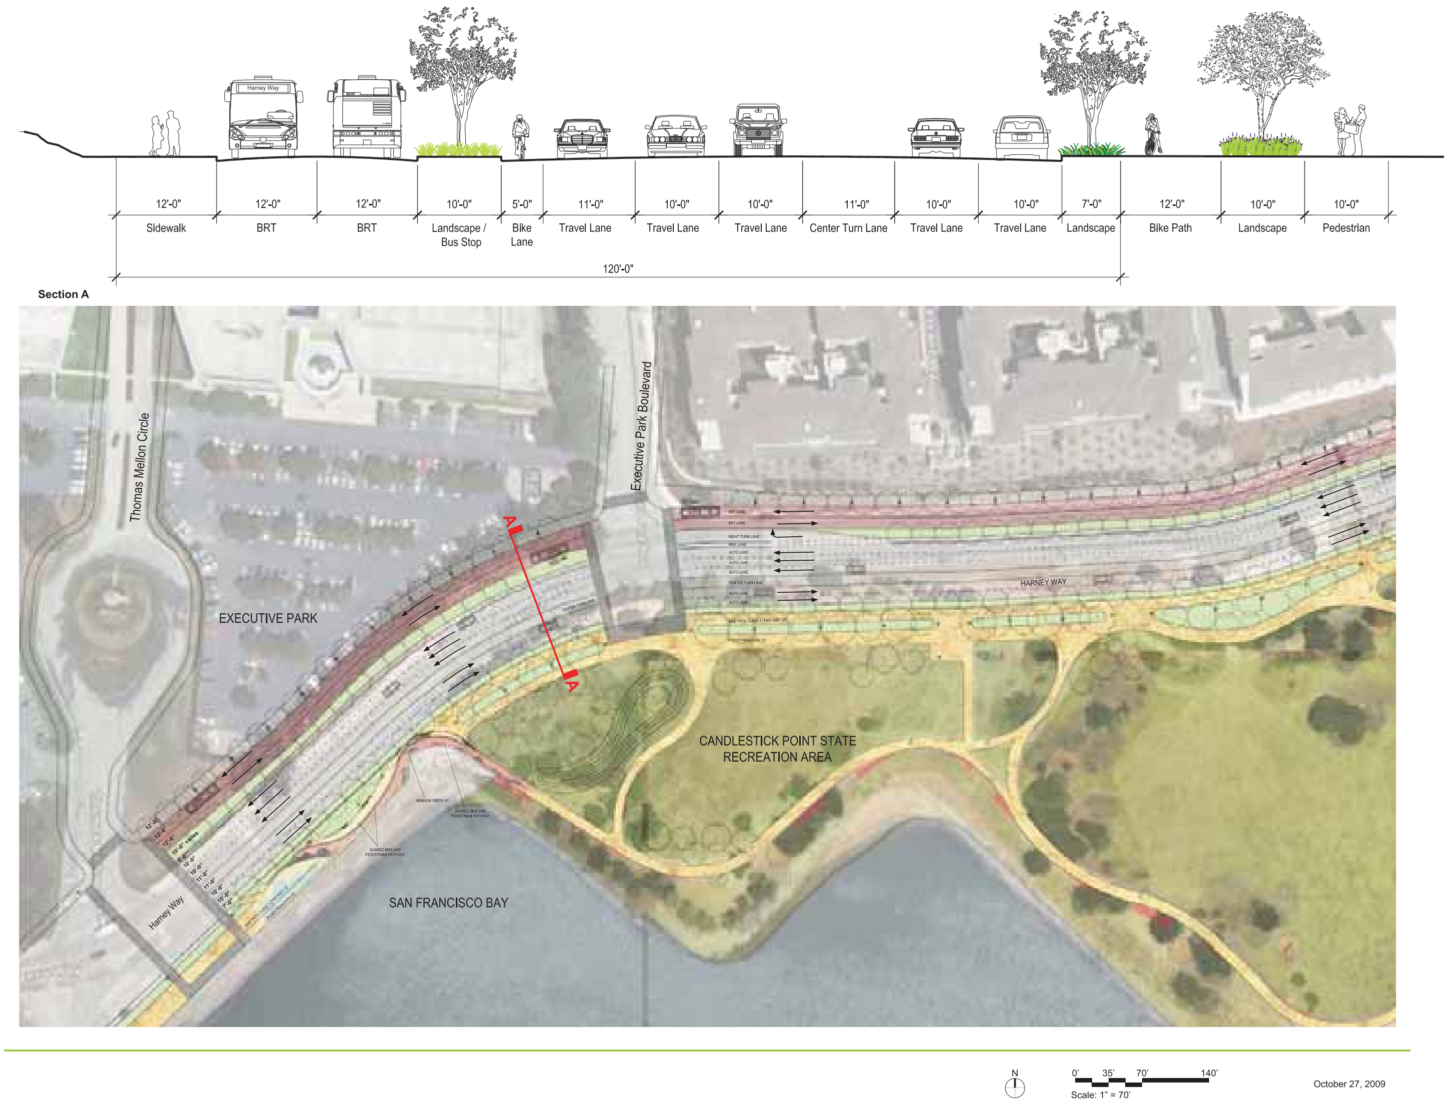
Under the final configuration, a portion of the landscaped area installed as part of the initial widening would be rebuilt to provide an additional lane from the proposed Harney Interchange east to Arelious Walker Drive, if necessary. **Figure 6** presents the final configuration of the Harney Way widening.

New and Improved Roadways – The street network proposed for Hunters Point Shipyard and Candlestick Point would be an extension of the existing grid of the adjacent Bayview neighborhood, using typical Bayview block sizes. Within Candlestick Point the extension and completion of the street network would enhance access between the existing neighborhoods and the existing and proposed waterfront park. Within Hunters Point Shipyard, the street grid would be aligned to focus on connections to the waterfront.

The internal street network would be composed of eight types of streets, as classified by the San Francisco Better Streets Plan (Draft for Public Review, June 2008): Commercial Throughway, Residential Throughway, Neighborhood Commercial Street, Neighborhood Residential Street, Mixed-Use Street, Parkway, Park Edge Street and Alley. Transportation Study Appendix C contains the proposed cross-sections for the various street types. Streets would be designed as complete streets consistent with the Better Streets Plan (Draft for Public Review, June 2008) to enable safe access for all users[3]. Proposed techniques would include driveway access management; traffic calming features such as signage and striping, pedestrian bulbouts where feasible at intersections, and refuge islands; streetscape amenities including street furniture, lighting, and plantings; and other features that would facilitate a high-quality pedestrian and bicycle network consistent with San Francisco's "Better Streets" Plan.

The spine of the Project's street network would be a continuous arterial beginning in the northwest of Hunters Point and traveling south to Candlestick Point. The portion of the arterial within Hunters Point would incorporate Innes Avenue, Robinson Street, and Crisp Avenue. The portion of the arterial connecting Hunters Point and Candlestick Point would incorporate a new Underwood Avenue extension and an improved Ingalls Street and Carroll Avenue. The reconfigured Arelious Walker Drive on the western edge of Candlestick Point would connect to an improved Harney Way at the southernmost point of Candlestick Point.

[3] Complete Streets are designed and operated to enable safe access for all users. Pedestrians, bicyclists, motorists and transit riders of all ages would be able to safely move along and across a complete street.



Under final configuration, a portion of the landscaped area may be rebuilt to provide an additional lane from the proposed Harney Interchange east to Arelious Walker Drive, if necessary.

FIGURE 6: PROPOSED HARNEY WAY CONFIGURATION - ULTIMATE CONFIGURATION

The Hunters Point Shipyard and Candlestick Point arterial streets would function as the primary thoroughfares of the Project, with generally perpendicular collector, parkway and park edge streets playing a subordinate role. BRT lanes would be on the north side of Harney Way before diverting through the Candlestick Point site, using the Yosemite Slough bridge to reach Hunters Point Shipyard. Automobiles would not be permitted to use the Yosemite Slough bridge except on game days, and would instead be routed via Carroll Avenue, Ingalls Street, Thomas Avenue, and Griffith Street. The local streets that form the balance of the street network would be Neighborhood Residential streets.

Hunters Point Shipyard would be served by a four-lane roadway extension of Thomas Avenue connecting to Arelious Walker Drive and Crisp Avenue via Griffith Street. Ingalls Street would contain two travel lanes and on-street parking/loading on both sides of the roadway. The existing portion of Thomas Avenue would be converted from a two-lane to a four-lane facility. On Thomas Avenue, parking would be retained on both sides of the roadway. Innes Avenue east of Donahue Street would be reconfigured to provide for two travel lanes in each direction and on-street parking on both sides of the roadway (this segment was recently constructed as part of HPS Phase I and contains one travel lane in each direction).

Game Day Roadway Network – Several roadway lane configurations would be temporarily changed to allow for the efficient ingress and egress of auto traffic to and from the proposed 49ers stadium before and after games. These roadways include Innes Avenue, Robinson Avenue, and Fisher Avenue on the north side of the Hunters Point Shipyard; Crisp Avenue on the southern side of the Hunters Point Shipyard; Griffith Street, Thomas Avenue, and Ingalls Street between the Shipyard and Candlestick Point; and Arelious Walker and Harney Way on Candlestick Point. Additionally, the Yosemite Slough bridge would be opened to vehicular traffic during this period. The bridge would be able to carry four lanes of auto traffic before and after games. In all cases, a travel lane would be dedicated to the "off-peak" travel direction (away from the stadium pre-game and to the stadium post-game) for local traffic and emergency access vehicles. Traffic control officers would be stationed at major intersections.

Streetscape Improvements – Streetscape improvements are planned for several key Bayview Hunters Point roadways: Harney Way and Innes, Palou, Gilman, Ingerson, and Jamestown Avenues. These streets would serve as primary routes for pedestrians, bicyclists, transit riders, and drivers. They are proposed to enhance the safety and experience of road users and existing residents, and are consistent with San Francisco's "Better Streets" Plan.

Enhanced streetscape design, including street trees, sidewalk plantings, furnishings, and paving treatments would be designed to visually tie together the proposed Project with the greater Bayview neighborhood. Specific streetscape treatments would vary depending on existing right-of-way and traffic demands. Streetscape improvements would take into consideration visibility at STOP-sign controlled intersections.

Yosemite Slough Bridge – A new Yosemite Slough bridge would extend Arelious Walker Drive from Candlestick Point to Crisp Avenue in Hunters Point Shipyard. The bridge would have an 81-foot-wide right-of-way and would contain a 40-foot-wide landscaped greenway, two 11-foot-wide BRT lanes, a sidewalk, and a Class I bicycle path. On 49ers game days, the 40-foot-wide landscaped area would be converted to four peak direction travel lanes for game day auto traffic. The Yosemite Slough bridge would not be used for vehicular traffic at any other time, including secondary events at the new stadium.

The Yosemite Slough bridge is a fundamental component of the proposed BRT service between Hunters Point Shipyard and points to the west, including Candlestick Point, the Bayshore Caltrain station, and the Balboa Park BART station. It would be a continuation of the dedicated right-of-way for BRT on Harney Way and through Candlestick Point that, along with signal priority to BRT vehicles, is essential to provide direct, fast and reliable BRT service, and is designed to be "rail ready" (not to preclude possible conversion to light-rail).

The bridge sidewalk and Class I bicycle path would provide a direct connection between Candlestick Point and Hunters Point Shipyard for pedestrians and bicyclists at all times, and would reduce the potential for conflicts between BRT vehicles and motorists, pedestrians and bicyclists.

During game days, the 40-foot-wide landscaped median would serve as the primary and most-direct route between the stadium parking areas and U.S. 101. This route would minimize the intrusion of game day traffic onto local residential streets (by directing vehicles directly onto Harney Way) and reduce the duration of post-game congestion.

Other Off-site Improvements – The Development Plan includes installation of new traffic signals at existing unsignalized intersections as part of the transit preferential treatment[4] on Palou Avenue, or when traffic volumes warrant signalization at:

- Palou Avenue and Griffith Street
- Palou Avenue and Hawes Street
- Palou Avenue and Ingalls Street
- Palou Avenue and Jennings Street
- Palou Avenue and Keith Street
- Palou Avenue and Lane Street
- Carroll Avenue and Ingalls Street
- Thomas Avenue and Ingalls Street
- Arelious Walker Drive and Carroll Avenue
- Arelious Walker Drive and Gilman Avenue

[4] Transit preferential street treatments include measures (e.g. transit only lanes, traffic signal pre-emption, sidewalk bus bulbs) that would improve transit travel times and service by giving priority to transit vehicles when conflicts with cars occur.

- Arelious Walker Drive and Ingerson Avenue
- Arelious Walker Drive and Harney Way
- Pennsylvania Avenue/25th Street
- Evans/Jennings/Middlepoint

At the intersection of **Evans/Jennings/Middlepoint**, in addition to signalization, the Project would also revise the existing lane configuration on the Evans Avenue and Jennings Street approaches. The eastbound and westbound approaches of Evans Avenue at Jennings Street currently have three lanes (one left turn lane, a through lane, and a shared through-right turn lane). Neither on-street parking nor bicycle lanes are provided on the segment of Evans Avenue roughly 600 feet to the east, and 400 feet to the west of Jennings Street. Jennings Street has one lane in each direction, with on-street parking permitted on both sides of the street.

- The Project improvement would reconfigure the existing three travel lanes on Evans Avenue for both the eastbound and westbound approaches to provide a shared through and left turn lane, a through lane, and a right turn lane. As indicated above, since there are no bicycle lanes or on-street parking, this reconfiguration of the existing lanes would not impact parking or bicycle travel.
- The Project improvement would also reconfigure the southbound approach of Jennings Street to Evans Avenue to provide a southbound left turn pocket, and a shared southbound through and right turn lane. The reconfiguration of the southbound approach would require displacement of about 200 feet of on-street parking on the west side of Jennings Street, which would eliminate about 8 to 10 parking spaces.

At the intersection of **Palou/Griffith/Crisp**, in addition to signalization, the Project would revise the existing lane configuration on the westbound Crisp Avenue, eastbound Palou Avenue and northbound Griffith Street approaches. As presently configured, there are six approaches at the intersection. All approaches of the intersection have one lane per approach (a shared left-through-right lane). Griffith Street, Palou Avenue, and Crisp Avenue have on-street parking on both sides of the street, and there are industrial loading/unloading zones on segments of Palou Avenue. Palou Avenue is designated as a Class III bicycle route (Bicycle Route #70). There are no bicycle lanes on Palou Avenue.

- The Project would reconfigure the intersection by removing the southwest leg of Crisp Avenue and creating limited access for the eastern block of Palou Avenue. The Crisp Avenue westbound approach, which is a Project roadway, would be restriped to provide two approach lanes, a left turn lane and a shared left/through/right lane.
- The Project would also reconfigure the northbound Griffith Street approach to provide two lanes, a shared left/through/right turn lane and a right turn lane. Additionally, the eastbound approach of Palou Avenue would be reconfigured to provide two approach lanes, a left turn lane and a shared through and right turn lane. The reconfiguration of the northbound approach would require displacement of about 200 feet of on-street parking on the east side of Griffith Street, which would eliminate about 8 to 10 parking spaces.

At the intersection of **Carroll/Ingalls**, in addition to signalization, the Project would revise the existing lane configuration on the westbound approach of Carroll Avenue, the southbound approach of Ingalls Street, and the eastbound approach of Carroll Avenue. The northbound and southbound approaches currently have one travel lane and on-street parking in each direction. The westbound approach of Carroll Avenue has three approach lanes, a shared left and through lane, a through lane, and a right turn lane. There is on-street parking on the southern side of the street. The eastbound approach has a travel lane (shared left/through/right lane) and on-street parking on the southern side of the street. Carroll Avenue is designated as a Class III bicycle route (Bicycle Route #805).

- The Project would reconfigure Carroll Avenue to provide two travel lanes and a bicycle lane in each direction. This would allow for a shared left turn and through lane, and a shared through and right turn at both the east- and westbound approaches. The southbound approach would be reconfigured to allow for two approach lanes: a left turn lane, and a shared through and right turn lane. The reconfiguration of the southbound approach would require displacement of about 200 feet of on-street parking/loading on the west side of Ingalls Street.

At the intersection of **Thomas/Ingalls,** in addition to signalization, the Project would revise the existing lane configuration on the westbound approach of Thomas Avenue. As presently configured all approaches of the intersection have one lane per approach (shared left/through/right lane) and on-street parking on both sides of the street. There are no bicycle facilities provided.

- The Project improvement would reconfigure the westbound approach of Thomas Avenue to Ingalls Street to provide two lanes, a left turn lane and a shared through and right turn lane. Thomas Avenue would be reconfigured to provide two travel lanes in each direction and on-street parking on both sides of the street.

Transportation Management System: The Project would include a transportation management system. The system would include the installation and coordination of existing and new signals at over 30 intersections in the Project vicinity and the surrounding area using fiber-optic technology including several changeable message signs and lane use control signals on roadways with reversible lanes. A Transportation Management Center near the 49ers stadium site would operate the system on game days. The Transportation Management Center would be operated by SFMTA.

2.4 TRANSIT NETWORK IMPROVEMENTS

The Transportation Plan for Project includes the following transit improvements, which were assumed as part of the future transportation network:

- Extension of existing Muni routes to better serve the Project area;
- Increased frequencies on existing routes to provide more capacity; and,
- Provision of new transit facilities and routes to better serve the Development Plan's proposed land use program and transit demand.

New direct transit service is proposed to serve employment trips to downtown San Francisco. Connections to the regional transit network (BART and Caltrain) would serve employment centers in the South Bay. Many of the proposed transit lines would include transit priority systems that use sensors to detect approaching transit vehicles and alter signal timings to improve transit efficiency. The analyses and proposals documented in this report acknowledge three components that must be funded in order to expand transit services. First, operating costs must be provided on an ongoing basis to underwrite the drivers, mechanics, supervisors, schedulers and other staffing necessary to put additional service in place, and these are costed on a fully-allocated funding basis. Secondly, additional transit vehicles are needed to provide any service expansion. In the Project service plan these include standard 40-foot diesel (now hybrid diesel-electric) motor coaches, 60-foot articulated motor coaches, 40-foot electric trolley coaches, and 73-foot electric light rail vehicles. Lastly, and particularly because the magnitude of new transit services proposed is substantial, funding to expand maintenance and storage facilities to accommodate these expanded fleets must also be provided. The proposed transit improvements are illustrated in **Figure 7** and are described below:

Extended bus routes and new bus routes: Existing Muni routes 23-Monterey, 24-Divisadero, 44-O'Shaughnessey, 48-Quintara-24th Street, and 54-Felton would be extended to Hunters Point Shipyard; the 29-Sunset would terminate at Candlestick Point. Service frequencies on these lines would be increased. Capacity on the T-Third route would be increased by operating two-car trains instead of single-car trains. A new Downtown Express route would connect both Candlestick Point and Hunters Point Shipyard with the Financial District. The Hunters Point Shipyard Downtown Express would have a stop on Innes Avenue to serve India Basin.

BRT Service: BRT service to connect the Project with the Bayshore Caltrain station and the Balboa Park BART station would be provided. The 28L-19th Avenue would be extended from its proposed TEP[5] terminus on Geneva Avenue (just east of Mission Street), to the east along

[5] TEP = Transit Effectiveness Project. SFMTA is currently initiating environmental assessment of the recommendations resulting from its Transit Effectiveness Project. The TEP is a comprehensive review of Muni operations, with numerous proposals for service and street network changes to address issues related to reliability, travel times and service areas.

SOURCE: Fehr & Peers; AECOM

FIGURE 7: PROPOSED TRANSIT IMPROVEMENTS

Geneva Avenue and Harney Way, across the proposed Yosemite Slough bridge, and into the Hunters Point Shipyard Transit Center. The 28L-19th Avenue currently operates during the morning (7 to 9 AM) and afternoon (2 to 4 PM) peak periods. With TEP improvements, limited stop service on the 28L-19th Avenue would operate from 9 AM to 6 PM. Harney Way/Geneva corridor would have exclusive bus and BRT lanes between the Hunters Point Transit Center and Bayshore Boulevard, through Candlestick Point and the Bayshore Caltrain Station.

Harney/Geneva BRT/Transit Preferential Street: The Harney Way/Geneva corridor would have exclusive bus and BRT lanes between the Hunters Point Transit Center and Bayshore Boulevard, through Candlestick Point and the Bayshore Caltrain Station.

Hunters Point Transit Center: The Hunters Point Transit Center would serve Hunters Point Shipyard and the Hunters Point Village Center subareas. The transit center would have approximately ten bus bays and the seven bus lines serving HPS would terminate at the center.

Bus Rapid Transit Stops: BRT stops would be at the Hunters Point Shipyard Transit Center, at three locations within Candlestick Point, and at two intermediate locations.

Palou Avenue Transit Preferential Street: The 24-Divisadero line would be extended along Palou Avenue to serve the Hunters Point Shipyard Transit Center. In addition, the 23-Monteery and the 44-O'Shaughnessey lines would continue to use Palou Avenue. Transit-priority technology would be installed on Palou Avenue including new traffic signals along Palou Avenue at Griffith, Hawes, Ingalls, Jennings, Keith and Lane Streets or other transit priority treatments.

2.5 BAY TRAIL, BLUE GREENWAY, AND BICYCLE CIRCULATION IMPROVEMENTS

The Project would include the construction of the regionally adopted Bay Trail in the southeastern portion of San Francisco, and incorporation of the Blue Greenway, a network of enhanced pedestrian and bicycle links in through the eastern portion of San Francisco to the waterfront. Trail improvements would include a pedestrian and bicycle trail along the shoreline with connections to the existing and new parks, from the western boundary of Candlestick Point near the Harney Way/U.S. 101 interchange, through the SRA, Yosemite Slough, and HPS shoreline to India Basin. The Bay Trail would be incorporated into the design of the parks.

Bikeways would provide connections within the Project and the surrounding neighborhoods and other parts of the City, including exclusive bikeways on the proposed Yosemite Slough bridge. Bicycle lanes would be provided along major roadways, consistent with City guidelines, and it is anticipated that as the street network develops, the bicycle facilities would be incorporated into the official Bicycle Route network. The Bay Trail would be extended along the entire Project waterfront. There would be bicycle parking in each commercial parking facility and residential garages. New commercial buildings with at least 20,000 gsf of floor area, as well as other facilities and attractions would provide locker and shower facilities. Bicycle racks would also be installed in parks, and along the streetscape of commercial and some residential streets. The proposed bicycle facilities and Bay Trail improvements within Hunters Point Shipyard and Candlestick Point are presented in **Figure 8**.

2.6 PEDESTRIAN CIRCULATION IMPROVEMENTS

The pedestrian network would encourage walking as a primary mode of transportation within the Project site, and with separated pedestrian pathways, between Hunters Point and Candlestick Point on the Yosemite Slough bridge. Sidewalk and multi-use pathways would allow access to transit facilities and to shopping, schools, and recreation. The interior roadway network would include traffic calming features to facilitate safe pedestrian travel. The streets would be designed to accommodate multi modal travel with features including curb extensions, intersection bulb-outs, raised crosswalks, comprehensive signage, street trees, narrow roadway lanes, and short blocks and other features to slow auto traffic. All pedestrian facilities would meet American with Disabilities Act (ADA) standards and are designed to conform to San Francisco's "Better Streets Plan" wherever possible. The proposed pedestrian circulation plan for Candlestick Point and Hunters Point Shipyard is presented on **Figure 9**.

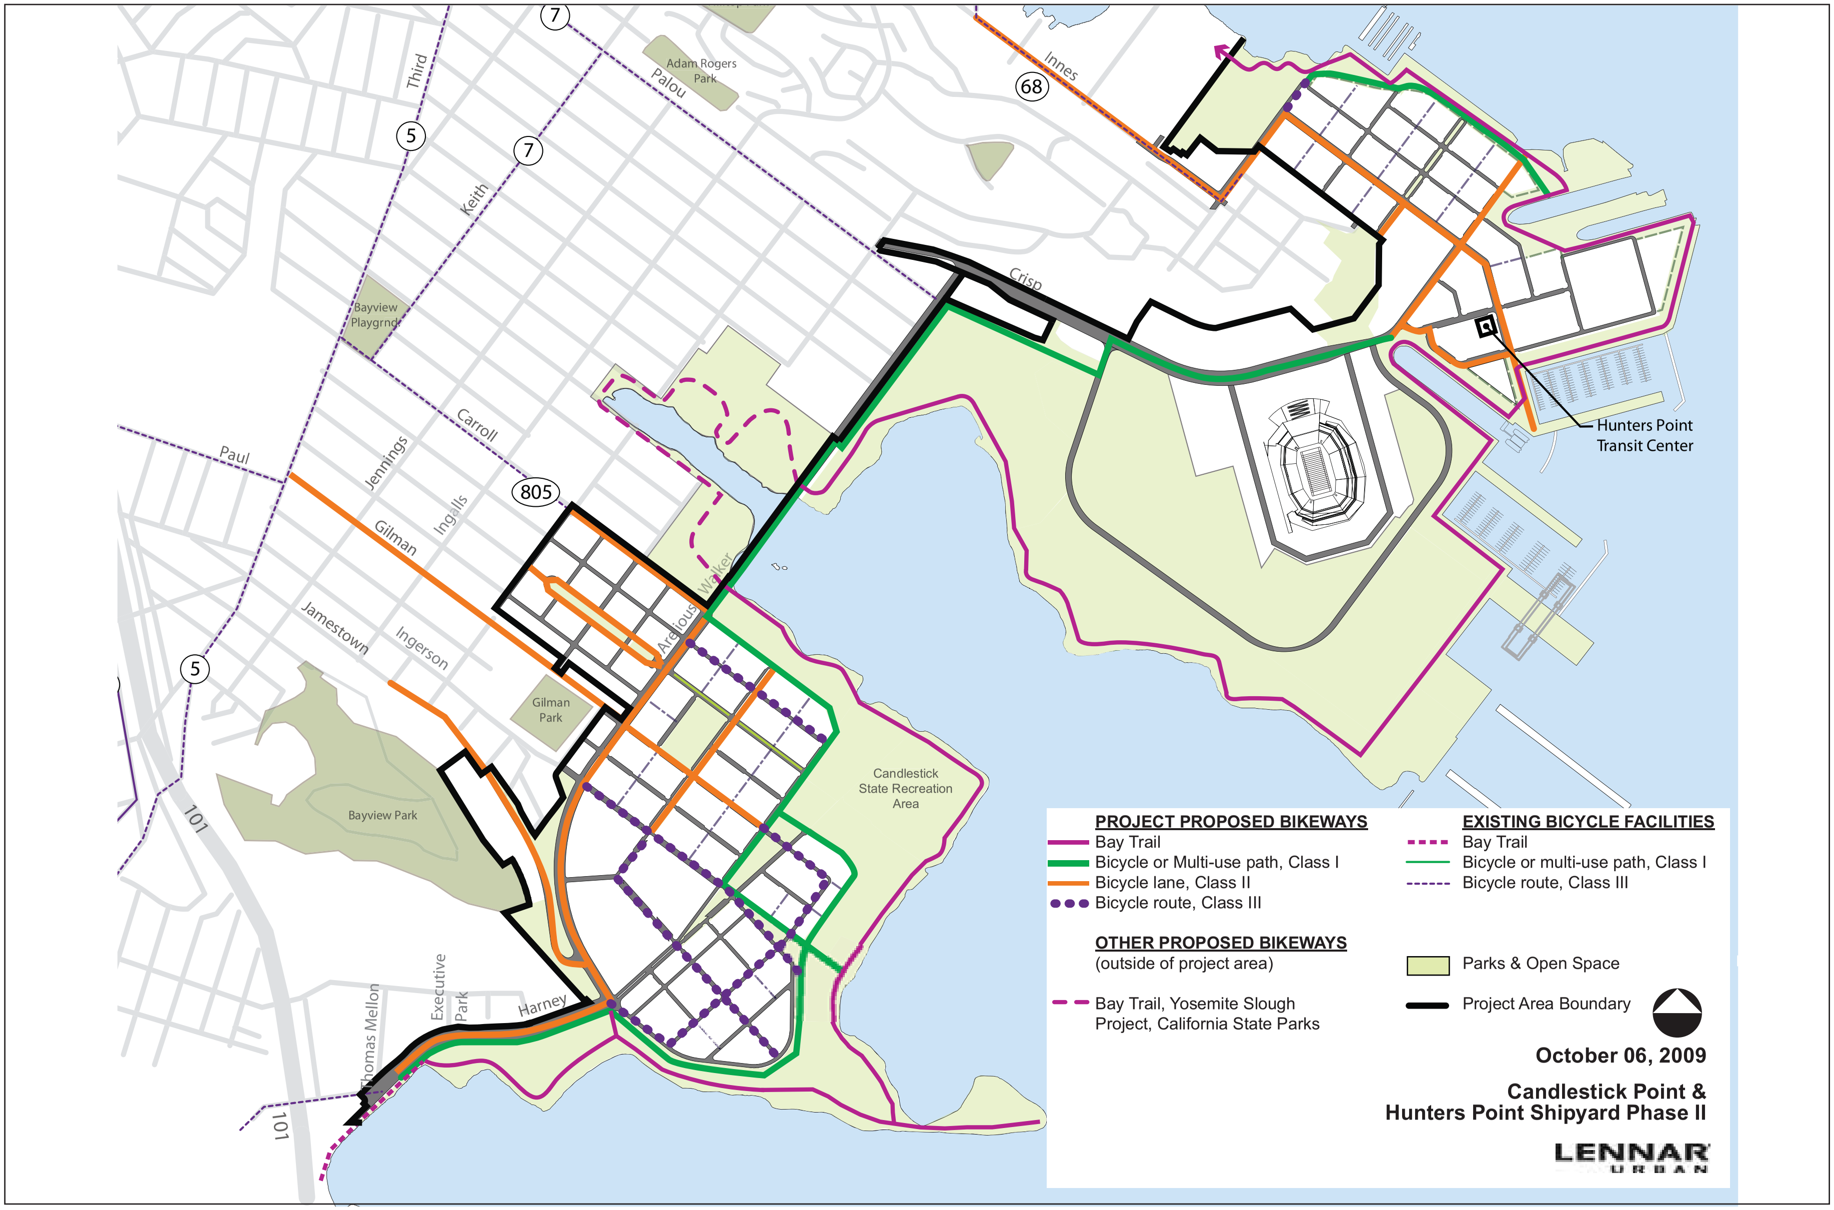
2.7 PARKING SUPPLY

Development within Hunters Point Shipyard and Candlestick Point would include off-street parking to accommodate residents, visitors and employees. The parking supply would be based on the D4D standards for the Project. In addition, on-street parking would be provided on a number of streets to support commercial and residential uses. The estimates of parking supply within Candlestick Point and Hunters Point Shipyard are presented on **Figure 10**.

The 49ers stadium area would have about 16,415 parking spaces, and an additional 1,000 off-street spaces would be available during game days within the commercial parking garage at the Candlestick Park retail center, for a total supply of 17,415 spaces. **Figure 11** presents the proposed stadium game day parking supply.

2.8 LOADING SUPPLY

Development within Hunters Point Shipyard and Candlestick Point would also include off-street freight loading facilities to accommodate loading and unloading activities (commercial delivery and moving trucks). The loading supply would be based on the D4D standards for the CP-HPS Phase II Development Plan, and would generally be consistent with Planning Code requirements for San Francisco. On-street loading spaces would serve as short-term parking near building entrances to meet the needs of disabled individuals, as a general convenience, and to allow package and other commercial deliveries.



SOURCE: Lennar Urban

FIGURE 11: PROPOSED STADIUM GAME DAY PARKING

The CP-HPS Phase II Development Plan also identifies roadways within the Project site for truck drivers to park while waiting for off-street loading spaces to become available and while resting between deliveries. Federal and state rules concerning safety related to hours of driving and mandatory rest periods require drivers to take a 10-hour rest period. Within Hunters Point Shipyard and Candlestick Point most parking lanes are 7 feet wide, however, curb lanes on the stadium Inner Ring Road and Outer Ring Road would be between 11 and 18 feet wide, which would accommodate most delivery trucks. An area of about 300 feet would be designated for truck parking only during non-game days.

2.9 TRANSPORTATION DEMAND MANAGEMENT PLAN

The CP-HPS Phase II Development Plan includes a commitment to develop and implement a Transportation Demand Management TDM Program designed to reduce use of single-occupant vehicles and to increase the use of rideshare, transit, bicycle and walk modes for trips to and from, as well as within the Project. The TDM program would be developed by a professional transportation consultant, in consultation with San Francisco Municipal transportation Agency (SFMTA) and the Planning Department. The program would establish target goals, monitoring program, and a reporting program to SFMTA and the Planning Department. A draft TDM Plan is included in Transportation Study Appendix B. The TDM Program would highlight the demand management qualities of the overall CP-HPS Phase II Development Plan, including:

1. **Jobs-Housing Linkage.** By providing a range of job types (retail, research, hospitality, office, etc.) and a range of housing types from affordable apartments to single family homes, the CP-HPS Phase II Development Plan would maximize the potential jobs/housing "matches" on site. Each match reduces the number of vehicle trips that would enter and leave the Project site during peak hours.

2. **Streets designed for low speed and safe crossings.** In addition to new residential and commercial buildings, the CP-HPS Phase II Development Plan would provide new infrastructure, including streets. All new streets and intersection upgrades would consider the needs of pedestrians and bicyclists.

3. **Land uses and transit located to encourage walking.** People walk more when destinations are within close proximity, along flat routes with easy street crossings, and through interesting areas with storefronts, street trees, street furniture and other pedestrian-oriented amenities. The CP-HPS Phase II Development Plan embraces these principles, with all homes located within a 15-minute walk of transit and neighborhood retail services integrated into residential blocks. Many existing neighborhoods would also benefit from their proximity to enhanced transit service, schools, retail locations, and jobs with the Project site.

The program would then describe a menu of TDM tools that, when employed, would make the most of the above design qualities of the Development Plan. These include:

Parking Strategies

1. **Visitor Variable, Market-Rate Parking Pricing.** Visitor parking charges at variable market rates would encourage transit use. This can be accomplished by increasing parking rates during the peak period when transit service is most frequent, or increasing parking rates progressively to favor short-term parking over long-term parking, discouraging commuter parking.

2. **Maximum Permitted Parking Ratios.** The Development Plan includes a maximum permitted of one off-street parking space per residential unit, as well as maximum permitted ratios for other development types.

3. **Flexible Parking Management Strategies.** Additional parking management strategies such as residential permit parking, time of day restrictions, parking technologies, and parking wayfinding would also be considered as needed to supplement other parking strategies.

4. **Unbundled Residential Parking.** As required for all new residential developments with more than 10 units in San Francisco, residential parking would be “unbundled” and sold or leased separately from units. Unbundling parking makes the cost of parking visible to households, and may encourage some residents to save money by opting for a single off-street space or no dedicated parking. Unbundled parking would also serve as a “self selection” incentive for residents who prefer to live in car-free or car-reduced neighborhoods.

Transit Strategies and Support Strategies

1. **Central Transit Hub.** A transit center at Hunters Point Shipyard would enable efficient and convenient transfers while providing a central location for transportation brochures and other information to be distributed and for attended bicycle parking. Major BRT stops throughout the Project site would also include information kiosks and real-time transit updates.

2. **Enhanced Transit Service and Bicycle Facilities.** Exclusive bike lanes and frequent bus rapid transit (BRT) service operating in dedicated lanes with signal priority, would offer convenient alternatives to driving to, from, and within the Project site. Additional transit service would include extended Muni routes, increased Muni frequencies, and enhanced connections to the regional network (BART and Caltrain).

3. **Bicycle Support Facilities.** Bicycle support facilities to encourage bicycling would include parking facilities in both residential and commercial developments (such as racks, indoor/long-term parking, lockers, and showers), attended bicycle parking and repair facilities at major destinations (with discounted rental space for a bike station at the Hunters Point Shipyard Transit Center), and potentially a bike sharing or rental program.

4. **Wayfinding.** A comprehensive wayfinding signage program would support the network of walkways and shared-use paths, encouraging pedestrian and bicycle trips.

5. **EcoPass.** Homeowner's dues would include the cost of transit passes. The transit pass or "EcoPass" would offer significant benefits including: a group discount (transit pass costs, while mandatory, would be priced significantly lower than individual passes because they are mandatory), a steady funding stream for enhanced transit service, and a "self selection" incentive – whereby more Eco-Minded (transit-inclined) residents would be attracted to live in the Project site.

6. **Carshare Services.** Local carshare organizations would provide carshare vehicles throughout the Project site. Carshare services, such as City CarShare and ZipCar, allow members to use vehicles when needed, paying based on how much they drive. Employers may include carshare memberships for their employees as an element of their mandatory TDM Program. For multi-unit housing developments, carshare vehicles may be provided in residential garages.

7. **Employee TDM Programs**. Employers of 20 or more employees in the Project site would be required to participate in TDM programs that would encourage the use of transit and facilitate walking and bicycling among their employees through both incentives and disincentives. Elements of the TDM programs may include:

    a. **Information Boards/Kiosks.** Employers would display transit routes and schedules; carpooling and vanpooling information; and bicycle lanes, routes, paths and facility information on information boards/kiosks or direct employees to web resources.

    b. **Commuter Benefits.** The TDM program would include participation in the Commuter Benefits program for tax-free paycheck deductions of transit and bicycle commuter expenses (a program mandatory for San Francisco employers of 20 or more employees).

    c. **Employee EcoPass.** Opportunities to provide employees with an "EcoPass" would be pursued, similar to the programs already underway at the University of California and the City of Berkeley. These passes would allow unlimited transit use and could be purchased at a discount bulk rate on a monthly and/or annual basis, and then be made available to all employees who work on the Project site.

d. **Carpool/Vanpools.** Through their TDM program and in collaboration with the On-Site TDM Coordinator, employers would offer carpool and vanpool matching services, subsidies, and priority accommodation. Designated and convenient spaces in parking facilities would be provided free to vanpools and carpools. The transit centers would also have designated signed areas for casual carpooling. Casual carpooling information would be provided through the On-Site Coordinator's TDM website, brochures, and targeted marketing.

e. **Guaranteed Ride Home Program.** A Guaranteed Ride Home program supported by employer participation would reimburse transit riders for return trip travel in the event of an emergency when an alternative means of travel is not available.

f. **Compressed Work Weeks, Flex Time, and Telecommuting.** Through these strategies, employees would adjust their work schedule to reduce vehicle trips to the worksite.

Implementation and Monitoring Strategies

1. **CP-HPS Transportation Management Association.** A CP-HPS Transportation Management Association would be formed to develop, implement, operate and administer strategies and programs to manage transportation resources in CP-HPS (including Phase I and Phase II) in accordance with the Transportation Demand Management Plan for CP-HPS.

2. **On-Site Transportation Coordinator and Website.** An On-site Transportation Coordinator would provide residents, employers, employees, and visitors with information regarding available transportation alternatives. The Transportation Coordinator would be responsible for implementation, monitoring, and improvement of the measures of the TDM plan. The Coordinator would maintain a website to include transportation-related data and real-time transit information. The Coordinator would serve as a liaison to City staff for all transportation concerns/communication needs.

3. **Targeted Marketing.** From the day that the first employee comes in to work and the first family moves in, a plan would be in place to help people discover alternatives to driving alone in a car. The On-Site Coordinator would be available to help people plan their trips and work with transportation agencies and others to promote transit, vanpooling, carpooling and carsharing, bicycling, and walking. In addition to one-on-one outreach, TDM brochures and a website would be available on an ongoing basis. A

yearly transportation options "fair" would also be scheduled for the neighborhood, with smaller outreach efforts available to employers and other organizations.

4. **Monitoring of Transportation Demand** The transportation measures and programs would all be monitored on an annual basis to determine the success of the programs and to allow the On-Site Coordinator to make decisions about the allocation of resources or changes in the services that may be needed to better address the needs of the Development Plan area. The objective of the monitoring would be to maximize the use of alternatives to the single occupant automobile and reduce peak hour congestion. A monitoring program could include user surveys, automobile counts, transit ridership, and bicycle and car share usage and costs.

5. **Monitoring Effectiveness of Congestion-Reducing and Traffic Calming Efforts.** As part of annual monitoring, the On-site Coordinator would, in cooperation with SFMTA, review the effectiveness of the Project's transportation measures and other traffic calming measures implemented in the area to reduce congestion due to Project vehicle trips and minimize traffic spillover to neighboring residential streets. If warranted, the On-Site Coordinator and SFMTA would consider implementation of additional traffic-calming and congestion-alleviating measures, such as adding additional lanes to the streets that approach Third Street, or other congested areas.

2.10 PROJECT PHASING

The Project would be implemented in four overlapping phases, with construction anticipated to be initiated in 2011 and completed by 2029. **Table 2** on page 27 presents the amount of development projected to be constructed at the end of each phase, as well as the transportation infrastructure improvements that would be implemented. As indicated in the table, the majority of development and infrastructure improvements would be completed by the end of the second phase, which has a scheduled completion date of 2021.

Table 2
Project Phasing of Land Use Program and Transportation Improvements

	Phase 1 2017	Phase 2 2021	Phase 3 2025	Phase 4 2029	Total

2.11 PROJECT VARIANTS AND ALTERNATIVES TO THE PROJECT

This section describes the five Project Variants and five Alternatives to the Project.

2.11.1 Project Variants

Five variants of the Project were formulated by the Redevelopment Agency, the City and Lennar Urban, and other stakeholders for purposes of the environmental analysis.

- Two variants address the scenario of the San Francisco 49ers moving to the City of Santa Clara with no football stadium constructed at Hunters Point Shipyard (HPS) Phase II. Those two variants include a different land use distribution at the HPS Phase II site. Compared to the Project, the development program of these variants at HPS Phase II would be increases in R&D space under the No Stadium—Additional Research and Development Variant (R&D Variant) and relocating residential units to HPS Phase II under the No Stadium - Housing Variant (Housing Variant).

- Three Candlestick Point tower variants (Variant 3) would have the same land use program and overall description as the Project, but would have different locations and heights for residential towers at Candlestick Point (Candlestick Point Tower Variants A, B, and C).

- A utilities variant (Variant 4) would include an automated solid waste collection system, decentralized wastewater treatment, and district energy.

- Variant 5 would include the scenario of a shared stadium where both the 49ers and Oakland Raiders would play at a new stadium at HPS Phase II

Project Variant 3 (Candlestick Point Tower) and Variant 4 (Utilities) would have the same development program and transportation network as the Project and therefore their transportation impacts would be the same. For this reason, these variants are not further discussed in the transportation study. Variant 5 (49ers/Raiders Shared Stadium) is assessed qualitatively because impacts would be similar to those identified for the Project conditions, however the number of times per year that these impacts would occur would double.

Table 3 summarizes the land use assumptions for the Project and for Project Variants 1 and 2. **Table 4** presents a comparison of the transportation network improvements for the Project and Project Variants.

Table 3
Summary of Project and Project Variants – Land Use Program

	Project	Project Variant 1 (R&D Variant)	Project Variant 2 (Housing Variant)
Hunters Point Shipyard

Variant 1 – No Stadium - R&D Variant

Variant 1 assumes that the 49ers stadium would not be constructed at Hunters Point Shipyard, and, instead, the 49ers would move to the City of Santa Clara. Under Project Variant 1, an additional R&D uses would be developed. As indicated in **Table 3** above, the land use program would be the same as for the Project, with the exception that 5,000,000 sf of research and development space, rather than 2,500,000 sf of R&D space would be developed at Hunters Point Shipyard. Variant 1 assumes the same roadway and transit improvements as the Project, including construction of the Yosemite Slough bridge. However, the bridge would be narrower than the bridge included as part of the Project, with a 39-foot wide right-of-way to accommodate two 11-foot wide BRT lanes, a sidewalk, and a Class I bicycle path.

Variant 2 – No Stadium – Housing Variant

Variant 2 also assumes that the 49ers stadium would not be constructed at Hunters Point Shipyard, and, that instead the 49ers would move to the City of Santa Clara. The land use program would be the same as for the Project, with the exception that 4,000 residential units, rather than 2,650 units, would be developed at Hunters Point Shipyard. As with Variant 1, Variant 2 assumes the same roadway and transit improvements as the Project, including construction of the Yosemite Slough bridge. The bridge would be narrower than the bridge included as part of the Project, with a 39-foot wide right-of-way to accommodate two 11-foot wide BRT lanes, a sidewalk, and a Class I bicycle path.

Variant 3 – Candlestick Point Tower Variants (Tower Variants A, B, and C)

The three Candlestick Point Tower Variants (Tower Variants A, B, and C) would have the same overall land use program as the Project. While there would be additional towers under these variants, the total number of residential units would remain the same as the Project. Transportation impacts associated with this variant would be the same as the Project, and are therefore not addressed further in the transportation study.

Variant 4 – Utilities

The Utilities Variant assumes the implementation of additional on-site utility infrastructure, including (1) district heating and cooling, (2) on-site wastewater treatment, and (3) an automated trash collection system. All land uses at Candlestick Point and the HPS Phase II site would be constructed at the same locations and at the same intensities proposed under the Project, although some minor shifts in building locations could occur to accommodate some elements of the proposed utility systems, which would require some additional built space. Transportation impacts associated with this variant would be the same as the Project, and are therefore not addressed further in the transportation study.

Variant 5 – SF 49ers and Oakland Raiders Shared Stadium at Hunters Point Shipyard

This variant assumes that both the 49ers and the Oakland Raiders would play home games at the new stadium at Hunters Point Shipyard. This variant addresses the requirement of the National Football League for NFL teams in close geographic proximity to one another to evaluate the potential shared use of a stadium. There currently are no specific plans for use of the stadium by a second NFL team.

This variant would have the identical land uses as the Project, however, the number of days during which football games would occur at the stadium would increase. Given that teams typically play half of all pre-season, post-season, and regular season games at home, the use of the stadium by two NFL teams could result in one NFL event at the stadium occurring every week from the beginning of the pre-season in August through the end of December for up to 24

NFL events per year. In addition, there would also be up to 20 secondary smaller events at the stadium per year.

2.11.2 Alternatives to the Project

As noted above, five Alternatives to the Project are analyzed in the transportation study. **Table 5** summarizes the land use assumptions for the Project and for the five Alternatives to the Project. **Table 6** presents a comparison of the transportation network improvements for the Project and the Alternatives to the Project.

Table 5
Summary of Project and Alternatives to the Project – Land Use Program

	Project	Alt 1 No Project	Alt 2 No Bridge	Alt 3 49ers at Candlestick	Alt 4 Lesser Build	Alt 5 No Park Agreement

Alternative 1 – No Project

Alternative 1 assumes that the CP-HPS Phase II Development Plan would not be implemented and that the land uses proposed under San Francisco Proposition G, the legislation that enabled the CP-HPS Phase II Development Plan, would not be pursued. Development regulations and zoning would revert to the regulations that were in place prior to passage of Propositions D and F and establishment of the Candlestick Point Special Use District[6].

Alternative 1 assumes that the program included in the existing Hunters Point Shipyard Redevelopment Program would be built out. No new development is assumed for Candlestick Point, and the existing stadium would remain.

Alternative 2 – No Bridge

The land use program for Alternative 2 would be the same as the Project. However, Alternative 2 would modify the circulation plan proposed under the CP-HPS Phase II Development Plan, and would not include construction of the Yosemite Slough bridge.

Under Alternative 2, since the Yosemite Slough bridge would not be constructed, motorized and non-motorized traffic would be required to circumnavigate the slough. Between the intersection of Carroll Avenue/Arelious Walker Drive and Crisp Avenue within Hunters Point Shipyard, the proposed BRT line would be routed on Carroll Avenue between Arelious Walker Drive and Hawes Street, on Hawes Street between Carroll Avenue and Armstrong Avenue (currently unimproved), and on Armstrong Avenue between Hawes Street and the Navy Rail right-of-way, along the Navy rail right-of-way between Armstrong Avenue and Shafter Avenue, along Shafter Avenue between the Navy rail right-of-way and Arelious Walker Drive, and on Arelious Walker Drive between Shafter Avenue and Crisp Avenue (currently unimproved). **Figure 12** illustrates the proposed route.

- On Carroll Avenue the BRT line would operate within an exclusive BRT lane – one transit-only lane and two mixed-flow travel lanes would be provided in each direction.
- Hawes Street between Carroll Avenue and Armstrong Avenue, and Arelious Walker Drive between Shafter Avenue and Crisp Avenue are currently unimproved streets and would be built out to accommodate one transit-only travel lane in each direction.
- The Navy rail right-of-way between Armstrong Avenue and Shafter Avenue would be improved to provide one transit-only travel lane in each direction.
- Shafter Avenue between the rail right-of-way and Arelious Walker Drive would be reconfigured to provide four travel lanes, with BRT operating within the center lanes. Providing four travel lanes would require either prohibiting parking on one side of the street or narrowing sidewalks by four feet (from 15 feet wide to 11 feet wide) on both sides of the street.

---

[6] In June 1997, San Francisco voters adopted two measures – proposition D and Proposition F – providing for the development of a new state-of-the-art stadium for the San Francisco 49ers football team and an entertainment/retail shopping center at Candlestick Point. Proposition F amended the General Plan, Planning Code, and Zoning Map, and established the Candlestick Point Special Use District to accommodate the development of a stadium suitable for professional football and a shopping and entertainment center with open space and related parking facilities, as principal uses, and other conditional uses, such as

Existing RR ROW

BRT Path: Using RR ROW for portion of route around Slough

Auto Route Alignment

0 500 Feet

SOURCE: SFMTA

FIGURE 12: BRT ROUTE FOR NO BRIDGE PROJECT CONDITIONS

Alternative 3 – 49ers at Candlestick

Alternative 3 assumes that the 49ers would continue to utilize the existing Candlestick Park stadium. The only new development that would occur at Candlestick Point would be replacement of Alice Griffith housing complex (256 units), and construction of 954 additional housing units. Within Hunters Point Shipyard, the land use program would be similar to the Project, however, the stadium would not be constructed, and instead, 1,350 residential units more than proposed as part of the Project would be developed. The Candlestick Park stadium would remain at its existing site.

Alternative 3 includes the construction of a bridge over Yosemite Slough for use by pedestrians, bicycles, and BRT. The bridge would be narrower than the bridge proposed as part of the Project, and would have a 39-foot wide right-of-way to accommodate two 11-foot wide BRT lanes, a sidewalk, and a Class I bicycle path.

Alternative 4 – Lesser Build

Land uses proposed under Alternative 4 would be similar to the Project, however, the proposed floor areas for most uses would be approximately 30 percent smaller at full buildout in comparison to the Project. The floor area for the artists studios, community services, the arena and stadium would remain the same as for the Project. Candlestick Park stadium would be demolished, and a new stadium would not be constructed.

Alternative 4 would not include construction of a bridge over Yosemite Slough. As under Alternative 2, motorized and non-motorized traffic would be required to circumnavigate the slough, and the most direct route between Hunters Point Shipyard and Candlestick Point would be via Ingalls Street. The proposed BRT line would be routed primarily within the Navy rail right-of-way as described under Alternative 2 above, and illustrated in **Figure 12.**

Alternative 5 – No Park Agreement

The land use program for Alternative 5 would be the same as Project Variant 2, which assumes that 1,350 residential units would be shifted from Candlestick Point to Hunters Point Shipyard. Alternative 5 assumes that the existing stadium would be demolished, and that a new stadium would not be constructed. However, Alternative 5 would not involve State land exchange, and therefore would not include construction of a bridge over Yosemite Slough.

Motorized and non-motorized traffic would be required to circumnavigate the slough, and the most direct route between Hunters Point Shipyard and Candlestick Point would be via Ingalls Street. The proposed BRT line would be routed primarily within the Navy rail right-of-way as described under Alternative 2 above, and illustrated in **Figure 12.**

Chapter 3
PROJECT SETTING

This chapter describes the facilities and systems that currently comprise the local and regional transportation network serving the Project. These facilities and systems include a network of local street, ramps and freeways; local and regional bus and rail transit lines; parking; pedestrian and bicycle facilities; and good movement.

This setting chapter describes: 1) the transportation study area; 2) existing regional and local transportation facilities and services that serve the Project area; 3) existing transportation conditions; and 4) transportation conditions following a football game at the existing stadium.

3.1 TRANSPORTATION STUDY AREA

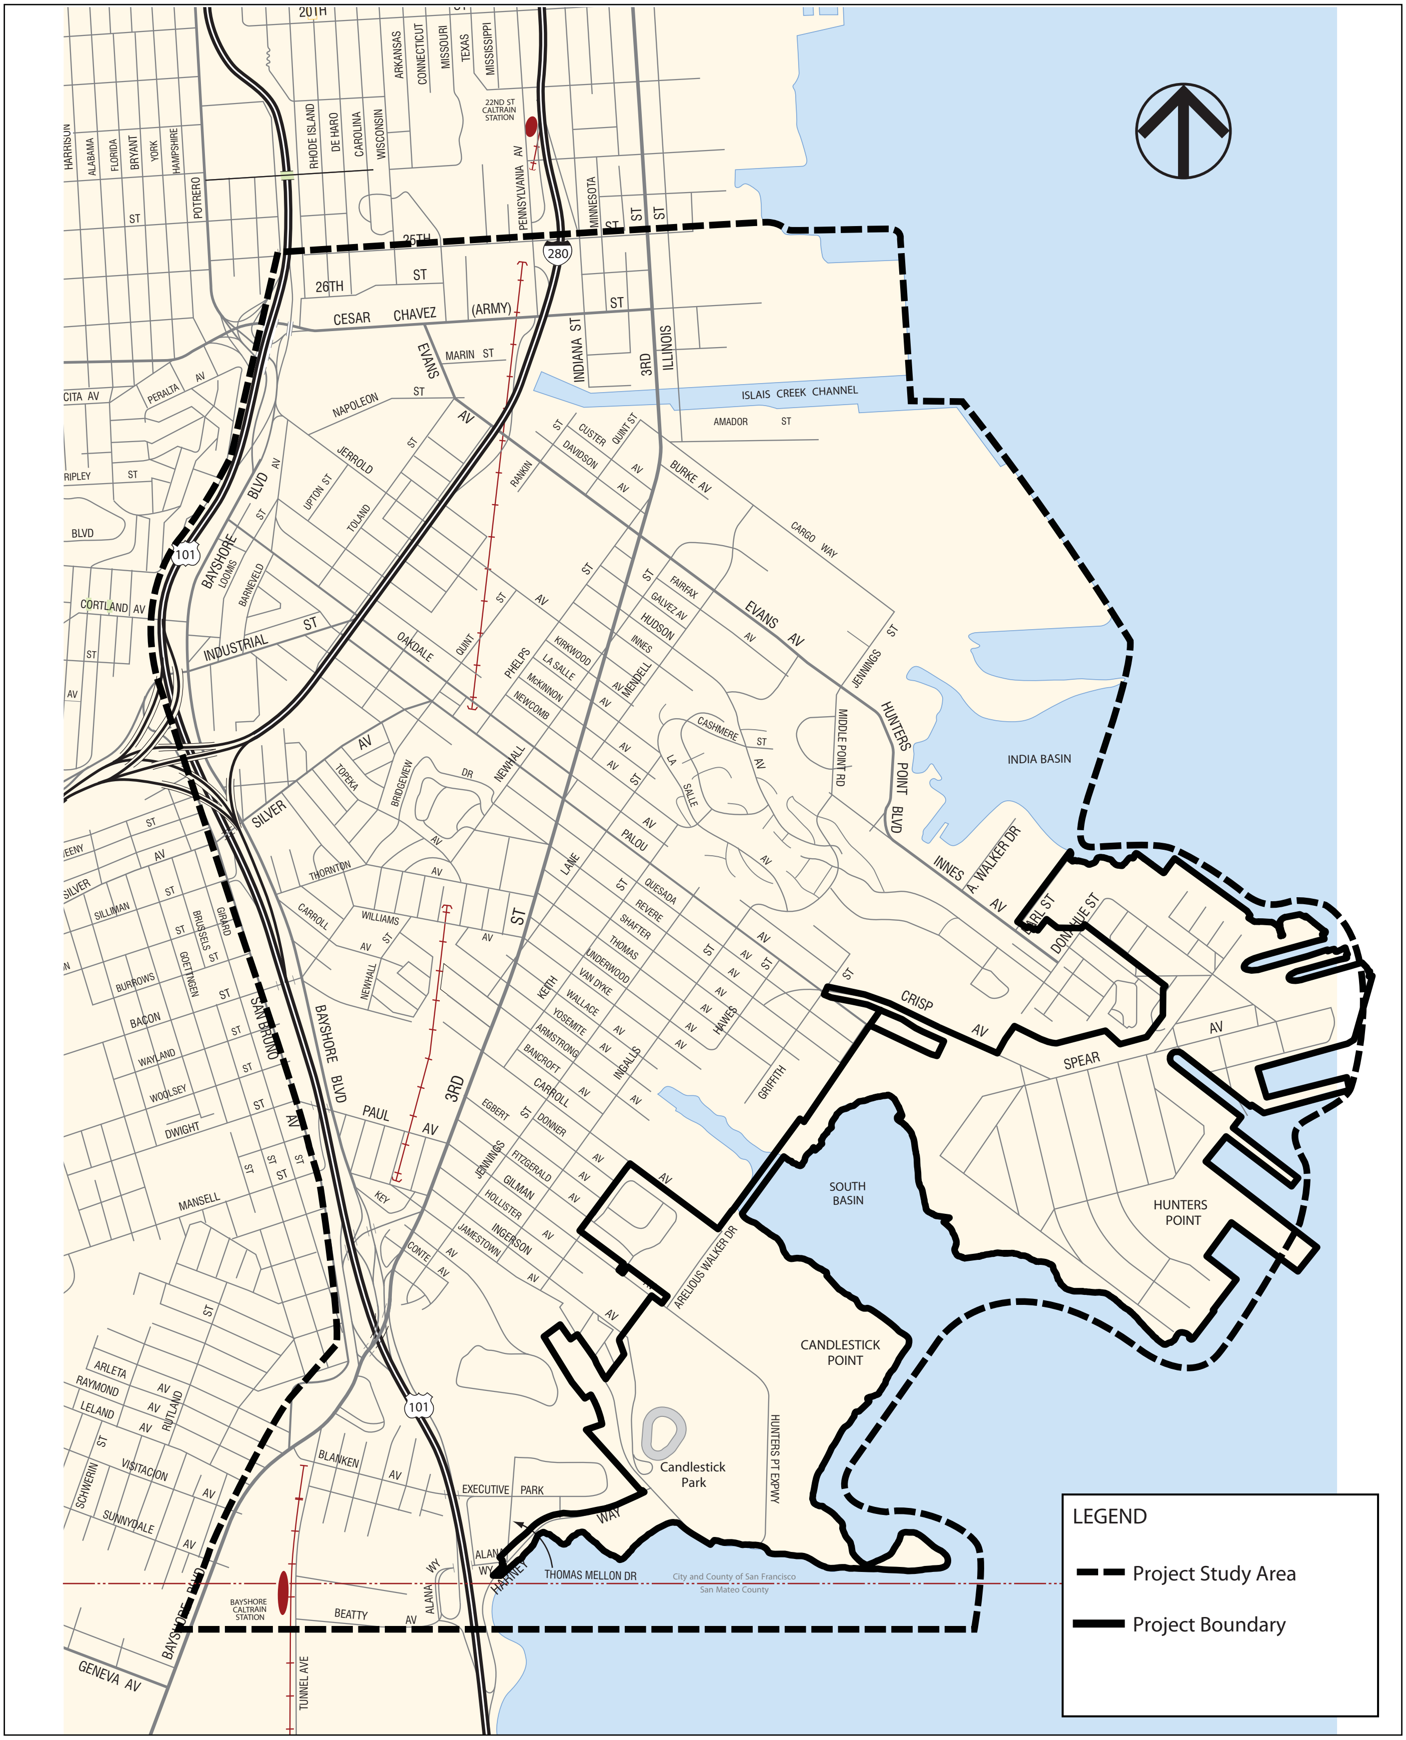
The transportation study area includes all aspects of the transportation network that may be measurably affected by Project traffic. The transportation study area is defined by travel corridors and by facilities such as bus stops/transit stations. It includes the freeway segments, freeway ramps and existing and proposed street intersections that residents and visitors would use in traveling to and from the Project. **Figure 13** presents the transportation study area.

A total of 59 existing intersections (including five intersections within the City of Brisbane), 11 freeway on- and off-ramps, and five freeway segments within the study area were identified as key locations that are likely to be impacted by the Project, and were selected for detailed study of the Project impacts. The study intersections include all major intersections along Third Street, Bayshore Boulevard, and access routes to and from U.S. 101 (including the off-ramp and local street junctions). Intersections further away were not analyzed as part of the study, as Project traffic remaining on local streets would be dispersed and consequently, the Project contribution would be less than at the study intersections. **Figure 14** presents the traffic analysis locations.

The parking analysis focused on two subareas where the stadium game day parking would occur including the on-site and off-site lots, as well as residential streets adjacent in Little Hollywood and Bayview/Candlestick Point.

3.2 ROADWAY NETWORK

This section provides a discussion of the existing roadway network within the study area. Transportation Study Appendix D contains definitions and regulatory requirements for the various San Francisco General Plan (General Plan) roadway classifications.



SOURCE: LCW Consulting

FIGURE 13: PROJECT STUDY AREA

SOURCE: Fehr & Peers

FIGURE 14: TRAFFIC ANALYSIS LOCATIONS

3.2.1 Regional Access

Travel to and from the Project site involves the use of regional transportation facilities, highways and transit services that link San Francisco with other parts of the Bay Area and Northern California. Candlestick Point is accessible by local streets with connections to and from regional freeways and highways in the state system.

U.S. 101 is generally a north/south freeway, connecting San Francisco with the Peninsula and beyond to the south, and Marin County and beyond to the north. Between I-80 and I-280, U.S. 101 is an eight to ten-lane limited-access freeway. Between I-80 and the Golden Gate Bridge, U.S. 101 is a six-lane surface street along Van Ness Avenue, Lombard Street and Doyle Drive.

U.S. 101 has both northbound and southbound on- and off-ramps at Harney Way/Beatty. At Bayshore/Third, there is no northbound on-ramp, and at Cesar Chavez Street, there is no southbound on-ramp. U.S. 101 has a southbound off-ramp at Paul/San Bruno; southbound and northbound on-ramps at Industrial Avenue; and southbound on- and off-ramps and a northbound off-ramp at Silver Avenue.

U.S. 101 is one of the most heavily used corridors in the Bay Area. U.S. 101 and I-280 merge approximately two miles north of Candlestick Point, a common location of congestion during weekday commute periods and pre- and post-game periods. Approximately two miles south of Candlestick Point, U.S. 101 merges with I-380[7] near the San Francisco International Airport.

I-80, which merges with U.S. 101 north of Candlestick Point and south of downtown San Francisco, is generally an east-west freeway, stretching from San Francisco in the west to Sacramento and beyond to the east. The San Francisco-Oakland Bay Bridge connects with U.S. 101 south of downtown San Francisco.

I-280 is generally a north-south freeway, connecting San Francisco with the Peninsula. The freeway provides a direct connection to U.S. 101 and terminates at the surface streets in the South of Market/Mission Bay area. South of the interchange with the U.S. 101 I-280 is currently a six- to eight-lane freeway.

Table 7 presents the U.S. 101 and I-280 ramps serving the study area. Within the study area, ramps are closely spaces, and standard full interchanges are not provided.

[7] I-380 is a short 3.3-mile east-west highway that connects I-280 in San-Bruno with U.S. 101 near the San Francisco International Airport.

3.2.2 Local Roadway Network

This section provides a discussion of the existing local roadway system in the vicinity of the Project site, including the roadway designation, number of travel lanes, and traffic flow directions.

Alana Way is an approximately 1,500-foot two-way roadway segment that connects Beatty Avenue with Harney Way. It serves as the primary connection between Harney Way and U.S. 101 southbound ramps at Alana/Beatty. Alana Way has one travel lane in the eastbound direction towards Harney Way, and two travel lanes in the westbound direction towards Beatty Avenue. On-street parking is not permitted at any time.

Arelious Walker Drive (previously named Fitch Street) is a north-south discontinuous roadway that is divided by the Yosemite Slough and Hunters Point Hill. Arelious Walker Drive runs between Gilman and Carroll Avenues, between Shafter and Palou Avenues, and between Innes and Galvez Avenues. Like other north-south streets in the vicinity, the Arelious Walker Drive alignment has a 64-foot wide right-of-way with room for two 10-foot wide sidewalks (presently un-paved). This street serves as an alternative way to access the northern unpaved privately-owned parking lots used for stadium parking. Arelious Walker Drive between Gilman and Carroll Avenues is part of Bicycle Route #805, and is part of the unimproved on-street Bay Trail.

Bayshore Boulevard is a north-south arterial that generally parallels U.S. 101. Bayshore Boulevard has three travel lanes in each direction, separated by a median. The General Plan designates Bayshore Boulevard as a Major Arterial, part of the MTS Network, and a Transit Preferential Street (other – secondary), and a Neighborhood Commercial Street. South of Arleta Avenue, Bayshore Boulevard is designated as a Transit Preferential Street (other – secondary). Bayshore Boulevard is part of Bicycle Routes #25 and #5. The T-Third light rail line runs on Bayshore Boulevard between Hester Avenue and Sunnydale Avenue.

Beatty Avenue is a two-way east-west roadway between Tunnel Avenue and the U.S. 101 southbound ramps at the intersection of Alana/Beatty. Beatty Avenue has one travel lane in each direction.

Blanken Avenue is a two-way east-west roadway that extends from Bayshore Boulevard through the Little Hollywood area west of Executive Park. The roadway has one lane in each direction with sidewalks and unrestricted parking on both sides of the street. Commercial vehicles weighing more than 6,000 pounds are prohibited from using this roadway as a through route. Blanken Avenue terminates at the intersection of Executive Park Boulevard and Candlestick Road.

Cargo Way is an east-west roadway that extends between Third and Jennings Streets, and serves as the primary access point for the Port of San Francisco's Intermodal Container Terminals. Cargo Way generally contains two travel lanes in each direction. The General Plan identifies Cargo Way as a Secondary Arterial, and as a street with significant truck traffic. Cargo Way is part of the unimproved on-street Bay Trail.

Carroll Avenue is an east-west roadway between Third Street and Arelious Walker Drive. Carroll Avenue has one eastbound lane and two westbound lanes. Carroll Avenue has a right-of-way width of 80 feet. It has discontinuous sidewalks, and, due to the rail tracks there is no sidewalk on the south side of Carroll Avenue between Jennings and Third Streets. Between Ingalls and Hawes Streets there are no sidewalks on the north side of the street, and between Hawes and Griffith Streets there are no sidewalks on either side of the street. Sidewalk accommodations to the east of Ingalls Street are generally discontinuous or frequently obstructed by parked vehicles. On-street parking is permitted west of Ingalls Street. The General Plan identifies Carroll Avenue as a street with significant truck traffic. Carroll Avenue is a part of Bicycle Route #805. Between Arelious Walker Drive and Ingalls Street, Carroll Avenue is currently part of the unimproved on-street Bay Trail.

Cesar Chavez Street is a major east-west arterial between Douglass Street to the west and the Port of San Francisco North Container Terminal, east of Third Street. In the vicinity of the Project, Cesar Chavez Street generally has two to three travel lanes in each direction, with a center median. West of Guerrero Street, Cesar Chavez Street has one lane in each direction. In the General Plan, Cesar Chavez Street is identified as a Major Arterial in the CMP Network from Guerrero Street to Third Street, a Secondary Arterial east of Third Street, and part of the MTS

Network. It is identified as a Route with Significant Truck Traffic east of U.S. 101. Cesar Chavez Street is part of the Bicycle Route #60.

Crisp Avenue is an east-west roadway that extends from the intersection of Griffith/Palou to Spear Avenue within the Shipyard. Public vehicle access is currently not permitted, with the exception of emergency vehicles, and the roadway is currently gated (Crisp south gate) at the intersection of Griffith/Palou. Crisp Avenue served as the primary truck and rail access into the Shipyard until 1971. Crisp Avenue would be reopened as part of the Project.

Evans Avenue is an east-west arterial, with two travel lanes in each direction. Evans Avenue extends between Cesar Chavez Street and Jennings Street (where it becomes Hunters Point Boulevard). The General Plan identifies Evans Avenue between Cesar Chavez Street and Third Street as a Major Arterial in the CMP Network, and part of the MTS Network. Evans Avenue between Third Street and Jennings Street is identified as a Secondary Arterial, and part of the MTS Network. The General Plan also identifies Evans Avenue as a street with significant truck traffic. Evans Avenue is part of Bicycle Route #68, and between Third and Jennings Streets a bicycle lane is provided in each direction.

Geneva Avenue is a major east-west roadway that connects Bayshore Boulevard in Brisbane and Daly City to Highway 1 and I-280 in San Francisco. Geneva Avenue generally has two travel lanes in each direction. The General Plan designates Geneva Avenue as a major arterial, and as a Transit Preferential Street. It is also part of the congestion Management Program Network. Geneva Avenue is part of Bicycle Route #90. The Geneva Avenue Corridor is part of an ongoing Transit Preferential Street study by SFMTA to identify short- and mid-term improvements to increase transit reliability, performance and service.

Gilman Avenue is an east-west street between Third Street and Giants Drive/Hunters Point Expressway. Gilman Avenue has one eastbound travel lane and two westbound lanes, and on-street parking is generally permitted. As with Jamestown and Ingerson Avenues, commercial vehicles weighing more than 6,000 pounds are prohibited from Gilman Avenue between Third and Fitch Streets, except for local service.

Griffith Street is a north-south discontinuous roadway that is divided by Yosemite Slough. On the southern side of the slough, Griffith Street runs between Gilman Avenue and Cameron Way. North of the Slough, Griffith Street extends from Navy Road south to Thomas Avenue. Between Thomas Avenue and the Slough, Griffith Street is an unimproved dirt road. The General Plan identifies Griffith Street between Thomas Avenue and Crisp Avenue as a street with significant truck traffic.

Harney Way is the primary southern access road to Candlestick Point. Harney Way provides a direct connection between U.S. 101 and Jamestown Avenue. Vehicles destined to and from U.S.

101 northbound use the Harney Way ramps, while vehicles destined to and from U.S. 101 southbound use the Alana/Beatty ramp on the west side of U.S. 101 (via Alana Way). Between Alana Way and Jamestown Avenue, Harney Way has two travel lanes in each direction. On-street parking is not permitted at any time, and a sidewalk is provided only on the north side. Harney Way is part of Bicycle Route #805.

Hunters Point Boulevard is an arterial that connects Evans Avenue at Jennings Street with Innes Avenue. Hunters Point Boulevard and Innes Avenue serve as the primary access road to the Shipyard. Hunters Point Boulevard has two travel lanes in each direction. The General Plan identifies Hunters Point Boulevard as a Secondary Arterial, and part of the MTS Network. It also identifies Hunters Point Boulevard as a street with significant truck traffic. Hunters Point Boulevard is part of Bicycle Route #68, and contains a bicycle lane in each direction.

Hunters Point Expressway (and the road south of the Harney Way/Jamestown Avenue intersection, called Jamestown Avenue Extension) circles the existing stadium and parking lot, and connects the east end of Jamestown Avenue with the east end of Gilman Avenue. Hunters Point Expressway provides access to the Candlestick Point State Recreational Area east of the Project site. The number of travel lanes on Hunters Point Expressway varies. In general, there are two continuous travel lanes in each direction, with additional lanes providing access between Jamestown and Gilman Avenues and the gates to the on-site parking. On-street parking is not permitted at any time. However, along parts of Jamestown Avenue Extension, on-street parking is permitted but restricted on event days. Hunters Point Expressway is part of Bicycle Route #805.

Illinois Street is a two-way, north-south roadway that generally parallels Third Street north of the Project site, extending from 16th Street over the Islais Creek Channel and merges into Cargo Way at the Amador Street intersection. The roadway primarily has one lane in each direction with sidewalks and on-street parking on both sides of the street

Indiana Street is a north-south roadway between Mariposa and Tulare Streets. Between Cesar Chavez and 25th Streets, Indiana Street operates one-way northbound and provides access to the I-280 northbound on-ramps at 25th Street. Indiana Street generally has on-street parking, both perpendicular and parallel, on both sides of the street. Indiana Street is part of Bicycle Route #907.

Ingalls Street is a north-south roadway between Jamestown Avenue and Innes/Middle Point. Ingalls Street has one travel lane in each direction, and on-street parking and sidewalks on both sides of the street. Ingalls Street has narrow sidewalks and very wide travel lanes between Yosemite Avenue and Thomas Avenue. Prior to the closure of the Hunters Point Shipyard, Ingalls Street was part of the designated truck route between Carroll Avenue and the currently inactive south (Crisp) gate at Palou Avenue. The General Plan identifies Ingalls Street between

Carroll and Thomas Avenues as a street with significant truck traffic. Ingalls Street between Carroll and Yosemite Avenues is currently part of the unimproved on-street Bay Trail.

Ingerson Avenue is an east-west street between Third Street and Giants Drive. Ingerson Avenue has one travel lane in each direction and on-street parking is permitted. Commercial vehicles weighing more than 6,000 pounds are prohibited from traveling on Ingerson Avenue between Third and Arelious Walker Drive, except for local service.

Innes Avenue is an east-west arterial that provides direct access to Hunter Point Shipyard's Innes (north) gate. It contains two travel lanes in each direction. The General Plan identifies Innes Avenue as a Secondary Arterial and part of the MTS Network. It also identifies Innes Avenue as a street with significant truck traffic. Innes Avenue is part of Bicycle Route #68.

Jamestown Avenue is an east-west street between Third Street and Hunters Point Expressway. West of Redondo Street, Jamestown Avenue has one travel lane in each direction. East of Redondo Street to Giants Drive, there is a substantial change in lane width as Jamestown Avenue increases to one lane in the eastbound direction and two lanes in the westbound direction. Commercial vehicles weighing more than 6,000 pounds are prohibited from using Jamestown as a through route. On-street parking is generally permitted on Jamestown Avenue. Jamestown Avenue provides access to Bayview Park and the Candlestick Point Recreation area, and is identified in the General Plan as a Recreational Street.

Oakdale Avenue is an east-west arterial between Bayshore Boulevard and Third Street. East of Third Street, Oakdale Avenue is discontinuous and is generally a residential street. The General Plan identifies Oakdale Avenue between Bayshore Boulevard and Third Street as a Secondary Arterial. Oakdale Avenue between Bayshore Boulevard and Phelps Street is part of Bicycle Route #170, and bicycle lanes are provided on both sides of the street between Selby and Phelps Streets.

Palou Avenue is an east-west roadway between Barneveld Avenue and Griffith Street. It generally has one travel lane in each direction, and parking on both sides of the street. Palou Avenue has truck restrictions (vehicles in excess of 6,000 pounds prohibited) between Selby Street and Griffith Street. Between Phelps and Griffith Streets, Palou Avenue is part of Bicycle Routes #7 and #70.

Pennsylvania Avenue is a two-way north-south roadway between 17th and Cesar Chavez Streets. Pennsylvania Avenue generally has on-street parking on both sides of the street. Pennsylvania Avenue provides on- and off-ramp access to southbound I-280 at Mariposa, 18th, 25th and Cesar Chavez Streets.

Sunnydale Avenue is a two-way east-west roadway that extends west of Bayshore Boulevard to Persia/Mansell. To the east of Bayshore Boulevard, Sunnydale Avenue is an unpaved dead-end roadway. West of Bayshore Boulevard, the roadway has one lane in each direction with sidewalks and on-street parking on both sides.

Third Street is the principal north-south arterial in the southeast part of San Francisco, extending from its interchange with U.S. 101 and Bayshore Boulevard, to its intersection with Market Street. It is the main commercial street in the Bayview Hunters Point district and also serves as a through street and an access way to all of the industrial areas north and east of U.S. 101. In the vicinity of the Project, Third Street has two travel lanes in each direction. On-street parking is generally permitted on one side of the street. The T-Third light rail operates in an exclusive median right-of-way, with the exception of the segment between Kirkwood and Thomas Avenues, where the light rail shares the travel lane with vehicles. In the General Plan, Third Street is designated as a Major arterial, as a Transit Preferential Street (TPS) in the General Plan, and as a route with significant truck traffic (between the segment between Jerrold Avenue and Fourth Street).

Thomas Avenue is an east-west roadway between Third and Griffith Streets. West of Ingalls Street, Thomas Avenue is a residential street, while east of Ingalls Street, there is a mix of land uses, including residential and light industrial uses. The General Plan identifies Thomas Avenue between Ingalls and Griffith Streets as a street with significant truck traffic.

Tunnel Avenue is a two-way north-south roadway that extends south of Bayshore Boulevard and merges into Bayshore Boulevard at Old County Road. The roadway has one lane in each direction with sidewalks and unrestricted on-street parking on both sides of the street. Tunnel Avenue provides access to Bayshore Caltrain Station and to the U.S. 101 ramps at Alana/Betty. Tunnel Avenue is part of Bicycle Route #905.

Underwood Avenue is an east-west roadway between Third Street and Hawes Street. Underwood Avenue is primarily a residential street between Third and Jennings Streets, and between Jennings and Ingalls Streets there is a mix of residential and light industrial land uses. Between Ingalls Street and Hawes Streets, Underwood Avenue is an unimproved street without paving or gutters, with light/medium industrial land uses.

25th Street is a two-way east-west roadway that runs two blocks north of Cesar Chavez Street between Michigan Street to the east and Grand View Avenue, near Market Street, to the west. It is discontinuous across U.S. 101. 25th Street has one travel lane in each direction, with parking on both sides of the street.

Truck Restrictions

The *San Francisco Transportation Code* Section 501 restricts vehicles with a gross weight of more than 6,000 pounds, or vehicles with a gross weight of more than 18,000 pounds, of operating on identified streets. Within the study area, this regulation was intended to discourage through truck traffic from using Third Street and local residential streets to bypass congestion on the parallel freeways, and to reduce the potential for conflicts between truck traffic and non-industrial land uses. **Figure 15** presents the streets within the study area that have truck restrictions.

San Francisco Congestion Management Program

The San Francisco Congestion Management Program (CMP) has identified U.S. 101 and I-280 as part of the CMP roadway network, with a Level of Service (LOS)[8] standard of E. Of the freeway analysis segments on U.S. 101 and I-280, only U.S. 101 northbound, between the county line and I-280 was identified operating at LOS F during the PM peak hour. The 2007 Level of Service Monitoring Report for the CMP roadway network indicates that during the AM peak period, U.S. 101 northbound between Cortland Street and the I-80 merge, as well as I-280 between Weldon Street and the 6th/Brannan off-ramp operate at LOS E conditions. All other CMP roadway segments within the study area operate at LOS D or better. See Transportation Study Appendix D.

3.3 TRAFFIC OPERATING CONDITIONS

Existing traffic operating conditions were determined for key freeway segments, ramps, and intersections in the study area. Operating conditions were determined using existing intersection and roadway traffic count data collected in November and December 2007, as well as June 2009, and recent freeway and ramp volumes obtained from Caltrans. Table E-1 in Transportation Study Appendix E lists the intersection and date of traffic count.

Analysis of existing conditions on regional facilities and at local intersections were analyzed for the weekday AM (8:00 to 9:00 a.m.) and PM (5:00 to 6:00 p.m.) peak hours, and for Sunday (no football game) PM peak hour (4:00 to 5:00 p.m.) conditions. The weekday AM and PM peak hours consider the current morning and evening commute periods. The Sunday PM peak hour coincides with the time that afternoon football games typically end, and the majority of the spectators depart the stadium. **Figure 14** presents the study area analysis locations.

3.3.1 Intersection Analysis

Existing intersection operating conditions were evaluated for 59 intersections in the study area that could be affected by the Project. Of the 59 study intersections, 42 are signalized and 17 are unsignalized. Existing traffic volumes at the 59 study intersection are presented on **Figure 16A** and **Figure 16B** for the weekday AM and PM peak hours, and on **Figure 16C** and **Figure 16D** for the Sunday PM peak hour (no football game conditions). Transportation Study Appendix E contains intersection turning movement volume summaries.

[8] Level of Service (LOS) is a measure of effectiveness used to determine the quality of service of transportation infrastructure.

FIGURE 16D

The operating characteristics of signalized and unsignalized intersections are described by the concept of Level of Service ("LOS"). LOS is a qualitative description of an intersection's performance based on the average delay per vehicle. Intersection levels of service range from LOS A, which indicates free flow or excellent conditions with short delays, to LOS F, which indicates congested or overloaded conditions with extremely long delays. LOS A through D are considered excellent to satisfactory service levels, LOS E is undesirable, and LOS F conditions are unacceptable. **Table 8** presents the level of service definitions for signalized and unsignalized intersections.

Table 8
LOS Definitions for Signalized and Unsignalized Intersections

Control/ LOS	Description of Operations	Average Control Delay (seconds per vehicle)
Signalized		
A	Insignificant Delays: No approach phase is fully used and no vehicle waits longer than one red indication.	≤ 10
B	Minimal Delays: An occasional approach phase is fully used. Drivers begin to feel restricted.	> 10.0 and ≤ 20.0
C	Acceptable Delays: Major approach phase may become fully used. Most drivers feel somewhat restricted.	> 20.0 and ≤ 35.0
D	Tolerable Delays: Drivers may wait through no more than one red indication. Queues may develop but dissipate rapidly without excessive delays.	> 35.0 and ≤ 55.0
E	Significant Delays: Volumes approaching capacity. Vehicles may wait through several signal cycles and long queues form upstream.	> 55 and ≤ 80
F	Excessive Delays: Represents conditions at capacity, with extremely long delays. Queues may block upstream intersections.	> 80.0
Unsignalized		
A	No delay for STOP-controlled approach.	≤ 10.0
B	Operations with minor delays.	> 10.0 and ≤ 15.0
C	Operations with moderate delays.	> 15 and ≤ 25.0
D	Operations with some delays.	> 25.0 and ≤ 35.0
E	Operations with high delays and long queues.	> 35.0 and ≤ 50.0
F	Operations with extreme congestion, with very high delays and long queues unacceptable to most drivers.	> 50.0

Source: Highway Capacity Manual (HCM 2000), Transportation Research Board, 2000.

The study intersections were evaluated using the *Highway Capacity Manual 2000* methodology ("*HCM*").[9] For signalized intersections, this methodology determines the capacity for each lane group approaching the intersection. The LOS is then based on average delay per vehicle (in seconds per vehicle) for the various movements within the intersection. A combined weighted

[9] As part of the *HCM* methodology, adjustments are typically made to the capacity of each intersection to account for various factors that reduce the ability of the streets to accommodate vehicles (such as the downtown nature of the study area, number of pedestrians, vehicle type, lane widths and queues). These adjustments are performed to ensure that the LOS analysis results reflect the operating conditions that are observed in the field. See Appendix D for adjustments made at study intersections.

average delay and LOS is presented for the intersection. In San Francisco, LOS E and F are considered unacceptable operating conditions for signalized intersections. For unsignalized intersections, average delay and LOS operating conditions are calculated by approach (e.g., northbound) and movement (e.g., northbound left-turn), for those movements that are subject to delay. For the purpose of this analysis, the operating conditions (LOS and delay) for unsignalized intersections are presented for the worst approach (i.e., the approach with the highest average delay per vehicle) for side-street STOP-sign controlled intersections, and average intersection delay is presented for all-way STOP controlled intersections. LOS calculation sheets are included in Transportation Study Appendix F.

Table 9 presents the results of the intersection LOS analysis for the existing weekday PM peak hour conditions.

Source: Fehr & Peers.

During the weekday AM and PM, and Sunday PM peak hours, most study intersections currently operate at LOS D or better. During the weekday AM peak hour, the intersections of Cesar Chavez/Pennsylvania/I-280 and San Bruno/Silver operate at LOS E conditions. During the weekday PM peak hour, the intersection of Bayshore/Alemany/Industrial operates at LOS E conditions. The poor operating conditions at intersections operating at LOS E are generally related to high volumes of traffic destined to U.S. 101 and I-280. During Sunday PM peak hour conditions (without a football game), none of the 59 study intersections currently operate at LOS E or LOS F conditions.

3.3.2 Freeway Mainline Analysis

The LOS for a freeway section, weaving section, and on-ramp junction with the freeway is based on vehicle density (passenger cars/lane/mile) and service volume (passenger cars/hour) using the relationships presented in **Table 10**. Service volume is the primary measure of the overall weaving segment. The specific level of service, and thus service volume, is prescribed by the weaving movement predicated on the weaving volume, number of lanes, and length of weave relationship. The value of service volume is determined with the aid of nomographs published in *Completion of Procedures for Analysis and Design of Traffic Weaving Sections*, by J Leisch, & Associates, September 1983.

Table 10
LOS Definitions for Freeway Mainline, Weaving and Ramp Junction

LOS	Description of Operations	Maximum Density (Passenger Cars Per Mile Per Lane)		Service Volume (Passenger Cars Per Hour)		
		Basic Freeway Sections	Freeway Weaving Segments and Ramp Junctions	Freeway Weaving Sections (Lanes)		
				2	3	4
A	Free-flow speeds prevail. Vehicles are almost completely unimpeded in their ability to maneuver within the traffic stream.	< 11	< 10	< 750	< 800	< 850
B	Free-flow speeds are maintained. The ability to maneuver with the traffic stream is only slightly restricted.	> 11 to 18	> 11 to 20	>750 to 1,000	>800 to 1,100	>850 to 1,200
C	Flow with speeds at or near free-flow speeds. Freedom to maneuver within the traffic stream is noticeably restricted, and lane changes require more care and vigilance on the part of the driver.	> 18 to 26	> 20 to 28	>1,000 to 1250	>1,100 to 1,350	>1200 to 1,450
D	Speeds decline slightly with increasing flows. Freedom to maneuver with the traffic stream is more noticeably limited, and the driver experiences reduced physical and psychological comfort.	> 26 to 35	> 28 to 35	>1,250 to 1550	>1,350 to 1,600	>1,450 to 1,650
E	Operation at capacity. There are virtually no usable gaps within the traffic stream, leaving little room to maneuver. Any disruption can be expected to produce a breakdown with queuing.	> 35 to 45	> 35	>1,550 to 1,900	>1,600 to 1,900	>1,650 to 1900
F	Represents a breakdown in flow.	> 45	Demand exceeds capacity	> 1900		

Source: Highway Capacity Manual (HCM) – Chapter 23: Basic Freeway Sections and Chapter 25: Ramps and Ramp Junctions Methodology, Transportation Research Board, 2000, Completion of Procedures for Analysis and Design of Traffic Weaving Sections, Jack E. Leisch & Associates, September 1983.

LOS is a qualitative description of traffic flow based on speed, travel time, delay, and freedom to maneuver. There are six levels, ranging from LOS A as the best operating conditions, to LOS F as the worst. LOS E represents "at-capacity" operation. When volumes exceed capacity, stop-and-go conditions result, and operations are designated as LOS F.

Within dense urban areas such as San Francisco, off-ramp operating conditions are largely controlled by the operations at the off-ramp terminus with the street network. For key off-ramps in the study area, the off-ramp queues during the red signal phase were compared to the storage capacity of the off-ramp. The storage capacity of the off-ramp was estimated by estimating the distance between the freeway diverge gore point[10], and the stop bar for the off-ramp approach to the street intersection. Vehicle queue lengths the off-ramp approaches to signalized intersections were estimated from intersection LOS calculations, by multiplying the 95th percentile vehicle queue of the constrained movement by 25 feet to account for average vehicle lengths and the space between queued vehicles.

Caltrans' policy is to maintain freeway mainline and ramp operations at the LOS C/D threshold based on the *Guide for the Preparation of Traffic Impact Studies* (Caltrans, December 2002). However, Caltrans acknowledges that this may not always be feasible and if an existing facility is operating at less than the appropriate target LOS, the existing service level should be maintained.

Freeway mainline and ramp volumes used in the traffic analysis are summarized and presented in Transportation Study Appendix E. Transportation Study Appendix G contains the level of service calculations. **Table 11** presents the level of service for the freeway mainline and weaving sections. All analysis segments experience LOS E or LOS F conditions during the commute periods – either in the AM or PM peak hours, with the exception of the segment of U.S. 101 southbound between the I-80 westbound merge and Cesar Chavez. The segment of U.S. 101 southbound between Third/Bayshore and Sierra Point experiences LOS E conditions during both the AM and PM peak hours.

[10] A gore point is the triangular area of land where freeways split or merge.

Table 11

I-280				
NB – 25th Street to Mariposa Street	**E** (C)	**1,680** (1,350)	**A**	**--**
SB – Mariposa Street to 25th Street	B (**E**)	810 (**1,630**)	A	--

Notes:
1. Segments operating at LOS E or LOS F conditions highlighted in **bold**
2. Density of vehicles per segment. pc/mi/ln = passenger cars per mile per lane.
3. For weaving sections service volume is reported as the measure of effectiveness. pc/h = passenger cars per hour
4. Weaving segments with travel speeds greater than 50 mph are out of the realm of weaving analysis and thus are assumed to operate at LOS A conditions.
Source: Fehr and Peers.

3.3.3 Freeway Ramp Junction Analysis

A ramp junction analysis was conducted to determine the operating conditions for ramp volumes merging with the freeway mainline traffic flow. Freeway ramp analyses were conducted at 15 on-ramps. Freeway ramps were evaluated using the *Highway Capacity Manual 2000* methodology for ramp merge and diverge conditions. Service levels at the on- and off-ramps are determined based on density, as calculated using the freeway volumes and the ramp volumes at each study location. Similar to the freeway mainline, the operating characteristics of the ramps are described using the concept of LOS (see **Table 8**).

Table 12 presents the results of the freeway ramp LOS analysis for Existing conditions. During the weekday AM and PM peak hours, all of the ramps currently operate at LOS D or better, with the exception of the U.S. 101 southbound on- and off-ramps at Cesar Chavez, and northbound on-ramps from Cesar Chavez and Industrial. Transportation Study Appendix G contains the LOS calculation summary sheets.

3.4 TRANSIT NETWORK

This section describes the transit network within the transportation study area. The study area is relatively well-served by public transit, with routes providing crosstown, community, downtown and regional service. Local service within the study area is provided by the San Francisco Municipal Railway (Muni) bus and light rail lines, which can be used to access regional transit operators. Service to and from the East Bay is provided by BART, AC Transit and ferries; service to and from the North Bay is provided by Golden Gate Transit buses and ferries; and service to and from the Peninsula and South Bay is provided by Caltrain, SamTrans, and BART.

3.4.1 Local Muni Service

Figure 17 presents the Muni lines serving the study area. **Table 14** summarizes the frequency of service for the Muni bus and light rail lines serving the study area. Peak period service on most lines are at 8 to 10 minute headways between buses. The 54-Felton has headways between buses of 20 minutes, and the 56-Rutland has headways of 30 minutes. The 44-O-Shaughnessey runs most frequently, with 6 minute headways between buses.

9-San Bruno (MC)[11]: The 9-San Bruno line travels between the Ferry Building in the Financial District to Sunnydale and Santos in the Sunnydale District via San Bruno, Bayshore Boulevard, Potrero Avenue, 11th Street, and Market Street. This route provides service to the Visitacion Valley, Portola, Mission, SoMa, and Downtown districts. It serves all Market Street BART/Muni stations and all Muni Metro stations east of Van Ness Avenue.

19-Polk (MC): The 19-Polk line travels between Polk/Beach Streets in Fisherman's Wharf to the Hunters Point Naval Shipyard via Polk Street, Larkin/Hyde Streets, Seventh/Eighth Streets, Rhode Island/De Haro Streets, Evans Avenue, and Innes Avenue. This route provides service to the Hunters Point, Potrero Hill, SoMa, Civic Center, Tenderloin, Nob Hill, and Russian Hill districts. It also serves the Civic Center BART/Muni station.

23-Monterey (MC): The 23-Monterey line travels between Third & Palou Streets in the Bayview district and Great Highway & Sloat in the Parkside District via Palou, Phelps, Jerrold, Toland, Oakdale, Bayshore, Alemany, Crescent, Mission, Bosworth, Diamond, Monterey, Santa Clara, St. Francis Blvd., and Sloat. This route provides service to the Bernal Heights, Glen Park, Sunnyside, and St. Francis Wood districts and the San Francisco Zoo. It serves the Glen Park BART station.

24-Divisadero (TC): The 24-Divisadero travels between Third & Palou in the Bayview district and Jackson & Fillmore in Pacific Heights via Palou, Industrial, Bayshore, Cortland, Mission,

11 LRV = light rail vehicle, MC = motor coach, TC = trolley coach.

30th, Noe, 26th, Castro, Divisadero, and Jackson. This route provides service to the Bernal Heights, Noe Valley, Castro, and Western Addition districts.

29-Sunset (MC): The 29-Sunset travels between Gillman and Third Street in the Bayview district, and either California & 25th Street in the Richmond district or Letterman Boulevard in the Presidio via Gillman, Hawes, Fitzgerald, Paul, Bayshore, Mansell, Persia, Mission, Geneva, Plymouth, Grafton, Garfield, Junipero Serra, Holloway, 19^{th}, Winston, Lake Merced, Sunset, Lincoln Way, Crossover, 25th, Lincoln Blvd. Mason, Hallek, Lincoln Blvd., Montgomery, Moraga, Funston, Presido and Letterman. This route provides service to the Portola, Excelsior, Outer Mission, Ingleside, Parkside, Outer Sunset, Outer Richmond, and Seacliff districts. It serves the Balboa Park BART, City College of San Francisco, San Francisco State, Stonestown mall, and Golden Gate Park. This is the only bus providing daily direct service to Candlestick Point.

44-O'Shaughnessey (MC): The 44-O'Shaughnessey travels between Evans & Keith near India Basin and California & Sixth Street in the Inner Richmond via Evans, Middle Point, Young Cir, Keith, Palou, Silver, Alemany, Lyell, Bosworth, O'Shaughnessy, Woodside, Laguna Honda, 7th, Lawton, Ninth, MLK Jr. Drive, Eighth, Cabrillo, Sixth. It serves the Glen Park BART station, Golden Gate Park Main Concourse, and the Portola, Glen Park, Laguna Honda and Inner Sunset districts.

48-Quintara-24^{th} Street (MC): The 48-Quintara-24^{th} Street travels between 20^{th} Street & Third Streets in the Dogpatch/Central Waterfront districts and Great Highway and Quintara Street in the Sunset district via Third, 22^{nd}, Texas, 20^{th}, Wisconsin, 26^{th}, Rhode Island, 23^{rd}, 24^{th}, Douglass, Grandview, Portola, Ulloa, 14^{th}, Santiago, 17^{th}, and Quintara. The route provides service to the Potrero Hill, Mission, Noe Valley, Diamond Heights, Laguna Honda, West Portal, and Parkside districts. It serves the 24^{th} Street BART station and the 22^{nd} Street Caltrain station.

54-Felton (MC): The 54-Felton is a community route that travels between Newhall & Hudson in the Bayview district and the Daly City BART station in Daly City via Hudson, Northridge, Kiska, La Salle, Newhall, Palou, Revere, Ingalls, Van Dyke, Williams, Topeka, Thornton, Vesta, Phelps, Bacon, Holyoke, Woolsey, University, Felton, Moscow, Geneva, Louisburg, Grafton, Plymouth, Sagamore, Alemany, and St. Charles. It serves the Balboa Park and the Daly City BART stations.

56-Rutland (MC short): The 56-Rutland is a community route that travels between Thomas Mellon Dr. & Executive Park Blvd. and Visitacion Valley Middle School via Blanken, Bayshore, Wilde, Rutland, Raymond, and Visitacion Ave. This route serves a small corner of the South Bayshore/Visitacion Valley area, and also provides service to Executive Park.

T-Third (LRV): The T-Third is a light rail vehicle line that operates as a streetcar along the Bayshore/Third corridors, Fourth Street, King Street, and The Embarcadero before entering the Market Street subway at Folsom Street. The route is cross-listed with the K-Ingleside and forms a contiguous route through the Market Street subway, Twin Peaks tunnel, West Portal Ave., and Ocean Avenue to the Balboa Park BART station. The route serves all the Muni and BART stations along Market Street in Downtown in addition to the Fourth Street Caltrain terminal and operates in close proximity to the Bayshore Caltrain Station. The route serves the Visitacion Valley, Bayview, Dogpatch, Mission Bay, SoMa, and Downtown districts.

The T-Third is planned to run along a new alignment north of the Fourth & King station by 2016. The new alignment will take the line as a streetcar for three more blocks on Fourth Street before entering a new subway terminating in Chinatown. There will be three new subway stops: one south of Market Street on Fourth Street, one near Market Street on Stockton Street, and one in Chinatown along Stockton Street. The planned operating scenario for the T-Third is to continue to operate single-car trains between Bayview and Chinatown, at the same frequencies as today (approximately every 8 minutes), and a new two-car short-line would be added to operate between Chinatown and Mariposa Street at approximately 8 minute headways.

Bayshore Intermodal Station Access Study: The Transportation Authority is conducting the Bayshore Intermodal Station Access Study to develop multi-jurisdictional consensus around a vision and conceptual design for new intermodal transit connections and passenger access to the Bayshore Caltrain Station. Multiple planning processes are proceeding to develop projects that would connect new transit services to the Bayshore Station, including an extension of the T-Third Light Rail line from its current nearby terminus, a new Bus Rapid Transit line from Hunters Point Shipyard, and a new local street connection across Bayshore Boulevard, the Caltrain tracks, and U.S. 101 as a Geneva Avenue extension. The Authority is partnering with stakeholder agencies to develop the proposed station connections in a seamless fashion and to promote strong multimodal access to the station. The end result will be a set of conceptual designs for the station and the new connections to serve as a vision that the individual projects will implement as they progress through their planning and preliminary engineering phases.

3.4.2 Regional Providers

BART operates regional rail transit service in the metropolitan Bay Area connecting San Francisco with the East Bay and northern San Mateo County. BART provides service along Market and Mission Streets and near the western I-280 corridor in San Francisco. BART does not provide direct service into the BWP site. Transit connections can be made to the following BART stations from the BWP area: Balboa Park station via the 29-Sunset from Candlestick Point, Glen Park Station via the 23-Monterey and the 44-O'Shaughnessy, and the Embarcadero station via the T-Third light rail route. BART operates at service frequencies of 3 minutes in the peak periods for intra-San Francisco travel.

Caltrain provides rail passenger service on the Peninsula between Gilroy and San Francisco. The Peninsula Corridor Joint Powers Board (JPB), a joint powers agency consisting of San Francisco, San Mateo, and Santa Clara Counties, operates the service. Caltrain currently operates 86 trains each weekday, with a combination of baby bullet, express, and local services. Headways during the peak periods are approximately ten to thirty minutes. The San Francisco Caltrain terminal is located on Fourth Street between King and Townsend Streets to the north of the study area.

The closest active Caltrain station to the study area is the Bayshore station in Brisbane at the San Mateo/San Francisco County border. The station is located off of Tunnel Avenue, just southeast of Bayshore Boulevard. Not all trains stop at the Bayshore Station. During the peak commute periods only one train per hour in each direction stops at the Bayshore Station. There are not direct connections with other transit services. However, Muni and SamTrans can be accessed by walking two to three blocks to bus stops along Bayshore Boulevard.

SamTrans, operated by the San Mateo County Transit District, provides bus service between San Mateo County and San Francisco. SamTrans operates 12 diesel bus lines that serve San Francisco, including nine routes into the downtown area. However, only two routes – the 292 and 397 - serve the Bayview district along Bayshore Boulevard. Only the 292 operates during peak hours. Headways during the peak commuting periods are approximately 15 minutes per line. There are no direct SamTrans services to Candlestick Point, except during football game days. Route 7B operates along Bayshore and stops near the Bayshore Caltrain station on game days.

AC Transit is the primary bus operator for the East Bay, including Alameda and western Contra Costa Counties. AC Transit operates 37 routes between the East Bay and San Francisco, all of which terminate at the Transbay Transit Terminal, located on Mission Street, between First and Fremont Streets. Most transbay service is peak-hour and peak-direction (to San Francisco during the a.m. peak period and from San Francisco during the p.m. peak period), with headways of 15 to 30 minutes per route.

To access Candlestick Point, AC Transit riders first must transfer at the Transbay Terminal to the T-Third line, and then to the 29-Sunset at Paul Avenue.

Golden Gate Transit (bus service) operated by the Golden Gate Bridge, Highway, and Transportation District (GGBHTD), provides bus service between the North Bay (Marin and Sonoma Counties) and San Francisco. Golden Gate Transit operates 18 commute bus routes and two basic routes with service between cities in the North Bay and San Francisco. Most routes serve either the Civic Center (via Van Ness Avenue and Mission Streets) or the Financial District (via Battery and Sansome Streets). Basic bus routes operate at 15 to 90 minute headways, depending on the time and day of the week. Commute and ferry feeder bus routes operate at more frequent intervals in the mornings and evenings. Golden Gate Transit does not provide local service within San Francisco Golden Gate Transit can be accessed from the study area via the T-Third line, with a transfer near the Transbay Terminal.

Golden Gate Transit (ferry service): The GGBHTD also provides ferry service between the North Bay and San Francisco. During the a.m. and p.m. peak periods, ferries operate between Larkspur and San Francisco and between Sausalito and San Francisco. The San Francisco terminal is located at the Ferry Building, on the Embarcadero at Market Street. From the study area, access to the Ferry Building would generally require travel along the T-Third LRT line to the Embarcadero Station.

3.4.3 Transit Ridership and Capacity Utilization

This section presents the ridership and capacity utilization for Muni and regional transit providers for the AM and PM peak hours. Transportation Study Appendix H includes the ridership and capacity assumptions, and capacity utilization calculations.

Muni

Table 15 on the following page presents Muni's ridership and capacity utilization at the maximum load point for the local lines serving the study area for the weekday AM and PM peak hours. For each line, the number peak hour riders inbound and outbound from downtown San Francisco were obtained at the maximum load point (i.e., the point of greatest demand) from Muni monitoring data. The service capacity of each line was estimated by multiplying the passenger capacity standard for transit vehicles by the number of actual bus trips that occurred at the time that the ridership data was collected. The capacity includes seated passengers and an appreciable number of standing passengers per vehicle (the number of standing passengers is between 30 and 80 percent of the seated passengers depending upon the specific transit vehicle configuration). The maximum loads, including both seated and standing passengers, vary by vehicle type and are 45 passengers for a 30-foot bus, 63 passengers for a 40-foot bus, 94 passengers for a 60-foot bus, and 119 passengers for a light rail vehicle. The comparison of the ridership demand to the capacity provided is expressed as a percent utilization of capacity

As indicated in **Table 15**, the maximum load point of two of the ten bus and rail lines occur within the study area. For the 54-Felton bus line, the AM and PM peak hour maximum load points in both the inbound and outbound directions occur at the stops at the intersection of San Bruno Avenue and Bacon Street. For the T-Third light rail line, the maximum load point in the outbound direction during the AM peak hour is at the stop at Third Street and Evans Avenue.

Muni has established a capacity utilization standard of 85 percent. As shown in **Table 15,** the weekday AM and PM capacity utilization for most lines serving the study area do not exceed Muni's standards. However, during the AM peak hour in the inbound direction, the 44-O'Shaughnessey has capacity utilization at the maximum load point exceeding the 85 percent standard, indicating noticeably crowded conditions. Additionally, the 29-Sunset and 48-

Quintara-24th Street are operating at 84 percent of their capacity, nearly exceeding Muni's standard.

Table 15

Notes:
1. Lines operating above Muni standard capacity utilization are highlighted in **bold.**
2. Route direction follows Muni convention; convention is generally inbound toward or clockwise around downtown with the following exceptions: 23-Monterey, 54-Felton, and T-Third lines inbound towards Bayview.
Source: SFMTA 2007 Trip Activity Reports, Fehr & Peers.

In addition to evaluating Muni operations at the maximum load point for individual routes, and consistent with standard practice in San Francisco, four screenlines for routes serving the downtown financial district were evaluated. This evaluation examined the overall utilization of Muni transit capacity into and out of downtown San Francisco from the northeast, northwest, southeast, and southwest. **Figure 18** presents the location of the downtown screenlines, while existing ridership and capacity utilization at each screenline location is shown in **Table 16**. Overall, each screenline currently operates within Muni's 85 percent utilization standard, with the southwest screenline the most crowded. The southwest screenline includes all subway lines except for the J-Church light rail, the F-Market historic streetcar, and the 6-Parnassus, 7-Haight, 71-Haight-Noriega, and 71L-Haight-Noriega Limited bus lines.

Source: SFMTA, Planning Department, AECOM, 2009.

Two cordons at the perimeter of the study area were also examined to analyze potential impacts of projects on Muni service: the north cordon at Cesar Chavez Street, and the west cordon located west of U.S. 101. In addition, a third cordon within the study area, located east of Third Street was reviewed to assess the degree to which Project transit demand between the Project site and the T-Third Street light rail service would affect localized transit capacity. **Figure 19** presents the cordon locations. **Table 17** presents the weekday AM and PM peak hour inbound and outbound ridership and capacity utilization for the north and west cordons, as well as for each line within the cordons. **Table 18** presents the weekday AM and PM peak hour inbound and outbound ridership and capacity utilization for the internal cordon located east of Third Street.

Regional Providers

As a means to determine the amount of available space for each regional transit provider, capacity utilization is also used. For all regional transit operators, the capacity is based on the number of seated passengers per vehicle. All of the regional transit operators except BART have a one-hour load factor standard of 100 percent, which would indicate that all seats are full. BART has a peak period load factor standard of 115 percent, which indicates that all seats are full, and an additional 15 percent of the seating capacity are standees (i.e., 1.15 passengers per seat).

Regional transit service was also evaluated at the screenline level. **Figure 20** presents the location of the regional transit screenlines. Screenlines were evaluated for the locations where different regional transit service enters San Francisco, including the North Bay (Golden Gate Transit and Ferries), East Bay (BART, AC Transit, Ferries), and South Bay (BART, Caltrain, SamTrans). The capacity utilization for each of the three regional screenlines is presented in **Table 19**. As shown, regional transit service between San Francisco and the East Bay is currently over its seated capacity; however, since BART can accommodate a substantial number of standees, this excess transit demand is accommodated during peak hours.

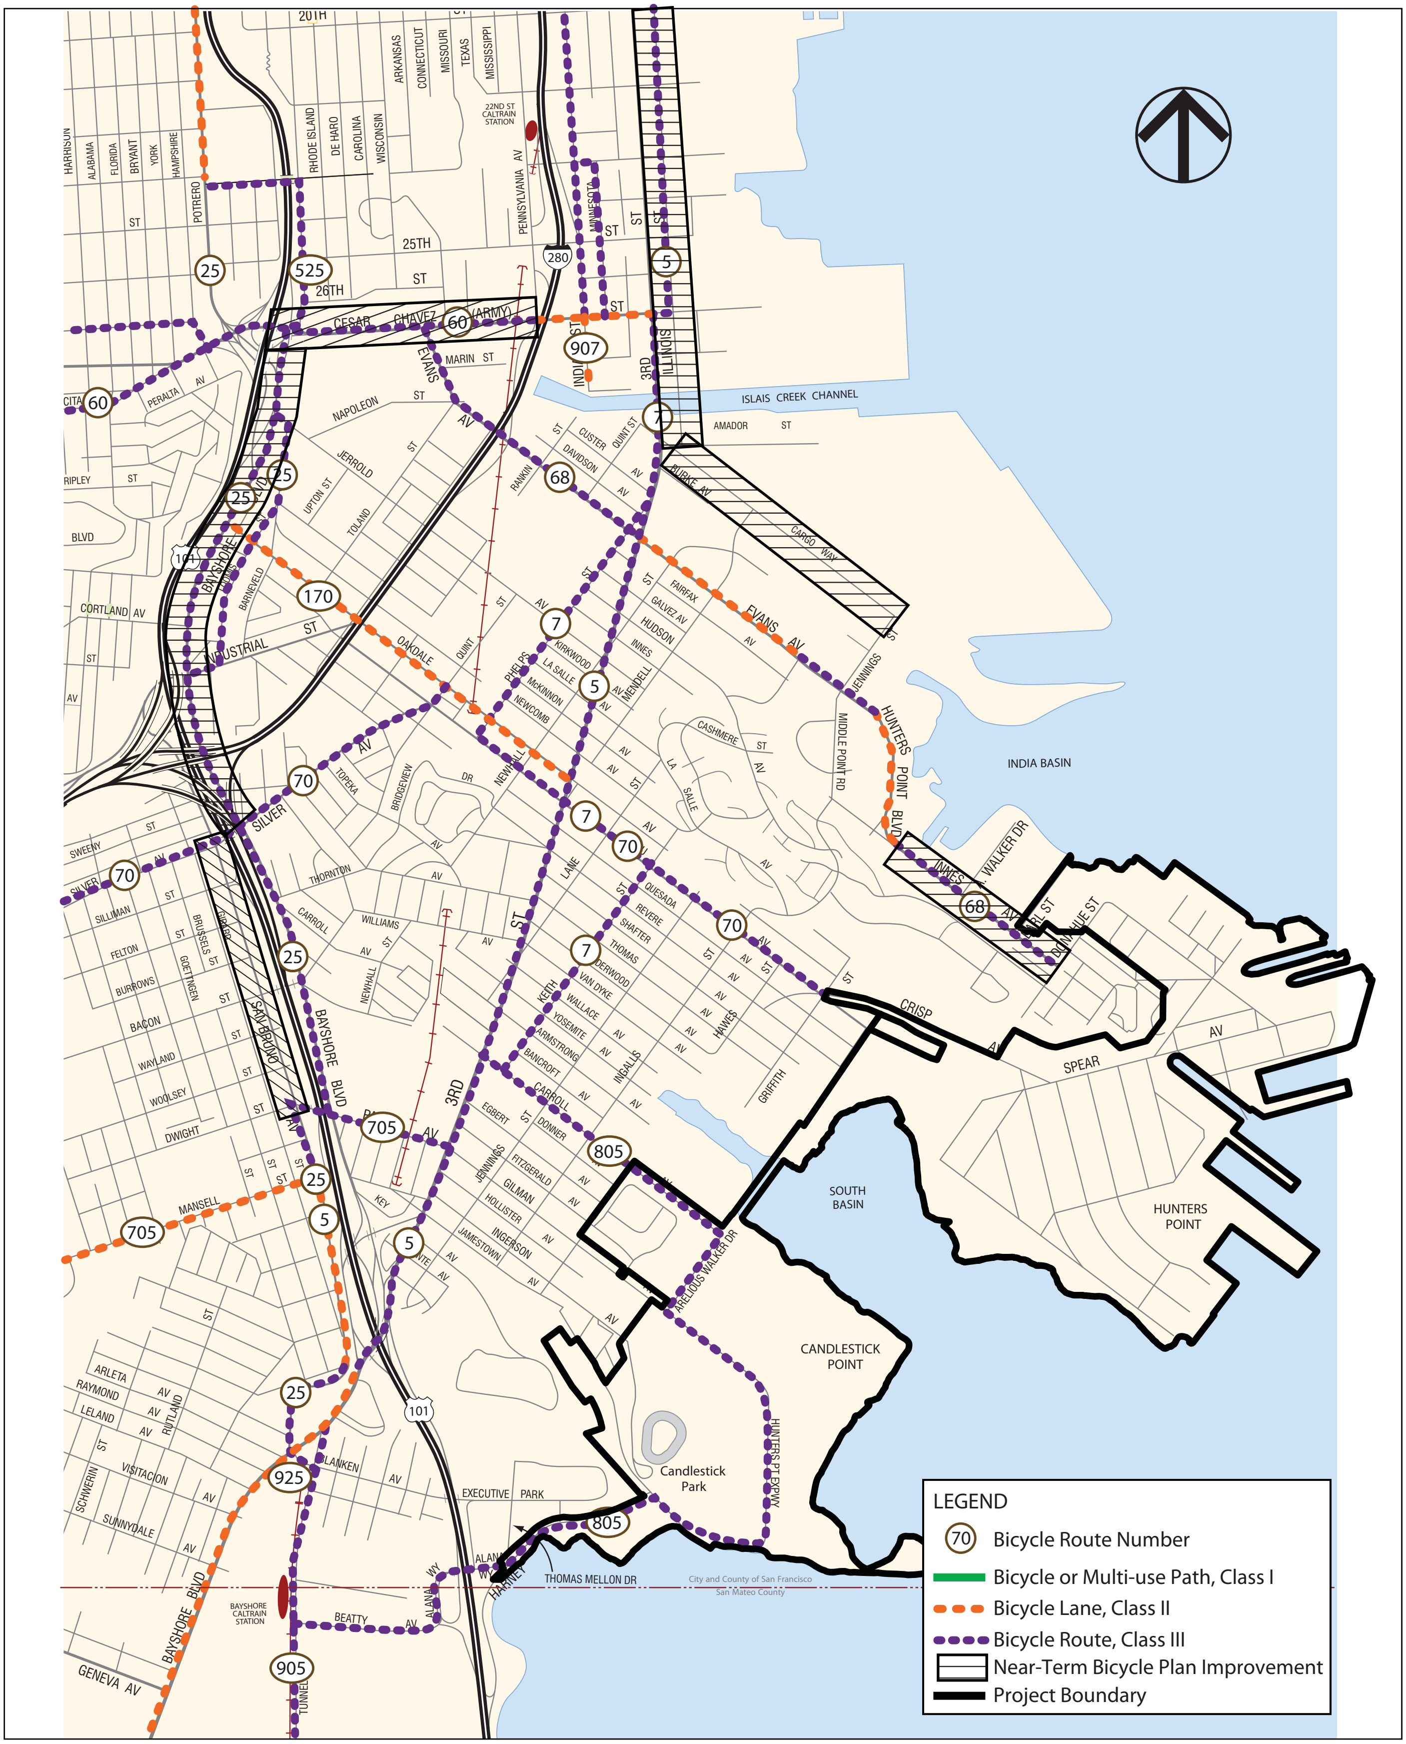
3.5 BICYCLE CONDITIONS

Several existing bicycle facilities are located in the study area. These facilities include municipal routes that are part of the San Francisco Bicycle Network, and regional routes, part of the San Francisco Bay Trail system. Bikeways are typically classified as Class I, Class II, or Class III facilities.[12] Class I bikeways are bike paths with exclusive right-of-way for use by bicyclists or pedestrians. Class II bikeways are bike lanes striped with the paved areas of roadways and established for the preferential use of bicycles, while Class III bikeways are signed bike routes that allow bicycles to share travel lanes with vehicles**.** **Figure 21** presents the bicycle routes within the study area, as identified in the *Official San Francisco Bike Route System*, while **Figure 22** presents the existing Bay Trail facilities.

The *San Francisco Bicycle Plan Draft EIR* was published in November 2008. In June 2009, the Final EIR was approved by the Planning Commission and the Bicycle Plan was approved by the SFMTA Board. In August 2009, the Board of Supervisors affirmed certification the *San Francisco Bicycle Plan Final EIR.* Near-term improvement projects on the existing bicycle network in the study area are noted below, and both near-term and long-term improvements are described in additional detail in Chapter 4 in section 4.3.3.

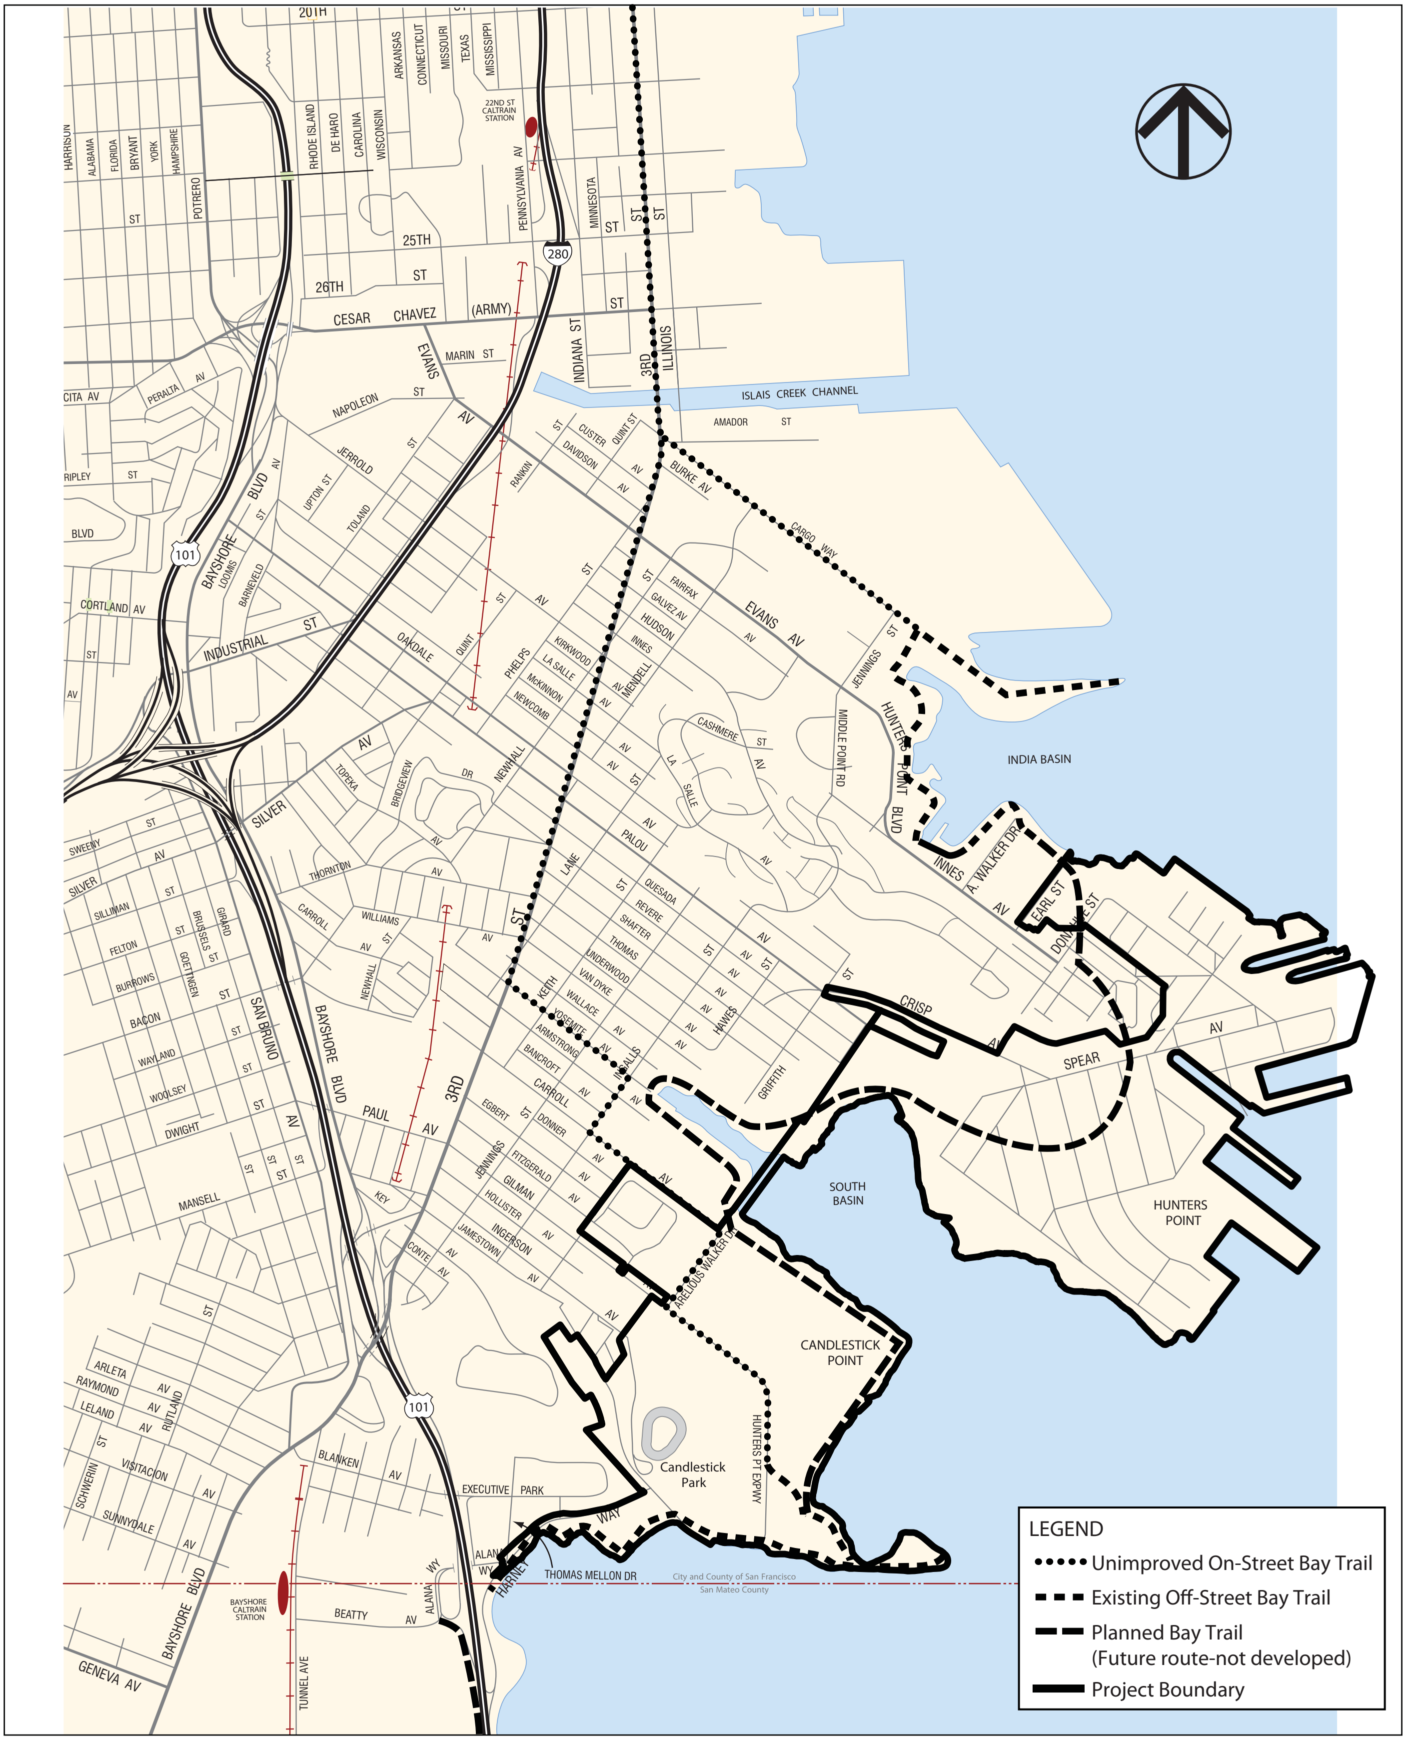
Route #5*:* Route #5 is the eastern-most north-south bicycle route. This route runs between Visitacion Valley and North Beach, primarily as a Class III facility along Bayshore Boulevard, Third Street, and Illinois Street, and as a Class II facility along The Embarcadero and San Bruno Avenue. Since southbound Third Street does not cross over U.S. 101 to connect with Bayshore Boulevard, southbound Bicycle Route #5 is routed onto Paul Avenue (via Connector Route #705) and San Bruno Avenue (also Bicycle Route #25).

12 Bicycle facilities are defined by the State of California in the California Streets and Highway Code Section, 890.4.



SOURCE: LCW Consulting, SFMTA, San Francisco Bicycle Plan

FIGURE 21: EXISTING SAN FRANCISCO BICYCLE ROUTE NETWORK



SOURCE: LCW Consulting

FIGURE 22: SAN FRANCISCO BAY TRAIL

This split in Bicycle Route #5 is required, since the U.S. 101 undercrossing that provides the connection between southbound Third Street and southbound Bayshore Boulevard would require bicyclists to weave across high-speed traffic. San Francisco Bicycle Plan Project 4-3: Illinois Street Bicycle Lanes, will involve the installation of Class II bicycle lanes in both directions on Illinois Street between 16th Street and Cargo Way. See section 4.3.3.

Route #7: Route #7 is a Class III bike route that runs between Mariposa Street and Carroll Avenue, via Indiana Street, Third Street, Phelps Street, Palou Avenue, and Keith Street. Route #7's southern terminus is at Keith Street and Carroll Avenue at the Bayview Playground and Martin Luther King Pool. It is a Class III facility, however, wider travel lanes that allow bicyclists to ride outside of the path of vehicle travel are provided on sections of Indiana and Phelps Streets, and on Keith Street.

Route #25: Route #25 runs between the southeastern part of San Francisco and the Marina District. Route #25 runs along San Bruno Avenue, Bayshore Boulevard, and Oakdale Avenue in the Bayview Hunters Point area. Within the study area, Route #25 is a Class III facility. North of the study area, Route #25 runs as both a Class II facility (e.g., along Potrero Avenue, Harrison Street, and 11th Street), and as a Class III facility (e.g., 10th Street, Polk Street). San Francisco Bicycle Plan Project 5-4: Bayshore Boulevard Bicycle Lanes, will involve the installation of Class II bicycle lanes in both directions of travel on Bayshore Boulevard between Cesar Chavez Street and Silver Avenue. See section 4.3.3.

Route #60: Route #60 runs between the Great Highway/Vicente and Cesar Chavez Street/Illinois Street. In the study area, it is a Class III facility along Cesar Chavez Street between Bayshore Boulevard and Mississippi Street, and a Class II facility between Mississippi and Illinois Streets. San Francisco Bicycle Plan Project 5-5: Cesar Chavez Bicycle Lanes, will involve the installation of Class II bicycle lanes in both directions on Cesar Chavez Street between Kansas Street (near U.S. 101) and Mississippi Street (near I-280). See section 4.3.3.

Route #68: Route #68 runs from the Innes north gate to Hunters Point Shipyard along Innes Avenue, Hunters Point Boulevard and Evans Avenue to Cesar Chavez. This route has dedicated bike lanes (Class II facility) on both sides of Evans Avenue, and Hunters Point Boulevard between Innes Avenue and Third Street. San Francisco Bicycle Plan Project 4-4: Innes Avenue Bicycle Lanes, will involve the installation of Class II or III bicycle facilities in both directions of Innes Avenue between Donahue Street and Hunters Point Boulevard. See section 4.3.3.

East-West Route #70 runs along Palou Avenue, Silver Avenue, and Monterey Boulevard between the Bayview Hunters Point area and West Portal as a Class III facility. The eastern terminus of this route is currently the Crisp south gate to Hunters Point Shipyard at Griffith Street and Palou Avenue.

Route #170: Connector Route #170 runs along Oakdale Avenue between Third Street and Bayshore Boulevard. Between Third Street and Bayshore Boulevard, this route has Class II bicycle lanes on both sides of the street.

Route #805: Connector Route #805 is a Class III facility that provides a connection between Beatty Avenue and Tunnel Avenue (near the Bayshore Caltrain Station) in Brisbane and Third Street and Carroll Avenue in the Bayview Hunters Point area. This route passes around Candlestick Park stadium and the Candlestick Point State Recreation Area via Harney Way, Hunters Point Expressway, Gilman Avenue, Arelious Walker Drive, and Carroll Avenue.

Route #905: Route #905 is a short Class III route that runs along Tunnel Avenue south, east of Bayshore Boulevard.

Route #907: Route #907 is a short Class II route that runs along Indiana Street between César Chávez Street and the embankment at Islais Creek, where it dead-ends.

Route #925: Route #925 is a short Class III route that runs along Blanken Avenue between Tunnel Avenue and Bayshore Boulevard, connecting Route #5 and Route #905.

The San Francisco Bay Trail is designed to create recreational pathway links to the various commercial, industrial and residential neighborhoods that surround the San Francisco Bay. In addition, the trail connects points of historic, natural and cultural interest; recreational areas such as beaches, marinas, fishing piers, boat launches, and over 130 parks and wildlife preserves totaling 57,000 acres of open space. At various locations, the Bay Trail consists of paved multi-use paths, dirt trails, bike lanes, sidewalks or city streets signed as bike routes. Within the study area, the Bay Trail has two discontinuous segments of existing, off-street pathways, one in the area of Candlestick Point and Harney Way, and another segment which partially surrounds India Basin. The Bay Trail currently bridges the gap between Islais Creek and Candlestick Point with an inland route that shares portions of Gilman Avenue, Arelious Walker Drive, Carroll Avenue, Ingalls Street, Yosemite Avenue and Third Street.

An improved trail exists in the southern part of the Candlestick Point State Recreation Area where public access improvements have been made, but the northern section is unimproved. The trail starts northeast of the U.S. 101 northbound Harney Way ramps. Parking is available off of Harney Way, west of Jamestown Avenue (approximately 30 parking spaces are currently provided), and parking, restrooms, and boat ramp facilities are provided off of Hunters Point Expressway near Gilman Avenue.

The Project includes development of the Bay Trail within the Project site along the shoreline through Candlestick Point and Hunters Point Shipyard. The Bay Trail is also planned to be extended south to Sierra Point on the west side of U.S. 101, potentially as part of the proposed development at Brisbane Baylands.

The majority of the study area is flat, with limited changes in grades, facilitating bicycling within and through the area. East of Third Street, there are active and inactive rail tracks within the roadways that could impede bicycle travel. Bicycle volumes were collected at four locations with the study area during the weekday AM (7 to 9 AM), weekday PM (4 to 6 PM) and Saturday midday (12 to 2 PM) periods in September 2007. All four locations are along the bicycle route network, and bicycle lanes are provided on Evans Avenue and Oakdale Avenue. **Table 20** summarizes the data collection effort for the peak hour of bicycle activity. As indicated in **Table 20**, there are more bicyclists on study area streets on weekdays, than on weekends. Third Street and Oakdale Avenue had the greatest number of bicyclists.

Table 20
Bicycle Volumes within Study Area – Existing Conditions

Count Location	Weekday AM [1]	Weekday PM [2]	Saturday Midday [3]
Third St – between Williams & Palou	21	21	3
Evans Ave – between Mendell & Third	7	8	3
Oakdale Ave – between Phelps & Third	27	14	2
Hunters Point Expressway – between Jamestown & Gilman	1	4	1

2. Hourly volume between 4 and 5 PM
3. Hourly volume between 12 and 1 PM
Source: LCW Consulting, September 2007 counts.

3.6 PEDESTRIAN CONDITIONS

Pedestrian facilities vary within the study area between the areas on the east side of Third Street and the industrial land uses surrounding the Caltrain rail corridor on the west side of Third Street. On the west side of Third Street, many of the commercial facilities surrounding the railroad mainline have partial or no sidewalks. Several of the streets in this area have active and inactive railroad tracks and many of the former industrial and storage buildings in the area retain large raised freight loading/unloading platforms abutting the street.

On Third Street and on the residential streets immediately surrounding Third Street, the sidewalk network is adequate and relatively complete. In the light manufacturing areas surrounding Yosemite Slough the sidewalk network is less complete and frequently obstructed by illegally parked vehicles and or loading vehicles. The extent, condition and usability of the sidewalks generally decrease closer to Yosemite Slough (within the Project area).

The Candlestick Point State Recreation Area has a network of existing multi-use trails that extend from the County Line to a point just southeast of the intersection of Gilman Avenue and Donahue Street (an as yet undeveloped 'paper' street). Most of these paths are within the park and do not intersect the local roadways, although some connect to, or are part of, the Bay Trail.

There are several dedicated pedestrian overcrossings in the vicinity of Candlestick Park. These structures are designed to reduce pedestrian-vehicle conflicts associated with Candlestick Park events and adjacent schools. These include the overcrossing of Jamestown Avenue just north of Harney Way, overcrossing of Harney Way, just west of Jamestown Avenue, and overcrossing of Gilman Avenue at Griffith Street (Adjacent to the Bret Harte School).

Pedestrian activity in the immediate vicinity of the Project site is light throughout the day during non-game days. During game days, pedestrians flood the area traveling between the on-site and off-site parking facilities and the stadium (game day conditions are discussed in section 3.8).

Third Street is the primary pedestrian corridor in the study area, with the central commercial core located roughly between Thomas Avenue and Kirkwood Streets (south of Evans Avenue). Counts of pedestrian volumes at crosswalks at three intersections on Third Street were conducted in September 2007 during the weekday AM and PM peak periods, and peak hour pedestrian volumes are summarized in **Table 21**.

Table 21
Pedestrian Crosswalk Volumes at Study Area Intersections
Weekday AM and PM Peak Hour Conditions

Intersection/Crosswalk Location	Weekday AM [1]	Weekday PM [2]
Third/Evans		
North	49	18
South	24	39

2. Hourly volume between 4 and 5 PM
Source: LCW Consulting, September 2007 counts.

3.7 PARKING CONDITIONS

This section presents the existing parking conditions within the study area for typical weekday conditions, and for conditions during a 49er game at the existing stadium. On-street parking conditions were based on field surveys conducted in October 2007 during the weekday midday (1:30 to 3:00 p.m.) and evening (6:30 to 8:00 p.m.) periods. Surveys were also conducted during a Sunday midday (1:30 to 3:00 p.m.) period during a 49ers game at the existing stadium. The 1:30 to 3:00 PM Sunday time period is the peak parking period during football games at the existing stadium because spectators would have already arrived at the stadium. Transportation Study Appendix I contains the detailed parking survey results. Off-street parking supply for game day conditions was obtained from 49ers and compared against information previously collected by SFMTA.

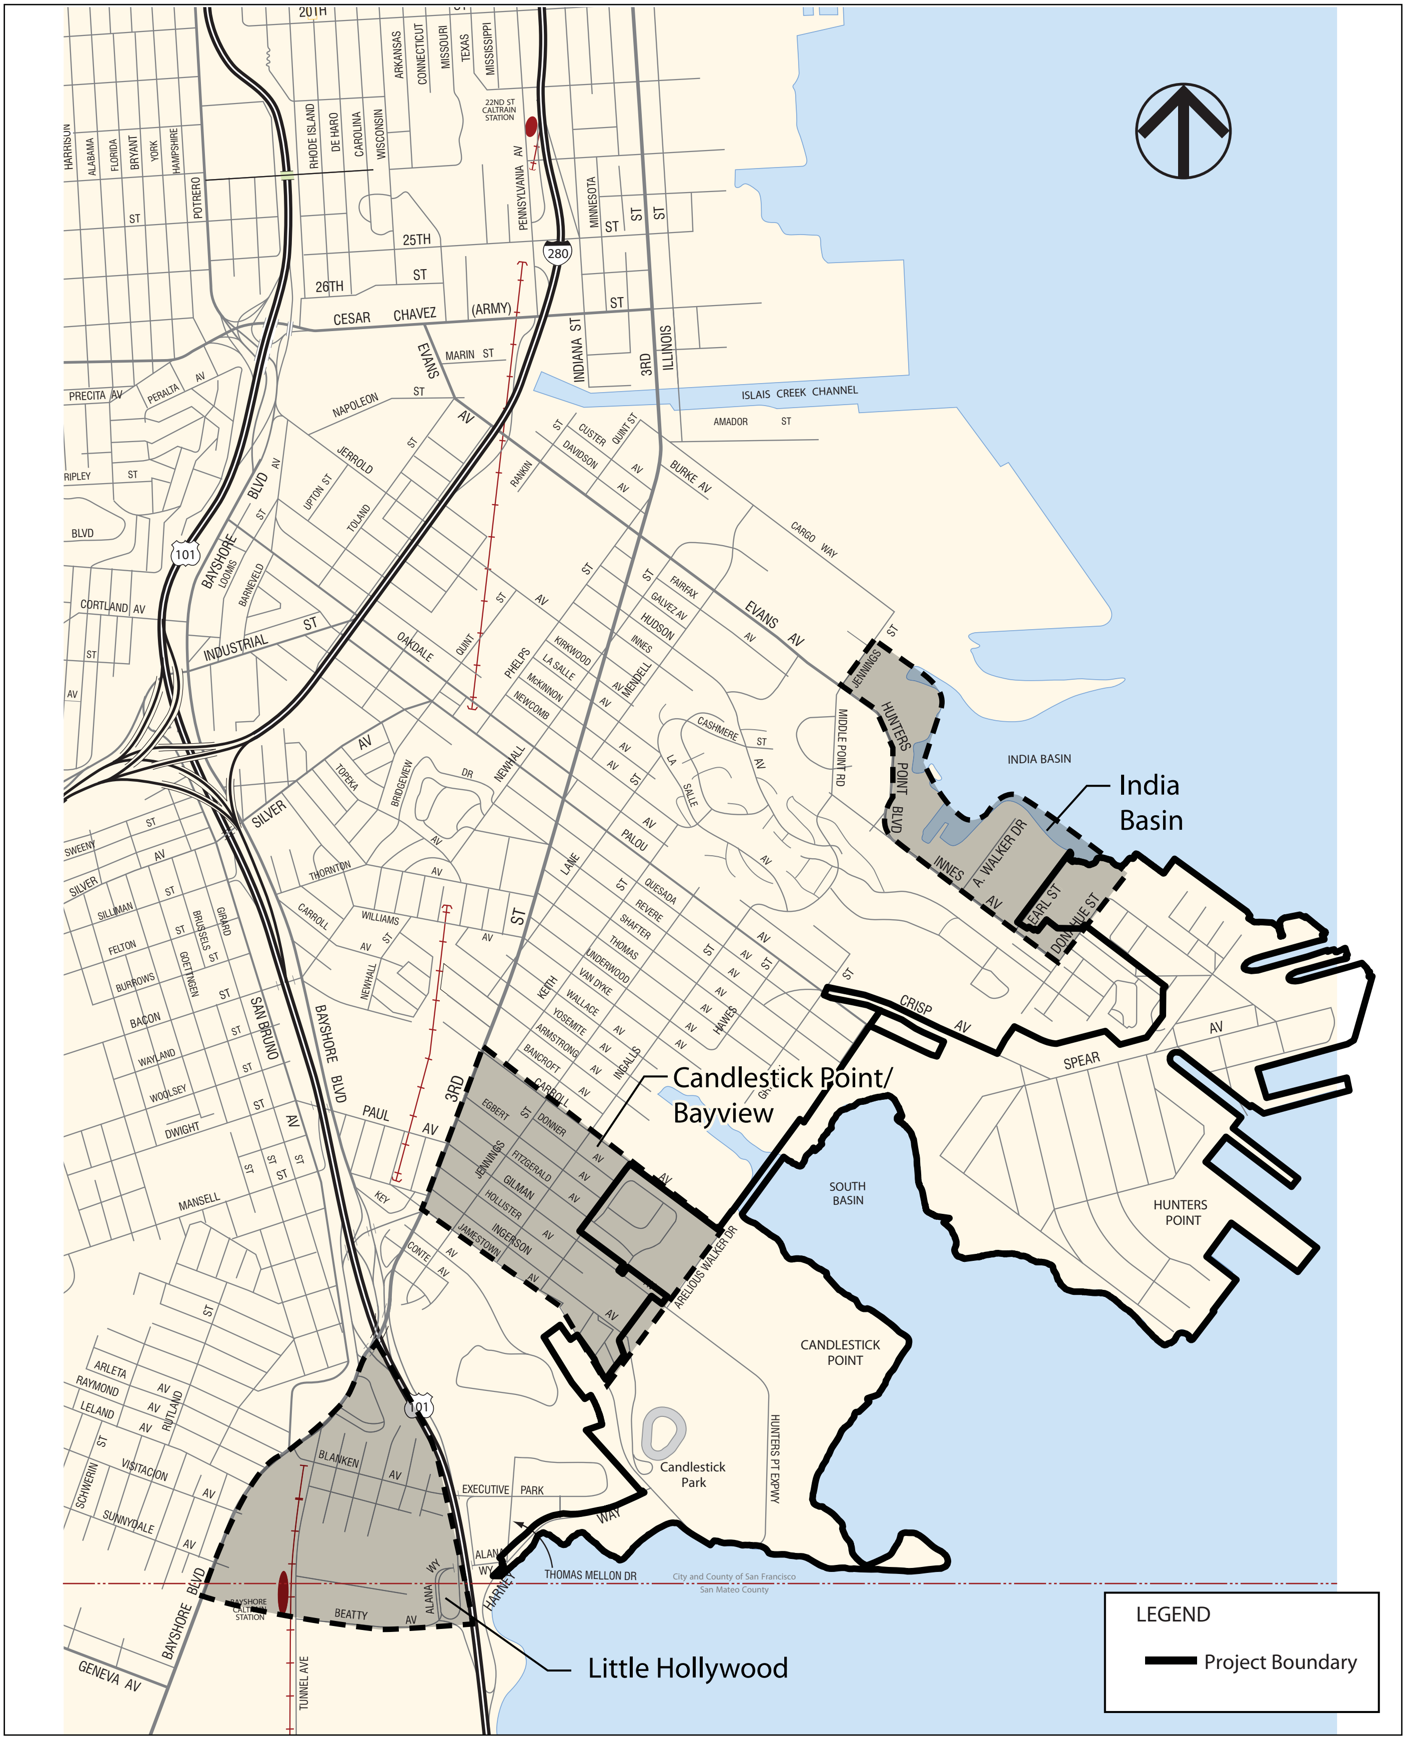
3.7.1 On-Street Parking Conditions

In general, on-street parking in the transportation study area is generally unrestricted (other than weekly street cleaning), and is typically permitted on both sides of the street. On the wider avenues in the study area (generally with an 80-foot wide right-of-way width) with light industrial land uses, roadways, such as Donner Avenue and Bancroft Avenue between Jennings and Hawes Streets, accommodate 90-degree perpendicular parking. Along Third Street on-street parking is metered, and has been removed in the vicinity of the light rail stations. There are no Residential Permit Parking (RPP) areas within the study area.

On-street parking supply and occupancy surveys were conducted for two subareas within the transportation study area, as shown on **Figure 23**:

- Candlestick Point/Bayview – within the mostly residential and partial industrial area bounded by Third Street to the west, Carroll Avenue to the north, Arelious Walker Drive to the east, and Jamestown Avenue to the south.
- Little Hollywood – within the mostly residential area bounded by Bayshore Boulevard to the west and north, U.S. 101 to the north and east, and the San Francisco/San Mateo County line to the south.
- India Basin – Within the mostly industrial area bounded by Jennings Street to the west, Hunters Point Boulevard to the south, Donahue Street to the east, and India Basin to the north.

Table 22 presents the weekday midday and evening parking supply and occupancy for the two subareas. During the daytime, on-street parking utilization is greatest in the Candlestick Point/Bayview subarea, and ranges between 66 percent during the midday period (accommodating employee parking demand associated with the industrial uses) and 57 percent during the evening. Parking demand within the Little Hollywood residential neighborhood is greatest during the evening period, with parking occupancy at about 60 percent.



SOURCE: CHS Consulting

FIGURE 23: ON-STREET PARKING STUDY AREAS

Of the three subareas, parking utilization is lowest within the India Basin subarea (between 17 and 28 percent), reflecting the limited residential and industrial uses in this area. Transportation Study Appendix I contains the detailed parking survey results.

Table 22
On-Street Parking Supply and Utilization
Existing Conditions

Parking Subarea	Supply (spaces)	Occupancy			
		Weekday Midday		Weekday Evening	
		Spaces	% Utilization	Spaces	% Utilization
Candlestick Point/Bayview	1,405	931	66%	807	57%
Little Hollywood	773	415	54%	466	60%
India Basin	398	110	28%	69	17%

Source: CHS Consulting.

There are no city-owned off-street parking facilities in the study area. There is limited number of privately-owned parking facilities in this subarea and most drivers rely on on-street parking in the area. The available privately-owned off-street parking facilities serve the employees and visitors to the businesses adjacent to them and are not available for general public parking.

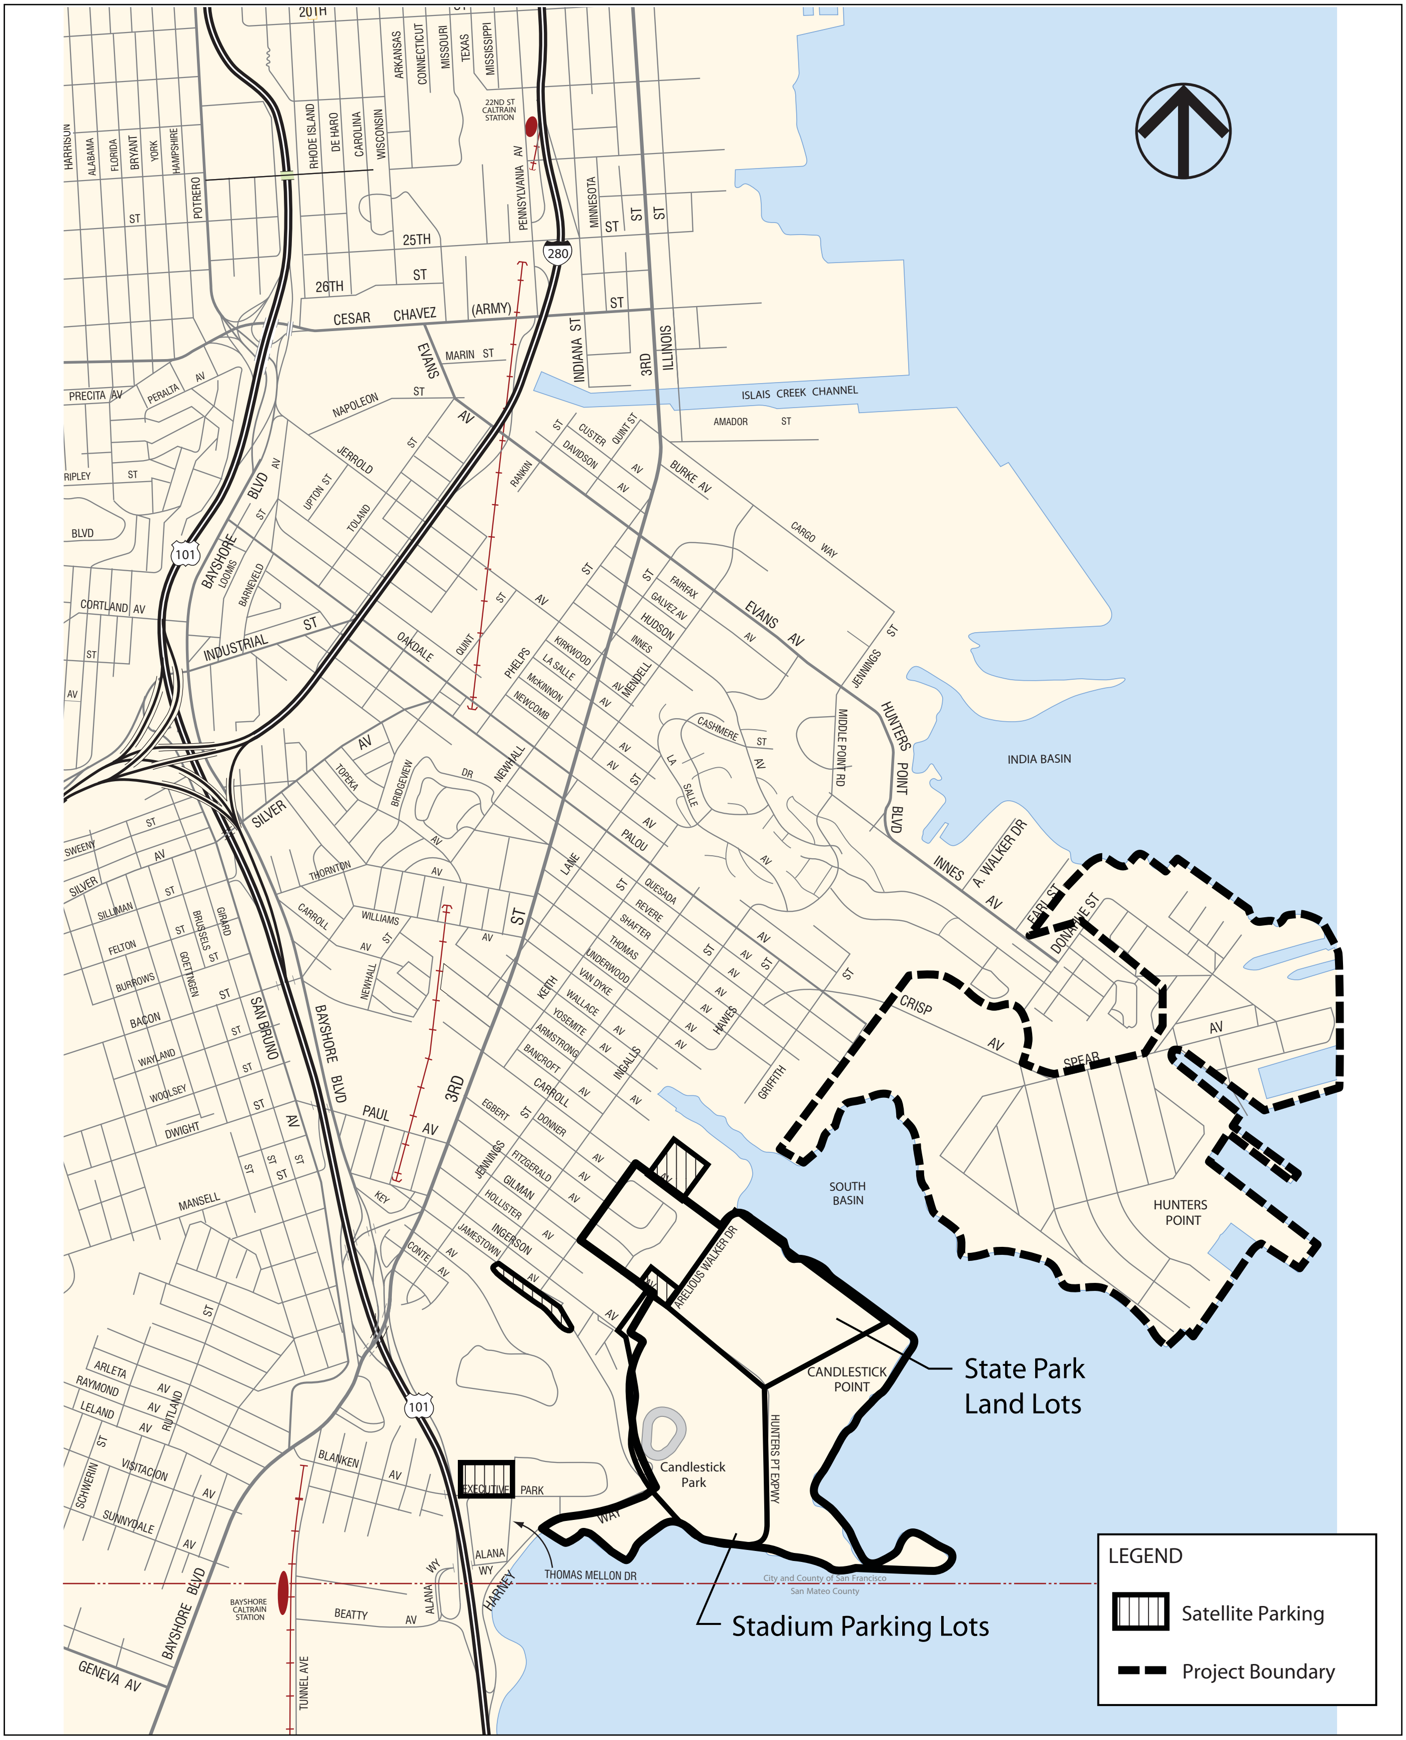
3.7.2 Game Day Parking Conditions

Game day parking demand for 49er games at the existing stadium is accommodated within off-street surface parking lots and on-street parking adjacent to the neighborhood and to the west in the Little Hollywood neighborhood. Game day parking demand varies depending on attendance levels, and maximum demand occurs during sell-out games. Game day conditions typically occur up to 12 times per year (two pre-season games, eight regular games, and usually up to two post-season games). During the last two seasons, two pre-season and eight regular games were played at Candlestick stadium.

Off-Street Parking

Parking for 49er games is provided within stadium parking lots, on state park land, and in satellite parking lots. These areas are identified on **Figure 24.**

- Stadium Parking: Stadium parking consists of the paved parking spaces that are located on the existing stadium premises in the area generally bounded by Hunters Point Parkway, Gilman Avenue, Giants Drive and an internal circulation road on the west side of the stadium.
- State Park Land Parking: Stadium event parking lots are also located between Hunters Point Expressway and the San Francisco Bay, east and northeast of the stadium premises. Most of these lots are unpaved and are located on undeveloped state park land owned by the state.



SOURCE: 49ers, 2008

FIGURE 24: EXISTING STADIUM OFF-STREET PARKING AREAS

- Satellite Parking: Satellite Parking in the study area consists of off-street lots north, west and southwest of the stadium. Existing satellite lots are located: 1) north of the stadium at the intersection of Gilman Avenue and Giants Drive, 2) west of the stadium along Jamestown Avenue, and 3) southwest of the stadium in the Executive Park Office complex.

Table 23 presents the total game day parking supply by the three parking areas.

Table 23
Off-Street Parking Supply for 49er Games
Existing Game Day Conditions

Parking Area	Supply (spaces)[1]
Stadium Parking	9,110
State Park Land Parking	5,470
Satellite Parking	
Executive Park Lots	1,950
Jamestown Lot	1,250
True Hope Church Lot	110
Hawes-Carroll Lot	990
Subtotal	4,300
Total	***18,880***

Note:
1. This inventory does not include private parking spaces that are generally restricted for use by residents, customers and employees of private businesses, or public agencies, however, some of the spaces are in private lots (e.g., churches) that are made available to the public on football game days.
Source: 49ers, 2009.

As indicated in **Table 23,** there are approximately 18,880 off-street parking spaces in the study area. All of the spaces are located in surface parking lots. Approximately 48 percent of the off-street parking spaces are located in the stadium parking lot (9,110 spaces for autos, buses, recreational vehicles, limousines, press and players), 23 percent are located in state park land lots (5,470 spaces), and 29 percent are located in satellite parking lots (4,300 spaces).

In addition to the satellite parking lots, there are a number of parking spaces in private lots that are generally restricted for use by residents, customers and employees of private businesses, or public agencies, however, some of the spaces are made available to the public on football game days. The 49ers estimate that up to 3,000 spaces are available on private land for game day parking.

In general, many football spectators arrive up to five hours before kickoff to prepare and eat food and drink beverages near their vehicles in the parking lots. These "tailgate" parties take place in the car and RV parking lots. Based on previously-collected information on stadium parking accumulation, on a typical game day, up to 40 percent of vehicles arrive between one and two hours prior to kickoff.[13]

On-Street Parking

During game days, parking restrictions are implemented to increase traffic capacity in and out of the facility and to reduce congestion. **Table 24** identifies the streets and segments in the Project vicinity where parking is prohibited between 10:00 a.m. and 6:00 p.m. on game days. In addition to these roadways, on-street parking is also restricted east of Third Street on Salinas Avenue and Gilroy Street.

Table 24
Game Day On-Street Parking Restrictions
Existing Game Day Conditions

Street	Segment	Side of Street
Carroll Avenue	- Jennings Street to Hawes Street - Third Street to Ingalls Street	South side North side
Gilman Avenue	- Third Street to Giants Drive - Giants Drive to a point about 365 feet west of Griffith Street	North side South side
Jamestown Avenue	- Third Street to Redondo Street - Stadium roadway to Third Street	Both sides North side
	- Harney Way to Hunters Pt Expressway	South side
Ingerson Avenue	- Third St to a point about 500 feet east of Griffith Street	Both sides
Paul Avenue	- Third Street to San Bruno Avenue	North side
Third Street	- Jamestown Avenue to Salinas Avenue	West side

Source: SFMTA.

Table 25 presents the parking supply and occupancy during game days for the two parking subareas. On game days between the hours of 10:00 a.m. and 6:00 p.m., the on-street parking supply in the Candlestick Point/Bayview subarea is reduced by about 32 percent due to the parking restrictions identified in **Table 25.** In the Little Hollywood neighborhood, there are no specific on-street parking restriction on game days, and the game day parking supply remains the same as on non game days.

13 from 49ers data provided for the Candlestick Point Stadium and Retail/Entertainment Center EIR – Transportation and Circulation Report, Second Preliminary Draft, February 1998.

Table 25
On-Street Parking Supply and Utilization
Existing Game Day Conditions

Parking Study Area	Supply[1] (spaces)	Game Day – Sunday Midday Occupancy	
		Spaces	% Utilization
Candlestick Point/Bayview	948	815	86%
Little Hollywood	773	849	110%
India Basin	398	87	22%

Note:
1. Game Day on-street parking restrictions on Carroll Avenue, Gilman Avenue, Jamestown Avenue, Ingerson Avenue, Paul Avenue, and Third Street.
Source: CHS Consulting.

On football game Sunday afternoons, approximately 86 percent of the 948 on-street parking spaces in the Candlestick Point/Bayview subarea are occupied. In the Little Hollywood neighborhood, all on-street parking spaces are occupied and a number of vehicles were observed to park illegally, resulting in an inconvenience to residents and their guests.

3.8 EXISTING STADIUM OPERATIONS DURING GAME DAYS

The additional traffic added to the transportation network following a football game at Candlestick Park results in substantial congestion on local streets between parking facilities and the freeway, and on the freeways, particularly where game day traffic merges with other traffic already on the freeway. This section discusses the existing transportation conditions on days when football games are played at Candlestick Park.

3.8.1 Football Game Frequencies

Candlestick Park currently serves as the home of the San Francisco 49ers. The existing Candlestick Park stadium typically hosts up to 12 games per year, including eight regular season games, typically two pre-season games, and for teams that qualify for playoffs, typically two post-season games. Professional football games on the west coast are typically scheduled for 1:00 p.m. (Pacific Time) on Sundays, from September through early December. The post-season runs into January and games can be played on either Saturday or Sunday. At the conclusion of the college football season in late November, a few NFL games are played on Saturdays, as are some pre-season games. Successful teams typically play at least one Monday night (6:00 p.m.) game, and the 49ers have had at least one such home game in each of the past several seasons. Occasionally (no more than once per year), Sunday games are held at 5:00 p.m. The typical duration of a football game is approximately three hours.

3.8.2 Pre-Game and Post-Game Circulation

Ingress and Egress Routes

The major access and egress routes to the existing stadium are shown in **Figure 25** and **Figure 26**, respectively. Vehicles access Candlestick Park by several routes, depending on the level of congestion and their point of origin. Most vehicles arriving from the south (San Mateo and Santa Clara Counties, as well as traffic from Alameda County using the San Mateo or Dumbarton Bridges) use northbound U.S. 101 and enter the site via the Harney Way exit. Vehicles from the north coming from either I-280 or U.S. 101 use the Silver Avenue, Paul Avenue, Bayshore Boulevard/Third or the Alana/Beatty exits to reach the north access routes (Carroll, Gilman, and Jamestown) to the stadium. In order to accommodate peak inbound and outbound traffic volumes generated by the largest special events at Candlestick Park, traffic lanes on Harney Way and on the roadway surrounding the Candlestick Park parking lot (Jamestown Avenue Extension, Hunters Point Expressway and part of Gilman Avenue) are reversed on event days. Overhead Lane Use Control Signals are used to designate the direction of each lane.

On event days, each lane has either a green downward-pointing arrow or a red arrow above it to indicate to drivers in each direction whether they may drive in that lane. The portion of Harney Way between Alana Way near U.S. 101 and Jamestown Avenue operates one-way eastbound (toward Candlestick Park) for several hours before events. Jamestown Avenue Extension and Hunters Point Expressway operate one-way counterclockwise before events. The portion of Gilman Avenue west of Candlestick Park Parking Lot Gate 4 is two-way before events in order to provide access to Gate F from the west. Once the pre-event traffic dies down, these roadways are converted back to two-way operation. In the last 30-60 minutes before the end of the event, the reversible roadways are converted to one-way operation away from the parking lot exits. Gilman Avenue operates one way westbound, while Hunters Point Expressway, Jamestown Avenue Extension and Harney Way operate one-way clockwise and westbound, respectively. During the post-game period, the Candlestick Park exit from northbound U.S. 101 is closed to all traffic, in order to prevent off-ramp traffic from conflicting with the one-way westbound post-event traffic on Harney Way. Additionally, all traffic using the Candlestick Park exit from southbound U.S. 101 is forced to proceed westbound on Beatty Avenue in order to prevent this traffic from having to make a U-turn if it were to proceed eastbound on Alana Way. Once the post-event traffic dies down, the roadways revert to the normal two-way operation.

SOURCE: Fehr & Peers, 2009

FIGURE 25: EXISTING STADIUM INGRESS ROUTES

SOURCE: Fehr & Peers, 2009

FIGURE 26: EXISTING STADIUM EGRESS ROUTES

Traffic Operations

Pre-Game Conditions: For a typical Sunday football game starting at 1:00 PM, vehicle arrival is spread over about six hours with approximately 40 percent of the vehicles arriving between one and two hours prior to the game start time, and 60 percent within the other five hours prior to the game. Since the arrival is spread out over a period of time, the game-related traffic does not substantially affect traffic flow on the study area freeways. During a recent Sunday football game, some localized congestion was observed at U.S. 101 northbound upstream of the Harney Way exit, as vehicles queued up from Harney Way and on U.S. 101 southbound upstream of the Alana/Beatty exit. The vehicles accessing the stadium from Third Street contribute to congestion and queues on the local residential streets, including Third Street, Gilman Avenue, Carroll Avenue and Jamestown Avenue. In September 2009, a pedestrian bridge was installed on Hunters Point Expressway at the location of the pedestrian crossing to the State Park parking lots. Since installation of the pedestrian bridge, pre-game traffic conditions improved.

During pre-game conditions, San Francisco Police Department officers, Parking Control Officers (PCOs) and California Highway Patrol (CHP) officers are posted on roadways leading to the stadium, in particular Harney Way, Hunters Point Expressway, Ingerson Avenue and Gilman Avenue. Officer tasks include: ensuring smooth traffic flow on the one-way inbound Harney Way, directing vehicles to proceed to downstream gates and off-site parking lots, and towing vehicles that obstruct traffic movement. In addition, they are responsible for providing priority to transit vehicles, ensuring pedestrian safety, and orderly queuing at the gates to the internal parking lot. Approximately 60 officers are posted during a football game.

Post-Game Conditions: Immediately following the end of the game, most spectators attempt to leave the stadium parking facilities, although depending on the game outcome, some patrons leave early to avoid congestion and a portion remain for tailgate parties. Players, press, administrative staff, and employees generally remain on-site longer than spectators. Typical clearance times for each of the egress routes following a sell-out football game vary; however, congestion and queues in the vicinity of the stadium generally clear up approximately one and a half to two hours following the end of the game.

During post-game conditions, Harney Way is converted to one-way outbound operation, with two lanes merging to one onto the northbound on-ramp and two lanes continuing onto Alana Way to access the southbound on-ramp and Beatty Avenue. To facilitate flow onto the on-ramps, the U.S. 101 northbound off-ramp is closed at Harney Way, and the allowable movements at the southbound off-ramp are restricted to westbound through onto Beatty Avenue. During post-game conditions, the southbound on-ramp is metered via a ramp metering signal to ensure stable traffic conditions on freeway mainline. Travel lanes on the mainline are also closed to increase the capacity of the on-ramp during post-game conditions. Field observations during recent games indicated that there is some localized congestion on U.S. 101 southbound upstream of and at the ramp merge influence area. Caltrans uses Variable Message Signs (VMS) on southbound U.S. 101 and southbound I-280 upstream of the on-ramp to direct through traffic to southbound I-280 instead of southbound U.S. 101 during post-game conditions.

On U.S. 101 northbound, stadium traffic generally does not have difficulty merging with the freeway mainline traffic, as northbound U.S. 101 traffic volumes approaching Harney Way are generally lower than the southbound volumes. However, as stadium traffic merges with I-80 eastbound traffic leaving downtown San Francisco, congestion and queues extend upstream from the Bay Bridge to the U.S. 101/I-280 merge. This congestion persists long after all congestion and queues dissipate in the vicinity of Candlestick Point.

The surge of vehicles exiting the parking facilities results in queues on the internal roadways and at access roads to Third Street and the on-ramps to U.S. 101. The queues on Jamestown Avenue, Gilman Avenue, and Carroll Avenue are mainly constrained by the capacity of the intersections of the respective street at Third Street. The traffic signals on Third Street are timed to prioritize transit movements along Third Street, including the T-Third light rail, which results in limited capacity for cross-traffic.

During post-game conditions, the San Francisco Police Department officers, PCOs and CHP officers ensure that traffic exits the stadium parking facilities in an orderly fashion and that vehicles access the regional routes as quickly as possible. Responsibilities of the officers include waving vehicles through STOP signs and ensuring that Ingerson Avenue is used by buses, taxis and emergency vehicles. A CHP officer is posted at the intersection of Alana/Beatty to wave vehicles through the STOP sign and onto the U.S. 101 southbound on-ramp. However, many vehicles come to a full stop prior to processing through the intersection.

3.8.3 Transit Services

Muni and Tri-Delta Transit and numerous private charter bus operators provide game day special services to Candlestick Park. BART, AC Transit, and Caltrain do not provide any special game day services. The San Mateo County Transit District (SamTrans), Golden Gate Transit, and the Santa Clara Valley Transportation Authority (VTA) have historically provided transit service to Candlestick Park; however, they have recently stopped providing this service, which will instead be provided by private charter companies.

Muni: On game days, Muni offers express services 75X, 77X, 78X, and 79X to and from the stadium. Line 75X provides express, non-stop shuttle service between Candlestick Park and the Balboa Park BART Station (via Geneva Avenue and Bayshore Boulevard). Line 77X provides express service from the Van Ness corridor, with service between the intersection of California/Van Ness and Candlestick Park (via Van Ness Avenue, South Van Ness Avenue, Mission Street and U.S. 101). Line 78X provides express service along the Park Presidio/19th Avenue corridor, from the Funston/California intersection (via Park Presidio, 19th Avenue, Junipero Serra Boulevard, Ocean Avenue, Geneva Avenue, and Bayshore Boulevard). Line 79X provides express service from downtown, with service between Candlestick Park and the Sutter/Montgomery intersection (via Stockton Street, Fourth Street, Folsom Street and U.S 101). The service starts about three hours prior to the beginning of the football game, and operates at headways of approximately 7 to 10 minutes.

Muni also operates special shuttle services from the Bacon/San Bruno intersection (86-Stadium Shuttle) and from the Gilman/Paul T-Third station (87-Stadium Shuttle). The shuttle service begins about four hours before the game and operates at approximately 5 to 10 minute headways. Approximately 6,500 spectators currently use the special Muni bus services to the stadium.

Tri-Delta Transit: Tri-Delta Transit provides one special game day bus to Candlestick Park from eastern Contra Costa County, with stops in Brentwood, Antioch, and Pittsburg. Tickets may be purchased in advance, or on the bus on the day of the games.

Neither AC Transit not BART provide special game day service. AC Transit riders need to take AC Transit to the San Francisco Transbay Terminal, walk to the intersection of Sutter/Montgomery intersection and transfer to the Muni 9X-Bayshore Express to the stadium. BART riders from East Bay need to take BART to the Montgomery Station and transfer to the Muni 9X-Bayshore Express to the stadium. BART riders from San Mateo County need to take BART to the Balboa Park station and transfer to Muni Line 28X at Geneva Avenue.

Charter Buses: A substantial number of spectators using transit come by private charter buses. Various groups charter buses from private companies including Frontier Tour Charter Bus, Evans, Pro Trav Charter and Sierra Pacific Tours. According to the San Francisco 49ers, approximately 3,000 spectators currently arrive and leave by private charter bus. In addition, private charter service from Santa Clara, San Mateo, Marin, and Sonoma counties will be initiated this season, replacing service previously provided by the VTA, SamTrans, and Golden Gate Transit, respectively. Routes and service are expected to be similar to that previously provided by those operators.

Bus Access and Parking: Buses from the north generally access the stadium by way of Ingerson or Jamestown Avenue, using the Third Street or Paul Avenue exits from U.S. 101 southbound. Buses from the south access the stadium using the Third Street exit. Ingerson Avenue between Third Street and Giants Drive is exclusively used by buses, taxis, and emergency vehicles during pre- and post-game periods.

Southbound buses leaving the stadium generally use westbound Ingerson Avenue to southbound Third Street and take the southbound U.S. 101 on-ramp at Bayshore/Third. Northbound buses use northbound U.S. 101 via the on-ramp at Bayshore/Third. The special Muni shuttle to San Bruno/Bacon turns from Ingerson Avenue onto Third Street northbound, and left at Gilman/Paul.

In general, buses operate inbound on Jamestown Avenue during the pre-game period and outbound on Ingerson Avenue during the post-game period.

Muni buses load and unload passengers along the drop-off roadway (Giants Drive) north of Jamestown Avenue. Other buses (including charters) load and unload in the main parking lot.

Muni buses park free along the drop-off roadway (Giants Drive) parallel to Jamestown Avenue. All other buses park in the main parking lot. The buses in the main lot are parked end-to-end. As a result, some fully loaded buses after the game are delayed until the bus parked in front of them leaves.

3.8.4 Pedestrian Circulation

The number of pedestrians in the vicinity of the stadium is highest during post-game conditions with spectators exiting the stadium at once. The primary pedestrian flows are towards the internal and off-site parking areas east of the stadium, and towards the parking areas along Harney Way and Little Hollywood/Tunnel Avenue, and to the off-site lot along Jamestown Avenue and T-Third line on Third Street.

The two pedestrian overcrossings, one crossing Jamestown at Harney Way, and one crossing the drop-off loop (connecting with Jamestown Avenue approximately 350 feet north of Harney Way), are too narrow to accommodate the surge of pedestrians leaving the stadium. Queues form at the approaches to the pedestrian overcrossings, particularly at Jamestown/Harney. This crossing has fences on either side of the sidewalk to channelize pedestrians and to prevent pedestrians from crossing Jamestown Avenue or Harney Way at-grade.

East of the stadium, pedestrian flows generally spread out throughout the internal lot, and cross Hunters Point Expressway at-grade along the roadway. These uncontrolled crossings often result in conflicts between pedestrians and vehicles, and police occasionally control these crossings. In September 2009, a pedestrian bridge was installed on Hunters Point Expressway at the location of the at-grade pedestrian crossing to the State Park parking lots.

Chapter 4
DEVELOPMENT OF FUTURE CONDITIONS AND SIGNIFICANCE CRITERIA

This chapter describes the methodology used to develop future year cumulative No Project conditions used in the impact analysis, the methodology for determining Project travel demand, and the background transportation network improvements that are anticipated to be implemented by year 2030. This chapter also presents the significance criteria used to identify significant transportation impacts.

The analysis of the Project, Project Variants and Alternatives to the Project was conducted for future year 2030 conditions. Year 2030 was selected as the future analysis year, since the San Francisco County's travel demand model (SF-CHAMP) used in the analysis develops traffic and transit forecasts for cumulative development and growth through the year 2030. The Project impact analysis was conducted for 2030 conditions, rather than existing conditions, to account for the significant roadway and transit network and development changes associated with the Project that would occur over a period of about 20 years (Project construction to be initiated in 2011 and completed by 2029), and to account for the significant changes to the area that are projected to occur. The project impact analysis therefore represents a cumulative growth scenario for the year 2030 that includes growth from development that would occur with implementation of the proposed Project, as well as other, non-project generated growth and transportation network improvements accounted for in the 2030 No Project conditions.

4.1 DEVELOPMENT OF YEAR 2030 NO PROJECT CONDITIONS

Future year 2030 No Project conditions were developed via a two-step process which utilized (1) the San Francisco County's travel demand model (SF-CHAMP) to determine background traffic growth on study area roadways, and (2) traffic volume overlays to reflect traffic volume turning movements associated with nearby developments that are not fully reflected in the SF-CHAMP model output. Future year 2030 No Project conditions are the same as the alternative 1 No Project conditions.

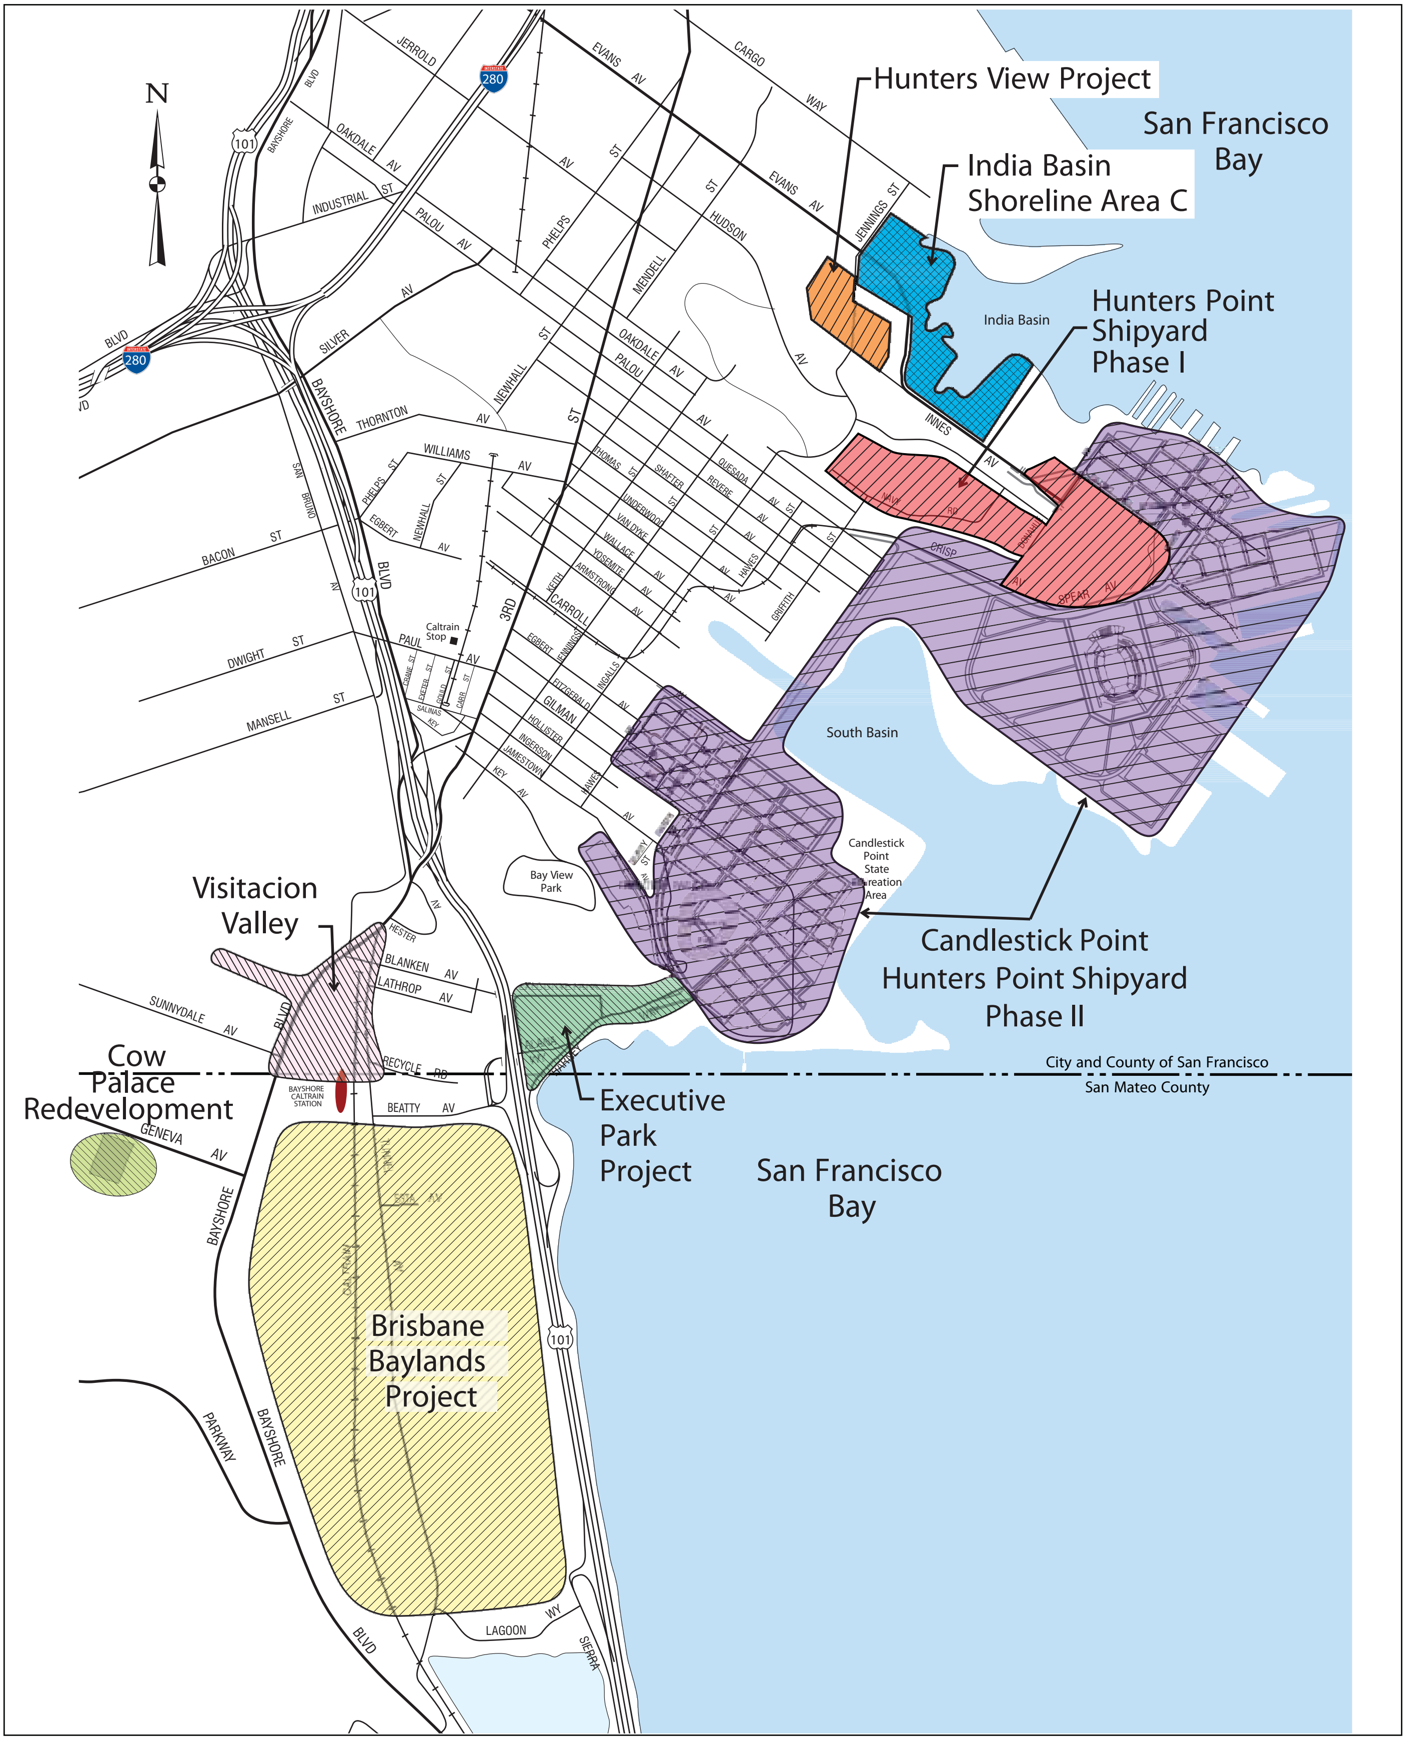
SF-CHAMP Model Growth Projections: Future year 2030 traffic volume forecasts were estimated based on cumulative development and growth identified by SF-CHAMP travel demand model. The SF-CHAMP model is an activity based travel demand model that has been validated to represent future transportation conditions in San Francisco and is updated regularly. The model predicts person travel for a full day based on assumptions of growth in population, housing units and employment, which are then allocated to different periods throughout the day, using time of day sub-models. The SF-CHAMP model predicts future person travel by mode for auto, transit, walk and bicycle trips. The SF-CHAMP model also provides forecasts of vehicular traffic on regional freeways, major arterials and on the study area local roadway network considering the available roadway capacity, origin-destination demand and travel speeds when assigning the future travel demand to the roadway network.

The SFCTA model divides San Francisco into approximately 981 geographic areas, known as Traffic Analysis Zones (TAZs). The SFCTA Model also includes zones outside of the City for which data is obtained through the current Metropolitan Transportation Commission (MTC) Model. For each TAZ, the SFCTA Model estimates the travel demand based on TAZ population and employment growth assumptions developed by the Association of Bay Area Governments (ABAG), determines the origin and destination and mode of travel (auto, transit, walk and bicycle) for each trip, and assigns those trips to the transportation system (roadway network and transit lines). The SFCTA output is developed on a weekday daily and a three-hour AM and PM period basis.

The SFCTA Model travel demand estimates incorporate the ABAG land use and socio-economic database and growth forecasts for the year 2030 (Projections 2007), which provide forecasts of economic and population growth for the County of San Francisco, as well as for the remaining eight Bay Area counties. Within San Francisco, the San Francisco Planning Department is responsible for allocating ABAG's countywide growth forecast to each SFCTA Model TAZ, based upon existing zoning and approved plans, using an area's potential zoning capacity and the anticipated extent of redevelopment of existing uses.

The increase in vehicle trips between existing conditions and 2030 No Project conditions was based on a comparison between model output that represents existing conditions and model output for 2030 conditions. The growth was then added onto existing intersection traffic volumes.

Local Development Traffic Overlays: In the vicinity of the Project, there are a number of development proposals that have recently been approved or are in the environmental review stages. **Figure 27** presents the general location of the planned development within San Francisco and nearby within City of Brisbane limits. While these projects had been included as part of the growth projections used for developing future conditions using the SF-CHAMP model, in order to account for the localized effects of traffic and transit demand, the trip generation associated with these projects was extracted from the SF-CHAMP model output, and travel demand estimates used in the environmental review of these projects were added to the traffic volume estimates developed in the previous step.



SOURCE: Fehr & Peers; AECOM

FIGURE 27: PROPOSED NEARBY DEVELOPMENTS

Specifically, these projects include the Visitacion Valley Redevelopment program (Visitacion Valley Redevelopment Program Final EIR), Hunters View (227-229 West Point Road EIR), Executive Park Development Plan (conversion of office space to residential, neighborhood serving retail and community space – EIR ongoing), and Brisbane Baylands. Travel demand and vehicle assignments for the Visitacion Valley and Hunters View projects were obtained from technical analyses conducted for the EIRs. The analysis of Executive Park is ongoing, and the latest traffic and transit data, including vehicle assignments, was obtained from the Planning Department. Travel demand for the Brisbane Baylands was based on the trip generation analysis conducted by the transportation consultant for the development plan proposed by the Project Applicant in 2008. The 2030 No Project condition also assumes development within Hunters Point Shipyard associated with the approved Phase 1, buildout of the existing Hunters Point Shipyard Redevelopment Plan, and proposed development within India Basin. Travel demand associated with Hunters Point Shipyard and India Basin development was developed consistent with the methodology described below for the Project conditions. No new development was assumed for Candlestick Point, as there are no previously approved plans for the area. The new vehicle and transit trips associated with each development were then manually added to the SFCTA Model 2030 baseline conditions.

Table 26 presents the land use program for the development projects included in determining the future travel demand. For each development proposal, the PM peak hour vehicle travel demand is presented.

Sunday PM Peak Hour Traffic Forecasts: Since the SF-CHAMP model is a weekday travel demand model, future year Sunday PM peak hour conditions were estimated based on the net growth developed for the weekday PM condition. Weekday PM to Sunday PM conversion factors were developed for each intersection, based on the existing relationship between weekday PM and Sunday PM peak hour, as determined from existing traffic counts.

4.2 PROJECT TRAVEL DEMAND

This section presents the travel demand methodology and results for the Project, the Project Variants, and the Alternatives to the Project. Details related to travel demand for the Alternatives to the Project are included in Transportation Study Appendix J.

4.2.1 Methodology

The transportation effects of the Project were determined by calculating the daily person trips generated by the different types of land uses in the CP-HPS Phase II areas, and the portion of those trips that would occur during the analysis peak hours. After determining the number of person trips generated by the Project, the trips were distributed to geographical origins/destination areas, including five San Francisco areas (downtown CBD, the rest of Superdistrict 1[14], Superdistrict 2, Superdistrict 3, Superdistrict 4) and three other regions in the Bay Area (South Bay, East Bay and North Bay). The mode split analysis then determined the portion of these trips made via automobile, transit, or any other mode of transportation, based upon the origin/destination of the trips, the purpose of the trips, and the availability of various modes. Finally, automobile occupancy rates were determined, to yield the average number of individuals in a vehicle, and, thus, determine the number of vehicles that would be traveling to and from the Project study area.

The methods commonly used for forecasting trip generation of stand-alone development projects in San Francisco are based on person-trip generation rates, trip distribution information, and mode split data described in the Transportation Impact Analysis Guidelines for Environmental Review, SF Planning Dept, Oct 2002 (*SF Guidelines).* These data are based on a number of detailed travel behavior surveys conducted within San Francisco. The data in the *SF Guidelines* are generally accepted as more appropriate than conventional methods for use on smaller projects in the complex environs of San Francisco because of the relatively unique mix of uses, density, availability of transit, and cost of parking commonly found in San Francisco. Similarly, standard trip generation rates, such as those provided by *Trip Generation,* 7th Edition, 2003, Institute of Transportation Engineers, would not be suitable for the Project, unless appropriate adjustments are made to account for the Project size, mix, and availability of transit. In addition, the methods described in the *SF Guidelines*, or standard vehicle-traffic generation rates provided by *Trip Generation*, 7th Edition, 2003, Institute of Transportation Engineers, cannot be directly applied to the Project since these methods do not take into consideration the fact that all Project trips would not be new trips to the area. Instead, some of the estimated new Project trips would begin and end within the Project area. The standard methodologies for forecasting trip generation would "double-count" these trips.

To account for the trip making patterns of this multi-use development Project, a state-of-the-practice trip generation forecasting method was used in this analysis. This method was originally developed by Fehr & Peers and others for the U.S. Environmental Protection Agency (EPA) and has been endorsed for use in project-specific and planning-level analyses by a number of jurisdictions, including the California Department of Transportation (Caltrans). This method is commonly referred to as the "4D" method, and generally accounts for the following factors that may influence travel behavior:

[14] Superdistricts are travel analysis zones established by the Metropolitan Transportation Commission (MTC). San Francisco is divided into four Superdistricts delineated to capture the different travel characteristics that are associated with the various street network, transit opportunities, and geographical constraints of different areas of San Francisco. Appendix J includes the boundaries that define the superdistricts.

- **Development scale** – the amount of trips generated increases as the amount of development increases
- **Density of the project** – the higher the project's density, the less vehicular traffic generated per unit of development
- **Diversity of uses –** an appropriate mix of uses can lead to internalization of trips and trip-linking within a project
- **Design of project** – a walkable, pedestrian- and bicycle-oriented circulation system can help to reduce automobile dependence within a project site

A detailed description of how these factors can be used to adjust standard traffic generation rates was provided in a letter to the City of San Francisco Planning Department dated August 4, 2008 (included in Transportation Study Appendix K). The general concept behind the 4D method is that projects that deviate from a base case (in this case, ITE trip generation rates) with respect to the four bulleted variables above exhibit different traffic generation patterns. Elasticities have been derived from travel behavior surveys from the Bay Area to help estimate how traffic generation changes as a function of changes in the 4D's. Those elasticities are used to adjust the base case trip generation to account for the project's density, diversity, and pedestrian/bicycle friendliness (i.e., design) compared to typical suburban developments reflected in the ITE trip generation rates. Applying the 4D method results in a percentage reduction in vehicular traffic generation from the base case (i.e., ITE *Trip Generation*).

This approach was determined to be appropriate by the San Francisco Planning Department because the Project:

- Is located in a relatively isolated area within the City and would redevelop an area comparable in size to a number of entire neighborhoods in other parts of San Francisco;
- Includes residential, employment, retail, and recreational opportunities;
- Follows a development pattern designed to facilitate walking and bicycling for internal trips, and bus service for external trips;
- Proposes street design situated around small, pedestrian-oriented blocks to accommodate a variety of modes of travel; and promote slow and moderate vehicular speeds;
- Locates all homes within a five minute walk of a transit stop; and,
- Proposes to make substantial investments in the transit system within the Project site.

The overall 4D method, as applied to the Project, is detailed in Transportation Study Appendix J, and includes the following steps:

1. Trip Generation: The number of weekday and Sunday person trips generated by the land use program was calculated using the 4D methodology. This process calculates the number of person trips generated by the development and estimates the percentage of those trips that occur internal to the Project area. The remaining external trips are then taken and used in the Project off-site impact analysis.

2. Trip Purpose: The external trips calculated in Step 1 are separated into work and non-work trips, as per *SF Guidelines*.

3. Trip Distribution: Once the trips are calculated by purpose, they are distributed to districts throughout San Francisco and the Bay Area. These districts are defined within the San Francisco CHAMP travel demand forecasting model, maintained by the San Francisco Transportation Authority (SFCTA). To account for more nuanced trip patterns within the City of San Francisco, they were further disaggregated into neighborhoods. This trip distribution calibration was done in consultation with the San Francisco Planning Department, San Francisco Municipal Transportation Agency, and the SFCTA.

4. Transit Mode Utility: Using drive and transit travel times between various districts throughout San Francisco, regression-based utility models were developed for work and non-work trips to determine the relationship between travel time and the cost and transit mode share for each trip type. The 4D model assumed the transit improvements that would be provided as part of Project improvements.

5. Auto and Vehicle Trips: Auto person trips are calculated by subtracting transit trips from all external person trips for each destination zone. The number of vehicle trips was determined based on an average vehicle occupancy of 1.6 persons per vehicle *(assumption based on the 1995 National Personal Transportation Survey).*

6. Trip Assignment: After estimating the transit mode share between the Candlestick Point and Hunters Point Shipyard and each of the districts, the number of transit riders were assigned to specific transit routes serving or proposed to serve the study area.

4.2.2 Project Trips by Mode of Travel

Table 27 presents the daily person trip generation for the Project, the two Project Variants, and the five Alternatives for the Project. The greatest number of daily person trips would occur under Project Variant 1, which assumes the Project development program plus an additional 2,500,000 square feet of R&D space. (Project Variant 1 assumes that the 49ers move to Santa Clara and that a new stadium is not constructed in Hunters Point Shipyard).

Alternative 1, the No Project condition, which assumes buildout of Hunters Point Shipyard Phase I, and would generate the fewest number of total person trips. No development would occur within Candlestick Point. Additional trip generation information for the five Alternatives to the Project is included in Transportation Study Appendix J.

Table 27
Daily Person Trip Generation Summary
Project, Project Variants, and Alternatives to the Project

Scenario	Hunters Point Shipyard	Candlestick Point	Total
Project	65,168	154,483	219,651
Project – Variant 1 (R&D)	81,808	154,483	236,291
Project – Variant 2 (Housing)	77,056	141,933	218,989
Alt. 1 – No Project	44,673	0	44,673
Alt. 2 – No Bridge	65,168	154,483	219,651
Alt. 3 – 49ers at Candlestick	77,056	8,870	85,926
Alt. 4 – Lesser Build	47,680	113,699	161,379
Alt. 5 – No Park Agreement	77,056	141,933	218,989

Note:
Does not include travel demand associated with stadium or arena events. See section 4.2.4.
Source: Fehr & Peers.

Table 28 summarizes the daily, weekday AM and PM peak hour, and Sunday PM peak hour person trip generation for the Project and Project Variants. Project Variant 1 (R&D) would generate the greatest number of peak hour person trips during both the AM and PM peak hours.

Table 28
Person Trip Generation Summary
Project and Project Variants

Source: Fehr & Peers.

Table 29 presents trip generation by mode for the weekday AM and PM peak hours, while **Table 28** presents this information for the Sunday PM peak hour. Between 28 and 34 percent of weekday AM and PM peak hour person trips would be internal/linked trips that would remain within the Project site and would occur primarily by walking and bicycling. External trips would occur via auto, transit and bicycle modes; approximately 76 percent of peak hour external trips would occur by auto, 21 percent by transit, and 3 percent by bicycling.

4.2.3 Project Trip Distribution/Vehicle Assignment

The distribution of the weekday AM and PM transit and vehicle trips to and from San Francisco and areas outside of San Francisco are presented in **Table 31**. The majority of transit trips and about half of vehicle trips would occur within the boundaries of San Francisco, with a greater portion of work trips occurring by transit than non-work trips. Within San Francisco the greatest number of trips would occur between the Project site and Superdistrict 3. Superdistrict 3 is the southeast quadrant of San Francisco and is bounded by the San Mateo County line to the south and the San Francisco Bay to the east, and reaches westward to incorporate the Twin Peaks area. For trips outside of San Francisco, the majority would be to and from nearby Brisbane, Daly City, San Bruno and South San Francisco.

Figure 28 presents the primary assignment routes and distribution percentages for vehicle trips to and from Hunters Point Shipyard, while **Figure 29** presents the routes and distribution percentages for trips to and from Candlestick Point.

4.2.4 Stadium and Arena Travel Demand

This section presents the estimates of trip generation, mode split, trip distribution and traffic assignment for the proposed stadium within Hunters Point Shipyard. Travel demand is presented for sellout conditions for a 49er Sunday event, and for a smaller secondary event occurring during a weekday evening. This section also presents the travel demand associated with a sold-out event at the proposed 10,000-seat arena at Candlestick Point.

49ers Game Day Conditions at the Proposed Stadium

Person-Trip Generation

This analysis considers the impacts of sellout games at the stadium, when all 69,000 seats are sold. The number of person-trips made by spectators to the proposed stadium was estimated based on the number of seats proposed for the new stadium, less the average number of "no-shows." Information provided by the San Francisco 49ers indicates that with a 69,000 seat stadium, there would be approximately 3,450 "no-shows" per game (an average 5 percent no-show rate), resulting in an actual attendance of 65,550 for a sellout game. In addition to the 65,550 spectators, the 49ers have indicated that up to 725 game operations/media personnel attend home games, and that approximately 2,610 other game day employees (concessions, security, janitorial, etc.) are on site each game, for a total on-site population of 68,885 people for a sell-out game.

Mode of Travel

Currently, approximately 19 percent of game day spectators arrive to Candlestick Park by public transit, including approximately:

- 6,500 patrons by Muni (11 percent)
- 3,100 patrons by SamTrans (Silverado Stages since 2008), Golden Gate Transit (California Wine Tours since 2009), Valley Transportation Authority (Silverado Stages since 2009), and Tri-Delta Transit (5 percent)[15]
- 1,900 patrons by other private charter service (3 percent)

It was assumed that a modest rise in transit use would occur with the new stadium, especially in light of the new transit service proposed by the Project:

- Harney Way BRT – The new express transit corridor is proposed to run in dedicated bus lanes from the proposed stadium site to key points west and south. This would greatly improve pre-and post-game transit running times as buses would bypass congested traffic conditions on Harney Way. It would also offer efficient and convenient access to regional transit service, such as Caltrain and BART.

- Palou Avenue Transit Preferential Street – On game days Palou Avenue would be a dedicated transit-only street to allow buses to proceed to the T-Third light rail line and points west and north without mixing in congested pre- and post-game traffic.

- Extension of Existing Transit Routes – In addition to operating "game day express" bus routes from strategic locations throughout San Francisco consistent with current game-day operations, the Project's transit plan calls for extending several existing Muni bus routes (the 24-Divisadero, the 44-O'Shaughnessy, and the 48-Quintara-24th Street) to provide regular service into the Project site. This service would be part of the Project's

15 As noted earlier, game day SamTrans, Golden Gate Transit, and VTA transit service will be replaced by private charter service beginning in the 2009 season. Ridership is expected to remain similar.

regularly scheduled service and would not be special game day service. As a result, patrons would be familiar with the routes.

Due to the dramatic increase in local transit service and improved connectivity to regional transit service, the transit mode share was assumed to increase from 19 percent under existing conditions to 25 percent. Given the extent of transit improvements and demonstrated evidence from other locations that NFL patrons are interested and willing to consider transit as a means to reach games, this increase is a reasonable assumption. This analysis assumes that game operations staff and media personnel would likely use autos. Other game day employees are likely to use transit in a similar fashion as patrons (i.e., 25 percent). **Table 32** summarizes game day travel demand for both spectators and non-spectators.

Table 32
Stadium Game day Attendance - Travel Demand Summary

Spectators	
Total Spectators	69,000
Less 5% No-Shows	*-3,450*
Net Attendance	65,550
Less 25% Transit Usage by Spectators	*-16,388*
Net Auto Person-Trips by Spectators	49,162
Employees/Non-Spectators	
Total Other Employees (Concessions, Security, Etc.)	2,900
Less 10% Other Employee No-Show	*-290*
Net Other Employee Population	2,610
Less 25% Other Employee Transit Usage	*-652*
Net Other Employee Auto Person-Trips	1,958
Total Entertainment/Media/Operations	725
Net Auto Person-Trips by Non-Spectators	2,683

Source: San Francisco 49ers and Fehr & Peers.

Vehicle Occupancy Rates and Vehicle Trip Generation

The average number of spectators in each vehicle is referred to as the vehicle occupancy rate (VOR). Average VORs not only vary by type of vehicle but can also tend to vary depending on the type of stadium seating. For example, existing San Francisco 49ers data indicate that the average VOR for spectators in the club seating sections is 2.0, while the average VOR for spectators in the general seating sections is 3.0.

In order to estimate the number of vehicle-trips under post-game conditions, the number of spectator person-trips was divided by the average VORs. **Table 33** presents auto person-trips generated by various seat types and employees on a typical sellout game, based on the data presented above in **Table 30**, as well as the VORs for the different vehicle types based on existing San Francisco 49ers data, and the resulting number of vehicle trips associated with the new stadium.

Table 33
Stadium Game Day Average VOR[1] by Vehicle Type

	Attendance Type	**Auto Person-Trips**	**Average VOR[1]**	**Vehicle Trips**
Spectators	Club Seat Holder	9,358	2.0	4,679
	Suite Holder	3,606	3.0	1,202
	Hospitality	88	2.0	44
	RVs	220	5.0	44
	Group Sales	39	2.0	20
	Administrative	50	2.0	25
	Players & Families	220	1.0	220
	Owners' Guests	60	1.0	60
	Limousines	50	3.0	17
	General Seating	35,471	3.0	11,824
Spectator Auto Person-Trips		**49,162**	**2.7**	**18,134**
Entertainment/ Operations/ Security/Etc.	Game Operations	225	1.0	225
	Entertainment	60	2.0	30
	Video/Audio	30	1.0	30
	Network	60	1.0	60
	PD, FD, Medical	200	1.0	200
	Media	150	1.0	150
Total Operations/Security Auto Person-Trips		**725**	**1.1**	**695**
Total Other Game day Employees		**2,610**	**1.5**	**1,305**
	Total Game day Travel Demand	***52,497***	***2.6***	***20,134***

Note:
1. VOR – Vehicle occupancy rate.
Source: San Francisco 49ers and Fehr & Peers.

Parking Constraints

The Project would provide 17,415 parking spaces dedicated for game day use. Of this total, 340 spaces adjacent to the stadium would be reserved for buses, and the remaining 17,075 would be for private autos, RVs, limos, etc. Of this total, 16,075 spaces would be adjacent to the stadium and the R & D development, and 1,000 spaces would be provided in Candlestick Point within a parking structure. As a result, 3,059 vehicles of the total unconstrained demand of 20,134 would not be able to park on-site on game days. These vehicles would likely park elsewhere and either walk or take transit into the stadium area. Therefore, although the demand for travel to the project site on game days would be 20,134 vehicles, the actual amount that would park within the project site on game days would be constrained by the 17,075 total parking spaces provided for game day spectators and/or employees.

Departure Patterns

Although the typical end time for a Sunday football game is about 4:00 p.m., there are many factors that influence departure times, including the game score, weather, traffic conditions, and the nature of post-game activities. **Table 34** presents the potential future departure patterns of spectator traffic to reflect the range of conditions likely to occur.

Table 34
Stadium Game Day Post-Game Exit Volumes

Scenario	Assumptions	Peak Hourly Vehicle Exit Demand
Most Conservative	Sold-out event: everyone leaves at end of event	17,075
	Sold-out event: 10% leave early, 5% stay late	14,510
	90% attendance: 10% leave early, 5% stay late	13,060
Average	90% attendance: 15% leave early, 5% stay late	12,290
	80% attendance: 15% leave early, 5% stay late	10,930
	80% attendance: 20% leave early, 5% stay late	10,250
Least Conservative	70% attendance: 20% leave early, 5% stay late	8,960

Note:
1. The Project game day parking supply would be less than the total game day auto travel demand of 20,134 vehicles (including game day employees). There exit demand described above is based on the constrained parking supply of 17,075 vehicles.
2. Although only 20 percent of patrons are shown to depart early in the least conservative scenario, depending on a number of factors, such as weather conditions and game score, the percentage of patrons who leave early may vary substantially from game to game, and may be greater than 20 percent on some occasions.
Source: Fehr & Peers.

An additional factor is the potential synergy after the football game between the stadium and the regional retail development at Candlestick Point, which may result in more spectators electing to stay later than currently do at Candlestick Park. **Table 34** assumes only 5 percent of spectators stay later, which is consistent with the existing stadium departure patterns. Synergies between adjacent attractions may result in higher numbers of patrons arriving earlier or staying late. Regardless, it is likely that the Project's exit routes would continue to function at capacity during the one hour after the end of the game, even with the presence of the nearby retail center and the new stadium location in Hunters Point Shipyard. All transit buses were assumed to leave the Project site during the one hour after the end of the game.

Geographic Distribution

The geographic distribution of spectators was obtained from information provided by the San Francisco 49ers on their season ticket holders. Since a substantial portion of football spectators are season ticket holders, the pattern can be expected to be representative of travel patterns by both season, as well as non-season, ticket holders. The information obtained from the San Francisco 49ers indicates that approximately 40 percent of the season ticket holders reside in the South Bay, 16 percent in the East Bay, 14 percent within San Francisco, and 10 percent in the North Bay counties. The remaining 20 percent reside in locations outside the Bay Area such as the Central Valley and Sacramento, with some living outside of the state.

Secondary (Non-Football) Events at the Proposed Stadium

It is anticipated that other types of events, such as soccer games or concerts, may also be scheduled at the new stadium during the year. A typical secondary event could occur at any time of day and on any day of the week, with an expected crowd ranging from 15,000 (e.g., monster truck rally) to sell-out conditions. For purposes of the transportation analysis, an event with 37,500 spectators was analyzed, which reflects events such as a Metallica concert. Assuming an approximate weekday evening start time of about 7:00 p.m., the weekday PM peak hour (5:00 to 6:00 p.m.) was analyzed for pre-event conditions to address transportation impacts associated with possible secondary events on evening commute traffic conditions. Secondary events would be limited to 20 total occurrences per year.

Trip Generation/Mode Split

Unlike football games, where there would be special transit service to the stadium, it is assumed that for secondary events only regularly scheduled transit service would be provided by Muni and only a small percentage of private charter buses would be expected. Still, the amount of regularly-scheduled transit service serving the new stadium would be substantial, such that transit mode share for a secondary event at the stadium would be approximately 20 percent. It is estimated that the 37,500 spectators would generate about 28,125 persons coming by autos, and 9,375 persons taking transit, including regularly scheduled service and charter buses.

Assuming that the average number of spectators per auto for a secondary event would be similar to that for football spectators in the general seating section (i.e., 3 spectators per auto), the 28,125 persons taking autos would translate to 9,375 vehicles to the stadium, and up to 10,100 vehicles including employees (conservatively estimating similar ratios of employees to spectators as football game days).

Arrival/Departure Patterns

In order to estimate the number of vehicles that would be generated during the weekday PM peak hour (5:00 to 6:00 p.m.), information regarding arrival patterns of non-football events were obtained from a technical paper titled "Understanding the Major Event Traffic Engineering Paradigm", presented in the Institute of Transportation Engineers, 1997 Compendium of Technical Papers. The information contained in this source indicates that approximately 25 percent of the total number of spectators to a non-football event would arrive within the one hour prior to the event start time, 50 percent would arrive within the second hour, and the remaining 25 percent would arrive within the third hour prior to the event start time. As such, about 50 percent, or 4,688 of the spectator vehicles would arrive between 5:00 and 6:00 p.m. for a weekday evening event starting at 7:00 p.m. Employees would arrive earlier to the site.

Geographic Distribution

The geographic distribution of trips associated with a secondary event would vary depending on the event. However, for the purposes of this transportation analysis, it was assumed that the geographic location of the secondary event spectators would be similar to that of the football spectators, where approximately 40 percent would come from the South Bay, 16 percent from the East Bay, 14 percent from within San Francisco, 10 percent from the North Bay, and 20 percent from locations outside of the Bay Area.

Events at the Proposed Arena

The Project also includes a new arena within Candlestick Point that would be used for theater productions, concerts, speaking engagements, educational events, or sporting events. While most events at the arena would be for smaller audiences, the arena would accommodate up to 10,000 attendees. It is anticipated that up to 150 events per year could occur at the arena (e.g., Wednesday, Friday and Saturday every week per year). Similar to the analysis of secondary events at the stadium, assuming an approximate weekday evening start time of 7:00 p.m., the weekday PM peak hour (5:00 to 6:00 p.m.) was analyzed for pre-event conditions to address transportation impacts associated with sold-out events that may occur at the arena. Although no specific program has been developed for events at the arena, sell-out events with 10,000 attendees occurring during weekday evenings would likely be infrequent.

Trip Generation/Mode Split

Similar to the analysis of secondary events at the arena, the analysis of a sold-out event at the arena assumes that only regularly-scheduled transit service would be provided and that only a small number of attendees would arrive by private charter bus. The analysis assumes that 20 percent of attendees would arrive by transit (again, similar to the assumptions for a secondary event at the stadium, and lower than the expected transit ridership to Sunday afternoon 49er games). Therefore, of the 10,000 spectators, 2,000 would be expected to arrive by transit and 8,000 would be expected to arrive via auto. Assuming that the average vehicle occupancy for a sold-out event at the arena would be similar to that of spectators to a 49ers game or for a secondary event at the stadium (i.e., 3 spectators per auto), the 8,000 people arriving via auto would generate an additional 2,667 vehicles to the stadium, and up to 2,860 vehicles including employees (assuming similar ratios of employees to spectators as football game days).

Arrival/Departure Patterns

Arrival and departure patterns for a sold-out event at the arena would likely be similar to those of secondary events at the stadium. Specifically, 50 percent of the attendees, or 1,333 vehicles and 1,000 transit trips, would arrive between 5:00 and 6:00 p.m. for an event that begins at 7:00 p.m. Employees would arrive earlier and would not affect the 5:00 to 6:00 p.m. peak hour.

Geographic Distribution

Similar to secondary events at the stadium, the geographic distribution of trips associated with events at the arena would vary depending on the event. For purposes of this analysis, it was assumed that the geographic location of the attendees would be similar to that of the football spectators, with 40 percent of attendees arriving from the South Bay, 16 percent from the East Bay, 14 percent from within San Francisco, 10 percent from the North Bay, and 20 percent from locations outside the Bay Area.

4.2.5 Parking Demand

The *SF Guidelines* methodology for estimating parking demand was used to calculate the parking demand associated with the land uses for each analysis scenario. For each analysis scenario, parking demand was estimated separately for residential and non-residential uses.

Residential Parking Demand – For individual development projects, residential parking demand is estimated based on the number and type of housing unit (i.e., studios/one bedroom versus two and two-plus bedroom units, and affordable versus market rate housing) that would be constructed.

Non-Residential Parking Demand – Non-residential demand was estimated for both short-term and long-term demand. Long-term demand refers to demand generated by employee trips by auto, while short-term demand refers to demand associated with visitor trips.

Long-term demand was calculated by applying the vehicle mode choice by Project area to the projected number of new employees associated with each land use. Average hour short-term demand was calculated by applying an average turnover of 5.5 vehicles per space to the daily non-work trips by vehicle (one-way trips).

Table 35 presents the residential and non-residential parking demand for the Project, Project Variants and Alternatives. The parking demand calculations are presented in Transportation Study Appendix J.

Table 35
Parking Demand – Project, Project Variants, and Alternatives

Scenario/Project Area	Residential	Non-Residential		Total Demand [1]
	Long Term Demand	Long Term Demand	Short-Term Demand

4.2.6 Loading Demand

The *SF Guidelines* methodology for estimating commercial vehicle and freight loading/loading demand was used to calculate the demand associated with each analysis scenario. Daily truck trips generated per 1,000 square feet were calculated based on the rates contained in the *SF Guidelines*, then converted to hourly demand based on a 9-hour day and a 25-minute average stay. Average hourly demand was converted to a peak hour demand by applying a peaking factor, as specified in the *SF Guidelines*. **Table 36** presents the number of trucks generated on a daily basis, and the demand for loading dock spaces during the peak hour of loading activities. The loading demand calculations are presented in Transportation Study Appendix J.

Table 36
Loading Demand – Project, Project Variants, and Alternatives

Scenario/Project Area	Daily Truck Generation	Peak Hour Loading Dock Space Demand

4.3 FUTURE BASELINE TRANSPORTATION IMPROVEMENTS

In addition to improvements proposed by the Project, the analysis assumes completion of certain planned and reasonably foreseeable roadway and transit improvements in the Project vicinity that, although not part of the Project, could affect circulation. These improvements would be completed by the City and County of San Francisco directly or through development approvals.

4.3.1 Roadway Improvements

Local Roadway Improvements

These improvements were identified as mitigation measures in the EIRs prepared for the Bayview Hunters Point Redevelopment Plan and the Visitacion Valley Redevelopment Plan, and implementation will be assured through conditions of approval placed on the development projects by the Planning Department and the San Francisco Redevelopment Agency.

- **Bayshore/Paul** – At this signalized intersection, as part of the Bayview Hunters Point Redevelopment Plan the signal will be changed from northbound and southbound Bayshore Boulevard operating with permitted left turns (left turns yield to oncoming traffic), to protected left turn movements with an exclusive signal phase.
- **Bayshore/Tunnel** – At this signalized intersection, the Visitacion Valley Redevelopment Plan calls for improvements to the signal timing plan, to redistribute green time from the southbound left turn movement to the northbound/southbound through movements.
- **Bayshore/Arleta/San Bruno** – At this signalized intersection, the Visitacion Valley Redevelopment Plan calls for improvements to the signal timing plan, to redistribute green time from the northbound left turn movement to the southbound through movement.
- **Bayshore/Leland** – At this signalized intersection, the Visitacion Valley Redevelopment Plan calls for improvements to the signal timing plan, to redistribute green time from the northbound left turn movement to the northbound/southbound through movements. As part of this improvement, the westbound approach will be restriped to provide two travel lanes: a left-through lane and an exclusive right-turn lane.
- **Bayshore/Visitacion** – The Visitacion Valley Redevelopment Plan calls for reconfiguration of this signalized intersection to extend the southbound left turn pocket by 80 feet. As part of this improvement, the west-side Bayshore/Leland Muni bus stop would be relocated to the south of Leland Avenue.
- **Bayshore/Sunnydale** – The Visitacion Valley Redevelopment Plan calls for reconfiguration of this signalized intersection to extend the southbound left turn pocket by 100 feet. In addition, the Plan calls for improvements to the signal timing plan, to redistribute green time from the northbound/southbound left turn movements to the eastbound/westbound through movements. The westbound and eastbound approaches

will be restriped to provide two travel lanes: a shared left-through lane and an exclusive right-turn lane.

- **Tunnel/Blanken** – The Visitacion Valley Redevelopment Plan calls for reconfiguration of this intersection to eliminate the all-way STOP-sign controls and install new traffic signal poles, masts and signal heads. In addition, the approaches to the intersection would be restriped to provide for two travel lanes for each approach.
- **Bayshore/Blanken** – At this signalized intersection, the Visitacion Valley Plan calls for restriping of the westbound approach of Blanken Avenue at Bayshore Boulevard to two lanes, to provide for an exclusive left turn lane, and an exclusive right turn lane.
- **Executive Park Improvements** —The Executive Park Property Owners are also required to make local roadway improvements when warranted by poor operating conditions. These include the following short-term and long-term improvements:
    - Signalization of Harney Way/Executive Park Boulevard East
    - Signalization and reconfiguration of Harney Way/Alana Way/Thomas Mellon Drive intersection
    - Widening of Harney Way by one lane
    - Signalization of Executive Park Boulevard West/Alana Way and the restriping of the southbound approach from one shared lane to one exclusive left lane and one exclusive right lane
    - Widening of Alana Way by one lane and two lanes
    - Signalization of Alana Way/Beatty Road

Planned Regional Improvements

Two regional roadway improvement were included as part of the future year analysis. These improvements are currently being designed and analyzed to accommodate the travel demand associated with the areawide projects identified in section 4.1 (**Table 26)** in both San Francisco and San Mateo counties. Implementation of these improvements would be based on fair-share funding measures through inter-jurisdictional study and cooperation, such as the ongoing inter-jurisdictional Bi-County Transportation Study effort led by the San Francisco County Transportation Authority. Within San Francisco, the Planning Department and the Redevelopment Agency will require project developer fair share contributions to these identified funding needs as a condition of development approval or as a condition of any Owner Participation Agreement. These regional roadway improvements are:

- **Geneva Avenue/Harney Way Extension** – Geneva Avenue which currently ends at Bayshore Boulevard, would be extended east to meet Harney Way, improving east-west access in the area. The Geneva Avenue Extension would have three eastbound and three westbound travel lanes between Bayshore Boulevard and a new interchange with U.S.

101. Currently, the nearest east-west access road is Blanken Avenue, which is designed as a neighborhood collector roadway and could not accommodate the additional east-west traffic generated by area projects. The lead agency for this project is the City of Brisbane, with the Caltrans Project Study Report (PSR) expected to be completed in early 2010.Extension from its current terminus at Bayshore Boulevard to a new interchange with U.S. 101.

- **New U.S. 101 Interchange at Geneva/Harney** – In conjunction with the extension of Geneva Avenue east, the existing Harney Way interchange would be redesigned as a typical diamond interchange. Caltrans and the City of Brisbane are the lead agencies for this project, and a PSR report is currently being prepared. Two alternatives are currently being assessed; one with Geneva Avenue/Harney Way crossing under U.S. 101, and one with Geneva Avenue/Harney Way crossing over U.S. 101.

  On the Geneva Avenue/Harney Way crossing of U.S. 101 there would be six lanes eastbound (three left turn lanes and three through lanes) and five lanes westbound (three left turn lanes and three through lanes), for a total of eleven lanes. The intersections of the northbound and southbound ramps with Geneva Avenue/Harney Way would be signalized. For both alternatives, a new bypass to the existing northbound Third Street off-ramp would be constructed, with the intention of diverting traffic on the existing off-ramp from the northbound mainline and improving conditions at the weave section where the new proposed northbound on-ramp from Harney Way would join the mainline. Preliminary drawings for each of the alternatives are included in Transportation Study Appendix L.

4.3.2 Transit Improvements

SFMTA has proposed changes to several of the lines that would serve the study area as part of its Transit Effectiveness Project (TEP). The TEP is a comprehensive review of Muni operations, with numerous proposals for service and street network changes to address issues related to reliability, travel times and service areas. Service planning changes are budget-neutral, while additional funding will be required for capital needs (e.g., additional buses). SFMTA will pursue Proposition K funds and federal grants for capital funding. The changes affecting the study area include:

- Eliminating 19-Polk service to the Hunters Point Shipyard.
- Increasing frequency on the 24-Divisadero from 8.5 minutes in the AM peak hour and 10 minutes in the PM peak hour to 7.5 minutes in the AM and PM peak hours.
- Increasing frequency on the 44-O'Shaughnessey to 6 minutes in the PM peak hour.
- Increasing frequency on the 54-Felton from 30 minutes to 20 minutes in the AM and PM peak hours.

- Extending the 48-Quintara-24th Street would be extended from 25th Street and Connecticut Street in Potrero Hill into the Hunters Point Shipyard in order to offset the elimination of the 19-Polk service to Hunters Point Shipyard. Frequencies on the 48-Quintara-24th Street would be reduced from 12 minutes to 15 minutes in the AM and PM peak hours.
- Rerouting and extending the 28L-19th Avenue Limited from its current terminus at the Daly City BART station up to Geneva Avenue, terminating just east of Mission Street. The 28L-19th Avenue Limited would maintain its current 10-minute frequency in the AM and PM peak hours.
- Extending/rerouting the T-Third light rail line north of the station at Fourth and King Streets. Currently the T-Third continues north along The Embarcadero, entering the Market Street subway just north of Folsom Street. As described earlier, as part of the Central Subway project, beginning in approximately year 2016, the T-Third line will continue north on Fourth Street, entering a new subway under Fourth Street just south of Harrison Street. The new terminus will be in Chinatown, underneath Stockton Street. The Central Subway operating plan calls for single-car trains at 7.5-minute frequencies during peak hours between Chinatown and Bayview, as well as a two-car short-line train between Chinatown and Mariposa Street operating at 7.5-minute frequencies.

While not included in the assumptions for future transit conditions, the objectives of the ongoing Bayshore Intermodal Station Access Study would complement the TEP improvements, as well as Project transit improvements. The SFCTA is conducting the Bayshore Intermodal Station Access Study to develop multi-jurisdictional consensus around a vision and conceptual design for new intermodal transit connections and passenger access to the Bayshore Caltrain Station. Multiple planning processes are proceeding to develop projects that would connect new transit services to the Bayshore Station, including an extension of the T-Third light rail line from its current nearby terminus, the extension of the BRT line to Hunters Point Shipyard, and a new local street connection across Bayshore Boulevard, the Caltrain tracks, and U.S. 101 as a Geneva Avenue extension. The SFCTA is partnering with stakeholder agencies to develop the proposed station connections in a seamless fashion and to promote strong multimodal access to the station. The end result will be a set of conceptual designs for the station and the new connections to serve as a vision that the individual projects will implement as they progress through their planning and preliminary engineering phases.

4.3.3 Bicycle Improvements

The certification of the San Francisco Bicycle Plan Final EIR was affirmed by the Board of Supervisors in August 2009. The San Francisco Bicycle Plan identifies near-term improvements that could be implemented within the next five years, as well as policy goals, objectives and actions to support these improvements. It also includes long-term improvements, and minor improvements that would be implemented to facilitate bicycling in San Francisco. The injunction to stop implementation of the Bicycle Plan improvements that was issued on June 2006 by the Superior Court of California would be lifted, and that implementation of near-term improvements would be contracted. Funds for Bicycle Plan improvements would be available from the State Bicycle Transportation Account and San Francisco Measure C funding. The SFMTA, the San Francisco Recreation and Park Department (RDP), or the San Francisco Department of Public Works (under the direction of SFMTA or RPD), would implement improvements, depending on which entity has jurisdiction. The *San Francisco Bicycle Plan* includes six short-term projects within the study area (see **Figure 21**):

- San Francisco Bicycle Plan Project 4-2: Cargo Way Bicycle Lanes, will involve the installation of Class II bicycle lanes in both directions on Cargo Way between Third Street and Jennings Street. On-street parking on the south side of Cargo Way will be removed, and a Class II left-turn bicycle lane will be installed on eastbound Cargo Way approaching Illinois Street and Amador Street. Cargo Way is not currently part of the citywide bicycle route network.
- San Francisco Bicycle Plan Project 4-3: Illinois Street Bicycle Lanes, would involve the installation of Class II bicycle lanes in both directions on Bicycle Route #5 on Illinois Street between 16th Street and Cargo Way. On-street parking on the east side of Illinois Street north of 22nd Street will be removed, and additional on-street parking spaces will be provided on Tennessee Street, 22nd Street, and 24th Street.
- San Francisco Bicycle Plan Project 4-4: Innes Avenue Bicycle Lanes, will involve the installation of Class II or Class III bicycle facilities in both directions on Bicycle Route #68 on Innes Avenue between Donahue Street and Hunters Point Boulevard. Two options have been identified for this segment and a preferred option was not included in the Bicycle Plan Final EIR: Option 1 would add Class II bicycle lanes in both directions, and remove on-street parking on the south side of Innes Avenue between Hunters Point Boulevard and Earl Street, and on both sides of Innes Street between Earl Street and Donahue Street. Option 2 would be similar to Option 1, except for the segment from Hunters Point Boulevard to Earl Street, where sharrows would be added to the existing Class III bicycle route in both directions. There would be no parking or travel lane removals associated with Option 2 between Hunters Point Boulevard and Earl Street.
- San Francisco Bicycle Plan Project 5-4: Bayshore Boulevard Bicycle Lanes, will involve the installation of Class II bicycle lanes in both directions of travel along most of Bayshore Boulevard between Cesar Chavez Street and Silver Avenue (Bicycle Route #25). Sharrows would be added in each direction between Cesar Chavez Street and approximately the beginning of the couplet split (i.e., at Jerrold Avenue). On-street parking will be removed on both sides of Bayshore Boulevard from the couplet split to Industrial Street, and one northbound lane will be removed beginning midblock between Helena and Industrial Streets. Sharrows will be added on northbound Bayshore Boulevard to Oakdale Avenue, Loomis Street, Barnveld Avenue and Jerrold Avenue, and

the northbound curbside bicycle lane from Helena Street to Marengo Street will be a shared transit and bicycle lane.

- San Francisco Bicycle Plan Project 5-5: Cesar Chavez Bicycle Lanes, will involve the installation of Class II bicycle lanes in both directions on Bicycle Route #25 on Cesar Chavez Street between Kansas Street (near U.S. 101) and Mississippi Street (near I-280). To accommodate the bicycle lanes, one of the two eastbound travel lanes will be removed.
- *San Francisco Bicycle Plan* Project 5-13: San Bruno Bicycle Lanes will involve the installation of Class II bicycle lanes in both directions on Bicycle Route #25 on San Bruno Avenue between Silver Avenue and Paul Avenue. To accommodate the bicycle lanes, on-street parking would need to be removed in the segment between Silliman Street and Silver Avenue.

The Bicycle Plan includes 24 long-term improvements that are proposed to be designed and implemented citywide over time. These improvements would complete the bicycle route network envisioned in the Bicycle Plan, close network gaps, refine and rationalize the bicycle route network, and improve safety and the bicyclists experience. Five long-term improvements have been identified within the study area for further design, environmental review and possible implementation. With the exception of the Bay Trail improvements which involve construction of a Class I off-street path, and Mendell Street which is currently a plaza, the long-term improvements generally involve implementation of Class II or Class III bicycle facilities. Design of these improvements would occur within the context of the bicycle route network, planned development characteristics, and roadway network configuration at the initiation of the design and review process for each improvement. The five long term improvements include:

- Long-Term Improvement L-3: Bay Trail Improvements in the vicinity of Hunters Point
- Long-Term Improvement L-4: Bayview Transportation Improvements Project
- Long-Term Improvement L-11: Industrial St between Loomis St and Oakdale Ave
- Long-Term Improvement L-12: Jennings St between Cargo Way and Evans Ave
- Long-Term Improvement L-15: Mendell St between Oakdale Ave and Palou Ave

4.4 SIGNIFICANCE CRITERIA

The City and Agency have not formally adopted significance standards for impacts related to transportation, but generally consider that implementation of the Project would have significant impacts on these resources if it were to:

- Cause an increase in traffic that is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in either the number of vehicle trips, the volume-to-capacity ratio on roads, or congestion at intersections)

- Exceed, either individually or cumulatively, an LOS standard established by the county congestion management agency for designated roads or highways (unless it is practical to achieve the standard through increased use of alternative transportation modes)
- Result in a change in air traffic patterns, including either an increase in traffic levels, obstructions to flight, or a change in location, that causes substantial safety risks
- Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses
- Result in inadequate parking capacity that could not be accommodated by alternative solutions
- Conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., conflict with policies promoting bus turnouts, bicycle racks, etc.), or cause a substantial increase in transit demand that cannot be accommodated by existing or proposed transit capacity or alternative travel modes

The transportation and circulation impact findings herein are also based on the following significance criteria used by the San Francisco Planning Department for the determination of impacts associated with a proposed project.

- Traffic – In San Francisco, the threshold for a significant adverse impact on traffic has been established as deterioration in the LOS at a signalized intersection from LOS D or better to LOS E or LOS F, or from LOS E to LOS F. The operational impacts on unsignalized intersections are considered potentially significant if project-related traffic causes the level of service at the worst approach to deteriorate from LOS D or better to LOS E or LOS F and Caltrans signal warrants would be met, or causes Caltrans signal warrants to be met when the worst approach is already at LOS E or LOS F.[16]

  For an intersection that operates at LOS E or LOS F under existing conditions, there may be a significant adverse impact depending upon the magnitude of the project's contribution to the worsening of delay. In addition, a project would have a significant adverse effect if it would cause major traffic hazards, or would contribute considerably to the cumulative traffic increases that would cause the deterioration in LOS to unacceptable levels (i.e., to LOS E or LOS F).

  The operational impacts on freeway mainline segments and freeway on-ramp merge and off-ramp diverge operations are considered significant when project-related traffic causes the level of service to deteriorate from LOS D or better to LOS E or LOS F, or from LOS

[16] Five of the study intersections are within the City of Brisbane. The level of service standard for all arterial streets within the City of Brisbane is LOS D, except for the intersections on Bayshore Boulevard at Old County Road and San Bruno Avenue, which shall not be less than LOS C.

E to LOS F. In addition, a project would have a significant effect on the environment if it would contribute substantially to congestion at unacceptable levels.

- Parking – Parking supply is not considered to be a part of the permanent physical environment in San Francisco[17]. Parking conditions are not static, as parking supply and demand varies day to night, day to day, month to month, etc. Hence, the availability of parking spaces (or lack thereof) is not a permanent physical condition, but changes over time as people change their modes and patterns of travel.

  Parking deficits are considered to be social effects, rather than impacts on the physical environment as defined by CEQA. Under CEQA, a project's social impacts need not be treated as significant impacts on the environment. Environmental documents should, however, address the secondary physical impacts that could be triggered by a social impact. (CEQA Guidelines § 15131(a).) The social inconvenience of parking deficits, such as having to hunt for scarce parking spaces, is not an environmental impact, but there may be secondary physical environmental impacts, such as increased traffic congestion at intersections, air quality impacts, safety impacts, or noise impacts caused by congestion. The absence of a ready supply of parking spaces, combined with available alternatives to auto travel (e.g., transit service, taxis, bicycles or travel by foot) and a relatively dense pattern of urban development, induces many drivers to seek and find alternative parking facilities, shift to other modes of travel, or change their overall travel habits. Any such resulting shifts to transit service in particular, would be in keeping with the City's "Transit First" policy. The City's Transit First Policy, established in the City's Charter Section 16.102 provides that "parking policies for areas well served by public transit shall be designed to encourage travel by public transportation and alternative transportation."

  The transportation analysis accounts for potential secondary effects, such as cars circling and looking for a parking space in areas of limited parking supply, by assuming that all drivers would attempt to find parking at or near the project site and then seek parking farther away if convenient parking is unavailable.

- Transit – The project would have a significant effect on the environment if it would cause a substantial increase in transit demand that could not be accommodated by adjacent transit capacity, resulting in unacceptable levels of transit service; or cause a substantial increase in operating costs or delays such that significant adverse impacts in transit service levels could result.

[17] Under California Public Resources Code, Section 21060.5, "environment" can be defined as "the physical conditions which exist within the area which will be affected by a Project, including land, air, water, minerals, flora, fauna, noise and objects of historic or aesthetic significance."

The project would also have a significant effect on the environment if it would increase transit travel times on a particular route such that existing (or proposed) headways could not be maintained based on the existing (or proposed) vehicle fleet.

- Pedestrians – The project would have a significant effect on the environment if it would result in substantial overcrowding on public sidewalks, create potentially hazardous conditions for pedestrians, or otherwise interfere with pedestrian accessibility to the site and adjoining areas.
- Bicycles – The project would have a significant effect on the environment if it would create potentially hazardous conditions for bicyclists or otherwise substantially interfere with bicycle accessibility to the site and adjoining areas.
- Loading – The project would have a significant effect on the environment if it would result in a loading demand during the peak hour of loading activities that could not be accommodated within the proposed on-site loading facilities or within convenient on-street loading zones, and if it would create potentially hazardous traffic conditions or significant delays affecting traffic, transit, bicycles or pedestrians.
- Emergency Vehicle Access – The project would have a significant impact on the environment if it would hinder emergency vehicle access.
- Construction – Construction-related impacts generally would not be considered significant due to their temporary and limited duration. However, in circumstances involving large development plans where construction would occur over long periods of time, construction-related impacts may be considered significant.

Project impacts were assessed by comparing future year 2030 conditions with the Project to 2030 No Project conditions. The 2030 No Project condition includes development within Hunters Point Shipyard associated with approved Phase I, as well as buildout of the existing Hunters Point Shipyard Redevelopment Plan, which would be replaced by the Project. However, for purposes of defining and assessing effectiveness of proposed mitigation measures, the total effect of the Project was considered (i.e., total vehicle, transit, bicycle and pedestrian trips generated by the Project were considered, not just the increase from the 2030 No Project condition which assumes development within the Hunters Point Shipyard component of the Project). Further, for purposes of determining the Project's contribution to cumulative impacts, the total Project effect was considered.

The Project was determined to have a significant traffic impact at an intersection if Project-generated trips would cause an intersection operating at LOS D or better under 2030 No Project conditions to operate at LOS E or LOS F, or intersections operating at LOS E under 2030 No Project conditions to deteriorate to LOS F conditions. At intersections that would operate at LOS E or LOS F under 2030 No Project conditions, and would continue to operate at LOS E or LOS F under Project conditions, the increase in Project vehicle trips were reviewed to determine whether the increase would contribute considerably (i.e., five percent or more) to critical movements operating at LOS E or LOS F.

For freeway mainline and ramp analyses, locations where the Project would result in a change from LOS D or better under 2030 No Project conditions to LOS E or LOS F, or from LOS E or LOS F, with the Project are identified as Project impacts. At locations that would operate at LOS E or LOS F under 2030 No Project conditions, and would continue to operate at LOS E or LOS F under Project conditions, the Project trips, as a percentage of total traffic volumes on the facility were reviewed to determine whether the increase would contribute considerably (i.e., five percent or more) to total volumes on the facility.

The Project was determined to have a significant impact if it would increase transit travel times such that additional transit vehicles would be required to maintain the proposed headways. This was assumed to be the case if either the Project's travel time increases to a particular route would be greater than ½ its proposed headway or if the number of required vehicles estimated using SFMTA's cost/scheduling model, which takes into account scheduled breaks and extra time built into schedules, increases by one or more vehicles with the addition of the Project characteristics. The Project would have a significant contribution to a cumulative impact if it was determined to have a significant Project impact. In a few circumstances, although no Project impact was identified, the Project contribution to the cumulative scenario was determined to be considerable when a transit line travels through intersections that would operate at LOS E or LOS F due to Project traffic.

Chapter 5
YEAR 2030 NO PROJECT CONDITIONS

This chapter presents the year 2030 No Project (without the Project development program, but assumes the approved development for HPS Phase I) conditions, and compares the analysis results to existing conditions, as presented in Chapter 3. The 2030 No Project condition represents the cumulative baseline condition for the impact analysis. Comparison to existing conditions was conducted to determine whether the 2030 No Project scenario would have significant cumulative impacts due to background development anticipated in the project study area, regardless of any Project development scenario. In Chapter 6, the Project, Project Variants, and Project Alternatives are compared to the 2030 No Project conditions to determine the impacts of the Project.

Under the 2030 No Project conditions, the vicinity of the Project is anticipated to experience growth of about 7,000 new housing units, and about 9.8 million square feet (see **Table 26** in Chapter 4) of development. The remainder of San Francisco is also projected to experience an increase in both jobs and housing units. Within the rest of San Francisco, total daily person trips via all modes are projected to increase by about 14 percent over existing conditions, and the total daily vehicle trips are projected to increase by about 8 percent over existing conditions. (SF-CHAMP, 2009)

5.1 TRAFFIC IMPACTS

5.1.1 Intersection Operations

Future year 2030 No Project traffic volumes at the 60 study intersections are presented on **Figure 30A** and **Figure 30B** for the weekday AM and PM peak hours, and on **Figure 30C** and **Figure 30D** for the Sunday PM peak hour conditions. Transportation Study Appendix E contains intersection turning movement volume summaries.

Table 37 presents a comparison of the weekday AM and PM peak hour intersection LOS analysis for the existing and 2030 No Project conditions. **Table 38** presents this comparison for Sunday PM peak hour conditions. As traffic volumes in the study area are anticipated to increase as a result of development in the area and within San Francisco, average vehicle delays at both signalized and unsignalized intersections would increase, and operating conditions would become more constrained.

Source: Fehr & Peers.

Under the 2030 No Project conditions, 38 of the 60 intersections would operate at LOS E or LOS F (as compared with three intersections under existing conditions). The intersections include:

- Third/25th
- Third/Cargo
- Third/Evans
- Third/Palou

- Third/Gilman/Paul
- 25th/Pennsylvania
- Cesar Chavez/Pennsylvania/I-280 northbound off-ramp
- Cesar Chavez/Evans
- Bayshore/Paul
- Bayshore/Hester/U.S. 101 southbound off-ramp
- Bayshore/Tunnel
- Bayshore/Bacon/Egbert/Phelps
- Bayshore/Arleta
- Bayshore/Leland
- Bayshore/Visitacion
- Bayshore/Sunnydale
- Tunnel Blanken
- Geneva/U.S. 101 southbound ramps (existing Alana/Beatty)
- Harney/U.S. 101 northbound ramps (existing Alana/Harney/Thomas Mellon)
- Harney/Jamestown
- Crisp/Palou/Griffith
- Arelious Walker/Gilman
- Amador/Cargo/Illinois
- Bayshore/Cortland
- Bayshore/Alemany/Industrial
- Bayshore/U.S. 101 northbound off-ramp/Jerrold
- Bayshore/Silver
- Bayshore/Blanken
- San Bruno/Paul
- San Bruno/Silver
- San Bruno/Mansell/U.S. 101 southbound off-ramp
- San Bruno/Silliman/U.S. 101 southbound ramps
- Evans/Jennings
- Bayshore/Geneva
- Bayshore/Old County
- Sierra Point Parkway/U.S. 101 southbound ramps/Lagoon Way
- Third/Jerrold
- Evans/Napoleon/Toland

As indicated in section 4.3, a number of intersection improvements would be implemented as part of conditions of approval placed on development projects by the Planning Department and the Redevelopment Agency. For the intersections of Cesar Chavez/Evans and Third/Evans, the Hunters Point Shipyard Development Plan's Mitigation Monitoring and Reporting Program included an improvement at the intersection of Cesar Chavez/Evans, which have not been assumed for the 2030 No Project condition due to its infeasibility.

Cesar Chavez/Evans – The Hunters Point Shipyard Redevelopment Plan's mitigation measure identified reconfiguration of the northbound approach of Evans Avenue to Cesar Chavez Street to provide exclusive northbound left and right turn lanes, and changing the signal timing plan to include the exclusive left turn and right turn movements. The measure identified that the southeast corner curb return would require structural modifications to the existing viaduct. DPW, as part of the BTI Project analysis, identified widening of the existing structure supporting the Evans Avenue and Cesar Chavez Street intersection as infeasible.

With the planned construction of a Class II bicycle lane on Cesar Chavez Street, which would remove an eastbound travel lane on Cesar Chavez Street, the operations at this intersection are expected to deteriorate even further. As a result, widening the Evans Avenue viaduct to provide an additional lane on Evans Avenue may not offer a substantial benefit, since the primary constraint would be on Cesar Chavez Street.

Third/Evans – The Hunters Point Shipyard Redevelopment Plan included a mitigation measure at the intersection of Third/Evans which proposed that the southbound left turn lane be eliminated and left turns be rerouted via Phelps Street to Evans Avenue. The mitigation measure also called for signalization of the intersection of Phelps/Evans and removal of on-street parking on Phelps Street and Evans Avenue. The intersection of Phelps Street and Evans Avenue has recently been signalized and on-street parking has been removed along Phelps Street and Evans Avenue, although the removal of the southbound left-turn movement from Third Street to Evans Avenue has not been implemented. Evaluation of intersection operating conditions with the rerouting of southbound left turns indicated that the elimination of the southbound left turn lane and rerouting of traffic to Phelps Street would not substantially improve intersection operating conditions and overall intersection operations would remain at LOS F.

5.1.2 Freeway Operations

The regional freeway and ramp analysis discusses traffic impacts on freeway segments and ramp locations that would be affected by cumulative development in the region. Five freeway locations (10 segments) and 15 ramp junctions along U.S. 101 and I-280 within the study area were analyzed. Transportation Study Appendix E contains a summary of freeway and ramp traffic volumes.

As described in Chapter 4, traffic forecasts were derived from the SF-CHAMP travel demand forecasting model. These forecasts were developed assuming the planned roadway improvements discussed in Section 4.3 would be in place, including the Geneva Avenue extension and the proposed new interchange with Geneva Avenue/Harney Way/U.S. 101. Without the proposed Geneva Avenue Extension and the Geneva/Harney/U.S. 101 interchange improvements, existing roadways serving the Harney interchange (Bayshore Boulevard, Harney Way, Blanken, Alana Way, Tunnel Road) would not be able to accommodate the projected traffic demand and would become oversaturated. Development of a number of the proposed and approved development projects would be constrained, and the existing roadway system would not be able to accommodate full buildout of these developments. Without the interchange the significant levels of congestion on area roadways due to proposed development would be considered a significant impact.

Future traffic demand associated with growth in the region and, in particular the study area, would increase congestion during the 2030 No Project weekday AM and PM peak periods. A discussion of the mainline and ramp analysis results is provided below. Locations operating at LOS E, indicating that the mainline segment is approaching capacity, and locations operating at LOS F, indicating that the segment is exceeding capacity, are noted.

Mainline and Weaving Segments

Table 39 presents the results of the freeway mainline and weaving section analysis for the 2030 No Project conditions. Traffic demand associated with cumulative development in the region would result in poor (i.e., LOS E or LOS F) operating conditions at all analysis segments during the weekday AM and/or PM peak hours. Weekday AM and PM peak hour traffic impacts on these ten freeway mainline segments would be considered significant cumulative impacts under 2030 No Project conditions. Study freeway segments generally operate at acceptable levels of service during the Sunday PM peak hour.

Ramp Junctions

Table 40 presents the results of the ramp junction merge (on-ramp) and diverge (off-ramp) analysis for the 2030 No Project conditions. Traffic demand associated with cumulative development in the region would result in poor (i.e., LOS E or LOS F) operating conditions all of the study ramps during the weekday AM and/or PM peak hours, with the exception of U.S. 101 northbound on-ramp from Bayshore Boulevard and the U.S. 101 southbound on-ramp from Alemany/San Bruno.

Table 40

I-280				
NB off to Cesar Chavez	**F** (D)	**>45** (28.4)	**F (F)**	**>45 (>45)**
NB on from Indiana/25th	D (C)	33.4 (27.4)	**F (F)**	**>45 (>45)**
SB off to Pennsylvania/25th	C **(E)**	23.6 **(36.7)**	**E (F)**	**37.0 (>45)**
SB on from Pennsylvania/25th	C **(E)**	22.9 **(38.5)**	**E (F)**	**36.3 (>45)**

Notes:
1. Density of vehicles per segment. pc/mi/ln = passenger cars per mile per lane.
2. Cumulative 2030 No Project conditions assume the reconstruction of the Harney Way interchange, as well as the extension of Geneva Avenue from Bayshore Boulevard east to the reconstructed interchange.
3. Ramp junctions at LOS E or LOS F conditions highlighted in **bold**
Source: Fehr and Peers.

The following ramps would operate at LOS E or LOS F during the Sunday PM peak hour:

- U.S. 101 northbound on-ramp from Bayshore Boulevard/Cesar Chavez (LOS F)
- U.S. 101 southbound off-ramp to Bayshore Boulevard/Cesar Chavez (LOS E)

Traffic impacts at these ramp junctions would be considered significant cumulative impacts under 2030 No Project conditions. Providing additional on-ramp lanes would simply increase the volume of traffic entering the freeway mainline segment, and may exacerbate conditions. Further, increasing mainline capacity is not feasible, as discussed above. To be effective, reducing impacts at off-ramps would require not only additional lanes on the off-ramps, but additional right-of-way on the mainline approaching the off-ramp, which is not feasible as discussed above. Therefore, cumulative impacts to ramp junctions would be considered *significant and unavoidable*.

Table 41 presents the results of the freeway diverge (off-ramp) queue storage analysis for the 2030 No Project conditions. This analysis was conducted to determine whether queues at ramp terminal intersections would back onto freeway mainline segments. Under 2030 No Project conditions, queues may extend onto study freeway mainline segments during the weekday AM and PM peak hours at the following five off-ramps:

- U.S. 101 northbound off-ramp to Geneva/Harney (PM)
- U.S. 101 northbound off-ramp to Bayshore/Cesar Chavez (AM)
- U.S. 101 southbound off-ramp to Alana Way (AM and PM)
- U.S. 101 southbound off-ramp to Sierra Point Parkway/Lagoon Way (AM)
- I-280 northbound off-ramp to Cesar Chavez (AM)

Table 41
Freeway Diverge Queue Storage
Existing and 2030 No Project Conditions
Weekday AM and (PM) Peak Hour

Ramp Location	Ramp Storage	Existing	2030 No Project
		95th % Queue[1]	95th % Queue
U.S. 101			
NB off to Harney Way[2]	2,800	< 100 (<100)	1,725 **(Spillback)**
NB off to Bayshore/Cesar Chavez	750	400 (375)	**Spillback** (525)
SB off to San Bruno/Silliman	600	225 (225)	175 (425)
SB off to San Bruno/Mansell	650	< 100 (150)	< 100 (350)
SB off to Bayshore/Hester	1,700	225 (325)	275 (125)
SB off to Alana Way[2]	1,000	< 100 (<100)	**Spillback (Spillback)**
SB off to Sierra Point/Lagoon	1,250	< 100 (<100)	**Spillback** (1,000)
I-280			
NB off to Cesar Chavez	2,500	1,500 (650)	**Spillback** (900)
SB off to Pennsylvania/25th	900	< 100 (<100)	< 100 (875)

Notes:
1. Ramps where there is potential for spillback are highlighted in **bold.**
2. 95th percentile queue is the length of queue that has a probability of 5 percent or less of being exceeded during the peak hour.
3. 2030 No Project conditions assume the reconstruction of the Harney Way Interchange as well as the connection of Geneva Avenue to the reconstructed interchange.
Source: Fehr & Peers.

During the Sunday PM peak hour, vehicle queues may also back onto freeway mainline at the following location:

- U.S. 101 southbound off-ramp to Alana Way

The analysis described above is based on travel demand volumes, and is not necessarily constrained to the amount of traffic that may actually arrive at ramp terminal intersections. As described earlier, many freeway segments would be congested, operating below free-flow speeds during peak hours, reducing the amount of traffic that can reach the off-ramp terminal intersections. Therefore, actual conditions may be better than presented in **Table 41.** Further, since mainline traffic would likely be moving at relatively slow (congested) speeds, safety and capacity issues caused by vehicle queues extending onto freeway mainline segments during peak hours are reduced compared to the same condition when freeway mainline segments are operating at higher free-flow speeds. However, potential queues spilling back onto freeway mainline segments would be considered significant cumulative impacts.

5.2 TRANSIT IMPACTS

This section describes the transit impacts associated with the 2030 No Project conditions. Transit impacts were evaluated for the weekday AM and PM peak hours, similar to the analysis conducted for traffic impacts. The transit impacts analysis focuses both on local transit service provided by Muni and on regional service provided by BART, Golden Gate Transit, SamTrans, Caltrain, and the Water Emergency Transit Authority (WETA).

The analysis of impacts to local Muni transit service was conducted at the same cordon and screenline locations described in the Project setting chapter (Chapter 3). As shown in **Table 42,** ridership on Muni cordons is expected to increase substantially under 2030 No Project conditions, as compared to existing conditions. During the AM peak hour, the North cordon is expected to exceed its capacity by 17 percent in the inbound direction and 7 percent in the outbound direction (relative to downtown). The West cordon is expected to exceed the capacity utilization standard in the inbound direction by 7 percentage points. In the PM peak hour, the North cordon is expected to be over-capacity by 16 percent in the inbound direction and exceed the 85 percent utilization standard by 7 percentage points in the outbound direction.

The large increases in north-south Muni ridership in the study area would be due to the large amount of development anticipated along the Third Street corridor, including Brisbane Baylands, Mission Bay, and the Central Waterfront/Eastern Neighborhoods as well as anticipated completion of the Central Subway project, which is expected to increase ridership on the T-Third light rail route. Since the East, North, and West cordons would all operate at more than the capacity utilization standard in one or more peak hours, there would be significant transit impacts at these cordons under 2030 No Project conditions.

Table 42
Muni Ridership and Capacity Utilization at Study Area Cordons

Note:
1. Year 2030 No Project analysis reflects implementation of TEP recommendations for lines serving the study area. 19-Polk will no longer serve the study area, but will be replaced by the 48-Quintara-24th Street, and the 56-Rutland will be eliminated.
Source: SFMTA, Fehr & Peers.

Table 43 presents the 2030 No Project conditions transit ridership at the Muni downtown screenlines. Although ridership through the screenlines is expected to increase by approximately 30 percent between existing conditions and year 2030, transit capacity is also expected to increase, such that the expected transit ridership would not exceed Muni's 85 percent capacity utilization standard on any of the downtown screenlines.

Table 43

Table 44 presents the ridership and capacity utilization for existing and 2030 No Project conditions at the regional screenlines. The analysis of regional transit impacts under the 2030 No Project conditions shows that during the AM peak hour, the overall transit travel demand to the East Bay would be approximately 50 percent higher than the total seated capacity and the travel demand to the North Bay would be just over the expected capacity. The BART system would be the most heavily congested of the transit providers, operating at 85 percent above its seated hourly capacity in the AM peak hour through the transbay tube. Travel on BART between the Project site and the South Bay would remain below the total capacity under 2030 No Project conditions.

Source: SFMTA, AECOM, Fehr & Peers.

Under 2030 No Project, weekday PM peak hour conditions would be slightly less congested than during the AM peak hour, with overall transit travel demand to the East Bay exceeding capacity by 28 percent. Similar to the AM peak hour, BART between San Francisco and the East Bay would be the most heavily congested system, operating at 55 percent above its capacity. Travel between San Francisco and the North Bay would exceed available capacity by six percent, and travel between San Francisco and the South Bay would remain within the available capacity.

Since the East Bay and North Bay regional screenlines would operate at more than the capacity utilization standard, there would be significant cumulative transit impacts at these regional screenlines under the No Project conditions.

Transit travel times would also increase under 2030 No Project conditions due to increased traffic congestion and transit ridership associated with cumulative development (including development that would occur at the project site under the currently approved Hunters Point Shipyard Development Plan). A discussion of potential Project impacts to transit travel times is included in Chapter 6, section 6.2.1.

Chapter 6
YEAR 2030 PROJECT IMPACT ANALYSIS

6.1 TRAFFIC IMPACTS

Consistent with the Significance Criteria presented in section 4.4, intersections where the Project, Project Variants, or Project Alternatives would result in a change in intersection operations from LOS D or better under the 2030 No Project condition to LOS E or LOS F, or from LOS E to LOS F, with the proposed Project are identified as Project impacts. At intersections that would operate at LOS E or LOS F under 2030 No Project conditions, and would continue to operate at LOS E or LOS F under Project conditions, the Project trips were reviewed to determine whether the increase would contribute considerably to critical movements operating at LOS E or LOS F. Transportation Study Appendix E includes the percent contributions of the resulting traffic increases at the critical movements at intersections operating at LOS E or LOS F under 2030 No Project conditions.

For freeway mainline and ramp analyses, locations where the Project, Project Variants, or Project Alternatives would result in a change from LOS D or better under 2030 No Project conditions to LOS E or LOS F, or from LOS E or LOS F, with the proposed Project are identified as Project impacts. At locations that would operate at LOS E or LOS F under 2030 No Project conditions, and would continue to operate at LOS E or LOS under Project conditions, the Project trips, as a percentage of total traffic volumes on the facility were reviewed to determine whether the increase would contribute considerably to total volumes on the facility. Transportation Study Appendix G includes the freeway mainline and ramp analyses and the percent contributions calculations.

6.1.1 Project and Project Variants

Overview

The travel demand analysis presented above and the number of vehicle trips assumed in the traffic impact analysis reflects implementation of the Project TDM Plan to encourage transit use and discourage use of single-occupant vehicles. The results of the traffic impact analysis presented in the traffic and freeway analysis below indicate that implementation of the Project would result in significant increases in traffic volumes, and at some locations impacts would be significant and unavoidable. The Project also would make a significant contribution to cumulative impacts at some locations. To minimize the potential for an increase in Project-generated vehicles and the Project's contribution to significant cumulative impacts, implementation of the Project TDM Plan would be required.

The final TDM Plan has not been formally approved yet and therefore Project Mitigation Measure 1 is required to ensure the final TDM Plan will be prepared and implemented. Thus, Mitigation Measure 1 below requires preparation, approval, and implementation of the final TDM Plan.

> ***Project Mitigation Measure 1***: The Project Applicant shall prepare and implement a final TDM plan, which shall include the following elements:

- Visitor Variable, Market-Rate Parking Pricing
- Maximum Permitted Parking Ratios
- Flexible Parking Management Strategies
- Unbundled Residential Parking
- Transit Strategies and Support Strategies
- Central Transit Hub
- Enhanced Transit Service and Bicycle Facilities
- Bicycle Support Facilities
- Wayfinding Signs
- EcoPass for Residents
- Carshare Services
- Employee TDM Programs
    - Information Boards/Kiosks
    - In-building Real-Time transit monitors with sightlines of transit hubs
    - Commuter Benefits
    - Employee EcoPass
    - Carpool/Vanpools
    - Guaranteed Ride Home Program
    - Compressed Work Weeks, Flex Time, and Telecommuting
- CP-HPS Transportation Management Association
- On-Site Transportation Coordinator and Website
- Targeted Marketing
- Monitoring of Transportation Demand
- Monitoring Effectiveness of Congestion-Reducing and Traffic-Calming Efforts

The final TDM plan shall be approved as part of the Disposition and Development Agreement (DDA).

With implementation of the Project Mitigation Measure 1, alternative modes would be encouraged, the use of single-occupant vehicles would be discouraged, and the impact of additional vehicles generated by the Project would be lessened. However, as described in Impact discussions below, the Project would still result in significant and unavoidable impacts on traffic and transit operations, and would still make considerable contributions to cumulative impacts related to substantial increases in traffic. Thus, the Project and Project's contribution to traffic would remain *significant and unavoidable.*

Intersection Operations

Project vehicle trips at the 60 study intersection are presented on **Figure 31A** and **Figure 31B** for the weekday AM and PM peak hours, and on **Figure 31C** and **Figure 31D** for the Sunday PM peak hour conditions. Future 2030 Cumulative (including Project trips) traffic volumes at the 60 study intersection are presented on **Figure 32A** and **Figure 32B** for the weekday AM and PM peak hours, and on **Figure 32C** and **Figure 32D** for the Sunday PM peak hour conditions. Transportation Study Appendix E contains intersection turning movement volume summaries.

Tables 45 and 46 on pages 167 to 172 present a comparison of the intersection LOS analysis for the existing, 2030 No Project, and 2030 Project and Project Variant conditions for the weekday AM and PM peak hours, respectively. **Table 47** on pages 173 to 175 presents this comparison for Sunday PM peak hour conditions. **Table 48** on pages 176 to 178 presents the summary table of Project traffic impacts for Project, Project Variants, and Alternatives to the Project.

On **Table 48**, Project impacts (PI) were identified where the Project would result in a change in intersection operations from LOS D or better under 2030 No Project conditions, to LOS E or LOS F with the Project, Project Variants, or Project Alternatives, or from LOS E under 2030 No Project conditions to LOS F with the Project, Project Variants or Alternatives. In addition, where the Project, Project Variants or Project Alternatives were determined to contribute significantly to intersections that would be operating at LOS E or LOS F under 2030 No Project conditions, this was also determined to be a Project impact, and noted as Significant Contribution/Project Impact (SC/PI). Where the Project would *not* contribute significantly to intersections operating at LOS E or LOS F under 2030 No Project conditions, this was noted as No Significant Contribution (NSC).

For 203 No Project conditions, where intersection operations change from LOS D or better under existing conditions to LOS E or LOS F under 2030 No Project conditions, or from LOS E under existing conditions to LOS F under 2030 No Project conditions this was identified as a No Project Impact (NP Impact).

In general, with the addition of Project-generated vehicle trips to the study area roadway network congestion levels would increase. However, due to project roadway improvements, operating conditions at some locations would improve over year 2030 No Project conditions. The number of study area intersections that would operate at LOS E or LOS F conditions would remain at 33 intersections during the AM peak hour and 38 intersections during the PM peak hour.

Because the HCM delay calculations break down in typical LOS F conditions, delays above 80 seconds per vehicle are simply reported as >80. This makes a comparison between scenarios difficult. For these cases, an additional measure was calculated, the volume to capacity (v/c) ratio. When intersections are operating at failing or breakdown conditions they lack the capacity to accommodate any more vehicles. One way of understanding the magnitude of the intersections lack of capacity is to calculate its v/c ratio. Intersections with a v/c ratio below 1.0 for the most part operate acceptably. As the ratio is increased, breakdown conditions will appear as there is more demand (vehicles) than capacity. Three ranges of v/c ratio have been identified in **Figure 33 and Figure 34**, for the AM and PM peak hours, respectively; less than 1.0, 1.0-2.0, and greater than 2.0, respectively, to provide for a useful comparison of the relative magnitudes of congestion at intersections operating at LOS F. The figures indicate where the 2030 No Project and Project v/c are in a different range when compared.

Project-Specific Traffic Impacts

Under Project conditions, a total of 39 of the 60 study intersections would operate at LOS E or LOS F conditions during the weekday AM or PM, or Sunday PM peak hours. At 10 of the 39 intersections the Project would result in Project-specific impacts (i.e., Project trips would cause intersections expected to operate at LOS D or better under 2030 No Project conditions to operate at LOS E or F, or intersections operating at LOS E under 2030 No Project conditions to deteriorate to LOS F conditions). A discussion of traffic operations at these 10 intersections, and potential mitigation measures, follows:

5. Third/Oakdale – At the signalized intersection of Third/Oakdale, the intersection operating conditions would worsen in the PM peak hour from LOS C under 2030 No Project conditions to LOS E with the Project. The degradation in level of service would be primarily due to forecasted substantial traffic volume increases on Third Street. Due to the presence of the Third Street light rail, space for additional travel lanes could not be taken from the center median. Parking is generally permitted on either side of the street; however, it is not permitted at the intersections. Instead, sidewalks are extended to increase the pedestrian waiting area at the intersection and reduce the pedestrian crossing distances.

Notes:
1. PI – Project Impact. Project results in a change in intersection operations from LOS D or better under 2030 No Project conditions, to LOS E or LOS F with the Project, Project Variants, or Project Alternatives, or from LOS E under 2030 No Project conditions to LOS F with the Project, Project Variants or Alternatives.
2. NSC – No Significant Contribution. Project would not contribute significantly to intersections operating at LOS E or LOS F under 2030 No Project conditions. No impacts.
3. SC/PI – Significant Contribution/Project Impact. Project would contribute significantly to intersections that would be operating at LOS E or LOS F under 2030 No Project conditions, resulting in a Project Impact.
4. NP Impact – No Project Impact. Intersection operations change from LOS D or better under existing conditions to LOS E or LOS F under 2030 No Project conditions, or from LOS E under existing conditions to LOS F under 2030 No Project conditions.

Notes:
1. PI – Project Impact. Project results in a change in intersection operations from LOS D or better under 2030 No Project conditions, to LOS E or LOS F with the Project, Project Variants, or Project Alternatives, or from LOS E under 2030 No Project conditions to LOS F with the Project, Project Variants or Alternatives.
2. NSC – No Significant Contribution. Project would not contribute significantly to intersections operating at LOS E or LOS F under 2030 No Project conditions. No impacts.
3. SC/PI – Significant Contribution/Project Impact. Project would contribute significantly to intersections that would be operating at LOS E or LOS F under 2030 No Project conditions, resulting in a Project Impact.
4. NP Impact – No Project Impact. Intersection operations change from LOS D or better under existing conditions to LOS E or LOS F under 2030 No Project conditions, or from LOS E under existing conditions to LOS F under 2030 No Project conditions.

SOURCE: Fehr & Peers

FIGURE 34: LOS OPERATING CONDITIONS AT STUDY INTERSECTIONS - WEEKDAY PM PEAK HOUR NO PROJECT AND PROPOSED PROJECT CONDITIONS

Traffic signals at intersections along Third Street are timed to prioritize transit movements along Third Street. The SFMTA has indicated that there may be slight adjustments to the traffic signal timing for intersections along Third Street that could be implemented that would reduce auto delay at signalized intersections without degrading transit travel times. However, those improvements would not be enough to improve intersection operating conditions to acceptable levels of LOS D or better.

To accommodate additional right-of-way needed for additional lanes, Third Street would need to be widened to the east and the west. This would require demolition of existing structures and substantial right-of-way acquisition, or reduction in corner sidewalk width and prohibition of on-street parking along Third Street. Widening Third Street or reducing the corner sidewalk space at this location would be inconsistent with the pedestrian environment created by the Third Street Light Rail Project. Widening of Third Street would make the pedestrian crossing of Third Street longer, and would require more dedicated pedestrian crossing time as part of the signal phasing plan. Because the mitigation measure would worsen the pedestrian conditions, the measure was not further considered. Traffic impacts at this intersection under the Project conditions would remain *significant and unavoidable*.

7. Third/Revere - At the signalized intersection of Third/Revere, the intersection operating conditions would worsen in the PM peak hour from LOS D under 2030 No Project conditions to LOS F with the Project.

The degradation in level of service would primarily be due to forecasted substantial traffic volume increases on Third Street. Due to the presence of the Third Street light rail, space for additional travel lanes could not be taken from the center median. Parking is generally permitted on either side of the street; however, it is not permitted at the intersections. Instead, sidewalks are extended to increase the pedestrian waiting area at the intersection and reduce the pedestrian crossing distances.

Traffic signals on intersections along Third Street are timed to prioritize transit movements along Third Street. The SFMTA has indicated that there may be slight adjustments to the traffic signal timing for intersections along Third Street that could be implemented that would reduce auto delay at signalized intersections without degrading transit travel times. However, those improvements would not be enough to improve intersection operating conditions to acceptable levels.

To accommodate additional right-of-way needed for additional lanes, Third Street would need to be widened to the east and the west. This would require demolition of existing structures and substantial right-of-way acquisition, or reduction in corner sidewalk width and prohibition of on-street parking along Third Street. Widening Third Street or reducing the corner sidewalk space at this location would be inconsistent with the pedestrian environment created by the Third Street

Light Rail Project. Widening of Third Street would make the pedestrian crossing of Third Street longer, and would require more dedicated pedestrian crossing time as part of the signal phasing plan. Because the mitigation measure would worsen the pedestrian conditions, the measure was not further considered. Traffic impacts at this intersection under the Project conditions would remain *significant and unavoidable*.

8. Third/Carroll - At the signalized intersection of Third/Carroll, the intersection operating conditions would worsen in the PM peak hour from LOS B under 2030 No Project conditions to LOS E with the Project.

The degradation in level of service would primarily be due to Project-related traffic increases on Carroll Avenue and Third Street. Traffic signals on intersections along Third Street are timed to prioritize transit movements along Third Street. The SFMTA has indicated that there may be slight adjustments to the traffic signal timing for intersections along Third Street that could be implemented that would reduce auto delay at signalized intersections without degrading transit travel times. However, those improvements would not be enough to improve intersection operating conditions to acceptable levels. To accommodate additional right-of-way needed for additional lanes, Third Street would need to be widened to the east and the west. This would require demolition of existing structures and substantial right-of-way acquisition, or reduction in corner sidewalk width and prohibition of on-street parking along Third Street. Widening Third Street or reducing the corner sidewalk space at this location would be inconsistent with the pedestrian environment created by the Third Street Light Rail Project. Widening of Third Street would make the pedestrian crossing of Third Street longer, and would require more dedicated pedestrian crossing time as part of the signal phasing plan. Because the mitigation measure would worsen the pedestrian conditions, the measure was not further considered. Traffic impacts at this intersection under the Project conditions would remain *significant and unavoidable*.

11. Third/Jamestown - At the signalized intersection of Third/Jamestown, the intersection operating conditions would worsen in the AM and PM peak hours from LOS C under 2030 No Project conditions to LOS F with the Project.

The degradation in level of service would primarily be due to project-related traffic increases on Jamestown Avenue and Third Street. Traffic signals on intersections along Third Street are timed to prioritize transit movements along Third Street. The SFMTA has indicated that there may be slight adjustments to the traffic signal timing for intersections along Third Street that could be implemented that would reduce auto delay at signalized intersections without degrading transit travel times. However, those improvements would not be enough to improve intersection operating conditions to acceptable levels.

To accommodate additional right-of-way needed for additional lanes, Third Street would need to be widened to the east and the west. This would require demolition of existing structures and substantial right-of-way acquisition, or reduction in corner sidewalk width and prohibition of on-street parking along Third Street. Widening Third Street or reducing the corner sidewalk space at this location would be inconsistent with the pedestrian environment created by the Third Street Light Rail Project. Widening of Third Street would make the pedestrian crossing of Third Street longer, and would require more dedicated pedestrian crossing time as part of the signal phasing plan. Because the mitigation measure would worsen the pedestrian conditions, the measure was not further considered. Traffic impacts at this intersection under the Project conditions would remain *significant and unavoidable*.

18. Bayshore/Paul – At the signalized intersection of Bayshore/Paul, the intersection operating conditions would worsen in the AM peak hour from LOS E under 2030 No Project conditions to LOS F with the Project. In the PM peak hour, intersection conditions would remain at LOS E.

The degradation in level of service would primarily be due to forecasted traffic volume increases on Paul Avenue. Paul Avenue is one of a relatively few number of streets in the area that connects between the east and west side of U.S. 101. As a result, east-west travel in the area is concentrated to the few streets that provide connections across the freeway, including Paul Avenue. Widening Paul Avenue at this intersection would create the need for major right-of-way acquisition and likely require reconstruction of the U.S. 101 overpass to accommodate a wider Paul Avenue cross section, which would be infeasible. Therefore Project-related impacts at this intersection would remain *significant and unavoidable*.

26. Tunnel/Blanken – At the signalized intersection of Tunnel/Blanken (currently unsignalized and required to be signalized as part of the Visitacion Valley Redevelopment), the intersection operating conditions would worsen in the AM peak hour from LOS D under 2030 No Project conditions to LOS F with the Project. In the PM peak hour, the intersection would operate at LOS F under 2030 No Project and with the Project conditions.

> ***Project Mitigation Measure 2***: Reconfigure the northbound and southbound approaches to the intersection of Tunnel/Blanken to provide dedicated left-turn lanes adjacent to shared through/right-turn lanes. This reconfiguration would require prohibition of parking for 160 feet in the southbound approach (loss of eight parking spaces) and for 100 feet in the northbound approach (loss of five parking spaces).
>
> Implementation of the intersection reconfiguration shall be the responsibility of SFMTA, and shall be implemented when intersection improvements associated with the Visitacion Valley Redevelopment Plan (i.e., signalization) are no longer sufficient to maintain acceptable intersection level of service conditions. Since these improvements were determined to be required even without the Project under 2030 No Project conditions, the Project Applicant shall contribute its fair-share toward the cost of improvements. Prior to payment of the contribution, the City shall create a mechanism to determine and receive

fair share contributions from the Project Applicant. The SFMTA and DPW shall design and implement the measure as necessary.

With implementation of ***Project Mitigation Measure 2***, operations at this intersection would improve, but not to acceptable LOS D or better conditions in the AM and PM peak hours. Therefore, Project-related impacts at this intersection would be *significant and unavoidable*.

36. Bayshore/Cortland - At the signalized intersection of Bayshore/Cortland, the intersection operating conditions would worsen in the AM peak hour from LOS D under 2030 No Project conditions to LOS F with the Project. In the PM peak hour, the intersection would operate at LOS F under 2030 No Project and with the Project conditions.

The degradation in level of service would primarily be due to forecasted substantial traffic volume increases on Bayshore Boulevard. Mitigation for this impact would require increasing capacity on Bayshore Boulevard. There is not sufficient right-of-way to provide additional lanes on Bayshore Boulevard without widening the roadway. Roadway widening would require major right-of-way acquisition along the entire Bayshore Boulevard corridor, at great cost and displacement of existing homes and businesses. Therefore, Project-related impacts at this intersection would remain *significant and unavoidable*.

39. Bayshore/US 101 Northbound off-ramp/Jerrold - At the signalized intersection of Bayshore/US 101 Northbound off-ramp to Cesar Chavez, the intersection operating conditions would worsen in the AM peak hour from LOS E under 2030 No Project conditions to LOS F with the Project. The intersection would operate at LOS F in the PM peak hour under 2030 No Project with the Project conditions.

The degradation in level of service would primarily be due to forecasted substantial traffic volume increases on all approaches to the intersection. Mitigation for this impact would involve increasing capacity on Bayshore Boulevard, the U.S. 101 Northbound Off-ramp, and Jerrold Street. There is not adequate right-of-way to provide additional lanes on Bayshore Boulevard or Jerrold Street without widening the roadway. Roadway widening to provide measurable improvements at this intersection would require major right-of-way acquisition along the entire Bayshore Boulevard and Jerrold Street corridor, at great cost and displacement of existing homes and businesses (It may be possible to widen the U.S. 101 Northbound off-ramp, but only for the last 150 to 200 feet of the approach to the intersection. This would not likely result in a substantial improvement to the intersection capacity.) Therefore, Project-related impacts at this intersection would remain *significant and unavoidable*.

56. Third/Williams/Van Dyke - At the signalized intersection of Third/Williams/Van Dyke, the intersection operating conditions would worsen in the PM peak hour from LOS B under 2030 No

Project conditions to LOS F with the Project. The Project would create a significant traffic impact at this intersection.

The degradation in level of service would primarily be due to forecasted substantial traffic volume increases on Third Street. Due to the presence of the Third Street light rail, space for additional travel lanes could not be taken from the center median, and parking is not permitted on either side of the street. Traffic signals on intersections along Third Street are timed to prioritize transit movements along Third Street. The SFMTA has indicated that there may be slight adjustments to the traffic signal timing for intersections along Third Street that could be implemented that would reduce auto delay at signalized intersections without degrading transit travel times. However, those improvements would not be enough to improve intersection operating conditions to acceptable levels.

To accommodate additional right-of-way needed for additional lanes, Third Street would need to be widened to the east and the west. This would require demolition of existing structures and substantial right-of-way acquisition. Widening Third Street at this location would be inconsistent with the pedestrian environment created by the Third Street Light Rail Project. Widening of Third Street would make the pedestrian crossing of Third Street longer, and would require more dedicated pedestrian crossing time as part of the signal phasing plan. Because the mitigation measure would worsen the pedestrian conditions and the right-of-way constraints, the measure was not further considered. The Project's traffic impacts at this intersection would remain *significant and unavoidable*.

57. Third/Jerrold - At the signalized intersection of Third/Jerrold, the intersection operating conditions would worsen in the AM peak hour from LOS D under 2030 No Project conditions to LOS F with the Project. In the PM peak hour, the intersection would operate at LOS F under 2030 No Project and with the Project conditions.

The degradation in level of service would primarily be due to forecasted substantial traffic volume increases on Third Street. Due to the presence of the Third Street light rail, space for additional travel lanes could not be taken from the center median, and parking is not permitted on either side of the street. Traffic signals on intersections along Third Street are timed to prioritize transit movements along Third Street. The SFMTA has indicated that there may be slight adjustments to the traffic signal timing for intersections along Third Street that could be implemented that would reduce auto delay at signalized intersections without degrading transit travel times. However, those improvements would not be enough to improve intersection operating conditions to acceptable levels.

To accommodate additional right-of-way needed for additional lanes, Third Street would need to be widened to the east and the west. This would require demolition of existing structures and substantial right-of-way acquisition. Widening Third Street at this location would be inconsistent with the pedestrian environment created by the Third Street Light Rail Project. Widening of Third Street would make the pedestrian crossing of Third Street longer, and would require more dedicated pedestrian crossing time as part of the signal phasing plan. Because the mitigation measure would worsen the pedestrian conditions and right-of-way constraints, the measure was not further considered. Therefore, Project-related impacts at this intersection would remain *significant and unavoidable*.

Project Cumulatively-Considerable Traffic Impacts

At the remaining 29 of the 39 intersections that would operate at LOS E or LOS F under Project conditions, Project contributions were determined to be significant at 20 intersections, and less than significant at 9 intersections (as identified in **Table 48**).

At the following four intersections, feasible mitigation measures were identified:

27. Geneva/U.S. 101 southbound ramps (existing Alana/Beatty)
28. Harney/U.S. 101 northbound ramps (existing Alana/Harney/Thomas Mellon)
35. Amador/Cargo/Illinois
49. Bayshore/Geneva

27. Geneva/U.S. 101 Southbound Ramps (existing Alana/Beatty)
28. Harney/U.S. 101 Northbound Ramps (existing Alana/Harney/Thomas Mellon)

The City of Brisbane, in consultation with the City of San Francisco, is currently evaluating a proposal to extend Geneva Avenue from its current terminus at Bayshore Boulevard to U.S. 101. The extension of Geneva Avenue would connect to Harney Way to the east. The proposed roadway improvement would include a reconstruction of the existing U.S. 101/Harney/Alana interchange (see Section 4.3 above for a description of the proposed improvements). As a result of this roadway modification, the intersections of Alana/Beatty and Alana/Harney/Thomas Mellon would be reconstructed into a tight diamond freeway interchange. Based on the currently-proposed configuration of this roadway, the new intersections of Geneva/U.S. 101 southbound ramps and Harney/U.S. 101 northbound ramps would operate at LOS F during the weekday peak hours, and additional capacity would be needed on the off-ramp approaches to Geneva Extension and Harney Way.

> ***Project Mitigation Measure 3*****:** The City of Brisbane and Caltrans, as part of the Harney Interchange Project, shall account for existing traffic, background traffic growth, and the most recent forecasts of traffic expected to be associated with each of several adjacent development projects, including the Project. The San Francisco County Transportation Authority (SFCTA) shall coordinate with the City of Brisbane and Caltrans to ensure Project-generated vehicle trips are accounted for in the Harney Interchange analyses and design.

Mitigations and associated fair-share funding measures for cumulative regional roadway system impacts, including freeway segment impacts, shall be formulated through the current interjurisdictional Bi-County Transportation Study effort being led by the SFCTA. The Project Applicant shall contribute its fair share to the Harney Interchange Project.

Because the environmental review of the interchange project is not yet complete and the interchange would be approved by Caltrans, the implementation of **Project Mitigation Measure 3** is uncertain and is outside of the City/Agency jurisdiction. Therefore, Project-related contributions to cumulative traffic impacts at these two intersections would remain *significant and unavoidable*.

35. Amador/Cargo/Illinois – At the signalized intersection of Amador/Cargo/Illinois, the degradation in LOS at this intersection would primarily be due to increased traffic volumes and delays to the southbound approach on Illinois Street. As travel on Third Street becomes more congested, as expected in the future, Illinois Street would become a desirable alternate and parallel route. Because this intersection represents the southern terminus of Illinois Street, a relatively large volume of southbound traffic turns onto Cargo Way.

To mitigate the poor operating conditions at this intersection, the southbound approach of Illinois Street to Amador/Cargo would need to be reconfigured to provide a dedicated southbound left-turn lane and a dedicated right-turn lane. Sufficient right-of-way is available to implement this improvement, however, provision of two southbound lanes would require narrowing a portion of the island to the west of the southbound approach to Cargo Way.

Project Mitigation Measure 4: SFMTA shall conduct a feasibility study of the intersection of Amador/Cargo/Illinois with the Port of San Francisco to determine the feasibility of reconfiguring the southbound approach on Illinois Street to provide a dedicated southbound left turn lane and a dedicated right-turn lane. Sufficient right-of-way is available to implement this improvement, however, provision of two southbound lanes would require narrowing a portion of the island to the west of the southbound approach to Cargo Way. Implementation of the intersection improvements shall be the responsibility of SFMTA and the Port of San Francisco, and shall be implemented when traffic operating conditions with the existing intersection configuration worsens to unacceptable levels. If determined feasible, the Project Applicant shall contribute its fair share to the intersection improvements.

With implementation of **Project Mitigation Measure 4,** operations at this intersection would improve to acceptable LOS C conditions during the AM and PM peak hours. However, since a feasibility study would be required, implementation of Mitigation Measure 4 is uncertain, and therefore, Project-related impacts at this intersection would remain *significant and unavoidable.*

49. Bayshore/Geneva – The City of Brisbane, in consultation with the City of San Francisco, is currently evaluating a proposal to extend Geneva Avenue from its current terminus at Bayshore Boulevard to U.S. 101. The extension of Geneva Avenue would connect to Harney Way to the east. The proposed roadway improvement would include a reconstruction of the existing U.S. 101/Harney/Alana interchange. As a result of this roadway modification, the intersection of Bayshore/Geneva would include a fourth leg, east of Bayshore Boulevard. To mitigate the poor operating conditions at this intersection, the proposed intersection design would need to be modified to provide three westbound through lanes on Geneva Avenue through the Bayshore Boulevard intersection. To accommodate three "receiving" lanes on the west side of Bayshore Boulevard, eliminate on-street parking between Bayshore Boulevard and Talbert Street (approximately 550 feet).

> ***Project Mitigation Measure 5***: The City of Brisbane, as part of the Geneva Avenue Extension Project, shall account for existing traffic, background traffic growth, and the most recent forecasts of traffic expected to be associated with each of several adjacent development projects, including the Project. The San Francisco County Transportation Authority (SFCTA) and SFMTA shall coordinate with the City of Brisbane to ensure projected traffic volumes are accounted for in the design of the Geneva Avenue Extension.
>
> Mitigations and associated fair-share funding measures for cumulative regional roadway system impacts, including freeway segment impacts, shall be formulated through the current interjurisdictional Bi-County Transportation Study effort being led by the SFCTA. The Project Applicant shall contribute its fair share to the Geneva Avenue Extension Project.

Since implementation of Project Mitigation Measure 5 would be under the jurisdiction of the City of Brisbane, the implementation of the mitigation measure is uncertain. Therefore, the Project-related impacts at this intersection would remain *significant and unavoidable.*

Of the 20 intersections where Project contributions were determined to be significant, feasible mitigation measures were not identified at 16 intersections, and therefore project-related impacts at these intersections would remain *significant and unavoidable*. The 16 study intersections where feasible mitigation measures have not been identified are:

1. Third/25th
2. Third/Cesar Chavez
3. Third/Cargo
4. Third/Evans
6. Third/Palou
9. Third/Paul

15. Cesar/Pennsylvania/I-280
21. Bayshore/Bacon
24. Bayshore/Visitacion
25. Bayshore/Sunnydale
38. Bayshore/Alemany/Industrial
41. Bayshore/Blanken
42. San Bruno/Paul
43. San Bruno/Silver
44. San Bruno/Mansell/U.S. 101 Southbound Off-ramp
58. Evans/Napoleon/Toland

1. Third/25th – At the signalized intersection of Third/25th, the degradation in level of service would primarily be due to forecasted substantial traffic volume increases on Third Street. Due to the presence of the Third Street light rail, space for additional travel lanes could not be taken from the center median, and parking is not permitted on either side of the street. Traffic signals on intersections along Third Street are timed to prioritize transit movements along Third Street. The SFMTA has indicated that there may be slight adjustments to the traffic signal timing for intersections along Third Street that could be implemented that would reduce auto delay at signalized intersections without degrading transit travel times. However, those improvements would not be sufficient to improve intersection operating conditions to acceptable levels.

To accommodate additional right-of-way needed for additional lanes, Third Street and 25th Street would need to be widened to the east and the west. This would require demolition of existing structures and substantial right-of-way acquisition. Widening Third Street at this location would be inconsistent with the pedestrian environment created by the Third Street Light Rail Project. Widening of Third Street would make the pedestrian crossing of Third Street longer, and would require more dedicated pedestrian crossing time as part of the signal phasing plan. Because the mitigation measure would worsen the pedestrian conditions and due to the right-of-way constraints, the measure was not further considered.

Alternatively, the eastbound and westbound approaches on 25th Street could be re-striped to provide separate left-turn lanes. This may shorten the amount of green time needed for the 25th Street movement and allow more time for Third Street traffic. However, this would require a narrowing of the "receiving" lane on 25th Street. Given the relatively high portion of truck traffic using this road, the narrow receiving lane may not physically accommodate the required truck turning movements and this mitigation measure was not considered further. Project-related traffic impacts at this intersection would remain *significant and unavoidable*.

2. Third/Cesar Chavez - To mitigate the significant impacts at the signalized intersection of Third/Cesar, additional capacity would need to be provided on both Third Street and Cesar Chavez Street. Due to the presence of the Third Street light rail, space for additional travel lanes could not be taken from the center median on Third Street, and parking is not permitted on either side of the street. Traffic signals on intersections along Third Street are timed to prioritize transit movements along Third Street. The SFMTA has indicated that there may be slight adjustments to the traffic signal timing for intersections along Third Street that could be implemented that would reduce auto delay at signalized intersections without degrading transit travel times. However, those improvements would not be enough to improve intersection operating conditions to acceptable levels of LOS D or better.

To accommodate additional right-of-way needed for additional lanes, Third Street and Cesar Chavez Street would need to be widened to the east, south, and north. This would require demolition of existing structures and substantial right-of-way acquisition. Widening Third Street at this location would be inconsistent with the pedestrian environment created by the Third Street Light Rail Project. Widening of Third Street would make the pedestrian crossing of Third Street longer, and would require more dedicated pedestrian crossing time as part of the signal phasing plan. Because the mitigation measure would worsen the pedestrian conditions and due to right-of-way constraints, the measure was not further considered, and Project-related traffic impacts at this intersection would remain *significant and unavoidable*.

3. Third/Cargo - At the signalized intersection of Third Street/Cargo Way, the degradation in level of service would primarily be due to forecasted substantial traffic volume increases on Third Street. Due to the presence of the Third Street light rail, space for additional travel lanes could not be taken from the center median, and parking is not permitted on either side of the street. Traffic signals on intersections along Third Street are timed to prioritize transit movements along Third Street. The SFMTA has indicated that there may be slight adjustments to the traffic signal timing for intersections along Third Street that could be implemented that would reduce auto delay at signalized intersections without degrading transit travel times. However, those improvements would not be enough to improve intersection operating conditions to acceptable levels of LOS D or better.

To accommodate additional right-of-way needed for additional lanes, Third Street would need to be widened to the east and the west. This would require demolition of existing structures and substantial right-of-way acquisition. Widening Third Street at this location would be inconsistent with the pedestrian environment created by the Third Street Light Rail Project. Widening of Third Street would make the pedestrian crossing of Third Street longer, and would require more dedicated pedestrian crossing time as part of the signal phasing plan. Because the mitigation measure would worsen the pedestrian conditions and due to the right-of-way constraints, the measure was not further considered. Project-related traffic impacts at this intersection would remain *significant and unavoidable*.

4. Third/Evans - Traffic signals on intersections along Third Street are timed to prioritize transit movements along Third Street. The SFMTA has indicated that there may be slight adjustments to the traffic signal timing for intersections along Third Street that could be implemented that would reduce auto delay at signalized intersections without degrading transit travel times. However, those improvements would not be enough to improve intersection operating conditions to acceptable levels of LOS D or better.

To achieve acceptable operations, additional capacity would need to be provided on Third Street and/or Evans Avenue. To accommodate additional right-of-way needed for additional lanes on either Third Street or Evans Avenue, the roadways would need to be widened to the north, south, east and the west. This would require demolition of existing structures and substantial right-of-way acquisition. Widening Third Street or Evans Avenue at this location would be inconsistent with the pedestrian environment created by the Third Street Light Rail Project. Widening of Third Street or Evans Avenue would make the pedestrian crossings at the intersection longer, and would require more dedicated pedestrian crossing time as part of the signal phasing plan. Because the mitigation measure would worsen the pedestrian conditions and due to the right-of-way constraints, the measure was not further considered.

Another option to achieve acceptable operations at this intersection would be to provide grade separation, whereby Evans Avenue travels either above or below Third Street, and the existing signalized intersection would be eliminated. This option would have similar degradation to the pedestrian environment by reducing pedestrian connectivity between the two streets and creating new grades for pedestrians and cyclists to cross through the intersection. This measure was not further considered. Therefore, Project-related traffic impacts at this intersection would remain *significant and unavoidable*.

6. Third/Palou - At the signalized intersection of Third/Palou, the degradation in level of service is primarily due to forecasted substantial traffic volume increases on Third Street. Due to the presence of the Third Street light rail, space for additional travel lanes could not be taken from the center median. Parking is generally permitted on either side of the street; however it is not permitted at the intersections. Instead, sidewalks are extended to increase the pedestrian waiting area at the intersection and reduce the pedestrian crossing distances.

Traffic signals on intersections along Third Street are timed to prioritize transit movements along Third Street. The SFMTA has indicated that there may be slight adjustments to the traffic signal timing for intersections along Third Street that could be implemented that would reduce auto delay at signalized intersections without degrading transit travel times. However, those improvements would not be enough to improve intersection operating conditions to acceptable levels of LOS D or better.

To accommodate additional right-of-way needed for additional lanes, Third Street would need to be widened to the east and the west. This would require demolition of existing structures and substantial right-of-way acquisition, or reduction in corner sidewalk width and prohibition of on-street parking along Third Street. Widening Third Street or reducing the corner sidewalk space at this location would be inconsistent with the pedestrian environment created by the Third Street Light Rail Project. Widening of Third Street would make the pedestrian crossing of Third Street longer, and would require more dedicated pedestrian crossing time as part of the signal phasing plan. Because the mitigation measure would worsen the pedestrian conditions and due to the right-of-way constraints, the measure was not further considered. Project-related traffic impacts at this intersection would remain *significant and unavoidable*.

9. Third/Gilman/Paul - At the signalized intersection of Third/Gilman/Paul, the degradation in level of service would primarily be due to substantial traffic volume increases on Third Street. In addition, Paul Avenue is one of a relatively few number of streets in the area that connects to the west side of U.S. 101. As a result, east-west travel in the area is concentrated to the few streets that provide connections across the freeway.

Due to the presence of the Third Street light rail, space for additional travel lanes on Third Street could not be taken from the center median, and parking is not permitted on either side of the street. Traffic signals on intersections along Third Street are timed to prioritize transit movements along Third Street. The SFMTA has indicated that there may be slight adjustments to the traffic signal timing for intersections along Third Street that could be implemented that would reduce auto delay at signalized intersections without degrading transit travel times. However, those improvements would not be enough to improve intersection operating conditions to acceptable levels LOS D or better.

To accommodate additional right-of-way needed for additional lanes, Third Street would need to be widened to the east and the west. This would require demolition of existing structures and substantial right-of-way acquisition. Widening Third Street at this location would be inconsistent with the pedestrian environment created by the Third Street Light Rail Project. Widening of Third Street would make the pedestrian crossing of Third Street longer, and would require more dedicated pedestrian crossing time as part of the signal phasing plan. Because the mitigation measure would worsen the pedestrian conditions and due to the right-of-way constraints, the measure was not further considered.

Widening Paul Avenue at this intersection would create the need for similar right-of-way acquisition and would cause similar inconsistencies with the desired pedestrian environment in the area. Further, widening Paul Avenue just at the Third Street intersection would not substantially address the problem created by limited vehicular capacity across U.S. 101. Widening Paul Avenue from Third Street to San Bruno Avenue, just west of US 101 would be required. However, this would require major right-of-way acquisition along the entire Paul Avenue corridor between Third Street and Bayshore Boulevard. Therefore, increased vehicular capacity along Paul Avenue was not considered further. Project-related traffic impacts at this intersection would remain *significant and unavoidable*.

15. Cesar Chavez/Pennsylvania/I-280 Northbound Off-Ramp - At the signalized intersection of Cesar Chavez/Pennsylvania/I-280 Northbound off-ramp, the degradation in level of service would primarily be due to forecasted substantial traffic volume increases on Cesar Chavez Street, and increases in off-ramp traffic. The transportation and engineering analysis conducted by the San Francisco Department of Public Works for the *Bayview Transportation Improvements Project* (BTI Project) identified a potential mitigation measure at this intersection that would provide an additional dedicated eastbound left-turn lane. To accomplish this, the existing travel lanes would need to be narrowed to 10 and 11 feet, and the north sidewalk would be narrowed from eight to six feet.

The reduction in width of travel lanes and sidewalk narrowing would degrade conditions for westbound cyclists because the curbside travel lane would be too narrow to comfortably share with a motor vehicle. In addition, the mitigation measure would make it more difficult to add a bicycle lane on Cesar Chavez Street in the future, as is currently planned. For these reasons, consistent with the BTI Project analysis, this mitigation measure was not considered further. Project-related traffic impacts at this intersection would remain *significant and unavoidable*.

21. Bayshore/Bacon/Egbert/Phelps - At the signalized intersection of Bayshore/Bacon/ Egbert/Phelps, the degradation in level of service is primarily due to forecasted substantial traffic volume increases on Bayshore Boulevard and due to the fact that Bacon Street is one of a relatively few streets in the area that connects across U.S. 101. As a result, all approaches to the intersection would become congested and would require increased capacity.

Widening Bayshore Boulevard would require major right-of-way acquisition and demolition of existing structures. Widening Bacon Avenue would require similar right-of-way acquisition and reconstruction of the U.S. 101 overcrossing. Capacity constraints at Phelps Street and Egbert Avenue are primarily due to the relationship between the street grid east of Bayshore Boulevard and Bayshore Boulevard itself. Because these two streets meet at Bayshore Boulevard, widening either one of them would not alleviate congestion on this approach, which is primarily due to the awkward position of the streets relative to the intersection.

Because the potential mitigation measures would be infeasible to construct economically and without displacing existing homes, the measure was not further considered. Project-related traffic impacts at this intersection would remain *significant and unavoidable*.

24. Bayshore/Visitacion - At the signalized intersection of Bayshore/Visitacion, the degradation in level of service would primarily be due to forecasted substantial traffic volume increases on Bayshore Boulevard. Due to the presence of the T-Third light rail, space for additional travel lanes could not be taken from the center median, and parking is permitted only intermittently on either side of the street. Traffic signals on intersections along Bayshore Boulevard are timed to prioritize transit movements along Bayshore Boulevard. The SFMTA has indicated that there may be slight adjustments to the traffic signal timing for intersections along Bayshore Boulevard that could be implemented that would reduce auto delay at signalized intersections without degrading transit travel times. However, those improvements would not be enough to improve intersection operating conditions to acceptable levels of LOS D or better.

To accommodate additional right-of-way needed for additional lanes, Bayshore Boulevard would need to be widened to the east and the west. This would require demolition of existing structures and substantial right-of-way acquisition. Widening Bayshore Boulevard at this location would be inconsistent with the pedestrian environment created by the Third Street Light Rail Project. Widening of Bayshore Boulevard would make the pedestrian crossing of Bayshore Boulevard longer, and would require more dedicated pedestrian crossing time as part of the signal phasing plan. Because the mitigation measure would worsen the pedestrian conditions and due to the right-of-way constraints, the measure was not further considered. Project-related traffic impacts at this intersection would remain *significant and unavoidable*.

25. Bayshore/Sunnydale - At the signalized intersection of Bayshore/Sunnydale, the degradation in level of service would primarily be due to forecasted substantial traffic volume increases on Bayshore Boulevard. Due to the presence of the T-Third light rail, space for additional travel lanes could not be taken from the center median, and parking is permitted only intermittently on either side of the street. Traffic signals on intersections along Bayshore Boulevard are timed to prioritize transit movements along Bayshore Boulevard. The SFMTA has indicated that there may be slight adjustments to the traffic signal timing for intersections along Bayshore Boulevard that could be implemented that would reduce auto delay at signalized intersections without degrading transit travel times. However, those improvements would not be enough to improve intersection operating conditions to acceptable levels of LOS D or better.

To accommodate additional right-of-way needed for additional lanes, Bayshore Boulevard would need to be widened to the east and the west. This would require demolition of existing structures and substantial right-of-way acquisition. Widening Bayshore Boulevard at this location would be inconsistent with the pedestrian environment created by the Third Street Light Rail Project. Widening of Bayshore Boulevard would make the pedestrian crossing of Bayshore Boulevard longer, and would require more dedicated pedestrian crossing time as part of the signal phasing plan. Because the mitigation measure would worsen the pedestrian conditions and due to the right-of-way constraints, the measure was not further considered. Project-related traffic impacts at this intersection would remain *significant and unavoidable*.

38. Bayshore/Alemany/Industrial - At the signalized intersection of Bayshore/Alemany/ Industrial, the degradation in level of service would primarily be due to forecasted substantial traffic volume increases on Bayshore Boulevard. Mitigation for this impact would involve increasing capacity on Bayshore Boulevard. There is not adequate right-of-way to provide additional lanes on Bayshore Boulevard without widening the roadway. Roadway widening would require major right-of-way acquisition along the entire Bayshore Boulevard corridor, at great cost and displacement of existing homes and businesses, and therefore, no feasible mitigation measures have been identified. Project-related traffic impacts at this intersection would remain *significant and unavoidable*.

41. Bayshore/Blanken - At the signalized intersection of Bayshore/Blanken, the degradation in level of service would primarily due to forecasted substantial traffic volume increases on Bayshore Boulevard. To mitigate the impact at this intersection, additional capacity would be needed on Bayshore Boulevard. Due to the presence of the T-Third light rail, space for additional travel lanes could not be taken from the center median. Although parking is permitted on the east side of the street, it is not permitted on the west side.

Traffic signals on intersections along Third Street and Bayshore Boulevard south of U.S. 101 are timed to prioritize transit movements along Bayshore Boulevard. The SFMTA has indicated that there may be slight adjustments to the traffic signal timing for intersections along Bayshore Boulevard that could be implemented that would reduce auto delay at signalized intersections without degrading transit travel times. However, those improvements would not be enough to improve intersection operating conditions to acceptable levels of LOS D or better.

To accommodate additional right-of-way needed for additional lanes, Bayshore Boulevard would need to be widened to the east and the west. This would require demolition of existing structures and substantial right-of-way acquisition. Widening Bayshore Boulevard at this location would be inconsistent with the pedestrian environment created by the Third Street Light Rail Project. Widening of Bayshore Boulevard would make the pedestrian crossing of Bayshore Boulevard longer, and would require more dedicated pedestrian crossing time as part of the signal phasing plan. Because the mitigation measure would worsen the pedestrian conditions and due to the right-of-way constraints, the measure was not further considered.

Previous studies have suggested restriping the westbound approach on Blanken Avenue to provide a dedicated right-turn lane and a dedicated left-turn lane approaching Bayshore Boulevard. However, SFMTA has indicated that this would not be advisable given the existing curve on Blanken Avenue. Therefore, this mitigation measure was not further considered. Project-related traffic impacts at this intersection would remain *significant and unavoidable*.

42. San Bruno/Paul - At the signalized intersection of San Bruno/Paul, the degradation in level of service would primarily due to forecasted substantial traffic volume increases on all approaches. Paul Avenue is one of a relatively few number of streets in the area that connects between the east and west side of U.S. 101. As a result, east-west travel in the area is concentrated to the few streets that provide connections across the freeway, including Paul Avenue.

Widening Paul Avenue at this intersection would create the need for major right-of-way acquisition and likely require reconstruction of the U.S. 101 overpass to accommodate a wider Paul Avenue cross section. Widening San Bruno Avenue would require roadway widening and major right-of-way acquisition, which would displace a large number of existing homes and businesses. Mitigation measures that would widen Paul Avenue or San Bruno Avenue at this intersection were not further considered. Project-related traffic impacts at this intersection would remain *significant and unavoidable*.

43. San Bruno/Silver - At the signalized intersection of San Bruno/Silver, the degradation in level of service would primarily be due to forecasted substantial traffic volume increases on all approaches. Silver Avenue is one of a relatively few number of streets in the area that connects between the east and west side of U.S. 101. As a result, east-west travel in the area is concentrated to the few streets that provide connections across the freeway, including Silver Avenue.

Widening Silver Avenue at this intersection would create the need for major right-of-way acquisition and likely require reconstruction of the existing bridge structure across U.S. 101 to accommodate a wider Silver Avenue cross section. Widening San Bruno Avenue would require roadway widening and major right-of-way acquisition, which would displace a large number of existing homes and businesses. Mitigation measures that would widen Silver Avenue or San Bruno Avenue at this intersection were not further considered. Project-related traffic impacts at this intersection would remain *significant and unavoidable*.

44. San Bruno/Mansell/U.S. 101 Southbound Off-ramp - At the all-way STOP sign controlled intersection of San Bruno/Mansell/U.S. 101 Southbound off-ramp, the degradation in level of service would primarily be due to forecasted substantial traffic volume increases on all approaches to the intersection. A new traffic signal at the intersection of San Bruno/Mansell/U.S. 101 Southbound off-ramp would increase the intersection's capacity. To ensure that queues from traffic using the off-ramp do not exceed 700 feet, which would extend onto the freeway mainline, the signal should be operated on a relatively short cycle length. However, due to the 50-foot wide median between eastbound and westbound Mansell Street, west of San Bruno Avenue, a new traffic signal would likely have to operate in a less-efficient "split phase" operation, such that westbound and eastbound movements could not happen simultaneously. Under this scenario, the intersection would improve to LOS E under 2030 No Project conditions, and queues on the off-ramp may occasionally extend to the freeway mainline during peak hours. Therefore, this improvement was deemed infeasible and was not considered further. Project-related traffic impacts at this intersection would remain *significant and unavoidable*.

58. Evans/Napoleon/Toland – At the signalized intersection of Evans/Napoleon/Toland, additional capacity would be required on Evans Street and Napoleon Street to achieve acceptable intersection LOS. Although the lanes on these streets are relatively wide, and additional lanes could possibly be striped within the existing right-of-way, particularly on Napoleon and Toland Streets, the resulting lane widths would not likely be appropriate for the relatively high portion of truck and industrial traffic in the area. Therefore, lane restriping at this intersection was not considered further as a mitigation measure.

Widening any of the approaches to this intersection would require right-of-way acquisition, and would require demolition of existing structures. This would require substantial amount of money and would result in the displacement of numerous businesses. Therefore, roadway widening at this intersection was not considered further as a mitigation measure. Project-related traffic impacts at this intersection would remain *significant and unavoidable*.

Less than Significant Traffic Impacts

Project-contributions to LOS E and LOS F operating conditions were determined to be less than significant at the following nine study intersections.

16. Cesar/Evans
19. Bayshore/Hester/U.S. 101 southbound off-ramp
20. Bayshore/Tunnel
22. Bayshore/Arleta
23. Bayshore/Leland
40. Bayshore/Silver
45. San Bruno/Silliman/U.S. 101 southbound ramps
52. Bayshore/Old County Road
53. Sierra Point/Lagoon Way

The degradation in level of service would primarily be due to forecasted traffic increases along Bayshore Boulevard, Cesar Chavez Street, Evans Avenue, and San Bruno Avenue. At the study intersections within San Bruno (i.e., Bayshore/Old County and Sierra Point/Lagoon) the primary cause of increased congestion development assumed to occur at the adjacent Brisbane Baylands site. Since the Project would not contribute significantly to the poor operating conditions at these nine intersections, Project-related impacts at these intersections would be *less than significant.*

Harney Way Widening – As part of the Project, the existing four-lane Harney Way would be widened to the north and south of its existing alignment, and would be rebuilt to contain between two and three travel lanes in each direction, turn pockets, two BRT-only lanes, Class I and Class II bicycle facilities, new sidewalks, as well as a landscaped area. Initially, the roadway would be rebuilt as a new five-lane roadway (with right-of-way reserved for additional lane(s) to be built in the future as needed for increased traffic levels). There would be two lanes in each direction, with eastbound left-turn lanes at Thomas Mellon Circle and Executive Park Boulevard East and a westbound right-turn lane at the Executive Park Boulevard East intersection. A Class II bicycle lane would be provided on the north side of the roadway, and a Class I bicycle path would be provided on the south side of the roadway. Two exclusive BRT lanes would be constructed adjacent to the roadway on its north side. After 49ers games at the new stadium, left turns would be prohibited at the two Harney Way intersections with Thomas Mellon Drive and Executive Park Boulevard for a period to allow for the configuration of the roadway to change to four westbound auto lanes and one eastbound auto lane. Under the final configuration, a portion of the landscaped area installed as part of the initial widening would be rebuilt to provide additional lane(s) from the proposed Harney Interchange east to Arelious Walker Drive, if necessary.

The initial phase of Harney Way widening would provide for additional landscaping area (i.e., in the area that would be converted to future travel lane(s)), which would make the pedestrian crossing of Harney Way shorter than with the final configuration. Under both the initial and final configurations, pedestrian crosswalks would be provided at the signalized intersections of Harney Way with Jamestown Avenue, Executive Park East and Thomas Mellon Drive, and pedestrian crossing times would be provided consistent with the requirements of the California Manual of Uniform Traffic Control Devices (MUTCD).

Since the need for the final lane configuration on Harney Way would depend on the rate of buildout of the Project, as well as the rate and extent of buildout of cumulative development in the area such as the Executive Park development, further studies would be needed to determine if and when additional travel lanes are needed to accommodate the traffic volume demand.

> ***Project Mitigation Measure 6:*** Prior to issuance of the grading permit for Phase 2 of the Project, the Project Applicant shall widen Harney Way as shown in **Figure 5** in the Transportation Study. Prior to the issuance of grading permits for Phases 2, 3 and 4, the Project Applicant shall fund a study to evaluate traffic conditions on Harney Way and determine whether additional traffic associated with the next phase of development would result in the need to modify Harney Way to its ultimate configuration, as shown in **Figure 6,** unless this ultimate configuration has already been built. This study shall be conducted in collaboration with the SFMTA, which would be responsible for making final determinations regarding the ultimate configuration. The ultimate configuration would be linked to intersection performance, and it would be required when study results indicate intersection LOS at one or more of the three signalized intersection on Harney Way at mid-LOS D (i.e., at an average delay per vehicle of more than 45 seconds per vehicle). If the study and SFMTA conclude that reconfiguration would be necessary to accommodate traffic demands associated with the next phase of development, the Project Applicant shall be responsible to fund and complete construction of the improvements prior to occupancy of the next phase.

With implementation of the Project Mitigation Measure 6, Harney Way would be widened and improved to its final configuration when traffic demand warrants additional capacity. Therefore, potential Project impacts and Project contribution to cumulative impacts on traffic capacity on Harney Way would be reduced to *less than significant*.

Traffic Spillover - As described above, the Project would result in traffic volumes on area roadways, and most substantially on key north/south and east/west streets, which would also experience cumulative traffic growth. A concern in the Bayview Hunters Point neighborhood is the likelihood that existing residential streets would be "cut-throughs," shortcuts, or bypasses used by non-neighborhood traffic. Substantial amounts of cut-through traffic can result in impacts such as noise, safety impacts to pedestrians, impaired driveway access, interference with emergency vehicle access, increased dust, exhaust, and litter, and similar annoyances that adversely affect neighborhood character.

Within the Candlestick Point area, the Project would include new arterials connecting the Project site to Harney Way and U.S. 101, as well as improvements to existing roadways such as Carroll Avenue, Gilman Avenue, and Jamestown Avenue. These improvements and new roadways would encourage residents and visitors to the Project to use the major arterials for access to and from the site, and would minimize the likelihood of cut-through traffic using residential streets in Bayview Hunters Point. Many of the residential streets in the neighborhood do not cross Third Street to connect with Bayshore Boulevard, and therefore are not attractive bypass routes. In addition, left turns from Third Street are permitted at limited locations, with Carroll Avenue, Gilman Avenue and Jamestown Avenue anticipated to serve as the key east/west routes for Project traffic.

SFMTA has recently completed the *Bayview Traffic Calming Project*[18] which was a community-based process to identify problem locations with a study area roughly bounded by Jamestown Avenue, Third Street and Evans Avenue, and traffic calming measures. The study resulted in a list of traffic calming measures (such as gateway islands, speed humps, speed cushions, and traffic circles) along specific roadways. Implementation of improvements will be phased, and most cost-efficient solutions will be implemented first. Implementation of SFMTA's traffic calming recommendations for the Bayview (e.g., gateway islands, speed humps, speed cushions, and traffic circles) would further discourage cut-through traffic. However, given that many intersections at or near the Project site would be congested, it is likely that spillover impacts would still occur.

The TDM Plan included as part of Project Mitigation Measure 1 would require annual monitoring of traffic conditions to review the effectiveness of the Project's transportation measures and other traffic calming measures implemented in the area to reduce congestion due to

[18] *Bayview Traffic Calming Project* report, SFMTA, December 2006.

Project vehicle trips and to minimize traffic spillover to neighboring residential streets. If warranted, the On-Site TDM Coordinator and SFMTA would consider implementation of additional traffic-calming and congestion-alleviating measures, such as adding additional lanes to the streets that approach Third Street, or other congested areas.

Implementation of the TDM Plan and the transit improvements would likely reduce spillover impacts. Nonetheless, cut-through traffic may occur during periods of congestion, and the impacts associated with spillover traffic would remain *significant and unavoidable.*

Project Variants

Project Variants 1 and 2 would be similar to the Project, except that instead of a new football stadium, which generates very few weekday peak hour vehicle trips, there would be additional research and development space under Variant 1, or a shift in residential units from Candlestick Point to Hunters Point Shipyard under Variant 2. The additional research and development space envisioned under Variant 1 would generate more weekday peak hour vehicular traffic than the Project. **Tables 29** and **30** in Chapter 4 present the peak hour vehicle trips for the Project Variants 1 and 2.

Since the final TDM Plan has not been formally approved yet, ***Project Variant 1 Mitigation Measure 1*** and ***Project Variant 2 Mitigation Measure 1*** would be to implement Project Mitigation Measure 1.

To ensure that Harney Way is widened and improved to its final configuration when traffic demand warrants additional capacity, ***Project Variant 1 Mitigation Measure 2*** and ***Project Variant 2 Mitigation Measure 2*** would be to implement Project Mitigation Measure 6.

Project Variant 1

Under Project Variant 1 conditions, 44 of the 60 study intersections would operate at LOS E or LOS F conditions during the weekday AM or PM, or Sunday PM peak hours. At 14 of the 44 intersections the Project would result in project-specific impacts (i.e., project trips would cause intersections expected to operate at LOS D or better under 2030 No Project conditions to operate at LOS E or F, or intersections operating at LOS E under 2030 No Project conditions to deteriorate to LOS F conditions). At the remaining 30 of the 44 intersections that would operate at LOS E or LOS F, Project Variant 1 contributions were determined to be less than significant at 8 intersections, and significant at 22 intersections (as identified in **Table 48**). Development associated with Project Variant 1 would therefore result in impacts at 36 intersections (14 Project-specific and 22 with significant contributions to LOS E or LOS F conditions).

Mitigation measures have been identified for the following seven intersections:

26. Tunnel/Blanken
27. Geneva/U.S. 101 Southbound Ramps (existing Alana/Beatty)
28. Harney/U.S. 101 Northbound Ramps (existing Alana/Harney/Thomas Mellon)
30. Crisp/Palou/Griffith
35. Amador/Cargo
37. Bayshore/Oakdale
49. Bayshore/Geneva

26. Tunnel/Blanken – At the signalized intersection of Tunnel/Blanken (currently unsignalized and required to be signalized as part of the Visitacion Valley Redevelopment), the intersection operating conditions would worsen in the AM peak hour from LOS D under 2030 No Project conditions to LOS F with Project Variant 1. In the PM peak hour, the intersection would operate at LOS F under 2030 No Project and with the Project Variant 1 conditions.

> ***Project Variant 1 Mitigation Measure 3*****:** Implement Project Mitigation Measure 2 to reconfigure the northbound and southbound approaches to the intersection of Tunnel/Blanken to provide left turn lanes adjacent to shared through/right lanes. With implementation of Project Mitigation Measure 2, operations at this intersection would improve, but not to acceptable LOS D or better conditions in the AM and PM peak hours. Therefore, project-related impacts at this intersection would remain *significant and unavoidable*.

27. Geneva/U.S. 101 Southbound Ramps (existing Alana/Beatty)
28. Harney/U.S. 101 Northbound Ramps (existing Alana/Harney/Thomas Mellon)
Project Variant 1 would contribute significantly to cumulative impacts at these intersections.

> ***Project Variant 1 Mitigation Measure 4*****:** Implement Project Mitigation Measure 3. The SFCTA shall coordinate with the City of Brisbane and Caltrans to ensure that Project-generated vehicle trips are accounted for the Harney Interchange analyses and design. Since implementation of Project Mitigation Measure 5 would be under the jurisdiction of the City of Brisbane, the implementation of the mitigation measure is uncertain. Therefore, the Variant 1-related impacts at these intersections would remain *significant and unavoidable.*

30. Crisp/Palou/Griffith – The intersection of Crisp/Palou is currently unsignalized, but would be signalized with implementation of Project Variant 1. With Project Variant 1, the intersection of Crisp/Palou would worsen in the AM and PM peak hours from LOS E under 2030 No Project conditions to LOS F with Project Variant 1.

> ***Project Variant 1 Mitigation Measure 5***: Restripe the southbound approach to provide a dedicated left-turn lane and a shared through/right-turn lane. On-street parking would be prohibited on Griffith Street between Palou Avenue and Oakdale Avenue.

Implementation of this improvement would be the responsibility of SFMTA and DPW, and shall be implemented as part of Hunters Point Shipyard Phase 3 roadway network improvements. The Project Applicant, in collaboration with the City, shall monitor traffic conditions at completion of Phase 2, Phase 3 and Phase 4 to determine whether the intersection operations would warrant reconfiguration and when it should be implemented. Based on the monitoring, if the City determines reconfiguration is warranted, the Project Applicant shall be required to fund the cost of reconfiguration. The SFMTA and DPW shall design and implement the measure as necessary. With implementation of Project Variant 1 Mitigation Measure 4, this intersection would operate at acceptable LOS D or better in the AM and PM peak hours, and therefore with its implementation, project-related impacts at this intersection would be *less than significant*.

35. Amador/Cargo/Illinois – Project Variant 1 would contribute significantly to cumulative impacts at this intersection.

***Project Variant 1 Mitigation Measure 6*:** Implement Project Mitigation Measure 4. SFMTA shall conduct a feasibility study of the intersection with the Port of San Francisco to determine the feasibility of reconfiguring the southbound approach on Illinois Street to provide a dedicated left turn lane and a dedicated right turn lane. With implementation of Project Mitigation Measure 4**,** operations at this intersection would improve to acceptable levels. However, since a feasibility study would be required, implementation of Mitigation Measure 4 is uncertain, and therefore, Variant 1-related impacts at this intersection would remain *significant and unavoidable.*

47. Innes/Earl - At the unsignalized intersection of Innes/Earl, operating conditions would worsen in the PM peak hour from LOS C under 2030 No Project conditions to LOS E with Project Variant 1, and traffic signal warrants would be met. The intersection is proposed as a side street STOP sign controlled intersection, with movements along Innes Avenue uncontrolled and movements on southbound Earl Street controlled by a STOP sign. The degradation in level of service is primarily due to large increases in traffic along Innes Avenue. The high traffic volumes on Innes Avenue cause additional delay for traffic attempting to exit Earl Street, which is assumed to provide a single lane to accommodate both southbound right-turns and southbound left-turns onto Innes. Project Variant 1 would result in higher volumes of traffic along Innes Avenue than the Project, therefore creating higher delays for southbound traffic on Earl Street.

Project Variant 1 Mitigation Measure 7: Install a traffic signal at the intersection of Innes/Earl. Installation of a traffic signal at the intersection of Innes/Earl would improve intersection operations to LOS D or better conditions. Traffic forecasts show that this intersection would be very close to meeting peak hour traffic signal warrants with buildout of the Project Variant 1. The Project Applicant, in collaboration with the City, shall monitor traffic volumes at completion of Phase 2, Phase 3 and Phase 4 to determine whether the intersection volumes would actually warrant a traffic signal and when it should be implemented. Based on the monitoring, if the City determines a traffic signal is warranted, the Project Applicant shall be required to fund installation of a traffic signal as part of later development phases. The SFMTA and DPW shall design and implement the measure as necessary. Implementation of Variant 1 Mitigation Measure 6 would reduce the impacts at this intersection to *less than significant* levels.

49. Bayshore/Geneva – Project Variant 1 would contribute significantly to cumulative impacts at this location.

***Project Variant 1 Mitigation Measure 8*:** Implement Project Mitigation Measure 5. The SFMTA and SFCTA shall coordinate with the City of Brisbane to ensure that projected traffic volumes are accounted for in the design of the Geneva Avenue Extension. Since implementation of Project Mitigation Measure 5 would be under the jurisdiction of the City of Brisbane, the implementation of the mitigation measure is uncertain. Therefore, the Variant 1-related impacts at this intersection would remain *significant and unavoidable.*

The Project impact discussion above did not identify any feasible mitigation measures for 25 of the 36 intersections that would be impacted by Project Variant 1, which include the following:

1. Third/25th
2. Third/Cesar Chavez
3. Third/Cargo
4. Third/Evans
5. Third/Oakdale
6. Third/Palou
7. Third/Revere
8. Third/Carroll
9. Third/Paul
11. Third/Jamestown
15. Cesar/Pennsylvania/I-280
18. Bayshore/Paul
21. Bayshore/Bacon
24. Bayshore/Visitacion
25. Bayshore/Sunnydale
36. Bayshore/Cortland
38. Bayshore/Alemany/Industrial
39. Bayshore/U.S. 101 northbound off to Cesar
41. Bayshore/Blanken
42. San Bruno/Paul
43. San Bruno/Silver
44. San Bruno/Mansell/U.S. 101 Southbound Off-ramp

56. Third/Williams/Van Dyke
57. Third/Jerrold
58. Third/Napoleon/Toland

At these 25 intersections feasible mitigation measures have not been identified, and therefore Variant 1 impacts at these locations would remain *significant and unavoidable.*

Discussion is provided for four intersections not previously discussed under Project condition where mitigation measures have not been identified. The four intersections include:

15. Cesar/Evans
32. Ingalls/Carroll
37. Bayshore/Oakdale
48. Evans/Jennings

15. Cesar/Evans – Project Variant 1 would contribute significantly to cumulative impacts at the signalized intersection of Cesar/Evans. As indicated in the 2030 No Project discussion, feasible mitigation measures that do not involve reconstruction of the existing viaduct have not been identified. Project Variant 1 impacts would remain significant and unavoidable.

32. Ingalls/Carroll – The intersection of Ingalls/Carroll is currently unsignalized, but would be signalized with implementation of Project Variant 1. The intersection of Ingalls/Carroll would worsen in the PM peak hour from LOS C under year 2030 No Project conditions to LOS E with Project Variant 1. The degradation in level of service at this intersection would primarily be due to heavy increases in traffic on Ingalls Street, particularly in the southbound direction in the PM peak hour. Ingalls Street would serve as the most direct auto traffic route for traffic from the Hunters Point Shipyard site destined for Candlestick Point and US 101. Therefore, it would experience substantial traffic increases as part of the Project Variant 1.

To accommodate additional right-of-way needed for additional lanes on southbound Ingalls, Ingalls Street would need to be widened to the east and west. This would require prohibition of on-street parking, which is vital to the industrial businesses along this section of Ingalls Street that use street parking for loading and unloading, or substantial narrowing of the sidewalks. Narrowing of sidewalks would create longer pedestrian crossing distances, and would require more pedestrian crossing time as part of a signal phasing plan. Because widening Ingalls Street would worsen pedestrian conditions, this mitigation was not considered further.

Alternatively, a mitigation measure that reduced travel demand on Ingalls Street by providing an alternate route, such as the Yosemite Slough bridge, would improve operations at this intersection. The proposed new bridge across Yosemite Slough would accommodate four lanes of traffic on game days only plus two transit-only lanes, open at all times, under the Project scenario. Under Project Variant 1, the bridge would only provide the two transit-only lanes, and a bicycle/pedestrian path. If this bridge were to be constructed to the full width as proposed by the Project and if traffic were allowed to use it at all times (two lanes each direction), it would reduce traffic impacts at this intersection. However, allowing traffic on the Yosemite Slough bridge at all times would have potential secondary impacts to Yosemite Slough associated with noise, air quality, and visual impacts, and would be inconsistent with the overall character of the Yosemite Slough restoration. Therefore, opening the Yosemite Slough bridge to regular traffic was not considered further.

Since widening Ingalls Street would not be feasible and providing an alternate traffic route via the Yosemite Slough bridge may have secondary impacts, project-related impacts at this intersection would remain *significant and unavoidable*.

37. Bayshore/Oakdale – At the signalized intersection of Bayshore/Oakdale, the intersection operating conditions would worsen in the PM peak hour from LOS C under 2030 No Project conditions to LOS E with Project Variant 1. The degradation in level of service would primarily be due to forecasted substantial traffic volume increases on Bayshore Boulevard. Mitigation for this impact would involve increasing capacity on Bayshore Boulevard. There is not adequate right-of-way to provide additional lanes on Bayshore Boulevard without widening the roadway. Roadway widening would require major right-of-way acquisition along the entire Bayshore Boulevard corridor, at great cost and displacement of existing homes and businesses. Traffic impacts at this intersection under conditions with the Project Variant 1 would remain *significant and unavoidable*.

48. Evans/Jennings - The unsignalized intersection of Evans/Jennings would operate at LOS F in the AM and PM peak hours under 2030 No Project conditions. With the Project Variant 1, the intersection would be signalized and restriped to accommodate the future travel patterns. With Project Variant 1, the intersection would operate at LOS E in the AM peak hour, and Project Variant 1 would contribute significantly to the poor operating conditions. Additional capacity would be required in the eastbound and southbound directions to accommodate the additional vehicles generated by Project Variant 1. Additional lanes would require substantial right-of-way acquisition to the north or south of Evans Avenue, and on Jennings Street. Right-of-way acquisition would not be possible, and therefore, project-related impacts at Evans/Jennings would remain *significant and unavoidable*.

Project Variant 2

Under Project Variant 2 conditions, 40 of the 60 study intersections would operate at LOS E or LOS F conditions during the weekday AM or PM, or Sunday PM peak hours. At 11 of the 40 intersections the Project Variant 2 would result in project-specific impacts (i.e., project trips would cause intersections expected to operate at LOS D or better under 2030 No Project conditions to operate at LOS E or F, or intersections operating at LOS E under 2030 No Project conditions to deteriorate to LOS F conditions). At the remaining 29 of the 40 intersections that would operate at LOS E or LOS F, Project Variant 2 contributions were determined to be less than significant at 8 intersections, and significant at 21 intersections (as identified in Table 48). Development associated with Project Variant 2 would therefore result in impacts at 32 intersections (11 project-specific and 21 with significant contributions to LOS E or LOS F conditions).

Mitigation measures were identified for the following five intersections:

26. Tunnel/Blanken
27. Geneva/U.S. 101 Southbound Ramps (Alana/Beatty)
28. Harney/U.S. 101 Northbound Ramps (Alana/Harney/Thomas Mellon)
35. Amador/Cargo
49. Bayshore//Geneva

26. Tunnel/Blanken – At the signalized intersection of Tunnel/Blanken (currently unsignalized and required to be signalized as part of the Visitacion Valley Redevelopment), the intersection operating conditions would worsen in the AM peak hour from LOS D under 2030 No Project conditions to LOS F with Project Variant 2. In the PM peak hour, the intersection would operate at LOS F under 2030 No Project and Project Variant 2 conditions.

> ***Project Variant 2 Mitigation Measure 3*:** Implement Project Mitigation Measure 2 to reconfigure the northbound and southbound approaches to the intersection of Tunnel/Blanken to provide left turn lanes adjacent to shared through/right lanes. With implementation of Project Mitigation Measure 2, operations at this intersection would improve, but not to acceptable LOS D or better conditions in the AM and PM peak hours. Therefore, project-related impacts at this intersection would remain *significant and unavoidable*.

27. Geneva/U.S. 101 Southbound Ramps (existing Alana/Beatty)
28. Harney/U.S. 101 Northbound Ramps (existing Alana/Harney/Thomas Mellon)
Project Variant 2 would contribute significantly to cumulative impacts at these intersections.

> ***Project Variant 2 Mitigation Measure 4*:** Implement Project Mitigation Measure 3. The SFCTA shall coordinate with the City of Brisbane and Caltrans to ensure that Project-generated vehicle trips are accounted for the Harney Interchange analyses and design. Since implementation of Project Mitigation Measure 5 would be under the jurisdiction of the City of Brisbane, the implementation of the mitigation measure is uncertain. Therefore, the Variant 1-related impacts at these intersections would remain *significant and unavoidable.*

35. Amador/Cargo/Illinois – Project Variant 2 would contribute significantly to cumulative impacts at this intersection.

> ***Project Variant 2 Mitigation Measure 5*:** Implement Project Mitigation Measure 4. SFMTA shall conduct a feasibility study of the intersection with the Port of San Francisco to determine the feasibility of reconfiguring the southbound approach on Illinois Street to provide a dedicated left turn lane and a dedicated right turn lane. With implementation of Project Mitigation Measure 4**,** operations at this intersection would improve to acceptable levels. However, since a feasibility study would be required, implementation of Mitigation Measure 4 is uncertain, and therefore, Variant 2-related impacts at this intersection would remain *significant and unavoidable.*

49. Bayshore/Geneva – Project Variant 2 would contribute significantly to cumulative impacts at this location.

> ***Project Variant 2 Mitigation Measure 6*:** Implement Project Mitigation Measure 5. The SFMTA and SFCTA shall coordinate with the City of Brisbane to ensure that projected traffic volumes are accounted for in the design of the Geneva Avenue Extension. Since implementation of Project Mitigation Measure 5 would be under the jurisdiction of the City of Brisbane, the implementation of the mitigation measure is uncertain. Therefore, the Project Variant 2-related impacts at this intersection would remain *significant and unavoidable.*

The Project and Project Variant 1 discussions did not identify any feasible mitigation measures for 27 of the 32 intersections that would be impacted by Project Variant 2, which include the following:

1. Third/25th
2. Third/Cesar Chavez
3. Third/Cargo
4. Third/Evans
5. Third/Oakdale
6. Third/Palou
7. Third/Revere
8. Third/Carroll
9. Third/Paul
11. Third/Jamestown
15. Cesar/Pennsylvania/I-280
16. Cesar/Evans
18. Bayshore/Paul
21. Bayshore/Bacon
24. Bayshore/Visitacion
25. Bayshore/Sunnydale
36. Bayshore/Cortland

37. Bayshore/Oakdale
38. Bayshore/Alemany/Industrial
39. Bayshore/U.S. 101 northbound off to Cesar
41. Bayshore/Blanken
42. San Bruno/Paul
43. San Bruno/Silver
44. San Bruno/Mansell/U.S. 101 Southbound Off-ramp
56. Third/Williams/Van Dyke
57. Third/Jerrold
58. Evans/Napoleon/Toland

At the 27 intersections where feasible mitigation measures have not been identified, Variant 2 impacts would remain *significant and unavoidable.*

Freeway Operations

Tables 49 through 51 present the results of the freeway mainline and weaving section analysis for conditions with the Project conditions for the AM and PM, and Sunday peak hours, respectively. **Table 52** presents a summary table of project impacts for Project, Project Variants, and Alternatives to the Project for the freeway mainline segments.

Tables 53 through 55 present the results of the freeway mainline and weaving section analysis for conditions with the Project conditions for the AM and PM, and Sunday peak hours, respectively. **Table 56** presents a summary table of project impacts for Project, Project Variants, and Alternatives to the Project for the ramp analysis locations. **Tables 57 through 59** present the results of the freeway diverge (off-ramp) queue storage analysis for conditions with the Project.

Mainline and Weaving Segments

The Project would not cause any freeway mainline segment to deteriorate from acceptable LOS D or better to LOS E or F conditions, nor would it cause any segment to deteriorate from LOS E to LOS F. However, the Project would contribute cumulatively considerable amounts of traffic to five freeway segments expected to operate at LOS E or F under 2030 No Project conditions:

- U.S. 101 northbound from Sierra Point to Alana/Geneva/Harney (AM and PM)
- U.S. 101 southbound from the I-80 Merge to Cesar Chavez (AM and PM)

Notes:
1. PI – Project Impact. Project results in a change in mainline segments from LOS D or better under 2030 No Project conditions, to LOS E or LOS F with the Project, Project Variants, or Project Alternatives.
2. NSC – No Significant Contribution. Project would not contribute significantly to mainline segments operating at LOS E or LOS F under 2030 No Project conditions. No impacts.
3. SC/PI – Significant Contribution/Project Impact. Project would contribute significantly to mainline segment operating at LOS E or LOS F under 2030 No Project conditions, resulting in a Project Impact.

- U.S. 101 southbound from Third/Bayshore to Alana/Geneva/Harney (AM and PM)
- U.S. 101 southbound from Alana/Geneva/Harney to Sierra Point (AM and PM)

All freeway mainline segments would operate at LOS D or better during the Sunday PM peak hour with the Project.

The Project's contributions to LOS E or LOS F conditions at the four freeway segments would be considered significant impacts. The projected poor operating conditions on the affected freeway segments could only be improved by creating additional mainline capacity, which would require substantial additional right-of-way acquisition, substantial freeway reconstruction, and associated substantial costs, and would require an associated jurisdictional transportation improvement planning, prioritization and fair share funding formulation effort, that exceed the reasonable scope of the Project and reasonable control of the lead agency. More specifically,

- Freeway mainline widening to provide acceptable operational conditions would require acquisition of substantial right-of-way, and substantial and infeasible reconstruction of the affected freeway segments and associated over- and under-crossings, the cost of which far exceed the reasonable capability and responsibility of the Project, and for which no interjurisdictional fair share funding mechanism has been established;
- The co-lead agencies (Planning Department and the Redevelopment Agency) do not have jurisdiction over the affected freeway right-of-way; the necessary right-of-way acquisition would necessarily involve Caltrans use of its eminent domain powers;
- Expansion of portions of the affected freeway segments rights-of-way is constrained by existing topography;
- Acquisition of portions of the necessary additional freeway mainline and associated under- and over-crossing right-of-way, and subsequent construction of the necessary freeway mainline widening and associated under- and over-crossings, could not be achieved without the displacement of existing businesses and households and demolition of existing residential and commercial establishments

Therefore, mitigation of this Project-related contribution to 2030 cumulative freeway congestion impacts to a less-than-significant level is considered to be infeasible. The Project-related contribution to this cumulative freeway segment congestion would be *significant and unavoidable*.

Ramp Junctions

Tables 53 through 55 present the results of the ramp junction merge (on-ramp) and diverge (off-ramp) analysis for Project conditions for the AM, PM, and Sunday peak hours, respectively. **Table 56** presents a summary table of project impacts for Project, Project Variants, and Alternatives to the Project for the ramp analysis locations.

The Project would cause four ramp junctions to deteriorate from acceptable LOS D or better to LOS E or F conditions or from LOS E to LOS F conditions:

- U.S. 101 northbound on-ramp from Alemany/Industrial (PM)
- U.S. 101 northbound on-ramp from Harney Way (Sunday)
- U.S. 101 northbound on-ramp from Bayshore/Cesar Chavez (Sunday)
- U.S. 101 southbound on-ramp from Harney/Geneva (PM)

The Project would result in significant traffic impacts at these locations. Providing additional on-ramp lanes would increase the volume of traffic entering the freeway mainline segment, and may exacerbate the poor merging conditions. As described above, widening of U.S. 101 to provide additional capacity would not be feasible. Thus, mitigation of these impacts has been determined to be infeasible. Project impacts at these locations would be *significant and unavoidable*.

The Project would also contribute cumulatively significant traffic increases at ramp junctions projected to operate at LOS E or LOS F under 2030 No Project conditions:

- U.S. 101 northbound on-ramp from Sierra Point (PM)
- U.S. 101 northbound on-ramp from Harney Way (AM and PM)
- U.S. 101 northbound on-ramp from Alemany/Industrial (AM)
- U.S. 101 northbound on-ramp from Bayshore/Cesar Chavez (AM and PM)
- U.S. 101 southbound off-ramp to Bayshore/Cesar Chavez (AM, PM, and Sunday)
- U.S. 101 southbound on-ramp from Third Street/Bayshore Boulevard (AM and PM)
- U.S. 101 southbound on-ramp from Harney/Geneva (AM)
- U.S. 101 southbound on-ramp from Sierra Point (AM)
- I-280 northbound off-ramp to Cesar Chavez (AM and PM)
- I-280 northbound on-ramp from Indiana/25th Street (AM and PM)
- I-280 southbound off-ramp to Pennsylvania/25th Street (AM and PM)
- I-280 southbound on-ramp from Pennsylvania/25th Street (AM and PM)

The Project would contribute significantly to cumulative impacts at these locations. As described above, no feasible mitigation measures have been identified for the ramp junction locations. Therefore, the Project's contributions to cumulative impacts at the ramp locations would be *significant and unavoidable*.

Tables 57 through 59 present the results of the freeway diverge (off-ramp) queue storage analysis for conditions with the Project. The Project would result in increases in traffic volumes that would cause the U.S. 101 northbound off-ramp to Harney Way to experience queues that may extend back to the upstream freeway mainline segment which could result in unsafe conditions on the freeway mainline. The Project would therefore result in significant traffic impacts at this location.

Project Mitigation Measure 3 provides for the Project Applicant to pay a fair share toward the construction of the Harney Way Interchange Project, which could mitigate for the Project's contributions to this impact. Because the environmental review of the interchange project is not yet complete and the interchange project would be undertaken and approved by Caltrans, the implementation of Project Mitigation Measure 3 is uncertain and is outside the City/Agency jurisdiction. Therefore, Project-related impacts related to freeway diverge queue storage would be *significant and unavoidable*.

The Project would also contribute cumulatively significant traffic increases at off-ramps where queues may extend onto freeway mainline segments under year 2030 No Project Conditions:

- U.S. 101 northbound off-ramp to Harney Way (PM)
- U.S. 101 northbound off-ramp to Bayshore/Cesar Chavez (AM)
- U.S. 101 southbound off-ramp to Harney/Geneva (AM, PM, and Sunday)
- U.S. 101 southbound off-ramp to Sierra Point/Lagoon (AM)
- I-280 northbound off-ramp to Cesar Chavez (AM)

As noted above, Project Mitigation Measure 3 provides for the Project Applicant to pay a fair share toward the construction of the Harney Way Interchange Project, which could mitigate for the Project's contributions to this impact. Because the environmental review of the interchange project is not yet complete and the interchange would be undertaken and approved by Caltrans, the implementation of Project Mitigation Measure 3 is uncertain and is outside the City/Agency jurisdiction. Therefore, Project's contribution to impacts related to freeway diverge queue storage would remain *significant and unavoidable*.

Project Variants

Mainline and Weaving Segments

The Project Variants would create impacts at similar freeway mainline sections to the Project, although the magnitude of impacts may be greater with Project Variants 1 and 2, due to increased traffic generation compared to the Project.

Project Variant 1

Project Variant 1 would result in significant impacts at the same freeway mainline sections as the Project. However, as described in Chapter 5 for 2030 No Project conditions, no feasible mitigation measures have been identified for the freeway segments expected to experience significant impacts under 2030 No Project conditions. Therefore, the Project Variant 1 contributions to LOS E or LOS F freeway operating conditions would be considered *significant and unavoidable*.

Project Variant 2

Project Variant 2 would result in similar significant traffic impacts at freeway mainline segments as the Project. As described in the discussion of Project impacts, no feasible mitigation measures have been identified for the freeway segments expected to experience significant impacts under Project conditions. Therefore, the Project Variant 2 contributions to LOS E and LOS F freeway operating conditions would be considered *significant and unavoidable*.

Ramp Junctions

The Project Variants would create impacts at similar freeway ramp junctions to the Project, although the magnitude of impacts may be greater with Project Variants 1 and 2, due to increased traffic generation compared to the Project.

Project Variant 1

Project Variant 1 would create similar significant traffic impacts to freeway ramp junctions as the Project. As described in the discussion of Project impacts, no feasible mitigation measures have been identified for the freeway ramp junctions expected to experience significant impacts under Project conditions. Therefore, the Project Variant 1 contributions to deficient freeway operating conditions are considered *significant and unavoidable*.

Project Variant 2

Project Variant 2 would create similar significant traffic impacts to freeway ramp junctions as the Project. As described in the discussion of Project impacts, no feasible mitigation measures have been identified for the freeway ramp junctions expected to experience significant impacts under Project conditions. Therefore, the Project Variant 1 contributions to deficient freeway operating conditions are considered *significant and unavoidable*.

The analysis of ramp queuing for Variants 1 and 2 is similar to the analysis of ramp merge and diverge junctions.

Project Variant 1

Project Variant 1 would result in significant impacts with respect to ramp queuing at the same off-ramp locations as the Project. As described in the discussion of Project impacts, no feasible mitigation measures have been identified for the freeway off-ramps expected to experience significant impacts under Project conditions. Therefore, the Project Variant 1 contributions to freeway segments operating at LOS E or LOS F conditions would be considered *significant and unavoidable*.

Project Variant 2

Project Variant 2 would result in significant impacts with respect to ramp queuing at the same off-ramp locations as the Project, with one exception. Under Project Variant 2, the U.S. 101 northbound off-ramp to Harney Way would not be likely to experience queues extending back to the mainline in the Sunday peak hour. However, the Project Variant 2 contributions to all other off-ramps expected to experience significant traffic impacts associated with queuing under Project conditions would be the same as the Project. As described in the discussion of Project impacts, no feasible mitigation measures have been identified for the freeway off-ramps expected to experience significant impacts under Project conditions. Therefore, the Project Variant 2 contributions to freeway segments operating at LOS E or LOS F would be considered *significant and unavoidable*.

6.1.2 Alternatives to the Project

Transportation Study Appendix E contains the intersection turning movement volumes at the study intersections for existing and future conditions in table format, while Transportation Study Appendix F contains the intersection LOS analysis calculation sheets.

Intersection Operations

Tables 60 and 61 presents a comparison of the intersection LOS analysis for the Alternatives to the Project for the weekday AM and PM peak hours, respectively. **Table 62** presents this comparison for Sunday PM peak hour conditions. **Table 48** on page 175 presented the summary table of project impacts for the Alternatives to the Project.

Alternative 1 – No Project: Alternative 1 assumes that development within Hunters Point Shipyard would occur per the approved plans for Phase I. No development within Candlestick Point was assumed. Under the 2030 No Project conditions, 38 of the 60 intersections would operate at LOS E or LOS F (as compared with three intersections under existing conditions). The intersections include:

- Third/25th
- Third/Cargo
- Third/Evans
- Third/Palou
- Third/Gilman/Paul
- 25th/Pennsylvania
- Cesar Chavez/Pennsylvania/I-280 northbound off-ramp
- Cesar Chavez/Evans
- Bayshore/Paul
- Bayshore/Hester/U.S. 101 southbound off-ramp
- Bayshore/Tunnel
- Bayshore/Bacon/Egbert/Phelps
- Bayshore/Arleta
- Bayshore/Leland
- Bayshore/Visitacion
- Bayshore/Sunnydale

- Tunnel Blanken
- Geneva/U.S. 101 southbound ramps (existing Alana/Beatty)
- Harney/U.S. 101 northbound ramps (existing Alana/Harney/Thomas Mellon)
- Harney/Jamestown
- Crisp/Palou/Griffith
- Arelious Walker/Gilman
- Amador/Cargo/Illinois
- Bayshore/Cortland
- Bayshore/Alemany/Industrial
- Bayshore/U.S. 101 northbound off-ramp/Jerrold
- Bayshore/Silver
- Bayshore/Blanken
- San Bruno/Paul
- San Bruno/Silver
- San Bruno/Mansell/U.S. 101 southbound off-ramp
- San Bruno/Silliman/U.S. 101 southbound ramps
- Evans/Jennings
- Bayshore/Geneva
- Bayshore/Old County
- Sierra Point Parkway/U.S. 101 southbound ramps/Lagoon Way
- Third/Jerrold
- Evans/Napoleon/Toland

As indicated in section 4.3, a number of intersection improvements would be implemented as part of conditions of approval placed on development projects by the Planning Department and the Redevelopment Agency. For the intersections of Cesar Chavez/Evans and Third/Evans, the Hunters Point Shipyard Development Plan's Mitigation Monitoring and Reporting Program included an improvement at the intersection of Cesar Chavez/Evans, which have not been assumed for the 2030 No Project condition due to its infeasibility.

Cesar Chavez/Evans – The Hunters Point Shipyard Redevelopment Plan's mitigation measure identified reconfiguration of the northbound approach of Evans Avenue to Cesar Chavez Street to provide exclusive northbound left and right turn lanes, and changing the signal timing plan to include the exclusive left turn and right turn movements. The measure identified that the southeast corner curb return would require structural modifications to the existing viaduct. DPW, as part of the BTI Project analysis, identified widening of the existing structure supporting the Evans Avenue and Cesar Chavez Street intersection as infeasible.

Source: Fehr & Peers.

With the planned construction of a Class II bicycle lane on Cesar Chavez Street, which would remove an eastbound travel lane on Cesar Chavez Street, the operations at this intersection are expected to deteriorate even further. As a result, widening the Evans Avenue viaduct to provide an additional lane on Evans Avenue may not offer a substantial benefit, since the primary constraint would be on Cesar Chavez Street.

Third/Evans – The Hunters Point Shipyard Redevelopment Plan included a mitigation measure at the intersection of Third/Evans which proposed that the southbound left turn lane be eliminated and left turns be rerouted via Phelps Street to Evans Avenue. The mitigation measure also called for signalization of the intersection of Phelps/Evans and removal of on-street parking on Phelps Street and Evans Avenue. The intersection of Phelps Street and Evans Avenue has recently been signalized and on-street parking has been removed along Phelps Street and Evans Avenue, although the removal of the southbound left-turn movement from Third Street to Evans Avenue has not been implemented. Evaluation of intersection operating conditions with the rerouting of southbound left turns indicated that the elimination of the southbound left turn lane and rerouting of traffic to Phelps Street would not substantially improve intersection operating conditions and overall intersection operations would remain at LOS F

Alternative 2 – No Bridge: Alternative 2 would be the same as the Project, except that the bridge across Yosemite Slough would not be constructed. Because the Yosemite Slough bridge would not accommodate auto travel on non-game days, the traffic circulation patterns are expected to be the same under Alternative 2 as the Project.

Without the bridge across Yosemite Slough, the proposed new BRT route traveling between Balboa Park BART Station and the Hunters Point Shipyard Transit Center would be follow a different alignment than under the Project. Instead of a direct route across Yosemite Slough, the BRT route would travel west along Carroll Avenue, north along Hawes Street, and then west on Armstrong Avenue, where it would join the Navy railroad right-of-way. The BRT route would travel in the railroad right-of-way around Yosemite Slough, rejoining the existing roadway network at Shafter Avenue. The route would continue east on Shafter Avenue to Arelious Walker, where it would reassume the same alignment as the Project. Operation of the BRT within the rail right-of-way would not affect study intersection operations. Therefore, the traffic impacts associated with Alternative 2 would be the same as the Project.

Under Alternative 2 conditions, 39 of the 60 study intersections would operate at LOS E or LOS F conditions during the weekday AM or PM, or Sunday PM peak hours. At 10 of the 39 intersections the Alternative 2 would result in project-specific impacts (i.e., project trips would cause intersections expected to operate at LOS D or better under 2030 No Project conditions to operate at LOS E or F, or intersections operating at LOS E under 2030 No Project conditions to deteriorate to LOS F conditions). At the remaining 29 of the 39 intersections that would operate at LOS E or LOS F, Alternative 2 contributions were determined to be less than significant at 9 intersections, and significant at 20 intersections (as identified in Table 48). Therefore, development associated with Alternative 2 would result in significant impacts at 30 intersections (10 project-specific and 20 due to significant contributions to LOS E or LOS F conditions).

No feasible mitigation measures have been identified for 25 of the 30 impacted intersections. The 25 intersections include:

1. Third/25th
2. Third/Cesar Chavez
3. Third/Cargo
4. Third/Evans
5. Third/Oakdale
3. Third/Palou
7. Third/Revere
8. Third/Carroll
9. Third/Paul
11. Third/Jamestown
15. Cesar/Pennsylvania/I-280
18. Bayshore/Paul
21. Bayshore/Bacon
24. Bayshore/Visitacion
25. Bayshore/Sunnydale
36. Bayshore/Cortland
38. Bayshore/Alemany/Industrial
39. Bayshore/U.S. 101 off to Cesar
41. Bayshore/Blanken
42. San Bruno/Paul
43. San Bruno/Silver
44. San Bruno/Mansell/U.S. 101 Southbound Off-ramp
56. Third/Williams/Van Dyke
57. Third/Jerrold
58. Evans/Napoleon/Toland

At the 25 intersections where feasible mitigation measures have not been identified, Alternative 2 impacts would remain *significant and unavoidable.*

At the following five intersections feasible mitigation measures were identified:

26. Tunnel/Blanken
27. Geneva/U.S. 101 southbound ramps (existing Alana/Beatty)
28. Harney/U.S. 101 northbound ramps (existing Alana/Harney/Thomas Mellon)
35.Amador/Cargo/Illinois
49. Bayshore/Geneva

At these intersections, Project Mitigation Measures 2 through 5 would be applicable for Alternative 2. At the intersection of Tunnel/Blanken, with implementation of Project Mitigation Measure 2, operations would improve, but not to acceptable LOS D or better conditions in the AM and PM peak hours. Therefore, project-related impacts at Tunnel/Blanken would be *significant and unavoidable*.

Since implementation of Project Mitigation Measures 3 though 5 are uncertain, Project-related impacts at the four intersections of Geneva/U.S. 101 southbound ramps, Harney/U.S. 101 northbound ramps, Amador/Cargo/Illinois, and Bayshore/Geneva, traffic impacts would remain *significant and unavoidable*.

Alternative 3 – 49ers at Candlestick: Compared to the Project, Alternative 3 would involve less overall development, with slightly more development at the Hunters Point Shipyard and virtually no change to the existing uses at Candlestick Point. Overall, Alternative 3 would result in fewer impacts than those identified for the Project.

Under Alternative 3 conditions, 36 of the 60 study intersections would operate at LOS E or LOS F conditions during the weekday AM or PM, or Sunday PM peak hours. At 3 of the 36 intersections, Alternative 3 would result in project-specific impacts (i.e., project trips would cause intersections expected to operate at LOS D or better under 2030 No Project conditions to operate at LOS E or F, or intersections operating at LOS E under 2030 No Project conditions to deteriorate to LOS F conditions). At the remaining 33 of the 36 intersections that would operate at LOS E or LOS F, Alternative 3 contributions were determined to be less than significant at 24 intersections, and significant at 9 intersections (as identified in Table 48). Therefore, development associated with Alternative 3 would therefore result in impacts at 20 intersections (3 project-specific and 17 with significant contributions to LOS E or LOS F conditions).

No feasible mitigation measures have been identified for 14 of the 20 impacted intersections. The 14 intersections include:

1. Third/25th
2. Third/Cesar Chavez
3. Third/Cargo
4. Third/Evans
6. Third/Palou
9. Third/Paul
15. Cesar/Pennsylvania/I-280
16. Cesar/Evans
18. Bayshore/Paul
21. Bayshore/Bacon
38. Bayshore/Alemany/Industrial
43. San Bruno/Silver

57. Third/Jerrold
58. Evans/Napoleon/Toland

At the 14 intersections where feasible mitigation measures have not been identified, Alternative 3 impacts would remain *significant and unavoidable.*

Project Mitigation Measures 3 through 5 were identified for the following three intersections where Alternative 3 would have significant contributions to cumulative impacts:

27. Geneva/U.S. 101 Southbound Ramps (existing Alana/Beatty)
35. Amador/Cargo
49. Bayshore/Geneva

At these intersections, Project Mitigation Measures 3 through 5 would be applicable for Alternative 3. Since implementation of Project Mitigation Measures 3 though 5 are uncertain, Project-related traffic impacts at the three intersections would remain *significant and unavoidable*.

In addition, Alternative 3 would have project-specific impacts at the following intersections, and mitigation measures were identified:

29. Harney/Jamestown
31. Ingalls/Thomas
34. Arelious Walker/Gilman

29. Harney/Jamestown – At the unsignalized intersection of Harney/Jamestown, the intersection operations would deteriorate in the PM peak hour from LOS E under year 2030 No Project conditions to LOS F with Alternative 3.

> ***Alternative 3 Mitigation Measure 5:*** Install a traffic signal at the intersection of Harney/Jamestown. Implementation of this measure would be the responsibility of SFMTA, and should be implemented when traffic signal warrants are met. Prior to completion of Phase 1 of development, the Project Applicant shall fully fund the cost of signalization improvements.

Implementation of this mitigation measure would reduce Alternative 3 traffic impacts at this intersection to *less than significant* levels.

31. Ingalls/Thomas - At the unsignalized intersection of Ingalls/Thomas, the intersection operating conditions would worsen in the PM peak hour from LOS C under 2030 No Project conditions to LOS E with Alternative 3. (The intersection would operate at LOS C in the AM and PM peak hours with the Project. This intersection would be signalized with the Project, but not under Alternative 3.) Traffic forecasts show that this intersection would meet peak hour traffic signal warrants with buildout of Alternative 3.

The intersection is a side street STOP sign controlled intersection, with movements along Ingalls Street uncontrolled and movements on eastbound and westbound Thomas Avenue controlled by a STOP sign. The degradation in level of service would primarily be due to large increases in traffic along Thomas Avenue attempting to turn left onto southbound Ingalls Street.

> ***Alternative 3 Mitigation Measure 6:*** Install traffic signal at the intersection of Ingalls/Thomas. Implementation of this measure would be the responsibility of SFMTA, and should be implemented when traffic signal warrants are met. Prior to completion of Phase 1 of development, the Project Applicant shall fully fund the cost of signalization improvements. Installation of a traffic signal at the intersection of Ingalls/Thomas intersection would improve intersection operations to LOS D or better conditions.

Implementation of Alternative 3 Mitigation Measure 6 would reduce the impacts at this intersection to *less than significant* levels.

34. Arelious Walker/Gilman – At the unsignalized intersection of Arelious Walker/Gilman, under Alternative 3 the LOS F operating conditions would worsen in the AM and PM peak hours. Peak hour traffic volumes at this intersection would meet signal warrants.

> ***Alternative 3 Mitigation Measure 7***: Install a traffic signal at the intersection of Arelious Walker/Gilman. Implementation of the new signal would be the responsibility of SFMTA, and should be implemented when traffic signal warrants are met. Since signalization was determined to be required even without the Project under 2030 No Project conditions, the Project Applicant shall contribute its fair-share toward the cost of improvements. Prior to payment of the contribution, the City shall create a mechanism to determine and receive fair share contributions from the Project Applicant. The SFMTA and DPW shall design and implement the measure as necessary. Since implementation of this mitigation measure is uncertain, traffic impacts would remain significant and unavoidable.

Alternative 4 – Lesser Build: Alternative 4 would be similar to the Project, but with less overall development in the project area. Impacts associated with Alternative 4 would be similar to or less than those identified for the Project.

Under Alternative 4 conditions, 37 of the 60 study intersections would operate at LOS E or LOS F conditions during the weekday AM or PM, or Sunday PM peak hours. At 8 of the 37 intersections Alternative 4 would result in project-specific impacts (i.e., project trips would cause intersections expected to operate at LOS D or better under 2030 No Project conditions to operate at LOS E or F, or intersections operating at LOS E under 2030 No Project conditions to deteriorate to LOS F conditions). At the remaining 29 of the 37 intersections that would operate at LOS E or LOS F, Alternative 4 contributions were determined to be less than significant at 16 intersections, and significant at 13 intersections (as identified in Table 48). Development associated with Alternative 4 would therefore result in impacts at 21 intersections (8 project-specific and 13 with significant contributions to LOS E or LOS F conditions).

No feasible mitigation measures have been identified for 21 of the 25 impacted intersections. The 21 intersections include:

1. Third/25th
2. Third/Cesar Chavez
3. Third/Cargo
4. Third/Evans
6. Third/Palou
7. Third/Revere
8. Third/Carroll
9. Third/Paul
11. Third/Jamestown
15. Cesar/Pennsylvania/I-280
18. Bayshore/Paul
21. Bayshore/Bacon
36. Bayshore/Cortland
38. Bayshore/Alemany/Industrial
39. Bayshore/U.S. 101 northbound off to Cesar
42. San Bruno/Paul
43.San Bruno/Silver
44.San Bruno/Mansell/U.S. 101 Southbound Off-ramp
56. Third/Williams/Van Dyke
59. Evans/Napoleon/Toland
57. Third/Jerrold

At the 21 intersections where feasible mitigation measures have not been identified, Alternative 4 impacts would remain *significant and unavoidable.*

Project Mitigation Measures 2, 3 and 5 would be applicable for the following four intersections:

26. Tunnel/Blanken
27. Geneva/U.S. 101 southbound ramps (existing Alana/Beatty)
28. Harney/U.S. 101 northbound ramps (existing Alana/Harney/Thomas Mellon)
49. Bayshore/Geneva

At the intersection of Tunnel/Blanken, with implementation of Project Mitigation Measure 2, operations would improve, but not to acceptable LOS D or better conditions in the AM and PM peak hours. Therefore, project-related impacts at Tunnel/Blanken would be *significant and unavoidable*.

Since implementation of Project Mitigation Measures 3 and 5 are uncertain, Project-related impacts at the four intersections of Geneva/U.S. 101 southbound ramps, Harney/U.S. 101

northbound ramps, and Bayshore/Geneva, traffic impacts would remain *significant and unavoidable*.

Alternative 5 – No Park Agreement: Alternative 5 would be the same as Project Variant 2, but with no bridge over Yosemite Slough. As discussed under Alternative 2, eliminating the bridge over Yosemite Slough may have a minor effect on mode choice, resulting in slightly higher auto trips compared to the same scenario with the bridge. However, the difference in the number of vehicle trips is expected to be negligible. The travel patterns would be the same with and without the bridge, since it would not be open to auto travel on non-game days. Therefore, impacts associated with Alternative 5 would be similar to those identified for Project Variant 2.

Under Alternative 5 conditions, 40 of the 60 study intersections would operate at LOS E or LOS F conditions during the weekday AM or PM, or Sunday PM peak hours. At 11 of the 40 intersections the Alternative 5 would result in project-specific impacts (i.e., project trips would cause intersections expected to operate at LOS D or better under 2030 No Project conditions to operate at LOS E or F, or intersections operating at LOS E under 2030 No Project conditions to deteriorate to LOS F conditions). At the remaining 29 of the 40 intersections that would operate at LOS E or LOS F, Alternative 5 contributions were determined to be less than significant at 8 intersections, and significant at 21 intersections (as identified in Table 48). Development associated with Alternative 5 would therefore result in impacts at 32 intersections (11 project-specific and 21 with significant contributions to LOS E or LOS F conditions).

Feasible mitigation measures were not identified for the following 27 of the 32 intersections that would be impacted by Alternative 5:

1. Third/25th
2. Third/Cesar Chavez
3. Third/Cargo
4. Third/Evans
5. Third/Oakdale
6. Third/Palou
7. Third/Revere
8. Third/Carroll
9. Third/Paul
11. Third/Jamestown
15. Cesar/Pennsylvania/I-280
16. Cesar/Evans
18. Bayshore/Paul
21. Bayshore/Bacon
24. Bayshore/Visitacion
25. Bayshore/Sunnydale
36. Bayshore/Cortland

37. Bayshore/Oakdale
38. Bayshore/Alemany/Industrial
39. Bayshore/U.S. 101 northbound off to Cesar
41. Bayshore/Blanken
42. San Bruno/Paul
43.San Bruno/Silver
44.San Bruno/Mansell/U.S. 101 Southbound Off-ramp
56. Third/Williams/Van Dyke
57. Third/Jerrold
58. Evans/Napoleon/Toland

At the 27 intersections where feasible mitigation measures have not been identified, Variant 2 impacts would remain *significant and unavoidable.*

Mitigation measures were identified for the following five intersections:

26. Tunnel/Blanken
27. Geneva/U.S. 101 Southbound Ramps (existing Alana/Beatty)
28. Harney/U.S. 101 Northbound Ramps (existing Alana/Harney/Thomas Mellon)
35. Amador/Cargo
49. Bayshore//Geneva

At these intersections, Project Mitigation Measures 2 through 5 would be applicable for Alternative 5. At the intersection of Tunnel/Blanken, with implementation of Project Mitigation Measure 2, operations would improve, but not to acceptable LOS D or better conditions in the AM and PM peak hours. Therefore, project-related impacts at Tunnel/Blanken would be *significant and unavoidable*.

Since implementation of Project Mitigation Measures 3 though 5 are uncertain, Project-related impacts at the four intersections of Geneva/U.S. 101 southbound ramps, Harney/U.S. 101 northbound ramps, Amador/Cargo/Illinois, and Bayshore/Geneva, traffic impacts would remain *significant and unavoidable*.

Freeway Operations

Tables 63 through 65 present the comparison of the mainline and weaving section LOS for Project Alternatives for the AM, PM, and Sunday peak hours, respectively. **Tables 66 through 68** present the comparison of the ramp junction analysis. **Tables 69 through 71** present a comparison of the ramp queuing analysis. Transportation Study Appendix G contains the freeway LOS analysis calculation sheets.

Project Alternative 1 is the 2030 No Project scenario, and was discussed in Chapter 5. Project Alternative 2 has the same travel demand and distribution characteristics as the Project and Project Alternative 5 has the same travel demand and distribution characteristics as Project Variant 2. Thus, discussion of these three Alternatives is not repeated in this section.

Project Alternatives 3 and 4 would generate fewer peak hour vehicle trips than the Project, and thus their contributions to study mainline and weaving segments and ramps would be less than for the Project.

Mainline and Weaving Segments

Project Alternatives 3 and 4 would generally contribute less traffic to the roadway system than the Project. A discussion of Project Alternatives 3 and 4 is included below.

Alternative 3 – 49ers at Candlestick: Traffic generated by Alternative 3 would create significant traffic impacts at the same locations as those identified for the Project. As described in the discussion of Project impacts, no feasible mitigation measures have been identified for the freeway mainline segments expected to experience significant impacts under Project conditions. Therefore, the impacts associated with Alternative 3 are considered *significant and unavoidable*.

Alternative 4 – Lesser Build: Traffic generated by Alternative 4 would create significant traffic impacts at the same locations as those identified for the Project. However, Alternative 4 would also cause the freeway mainline segment on I-280 southbound between Mariposa Street and 25th Street to deteriorate from LOS E to LOS F in the AM peak hour, compared to the No Project. This would be an additional significant impact associated with Alternative 4, compared to the Project. As described in the discussion of Project impacts, no feasible mitigation measures have been identified for the freeway mainline segments expected to experience significant impacts under Project conditions. Therefore, the impacts associated with Alternative 4 are considered *significant and unavoidable*.

Ramp Junctions

The freeway impacts analysis also examined merge/diverge levels of service and the potential for queues to extend from off-ramps onto freeway mainline segments for Alternatives 3 and 4.

Alternative 3 – 49ers at Candlestick: Traffic generated by Alternative 3 would create significant traffic impacts at the same locations as those identified for the Project, with four exceptions:

- The U.S. 101 northbound on-ramp from Alemany/Industrial was projected to deteriorate from LOS E in the PM peak hour under 2030 No Project conditions to LOS F with the Project. Under Alternative 3, the ramp merge section would continue to operate at LOS E in the PM peak hour.
- The U.S. 101 southbound on-ramp from Geneva Extension was projected to deteriorate from LOS D in the PM peak hour under 2030 No Project conditions to LOS F with the

Project. Under Alternative 3, the ramp merge section would operate at acceptable LOS C in the PM peak hour.

- The U.S. 101 northbound on-ramp from Harney Way was projected to deteriorate from LOS D in the Sunday peak hour under 2030 No Project conditions to LOS E with the Project. Under Alternative 3, this segment would remain at acceptable LOS D.
- The U.S. 101 northbound on-ramp from Bayshore/Cesar Chavez was projected to deteriorate from LOS D in the Sunday peak hour under 2030 No Project conditions to LOS F with the Project. Under Alternative 3, this segment would remain at acceptable LOS D.

Otherwise, significant traffic impacts associated with Alternative 3 would occur at the same locations as the Project, although the magnitude may be less due to less overall traffic generation associated with Alternative 3. As described in the discussion of Project impacts, no feasible mitigation measures have been identified for the freeway mainline segments expected to experience significant impacts under Project conditions. Therefore, the impacts associated with Alternative 3 are considered *significant and unavoidable*.

Alternative 4 – Lesser Build: Traffic generated by Alternative 4 would create significant traffic impacts at the same locations as those identified for the Project, with two exceptions:

- The U.S. 101 northbound on-ramp from Harney Way was projected to deteriorate from LOS D in the Sunday peak hour under 2030 No Project conditions to LOS E with the Project. Under Alternative 3, this segment would remain at acceptable LOS D.
- The U.S. 101 northbound on-ramp from Bayshore/Cesar Chavez was projected to deteriorate from LOS D in the Sunday peak hour under 2030 No Project conditions to LOS F with the Project. Under Alternative 3, this segment would remain at acceptable LOS D.

Otherwise, significant traffic impacts associated with Alternative 4 would occur at the same locations as the Project, although the magnitude may be less due to less overall traffic generation associated with Alternative 4. As described in the discussion of Project impacts, no feasible mitigation measures have been identified for the freeway mainline segments expected to experience significant impacts under Project conditions. Therefore, the impacts associated with Alternative 3 are considered *significant and unavoidable*.

The ramp analysis also examined the potential for queues at study off-ramps to extend back onto study freeway segments under conditions with Alternatives 3 and 4.

Alternative 3 – 49ers at Candlestick: Traffic generated by Alternative 3 would create significant traffic impacts associated with off-ramp queuing at the same locations as those identified for the Project, with one exception:

- Queues on the U.S. 101 northbound off-ramp to Harney Way were projected to extend back onto the adjacent freeway mainline segment during the Sunday peak hour under conditions with the Project. This would not occur under conditions with Alternative 3.

Otherwise, significant traffic impacts associated with Alternative 3 associated with off-ramp queuing would occur at the same locations as the Project, although the magnitude may be less due to less overall traffic generation associated with Alternative 3. As described in the discussion of Project impacts, no feasible mitigation measures have been identified for the freeway off-ramps expected to experience significant queuing impacts under Project conditions. Therefore, the impacts associated with Alternative 3 are considered *significant and unavoidable*.

Alternative 4 – Lesser Build: Conditions under Alternative 4 would be similar to Alternative 3. Traffic generated by Alternative 4 would create significant traffic impacts associated with off-ramp queuing at the same locations as those identified for the Project, with one exception:

- Queues on the U.S. 101 northbound off-ramp to Harney Way were projected to extend back onto the adjacent freeway mainline segment during the Sunday peak hour under conditions with the Project. This would not occur under conditions with Alternative 4.

Otherwise, significant traffic impacts associated with Alternative 4 associated with off-ramp queuing would occur at the same locations as the Project, although the magnitude may be less due to less overall traffic generation associated with Alternative 4. As described in the discussion of Project impacts, no feasible mitigation measures have been identified for the freeway off-ramps expected to experience significant queuing impacts under Project conditions. Therefore, the impacts associated with Alternative 4 would be considered *significant and unavoidable*.

6.2 TRANSIT IMPACTS

The changes to the transit network that would be made as part of the ongoing TEP effort were described in section 4.3.2. The TEP operating improvements do not consider the needs of potential future development associated with the Project. As a result, the Project includes a series of transit service improvements in addition to those proposed by the TEP. Three routes would be extended into the proposed Hunters Point Transit Center: the 24-Divisadero, the 44-O'Shaughnessy, and the 48-Quintara-24th Street. Frequencies on the 24-Divisadero would increase from 7.5 minutes under the TEP operating scenario to 6 minutes in the AM and PM peak hours. Frequencies on the 44-O'Shaughnessey would remain at 6 minutes and frequencies on the 48-Quintara-24th Street would increase from 15 minutes to 10 minutes in the AM and PM peak hours. The Project would also extend the 29-Sunset from its current terminus near the Alice Griffith housing development, near Gilman Avenue and Giants Drive into the proposed Candlestick Point retail area, and increase its frequency by reducing headways between buses from 10 minutes to 5 minutes during the AM and PM peak hours. The T-Third service between Bayview and Chinatown via the Central Subway would convert from one-car to two-car trains, but headways would remain unchanged.

In addition, the 28L-19th Avenue Limited would be extended from its TEP-proposed terminus on Geneva Avenue, just east of Mission Street, into the Hunters Point Shipyard transit center. The 28L-19th Avenue Limited would travel along Geneva Avenue across U.S. 101 via the proposed Geneva Avenue extension and new interchange with U.S. 101, to Harney Way. East of Bayshore Boulevard, the 28L-19th Avenue Limited would operate as BRT, traveling in exclusive bus lanes into the Candlestick Point area. The BRT route would travel through the Candlestick Point retail corridor, and cross over Yosemite Slough into the Hunters Point Shipyard transit center. Frequencies on the 28L-19th Avenue Limited would be increased, and headways between buses would be reduced from 10 minutes to 5 minutes.

Funding for implementing the proposed TEP improvements is expected to be negligible because the TEP is designed to be budget-neutral. For the additional service proposed as part of the Project, the City and the Project Applicant have agreed to a Muni service plan that includes service hours, miles and vehicles associated, and have also agreed to execute an agreement which would determine a funding plan to provide the SFMTA the revenues necessary to support the Project. See Transportation Study Appendix K.

Table 72 compares the overall cordon capacity for Muni service for existing conditions, 2030 No Project (with TEP changes assumed to be in place), and the Project conditions for the three study area cordons (**see Figure 19**). Specifically, the Project would more than double overall east-west transit capacity at the cordon just east of Third Street (primarily due to the extension of the 28L-19th Avenue/Geneva Limited BRT route into Hunters Point Shipyard). North-south transit capacity to the north of the project site would double and capacity to the south of the project site would increase by over 80 percent over the transit service proposed by the TEP. Therefore, even though the Project would increase transit ridership on local transit service, the additional capacity provided by the project results in lower overall capacity utilization at the cordons with the Project compared to the 2030 No Project condition.

Table 72
Comparison of Capacity at Study Area Cordons [1, 2]
Existing, 2030 No Project and Project Conditions – Weekday AM and PM Peak Hours

Cordon	Existing Capacity	2030 No Project TEP Capacity [3]	Project Capacity [4]
East of Third Cordon	1,715	1,715	3,988
North Cordon	2,085	1,769	3,546
West Cordon	2,033	2,224	4,002

Notes:
1. Capacity presented in riders per hour. Inbound and Outbound Capacity the same – one direction of capacity presented.
2. Study Area Cordons presented on Figure 19.
3. Year 2030 No Project reflects implementation of TEP recommendations for lines serving the study area. 19-Polk will no longer serve the study area, but will be replaced by the 48-Quintara-24th Street, and the 56-Rutland will be eliminated.
4. Project conditions reflect TEP, plus the following improvements (see Figure 7):
a. 24-Divisadero would be extended from its terminus at Third/Palou, along Palou Avenue and Crisp Avenue into the Hunters Point Shipyard Transit Center. Peak period headways would be reduced from 7.5 minutes under the TEP to 6 minutes
b. The 28L would be extended from its proposed TEP terminus on Geneva Avenue, just east of Mission Street, along Geneva Avenue and Harney Way, across the proposed Yosemite Slough bridge, and into the Hunters Point Shipyard Transit Center. Peak period headways would be reduced from 10 minutes under the TEP to 5 minutes
c. 29-Sunset would be extended from its current terminus at Gilman Avenue/Giants Drive into the Candlestick Point retail center. Headways would be reduced from 10 minutes under the TEP to 5 minutes.
d. 44-O'Shaughnessey would be rerouted from its current route terminating at Evans/Mendell into the Hunters Point Transit Center. Headways would remain at 6 minutes, similar to the TEP scenario.
e. 48-Quintara-24th Street would be rerouted from its current terminus near 22nd/Third to serve the project study area as part of the TEP (replacing the 19-Polk, which would no longer serve the Shipyard site). With the Project, this route would be extended to the Hunters Point Transit Center and headways would decrease from 15 minutes under the TEP to 10 minutes.
f. CPX-Candlestick Express to downtown would be a new express bus route serving the Candlestick Point site, traveling along Harney Way (with potential stops at Executive Park), before traveling on U.S. 101 toward downtown, terminating at the Transbay Terminal.
g. HPX- Hunters Point Shipyard Express to downtown would be a new express bus route serving the Hunters Point Shipyard site, traveling from the Hunters Point Shipyard Transit Center, along Innes Street, with stops at the India Basin and Hunters View areas, before continuing along Evans Avenue to Third Street, eventually entering I-280 northbound at 25th/Indiana. The HPX would continue non-stop to the Transbay Terminal in Downtown San Francisco.
h. T-Third service between Bayview and Chinatown via the Central Subway would convert from one-car to two-car trains, but headways would remain unchanged. The two-car short-line operating between Chinatown and Mariposa Street would remain unchanged.

6.2.1 Project and Project Variants

This section describes the impacts to transit associated with the Project and Project Variants. For project impacts, two transit analyses were conducted: the impact of the additional transit travel demand generated by the Project on the capacity utilization of the study area cordons, the downtown Muni screenlines, and the regional screenlines; and the impact of the additional vehicle and transit travel demand on transit travel times for the Muni routes traveling within the study area.

Overview

The Project would include substantial improvements to transit service in the Hunters Point Shipyard, Candlestick Point, and Bayview neighborhoods, in addition to improvements currently proposed as part of SFMTA's Transit Effectiveness Program. As discussed below, the Project improvements to transit service, combined with existing service and proposed TEP improvements, would provide transit capacity to accommodate the new transit riders generated by the Project and by cumulative development.

Although the Project Description includes a plan for increased transit service to the study area (described in the Project Description), because the final Transit Plan has not been formally approved by SFMTA, **Project Mitigation Measure 7** is required to ensure the final Transit Plan will be prepared and implemented. Thus, mitigation measure **Project Mitigation Measure 7** below requires preparation, approval, and implementation of the final transit-operating plan.

> ***Project Mitigation Measure 7***: The Project Applicant shall work with SFMTA to develop and implement the Project's Transit Operating Plan. Elements of the Project Transit Operating Plan shall include:
>
> - Extension of the 24-Divisadero, the 44-O'Shaughnessy, and the 48-Quintara-24th Street into Hunters Point Shipyard.
> - Increased frequency on the 24-Divisadero to 6 minutes in the AM and PM peak periods. Extension of the 29-Sunset from its current terminus near the Alice Griffith housing development, near Gilman Avenue and Giants Drive, into the proposed Candlestick Point retail area. The 29-Sunset would operate a short line between Candlestick Point and the Balboa Park BART station. This would increase frequencies on the 29-Sunset by reducing headways between buses from 10 minutes to 5 minutes during the AM and PM peak periods between Candlestick Point and the Balboa BART station. Every other bus would continue to serve the Sunset District (to the proposed terminus at Lincoln Drive and Pershing Drive in the Presidio) at 10-minute headways.
> - Convert T-Third service between Bayview and Chinatown via the Central Subway from one-car to two-car trains or comparable service improvement.

- Extension of the 28L-19th Avenue Limited from its TEP-proposed terminus on Geneva Avenue, just east of Mission Street, into the Hunters Point Shipyard transit center. The 28L-19th Avenue Limited would travel along Geneva Avenue across U.S. 101 via the proposed Geneva Avenue extension and new interchange with U.S. 101, to Harney Way. East of Bayshore Boulevard, the 28L-19th Avenue Limited would operate as BRT, traveling in exclusive bus lanes into the Candlestick Point area. The BRT route would travel through the Candlestick Point retail corridor, and cross over Yosemite Slough into the Hunters Point Shipyard transit center.
- The 28L-19th Avenue Limited would operate a short line to the Balboa Park BART station. This would increase frequencies on the 28L-19th Avenue Limited by reducing headways between buses from 10 minutes to 5 minutes for the segment between Hunters Point Shipyard and the Balboa Park BART station. Every other bus would continue to the Sunset District (to the proposed terminus at North Point Street and Van Ness Avenue) at 10-minute headways. If the TEP-proposed extension of the 28L has not been implemented by the SFMTA by the Phase 2 of Project development, the Project Applicant shall fund the extension of that line between its existing terminus and Bayshore Boulevard.
- New CPX-Candlestick Express to downtown serving the Candlestick Point site, traveling along Harney Way (with potential stops at Executive Park), before traveling on U.S. 101 toward downtown, terminating at the Transbay Terminal.
- New HPX-Hunters Point Shipyard Express to downtown serving the Hunters Point Shipyard site, traveling from the Hunters Point Shipyard Transit Center, along Innes Avenue, with stops at the India Basin and Hunters View areas, before continuing along Evans Avenue to Third Street, eventually entering I-280 northbound at 25th/Indiana. The HPX would continue non-stop to the Transbay Terminal in Downtown San Francisco.

Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources. With implementation of the Transit Plan, Project-generated transit trips would be accommodated within the existing and proposed transit capacity, and therefore Project impacts on transit capacity would be *less than significant.*

Transit Capacity Utilization

Table 73 summarizes the capacity utilization for each of the three cordons for the AM and PM peak hours for the Project conditions, and for Project Variants 1 and 2. With the transit capacity increases proposed by the Project, the total transit travel demand on Muni under Project conditions could be accommodated for each of the three cordons during the AM and PM peak hours. All three cordons would operate at less than Muni's 85 percent capacity utilization standards.

Table 73
Ridership and Capacity Utilization at Study Area Cordons
Project and Project Variants – Weekday AM and PM Peak Hours

Source: Fehr & Peers.

If Project-related transit capacity improvements are not provided, then only the capacity presented in **Table 72** for the 2030 No Project conditions would be available to accommodate Project and cumulative transit ridership. As indicated in **Table 42**, under 2030 No Project conditions, the capacity utilization at the study area cordons is projected to exceed Muni's 85 percent capacity utilization standard. With the addition of Project-generated transit trips, the severity of the standard exceedance would increase, and would result in significant impacts. Because the final transit plan has not been formally approved by SFMTA, Project Mitigation Measure 7 is required to ensure the final Transit Plan will be prepared and implemented.

With implementation of Project Mitigation Measure 7, the Project's impacts and the Project's contribution to cumulative impacts on transit capacity at the study area cordons would be *less than significant*.

Table 74 summarizes the capacity utilization for the downtown screenlines for the AM and PM peak hours for the Project conditions, and for Project Variants 1 and 2. As summarized in Table 72, the project would only add peak-direction riders through the southeast downtown screenline. Ridership on other screenlines would remain unchanged. With the addition of project trips, all downtown screenlines would continue to operate with Muni's 85 percent utilization standard. Therefore, Project impact on transit capacity at the Downtown Screenlines would be *less than significant.*

Table 74

Source: Fehr & Peers.

Table 75 summarizes the capacity utilization for the regional transit provider screenlines for the AM and PM peak hours for the Project conditions, and for Project Variants 1 and 2. The Project and Project Variants 1 and 2 would each contribute relatively small ridership increases to regional transit compared to 2030 No Project conditions. Regional cordons would operate at the same percentage of capacity utilization with the Project and Project Variants 1 and 2 as under 2030 No Project conditions, with one exception. The capacity utilization for the South Bay would increase from 69 to 70 percent during the PM peak hour with the Project and Variants 1 and 2, compared to the 2030 No Project scenario. The Project and Variants 1 and 2 would contribute slightly fewer trips to the South Bay cordon in the off-peak directions (southbound in the AM peak hour and northbound in the PM peak hour) than in the peak directions. Off-peak direction ridership would remain within available capacity in the AM and PM peak hours.

Overall, the Project would not increase the capacity utilization by more than one percentage point on any cordon or screenline expected to exceed available capacity without the Project. Further, the increase in Project transit trips would not result in any cordon or screenline expected to operate within available capacity without the Project to exceed its capacity. Project contributions to regional transit providers operating at more than 100 percent capacity utilization (e.g., BART to East Bay, Golden Gate Transit to North Bay) would be minimal, about 0.1 percent. Therefore, the Project and Project Variant's impacts on transit capacity would be *less than significant*.

Project Transit Delay

Impacts to transit were also measured in terms of increases to transit travel times. The analysis evaluated the increases to transit travel times associated with the following three influencing factors[19]:

- **Traffic congestion delay** – Traffic congestion associated with increases in area traffic slows down transit vehicles and results in increased transit travel times. Traffic congestion delays are calculated by summing the average vehicular delay at each intersection along the transit line's route within the study area. The increase in total route segment delay is equal to the increase in travel time associated with the project.
- **Transit re-entry delay** – Transit vehicles typically experience delays after stopping to pick up and drop off passengers while waiting for gaps in adjacent street traffic in order to pull out of bus stops. As traffic volumes on the adjacent street increase, re-entering the flow of traffic becomes more difficult and transit vehicles experience increased delay. Transit re-entry delay was calculated using empirical data presented in the 2000 Highway Capacity Manual (HCM). Total transit re-entry delay for each route was calculated as the sum of transit re-entry delay at each stop within the study area.
- **Passenger boarding delay** – Although increases in transit ridership are generally viewed positively, the amount of time a transit vehicle has to stop to pick up and drop off passengers (i.e., the transit vehicle dwell time) is directly correlated to the number of passengers boarding the vehicle. If, as proposed, the project includes substantial improvements to transit service in the future (and as general transit ridership grows), vehicles would have to spend more time at stops, which may increase overall transit travel times. Passenger boarding delay was calculated assuming two seconds per passenger boarding for buses, and 0.5 seconds per passenger boarding for light rail vehicles. Passenger boardings within the study area were estimated by examining the increases in ridership across the study area cordons.

Although the transit routes in the study area would not be extended into the study area under existing conditions or under 2030 No Project conditions, transit delay for those scenarios was calculated as if the transit routes were extended only for purposes of comparing project impacts. Generally, the increases in travel times associated with the project are somewhat smaller than those associated with the increases expected between existing and 2030 No Project conditions.

[19] The methodology used is similar to that used in the *San Francisco Bicycle Plan Draft EIR*, City of San Francisco Planning Department, November 2008, except that methodology included the additional transit delay associated with substantial increases in bicycle volumes, which was appropriate for a project contemplating large-scale changes to the City's bicycle network. Bicycle volumes are not expected to substantially change as part of this project, so the "bicycle delay" was not included. However, instead, this evaluation includes the added delay associated with increases in passenger boardings, which is more appropriate for this project since the project includes major improvements to area transit service. A more detailed discussion of the methodology is included in Appendix H.

A detailed discussion of how each of these three delay components was calculated is included in Transportation Study Appendix H. **Table 76** summarizes the increases in transit travel times associated with the Project and the Project Variants for each route within the study area, compared to 2030 No Project conditions. A detailed breakdown of the calculations of increased delay associated with the Project is provided in Transportation Study Appendix H. **Table 77** identifies the number of additional vehicles that would be required to meet the proposed headways.

The Project would have a significant impact if it would increase travel times such that additional vehicles would be required to maintain the proposed headways. This was assumed to be the case if either the project's travel time increases to a particular route would be greater than ½ its proposed headway or if the number of required vehicles estimated using SFMTA's cost/scheduling model, which takes into account scheduled breaks and extra time built into schedules, increases by one or more vehicles with the addition of the project characteristics.

Table 78 presents the summary table of project transit impacts for Project, Project Variants, and Alternatives to the Project. On **Table 78**, Project impacts (PI) were identified where the Project would result in an increase in ridership that would result in an exceedance of the capacity utilization standard, or an increase in transit delay such that additional transit vehicles would be required to maintain proposed headways**.** In addition, Project impacts were identified where the Project would contribute significantly to poor intersection operations that, therefore, would contribute to significantly to transit delays that would result in the need for additional transit vehicles to maintain proposed headways, and noted as Significant Contribution/Project Impact (SC/PI). Where the Project would *not* contribute significantly to transit ridership at locations where capacity utilization under 2030 No Project condition exceeds capacity utilization standards, or if the Project would not contribute significantly to poor intersection operations that would affect transit operations, this was noted as No Significant Contribution (NSC).

Where projected ridership under the 2030 No Project condition would result in an exceedance of the capacity utilization standard, or where traffic congestion associated with background traffic growth would result in a need for additional transit vehicles to maintain existing or TEP-proposed headways, this was identified as a No Project Impact (NP Impact).

T-Third	8	**2:57**	**3:35**	**2:50**	**2:33**	**2:45**	**2:32**

Notes:
1. Delays measured for each route between project site and key destination/transfer point away from the project. The study segment for each route is as follows:
- 9-San Bruno: Bayshore Boulevard between Sunnydale Avenue and Jerrold Avenue
- 23-Monterey: between Ingalls Street/Oakdale Avenue and the Glen Park BART Station
- 24-Divisadero: between Hunters Point Shipyard and Mission Street
- 28L-19th Avenue Limited: between Hunters Point Shipyard and Mission Street
- 29-Sunset: between Candlestick Point and Mission Street
- 44-O'Shaughnessy: between Hunters Point Shipyard and the Glen Park BART Station
- 48-Quintara-24th St: between Hunters Point Shipyard and the 24th Street BART Station
- 54-Felton: between Jerrold Avenue/Earl Street and Mission Street
- T-Third: Third Street between Thomas Avenue and Jerrold Avenue (This segment represents the section of the T-Third route that does not provide exclusive right-of-way for transit and would be most affected by increased traffic congestion.)

2. Routes where the Project would increase travel times such that additional vehicles would be required highlighted in **bold**.
3. Due to roadway improvements proposed by the Project and differences between the No Project and Project land use assumptions at the Hunters Point Shipyard, there would be less traffic congestion along 54-Felton route in study area with the Project, than under 2030 No Project conditions.

Source: Fehr & Peers.

As shown on **Table 77**, the addition of Project traffic and ridership demands would create the need for additional vehicles on five routes in the AM peak hour and six routes in the PM peak hour.

- In the AM peak hour, the Project travel demand would require 7 additional transit vehicles for the 9-San Bruno (1 vehicle), 24-Divisadero (1 vehicle), 28L-19th Avenue Limited (1 vehicle), 29-Sunset (1 vehicle), 44-O'Shaughnessy (2 vehicles), and the 48-Quintara-24th Street (1 vehicle) routes. These would be in addition to the 16 vehicles required to maintain 2030 No Project headways (see Table 83).

- In the PM peak hour, the Project would result in the need for 12 additional transit vehicles for the 9-San Bruno (1 vehicle), 24-Divisadero (3 vehicles), 28L-19th Avenue Limited (1 vehicle), 29-Sunset (3 vehicles), 44-O'Shaughnessy (2 vehicles), the 54-Felton (1 vehicle), and the T-Third (1 train car) routes. These would be in addition to the 16 required to maintain 2030 No Project headways.

This would be a significant impact. Although the Project would increase congestion in the overall study area, the traffic analysis indicates that the impacts to transit would be greatest at key bottleneck locations where there is substantial cross-traffic, specifically routes that cross Third Street. Discussion of impacts is presented by line and corridor.

9-San Bruno - Project-related transit delays due to congestion on study area roadways and passenger loading delays associated with increased ridership would result in significant impacts on the operation of the 9-San Bruno. Within the study area, the 9-San Bruno would experience substantial delays at key intersections along San Bruno Avenue, including at Silver Avenue, Silliman Avenue, Paul Avenue/Dwight Street, and at Mansell Street. Overall, the Project-related congestion would add up to 8 minutes of delay per bus during peak hours. The provision of transit-only lanes on San Bruno Avenue, and other transit-priority treatments would reduce travel time delays and impacts on this line.

> **Project Mitigation Measure 8.1:** To address Project impacts to the 9-San Bruno, prior to issuance of a grading permit for Phase 1, the Project Applicant in cooperation with SFMTA shall conduct a study to evaluate the effectiveness and feasibility of the following improvements which could reduce Project impacts on transit operations along the San Bruno Avenue corridor, generally between Campbell Avenue and Silver Avenue. The study shall create a monitoring program to determine the implementation extent and schedule (as identified below) to maintain the proposed headways of the 9-San Bruno.
>
> - Install a transit-only lane on northbound San Bruno Avenue for the one-block section (400 feet) between Silliman Street and Silver Avenue. This would involve removal of five metered spaces on the east side of San Bruno Avenue, just south of Silver Avenue. Treatment for transit-only lanes can range from

striping to physical elevation changes or barriers to protect transit right-of-way from mixed-flow traffic.

- Install a transit-only lane on southbound San Bruno Avenue at the approach to Dwight Street/Paul Avenue. This lane would function as a so-called "queue-jump" lane, allowing buses to bypass queues on southbound San Bruno Avenue at the intersection. The lane should begin approximately 200 feet north of Dwight Street and extend one block (about 300 feet) south of Paul Avenue to Olmstead Street. This would involve the removal of up to 20 on-street parking spaces on the west side of San Bruno Avenue. This treatment could be limited to peak hours only, which would minimize the impact of the parking loss. The segment of San Bruno Avenue between Dwight Street and Olmstead Street is designated as Bicycle Routes #705 and 5 (Class III signed routes).

- At the intersection of San Bruno/Silver install signal priority treatments on westbound Silver Avenue, where buses waiting to turn left from Silver Avenue onto southbound San Bruno Avenue must currently wait through almost an entire signal cycle due to the heavy oncoming traffic on eastbound Silver Avenue. Installation of a transit signal pre-emption at this location that provides a "green" signal for westbound vehicles but holds eastbound vehicles when buses are present would allow transit vehicles to turn left onto San Bruno Avenue without having to wait for opposing eastbound through traffic to clear.

The Project Applicant shall fully fund the costs of implementing the transit priority improvements (either the improvements identified above, or alternative improvements of equal or greater effectiveness and comparable cost) as determined by the study and the monitoring program. Other options to be evaluated in the study could include comprehensive replacement of stop-controlled intersections with interconnected traffic signals equipped with transit priority elements.

Project Mitigation Measure 8.2 - Should Project Mitigation Measure 8.1 not be feasible or effective, the Project Applicant shall work with SFMTA to purchase additional transit vehicles and contribute to operating costs and facility improvements as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 9-San Bruno. Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources not otherwise accessible to Muni, adequate and sufficient to provide for SFMTA's associated ongoing operating costs, transit vehicle capital costs, and facility costs to store and maintain these vehicles.

The three treatments contained in Project Mitigation Measure 8.1 combined could reduce AM peak hour travel times by 4 minutes and 6 seconds in the northbound direction, and 6 minutes 18 seconds in the southbound direction. During the PM peak hour, these treatments could reduce PM peak hour travel times by 4 minutes 6 seconds in the northbound direction and by 8 minutes in the southbound direction. With the combination of mitigation measures, transit travel times in each direction and during each peak period would be no greater than for 2030 No Project conditions. However, because 2030 No Project conditions constitute adverse delays to transit service, cumulative adverse delays to transit service would occur even with these Project transit mitigation measures. Because adverse transit delays affecting this line are generated by adverse traffic congestion to which the Project has a considerable contribution, the Project also has a cumulatively considerable contribution to adverse transit delays.

Implementation of Project Mitigation Measure 8.2, on the other hand, would allow operation of headways as described in Project Mitigation Measure 7. However, given the congestion along the San Bruno Avenue corridor, implementation of Project Mitigation Measure 8.2 alone, without Project Mitigation Measure 8.1, might not be sufficient to reduce the impact to less than significant levels.

Implementation of **Project Mitigation Measure 8.1** would exacerbate LOS F conditions at the intersections of San Bruno/Silver, San Bruno/Silliman/U.S. 101 Southbound off-ramp, and San Bruno/Paul that were identified as having significant and unavoidable impacts. Additional impacts of these mitigation measures would be similar to Project impacts addressed in this section regarding traffic circulation, parking supply, loading supply and operations, and bicycle circulation.

Because a feasibility study of the improvements contemplated in mitigation measure **Project Mitigation Measure 8.1** would be required, implementation of **Project Mitigation Measure 8.1** is uncertain. Because implementation of **Project Mitigation Measure 8.2** alone, without **Project Mitigation Measure 8.1**, might not be sufficient to reduce the impacts on the 9-San Bruno to a less than significant level, the Project impacts on the 9-San Bruno would remain *significant and unavoidable.*

23-Monterey, 24-Divisadero and 44-O'Shaughnessy - Project-related transit delays due to congestion on study area roadways and passenger boarding delays associated with increased ridership would result in significant impacts on the operation of the 23-Monterey, 24-Divisadero, and 44-O'Shaughnessy. Along Palou Avenue these lines would be affected by the substantial congestion projected at the intersection of Third/Palou and the queues that would extend to the east and west of Third Street. Overall, the Project-related congestion would add up to 7 minutes of delay per bus during peak hours. The provision of transit-only lanes on Palou Avenue would reduce travel time delays and impacts on these lines.

Project Mitigation Measure 9.1: To address Project impacts to the 23-Monterey, 24-Divisidero and the 44-O'Shaughnessy, prior to issuance of a grading permit for Phase 1, the Project Applicant in cooperation with SFMTA shall conduct a study to evaluate the effectiveness and feasibility of the following improvements which could reduce Project impacts on transit operations along the Palou Avenue corridor, generally between Griffith Street and Newhall Street. The study shall create a monitoring program to determine the implementation extent and schedule (as identified below) to maintain the proposed headways of the 23-Monterey, 24-Divisidero and the 44-O'Shaughnessy.

- Convert one of the two westbound travel lanes on Palou Avenue between Keith Street and Newhall Street (three blocks) to a transit-only lane at all times. Treatment for transit-only lanes can range from striping to physical elevation changes to protect right-of-way from mixed-flow traffic. Because the westbound lanes between Third Street and Newhall Street are relatively narrow, parking would likely need to be prohibited on the north side of Palou Avenue between Third Street and Newhall Street (approximately 600 feet) during peak periods to maximize the effectiveness of the transit-only lane.

- Convert one of the two eastbound travel lanes on Palou Avenue between Newhall Street and Third Street (one block) to a transit-only lane at all times. Because the eastbound travel lanes between Newhall Street are relatively narrow, parking would likely need to be prohibited on the south side of Palou Avenue between Newhall Street and Third Street (approximately 600 feet) during peak periods to maximize the effectiveness of the transit-only lane. In the eastbound direction, east of Third Street, buses would re-enter the single mixed-flow traffic lane at the bus stop on the far (east) side of Third Street.

- There are currently pedestrian corner bulbs on the northwest and southwest corners of the intersection of Palou Avenue and Third Street. In order to accommodate the transit-only lanes west of Third Street, these bulbouts would be reconfigured or removed. Although removing pedestrian bulb-outs may increase pedestrian crossing distances and is generally inconsistent with the City's desire to prioritize pedestrian activity, in this case, the improvement would offer substantial benefits to transit travel times by allowing a transit-only lane through a congested intersection. This would be consistent with the City's transit-first policy.

- During the PM peak period only, prohibit parking on westbound Palou Avenue for the four-block segment between Griffith Street/Crisp Avenue and Keith Street, to provide for a PM peak period curb transit-only lane along this segment. This would create a continuous westbound transit-only lane on Palou

Avenue between Griffith Street/Crisp Avenue and Newhall Street during the PM peak period.

- As an alternative to the bulleted measures above, narrow the existing sidewalks on Palou Avenue from Third Street to Crisp Avenue (seven blocks) from 15 feet to 12 feet in width. The pedestrian bulb-outs on the west side of Third Street would be removed. The resulting 12-foot-wide sidewalks would be consistent with the Better Streets Plan guidelines. The reduction in sidewalk width would allow for the provision of a 7-foot-wide on-street parking lane, an 11-foot-wide transit-only lane, and a 10-foot-wide mixed-flow lane in each direction on Palou Avenue. This would preserve on-street parking along the corridor and provide a seven-block transit-only lane on Palou Avenue between Griffith Street/Crisp Avenue and Newhall Street. Treatment for transit-only lanes can range from striping to physical elevation changes to protect right-of-way from mixed-flow traffic.

The Project Applicant shall fully fund the costs of implementing the transit priority improvements (either the improvements identified above, or alternative improvements of equal or greater effectiveness and comparable cost) as determined by the study and the monitoring program. Other options to be evaluated in the study could include signal priority treatments at other signalized intersections including at Bayshore/Cortland, Bayshore/Industrial, and Bayshore/Oakdale.

Project Mitigation Measure 9.2: Should Project Mitigation Measure 9.1 not be feasible or effective, the Project Applicant shall work with SFMTA to purchase additional transit vehicles and contribute to operating costs and facility improvements as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 23-Monterey, the 24-Divisadero and the 44-O’Shaughnessy. Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources not otherwise accessible to Muni, adequate and sufficient to provide for SFMTA’s associated ongoing operating costs, transit vehicle capital costs, and facility costs to store and maintain these vehicles.

Implementation of the transit-only lanes would reduce travel times on the three routes:

<u>23-Monterey</u> – The Project would not result in Project-specific impacts to the 23-Monterey because increases in Project-generated vehicles would not increase intersection delay and transit travel times such that additional transit vehicles would be required to maintain the proposed headways. However, it would contribute to cumulatively significant impacts identified for the 2030 No Project condition. The mitigation measures identified for Palou Avenue would improve

service on the 23-Monterey, but the route would continue to experience cumulatively significant impacts.

24-Divisadero – Combined, these measures (either the first three bullets combined or the fourth alone) could reduce AM peak hour travel times by 4 minutes and 45 seconds in the westbound direction and by 4 minutes in the eastbound direction. During the PM peak hour travel times could be reduced by 8 minutes and 15 seconds in the westbound direction and by 4 minutes in the eastbound direction. In each direction and peak hour, the transit travel times with the Project might not be greater than the 2030 No Project travel times by more than ½ headway, and therefore additional transit vehicles would not be required.

44-O'Shaughnessy – The improvements along Palou Avenue between Keith Street and Newhall Street would improve the travel times on the 44-O'Shaughnessy such that in each direction and peak hour, the transit travel times with the Project would not be greater than the 2030 No Project travel times by more than ½ headway, and therefore additional vehicles would not be required to maintain the proposed headways.

With the combination of treatments identified in Project Mitigation Measure 9.1, transit travel times in each direction and during each peak period would be no greater than for 2030 No Project conditions. However, because 2030 No Project conditions constitute adverse delays to transit service, cumulative adverse delays to transit service would occur even with these Project transit mitigation measures. Because adverse transit delays affecting this line are generated by adverse traffic congestion to which the Project has a considerable contribution, the Project also has a cumulatively considerable contribution to adverse transit delays.

Implementation of Project Mitigation Measure 9.2, on the other hand, would allow operation of headways as described under Project Mitigation Measure 9.1. However, given the congestion along the Palou Avenue corridor, implementation of Project Mitigation Measure 9.2 alone, without Project Mitigation Measure 9.1, might not be sufficient to reduce the impact to less than significant levels.

Implementation of Project Mitigation Measure 9.1 would also exacerbate automobile LOS F conditions at the intersection of Third/Palou that would have significant and unavoidable impacts under Project conditions. In addition, these measures may result in new significant and unavoidable impacts at intersections along Palou Avenue (i.e., at Griffith/Crisp, Ingalls, Jennings, Lane, Keith Streets). Additional impacts of these mitigation measures would be similar to other Project impacts regarding traffic circulation, parking supply, loading supply and operations, and bicycle circulation.

Because a feasibility study of the improvements contemplated in Project Mitigation Measure 9.1 would be required, implementation of this measure is uncertain. Because implementation of

Project Mitigation Measure 9.2 alone, without Project Mitigation Measure 9.1, might not be sufficient to reduce the impacts on the 23-Monterey, 24-Divisadero, and 44-O'Shaughnessy to a less than significant level, the Project impacts on the 23-Monterey, 24-Divisadero, and 44-O'Shaughnessy would remain *significant and unavoidable.*

29-Sunset - Project-related transit delays due to congestion on study area roadways and passenger loading delays associated with increased ridership would result in significant impacts on the operation of the 29-Sunset. Within the study area, the 29-Sunset would experience substantial delays at key intersections along Gilman Avenue and Paul Avenue, particularly at Third Street and Bayshore Boulevard. Overall, the Project-related congestion would add up to 17 minutes of delay per bus during peak hours. The provision of transit-only lanes on Gilman Avenue and Paul Avenue would reduce travel time delays and impacts on this line.

> **Project Mitigation Measure 10.1:** To address Project impacts to the 29-Sunset, prior to issuance of a grading permit for Phase I, the Project Applicant in cooperation with SFMTA shall conduct a study to evaluate the effectiveness and feasibility of the following improvements which could reduce Project impacts on transit operations along the Gilman Avenue and Paul Avenue corridor, generally between Arelious Walker Drive and Bayshore Boulevard. The study shall create a monitoring program to determine the implementation extent and schedule (as identified below) to maintain the proposed headways of the 29-Sunset.
>
> - For the five-block segment of Gilman Avenue between Arelious Walker Drive and Third Street, prohibit on-street parking on westbound Gilman Avenue during the AM and PM peak periods to provide for three westbound travel lanes. During the peak periods convert one of the three westbound travel lanes to transit-only. During off-peak periods, parking would be allowed, and buses would travel in one of the two mixed-flow lanes. The peak period transit lanes would impact 90 parking spaces.
>
> - For the same five-block segment of Gilman Avenue between Arelious Walker Drive and Third Street, restripe the eastbound direction to provide two travel lanes, one of which would accommodate on-street parking and one of which would be a mixed-flow travel lane. During the AM and PM peak periods, prohibit on-street parking in the eastbound direction, and operate one of the two eastbound lanes as transit-only lanes. The peak period transit lanes would impact 80 parking spaces.
>
> - As an alternative to the two bulleted measures above, narrow the existing sidewalks on Gilman Avenue from Third Street to Griffith Street (four blocks) from 15 feet to 12 feet in width. The resulting 12-foot-wide sidewalks would

be consistent with the Better Streets Plan guidelines. The reduction in sidewalk width would allow for the provision of a 7-foot-wide on-street parking lane, an 11-foot-wide transit-only lane, and a 10-foot-wide mixed-flow lane in each direction on Gilman Avenue. This would preserve on-street parking along the corridor and provide four-block transit-only lanes on Gilman Avenue between Griffith Street and Third Street. Treatment for transit-only lanes can range from striping to physical elevation changes to protect right-of-way from mixed-flow traffic.

- Prohibit on-street parking on the north side of Paul Avenue, between Third Street and Bayshore Boulevard to create two westbound through lanes. Convert one westbound through lane to transit-only in the AM and PM peak periods. The peak period transit-only lane would impact 40 parking spaces. At the intersection of Paul Avenue and Bayshore Avenue, provide transit signal priority treatment (i.e., queue jump) to allow transit vehicles to maneuver into the mixed flow left-hand lane, facilitating a left-turn movement immediately west of Bayshore Boulevard from westbound Paul Avenue to southbound San Bruno.

The Project Applicant shall fully fund the costs of implementing the transit priority improvements (either the improvements identified above, or alternative improvements of equal or greater effectiveness and comparable cost) as determined by the study and the monitoring program. Other options to be evaluated in the study could include transit priority treatments on San Bruno Avenue, on the portions where the 29-Sunset travels.

Project Mitigation Measure 10.2: Should Project Mitigation Measure 10.1 not be feasible or effective, the Project Applicant shall work with SFMTA to purchase additional transit vehicles and contribute to operating costs and facility improvements as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 29-Sunset. Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources not otherwise accessible to Muni, adequate and sufficient to provide for SFMTA's associated ongoing operating costs, transit vehicle capital costs, and facility costs to store and maintain these vehicles.

Implementation of transit-only lanes identified in mitigation measure Project Mitigation Measure 10.1 could reduce AM peak hour transit travel times by 4 minutes and 48 seconds in the westbound direction and 5 minutes and 10 seconds in the eastbound direction. During the PM peak, these measures would reduce transit travel times by 5 minutes and 20 seconds in the westbound direction and by 2 minutes in the eastbound direction. With the combination of mitigation measures, transit travel times in each direction and during each peak period would be no greater than for 2030 No Project conditions. However, because 2030 No Project conditions constitute adverse delays to transit service, cumulative adverse delays to transit service would occur even with these Project transit mitigation measures. Because adverse transit delays affecting this line are generated by adverse traffic congestion to which the Project has a considerable contribution, the Project also has a cumulatively considerable contribution to adverse transit delays.

Implementation of Project Mitigation Measure 10.1, on the other hand, would allow operation of headways as described under Project Mitigation Measure 7. However, given the congestion along the Gilman Avenue corridor, implementation of Project Mitigation Measure 10.2 alone, without Project Mitigation Measure 10.1, might not be sufficient to reduce the impact to less than significant levels.

Implementation of Project Mitigation Measure 10.1 would also exacerbate automobile LOS F conditions at the intersection of Third/Paul and Paul/Bayshore that was identified as having significant and unavoidable impacts. Additional impacts of these mitigation measures would be similar to Project impacts regarding traffic circulation, parking supply, loading supply and operations, and bicycle circulation.

Because a feasibility study of the improvements contemplated in mitigation measure Project Mitigation Measure 10.1 would be required, implementation of Project Mitigation Measure 10.1 is uncertain. Because implementation of Project Mitigation Measure 10.2 alone, without Project Mitigation Measure 10.1, might not be sufficient to reduce the impacts on the 29-Sunset to a less than significant level, the Project impacts on the 29-Sunset would remain *significant and unavoidable.*

48-Quintara-24th Street – Project-related transit delays due to congestion on study area roadways and passenger loading delays associated with increased ridership would result in significant impacts on the operation of the 48-Quintara-24th Street. Within the study area, the 48-Quintara-24th Street would experience substantial delays at key intersections along Evans Avenue, particularly at the key intersections with Third Street, Napoleon/Toland Streets and at Cesar Chavez Street. Overall, the Project-related congestion would add up to 3 minutes of delay per bus during peak hours. The provision of transit-only lanes on Evans Avenue and other transit-priority treatments would reduce travel time delays and impacts on this line.

> **Project Mitigation Measure 11.1:** To address Project impacts to the 48-Quintara-24th Street, prior to issuance of a grading permit for Phase I, the Project Applicant in cooperation with SFMTA shall conduct a study to evaluate the effectiveness and feasibility of the following improvements which could reduce Project impacts on transit operations along the Evans Avenue corridor, generally between Hunters Point Boulevard and Napoleon Street. The study shall create a monitoring program to determine the

implementation extent and schedule (as identified below) to maintain the proposed headways of the 48-Quintara-24th Street.

- On Evans Avenue, between Jennings Street and Napoleon Street (a nine-block segment—about 6,000 feet), convert one of the two travel lanes in each direction to a transit-only lane at all times. Treatment for transit-only lanes can range from striping to physical elevation changes or barriers to protect transit right-of-way from mixed-flow traffic.

The Project Applicant shall fully fund the costs of implementing the transit priority improvements (either the improvements identified above, or alternative improvements of equal or greater effectiveness and comparable cost) as determined by the study and the monitoring program. Other options to be evaluated in the study could include extension of transit only lanes in one or both directions between Napoleon Street and Cesar Chavez Street or onto Hunters Point Boulevard and Innes Avenue.

Project Mitigation Measure 11.2: Should Project Mitigation Measure 11.1 not be feasible or effective, the Project Applicant shall work with SFMTA to purchase additional transit vehicles and contribute to operating costs and facility improvements as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 48-Quintara-24th Street. Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources not otherwise accessible to Muni, adequate and sufficient to provide for SFMTA's associated ongoing operating costs, transit vehicle capital costs, and facility costs to store and maintain these vehicles.

Provision of the transit-only lane on Evans Avenue, as identified in mitigation measure Project Mitigation Measure 11.1 would reduce AM peak hour transit travel times by 80 seconds in the westbound direction, and by 2 minutes and 33 seconds in the eastbound direction. During the PM peak hour transit travel times would be reduced by 1 minute and 40 seconds in the westbound direction, and by 2 minutes and 15 seconds in the eastbound direction. With the combination of mitigation measures, transit travel times in each direction and during each peak period would be no greater than for 2030 No Project conditions. However, because 2030 No Project conditions constitute adverse delays to transit service, cumulative adverse delays to transit service would occur even with these Project transit mitigation measures. Because adverse transit delays affecting this line are generated by adverse traffic congestion to which the Project has a considerable contribution, the Project also has a cumulatively considerable contribution to adverse transit delays.

Implementation of Project Mitigation Measure 11.2, on the other hand, would allow operation of headways as described under Project Mitigation Measure 7. However, given the congestion along Evans Avenue, implementation of Project Mitigation Measure 11.2 alone, without Project Mitigation Measure 11.1, might not be sufficient to reduce the impact to less than significant levels.

Implementation of Project Mitigation Measure 11.1 would also exacerbate automobile LOS F conditions at some intersections that were identified as significant and unavoidable impacts. In addition, it would ultimately be at SFMTA's discretion whether the transit-only lane would be implemented in the center lanes or in the lanes adjacent to the curb. Implementation of center-running lanes may have some operational benefit (depending on the results of feasibility study to be conducted if conditions warrant implementation of this measure), center-running lanes may result in loss of some additional on-street parking near stop platforms. Additional impacts of these mitigation measures would be similar to Project impacts regarding traffic circulation, parking supply, loading supply and operations, and bicycle circulation.

Because a feasibility study of the improvements contemplated in Project Mitigation Measure 11.1 would be required, implementation of Project Mitigation Measure 11.1 is uncertain. Because implementation of Project Mitigation Measure 11.2 alone, without Project Mitigation Measure 11.1, might not be sufficient to reduce the impacts on the 48-Quintara-24th Street to a less than significant level, the Project impacts on the 48-Quintara-24th Street would remain *significant and unavoidable.*

54-Felton – Additional traffic congestion associated with Project vehicle trips would result in significant impacts to the operations of the 54-Felton, particularly during the PM peak hour. Overall, the Project-related congestion would add up to 6 minutes of delay per bus during peak hours. However, unlike many of the other transit routes within the study area, the 54-Felton provides a relatively circuitous neighborhood collector service, which typically includes a number of turns and short distances on individual streets. As a result, mitigation measures that provide transit-only lanes are not practical due to the difficulty of accommodating turning movements at intersections. Further, although the 54-Felton would travel along Third Street between Palou Avenue and Hudson Street, relocating the 54-Felton to the dedicated light rail transit right of way in the center of Third Street would not be feasible because the train platforms are high-floor and on the left-hand side and buses load and unload from the right-hand side at low-floor stops. There is not adequate space in the existing right-of-way to provide new platforms to load and unload passengers from a bus in this area.

> **Project Mitigation Measure 12:** SFMTA shall purchase additional transit vehicles and contribute to operating costs and facility improvements to mitigate the Project impacts and Project contribution to cumulative impacts to headways on 54-Felton. Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources not otherwise accessible to Muni, adequate and sufficient to provide for SFMTA's associated

ongoing operating costs, transit vehicle capital costs, and facility costs to store and maintain these vehicles.

While the provision of additional transit vehicles for the 54-Felton would reduce impacts associated with increased travel times, the transit vehicles would still be subject to delays resulting from increased congestion, and therefore Project impacts on the 54-Felton would remain *significant and unavoidable.*

T-Third – Project-related transit delays due to congestion on Third Street and passenger loading delays associated with increased ridership would result in significant impacts on the operation of the T-Third. Within the study area, the T-Third would primarily experience delays related to increased traffic volumes within the segment between Thomas Avenue and Kirkwood Avenue where the light rail operates within a mixed-flow travel lane. Along the remainder of Third Street and Bayshore Boulevard, the T-Third operates within an exclusive right-of-way. Overall, the Project-related congestion would add up to 3 minutes of delay per bus during peak hours. Providing exclusive right-of-way for the T-Third in the segment between Thomas Avenue and Kirkwood Avenue would reduce travel time delays for the T-Third.

Project Mitigation Measure 13.1: To address Project impacts to the T-Third, prior to issuance of a grading permit for Phase I, the Project Applicant in cooperation with SFMTA shall conduct a study to evaluate the effectiveness and feasibility of the following improvement that could reduce Project impacts on transit operations along Third Street between Thomas Avenue and Kirkwood Avenue. The study shall create a monitoring program to determine the implementation extent and schedule (as identified below) to maintain the proposed headways of the T-Third.

- Reconfigure the section of Third Street between Thomas Avenue and Kirkwood Avenue (9 blocks) where the light rail vehicles currently share the travel lane with auto traffic to provide a dedicated transit right-of-way, consistent with the rest of the route. This would require either removal of one travel lane in each direction on Third Street, or removal of on-street parking and some sidewalk bulbouts. In addition, left-turns from Third Street in this segment would be restricted in both directions. Treatment for transit-only lanes can range from striping to physical elevation or barriers to protect transit right-of-way from mixed-flow traffic.

Implementation of the intersection reconfiguration shall be the responsibility of SFMTA, and shall be implemented when the results of the study described above indicate transit improvements are necessary. The Project Applicant shall fully fund the costs of implementing the transit priority improvements prior to approval of subsequent phases of development.

Project Mitigation Measure 13.2: Should Project Mitigation Measure 13.1 not be feasible or effective, the Project Applicant shall work with SFMTA to purchase additional transit vehicles and contribute to operating costs and facility improvements as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the T-Third. Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources not otherwise accessible to Muni, adequate and sufficient to provide for SFMTA's associated ongoing operating costs, transit vehicle capital costs, and facility costs to store and maintain these vehicles.

Providing an exclusive right-of-way for the T-Third would reduce all delays associated with traffic congestion on Third Street during both AM and PM peak periods, such that transit travel times in year 2030 with the Project would be less than under than existing conditions.

Implementation of Project Mitigation Measure 13.2, on the other hand, would allow operation of headways as described under Project Mitigation Measure 7. However, given the congestion along Third Street, implementation of Project Mitigation Measure 13.2 alone, without Project Mitigation Measure 13.1, might not be sufficient to reduce the impact to less than significant levels.

Implementation of mitigation measure Project Mitigation Measure 13.2 would also exacerbate automobile LOS F conditions at intersections along Third Street that were identified as significant and unavoidable impacts. Additional impacts of these mitigation measures would be similar to Project impacts regarding traffic circulation, parking supply, loading supply and operations, and bicycle circulation.

Because a feasibility study of the improvements contemplated in Project Mitigation Measure 13.1 would be required, implementation of Project Mitigation Measure 13.1 is uncertain. Because implementation of Project Mitigation Measure 13.2 alone, without Project Mitigation Measure 13.1, might not be sufficient to reduce the impacts on the T-Third to a less than significant level, the Project impacts on the T-Third would remain *significant and unavoidable.*

28L-19th Avenue/Geneva Limited – Increased congestion associated with Project vehicle trips would impact the operations of the 28L-19th Avenue/Geneva Limited, which would be a significant impact. In the Project vicinity, the 28L-19th Avenue/Geneva Limited would generally travel in the exclusive BRT lanes, but would be subject to delays at the intersection of Geneva Avenue and Bayshore Boulevard. Overall, the Project-related congestion would add up to 4 minutes of delay per bus during peak hours. The intersection of Bayshore/Geneva would be reconfigured as part of the Geneva Avenue Extension project, and the provision of transit-only lanes on Geneva Avenue on the eastbound and westbound approaches to the intersection would reduce the impact of cumulative congestion.

Project Mitigation Measure 14.1: The City of Brisbane, as part of the Geneva Avenue Extension Project, shall account for existing traffic, background traffic growth, and the most recent forecasts of traffic expected to be associated with each of several adjacent development projects, including the Project. The San Francisco County Transportation Authority (SFCTA) and SFMTA shall coordinate with the City of Brisbane to ensure transit preferential treatment is accounted for in the design of the Geneva Avenue Extension.

Project Mitigation Measure 14.2: Should Project Mitigation Measure 14.1 not be feasible or effective, the Project Applicant shall work with SFMTA to purchase additional transit vehicles and contribute to operating costs and facility improvements as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 28L-19th Avenue/Geneva Limited. Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources not otherwise accessible to Muni, adequate and sufficient to provide for SFMTA's associated ongoing operating costs, transit vehicle capital costs, and facility costs to store and maintain these vehicles.

Since implementation of Project Mitigation Measure 14.1 would be under the jurisdiction of the City of Brisbane, the implementation of the mitigation measure is uncertain. Implementation of Project Mitigation Measure 14.2, on the other hand, would allow operation of headways as described under Project Mitigation Measure 7. However, given the congestion along Geneva Avenue, implementation of Project Mitigation Measure 14.2 alone, without Project Mitigation Measure 14.1, might not be sufficient to reduce the impact to less than significant levels.

Because implementation of Project Mitigation Measure 14.2 alone, without Project Mitigation Measure 14.1, might not be sufficient to reduce the impacts on the 28L-19th Avenue/Geneva Limited to a less than significant level, the Project impacts on the 28L-19th Avenue/Geneva Limited would remain *significant and unavoidable.*

9X, 9AX, 9BX-Bayshore Expresses, 14X-Mission Express, CPX-Candlestick Express and HPX-Hunters Point Express – As described in traffic section above, the Project would contribute to cumulative traffic impacts on U.S. 101 northbound and southbound. The projected increases in congestion would affect transit lines operating on U.S. 101, notably the 9X, 9AX, and 9BX-Bayshore Expresses, and the 14X-Mission Express (the 14X-Mission Express operates southbound on U.S. 101, and northbound on I-280). The Project's new CPX-Candlestick Express between Candlestick Point and downtown would also use U.S. 101, and the HPX-Hunters Point Express would use I-280, and both would be subject to increased travel times due to freeway congestion. The Project's contribution to cumulative traffic congestion on U.S. 101 and associated delays to express bus service operating on U.S. 101 would be considered a significant impact on transit operations.

Potential strategies to reduce congestion impacts on transit travel times could include bus-only operation on the shoulders of U.S. 101, re-opening of the U.S. 101 northbound Silver Avenue on-ramp for transit only, and creating transit-only lanes on I-280 along with rerouting of the transit lines to I-280. Additional studies and coordination with Caltrans would be required to determine the feasibility of these strategies. As feasibility of these strategies is uncertain, the impact on the 9X, 9AX, 9BX-Bayshore Expresses, the 14X-Mission Express, and the new CPX-Candlestick Express and the HPX-Hunters Point Express operations would remain *significant and unavoidable*.

Regional Transit - As described above in the traffic intersection and freeway impact analysis, the Project would increase congestion and contribute to cumulative traffic congestion on Bayshore Boulevard and on U.S. 101, which would impact the travel times of SamTrans buses using these facilities. Potential strategies to reduce transit delay could include providing transit-only lanes on Bayshore Boulevard, permitting bus-only use of the shoulders of U.S. 101, and providing transit-only lanes on I-280 (and rerouting SamTrans buses from U.S. 101 to I-280).

Additional studies and coordination with SamTrans, Caltrans, and the City of Brisbane would be required to determine the feasibility of these strategies. Since implementation of these strategies is uncertain the impact on SamTrans bus operations would remain *significant and unavoidable*.

Project Variants

During the AM peak hour Project Variants 1 and 2 would require additional transit vehicles on the same routes as the Project. During the PM peak hour, Project Variants 1 and 2 would require additional vehicles on the same routes as the Project, except that the Variants would also require additional vehicles on the 48-Quintara-24th Street. The number of vehicles required for each peak hour for the Project and the two Project Variants is shown in **Table 75**, above. Impacts associated with Project Variants 1 and 2 would be somewhat more extensive than those for the Project. Project Variant 1 would require 10 additional vehicles in the AM peak hour, and 15 additional vehicles in the PM peak hour. Project Variant 2 would require 8 additional vehicles in the AM peak hour, and 12 additional vehicles in the PM peak hour. As with the Project, these vehicles would be in addition to those required to maintain 2030 No Project headways.

Project Mitigation Measures 7 though 14.2 above would be applicable for Project Variants 1 and 2, and reduce the impacts associated with Project Variants 1 and 2 by similar amounts as described above. However, as with the Project, impacts on transit operations would remain *significant and unavoidable*.

6.2.2 Alternatives to the Project

This section describes the transit impacts associated with Project Alternatives.

Transit Capacity Utilization

For each of the Project Alternatives, **Table 79** summarizes the additional transit trips and overall capacity utilization for each of the three study area Muni cordons during the AM and PM peak hours. **Table 80** presents the Project Alternative additional transit trips and capacity utilization at the Muni downtown screenlines, while **Table 81** presents the Alternative additional transit trips and capacity utilization for the regional screenlines. It should be noted that Alternatives 2, 3, 4 and 5 assumed the same transit improvements as the Project, and therefore capacity during the AM and PM peak hours would be the same. Alternative 1 (the No Project condition) would only include the planned TEP improvements, and, as indicated in **Table 72**, peak hour capacity within the study area and at the cordons would decrease slightly.

Source: AECOM, Fehr & Peers.

The Alternatives would contribute slightly fewer trips to the South Bay cordon in the off-peak directions (southbound in the AM peak hour and northbound in the PM peak hour) than in the peak directions. Off-peak direction ridership would remain within available capacity in the AM and PM peak hours. Generally, the project cordons would operate at similar or lower capacity utilization under Alternatives 2, 3, 4, and 5 than with the Project. The exception to this is that Alternative 5 would have slightly higher capacity utilization on the East of Third Cordon and the West Cordon in the outbound direction in the PM peak hour only. However, all cordons would operate within Muni's 85 percent capacity utilization under Alternatives 2, 3, 4, and 5. As described in the previous chapter, the study area cordons would exceed the 85 percent capacity utilization standard under Alternative 1 on the North Cordon, in both the inbound and outbound directions during the AM and PM peak hours. During the AM peak hour, the East of Third Cordon in the outbound direction and the West Cordon in the inbound direction would exceed Muni's capacity utilization standard.

The Alternatives to the Project would add trips to the southeast downtown screenline. Under Alternatives 1, 2, 3, 4, and 5, the capacity utilization of the southeast screenline would be the same as or lower than it would be with the Project, and in all cases, would operate below Muni's 85 percent capacity utilization standard.

Regional cordons would operate at the same percentage of capacity utilization with the Project Alternatives as under 2030 No Project conditions, with one exception. The capacity utilization for the South Bay would increase from 69 to 70 percent during the PM peak hour for each of the Alternatives compared to the 2030 No Project condition. Overall, the Alternatives would not increase the capacity utilization by more than one percentage point on any cordon expected to exceed available capacity without the project. Further, the project alternatives would not cause any cordon expected to operate within available capacity without the project to exceed its capacity.

Alternative 1 – No Project: Under Alternative 1 (No Project) transit ridership at the cordons would increase due to projected development within the India Basin area and Hunters Point Shipyard. The North, West and East of Third cordons would operate at more than the capacity utilization standard of 85 percent, and therefore there would be significant cumulative (2030 No Project) transit impacts at these cordons.

The existing Hunters Point Shipyard Mitigation Monitoring and Reporting Program (MMRP) includes adoption of a TDM program (including forming a Transportation Management Association) and a Transportation System Management Plan (including measures such as transit pass sales, transportation option information, employee transit subsidies, expansion of transit service, secure bicycle parking, parking management guidelines, flexible work hours, and shuttle service). The measure shall be implemented per the requirements of the existing MMRP.

Since implementation of the mitigation measures included in the Hunters Point Shipyard MMRP is not certain, Project Alternative 1 impacts on transit capacity at the study area cordons would remain *significant and unavoidable.*

Alternative 1 contributions to the significant transit impacts at the regional screenlines under 2030 No Project conditions would be *less than significant.*

Alternative 2 – No Bridge: The transit operating plan assumed for Alternative 2 would be the same as for the Project. However, since the Yosemite Slough bridge would not be constructed, and the BRT route would travel around Yosemite Slough. The alternate route would extend west on Carroll Avenue, north on Hawes Street, west on Armstrong Avenue to an abandoned railroad right-of-way, previously operated by the United States Navy. The BRT route would then travel along this right-of-way, just east of Ingalls Street, to its intersection with Shafter Street, just east of Hawes Street. The BRT route would travel east on Shafter Street to Arelious Walker Drive, where it would resume its primary proposed route into Hunters Point Shipyard.

Although the alternate route around Yosemite Slough would be technically feasible, it would not be the optimal configuration for a BRT system. A fundamental component of BRT service is direct, fast, and reliable travel in dedicated right-of-way, typically with signal priority given to the BRT vehicles. When these elements are combined, the BRT service takes on a higher-quality character than typical local bus service. The Yosemite Slough bridge would provide such a service in the project study area by providing dedicated right-of-way and providing the most direct route of travel between the Hunters Point Shipyard and points to the west, including Candlestick Point, the Bayshore Caltrain station, and the Balboa Park BART station.

If the Yosemite Slough bridge were not in place, only one transit route (the 28L-19th Avenue/Geneva BRT route) would be affected. BRT travel times, particularly between major development and regional transit connections (e.g., Caltrain and BART) would increase by approximately five minutes. As a result, BRT ridership to and from the Hunters Point Shipyard would decrease by approximately 15 percent to the forecasts presented for the Project. However, because this represents a relatively small portion of the overall project transit ridership, the additional traffic generated by the Project Alternative 2 would be minimal, and thus, a separate analysis was not conducted.

With the Muni transit capacity increases assumed for Alternative 2, compared to the No Project Alternative 1, the total transit travel demand on Muni would be accommodated at each of the three the cordons during the AM and PM peak hours. At the regional screenlines, Alternative 2 would contribute minimally to future ridership and contributions to future cumulative impacts would be less than significant. As with the Project, Alternative 2 impacts on transit capacity would be *less than significant.*

Alternative 3 – 49ers at Candlestick: Under Alternative 3, the 49ers would remain at Candlestick Park and proposed development would occur primarily in the Hunters Point Shipyard. The transit operating plan assumed for Alternative 3 would be the same as for the Project. Under Alternative 3, the Yosemite Slough bridge would only be for pedestrians, bicycles, and the BRT route. Therefore, the bridge would be somewhat narrower than proposed for the Project, but would function the same as under the Project on non-game days.

Transit ridership associated with Alternative 3 would be less than with the Project. With the Muni transit capacity increases assumed for Alternative 3, the total transit travel demand on Muni would be accommodated at each of the three cordons during the AM and PM peak hours. At the regional screenlines, Alternative 3 would contribute minimally (and less than the Project) to future ridership and contributions to future regional cumulative transit impacts would be less than significant. As with the Project, Alternative 3 impacts on transit capacity would be *less than significant.*

Alternative 4 – Lesser Build: Alternative 4 assumes a general reduction in development as compared to the Project, and therefore transit travel demand would be less. The transit operating plan assumed for Alternative 4 would be the same as for the Project. Under Alternative 4, the Yosemite Slough bridge would not be constructed, and, as with Alternative 2, the BRT route would travel around Yosemite Slough using the former railroad right-of-way. Similar to Alternative 2, the increased travel time of approximately five minutes for the BRT route would somewhat reduce ridership on the BRT line for trips to and from the Hunters Point Shipyard, but overall, the increase in project-generated automobile traffic associated with this travel time increase would be negligible.

With the Muni transit capacity increases assumed for Alternative 4, the total transit travel demand on Muni would be accommodated at each of the three cordons during the AM and PM peak hours. At the regional screenlines, Alternative 4 would contribute minimally (and less than the Project) to future ridership and contributions to future regional cumulative transit impacts would be less than significant. As with the Project, Alternative 4 impacts on transit capacity would be *less than significant.*

Alternative 5 – No Park Agreement: Alternative 5 assumes a similar land use program as the Project Variant 2 (1,350 residential units more than the Project within Hunters Point Shipyard), and therefore transit travel demand would be greater than with the Project. The transit operating plan assumed for Alternative 5 would be the same as for the Project. Under Alternative 5, the Yosemite Slough bridge would not be constructed, and the proposed BRT route would be the same as for Alternatives 2 and 4, with similar effects on BRT travel times and ridership.

With the Muni transit capacity increases assumed for Alternative 5, the total transit travel demand on Muni would be accommodated at each of the three cordons during the AM and PM peak hours. At the regional screenlines, Alternative 5 would contribute minimally (and less than the Project) to future ridership and contributions to future regional cumulative transit impacts would be less than significant. As with the Project, Alternative 5 impacts on transit capacity would be *less than significant.*

Alternatives Transit Delay

Table 82 presents the travel time increases associated with the project alternatives for each transit line in the study area. Although neither Alternative 1 nor the existing conditions include extensions of transit routes into the project site, the analysis of increases to transit travel times over existing conditions associated with Alternative 1 was conducted for the same segments as the Project, to provide a meaningful comparison. **Table 83** identifies the number of additional vehicles that would be required to meet the proposed headways.

Alternative 1 – No Project: As shown on **Table 83**, under Alternative 1 - No Project, traffic and ridership demands would increase and result in the need for an additional 16 transit vehicles for seven routes in the AM peak hour, and an additional 16 vehicles for six routes in the PM peak hour. During the AM peak hour, additional vehicles would be required on the 9-San Bruno (5 vehicles), 24-Divisadero (1 vehicle), 28L-19th Avenue Limited (1 vehicle), 29-Sunset (1 vehicle), 44-O'Shaughnessy (2 vehicles), the 48-Quintara-24th Street (1 vehicle), the 54-Felton (1 vehicle) and the T-Third (2 train cars). In the PM peak hour, additional vehicles would be needed on the 9-San Bruno (7 vehicles), 23-Monterey (1 vehicle), 28L-19th Avenue Limited (1 vehicle), 44-O'Shaughnessy (3 vehicles), 48-Quintara-24th Street (1 vehicle), 54-Felton (1 vehicle), and the T-Third (1 train car). These would be significant No Project impacts.

Alternative 2 – No Bridge: Transit impacts associated with Alternative 2 would be the same as for the Project, with the exception of the 28L-19th Avenue/Geneva Limited. Under Alternative 2, the Yosemite Slough bridge would not be constructed, and the BRT travel times would increase by about 5 minutes since the BRT route would need to travel around the slough. During the AM peak hour, an additional 7 vehicles would be required to maintain projected headways, and during the PM peak hour and additional 12 vehicles would be required. As for the Project, these transit vehicles would be in addition to those identified to maintain 2030 No Project conditions (16 vehicles in the AM peak hour, and 16 vehicles in the PM peak hour).

Project Mitigation Measures 7 through 14.2 would also be applicable for Alternative 2. As with the Project, Project Mitigation Measures 7 through 14.2 would reduce, but not eliminate, Alternative 3 impacts on transit operations. Alternative 2 impacts on transit operations would therefore remain *significant and unavoidable.*

Notes:

1. Delays measured for each route between project site and key destination/transfer point away from the project. The study segment for each route is as follows:
   - 9-San Bruno: Bayshore Boulevard between Sunnydale Avenue and Jerrold Avenue
   - 23-Monterey: between Ingalls Street/Oakdale Avenue and the Glen Park BART Station
   - 24-Divisadero: between Hunters Point Shipyard and Mission Street
   - 28L-19th Avenue: between Hunters Point Shipyard and Mission Street
   - 29-Sunset: between Candlestick Point and Mission Street
   - 44-O'Shaughnessy: between Hunters Point Shipyard and the Glen Park BART Station
   - 48-Quintara-24th St: between Hunters Point Shipyard and the 24th Street BART Station
   - 54-Felton: between Jerrold Avenue/Earl Street and Mission Street
   - T-Third: Third Street between Thomas Avenue and Jerrold Avenue (This segment represents the section of the T-Third route that does not provide exclusive right-of-way for transit and would be most affected by increased traffic congestion.)
2. Routes where project would increase travel times such that additional vehicles would be required highlighted in **bold**.
3. Travel times for Alternative 2 same as for Project, and travel times for Alternative 5 same as Project Variant 2, as presented on Table 76. The exception is the 28L-19th Avenue Limited, were travel times in each direction would increase by five minutes per direction as neither Alternative 2 nor Alternative 5 would include the Yosemite Slough bridge.
4. Due to roadway improvements proposed by the Project and differences between the No Project and Project land use assumptions in the Hunters Point Shipyard, there would be less traffic congestion along 54-Felton route in the study area with the Project, than under 2030 No Project conditions.

Total	*16*	*12*	*6*	*11*	*12*

Note:
1. Transit vehicle requirements for Alternatives 2 through 5 are in addition to those required for the 2030 No Project condition (Alternative 1).
Source: Fehr & Peers.

Alternative 3 – 49ers at Candlestick: Alternative 3 would result in the need for additional transit vehicles beyond those required for 2030 No Project conditions on three routes in the AM peak hour and on five routes in the PM peak hour. During the AM peak hour, 4 vehicles would be required to maintain proposed headways on the 24-Divisadero (1 vehicle), 44-O'Shaughnessy (2 vehicles), and the 48-Quintara-24th Street (1 vehicle). During the PM peak hour, 6 additional vehicles would be needed for the 24-Divisadero (1 vehicle), 28L-19th Avenue Limited (1 vehicle), 44-O'Shaughnessy (2 vehicles), 48-Quintara-24th Street (1 vehicle), and 54-Felton (1 vehicle) routes. Impacts associated with Alternative 3 would be somewhat less than those for the Project.

Project Mitigation Measures 7 through 14.2 would also be applicable for Alternative 3. As with the Project, Project Mitigation Measures 7 through 14.2 would reduce, but not eliminate, Alternative 3 impacts on transit operations. Alternative 3 impacts on transit operations would therefore remain *significant and unavoidable.*

Alternative 4 – Lesser Build: Alternative 4 would result in the need for 7 additional transit vehicles beyond those required for 2030 No Project conditions on five routes during the AM peak hour, and an additional 11 vehicles for seven routes during the PM peak hour. During the AM peak hour, additional vehicles would be required on the 9-San Bruno (1 vehicle), 24-Divisadero (1 vehicle), 29-Sunset (2 vehicles), 44-O'Shaughnessy (2 vehicles), and the 48-Quintara-24th Street (1 vehicle). In the PM peak hour, additional vehicles would be required on the 9-San Bruno (1 vehicle), 24-Divisadero (2 vehicles), 29-Sunset (3 vehicles), 44-O'Shaughnessy (1 vehicle), 48-Quintara-24th Street (1 vehicle), 54-Felton (1 vehicle), and the T-Third (1 train car). Impacts associated with Alternative 4 would be somewhat less than those for the Project.

Project Mitigation Measures 7 through 14.2 would also be applicable for Alternative 4. As with the Project, Project Mitigation Measures 7 through 14.2 would reduce, but not eliminate, Alternative 4 impacts on transit operations. Alternative 3 impacts on transit operations would therefore remain *significant and unavoidable.*

Alternative 5 – No Park Agreement: Since the land use program and transit operating plan for Alternative 5 would be the same as for Project Variant 2, transit impacts for Alternative 5 would be the same as Project Variant 2, with the exception of the 28L-19th Avenue/Geneva Limited. Under Alternative 5, the Yosemite Slough bridge would not be constructed, and the BRT travel times would increase by about 5 minutes since the BRT would need to travel around the slough. Project Mitigation Measures 7 through 14.2 would also be applicable for Alternative 5. As with the Project, Project Mitigation Measures 7 through 14.2 would reduce, but not eliminate, Alternative 5 impacts on transit operations. Alternative 3 impacts on transit operations would therefore remain *significant and unavoidable.*

6.3 BICYCLE IMPACTS

6.3.1 Project and Project Variants

The street network proposed for Candlestick Point would be an extension of the existing grid of the adjacent Bayview neighborhood, which would facilitate access between the new uses and the rest of San Francisco, and provide a connection between existing Bayview/South Basin neighborhoods and the existing and proposed waterfront amenities.

A number of existing and proposed study area roadways would include bicycle facilities in the form of bicycle lanes (Class II facilities) or signed routes (Class III facilities – e.g., roadways with sharrow designations) that would facilitate bicycling within and in the vicinity of the Project area. Off-street Class I pathways would be provided around the bayside perimeter of

Candlestick Point, across the proposed Yosemite Slough bridge, and into Hunters Point Boulevard via Crisp Avenue. Within the Project area, the Bay Trail would also be completed. **Figure 8** in Chapter 2 presented the proposed improvements.

Outside of the Project site, street improvements would include striping of bicycle lanes on Innes Avenue, Gilman Avenue, Jamestown Avenue and on Harney Way. As noted in section 4.3.3, the Bicycle Plan includes a near-term project on Innes Avenue (Bicycle Route #68) between Donahue Street and Hunters Point Boulevard, however, a preferred option was not identified in the Final EIR for the Bicycle Plan. The CP-HPS Phase II Development Plan proposes to provide a bicycle lane in both directions on Innes Avenue between Donahue Street and Hunters Point Boulevard, which would require removal of on-street parking on the south side of Innes Avenue between Earl Street and Hunters Point Boulevard. The Project proposal is consistent with Option 1 in the Bicycle Plan, however, it would not preclude implementation of Option 2 (sharrows added to the existing Class III facility), if that option were determined to be preferable by SFMTA.

Overall, bicycle access and the environment for bicycling would improve within and in the vicinity of the Project site. The facilities would be adequate to meet the bicycling demand associated with the Project uses, and Project impacts on bicycle circulation would be *less than significant*.

However, outside of the project site Bicycle Route #70 and Bicycle Route #170 on Palou Avenue are designated as Class III signed routes, and the combination of the proposed transit preferential treatment and the substantial increase in traffic volumes and congestion would result in potentially significant impacts on bicycle travel on this route. When faced with traffic congestion and constrained environment bicyclists may chose to ride on other streets not designated as part of the bicycle route network. Since the proposed development in Candlestick Point and Hunters Point Shipyard had not been anticipated in the needs assessments conducted for the Bicycle Plan, this segment of Palou Avenue is not included in the Bicycle Plan for near-term or long-term improvement projects.

> ***Project Mitigation Measure 15***: Prior to issuance of the grading permit for Phase I, the Project Applicant shall fund a study to determine the feasibility of relocating Bicycle Routes #70 and #170. The study of the bicycle route relocation, necessary environmental clearance documentation, and implementation shall be the responsibility of SFMTA. Since the feasibility of the relocation of the routes is uncertain at this time, the Project impact on bicycle circulation on Palou Avenue would remain significant and unavoidable.

Because a feasibility study of the relocation of Bicycle Routes #70 and #170 on Palou Avenue would be required, the implementation of Project Mitigation Measure 15 is uncertain, and therefore the Project impact on bicycle circulation would remain *significant and unavoidable.*

Project Variants 1 and 2 include additional development within Hunters Point Shipyard (these variants assume that the 49ers would relocate to Santa Clara and that a new stadium would not be constructed within Hunters Point Shipyard) and would result in increased bicycle travel within and adjacent to the Project area. The bicycle trips associated with the increased development would be accommodated within the proposed street network, and impacts on bicycle circulation would *be less than significant*.

As with the Project, potential significant impacts on bicycle travel on Palou Avenue would occur under both Variants 1 and 2. Project Mitigation Measure 15, described above, would be applicable to both Project Variants 1 and 2. Because a feasibility study of the relocation of Bicycle Routes #70 and #170 on Palou Avenue would be required, the implementation of Project Mitigation Measure 15 is uncertain, and therefore the Project Variants 1 and 2 impacts on bicycle circulation would remain *significant and unavoidable.*

6.3.2 Alternatives to the Project

Alternative 1 – No Project: Under the No Project Alternative, the bicycle route network and bicycle lanes would not be changed from existing conditions, with the exception of the near-term improvements proposed as part of the Bicycle Plan on Cargo Way, Illinois Street, Bayshore Boulevard, Cesar Chavez Street, and on Innes Avenue (see section 4.3.3).

Travel demand associated with Hunters Point Shipyard would increase bicycle travel along Innes Avenue. In the Candlestick Point area, bicycle volumes would remain similar to current conditions, however, increased traffic volumes associated with Hunters Point Shipyard development using the south gate at Crisp Avenue would increase the potential for conflicts between motorists and bicyclists. As with the Project, Alternative 1 impacts on bicycle circulation would be *less than significant.*

Alternative 2 – No Bridge: Street network and bicycle facilities and amenities under Alternative 2 would be similar to the Project. However, the Yosemite Slough bridge would not be constructed. Without the Yosemite Slough bridge, bicycle connectivity between Hunters Point Shipyard and Candlestick Point would occur via the network of existing streets, including Palou Avenue, Ingalls Street, Carroll Avenue and Gilman Avenue. Ingalls Street between Carroll Avenue and Palou Avenue would be designated as a Class III bicycle route, signed with sharrows. While an inconvenience, the lack of the connection provided by the proposed Yosemite Slough bridge would not result in significant impacts on bicycling. As with the Project, Alternative 2 impacts on bicycle circulation would be *less than significant.*

As with the Project, potential significant impacts on bicycle travel on Palou Avenue would occur under Alternative 2. These impacts would be exacerbated somewhat from Project conditions, as Alternative 2 would not include the Yosemite Slough bridge and the direct connection to areas to the southwest of Hunters Point Shipyard.

Project Mitigation Measure 15, described above, would be applicable to Alternative 2. Because a feasibility study of the relocation of Bicycle Routes #70 and #170 on Palou Avenue would be required, the implementation of Project Mitigation Measure 15 is uncertain, and therefore the Alternative 2 impacts on bicycle circulation would remain *significant and unavoidable.*

Alternative 3 – 49ers at Candlestick: Under Alternative 3, the 49ers would remain at Candlestick Park and proposed development would occur primarily in Hunters Point Shipyard. However, within Candlestick Point about 1,210 residential units would be constructed. Bicycle facilities within Hunters Point Shipyard would be similar to the Project, and would be adequate to accommodate the bicycle travel associated with the new development. Alternative 3 would include construction of the Yosemite Slough bridge for the BRT service to Hunters Point Shipyard, and as a pedestrian and bicycle connector. As with the Project, Alternative 3 impacts on bicycle circulation would be *less than significant.*

As with the Project, potential significant impacts on bicycle travel on Palou Avenue would occur under Alternative 3. Project Mitigation Measure 15, described above, would be applicable to Alternative 3. Because a feasibility study of the relocation of Bicycle Routes #70 and #170 on Palou Avenue would be required, the implementation of Project Mitigation Measure 15 is uncertain, and therefore the Alternative 3 impacts on bicycle circulation would remain *significant and unavoidable.*

Alternative 4 – Lesser Build: Alternative 4 assumes a general reduction in development as compared to the Project, and therefore pedestrian travel demand would be less. The proposed street network and bicycle facilities would be similar to Project, however this alternative would not include construction of the Yosemite Slough bridge. As noted above for Alternative 2, without provision of the Yosemite Slough bridge, pedestrian connectivity between Hunters Point Shipyard and Candlestick Point would occur via the network of existing streets, including Palou Avenue, Ingalls Street, Carroll Avenue and Gilman Avenue. Ingalls Street between Carroll Avenue and Palou Avenue would be designated as a Class III facility, signed with sharrows. While an inconvenience, the lack of the connection provided by the proposed Yosemite Slough bridge would not result in significant impacts on bicycling. As with the Project, Alternative 4 impacts on bicycle circulation would be *less than significant.*

As with the Project, potential significant impacts on bicycle travel on Palou Avenue would occur under Alternative 4. These impacts would be exacerbated somewhat from Project conditions, as Alternative 4 would not include the Yosemite Slough bridge and the direct connection to areas to the southwest of Hunters Point Shipyard. Project Mitigation Measure 15, described above, would be applicable to Alternative 4. Because a feasibility study of the relocation of Bicycle Routes #70 and #170 on Palou Avenue would be required, the implementation of Project Mitigation Measure 15 is uncertain, and therefore the Alternative 4 impacts on bicycle circulation would remain *significant and unavoidable.*

Alternative 5 – No Park Agreement: Alternative 5 assumes a similar land use program as the Project Variant 2, and therefore bicycle travel demand would be greater than the Project. The proposed street network and bicycle facilities would be similar to the Project, however, Yosemite Slough bridge would not be constructed. Without the Yosemite Slough bridge, bicycle connectivity between Hunters Point Shipyard and Candlestick Point would occur via the network of existing streets, including Palou Avenue, Ingalls Street, Carroll Avenue and Gilman Avenue. Ingalls Street between Carroll Avenue and Palou Avenue would be designated as a Class III bicycle route, signed with sharrows. While an inconvenience, the lack of the connection provided by the proposed Yosemite Slough bridge would not result in significant impacts on bicycling. As with the Project, Alternative 5 impacts on bicycle circulation would be *less than significant.*

As with the Project, potential significant impacts on bicycle travel on Palou Avenue would occur under Alternative 5. These impacts would be exacerbated somewhat from Project conditions, as Alternative 4 would not include the Yosemite Slough bridge and the direct connection to areas to the southwest of Hunters Point Shipyard. Project Mitigation Measure 15, described above, would be applicable to Alternative 4. Because a feasibility study of the relocation of Bicycle Routes #70 and #170 on Palou Avenue would be required, the implementation of Project Mitigation Measure 15 is uncertain, and therefore the Alternative 4 impacts on bicycle circulation would remain *significant and unavoidable.*

6.4 PEDESTRIAN IMPACTS

6.4.1 Project and Project Variants

The street network proposed for Candlestick Point would be an extension of the existing grid of the adjacent Bayview neighborhood, which would facilitate access between the new uses and the rest of San Francisco, and provide a connection between existing Bayview/South Basin neighborhoods and the existing and proposed waterfront amenities.

Other pedestrian amenities would include: crosswalks at unsignalized intersection, pedestrian crosswalks and signals at all new signalized intersections, corner bulbouts, and completion of sidewalk network where currently incomplete (e.g., Arelious Walker Drive, Palou Avenue). Along Gilman Avenue between Earl Street and Hunters Point Boulevard, and on Palou Avenue and Gilman Avenue between Arelious Walker Drive and Third Street, sidewalks would be reconstructed and landscaping improvements would be implemented.

Sidewalk widths on new or improved streets within the Project site would range from 10-feet to 15-feet in width, with the majority of streets having sidewalks 12 feet or greater in width. The Project would also include new sidewalks, and minor sidewalk narrowing on a number of existing streets, including:

- Griffith Street – narrow east and west sidewalks between Palou Avenue and Thomas Avenue from 12 to 11 feet.
- Thomas Avenue – narrow north and south sidewalks between Griffith Street and Ingalls Street from 15 to 12 feet.
- Ingalls Street – narrow east and west sidewalks between Yosemite Ave and Carroll Ave narrow from 15 to 11 feet.
- Carroll Avenue – new 12 foot wide sidewalks between Ingalls Street and Arelious Walker Drive
- Harney Way – new 15 foot wide sidewalk on north side from Thomas Mellon Drive to Jamestown Avenue

Overall, with the Project, pedestrian access would improve over the No Project conditions, except where sidewalks would be narrowed. The proposed narrowing of sidewalks would still allow for maintenance of sufficient clear space for people using walking aids or wheelchairs, as needed to meet *American with Disabilities* (ADA) requirements. Development of the Project would increase pedestrian presence in the area. Since pedestrian volumes within the Project site are very low, the addition of pedestrian trips associated with the Project would be accommodated within the existing and proposed sidewalk network.

A qualitative assessment was also conducted of potential pedestrian impacts resulting from increased travel demand outside of the Project site. As noted in previous sections, the Project would increase vehicle and bicycle volumes in the Bayview Hunters Point area, which would increase the potential for pedestrian-vehicle and pedestrian-bicycle conflicts particularly in locations where the sidewalk network is incomplete or where vehicles park on sidewalks, causing pedestrians to walk in the roadway and mix with vehicular traffic. The Project-proposed sidewalk network improvements on Innes Avenue, Palou Avenue, Gilman Avenue, and Jamestown Avenue would improve and define the pedestrian network on these roadways. Along Third Street sidewalks have been improved and pedestrian signals and crosswalks were installed as part of the Third Street light rail project. As cumulative development occurs within the area, individual development projects would be required to address any sidewalk deficiencies adjacent to their site.

With the Project, the number of pedestrians on streets outside of the Project site would increase as a result of the expanded recreational uses, extension of transit lines, and overall increase in commercial activity in the area. While the presence of an increased number of pedestrians may partially offset risks associated with increased pedestrian-vehicle and pedestrian-bicycle conflicts, the enhanced pedestrian network and "safety in numbers" conditions due to increased pedestrian presence would cause drivers to expect and adapt to increased interactions with pedestrians.

SFMTA and SFCTA have recognized the existing inadequacies in the Bayview Hunters Point area to the pedestrian network. SFMTA has begun implementing the Bayview Traffic Calming Project, which was developed through a community-based process that identified problem locations with a study area roughly bounded by Jamestown Avenue, Third Street and Evans Avenue, and traffic calming measures. Community concerns included high traffic volumes, numerous trucks, speeding cars, and reckless driving. The study resulted in a list of traffic calming measures (such as gateway islands, speed humps, speed cushions, and traffic circles) along specific roadways. Implementation of improvements is being phased in, and most cost-efficient solutions are being implemented first. The Project improvements would not preclude implementation of the traffic calming measures and would complement the goals of the community to enhance pedestrian safety. SFCTA has recently initiated the Bayview Hunters Point Neighborhood Transportation Plan (NTP) study that is focusing on the existing needs and concerns of the community, to develop smaller-scale solutions that could be implemented in the near-term. Measures such as better bus stops, brighter lighting, and landscaping, as well as parking management and mobility strategies such as shuttle service will be explored with the community.

The San Francisco Department of Public Health (DPH) analyzes pedestrian injuries in traffic accidents from a public health perspective. DPH notes that traffic accidents in general are a leading cause of death and injury in the United States. Beyond direct injuries and deaths, as matter of public health, DPH states that increased pedestrian safety can encourage walking, which in turn can have direct health benefits such as reducing obesity and indirect benefits such as improved air quality resulting from lesser traffic volumes.

There are a number of factors that contribute to increased pedestrian-vehicle collisions, and the number of collisions at an intersection is a function of the traffic volume, travel speeds, intersection configuration, traffic control, surrounding land uses, location, and number of pedestrians. The Project would result in a substantial change in the street network in the Project site, and includes street improvements that would enhance pedestrian safety in the Project site and beyond. The increased potential for pedestrian-vehicle conflicts and pedestrian injury would be tempered by the "safety in numbers" factor in an area currently characterized by low pedestrian volumes and mix of industrial and residential land uses. Overall, the existing and proposed pedestrian facilities would be adequate to meet the pedestrian demand associated with the Project land uses, and the Project impacts on pedestrian circulation within and in the vicinity of the Project would be *less than significant.*

Project Variants 1 and 2 include additional development within Hunters Point Shipyard (these variants assume that the 49ers would relocate to Santa Clara and that a new stadium would not be constructed within Hunters Point Shipyard) and would result in increased pedestrian travel within and adjacent to the Project area. The pedestrian trips associated with the increased development would be accommodated within the proposed sidewalk network, and impacts on pedestrian circulation would *be less than significant*.

6.4.2 Alternatives to the Project

Alternative 1 – No Project: Under the No Project Alternative, sidewalks in the study area would not be changed, with the exception of any street network improvements within Hunters Point Shipyard. Travel demand associated with Hunters Point Shipyard would increase pedestrian travel between Innes Avenue and Third Street, which would be accommodated on the 7-foot to 10-foot wide sidewalks on Innes Avenue, Hunters Point Boulevard, and Evans Avenue.

In the Candlestick Point area, pedestrian volumes would remain similar to current conditions, however, increased traffic volumes associated with Hunters Point Shipyard development using the south gate at Crisp Avenue would increase the potential for conflicts between motorists and pedestrians, particularly on streets in the South Basin where vehicles frequently park on sidewalks, and where there are no sidewalks. As with the Project, Alternative 1 impacts on pedestrian circulation would be *less than significant.*

Alternative 2 – No Bridge: Street network and pedestrian facilities and amenities under Alternative 2 would be similar to the Project, with the exception of the Yosemite Slough bridge, which would not be constructed. Pedestrian connectivity between Hunters Point Shipyard and Candlestick Point would occur via the network of existing streets, including Palou Avenue, Ingalls Street, Griffith Street, Carroll Avenue and Gilman Avenue. In addition, some pedestrians may walk along the Bay Trail. While an inconvenience, the lack of the connection provided by the proposed Yosemite Slough bridge would not result in significant impacts on pedestrian operations. As with the Project, Alternative 2 impacts on pedestrian circulation would be *less than significant.*

Alternative 3 – 49ers at Candlestick: Under Alternative 3, the 49ers would remain at Candlestick Park and proposed development would occur primarily in Hunters Point Shipyard. However, within Candlestick Point about 1,210 residential units would be constructed. Pedestrian facilities within Hunters Point Shipyard would be similar to the Project, and would be adequate to accommodate the pedestrian travel associated with the new development. Alternative 3 would include construction of the Yosemite Slough bridge for the BRT service to Hunters Point Shipyard, and as a pedestrian and bicycle connector. As with the Project, Alternative 3 impacts on pedestrian circulation would be *less than significant.*

Alternative 4 – Lesser Build: Alternative 4 assumes a general reduction in development as compared to the Project, and therefore pedestrian travel demand would be less. The proposed street network and pedestrian facilities would be similar to Project, however this alternative would not include construction of the Yosemite Slough bridge. As noted above for Alternative 2, without provision of the Yosemite Slough bridge, pedestrian connectivity between Hunters Point Shipyard and Candlestick Point would occur via the network of existing streets, including Palou Avenue, Ingalls Street, Griffith Street, Carroll Avenue and Gilman Avenue. In addition, some pedestrians may walk along the Bay Trail. While an inconvenience, the lack of the connection provided by the proposed Yosemite Slough bridge would not result in significant impacts on pedestrian operations. As with the Project, Alternative 4 impacts on pedestrian circulation would be *less than significant.*

Alternative 5 – No Park Agreement: Alternative 5 assumes a similar land use program as the Project Variant 2 (1,350 residential units more than the Project within Hunters Point Shipyard), and therefore pedestrian travel demand would be greater. The proposed street network and pedestrian facilities would be similar to Project, however this alternative would not include construction of the Yosemite Slough bridge. As noted above for Alternative 2, without provision of the Yosemite Slough bridge, pedestrian connectivity between Hunters Point Shipyard and Candlestick Point would occur via the network of existing streets, including Palou Avenue, Ingalls Street, Griffith Street, Carroll Avenue and Gilman Avenue. In addition, some pedestrians may walk along the Bay Trail. While an inconvenience, the lack of the connection provided by the proposed Yosemite Slough bridge would not result in significant impacts on pedestrian operations. As with the Project, Alternative 5 impacts on pedestrian circulation would be *less than significant.*

6.5 PARKING IMPACTS

Parking impacts assessment associated with the Project, Variants, and Alternatives include the comparison of the parking demand to the maximum off-street parking permitted per the parking standards detailed in the draft D4D standards for CP-HPS Phase II Development Plan. Since maximum permitted parking controls are proposed for the project site (not minimum requirements), a discussion is also presented for conditions if no off-street parking is provided. In addition, the impact of the Project relative to on-street parking supply on existing and proposed roadways is discussed.

The parking demand calculations represent the number of spaces that would be required in order to accommodate all the vehicles anticipated to result from the Project if the proposed parking supply was unconstrained. Since the parking supply would be constrained, the actual parking demand would be expected to be less. Transportation Study Appendix J includes the parking demand calculations, and provides a summary by residential and non-residential/commercial uses.

As part of its "transit first" policy, the City and County of San Francisco does not require that the supply of parking spaces equal the demand. Consequently, even though it is anticipated that the maximum number of parking spaces permitted per the D4D standards would be provided, they may not be sufficient to accommodate the actual demand. If fewer spaces than the maximum permitted were to be constructed, the projected shortfall would increase. Therefore, individuals who would prefer to drive may use transit because the perceived convenience of driving is lessened by a shortage of parking. This shortage in proposed off-street parking is not considered a significant environmental effect because it implements a policy intended to reduce citywide traffic congestion and air quality effects. Even with a shortage of off-street parking, measures often are implemented that result in more efficient use of the parking spaces provided. By promoting carpooling, allowing for the shared use of parking, and implementing pricing strategies designed to encourage short-term parking, the spaces provided for non-residential use would likely be used by more individuals, be vacant for shorter periods of time, and attract drivers needing short-term parking.

6.5.1 Project and Project Variants

Table 84 summarizes the aggregate of the parking demand calculated for Project land uses, and also presents the maximum permitted parking supply per the parking standards detailed in the draft D4D standards as well as the proposed number of new on-street parking spaces that would be provided on new and reconfigured streets.[20] **Table 85** summarizes the parking demand, and

[20] The Project would include some on-street parking in the project site for both commercial and general/residential uses. About 683 on-street spaces would be provided within Hunters Point Shipyard and 1,360 spaces within Candlestick Point for a total of 2,043 spaces.

the resultant parking shortfalls assuming Project parking supply for two scenarios: based on the maximum permitted draft D4D standards; and, assuming provision of no off-street spaces but that only the on-street parking spaces would be available. Since the D4D standards do not include minimum requirements (instead specify the maximum parking supply that would be permitted to be provided) it is possible that the Project could be constructed without any off-street parking. However, most development projects in San Francisco develop the maximum permitted supply, and therefore the comparison of the parking demand to the maximum permitted off-street supply and to no off-street supply presents the range of potential parking impacts.

Table 84
Summary of Parking Demand and Maximum Permitted Supply
Project and Project Variants

Scenario/Project Component	Demand [1]				Supply [1]		
	Residential	Non-Residential		Total Demand	Maximum Permitted Off-Street [2]	New On-Street	Total Supply
	Long Term	Long Term	Short Term				
Project							
Hunters Point Shipyard	3,110	3,818	996	7,924	6,678	683	7,361

Table 85
Summary of Parking Shortfalls for No Minimum and Maximum Permitted Supply [1, 2]
Project and Project Variants

Scenario/Project Component	Total Demand	Minimum Supply		Maximum Supply	
		Supply	Shortfall	Supply	Shortfall
Project					
Hunters Point Shipyard	7,924	683	- 7,241	7,361	- 563
Candlestick Point	13,309	1,360	- 11,949	11,556	- 1,753
Total	*21,233*	*2,043*	*- 19,190*	*18,917*	*- 2,316*
Variant 1 (R&D)					
Hunters Point Shipyard	11,856	1,678	- 10,178	11,356	- 500
Candlestick Point	13,309	1,360	- 11,949	11,556	- 1,753
Total	*25,165*	*3,038*	*- 22,127*	*22,912*	*- 2,253*
Variant 2 (Housing)					
Hunters Point Shipyard	9,416	1,298	- 8,118	9,076	- 340
Candlestick Point	11,894	1,360	- 10 534	10,206	- 1,688
Total	*21,310*	*2,658*	*- 18,652*	*19,282*	*- 2,028*

Notes:
1. Includes off-street and new on-street supply.
2. Does not include stadium parking supply or demand.
Source: CHS Consulting, LCW Consulting.

As shown in **Table 84**, the demand analysis indicates a Project need for about 21,233 spaces, compared with a maximum permitted supply of about 18,917 spaces; therefore the maximum off-street parking supply would be approximately 2,316 spaces less than the estimated peak demand. Residential spaces would comprise approximately 79 percent of the total shortfall spaces, and non-residential commercial spaces the remaining 21 percent of the shortfall:

- The residential parking demand of 12,322 spaces, compared to a maximum permitted of 10,500 spaces (one space per unit), would result in a deficit of 1,822 spaces demand).
- The non-residential demand would be 8,911 spaces, of which 41 percent would be needed for short-term use, while the remaining 59 percent would be needed for long-term use. The non-residential commercial parking demand, compared with a maximum permitted number of about 8,417 spaces, would result in a deficit of 494 spaces.

If no off-street parking is provided, the parking shortfall associated with the Project would increase substantially, and there would be a deficit of about 19,190 spaces. As indicated above, this represents the maximum shortfall, as it is anticipated that most, if not all, maximum permitted parking would likely be constructed.

Due to parking supply constraints and accessibility to transit, future Project parking demand may be somewhat lower than estimated, and therefore the parking space shortfall would also be less than presented above in **Table 85.** Specifically:

- The parking demand estimates included in **Table 84** and **Table 85** represent the number of spaces that would be required in order to accommodate all the vehicles anticipated to result from the Project if the proposed parking supply was unconstrained. Since the parking supply would be constrained, the actual parking demand would be expected to be less.
- The parking demand estimates represent the peak parking demand calculated separately for each land use. Since all land uses do not experience the peak parking demands simultaneously, the peak parking demand may be less than presented. The Project-proposed parking ratios are generally less than the existing Planning Code requirement for similar uses to discourage auto use and to reflect the potential for shared parking opportunities among the various uses. For example, a restaurant can share parking with an office complex, since restaurant parking demand peaks in the evening, while office parking demand peaks during the middle of the day. Public parking facilities, such as the one proposed in Candlestick Point, and on-street parking spaces can usually be shared efficiently among many destinations. Accounting for the shared parking would reduce the non-residential parking demand, and the excess demand that would not be accommodated within the proposed parking supply would also be less.
- The Project includes a Travel Demand Management program that includes a number of parking strategies to make auto use and ownership less attractive, as well as strategies to encourage alternative modes. While the TDM program was assumed in developing Project travel demand, the residential parking demand was based on standard *SF Guidelines* parking demand rates that are based on Citywide averages.
- Residents within Hunters Point Shipyard and Candlestick Point would have new and improved existing transit routes connecting the Project site with downtown and with Caltrain and BART. Under Project conditions, capacity on local and regional lines would be available to accommodate additional Project transit trips.

As part of its “transit first” policy, the City and County of San Francisco does not require that the supply of parking spaces equals the demand. Consequently, even though it is anticipated that the Project would provide the maximum number of parking spaces permitted, they may not be sufficient to accommodate the actual demand. If fewer spaces than the maximum permitted were to be constructed, the projected shortfall would increase. Therefore, individuals who would prefer to drive may use transit because the perceived convenience of driving is lessened by a shortage of parking. This shortage is not considered a significant environmental effect because it implements a policy intended to reduce citywide traffic congestion and air quality effects. Even with a shortage of off-street parking, measures often are implemented that result in more efficient use of the parking spaces provided. By promoting carpooling, allowing for the shared use of parking, and implementing pricing strategies designed to encourage short-term parking, the spaces provided for non-residential use would likely be used by more individuals, be vacant for shorter periods of time, and attract drivers needing short-term parking.

Since the proposed parking supply in the Project site would not meet demand, it is possible that some drivers may seek available parking in adjacent Bayview residential areas to the west. The potential increase in parking demand in adjacent neighborhoods would likely spill over to streets with existing industrial uses in the Project vicinity, which could, in turn, increase demand for parking in nearby Bayview residential areas. Residential streets near the Project site do not currently have parking restrictions and are about 70 percent occupied during the weekday midday and evening periods. Commercial and industrial spillover into residential areas is not expected to be a substantial problem because parking demand in residential areas in Bayview would be highest at night, when the commercial and industrial parking demand is lowest. If parking demand is found to exceed supply in the Bayview residential area, the City's residential parking permit program could be introduced to the area to help ensure availability of parking for local residents. The extent of spillover into the nearby industrial and residential neighborhoods to the west would be limited by the existing topography (e.g., steep grades due to the Bayview Hill), the distance between the Project site and available parking supply, and concerns related to safety in the industrial area. Transit service with available capacity and on-site carsharing services would provide an alternative to seeking parking supply further afield.

On days when events were scheduled at the stadium, parking spaces in the Bayview and Candlestick Point area would be in great demand. Those arriving to the Project vicinity on weekends after drivers have started arriving for the stadium event would have difficulty parking on event days unless they have already-reserve parking, such as spaces allocated to residential units.

Additionally, no cumulative parking impacts are expected. Other cumulative projects in the area, such as most of the surrounding existing development, Executive Park, and India Basin, are located too far from the Project site to expect that drivers going to other projects would seek parking on the Project site, or that drivers going to the Project site would park far outside the Project boundaries. Additionally, in some areas, the topography is not conducive to parking beyond the Project site boundaries. Consequently, there is no potential for significant cumulative parking impacts.

As noted above, in San Francisco, parking supply is not considered a permanent physical condition, and changes in the parking supply would not be a significant environmental impact under CEQA, but rather a social effect. The loss of parking may cause potential social effects, which would include cars circling and looking for a parking space in neighboring streets. The secondary effects of drivers searching for parking is typically offset by a reduction in vehicle trips due to some drivers, who are aware of constrained parking conditions in a given area, shifting to other modes. Hence, any secondary environmental impacts that may result from a shortfall in parking would be minor. Therefore, the parking shortfall would not result in significant parking impacts, and Project impacts on parking would be *less than significant.*

Loss of On-Street Parking - Some existing parking spaces would also be lost because of Project changes to the existing roadway configuration. The bus transit preferential treatments and streetscape improvements on Palou Avenue between Third Street and Griffith Street would result in a net loss of approximately 60 parking spaces (about 40 spaces due to bus stop improvements and corner bulbouts, and 20 spaces on the north side of the street between Ingalls and Griffith Streets where vehicles park perpendicular off-street within the sidewalk right-of-way. In addition, on the following streets a total of about 77 on-street parking spaces would be displaced:

- Carroll Avenue between Hawes and Ingalls Streets – 26-spaces.
- Innes Avenue between Earl Street and Hunters Point Boulevard – 51-spaces.

Project intersection improvements and mitigation measures would require removal of some on-street parking at the approaches to intersections. These on-street losses include:

- Evans/Jenning/Middlepoint – 8 to 10 spaces on the west side of Jennings Street at the southbound approach to Evans.
- Palou/Griffith/Crisp – 8 to 10 spaces on the east side of Griffith Street at the northbound approach.
- Carroll/Ingalls – 8 to 10 spaces on the west side of Ingalls Street at the southbound approach.
- Blanken/Tunnel – 13 spaces on the east side of Tunnel Avenue at the northbound and southbound approaches.

Project mitigation measures related to transit improvements would also result in peak period parking prohibitions. At some locations, such as on Third Street and Paul Avenue, parking spaces would be eliminated.

- San Bruno Avenue – 5 spaces on the east side of San Bruno Avenue south of Silver Avenue, and 20 spaces on the west side of San Bruno Avenue between Woolsey Street and Olmstead Street.
- Palou Avenue – about 140 spaces on the north side and 130 spaces on the south side of Palou Avenue between Newhall Street and Crisp Avenue.
- Gilman Avenue – about 90 spaces on the north side and 80 spaces on the south side of Gilman Avenue between Arelious Walker Drive and Third Street.
- Paul Avenue – about 40 parking spaces on the north side of Paul Avenue between Third Street and Bayshore Boulevard.
- Third Street – about 110 spaces on the east and west curbs of Third Street between Thomas Avenue and Kirkwood Avenue.

The parking demand that would be displaced due to the temporary and permanent parking losses would be accommodated on other streets in the study area. At some locations, residents and visitors to commercial establishments would have to walk further between their parking space and destination, or switch to transit or other modes. The impact related to parking supply would be *less than significant.*

Project Variant 1 (R&D) and Variant 2 (Housing)

Under Project Variants 1 and 2, it is assumed that the 49ers relocate to Santa Clara and that a new stadium would not be constructed within Hunters Point Shipyard. Under Project Variant 1 the amount of research and development space within Hunters Point Shipyard would increase by 2,500,000 square feet from the Project. As indicated in **Table 81**, Project Variant 1 would result in a need for about 25,165 spaces, compared with a maximum supply of about 22,912 spaces; therefore the maximum off-street parking supply would be approximately 2,253 spaces less than the estimated peak demand. More on-street parking spaces would be provided under Variant 1 than the Project, and thus the overall parking shortfall for Variant 1 would be slightly less than for the Project. As with the Project, Project Variant 1 would not significantly impact parking conditions.

The development program for Variant 2 would be similar to the Project, however, about 1,350 residential units would be shifted from Candlestick Point to Hunters Point Shipyard. Parking impacts would be similar to the Project. Compared with a maximum supply of about 19,282 spaces, the parking demand of 21,310 spaces would result in an excess demand of 2,028 spaces. As with the Project, Variant 2 would not significantly impact parking conditions.

As indicated in **Table 82,** if no off-street parking is developed, the parking shortfall would be substantially greater than if the maximum permitted supply is provided. The parking shortfall would be 22,127 spaces for Variant 1, and 18,652 spaces for Variant 2. As noted above, if no parking is provided, drivers may park outside of the project area, or may switch to transit, carpool, bicycle or other modes of travel. Due to parking shortfalls, there may be impacts to pedestrians, bicycles and transit caused by parking on the sidewalks, double-parking, and parking at intersections or other illegal parking activities. However, parking impacts for Project Variant 1 and Project Variant 2 would be *less than significant*.

6.5.2 Alternatives to the Project

Table 86 summarizes the aggregate of the parking demand calculated for the land uses assumed for the project Alternatives and presents the parking supply for the maximum allowable per the parking standards detailed in the draft D4D standards for the Candlestick Point HPS II Development Program and the anticipated number of new on-street spaces that would be provided. **Table 87** summarizes the parking demand, and the resultant parking shortfalls assuming two scenarios: Alternative parking supply based on the maximum permitted draft D4D standards, and assuming provision of no off-street spaces.

Table 86
Summary of Parking Demand and Maximum Permitted Supply [1, 2]
Alternatives to the Project

Total	*21,310*	*2,563*	*- 18,747*	*19,187*	- 2,123

Notes:
1. Includes off-street and new on-street supply.
2. Does not include stadium parking demand or supply.
Source: CHS Consulting, LCW Consulting.

Alternative 1 – No Project: Alternative 1 assumes buildout of Hunters Point Shipyard Phase II per the Hunters Point Shipyard Redevelopment Plan and EIR (February 2000) and subsequent addendums dated November 19, 2003 and July 13, 2006. As indicated in **Table 86,** the demand analysis indicates for the Project a need for about 9,148 spaces, compared with a permitted supply of about 7,410 off-street and on-street spaces; therefore the maximum supply would be approximately 1,738 spaces less than the estimated peak demand. As for the Project, Alternative 1 impacts on parking conditions would be *less than significant*.

Alternative 2 – No Bridge: The Alternative 2 development program is the same as the Project; however, Alternative 2 would not include construction of the Yosemite Slough bridge. Therefore, the parking demand and supply analysis would be the same as for the Project, yielding an overall deficit of about 2,316 spaces. As indicated on **Table 87**, if no off-street parking is developed, the parking shortfall would be substantially greater (19,190-space shortfall) than if the maximum permitted supply is provided. As for the Project, Alternative 2 impacts on parking conditions would be *less than significant*.

Alternative 3 – 49ers at Candlestick: Construction activities associated with Alternative 3 would be less than for the Project. Within Candlestick Point the existing stadium would remain, and only 1,210 residential units would be constructed. Alternative 3 would result in a demand of about 10,835 spaces, and compared with a maximum supply of 10,566 spaces, would result in an excess demand of about 269 spaces. As indicated on **Table 87**, if no off-street parking is developed, the parking shortfall would be substantially greater (9,257-space shortfall) than if the maximum permitted supply is provided. Therefore, overall parking impacts would be less than identified for the Project. As for the Project, Alternative 3 impacts on parking conditions would be *less than significant*.

Alternative 4 – Lesser Build: Alternative 4 assumes a general reduction in development as compared to the Project (approximately a 30 percent reduction), and therefore associated parking demand and supply would be less than the Project. The demand analysis for Alternative 4 indicates a need for about 16,746 spaces, compared with a maximum supply of about 15,185 spaces; therefore the maximum parking supply would be approximately 1,661 spaces less than the estimated peak demand. As indicated on **Table 87,** if no off-street parking is developed, the parking shortfall would be substantially greater (14,703-space shortfall) than if the maximum permitted supply is provided. As for the Project, Alternative 4 impacts on parking conditions would be *less than significant*.

Alternative 5 – No Park Agreement: The Alternative 5 development program is similar to Project Variant 2. As shown in **Table 86**, Alternative 5 would result in a need for about 21,310 spaces, and compared with a maximum supply of about 19,187 spaces would result in an excess demand of 2,123 spaces. As indicated on **Table 87**, if no off-street parking is developed, the parking shortfall would be substantially greater (18,747-space shortfall) than if the maximum permitted supply is provided. As for the Project, Alternative 5 impacts on parking conditions would be *less than significant*.

6.6 LOADING IMPACTS

Loading impacts assessment associated with the Project, Variants, and Alternatives include the comparison of the demand for loading spaces to the number of loading spaces permitted per the loading standards detailed in the draft D4D standards for the Candlestick Point HPS II Development Program. The loading standards incorporated into the Candlestick Point Hunters Point II draft D4D standards would be the same as the San Francisco Planning Code standards. As indicated in section 4.2.6, the demand for loading spaces was estimated based on the development program and the daily truck trip generation rates for 1,000 gross square feet of use, then converted to hourly demand.

In general, if loading demand is not met on site and could not be accommodated within on-street loading zones, trucks could temporarily double-park and partially block local streets while loading and unloading goods which could result in disruptions and impacts to traffic and transit operations, as well as to bicyclists and pedestrians. Because any effects of unmet loading demand would be temporary inconveniences, any excess demand would not be a significant impact. The Project Design for Development standards establish a minimum number of loading spaces; more could be provided as part of individual development projects.

As noted in section 2.8, approximately 300 feet of curb space on the Stadium Outer Ring Road would be designated for truck parking. The parking areas would have 17-foot wide parking lanes which would fully accommodate wider trucks without impeding on adjacent bicycle or travel lanes. This designated truck parking area would meet the needs of truck drivers to take a ten-hour rest period that is governed by federal and state safety rules, and to stage when off-street loading facilities are not ready to accommodate deliveries. The designation of this on-street parking area would reduce the potential for truck drivers to seek long-term parking on residential streets in the project site and within the Bayview/South Basin area.

Stadium loading supply and demand is discussed in section 6.8.

6.6.1 Project and Project Variants

Table 88 summarizes the estimate of daily truck trips generated by the proposed land uses and the associated demand for loading dock spaces during the peak hour of loading activities (which generally occurs between 10:00 a.m. and 1:00 p.m.), and the estimated supply that would be provided per draft Design for Development. For the Project and Project Variant 2, the estimated loading supply would be greater than the loading demand during the peak hour of loading operations. Within the Hunters Point Shipyard the loading demand and estimated supply would be similar, while within Candlestick Point the supply would substantially exceed the demand. This is due primarily to the calculation for retail uses, which has the most intensive loading demand. For the regional retail uses within Candlestick Point, loading facilities would be located to meet multiple tenants within the retail development. For Project Variant 2, the loading demand within Hunters Point Shipyard would not be met within the on-site supply, and therefore, as noted above, would need to be accommodated on-street, which may result in temporary disruptions to traffic and transit operations, as well as to pedestrians and bicyclists. Overall, Project and Project Variants 1 and 2 impacts related to loading operations would be *less than significant.*

Table 88
Summary of Loading Demand and Supply
Project and Project Variants

Scenario/Project Area	Daily Truck Generation	Peak Hour Loading Dock Space Demand	Supply [1, 2,]
Project			
Hunters Point Shipyard	713	41	42
Candlestick Point	507	29	59
Total	*1,220*	*70*	*101*
Project – Variant 1 (R&D)			
Hunters Point Shipyard	1,238	72	67
Candlestick Point	507	29	59
Total	*1,745*	*101*	*126*
Project – Variant 2 (Housing)			
Hunters Point Shipyard	766	44	47
Candlestick Point	458	27	55
Total	*1,224*	*71*	*102*

Notes:
1. Minimum number of loading spaces permitted per draft Design for Development standard for the CP-HPS Phase II Development Plan.
2. Does not include stadium loading facilities.

6.6.2 Alternatives to the Project

Table 89 summarizes the estimate of daily truck trips, demand for loading dock spaces during the peak hour of loading activities, and the estimated supply for the Alternatives to the Project that would be provided per draft D4D standards.

Alternative 1 – No Project: Alternative 1 assumes buildout of Hunters Point Shipyard Phase II per the Hunters Point Shipyard Redevelopment Plan. As indicated in **Table 89,** the loading demand analysis indicates a demand for Hunters Point Shipyard of about 52 spaces, compared with a supply of about 36 spaces; therefore the off-street loading supply would be approximately 16 spaces less than the estimated peak demand. The excess loading demand could be met within on-street loading zones, or if not provided, trucks could temporarily double-park and partially block local streets while loading and unloading goods which could result in disruptions and impacts to traffic and transit operations, as well as to bicyclists and pedestrians. Because any effects of unmet loading demand would be temporary inconveniences, any excess demand would not result in a significant impact. The Redevelopment Plan design document used to calculate expected loading supply establishes a minimum number of loading spaces; more could be provided as part of individual development proposals. As for the Project, Alternative 1 impacts on loading conditions would be *less than significant*.

Table 89
Summary of Loading Demand and Supply
Alternatives to the Project

Alternative/Project Area	Daily Truck Generation	Peak Hour Loading Dock Space Demand	Supply [1, 2, 3]
Alt. 1 - No Project			
Hunters Point Shipyard	891	52	36
Candlestick Point	0	0	0
Total	*891*	*52*	*36*
Alt. 2 – Project - No Bridge			
Hunters Point Shipyard	713	41	42
Candlestick Point	507	29	59
Total	*1,220*	*70*	*101*
Alt. 3 – 49ers at Candlestick			
Hunters Point Shipyard	766	44	47
Candlestick Point	53	3	6
Total	*819*	*47*	*53*
Alt. 4 – Lesser Build			
Hunters Point Shipyard	518	30	31
Candlestick Point	358	21	42
Total	*876*	*51*	*73*
Alt. 5 – No Park Agreement			
Hunters Point Shipyard	766	44	47
Candlestick Point	458	27	55
Total	*1,224*	*71*	*102*

Notes:
1. Minimum number of loading spaces permitted per draft Design for Development standard for CP-HPS Phase II Development Plan.
2. Does not include stadium loading facilities.
3. Loading spaces for No Project conditions based on existing Design for Development standards for Hunters Point Shipyard Redevelopment Project.
Source: LCW Consulting .

Alternatives 2 through 5: For Alternative 2 (No Bridge), Alternative 3 (49ers at Candlestick), Alternative 4 (Lesser Build) and Alternative 5 (No Park Agreement) the estimated loading supply calculated per D4D standards would be greater than the loading demand during the peak hour of loading operations. Similar to the Project, the estimated supply within the Candlestick Point area would substantially exceed the demand. Alternative 2 through Alternative 5 impacts related to loading operations would be *less than significant.*

6.7 EMERGENCY VEHICLE ACCESS IMPACTS

The Project includes the construction of new roadways to facilitate emergency access. Existing emergency response routes would either be maintained in their existing locations or rerouted as necessary. Further, all development would be designed in accordance with City standards, which include provisions that address emergency access (e.g., minimum street widths, minimum turning radii). In addition, emergency vehicles would be able to utilize transit lanes when streets are congested. Therefore, Project impacts on emergency access would be less than significant.

Emergency vehicle access impacts under Project Variants 1 and 2, and Alternatives 1 through 5 would be similar to the Project; impacts on emergency access would be *less than significant.*

6.8 AIR TRAFFIC IMPACTS

The Project site is not near an airfield; San Francisco International Airport is about seven miles to the south. This distance is outside of the limit for objects near airports in the guidance published by the Federal Aviation Administration (FAA) (within 20,000 feet or less than 4 miles from an airport). The FAA requires notice of construction for any structures within 20,000 feet what would extend 200 feet above ground level.[21] The proposed height of the tallest buildings (420 feet) would be approximately 30 feet higher than the crest of the adjacent Bayview Hill (which reaches an elevation of about 390 feet). The Project applicant will notify FAA prior to construction of buildings exceeding 200 feet to ensure compliance with FAA requirements. For those reasons, the heights of the Project buildings would not interfere with or result in any changes to air traffic. Therefore, Project impacts on air traffic safety would be *less than significant*.

Air traffic impacts under Project Variants 1 and 2, and Alternatives 1 through 5 would be similar to the Project; impacts on air traffic safety would be *less than significant.*

6.9 HAZARDS DUE TO DESIGN FEATURES

The Project includes construction of new roadways within the Project site, the construction of the Yosemite Slough bridge, and streetscape and intersection improvements outside of the Project site. New and reconfigured roadways would be designed in accordance with City standards, and would need to be reviewed and approved by the City prior to construction. Therefore, Project impacts related to hazards would be *less than significant*.

Impacts related to hazards under Project Variants 1 and 2, and Alternatives 1 through 5 would be similar to the Project; *less than significant.*

6.10 CONSTRUCTION IMPACTS

6.10.1 Project and Project Variants

Buildout of the Project would occur over a 20-year period between 2010 and 2029. Initial construction activities would include demolition of existing structures, utility relocation and site clearance and grading at Hunters Point Shipyard to make the land available for the new stadium. The new stadium and the Yosemite Slough bridge are anticipated to be completed by 2017 in time for the 2017 football season.

Buildout of the project would occur over about a 20-year period as part of four overlapping phases (see **Table 2** for development phasing). The duration of each phase would vary, depending on the type of development (e.g., residential, retail, office) and the amount of building space included in each phase. The majority of development would occur and be occupied by the end of the second phase, which has a scheduled completion date of 2021. The majority of the roadway network improvements would occur by 2017 (Phase I), and most transit improvements would be phased in by 2021 (within Phase I and Phase II). Construction impacts within the Project site would affect new residents, employees, and visitors to the area. Overall, throughout the construction period the addition of worker-related vehicles and transit trips would be less than those associated with Project conditions at full buildout.

During construction of the Project phases, building activities would generate traffic volumes from construction workers, truck deliveries of supplies and construction equipment, and the hauling of soils during Project grading and excavation. **Table 90** presents the phases for the Hunters Point Shipyard and Candlestick Point development, the number of construction workers that would be on-site on a daily basis, as well as the maximum number of construction truck trips that would travel to and from the sites on a daily basis. These truck trip estimates assume that approximately 40 percent of the required import fill materials would be brought onto the site via barge, with the remaining arriving by truck. **Table 91** presents the number of daily construction truck trips and construction workers, as well as the annual number of barge trips associated with improvements to the shoreline at both Hunters Point Shipyard and Candlestick Point.

The peak phases of construction activities would occur between 2012 and 2016, when grading and infrastructure improvements would be ongoing at both Candlestick Point and Hunters Point Shipyard. During this phase, there would be between 50 and 180 construction workers that would be on-site on a daily basis, and between 140 and 570 construction truck trips that would travel to and from the site on a daily basis. These truck trip estimates assume that about 40 percent of the required import fill materials would be brought onto the site via barge, with the remaining arriving by truck.

Table 90
Construction Workers and Trucks by Phase
Hunters Point Shipyard and Candlestick Point

Project Area/Construction Phase	Construction Duration	Daily Construction Workers	Daily Construction Truck Trips
Hunters Point Shipyard

2024 Shoreline	1	5-7	--	3
2026 Shoreline	3	5-7	--	4
2027 Shoreline	4	5-7	--	6

Note:
1. Includes stadium construction.
Source: MACTEC, 2009.

Shoreline improvements at both Hunters Point Shipyard and Candlestick Point would peak in 2016 and 2017, and would require an additional 40 to 50 construction workers on-site.

Construction related activities would generally occur Monday through Saturday, between 7:00 A.M. and 8:00 P.M., and the typical work shift for most construction workers would be from 7:00 A.M. to about 3:30 P.M. Construction is not anticipated to occur on Sundays or major legal holidays, but may occur on an as-needed basis. The hours of construction would be stipulated by the Department of Building Inspection, and the contractor would be required to comply with the San Francisco Noise Ordinance.[22] Delivery and removal of extra long or wide bridge construction components, equipment, or materials may occur outside theses hours on an as-needed basis.

Construction staging would mostly occur within the individual sites under construction or along existing street right-of-way. Construction staging would involve staging of construction vehicles, storage of construction materials, construction worker vehicles, delivery, and hauling trucks. Due to the large amount of vacant land in the Project site, construction staging would occur on-site,

[22] The San Francisco Noise Ordinance permits construction activities seven days a week, between 7:00 A.M. and 8:00 P.M.

and construction-worker vehicles would likely park near construction sites in the Project site during most phases, and would not occupy spaces on neighborhood streets.

While the exact routes that construction trucks would be using would depend on the location of individual construction sites, it is expected that Harney Way, Hunters Point Expressway, Innes Avenue, Evans Avenue, Cesar Chavez Street, and Third Street would be the primary haul routes between U.S. 101 and the various components of the Project.

In general, construction related transportation impacts would include impacts in the immediate vicinity of the development project under construction, on roadways within the Project site, and cumulative construction traffic impacts along the roadways in the Bayview Hunters Point neighborhood. Since the Project includes building construction as well as construction of a new street system and transit route extensions into the Project site, all Project construction operations would include plans for the closure of traffic/parking lanes and sidewalks adjacent to construction sites. The closure of sidewalks and parking lanes could last throughout the entire construction phase for each building or group of buildings. It is possible that more than one location within the Project site could be under construction at any one time and that multiple travel lane closures may be required.

During the construction period, temporary and intermittent disruption to existing and proposed transit routes and bus stops may occur, and some bus routes may need to be temporarily rerouted (for example, the 29-Sunset on Gilman Avenue and Giants Drive, the 54-Felton on Ingalls, the 23-Monterey and 44-O'Shaughnessey on Palou Avenue, and the 19-Polk on Innes Avenue. In addition, temporary and intermittent interference to transit operations caused by increased truck movements to and from the construction sites may occur. Any change in transit routes and stops would have to be coordinated and approved by the SFMTA.

Due to the reduction in travel lanes, the remaining travel lanes would become more congested with automobiles, trucks and buses, which would pose a greater challenge for bicycle travel in the area. Since bicycle traffic in the Project vicinity is relatively low, this impact is not anticipated to be significant. Existing pedestrian volumes along the key access routes and at the proposed construction sites are low and, therefore, any sidewalk closures or rerouting of the walkway would not significantly affect pedestrian circulation. In general, temporary pedestrian walkways must be maintained in order to facilitate pedestrian movements.

The construction activities associated with the Project would overlap with construction activities of other development projects in the area, notably the HPS Phase I, Executive Park site, Brisbane Baylands, Visitacion Valley, India Basin Shoreline, and the Hunters View site. In addition, the Project construction activities would also overlap with nearby proposed transportation improvement projects, such as the U.S. 101/Harney interchange improvements, and the Geneva Avenue Extension. These overlapping construction activities would increase the number of construction worker vehicles and trucks traveling to and from the project sites along Harney Way and Jamestown Avenue for the Executive Park project and for development within Candlestick Point, and on Cesar Chavez Street and Evans Avenue for the India Basin Shoreline, Hunters View project, and development within Hunters Point Shipyard. For example, construction activities of one or more projects that adversely affect roadway capacity (e.g., Harney Way widening), combined with construction vehicle traffic traveling to and from the roadway project and nearby development projects under construction (e.g., Executive Park and Candlestick Point), could result in increased delays due to traffic diversions and substantial increases in truck traffic.

Given the magnitude of development proposed for the area, the Project's prolonged construction period, and the lack of certainty about the timing of the projects in the area, significant Project-related and significant Project contributions to cumulative traffic and circulation impacts could occur on some roadways, such as U.S. 101, Cesar Chavez Street, Evans Avenue, Harney Way, and Bayshore Boulevard. Cumulative impacts would include construction detours and increased travel times, although the extent and duration of delay would vary depending on individual driver's origin and destination, time of travel and use of alternate routes. Implementation of individual traffic control plans would minimize impacts associated with each project and reduce each project's contribution to cumulative impacts in overlapping areas. However, some disruption and increased delays could still occur even with implementation of traffic control plans, and it is possible that significant construction-related traffic impacts on local and regional roadways could still occur.

> ***Project Mitigation Measure 16***: The Project Applicant shall develop and implement a Candlestick Point–Hunters Point Shipyard Phase II Construction Traffic Management Program to minimize impacts of the Project and its contribution to cumulative impacts related to construction activities and construction traffic. The program shall provide necessary information to various contractors and agencies as to how to maximize the opportunities for complementing construction management measures and to minimize the possibility of conflicting impacts on the roadway system, while safely accommodating the traveling public in the area. The program shall supplement and expand, rather than modify or supersede any manual, regulations, or provisions set forth by SFMTA, DPW or other City departments and agencies.
>
> Preparation of the Construction Management Program shall be the responsibility of the Project Applicant, and shall be reviewed and approved by SFMTA and DPW prior to initiation of construction. The Project Applicant shall update the program prior to approval of development plans for Phase 2, Phase 3 and Phase 4 of construction to reflect any change to Project development schedule, reflect transportation network changes, to update status of other development construction activities, and to reflect any changes to City requirements.

The program shall:

- Identify construction traffic management practices in San Francisco, as well as other jurisdictions that although not being implemented in the City could provide useful guidance for a project of this size and characteristics.
- Describe procedures required by different departments and/or agencies in the City for implementation of a construction management plan, such as reviewing agencies, approval process, and estimated timelines.
- Describe coordination efforts associated with the Navy remediation efforts and scheduling regarding construction vehicle routing via the Crisp gate.
- Identify construction traffic management strategies and other elements for the Project, and present a cohesive program of operational and demand management strategies designed to maintain acceptable levels of traffic flow during periods of construction activities in the Bayview Hunters Point area. These could include construction strategies, demand management strategies, alternate route strategies, and public information strategies.
- Coordinate with other projects in construction in the immediate vicinity, so that they can take an integrated approach to construction-related traffic impacts.
- Present guidelines for selection of construction traffic management strategies.

Implementation of Project Mitigation Measure 16 would help minimize the Project construction-related transportation impacts, and the Project's contribution to cumulative-construction related transportation impacts. However, some disruption and increased delays could still occur even with implementation of Mitigation Measure 16, and it is possible that significant construction-related transportation impacts on local and regional roadways could still occur. Localized construction-related transportation impacts would therefore remain *significant and unavoidable*.

Project Variants: Construction activities associated with the Variant 1 and Variant 2 would be similar to the Project. These variants do not include construction of a new stadium at Hunters Point Shipyard, instead assume an additional 2,500,000 square feet of research and development uses under Variant 1, and reallocation of 1,350 residential units from Candlestick Point to Hunters Point Shipyard under Variant 2. Depending on the phasing of the additional development, the Variants 1 and 2 may result in fewer construction traffic impacts between future years 2012 and 2017 when the new stadium is proposed to be constructed, and somewhat greater impacts in the years the additional R&D space or housing units would be constructed. Implementation of a traffic control plan would reduce the project's contribution to significant cumulative impacts of overlapping construction traffic. However, as with the Project, cumulative transportation impacts associated with construction activities would be considered *significant and unavoidable.*

Implementation of Project Mitigation Measure 16 would be applicable to Project Variants 1 and 2. A Hunters Point Shipyard – Candlestick Point Construction Traffic Management Program would help minimize the Project Variants' construction-related transportation impacts and contribution to cumulative-construction related transportation impacts. However, since some disruption and increased delays could still occur even with implementation of the mitigation measure, and it is possible that significant construction-related transportation impacts on local and regional roadways could still occur. Localized construction-related transportation impacts would therefore remain *significant and unavoidable.*

6.10.2 Alternatives to the Project

Alternative 1 – No Project: Construction activities associated with Alternative 1 would be less than the Project. Alternative 1 assumes buildout of Hunters Point Shipyard Phase II per the Hunters Point Shipyard Redevelopment Plan and EIR (February 2000) and subsequent addendums dated November 19, 2003 and July 13, 2006. Under Alternative 1, the existing stadium would remain and no construction activities would occur within Candlestick Point. Due to the reduced level of development anticipated for Hunters Point Shipyard construction impacts associated with Alternative 1 would be *less than significant*.

Alternative 2 – No Bridge: The Alternative 2 development program is the same as the Project; however, Alternative 2 would not include construction of the Yosemite Slough bridge. Therefore, Alternative 2 would not include the construction impacts associated with the bridge and access roads (proposed to occur between 2015 and 2016). All other construction activities and impacts would be the same as described for the Project above. As with the Project, cumulative traffic impacts during construction would be considered *significant.*

Project Mitigation Measure 16 would be applicable to Alternative 2. Implementation of this measure would help minimize Alternative 2's construction-related transportation impacts, and contribution to cumulative-construction related transportation impacts. However, since some disruption and increased delays could still occur even with implementation of traffic control plans, and it is possible that significant construction-related transportation impacts on local and regional roadways could still occur. Localized construction-related transportation impacts would therefore remain *significant and unavoidable.*

Alternative 3 – 49ers stay at Candlestick: Construction activities associated with Alternative 3 would be less than for the Project within the Candlestick Point area. Construction within Hunters Point Shipyard would be similar to the Project; however, 1,350 residential units would be developed within Hunters Point Shipyard. Within Candlestick Point the existing stadium would remain, and only 1,210 residential units would be constructed. Overall construction activities and impacts would be somewhat less than identified for the Project, however, as with the Project cumulative traffic impacts during construction would be *significant*.

Project Mitigation Measure 16 would be applicable to Alternative 3. Implementation of this measure would help minimize Alternative 3's construction-related transportation impacts, and contribution to cumulative-construction related transportation impacts. However, since some disruption and increased delays could still occur even with implementation of traffic control plans, and it is possible that significant construction-related transportation impacts on local and regional roadways could still occur. Localized construction-related transportation impacts would therefore remain *significant and unavoidable.*

Alternative 4 – Lesser Build: Alternative 4 assumes a general reduction in development as compared to the Project (approximately a 30 percent reduction), and therefore construction activities and impacts would be similar to the Project, however, the extent and duration would likely be somewhat less than identified for the Project. As with the Project, cumulative traffic impacts during construction would be *significant*.

Project Mitigation Measure 16 would be applicable to Alternative 4. Implementation of this measure would help minimize Alternative 4's construction-related transportation impacts, and contribution to cumulative-construction related transportation impacts. However, since some disruption and increased delays could still occur even with implementation of traffic control plans, and it is possible that significant construction-related transportation impacts on local and regional roadways could still occur. Localized construction-related transportation impacts would therefore remain *significant and unavoidable.*

Alternative 5 – Park Agreement: The Alternative 5 development program is similar to Project Variant 2, which assumes 1,350 more residential units in Hunters Point Shipyard rather than in Candlestick Point. Alternative 5 does not include construction of a new stadium or a Yosemite Slough bridge, and therefore construction activities associated with these elements would not occur. As with the Project, cumulative traffic impacts during construction would be *significant.* As with the Project, cumulative traffic impacts during construction would be considered *significant.*

Project Mitigation Measure 16 would be applicable to Alternative 5. Implementation of this measure would help minimize Alternative 5's construction-related transportation impacts, and contribution to cumulative-construction related transportation impacts. However, since some disruption and increased delays could still occur even with implementation of traffic control plans, and it is possible that significant construction-related transportation impacts on local and regional roadways could still occur. Localized construction-related transportation impacts would therefore remain *significant and unavoidable.*

6.11 STADIUM AND ARENA IMPACTS

This section describes the impacts associated with replacing Candlestick Park stadium with a new 49ers stadium that would be located in the Hunters Point Shipyard. In addition, this section analyzes impacts associated with the proposed arena in Candlestick Point. A Sunday 49ers game and a weekday secondary event are analyzed for the stadium, and a weekday event was analyzed for the arena.

6.11.1 Stadium 49ers Game Impacts

No Project

<u>*Auto Congestion*</u>

Due to projected increases in background traffic on the study area freeways and traffic associated with buildout of land uses already approved for HPS, congestion following a football game would worsen somewhat over existing conditions on area roadways and freeways. On freeway facilities, substantial congestion and delays could be anticipated on U.S. 101 northbound and southbound at Hospital Curve, and at U.S. 101 near the new Geneva/Harney interchange, mainly near on- and off-ramp merge and diverge points. The existing post-game congestion that extends upstream from the Bay Bridge to the U.S. 101/I-280 merge would worsen in terms of extent of queue from existing conditions. **Table 92** presents freeway mainline segment and ramp merge and diverge section operating conditions under No Project alternative for conditions immediately following a football game.

On local streets, the primary locations of congestion following a football game are along the existing stadium's main exit routes. The main exit routes of the existing stadium (No Project conditions) are as follows:

- Harney Way, between Candlestick Park and U.S. 101
- Jamestown, Ingerson, Gilman, and Carroll Avenues, between Candlestick Park and Third Street
- Paul Avenue, between Third Street and Bayshore Boulevard
- Third Street, between Jamestown and Cesar Chavez Street

The analysis of No Project impacts assumes the proposed extension of Geneva Avenue from its current terminus at Bayshore Boulevard to connect across U.S. 101 to Harney Way would be in place. As part of the interchange project, additional capacity onto U.S. 101 would be provided. As a result, although queuing and congestion may worsen compared to existing conditions, due to background growth in traffic, actual stadium clearance times may improve somewhat over existing conditions due to the increased capacity at the new Geneva Avenue/Harney Way/U.S. 101 interchange. The improved capacity associated with this new interchange may be limited in terms of game day operations, though, depending on the operation of ramp meters.

Table 92
Freeway LOS Analysis – 2030 No Project Conditions

Queuing

Queuing impacts associated with the post-game period at the stadium under the No Project conditions would be similar to those occurring under existing conditions. Following a football game at the existing stadium, the existing egress system effectively meters the traffic that can merge onto U.S. 101 and other routes so as to minimize mainline congestion. Virtually all egress routes from the stadium suffer congestion. Post-game field observations indicate that spectators begin leaving the stadium approximately one hour prior to the end of the game (between 3:00 and 4:00 p.m.) to avoid the peak congestion period. The percentage of spectators leaving prior to the end of the game depends on factors such as game score, weather, and/or traffic conditions. Typically, depending on the nature of the game and the weather, approximately 20 percent to 30 percent of the spectators leave during the one-half hour prior to the end of the game. These vehicles are able to exit the project vicinity (e.g., get onto the freeway or Third Street) under unconstrained conditions as the capacity of the egress system can accommodate these vehicles.

However, immediately following the end of the game is the time when the vast majority of the spectators begin to leave the stadium and enter the roadway egress system, thus resulting in queues along the roadways leading to the freeway and Third Street. For example, vehicles directed to use Harney Way for egress develop queues that extend from the U.S. 101/Harney Way interchange along Harney Way to Hunters Point Expressway. Under existing conditions, all queues in the study area begin to dissipate sometime between approximately 1.5 to 2 hours following the end of the game.

Parking

Under the No Project conditions, the off-street parking supply provided as part of stadium operations would not substantially change from the 18,880 spaces described in section 3.7.2. Approximately 9,110 spaces would continue to be located in the stadium lots, 5,470 on undeveloped state park land, and 4,300 in satellite parking lots. An additional 3,000 spaces are currently estimated to be provided on private lots. However, some of the satellite and private lots may not be available in the future due to development of other uses on that land (e.g., Executive Park development project). Development of the satellite and private lots would likely occur gradually so that the parking deficit would increase incrementally over time. Without the use of satellite lots, and without the provision of additional parking on-site (such as in a garage) or off-site (on adjacent properties such as Brisbane Baylands), stadium spectators would park on-street further from the stadium (such as in the Bayview or Little Hollywood neighborhoods), or switch to alternative modes of transportation such as transit or charter buses.

Project

Traffic Impacts

With the Project, the existing traffic management of pre-game and post-game traffic would be adjusted to reflect the new stadium location and access routes. The Project calls for a new Traffic Management Center, to be staffed by City employees, to dynamically monitor and operate traffic signals along primary ingress and egress routes to efficiently move traffic into and out of the area prior to and after games. In addition, similar to existing conditions, traffic control officers would be stationed at key locations to ensure efficient traffic movements. The overall game day traffic control plan is shown in **Figure 35.**

Similar to existing conditions, the majority of stadium bound traffic would use a portion of U.S. 101 to access the project site on game days. Traffic from the south would predominantly use northbound U.S. 101 and access the site via Harney Way, while traffic from the north would predominantly use southbound U.S. 101 and I-280 and access the site via Cesar Chavez Street, Cargo Way, Evans Avenue, and Innes Street. Some trips to the site would use Bayshore Boulevard or Third Street to access the area via Carroll Avenue, Gilman Avenue and Ingalls Street.

SOURCE: Fehr & Peers; AECOM

FIGURE 35: GAME DAY TRAFFIC CONTROL PLAN

Prior to and after games in the proposed stadium, special measures (similar to those in place for existing football games) would be taken to allow the site's circulation system to accommodate unique game day traffic flows. **Figure 36** presents the site's pre-game circulation plan and **Figure 37** presents the site's post-game circulation plan. Prior to games, the site's roadways would be geared towards inbound flow and after games the roadways would be geared towards outbound flow.

Vehicles accessing the new stadium from the south would use Harney Way. Harney Way would be configured to provide four inbound lanes (to the stadium) and one outbound lane between U.S. 101 and Arelious Walker Drive. Arelious Walker Drive, between Harney Way and Crisp Avenue would provide four inbound lanes. Crisp Avenue would provide seven inbound lanes between Arelious Walker Drive and the new stadium. The lane configurations would be reversed for post-game conditions.

Vehicles accessing the new stadium from the south, would be routed via the routes described above to Crisp Avenue, where it would be channeled to a Ring Road on the southern portion of the stadium. Access to the internal parking aisles would be from the Ring Road.

Vehicles accessing the new stadium from the north would use Evans Avenue and Cargo Way. These inbound routes would merge at Hunters Point Boulevard/Jennings/Evans. From there, the inbound route along Hunters Point Boulevard and Innes Avenue would provide four inbound lanes and one outbound lane. The lane configurations along Hunters Point Boulevard and Innes Avenue would be reversed for post-game conditions.

Under typical traffic conditions, traffic impacts are measured in terms of intersection levels of service. However, due to the unique circumstances following a football game, including manual and dynamic control of intersections by traffic control officers and complex travel patterns, traditional methods of calculating intersection levels of service may not be appropriate. Instead, for post-game conditions, traffic impacts associated with the new stadium are described in terms of the magnitude, duration, and expected locations of congestion.

The one hour period immediately following the conclusion of a football game is generally the most congested period. The amount of vehicular traffic associated with the new stadium is expected to be similar to, or even slightly less than, the amount of traffic associated with the existing stadium because of the improved transit service proposed to serve the new stadium. However, because under the project conditions, there would be additional development around the stadium compared to the No Project alternative, the additional vehicle trips associated with the new stadium and increased surrounding development would somewhat increase congestion and delays following a football game from 2030 No Project conditions.

FIGURE 36: PROPOSED STADIUM GAME DAY INGRESS ROUTES

SOURCE: Fehr & Peers; AECOM

FIGURE 37: PROPOSED STADIUM GAME DAY EGRESS ROUTES

As shown on **Table 93**, the proposed location of the new stadium would create additional exit routes such that more streets would be congested following a game than under the No Project conditions. Providing additional egress routes would spread the post-game congestion, and provide a quicker parking lot clearance time. However, it would result in game day traffic congestion along Innes Avenue, Evans Avenue, and Cargo Way, which would not experience substantial congestion following a game under the 2030 No Project condition.

Table 93
Locations of Congestion Following San Francisco 49ers Football Game

Exit Route	No Project (Existing Stadium)	Project (HPS Stadium)

Cesar Chavez Street, between U.S. 101 and I-280		X

Note:
Analysis based on expected stadium exit routes. Other exit routes identified in **Figure 37**, but not shown on this table are downstream of major bottlenecks and, although expected to carry additional post-game traffic, are not expected to function at capacity.
Source: Fehr & Peers.

One result of providing additional egress routes from the proposed new stadium is that traffic congestion is expected to clear the area quicker. **Table 94** presents the expected parking lot clearance time under No Project conditions (based on the current stadium exit capacity) and Project conditions, based on the existing and proposed stadium travel demand scenarios described in the travel demand discussion. The total travel demand assumed in the calculations for the proposed stadium is based on the number of vehicles parked in the stadium parking lot. Although there may be some additional vehicles parked off-site (i.e., outside of the Project study area), they would be parked beyond the expected area bottlenecks, and therefore, would not likely increase the amount of time to clear post-game congestion.

Table 94
Post-Game Exit Demand and Clearance Times

Scenario	Assumptions	Exit Demand (vehicles)		Clearance Time (hours:minutes)	
		Existing Stadium	HPS Stadium	Existing Stadium[1]	HPS Stadium: With U.S. 101 Interchange[2]
Most Conservative	Sold-out event, everyone leaves at end of event	21,875	17,075	2:50	1:28
	Sold-out event, 10% leave early, 5% stay late	18,590	14,510	2:25	1:14
	90% attendance, 10% leave early, 5% stay late	16,730	13,060	2:10	1:11
Average	90% attendance, 15% leave early, 5% stay late	15,750	12,290	2:03	1:07
	80% attendance, 15% leave early, 5% stay late	14,000	10,930	1:49	1:00
	80% attendance, 20% leave early, 5% stay late	13,130	10,250	1:42	0:56
Least Conservative	70% attendance, 20% leave early, 5% stay late	11,480	8,960	1:29	0:49

Notes:
1. Based on existing stadium clearance capacity of 7,700 vehicles per hour.
2. Ultimate HPS Stadium clearance capacity is projected to be 11,000 vehicles per hour, which is constrained by the exit gates at the stadium parking lot. Under this condition, the 1,000 spaces in the Candlestick Point retail structure are unconstrained and would be able to clear faster than the stadium parking lot. Therefore, demand from these spaces is not included in the calculation of parking clearance times. However, to be conservative, the analysis assumes that for non-sellout games, all parking occurs in the stadium lots and that the parking adjacent to the Candlestick Point retail structure is unused.
Source: Fehr & Peers.

As shown in **Table 95,** although the number of roadways expected to experience post-game traffic congestion is expected to increase with the Project, the total duration of expected post-game congestion is expected to be considerably less than under the 2030 No Project condition.

Similar to the roadway analysis, because the post-game traffic is expected to be spread out over a greater number of exit routes. As a result more freeway interchanges are expected to handle larger numbers of game day traffic. As shown in **Table 95,** two freeway facilities, I-280 southbound between the Alemany Street off- and on-ramps and U.S. 101 northbound at the on-ramp from Bayshore Boulevard would actually see improvements, compared to the 2030 No

Project conditions. This is because traffic from the proposed stadium location would use different routes to reach the freeway. The Project would impact the segment of I-280 northbound between 25th Street/Indiana Street and Mariposa Street.

Source: Fehr & Peers.

The Project would result in new freeway facilities operating unacceptably. However, the duration of expected congestion would likely be less due to the higher level of transit use, the Transportation Management Center housed within the stadium to increase efficiency of exiting traffic, and the greater amount of identified post-game exit routes and freeway access points. Overall, since new facilities, including local streets and freeway facilities, would experience congested traffic following a football game, traffic impacts associated with the new stadium during game days would be considered *significant.*

The Project includes measures to reduce the magnitude of the traffic impacts associated with the new stadium, including limiting the parking supply, providing a more robust transit system, and locating the stadium so as to better disperse traffic following a game. As a result, the exit capacity of the new stadium would be greater than that of the existing stadium. Mitigation measures associated with additional roadway widening would degrade pedestrian and bicycle conditions during non-game days, which represent the vast majority of the time, and were therefore not considered further. However, Project Mitigation Measure 17 is required to ensure that a management plan for accommodating the increased vehicle, transit, pedestrian and bicycle demands during game days is prepared and implemented.

Project Mitigation Measure 17: The stadium operators shall develop and maintain a Transportation Management Plan (TMP) for the stadium. The stadium operator shall work with representatives from the SFMTA, the State Highway Patrol, the Police Department, private charter operators, Caltrain and others on a continuing basis to develop and refine the TMP, as determined appropriate by SFMTA. The final stadium TMP shall be approved by SFMTA. Preparation of the TMP shall be fully funded by the stadium operator, and shall be completed in time for implementation on opening day of the stadium.

The following actions shall be included in the TMP:

- Information on transportation options to the stadium, including game day service by the various regional service providers shall be distributed to season ticket holders, employees, and other patrons if possible.
- A brochure, information packet, and/or web page providing full information on transit access to the stadium, similar to that currently offered at the 49ers website, shall be updated and maintained.
- The use of charter buses to the stadium shall be encouraged and expanded. A number of measures shall be considered that could be implemented at low-cost to expand the use of group charters, including reduced parking costs, publicize the groups in 49ers publications and mailings, provide priority parking, provide lounges for bus drivers and provide support services for rooter clubs.
- Residential Permit Parking Program and/or additional parking restrictions, such as time limits, during game days, particularly in the Bayview Hunters Point areas, shall be explored with residents to reduce potential for intrusion of stadium vehicles into the adjacent neighborhood during a football game or secondary event.
- The stadium operator shall implement measures to encourage carpools of 4-plus persons per vehicle.
- The stadium operator shall charge a higher parking cost for low occupancy vehicles.
- The stadium operator shall develop a separate TDM plan for employees of the stadium and concessionaires. The plan shall consider measures such as providing

employees and concessionaires with free or subsidized transit passes to encourage transit use and reduce vehicular travel to the stadium. Employees shall not receive preferential parking.

- The stadium operator shall develop measures with CPSRA to ensure that game day spectators do not park in CPSRA day use parking lots. Strategies to be explored include limiting parking in CPSRA lots to a limited duration during game days (e.g., to a two-hour period), or an increase in parking fees equivalent to game day parking, and ticketing and enforcement.
- The TMP shall ensure that regular transit routes operate acceptably near the stadium. The plan should consider providing alternate routes for those transit lines that do not have exclusive right of way on game days (48-Quintara-24th Street, 44-O'Shaughnessy, 29-Sunset) onto transit-only facilities such as the BRT right of way to the south and Palou Avenue to the north (which would be a transit-only facility on game days).

Implementing this mitigation measure would likely reduce automobile travel to the stadium and encourage transit usage. However, even with implementation of Project Mitigation Measure 17, the Project's impacts on Sunday pre-game and post-game period traffic conditions would remain *significant and unavoidable.*

Transit Impacts

During game days, the regularly scheduled bus service adjacent to the stadium would continue to operate on normal routes, providing direct service to the stadium and into the Hunters Point Shipyard Transit Center. **Figure 38** presents the game day transit service. Special game day transit, including charter buses and public transit express service would access the stadium via Palou Avenue, which would be converted to transit-only on game days. These buses would conduct passenger loading and unloading on Crisp Avenue, in front of the stadium. The stadium parking program calls for 340 bus parking spaces to store empty buses during the game.

During sellout games, about 16,388 spectators and 652 game day employees are expected to use transit to access the stadium, a total of 17,040 transit riders. Assuming similar transit ridership from regional providers (including charter service expected to replace service previously provided by Golden Gate Transit, the Santa Clara Valley Transportation Authority, and SamTrans) and other private charters, the expected Muni ridership to the stadium would be 12,040 (an increase of about 5,500 patrons from existing conditions). This ridership includes transit patrons who use regional transit, such as Caltrain and BART, and transfer to Muni to access the stadium.

SOURCE: Fehr & Peers; AECOM

FIGURE 38: PROPOSED STADIUM GAME DAY TRANSIT

As presented in **Table 96,** the combination of regularly scheduled transit service and game day express routes, similar to what is provided to the existing stadium, is expected to be approximately 8,400 passengers per hour. Therefore, with a projected Muni ridership of 12,040 patrons and capacity of 8,400 passengers per hour, there would be a capacity shortfall of approximately 3,640 passengers per hour. This shortfall in transit capacity would be considered significant.

Table 96
Game Day Muni Capacity by Line

Route	One-Way Hourly Capacity (passengers per hour)
24-Divisadero	400 [1]
28L-19th Avenue/Geneva Avenue	800 [1]
44-O'Shaughnessy	450 [1]
48-Quintara-24th Street	250 [1]
Game Day Express Service (75X, 77X, 78X, 79X, 86, and 87)	6,500 [2]
Total	**8,400**

Notes:
1. Assumes Sunday peak hour capacity is 75 percent of typical weekday peak hour capacity, per SFMTA TEP assumptions.
2. Based on existing ridership on these express routes
Source: SFMTA, Fehr & Peers.

> ***Project Mitigation Measure 18***: SFMTA shall increase frequency on regularly scheduled Muni routes serving the stadium area on game days. In addition, the stadium operator shall fund additional Muni shuttle service between the stadium and regional transit service, including BART (Balboa Park and/or Glen Park Station) and Caltrain (Bayshore Station). Although the specific frequencies of individual routes should be determined based on patron characteristics that may evolve over time, the increased transit service, taken as an aggregate, should generally compensate for the projected shortfall of 3,600 passengers per hour on the existing and proposed transit lines.
>
> Prior to opening day at the new stadium, the City and stadium operator shall determine costs associated with the increased service and determine funding sources. Examples of funding sources that shall be considered include a surcharge on game tickets or other such revenue mechanism. Implementation of increased transit service would be the responsibility of SFMTA and the stadium operator, and would be implemented when projected attendance warrants additional service.

With implementation of Project Mitigation Measure 18, the Project's impacts to transit service on Sundays during a football game could be reduced to less-than-significant levels. However, area roadways would experience congestion during post-game conditions that could be lessened but not eliminated with mitigation, and the transit lines serving the Project vicinity would be subject to traffic congestion. Therefore, the effectiveness of providing additional capacity may be limited due to the traffic impacts on transit operations, and therefore, the impact on transit operations would remain *significant and unavoidable.*

Bicycle Impacts

The Project would improve bicycle access to the area in terms of new bicycle lanes on existing and reconfigured roadways, and bicycle access within and in the vicinity of the Project site would be maintained on game days. However, bicycle access would be constrained due to the heavy traffic volumes at locations further away from the Project site where bicycle lanes are not provided. At these locations, bicyclists would likely divert to roadways not designated as stadium access routes (e.g., bicyclists may use Revere Avenue instead of Gilman Avenue for access to and from the stadium).

For those patrons arriving by bicycle, the proposed stadium would provide improved amenities compared to the existing stadium. Bicycle racks and lockers would be provided at the stadium entrances. In addition, a bicycle valet, similar to the service operated at AT&T Park for San Francisco Giants baseball games would be provided.

Bicycle access to the stadium on football game days would be difficult, as at present, due to heavy traffic volumes. However, bicycle access to the new stadium would be provided, and impacts on bicycle operations would therefore be *less than significant.*

Pedestrian Impacts

Pedestrian access to the stadium from external locations would be provided via 15-foot sidewalks on either side of Crisp Avenue. All other streets leading into the stadium site would provide 12 to 15-foot-wide sidewalks. Near the stadium, game day pedestrians would be allowed to cross the Crisp Avenue at two locations where the Ring Road intersects Crisp Avenue. In addition, pedestrians traveling between the stadium and the 3,000 parking spaces in the Hunters Point Shipyard R&D campus would cross the Ring Road on the south side of Crisp Avenue. Because of the need to balance pedestrian flows with efficient auto egress, temporary pedestrian overcrossings, similar to the one recently installed across Hunters Point Expressway, would be provided. Traffic control officers would also be stationed at the overcrossings, as well as at other at-grade crossings.

Pedestrian travel throughout the Project site may be disrupted by game day traffic, and pedestrian travel near the new stadium, would experience crowding. However, this is expected and understandable for large events, and would be similar to conditions at the existing stadium.

Pedestrian access to the stadium during game days would be difficult, as at present, due to heavy traffic volumes. However, since pedestrian access would be maintained, stadium game day impacts on pedestrian circulation would be *less than significant.*

State Park Access Impacts

With the Project, the Bay Trail around Yosemite Slough would be completed, and all existing connections to the Bay Trail would be maintained. Pedestrian and bicycle access to the developed state park lands would be maintained, and the Project's extensive improvements to the area bicycle and pedestrian network would facilitate access to the state parks lands. Pedestrian and bicycle access to state park lands on game days would be similar to existing condition; that is, heavy traffic congestion in the pre- and post-game periods could discourage bicycle use to and from CPSRA during these periods, generally during two hours before and after each game.

Because there would be at least one lane open to traffic in each direction during pre- and post-game operations on roadways providing access to CPSRA facilities, vehicle access to state parks would still be accommodated on game days. However, as with bicycle access, heavy traffic congestion during game days could discourage vehicular access to and from the state parks during these periods.

Overall, since vehicle, bicycle and pedestrian access to state park facilities would be maintained during game days, impacts related to access would be *less than significant.*

Parking Impacts

The 49ers stadium area would have a total supply of 17,415 game day parking spaces, as presented on **Figure 11.** A total of 12,665 of the 17,415 parking spaces would be adjacent to the stadium, and accessible via a new loop road on the southern portion of the stadium. Of the 12,665 spaces, 340 spaces adjacent to the stadium would be reserved for buses, and the remaining 12,325 would be for private autos, RVs, limos, etc. Parking structures on the north side of Crisp Avenue, immediately across from the stadium, would accommodate an additional 750 vehicles, and would be accessible from Crisp Avenue. The R&D campus in Hunters Point Shipyard would provide an additional 3,000 spaces, of which 2,747 would be in structures and 253 would be on street.[23] These spaces would be accessible from internal roadways, which, in turn, would be accessible from Crisp Avenue. An additional 1,000 spaces would be provided in Candlestick Point retail parking structure that on game days would be reserved for stadium spectators.

A sell-out event at the stadium would result in a total game day travel demand of 20,134 vehicles (excluding buses) that would need to be accommodated. The Project would have a total game day parking supply of 17,415 spaces, of which 17,075 would be available for vehicle parking

[23] The on-street parking spaces in Area C would be made available for fixed-rate, longer-term parking by football patrons and controlled by City parking control officers on game days.

(340 spaces would be designated for buses). The 20,134-space parking demand would not be met within the 17,075-space parking supply, thus resulting in a shortfall of 3,059 spaces.

It is anticipated that the shortfall would be met similar to existing conditions, where spectators park in satellite parking lots, on street, or within private lots in the area. Currently about 4,300 parking spaces are available within satellite lots, and about 3,000 spaces on private lots that are generally restricted for use by residents, customers, and employees of private businesses. The likely result is that many patrons may elect to park in other off-site parking lots and either walk or take transit to the stadium. Some patrons may park within the CPSRA day use parking lots. Additionally, some patrons may also elect to take transit instead. Through effective parking management, including real-time information, public relations campaigns, and parking pricing strategies, the additional parking demand can be effectively managed.

The satellite parking lots identified in the parking supply are privately owned and operated and are not under the control of the stadium operator. Some of the satellite and private lots may not be available in the future due to development of other uses on that land (e.g., Executive Park development project). Development of the satellite and private lots would likely occur gradually so that the parking deficit would increase incrementally over time. Without the use of satellite lots, and without the provision of additional parking on-site (such as in a garage) or off-site (on adjacent properties such as Brisbane Baylands), stadium spectators would park on street further from the stadium (such as in the Bayview), or switch to alternative modes of transportation such as transit or charter buses.

As noted above, during game days, 1,000 parking spaces in the Candlestick Point retail parking structure would be reserved for stadium spectators, and as a result fewer spaces would be available for Candlestick Point retail patrons. In general, peak parking demand for shopping centers is lower on Sundays than on Saturdays or weekdays, and it is expected that during game days retail patrons would adjust their shopping trip to outside of the game day period, find short-term parking on-street, or access the shopping center via transit. During December when parking demand at shopping centers increases due to holiday shopping, the number of retail patrons that would be affected would increase. However, these patrons could be accommodated within the transit service provided pre- and post-game days.

Since stadium game day parking demand would be accommodated within the proposed parking facilities, privately owned satellite parking lots, and on street, and since alternative modes of transportation such as transit and charter buses would be available for spectators, stadium game day impacts on parking would be *less than significant.*

Loading Impacts

The preliminary design for the new stadium includes loading dock accommodating four semi-trailer trucks and an adjacent TV staging and loading area. The TV staging and loading area would be used for loading/unloading on the days leading up to a game. Separate trash and recycling areas would be provided. The loading facilities for the stadium would be designed based on experience at the existing stadium, and for the needs for large special events such as Monday Night Football games or the Super Bowl.

A total of 100 delivery trucks are expected to serve the stadium in the week prior to a game. The majority of these trucks would serve the concession and food service functions. Stadium-bound delivery trucks would make their deliveries in advance of events to avoid peak travel periods that occur in the hours leading up to a game. Vendors would be notified by the stadium of appropriate delivery times.

Based on information obtained from the 49ers for the existing stadium, for a Sunday afternoon game, truck deliveries would occur in the middle of the week, with about 10 percent occurring on Wednesday, 40 percent on Thursday, and 50 percent on Friday. This truck traffic would be spread over the entire day. The peak stadium delivery day would be Friday, when approximately 50 trucks would make deliveries to the stadium. As is currently done, television trucks would arrive in advance of events to allow for appropriate set-up time and to avoid peak travel periods.

The proposed stadium loading facilities would be sufficient to accommodate projected demand, and therefore the impacts related to loading would be *less than significant.*

Emergency Vehicle Access

During game days, two-way inbound and outbound vehicular circulation would be provided at all times, via three primary routes. On the Harney Way/Arelious Walker Drive route, emergency vehicles would be allowed to use the BRT-only lanes (the BRT-only lanes break off from the primary auto route and continue on Harney Way, east of Arelious Walker Drive, and on Egbert Street before reconnecting with Arelious Walker Drive immediately south of the Yosemite Slough bridge). Emergency vehicles would also be allowed to use Palou Avenue, which would be transit-only on game days. Both of these routes would be free of congestion, and would offer emergency vehicle access between regional facilities and Crisp Avenue. Emergency vehicles would be able to enter the stadium parking lot via Crisp Avenue. Emergency vehicles would also be able to use Innes Avenue, as there would be at least one lane in each direction on this route open to traffic. However, since immediately following games the outbound direction may be congested, this may not be a desirable route as the Harney Way BRT lanes or Palou Avenue.

Since multiple emergency access routes would be provided, stadium game day impacts on emergency access would be *less than significant.*

Project Variants

Project Variant 1 and Variant 2 would be similar to the Project, but would not involve construction of a new stadium. Furthermore, the existing stadium at Candlestick Point would be demolished, and the 49er games would be played elsewhere. Game day impacts for Project Variant 1 and Variant 2 are *not applicable*.

Project Variant 3 would be similar to the Project and would include the proposed new football stadium. However, instead of being the exclusive home to the San Francisco 49ers, the stadium would be shared with another National Football League team, the Oakland Raiders. Game day operations and impacts under this scenario would be the same as the Project. The primary difference would be twice as many regular season games would be played at the stadium, and the chances of hosting post-season playoff games would be increased. Project Mitigation Measure 17 and Project Mitigation Measure 18 would be applicable to Project Variant 3. Similar to the Project, traffic and transit impacts related to the new stadium would be *significant and unavoidable*, and *b*icycle, pedestrian, State Park access, parking, loading and emergency access impacts related to the new stadium would be *less than significant*.

Alternatives to the Project

Alternative 1 – No Project: Game day conditions for Alternative 1 would be the same as for No Project conditions. Due to a projected increase in development in the area, traffic congestion on the local street network would increase compared to existing conditions, and traffic and transit impacts would be *significant and unavoidable.*

Alternative 2 – No Bridge*:* Alternative 2 would be the same as the Project, except that the Yosemite Slough bridge would not be constructed. Because the Yosemite Slough bridge is expected to accommodate four lanes of auto traffic into and out of the stadium before and after games, respectively, this would substantially reduce the ingress and egress capacity of the stadium. During the peak egress time, the egress capacity would be reduced by nearly 40 percent, as the stadium would lose 4 out of the proposed 11 total auto lanes exiting the stadium. This would serve to meter the amount of traffic leaving the stadium, which would mean similar or less congestion on area roadways, particularly those leading toward the U.S. 101/Harney Way interchange. However, the lower exit capacity would likely render the proposed new stadium site infeasible as a desirable option for an NFL football team. Project Mitigation Measure 17 and Project Mitigation Measure 18 would be applicable to Alternative 2. Similar to the Project, even with mitigation, traffic and transit impacts associated with the new stadium under Alternative 2 would be *significant and unavoidable*.

Similar to the Project, bicycle, pedestrian, State Park access, parking, loading and emergency access impacts related to the new stadium would be *less than significant.*

Alternative 3 – 49ers stay at Candlestick: Alternative 3 would involve less development overall, with slightly more development at the Hunters Point Shipyard site and virtually no change to the Candlestick Point area. Candlestick Park stadium would remain at its existing site. Assuming the 49ers would remain at that location, the game day operations under Alternative 3 would be similar to the Alternative 1, the No Project condition. Traffic and transit impacts associated with the existing stadium under Alternative 3 would be *significant and unavoidable.*

Alternative 4 – Lesser Build: Alternative 4 would be similar to the Project, however, the amount of development in the project site would be reduced compared to the Project. Under Alternative 4, the Candlestick Park stadium would be demolished, and no new stadium would be constructed. The 49er football games would be played elsewhere, and therefore there would not be any impacts related to game day operations. Game day impacts for this alternative are *not applicable*.

Alternative 5 – No Park Agreement*:* Alternative 5 would be similar to Project Variant 2, in which the Project is constructed, the Candlestick Park stadium would be demolished, and no new stadium would be constructed. The 49er football games would be played elsewhere, and therefore there would not be any impacts related to game day operations. Game day impacts for this alternative *are not applicable*.

6.11.2 Stadium Secondary Event Impacts

No Project Conditions

Under the No Project scenario, the existing Candlestick Park would remain and development would occur in the Hunters Point Shipyard site. Due to its age and the availability of other nearby newer facilities, the existing Candlestick Park does not host a great deal of special events. Although the background traffic would be higher than existing conditions under the 2030 No Project scenario and the combination of background traffic and special event traffic at Candlestick Park would be somewhat more severe than today's situation, special events at Candlestick Park would continue to be rare events.

Project

As indicated in section 4.2.4, other types of events, such as soccer games or concerts, may also be scheduled at the new stadium during the year. A typical secondary event could occur at any time of day and on any day of the week. The analysis of a secondary event at the stadium considers an expected crowd of about 37,500 spectators, with a weekday evening start time of about 7:00 p.m. The weekday PM peak hour was analyzed for pre-event conditions, for future year 2030 conditions with the Project.

Similar to football game day events, the majority of stadium bound traffic would use a portion of U.S. 101 to access the stadium site prior to secondary events. Traffic from the south would predominantly use northbound U.S. 101 and access the site via Harney Way, while traffic from the north would predominantly use southbound U.S. 101 and I-280 and access the site via Cesar Chavez Street, Cargo Way, Evans Avenue, and Innes Street. Some trips to the site would use Bayshore Boulevard or Third Street to access the area via Carroll Avenue, Gilman Avenue and

Ingalls Street. The Yosemite Slough bridge would not be used for secondary event vehicle traffic.

Traffic Impacts

The impact analysis of a secondary event at the new stadium assumed a weekday evening event with an attendance of 37,500 spectators. Secondary events could occur at any time of the day, and on any day of the week. Secondary events at the stadium would be limited to 20 total occurrences per year. The weekday PM peak hour was analyzed for pre-event conditions.

After exiting regional freeways, traffic generated by a secondary event would access the site via Cesar Chavez Street, Cargo Way, Evans Avenue, Innes Avenue, Bayshore Boulevard, Third Street, Carroll Avenue, Gilman Avenue, and Ingalls Street. The Yosemite Slough bridge would not be used for secondary event vehicle traffic. The number of vehicles on the roadways accessing the stadium would vary by route and the size of the event.

During a weekday evening secondary event, it is projected that approximately one half of vehicle trips generated by a secondary event, or 4,688 vehicles would arrive approximately one hour prior to an event start time, likely between 5:00 and 6:00 p.m., coinciding with the weekday evening peak hour. Project vehicle trips would be added to the following freeway facilities that would operate at LOS E or LOS F during the weekday PM peak hour:

- U.S. 101 northbound from Harney Way to Third/Bayshore
- U.S. 101 northbound from Sierra Point Parkway to Harney Way
- U.S. 101 southbound from Mariposa Street to Cesar Chavez
- U.S. 101 southbound off-ramp to Harney Way
- I-280 southbound off-ramp to Pennsylvania/25th

In addition, the secondary event would cause an additional off-ramp to operate at LOS F conditions:

- U.S. 101 southbound off-ramp to Bayshore/Cesar

Table 97 compares the intersection LOS operating conditions for the Project weekday PM peak hour conditions without a secondary event to conditions with a secondary event. The table includes only the intersections along the access routes that would be primarily affected by secondary event traffic. Although other study intersections may experience traffic increases immediately preceding and following an event, the increase is not expected to be substantial since those locations would not be on primary routes between regional transportation facilities and the stadium.

Table 97
Intersection Level of Service
Project and Secondary Event – Weekday PM Peak Hour – 2030 Conditions

Intersection		Project No Event		Project with Secondary Event	
		Delay [1]	LOS [2]	Delay	LOS
1	Third St/25th St	**>80**	**F**	**>80**	**F**

60	Harney Way/Thomas Mellon	26	C	**>80**	**F**

Notes:
1. Delay in seconds per vehicle.
2. Intersections operating at LOS E or LOS F conditions highlighted in **bold.**
3. Year 2030 analysis includes signalization as part of Executive Park Development or new Harney Interchange.
4. Year 2030 analysis includes signalization as part of Project.

Source: Fehr & Peers.

With a secondary event, an additional 9 intersections would operate at LOS E or LOS F conditions, beyond those identified for the PM peak hour under Project conditions, including:

- Harney/Jamestown
- Crisp/Palou
- Ingalls/Thomas
- Ingalls/Carroll
- Arelious Walker/Gilman

- Amador/Cargo
- Innes/Arelious Walker
- Evans/Jennings
- Harney/Executive Park East
- Harney/Thomas Mellon

Additionally, traffic associated with a secondary event would exacerbate traffic operations at 11 intersections that would operate at LOS E or LOS F conditions without a secondary event in the PM peak hour, including:

- Third/25th
- Third/Evans
- Third/Carroll
- Third/Paul
- Third/Jamestown
- Cesar Chavez/Evans
- Alana Way/Beatty
- Alana Way/Harney/Mellon
- Amador/Cargo Way
- Innes/Arelious Walker
- Evans/Napoleon/Toland

Overall, since new facilities, including local streets and freeway facilities, would experience congested traffic following prior to a secondary event, traffic impacts associated with the new stadium during secondary events would be *significant.*

> ***Project Mitigation Measure 19:*** The stadium operator shall develop as part of a stadium Transportation Management Plan (TMP), a strategy for coordinating with representatives of SFMTA and the SF Police Department for deploying traffic control officers in the Project vicinity to increase efficiency of pre- and post- event traffic, similar to what would be in place for football game days. The secondary event component of the stadium TMP shall be approved by SFMTA. The stadium operator shall fully fund implementation of the secondary event (i.e., non-49ers football events) measures.

Implementation of this mitigation measure would likely improve vehicle entrance and exit flows to the stadium site, maintain orderly traffic operations, and reduce intrusion onto neighborhood streets near the stadium. However, even with the implementation of Project Mitigation Measure 19 on days when special events are held at the stadium, the Project's impacts to the study roadway network would be *significant and unavoidable.*

<u>*Transit Impacts*</u>

During secondary events, regularly scheduled bus service adjacent to the stadium would continue to operate, providing direct service to the stadium and into the Hunters Point Shipyard Transit

Center. Additional secondary event-related transit service is not proposed. As shown in **Table 98**, the total one-way transit capacity serving the stadium site during a typical weekday PM peak hour would be 3,100 passengers per hour.

Table 98
PM Peak Hour One-Way Muni Capacity to Stadium by Line

Route	Peak Hour Frequency (minutes)	One-Way Hourly Capacity (passengers per hour)
24-Divisadero	6	635
28L-19th Avenue/Geneva Avenue	5	1,130
44-O'Shaughnessy	6	635
48-Quintara-24th Street	10	380
HPX – Hunters Point Express	12	320
Total		**3,100**

Notes:
Source: SFMTA, Fehr & Peers.

During the weekday evening period, up to 4,688 additional transit riders would be generated by a secondary event during the peak hour prior to the event. These would be in addition to the 1,037 transit trips inbound to the study area in the PM peak hour on routes serving the stadium area (e.g., 24-Divisadero, 28L-19th Avenue Limited, 44-O'Shaughnessey, 48-Quintara-24th Street, and HPX as extended to serve the event). Therefore, the overall one-way transit demand in the PM peak hour on days when a special event is being held at the stadium could be up to 5,725 riders. As shown in **Table 92,** the total one-way transit capacity serving the stadium site during a typical weekday PM peak hour would be 3,100 passengers per hour, which would result 2,625 riders that would not be accommodated. This would be considered a *significant impact*.

Project Mitigation Measure 20: SFMTA shall increase frequency on regularly scheduled Muni routes serving the stadium area prior to large special events. In addition, the stadium operator shall fund additional Muni shuttle service between the stadium and regional transit service, including BART (Balboa Park and/or Glen Park stations) and Caltrain (Bayshore station).

- Routes 24-Divisadero, 28L-19th Avenue Limited, and 44-O'Shaughnessey would already be operating near their maximum frequency. Therefore, this mitigation measure primarily applies to the 48-Quintara-24th Street route and the new HPX service. If each of these routes were increased to have five-minute frequencies (typically considered the maximum frequency that can be regularly maintained), the transit capacity toward the stadium would increase by 828 passengers per hour, for a total of 3,928 passengers. Even with the additional service on these two lines, there would be a shortfall of 1,797 passengers per hour in transit capacity.

- Additional express service to key regional transit destinations and regional charter express service, similar to what is offered on football game days, would offset a portion of the shortfall in transit capacity. The amount and nature of special service to special stadium events would depend on the type and size of the special event. Generally, the capacity of the express service should compensate for the shortfall of 1,797 passengers per hour for a 37,500-person event (transit supply, would of course, be designed on a case-by-case basis depending on the expected size of the secondary event).
- SFMTA and the stadium operator shall implement a stadium transportation systems plan similar to that developed for game-day operations (except that the Yosemite Slough bridge shall not be available for private automobiles), on a case-by-case basis depending on the expected size of the secondary event.

Prior to opening day at the new stadium, the City and the stadium operator shall determine costs associated with the increased service and determine funding requirements. Examples of funding sources that shall be considered include a surcharge on game tickets, parking or admission surcharge, or other such revenue mechanism. Implementation of increased transit service would be the responsibility of SFMTA and the stadium operator, and would be implemented when projected attendance warrants additional service.

With implementation of Project Mitigation Measure 20, the Project's impacts to transit service on special event days would be reduced, but not to less-than-significant levels. In addition, traffic impacts during secondary events would not be mitigated, and would impact transit operations. Therefore, the impact on transit operations would remain *significant and unavoidable.*

Bicycle Impacts

During secondary events, bicyclists would have access to the proposed bicycle facilities on existing and reconfigured roadways, as it is not anticipated that any special roadway network restrictions would be required to accommodate secondary event traffic. Bicycle access would be maintained on all study area roadways.

For those patrons arriving to the stadium by bicycle, the stadium would include bicycle racks and lockers would be provided at the stadium entrances. In addition, a bicycle valet, similar to the service operated at AT&T Park for the San Francisco Giants would also be provided. Overall, while traffic volumes on area roadways would increase during secondary events, the increase would not be sufficient to substantially affect bicycle circulation, and impacts on bicycle operations would therefore be *less than significant.*

<u>*Pedestrian Impacts*</u>

The proposed street and sidewalk network in the vicinity of the stadium is designed to accommodate sell-out football game day crowds accessing and leaving the stadium site. Pedestrian access to the stadium during secondary events would be accommodated within the existing and proposed sidewalk network, although due to large number of pedestrians and vehicles accessing the stadium, pedestrians may experience crowding. However, this is expected and would be managed during large events as part of the stadium operations. Therefore, secondary event impacts on pedestrian circulation would be *less than significant.*

<u>*Parking Impacts*</u>

The parking supply associated with secondary events would vary, depending on the size of the event. For a secondary event with 37,500 spectators, it is anticipated that the stadium parking supply of 12,665 spaces would be made available. These include the dual-use fields, paved lot, structured parking facilities, and on-street parking.

A stadium secondary event with 37,500 spectators is expected to generate up to 10,100 vehicles, or about one half that of a sell-out football game day. These vehicles would be accommodated within the stadium parking supply. Impacts of stadium secondary events on parking would be *less than significant.*

Variants

Project Variants 1 and 2 would be similar to the Project but would not involve construction of a new stadium. Furthermore, the existing stadium at Candlestick Point would be demolished. No stadium facilities would be present in the study area under Project Variants 1 and 2 and therefore there would be no secondary event venues capable of accommodating large crowds (i.e., more than 10,000 spectators). Secondary event impacts for Project Variants 1 and 2 would be *not applicable.*

Project Variant 3 would be similar to the Project and would include the proposed stadium at Hunters Point Shipyard. However, instead of being the exclusive home to the San Francisco 49ers, the stadium would be shared with the Oakland Raiders. In this case, the stadium would still likely host secondary events and would have the same impacts as the Project. Project Mitigation Measure 20 and Project Mitigation Measure 21 would be applicable to Project Variant 3. Traffic and transit impacts related to the stadium secondary events would be *significant and unavoidable*, and bicycle, pedestrian, and parking impacts would be *less than significant.*

Alternatives to the Project

Alternative 1 – No Project: Under Alternative 1, the existing Candlestick Park would remain and development would occur in the Hunters Point Shipyard site. Due to its age and the availability of other nearby newer facilities, the existing Candlestick Park does not host a great deal of special events. Although the background traffic would be higher than existing conditions under the 2030 No Project scenario and the combination of background traffic and special event traffic at Candlestick Park would be somewhat more severe than today's situation, special events at Candlestick Park would continue to be rare. Due to the rarity of special events at Candlestick Park, impacts would be *less than significant.*

Alternative 2 – No Bridge: Since special event traffic would not be able to use the Yosemite Slough bridge, special event conditions under Alternative 2 would be the same as described above for the Project. Project Mitigation Measure 20 and Project Mitigation Measure 21 would be applicable to Alternative 2. As with the Project, traffic and transit impacts would remain *significant and unavoidable,* and bicycle, pedestrian, and parking impacts would be *less than significant*

Alternative 3 – 49ers stay at Candlestick: As described in the No Project scenario, due to its age and the proximity of other newer stadiums, Candlestick Park would rarely hold large special events. Although background traffic volumes would be higher than under existing conditions or No Project conditions, the rarity of special events at Candlestick Park result in *less than significant* impacts.

Alternative 4 – Lesser Build: Alternative 4 would include less overall development, and would not include construction of a new stadium. Secondary event impacts for Alternative 4 are *not applicable*.

Alternative 5 – No Park Agreement: Alternative 5 would be similar to Variant 2, however, the existing stadium would be demolished, and a new stadium would not be constructed. Secondary event impacts for Alternative 5 are *not applicable*.

6.11.3 Arena Event Impacts

As described earlier, the Project includes a 10,000-seat arena in the Candlestick Point area. Although most events would have less than 10,000 attendees, preliminary economic analysis has indicated that the arena could hold up to 250 events annually with an average attendance of 5,000. The transportation analysis examines the worst-case scenario, in which a 10,000-person event is held on a weekday evening.

No Project Conditions

Under the No Project scenario, no arena would be constructed at the project site. Arena impacts for No Project conditions are *not applicable*.

Project

Traffic Impacts

The impact analysis of arena events assumed a weekday evening sell-out event at the 10,000-seat arena. Although no specific program has been developed for events at the arena, sell-out events with 10,000 attendees occurring during weekday evenings would likely be infrequent. Smaller-sized events during the weekday evening, and events occurring during the day and on weekends would have fewer impacts due to the lower traffic volumes demands on the study area roadways.

Access to the arena would be via the existing roadway network: U.S.101, Harney Way, Gilman Avenue, and Third Street—as well as local streets within Candlestick Point. The number of vehicles would vary by route and the size of the event.

During a weekday evening event, it is projected that approximately one half of vehicle trips generated by an arena event, or 1,333 vehicles would arrive approximately one hour prior to an event beginning, likely between 5:00 and 6:00 p.m., coinciding with the weekday evening peak hour. These vehicles would add project vehicle trips to regional facilities that would operate at LOS E or LOS F during the weekday PM peak hour for 2030 Project conditions:

- U.S. 101 northbound from Harney Way to Third/Bayshore
- U.S. 101 northbound from Sierra Point to Harney Way
- U.S. 101 southbound from Mariposa Street to Cesar Chavez
- U.S. 101 southbound off-ramp to Harney Way

Table 99 presents a comparison of intersection LOS operating conditions for the Project weekday PM peak hour conditions without a sell-out event to conditions with a sell-out event at the arena. The table includes only the intersections along the access routes that would be primarily affected by arena traffic.

Table 99
Intersection Level of Service
Project No Event and Arena Event – Weekday PM Peak Hour – 2030 Conditions

Intersection		Project No Event		Project with Arena Event	
		Delay [1]	LOS [2]	Delay	LOS

56	Third/Williams/Van Dyke	**>80**	**F**	**>80**	**F**
57	Third St/Jerrold Ave	**>80**	**F**	**>80**	**F**
59	Harney Way/Executive Park East	26	C	30	C
60	Harney Way/Thomas Mellon	26	C	42	D

Notes:
1. Delay in seconds per vehicle.
2. Intersections operating at LOS E or LOS F conditions highlighted in **bold.**
3. Year 2030 analysis includes signalization as part of Executive Park Development or new Harney Interchange.
4. Year 2030 analysis includes signalization as part of Project.

Source: Fehr & Peers.

During the weekday PM peak hour, the LOS at the intersection of Harney/Jamestown would change from LOS D under Project conditions without an event to LOS F conditions for Project conditions with an event. This would be a significant impact.

Additionally, traffic associated with a sell-out arena event would exacerbate traffic operations at 11 intersections that would operate at LOS E or LOS F conditions under Project conditions without an event, including:

- Third/25th
- Third/Cesar Chavez
- Third/Evans

- Third/Oakdale
- Third/Revere
- Third/Carroll
- Third/Jamestown
- Alana Way/Beatty
- Alana Way/Harney/Mellon
- Third/Williams/Van Dyke
- Third/Jerrold

Overall, since local streets and freeway facilities would experience increased congested prior to an arena event, traffic impacts associated with the new arena would be *significant.*

> ***Project Mitigation Measure 21***: The arena operator shall develop a Transportation Management Plan (TMP) for coordinating with representatives of SFMTA and the SF Police Department for deploying traffic control officers in the Project vicinity to increase efficiency of pre- and post- event traffic, and for developing incentives to increase transit ridership to the arena. Implementation of this mitigation measure would likely speed vehicle entrance and exit to the arena site as well as maintain orderly traffic operations and reduce intrusion onto minor routes to and from the arena. Traffic control officers would facilitate traffic flow at the intersection of Harney/Jamestown that would operate at LOS F conditions with a sell-out arena event. The final arena TMP shall be approved by SFMTA. Preparation of the TMP Plan shall be fully funded by the arena operator, and shall be completed in time for implementation on opening day of the arena.

However, even with the implementation of Project Mitigation Measure 21, the Project's impacts to the study roadway network during a sell-out event at the arena would be *significant and unavoidable*.

Transit Impacts

Arena events would be served by the existing and proposed transit routes serving Candlestick Point. Additional transit service is not planned as part of special events at the arena. As shown in **Table 100,** the total one-way transit capacity serving the stadium site during a typical weekday PM peak hour would be 2,278 passengers per hour.

Table 100
PM Peak Hour One-Way Muni Capacity to Arena by Line

Route	Peak Hour Frequency (minutes)	One-Way Hourly Capacity (passengers per hour)
29-Sunset	5	768
28L-19th Avenue/Geneva Avenue	5	1,130
CPX – Candlestick Point Express	10	380
Total		**2,278**

Notes:
Source: SFMTA, Fehr & Peers.

As presented in the travel demand section, up to 1,000 transit riders would be generated in the peak hour prior to an event. These would be added to the 1,023 transit trips inbound to the project study area in the PM peak hour (i.e., inbound trips to Candlestick Point and Hunters Point Shipyard) on routes serving the arena (Routes 29-Sunset, 28L-19th Avenue Limited, and the proposed CPX service). Therefore, the overall one-way transit demand in the PM peak hour on days when an event is being held at the arena could be up to 2,023.

During the weekday evening period, up to 1,000 transit riders would be generated in the peak hour prior to an event. These would be added to the 1,023 transit trips inbound to the study area during the PM peak hour on routes serving the arena (e.g., 29-Sunset, 28L-19th Avenue Limited, and the proposed CPX service). Therefore, the overall one-way transit demand in the PM peak hour on days when an event is being held at the arena could be up to 2,023. As shown in Table 97, the total one-way transit capacity serving the arena during a typical weekday PM peak hour would be 2,278 passengers per hour, which would be adequate to serve the arena event and background demand generated by the Project land uses.

As described above, traffic associated with a sell-out event at the arena would add to already congested conditions on the study area roadway network, and these conditions could not be mitigated to less-than-significant levels. Therefore, traffic impacts would impact transit service accessing the Project site. Providing transit-priority treatments on Gilman Avenue, as described in Mitigation Measure 10.1 would reduce travel time impacts on the 29-Sunset (the 28L-19th Avenue/Geneva Avenue and the CPX would be traveling with the proposed transit-only lanes and would not be subject to increased traffic congestion).

The impact of traffic congestion on transit service could be avoided with implementation of Project Mitigation Measure 10.1 (Gilman transit lanes). Implementation of this mitigation measure would reduce impacts on transit operations to less-than-significant. However, due to the uncertainty of this mitigation, the impact would remain *significant and unavoidable*.

<u>*Bicycle Impacts*</u>
During arena events, bicyclists would have access to the proposed bicycle facilities on existing and reconfigured roadways, as it is not anticipated that any special roadway network restrictions would be required to accommodate arena event traffic. Bicycle impacts would be similar to those described for the Project.

For those patrons arriving to the arena by bicycle, the arena would include bicycle racks and lockers would be provided at the stadium entrances. Overall, while traffic volumes on area roadways would increase during arena events, the increase would not be sufficient to affect bicycle circulation, and impacts on bicycle operations would therefore be less than significant.

<u>*Pedestrian Impacts*</u>
In the vicinity of the arena, 12- to 15-foot-wide sidewalks would be provided. In addition, the arena would be set back from the street to provide a pedestrian plaza area for gathering pedestrians. Pedestrian access to the arena events would be accommodated within the proposed sidewalk network, although due to large number of pedestrians and vehicles accessing the arena during a sell-out event, pedestrians may experience crowding. However, this is expected and would be managed during large events by the arena operator. Therefore, arena event impacts on pedestrian circulation would be *less than significant.*

<u>*Parking Impacts*</u>
No separate parking facilities would be provided for arena patrons. Visitors would utilize proposed public off-street and on-street parking spaces in the vicinity of the proposed arena. A sell-out arena event would generate a demand for 2,860 vehicles (including patrons and employees), which would be accommodated within the approximately 2,300 parking spaces within structured parking in Candlestick Point, and within the approximately 1,000 on-street parking spaces in the Candlestick Point North, South and Central areas. See **Figure 10.**

During the weekday evenings, parking demand associated with the commercial uses in Candlestick Point that would utilize the public parking garage would be less than during the day, and spaces would be available for arena events. There would generally be a shortfall in parking supply, compared to Project parking demand, and therefore depending on the time of day of the arena event, surplus capacity may not be available to accommodate the arena parking demand. Arena events during peak periods of commercial activity would increase the shortfall in parking spaces. It is possible that some drivers may seek available parking in the available Bayview area, or others may shift to transit. As discussed above, the secondary effects of drivers searching for parking is typically offset by a reduction in vehicle trips due to some drivers, who are aware of constrained parking conditions in a given area, shifting to other modes. Hence, any secondary environmental impacts that may result from a shortfall in parking would be minor. Therefore, the parking shortfall would not result in significant parking impacts, and Project impacts on parking would be *less than significant.*

Project Variants

Project Variants 1 and 2 would each include somewhat more development in the Hunters Point area and development in the Candlestick Point area would be the same as the Project, including construction of a 10,000-seat arena. Overall, since new facilities, including local streets and freeway facilities, would experience congested traffic prior to an arena event, traffic impacts associated with the new Arena during arena events would be *significant*. Implementation of Project Mitigation Measure 21 would be applicable to Project Variants 1 and 2. However, even with the implementation of Project Mitigation Measure 21, the Project Variants 1 and 2's impacts to the study roadway network during a sell-out event at the arena would be *significant and unavoidable*.

As described earlier, transit demand with a sold-out arena event under the Project conditions were approaching, but not above, the amount of available transit capacity. However, since the amount of background transit demand under Variants 1 and 2 would be higher, it is possible that the added transit demand associated with a sold-out arena event would create demand for transit service greater than the capacity of the transit supply to the arena.

> ***Project Variant 1 Mitigation Measure 20 and Project Variant 2 Mitigation Measure 18***: SFMTA shall increase frequency on regularly scheduled Muni routes serving the stadium area prior to large events at the arena. Routes 29-Sunset and 28L-19th Avenue Limited would already be operating near their maximum frequency. Therefore, this mitigation measure primarily applies to Route CPX. If headways on this route were increased to five-minute frequencies in the one to two-hours prior to an event at the arena, the hourly transit capacity toward the arena would increase by 380 passengers per hour, for a total of 2,658. This would likely be adequate capacity, but may still leave some routes over-capacity and others below-capacity. Therefore, additional shuttle service to key regional transit destinations, such as BART, Caltrain, and the T-Third light rail route shall also be provided by the arena operator.

With implementation of Project Variant 1 Mitigation Measure 20 and Project Variant 2 Mitigation Measure 18, the Project's impacts to transit service during sell-out events at the arena would be reduced, but not to less-than-significant levels. In addition, traffic impacts during secondary events would not be mitigated, and would impact transit operations. Therefore, the impact on transit operations would remain *significant and unavoidable.*

Alternatives to the Project

Alternative 1 – No Project: Under No Project conditions, an arena would not be constructed. No impacts related to arena events.

Alternative 2 – No Bridge: Since arena traffic would not be able to use the Yosemite Slough bridge, conditions with a special event at the arena under Alternative 2 would be the same to those as for the Project. Implementation of Project Mitigation Measure 21 would be applicable to Alternative 2. However, even with the implementation of Project Mitigation Measure 21, the Alternative 2's impacts to the study roadway network during a sell-out event at the arena would be *significant and unavoidable*.

Alternative 3 – 49ers at Candlestick: Under Alternative 3, no arena would be constructed. There would be no special events at an arena. *No impact.*

Alternative 4 – Lesser Build: Alternative 4 would include the arena, but would have less overall development than the Project. Implementation of Project Mitigation Measure 21 would be applicable to Alternative 4. However, even with the implementation of Project Mitigation Measure 21, the Alternative 4's impacts to the study roadway network during a sell-out event at the arena would be *significant and unavoidable*.

Alternative 5 – No Park Agreement: Alternative 5 would be similar to Project Variant 2. Implementation of Project Mitigation Measure 21 would be applicable to Alternative 5. However, even with the implementation of Project Mitigation Measure 21, the Alternative 5's impacts to the study roadway network during a sell-out event at the arena would be *significant and unavoidable*.

Chapter 7
MITIGATION MEASURES

This chapter presents the transportation mitigation measures to reduce the impacts of the 2030 No Project, Project, Project Variants, and Alternatives to the Project. It also identifies locations where mitigation measures would not be feasible and therefore impacts would remain significant and unavoidable.

7.1 PROJECT

7.1.1 Traffic

Project Mitigation Measure 1: TDM Plan

The Project Applicant shall prepare and implement a final TDM plan, which shall include the following elements:

- Visitor Variable, Market-Rate Parking Pricing
- Maximum Permitted Parking Ratios
- Flexible Parking Management Strategies
- Unbundled Residential Parking
- Transit Strategies and Support Strategies
- Central Transit Hub
- Enhanced Transit Service and Bicycle Facilities
- Bicycle Support Facilities
- Wayfinding Signs
- EcoPass for Residents
- Carshare Services
- Employee TDM Programs
    - Information Boards/Kiosks
    - In-building Real-Time transit monitors with sightlines of transit hubs
    - Commuter Benefits
    - Employee EcoPass
    - Carpool/Vanpools
    - Guaranteed Ride Home Program
    - Compressed Work Weeks, Flex Time, and Telecommuting
- CP-HPS Transportation Management Association
- On-Site Transportation Coordinator and Website
- Targeted Marketing
- Monitoring of Transportation Demand
- Monitoring Effectiveness of Congestion-Reducing and Traffic-Calming Efforts

With implementation of the Project Mitigation Measure 1, alternative modes would be encouraged, the use of single-occupant vehicles would be discouraged, and the impact of additional vehicles generated by the Project would be lessened. However, as described in Impact discussions below, the Project would still result in significant and unavoidable impacts on traffic and transit operations, and would still make considerable contributions to cumulative impacts related to substantial increases in traffic. Thus, the Project and Project's contribution to traffic would remain *significant and unavoidable.*

Project Mitigation Measure 2: Intersection of Tunnel/Blanken

Reconfigure the northbound and southbound approaches to the intersection of Tunnel/Blanken to provide dedicated left-turn lanes adjacent to shared through/right-turn lanes. This reconfiguration would require prohibition of parking for 160 feet in the southbound approach (loss of eight parking spaces) and for 100 feet in the northbound approach (loss of five parking spaces).

Implementation of the intersection reconfiguration shall be the responsibility of SFMTA, and shall be implemented when intersection improvements associated with the Visitacion Valley Redevelopment Plan (i.e., signalization) are no longer sufficient to maintain acceptable intersection level of service conditions. Since these improvements were determined to be required even without the Project under 2030 No Project conditions, the Project Applicant shall contribute its fair-share toward the cost of improvements. Prior to payment of the contribution, the City shall create a mechanism to determine and receive fair share contributions from the Project Applicant. The SFMTA and DPW shall design and implement the measure as necessary.

With implementation of ***Project Mitigation Measure 2***, operations at this intersection would improve, but not to acceptable LOS D or better conditions in the AM and PM peak hours. Therefore, project-related impacts at this intersection would be *significant and unavoidable*.

Project Mitigation Measure 3: Harney Interchange Project

The City of Brisbane and Caltrans, as part of the Harney Interchange Project, shall account for existing traffic, background traffic growth, and the most recent forecasts of traffic expected to be associated with each of several adjacent development projects, including the Project. The San Francisco County Transportation Authority (SFCTA) shall coordinate with the City of Brisbane and Caltrans to ensure Project-generated vehicle trips are accounted for in the Harney Interchange analyses and design.

Mitigations and associated fair-share funding measures for cumulative regional roadway system impacts, including freeway segment impacts, shall be formulated through the current interjurisdictional Bi-County Transportation Study effort being led by the SFCTA. The Project Applicant shall contribute its fair share to the Harney Interchange Project.

Because the environmental review of the interchange project is not yet complete and the interchange would be approved by Caltrans, the implementation of **Project Mitigation Measure 3** is uncertain and is outside of the City/Agency jurisdiction. Therefore, Project-related contributions to cumulative traffic impacts at these two intersections would remain *significant and unavoidable*.

Project Mitigation Measure 4: Intersection of Amador/Cargo/Illinois

SFMTA shall conduct a feasibility study of the intersection of Amador/Cargo/Illinois with the Port of San Francisco to determine the feasibility of reconfiguring the southbound approach on Illinois Street to provide a dedicated southbound left turn lane and a dedicated right-turn lane. Sufficient right-of-way is available to implement this improvement, however, provision of two southbound lanes would require narrowing a portion of the island to the west of the southbound approach to Cargo Way. Implementation of the intersection improvements shall be the responsibility of SFMTA and the Port of San Francisco, and shall be implemented when traffic operating conditions with the existing intersection configuration worsens to unacceptable levels. If determined feasible, the Project Applicant shall contribute its fair share to the intersection improvements.

With implementation of Project Mitigation Measure 4, operations at this intersection would improve to acceptable LOS C conditions during the AM and PM peak hours. However, since a feasibility study would be required, implementation of Mitigation Measure 3 is uncertain, and therefore, Project-related impacts at this intersection would remain *significant and unavoidable.*

Project Mitigation Measure 5: Intersection of Bayshore/Geneva

The City of Brisbane, as part of the Geneva Avenue Extension Project, shall account for existing traffic, background traffic growth, and the most recent forecasts of traffic expected to be associated with each of several adjacent development projects, including the Project. The San Francisco County Transportation Authority (SFCTA) and SFMTA shall coordinate with the City of Brisbane to ensure projected traffic volumes are accounted for in the design of the Geneva Avenue Extension.

Mitigations and associated fair-share funding measures for cumulative regional roadway system impacts, including freeway segment impacts, shall be formulated through the current interjurisdictional Bi-County Transportation Study effort being led by the SFCTA. The Project Applicant shall contribute its fair share to the Geneva Avenue Extension Project.

Since implementation of Project Mitigation Measure 5 would be under the jurisdiction of the City of Brisbane, the implementation of the mitigation measure is uncertain. Therefore, the Project-related impacts at this intersection would remain *significant and unavoidable.*

Project Mitigation Measure 6: Harney Way Widening

Prior to issuance of the grading permit for Phase II of the Project, the Project Applicant shall widen Harney Way as shown in **Figure 5.** Prior to the issuance of grading permits for Phases II, III and IV, the Project Applicant shall fund a study to evaluate traffic conditions on Harney Way and determine whether additional traffic associated with the next phase of development would result in the need to modify Harney Way to its ultimate configuration, as shown in **Figure 6,** unless this ultimate configuration has already been built. This study shall be conducted in collaboration with the SFMTA, which would be responsible for making final determinations regarding the ultimate configuration. The ultimate configuration would be linked to intersection performance, and it would be required when study results indicate intersection LOS at one or more of the three signalized intersection on Harney Way at mid-LOS D (i.e., at an average delay per vehicle of more than 45 seconds per vehicle). If the study and SFMTA conclude that reconfiguration would be necessary to accommodate traffic demands associated with the next phase of development, the Project Applicant shall be responsible to fund and complete construction of the improvements prior to occupancy of the next phase.

With implementation of the Project Mitigation Measure 6, Harney Way would be widened and improved to its final configuration when traffic demand warrants additional capacity. Therefore, potential Project impacts and Project contribution to cumulative impacts on traffic capacity on Harney Way would be reduced to *less than significant*.

7.1.2 Transit

Project Mitigation Measure 7: Transit Operating Plan

The Project Applicant shall work with SFMTA to develop and implement the Project's Transit Operating Plan. Elements of the Project Transit Operating Plan shall include:

- Extension of the 24-Divisadero, the 44-O'Shaughnessy, and the 48-Quintara-24th Street into Hunters Point Shipyard.
- Increased frequency on the 24-Divisadero to 6 minutes in the AM and PM peak periods. Extension of the 29-Sunset from its current terminus near the Alice Griffith housing development, near Gilman Avenue and Giants Drive, into the proposed Candlestick Point retail area. The 29-Sunset would operate a short line between Candlestick Point and the Balboa Park BART station. This would increase frequencies on the 29-Sunset by reducing headways between buses from 10 minutes to 5 minutes during the AM and PM peak periods between Candlestick Point and the Balboa BART station. Every other bus would continue to serve the Sunset District (to the proposed terminus at Lincoln Drive and Pershing Drive in the Presidio) at 10-minute headways.
- Convert T-Third service between Bayview and Chinatown via the Central Subway from one-car to two-car trains or comparable service improvement.
- Extension of the 28L-19th Avenue Limited from its TEP-proposed terminus on Geneva Avenue, just east of Mission Street, into the Hunters Point Shipyard transit center. The

28L-19th Avenue Limited would travel along Geneva Avenue across U.S. 101 via the proposed Geneva Avenue extension and new interchange with U.S. 101, to Harney Way. East of Bayshore Boulevard, the 28L-19th Avenue Limited would operate as BRT, traveling in exclusive bus lanes into the Candlestick Point area. The BRT route would travel through the Candlestick Point retail corridor, and cross over Yosemite Slough into the Hunters Point Shipyard transit center.

- The 28L-19th Avenue Limited would operate a short line to the Balboa Park BART station. This would increase frequencies on the 28L-19th Avenue Limited by reducing headways between buses from 10 minutes to 5 minutes for the segment between Hunters Point Shipyard and the Balboa Park BART station. Every other bus would continue to the Sunset District (to the proposed terminus at North Point Street and Van Ness Avenue) at 10-minute headways. If the TEP-proposed extension of the 28L has not been implemented by the SFMTA by Phase 2 of Project development, the Project Applicant shall fund the extension of that line between its existing terminus and Bayshore Boulevard.
- New CPX-Candlestick Express to downtown serving the Candlestick Point site, traveling along Harney Way (with potential stops at Executive Park), before traveling on U.S. 101 toward downtown, terminating at the Transbay Terminal.
- New HPX-Hunters Point Shipyard Express to downtown serving the Hunters Point Shipyard site, traveling from the Hunters Point Shipyard Transit Center, along Innes Avenue, with stops at the India Basin and Hunters View areas, before continuing along Evans Avenue to Third Street, eventually entering I-280 northbound at 25th/Indiana. The HPX would continue non-stop to the Transbay Terminal in Downtown San Francisco.

Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources. With implementation of the Transit Plan, Project-generated transit trips would be accommodated within the existing and proposed transit capacity, and therefore Project impacts on transit capacity would be *less than significant.*

Project Mitigation Measures 8.1 and 8.2: 9-San Bruno

Project Mitigation Measure 8.1: To address Project impacts to the 9-San Bruno, prior to issuance of a grading permit for Phase 1, the Project Applicant in cooperation with SFMTA shall conduct a study to evaluate the effectiveness and feasibility of the following improvements which could reduce Project impacts on transit operations along the San Bruno Avenue corridor, generally between Campbell Avenue and Silver Avenue. The study shall create a monitoring program to determine the implementation extent and schedule (as identified below) to maintain the proposed headways of the 9-San Bruno.

- Install a transit-only lane on northbound San Bruno Avenue for the one-block section (400 feet) between Silliman Street and Silver Avenue. This would involve removal of five metered spaces on the east side of San Bruno Avenue, just south of Silver Avenue. Treatment for transit-only lanes can range from striping to physical elevation changes or barriers to protect transit right-of-way from mixed-flow traffic.

- Install a transit-only lane on southbound San Bruno Avenue at the approach to Dwight Street/Paul Avenue. This lane would function as a so-called “queue-jump” lane, allowing buses to bypass queues on southbound San Bruno Avenue at the intersection. The lane should begin approximately 200 feet north of Dwight Street and extend one block (about 300 feet) south of Paul Avenue to Olmstead Street. This would involve the removal of up to 20 on-street parking spaces on the west side of San Bruno Avenue. This treatment could be limited to peak hours only, which would minimize the impact of the parking loss. The segment of San Bruno Avenue between Dwight Street and Olmstead Street is designated as Bicycle Routes #705 and 5 (Class III signed routes).
- At the intersection of San Bruno/Silver install signal priority treatments on westbound Silver Avenue, where buses waiting to turn left from Silver Avenue onto southbound San Bruno Avenue must currently wait through almost an entire signal cycle due to the heavy oncoming traffic on eastbound Silver Avenue. Installation of a transit signal pre-emption at this location that provides a “green” signal for westbound vehicles but holds eastbound vehicles when buses are present would allow transit vehicles to turn left onto San Bruno Avenue without having to wait for opposing eastbound through traffic to clear.

The Project Applicant shall fully fund the costs of implementing the transit priority improvements (either the improvements identified above, or alternative improvements of equal or greater effectiveness and comparable cost) as determined by the study and the monitoring program. Other options to be evaluated in the study could include comprehensive replacement of stop-controlled intersections with interconnected traffic signals equipped with transit priority elements.

<u>Project Mitigation Measure 8.2</u> - Should Project Mitigation Measure 8.1 not be feasible or effective, the Project Applicant shall work with SFMTA to purchase additional transit vehicles and contribute to operating costs and facility improvements as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 9-San Bruno. Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources not otherwise accessible to Muni, adequate and sufficient to provide for SFMTA’s associated ongoing operating costs, transit vehicle capital costs, and facility costs to store and maintain these vehicles.

Because a feasibility study of the improvements contemplated in mitigation measure Project Mitigation Measure 8.1 would be required, implementation of Project Mitigation Measure 8.1 is uncertain. Because implementation of Project Mitigation Measure 8.2 alone, without Project Mitigation Measure 8.1, might not be sufficient to reduce the impacts on the 9-San Bruno to a less than significant level, the Project impacts on the 9-San Bruno would remain *significant and unavoidable.*

Project Mitigation Measures 9.1 and 9.2: 23-Monterey, 24-Divisadero, 4-O'Shaughnessy

Project Mitigation Measure 9.1: To address Project impacts to the 23-Monterey, 24-Divisidero and the 44-O'Shaughnessy, prior to issuance of a grading permit for Phase 1, the Project Applicant in cooperation with SFMTA shall conduct a study to evaluate the effectiveness and feasibility of the following improvements which could reduce Project impacts on transit operations along the Palou Avenue corridor, generally between Griffith Street and Newhall Street. The study shall create a monitoring program to determine the implementation extent and schedule (as identified below) to maintain the proposed headways of the 23-Monterey, 24-Divisidero and the 44-O'Shaughnessy.

- Convert one of the two westbound travel lanes on Palou Avenue between Keith Street and Newhall Street (three blocks) to a transit-only lane at all times. Treatment for transit-only lanes can range from striping to physical elevation changes to protect right-of-way from mixed-flow traffic. Because the westbound lanes between Third Street and Newhall Street are relatively narrow, parking would likely need to be prohibited on the north side of Palou Avenue between Third Street and Newhall Street (approximately 600 feet) during peak periods to maximize the effectiveness of the transit-only lane.
- Convert one of the two eastbound travel lanes on Palou Avenue between Newhall Street and Third Street (one block) to a transit-only lane at all times. Because the eastbound travel lanes between Newhall Street are relatively narrow, parking would likely need to be prohibited on the south side of Palou Avenue between Newhall Street and Third Street (approximately 600 feet) during peak periods to maximize the effectiveness of the transit-only lane. In the eastbound direction, east of Third Street, buses would re-enter the single mixed-flow traffic lane at the bus stop on the far (east) side of Third Street.
- There are currently pedestrian corner bulbs on the northwest and southwest corners of the intersection of Palou Avenue and Third Street. In order to accommodate the transit-only lanes west of Third Street, these bulbouts would be reconfigured or removed. Although removing pedestrian bulb-outs may increase pedestrian crossing distances and is generally inconsistent with the City's desire to prioritize pedestrian activity, in this case, the improvement would offer substantial benefits to transit travel times by allowing a transit-only lane through a congested intersection. This would be consistent with the City's transit-first policy.
- During the PM peak period only, prohibit parking on westbound Palou Avenue for the four-block segment between Griffith Street/Crisp Avenue and Keith Street, to provide for a PM peak period curb transit-only lane along this segment. This would create a continuous westbound transit-only lane on Palou Avenue between Griffith Street/Crisp Avenue and Newhall Street during the PM peak period.

- As an alternative to the bulleted measures above, narrow the existing sidewalks on Palou Avenue from Third Street to Crisp Avenue (seven blocks) from 15 feet to 12 feet in width. The pedestrian bulb-outs on the west side of Third Street would be removed. The resulting 12-foot-wide sidewalks would be consistent with the Better Streets Plan guidelines. The reduction in sidewalk width would allow for the provision of a 7-foot-wide on-street parking lane, an 11-foot-wide transit-only lane, and a 10-foot-wide mixed-flow lane in each direction on Palou Avenue. This would preserve on-street parking along the corridor and provide a seven-block transit-only lane on Palou Avenue between Griffith Street/Crisp Avenue and Newhall Street. Treatment for transit-only lanes can range from striping to physical elevation changes to protect right-of-way from mixed-flow traffic.

The Project Applicant shall fully fund the costs of implementing the transit priority improvements (either the improvements identified above, or alternative improvements of equal or greater effectiveness and comparable cost) as determined by the study and the monitoring program. Other options to be evaluated in the study could include signal priority treatments at other signalized intersections including at Bayshore/Cortland, Bayshore/Industrial, and Bayshore/Oakdale.

<u>Project Mitigation Measure 9.2:</u> Should Project Mitigation Measure 9.1 not be feasible or effective, the Project Applicant shall work with SFMTA to purchase additional transit vehicles and contribute to operating costs and facility improvements as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 23-Monterey, the 24-Divisadero and the 44-O'Shaughnessy. Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources not otherwise accessible to Muni, adequate and sufficient to provide for SFMTA's associated ongoing operating costs, transit vehicle capital costs, and facility costs to store and maintain these vehicles.

Because a feasibility study of the improvements contemplated in Project Mitigation Measure 9.1 would be required, implementation of this measure is uncertain. Because implementation of Project Mitigation Measure 9.2 alone, without Project Mitigation Measure 9.1, might not be sufficient to reduce the impacts on the 23-Monterey, 24-Divisadero, and 44-O'Shaughnessy to a less than significant level, the Project impacts on the 23-Monterey, 24-Divisadero, and 44-O'Shaughnessy would remain *significant and unavoidable.*

Project Mitigation Measures 10.1 and 10.2: 29-Sunset

<u>Project Mitigation Measure 10.1:</u> To address Project impacts to the 29-Sunset, prior to issuance of a grading permit for Phase I, the Project Applicant in cooperation with SFMTA shall conduct a study to evaluate the effectiveness and feasibility of the following improvements which could reduce Project impacts on transit operations along the Gilman Avenue and Paul Avenue corridor,

generally between Arelious Walker Drive and Bayshore Boulevard. The study shall create a monitoring program to determine the implementation extent and schedule to maintain the proposed headways of the 29-Sunset.

- For the five-block segment of Gilman Avenue between Arelious Walker Drive and Third Street, prohibit on-street parking on westbound Gilman Avenue during the AM and PM peak periods to provide for three westbound travel lanes. During the peak periods convert one of the three westbound travel lanes to transit-only. During off-peak periods, parking would be allowed, and buses would travel in one of the two mixed-flow lanes. The peak period transit lanes would impact 90 parking spaces.
- For the same five-block segment of Gilman Avenue between Arelious Walker Drive and Third Street, restripe the eastbound direction to provide two travel lanes, one of which would accommodate on-street parking and one of which would be a mixed-flow travel lane. During the AM and PM peak periods, prohibit on-street parking in the eastbound direction, and operate one of the two eastbound lanes as transit-only lanes. The peak period transit lanes would impact 80 parking spaces.
- As an alternative to the two bulleted measures above, narrow the existing sidewalks on Gilman Avenue from Third Street to Griffith Street (four blocks) from 15 feet to 12 feet in width. The resulting 12-foot-wide sidewalks would be consistent with the Better Streets Plan guidelines. The reduction in sidewalk width would allow for the provision of a 7-foot-wide on-street parking lane, an 11-foot-wide transit-only lane, and a 10-foot-wide mixed-flow lane in each direction on Gilman Avenue. This would preserve on-street parking along the corridor and provide four-block transit-only lanes on Gilman Avenue between Griffith Street and Third Street. Treatment for transit-only lanes can range from striping to physical elevation changes to protect right-of-way from mixed-flow traffic.
- Prohibit on-street parking on the north side of Paul Avenue, between Third Street and Bayshore Boulevard to create two westbound through lanes. Convert one westbound through lane to transit-only in the AM and PM peak periods. The peak period transit-only lane would impact 40 parking spaces. At the intersection of Paul Avenue and Bayshore Avenue, provide transit signal priority treatment (i.e., queue jump) to allow transit vehicles to maneuver into the mixed flow left-hand lane, facilitating a left-turn movement immediately west of Bayshore Boulevard from westbound Paul Avenue to southbound San Bruno.

The Project Applicant shall fully fund the costs of implementing the transit priority improvements (either the improvements identified above, or alternative improvements of equal or greater effectiveness and comparable cost) as determined by the study and the monitoring program. Other options to be evaluated in the study could include transit priority treatments on San Bruno Avenue, on the portions where the 29-Sunset travels.

Project Mitigation Measure 10.2: Should Project Mitigation Measure 10.1 not be feasible or effective, the Project Applicant shall work with SFMTA to purchase additional transit vehicles and contribute to operating costs and facility improvements as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 29-Sunset. Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources not otherwise accessible to Muni, adequate and sufficient to provide for SFMTA's associated ongoing operating costs, transit vehicle capital costs, and facility costs to store and maintain these vehicles.

Because a feasibility study of the improvements contemplated in mitigation measure Project Mitigation Measure 10.1 would be required, implementation of Project Mitigation Measure 10.1 is uncertain. Because implementation of Project Mitigation Measure 10.2 alone, without Project Mitigation Measure 10.1, might not be sufficient to reduce the impacts on the 29-Sunset to a less than significant level, the Project impacts on the 29-Sunset would remain *significant and unavoidable.*

Project Mitigation Measures 11.1 and 11.2: 48-Quintara-24th Street

Project Mitigation Measure 11.1: To address Project impacts to the 48-Quintara-24th Street, prior to issuance of a grading permit for Phase I, the Project Applicant in cooperation with SFMTA shall conduct a study to evaluate the effectiveness and feasibility of the following improvements which could reduce Project impacts on transit operations along the Evans Avenue corridor, generally between Hunters Point Boulevard and Napoleon Street. The study shall create a monitoring program to determine the implementation extent and schedule (as identified below) to maintain the proposed headways of the 48-Quintara-24th Street.

- On Evans Avenue, between Jennings Street and Napoleon Street (a nine-block segment—about 6,000 feet), convert one of the two travel lanes in each direction to a transit-only lane at all times. Treatment for transit-only lanes can range from striping to physical elevation changes or barriers to protect transit right-of-way from mixed-flow traffic.

The Project Applicant shall fully fund the costs of implementing the transit priority improvements (either the improvements identified above, or alternative improvements of equal or greater effectiveness and comparable cost) as determined by the study and the monitoring program. Other options to be evaluated in the study could include extension of transit only lanes in one or both directions between Napoleon Street and Cesar Chavez Street or onto Hunters Point Boulevard and Innes Avenue.

Project Mitigation Measure 11.2: Should Project Mitigation Measure 11.1 not be feasible or effective, the Project Applicant shall work with SFMTA to purchase additional transit vehicles and contribute to operating costs and facility improvements as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 48-Quintara-24th Street. Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources not otherwise accessible to Muni, adequate and sufficient to provide for SFMTA's associated ongoing operating costs, transit vehicle capital costs, and facility costs to store and maintain these vehicles.

Because a feasibility study of the improvements contemplated in Project Mitigation Measure 11.1 would be required, implementation of Project Mitigation Measure 11.1 is uncertain. Because implementation of Project Mitigation Measure 11.2 alone, without Project Mitigation Measure 11.1, might not be sufficient to reduce the impacts on the 48-Quintara-24th Street to a less than significant level, the Project impacts on the 48-Quintara-24th Street would remain *significant and unavoidable.*

Project Mitigation Measure 12: 54-Felton

SFMTA shall purchase additional transit vehicles and contribute to operating costs and facility improvements to mitigate the Project impacts and Project contribution to cumulative impacts to headways on 54-Felton. Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources not otherwise accessible to Muni, adequate and sufficient to provide for SFMTA's associated ongoing operating costs, transit vehicle capital costs, and facility costs to store and maintain these vehicles.

While the provision of additional transit vehicles for the 54-Felton would reduce impacts associated with increased travel times, the transit vehicles would still be subject to delays resulting from increased congestion, and therefore Project impacts on the 54-Felton would remain *significant and unavoidable.*

Project Mitigation Measures 13.1 and 13.2: T-Third

<u>Project Mitigation Measure 13.1:</u> To address Project impacts to the T-Third, prior to issuance of a grading permit for Phase I, the Project Applicant in cooperation with SFMTA shall conduct a study to evaluate the effectiveness and feasibility of the following improvement that could reduce Project impacts on transit operations along Third Street between Thomas Avenue and Kirkwood Avenue. The study shall create a monitoring program to determine the implementation extent and schedule (as identified below) to maintain the proposed headways of the T-Third.

- Reconfigure the section of Third Street between Thomas Avenue and Kirkwood Avenue (9 blocks) where the light rail vehicles currently share the travel lane with auto traffic to provide a dedicated transit right-of-way, consistent with the rest of the route. This would require either removal of one travel lane in each direction on Third Street, or removal of on-street parking and some sidewalk bulbouts. In addition, left-turns from Third Street in this segment would be restricted in both directions. Treatment for transit-only lanes can range from striping to physical elevation or barriers to protect transit right-of-way from mixed-flow traffic.

Implementation of the intersection reconfiguration shall be the responsibility of SFMTA, and shall be implemented when the results of the study described above indicate transit improvements are necessary. The Project Applicant shall fully fund the costs of implementing the transit priority improvements prior to approval of subsequent phases of development.

Project Mitigation Measure 13.2: Should Project Mitigation Measure 13.1 not be feasible or effective, the Project Applicant shall work with SFMTA to purchase additional transit vehicles and contribute to operating costs and facility improvements as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the T-Third. Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources not otherwise accessible to Muni, adequate and sufficient to provide for SFMTA's associated ongoing operating costs, transit vehicle capital costs, and facility costs to store and maintain these vehicles.

Because a feasibility study of the improvements contemplated in Project Mitigation Measure 13.1 would be required, implementation of Project Mitigation Measure 13.1 is uncertain. Because implementation of Project Mitigation Measure 13.2 alone, without Project Mitigation Measure 13.1, might not be sufficient to reduce the impacts on the T-Third to a less than significant level, the Project impacts on the T-Third would remain *significant and unavoidable.*

Project Mitigation Measures 14.1 and 14.2: 28L-19th Avenue/Geneva Limited

Project Mitigation Measure 14.1: The City of Brisbane, as part of the Geneva Avenue Extension Project, shall account for existing traffic, background traffic growth, and the most recent forecasts of traffic expected to be associated with each of several adjacent development projects, including the Project. The San Francisco County Transportation Authority (SFCTA) and SFMTA shall coordinate with the City of Brisbane to ensure transit preferential treatment is accounted for in the design of the Geneva Avenue Extension.

Project Mitigation Measure 14.2: Should Project Mitigation Measure 14.1 not be feasible or effective, the Project Applicant shall work with SFMTA to purchase additional transit vehicles and contribute to operating costs and facility improvements as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 28L-19th Avenue/Geneva Limited. Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources not otherwise accessible to Muni, adequate and sufficient to provide for SFMTA's associated ongoing operating costs, transit vehicle capital costs, and facility costs to store and maintain these vehicles.

Since implementation of Project Mitigation Measure 14.1 would be under the jurisdiction of the City of Brisbane, the implementation of the mitigation measure is uncertain. Because implementation of Project Mitigation Measure 14.2 alone, without Project Mitigation Measure

14.1, might not be sufficient to reduce the impacts on the 28L-19th Avenue/Geneva Limited to a less than significant level, the Project impacts on the 28L-19th Avenue/Geneva Limited would remain *significant and unavoidable.*

7.1.3 Bicycle

Project Mitigation Measure 15: Bicycle Routes #70 and #170 on Palou Avenue

Prior to issuance of the grading permit for Phase I, the Project Applicant shall fund a study to determine the feasibility of relocating Bicycle Routes #70 and #170. The study of the bicycle route relocation, necessary environmental clearance documentation, and implementation shall be the responsibility of SFMTA. Since the feasibility of the relocation of the routes is uncertain at this time, the Project impact on bicycle circulation on Palou Avenue would remain significant and unavoidable.

Because a feasibility study of the relocation of Bicycle Routes #70 and #170 on Palou Avenue would be required, the implementation of Project Mitigation Measure 15 is uncertain, and therefore the Project impact on bicycle circulation would remain *significant and unavoidable*.

7.1.4 Pedestrian

No significant environmental impacts have been identified; no mitigation required.

7.1.5 Parking

No significant environmental impacts have been identified; no mitigation required.

7.1.6 Loading

No significant environmental impacts have been identified; no mitigation required.

7.1.7 Construction

Project Mitigation Measure 16: Construction Traffic Management Program

The Project Applicant shall develop and implement a Candlestick Point–Hunters Point Shipyard Phase II Construction Traffic Management Program to minimize impacts of the Project and its contribution to cumulative impacts related to construction activities and construction traffic. The program shall provide necessary information to various contractors and agencies as to how to maximize the opportunities for complementing construction management measures and to minimize the possibility of conflicting impacts on the roadway system, while safely accommodating the traveling public in the area. The program shall supplement and expand, rather than modify or supersede any manual, regulations, or provisions set forth by SFMTA, DPW or other City departments and agencies.

Preparation of the Construction Management Program shall be the responsibility of the Project Applicant, and shall be reviewed and approved by SFMTA and DPW prior to initiation of construction. The Project Applicant shall update the program prior to approval of development plans for Phase 2, Phase 3 and Phase 4 of construction to reflect any change to Project development schedule, reflect transportation network changes, to update status of other development construction activities, and to reflect any changes to City requirements.

The program shall:

- Identify construction traffic management practices in San Francisco, as well as other jurisdictions that although not being implemented in the City could provide useful guidance for a project of this size and characteristics.
- Describe procedures required by different departments and/or agencies in the City for implementation of a construction management plan, such as reviewing agencies, approval process, and estimated timelines.
- Describe coordination efforts associated with the Navy remediation efforts and scheduling regarding construction vehicle routing via the Crisp gate.
- Identify construction traffic management strategies and other elements for the Project, and present a cohesive program of operational and demand management strategies designed to maintain acceptable levels of traffic flow during periods of construction activities in the Bayview Hunters Point area. These could include construction strategies, demand management strategies, alternate route strategies, and public information strategies.
- Coordinate with other projects in construction in the immediate vicinity, so that they can take an integrated approach to construction-related traffic impacts.
- Present guidelines for selection of construction traffic management strategies.

Implementation of Project Mitigation Measure 16 would help minimize the Project construction-related transportation impacts, and the Project's contribution to cumulative-construction related transportation impacts. However, some disruption and increased delays could still occur even with implementation of Project Mitigation Measure 16, and it is possible that significant construction-related transportation impacts on local and regional roadways could still occur. Localized construction-related transportation impacts would therefore remain *significant and unavoidable*.

7.1.8 Stadium

Project Mitigation Measure 17: Stadium 49ers Game Days Transportation Management Plan

The stadium operators shall develop and maintain a Transportation Management Plan (TMP) for the stadium. The stadium operator shall work with representatives from the SFMTA, the State Highway Patrol, the Police Department, private charter operators, Caltrain and others on a continuing basis to develop and refine the TMP, as determined appropriate by SFMTA. The final stadium TMP shall be approved by SFMTA. Preparation of the TMP shall be fully funded by the stadium operator, and shall be completed in time for implementation on opening day of the stadium.

The following actions shall be included in the TMP:

- Information on transportation options to the stadium, including game day service by the various regional service providers shall be distributed to season ticket holders, employees, and other patrons if possible.
- A brochure, information packet, and/or web page providing full information on transit access to the stadium, similar to that currently offered at the 49ers website, shall be updated and maintained.
- The use of charter buses to the stadium shall be encouraged and expanded. A number of measures shall be considered that could be implemented at low-cost to expand the use of group charters, including reduced parking costs, publicize the groups in 49ers publications and mailings, provide priority parking, provide lounges for bus drivers and provide support services for rooter clubs.
- Residential Permit Parking Program and/or additional parking restrictions, such as time limits, during game days, particularly in the Bayview Hunters Point areas, shall be explored with residents to reduce potential for intrusion of stadium vehicles into the adjacent neighborhood during a football game or secondary event.
- The stadium operator shall implement measures to encourage carpools of 4-plus persons per vehicle.
- The stadium operator shall charge a higher parking cost for low occupancy vehicles.
- The stadium operator shall develop a separate TDM plan for employees of the stadium and concessionaires. The plan shall consider measures such as providing employees and concessionaires with free or subsidized transit passes to encourage transit use and reduce vehicular travel to the stadium. Employees shall not receive preferential parking.
- The stadium operator shall develop measures with CPSRA to ensure that game day spectators do not park in CPSRA day use parking lots. Strategies to be explored include limiting parking in CPSRA lots to a limited duration during game days (e.g., to a two-hour period), or an increase in parking fees equivalent to game day parking, and ticketing and enforcement.
- The TMP shall ensure that regular transit routes operate acceptably near the stadium. The plan should consider providing alternate routes for those transit lines that do not have exclusive right of way on game days (48-Quintara-24th Street, 44-O'Shaughnessy, 29-Sunset) onto transit-only facilities such as the BRT right of way to the south and Palou Avenue to the north (which would be a transit-only facility on game days).

Implementing this mitigation measure would likely reduce automobile travel to the stadium and encourage transit usage. However, even with implementation of Project Mitigation Measure 17, the Project's impacts on Sunday pre-game and post-game period traffic conditions would remain *significant and unavoidable.*

Project Mitigation Measure 18: Stadium 49ers Game Days Transit Service

SFMTA shall increase frequency on regularly scheduled Muni routes serving the stadium area on game days. In addition, the stadium operator shall fund additional Muni shuttle service between the stadium and regional transit service, including BART (Balboa Park and/or Glen Park Station) and Caltrain (Bayshore Station). Although the specific frequencies of individual routes should be determined based on patron characteristics that may evolve over time, the increased transit service, taken as an aggregate, should generally compensate for the projected shortfall of 3,600 passengers per hour on the existing and proposed transit lines.

- Prior to opening day at the new stadium, the City and stadium operator shall determine costs associated with the increased service and determine funding sources. Examples of funding sources that shall be considered include a surcharge on game tickets or other such revenue mechanism. Implementation of increased transit service would be the responsibility of SFMTA and the stadium operator, and would be implemented when projected attendance warrants additional service.

With implementation of Project Mitigation Measure 18, the Project's impacts to transit service on Sundays during a football game could be reduced to less-than-significant levels. However, due to the traffic impacts during post-game conditions on transit operations, which could not be mitigated, the impact on transit operations would remain *significant and unavoidable.*

Project Mitigation Measure 19: Stadium Secondary Event Transportation Management Plan

The stadium operator shall develop as part of a stadium Transportation Management Plan (TMP), a strategy for coordinating with representatives of SFMTA and the SF Police Department for deploying traffic control officers in the Project vicinity to increase efficiency of pre- and post- event traffic, similar to what would be in place for football game days. The secondary event component of the stadium TMP shall be approved by SFMTA. The stadium operator shall fully fund implementation of the secondary event (i.e., non-49ers football events) measures.

Implementation of this mitigation measure would likely improve vehicle entrance and exit flows to the stadium site, maintain orderly traffic operations, and reduce intrusion onto neighborhood streets near the stadium. However, even with the implementation of Project Mitigation Measure 19 on days when special events are held at the stadium, the Project's impacts to the study roadway network would be *significant and unavoidable.*

Project Mitigation Measure 20: Stadium Secondary Event Transit Service

SFMTA shall increase frequency on regularly scheduled Muni routes serving the stadium area prior to large special events. In addition, the stadium operator shall fund additional Muni shuttle service between the stadium and regional transit service, including BART (Balboa Park and/or Glen Park stations) and Caltrain (Bayshore station).

- Routes 24-Divisadero, 28L-19th Avenue Limited, and 44-O'Shaughnessey would already be operating near their maximum frequency. Therefore, this mitigation measure primarily applies to the 48-Quintara-24th Street route and the new HPX service. If each of these routes were increased to have five-minute frequencies (typically considered the maximum frequency that can be regularly maintained), the transit capacity toward the stadium would increase by 828 passengers per hour, for a total of 3,928 passengers. Even with the additional service on these two lines, there would be a shortfall of 1,797 passengers per hour in transit capacity.
- Additional express service to key regional transit destinations and regional charter express service, similar to what is offered on football game days, would offset a portion of the shortfall in transit capacity. The amount and nature of special service to special stadium events would depend on the type and size of the special event. Generally, the capacity of the express service should compensate for the shortfall of 1,797 passengers per hour for a 37,500-person event (transit supply, would of course, be designed on a case-by-case basis depending on the expected size of the secondary event).
- SFMTA and the stadium operator shall implement a stadium transportation systems plan similar to that developed for game-day operations (except that the Yosemite Slough bridge shall not be available for private automobiles), on a case-by-case basis depending on the expected size of the secondary event.

Prior to opening day at the new stadium, the City and the stadium operator shall determine costs associated with the increased service and determine funding requirements. Examples of funding sources that shall be considered include a surcharge on game tickets, parking or admission surcharge, or other such revenue mechanism. Implementation of increased transit service would be the responsibility of SFMTA and the stadium operator, and would be implemented when projected attendance warrants additional service.

With implementation of Project Mitigation Measure 20, the Project's impacts to transit service on special event days would be reduced, but not to less-than-significant levels. In addition, traffic impacts during secondary events would not be mitigated, and would impact transit operations. Therefore, the impact on transit operations would remain *significant and unavoidable.*

7.1.9 Arena

Project Mitigation Measure 21: Arena Transportation Management Plan

The arena operator shall develop a Transportation Management Plan (TMP) for coordinating with representatives of SFMTA and the SF Police Department for deploying traffic control officers in the Project vicinity to increase efficiency of pre- and post- event traffic, and for developing incentives to increase transit ridership to the arena. Implementation of this mitigation measure would likely speed vehicle entrance and exit to the arena site as well as maintain orderly traffic operations and reduce intrusion onto minor routes to and from the arena. Traffic control officers would facilitate traffic flow at the intersection of Harney/Jamestown that would operate at LOS F conditions with a sell-out arena event. The final arena TMP shall be approved by SFMTA. Preparation of the TMP Plan shall be fully funded by the arena operator, and shall be completed in time for implementation on opening day of the arena.

However, even with the implementation of Project Mitigation Measure 21, the Project's impacts to the study roadway network during a sell-out event at the arena would be *significant and unavoidable*.

7.2 PROJECT VARIANT 1

7.2.1 Traffic

Project Variant 1 Mitigation Measure 1: Implement Project Mitigation Measure 1 – TDM Plan

Project Variant 1 Mitigation Measure 2: Implement Project Mitigation Measure 6 – Harney Way Widening

Project Variant 1 Mitigation Measure 3: Implement Project Mitigation Measure 2 – Improvements at Tunnel/Blanken

Project Variant 1 Mitigation Measure 4: Implement Project Mitigation Measure 3 – Harney Interchange Project Improvements

Project Variant 1 Mitigation Measure 5: At the intersection of Crisp/Palou/Griffith, restripe the southbound approach to provide a dedicated left-turn lane and a shared through/right-turn lane. On-street parking would be prohibited on Griffith Street between Palou Avenue and Oakdale Avenue. Implementation of this improvement would be the responsibility of SFMTA and DPW, and shall be implemented as part of Hunters Point Shipyard Phase 3 roadway network improvements. The Project Applicant, in collaboration with the City, shall monitor traffic conditions at completion of Phase 2, Phase 3 and Phase 4 to determine whether the intersection operations would warrant reconfiguration and when it should be implemented. Based on the monitoring, if the City determines reconfiguration is warranted, the Project Applicant shall be required to fund the cost of reconfiguration. The SFMTA and DPW shall design and implement the measure as necessary. With implementation of Project Variant 1 Mitigation Measure 5, this intersection would operate at acceptable LOS D or better in the AM and PM peak hours, and therefore with its implementation, project-related impacts at this intersection would be *less than significant*.

Project Variant 1 Mitigation Measure 6: Implement Project Mitigation Measure 4 – Improvements at Amador/Cargo/Illinois

Project Variant 1 Mitigation Measure 7: At the intersection of Innes/Earl, install a traffic signal. Installation of a traffic signal at the intersection of Innes/Earl would improve intersection operations to LOS D or better conditions. Traffic forecasts show that this intersection would be very close to meeting peak hour traffic signal warrants with buildout of the Project Variant 1. The Project Applicant, in collaboration with the City, shall monitor traffic volumes at completion of Phase 2, Phase 3 and Phase 4 to determine whether the intersection volumes would actually warrant a traffic signal and when it should be implemented. Based on the monitoring, if the City determines a traffic signal is warranted, the Project Applicant shall be required to fund installation of a traffic signal as part of later development phases. The SFMTA and DPW shall design and implement the measure as necessary. Implementation of Project Variant 1 Mitigation Measure 7 would reduce the impacts at this intersection to *less than significant* levels.

Project Variant 1 Mitigation Measure 8: Implement Project Mitigation Measure 5 – Improvements at Bayshore/Geneva

7.2.2 Transit

Project Variant 1 Mitigation Measure 9: Implement Project Mitigation Measure 7 – Project Transit Operating Plan

Project Variant 1 Mitigation Measure 10: Implement Project Mitigation Measure 8.1 and 8.2 – 9-San Bruno Improvements

Project Variant 1 Mitigation Measure 11: Implement Project Mitigation Measure 9.1 and 9.2 – 23-Monterey, 24-Divisadero, and 44-O’Shaughnessy Improvements

Project Variant 1 Mitigation Measure 12: Implement Project Mitigation Measure 10.1 and 10.2 – 29-Sunset Improvements

Project Variant 1 Mitigation Measure 13: Implement Project Mitigation Measure 11.a and 11.2 – 48-Quintara-24th Street Improvements

Project Variant 1 Mitigation Measure 14: Implement Project Mitigation Measure 12 – 54-Felton Improvements

Project Variant 1 Mitigation Measure 15: Implement Project Mitigation Measure 13.1 and 13.2 – T-Third Improvements

Project Variant 1 Mitigation Measure 16: Implement Project Mitigation Measure 14.1 and 14.2 – 28L-19th Avenue/Geneva Limited Improvements

7.2.3 Bicycle

Project Variant 1 Mitigation Measure 17: Implement Project Mitigation Measure 15 – Bicycle Route #70 and #170 Improvements

7.2.4 Pedestrian

No significant environmental impacts have been identified; no mitigation required.

7.2.5 Parking

No significant environmental impacts have been identified; no mitigation required.

7.2.6 Loading

No significant environmental impacts have been identified; no mitigation required.

7.2.7 Construction

Project Variant 1 Mitigation Measure 18: Implement Project Mitigation Measure 16 – Construction Traffic Management Program

7.2.8 Stadium

No stadium proposed as part of Project Variant 1; no mitigation measures required.

7.2.9 Arena

Project Variant 1 Mitigation Measure 19: Implement Project Mitigation Measure 21 – Arena Transportation Management Program

Project Variant 1 Mitigation Measure 20: SFMTA shall increase frequency on regularly scheduled Muni routes serving the stadium area prior to large events at the arena. Routes 29-Sunset and 28L-19th Avenue Limited would already be operating near their maximum frequency. Therefore, this mitigation measure primarily applies to Route CPX. If headways on this route were increased to five-minute frequencies in the one to two-hours prior to an event at the arena, the hourly transit capacity toward the arena would increase by 380 passengers per hour, for a total of 2,658. This would likely be adequate capacity, but may still leave some routes over-capacity and others below-capacity. Therefore, additional shuttle service to key regional transit destinations, such as BART, Caltrain, and the T-Third light rail route shall also be provided by the arena operator.

7.3 PROJECT VARIANT 2

7.3.1 Traffic

Project Variant 2 Mitigation Measure 1: Implement Project Mitigation Measure 1 – TDM Plan

Project Variant 2 Mitigation Measure 2: Implement Project Mitigation Measure 6 – Harney Way Widening

Project Variant 2 Mitigation Measure 3: Implement Project Mitigation Measure 2 – Improvements at Tunnel/Blanken

Project Variant 2 Mitigation Measure 4: Implement Project Mitigation Measure 3 – Harney Interchange Project Improvements

Project Variant 2 Mitigation Measure 5: Implement Project Mitigation Measure 4 – Improvements at Amador/Cargo/Illinois

Project Variant 2 Mitigation Measure 6: Implement Project Mitigation Measure 5 – Improvements at Bayshore/Geneva

7.3.2 Transit

Project Variant 2 Mitigation Measure 7: Implement Project Mitigation Measure 7 – Project Transit Operating Plan

Project Variant 2 Mitigation Measure 8: Implement Project Mitigation Measure 8.1 and 8.2 – 9-San Bruno Improvements

Project Variant 2 Mitigation Measure 9: Implement Project Mitigation Measure 9.1 and 9.2 – 23-Monterey, 24-Divisadero, and 44-O'Shaughnessy Improvements

Project Variant 2 Mitigation Measure 10: Implement Project Mitigation Measure 10.1 and 10.2 – 29-Sunset Improvements

Project Variant 2 Mitigation Measure 11: Implement Project Mitigation Measure 11.a and 11.2 – 48-Quintara-24th Street Improvements

Project Variant 2 Mitigation Measure 12: Implement Project Mitigation Measure 12 – 54-Felton Improvements

Project Variant 2 Mitigation Measure 13: Implement Project Mitigation Measure 13.1 and 13.2 – T-Third Improvements

Project Variant 2 Mitigation Measure 14: Implement Project Mitigation Measure 14.1 and 14.2 – 28L-19th Avenue/Geneva Limited Improvements

7.3.3 Bicycle

Project Variant 2 Mitigation Measure 15: Implement Project Mitigation Measure 15 – Bicycle Route #70 and #170 Improvements

7.3.4 Pedestrian

No significant environmental impacts have been identified; no mitigation required.

7.3.5 Parking

No significant environmental impacts have been identified; no mitigation required.

7.3.6 Loading

No significant environmental impacts have been identified; no mitigation required.

7.3.7 Construction

Project Variant 2 Mitigation Measure 16: Implement Project Mitigation Measure 16 – Construction Traffic Management Program

7.3.8 Stadium

No stadium proposed as part of Project Variant 1; no mitigation measures required.

7.3.9 Arena

Project Variant 2 Mitigation Measure 17: Implement Project Mitigation Measure 21 – Arena Transportation Management Program

Project Variant 2 Mitigation Measure 18: SFMTA shall increase frequency on regularly scheduled Muni routes serving the stadium area prior to large events at the arena. Routes 29-Sunset and 28L-19th Avenue Limited would already be operating near their maximum frequency. Therefore, this mitigation measure primarily applies to Route CPX. If headways on this route were increased to five-minute frequencies in the one to two-hours prior to an event at the arena, the hourly transit capacity toward the arena would increase by 380 passengers per hour, for a total of 2,658. This would likely be adequate capacity, but may still leave some routes over-capacity and others below-capacity. Therefore, additional shuttle service to key regional transit destinations, such as BART, Caltrain, and the T-Third light rail route shall also be provided by the arena operator.

7.4 ALTERNATIVE 1 (NO PROJECT)

No mitigation measures presented for No Project conditions. Development within Hunters Point Shipyard would be subject to the existing MMRP.

7.5 ALTERNATIVE 2 (NO BRIDGE)

7.5.1 Traffic

Alternative 2 Mitigation Measure 1: Implement Project Mitigation Measure 1 – TDM Plan

Alternative 2 Mitigation Measure 2: Implement Project Mitigation Measure 2 – Improvements at Tunnel/Blanken

Alternative 2 Mitigation Measure 3: Implement Project Mitigation Measure 3 – Harney Interchange Project Improvements

Alternative 2 Mitigation Measure 4: Implement Project Mitigation Measure 4 – Improvements at Amador/Cargo/Illinois

Alternative 2 Mitigation Measure 5: Implement Project Mitigation Measure 5 – Improvements at Bayshore/Geneva

Alternative 2 Mitigation Measure 6: Implement Project Mitigation Measure 6 – Harney Way Widening

7.5.2 Transit

Alternative 2 Mitigation Measure 7: Implement Project Mitigation Measure 7 – Project Transit Operating Plan

Alternative 2 Mitigation Measure 8: Implement Project Mitigation Measure 8.1 and 8.2 – 9-San Bruno Improvements

Alternative 2 Mitigation Measure 9: Implement Project Mitigation Measure 9.1 and 9.2 – 23-Monterey, 24-Divisadero, and 44-O'Shaughnessy Improvements

Alternative 2 Mitigation Measure 10: Implement Project Mitigation Measure 10.1 and 10.2 – 29-Sunset Improvements

Alternative 2 Mitigation Measure 11: Implement Project Mitigation Measure 11.a and 11.2 – 48-Quintara-24th Street Improvements

Alternative 2 Mitigation Measure 12: Implement Project Mitigation Measure 12 – 54-Felton Improvements

Alternative 2 Mitigation Measure 13: Implement Project Mitigation Measure 13.1 and 13.2 – T-Third Improvements

Alternative 2 Mitigation Measure 14: Implement Project Mitigation Measure 14.1 and 14.2 – 28L-19th Avenue/Geneva Limited Improvements

7.5.3 Bicycle

Alternative 2 Mitigation Measure 15: Implement Project Mitigation Measure 15 – Bicycle Route #70 and #170 Improvements

7.5.4 Pedestrian

No significant environmental impacts have been identified; no mitigation required.

7.5.5 Parking

No significant environmental impacts have been identified; no mitigation required.

7.5.6 Loading

No significant environmental impacts have been identified; no mitigation required.

7.5.7 Construction

Alternative 2 Mitigation Measure 16: Implement Project Mitigation Measure 16 – Construction Traffic Management Program

7.5.8 Stadium

Alternative 2 Mitigation Measure 17: Implement Project Mitigation Measure 17 – Stadium 49ers Game Days Transportation Management Program

Alternative 2 Mitigation Measure 18: Implement Project Mitigation Measure 18 – Stadium 49ers Game Days Transit Service

Alternative 2 Mitigation Measure 19: Implement Project Mitigation Measure 19 – Stadium Secondary Event Transportation Management Program

Alternative 2 Mitigation Measure 20: Implement Project Mitigation Measure 20 – Stadium Secondary Event Transit Service

7.5.9 Arena

Alternative 2 Mitigation Measure 21: Implement Project Mitigation Measure 21 – Arena Transportation Management Program

7.6 ALTERNATIVE 3 (49ERS AT CANDLESTICK)

7.6.1 Traffic

Alternative 2 Mitigation Measure 1: Implement Project Mitigation Measure 1 – TDM Plan

Alternative 2 Mitigation Measure 2: Implement Project Mitigation Measure 3 – Harney Interchange Project Improvements

Alternative 2 Mitigation Measure 3: Implement Project Mitigation Measure 4 – Improvements at Amador/Cargo/Illinois

Alternative 2 Mitigation Measure 4: Implement Project Mitigation Measure 5 – Improvements at Bayshore/Geneva

Alternative 3 Mitigation Measure 5: At the intersection of Harney/Jamestown, install a traffic signal at the intersection of Harney/Jamestown. Implementation of this measure would be the responsibility of SFMTA, and should be implemented when traffic signal warrants are met. Prior to completion of Phase 1 of development, the Project Applicant shall fully fund the cost of signalization improvements. Implementation of this mitigation measure would reduce Alternative 3 traffic impacts at this intersection to *less than significant* levels.

Alternative 3 Mitigation Measure 6: At the intersection of Ingalls/Thomas, install traffic signal at the intersection of Ingalls/Thomas. Implementation of this measure would be the responsibility of SFMTA, and should be implemented when traffic signal warrants are met. Prior to completion of Phase 1 of development, the Project Applicant shall fully fund the cost of signalization improvements. Installation of a traffic signal at the intersection of Ingalls/Thomas intersection would improve intersection operations to LOS D or better conditions. Implementation of Alternative 3 Mitigation Measure 6 would reduce the impacts at this intersection to *less than significant* levels.

Alternative 3 Mitigation Measure 7: At the intersection of Arelious Walker/Gilman, install a traffic signal at the intersection of Arelious Walker/Gilman. Implementation of the new signal would be the responsibility of SFMTA, and should be implemented when traffic signal warrants are met. Since signalization was determined to be required even without the Project under 2030 No Project conditions, the Project Applicant shall contribute its fair-share toward the cost of improvements. Prior to payment of the contribution, the City shall create a mechanism to determine and receive fair share contributions from the Project Applicant. The SFMTA and DPW shall design and implement the measure as necessary. Since implementation of this mitigation measure is uncertain, traffic impacts would remain significant and unavoidable.

7.6.2 Transit

Alternative 3 Mitigation Measure 8: Implement Project Mitigation Measure 7 – Project Transit Operating Plan

Alternative 3 Mitigation Measure 9: Implement Project Mitigation Measure 8.1 and 8.2 – 9-San Bruno Improvements

Alternative 3 Mitigation Measure 10: Implement Project Mitigation Measure 9.1 and 9.2 – 23-Monterey, 24-Divisadero, and 44-O'Shaughnessy Improvements

Alternative 3 Mitigation Measure 11: Implement Project Mitigation Measure 10.1 and 10.2 – 29-Sunset Improvements

Alternative 3 Mitigation Measure 12: Implement Project Mitigation Measure 11.a and 11.2 – 48-Quintara-24th Street Improvements

Alternative 3 Mitigation Measure 13: Implement Project Mitigation Measure 12 – 54-Felton Improvements

Alternative 3 Mitigation Measure 14: Implement Project Mitigation Measure 13.1 and 13.2 – T-Third Improvements

Alternative 3 Mitigation Measure 15: Implement Project Mitigation Measure 14.1 and 14.2 – 28L-19th Avenue/Geneva Limited Improvements

7.6.3 Bicycle

Alternative 3 Mitigation Measure 16: Implement Project Mitigation Measure 15 – Bicycle Route #70 and #170 Improvements

7.6.4 Pedestrian

No significant environmental impacts have been identified; no mitigation required.

7.6.5 Parking

No significant environmental impacts have been identified; no mitigation required.

7.6.6 Loading

No significant environmental impacts have been identified; no mitigation required.

7.6.7 Construction

Alternative 3 Mitigation Measure 17: Implement Project Mitigation Measure 16 – Construction Traffic Management Program

7.6.8 Stadium

49ers would remain at existing stadium. No stadium proposed as part of Alternative 3; no mitigation measures required.

7.6.9 Arena

No arena proposed as part of Alternative 3; no mitigation measures required.

7.7 ALTERNATIVE 4 (LESSER BUILD)

7.7.1 Traffic

Alternative 4 Mitigation Measure 1: Implement Project Mitigation Measure 1 – TDM Plan

Alternative 4 Mitigation Measure 2: Implement Project Mitigation Measure 6 – Harney Way Widening

Alternative 4 Mitigation Measure 3: Implement Project Mitigation Measure 2 – Improvements at Tunnel/Blanken

Alternative 4 Mitigation Measure 4: Implement Project Mitigation Measure 3 – Harney Interchange Project Improvements

Alternative 4 Mitigation Measure 5: Implement Project Mitigation Measure 5 – Improvements at Bayshore/Geneva

7.7.2 Transit

Alternative 4 Mitigation Measure 6: Implement Project Mitigation Measure 7 – Project Transit Operating Plan

Alternative 4 Mitigation Measure 7: Implement Project Mitigation Measure 8.1 and 8.2 – 9-San Bruno Improvements

Alternative 4 Mitigation Measure 8: Implement Project Mitigation Measure 9.1 and 9.2 – 23-Monterey, 24-Divisadero, and 44-O'Shaughnessy Improvements

Alternative 4 Mitigation Measure 9: Implement Project Mitigation Measure 10.1 and 10.2 – 29-Sunset Improvements

Alternative 4 Mitigation Measure 10: Implement Project Mitigation Measure 11.a and 11.2 – 48-Quintara-24th Street Improvements

Alternative 4 Mitigation Measure 11: Implement Project Mitigation Measure 12 – 54-Felton Improvements

Alternative 4 Mitigation Measure 12: Implement Project Mitigation Measure 13.1 and 13.2 – T-Third Improvements

Alternative 4 Mitigation Measure 13: Implement Project Mitigation Measure 14.1 and 14.2 – 28L-19th Avenue/Geneva Limited Improvements

7.7.3 Bicycle

Alternative 4 Mitigation Measure 14: Implement Project Mitigation Measure 15 – Bicycle Route #70 and #170 Improvements

7.7.4 Pedestrian

No significant environmental impacts have been identified; no mitigation required.

7.7.5 Parking

No significant environmental impacts have been identified; no mitigation required.

7.7.6 Loading

No significant environmental impacts have been identified; no mitigation required.

7.7.7 Construction

Alternative 4 Mitigation Measure 15: Implement Project Mitigation Measure 16 – Construction Traffic Management Program

7.7.8 Stadium

No stadium proposed; no mitigation measures required.

7.7.9 Arena

Alternative 4 Mitigation Measure 16: Implement Project Mitigation Measure 21 – Arena Transportation Management Program

7.8 ALTERNATIVE 5 (NO PARK AGREEMENT)

7.8.1 Traffic

Alternative 5 Mitigation Measure 1: Implement Project Mitigation Measure 1 – TDM Plan

Alternative 5 Mitigation Measure 2: Implement Project Mitigation Measure 2 – Improvements at Tunnel/Blanken

Alternative 5 Mitigation Measure 3: Implement Project Mitigation Measure 3 – Harney Interchange Project Improvements

Alternative 5 Mitigation Measure 4: Implement Project Mitigation Measure 4 – Improvements at Amador/Cargo/Illinois

Re: CP-HPS Phase II Developmental Plan Transportation Study – Transit Delay Analysis Erratum

Dear Bill:

This letter report is an erratum to the *Candlestick Point-Hunters Point Shipyard Phase II Development Plan Transportation Study* (November 2009) to update the transit delay analysis in the original report.

Our recent work refining transit mitigation measures identified in the DEIR has led to updated calculations for transit travel time savings associated with the measures. In the course of this refinement, we identified discrepancies in the calculation of transit travel increases associated with the Proposed Project, Variants and Alternatives.

This letter report contains the revised calculations. Revisions have been made to Tables 76, 77, 82, and 83 as they appear in the Transportation Study. Rather than renumbering for this letter report, those tables have been left with their original numbering scheme.

The revised transit delay analysis includes a Project Variant that was not included in the report at the time of publication, Variant 2A. For additional background on Variant 2A and the reasons for its inclusion please see *CP-HPS Phase II Developmental Plan Transportation Study, Supplemental Memorandum – Project Variant 2A (Housing/R&D)*, LCW Consulting, March 2010.

The revisions contained herein were not found to identify any additional significant impacts to transit travel times beyond those previously identified and disclosed in the Transportation Study and DEIR. The same mitigation measures identified in those documents would continue to apply based on the information presented in this letter.

TRANSIT DELAY ANALYSIS

The transit delay analysis and impact methodologies are the same as described in Chapter 6 (Year 2030 Project Impact Analysis) of the Transportation Study and are summarized below.

Transit Delay Methodology

Transit delay is the sum of three components; traffic congestion delay, transit re-entry delay, and passenger delay. The following is a brief description of each delay component:

Traffic congestion delay – Traffic congestion associated with increases in area traffic slows down transit vehicles and results in increased transit travel times. Traffic congestion delays are calculated by summing the average vehicular delay at each intersection along the transit line's route within the study area. The increase in total route segment delay is equal to the increase in travel time associated with the project.

FEHR & PEERS
TRANSPORTATION CONSULTANTS

Transit re-entry delay – Transit vehicles typically experience delays after stopping to pick up and drop off passengers while waiting for gaps in adjacent street traffic in order to pull out of bus stops. As traffic volumes on the adjacent street increase, re-entering the flow of traffic becomes more difficult and transit vehicles experience increased delay. Transit re-entry delay was calculated using empirical data presented in the 2000 Highway Capacity Manual (HCM). Total transit re-entry delay for each route was calculated as the sum of transit re-entry delay at each stop within the study area.

Passenger boarding delay – Although increases in transit ridership are generally viewed positively, the amount of time a transit vehicle has to stop to pick up and drop off passengers (i.e., the transit vehicle dwell time) is directly correlated to the number of passengers boarding the vehicle. If, as proposed, the project includes substantial improvements to transit service in the future (and as general transit ridership grows), vehicles would have to spend more time at stops, which may increase overall transit travel times. Passenger boarding delay was calculated assuming two seconds per passenger boarding for buses, and 0.5 seconds per passenger boarding for light rail or bus rapid transit (BRT) vehicles. Passenger boarding's within the study area were estimated by examining the increases in ridership across the study area cordons.

Although the transit routes in the study area would not be extended into the study area under existing conditions or under 2030 No Project conditions, transit delay for those scenarios was calculated as if the transit routes were extended only for purposes of comparing project impacts. Generally, the increases in travel times associated with the project are somewhat smaller than those associated with the increases expected between existing and 2030 No Project conditions.

Transit Delay Study Segments

Transit delay was calculated for the study transit routes between the project site and key destination/transfer points over the following segments:

- 9-San Bruno: Bayshore Boulevard between Sunnydale Avenue and Jerrold Avenue
- 23-Monterey: between Ingalls Street/Oakdale Avenue and the Glen Park BART Station
- 24-Divisadero: between Hunters Point Shipyard and Mission Street
- 28L-19th Avenue: between Hunters Point Shipyard and Mission Street
- 29-Sunset: between Candlestick Point and Mission Street
- 44-O'Shaughnessy: between Hunters Point Shipyard and the Glen Park BART Station
- 48-Quintara-24th St: between Hunters Point Shipyard and the 24th Street BART Station
- 54-Felton: between Jerrold Avenue/Earl Street and Mission Street
- T-Third: Third Street between Thomas Avenue and Jerrold Avenue

Transit Delay Impact Criteria

As noted in the Transportation Study and the DEIR, the Proposed Project would have a significant impact if it would increase travel times such that additional vehicles would be required to maintain the proposed headways. This was assumed to be the case if either the project's travel time increases to a particular route would be greater than ½ its proposed headway or if the number of required vehicles estimated using SFMTA's cost/scheduling model, which takes into account scheduled breaks and extra time built into schedules, increases by one or more vehicles with the addition of the project characteristics.

Revised Transit Delay Analysis – Project and Project Variants

This section describes the transit delay analysis and impacts associated with the Project and Project Variants.

Table 76 summarizes the increases in transit travel times associated with the Proposed Project and the Project Variants for each route within the study area, compared to 2030 No Project

(Alternative 1) conditions. **Table 77** identifies the number of additional vehicles that would be required to meet the proposed headways.

Source: Fehr & Peers, 2010.

Proposed Project: As shown on Table 77, under the Proposed Project, traffic and ridership demands would increase compared to conditions without the Proposed Project, and would result in the need for an additional 7 transit vehicles AM peak hour, and an additional 14 vehicles in the PM peak hour. During the AM peak hour, additional vehicles would be required on the 9-San Bruno (one vehicle), 24-Divisadero (two vehicles), 28L-19th Avenue Limited (one vehicle), 29-Sunset (two vehicles), and the 44-O'Shaughnessy (two vehicles) routes. These would be in addition to the 18 vehicles required to maintain 2030 No Project headways (see Table 83). In the PM peak hour, additional vehicles would be needed on the 9-San Bruno (one vehicle), 24-Divisadero (two vehicles), 28L-19th Avenue Limited (one vehicle), 29-Sunset (four vehicles), 44-O'Shaughnessy (three vehicles), 48-Quintara-24th Street (one vehicle), 54-Felton (one vehicle), and the T-Third (one train car). These would be in addition to the 16 required to maintain 2030 No Project headways.

These impacts to transit travel times were discussed in Impacts TR-21 through TR-27. Although mitigation measures were identified to reduce the severity of these impacts, the DEIR determined that their feasibility was uncertain because they would require detailed engineering feasibility studies and ultimate approval by SFMTA. Further, in some cases, even if feasibility were certain, the proposed mitigation measures would not fully mitigate the transit impacts to less than significant levels. Consequently, the DEIR concluded that the impacts would remain significant and unavoidable.

Many of the mitigation measures described in the DEIR included a series of options and/or improvements that should be considered in the feasibility study. Since the time of publication of the DEIR, feasibility studies have been conducted in collaboration with the Planning Department and SFMTA. As a result of this process, the recommended mitigation measures have been refined considerably and the mitigation measures have been made more specific. The language used to describe mitigation measures MM TR-21.1 through MM TR-27.1 has been refined as a result of this subsequent feasibility study, and will be included as staff-initiated text changes in the FEIR. Further, Master Response 18 – Traffic Mitigation Measures, has been included in the Comments and Responses portion of the FEIR, and includes a more detailed discussion of the mitigation measures, their feasibility, and their benefits to transit travel times.

However, because the mitigation measures require further approvals by the SFMTA board, and because some of them do not fully mitigate their associated impacts to less than significant levels, the conclusions of the DEIR (namely that the transit travel time impacts discussed in Impacts TR-21 through TR-27 would remain significant and unavoidable with mitigation) are unchanged.

Project Variant 1 – R&D: Under Project Variant 1, traffic and ridership demands would increase and result in the need for one additional transit vehicle (29-Sunset, one vehicle) in the AM Peak Hour and two additional vehicles (24-Divisadero, one vehicle; 44-O'Shaughnessy, one vehicle) in the PM Peak Hour in addition to those identified for the Proposed Project. The same significant impacts associated with Variant 1 identified in the Transportation Study and the DEIR would remain significant and unavoidable.

Project Variant 2 – Housing: Under Project Variant 2, traffic and ridership demands would increase and result in the need for zero additional transit vehicles in the AM Peak Hour and one additional vehicle (24-Divisadero, one vehicle) in the PM Peak Hour in addition to those identified for the Proposed Project. The same significant impacts associated with Variant 2 identified in the Transportation Study and the DEIR would remain significant and unavoidable.

Project Variant 2A – Housing/R&D: Under Project Variant 2A, traffic and ridership demands would increase and result in the need for zero additional transit vehicles in the AM Peak Hour and one additional vehicle (24-Divisadero, one vehicle) in the PM Peak Hour in addition to those identified for the Proposed Project. The same significant impacts associated with Variant 2A identified in *CP-HPS Phase II Developmental Plan Transportation Study, Supplemental Memorandum – Project Variant 2A (Housing/R&D)*, LCW Consulting, March 2010 would remain significant and unavoidable.

Revised Transit Delay Analysis – Project and Project Alternatives

This section describes the transit delay analysis and impacts associated with Project Alternatives.

Table 82 summarizes the increases in transit travel times associated with Alternatives to the Project for each route within the study area, compared to 2030 No Project (Alternative 1) conditions. Although neither Alternative 1 nor the existing conditions include extensions of transit routes into the project site, the analysis of increases to transit travel times over existing conditions associated with Alternative 1 was conducted for the same segments as the Project, to provide a meaningful comparison. **Table 83** identifies the number of additional vehicles that would be required to meet the proposed headways.

Source: Fehr & Peers, 2010.

Alternative 1 – No Project: As shown on Table 83, under Alternative 1 - No Project, traffic and ridership demands would increase and result in the need for an additional 18 transit vehicles in the AM peak hour, and an additional 18 vehicles in the PM peak hour. During the AM peak hour, additional vehicles would be required on the 9-San Bruno (six vehicles), 23-Monterey (one vehicle), 24-Divisadero (three vehicles), 28L-19th Avenue Limited (one vehicle), 29-Sunset (one vehicle), 44-O'Shaughnessy (two vehicles), the 48-Quintara-24th Street (one vehicle), the 54-Felton (one vehicle) and the T-Third (two train cars). In the PM peak hour, additional vehicles would be needed on the 9-San Bruno (seven vehicles), 23-Monterey (one vehicle), 24-Divisadero (two vehicles), 28L-19th Avenue Limited (one vehicle), 44-O'Shaughnessy (four vehicles), 48-Quintara-24th Street (one vehicle), 54-Felton (one vehicle), and the T-Third (one train car).

Alternative 2 – No Bridge: Under Alternative 2, traffic and ridership demands would increase and result in the need for 8 additional transit vehicles in the AM Peak Hour and 14 additional vehicles in the PM Peak Hour in addition to those identified to maintain 2030 No Project conditions (18 vehicles in the AM peak hour, and 18 vehicles in the PM peak hour). The same significant impacts associated with Alternative 2 identified in the Transportation Study and the DEIR would remain significant and unavoidable.

FEHR & PEERS
TRANSPORTATION CONSULTANTS

Alternative 3 – 49ers at Candlestick: Under Alternative 3, traffic and ridership demands would increase and result in the need for 5 additional transit vehicles in the AM Peak Hour and 7 additional vehicles in the PM Peak Hour in addition to those identified to maintain 2030 No Project conditions (18 vehicles in the AM peak hour, and 18 vehicles in the PM peak hour). The same significant impacts associated with Alternative 3 identified in the Transportation Study and the DEIR would remain significant and unavoidable.

Alternative 4 – Lesser Build: Under Alternative 4, traffic and ridership demands would increase and result in the need for 5 additional transit vehicles in the AM Peak Hour and 10 additional vehicles in the PM Peak Hour in addition to those identified to maintain 2030 No Project conditions (18 vehicles in the AM peak hour, and 18 vehicles in the PM peak hour). The same significant impacts associated with Alternative 4 identified in the Transportation Study and the DEIR would remain significant and unavoidable.

Alternative 5 – No Park Agreement: Since the land use program and transit operating plan for Alternative 5 would be the same as for Project Variant 2. The same significant impacts associated with Alternative 5 identified in the Transportation Study and the DEIR would remain significant and unavoidable.

SUMMARY

The revisions described herein to the transit delay analysis presented in the Transportation Study and DEIR did not identify any additional significant impacts to transit travel times beyond those previously identified and disclosed in the Transportation Study and DEIR. The same mitigation measures identified in those documents would continue to apply based on the information presented in this letter. However, as discussed above and further described in Master Response 18 in the Comments and Responses to the DEIR, additional feasibility studies of transit-related mitigation measures have been performed since publication of the DEIR. This has resulted in more detailed information regarding feasible improvements. As a result, the text of mitigation measures MM TR-21 through MM TR-27 has been revised to incorporate this subsequent feasibility study.

We hope you find this information useful. Please do not hesitate to call for clarifications or additional information.

Sincerely,

FEHR & PEERS

Candlestick Point and Hunter's Point Developments, CPP Project 4139,
Addendum 1.

Dear Stuart:

This letter report addresses three issues related to the Preliminary Pedestrian Wind Assessment Final Report issued by CPP in June of 2007.

The first issue concerns changes to some of the tower locations. In some cases, the movement of the tower is expected to improve wind conditions, while in other cases, ground level winds will increase. However, the basic merits of the original layout are maintained, which is that the random layout of the towers (see Figures 1 and 2) is an excellent design feature in terms of mitigating a number of wind effects (when compared to closely grouped towers which can effectively form a wall for certain wind directions).

The second issue concerns the effects of Bayview Hill and Hunter's Point Hill on the wind conditions in the proposed developments. Both hills are directly upwind of the developments for the prevailing westerly winds. As stated in the final report, the hills will:

1. accelerate the wind,
2. change the direction slightly, and
3. cause additional turbulence or gustiness.

1. Accelerated wind flows around hills are most pronounced at the crests and near the sides. For the dominant west winds, the primary location of concern for wind acceleration is at the south end of the hill. As most of the development lies to the west of the hill, acceleration is not considered a major concern.

2. Around San Francisco Bay, high winds are most common in the late afternoon between March and October. During these times, the atmosphere is often quite stable, with a thermal inversion between 1000 ft and 3000 ft above sea level. The lower the temperature inversion, the more wind is forced around the hills, rather than flowing over the top of the hills. This is particularly pronounced for hills which are as high as, or higher than, the inversion level. On days with a particularly low inversion, winds would be expected to be channeled along the direction of the hill, which would produce more of a west-northwest wind at the development site. This possibility is addressed in Figure 11 of the final report. Given that the streets are required to

www.cppwind.com

follow a grid pattern (staggered or meandering streets would further reduce the likelihood of high wind speeds at street level), the streets are well aligned to minimize the likelihood of high pedestrian winds for both the prevailing W and W winds.

3. The full effects of the hills on local wind patterns are difficult to predict. However, one effect which is certain is that much of the Candlestick development will be in the wake of the Bayview hill most afternoons and evenings from spring through autumn. As noted in the final report, wakes tend to feature lower mean wind speeds, but higher turbulence or gustiness. A wind tunnel study of Candlestick Park performed by Jack Cermak at Colorado State University shortly after the stadium was built revealed that it is the turbulence from Bayview Hill which caused wind gusting problems at the Park, making field goals and fly balls more difficult. The wake effect (more gusts, lower average speeds) will diminish with distance from the hill. The wake effect behind Hunter's Point Hill will be much less pronounced that at Candlestick, as the hill is much lower.

Hunter's Point and Candlestick Point are known to be windy locations. Both the proposed arrangement of the streets (at angles to the dominant winds) and the proposed locations of the towers (spread about the development) are well designed to avoid exacerbating wind conditions for pedestrians. Nonetheless, it is likely that mitigation will be desirable in many locations. Potential mitigation measures include

a. Winding or staggered streets (rather than a clean grid pattern) would keep with winds from sweeping along the streets from end to end, thus helping to keep the faster winds above building height.

b. Narrow streets would also help to keep high winds above the low-rise buildings and therefore above street level.

c. Taller buildings will channel high winds from their upper floors down to street level. This phenomenon is called "downwash". It can be mitigated using podium setbacks and street level awnings; for effective mitigation the setback and awnings would have to be of the order of 15 ft. As the winds are highly directional, setbacks may only be needed for buildings faces exposed to the west. Note however that San Francisco Bay does occasionally see strong winds from the south during the winter months. The benefit provided by setbacks can be quantified with a wind tunnel study.

d. Trees, trellises and porous fences are all common mitigation techniques for locations with higher than desirable pedestrian winds. The benefits of these measures can also be quantified by a wind tunnel study.

Pedestrian level wind conditions around the site are expected to be acceptable for use as a main public accessway, but amelioration techniques as discussed above are likely to be required at specific sites, particularly to ensure the retail areas are fit for purpose and where outdoor dining is being considered. Additional advice on these matters can be given once the detailed design has commenced. Please do not hesitate to contact me with questions or comments.

FINAL REPORT

PRELIMINARY PEDESTRIAN WIND ASSESSMENT
CANDLESTICK POINT AND HUNTERS POINT DEVELOPMENTS
San Francisco, California

CPP Project 07-4129

June 2007

Prepared by:

EXECUTIVE SUMMARY

An assessment has been made of the likely environmental wind conditions around the proposed Candlestick and Hunters Point developments, San Francisco. This report follows on from a study of the local wind climate, architectural sketch drawings, and discussion with the client. The purpose of the report is to offer advice on the orientation of the development with regard to the likely wind conditions.

Pedestrian level wind conditions around the site are expected to be acceptable for use as a main public accessway, but amelioration techniques are suggested to ensure the retail areas are fit for purpose. No change in the orientation of the roads is recommended.

LIST OF FIGURES

LIST OF TABLES

1. INTRODUCTION

It is generally accepted that wind speed and the rate of change of wind velocity are the primary parameters that should be used in the assessment of how wind affects pedestrians. Local wind effects can be assessed with respect to a number of environmental wind speed criteria established by various researchers. Despite the apparent differences in numerical values and assumptions made in their development, it has been found that when these are compared on a probabilistic basis, there is remarkably good agreement. Because pedestrians will tolerate higher wind speeds for a smaller period of time than for lower wind speeds, these criteria provide a means of evaluating the overall acceptability of a pedestrian location. Also, a location can be evaluated for its intended use, such as for an outdoor café or a sidewalk. One of the most widely accepted set of criteria was developed by Lawson (1990).

Lawson's criteria have categories for discomfort, based on wind speeds exceeded 5% of the time. The criteria also include a distress rating, for safety assessment, which is based on occasional (once or twice per year) wind speeds. In both cases, the wind speed used the larger of a mean or gust-equivalent-mean (GEM) wind speed. The criteria based on the mean wind speeds define when the steady component of the wind causes discomfort, whereas the GEM wind speeds define when the wind gusts cause discomfort. For this report only the mean wind speeds for distress are discussed. The wind speed categories are listed in Table 1.

A detailed assessment of the acceptability of the pedestrian-wind environment is often desirable (and is required in windier cities such as Boston or San Francisco) during the project design phase so that mitigation measures (typically changes to the landscaping) can be made, if necessary, to improve areas found to be excessively windy. Such an assessment is carried out using scaled-models in a boundary layer wind tunnel, as analytical methods such as computational fluid dynamics (CFD) are not capable at this time, except in very simple geometries, to estimate wind pressures, frame loads, or windiness in pedestrian areas.

In some situations, however, the massing of the buildings presents adverse wind conditions which cannot be easily remedied through local mitigation. A good example of this is Candlestick Park, which was studied by Dr. Jack Cermak at Colorado State University, in a pioneering wind tunnel test in 1963 (see Figure 1). This study revealed that many of the wind problems experienced in the stadium could have been avoided if the stadium and the parking lot locations had been reversed.

It is the goal of this report to make preliminary assessment of the potential for pedestrian wind problems at the Hunter's Point and Candlestick Point developments. In a detailed assessment, the wind speeds at several points around the site would be measured for 16 wind directions, and the results would be compared to the Lawson criteria at each location. For this preliminary assessment, the criteria of Lawson will serve primarily as a guidelines for the discussion, as we discuss the wind conditions necessary for ratings of suitable for sitting, standing, walking, or business walking.

The proposed developments are depicted in Figure 2 and Figure 3. In the plan view of Figure 2, difference section of the developments are identified:

A. Residential, primarily townhomes. There is a retail strip along the main road running along the NW border of the section, which is expected to have café's and outdoor seating. The street orientation is section A is set by the planners.

B. Retail, with a parking garage on the western edge. Two residential towers are visible to the west of section B. These towers are on the side of the 400 ft-tall hill located to the west of the site.

C. Residential, including several high-rise towers. As with section A, there is a retail corridor along some of the perimeter roads. The street orientation is section C is designed to match that of the existing streets to the northwest of the section.

D. Residential, a mix of 4-story wood frame and three towers. The street orientation is designed to match an existing street grid.

E. Office space and parking structures. The street grid orientation is set by the planners.

F. A residential space which includes many existing buildings.

Note that a proposed football stadium for the San Francisco 49ers is shown at the southern end of the Hunters Point images.

2. WIND CLIMATE

Wind climatology for the everyday winds that affect pedestrians was defined using wind statistics from nearby anemometers. The locations of these anemometers relative to the proposed developments sites are shown in Figure 4. For wind engineering analysis along the San Francisco peninsula, it is customary to use data from San Francisco International Airport (SFO).

The wind roses of Figure 5 indicate the direction and strength of winds at a height of 10m at this airport. The wind roses are simply stacked bar charts arranged in a circle– the longer the bar, the more often the winds originate from that direction. For example, we see in Figure 5a that the dominant wind direction is the West-Northwest, with winds coming out of this direction 23% of the time. Of these winds, winds exceeding 12 mph account for 14%, or nearly two thirds of these winds. Winds come from the neighboring wind directions (West and Northwest) 13% of the time each, so that these three wind directions account for roughly half of the winds.

To get some sense what these winds speeds entail, the Beaufort wind scale is provided in Table 2. Sir Francis Beaufort established the earliest quantitative description of wind effects in 1806, for use at sea. It is still in use today (Penwarden and Wise 1975). The Beaufort scale is based on *mean* velocity only, and includes qualitative descriptions of wind effects. Table 2 suggests that mean wind speeds below 12 mph are of minor concern and that mean wind speeds above 24 mph are definitely inconvenient.

A closer examination of the wind patterns in San Francisco reveals that the winds change markedly during the winter months (Figure 5c), becoming milder and less dominated by the west-northwesterly winds. Figure 6 indicates that the winds also change significantly during the day, typically intensifying from late morning until reaching an average peak of 20 knots (23 mph) in the late afternoon, then diminishing in the evening. As it is the highest 5% of the wind speeds which dictate the pedestrian wind rating system of Table 1, this report will focus on the potential impact of these summer afternoon winds, shown in Figure 5b. Locations which are susceptible to these directions can be expected to experience higher speeds more often, and will develop reputations as windy places. The high exceedance of the wind speed governing the criteria for long term stationary activities, Table 1, means that any outdoor eating areas will have to be carefully located to ensure acceptable conditions and profitable tenancies.

Figure 7a illustrate one of the ways in which a location can be susceptible to winds. When strong winds are aligned with a street grid, then the winds tend to sweep along the streets. Conversely, if the winds and the street are at angles to each other, then the wind tends to pass over the streets, as shown in Figure 7b. This issue is further addressed in the Discussion section below. However, in order to avoid aligning the streets with the dominant wind direction, it is important to identify this wind direction accurately. Figure 8 plots the fraction of the time that a given wind direction was measured at SFO for three different time periods, which represent different anemometer locations. Prior to 1995, the dominant wind direction was 300° (270° is winds from the west; 315° is winds from the NW). After the anemometer was moved in 1995, the dominant wind direction is now reported as 290°.

Given the sensitivity of street orientation to wind direction, CPP pursued additional wind data closer to the sites. Reliable wind data was located for three years from a downtown anemometer, and this data is overlayed with the SFO data in Figure 8. This data indicates less of a shift to the west than had been expected, and that winds from the NW are less of a concern than winds from the west.

CPP has also determined that reliable wind data from a well sited anemometer was recorded at the Hunters Point Naval Shipyard as part of the Superfund Site monitoring. Only 16 months of data from this anemometer are available. To avoid seasonal bias, one full calendar year from Hunters Point is presented in Figure 8 and Figure 9a. This data indicates a clear dominance of westerly winds; strong winds outside a band from 240° to 300° are quite rare.

This shift between the airport and downtown is not unexpected. The dominant wind direction is know to shifts with locations around the bay. Figure 9b shows wind data taken from an anemometer across the bay in Oakland, indicating that winds generally come more from the west (270°). Figure 10 shows data taken from around the bay area. We see that on this summer afternoon, winds at SFO are out of the west, but out of the west-southwest at Golden Gate. Wind direction is affected by local topography.

The Candlestick Point development will be influenced by the relatively large hill to the west, which will tend to accelerate the wind and may change the direction from west towards west-north-west. It is the turbulence from this hill which causes wind gusting problems at Candlestick Park.

3. DISCUSSION

3.1 Street Orientation

As mentioned above, when looking at the overall orientation of the scheme it is important to ensure that the streets do not align with the strong prevailing summer afternoon winds, otherwise the wind will be funneled along these streets causing uncomfortable conditions. The funneling of wind will occur along any street when there is a continuous street front with buildings in the order of 4 storeys or taller.

Figure 11 illustrates the street alignment when compared to the prevailing wind directions. None of the streets are vulnerable to west winds. The sections in which the street plan is based upon the existing street plan are vulnerable as the winds shift towards the NW, but these winds are outside the dominant range at Hunters Point.

The streets in each of the sections are aligned in a manner to encourage the wind to flow over the top of the buildings reducing the wind speed at ground level. This becomes more important the wider the street, which may be of importance for the park areas in embedded in the residential areas. Wide streets bordered by tall buildings are especially vulnerable to this so-called "wind tunnel" funneling phenomenon.

Winding streets that do not follow a grid, such as those in section B, can keep high winds above the buildings as well. The impact of wind funneling can be reduced by planting tall, bushy trees along these streets to force the winds to stay above the street level.

3.2 Retail Areas

Candlestick Point has a retail block, and two retail strips; the primary one running south-west to north-east which is understood to contain outdoor eating areas, and the secondary running north-west to south east. The retail block (section B), with its irregular street pattern, is ideal for minimising adverse wind conditions. While the gridded street plans of sections A and C are well aligned to minimize the adverse effects of the dominant winds, the street orientations will nonetheless occasionally tend to encourage wind to be funneled to the retail crossroads, particularly if the local topography shifts the wind directions to align with the nearby hill. The full effects of the hill are difficult to predict. It is likely that much of the candlestick development will be in the wake of the hill much of the time. Wakes tend to feature lower mean wind speeds, but higher turbulence or gustiness.

Wind conditions at the main crossroads are likely to be gusty and outdoor eating should not be located on this corner (see red highlighted region in Figure 11a). It is best to locate the outdoor eating areas towards the centre of the blocks. Awnings along the street front will give additional protection not only from wind, but also rain, thereby encouraging patrons to come even in inclement weather.

While the street alignments are close to ideal, the potential need to mitigate remains considerable in the face of such a strong dominant afternoon winds. Mitigation measures to counteract pedestrian wind problems could include awnings along the retail strip, combined with local screening and roadside tree planting.

3.3 General Guidelines

Corners: It is best to locate entrances at least 5 m away from the corners of buildings, as these are typically the windiest locations.

Balconies: Any balconies on the high-rise towers should be located away from the building corners, otherwise they will only be usable for a short period of the year. Balconies facing into the prevailing wind direction will be equally uncomfortable for a large portion of the year and can cause issues with building operations due to internal pressurisation.

Towers:

1. By setting the tower on a podium with about a 5 m setback from the street edge, the downwash is forced into the street away from the pedestrian areas. The current scheme typically has the tall towers on the street edge and it would be preferable to mount these on podiums, alternatively include awnings along all frontages in the vicinity of the towers.
2. The random layout of the towers is an excellent design feature in terms of mitigating a number of wind effects. The only tower that causes slight concern is the one on the corner of the main retail streets as this has the potential to cause problems along the main retail strip. It would be better if this tower could be located away from this corner.

3.4 Conclusion

This area of San Francisco is known to be windy, especially in summer afternoons when winds from the west quadrant dominate the wind climate. Based on the Hunters Point wind data, the street alignments are close to ideal to reducing the effects of winds. In spite of this, it is likely that some locations will be too windy for certain uses, simply because of how windy the site is.

Pedestrian level wind conditions around the site are expected to be acceptable for use as a main public accessway, but amelioration techniques as discussed above will be required to ensure the retail areas are fit for purpose, particularly where outdoor dining is being considered.

Additional advice on these matters can be given once the detailed design has commenced.

TABLES

TABLE 2
SUMMARY OF LAWSON CRITERIA

Comfort (maximum of mean or gust-equivalent-mean (GEM[1]) wind speed exceeded 5% of the time)		
< 4 m/s	< 9 mph	Pedestrian Sitting (considered to be of long duration)
4 - 6 m/s	9 - 13 mph	Pedestrian Standing (or sitting for a short time or exposure)
6 - 8 m/s	13 - 18 mph	Pedestrian Walking
8 - 10 m/s	18- 22 mph	Business Walking (objective walking from A to B or for cycling)
> 10 m/s	> 22 mph	Uncomfortable
Distress (for safety assessment)		
15 m/s	34 mph	not to be exceeded more than two times per year (or one time per season)

Note:

1. The gust-equivalent-mean (GEM) is the peak gust wind speed divided by 1.85.

TABLE 2

SUMMARY OF WIND EFFECTS ON PEOPLE

Description	Beaufort Number	Mean Speed (mph)	Mean Speed (m/s)	Effects
Calm, light air	0, 1	0–3	0–2	Calm, no noticeable wind.
Light breeze	2	4–7	2–3	Wind felt on face.
Gentle breeze	3	8–12	3–5	Wind extends light flag. Hair is disturbed. Clothing flaps
Moderate breeze	4	13–18	5–8	Raises dust, dry soil, and loose paper. Hair disarranged.
Fresh breeze	5	19–24	8–11	Force of wind felt on body. Drifting snow becomes airborne. Limit of agreeable wind on land.
Strong breeze	6	25–31	11–14	Umbrellas used with difficulty. Hair blown straight. Difficult to walk steadily. Wind noise on ears unpleasant. Windborne snow above head height (blizzard).
Near gale	7	32–38	14–17	Inconvenience felt when walking.
Gale	8	39–46	17–21	Generally impedes progress. Great difficulty with balance in gusts.
Strong gale	9	47–54	21–24	People blown over by gusts.

Note: Table from Penwarden and Wise [1975].

* Area emissions are from sources located on the project site, such as natural gas combustion for heating/cooling, maintenance equipment, consumer product use, etc.

Daily emissions of ROG and NOx were calculated under Summer conditions when ambient ozone concentrations are highest. Daily emissions of CO, PM10 and PM2.5 were calculated under winter conditions when associated ambient concentrations are highest.

SOURCE: MACTEC

Note:

1. Number of truck trips making deliveries, and number of truck trips required for materials removal, see assumptions for trip details.
2. Back up equipment is kept onsite to minimize downtime if a piece of equipment breaks down and needs replacement. Typically this equipment will not be used on a day to day basis.
3. It should be assumed that all Man Lifts referenced in the "Construction Equipment" columns will be propane or electric powered.
4. Hunters Point and Candlestick Point will each utilize a new dedicated crushing plant located near the Bay. The crushing plants will be comprised of 1 loader, 1 hammer, 1 screener, 1 crusher and an adjacent batch plant. Each crushing plant will operate ½ time.

(2) = Number of pieces of specified equipment.

Changed since latest version of the table

Assumptions

Max. number of round trips to be performed by 1 haul truck is 4 which = 8 total trips

Each truck will be able to carry 20 tons of material

Personal vehicle trips to and from the construction site were not included in the truck trip calculations and are estimated to be 1 trip for every 2 workers as incentives will be offered for use of mass transit and car/van pooling.

Import fill will be brought onto the site through two primary modes; Trucks (60%) and Barge (40%).

Quantities do not account for concurrent remediation work occurring at Hunters Point Shipyard.

1 Introduction

At the request of Post, Buckley, Schuh & Jernigan, Inc. (PBS&J), ENVIRON International Corporation (ENVIRON) has performed four ambient air quality (AAQ) human health risk assessments (HHRA) as part of the Environmental Impact Report (EIR) for the proposed Candlestick Point – Hunters Point Shipyard Phase II Development Plan ("Project"). The EIR for the Project is being prepared by PBS&J on behalf of the San Francisco Redevelopment Agency and the San Francisco Planning Department.

The Project will consist of the development of approximately 702-acre area east of U.S. 101 in the southeast area of the City and County of San Francisco and will occupy the waterfront area from south of India Basin to Candlestick Cove. The Project is comprised of two major sub-components: Candlestick Point (CP) and Hunters Point Shipyard (HPS) Phase II.

Details of the Project are described in Chapter II of the EIR. The Project proposed by Lennar Urban includes a mixed-use community with a range of residential, retail, office, research and development, civic and community uses, and parks and recreational open space. In addition, a major component would be a new stadium for the San Francisco 49ers, a National Football League (NFL) team. Necessary infrastructure improvements (including several roadway modifications) are also proposed in support of the Project development plan.

The EIR also examines variants to the Project:

- Variant 1 would include an additional 2.5 million gross square footage (gsf) of research and development space on the proposed stadium site. All other elements of the Project would remain the same.
- Variant 2 would redistribute 1,350 residential units to the proposed stadium site from Candlestick Point. All other elements of the Project would remain the same.
- A third variant (Variant 3) would include the same land use program and overall description as the Project, with different locations for the residential towers.
- Variant 4 is the same overall development plan as the Project, but with minor shifts in building locations to accommodate 570,000 gsf for the proposed utility systems (with 330,000 gsf located below ground).
- Variant 5 assumes that a new stadium would be constructed and shared between the San Francisco 49ers and the Oakland Raiders football teams. The land use program would remain the same as the proposed Project.

Chapter IV of the EIR analyzes these Variants. Evaluation of the variants in the EIR allows for consideration and approval of these variants without further environmental review.

ENVIRON conducted four AAQ HHRAs in support of the EIR for the Project, as follows:

1. **Human Health Risk Assessment of Construction-Related Diesel Particulate Matter:** This HHRA included evaluation of the potential health effects associated with exposure to diesel particulate matter (DPM) that may be emitted during Project-related construction activities.

2. **Human Health Risk Assessment of Chemicals Bound to Airborne PM_{10}:** This HHRA included an evaluation of the potential health effects associated with potential exposures to chemicals bound to particulate matter (PM) with a mean diameter of 10 microns or less (PM_{10}) released from soils during Project-related construction activities. Those chemicals present in soil dusts at concentrations above the residential cleanup goal are evaluated.

3. **Analysis of Toxic Air Contaminant Emissions from Stationary Sources in Research and Development Areas:** This HHRA involved a screening-level prospective analysis to evaluate potential health impacts from future stationary sources of toxic air contaminant (TAC) emissions in the areas designated for research and development (R&D) within the proposed Project.

4. **$PM_{2.5}$ Analysis of Traffic/Vehicular Emissions**: This HHRA included an evaluation of the potential health impacts associated with concentrations of particulate matter (PM) with a mean diameter of 2.5 microns or less ($PM_{2.5}$) along major thoroughfares in the vicinity of the Project due to Project-related traffic.

The HHRAs performed by ENVIRON have been conducted in accordance with the California Environmental Quality Act (CEQA) and were prepared using information obtained from PBS&J and Lennar Urban.

The HHRAs are presented in four separate attachments to this main report, as identified below. Attachment V presents documentation of the meteorological data used in the air dispersion modeling component of the four AAQ HHRAs. The methods used in each HHRA as well as the findings from each analysis are summarized below.

Since the HHRAs were completed, changes were made to the Project Description including the addition of roadway improvements on Ingerson and Jamestown Avenues, compaction of Candlestick Point construction schedule (completion in 2026), and slight changes to the Candlestick Point phasing boundaries. These changes to the Project Description were found not to change the HRA conclusions significantly, as documented in a technical memorandum included in Attachment VI. In addition to the above changes, Variant 4 (a new stadium constructed and shared between the San Francisco 49ers and the Oakland Raiders football teams) has been renumbered Variant 5; with a new Variant 4 (the Utilities Variant) which proposes centralized wastewater facilities, heating and cooling plants, and a transvac system for trash (tubes). This new Variant 4 includes 527,000 gsf of new development most of which is underground.

2 Analysis of Construction Equipment Emissions

ENVIRON performed an HHRA to evaluate the potential human health effects associated with potential exposure to DPM that may be emitted during construction activities related to the Project. The full HHRA is included as Attachment I.

2.1 Methodology

The methods used in the analysis of DPM emissions from Project-related construction emissions are consistent with CEQA guidelines and Bay Area Air Quality Management District (BAAQMD), California Environmental Protection (Ca/EPA) and United States Environmental Protection Agency (USEPA) risk assessment guidance. The HHRA incorporates conservative (i.e., health-protective) methodologies for the following: 1) the estimation of DPM emissions, 2) the calculation of airborne DPM concentrations at receptor locations, and 3) the estimation of excess lifetime cancer risks and noncancer health effects or hazard indices (HIs).

ENVIRON estimated DPM emissions for construction equipment associated with the Project construction activities. Construction activities considered in this evaluation include abatement, demolition, grading, excavation, and foundation and structure construction. Specifically, construction sources of DPM evaluated in this HHRA included off-road construction equipment such as lifts, loaders, excavators, dozers, and graders. ENVIRON also evaluated three types of vehicle traffic in this DPM construction HHRA:

- Equipment and material delivery,
- Spoils and debris hauling, and
- Construction employee commute.

Airborne DPM concentrations were then estimated at receptor locations using the DPM emissions estimates and the USEPA recommended air dispersion model American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD) version 07026.

Offsite receptors evaluated in this HHRA included residents (child and adult), workers and sensitive receptors (school children) located in the surrounding community and along the expected travel routes of on-road delivery and haul trucks. Onsite receptors evaluated in this HHRA included residents at the Alice Griffith Housing area. As stated in the Chapter II of the EIR, the proposed Project includes rebuilding Alice Griffith Housing to provide one-for-one replacement units and ensuring that eligible Alice Griffith Housing residents have the opportunity to move to the new, upgraded units directly from their existing Alice Griffith Housing units without having to relocate to any other area. Based on the proposed plan outlined in the EIR, it is anticipated that construction activities within the Alice Griffith Housing area will be phased by parcel. While construction occurs at one parcel, residents will continue to reside at the remaining parcels. These residents were identified as onsite receptors for the Project.

Based on the results of the exposure evaluation and air dispersion modeling, ENVIRON developed quantitative estimates of excess lifetime cancer risks and noncancer HIs associated with potential exposure to DPM that may be emitted during construction activities related to the Project. The methods used to estimate excess lifetime cancer risks and noncancer HIs are consistent with risk assessment guidance from BAAQMD, Cal/EPA and USEPA.

In accordance with CEQA, the cancer risks and chronic noncancer HIs estimated in this HHRA were then compared to the BAAQMD CEQA thresholds of significance. Pursuant to BAAQMD *CEQA Guidelines* (BAAQMD 1999), projects that expose the public to TACs in excess of the following thresholds would be considered to have a significant air quality impact:

- Probability of contracting cancer for the maximally exposed individual (MEI) exceeds 1×10^{-5} (10 in a million);
- Ground level concentrations of noncarcinogenic TACs resulting in a Hazard Index greater than 1 for the MEI.

2.2 Findings

The results of this HHRA indicate that potential excess lifetime cancer risks to offsite residents, workers and sensitive receptors in areas surrounding the Project are below 10 in a million for DPM emitted from construction activity, assuming that certain mitigation measures are implemented as discussed in Attachment I. Further, estimated cancer risks for onsite residents at the Alice Griffith Housing area are also below 10 in a million. The estimated chronic noncancer hazard indices are below one for all receptors evaluated in this HHRA. Thus, based on the results of this HHRA, DPM emission related to Project construction activities should not have a significant air quality impact according to BAAQMD CEQA Guidelines (BAAQMD 1999).

The many conservative assumptions that have been used in this assessment regarding the estimation of emissions, ambient air concentrations, exposure assumptions, and carcinogenic potency lead to an overestimate of potential risks, the magnitude of which could be substantial.

A screening-level analysis was conducted to evaluate the potential impacts of changes to the Project Description on the HHRA conclusions. This screening-level analysis is described in Attachment VI: Technical Memorandum, Updated Project Description. Using this screening approach, the estimated excess lifetime cancer risks and chronic noncancer HIs for all receptors are below the BAAQMD CEQA thresholds of significance, and therefore, the impact from these emissions remains less than significant.

3 Analysis of Airborne Soils

ENVIRON performed a HHRA to evaluate the potential human health risks due to potential exposure to chemicals that may be present in airborne soils (dusts) emitted during Project-related construction activities. The full HHRA is included as Attachment II.

3.1 Methodology

The methods used in the analysis of soil dust emissions from Project-related construction activities are consistent with CEQA guidelines and BAAQMD, Ca/EPA, and USEPA risk assessment guidance. The dusts evaluated are referred to as PM_{10}, that is, PM with a mean aerodynamic diameter of 10 microns or less. PM_{10} corresponds to particles of a size that could be inhaled and retained in the lungs.

Conservative (i.e., health-protective) methodologies were applied for the following: 1) the estimation of PM_{10} emissions from soils, 2) the calculation of airborne PM_{10} and associated chemical concentrations at receptor locations, and 3) the estimation of excess lifetime cancer risks and noncancer health effects or HIs.

The sources of PM_{10} emissions evaluated were demolition and soil grading activities associated with Project construction activities. Those Project areas where PM_{10} emissions were from soils with chemicals present at concentrations above residential cleanup goals were included in the evaluation. Airborne PM_{10} concentrations were estimated at receptor locations using the PM_{10} emissions estimates and the USEPA recommended air dispersion model AERMOD version 07026. Chemical concentrations associated with the airborne PM_{10} were estimated based on the chemical concentrations in soils, referred to as the soil source terms.

Offsite receptors evaluated in the HHRA included residents (child and adult), workers, and sensitive receptors (school children) located in the surrounding community. Onsite receptors evaluated included residents at the Alice Griffith Housing area. As discussed in Section 2.1, it is anticipated that construction activities within the Alice Griffith Housing area will be phased by parcel. While construction occurs at one parcel, residents will continue to reside at the remaining parcels.

Inhalation exposures were quantitatively evaluated for all receptors. In addition, a sensitivity analysis – referred to as a multipath analysis – was conducted for specific chemicals to evaluate the potential contribution of other (noninhalation) exposure pathways. Specifically, airborne dusts released during construction activities could deposit on soils such that exposures could also occur through other pathways (i.e., incidental ingestion of and dermal contact with soil for all receptors, and for residents, ingestion of produce grown in residential gardens).

Based on the results of the exposure evaluation and air dispersion modeling, ENVIRON developed quantitative estimates of excess lifetime cancer risks and noncancer HIs associated with potential exposures to chemicals bound to PM_{10} emitted during construction activities. The methods used to estimate excess lifetime cancer risks and noncancer HIs are consistent with risk assessment guidance from BAAQMD, Cal/EPA, and USEPA. The estimated cancer risks and chronic noncancer HIs were then compared to the BAAQMD CEQA thresholds of significance presented in Section 2.1.

3.2 Findings

The results of this HHRA indicate that potential excess lifetime cancer risks to offsite residents, workers, and sensitive receptors surrounding the Project are below 10 in a million for inhalation exposures to chemicals bound to PM_{10} emitted during construction activities. Further, estimated cancer risks for onsite residents at the Alice Griffith Housing area are below 10 in a million. The estimated chronic noncancer HIs are below one for all receptors evaluated. Thus, based on the results of this HHRA, PM_{10} emissions related to Project construction activities should not have a significant air quality impact according to current BAAQMD CEQA Guidelines (BAAQMD 1999).

The results of the sensitivity analysis for cumulative exposures from inhalation and noninhalation (i.e., incidental ingestion of and dermal contact with soil for all receptors, and for residents, ingestion of produce grown in residential gardens) exposure pathways indicate that the estimated cancer risks and noncancer HIs are below BAAQMD thresholds for all populations evaluated.

A screening-level analysis was conducted to evaluate the potential impacts of changes to the Project Description on the HHRA conclusions. This screening-level analysis is described in Attachment VI: Technical Memorandum, Updated Project Description, which indicates that at the MEI worker, resident adult and resident child the estimated excess lifetime cancer risks continue to be below the threshold of 10 in a million (1.0×10^{-5}) and the noncancer chronic HIs and acute HIs are below the threshold of 1.0. The estimated excess lifetime cancer risks and chronic and acute noncancer HIs for all receptors are below the BAAQMD CEQA thresholds of significance, and therefore, the impact from these emissions remains less than significant.

4 Analysis of Operational Sources

ENVIRON performed a prospective screening-level analysis to evaluate potential health impacts from operational sources of TACs which may locate in the areas designated for R&D within the Project. The full analysis included as Attachment III.

4.1 Methodology

For this prospective screening-level analysis, ENVIRON made a series of assumptions:

- A wide range of stationary sources could operate in the R&D area; thus, the identity and amounts of the TACs emitted from these sources can not be determined at this time.
- The area designated for proposed R&D development would be divided into one-acre plots, which is consistent with the minimum size of a parcel based on the expected land uses within the R&D parcels.
- A single R& D facility (or stationary source) would be constructed on the one-acre plot.
- The cancer risk at the boundary of each one-acre plot was set not to exceed a designated cancer risk level or chronic noncancer HI threshold.
- It was conservatively assumed that all receptor locations surrounding the R&D area were residential.

Evaluation of the impacts associated with stationary sources consisted of two (2) steps:

1.) TAC emissions for each stationary source within a one-acre plot were estimated assuming that the cancer risk and HI at the plot boundary corresponded to 5 in a million and 0.5, respectively.

2.) TAC emissions from each stationary R&D source were summed to assess the cumulative impact of all potential stationary sources within the area designated for R&D development on the surrounding community.

Pursuant current BAAQMD *CEQA Guidelines* (BAAQMD 1999), projects that expose the public to TACs in excess of the following thresholds would be considered to have a significant air quality impact:

- Probability of contracting cancer for the MEI exceeds 1 x 10^{-5} (10 in a million);
- Ground level concentrations of noncarcinogenic TACs resulting in a HI greater than 1 for the MEI.

4.2 Findings

This analysis presents a conservative assessment of the cumulative excess lifetime cancer risk and chronic noncancer HI due to TAC emissions from the R&D areas at any surrounding receptor location. All receptors were initially evaluated as residential receptors. It assumes that each allowable location for TAC emissions will emit chemicals at the maximum allowable rate. In fact, the TAC emissions at some of these locations will be below the maximum rate (for example office building emissions for TAC would be zero or close to zero), and the resultant cumulative risks will also be lower.

Under this conservative evaluation, there are limited areas outside of the R&D areas that would exceed the proposed BAAQMD thresholds if they were residential locations. However, none of these areas are designated for residential land use in the proposed Project. If these areas were used for commercial or recreational land use, the frequency and duration of potential exposures would be less than that for a resident. Thus, the estimated risks and HIs would decrease below the proposed thresholds.

Further evaluation may be warranted if land use in the vicinity of the Project is modified or if the placement of the stationary sources does not conform to the assumptions made in this screening-level analysis.

5 Analysis of $PM_{2.5}$ Concentrations

ENVIRON performed an evaluation of $PM_{2.5}$ concentrations due to Project-associated traffic. The evaluation of potential health impacts from $PM_{2.5}$ is not required under current CEQA guidelines~~, but was performed in response to guidance developed by the San Francisco Department of Public Health (SFDPH)~~. The complete evaluation is included as Attachment IV.

5.1 Methodology

The methods used in the analysis of $PM_{2.5}$ emissions from Project-related traffic are consistent with guidance of the San Francisco Department of Public Health (SFDPH). As discussed in Attachement IV, based on guidance from the US Environmental Protection Agency, Bay Area Air Quality Management District, and SFDPH, a $PM_{2.5}$ action level of 0.2 microgram per cubic meter [µg/m^3] was chosen as a conservative action level for judging significance in this analysis. ~~The SFDPH is concerned that individuals who live in the proximity of heavily-travelled roads or freeways will incur adverse health effects as a result of exposure to vehicle emissions. To minimize contributions to health impacts associated with locating new residential projects near roadway "hot spots", the SFDPH developed a strategy to assess and mitigate air pollution at these locations. Their strategy is based on the use of an annual average threshold concentration of $PM_{2.5}$ (0.2 microgram per cubic meter [µg/m^3]) within a 150 meter zone of a new project as a means of assessing the potential for concern. The threshold concentration of $PM_{2.5}$ is meant to serve as a health-protective "proxy" or surrogate for pollutant exposures from vehicles i.e., $PM_{2.5}$ is not the only pollutant of concern. Instead, the $PM_{2.5}$ threshold serves as a concentration meant to protect the health of residents from all vehicle-associated emissions from a project.~~

Emissions from vehicle exhaust, tire wear, and brake wear were estimated using emission factors generated using the most recent version of the EMission FACtor model (EMFAC), developed by the California Air Resources Board (ARB). Vehicle volumes were estimated from the traffic report, prepared by the CHS Consulting Group.

The concentration of $PM_{2.5}$ from vehicular emissions was characterized by developing exposure point concentrations at residential receptors surrounding the thoroughfares and roadways evaluated: Third Street; Innes Avenue/Hunters Point Boulevard /Evans Avenue; Palou Avenue; Gilman Avenue/Paul Avenue; and Harney Way. Those thoroughfares were identified in the traffic report as primary or secondary roads which connect the proposed Project site and major arterials to U.S. 101. In addition, Evans Avenue/Hunters Point Boulevard /Evans Avenue, and Harney Way were selected since they were identified as streets with significant truck traffic and thus are expected to yield more $PM_{2.5}$ compared to other roads. Furthermore, Palou Avenue, Gilman Avenue/Paul Avenue were selected since there are residences in the vicinity of these roads where individuals may incur exposure to $PM_{2.5.}$

Annual average airborne concentrations of $PM_{2.5}$ attributable to Project-related traffic emissions were estimated by applying a Gaussian air dispersion model, approved by the USEPA and ARB for use in the environmental documentation of transportation projects. Both free flowing traffic and queuing at intersections were evaluated.

The potential health impacts from Project-associated $PM_{2.5}$ were evaluated by comparing predicted concentrations of $PM_{2.5}$ to the ~~SFDPH PM2.5 threshold~~ action level of 0.2 µg/m^3. The evaluation of potential health impacts from $PM_{2.5}$ is not required under current CEQA guidelines~~, but was conducted to comply with SFDPH guidance~~.

5.2 Findings

Modeled concentrations of $PM_{2.5}$ attributable to Project traffic do not exceed the ~~SFDPH threshold concentration~~ action level of 0.2 µg/m^3. The maximum $PM_{2.5}$ concentration in residential areas is below the 0.2 µg/m^3 action level, indicating that ~~by comparison to the SFDPH threshold,~~ residents in the areas impacted by Project traffic are not expected to experience adverse health effects above the proposed level of significance.

This evaluation utilized a number of conservative assumptions in modeling $PM_{2.5}$ concentrations which provide support for the determination that adverse effects of exposure to $PM_{2.5}$ are not likely.

A screening-level analysis was conducted to evaluate the potential impacts of changes to the Project Description on the HHRA conclusions. As described in Attachment VI: Technical Memorandum, Updated Project Description, $PM_{2.5}$ concentrations in the area surrounding Gilman, Ingerson, Jamestown, and Third Street are not expected to exceed 0.2 ~~micrograms per cubic meter (~~µg/m^3~~)~~ action level~~, the SFDPH threshold (SFDPH 2008)~~. The maximum estimated concentration is 0.15 µg/m^3, which occurs on the northern side of Gilman, near its easternmost end. As the impact from traffic $PM_{2.5}$ remains below the ~~SFDPH threshold~~ action level, the impact from these emissions remains less than significant.

1 Introduction

At the request of Post, Buckley, Schuh & Jernigan, Inc. (PBS&J), ENVIRON International Corporation (ENVIRON) estimated the concentration of particulate matter (PM) with a mean diameter of 2.5 microns or less ($PM_{2.5}$) in the vicinity of the proposed Candlestick Point (CP) – Hunters Point Shipyard (HPS) Phase II Development Plan ("Project"), and assessed the potential impacts of $PM_{2.5}$ concentrations attributable to Project-related traffic along the thoroughfares and nearby roads. The Project is situated such that there are several major thoroughfares which Project-related traffic would use to access neighboring freeways and other areas of San Francisco. Estimates for the Project-associated traffic, including average speeds, on each of these thoroughfares were taken directly from the traffic report (CHS Consulting Group et al. 2009) developed in support of the Environmental Impact Report (EIR).

1.1 Objectives and Methodology

The objective of this assessment is to estimate Project-related concentrations of $PM_{2.5}$ along major roadways in the vicinity of the Project, and to examine the potential health affects associated with these concentrations.

$PM_{2.5}$ from vehicle exhaust, tire wear, and brake wear were estimated using emission factors generated using the most recent version of the EMission FACtor model (EMFAC), developed by the Air Resources Board (ARB). On December 12, 2008, ARB adopted an On-Road Heavy-Duty Diesel Vehicles (In-Use) Regulation which affects exhaust emission for vehicles larger than 14,000 pounds gross vehicular weight. EMFAC 2007, the most recent EMFAC version, does not yet include impacts for the new ARB Regulation, therefore, ENVIRON used the emission reduction estimates developed for the ARB rulemaking process in order to evaluate the impacts of the new Regulation. Vehicle volumes were estimated from the traffic report (CHS Consulting Group et al. 2009).

The concentration of $PM_{2.5}$ from vehicular emissions was characterized by developing exposure point concentrations at residential receptors surrounding the thoroughfares evaluated. This analysis was conducted by estimating the average annual airborne concentrations of $PM_{2.5}$ expected to result from Project-related traffic emissions, and by conducting air dispersion modeling of those emissions. A Gaussian air dispersion model, approved by the United States Environmental Protection Agency (USEPA) and ARB for use in the environmental documentation of transportation projects, was used to estimate ambient air concentrations. Both free flowing traffic and queuing at intersections were evaluated.

The potential health impacts from Project-associated $PM_{2.5}$ were evaluated by comparing predicted concentrations of $PM_{2.5}$ to ~~the San Francisco Department of Public Health (SFDPH 2008) $PM_{2.5}$ threshold of~~ a 0.2 microgram per cubic meter (μg/m^3) action level. The evaluation of potential health impacts from $PM_{2.5}$ is not required under current CEQA guidelines. The analysis~~, but~~ was conducted in accordance with methods ~~to comply with~~ presented by the San

Francisco Department of Public Health (SFDPH) in their 2008 guidance ~~(2008). The SFDPH (2008) $PM_{2.5}$ threshold is documented in~~:

- SFDPH. 2008. *Assessment and Mitigation of Air Pollutant Health Effects from Intra-urban Roadways: Guidance for Land Use Planning and Environmental Review*. May 6.

1.2 Report Organization

This report is divided into eight sections as follows:

Section 1.0 – Introduction: describes the purpose and scope of this assessment and outlines the report organization.

Section 2.0 – Background: presents a description of the Project and provides the regulatory background.

Section 3.0 – Chemical Selection: describes the selection of the chemical evaluated in this Attachment.

Section 4.0 –Estimated $PM_{2.5}$ Concentrations in Air: discusses the methods used to estimate emissions of $PM_{2.5}$, including a description of the emission sources, the air dispersion model used to predict $PM_{2.5}$ concentrations, meteorological data, building and terrain considerations, land use analysis, identification of receptor locations, and results of the modeling.

Section 5.0 –Risk Characterization: presents a comparison of Project-associated $PM_{2.5}$ concentrations to the ~~SFDPH threshold concentration~~0.2 $\mu g/m^3$ action level.

Section 6.0 –Conclusions: summarizes the results of this assessment.

Section 7.0 –Uncertainty: discusses the different sources and types of uncertainties in this assessment.

Section 8.0 –References: includes all references cited in this report.

2 Background

2.1 Project Description

Details of the Project have been provided in the Project Description included in Chapter II of the EIR prepared by PBS&J. Based on information provided in this source, the Project will consist of the development of two areas collectively referred to as the Candlestick Point- Hunters Point Shipyard Phase II Development Plan (the "Project"). The description of the Project is organized under two major sub-components: Candlestick Point (CP) and Hunters Point Shipyard Phase II (HPS Phase II). The Project comprises an approximately 702-acre area shown on Figure 2-1 and Figure 2-2. The Project proposed by Lennar Urban includes a mixed-use community with a range of residential, retail, office, research and development, civic and community uses, and parks and recreational open space. In addition, a major component would be a new stadium for the San Francisco 49ers, a National Football League (NFL) team. Necessary infrastructure improvements (including several roadway modifications) are also proposed in support of the Project development plan, as shown on Figure 2-2.

A summary of the Project for the CP and HPS Phase II development are provided separately below. A more detailed discussion of the Project is included in Chapter II of the EIR.

Candlestick Point: This area is approximately 281 acres in size. Current land use in the CP area includes Candlestick Park stadium, and associated parking lots and access roadways. The area also includes several vacant privately owned parcels that are used primarily for stadium parking. Acquisition of these parcels is anticipated as part of the Project. Approximately 120 acres of the 154-acre Candlestick Point State Recreation Area (SRA) is also included within the Project and forms the south and east shoreline boundary.

The proposed Project for CP includes site preparation activities, including abatement, demolition of existing structures, and grading, and construction of residential units, parks and open space, retail space, community services, office space, hotel accommodations, and a performance arena. The development plan also includes a rebuild of Alice Griffith Housing which will provide upgraded units to existing residents.

Hunters Point Shipyard Phase II: The HPS Phase II area comprises 421 acres (dry-land) on the former Navy Parcels B, C, D and E. Navy Parcel F comprises approximately 440 acres of submerged lands in San Francisco Bay surrounding the central portion of the HPS Phase II area to the north, east and south. The entire HPS Phase II area is currently under the jurisdiction of the Navy. The HPS Phase II area includes many structures associated with ship repair, piers, dry-docks, storage, administrative, and other former Navy uses, largely from the World War II era. Most structures are vacant, although several former Navy buildings are currently leased and occupied. Current tenants at the HPS Phase II area include an estimated 252 artists located in studios on Parcels A and B, and a San Francisco Police Department (SFPD) facility on Parcel D-1 in Building 606. The proposed Project plan for this area includes new residential units, parks and open space, research and development (R&D), community services, artist studios and centers, neighborhood retail, and a new stadium for the San Francisco 49ers, a National Football League team. The stadium parking plan will accommodate parking for stadium events and will serve public recreational uses.

The EIR also examines variants to the Project:

- Variant 1 would include an additional 2.5 million gross square footage (gsf) of research and development space on the proposed stadium site. All other elements of the Project would remain the same.
- Variant 2 would redistribute 1,350 residential units to the proposed stadium site from Candlestick Point. All other elements of the Project would remain the same.
- A third variant (Variant 3) would include the same land use program and overall description as the Project, with different locations for the residential towers.
- Variant 4 assumes that a new stadium would be constructed and shared between the San Francisco 49ers and the Oakland Raiders football teams. The land use program would remain the same as the proposed Project.

Chapter IV of the EIR analyzes these Variants. Evaluation of the Variants in the EIR allows for consideration and approval of these variants without further environmental review.

2.2 Surrounding Area

The Project comprises an approximately 702-acre area east of U.S. 101 in the southeast area of the City and County of San Francisco and occupies the waterfront area from south of India Basin to Candlestick Cove (Figure 2-1 and Figure 2-2).

The CP area is immediately east of Executive Park, with the Bayview neighborhood to the north, the HPS Phase II to the northeast, and Candlestick Point State Recreation Area (SRA) along the Bay frontage generally to the east (Figure 2-1). The CP area is generally bounded by Hawes Street to the northwest and Jamestown Avenue to the southwest, the Candlestick Cove and South Basin areas of the Bay are to the south and east, respectively.

The HPS Phase II area is to the southeast of the Bayview Hunters Point neighborhood. As shown in Figure 2-1, the HPS Phase II area is generally bounded by San Francisco Bay to the north, east, and south. The south end of the western boundary extends from Yosemite Slough along Arelious Walker Drive to approximately Crisp Road, excluding the University of California San Francisco (UCSF) property. The northern boundary generally extends along Crisp Road and Spear Avenue. The northernmost end of the HPS Phase II area is contiguous with Earl Street.

Figure 2-3 shows the zoning information, obtained from the City of San Francisco, for areas in the immediate vicinity of the Project. To the west of the Project, the city areas are zoned mixed use residential and industrial. The area to the south is zoned for commercial or industrial use. The Project Area is bordered by the San Francisco Bay to the north and east.

2.3 Regulations and Guidance

The SFDPH (2008) has developed guidance for $PM_{2.5}$ that draws on a broad regulatory framework and a comprehensive body of scientific literature that has established strong correlations between $PM_{2.5}$ exposures and a number of adverse health effects. For example, under the Clean Air Act (USEPA), 1990, the USEPA regulates PM as a criteria air pollutant (USEPA, 2009), and has established national ambient air quality standards (NAAQS) for both particulate matter with a diameter less than ten microns (PM_{10}) (150 μg/m^3)[1] and $PM_{2.5}$ (15 or 35 μg/m^3)[2]. The State of California also regulates PM, and has ambient air quality standards (AAQS) for PM_{10} (20 or 50 μg/m^3)[3] and $PM_{2.5}$ (12 μg/m^3)[4] (ARB 2005a). ~~Of particular concern to the SFDPH is that $PM_{2.5}$ appears to have health effects below the NAAQS and AAQS as described by ARB (2008a) in their most recent examination of the relationship between particulate matter exposures and premature mortality.~~

Another information source that is key to the SFDPH guidance (SFDPH 2008) is ARB's 2005 guidance for land use planning (ARB 2005b). That guidance recommends against locating "sensitive land uses, including residential development" within 500 feet of a highway traveled by more than 100,000 vehicles a day (ARB 2005b). (The ARB guidance also addresses the location of sensitive land uses in the vicinity of distribution centers, railyards, and ports, but these sources are not of direct concern to the Project and are not addressed further.)

The SFDPH guidance was also developed to support compliance with the California Environmental Quality Act (CEQA), and to address specific goals of the City of San Francisco's General Plan which include:

> " …to reduce the level of pollutants in the air, to protect and improve public health, welfare, and quality of life…" (SFDPH 2008).

---

[1] This is a 24-hour concentration that is not to be exceeded more than once per year on average over three years (USEPA 2009).

[2] 15 μg/m^{3}is an annual arithmetic mean concentration. Attainment is achieved if the three-year average of the weighted annual mean $PM_{2.5}$ concentrations from a single or multiple community-oriented monitors must not exceed 15.0 μg/m^3 (USEPA 2009). 35 μg/m^3 is a 24-hour concentration. Attainment is achieved if the three-year average of the 98th percentile of 24-hour concentrations at each population-oriented monitor within an area does not exceed 35 μg/m^3 (USEPA 2009)

[3] 20 μg/m^3 is an annual arithmetic mean concentration of PM_{10}; 50 μg/m^3 is the 24-hour annual arithmetic mean concentration of PM_{10} (ARB 2005a).

[4] 12 μg/m^3 is an annual arithmetic mean concentration of $PM_{2.5}$ (ARB 2005a).

2.3.1 Development of an ~~SFDPH Criterion~~Action Level for $PM_{2.5}$

~~The SFDPH is concerned that individuals who live in the proximity of heavily-travelled roads or freeways will incur adverse health effects as a result of exposure to vehicle emissions. To minimize contributions to health impacts associated with locating new residential projects near roadway "hot spots", the SFDPH developed a strategy to assess and mitigate air pollution at these locations. Their strategy is based on the use of an annual average threshold concentration of $PM_{2.5}$ (0.2 µg/m^3) within a 150 meter zone of a new project as a means of assessing the potential for concern. The threshold concentration of $PM_{2.5}$ is meant to serve as a health-protective "proxy" or surrogate for pollutant exposures from vehicles i.e., $PM_{2.5}$ is not the only pollutant of concern. Instead, the $PM_{2.5}$ threshold serves as a concentration meant to protect the health of residents from all vehicle-associated emissions from a project.~~

Health effects of individual chemicals or of a mixture are typically evaluated by the use of a toxicity criterion. However, despite the establishment of NAAQS and AAQS for $PM_{2.5}$, no toxicity criterion has been developed by either the state or federal government. The reasons for this are complex, and are related both to how these criteria are developed, as well as the properties of $PM_{2.5}$. That is, toxicity criteria are typically derived for a chemical based on standardized exposures to known concentrations or doses of the material; effects (if any) can then be correlated to a specific quantity. However, for $PM_{2.5}$, its toxicity is at least partially dependent on the mixture of metals, polynuclear aromatic hydrocarbons (PAHs), volatile organic compounds (VOCs) or other chemicals sorbed to the surface of the particulate. This heterogeneity of $PM_{2.5}$ depends on the source of the particulate, and varies with the fuel type, engine type, dust, etc. that is the source of the $PM_{2.5}$. This variability precludes the derivation of a single representative toxicity criterion. Instead, epidemiologists have examined the relationship between $PM_{2.5}$ concentrations in ambient air and correlated these to effects within a population. Exposure to $PM_{2.5}$ has been linked to an increase in premature mortality, hospitalizations, cardiovascular events, and asthma attacks, among others (see ARB 2008a). The mathematical expression which relates changes in exposure to ambient concentrations of a pollutant, such as $PM_{2.5}$, to changes in an adverse effect such as premature mortality is known as a concentration-response function.

The concentration-response function incorporates a term for relative risk, which describes the incremental increase in effect for a given concentration of a pollutant i.e., a 1.4% increase in the annual incidence of premature mortality per 1.0 µg /m^3 increase in $PM_{2.5}$. The SFDPH criterion for $PM_{2.5}$ of 0.2 µg/m^3 is based on these concepts (SFDPH 2008). The SFDPH (2008) guidance provides specific rationale for selection of the $PM_{2.5}$ threshold concentration as follows:

- "*A threshold of 0.2 µg/m^3 represents about 8-10% of the intra-urban range of PM 2.5 ambient concentration based on available and reliable monitoring data in San Francisco.*
- *A change in ambient concentration of $PM_{2.5}$ by 0.2 µg/m^3, independent of other vehicle pollutants would result in significant forecasted health impacts.*

- *Based on a recent study of intra-urban pollution in Los Angeles, a 0.2 μg/m^3 increase in PM 2.5 would result in a 0.28% increase in non-injury mortality or an increase of about twenty-one excess death per 1,000,000 population per year from non-injury causes in San Francisco (Jerrett et al. 2005). This effect is well above the one-in-a-million lifetime de minimus risk threshold for premature death considered insignificant by most regulatory agencies (Asante-Duah 2002).*
- *Applying the health effects assessment methodology and Concentration Response Functions in the ARB Staff Report on AAQS for PM published in 2002, a 0.2 μg/m^3 increase in $PM_{2.5}$ affecting a population of 100,000 adults would result in about 20 extra premature deaths per year (ARB 2002). This effect is well above the one-in-a-million lifetime de minimus risk threshold for premature death considered insignificant by most regulatory agencies (Asante-Duah 2002).*
- *A 0.2 μg/m^3 increase in $PM_{2.5}$ would also result in ~ 160 days per year with respiratory symptoms, 108 days with work limitations, and 577 days with minor activity limitations in the same adult population."*

The Bay Area Air Quality Management District (BAAQMD) does not currently recommend a threshold of significance for determining impacts associated with localized exposures to $PM_{2.5}$, but is addressing this issue in its draft CEQA guidelines (BAAQMD 2009b). California ARB also has not established a health-protective threshold for $PM_{2.5}$.

The 0.2 ug/m^3 identified level is in accord with proposed CEQA guidelines developed by BAAQMD for $PM_{2.5}$.[5] According to BAAQMD, "emissions from a new source or emissions affecting a new receptor would be considered significant where ground-level concentrations of $PM_{2.5}$ from any source would result in an average annual increase greater than 0.3 μg/m^3."[6] This determination is based on the lower range of a US EPA proposed Significant Impact Level (SIL) for stationary sources, which is interpreted by the US EPA as the level of ambient impact that is considered to represent a "significant contribution" to regional nonattainment. The BAAQMD goes on to indicate that the US EPA did not design this threshold for addressing community risks and hazards, but it was designed to protect human public health at a regional level by helping an area to maintain the NAAQS. The BAAQMD determined this SIL to be a reasonable goal at the local scale and, therefore, a useful reference for comparison. The BAAQMD states that this proposed threshold (0.3 μg/m^3) is consistent with the SFDPH threshold of 0.2 μg/m^3. The BAAQMD reached that conclusion based on an ARB report that determined an increase in mortality from a 0.3 μg/m^3 increment of $PM_{2.5}$ was consistent with the estimated increase in

5 Bay Area Air Quality Management District, *California Environmental Quality Act Guidelines Update: Proposed Thresholds of Significance*, December 7, 2009.

6 Bay Area Air Quality Management District, *California Environmental Quality Act Air Quality Guidelines: Proposed Thresholds of Significance*, December 7, 2009, page 43.

mortality assumed by SFDPH in identifying the 0.2 ug/m^3 increment. BAAQMD further states that "On balance, the Air District estimates that the SFDPH threshold and the [District proposed threshold of 0.3 µg/m^3], in combination with the cumulative threshold for $PM_{2.5}$, will afford similar levels of health protection." As discussed at the end of this section, BAAQMD is recommending a cumulative threshold for $PM_{2.5}$ of 0.8 µg/m^3, which is the mid-range US EPA proposed SIL.

Based on these proposed thresholds, the most stringent limit, 0.2 µg/m^3, was chosen as a conservative action level for judging significance in this analysis.

~~2.3.2 Application of SFDPH Criterion for $PM_{2.5}$~~

~~If exposure to $PM_{2.5}$ from Project traffic is below the threshold of 0.2 µg /m^3 (or if traffic exposures are "fully mitigated"), no further analysis of health effects is required (SFDPH 2008). However, if $PM_{2.5}$ concentrations exceed 0.2 µg/m^3, then SFDPH guidance suggests estimating $PM_{2.5}$-related effects on "excess" (or premature) mortality. SFDPH guidance (SFDPH 2008) provides a simplified version of a $PM_{2.5}$ concentration-response function designed to provide a rapid means of estimating excess mortality from $PM_{2.5}$ exposures. The equation suggested by the SFDPH to estimate excess mortality from $PM_{2.5}$ is:~~

~~*Excess Mortality$_{\text{Traffic-attributable PM2.5}}$ = (Concentration$_{\text{Traffic-attributable PM2.5}}$) x (Incidence Non-Injury Mortality) x (Relative Risk$_{\text{PM2.5}}$)*~~ ~~(Eq. 1)~~

~~Where:~~

~~Concentration $_{\text{Traffic-attributable PM2.5}}$~~	~~=~~	~~Concentration of $PM_{2.5}$ generated by Project sources;~~
~~Incidence Non-injury Mortality~~	~~=~~	~~Annual mortality incidence from all non-injury causes; and~~
~~Relative Risk$_{\text{PM2.5}}$~~	~~=~~	~~0.014, or a 1.4% increase in annual mortality incidence per 1.0 µg/m^3 increase in $PM_{2.5}$ (based on Jerrett et al. 2005).~~

3 Chemical Selection

As this analysis follows SFDPH guidance (2008) for evaluating roadways exposure, ~~specifies that while~~ the assessment methodologies contained in that document are specific to $PM_{2.5}$, that $PM_{2.5}$ is used as a "proxy" i.e., as a surrogate, for vehicle-related pollutant emissions and associated exposure to these chemicals. Consistent with this framework, analysis of potential Project-associated emissions focuses solely on $PM_{2.5.}$

4 Estimated $PM_{2.5}$ Concentrations in Air

4.1 Roads Evaluated

The Project is situated such that there are several major thoroughfares which Project-related traffic would use to access neighboring freeways and other areas of San Francisco. The traffic throughputs for roads of potential concern were assessed and determined~~,~~ based upon Project-related traffic volume and expected impact. Those thoroughfares modeled include Third Street, Innes Avenue/Hunters Point Boulevard /Evans Avenue, Palou Avenue, Gilman Avenue/Paul Avenue, and Harney Way. Those thoroughfares are identified in the traffic report as primary or secondary roads which connect the proposed Project site and major arterials to U.S. 101. In addition, Evans Avenue/Hunters Point Boulevard /Evans Avenue, and Harney Way were selected since they have been identified as streets with significant truck traffic and thus are expected to yield more $PM_{2.5}$ compared to other roads. Furthermore, Palou Avenue, Gilman Avenue/Paul Avenue were selected since there are residences in the vicinity of these roads where individuals may incur exposure to $PM_{2.5.}$

4.2 Emissions Estimation

Emission factors and traffic volumes were calculated for each hour of the weekday for all vehicles in order to estimate $PM_{2.5}$ emissions. Weekend traffic conditions were assumed to be the same as weekday conditions. This approach is expected to yield more conservative estimates of $PM_{2.5}$ concentrations, since weekday traffic volumes are generally greater than on the weekend. Three categories of emissions were taken into account: 1) running emissions from exhaust, 2) running emissions from tire wear and brake wear, and 3) idling or queuing emissions from exhaust. There are no emissions of $PM_{2.5}$ during idling (queuing) from tire wear and brake wear.

Information to estimate emissions for the Project-related traffic on each of the modeled thoroughfares, including peak hour traffic volumes, peak hour number of idling cars, and average speeds, was taken directly from the traffic report developed in support of the EIR (CHS Consulting Group et al. 2009).

$PM_{2.5}$ emissions from vehicle exhaust and tire wear and brake wear were estimated using emission factors generated by the ARB's EMFAC 2007 and modified to account for the On-Road Heavy-Duty Diesel Vehicles (In-Use) Regulation (the ARB Regulation, or the Regulation) that was approved by the ARB on December 11, 2008, which affects emissions for vehicles larger than 14,000 pounds gross vehicular weight (ARB 2008b). EMFAC is a mathematical model that was developed to calculate emission rates from motor vehicles that operate on highways, freeways, and local roads in California and is used by ARB to project changes in future emissions of on-road mobile sources. The most recent version of this model, EMFAC 2007, incorporates local motor vehicle data, information and estimates regarding the distribution of VMT by speed, and number of starts per day.

Annual average emission factors were generated using the average temperature and relative humidity for the Project area, as calculated from the meteorological data, discussed in Section 4.6 below. EMFAC allows the estimation of emissions for in-use fleets from 1970 through 2040. The traffic report's future traffic scenario provides estimates of traffic conditions for 2030, and in-use fleet emissions were estimated for that year. EMFAC 2007 does not yet include impacts for the new ARB Regulation mentioned above; therefore, the emission reduction percentage developed for the ARB rulemaking process was applied to the EMFAC-derived emission factors, as discussed below, to account for the impact of the Regulation on project-related emissions.

4.2.1 Emission Factors

Using EMFAC, $PM_{2.5}$ emission factors (in g/vehicle-mile for running emissions, and in g/vehicle-idling hour for idling emissions) were estimated for calendar year 2030 based on the vehicle fleets of San Francisco County for vehicles of all model years. The traffic report (CHS Consulting Group et al. 2009) provided a.m. and p.m. peak hour speeds along about half of the roadway segments modeled; the average peak hour speed was 21.4 miles per hour (mph) with a standard deviation of 2.4 mph. Thus, for all roadway segments, the emission factors corresponding to travel speed of 20 mph (in g/vehicle-mile) were used for running emissions, while emission factors corresponding to 0 mph (in g/vehicle-idling hour) were used for idling emissions.

EMFAC also presents the fraction of trips that each vehicle class makes on roads in San Francisco County at each hour of the weekday. The emission factors from each vehicle class were multiplied by these hourly trip fractions, then summed across all applicable vehicle classes for each hour to estimate hourly emission factors. The applicable vehicle classes for each modeled thoroughfare were determined by whether truck restrictions are designated in the traffic report (CHS Consulting Group et al. 2009). The traffic report identifies truck restrictions that prevent trucks weighing over 6,000 pounds from driving on segments of Gilman Avenue and Palou Avenue (CHS Consulting Group et al. 2009). For these segments, heavy-duty trucks were excluded from the emission factor estimates. For all other roads modeled, the emission factors were used for all vehicle classes and all model years.

Finally, the ratio of the 2025 projected $PM_{2.5}$ emissions under ARB Regulation to the baseline $PM_{2.5}$ emissions without Regulation[7] was used to scale down running emissions for regulated vehicle classes including mid heavy-duty trucks, heavy heavy-duty trucks, school buses, and other buses. For this scaling, the year 2025 was used in absence of 2030 data. Hourly running emission factors in grams per vehicle-mile for all modeled roadway segments are shown in Table 4-1. Since the ARB Regulation is not explicitly applicable to idling emissions, idling emissions were not scaled using the ratio.

[7] The emission inventory was developed by ARB to assist the rulemaking process. http://www.arb.ca.gov/regact/2008/truckbus08/truckbus08.htm

Hourly idling emission factors in grams per vehicle-idling hour for all modeled roadway segments are presented in Table 4-1.

4.2.2 Traffic Volume

Hourly peak a.m. and hourly peak p.m. traffic volumes were obtained for each modeled roadway segment from the traffic report (CHS Consulting Group et al. 2009). As mentioned above, EMFAC generates trips-per-day by vehicle-class by hour for San Francisco. All trips for each hour of the day were summed, and then the hourly trip fractions were calculated. For segments with truck restrictions, the hourly total trips were modified so as to exclude trips made by heavy-duty trucks, then recalculated the hourly trip fractions.

To estimate daily trips, the average of the AM peak hour trips was divided by the appropriate a.m. peak hour trip fraction and the p.m. peak hour trips divided by the appropriate p.m. peak hour trip fraction. To divide the daily trips into hourly trips for each road segment, the segment's daily trips were multiplied by the calculated appropriate hourly trip fractions. For the peak a.m. and peak p.m. hours, the actual estimates from the traffic study were used.

The hourly traffic volumes on all modeled road segments are shown in Table 4-2.

4.2.3 Queuing

Queuing emissions were estimated for all intersections along the modeled thoroughfares, which, according to the traffic report, have traffic signals or stop signs (CHS Consulting Group et al. 2009). Forty-one queues, or locations were identified where vehicles would idle at a traffic signal. No stop signs were identified as affecting traffic on the modeled roads.

To model queuing emissions, the methodology used in CAL3QHCR was followed while employing actual data from the traffic report (CHS Consulting Group et al. 2009). The traffic report provides information by ultimate direction through the intersection: left turn, through, or right turn. To estimate queue emissions per hour for each direction, the following equation was used:

> Queue Emissions (g/hr) = Idling Emission Factor (g/vehicle-hr) x Number of Vehicles Idling (vehicle) x Red & Yellow Phase per Cycle (sec/cycle) x Number of Cycles per Hour (cycle/hr) ÷ 3600 (sec/hr)

The idling emission factors (in g/vehicle-hr) were estimated using the methodology described in Section 4.1.1. For each queue, the number of vehicles idling per direction during the a.m. peak hour and the p.m. peak hour were obtained from the traffic report (CHS Consulting Group et al. 2009). The hourly traffic volumes, calculated as described in Section 4.1.2, were then used to determine the a.m. hour with the maximum number of vehicles. The ratio of hourly traffic volume to this a.m. peak hour traffic volume was then used to estimate the number of vehicles idling per direction during the a.m. hours (hours 24-11). The same approach was used for the p.m. hours (hours 12-23).

The queuing time per cycle was estimated to be equal to cycle time minus duration of the green light presented in the traffic report; this means that cars are assumed to queue during the yellow and red phases. The number of cycles per hour was calculated from the cycle time (seconds/cycle), provided in the traffic report (CHS Consulting Group et al. 2009).

In order to follow the "nominal free flow" methodology as used by CAL3QHCR, the queue emissions were converted from grams per hour to grams per vehicle-mile. The following formula was used for the conversion.

> Queue Emissions (g/vehicle-mile) = Queue Emissions (g/hr) ÷ Hourly Traffic Volume (vehicle/hr) ÷ (Average Queue Length (m) ÷ 1609.344 (m/mile))

The hourly traffic volumes were estimated using the methodology described in Section 4.1.2. The length of the queue in each direction for each hour, according to CAL3QHCR methodology, is estimated to be six meters for each vehicle idling in that direction for the given hour, with a minimum of six meters used. To estimate an average length across the entire day, the hourly queue length was multiplied by the hourly emission factors and summed across all hours. This approach gives queue emissions in grams per vehicle-mile for every hour of the day on all roadway segments, allowing the queuing emissions to be modeled as running emissions.

4.3 Refined Air Dispersion Modeling

The concentration of $PM_{2.5}$ from vehicular emissions was characterized by developing exposure point concentrations at residential receptors surrounding the thoroughfares evaluated. This analysis was conducted by estimating the average annual airborne concentrations of $PM_{2.5}$ that will result from emissions from the Project-related traffic and by conducting air dispersion modeling of those emissions.

To estimate ambient air concentrations, a Gaussian air dispersion model, approved by the USEPA and ARB for use in preparing environmental documentation for transportation projects, was used. CAL3QHCR is a refined version of USEPA's CAL3QHC, which is a multi-source model developed in 1990 to estimate air concentrations of vehicle emissions near roadway intersections. CAL3QHC is based on the same line-source dispersion algorithm used in CALINE3, and CAL3QHCR adds the ability to evaluate multiple-year meteorological observations rather than evaluating only the worst-case meteorological assumptions. CAL3QHCR uses a meteorological data set that incorporates representative hourly surface and twice-daily upper air data for estimating the dispersion of emissions through the atmosphere.

In addition to the observed meteorological data set, the model uses the roadway geometries, receptor locations, vehicular emission factors (from EMFAC), signal timing (if applicable), and intersection configuration. The GIS shapefile developed by the SFDPH for their CAL3QHCR model setup as basis of the SFDPH land use guidance was requested. That shapefile presents roadway geometries, vehicular traffic volume and emission factors. The roadway geometries were used along with refinements (i.e., dividing roads into two directions, adding Project-related vehicular traffic volume and emission factors) whenever applicable in order to estimate $PM_{2.5}$ concentrations due to Project-related traffic.

Annual average concentrations were calculated for all receptors. No differentiation was made for potential differences in daytime versus nighttime traffic, or for daytime and nighttime exposure. Both free flowing traffic and queuing at intersections were evaluated.

4.3.1 Modeled Pollutants and Averaging Periods

$PM_{2.5}$ emissions were modeled using one year of meteorological data. Using those data, a one-year average concentration was calculated.

4.3.2 Modeling Sources

Emissions from all Project-related traffic on the selected thoroughfares was modeled. Those road segments were represented in CAL3QHCR by a series of straight line segments, each with constant height, width, hourly traffic volume, and hourly emission rates. Widths of the segments under consideration were determined from aerial photographs, and heights were set to zero meters as discussed in the terrain section below. For all running emissions, the mixing zone was set to the road width (along the direction of traffic flow) plus three meters on each side to account for wake effects. For all queuing emissions, the mixing zone was set to the road width since there are no wake effects while idling. Tables 4-3 and 4-4 summarize the source parameters used as inputs in CAL3QHCR for running emissions and queuing emissions, respectively. Figures 4-1 and 4-2 show the location of the travel lanes modeled for running emissions and queuing emissions, respectively.

4.3.3 Terrain

The terrain surrounding the selected thoroughfares was evaluated using National Elevation Dataset (NED) files from the United States Geological Survey (USGS). The area is generally flat with roads ranging from three to 50 meters in elevation and surrounding area ranging from three to 80 meters in elevation; the majority of the roads are at elevations between three and 30 meters with only one segment on Palou Avenue rising above 50 meters. CAL3QHCR limits sources to be placed at elevations of ±10 meters, while receptors can be placed at any elevation. Due to the generally flat nature of the area, all sources were modeled at 0 meters with all receptors at 1.8 meters as recommended by CAL3QHCR documentation.

4.3.4 Meteorological Data

Details regarding the meteorological data used for modeling are presented in Attachment V.

4.3.5 Receptor Locations

Residential receptors were evaluated along the modeled thoroughfares~~, as recommended in the SFDPH land use guidance (SFDPH 2008)~~. A three-tiered approach was employed to determine the location of these residential receptors. First two receptor grids were placed alongside the thoroughfares that were modeled: 1) a coarse grid of receptors spaced 50 meters apart positioned from the edge of the mixing area to 250 meters from the roadway and 2) a fine grid consisting of receptors spaced 10-meters from the edge of the mixing area to 50 meters from the roadway. San Francisco zoning maps obtained from the City and County of San Francisco Planning Department[8] were then overlaid on the receptor grids to identify receptors within residential zones. Finally, visual screening was conducted on Google Street View to indentify possible residential buildings in commercial and/or industrial zones. The modeled residential receptors are shown in Figure 4-3. Land use zoning in relation to modeled roads is shown in Figure 4-4. Sensitive receptors, such as schools and hospitals, within one mile of the site were also modeled and are summarized in Table 4-5.

4.4 Results of Emissions Estimations

The results of the dispersion modeling are shown in Figure 4-5. All modeled $PM_{2.5}$ concentrations are at or below 0.2 μg/m^3. The highest modeled concentrations occur at intersections and along roads that do not have a truck restriction. The maximum modeled $PM_{2.5}$ concentration is 0.2 μg/m^3, which occurs on the northern edge of Innes Avenue, west of Arelious Walker Drive. As can also be seen in Figure 4-5, $PM_{2.5}$ concentrations are dominated by running emissions.

[8] City and County of San Francisco Planning Department zoning maps are available at http://www.municode.com/Resources/gateway.asp?pid=14145&sid=5

5 Risk Characterization

Modeled concentrations of $PM_{2.5}$ attributable to Project traffic do not exceed the ~~SFDPH (2008) threshold concentration of~~ 0.2 µg/m³ action level (Figure 4-5). In general, the areas most impacted by Project-associated $PM_{2.5}$ concentrations are major intersections, such as those at 3rd Street and (1) Palou Avenue and (2) Gilman Avenue/Paul Avenue (Figure 4-5). The maximum $PM_{2.5}$ concentration in residential areas is 0.2 µg/m³, which meets the action level discussed previously, indicating that ~~by comparison to the SFDPH (2008) threshold,~~ residents in the areas impacted by Project traffic are not expected to experience adverse health effects above the proposed significance level.

This evaluation utilized a number of conservative assumptions in modeling $PM_{2.5}$ concentrations which provide support for the determination that adverse effects of exposure to $PM_{2.5}$ are not likely. These conservative assumptions include:

- The peak traffic speed emission factor (grams/mile) from EMFAC2007 was used for all traffic. Since the traffic speed during non-peak hours would be expected to yield lower emissions than during peak hours, this approach yielded higher modeled concentrations of $PM_{2.5}$ than using separate emission factors for peak and non-peak times.
- Weekday traffic volumes were assumed to occur 365 days per year. This approach is expected to yield more conservative estimates of $PM_{2.5}$ concentrations, since weekday traffic volumes are generally greater than on the weekend.
- It was assumed that vehicles idle for the entire duration of the yellow and red phases of a traffic light. This results in higher estimated $PM_{2.5}$ concentrations than the more realistic assumption that idling occurs only during some or all of the red light phase.
- The ARB (2008b) regulation for On-Road Heavy-Duty Diesel Vehicles (In-Use) was applied to queuing emissions only. This assumption yields higher concentrations of $PM_{2.5}$ than if the regulation had been applied to operating emissions as well.

6 Conclusions

Project-related traffic is predicted to yield concentrations of $PM_{2.5}$ that do not exceed the 0.2 μg/m^3 action level, ~~SFDPH (2008) concentration threshold for residential uses.~~ The maximum $PM_{2.5}$ concentration in residential areas is below the 0.2 μg/m^3 action level, ~~,~~ indicating that ~~by comparison to the SFDPH (2008) threshold,~~ residents in the areas impacted by Project traffic are not expected to experience adverse health effects above the proposed level of significance.

7 Uncertainties

7.1 Method of Emission Estimation

Emission factors were estimated based on the vehicle fleets of San Francisco County, which may differ than the vehicle mix along the thoroughfares evaluated. EMFAC 2007's emission factors for the year 2030 were used and adjusted to account for the ARB Regulation. To account for the ARB regulation, the expected emissions reductions for the year 2025 were used in lieu of 2030 data. Additionally, the emission factors for 2030 contain uncertainties related to future advances in vehicle technology. Similarly, vehicle volumes were estimated based on the traffic report (CHS Consulting Group et al. 2009), which makes estimates of future Project-related vehicle volumes. As the traffic report results are based on a traffic model that contains uncertainties, the vehicle volumes used also contain uncertainties.

Further, peak hour traffic and peak hour number of idling vehicles from the traffic report were used together with the default hour of day fraction of trips to calculate the hourly traffic volume and hourly idling vehicle volumes. The hour of day fraction of trips for the projected area could differ from the default values provided in EMFAC for 2030 for the San Francisco County, thus bringing additional uncertainties.

Finally, ARB's EMFAC provides weekday trip distribution. Weekday traffic volume and number of idling vehicles from the traffic report were used in this analysis and applied to 365 days of the modeled year. However, weekend traffic conditions could differ significantly from weekday traffic conditions.

Together, all of the uncertainties above influence the emissions estimation.

7.2 Estimation of Exposure Concentrations

There are a number of uncertainties associated with the estimation of $PM_{2.5}$ concentrations from air dispersion modeling of potential emissions from the Project. This section briefly describes some of those uncertainties.

7.2.1 Estimates from Air Dispersion Models

As discussed in Section 4, the USEPA-recommended dispersion model CAL3QHCR was used to estimate annual average $PM_{2.5}$ concentrations due to Project-related traffic at the hypothetical receptor locations. This model uses the Gaussian plume equation to calculate ambient air concentrations from vehicular emission sources. For this model, the magnitude of error for the maximum concentration is estimated to range from 10 to 40% (USEPA 2005a). Therefore, modeled exposure concentrations used in this assessment represent approximate exposure concentrations.

7.2.2 Source Representation

The source parameters (*i.e.*, road elevation and width) used to model emissions are sources of uncertainty. As CAL3QHCR limits source elevations to ±10 meters and as the area is generally flat, road elevations were assumed to be uniformly 0 meters. Widths were estimated using aerial photographs and could contain uncertainties related to human error. Therefore, exposure concentrations used in this assessment represent approximate exposure concentrations.

7.2.3 Meteorological Data Selection

Uncertainty also exists in the meteorological data used in the CAL3QHCR air dispersion model. Onsite meteorological data, which should be representative of the meteorological condition of the modeled roadway segments, was used. However, buildings that are near the roads and which may potentially block some of the winds were not considered. Additionally, CALINE-3, a model on which CAL3QHCR is based, is highly sensitive to extremely low mixing heights (USEPA 1995). Since a 300-meter constant mixing height is used in the metrological data (By Area Air Quality Management District 2009a), some potentially extreme conditions occurring when the mixing height is below 100 meters are lost.

Notes:

1. The emission factors for each vehicle class were extracted from EMFAC2007 and were weighted by default hourly fraction of trip in EMFAC2007 to yield composite hourly emission factors. Detailed discussion of the methodology is presented in Attachment IV section 4.2.
2. Exhaust refers to running emissions from vehicle exhaust; non-exhaust refers to running emissions from tire and brake wear.
3. Exhaust refers to idling emissions from vehicle exhaust; non-exhaust refers to idling emissions from tire and brake wear.
4. The emission factors for all vehicles are used for road segments with no truck restrictions.
5. The emission factors for all vehicles, excluding heavy-duty vehicles, are used for road segments with truck restrictions which forbid trucks over 14,000 lbs. Those emission factors are shown in *italics.*

Abbreviations:

HD: heavy duty vehicle, and refers to vehicles with a gross vehicle rating of 10,001 pounds or more.

Notes:

1. Hourly fraction of trips per day calculated from EMFAC total trips per hour for San Francisco County in 2030 were used to convert AM peak hour and PM peak hour traffic volumes into hourly traffic count. AM and PM peak hour traffic volumes were extracted from the Traffic Report. Detailed discussion of the methodology is presented in Appendix IV section 4.2.

2. The fractions of trips per day, excluding heavy-duty vehicles, are used for segments with truck restrictions which forbid trucks over 14,000 lbs. Those segments with truck restrictions are shown in *italics.*

Abbreviations:
HD: heavy duty vehicle, and refers to vehicles with a gross vehicle rating of 10,001 pounds or more.

Notes:
1. Segments are identified by the bounding intersections, using the intersection numbering developed in Figure 26A of the Traffic Report, and by the direction of traffic flow.
2. CAL3QHCR limits relative elevations to a range of -10 meters to +10 meters. Here, the elevations are fairly flat. Therefore, the site is assigned an elevation of 0 meters.
3. As defined in CAL3QHCR, mixing zone width for a given free flow link is calculated by adding 6 meters to the width of the road. The width of the road is obtained by visual observation of high-resolution aeiral photograph.

Abbreviations:
CAL3QHCR: a steady-state Gaussian dispersion model
UTMx: X coordinate in Universal Transverse Mercator coordinate system, zone 10N
UTMy: Y coordinate in Universal Transverse Mercator coordinate system, zone 10N

Appendix H4 ENVIRON, Community Hazards and San Francisco Health Code Article 38 Analyses Candlestick Point–Hunters Point Shipyard Phase II Redevelopment Project, May 2010

ENVIRON

May 4, 2010

Mr. Michael Rice
Post, Buckley, Schuh & Jerrigan, Inc.
353 Sacramento Street, Suite 1000
San Francisco, CA 94111

Re: Community Hazards and San Francisco Health Code Article 38 Analyses
Candlestick Point–Hunters Point Shipyard Phase II Redevelopment Project

Dear Mr. Rice:

At the request of Post, Buckley, Schuh & Jerrigan, Inc. (PBS&J), ENVIRON International Corporation (ENVIRON) previously conducted four human health risk analyses (HHRAs) in support of the Draft Environmental Impact Report (DEIR) process for the Candlestick Point – Hunter's Point Shipyard Phase II Redevelopment Project ("Project"). These HHRAs included evaluation of Construction Emissions, Airborne Contaminated Soil, Emissions from Stationary Sources and Traffic/Vehicular Emissions. In this letter report, we present three additional evaluations for the Project: 1) an analysis of onsite residential receptors that addresses single source and cumulative community hazard impacts pursuant to the proposed Bay Area Air Quality Management District (BAAQMD) California Environmental Quality Act (CEQA) guidance; 2) at the request of the San Francisco Planning Department, a cumulative analysis of offsite residential receptors; and 3) evaluation of the Project for compliance with *San Francisco Health Code* Article 38.

The remainder of this letter is divided into five sections. Section 1.0 outlines the Project background. Section 2.0 presents the community hazard analysis of single sources on onsite residential receptors. Section 3.0 presents the cumulative analysis of community hazards for onsite residential receptors including source identification and emissions estimation, air dispersion modeling, risk analysis and risk characterization. Section 4.0 presents the cumulative analysis for offsite residential receptors. Section 5.0 describes the evaluation of the Project for compliance with *San Francisco Health Code* Article 38. Section 6.0 summarizes the conclusions from these evaluations.

1.0 Background

Details of the Project have been provided in the Project Description included in Chapter II of the DEIR prepared by PBS&J. Based on information provided in this source, the Project will consist of the development of two areas collectively referred to as the Candlestick Point-Hunters Point Shipyard Phase II Development Plan (the "Project"). The description of the Project is organized under two major sub-components: Candlestick Point (CP) and Hunters Point Shipyard Phase II (HPS Phase II). The Project comprises an approximately 702-acre area.

The Project proposed by Lennar Urban includes a mixed-use community with a range of residential, retail, office, research and development, civic and community uses, and parks and recreational open space. In addition, a major component would be a new stadium for the San Francisco 49ers, a National Football League (NFL) team. Necessary infrastructure improvements (including several roadway modifications) are also proposed in support of the Project development plan.

The Project construction activities are anticipated to occur over an approximately 20 year period, beginning in 2011 and concluding in 2031 with full operation by 2032.

A more detailed discussion of the Project is included in Chapter II of the DEIR.

2.0 Community Hazard Analysis – Single Source

The community hazard analysis addresses single source and cumulative impacts pursuant to proposed BAAQMD CEQA Guidelines ("Draft BAAQMD CEQA Guidelines"). By the time the DEIR was released on November 12, 2009, the BAAQMD had released several versions of draft guidelines and significance thresholds in September 2009, October 7, 2009 (thresholds only), and November 2, 2009. The BAAQMD also released accompanying documents that support the basis for the significance thresholds in October 2009 and November 2, 2009. After release of the Draft EIR, updated draft guidelines were released on December 7, 2009.[1] Throughout the process the significance thresholds and methodology have changed and the BAAQMD continues to evaluate and revise these documents and the recommended approaches used to quantify impacts from a project. The BAAQMD is still conducting public workshops in May 2010 and taking public comment, and it is expected to release revised thresholds and basis documents in advance of the June 2010 Board meeting. For the purpose of this analysis, the December 7, 2009 thresholds and methodologies are used to make significance determinations as well as materials released during public workshops in April 2010.[2]

In the December 7, 2009, guidance[3] and accompanying threshold basis document,[4] the BAAQMD proposed a single source cancer risk, non-cancer hazard index, and $PM_{2.5}$ [particulate matter less than 2.5 microns in diameter] threshold, considering whether new sensitive receptors would be exposed to Toxic Air Contaminants (TACs) and $PM_{2.5}$ concentrations exceeding thresholds from any single source within 1,000 feet of the Project. The thresholds are:

- An excess cancer risk level of more than 10 in one million or a chronic or acute hazard index (HI) greater than 1.0 for TACs
- An incremental increase of greater than 0.3 micrograms per cubic meter (μg/m^3) annual average $PM_{2.5}$.

---

1 BAAQMD, 2009b. *California Environmental Quality Act Air Quality Guidelines*, December 7.

2 BAAQMD, 2010. CEQA Guidelines Update, Public Workshop Slides, Oakland, CA, April 26.

3 Bay Area Air Quality Management District, *California Environmental Quality Act Guidelines*, December 7, 2009.

4 Bay Area Air Quality Management District, *California Environmental Quality Act Guidelines Update: Proposed Thresholds of Significance*, December 7, 2009.

When siting a new receptor, the BAAQMD recommends the Lead Agency examine existing or future proposed sources of TAC and/or $PM_{2.5}$ emissions that would adversely affect new receptors. These impacts include impacts from existing individual stationary sources and impacts from individual freeways or major roadways. The BAAQMD has provided more recent examples of how to conduct these single sources analyses. [5]

2.1 Stationary Sources

As discussed further in Section 3.1.1, according to the BAAQMD database, there are a total of three listed sources of TAC and $PM_{2.5}$ emissions within 1,000 feet of the Project boundary, all of which are diesel-fueled generators. These sources include the Griffith pump station, UCSF/Hunters Point Facility, and Bayview Greenwaste Facility. ENVIRON requested and received from the BAAQMD the daily emissions estimates and source parameters for use in modeling of these three sources. A discussion of the approaches used to model emissions from these facilities and estimate risks, hazards and $PM_{2.5}$ concentration is presented in detail in Section 3 of this technical letter.

For these stationary sources (diesel generators), ENVIRON conservatively assumed that $PM_{2.5}$ emissions can be represented by diesel particulate emissions (DPM) emissions.

Screening Level Single-Source Cancer Risk, Non-cancer Hazard Index (HI) and PM2.5 Concentration from Offsite Sources within 1000 Feet of Project Sensitive Receptors

Source	High End Cancer Risk (in a million)	Single-Source Cancer Risk Threshold (in a million)	Chronic Non-Cancer HI (-)	Single-Source Chronic Non-Cancer HI (-)	Annual Average $PM_{2.5}$ Concentration (ug/m^3)	Single-Source $PM_{2.5}$ Threshold (ug/m^3)
Griffith Pump Station	0.003	10	$2.2*10^{-6}$	1.0	$1.1*10^{-5}$	0.3
UCSF/Hunters Point	0.02		$1.5*10^{-5}$		$7.6*10^{-5}$	
Bayview Greenwaste – Current	135		$8.5*10^{-2}$		0.42	
Bayview Greenwaste – ATCM Compliant	1.2		$7.7*10^{-4}$		$3.8*10^{-3}$	

Note: Analysis based on BAAQMD, CEQA Guidelines Update, Public Workshop Slides, Oakland, CA, April 26, 2010.

As the table above demonstrates, only the Bayview Greenwaste Facility currently exceeds the cancer risk and $PM_{2.5}$ thresholds. Depending on the classification and permit status of diesel engine at the Bayview Greenwaste Facility, it is reasonable to expect that by the time new Project sensitive receptors will be located next to the facility (by 2013, at the earliest), this facility will be operating in compliance with the California Air Resources Board (ARB) Airborne Toxic

5 BAAQMD, 2010. CEQA Guidelines Update, Public Workshop Slides, Oakland, CA, April 26.

Control Measure (ATCM) for Stationary Compression-Ignition Engines Rule.[6] As the table indicates, with compliance with the ATCM, the estimated cancer risks, non-cancer hazards, and annual average $PM_{2.5}$ concentration from this source would be below the indicated thresholds.

2.2 Freeway/Major Roadway Sources

In their draft CEQA Air Quality Guidelines and as discussed in public workshops, the BAAQMD recommends the evaluation of all roadways with daily traffic greater than 10,000 vehicles within 1,000 feet of the Project boundary as sources of $PM_{2.5}$.[7] The roadways evaluated for the single-source on-site residential receptor analysis are portions of Carroll Avenue; Innes Avenue; Arelious Walker Avenue; Gilman Avenue; Jamestown Avenue; and Harney Way.[8]

Screening Level Single-Source PM2.5 Concentration from Roadways with Traffic >10,000 Vehicles per Day within 1000 Feet of Project Sensitive Receptors

Roadway	Future Cumulative Traffic Volume (vehicles per day)	Location of Roadway Relative to On-site Sensitive Receptor[a]	Minimum Distance to Sensitive Receptor (feet)[b,c]	BAAQMD Screening $PM_{2.5}$ Concentration (ug/m^3)b	Single-Source $PM_{2.5}$ Threshold (ug/m^3)
Harney Way	36,400	West	100	0.26	0.3
Arelious Walker	25,300	West	100	0.21	
Jamestown	15,000	North	100	0.16	
Gilman	25,000	North	100	0.25	
Carroll	10,300	South	100	0.16	
Innes	24,000	West	100	0.21	

[a]With the exception of Harney and Arelious Walker, all streets run in a northwest-southeast configuration. As a conservative measure, it was assumed that the roadways were east-west directional, which correspond to the maximum impacts in the BAAQMD screening tables.

[b]100 feet is the minimum distance presented in the BAAQMD screening table.

[c]BAAQMD, CEQA Guidelines Update, Public Workshop Slides, Oakland, CA, April 26, 2010.

6 BAAQMD's reported emissions are consistent with a source operating as a prime engine; however, the permit to operate has language to indicate it is classified as a standby emergency generator. The ARB has issued ATCMs to address both stationary prime/emergency diesel engines as well as portable equipment:
* Amended Airborne Toxic Control Measure for Stationary Compression Ignition Engines, effective October 18, 2007.
* Airborne Toxic Control Measure For Diesel Particulate Matter From Portable Engines Rated At 50 Horsepower And Greater, effective September 12, 2007.

7 To date, the BAAQMD has only provided screening level guidance for PM2.5 in their CEQA Guidelines Update, Public Workshop Slides, Oakland, CA, April 26, 2010.

8 CHS Consulting Group, Fehr & Peers, LCW Consulting 2009. Bayview Waterfront Project Transportation Study: Preliminary Draft 1 Report. Prepared for City of San Francisco Planning Department.

As the table above demonstrates, concentrations of $PM_{2.5}$ at the minimum screening distance (100 feet) from these roadways would be below the indicated thresholds. It is recognized that Project receptors could be located less than 100 feet from roadways, which is not addressed by the BAAQMD screening tables. As discussed in Section 5 of this technical letter, any new sensitive receptors on the Project which exceed a $PM_{2.5}$ concentration of 0.2 µg/m^3 from cumulative traffic would be required to install filtration under *San Francisco Health Code* Article 38. As such, compliance with Article 38 will ensure that no cumulative exposures above 0.2 µg/m^3 would be experienced by new receptors in the Project site and, therefore, the BAAQMD threshold of 0.3 µg/m^3 would not be exceeded.

3.0 Community Hazard Analysis – Cumulative Sources

As proposed in the Draft BAAQMD CEQA Guidelines, a cumulative impacts analysis would "examine TAC and/or $PM_{2.5}$ sources that are located within 1,000 feet of a proposed project site." "A project would have a cumulative significant impact if the aggregate total of all past, present, and foreseeable future sources within a 1,000 foot radius (or beyond where appropriate) from the fence line of a source, or from the location of a receptor, plus the contribution from the project, exceeds the following:

- An excess cancer risk level of more than 100 in one million or a chronic or acute [hazard index] HI greater than 1.0 for TACs; or
- 0.8 µg/m^3 annual average PM2.5."

During a meeting attended by representatives from ENVIRON, the City of San Francisco Planning Department, and BAAQMD on January 13, 2010, the District stated that the cumulative impacts analysis described in the Draft BAAQMD CEQA Guidelines should consist of an evaluation of cancer risks and noncancer hazards associated with offsite sources within a 1,000 foot radius of the Project and potential impacts of those sources on onsite residents only, assuming 70 years of exposure. This cumulative analysis was completed based on the BAAQMD's guidance coupled with information provided by the BAAQMD to ENVIRON regarding the emission sources requiring analysis within the 1,000 foot radius of the Project.

3.1 Source Identification and Emissions Estimation

<u>3.1.1 Stationary Sources</u>

To perform a cumulative impacts analysis, sources of TACs and $PM_{2.5}$ within a 1,000 foot radius of the proposed Project were identified. According to Draft BAAQMD CEQA Guidelines, "sources of TACs include, but are not limited to, land uses such as freeways and high volume roadways, truck distribution centers, ports, rail yards, refineries, chrome plating facilities, dry cleaners using perchloroethylene, and gasoline dispensing facilities." Non-permitted TAC and $PM_{2.5}$ sources (such as facilities that host a high volume of diesel truck activity) were also considered by taking into account roadway traffic that would be most affected by these sources.

In December 2009, BAAQMD Staff provided the City of San Francisco Planning Department with a listing of facilities in southeastern San Francisco with currently permitted sources of TAC emissions. According to this database, ENVIRON determined there are three listed sources within 1,000 feet of the Project boundary, all of which were diesel-fueled generators. ENVIRON requested and received from the BAAQMD the daily emissions estimates and source parameters for use in modeling of these three sources. For these stationary sources (diesel generators), ENVIRON conservatively assumed that DPM emissions are equivalent to $PM_{2.5}$ exhaust emissions. Emission rates and source parameters of these three sources used in modeling are summarized in Table 1.

In BAAQMD's Draft CEQA Air Quality Guidelines, there is discussion of several possible non-permitted sources of $PM_{2.5}$ and TACs that may contribute a large amount of emissions. These include freeways, distribution centers, warehouses, rail yards, ports, and truck stops. In the draft CEQA guidelines, the BAAQMD recommends the evaluation of all roadways with daily traffic greater than 10,000 vehicles within 1,000 feet of a project boundary.

3.1.2 Traffic/Vehicular Sources

Consistent with the description above, ENVIRON evaluated all roads and intersections within 1,000 feet of the Project that have traffic information available from the traffic report performed by CHS Consulting Group et al in 2009.[9] The cumulative analysis includes existing traffic plus future projections including Project-related traffic.

The roadways evaluated for this cumulative analysis are portions of Egbert Avenue, Carroll Avenue, Thomas Avenue, Revere Avenue, Palou Avenue, and Innes Avenues east of 3rd Street; Arelious Walker Avenue between Harney Way and Van Dyke Avenue; Ingalls Avenue between Palou and Egbert Avenues; Gilman, Jamestown and Ingerson Avenues; and Harney Way. Arelious Walker between Harvey Way and Van Dyke Avenue, and Ingalls Avenue from Palou Avenue to Egbert Avenue, were included, though they did not have predicted traffic volumes greater than 10,000 vehicles per day. ENVIRON had previously evaluated health impacts of Jamestown Avenue, and Ingerson Avenue using a semi-quantitative approach, and also included both roadways in the current evaluation.

ENVIRON considered vehicular running emissions of $PM_{2.5}$ from exhaust and non-exhaust, DPM, total organic gases (TOG) from gasoline vehicle exhaust and non-exhaust, and TOG from diesel vehicle exhaust. Vehicular queuing emissions of $PM_{2.5}$ from exhaust, DPM, TOG from diesel vehicle exhaust, and TOG from gasoline vehicle exhaust and non-exhaust were also considered.

Vehicular emission factors used in the cumulative analysis were generated in the same way that the $PM_{2.5}$ emission factors were generated in technical analyses supporting the DEIR (see Appendix H3, Attachment IV of the DEIR) with PM_{10} emission factors for exhaust of diesel vehicles generated from EMFAC to represent DPM emission factors. TOG emission factors generated from EMFAC for catalytic gasoline vehicles, including exhaust emissions, and evaporative emissions were extracted. Similar to the approach taken in the DEIR, differences between emissions of catalytic and non-catalytic gasoline vehicles were not considered, and all gasoline vehicles were assumed to be equipped with catalytic converters.

---

9 Several roadways presented in the CHS Consulting Group report had traffic volumes slightly less than 10,000 vehicles per day. As a conservative measure, all roadways, regardless of traffic volume, were included in this analysis.

ENVIRON used queuing data from the traffic study, as was done in the technical analyses supporting the DEIR (see Appendix H3, Attachment IV of the DEIR). The traffic study did not provide all necessary queuing data for intersection 33 (where Egbert Avenue crosses Ingalls Street); ENVIRON used intersection 32 (where Carroll Avenue crosses Ingalls Street) queuing data absent this information, based on the similarity of the intersection locations to the Project site, and to nearly freeway (i.e., US-101), and the similarities of land use pattern surrounding the those intersections. Both intersections have four-way stop signs and are located on Ingalls Avenue, separated by only two blocks.

Emission factors for vehicular running and queuing operations are summarized in Tables 2a through 2h.

3.2 Air Dispersion Modeling

3.2.1 Stationary Sources

ENVIRON performed air dispersion modeling using methodology consistent with that used in Appendix H, Attachment I, of the DEIR, with a few modifications, discussed below.

In addition to emissions estimates for each stationary source, BAAQMD provided source parameters needed for air dispersion modeling. Additionally, ENVIRON examined aerial photographs to obtain heights of buildings in close vicinity to each source under evaluation.

Building downwash algorithms incorporated into AERMOD account for the plume dispersion effects of the aerodynamic wakes and eddies produced by buildings and structures; building downwash algorithms were used. Based on BAAQMD's Draft CEQA Air Quality Guidelines, in order to evaluate health impacts of offsite sources to onsite receptors, ENVIRON created a receptor grid with 20 meter spacing, which covers the future onsite residential development proposed. Three receptor grids were created based on the future land use map of the proposed Project. The onsite residential receptors included in the evaluation are shown on Figure 1. Note that even though the receptor grids cover the designated residential areas, each individual receptor does not necessarily fall on the actual location of the future residential buildings. For example, one receptor could be at the yard or parking lot of the residential area. Therefore concentrations calculated for each receptor should be viewed in the context of concentrations calculated for the neighboring receptors.

The locations of the three stationary sources considered in this cumulative impact analysis are presented on Figure 2.

3.2.2 Traffic/Vehicular Sources

ENVIRON used methodologies consistent with Appendix H, Attachment IV, of the DEIR, with a few updates, summarized here.

ENVIRON refined the methodology regarding terrain. In the Draft EIR, roads were set to zero meter elevations (e.g., ground level), with all receptors at 1.8 meters as recommended by CAL3QHCR documentation. In this updated analysis, ENVIRON used National Elevation Dataset (NED) files from the United States Geological Survey (USGS) to estimate elevations for roadways and receptors. ENVIRON estimated the height of each roadway using the average elevation within five meters of the road read from the NED file. CAL3QHCR restricts roadway heights to be within -10 meters to 10 meters. Since the lowest roadway under evaluation is approximately 3.3 meters, ENVIRON subtracted 13.3 meters from each roadway elevation so that the lowest roadway elevation was at -10 meters. All receptor elevations were determined using the surface elevations from NED files plus 1.8 meters to represent the CAL3QHCR-recommended breathing height, before being adjusted by subtracting 13.3 meters. This approach ensured that the relative height between roadway segments and receptors in the model reflect the actual conditions, with the exception that for roads with average elevations above 10 meters after this adjustment, ENVIRON set the elevation to 10 meters. This further adjustment suppressed the vertical distance between some of the roadways and most receptors and thus will lead to more conservative results. The only exception is the cluster of elevated residential receptors located on the hillside of Bayview Park, in which case, due to the adjustment described above, the modeled difference in elevation was greater than the actual distance in elevation. The effect is not significant; however, as estimated $PM_{2.5}$ concentrations at locations closer (both horizontally and vertically) to the roadways are much lower than significance thresholds. Therefore, due to their increased distance, the estimated concentrations at these hillside receptors will be lower still.

Additionally, ENVIRON refined the hourly traffic volumes for each roadway depending on the pollutant being modeled. ENVIRON used the hourly diesel and gasoline fractions of total trips in San Francisco County from EMFAC to calculate hourly traffic volumes for diesel and gasoline vehicles, respectively. For the $PM_{2.5}$ models, the hourly traffic volumes from all vehicles were used, as was done in the DEIR. Hourly traffic volumes from diesel vehicles were used for the DPM and diesel vehicle TOG models. Similarly, hourly traffic volumes from gasoline vehicles were used for the gasoline vehicle TOG models. ENVIRON updated the receptors in the cumulative analysis, as well. Onsite receptors identical to those used in the stationary source air dispersion modeling domain were used.

The locations of the traffic/vehicular sources considered in this cumulative impact analysis are presented on Figure 2. The hourly traffic volumes of the modeled roadway segments are presented in Tables 3a through 3c. The vehicular source parameters representing running and queuing operations of the traffic are presented in Table 4 and 5.

3.3 Risk Analysis

3.3.1 Identification of Chemicals of Concern

TACs and $PM_{2.5}$ emitted from all stationary and traffic/vehicular sources were considered in this cumulative analysis.

For traffic-related impacts, the chemicals of concern evaluated were chosen in accordance with the indicator chemical approach that is consistent with OEHHA guidance.[10] DPM from diesel exhaust along with several indicator chemicals associated with gasoline exhaust were evaluated. A United States Environmental Protection Agency (USEPA) guidance document[11]

---

10 California Environmental Protection Agency (Cal/EPA). 2003. *Air Toxics Hot Spots Program Risk Assessment Guidelines: The Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments.* Office of Environmental Health Hazard Assessment. August.

11 USEPA. 2002. *Technical Description of the Toxics Module for MOBILE 6.2 and Guidance on its Use for Emission Inventory Preparation.* Air and Radiation. EPA420-R-02-029. November.

identifies acetaldehyde; benzene; 1,3-butadiene; formaldehyde; acrolein; and methyl-t-butyl ether (MTBE) as the chemicals that dominate risk from mobile sources, based on the results of the USEPA's National-Scale Air Toxics Assessment. ENVIRON included all indicator chemicals except MTBE as it is no longer present in gasoline formulations sold in California. Potential carcinogenic effects, as well as acute and chronic noncancer hazard HIs, from exposure to these compounds were evaluated.

3.3.2 Exposure Assessment

As previously discussed, the BAAQMD guidance[12] was that the cumulative analysis described in the Draft BAAQMD CEQA Guidelines should consist of an evaluation of risk associated with offsite stationary and traffic/vehicular sources within a 1,000 foot radius of the Project and potential impacts of those sources on on-site residents, assuming 70 years of exposure.

For this cumulative analysis, ENVIRON identified residential receptors based on the proposed residential land uses identified for the Project in the DEIR. As previously discussed, the receptor locations considered in this cumulative analysis are presented in Figure 1.

Only the inhalation exposure pathway was considered in this cumulative analysis for TACs emitted from stationary and traffic/vehicular sources. As previously discussed, $PM_{2.5}$ was evaluated using the 0.8 $\mu g/m^3$ Threshold of Significance proposed in the Draft BAAQMD CEQA Guidelines. Selection of additional pathways for a multipathway analysis is specific to the chemical and land use designations in the area potentially impacted by the Project. The California Environmental Protection Agency (Cal/EPA)[13] has identified chemicals that must be evaluated in a multipathway analysis and none of the TACs evaluated in this cumulative analysis are listed by Cal/EPA as a multipathway chemical. Thus, ENVIRON only conducted an evaluation of inhalation exposures.

The residential exposure parameters used in this cumulative impact analysis are consistent with those used in the DEIR, with the exception of the exposure duration. As requested by the BAAQMD, exposures were evaluated over a 70 year lifetime for residents.

The exposure assumptions used for evaluating inhalation exposures to TACs for residential populations are presented in Table 6.

3.3.3 Toxicity Assessment

The toxicity assessment characterizes the relationship between the magnitude of exposure and the nature and magnitude of adverse health effects that may result from such exposure. For purposes of calculating exposure criteria to be used in risk assessments, adverse health effects are classified into two broad categories – cancer and noncancer endpoints. Toxicity values used to estimate the likelihood of adverse effects occurring in humans at different exposure levels are identified as part of the toxicity assessment component of a risk assessment.

---

12 Meeting between representatives from ENVIRON, PBS&J, and BAAQMD on January 13, 2010. San Francisco, California.

13 California Environmental Protection Agency (Cal/EPA). 2003. *Air Toxics Hot Spots Program Risk Assessment Guidelines: The Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments.* Office of Environmental Health Hazard Assessment. August.

Consistent with the methodology used in the DEIR and Cal/EPA risk assessment guidance, ENVIRON used current Cal/EPA toxicity values for TACs to estimate cancer risks associated with exposure to emissions resulting from the Project. Specifically, toxicity values were obtained from the Cal/EPA *OEHHA Table of Approved Cancer Potency Factors*[14] (CPFs) and *OEHHA Acute, 8-hour and Chronic Reference Exposure Level (REL) Summary*[15] and are presented in Table 7.

3.3.4 Risk Characterization Methods

The results of this cumulative analysis are presented as estimated excess lifetime cancer risks, noncancer hazard indices, and modeled $PM_{2.5}$ concentrations which are then compared to the applicable proposed Thresholds of Significance in the Draft BAAQMD CEQA Guidelines. The methodology used to estimate excess lifetime cancer risks, noncancer HIs, and modeled $PM_{2.5}$ concentrations is described below.

Cancer risk estimates represent the probability of cancer (presented as a probability per million people) related to potential exposures to TAC emissions quantified in this cumulative analysis. Noncancer HIs are represented as the ratio between the estimated TAC exposure-point concentrations and associated RELs identified as part of the toxicity assessment. The excess lifetime cancer risks and noncancer HIs estimated in this evaluation are then compared to Thresholds of Significance proposed in the Draft BAAQMD CEQA Guidelines to determine if any significant impacts can be associated with sources located within a 1,000 foot radius of the Project, as identified by the BAAQMD.

The cancer risks and noncancer HIs are estimated for the maximally impacted individual resident (MEIR). The MEIR is defined in the context of this evaluation as the onsite residential location with the highest estimated acute, chronic, or cancer health impact based on the proposed residential land uses identified for the Project.

The methodology used to estimate cancer risks and chronic noncancer HIs as presented in the DEIR were also used in this cumulative analysis. However, acute effects were not evaluated as part of the analysis conducted for the DEIR.

The potential for acute effects was evaluated by comparing the annual one-hour maximum concentrations with the acute RELs. Acute hazard quotients (HQs) were estimated for those chemicals for which an REL was available. The equation used to calculate acute HQs is as follows:

$$HQ_i = \frac{C_i}{REL_i}$$

Where:

HQ_i	=	Acute hazard quotient for chemical_i
C_i	=	One-hour maximum air concentration for chemical_i ($\mu g/m^3$)
REL_i	=	Acute noncancer reference exposure level for chemical_i ($\mu g/m^3$)

14 California Environmental Protection Agency (Cal/EPA). 2009. *Table of Approved Cancer Potency Factors, Toxicity Criteria Database*. July 21.

15 California Environmental Protection Agency (Cal/EPA). 2008. *OEHHA Acute, 8-hour and Chronic Reference Exposure Level (REL) Summary.* Office of Environmental Health Hazard Assessment. December 18.

ENVIRON conservatively summed the chemical-specific HQs to obtain an acute HI as follows:

$$HI = \sum HQ_i$$

Target organ segregation for acute effects was not conducted because the acute HI for all chemicals is well below the Threshold of Significance of one for acute effects proposed in the Draft BAAQMD CEQA Guidelines. The acute HIs presented in this cumulative analysis conservatively overestimates the true one hour maximum at any one time because one hour maximum air concentrations were summed regardless of time of occurrence (i.e., hour of year) which can differ by source.

3.4 Risk Characterization

This section compares the estimated excess lifetime cancer risks, noncancer HIs, and $PM_{2.5}$ concentrations for the MEIR to the Thresholds of Significance proposed in the Draft BAAQMD CEQA Guidelines.

3.4.1 Cancer Risks and Noncancer Hazards Estimated for Stationary and Traffic/Vehicular Sources of TACs

As shown in Table 8, the cancer risk associated with all stationary and traffic/vehicular sources for the MEIR under the existing scenario in which it is assumed that the Bay-View Greenwaste Management facility operates as it does today, is 148 in a million (148×10^{-6}) assuming high-end exposure assumptions (exposure duration of 70 years). The MEIR is located within the boundary of the Alice Griffith Housing Area and is approximately 340 feet from the Bay-view Greenwaste Facility. Approximately 97% of the cancer risk, or 143 in a million (143×10^{-6}), can be attributed to a diesel generator located at the Bay-View Greenwaste Management facility. The estimated cancer risks for the onsite MEIR assuming average exposures is slightly lower than those estimated using high-end exposure assumptions.

It is unlikely that the diesel generator currently at the site will continue to operate for the full 70 years beyond the 2030 initiation of the 70 year risk duration (i.e. ending at year 2100). It is more likely that this diesel generator will be replaced by a generator that has much lower emissions, due strictly to age, if not Reasonably Achievable Control Technology (RACT) requirements. A replacement generator would not be permitted emissions at the level at which the generator is currently operating, rather it would have to comply with BAAQMD or California Air Resources Board (ARB) regulations in effect at the time of replacement.

Under the scenario in which it is assumed that the Bay-View Greenwaste Management facility operates in accordance with the ARB Airborne Toxic Control Measure (ATCM) for Stationary Compression-Ignition Engines, emissions from the diesel generator located at the Bay-View Greenwaste Management facility are reduced by approximately 99% due to the application of an ATCM compliant diesel generator. This reduction in DPM emissions significantly reduces the estimated cancer risks at the MEIR. Under the ATCM compliance scenario, the estimated cancer risk for the MEIR is 43 in a million (43×10^{-6}) assuming high-end exposure assumptions. In addition, the MEIR under the ATCM compliance scenario is located near the intersection of Gilman Avenue and Arelious Walker Drive. The estimated cancer risk for the onsite MEIR assuming average exposures is slightly lower than those estimated using high-end exposure assumptions. The results for the ATCM compliance scenario are presented in Table 8.

As shown on Table 8, the estimated chronic and acute noncancer HIs for all onsite residents are 0.1 and 0.23 or below under the scenario in which Bay-View Greenwaste Management does not comply with the ATCM, respectively. Estimated chronic and acute noncancer HIs are even lower under the ATCM compliance scenario.

3.4.2 $PM_{2.5}$ Originating from Stationary and Traffic/Vehicular Sources

The concentration of $PM_{2.5}$ at the MEIR and attributable to stationary and traffic/vehicular sources (0.5 $\mu g/m^3$) does not exceed the Threshold of Significance $PM_{2.5}$ concentration of 0.8 $\mu g/m^3$ proposed in the Draft BAAQMD CEQA Guidelines.

The $PM_{2.5}$ concentration is further reduced to 0.4 $\mu g/m^3$ under the ATCM compliance scenario.

4.0 Evaluation of Offsite Receptors

At the request of the San Francisco Planning Department, ENVIRON also evaluated the cumulative risks (cancer risks, acute and chronic noncancer hazard indices, and $PM_{2.5}$ concentrations) for offsite residential receptors within the 1,000 foot radius, assuming a 70 year exposure. The methodology used for this evaluation was the same as that used to evaluate the cumulative risks for the onsite residential receptors. Offsite residential receptors evaluated are shown on Figure 3.

As shown in Table 9, the estimated cancer risk associated with all stationary and traffic/vehicular sources for the MEIR under the scenario in which the Bay-View Greenwaste Management facility operates as it does today is 88 in a million (88×10^{-6}), assuming high-end exposure assumptions. The MEIR is located near the Gilman Avenue and Arelious Walker Drive intersection. Approximately 91% of the cancer risk, or 80 in a million (80×10^{-6}), can be attributed to a traffic/vehicular sources. The estimated cancer risks for the offsite MEIR assuming average exposures is slightly lower than those estimated using high-end exposure assumptions.

Under the scenario in which the Bay-View Greenwaste Management facility operates in compliance with the ARB's ATCM rule, emissions from the diesel generator located at the Bay-View Greenwaste Management facility are reduced by approximately 99% due to the application of an ATCM compliant diesel generator. This reduction in DPM emissions results in the same location of MEIR and slightly reduces the estimated cancer risks at the MEIR. Under the mitigated scenario, the estimated cancer risk for the MEIR is 80 in a million (80×10^{-6}) assuming high-end exposure assumptions. In addition, the MEIR under the ATCM- compliant scenario is located near the intersection of Gilman Avenue and Arelious Walker Drive. The estimated cancer risk for the offsite MEIR, assuming average exposures, is slightly lower than those estimated using high-end exposure assumptions. The results for the ATCM-compliant scenario are presented in Table 9.

As shown on Table 9, the estimated chronic and acute noncancer HIs for all offsite residents are 0.11 and 0.31 or below under the existing scenario in which the Bay-View Greenwaste Management facility operates as it does today, respectively. As expected, since the MEIR is relatively far from the modeled stationary sources, estimated chronic and acute noncancer HIs are only slightly lower than or equal to the values under the ATCM-compliant scenario.

Under the existing scenario, the concentration of $PM_{2.5}$ at the MEIR and attributable to stationary and traffic/vehicular sources (0.74 μg/m^3) does not exceed the Threshold of Significance $PM_{2.5}$ concentration of 0.8 μg/m^3 proposed in the Draft BAAQMD CEQA Guidelines.

The $PM_{2.5}$ concentration is further reduced to 0.72 μg/m^3 under the ATCM-compliant scenario.

5.0 Compliance with San Francisco Health Code Article 38

The potential health impacts from $PM_{2.5}$ associated with traffic were evaluated for compliance with *San Francisco Health Code* Article 38. The *San Francisco Health Code* Article 38 requires an air quality assessment to evaluate the concentration of $PM_{2.5}$ from local roadway traffic sources that may impact new structures containing ten or more dwelling units. If the air quality assessment indicates the estimated concentration of $PM_{2.5}$ at the site attributable to all roadway vehicle emissions within 500 feet (approximately 150 meters) of the project would be greater than 0.2 μg/m^3 (micrograms per cubic meter), Section 3807 requires development on the site to be designed or relocated to avoid exposure greater than 0.2 μg/m^3, or a ventilation system to be installed that would be capable of removing 80 percent of ambient $PM_{2.5}$ from habitable areas of the residential units.

Roadways evaluated in this analysis include portions of Egbert and Carroll Avenues east of 3rd Street; Arelious Walker between Harney Way and Carroll Avenue; Gilman, Jamestown and Ingerson Avenues; and Harney Way.

Exceedances of 0.2 μg/m^3 are located at future residential sites located near the following roadways:

- Approximately 30 meters from the intersection of Harney Way and Arelious Walker
- Approximately 15 meters from the intersection of Gilman and Arelious Walker
- Approximately 15 meters on each side of Arelious Walker just east of Alice Griffith

Under SF Health Code Section 3807, one of the following actions is required: (1) residential uses must be designed or located on the site in a way that would avoid residential exposures above a $PM_{2.5}$ concentration of 0.2 μg.m^3, or (2) a ventilation system must be installed at the site that would be capable of removing greater than 80% of ambient $PM_{2.5}$ from habitable areas of dwelling units.

6.0 Conclusions

In summary, the results of the single-source community hazards analysis indicate that potential excess cancer risks to onsite residents are below 10 in a million for TACs emitted from offsite stationary and traffic/vehicular sources within a 1,000 foot radius of the Project assuming that the Bay-View Greenwaste Management facility comes into compliance with the ARB's ATCM rule before 2013. The estimated acute and chronic noncancer hazard indices are below one for all receptors evaluated in this cumulative analysis under both the ATCM compliant and ATCM non-compliant scenarios. In addition, the $PM_{2.5}$ concentrations for onsite residents are below the single-source $PM_{2.5}$ concentration of 0.3 μg/m^3 proposed in the Draft BAAQMD CEQA Guidelines.

Additionally, the results of the cumulative community hazards analysis indicate that potential excess cancer risks to onsite residents are below 100 in a million for TACs emitted from offsite stationary and traffic/vehicular sources within a 1,000 foot radius of the Project assuming that the Bay-View Greenwaste Management facility comes into compliance with the ARB's ATCM rule before 2013. The estimated acute and chronic noncancer hazard indices are below one for all receptors evaluated in this cumulative analysis under both the ATCM compliant and ATCM non-compliant scenarios. In addition, the $PM_{2.5}$ concentrations for onsite residents are below the $PM_{2.5}$ concentration of 0.8 μg/m^3 proposed in the Draft BAAQMD CEQA Guidelines.

At the request of the San Francisco Planning Department, ENVIRON also evaluated the potential cumulative impacts within the 1,000 radius for offsite residential receptors. For the offsite residential receptors, under both the ATCM non-compliant and compliant scenarios, the estimated excess cancer risks are below 100 in a million, the estimated acute and chronic noncancer hazard indices are below one, and the cumulative $PM_{2.5}$ concentrations are below 0.8 μg/m^3.

For San Francisco Article 38, all future traffic/vehicular sources are predicted to yield concentrations of $PM_{2.5}$ that exceed the San Francisco Health Code Article 38 $PM_{2.5}$ action level at residential sites in three areas. The estimated cumulative traffic $PM_{2.5}$ concentrations at some onsite residential locations directly adjacent to Arelious Walker could exceed the San Francisco Health Code Article 38. Consequently, residential development at these locations would be required by SF Health Code Section 3807 to either locate the residential units in a way to avoid the residential exposure or install ventilation systems that will remove 80% of $PM_{2.5}$ from habitable areas of the dwelling units.

Please feel free to contact us if you have any questions about this analysis. Thank you for the opportunity to assist you with this matter.

Sincerely,

Shari B. Libicki, PhD

Notes:
1. The emission factors for each vehicle class were extracted from EMFAC2007 and were weighted by default hourly fraction of trip in EMFAC2007 to yield composite hourly emission factors. Detailed discussion of the methodology is presented in Draft EIR Attachment IV section 4.2.
2. Exhaust refers to running emissions from vehicle exhaust; non-exhaust refers to running emissions from tire and brake wear.
3. Exhaust refers to idling emissions from vehicle exhaust; non-exhaust refers to idling emissions from tire and brake wear.
4. The emission factors for all vehicles are used for road segments with no truck restrictions.
5. The emission factors for all vehicles, excluding heavy-duty vehicles, are used for road segments with truck restrictions which forbid trucks over 14,000 lbs. Those emission factors are shown in *italics.*

Abbreviations:
EIR: Environmental Impact Report
HD: heavy duty vehicle, and refers to vehicles with a gross vehicle rating of 10,001 pounds or more.

Notes:
1. The emission factors for each vehicle class were extracted from EMFAC2007 and were weighted by default hourly fraction of trip in EMFAC2007 to yield composite hourly emission factors. Detailed discussion of the methodology is presented in Draft EIR Attachment IV section 4.2.
2. Exhaust refers to running emissions from vehicle exhaust.
3. Exhaust refers to idling emissions from vehicle exhaust.
4. The emission factors for all vehicles are used for road segments with no truck restrictions.
5. The emission factors for all vehicles, excluding heavy-duty vehicles, are used for road segments with truck restrictions which forbid trucks over 14,000 lbs. Those emission factors are shown in *italics.*

Abbreviations:
EIR: Environmental Impact Report
HD: heavy duty vehicle, and refers to vehicles with a gross vehicle rating of 10,001 pounds or more.

Notes:
1. The emission factors for each vehicle class were extracted from EMFAC2007 and were weighted by default hourly fraction of trip in EMFAC2007 to yield composite hourly emission factors. Detailed discussion of the methodology is presented in Draft EIR Attachment IV section 4.2.
2. Exhaust refers to running emissions from vehicle exhaust.
3. Exhaust refers to idling emissions from vehicle exhaust.
4. The emission factors for all vehicles are used for road segments with no truck restrictions.
5. The emission factors for all vehicles, excluding heavy-duty vehicles, are used for road segments with truck restrictions which forbid trucks over 14,000 lbs. Those emission factors are shown in *italics.*

Abbreviations:
EIR: Environmental Impact Report
HD: heavy duty vehicle, and refers to vehicles with a gross vehicle rating of 10,001 pounds or more.

Notes:

1. Segments are identified by the bounding intersections, using the intersection numbering developed in Figure 26A of the Traffic Report, and by the direction of traffic flow.

2. CAL3QHCR limits relative elevations to a range of -10 meters to +10 meters. All roads have 13.3 meters subtracted from their elevations to allow the lowest road to be at -10 meters.

3. As defined in CAL3QHCR, mixing zone width for a given free flow link is calculated by adding 6 meters to the width of the road. The width of the road is obtained by visual observation of high-resolution aeiral photograph.

LIST OF FIGURES

1.0 Executive Summary

Wilson, Ihrig & Associates (WIA) has conducted a noise study and mitigation evaluation for the Bayview Waterfront EIR Project. The study is limited to operational noise impacts from the San Francisco 49ers stadium proposed to be constructed in the Hunter's Point neighborhood of San Francisco to replace the Candlestick Park stadium now used for 49ers NFL football games. The impact evaluation presented herein includes assessment of noise from two types of events, which are unrelated: football games and large venue popular music concerts. As a result of this study, it was determined that there is a potential for significant noise impacts from both types of events. Potential noise mitigation has been evaluated to determine if these impacts could be sufficiently reduced to a level that is less than significant.

2.0 Introduction

This report presents the results and findings of a noise study conducted by WIA for a proposed San Francisco 49ers stadium (Stadium) option of the Bayview Waterfront Development Project (Project). This option of the Project proposes to construct a new stadium in the Hunter's Point neighborhood for the San Francisco 49ers National Football League (NFL) team. The current location for the 49ers football games is Candlestick Park located approximately 1.25 miles from the proposed site for the new stadium. On certain occasions, the Stadium may also be used for music concerts.

In the study reported herein, WIA evaluated potential operational noise impacts associated with the proposed siting of the Stadium which would be used for football games and could be used for occasional music concerts. The results of the study indicated potentially significant noise impacts. Investigated were various possible noise mitigation options to lessen impacts to the surrounding community for both types of events.

This noise study is being performed to support the Draft Environmental Impact Report (DEIR) for the Project prepared by PBS&J for the City of San Francisco, the Lead Agency. The noise study addresses operational noise impacts associated with 49ers National Football League (NFL) football games of which there are approximately eight (8) every year and the noise impacts associated with music concerts held within the Stadium. The study does not evaluate noise impacts that may occur for other types of events that might be conducted in the proposed Stadium.

The purpose of this noise study is to identify potential noise impacts and noise mitigation for the Stadium.

The steps taken to determine impacts and mitigation were:

- Identify potentially significant sources of environmental noise for the Stadium associated with football games and music concerts
- Evaluate the need for mitigation based on individual source noise emission, multiple source emission, and proximity to adjacent sensitive land uses (e.g., residences)
- Determine if there are appropriate noise mitigation measures and strategies that would lessen impacts

The potentially significant sources of Stadium noise were determined by reviewing the Project description, Stadium configuration plans and the proximity of the site to sensitive receptors, discussions with PBS&J concerning the operational plans for the Stadium, and WIA experience with other similar sports facilities.

There are two sources of noise during football games in the Stadium that could produce audible noise in the surrounding community:

- The spectators at the game
- Amplified speech and music broadcast over the Stadium's sound system.

Both of these sources will be intermittent. Consequently noise intensity and its duration are important with regard to determining impact.

There are two sources of noise during music concerts held in the Stadium that could produce audible noise in the surrounding community:

- The concert audience
- Amplified music broadcast over a concert sound system.

Both of these sources will be intermittent. Consequently noise intensity and its duration are important with regard to determining impact.

WIA reviewed the proposed Stadium site layout, the surrounding topography, and the location of noise sensitive receptors (residences) in the area. Based on its previous experience with large sports facilities and sound system equipment with the guidance of the acoustical consulting firm and sound system designer Rosen, Goldberg, Der and Lewitz (RGDL), WIA developed input parameters to be used in the community noise prediction computer model SoundPLAN®.

Using field measured noise data from its in-house database and other sources, WIA developed reference noise levels for the audience. The Stadium's "house" sound system would be used during football games whereas a band or other musical performer would normally provide their own sound system for a concert. The house sound system will be a fixed public address (PA) system. The concert sound system is a portable system typically set up at field level and in the vicinity of the performer's stage.

For the house sound system, WIA used the Stadium sound system specifications to develop a maximum sound power level output for this source. For the concert sound system, WIA used a typical configuration of loudspeakers for this type of event. The typical details for these two types of sound systems (e.g., type, number of speakers, size, sound radiation patterns) were provided by Joel Lewitz of RGDL. The sound emission characteristics of the sound systems were used in the SoundPLAN® models to project noise levels in the community and evaluate whether noise impacts would potentially occur. The SoundPLAN® noise projection results were used to determine the possible need for mitigation and the preliminary details of such mitigation.

Contained herein are the findings of the study based on WIA's noise analysis and mitigation evaluation. Possible mitigation has been evaluated and preliminary design details were analyzed to determine specific noise reduction benefits. The mitigation presented here will be reviewed by the City of San Francisco for reasonableness and feasibility of implementation. Depending on the result of these reviews, certain mitigation or aspects thereof may be developed further, modified by additional analysis, or even eliminated from further consideration based on conclusions regarding feasibility, and/or cost effectiveness.

3.0 Description of Facility

The site for the proposed 49ers Stadium is shown in Figure 3-1 as is the proximity of nearby land use that might be affected by Project noise. This site is adjacent to San Francisco Bay (on the east) and bounded directly to the north by land proposed for development of R&D facilities. Beyond the R&D development is land proposed for residences. For the purpose of modeling noise source locations in this study, the site and Stadium details contained in project drawings (Ref. 1) were used.

3.1 General Details

The proposed Stadium option would provide a new 69,000-seat NFL stadium for the San Francisco 49ers. The Stadium footprint is on 17.4 acres. The Stadium proper would include seating, ramps and stairs, office and administrative facilities, food service and retail areas, and access facilities for stadium visitors, players and staff. The top row seating would be at an elevation of approximately 156 feet above the playing field. The parking area surrounding the Stadium would serve stadium-related events.

3.2 Operational Details

The Stadium would primarily be used for football games. It also may be used occasionally for popular music concerts. The following is discussion of the general Stadium details and the sound system details relevant to the SoundPLAN® noise prediction models.

3.2.1 Football Games

It is planned that the 49ers Stadium will be used for the team's home football games on weekends and Monday nights, and also during the NFL playoffs should the team advance to that stage. There are expected to be approximately eight 49ers home games at the Stadium during the normal football season.

The following narrative on the Stadium sound system is excerpted from the Project Description.

***Overview of Systems** – All of the electronic systems considered in this outline are related to game operations or fan entertainment. The specific football operations issues listed are based in information from 49'ers game and stadium operations staff. The systems are best considered as parts of an overall whole, rather than independently operating entities.*

<u>Audio Systems – Main Seating Bowl</u>

***Bowl Loudspeaker Options** – The main seating bowl system is requested to be a point source, or "single cluster" loudspeaker type. Due to the asymmetrical seating bowl geometry and the lack of structure in the end zone center lines, a side line cluster system, such as that installed at Soldier Field may be the most appropriate solution. The seating bowl loudspeaker system is to achieve:*

- *Frequency response of 60 to 8,500 Hz minimum*
- *Uniformity of loudness - +/- 3 dBA; +/- 3 dB at 4000 Hz*
- *Ratio of first/direct arrival sound to reverberant or indirect sound - +6 dB.*
- *Maximum continuous loudness of 105 dBA*

3.2.2 Music Concerts

It is proposed that the Stadium may be used occasionally as a venue for popular music concerts performed in front of a large audience. In such a venue (e.g., football stadium), the musicians perform on a large, elevated stage situated on the stadium field. The sound system used by the performers would be one that is specifically designed for touring bands. “Tour” type sound systems generally have the following basic elements.

The sound system would consist of four line arrays at the front of house (FOH) composed of twelve full-size elements such as JBL VerTec VT4889 above four full-size arrayable subwoofers integrated into each full-range speaker array such as JBL VerTec VT4880. Two towers with delayed signals are added at the 50-yard line to fulfill the back of the Stadium audio needs. Each tower has a pair of eight (8) box arrays, an example of which are JBL VT 4889 full-size line array elements. The polar or directivity pattern of the source is included based either on the manufacturer’s published data or the pattern for a typical loudspeakers array used in a concert of this magnitude. To calibrate the sound system source strength inside the stadium, the level was set at 105 dBA at the “mixing position,” which is the typical level observed during a concert.

The typical stage configuration during concerts would likely have the stage in the end zone for large events or at the 50-yard line for smaller shows. The noise impacts associated with large events were analyzed since this represents a worst-case condition. Although the stage could be located at either end of the field (north or south), for the purpose of this study it was assumed the stage is in the northern end field pointing south. In this way most of the sound would be projected towards the Bay and away from residences.

Noise levels from a music concert will fluctuate greatly depending on the type of music being performed (e.g., rock, pop, hip-hop, etc.) and on the performers’ preferred style of loudness. The latter affects the sound power settings used for the event. The loudness is also related to the size of the venue and to some degree the size of the audience. To address the variable range of music genre possible, recorded music samples were used to obtain sound spectra for rock and hip-hop music as two different styles of music that might use the Stadium as a concert venue. Other styles of music would generally be less percussive and therefore presumably have less of an impact on the surrounding community.

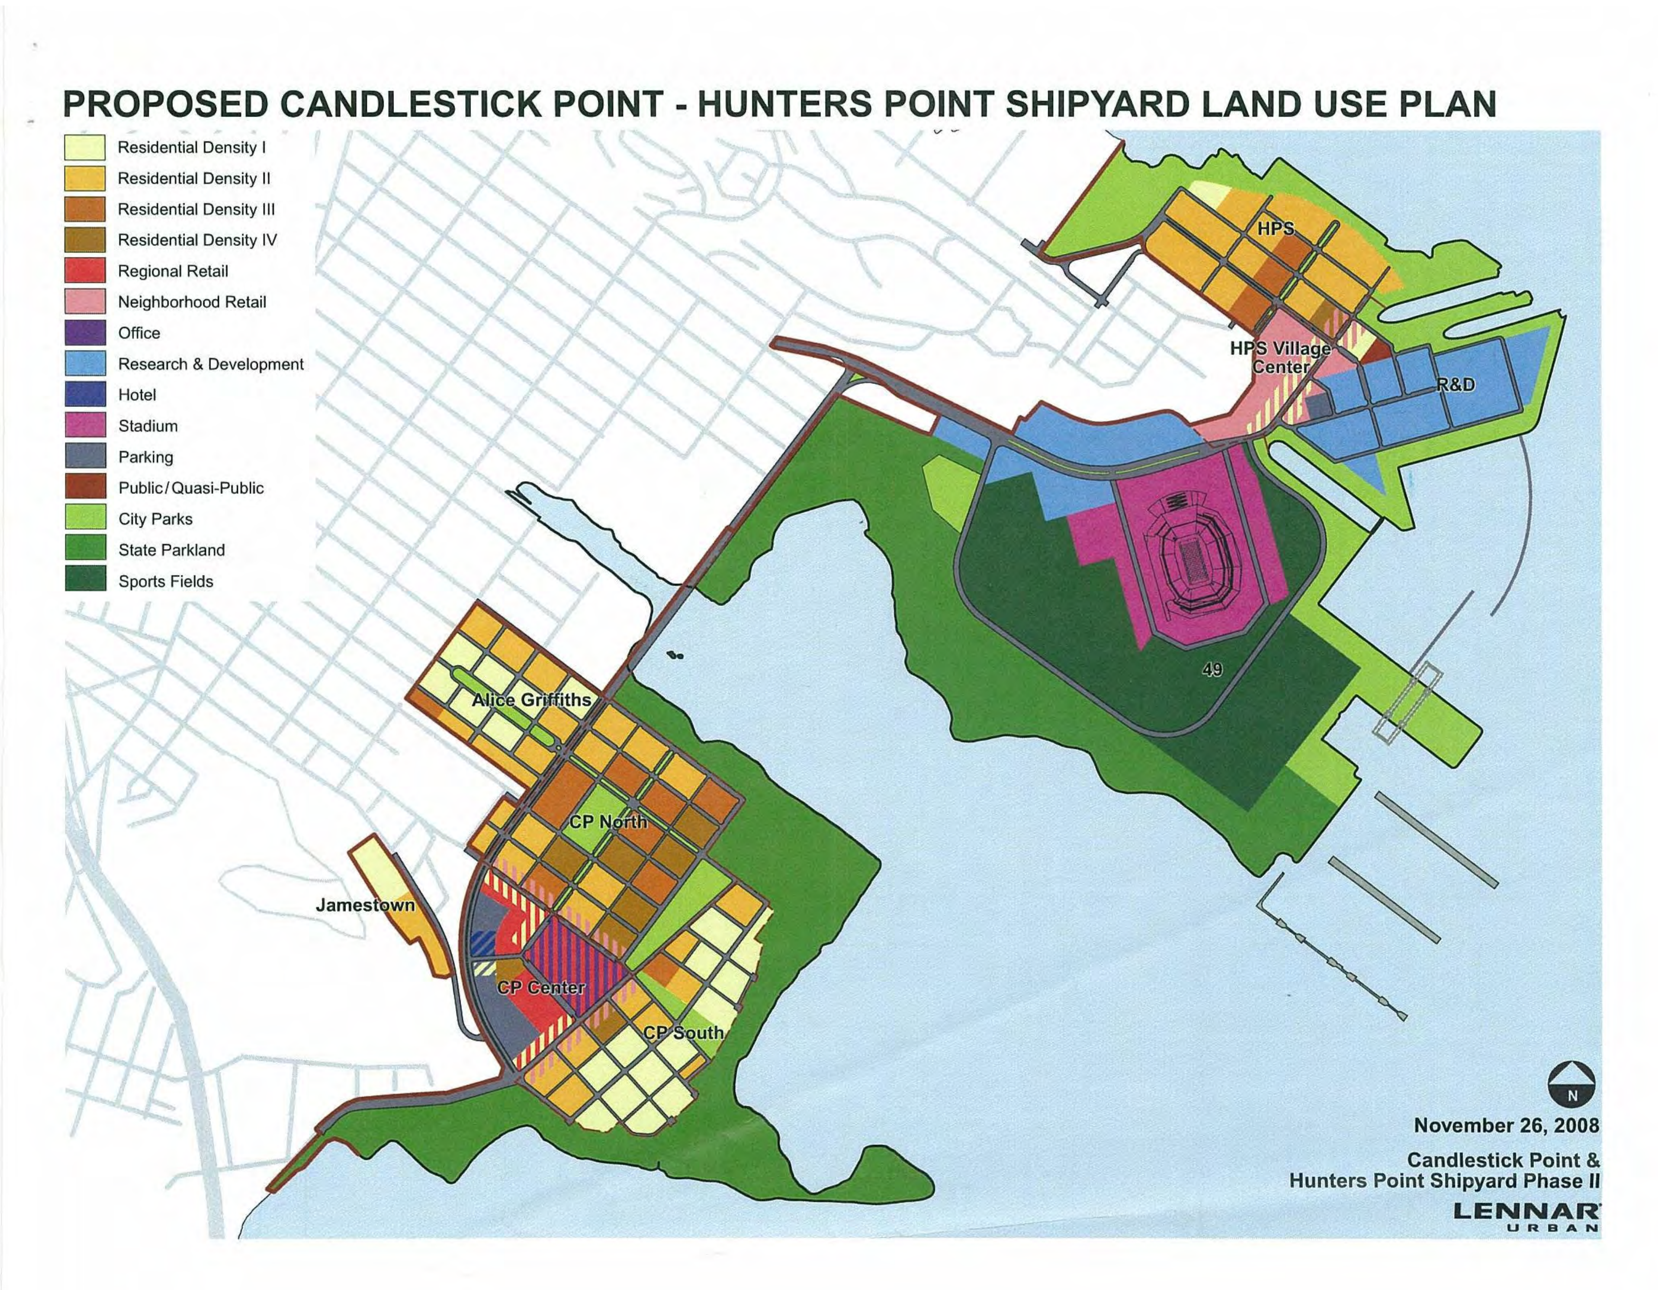

Figure 3-1 Site Plan for Stadium and Proposed Local Surrounding Land Use

4.0 Noise Sensitive Receptors and Noise Criteria

Figure 3-1 indicates the land use designations for areas in the near vicinity of the proposed Stadium building site. Land use in the immediate area of the proposed Stadium site is proposed as part of the Project to be a mixture of R&D, commercial and residential. The residential land, as shown in **Error! Reference source not found.** has the highest degree of sensitivity to noise.

Unlike most community noise, which is typically dominated by transportation sources and occurs throughout the day, the noise during football games associated with sources inside the Stadium although possibly much louder in the immediate vicinity of the Stadium than other noise sources, only affect the environment occasionally.

The primary sources within the Stadium are cheering fans and the Stadium's sound system. In terms of typical community noise sources, these sources of noise are infrequent (i.e., occurring only on days that football games are held). The noise that occurs during a game is also limited in its duration. A typical game lasts for about three hours, although the time the ball is in play is only one hour.

Therefore it is necessary to select appropriate noise criteria, which address the unique nature of the Stadium noise. To arrive at appropriate noise impact criteria we consider the Initial Study Checklist and the associated local standards of the community.

4.1 Initial Study Checklist

There are two or three topics in the Initial Study Checklist that could cause a potentially significant noise impact to occur when the Stadium is used either for an NFL football game or a popular music concert.

- Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.
- Substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project.
- Project may be located within an airport land use plan area (SFIA). Project may expose people residing in immediate area to excessive noise levels.

4.2 Local Noise Criteria

The criteria cited in Environmental Protection Element of the City and County of San Francisco General Plan and the criteria cited in San Francisco Police Code are reviewed to determine which could be applicable to a noise impact evaluation of the Stadium.

4.2.1 Local General Plan

The Environmental Protection Element of the General Plan contains a Transportation Noise (TN) section. Objective 10 of the TN section is to *Minimize The Impact Of Noise On Affected Areas.* Although typically used to evaluate proposed new residential developments, the "Land Use

Compatibility Chart for Community Noise" contained under Objective 11 (***Promote Land Uses That Are Compatible With Various Transportation Noise Levels***) of the TN section, it is proposed that the guidelines the Chart provides can be used to evaluate projected increases in noise and their impact on existing residence based on current ambient levels of community noise.

- For residential developments, an L_{dn} of 60 or less is considered satisfactory with no special noise insulation requirements.

- Where the L_{dn} is between 60 and 70, new construction would be undertaken only after a detailed analysis.

- Where the L_{dn} is over 65, new construction is generally discouraged.

From these general guidelines, we are inclined to conclude that where existing ambient levels in the residential community exceed 65 L_{dn}, increases in community noise, even temporary or periodic increases, could be potentially significant.

4.2.2 San Francisco Noise Ordinance

Article 29 of the San Francisco Police Code regulates the creation of noise in the community by defining noise, how it is measured, and establishing when a noise level is in violation of the Police Code. Some of Article 29 pertains to transportation and construction noise sources. There are three sections of Article 29 that appear to be relevant to the proposed Stadium project. Note that the language of the Code has been paraphrased below and what appears to be relevant to the Project was included.

- Sec. 2901. Definitions

  To address general community noise sources, "ambient" means the lowest sound level repeating itself during a minimum ten-minute period as measured with a type 1, precision sound level meter, using slow response and A-weighting. For the purpose of this chapter, in no case shall the ambient be considered to be less than Forty-five dBA for exterior noise.

  To address music from entertainment venues, "low frequency ambient" means the lowest sound level repeating itself during a ten-minute period as measured with a sound level meter, using slow response and C-weighting. For the purpose of this chapter, in no case shall the local ambient be considered to be less than Fifty-five dBC for exterior noise.

- Sec. 2909 Noise Limits

  (b) Commercial and Industrial Noise Limits

  No person shall produce or allow to be produced by any machine, or device, music or entertainment or a combination of same, on commercial or industrial property a noise level more than eight dBA above the local ambient at any point outside the property plane. With respect to noise generated by a licensed Place of Entertainment, in addition to the dBA criteria a secondary low frequency dBC criterion shall apply to the definition above. No noise or music associated with a licensed Place of Entertainment shall exceed the low frequency ambient noise level defined by Section 2901 (f) by more than eight dBC.

- Sec. 2910 Variances

  The Directors of Public Health, Public Works, Building Inspection, or the Entertainment Commission, or the Chief of Police may grant variances to noise regulations, over which they have jurisdiction pursuant to Section 2916. All administrative decisions granting or denying variances are appealable to the San Francisco Board of Appeals.

Although not explicitly stated, it would appear that the ambient noise levels defined by Section 2901 would be consistent with what is called the L_{90} (level exceeded 90% of the time) or the background noise level, since the operative words are the “lowest repeating sound level.” If this is in fact the intent of Article 29 and it appears that it is then the noise limits are L_{90} + 8 dBA for general community noise and L_{90} + 8 dBC for low frequency noise such as might be produced by amplified music.

The Article 29 noise limits are quite restrictive, in particular for events that are infrequent, generate transient noises and last for a limited duration. Article 29 noise limits have more relevance to noises that are permanent and continuous. The noise produced during a football game is very transient in nature. Cumulatively the noises would last for less than 1 hour and occur eight times a year. The very transient nature of football game noises are such that each noise event typically lasts for 1 minute or less except of course during the halftime show when the a music program is performed. The halftime show may last for approximately 20 minutes.

In the case of a music concert, the noise producing portion may cumulatively last approximately 2 to 3 hours and occur once or twice a year. However, unlike football game noise (crowd cheering and PA announcements), music concert noises would typically last for periods of 10 minutes each followed by short pauses. This would typically repeat for an hour until the performers took a break.

Section 2910 allows for variances from the noise regulations. It would appear that in the case of the Stadium the Entertainment Commission would have jurisdiction. Section 2910 seems to indicate that under certain circumstances discretion is applied to enforce the noise limits.

Although they are exempted, common community noise sources such as automobiles, buses and trucks routinely generate levels that exceed the Article 29 noise limits. There are also yearly events that occur in San Francisco, which produce noise levels in excess of Article 29 noise limits, examples of which are the Blue Angels flying showing the occurs during Fleet Week and there are fireworks on the 4th of July.

Under the circumstances and with all due consideration, applying the Article 29 noise limits as thresholds for significant impacts would appear to be inconsistent with the intent of CEQA. However, the noise projections for a football game and for a music concert are compared to Article 29 noise limits and discussed.

4.2.3 L_{max} Criterion

It is common to apply a limit to the maximum noise level (L_{max}) when noise is transient or even continuous but of short duration. The maximum noise level that would interfere with normal speech indoors is commonly used as a criterion. Noise levels that exceed 60 dBA would generally be considered to cause interference with normal speech or interference with listing to television, whereas noise levels that are less than 55 dBA would generally not interfere. The amount of sound reduction typically obtained from residential structures with windows closed ranges from 15 to 20 dBA. Consequently, an exterior noise level that did not exceed 75 dBA would not be expected to substantially interfere with normal speech indoors. Exterior levels that exceeded 75 dBA might be expected to interfere with speech indoors or comfortably listening to television. We propose that a reasonable outdoor L_{max} criterion is 75 dBA.

4.2.4 Audibility of Game Sounds at Greater Distances from the Stadium

It may be possible for individuals in the noise study area at times and under the right weather conditions to hear sounds from NFL football games and music concerts even though the noise levels associated with these sounds do not necessarily exceed local standards such as Article 29. Sometimes this may occur at distances removed from the Stadium (e.g., greater than 1 mile) and in particular in neighborhoods where there is low background ambient noise.

Audibility of Stadium sounds might be cause for concern among certain individuals in the community bothered by such sounds. However, in the case of the proposed Stadium, this is not expected to cause a significant noise impact, because Candlestick Park currently exists and is used for the 49ers games. Presumably under the right weather conditions current 49ers game sounds from Candlestick Park can be heard over a wide area. Consequently this phenomenon is already part of the existing ambient condition.

4.3 Proposed Significance Thresholds for Noise Impacts

WIA proposes the following steps in determining whether a significant noise impact is projected to occur:

a) Evaluate the change in L_{dn} on a typical football day due to operational noise. Minor changes of less than 1 dBA would be considered less than significant regardless of the existing ambient. Greater changes of more than 1 dBA could be considered potentially significant if the existing ambient L_{dn} exceeds 65 or the change in the L_{dn} would exceed 65.

b) Evaluate whether projected maximum operational noise levels (L_{max}) exceed 75 dBA.

4.4 Noise Sensitive Receptors Potentially Affected by the Project

The proposed Stadium site is on the land that was the former Hunters Point Shipyard (HPS). The land is now vacant except for a couple of large, unoccupied buildings. There are currently four residential neighborhoods to the north and west of the HPS site. Most of the residences in these neighborhoods are single-family homes, but there are apartments as well.

WIA conducted long-term ambient noise measurements at six locations in these neighborhoods. The locations of these measurements are indicated as N1 through N6 on the aerial photo in **Error! Reference source not found.**. As discussed further below, there are additional noise sensitive receptor locations which WIA has modeled as part of this analysis in order to address the range of community environments affected. All ten noise sensitive receptors studied are shown on the aerial photo in Figure 4-2 where R1 through R6 represent the same locations as N1 through N6. The long-term ambient noise measurements were conducted first by recording A-weighted community noise levels in January 2009 and then C-weighted community noise levels in July 2009.

The topography of the area surrounding the Stadium site is somewhat complex. Directly to the north there is a bluff that forms the end of a ridge extending to the northwest almost to Third Street. The bluff is currently being developed as residential land by Lennar (Phase I). The ridge shields the residential portion of the Hunters Point neighborhood from the Stadium site. To the southwest is Candlestick Point and above that to the west is the Bayview Heights neighborhood which elevated above the surrounding terrain. To the northwest of the Stadium site the land is generally flat and rising to the Silver Terrace neighborhood.

The noise study area, for the Stadium option of the Project, extended out to approximately 1½ miles away from the site. The reason for having such a large study area was to include receivers that while not normally affected by Project noise associated with the Stadium, under certain metrological conditions might experience higher levels of noise than usual. Such conditions occur only infrequently.

4.4.1 Hunters Point Neighborhood

There are existing residences relatively near the Stadium site and there also new residential areas proposed for the Project. Lennar Corporation is also currently developing land under the Hunters Point Shipyard Phase I (Phase I) redevelopment plan, which will include residences just to the north of the Project site. The closest existing residential land to the proposed Stadium site is located just north of Donahue Street.

Receptor location N3 (located near the corner of Donahue Street and Kirkwood Avenue) is generally characteristic of the quieter portions of this neighborhood. However this may change depending on traffic patterns once the Phase I Lennar development is completed. The ambient noise in this part of the Hunters Point neighborhood was measured to be L_{dn} 58 to 62 (Saturday through Monday). The noise levels on the Saturday (1/10/09) when measurements were obtained may have been elevated somewhat by construction grading work occurring on the Lennar property directly across Donahue Street. The normal ambient noise is due to a combination of motor vehicles on local and distant streets.

Receptor location N4 (located on Kirkwood Avenue near its intersection with Ingalls Street) has slightly more traffic than does N3. The ambient noise in this part of the Hunters Point neighborhood was measured to be L_{dn} 62 to 65 (Saturday through Monday) with higher levels on Saturday than on the other two days. The ambient noise is due to a combination of noise from motor vehicles on local traffic streets, but primarily on Hunters Point Boulevard.

Receptor location N5 (located near the intersection of Hunters Point Boulevard and Hawes Street) has more traffic than does N3. The ambient noise in this part of the Hunters Point neighborhood was measured to be L_{dn} 62 to 65 (Saturday through Monday) with higher levels on Saturday than on the other two days. The ambient noise is due to a combination of noise from motor vehicles on local traffic streets, but primarily on Hunters Point Boulevard.

In addition to these receptor locations, two other locations were included in the study. Receptor location R7 (at what used to be the intersection of Jerrold Avenue and Coleman Street) is in the area currently being developed by Lennar as Phase I. This is at the closest residential land in this area. Receptor location R8 (on what used to be Robinson Street near Horne Avenue) is representative of the new residential land proposed as part of the Project. No ambient measurements were obtained for these receptors, since they are yet to be developed. However, the ambient conditions will be somewhat like those at N3 and N4 with an L_{dn} probably between 58 and 63 depending on local traffic conditions.

4.4.2 Bayview Neighborhood

This neighborhood is bounded by US101 on the west, Cesar Chavez Street on the north, Gilman Avenue on the south and the Hunters Point neighborhood on the east. It is primarily a residential neighborhood, but also with commercial land in particular along Third Street. Third Street runs through the center of this neighborhood and is a major noise source in addition to US101. The closest homes to the Stadium site in this neighborhood are approximately 3,965 feet away.

Receptor Location N1 (located on Carroll Avenue Walker Drive) is characteristic of the generally noisier portion of this neighborhood, since it is along a truck route. The ambient noise in this part of the Bayview neighborhood was measured to be L_{dn} 63 to 67 (Saturday through Monday) with higher levels on Saturday and Monday than on Sunday. The ambient noise is primarily to traffic on Carroll Avenue.

Receptor location N2 (located on Revere Avenue near Ingalls Street) is characteristic of the somewhat quieter portions of this neighborhood. The ambient noise in this part of the Bayview neighborhood was measured to be L_{dn} 63 to 65 (Saturday through Monday) with higher levels on Monday than on the other two days. The ambient noise is due to a combination of noise from motor vehicles on local traffic streets, but primarily on Ingalls Street.

Additional receiver locations were used to project operational noise levels for the Stadium. They include R9 (located on Palou Avenue near Lane Street) and R10 (located on Bayview Circle near Newhall Street). No ambient measurements were obtained for these receptors. However, it is reasonable to assume that the ambient conditions at R9 will be somewhat like those at N2, with an L_{dn} probably between 63 and 65 depending on local traffic conditions. The ambient conditions at N10 will be somewhat like those at N4, with an L_{dn} probably between 58 and 62 depending on local traffic conditions.

4.4.3 Bayview Heights Neighborhood

This neighborhood is bounded by Gilman Avenue, the San Francisco Bay and US101. It is primarily a residential neighborhood, but also includes Candlestick Park. The closest homes to the Stadium site in this neighborhood are approximately 6,400 feet away. Receptor Location N6 (located at the corner of Jamestown Avenue and Hawes Street) is characteristic of the generally quieter portion of this neighborhood, since it is shielded from US101 and is removed somewhat from Third Street.

The ambient noise in this part of the Bayview Heights neighborhood was measured to be L_{dn} 59 to 60 (Saturday through Monday). The ambient noise is due to a combination of noise from motor vehicles on Gilman Street and some local traffic on Jamestown Avenue. However, on football game days, Jamestown is a major access route to Candlestick Park.

4.4.4 Silver Terrace Neighborhood

Somewhat beyond the study area is the neighborhood of Silver Terrace, which is bounded on the west by US101 and Industrial Street on the north. Silver Avenue bisects the neighborhood. This neighborhood is approximately 2 miles from the Stadium site and therefore was considered to be sufficiently far enough away as to not be significantly impacted.

4.4.5 Nearby Non-residential Land Uses

There are R&D facilities proposed directly adjacent to the Stadium site. These uses would normally be occupied during the daytime work hours on weekdays, but not on the weekend or at night when football games would be held. Consequently, these future facilities were not considered to be noise sensitive for the purpose of this study. There are also existing light industry and warehouse land use to the west and northwest of the Stadium site. This type of receptor is not generally considered to be noise sensitive.

4.5 Ambient Noise Survey

WIA first conducted A-weighted, ambient noise measurements over the course of three days in January 2009. Long-term ambient noise data were obtained between Saturday and Monday, January 10 to 12. **Error! Reference source not found.** indicates the location of the long-term ambient noise measurement locations. WIA also conducted another set of the ambient noise measurements in July 2009 by logging C-weighted levels at the same locations used in January 2009. Both sets of noise data were obtained using Larson Davis digital, sound level meter, logging instruments at six locations. The loggers were mounted to utility poles approximately 12 ft above the ground.

4.5.1 A-weighted Ambient Noise Levels

Hourly data were recorded for the energy average (L_{eq}) and statistical noise levels (L_n, where n=90, 50, 10, and 1) also known as the level exceeded n% of the time. The full hourly data for each of the six measurement locations for the three days are contained in Appendix A. Table 4-1 contains a summary of the L_{dn} measurements by location for each full day of the survey.

Table 4-1 Existing Day-Night Noise Levels (Ldn)

Location ID	Description	Saturday 10 Jan 2009	Sunday 11 Jan 2009	Monday 12 Jan 2009
N1	Carroll Avenue north of Walker Drive	67	63	67
N2	Revere Avenue between Ingalls Street and Jennings Street	64	63	65
N3	Donahue Street between Kirkwood Avenue and Jerrold Avenue	62	58	59
N4	Kiska Road between Reardon Road and Ingalls Street	65	65	66
N5	Hawes Street near Hunters Point Boulevard	65	62	64
N6	Jamestown Avenue at Hawes Street	60	59	60

Table 4-2 contains a summary of the range of A-weighted L_{90} levels), at times when a football game might occur: afternoon (3pm to 6pm) on the weekend and evening on Monday (6pm to 9pm).

Table 4-2 Existing A-weighted Background Noise Levels (L_{90})

Location ID	Description	Saturday[1] 10 Jan 2009	Sunday[1] 11 Jan 2009	Monday[2] 12 Jan 2009
N1	Carroll Avenue north of Walker Drive	45 to 46	45 to 49	43 to 47
N2	Revere Avenue between Ingalls Street and Jennings Street	48 to 49	47 to 50	45 to 49
N3	Donahue Street between Kirkwood Avenue and Jerrold Avenue	42 to 45	43 to 45	41 to 43
N4	Kiska Road between Reardon Road and Ingalls Street	45 to 48	42 to 43	44 to 45
N5	Hawes Street near Hunters Point Boulevard	47 to 50	44 to 46	43 to 48
N6	Jamestown Avenue at Hawes Street	47 to 50	49 to 50	46 to 48

1 Afternoon 3pm to 6pm
2 Evening 6pm to 9pm

4.5.2 C-Weighted Ambient Noise Levels

Hourly data were recorded for the energy average (L_{eq}) and statistical noise levels (L_n, where n=90, 50, 10, and 1) also known as the level exceeded n% of the time. Table 4-3 contains a summary of the C-weighted L_{90} levels at night during the time a concert might occur (7pm to midnight).

Table 4-3 Existing C-weighted Background Noise Levels (L_{90}) at Night

Location ID	Description	Range	Median
N1	Carroll Avenue north of Walker Drive	58 to 63	60
N2	Revere Avenue between Ingalls Street and Jennings Street	55 to 62	58
N3	Donahue Street between Kirkwood Avenue and Jerrold Avenue	53 to 60	56
N4	Kiska Road between Reardon Road and Ingalls Street	55 to 64	59

N6	Jamestown Avenue at Hawes Street	--	--

1 Location of Long-term Ambient Noise Measurement

Location of All Noise Study Receptors

4.6 General Conclusion on Existing Ambient Noise

The existing ambient noise measurement data indicate variable conditions within the noise study area, as would be expected, with some areas which are quieter than others. From Table 4-1 it can be seen that the measured L_{dn} ranges from 58 to 67, with the highest level measured at N1, which is due to a higher level of truck traffic there than elsewhere. Noise levels on the weekend, as would be expected were lower (from 1 to 4 dBA) on Sunday than on Saturday and Monday's noise levels were generally similar to Saturday's.

The ambient noise conditions in the study area can be characterized as being generally noisy with L_{dn} values that, except in two locations (N3 and N6) approach or are greater then than 65. An L_{dn} of 65 can be considered the threshold of unacceptable for new residential development. It was observed that N3 and N6 had less traffic than the other locations measured, which would explain why these locations are quieter than the others.

Background A-weighted noise levels at the six measurement locations indicate a range of 42 to 50 dBA taking into account all locations. At quieter locations (N3 and N4), a median L_{90} is about 44 dBA. At the rest of the locations (N1, N2, N5 and N6) a median L_{90} is about 48 dBA.

Background C-weighted noise levels at night range from 53 to 63 taking into account all six locations. For quieter locations (e.g., N3) the median L90 is about 56 dBC. For the other locations, the median L_{90} is about 59.

5.0 Project Noise Sources and Prediction Model for Football Games

During football games, the noise sources that will likely have the most potential to affect the stadium surroundings will be: a) noise from the crowd and b) amplified speech, music and/or sound effects from the sound system. The intensity of the crowd noise is not controllable nor would that be desirable and will vary depending on the number of people and their reactions to what is happening on the field. Further there are no feasible physical changes other than proximity to receptors that can be made to lessen crowd noise with an open stadium design. In general, the Stadium sound system noise sources is the easier of the two noise sources to control. This can be accomplished through the selection of the loudspeakers and their orientation.

5.1 Crowd Noise

WIA modeled the noise from the audience in the Stadium as an area source with uniform sound power distribution. The model assumes the exposed seating areas contain a total of approximately 65,000 seats (i.e., all seats except the enclosed suites).[1] Figure 5-1 illustrates the extent of the crowd area based on the outline of the seating sections angled from the top seating row down to the field level.

The noise spectrum (i.e., frequency content) is based on 1/3 octave band data that WIA obtained from measurements for another stadium project. WIA has adjusted the 1/3 octave band data to represent the total sound power for a full capacity crowd at the 49ers Stadium. The underlying metric for the sound power derivation is the L_1 (levels exceeded only 1% of the original measurement period). Refer to Figure 5-2 which shows the reference spectrum. While use of the L_1 is more conservative than other metrics such as an L_{eq} or a set duration, WIA believes this is more appropriate as a starting point for this study. The crowd noise projections are thus representative of anticipated relative maximum noise levels. However as the duration of event noise levels is also important with respect to community noise standards and proposed impact criteria, WIA also made projections that account for anticipated duration of event noise levels for a typical game as described in Section 6.

[1] Based on the number of seats listed in “Areas and Seat Counts etc 11-20-2006.xls” for the Lower, Mid, and Upper Bowl general seating sections (57,834 seats) adjusted to included club seats in the Red Zone, Main, and Mezzanine sections for a total of approximately 65,000 seats. Assumes approximately 5.38 ft^2 (0.5 m^2) per seat.

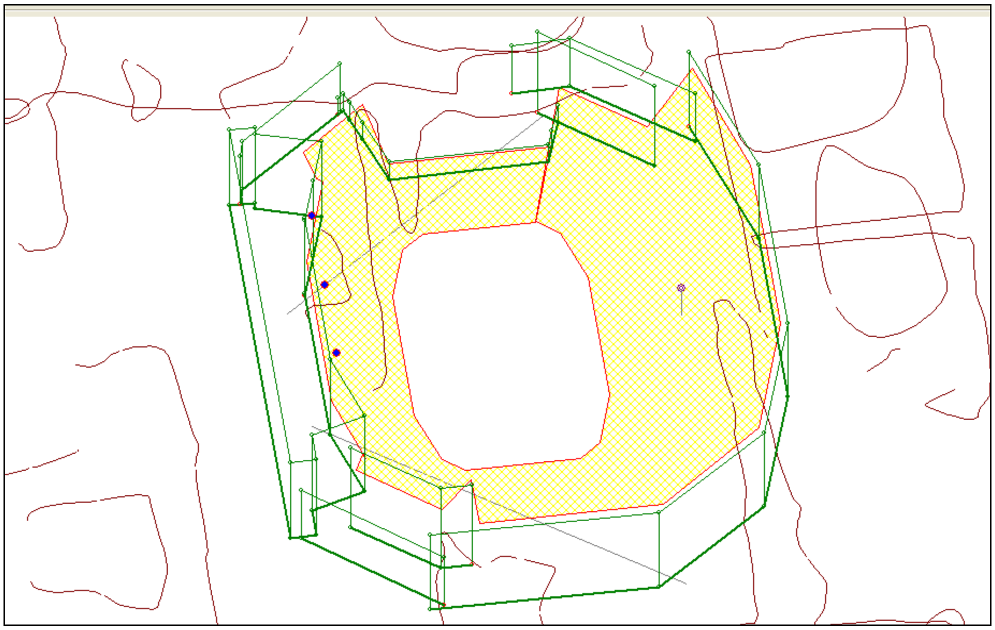

Figure 5-1 Computer Model Representation of Crowd Noise Area Source

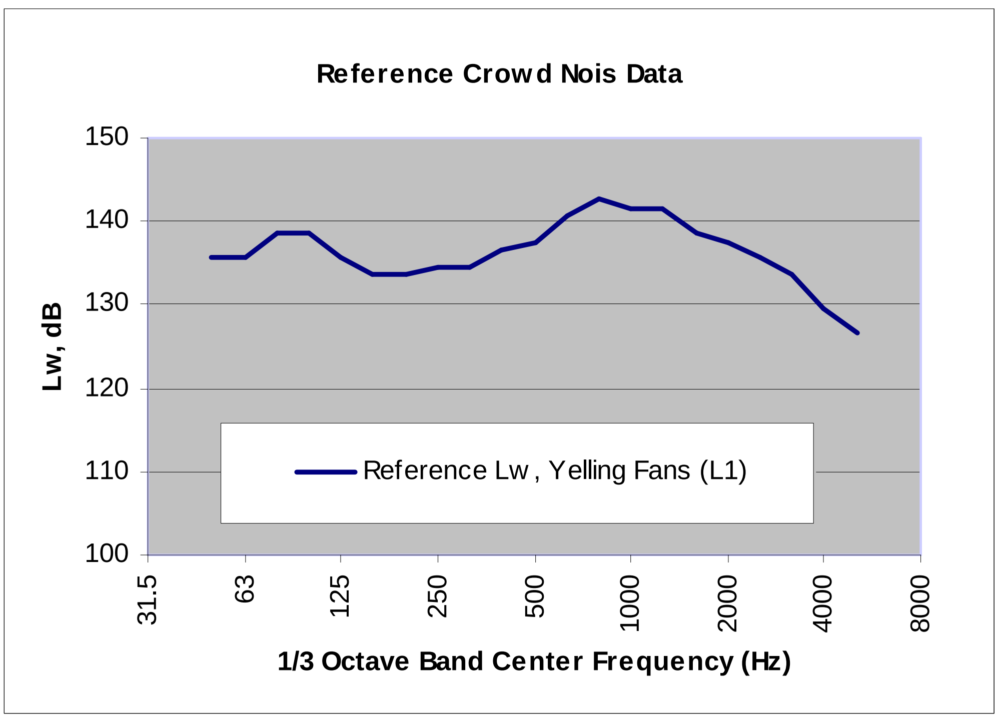

Figure 5-2 49ers Crowd Noise Reference Sound Power Levels

5.2 Stadium Sound System Noise

The Stadium will have a sound system which WIA anticipates would be similar to that which is currently installed at Soldier Field in Chicago. Consequently a similar sound system design concept served as the basis for developing the Stadium model. Figure 5-3 shows part of the sound system at Soldier Field.

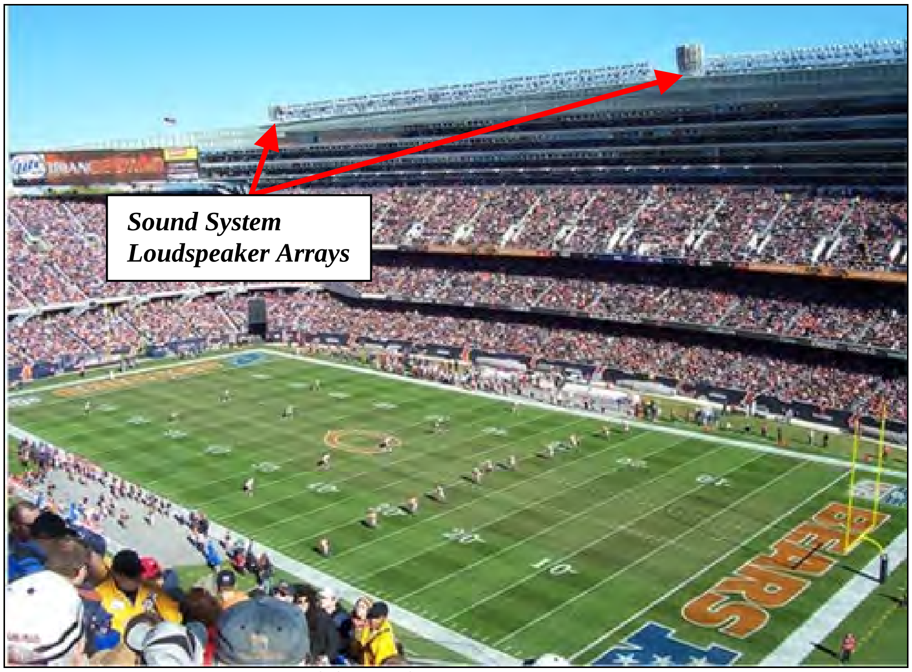

Photo Source: http://www.stadiumsofnfl.com/nfc/images/soldmain08.jpg

Figure 5-3 Soldier Field in Chicago, Illinois

The Stadium sound system would likely use JBL VLA or similar type series arrays with a sideline (as opposed to end-zone) cluster configuration for the following reasons:

1. The configuration of the suites along one sideline is a good place to locate the side cluster, especially since there are no loudspeaker mounting opportunities on the opposite side.

2. The difference between an end-zone cluster and side line cluster is that in the side cluster the three arrays would be “distributed” with the center array on the roof of the suites at the 50 yard line covering all the seats on the opposite side between the 10 yard lines. The other two clusters will also be on opposite ends of the roof at the 10 yard lines covering the remaining seats from the 10 yard lines around through the end zones.

Figure 5-4 and Figure 5-5 illustrate the general concept configuration in plan and section, respectively. The greatest potential noise impact would likely be from three large arrays on the roof of the suites pointing across the field out toward the opposite seats. As shown in the section view, the center array assumes a throw on axis of about 504 ft from the roof top to the seating plane.

Each of the three arrays is assumed to have a horizontal coverage of about 60 degrees and a vertical coverage of about 30 degrees. These are the 6 dB down points of the loudspeaker array coverage. The horizontal coverage is determined by the type of device used in the array, in this case JBL VLA601H. The vertical coverage is controlled by the number of individual components in the array (it will be probably be about six, as shown), and by the “splay” of the array (the angle between components).

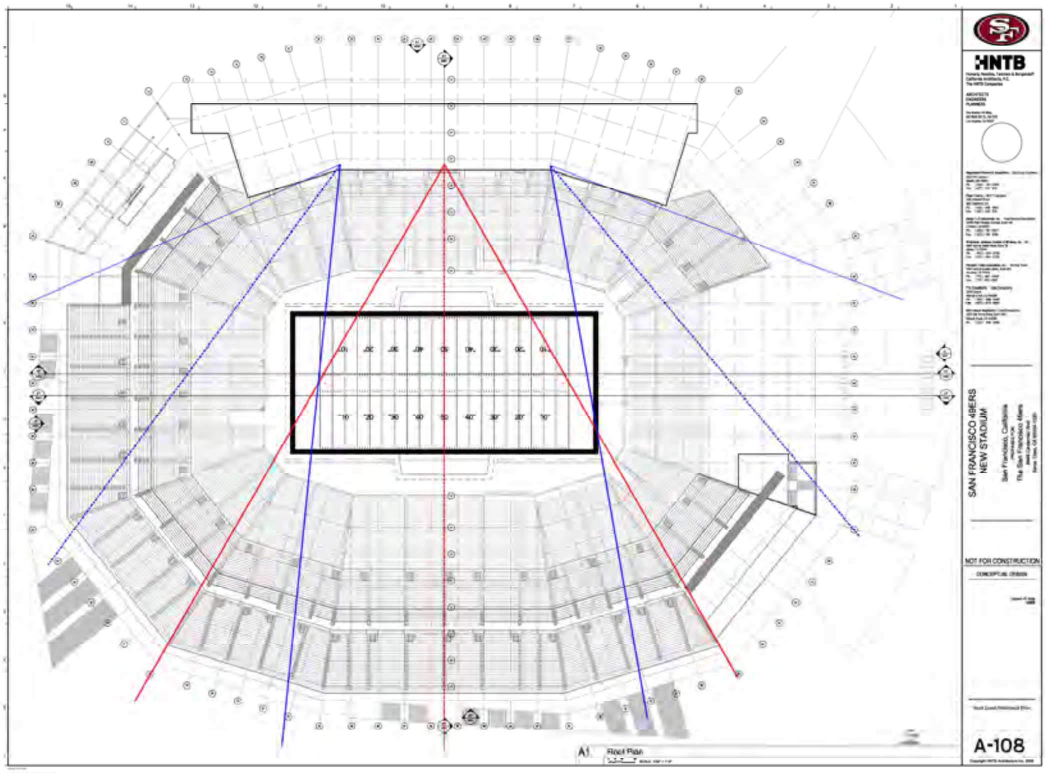

Figure 5-4 Plan View of Sideline Cluster Sound System Configuration Concept

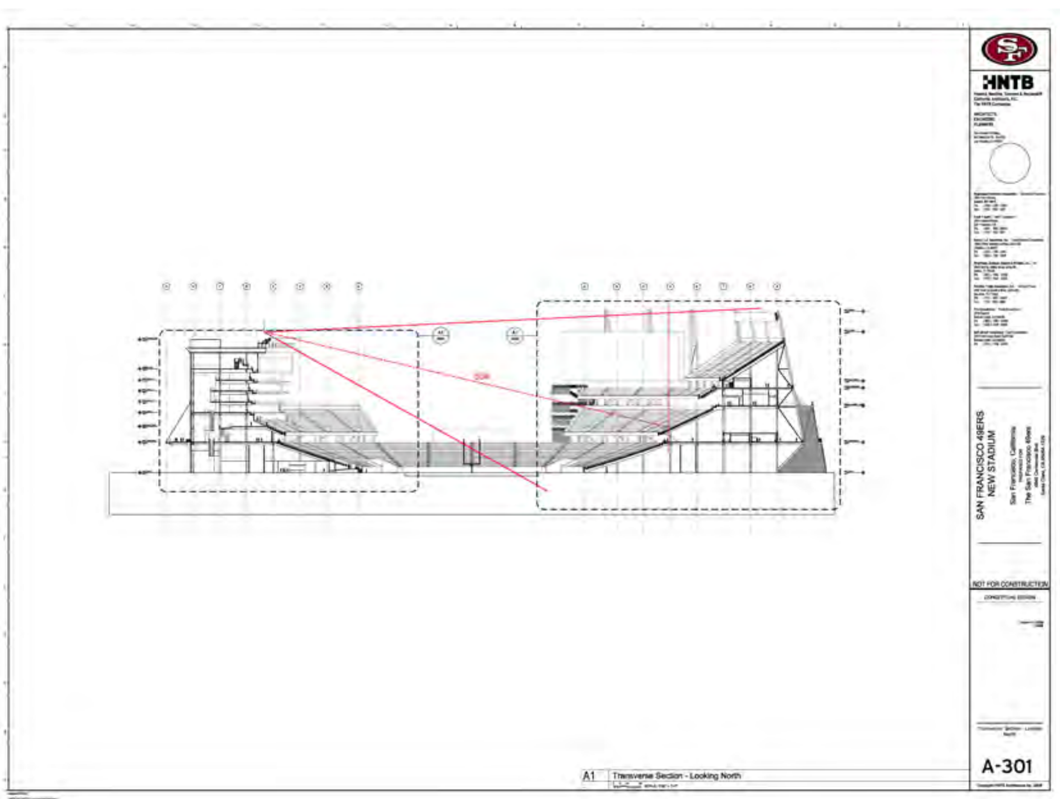

Figure 5-5 Section View of Sideline Cluster Sound System Configuration Concept

Figure 5-6 shows the location of the three line array clusters with respect to the Stadium in the computer model. In modeling the sound system noise source, WIA has assumed:

- The sound system achieves a sound pressure level of 105 dBA at the seats,
- Sound power levels based on pink noise (equal sound power per 1/3-octave band)[2],
- Point source attenuation for each cluster positioned at a height of 169 ft (51.5 m),
- 6-box line array built using EASE[3] software to create 500 Hz and 1 kHz directivity polar plots in horizontal and vertical directions,
- 500 Hz directivity pattern assigned to octave bands 500 Hz and below and 1 kHz directivity pattern assigned to octave bands 1 kHz and above.

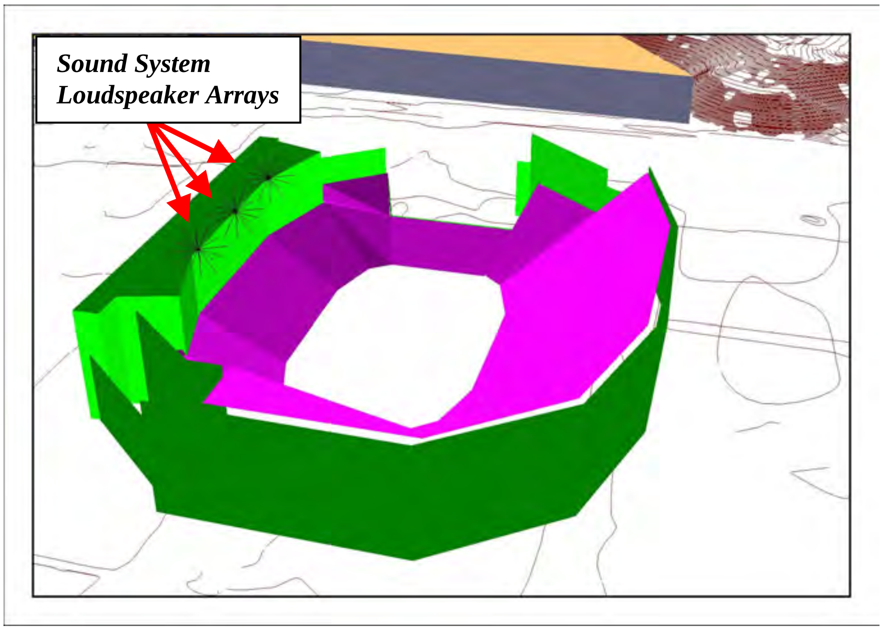

Figure 5-6 Computer Model of Stadium Sound System

The system will likely include other loudspeaker components (not currently in the model), such as small distributed loudspeakers covering under balcony seating opposite the suites which do not have line of sight to the clusters. The seats on the suites side of the field would be covered by distributed loudspeakers mounted on and under the suites. This study does not include any distributed loudspeakers since these would be small and pointing down toward the zones of coverage. Since these loudspeakers would be close to the seats and pointing towards them, the sound energy would be well contained within the seating bowl. Representing the maximum sound power with just the line arrays is therefore a conservative assumption.

5.3 Noise Projection Computer Model for Football Game

WIA developed a 3-D computer noise model using SoundPLAN® to project Stadium operational noise levels to the surrounding community for football games.
Figure 5-6 shows the model in plan view and the location of the Stadium with respect to the ten model receivers. Figure 5-7 shows the model in perspective view illustrating the site topography.

[2] The pink noise assumption is somewhat conservative and may warrant further refinement.
[3] Enhanced Acoustic Simulator for Engineers (EASE), version 4.2,using JBL_VLA_V1p5.dll.

For the purpose of this study which involves sound propagation over large distances, WIA evaluated results using the ISO 9613-2 1996 methodology which is a widely used industry standard and generally considered to be fairly reliable. The model accounts for geometrical spreading losses, air absorption, ground effects and acoustical shielding from buildings or topography that may block line-of-sight conditions between noise sources and receivers.

<u>Model Receivers</u>
All model receivers are 5 ft above the local terrain elevation. As indicated above, receivers R1 through R6 are located at the 6 long-term noise measurement locations (N1 through N6). As described above in Section 4, the additional study receivers include:

Two receivers east of long-term measurement location N3:

- R7 is on Coleman Street, representative of the new residential development, (it as at the closest point extending out from the long axis of the stadium).
- R8 is at the closest point in the proposed Project HPS Residential Density III area (next to the HPS Village Retail Center).

Two receivers in the Bayview Neighborhood:

- R9 is on Palou Avenue and Lane Street
- R10 is on Bayview Circle near Newhall Street

<u>Stadium Shell</u>
The model represents the outer shell of the Stadium as noise walls with different heights, depending on the highest elevation of the stadium structure (e.g., suite tower roof, top row of seating, top of scoreboard). Noise generated from within the Stadium will project out over the stadium structure. As shown on the conceptual design drawings, the main concourse (36.5 ft high) is open on the north end, leaving less acoustical shielding in that direction.

<u>Topography/Terrain/Attenuation</u>
The site terrain data are based on an import of the CitySF_Topo drawings scaled to metric units (a SoundPLAN® convention). The entire project area assumes a ground absorption of 0.30 (0 = hard; 1 = soft) assuming the majority of it will be developed land, except for State Park Land (0.50) and water (0.00).

Building data are based on an import of the x-Korve-topo layer and conversion to building objects in SoundPLAN®. Buildings directly east of Location N3 have been deleted due to current redevelopment occurring there. Building 199959 (east of N3) will not be in the future scenario and has been replaced with one 100 ft tall and the same size as the proposed R&D area shown on the building's elevation plan view drawing provided by PBS&J. The purpose of this step was to study potential acoustical shielding effects this may have on nearby receivers.

<u>Meteorological Effects</u>
For all calculations, the model assumes average conditions for the area: 71.5% humidity, 29.36 in Hg, and 56.6 ºF [4]. For evaluating potential worst case wind conditions (i.e., receiver downwind of noise source), WIA assumed a maximum expected wind speed and potential worst case direction for each receiver. Though very infrequent since the general prevailing winds blow from west to east, high winds may achieve 24 mph occasionally in the direction of the neighborhoods. Section 6 below

[4] www.wunderground.com

further discusses the noise levels associated with the worst case wind conditions for each receiver and likelihood that such conditions would occur.

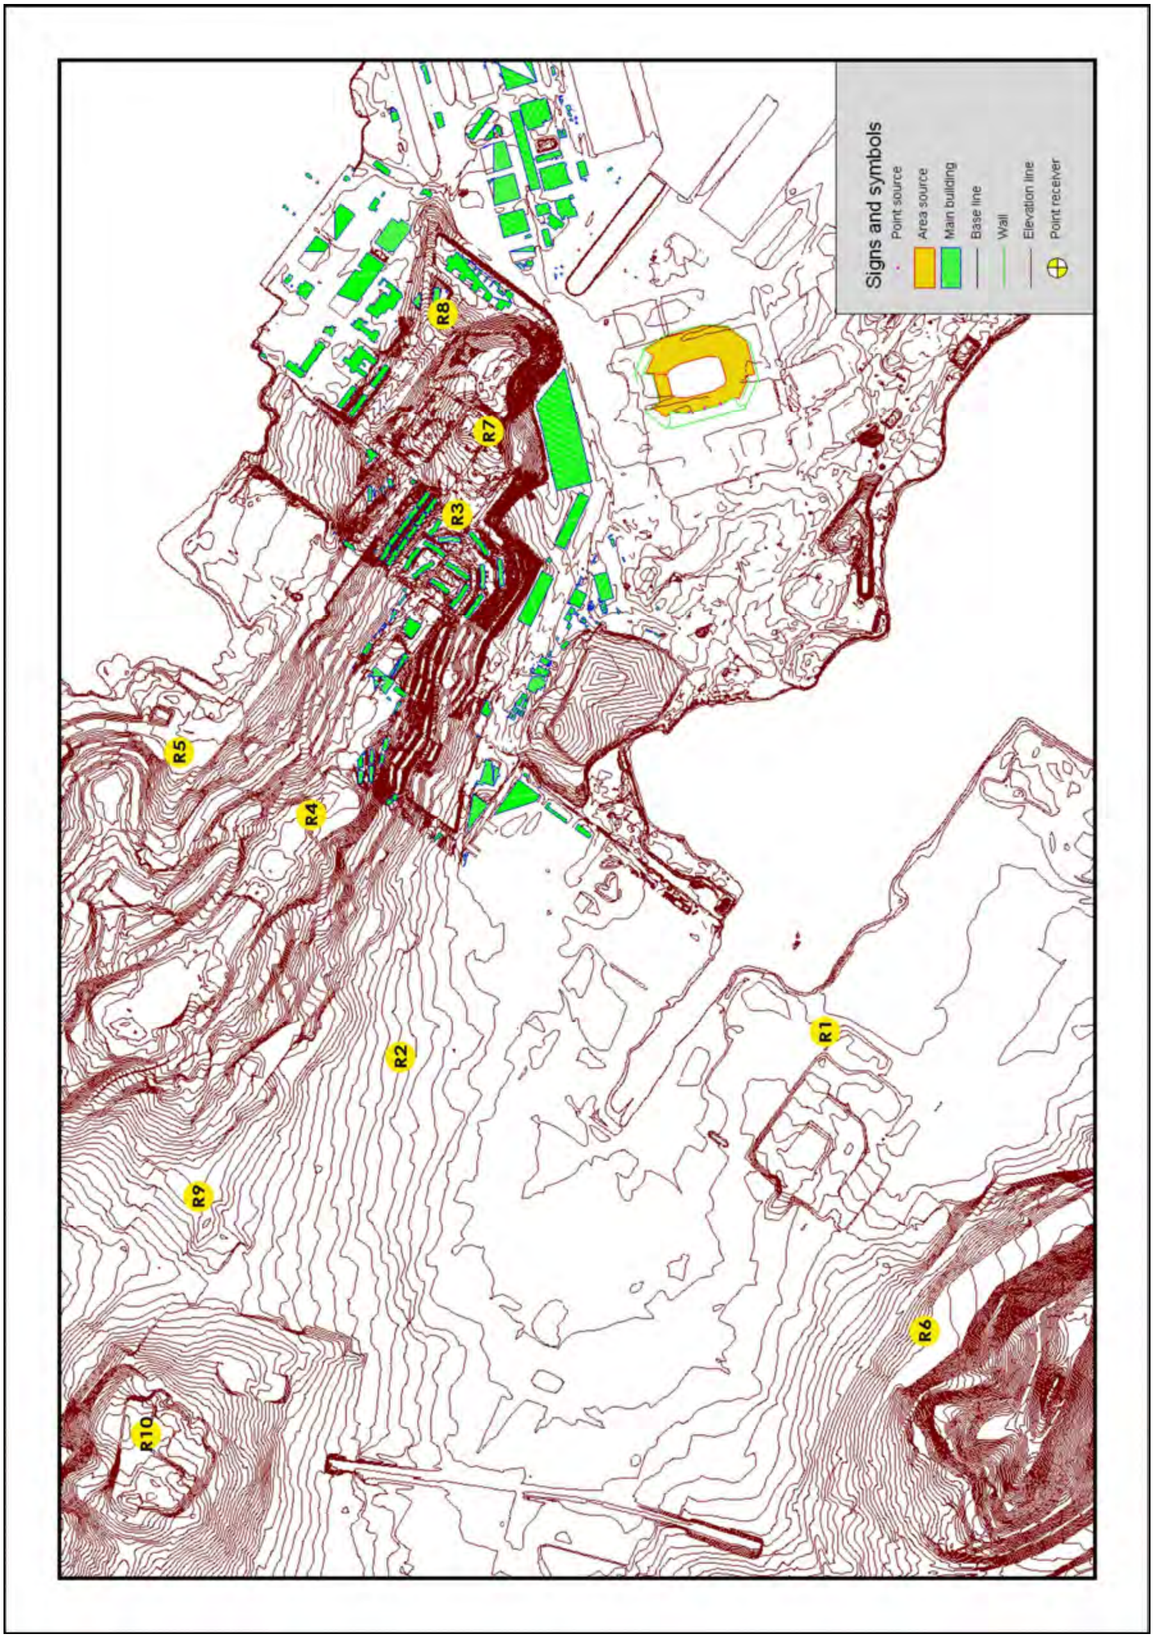

Figure 5-7 3-D Computer Noise Model (Plan View)

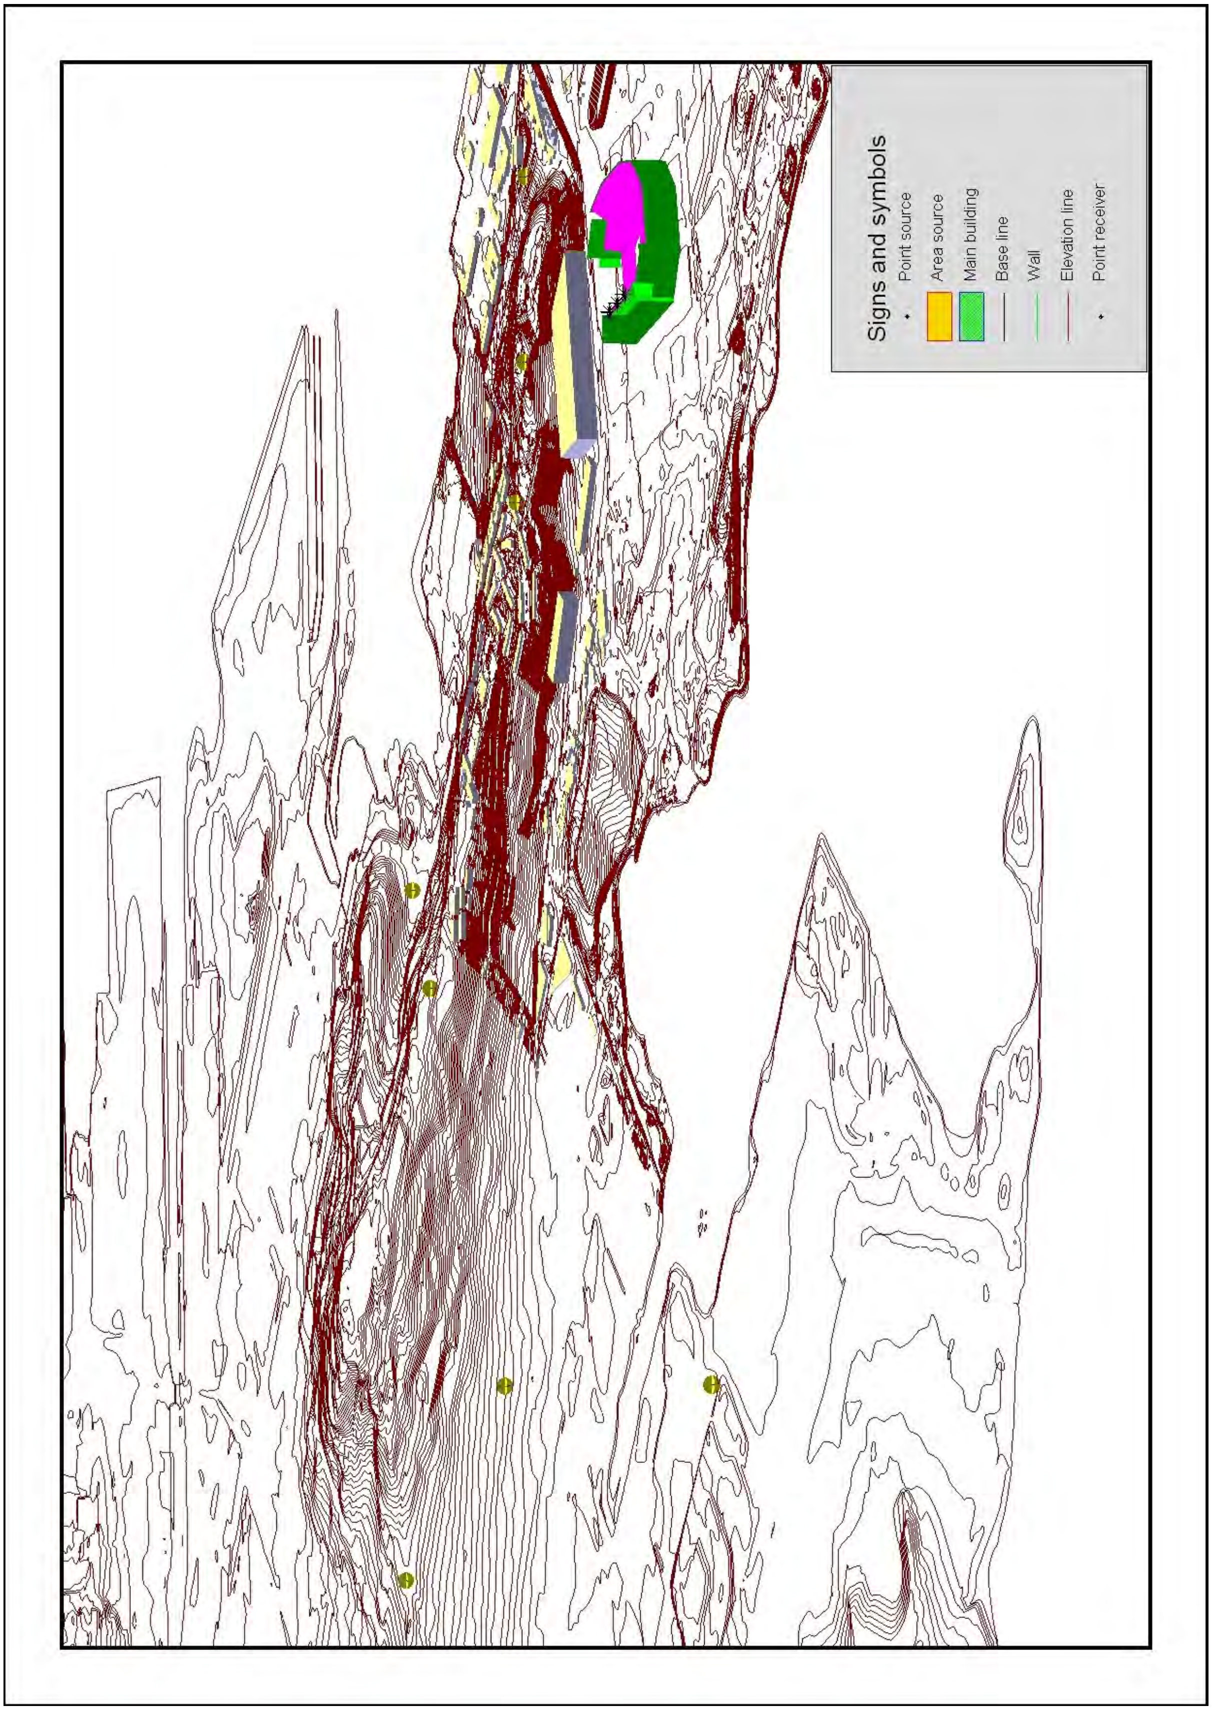

Figure 5-8 3-D Computer Noise Model (Perspective View)

6.0 Project Noise Sources and Prediction Model for Music Concerts

During music concerts, there is primarily only one noise source that needs to be considered and that is the performer's sound system. The audience will produce some noise, but it is reasonable to assume that it will be of a lesser intensity than the crowd noise at a football game. In general, the performer's sound system can be controlled to some degree. This can be accomplished through the selection of the loudspeakers and their orientation.

6.1 Music Concert Sound System

The performer's sound system would be similar to that which is typically seen at many large outdoor music concerts.

Figure 6-1 illustrates what such a sound system could look like.

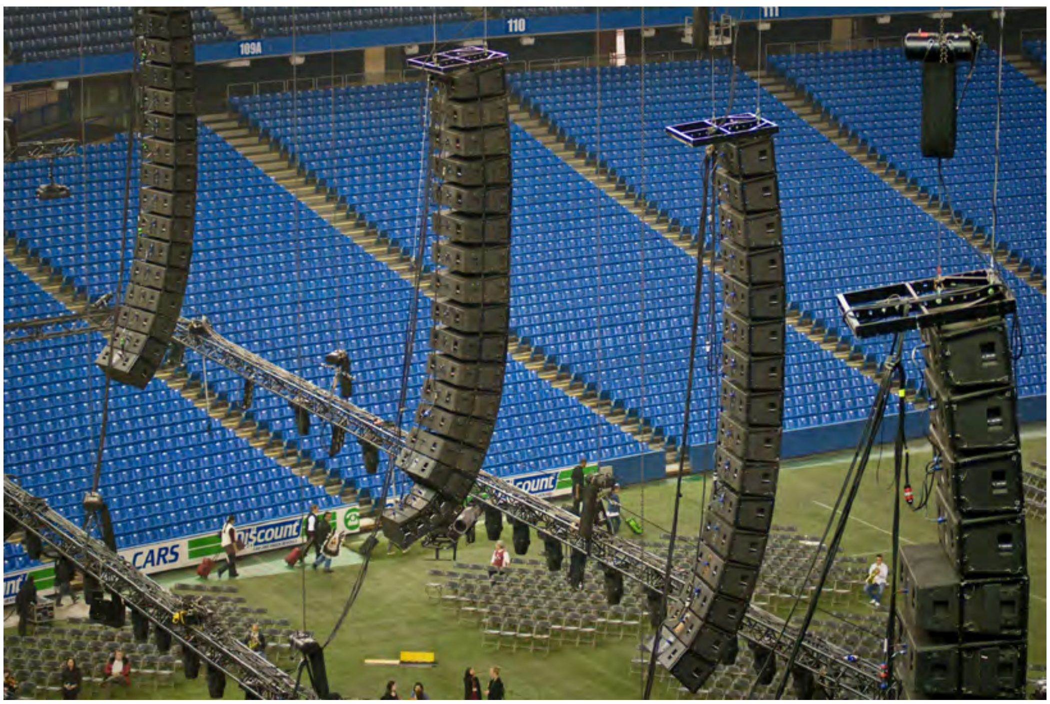

Figure 6-1 Example of Sound System for Touring Concerts

The performer's sound system would likely use JBL or similar type line series arrays composed of full-size components:

1. At the performance stage there would be four line arrays serving as FOH and composed of twelve full-size elements such as JBL VerTec VT4880 above four full-size arrayable subwoofers integrated into each full-range speaker array such as JBL VerTec VT4880.

2. Two towers with delayed signals would be positioned at the 50-yard line to fulfill the back of the Stadium audio needs. Each tower has a pair of eight box arrays, an example of which is a JBL Vertec 4889 full-size array with multiple elements.

Figure 6-2 shows the location of the line arrays with respect to the Stadium in the computer model. In modeling the performer's sound system as a noise source, WIA has assumed:

- Stage layout for large venue is either at north end of field or at 50-yard line,
- Towers (end field and delay) are directed south towards Bay,
- The sound system achieves a sound pressure level of 105 dBA at the mixing panel on the field in front of the stage,
- Sound power levels were based on three different samples of music including one rock sample and two hip-hop samples,
- Point source attenuation for each cluster positioned at a height of 36.5 ft (11.1 m),
- 16-box line array (Vertec VT4880) built using JBL Calculator[5] to create angle and coverage of array and EASE[6] software to create directivity polar plots in horizontal and vertical directions for 100 Hz to 2 kHz,
- For Vertec VT 4880 line arrays 100 Hz directivity pattern assigned to octave bands form 25 to 200 Hz, 500 Hz directivity pattern assigned to octave bands from 250 to 8000 Hz, and 1 kHz directivity pattern assigned to octave bands 1 kHz and above,
- Four arrayable subwoofers (Vertec VT 4889) built using JBL Calculator to create angle and coverage of array and EASE software to create directivity polar plots in horizontal and vertical directions for 25 to 160 Hz,
- For Vertec VT 4889 subwoofer line arrays 100 Hz directivity pattern assigned to octave bands form 25 to 160 Hz.

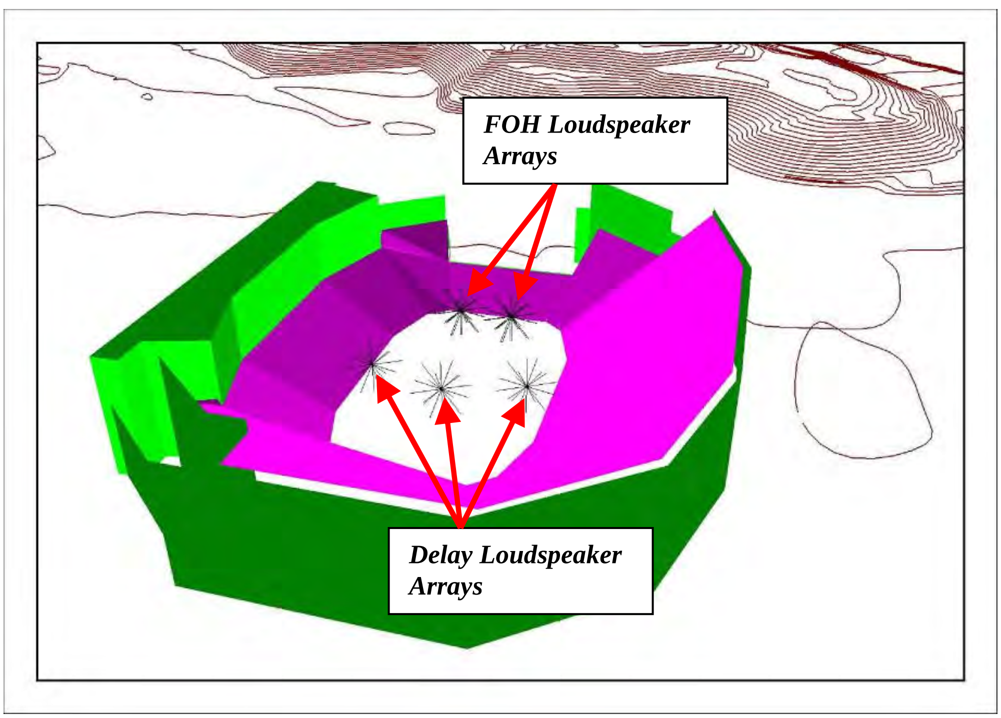

Figure 6-2 Computer Model of Concert Sound Systems

[5] JBL Vertec Line Array Calculator Version 2.10
[6] Enhanced Acoustic Simulator for Engineers (EASE)

The sound pressure levels at the mixing console for each of the three music samples are shown in Figure 6-3.

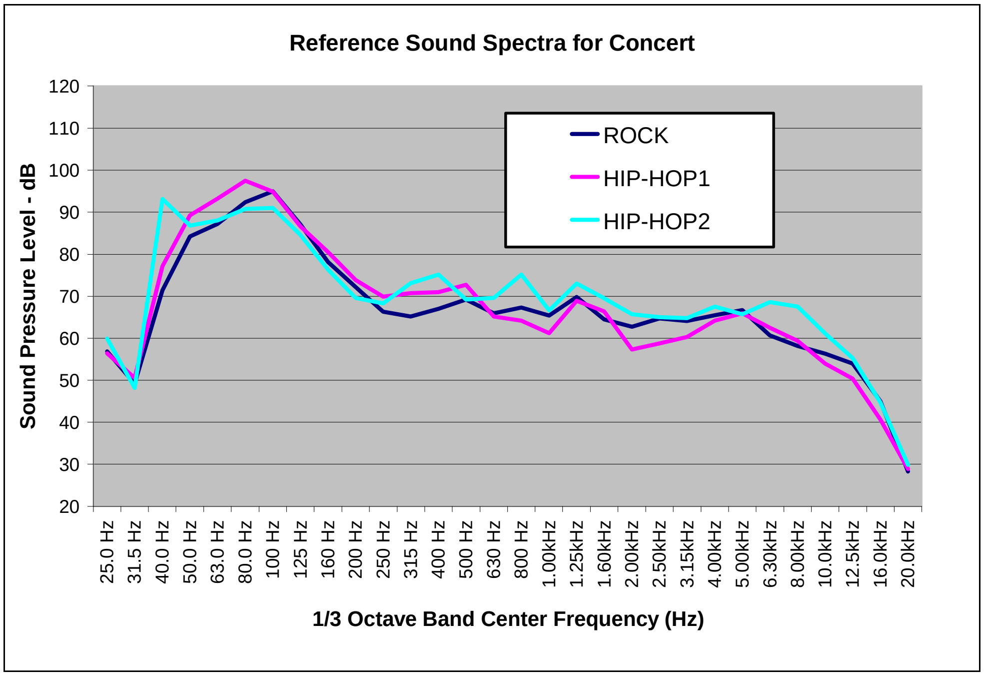

Figure 6-3 Concert Music Sound Pressure Levels

6.2 Noise Projection Computer Model for Concert

The same computer model used for football game noise projections was used to project concert noise outside the Stadium, except for the different sound system being used as described above. Consequently, Figure 5-7 shows the basic geometry of the noise projection model as modeled in SoundPLAN®.

7.0 Potential Noise Impacts

7.1 Football Games

WIA has evaluated the potential noise impacts associated with both the crowd and sound system for a typical full capacity football game. As is standard practice, the noise analyses conducted by WIA to determine noise impact levels assume noise sensitive receptors that are located five feet above the ground and at the setback or nearest building façade to the noise source.

Projections assume a typical game is on the order of three hours with crowd and/or PA noise sustained at typical maximum levels for an aggregate 45 minutes over the three hour period. This is a conservative assumption in that crowd noise probably is less than 45 minutes and not necessarily would occur at maximum levels. Furthermore, it is also assumed that crowd noise consists of people cheering continuously during this 45 minute aggregate. The assumption was also made that all of the football fans in the stadium are cheering at maximum level they are capable of when they do cheer. These are also conservative assumptions.

For the two noise sources (fans cheering and PA), WIA presents the projections for maximum noise levels (L_{max}), and the day night level (L_{dn}) for a game day with the conservative assumptions of level and duration of sound. The game day L_{dn} calculations are based on a noise energy summation of the existing ambient hourly L_{eq} noise levels at each location (i.e., measured or assumed from measured data) and the projected game noise levels at that location. The L_{dn} calculations assume typical games would be during evening hours and game operational noise would not occur between 10 p.m. and 7 a.m. which could substantially affect the L_{dn}. Doubleheaders, game delays, or other potential reasons for game operations occurring past 10 p.m. would increase the potential for noise impacts.

7.1.1 Impacts Associated with Individual Noise Sources at Football Games

It should be noted that the noise levels projected in detail herein are for a “no wind” condition. The presence of a wind blowing to the south or east would greatly reduce the noise levels occurring in the local residential community. Consequently, the operational impact analysis is based on a conservative assumption.

7.1.1.1 Football Crowd Noise

WIA evaluated the impact of noise from fans cheering in the Stadium during a “no wind” condition. This is a conservative assumption in that often the local wind is either blowing to the south or east away from the residential community and towards the Bay. Based on the analysis results shown in Table 7-1, WIA would expect noise levels to exceed the proposed impact criteria at receivers R3 and R7 based on the conservative conditions assumed. It should be noted that except for the wind condition the L_{max} levels would be expected to occur and possibly often, however the changes in L_{dn} levels are based on duration and level may not occur with regularity.

At R3, which is representative of the existing residential portion of the Hunters Point neighborhood closest to the stadium, crowd noise would be less than the 75 dBA L_{max} criterion during a game. There is the potential for an impact based on L_{dn} although the projected game day L_{dn} is less than 65. The potential increase is 2 to3 dBA which could be considered significant.

Higher noise levels are predicted at R7 which is representative of the new residential development closest to the stadium and closer to the stadium than R3 but not part of the Project. At R7, maximum crowd noise would approach but not exceed the 75 dBA L_{max} criterion. The L_{dn} may increase by 4 to 7 dBA assuming ambient noise data measured at R3 (N3) is representative of this location.

Table 7-1 Predicted Crowd Only Noise Levels (No Wind Condition)

Model Receiver	Distance[1] ft	L_{max}[2] dBA	Game Day Ldn[3]	L_{dn} Increase over existing[4]	Proposed Criteria Exceeded
R1	5,060	60	63 to 67	<1 dBA	None
R2	5,330	63	63 to 65	<1 dBA	None
R3	1,650	73	61 to 64	**2 to 3 dBA**	Increase in Ldn
R4	3,820	64	65 to 66	<1 dBA	None
R5	4,490	60	62 to 65	<1 dBA	None
R6	7,250	57	59 to 60	<1 dBA	None
R7	1,150	**79**	**65 to 66**	**4 to 7 dBA**	75 dBA L_{max}, 65 Ldn
R8	1,675	68	59 to 63	1 dBA	None
R9	6,880	55	63 to 65	<1 dBA	None
R10	8,600	56	65 to 66	<1 dBA	None

1. Approximate distance to center of stadium.
2. L_{max} is based on L_1 reference spectrum (Figure 5-1) and represents anticipated typical maximum noise levels.
3. Based on noise energy summation of measured or assumed ambient plus predicted game noise levels.
4. Relative to representative ambient data.

7.1.1.2 Stadium PA System Noise

The noise projections for the proposed PA system are shown in Table 7-2. The greatest potential for noise impacts due to PA sound would occur at locations R3, R7, and R8.

At R3, which is representative of the existing residential portion of the Hunters Point neighborhood closest to the stadium, PA noise levels would be roughly similar to crowd noise levels – less than the 75 dBA L_{max} criterion during a game. There is also the potential for an L_{dn} impact since although the projected game day L_{dn} is less than 65, the potential increase is 2 to3 dBA which could be considered significant.

At R7 which is representative of the new residential development closest to the stadium but not part of the Project, PA noise levels would be greater than the crowd noise levels alone. Typical maximum PA noise levels would be on the order of 82 dBA and exceed the 75 dBA L_{max} criterion. The L_{dn} may increase by 6 to 8 dBA assuming ambient noise data measured at R3 (N3) is representative of this location.

R8, the receiver representative of the new residential portion of the Project closest to the stadium, would experience a potential noise impact from PA noise even though crowd noise would be within the criteria. This is largely due to the loudspeaker coverage provided by the line arrays on the north end of the stadium which project out to the northeast. At R8, the projected L_{max} level is 78 dBA, which exceeds the 75 dBA L_{max} criterion. The L_{dn} would potentially increase by 4 to 6 dBA to 64 to 66 L_{dn} assuming ambient noise data similar to R3.

For most distant receivers the PA only noise levels are lower than the crowd only noise levels. This is apparent at locations R1 and R2 and other distant receivers west of the stadium. The directivity and orientation of the PA strongly influence the lower noise levels evident at receivers positioned away from the direction of the loudspeakers which face toward the east.

The PA noise projections are based on the nominal maximum design conditions and assume a continuous RMS signal. It is reasonable to expect that there may be isolated incidents where PA noise levels could be higher than the projections if PA sound levels are increased to overcome extreme bursts of crowd noise.

Table 7-2 Predicted PA Only Noise Levels (No Wind Condition)

Model Receiver	Distance[1] ft	L_{max} [2] dBA	Game Day Ldn[3]	L_{dn} Increase over existing[4]	Proposed Criteria Exceeded
R1	5,060	55	63 to 67	<1 dBA	None
R2	5,330	55	63 to 65	<1 dBA	None
R3	1,650	73	61 to 64	**2 to 3 dBA**	Increase in Ldn
R4	3,820	61	65 to 66	<1 dBA	None
R5	4,490	57	62 to 65	<1 dBA	None
R6	7,250	48	59 to 60	<1 dBA	None
R7	1,150	**82**	**67 to 68**	**6 to 8 dBA**	75 dBA L_{max}, 65 Ldn
R8	1,675	**78**	**64 to 66**	**4 to 6 dBA**	75 dBA L_{max}, 65 Ldn
R9	6,880	48	63 to 65	<1 dBA	None
R10	8,600	48	65 to 66	<1 dBA	None

1. Approximate distance to center of stadium.
2. L_{max} is based on L_1 reference spectrum (Figure 5-1) and represents anticipated typical maximum noise levels.
3. Based on noise energy summation of measured or assumed ambient plus predicted game noise levels.
4. Relative to representative ambient data.

7.1.2 Impacts Associated with Combined Noise Sources at Football Games

Table 6-3 present the results of combined crowd noise and PA system noise. As expected the noise levels slightly increase due to the energy summation of these simultaneous noise sources though this depends on the dominant noise source at each receiver. The greatest potential for noise impacts occurs at R3, R7, and R8.

At R3 which is representative of the existing residential portion of the Hunters Point neighborhood closest to the stadium, combined noise sources would generate typical maximum noise levels on the order of 76 dBA which is less than the 75 dBA L_{max} criterion. There is also the potential for an L_{dn} impact at this location since game days would potentially increase the existing L_{dn} by 3 to 4 dBA to 62 to 65 L_{dn}.

At R7 which is representative of the new residential development closest to the stadium but not part of the Project, combined noise sources would generate typical maximum noise levels on the order of 83 dBA exceeding the 75 dBA L_{max} criterion. The L_{dn} may increase by as much as 7 to 9 dBA to approximately 69 L_{dn} assuming ambient noise data measured at R3 (N3) is representative of this location.

R8, the receiver representative of new residential part of the Project closest to the stadium, would experience a potential noise impact from PA only noise. L_{max} level would be 78 dBA, which exceeds the 75 dBA L_{max} criterion. The L_{dn} would potentially increase by 4 to 6 dBA to 64 to 66 L_{dn} assuming ambient noise data similar to R3.

The general conclusion regarding potential noise impacts is that they would occur locally near the stadium but not farther out as would be expected. The influence distance appears to be on the order of approximately 2,000 to 2,500 ft. Beyond this distance it is not likely that game operational levels would exceed the proposed impact criteria.

Table 7-3 Predicted Crowd and PA Combined Noise Levels (No Wind Condition)

Model Receiver	Distance[1] ft	L_{max} [2] dBA	Game Day Ldn[3]	L_{dn} Increase over existing[4]	Proposed Criteria Exceeded
R1	5,060	61	63 to 67	<1 dBA	None
R2	5,330	64	63 to 65	<1 dBA	None
R3	1,650	**76**	62 to 65	**3 to 4 dBA**	75dBA L_{max}, Increase in Ldn
R4	3,820	66	65 to 66	<1 dBA	None
R5	4,490	62	62 to 65	<1 dBA	None
R6	7,250	58	59 to 60	<1 dBA	None
R7	1,150	**83**	**69**	**7 to 9 dBA**	75 dBA L_{max}, 65 Ldn
R8	1,675	**78**	**64 to 66**	**4 to 6 dBA**	75 dBA L_{max}, 65 Ldn
R9	6,880	55	63 to 65	<1 dBA	None
R10	8,600	57	65 to 66	<1 dBA	None

1. Approximate distance to center of stadium.
2. L_{max} is based on L_1 reference spectrum (Figure 5-1) and represents anticipated typical maximum noise levels.
3. Based on noise energy summation of measured or assumed ambient plus predicted game noise levels.
4. Relative to representative ambient data.

7.1.3 Meteorological Effects on Football Game Noise

Wind effects can increase noise levels downwind of a noise source, while reducing noise levels upwind. Generally speaking, the prevailing winds for the Project study area originate from the west, northwest, or west-northwest directions. These directions would actually be acoustically favorable for neighborhood receivers and have the potential to reduce noise levels from the Stadium[7]. However, as indicated in the Project wind assessment report, there are notable changes during winter months and winds become milder and less dominated by west-northwesterly winds. Therefore, WIA believes the above noise predictions for "no wind" present the typical worst-noise conditions for NFL games during fall and winter months.

A small percentage of the time wind conditions may occur such that the receivers are downwind of the stadium and its noise sources thus creating the potential for an increase in game noise levels over the baseline "no wind" condition. Based on preliminary analysis, WIA would expect the potential for an increase in typical maximum game noise levels of up to 3 to 5 dBA for model receivers. To calculate the potential increase, WIA assumed the downwind condition for each receiver and a wind velocity of 24 mph[8] as typical. A downwind condition however, would be a very seldom occurring and therefore unlikely condition on the order of only 6 to 7 % of the time during game season months[9]. In the event that such downwind conditions do occur, there is the possibility that

[7] Reference 8 discusses the Project Area wind climate. The dominant wind condition is associated with summer months.
[8] 24 mph is worst case based on review of wind rose plots contained in Reference 8 and would not necessarily occur in all receiver directions.
[9] Based on review of wind rose plots contained in Reference 8 for daytime winter data.

operational noise levels may exceed the proposed impact criteria at additional homes which would otherwise not experience any exceedance (i.e., locations which would otherwise be marginally in accordance with the proposed impact criteria but are near receivers already showing an exceedance). However, the overall picture does not change substantially since game noise levels would still be expected to be within the proposed impact criteria at the more distant receivers.

Most often the wind is blowing to the south or east. In this case, the noise from the Stadium during a football game would be significantly reduced in the surrounding community. This affect has been observed at the current home of the 49ers at Candlestick Park.

Temperature inversions occur when the normal temperature gradient (lower temperature with increasing height above the ground) becomes inverted due to certain atmospheric conditions. This can cause sound waves to temporarily travel faster at higher altitudes which may result in increased noise levels at distant receivers. Temperature inversions are fairly complex phenomena and modeling their potential effects is beyond the current scope of this study. Further, for the Project study area, while it is possible that temperature inversions do occur, wind conditions associated with the area are likely to disrupt an inversion condition and thus minimize its effect.

7.1.4 Potential for Audibility of Football Game Noise

Although audibility would <u>not</u> have the potential for causing a significant impact, we discuss the potential for audibility at distances greater than 3,300 ft when there is low background ambient noise. In this discussion the potential for audibility refers to the ability to easily detect game operational noise in the presence of ambient sources of community noise. For the purpose of this study the potential for game noise to be easily detectable exists where the A-weighted game noise level is equal or greater than the A-weighted community noise level. Technically, delectability is based on specific frequency bands (i.e., comparison of 1/3-octave band Stadium noise levels and corresponding 1/3-octave band ambient noise levels). However, low frequencies can mask higher frequencies and this analysis assumes that in general the ambient noise would be dominated by low frequencies while the (potentially audible) crowd and PA noise would be dominated by mid to high frequencies.

The potential for crowd and PA noise to be easily detectable both outdoors is shown in Table 6-4 and the likelihood of this condition can be determined by comparing anticipated game noise levels to the ambient statistical noise descriptors. For example, crowd noise that is less than the L_{90} would be masked (not easily detectable) at least 90% of the time. On the other hand, crowd noise that exceeds the ambient L_{10} would be easily detectable at least 90% of the time. However, the amount of time would be limited by the duration the crowd noise occurs. If the crowd noise L25 exceeds the ambient L_{10}, then, crowd noise would be easily detectable for approximately 23% of the time (or 13.5 minutes for a given hour). Review of Table 7-4 indicates that at times game noise would potential be audible at distances on the order of 1.6 miles.

The calculations for indoors also shown in Table 7-4 assume a 15 dBA nominal exterior-to-interior noise reduction provided by the building shell which is considered typical for single family homes without special acoustical mitigation. Compared with an assumed low-level ambient background noise level of 45 dBA, maximum game noise levels would potentially be audible at times at Receivers R1, R2, R4, and R5.

Table 7-4 Potential for Audibility of Game Noise at Distant Receivers Outdoors

Model Receiver	Distance ft	Exterior Ambient L_{10}, dBA	Exterior Ambient L_{50}, dBA	Exterior Ambient L_{90}, dBA	Exterior Game L_{max} (L_{25})	Detectable Outdoors?	Interior Game L_{max}, dBA	Detectable Indoors?
R1	5,060	52 to 55	44 to 48	42 to 45	61 (55)	At least 22.5% of the time	46	Yes
R2	5,330	60 to 64	48 to 53	45 to 47	64 (58)	At least 12.5% of the time	49	Yes
R4	3,820	60 to 63	48 to 52	44 to 46	66 (60)	At least 12.5% of the time	51	Yes
R5	4,490	61 to 63	47 to 50	43 to 44	62 (56)	At least 12.5% of the time	47	Yes
R6	7,250	58 to 62	49 to 50	45 to 46	58 (52)	At least 12.5% of the time	43	No
R9	6,880	60 to 64	48 to 53	45 to 47	55 (49)	At least 2.5% of the time	40	No
R10	8,600	60 to 63	48 to 52	44 to 46	57 (51)	At least 2.5% of the time	42	No

1. Range represents lowest ambient for afternoon or evening hours.
2. Compared with an assumed indoor ambient background noise level of 45 dBA.

7.2 Noise Impacts from Music Concerts

The projected noise levels for a concert (rock music) are presented in Table 7-5. Note that the L_{max} levels in terms of dBC are presented only for informational purposes. It can be seen that the as with a football game exceedance of the proposed criteria are projected for receptors R3 and R7. The noise levels associated with the music concert are due to the concert's sound system.

Because the concert's sound system would be located closer to the ground than the stadiums sound system it is projected the sound levels outside the stadium are somewhat less for the music concert compared with the football game. The general conclusion regarding potential noise impacts is that they would occur locally near the stadium but not farther out as would be expected. The influence distance appears to be on the order of approximately 2,000 ft. Beyond this distance it is not likely that music concert noise levels would exceed the proposed impact criteria.

Table 7-5 Predicted Concert Sound System Noise Levels (Rock Music)

Model Receiver	Distance ft	L_{max} dBA	L_{max} dBC	Concert Ldn	Ldn Increase over existing	Proposed Criteria Exceeded
R1	5,060	57	78	63 to 67	< 1 dBA	None
R2	5,330	63	83	64 to 65	<1 to 1 dBA	None
R3	1,650	72	92	63 to 65	**3 to 5 dBA**	Increase in Ldn
R4	3,820	64	84	65 to 67	< 1 to 1 dBA	None
R5	4,490	63	82	62 to 65	< 1 dBA	None
R6	7,250	56	76	59 to 60	< 1 dBA	None
R7	1,150	75	95	**65 to 67**	**5 to 7 dBA**	65 Ldn, Increase in Ldn
R8	1,675	63	83	59 to 63	1 dBA	None
R9	6,880	56	76	63 to 65	< 1 dBA	None
R10	8,600	58	78	65 to 66	< 1 dBA	None

8.0 Potential Noise Mitigation

8.1 Football Game Noise Mitigation

Potentially significant noise impacts have been identified for residential areas that are relatively close to the proposed Stadium. The following is a list of potential mitigation measures that could be used to reduce noise impacts associated with the Stadium:

- Improving the external noise insulation of individual residences that would be impacted
- Shielding the back of the PA speakers
- Constructing a partial canopy to reduce crowd noise
- Limiting the level of allowable sound within the Stadium associated with the PA system

8.2 Music Concert Noise Mitigation

Potentially significant noise impacts have also been identified for residential areas during a music concert in the Stadium. The following is a list of potential mitigation measures that could be used to reduce noise impacts during a concert:

- Improving the external noise insulation of individual residences that would be impacted
- Limiting the level of allowable sound within the Stadium during a concert

9.0 Summary and Conclusions

WIA has evaluated the potential for significant noise impacts for the proposed 49ers Stadium. Both football game and a music concert noise were model and noise levels projected for the community. Significant impacts are projected to occur up to a distance of approximately 2,000 ft and possibly somewhat further for both football games and music concerts. Potential noise mitigation for football games includes residential noise insulation improvements, shielding of PA loudspeakers, a partial canopy at the top of the east side of the Stadium or limiting the level of sound associated with the PA sound system. Potential noise mitigation for music concerts includes residential noise insulation improvements, and limiting the sound level produced by the concert's sound system.

Appendix J Page & Turnbull Secretary's Standards Evaluation of Proposed Treatments for Dry Docks 2, 3, and 4, October 5, 2009

DATE	October 5, 2009	PROJECT NO.	09061a
TO	Therese A. Brekke	PROJECT NAME	Hunters Point Shipyard
OF	Lennar Urban 49 Stevenson Street, Ste. 600 San Francisco, CA 94105 415.344.8853	FROM	Lada Kocherovsky and Richard Sucré
CC		VIA	Email

REGARDING : SECRETARY'S STANDARDS EVALUATION OF PROPOSED TREATMENTS FOR DRY DOCKS 2, 3 AND 4

This memorandum provides an evaluation of the proposed treatments planned for Dry Docks #2, #3, and #4, which are part of the Hunters Point Shipyard. These treatments are part of the proposed project being undertaken by Lennar Urban for the Candlestick Point/Hunters Point Redevelopment Project. The three dry docks under review will no longer be used as dry docks, and will function as elements of the shoreline flanked by public open space. As part of the proposed project, the area surrounding Dry Docks #2 and #3 will be known as Heritage Park, while the area surrounding Dry Dock #4 will be known as the Waterfront Promenade. Both areas will feature a park-like setting. The proposed treatments have been outlined by Moffatt & Nichol in a series of reports, which study the dry docks and shoreline, including:

- Moffatt & Nichol, *Candlestick Point/Hunters Point Redevelopment Project, Proposed Shoreline Improvements* (September 2009);
- Moffatt & Nichol, *Hunters Point Shoreline Structures Rapid Reconnaissance Investigation* (June 2009); and
- Moffatt & Nichol, *Hunters Point Shoreline Structures Assessment* (August 2009).

Dry Docks #2 and #3 are contributing elements of the Hunters Point Commercial Dry Dock and Naval Shipyard Historic District, which has been determined to be eligible for listing in the National Register of Historic Places (National Register). Dry Dock #4 has been individually recognized as a structure, which is eligible for listing in the National Register. Therefore, Dry Docks #2, #3, and #4 are considered to be historic resources.

This memorandum also addresses the requirements outlined in the Memorandum of Agreement (MOA) between the United States Navy, the Advisory Council on Historic Preservation, and the California State Historic Preservation Officer regarding the interim leasing and disposal of historic properties on the former Hunters Point Naval Shipyard in San Francisco, California. As noted in the MOA:

> *5. Leasing of Historic Properties*
>
> *a. Prior to the transfer, sale or conveyance by some other means from the control and jurisdiction of the Navy, the Navy may enter into interim leases which will permit tenants to adaptively reuse Shipyard's National Register eligible properties, provided that the lease agreements require tenants to follow the recommended practices of the Secretary of the Interior's Standards for Rehabilitation and Guidelines for Rehabilitating Historic Buildings (Standards) in maintaining or adapting these historic properties for use.*

b. Until the Shipyard's National Register eligible properties are transferred, sold, or conveyed by some other means from the control and jurisdiction of the Navy, the Navy shall require the Agency to seek the comments of the San Francisco Landmarks Preservation Advisory Board prior to seeking Navy approval for adaptive reuses of Drydock 4 and the Hunters Point Commercial Drydock Historic District.

This memorandum analyzes the proposed treatments outlined for Dry Docks #2, #3, and #4, and would satisfy the requirements of the MOA. It should be noted that the San Francisco Landmarks Preservation Advisory Board has been replaced by the San Francisco Historic Preservation Commission.

Description: Dry Dock #2

Dry Dock #2 was completed in 1903 and was constructed as part of the San Francisco Dry Dock Company (formerly California Dry Dock Company and the predecessor to the Hunter Point Naval Shipyard). As noted in the DPR 523 forms completed by Circa: Historic Property Development in June 2008:

Dry dock 2 is a graving dry dock, measuring 750' by 122' at ground level and 712' by 74' at the base. It is approximately 30 feet deep. The dry dock was filled through 13, 30-inch culverts in the steel caisson. A discharge channel runs east from the dry dock to the Bay (NAVSEA). Typical of many dry docks, it was constructed in a terraced manner, with a regular series of shelf-like ridges excavated into the bedrock. The basin was lined primarily in concrete and at the gates, just above water level, the basin is lined with what appear to be granite blocks. The gates and gate structures were removed sometime after 1988 and the dry dock can no longer be dewatered (JRP). The crane ways, railroad spurs, perimeter fence, bollards and other site features are largely intact.

In the *Hunters Point Shoreline Structures Rapid Reconnaissance Investigation,* Moffatt & Nichol provide a description of all three dry docks, as follows:

Dry Docks 2, 3, and 4 consist primarily of concrete walls. Cross-sectional shape varies within these dry docks, ranging from trapezoidal to rectangular sections. The bottom surfaces are concrete. The sides are constructed of smooth-surfaced reinforced concrete walls and stepped reinforced concrete walls. Concrete steps are found at various locations along the sides. Concrete overhangs with hand railing are found intermittently above the waterline.[1]

Description: Dry Dock #3

Dry Dock #3 was completed in 1918, and was constructed to replace the original dry dock (Dry Dock #1), which was constructed in 1867. As noted in the DPR 523 forms completed by Circa: Historic Property Development in June 2008:

Dry dock 3 is a graving dry dock that is located north of and parallel to Dry dock 2. It measures 1,076' by 153' at ground level and 1,020' by 110' at the bottom. A channel for water from Dry dock 3 passes in a straight line north from the dry dock through Pumphouse 3 (Building 140) to the Bay (NAVSEA). Like Dry dock 2, it was constructed in a terraced manner, with a regular series of shelf-like ridges constructed to create the basin. The basin was then lined primarily in concrete and at the gates, just above water level, the

[1] Moffatt & Nichol, *Hunters Point Shoreline Structures Rapid Reconnaissance Investigation* (June 2009) 3.

> *basin is lined with stone blocks. The gates and gate structures were removed sometime after 1988 and the dry dock can no longer be dewatered (JRP). The crane ways, railroad spurs, perimeter fence, bollards and other site features are largely intact.*

<u>*Description: Dry Dock #4*</u>

Dry Dock #4 was completed in 1943 by naval architect and engineer Hugo Fear and the Pacific Bridge Company. It is noted as one of the largest graving dry docks on the Pacific Coast is one of the largest of its kind in the world. As noted in the DPR 523 forms completed by Circa: Historic Property Development in August 2008:

> *Dry Dock 4 is 1,092' by 143' northwest to southeast, 143' east to west and 53-foot-deep concrete graving dry dock, with a rounded northwest end. Access steps are recessed into the sloped sidewalls and the floor is flat. The dry dock is outlined by a crane track that permits access to ships in the dock from all angles. Two or more smaller ships could be docked for servicing at the same time. A caisson or closing gate is located at the south end of the dry dock and the drainage system runs from the southeast corner of the structure eastward to the Bay. Crane ways, rail spurs, bollards and cleats surround the dry dock at ground level and are still extant.*

> *Dry Dock #4 is a graving dock. A graving dock is cut (engraved) into the base rock, as opposed to a floating dry dock that is constructed of wood and other materials and has no foundation other than water. Graving docks; when located adjacent to deep water channels, supported by land transportation systems, and work forces, are the more efficient. They are also stable and require less maintenance than the floating dry dock. For these reasons graving dry docks are preferred, particularly for servicing large ships.*

In *Hunters Point Shoreline Structures Assessment*, Moffatt & Nichol describe Dry Dock #4 as:

> *Drydock no. 4 is a reinforced concrete structure with concrete sidewalls. The cross section of the drydock varies in trapezoidal shapes the entrance has steeper sloping walls compared to the main drydock with flatter sloping walls. It is larger compared to drydocks 2 and 3.*[2]

[5] Moffatt & Nichol, *Hunters Point Shoreline Structures Rapid Reconnaissance Investigation* (June 2009) 10.
[6] Moffatt & Nichol, *Candlestick Point/Hunters Point Redevelopment Project, Proposed Shoreline Improvements* (September 2009) 9-10.
[7] Moffatt & Nichol, *Hunters Point Shoreline Structures Assessment* (August 2009) 21.
[8] Morton, W. Brown III, Gary L. Hume, Kay D. Weeks, and H. Ward Jandl, *Secretary of the Interior's Standards for Rehabilitation & Illustrated Guidelines for Rehabilitating Historic Buildings* (Washington, D.C.: U.S. Department of the Interior, National Park Service, Cultural Resources, Preservation Assistance Division, 1992). The *Standards*, revised in 1992, were codified as 36 CFR Part 68.3 in the July 12, 1995 Federal Register (Vol. 60, No. 133). The revision replaces the 1978 and 1983 versions of 36 CFR 68 entitled *The Secretary of the Interior's Standards for Historic Preservation Projects*. The 36 CFR 68.3 *Standards* are applied to all grant-in-aid development projects assisted through the National Historic Preservation Fund. Another set of *Standards*, 36 CFR 67.7, focuses on "certified historic structures" as defined by the IRS Code of 1986. *The Standards* in 36 CFR 67.7 are used primarily when property owners are seeking certification for Federal tax benefits. The two sets of *Standards* vary slightly, but the differences are primarily technical and are not substantive in nature. The *Guidelines*, however, are not codified in the Federal Register.

Condition

As documented by Moffat & Nichol in *Hunters Point Shoreline Structures Rapid Reconnaissance Investigation* (June 2009), the condition of Dry Dock #2 and #3 was noted as follows:

> *These dry docks are rated in POOR condition. Although widespread, damage is primarily characterized by minor, infrequent spalls with occasional vertical cracks extending the full height of the concrete from above the waterline. Approximately half of these cracks show discoloration. The more widespread damage was observed on the concrete just above the waterline, which exhibits smaller cracking in vertical and horizontal directions. This type of cracking (see Photograph D3.4) typically shows corrosion, and is found along approximately half of the total length that bounds Dry Dock No. 3. As indicated on the stepped side in Photograph D2.1, the concrete matrix has deteriorated due to its age, and air pockets have expanded into large voids, displaying a rough outer surface. A rough outer surface is also visible on vertical and sloped portions of the wall (see Photograph D2.2).*[3]

Further observation of the condition of Dry Docks #2 and #3 noted that vertical cracks extend the full height of the walls and that air pockets have expended into large voids.[4]

For Dry Dock #4, Moffat & Nichol noted the condition as follows:

> *Dry dock No. 4 is rated in POOR condition. Advanced deterioration is widespread throughout the structure. Greater than 40% of the concrete structure exhibits patches of open and closed corrosion spalls and delamination. The majority of these types of damages are exhibited along the full height of the concrete, as shown in Photographs D4.1 through D4.6. Delaminations are observable on open faces of concrete, as well as around openings for utility lines (see Photograph D4.4). Spalls are also localized around cold joints and corners of various parts of concrete, such as the corners at the slots where the gate was positioned during periods of dry dock usage (see Photograph D4.8). Damage also consists of horizontal corrosion cracking, as shown in Photograph D4.7, where horizontal cracks with discoloration were observed in the splash zone.*[5]

Proposed Treatments

Based upon the proposed improvement concepts outlined by Moffatt & Nichol in *Candlestick Point/Hunters Point Redevelopment Project, Proposed Shoreline Improvements*, Dry Docks #2, #3, and #4 would be modified as follow:

- <u>Addition of Weep Holes</u>: The project will add weep holes on the sidewall to reduce pressure behind it. These weep holes shall be located above the lowest tide and shall extend to near the top of the dry dock walls;
- <u>Addition of Rock/Sand Buttresses</u>: The project will add rock or sand buttresses on the face of the dry dock walls at the bottom. This will result in additional passive resistance with the intent of increasing slope stability.
- <u>Concrete Repair</u>: The project will repair the exposed dry dock walls by patching any spalls, exposed and corroded reinforcing bars, and broken concrete. This will include applying high strength concrete grout to exposed surfaces and/or epoxy mix application to cracks. It should extend from below the lowest tide up to near the top of the dry dock walls.[6]

The quantity of these repairs is as follow:

- *Dry Dock #2* = Concrete Repair (9,000 square feet); Addition of Rock/Sand Buttresses (32,000 cubic yards); and Addition of Weep Holes (360 ea)
- *Dry Dock #3* = Concrete Repair (19,300 square feet); Addition of Rock/Sand Buttresses (44,500 cubic yards); and Addition of Weep Holes (440 ea)

- *Dry Dock #4* = Concrete Repair (38,000 square feet); Addition of Rock/Sand Buttresses (49,700 cubic yards); and Addition of Weep Holes (460 ea)

In detail, the concrete repairs are described as follows:

> *Concrete repairs include spall and crack repair above and under water. Concrete wall, caisson and underside of wharf deck repairs above the waterline will be completed from small floating platforms or temporary scaffolding. Spalled concrete areas above water will have the spalls removed (by grinding or abrasive blasting) and replaced with pneumatically placed concrete (shotcrete) or trowel applied mortar. Large-width concrete cracks will be cleared of debris (by air-blasting or hand tools) and pressure-injected with epoxy or cementitious grout.*
>
> *Underwater concrete repairs includes concrete removal (by high pressure water jets, pneumatic- or hydraulic-powered chipping hammers or saws), surface preparation (by high pressure water jets, abrasive blasting or mechanical scrubbers), installation of anchors and placement of concrete (for spalls) or epoxy (for cracks) by pipe and pump, injection or hand placement, spall repairs will be held in place by form work where spall sizes are large. Underwater repair work will be accomplished with support crew and equipment on a floating platform or barge.*[7]

In addition to the proposed treatments outline above, new guardrails would be added to the perimeter of each of the dry docks.

<u>*Evaluation*</u>
This section provides an evaluation of proposed treatments and examines their consistency with each of the Standards for Rehabilitation. *The Secretary of the Interior's Standards for Rehabilitation & Illustrated Guidelines for Rehabilitating Historic Buildings* (Standards) provide guidance for reviewing proposed work on historic properties.[8] The Standards are used by Federal agencies in evaluating work on historic properties. The Standards have also been adopted by local government bodies across the country (including the Historic Preservation Commission) for reviewing proposed rehabilitation work on historic properties under local preservation ordinances. The Standards are a useful analytic tool for understanding and describing the potential impacts of substantial changes to historic resources. The following analysis applies each of the Standards to the proposed treatment.

1. *A property will be used as it was historically or be given a new use that requires minimal change to its distinctive materials, features, spaces, and spatial relationships.*

The three dry docks under review will be used as an open space amenity and will no longer be used as a dry dock facility. This new use will require minimal change to the resource's distinctive materials, features, spaces and spatial relationships. The proposed treatments outlined for the dry docks provide for the repair and retention of the historic elements, including the concrete and trapezoidal or rectangular shape. Therefore, the proposed treatments for the three dry docks are consistent with Rehabilitation Standard #1.

2. *The historic character of a property will be retained and preserved. The removal of distinctive materials or alteration of features, spaces, and spatial relationships that characterize a property will be avoided.*

The overall historic character of the three dry docks will be retained and preserved by the proposed treatments. The proposed treatments call for the installation of weep holes into the concrete dry docks sidewalls, in order to reduce the pressure from behind. This treatment will involve the removal of some distinctive materials. These weep holes will be approximately 6" in diameter and spaced ten feet on center along the sidewalls of the dry docks. The weep holes will be located above the lowest tide point and will extend towards the top of the dry dock walls. Although the installation of the weep holes removes some distinctive materials, this treatment can be considered a minor alteration, especially when examined against the vast amount of surface area of the dry dock sidewalls. The amount of concrete sidewall being removed is minor compared to the overall size and scale of the dry docks. The installation of the weep holes provides for continued use of the dry dock walls, and the distinctive materials of the dry docks are largely retained and preserved as part of the project. Therefore, the proposed treatments for the three dry docks are consistent with Rehabilitation Standard #2.

3. *Each property will be recognized as a physical record of its time, place, and use. Changes that create a false sense of historical development, such as adding conjectural features or elements from other historic properties, will not be undertaken.*

The proposed treatments for the three dry docks under review will not feature changes that create a false sense of historical development. The addition of the rock and sand buttresses will be clearly differentiated from the historic concrete form of the dry dock. Therefore, the proposed treatments for the three dry docks are consistent with Rehabilitation Standard #3.

4. *Changes to a property that have acquired historic significance in their own right will be retained and preserved.*

In general, few alterations have occurred to Dry Docks #2, #3, and #4. These dry docks have not acquired changes, which have garnered historic significance in their own right. Therefore, the proposed treatments for the three dry docks are consistent with Rehabilitation Standard #4.

5. *Distinctive materials, features, finishes, and construction techniques or examples of craftsmanship that characterize a property will be preserved.*

The proposed treatments will preserve distinctive materials, features, finishes and construction techniques found in the three dry docks under review. In particular, the proposed treatments call for the repair of exposed dry dock walls, which may include patching any spalls, removal and replacement of exposed and corroded reinforcing bars, and broken concrete that can't be patch. Overall, the distinctive features of the three dry docks, including the concrete sidewalls, overall form, and location, are being maintained by the proposed treatments. Therefore, the proposed treatments for the three dry docks are consistent with Rehabilitation Standard #5.

6. *Deteriorated historic features will be repaired rather than replaced. Where the severity of deterioration requires replacement of a distinctive feature, the new feature will match the old in design, color, texture, and, where possible, materials. Replacement of missing features will be substantiated by documentary and physical evidence.*

As mentioned previously, the proposed treatments call for the repair of the exposed dry dock walls, which includes patching any concrete spalls, repairing and/or replacing exposed or corroded reinforcing bars, and repairing broken concrete. These treatments are all consistent with Rehabilitation Standard #6, since they involve repairing, not replacing, deteriorated historic features. Where deteriorated beyond repair, the proposed treatments will replace materials in-kind, keeping the character of the dock walls consistent with the original design. Where parts of concrete walls need to be replaced due to severe deterioration, the replacement surface will be similar in texture and color to the original concrete wall finish. Therefore, the proposed treatments for the three dry docks are consistent with Rehabilitation Standard #6.

7. *Chemical or physical treatments, if appropriate, will be undertaken using the gentlest means possible. Treatments that cause damage to historic materials will not be used.*

The proposed treatments do not involve chemical or physical treatments, which may damage historic materials. Therefore, the proposed treatments for the three dry docks are consistent with Rehabilitation Standard #7.

8. *Archeological resources will be protected and preserved in place. If such resources must be disturbed, mitigation measures will be undertaken.*

If archaeological resources are uncovered during the implementation of the proposed treatments, the project sponsor will seek consultation from a qualified archaeologist (meeting or exceeding the Secretary of the Interior's Professional Qualification Standards in Archaeology) and shall undertake appropriate mitigation measures. Since this resource involves underwater resources, specialized knowledge of underwater archaeology may be required. The environmental document for the proposed project should outline the appropriate mitigation measures for archaeological resources. If undertaken as outlined, the proposed treatments for the three dry docks would be consistent with Rehabilitation Standard #8.

9. *New additions, exterior alterations, or related new construction will not destroy historic materials, features, and spatial relationships that characterize the property. The new work shall be differentiated from the old and will be compatible with the historic materials, features, size, scale and proportion, and massing to protect the integrity of the property and its environment.*

The proposed treatments for the three dry docks under review involve the new addition of rock/sand buttresses and the installation of weep holes. These two treatments will affect the historic concrete sidewalls and the overall shape of the dry docks basins. However, these two treatments will not negatively impact these two features, or any other important historic materials, features, and spatial relationships that characterize the property. The proposed treatments provide for the longevity and continued use of the resource, and when viewed in reference to the overall size and scale of the dry docks, these treatments can be considered minor. The new work will be clearly differentiated from the historic dry docks, since the original form of the dry docks only included concrete, and new materials include rock and sand. Overall, the integrity of the property is maintained, since a minimal amount of historic materials are being removed and since the form, size, scale are being preserved. Therefore, the proposed treatments for the three dry docks are consistent with Rehabilitation Standard #9.

10. *New additions and adjacent or related new construction will be undertaken in such a manner that, if removed in the future, the essential form and integrity of the historic property and its environment would be unimpaired.*

The proposed treatments involve new construction consisting of new guardrails along the perimeter of the dry docks and new sand/rock buttresses, which will be located underwater in the basin of the dry dock. This new construction will not affect the overall form and integrity of the three dry docks, since its original concrete construction and trapezoidal/rectangular shape will be retained. Furthermore, the individual contributing features of the dry docks, including the concrete staircases, filling culverts, discharge culverts and adjacent decks will not be impacted by the proposed treatments, and will remain in place. Therefore, the proposed treatments for the three dry docks are consistent with Rehabilitation Standard #10.

Recommendations

The rehabilitation strategies and treatments, as outlined in Moffat & Nichol's reports, are preliminary. We recommend that, as the Dry Docks are evaluated further, details of the proposed treatments be reviewed for consistency with the Standards. For example, weep holes should be installed in a manner that would have the least visual impact on the face of the concrete wall, avoiding exposed piping and anchors. The specifications for the concrete patching should be developed to allow close matching of the texture and color of existing concrete surfaces. New elements, such as guardrails and handrails, should be designed to maintain the overall simple industrial character appropriate to the shipyard's original utilitarian uses. Contingencies should be included in the overall cost estimates for the future project in order to accommodate these recommendations.

Conclusion

The proposed treatments for Dry Docks #2, #3, and #4 are consistent with the Secretary of the Interior's Standards for Rehabilitation. The treatments outlined provide a methodology for resolving severe deterioration issues, and ultimately provide for the longevity of the historic resources.

This memorandum and evaluation has been undertaken by professionals whom meet the Secretary of the Interior's Professional Qualification Standards in Historic Architecture and Architectural History.

I. BACKGROUND AND OBJECTIVES

INTRODUCTION

This historic context statement is part of the review of the Bayview Waterfront Project (BWP) Environmental Impact Report (EIR). This project encompasses Candlestick Point, Hunters Point Shipyard and the India Basin Shoreline. The Candlestick Point-Hunters Point Shipyard Phase II Development Plan contains Candlestick Point State Park, Candlestick Stadium, the Alice Griffith public housing and most of Hunters Point Shipyard. The India Basin Shoreline plan includes parcels from the boundaries of Hunters Point Shipyard up to and including the Pacific Gas & Electric Hunters Point Plant, now under demolition. The purposes of this document are to provide background material for the evaluation of potential historic resources within the Project and to inform the relevant sections of the Environmental Impact Report for the BWP.

To this end, this document is primarily concerned with the historical development of specific project sub-areas noted above. However, these parcels have traditionally been part of a larger community. The history and development of this larger community must be discussed to a degree to more fully frame the significance within the specific project sub-areas. This report is not intended to be a comprehensive history of the Bayview or Hunters Point districts, though information on the early development of these districts is briefly discussed.

This context statement is focused on specific geographic zones. It is primarily concerned with the existing built environment. For further discussions on prehistorical and historical archaeological studies and contexts, please see the archaeological context statement for the Project prepared by Archeo-Tec: Consulting Archaeologists for a parallel discussion. Where relevant, sections of this complementary document have been used for continuity and clarification. Please see footnotes for more precise citations of their work.

USE OF GEOGRAPHIC TERMINOLOGY

The use of geographic descriptions throughout this report refer to the general districts of the City and County of San Francisco unless specifically stated otherwise. When the point being discussed is within a specific Project sub-area, this is noted as such. Because much of the historical context for the Project is tied closely with the development of nearby parcels and regions that are not part of the Project, discussion must include a broader geographic region than is defined in the EIR scope. Therefore, when discussing the general area, including the sub-area sites, the term "Bayview-Hunters Point" is used. Where the discussion is confined to the sub-areas only (Candlestick Point, Hunters Point Shipyard Phase II, or India Basin) then these specific terms are used. Alice Griffith public housing represents a portion of the Candlestick Point-Hunters Point Shipyard Phase II development area. It is discussed separately because its historical context is highly specific.

PURPOSE OF A HISTORIC CONTEXT

A Historic Context enables the assessment of a property's historic significance by creating a framework against which to qualify objectively its relationship to larger historical themes and events. Once this framework has been adopted, qualified historic professionals can then use the Historic Context as a basis for the completion of historical evaluations. Such evaluations encompass the following:

- Evaluate a property's historic significance including its associative value and context utilizing national, state and local criteria and status codes.
- Establish historic/cultural themes and periods of significance based on substantiated documentation.
- Evaluate a property's integrity and identify character-defining features.

Updated: July 2009

- Determine which Standard of the *Secretary of the Interior's Standard for the Treatment of Historic Properties* will be followed for proposed changes (Preservation, Rehabilitation, Restoration, or Reconstruction.)
- Review proposed changes for consistency with the selected Standard to meet the criteria and requirements of the California Environmental Quality Act (CEQA) to avoid a substantial adverse impact.

Historical evaluation of a subject property within the Project should use this context statement as a tool for understanding where the property's significance lies within the larger historical timeline. Such assessments should also include an analysis of the immediate environment that represents the physical context for the building or site. This is part of determining the level of the resource's historic integrity. Therefore, buildings in their original locations retain a much higher integrity level and consequently are of stronger historic importance than those that have been moved. When determining the historic and cultural value of the resource, its place in history should be evaluated as well as physical location within the City's jurisdiction. In many cases, the location and environmental surroundings played a large role in its historical use and importance in the larger Bayview-Hunters Point neighborhood historic context as outlined in the following pages.

LOCATION AND BOUNDARIES OF STUDY[1]

The Bayview Waterfront Project is within the southeast quadrant of the City and County of San Francisco. The site is generally bounded by Jennings and Newhall Streets to the north, U.S. 101 to the west, the Visitacion Valley and Executive Park neighborhoods and the City and County of San Francisco – San Mateo County line and the City of Brisbane to the south, and San Francisco Bay to the east. Figure 1, illustrates the regional location of the Project and the location of the Project within San Francisco. As shown in Table 1, Phase II would comprise approximately 728 acres. The India Basin Plan area would comprise 76 acres. The sites together comprise approximately 804

[1] Taken from EIR guidelines provided by PBS&J in April 2008.

Updated: July 2009

acres, occupying the waterfront from the northern boundary of the India Basin Shoreline area to the western edge of Candlestick Point, and extending inland from the waterfront. Figure 2, Bayview Waterfront Project Site Boundaries, illustrates the Project boundaries.

CANDLESTICK POINT-HUNTERS POINT SHIPYARD DEVELOPMENT PLAN

The Candlestick Point area of the Development Plan is immediately east of Executive Park, with the Bayview neighborhood to the north, the Hunters Point Shipyard (HPS) to the north and east, and Candlestick Point State Recreation Area (SRA) along the Bay frontage, as shown in Figure 2. The Candlestick Point area of the Development Plan is generally bounded by Hawes Street to the north, Candlestick Cove and San Francisco Bay to the south, South Basin to the east and, Jamestown Avenue to the west. The northern boundary of Hawes Street is limited to the San Francisco Housing Authority's Alice Griffith public housing site between Gilman and Carroll Avenues, which extends north from Aurelious Walker Way. The Candlestick Point area also includes the Candlestick Point SRA land surrounding Yosemite Slough, generally bounded by Ingalls Avenue to the north, Yosemite Avenue to the west and Thomas Avenue to the east. The southern portion of the area surrounding Yosemite Slough is contiguous with the northwestern edge of the HPS Phase II.

The HPS Phase II area is to the south of the Bayview neighborhood. As shown in Figure 2, the HPS Phase II area is generally bounded by the San Francisco Bay to north, south and east. The west end of the northern boundary extends along Fitch Street to approximately Crisp Avenue, excluding the University of California San Francisco (UCSF) Animal Research and Care Facility and former Building 815 (now owned by DataSafe Records Storage and Information Management). The northern boundary generally extends along Crisp and Spear Avenues and is contiguous with the current north, south, and east boundaries of the HPS Redevelopment Project Area, Parcel A'. The northernmost end of the HPS Phase II area is contiguous with Earl Street and the southern boundary of the India Basin Shoreline Plan.

INDIA BASIN SHORELINE PLAN

The India Basin Shoreline Plan is comprised of approximately 76 acres, immediately north of the HPS Phase II. As shown in Figure 2, the India Basin Shoreline plan is bounded generally by Jennings and Newhall Streets and Heron's Head Park to the north, Hunters Point Boulevard and Innes Avenue to the west, and Earl Street to south. San Francisco Bay forms the eastern border.

CONTEXT STATEMENT OBJECTIVE

A historical context statement is an important planning tool that is the basis for making informed and consistent decisions. Historic contexts provide information to establish significance and answer the question "why is this property important?". Context statements are critical in later survey and evaluation phases. The information as to

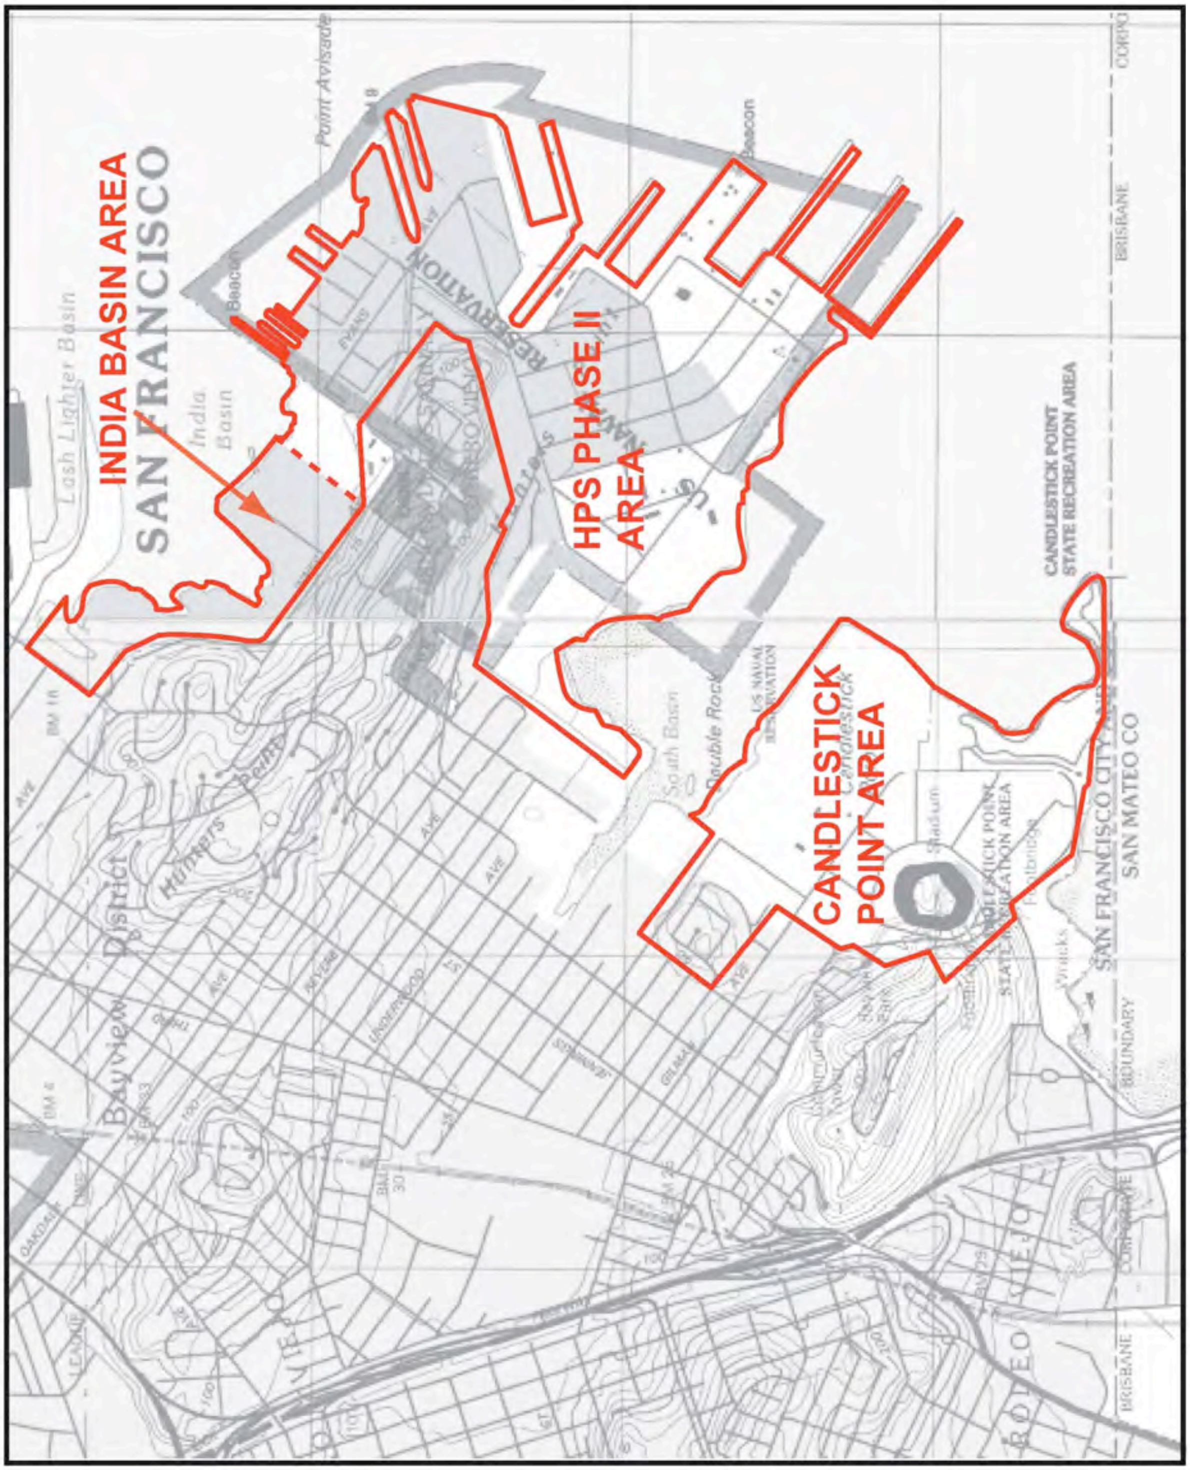

Figure 2. Map showing overview of Project site and sub-areas.. Figure prepared by Archeo-Tec and excerpted with permission from their companion document, *Historic Context for the Archeology of the Bayview Waterfront Project, San Francisco, California.*

"why?" is well researched using primary sources such as period photographs, maps, newspapers, brochures, etc., and secondary sources such as books and reports based on primary sources. Because properties can be significant for more than architecture (relationship to an event, person, yield information) a broad spectrum of sources are consulted. The context statement itself does not evaluate individual properties. Also, it is not intended to be a definitive history of the Bayview or Hunters Point neighborhoods. It is however, the basis for all preservation planning and provides much needed information that can be used by professionals and laypersons. Because the historic context statement is based on substantiated documentation it is therefore is a "living document" that can be added to as valid information arises.

Decisions about the identification, evaluation, registration and treatment of historic properties are most reliably made when the relationship of individual properties to other similar properties is understood. Information about historic properties representing aspects of history, architecture, archeology, engineering and cultural themes must be collected and organized to define these associations. The historic context statement provides identified areas of significance. The approach describes the important broad patterns of development in an area that may be represented by historic properties. The historic context statement is the foundation for decisions about identification, evaluation, registration and treatment of historic properties.

The objectives of this context statement are as follows:

- Create a well-defined historic context based on property types, architectural character-defining features, local development and land use patterns, and significance of place and cultural themes for the period of approximately 1849 to 1966.
- Outline the chronological development of the neighborhood with connections made between patterns of development, and structures and properties that may still exist today.
- Offer an understanding to how and why the neighborhood was developed in the way it exists today.

- Provide documented information to allow for the comprehensive evaluation of a property's importance within the historic context of the Bayview-Hunters Point area.

Historic context statements are important tools for the preservation planning process. This Historic Context Statement is meant to provide the San Francisco Redevelopment Agency, the San Francisco Planning Department and other bodies with a means to evaluate potential resources for their associative, architectural, or historic value. Such a tool will provide a baseline reference for determining environmental impacts related to future development of the area and inform mitigation measures to limit or avoid adverse environmental impacts.

All evaluations of significance for specific buildings within the Project area are presented in the second volume of this study, the *Bayview Waterfront Plan Historic Resources Survey Report,* also prepared by Circa: Historic Property Development. This companion volume presents the result of the historic resource survey, including State of California Department of Parks and Recreation forms (DPR forms) relevant to the Project and recommendations for further actions related to historic resources. This document, *Bayview Waterfront Plan Historic Resources Evaluation, Volume I: Historic Context Statement*, is intended to provide the initial background for these evaluations and to present general property types that may be associated with the historical development of the areas in question.

Updated: July 2009

II. METHODOLOGY

RESEARCH AND DEVELOPMENT

There have been many studies of the cultural and historical development of the areas within the Bayview Waterfront Project. The oldest were completed over 30 years ago, while others were undertaken concurrent with the writing of this document. Consequently, much of the background information presented here was first gathered from these existing documents, then cross-referenced to verify accuracy and merit. Where required, additional research with primary and secondary sources was undertaken. In some cases, the information presented in previous documents is paraphrased. These examples are typically noted at the beginning of the subject headings.

Unlike most historical context statements, this one encompasses several distinct plan areas. Much of this is comprised of lands reclaimed from San Francisco Bay during the World War II and later periods. Therefore, there is little to historically connect the project areas except their relationship to the larger development of the outer limits of San Francisco during the late 19th and early 20th Centuries. Therefore, original research was largely limited to the very early and very late chronological periods of development.

Gathering this information depended upon a diverse assortment of local archives and libraries. For those subjects within the more recent past, oral histories and personal remembrances of individuals who either worked, lived or had been associated with Hunters Point Shipyard, Alice Griffith public housing, Candlestick Park or India Basin have been used.

Updated: July 2009

SUMMARY OF RESOURCES

The following are general resource types. Individual resources of these types are listed in the bibliography.

- Historical societies – including the California Historical Society and other local historical societies.
- Public and private archives and libraries – including the San Francisco Public Library, Main Branch and Bayview Branch, the Bancroft Library, the Oakland Public Library, Main Branch, The Maritime Museum and Naval archives on Treasure Island.
- Census records
- Newspaper clippings – including historical and contemporary newspapers available in online repositories as well as in the collections of various archives and libraries.
- Books
- Maps – including Sanborn Fire Insurance Maps, United State Geological Survey Maps, coast survey maps and a wide variety of specialty maps included in previously completed reports.
- Promotional material
- Volunteers
- Scholarly articles
- Trade publications
- Period photographs
- Oral histories
- Government publications – including previously commissioned reports
- Environmental reports
- U.S. Navy documents
- Previously prepared contexts and historical evaluations – in particular evaluations of San Francisco Public Housing, the Shipyard, India Basin, Candlestick Park, among others.

III. INTRODUCTION

HISTORIC CONTEXT THEMES

Main sections of historic contexts are generally organized into “themes’ or areas of significance as identified in National Register Bulletin 15, *How to Apply the National Register Criteria for Evaluation*. This bulletin explains that a determination must be made on how the theme of the context is significant in the history of the local area, the State, or the nation. “A theme is a means of organizing properties into coherent patterns based on elements such as environment, social/ethnic groups, transportation networks, technology, or political developments that have influenced the development of an area during one or more periods of prehistory or history. A theme is considered significant if it can be demonstrated, through scholarly research, to be important in American history. Many significant themes can be found in the list of Areas of Significance used by the National Register.” This list is quoted as follows:

AREAS OF SIGNIFICANCE:

- Agriculture
- Architecture
- Archeology
- Prehistoric
- Historic-Aboriginal
- Historic-Non-Aboriginal
- Art
- Commerce
- Communications
- Community Planning & Development
- Conservation
- Economics
- Education
- Engineering
- Entertainment/Recreation
- Ethnic Heritage
    - Asian
    - Black
    - European
    - Hispanic
    - Native American
    - Pacific Islander
    - Other
- Exploration/Settlement
- Health/Medicine
- Industry
- Invention
- Landscape Architecture
- Law
- Literature
- Maritime History
- Military
- Performing Arts
- Philosophy
- Politics/Government
- Religion
- Science
- Social History
- Transportation
- Other

Updated: July 2009

Themes are then tailored to accommodate areas of significance specific to a particular community when appropriate. In this way, contexts follow a common thread of understanding regarding building development and growth patterns, cultural and ethnic evolutions and economic changes etc., while allowing for customization or specification in areas that define community character. One obvious context for the Bayview Waterfront Project, and indeed the entire San Francisco Bay Area, is military development. However, we explore four other context areas that we feel more closely relate to the specific aspects of local history. These themes are: early development of the area, early development of India Basin with particular emphasis on maritime development, evolution of public and subsidized housing and recreation.

To better understand important historic events and their impact on the local community and/or historical resource, it is often helpful to have a sense of the larger natural, political and social setting in which these events took place. While this document is concerned with the chronological development of the Project, the more general community's connection to broad historical movements, development trends and natural setting are key elements in understanding the influential factors that may be implied, but not overtly stated, in the following discussions.

SUMMARY OF REGIONAL GEOGRAPHY AND GEOLOGY

The Bayview-Hunters Point and India Basin neighborhoods of southeast San Francisco generally occupy the waterfront south of Islais Creek (more generally, south of César Chávez Street (see Figure 1.) This area of Islais Creek has changed considerably during the 20th Century. What was originally a series of extensive marshes interspersed with rocky outcroppings was transformed into mostly flat land reclaimed by leveling nearby hills and clearing rocky shoreline. All of the project sub-areas contain a mixture of original and reclaimed land. What differs are the reasons the land was created and how it was developed.

Updated: July 2009

At the southern end of Bayview is Candlestick Point. This area is dominated by a large hill (now known as Bayview Hill), of serpentine and sandstone that originally arose from the shallow marshland at its base. Today, it has been extensively quarried and otherwise altered to accommodate Candlestick Park Stadium. The remainder of Candlestick Point is a former landfill that was further reclaimed with fill for parking lots and Candlestick Point State Recreational Area. Near Yosemite Slough and the Alice Griffith public housing, the land was a mix of marshlands and rocky shoals. During World War II, it was partially filled to create the site for the Double Rock War Dwellings. After the war, the area around Yosemite Slough, known as South Basin, was filled in to create its current configuration.

Hunters Point Hill is comprised of serpentine rock with steep slopes to the north and south. It rises much more gently to the east and west. What remains today is only a part of the original natural formation. Before U.S. Navy development in 1941, Hunters Point Hill extended almost a mile out into San Francisco Bay and was much steeper, longer and more prominent than its current form.

India Basin is a mixture of fill and original shoreline. Of all the sub-areas, this one has seen the least alteration of its natural geologic formations. It is here that the northern slopes of Hunters Point Hill fall steeply down to a gravelly shoreline that extends out into mud flats at low tide. See Figure 3 for a comparison of shore locations in 1852 to the present.

CHRONOLOGICAL SUMMARY OF AREA DEVELOPMENT

The story of the Bayview-Hunters Point project site is varied. For much of its early existence, it was part of San Francisco only on paper. Until the 1940s, its development and purpose showed little resemblance to the trends shaping the rest of the City. In many ways, it was akin to the farming communities of the San Francisco Peninsula,

Updated: July 2009

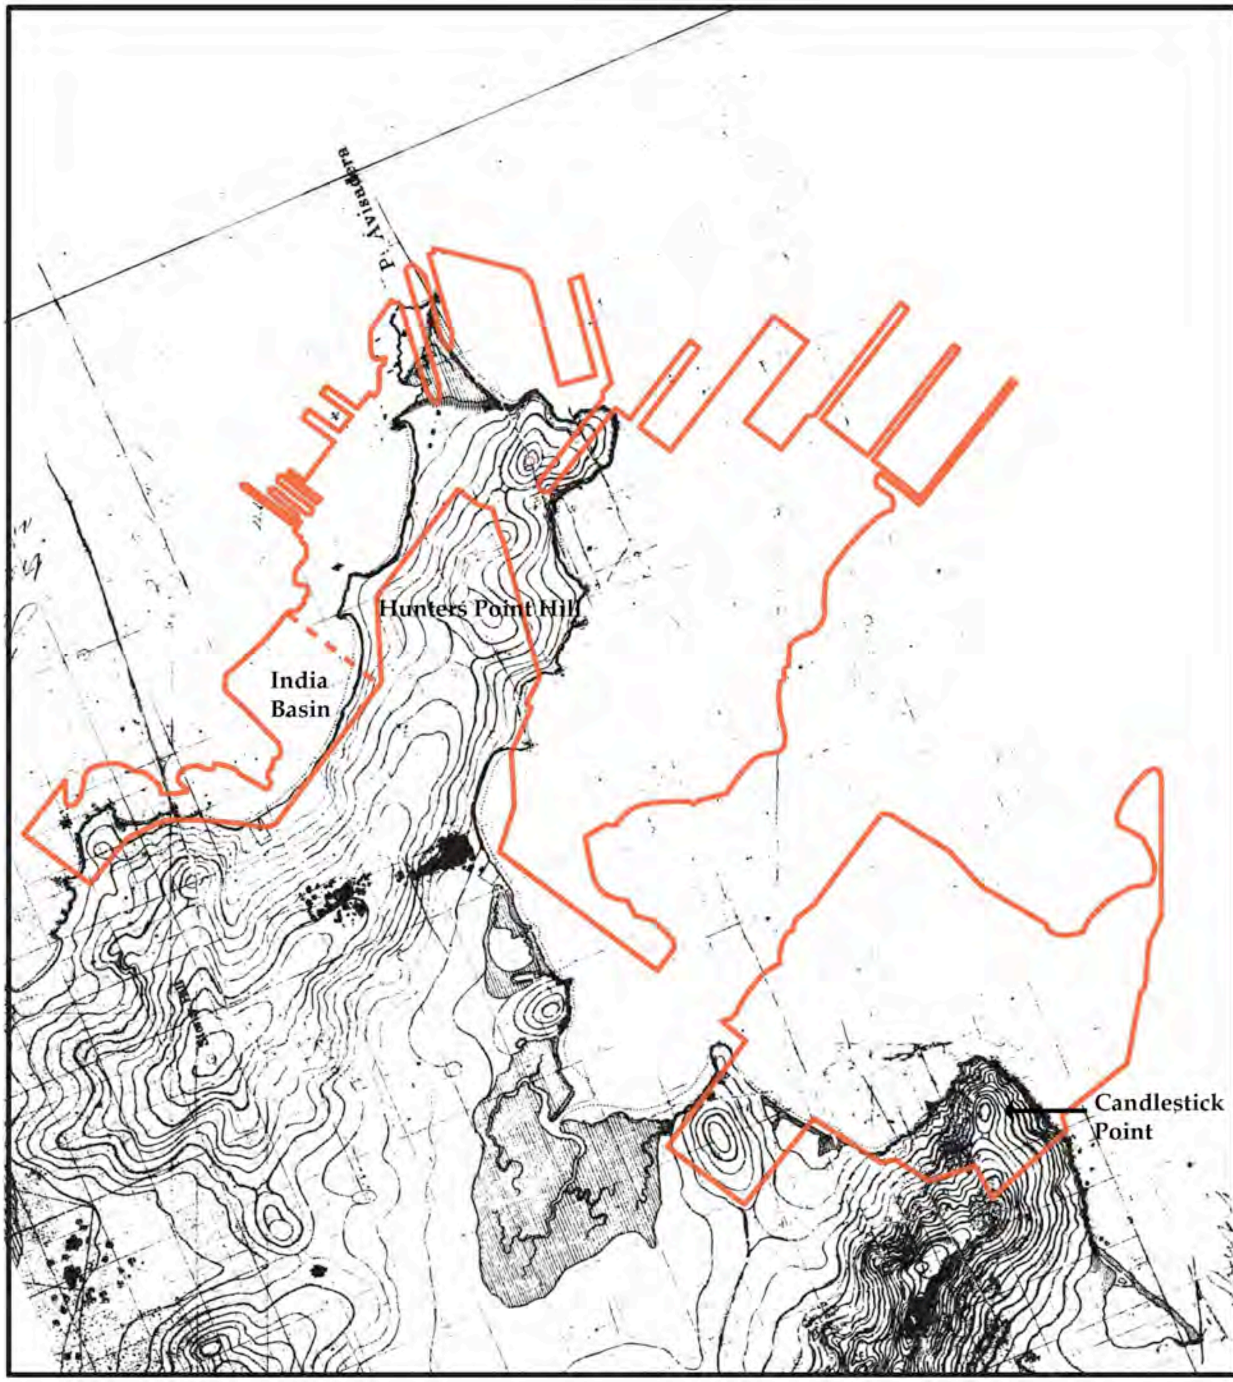

Figure 3. Map comparing the 1852 shoreline to present day shoreline. Figure prepared by Archeo-Tec and excerpted with permission from their companion document, *Historic Context for the Archeology of the Bayview Waterfront Project, San Francisco, California*.

mostly rural, used for weekend retreats and drives in the country. It was a relatively bucolic district composed of rocky shoreline, marshlands and fertile tidal plains. A place of continual speculation but little development, growth was focused and never sponsored from within the existing community.

This changed when the United States entered World War II in 1941. This seminal moment thrust the Bayview-Hunters Point area into the national spotlight. Farms were replaced with housing. Drydocks became shipyards. Fishing shacks gave way to cranes and berthing piers. When the dust settled, a whole new population called the area home and most of the reminders of the rural past were swept aside. A brief account of the history of this transition is provided in the following section. These areas are discussed in greater detail in the individual chapters of this document.

PRE-1849

Before modern settlements, the Bayview-Hunters Point project site was a favored fishing ground for native populations. It was relatively protected from the harsh winds and fogs of the ocean coastline and the extensive marshes harbored numerous species of waterfowl, fish and useful grasses. These first inhabitants lived in the area for several thousand years.

In 1775, the Spanish government sent Lieutenant Juan Bautista de Ayala into San Francisco Bay to map the coastline and to select sites for fortification. He dispatched his second mate, Juan Bautista Aguirre to explore the Bay further south. Aguirre and his crew came upon a rocky peninsula surrounded by deep water. They named it Point Avisadera (Beacon Point.) Aguirre's diary is the earliest known written account of Hunters Point Hill.

In 1776, as soldiers were busy building a military fortification at the entrance to San Francisco Bay, missionaries were establishing a church along Dolores Creek. Mission

San Francisco de Asis was granted all of the land now contained within the Project for use as pasture for its cattle. When Mexico secularized the Missions in 1834, their lands were disbursed to loyal Mexican citizens. In 1839, Jose Bernal was given most of Mission's southeastern pasture lands, including all of the land within the Project boundaries.

1849-1906

The discovery of gold at Sutter's Creek in 1848 brought floods of people from all over the world to California. Most came through San Francisco before heading east to the Sierra. Some decided to stay. More returned after mining claims proved worthless. As a result, San Francisco grew in both population and geographic extent very rapidly over a short period of time. When it became a state in 1850, even more people were drawn to settle in the area.

Settlement in the Project vicinity during this period was primarily limited to the India Basin sub-area where northern European boatwrights established small family boatyards. They found the area to be sparsely settled and easily navigable by boat. Slowly they were joined by Italian and Chinese farmers who grew vegetables for the expanding City center four miles north.

Access to the interior of the area was difficult. Few roads passed nearby and no roads ventured east except to access the boatyards along India Basin. Most travel was by ship or by a long, arduous journey through the swamps around Islais Creek. In spite of this, people came to Hunters Point Hill for outings, and to the flatlands near today's Yosemite Slough for recreation. The draw was the area's pleasant weather and wonderful Bay views.

These two factors also enticed several real estate speculations. One of the earliest was a partnership with Jose Bernal's family that involved a pair of brothers from the east coast. The Hunter brothers never found success in the venture but they stayed to settle on Hunters Point Hill where they lived and worked. The South San Francisco Homestead and Railroad Company was only slightly more successful. Their lasting legacy was the granting of land at the end of Hunters Point Hill for completion of a drydock in 1867. It was this drydock that eventually became the Hunters Point Shipyard.

1906-1941

The great earthquake and fire of 1906 had very little impact on development within the Project vicinity. A small increase in settlement occurred along Third Street near Butchertown and Islais Creek. The real improvement was the completion of a bridge across Islais Creek at Third Street in 1915. Finally there was a direct way to access Hunters Point Hill, India Basin and eventually Candlestick Point.

During this time the population was predominantly Italian with a fair number of Irish, Maltese, Portuguese, and Chinese settlers. They formed small enclaves within the larger community, sponsoring their own churches and social clubs. For the most part, this area of the City was largely self-sufficient and received little attention from the City government. The one exception to this was the commercial activity at the Union Iron Works Drydocks the end of Hunters Point Hill.

The drydocks were expanded twice during this period in response to U.S. Navy contracts. The Navy was increasingly dependent on the services at the drydocks as one of their primary shipyard resources on the Pacific Coast. This eventually prompted them to purchase the drydocks from Bethlehem Steel (then the parent company of Union Iron Works) in 1939.

1941-1945

When the United States entered World War II at the end of 1941, the Navy had just completed its takeover of the drydocks at Hunters Point. From there, construction ensued for the next five years, dramatically increasing the dry landmass around the end of the point and changing the topography of the entire area. Demands for housing for the defense workers at the shipyard resulted in over 12,000 units of housing constructed in the immediate area. Every portion of the Bayview was impacted by these housing projects. The population explosion transformed the rural Bayview and Hunters Point neighborhoods into an urban enclave almost overnight. Demographic shifts from Italian to African-American, economic shifts from agriculture to heavy industry and social shifts from multigenerational families to transient settlers all occurred during this highly tumultuous time.

1945-1966

After World War II, construction continued at Hunters Point Shipyard, but the jobs began to decrease in numbers. In response to peacetime activities, a sizable workforce was needed, but not in the around-the-clock mode that was common during the war. This decrease in work prompted some families to leave the area. Others moved into one of the hundreds of permanent single-family homes that were being constructed on the former truck garden lots. This left a great number of temporary war dwellings vacant.

The post-war period in San Francisco was marked with an extreme shortage of quality housing. However, the low-income segment of the market was even harder hit. These temporary buildings became apartment units managed by the San Francisco Housing Authority. The concentration of war dwellings around Hunters Point Shipyard was transformed into the highest concentration of low-income housing in San Francisco. The history of the post-war period within the Project boundaries is largely a story of the transition of this housing stock and its impact on the more well-established surrounding community.

SUMMARY

When considered as a whole, the Project areas had a relatively uneventful history up until 1941. The outbreak of World War II transformed the whole southeastern portion of

San Francisco. Each of the sub-areas was altered in its own way, but the result was a vastly different social (housing and demographics), economic (military and industry) and physical environment than what existed prior to 1941. The second most influential date was 1945 – the end of World War II. If the onset of the war changed the area from farmland to industrial powerhouse, the end of the war changed the industrial areas into a community. Even today, the various portions of the Project wrestle with their post-war identity and purpose. In most of the specific, these purposes and uses have remained relatively constant but in a state of routine unrest. The uncertainties of how to adapt from wartime to peacetime uses was the first step. Today they experience uncertainties of redevelopment on a scale not seen since World War II.

This context attempts to frame the past evolution of the Project site in order to help shape the path of this next major chapter in the Bayview-Hunters Point history. The following chapters each focus on one aspect of this history and present it in greater detail. Chapter IV discusses the general development of the geographic region prior to the start of World War II. It will elaborate on much of the information presented, briefly, in this section. Chapter V focuses on India Basin and its unique development history. Chapter VI concentrates on the Hunters Point Shipyard and its development from a single drydock to a vital military installation. Chapter VII looks at the history of public housing in San Francisco with a focus on the evolution of housing from temporary workers' housing to public housing in the South Basin Activity Node and at the Alice Griffith public housing. Finally, Chapter VIII briefly discusses the development of Candlestick Park and Candlestick Point.

Within the Project site there are a variety of previously identified historic resources. Several are discussed in this document. However, this context is meant to provide the background information necessary for facilitate *future* evaluations of historical significance for the Project. Please refer to the Bayview Waterfront Project Survey Report for a more complete account of existing and newly identified historic resources within the Project site.

Updated: July 2009

IV. BAYVIEW-HUNTERS POINT (PRE-HISTORY-1941)

Human habitation of Northern California has occurred since at least 11,000 years ago. What is generally recognized as the first native civilization on the San Francisco Peninsula appeared around 6,000 years ago and flourished as a population until the mid-1700s, when they encountered the first Spanish explorers.[2] For the next half-century, Spanish military and Catholic missionaries tried to bend the native cultures to the will of European social and religious norms, with little success. Their efforts largely ended when Mexico won its independence from Spain in 1821. When Mexico secularize the Missions in 1834, withdrawing strong governmental support of the mission system, most missions were abandoned or dramatically reduced. The lands were bought by or given to favored Mexican citizens. The grants within present-day San Francisco were initially used as grazing pastures for small herds of livestock. When gold was discovered in 1848, much of the land within several miles of the entrance to San Francisco Bay was surveyed and platted for more intensive development.

In the Bayview-Hunters Point area, this period between pasture land and urban settlement lasted much longer than elsewhere. Even though several individuals and corporations tried to entice people to build their homes on the slopes and valleys of the area, it was not until World War II that the current neighborhoods started to take on substantial form. This late development is unique within the history of San Francisco and as a result, Bayview-Hunters Point has an unusual development history.

The following brief history covers the period from pre-history through the military buildup to World War II, marked by three periods settlement: Pre-history, settlement prior to statehood and settlement after 1850. Little of the architectural record remains for any of

[2] Archeo-Tec, Historic Context for the Archeology of the Bayview Waterfront Project, San Francisco, California-Draft. 2008, p. III.J-18.

these periods, but it is important to understand this period to comprehend the extreme changes brought by World War II.[3]

PRE-HISTORY

As the ice sheet retreated from Northern California at the end of the last Ice Age approximately 10,000 years ago, San Francisco Bay was formed from the flood plains around a deep pre-historic river. For thousands of years the shores of the Bay were covered with extensive wetlands, grasslands and sand dunes. The area that now comprises the Bayview and Hunters Point districts was a mixture of shallow, tule covered swamps and deep channel drop-offs. Hunters Point extended over a mile out into San Francisco Bay and was edged with deep water almost immediately off its steep slopes. Those areas around the Islais Creek delta (now India Basin) and between Hunters Point and Candlestick Point (centered on Yosemite Slough), were fairly shallow and bordered by tidal mud flats.

Hunters Point Hill is a bedrock formation that originally extended over 6000 feet into San Francisco Bay. Its serpentine rock and steep slopes made it quite inhospitable but afforded settlers on its slopes protection from prevailing wind patterns and weather. At Candlestick Point the eastern edge of Bayview Hill dropped almost straight into the Bay waters, with sandy beaches extending north and south along the shoreline.

Accounts from 1776 by Spanish settlers note encounters with the native population around Islais Creek and the presence of good land and a small spring. A large marsh spanned the distance from Potrero Point to Hunters Point. Further south, a smaller outlet existed near the present-day Yosemite Slough. See Figure 3 for a view of the 1852 shoreline.

[3] The specifics of the various types of archaeological deposits, their context, importance and locations are discussed more fully in the archaeological survey of the Bayview-Hunters Point District created by Archeo-Tec Consulting Archaeologists in parallel with the development of this document (2008).

Updated: July 2009

The marshy shore and sheltered coves of the Bayview-Hunters Point area made it a natural settlement location. Native peoples had inhabited the San Francisco Peninsula for an estimated 6,000 years before European and Mexican explorers came to the region. Islais Creek had a large tidal plain rich with various reeds, grasses, waterfowl, and other wildlife. This rich saltwater marshland covered most of the area between today's Potrero Hill and Bayview districts. Yosemite Slough supported a second, smaller marshland. The lowlands around and between these two areas were flooded daily by the continual ebb and flood of the Bay waters, creating marshlands over half a mile wide along this section of the shore.

A detailed account of the social customs and lifestyles of the native populations is presented in Historic Context for the Archeology of the Bayview Waterfront Project, San Francisco, California, prepared by Archeo-Tec in parallel with this document. The information presented on these peoples is summarized from this report. For additional detail, please see the referenced document.

OHLONE

The Project is situated along a relatively protected area of Bay shoreline. Before modern reclamation it was covered in extensive marshes rich with plants and animals. As a result, it was a favored location by native inhabitants, as evidenced in the numerous indigenous sites that have been identified within the Project boundaries.

"The Northern tip of the San Francisco peninsula was once the Yelamu tribal territory. The Yelamu were one of a number of smaller tribal groups within the larger Costanoan (Ohlone) language family, composed of no more than 160 people who spent much of their year split into three semi-sedentary villages. The present Project is located within several miles of the predicted location of the Yelamu village of Chutchui… The group of people who lived at Chutchui moved seasonally along Mission Creek to the Bay shore, where they had another village called Sitlintac."[4]

By the time Europeans arrived in the 18th Century, a stable and thriving native population existed in the San Francisco and Monterey Bay regions. At the time of the Missions' founding, central California had the densest native population north of Mexico with an estimated 7,000 to 10,000 inhabitants between Point Sur and San Francisco Bay. This population was made up of many different groups, or tribelets. Each tribelet constituted an autonomous governing body but they did not always live in a single village. Around San Francisco Bay these tribelets were more nomadic and often traveled between two or more settlements depending on the time of year.

The abundance of natural springs and freshwater wetlands in the region provided many suitable locations for temporary settlement. This cultural habit of wandering made them unusual from other Native American groups in the western United States. This was due in part to the abundance of fish, game, and wild grains around them. With little effort they had plenty to eat and never had a need for supplementing their diet with cultivated crops. Instead they were able to sustain themselves relatively comfortably with staples such as acorns and acorn flour, seeds, grasses and whatever elk, deer, rabbit, wild birds and fish they could readily hunt or catch. Their primary hunting weapons were the bow and arrow but most were also proficient with knives for close hunting and meat preparation.

Linguistically, the Ohlone language was the most widespread of the five distinct native languages in the Bay Area. These languages also included Bay Miwok, Coast Miwok, Patwin and Wappo. Ohlone, Bay Miwok and Coast Miwok were derived from a common linguistic base known as Utian. Patwin was more distantly related and Wappo was from

[4] Archeo-Tec, *Historic Context for the Archeology of the Bayview Waterfront Project, San Francisco, California-Draft*. 2008, p. III.J-12.

unrelated origins. Within the Ohlone language were many dialects. While recognized as distinct languages, some were similar enough to be understood across tribelet groups.[5]

When the missionaries came to the region in the 18th Century, the Ohlone first greeted them cautiously. The Spanish tried to trade glass beads and cloth, items both foreign and fascinating to the Ohlone. Increased contact brought about an evolution of their behavior and most soon greeted the Spanish with excitement and anticipation of the goods they traded.

The missionaries sought to convert the natives to Catholicism and to show them how to live as they did, farming the land and conducting themselves as proper Spanish citizens. The newly converted were referred to as neophytes. Generally, after conversion the neophytes moved to the mission and lived in single-sex dormitories. Living in close quarters allowed Western diseases, to which the Ohlone had no resistance, to spread quickly through the population. “Between 1817 and 1835, several hundred Indians were transferred from Misison Dolores to Mission San Rafael in Marin County where agriculture and grazing were better. By 1827, there were reported only 241 Indian men, women and children at Mission Dolores.”[6] In this way, traditional ways of life were lost. Under Mexican rule, the missions were secularized in 1834. There were no villages to return to and the wildlife and plants they depended upon were largely gone or severely impacted by the use of the land for cattle grazing.[7] Most neophytes left and tried to find work on the ranches.

EARLY SETTLEMENT (EXPLORATION – 1849)

Spanish Era

The first Europeans to come to the San Francisco Bay area in the 18th Century were Spanish explorers from Spanish-controlled Mexico. Captain Gaspar de Portola and his exploration party are generally credited with "discovering" San Francisco Bay in 1769. The purpose of their mission was to locate Monterey Bay, which they failed to do, by taking a coastal route. Instead they passed Monterey and viewed San Francisco Bay from a hilltop in present-day Pacifica. This expedition was the first to the general region and established a Spanish claim over the land between the two bays.

By 1776, permanent settlements were desired to secure Spain's claim over the newly discovered land. The great harbor was of particular value so it was one of the sites chosen for both a mission and for a Spanish fort. The mission was founded by Father Francisco Palou on June 29, 1776. He named the site for his order's patron saint, Saint Francis of Asis. The mission was inland several miles along the shores of a small creek which they called Arroyo de los Dolores.[8] Eventually the mission became known as Mission Dolores, the name in use today.

At that time, five of the original 13 missions had been established. They eventually ranged geographically from San Diego to San Francisco, founded over a 22-year period. The chain of missions up through Alta California were to be connected by El Camino Real, spaced about a day's ride apart. Mission Santa Clara (1777) was the closest mission to Mission Dolores. The original 13 missions were further apart than called for in the plan, making travel between them dangerous. In 1797, the Spanish government authorized the founding of five more missions. Mission San Jose (1797)

---

[8] Historic American Buildings Survey, San Francisco de Asis, Mission Dolores Church, San Francisco, California: HABS No. CAL-38-SANFRA, 1937.

dates from this period. El Camino Real continued to be a primary north-south route well into the 19th Century.

Mexican Era

The founding of the missions continued in Alta California even as problems began for the territorial governors in Mexico. By 1810, tensions between Spain and its Mexican territory had become too great and Mexican rebels declared themselves an independent country. Nearly a decade of fighting on Mexican soil ensued. In 1817, a Mexican constitution was ratified and five years later, the newly established government took over control of the missions.

For a period, the Franciscan brothers remained at the missions and ran them with the support of the Mexican Army. However, in 1834, the Mexican government secularized the missions, stripping them of their lands and government support. The lands were given to well-connected Mexican citizens, who either paid a nominal fee or were being rewarded for military services. With the loss of military and governmental protection and support, the missions soon fell into poverty and disrepair. Food shortages and old age forced many Franciscans to return to Mexico or to abandon the more remote missions.

In 1839, a large section of the lands originally attached to Mission Dolores were granted to Jose Cornelio Bernal. According to the c1854 land case map, Bernal's Rancho Rincon de Las Salinas encompassed all the lands between Precita Creek on the north and a series of hills just north of Visitacion Valley on the south, and from El Camino Real to San Francisco Bay.[9] In total he was eventually granted approximately 4,400 acres (see Figure 4.)

Bernal was a well-established Spanish soldier. (His father, Juan Francisco Bernal traveled with Juan Bautista de Anza when they discovered San Francisco Bay.) In his

---

[9] Land Case Map D-8, Unites States District Court. California, Northern District. Land Case 5 ND, p. 365, http://oac.cdlib.org/.

lifetime, Bernal was granted several other plots of former mission lands. In 1834, he was given a small plot of land near Mission Dolores as a reward for his civic services in the fledging political realms of San Jose and San Francisco. In 1840, he was granted the adjacent Potrero Viejo lands, giving him ownership of approximately 20 percent of present-day San Francisco. Unfortunately, he did not live long enough to capitalize on his gains. Jose Cornelio Bernal died in 1842 at the age of 46.[10]

Because most of the Mexican land grants were large and far from existing settlements, they were difficult to patrol. Consequently, it was easy for squatters to occupy land. According to Mexican law, non-Mexican citizens could not own Mexican land. Because of this, many Americans came west and tried to force claims on pieces of the large ranchos. Over the next ten years, problems continued to brew.

In 1846, the Mexican Governor, Jose Castro, issued an edict to all American settlers in the Mexican territories in California. They were told to relinquish all their claims on Mexican-held land or face involuntary removal. Many settlers had lived and worked the land for close to a decade and were angered by the governor's proposal to remove them. Twenty men banded together near Santa Clara and ambushed a shipment of Castro's horses being sent to troops charged with carrying out his orders to evict the Americans. They met little resistance. Embolden with this success, they continued to Sonoma to General Vallejo's home to force his surrender.[11] Here too, they met little resistance and easily captured Vallejo, who did not put up any struggle. U.S. Army Captain John Charles Fremont joined their fight and the small group, called the "Bear Flaggers" after the flag they fashioned for their independent Republic of California, soon controlled most of northern California. These events, and similar struggles in Texas, prompted the U.S. to declare war on Mexico later that year.

Updated: July 2009

The Mexican-American War ended in 1848 with the signing of the Treaty of Guadalupe-Hidalgo just days before the discovery of gold at Sutters Creek was announced. The terms of the treaty transferred all of present-day California, Nevada and Utah and parts of Arizona, New Mexico, Colorado and Wyoming to U.S. control in exchange for $15 million. California became a state in 1850.

STATEHOOD (1850 – 1941)

Early statehood in the Bayview-Hunters Point area was relatively quiet. The former Mission Delores lands were still largely held by the Bernal family or farmed by tenant farmers to supply produce to San Francisco. While the Gold Rush transformed San Francisco from a backwater port to a bustling city, the effect within the Project was minimal. The number of farms increased but it was mostly left in its natural state or used for recreational purposes. As the 19th Century progressed, more people did settle in the area, but the overall population gain was slow. Commercial development was centered around Railroad Avenue (now Third Street), near the Butchertown enclave. Transportation was the main impediment to more widespread development. However, this obstacle did not stop several entrepreneurs from attempting to bring greater residential development to the area. In the end, only the onset of World War II brought about any major alterations to the relatively quiet Bayview-Hunters Point section of San Francisco.

EARLY TRANSPORTATION

One of the biggest impediments to development of the Bayview-Hunters Point area was access. The first roads through the general area were not much more than wide footpaths connecting the scattered small settlements and farmsteads. El Camino Real, also known as San Jose Road at the time, traveled well inland, along the base of inland hills. Further east was the Bay View Turnpike, but it too avoided the marshes and rocky outcroppings in the area. Just before the gold rush, in 1848, the San Bruno Road was graded to more efficiently connect downtown San Francisco with the Mission district, Potrero Point and the farmlands immediately south. This road started further east near downtown San Francisco, following the shoreline a little more closely than the San Jose Road. Even though it was the first road to cross Islais Creek, it too took a route well west of today's Bayview neighborhood, roughly following the present-day Bayshore Boulevard. It met up with the San Jose Road near the present City of San Bruno. The San Bruno Road served workers on dairy farms in Bayview, Visitacion Valley, and present-day Brisbane. The road was so narrow that a driver had to pull the wagon into the deep grass to let another wagon pass.[12]

The first direct overland access to Hunters Point was completed in 1868. Known as Long Bridge, this horse-drawn railway trestle spanned Mission Bay and the Islais Creek estuary. South of the estuary, the route continued down Railway Avenue (now Third Street) to its original terminus at the Bay View Race Track.[13] (See page 46 for more information on this early recreational facility.) Construction of Long Bridge took three years of working through the mud flats and blasting into the serpentine rock of the coastline.[14] Shortly after its completion, tracks were laid for the Potrero and Bayview Railroad, thus opening (in theory) the southern areas of the City to settlement (see Figure 5.) Unfortunately, the railroad completion was not accompanied by improved road access. To reach the area, travelers could arrive by horse-drawn train, sail by boat, or endure the long, circuitous route around the marches if they went by wagon. Because of this most of the Bayview-Hunters Point area remained fairly sparsely settled except for those areas directly accessible by train or boat: Butchertown, Third Street and India Basin.

Figure 5: Long Bridge shortly after construction, c.1866. Note the cut through the hillside in the distance. Photo used with permission from the San Francisco History Center, San Francisco Public Library.

The Southern Pacific Railroad finished the Bayshore Cutoff in 1908, opening a direct rail line to the entire area. It eventually included a 4110-foot bridge over Islais Creek north of Custer Streets between Islais and Tulare Streets. The Bayshore Cutoff ran parallel to Long Bridge and the Potrero & Bay View Railroad horsecar tracks and trestle, then through a series of tunnels through Hunters Point, over the marshes of Bayview and around San Bruno mountain before meeting up with the existing main line in present day South San Francisco.[15][15]

In the aftermath of the earthquake and fire of 1906, Hunters Point became an area of respite from the smoke, chaos and debris. Accounts from the period tell of the railroad construction crews working on the Southern Pacific's Bayshore Cutoff opening their work camps to refugees. Because the area received little major damage, businesses and homes were open and occupied immediately after the earthquake stopped. Most damage occurred to buildings on the long piers over the mudflats or to buildings sliding from their foundations. Once righted, these latter buildings were once again serviceable. People took in the homeless with overflow shelters being set up in local cultural and community institutions, such as the Bayview Opera House and camps established on the open grazing lands of Hunters Point and Bayview.[16] At the drydocks, only the tall pumphouse chimney received any damage and the pumps remained functional in the immediate aftermath.

Even with the Bayshore Cutoff, the Bayview-Hunters Point area remained largely undeveloped. Foot and vehicular traffic were still required to go around most of Islais Creek to cross near the intersection of Bay Shore Boulevard and Army (present day Cesar Chavez) Street. A bridge connecting Third Street with Railroad Avenue at Butchertown was not completed until 1915.[17] This drawbridge was the final element to provide direct access to the area.

SETTLEMENT AND DEVELOPMENT

Settlement in Bayview-Hunters Point happened rather gradually compared to those districts closer to the City's core. The building boom in downtown San Francisco at the height of the Gold Rush did not extend the four miles down San Jose Road. However, speculators did try to entice people to the area. In 1849, Dr. John Townsend and John Cornelius de Boom entered into a business venture with the Bernal family to subdivide large portions of their Rancho de las Salinas and Rancho Potrero Viejo. Townsend and de Boom handled promotions and business matters in exchange for 50 percent of the sales revenues.[18] They extolled the virtue of the superior climate, protected harbors, fertile land and relative proximity to the City's core. Robert and Philip Hunter had recently arrived from New York, when they joined Townsend and de Boom's team as real estate agents.[19]

Townsend and de Boom abandoned the project by the beginning of 1850, leaving the Hunter brothers as sole agents. They built a hotel at the tip of Hunters Point Hill for prospective clients who toured the area. Ultimately, the venture was commonly referred to as "Hunters Folly" and the area became known as an escape from the noise and grime of the city. The later addition of the Bay View Race Track in 1863 only emphasized its early fame as a place for fresh air and relaxation (see page 47.)

Eventually, Robert and Philip Hunter obtained ownership of the peninsula from the Bernal Estate and were joined by their older brother John and his family in 1856.

---

[18] Millie Robbons, "A Hunters Point Dream Scheme" Millie' Column. *San Francisco Chronicle.* August 24, 1973.

[19] Ironically, Robert and Philip Hunter settled themselves on the slopes of the point that would eventually bear their names but never actually purchased the land from either the Bernals or from de Boom and Townsend. While they eventually did receive claim to a small portion of Hunters Point Hill, it was years later after a court suit.

Besides the hotel and selling the occasional lot, the brothers ran a successful water supply business with abundant spring water well on their property.[20]

The Hunter brothers stayed at Hunters Point until the early 1870s, when they sold their land to a savings and loan company.

SOUTH SAN FRANCISCO HOMESTEAD & RAILROAD COMPANY

In 1861, the State Legislature passed an act authorizing the legal formation of homestead associations.[21] At that time, most of the land in San Francisco was owned by a handful of wealthy families, who had the connections and means to acquire portions of, or entire, rancho grants. The sums of money and political clout required for these transactions were well beyond the means of the average person. As demand for housing continued to increase, speculators formed homestead associations to purchase large tracts of land, made minor access improvements, and then sold smaller lots at a price within the reach of a workingman's wages. Many offered installment payments to ease the financial burden. Many neighborhoods in San Francisco were developed in this way, each with a slightly different character depending on the improvements made by the speculative owners. In the next several decades, homestead associations were responsible for forming much of present-day San Francisco.

The South San Francisco Homestead and Railroad Company was formed in 1862 in anticipation of rail service extending to the Bayview-Hunters Point area. They owned and subdivided over 2,000 75 by 100 foot lots covering Hunters Point and most of the Bayview neighborhood. In addition, they gained development rights to hundreds of underwater lots extending out into the shallow Bay waters around Hunters Point Hill and running south to Candlestick Point.

[21] Roger and Nancy Olmsted, Historical Consultants, San Francisco Bayside Historical Cultural Resource *Survey*, 1982, p.101.

Updated: July 2009

As with many homestead associations, the South San Francisco Homestead and Railroad Company tried to lure investors to their sites by building or partnering with existing recreational facilities. In this case, the company attempted to capitalize on the popularity of the recently opened Bay View Park (c.1863) race track by partially subsidizing the construction of an extension of the Potrero and Bayview Railroad's horse-drawn rail line to the park (see page 48 for more on Bay View Park.) Not only would this bring in customers for the races, but it eventually would serve the residents of "South San Francisco," as the area was then called. To further the appeal of their holdings, the Association donated land for the construction of drydocks at the end of Innes Street to attract businesses, and employees, to their land.[22] (See Chapter VI: Hunters Point Shipyard for a more complete account of the development of the drydocks at the end of Hunters Point.)

Although the Bayview Turnpike and Potrero and Bayview Railroad improved access to the area, the anticipated building boom did not materialize. Other homestead associations appear on historical maps, mostly corresponding to the larger shares of land given to stockholders in the South San Francisco Homestead and Railroad Company. These include Hunters Tract, Central Park, and Hudson Gardens and Orchards.[23] Most of the tracts and associations appeared only on paper and did not represent developed land.

By 1907, most of the area still appeared fairly open with development concentrated along Third Street (Railroad Avenue), close to Islais Creek and Butchertown (discussed below), or further south near the intersection of Yosemite and Third Street (see Figure 6.) However, the 1899 and 1913 Sanborn maps show extensive water lots platted in a

[23] San Francisco Block Book Vol. II, Homesteads, 1907. Other, larger homestead associations were found west of Third Street but these appear to have been formed concurrent with, and separate from, the South San Francisco Homestead and Railroad Company

strict grid from the shoreline out to the tip of Hunters Point (see Figure 7.) These water lots remained part of the South San Francisco Homestead and Railroad Association until 1910. At that point, all the remaining unsold lots east of H Street (Hudson) were transferred to the South San Francisco Dock Company (not to be confused with the San Francisco Drydock Company, discussed below.) The transfer amounted to approximately 40 city blocks, largely comprised of these underwater and tidal flat lands.[24]

Street Grid and Names

The impact of the South San Francisco Homestead and Railroad Company remains in the street grid in Bayview-Hunters Point. Unlike development in much of the rest of San Francisco, the association decided to lay out streets to minimize the impacts of topography, with 60-foot wide streets parallel to the prominent ridge of Hunters Point Hill. Thus, the streets east of Third Street are offset from the typical San Francisco north-south/east-west orthogonal grid. While this made the east-west streets much more amenable to horse and foot traffic, it meant that the north-south streets over Hunters Point Hill were largely impassable. Today, many of the streets are interrupted as they pass over Hunters Point Hill. The South San Francisco Homestead and Railroad Company surveyors used units based on the English system of measurement (feet, inches, gallons, etc.), as opposed to the rest of the City, which was surveyed according to the Spanish vara.[25] The north-south streets were originally given alphabetical letter names such as “N” and “P” Streets while the east-west streets were numbered. A similar system was employed elsewhere in the City, causing confusion for the postal service. About 1880, the post office requested that the streets be renamed.

Updated: July 2009

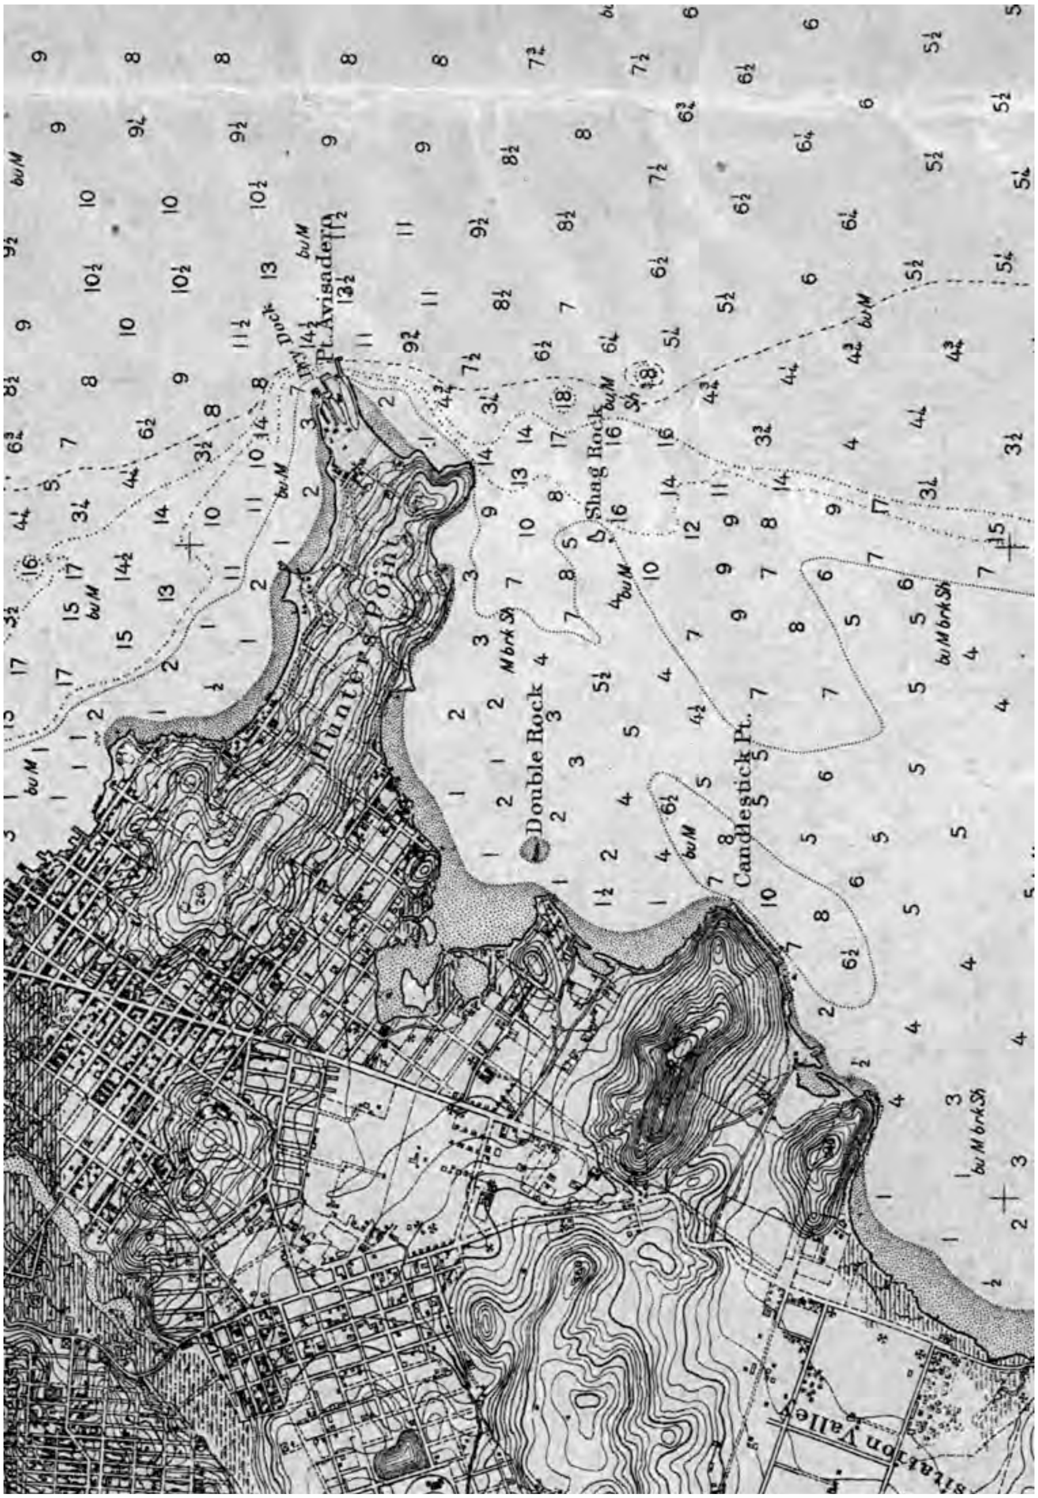

Figure 6. 1905 Coast Survey Map showing locations of development just prior to the 1906 earthquake.

Updated: July 2009

Figure 7. 1913 Sanborn Map showing the extensive water lots that had been platted for development.

The streets were given exotic geographical names of major islands and foreign nations. The north-south streets were renamed after major American rivers. The local residents resisted the new, difficult to remember names and petitioned the Board of Supervisors in 1890 to restore the old names. A compromise restored the letter and number street names, but with the designation of "south" for Bayview-Hunters Point and "north" for those streets in the Sunset district.[26]

This nomenclature continued to be confusing. Some estimates from the period claimed over 500 units of post per day were mishandled because of the street names. As San Francisco rebuilt after the earthquake and fire of 1906, and expanded into new neighborhoods in the western and southern districts, the time seemed right to address the problem of duplicate or very similar names in various districts. Mayor Taylor authorized the *Commission on the Changing of Street Names* in 1909. The three primary affected areas were the Richmond, the Sunset and the Bayview-Hunters Point districts. Most of the proposed changes were in favor of honoring the Spanish and Mexican heritage of the area. This proved to be more contentious than the committee envisioned. Because the Richmond and Sunset districts had well-organized neighborhood improvement associations, they received the bulk of the commission's time and press coverage. Because of this, the Bayview name changes were postponed until 1910, when the commission addressed the community's comments.

Until 1908, this section of the city had been generally known as South San Francisco. When the City of South San Francisco incorporated, this district was forced to change its popular identity to Bayview. When the Naming Commission started to work with the lettered and numbered streets in the district, the residents were generally in agreement that it was needed but lacked a consensus as to what names would best honor their community. The relatively remote, small and self-sufficient community lacked both a unifying organization and a collective identity. Into this stepped two prominent religious

[26] Ibid, p. 22.

leaders, Father O'Sullivan from All Hallows Parish and Father Ford from St. Ignatius College. They set about pushing their pro-Catholic, pro-Irish agenda in the naming of the streets in the district. The results were the selection of Palou Avenue for Padre Palou, founder of Mission Dolores. (The proposed name was Paine after Thomas Paine who the Fathers felt was an atheist and therefore unfit for a street in their neighborhood.) Another street was named for Charles Carroll, the only Catholic signer of the Declaration of Independence. (The proposed name was Cromwell, which the Irish priests objected to out of patriotic fervor.) A third street was named for H.H. Bancroft the historian, one of the only streets named for a living person. (This naming replaced the proposed Belfast, which was objected to because it was a Protestant city.) The Fathers protested unsuccessfully against Wallace (a Scotsman), Fitzgerald (after author Edward Fitzgerald who they felt was an pagan), and Nelson, until they were told it was named after American General William Nelson of Kentucky and not British Admiral Horatio Nelson.[27]

The street names negotiated in 1910 remain today throughout the Bayview-Hunters Point area. Some changes have been made, especially around Hunters Point Hill and on Hunters Point Shipyard where many of the streets were created by the Navy and do not follow the street grid.

Reclamation

Other problems also complicated the situation. The failure of the homestead associations in the Bayview and Hunters Point meant that many of the unsold lots were distributed to the respective stockholders. The end result of this was a patchwork of largely absentee landowners. For the City, trying to purchase outright or exercise eminent domain to obtain rights to these lands and water lots was a formidable task, both financially and politically. Hunters Point itself acted like a natural barrier, limiting

[27] John Freeman, "Street Naming Controversy–1909," Encyclopedia of San Francisco, http://www.sfhistoryencyclopedia.com/articles/s/streetNaming.html

settlement and transportation both to and around it.[28] Limited access to the choicest waterside locations would be a hard sell to industrial leaders looking for good locations to establish marine businesses.

In 1925, the State legislature passed the Tidelands Reclamation Act. In response, San Francisco established a reclamation district. This included a 280-acre section near Islais Creek. As with many prior ventures, this held a promise to open the district for development. This was reflected by the business community in San Francisco who saw it as an opportunity to reap economic benefit from the neglected area.

"This area has been an eyesore for years. It has prevented the development not only of the territory within the district itself but that surrounding it… The reclamation of Islais Creek is but the beginning of the utilization of the land and facilities that are available to industry and commerce lying between the Potrero and Bay View District…"[29]

Reclamation began with seawall construction between Third Street and the Southern Pacific right-of-way. This roughly half-mile wall was then backfilled with muck dredged from the resulting channel on the opposite side of the seawall. The seawall itself was constructed of rock blasted from nearby hillsides. The U.S. Army Corps of Engineers completed a dredged a channel out to the Bay as well as a turning basin at the inland terminus. The dredged fill was used to raise the ground in the flood plain. The process continued through 1930 when the remaining marshlands of Islais Creek were filled to City grade and streets were adjusted to maintain the grid over the newly reclaimed land. The entire reclamation project was completed in 1936.[30]

CONTINUED DEVELOPMENT

Further south along Railroad Avenue, improvements to the Southern Pacific rail lines in 1905 resulted in demolition of at least a dozen early buildings. The Bayshore Cutoff included a tunnel through the block bounded by Phelps Street, Palou Avenue, Quint Street and Oakdale Avenue, just west of Railroad Avenue. That loss was more than made up for in the next ten years as the area grew. Buildings constructed after 1905 tended to be larger and of varied uses with street front retail and residential above. The increase in lodging houses along Railroad Avenue was the result of the increasing importance of the drydocks as well as the growing popularity of the area as a home for Southern Pacific's Pullman porters.[31]

Closer to the shoreline, maps after 1906 tend to show many water lots platted into the mudflats. However, little development occurred. One of the only areas of continual development was that around Butchertown and along Third Street. Some lots were used for housing, but most were for new industrial buildings. Butchertown was slowly starting to be squeezed out.[32]

Elsewhere in the district, construction was piecemeal and not part of a concerted effort for development. This is tempered with a relatively significant shift in the development of single-family homes in the areas immediately around Third Street from 1899 to 1913. Even though many lots were still rather sparsely built up, there was more general settlement along Third Street down to Palou Street, and again south of Yosemite Avenue. The in-between area was still swampy in comparison and remained devoid of buildings.[33] It was largely used for vegetable farming.

[32] Butchertown was an industrial area located along the banks of Islais Creek in the late 19th century. In addition to slaughterhouses, the district was home to a multitude of related businesses including tallow works, glue factories, sausage factories, mattress manufacturers, tanneries and large stockyards. See below for further discussion.

Post-1906 Housing

The 1906 earthquake and fire left a vast number of San Francisco residents homeless and afraid of the crowded city. Many sought to rebuild their lives in more spacious, though more remote, areas of the city. Some small subdivisions of the early homesteading attempts in the Bayview area had enjoyed modest success, but most of these early plans remained fairly wide open. While the number of people who moved to the Bayview-Hunters Point area was significantly greater than during the preceding years, it was by no means the rush of families that areas closer to the city core enjoyed (see Figure 8.) At this time, the character of the Bayview started to shift from industrial and pastoral to a more organized urban environment. However, Butchertown, the boatyards near India Basin (see Chapter V), the drydocks on Hunters Point (see Chapter VI) and the greenhouses and farms in the Bayview area continued to dominate the landscape and shape where people settled. Up until the beginning of World War II, most of the blocks east of Third Street remained developed only in pockets.

HUNTERS POINT IMPROVEMENT ASSOCIATION

By the 1930s, City government officially recognized Hunters Point as a separate district. However, this recognition did little to bring about civic-sponsored improvements to the area. Public transportation, adequate water and sewer service, and public recreational facilities were all still woefully lacking. The different settlement and industrial nodes – Butchertown, the boatyards of India Basin, the Drydocks, the Third Street corridor and the settlements around Yosemite Avenue were not united politically or socially.

After fighting for years to get streets graded and paved, to get parks, sewer line extensions and public transportation, the residents near the India Basin boatyards in 1939 formed the Hunters Point Improvement Association to try to bring more awareness to the needs of the community. At first they received little attention from City Hall, both because the district was not politically well connected, and because there were few

Updated: July 2009

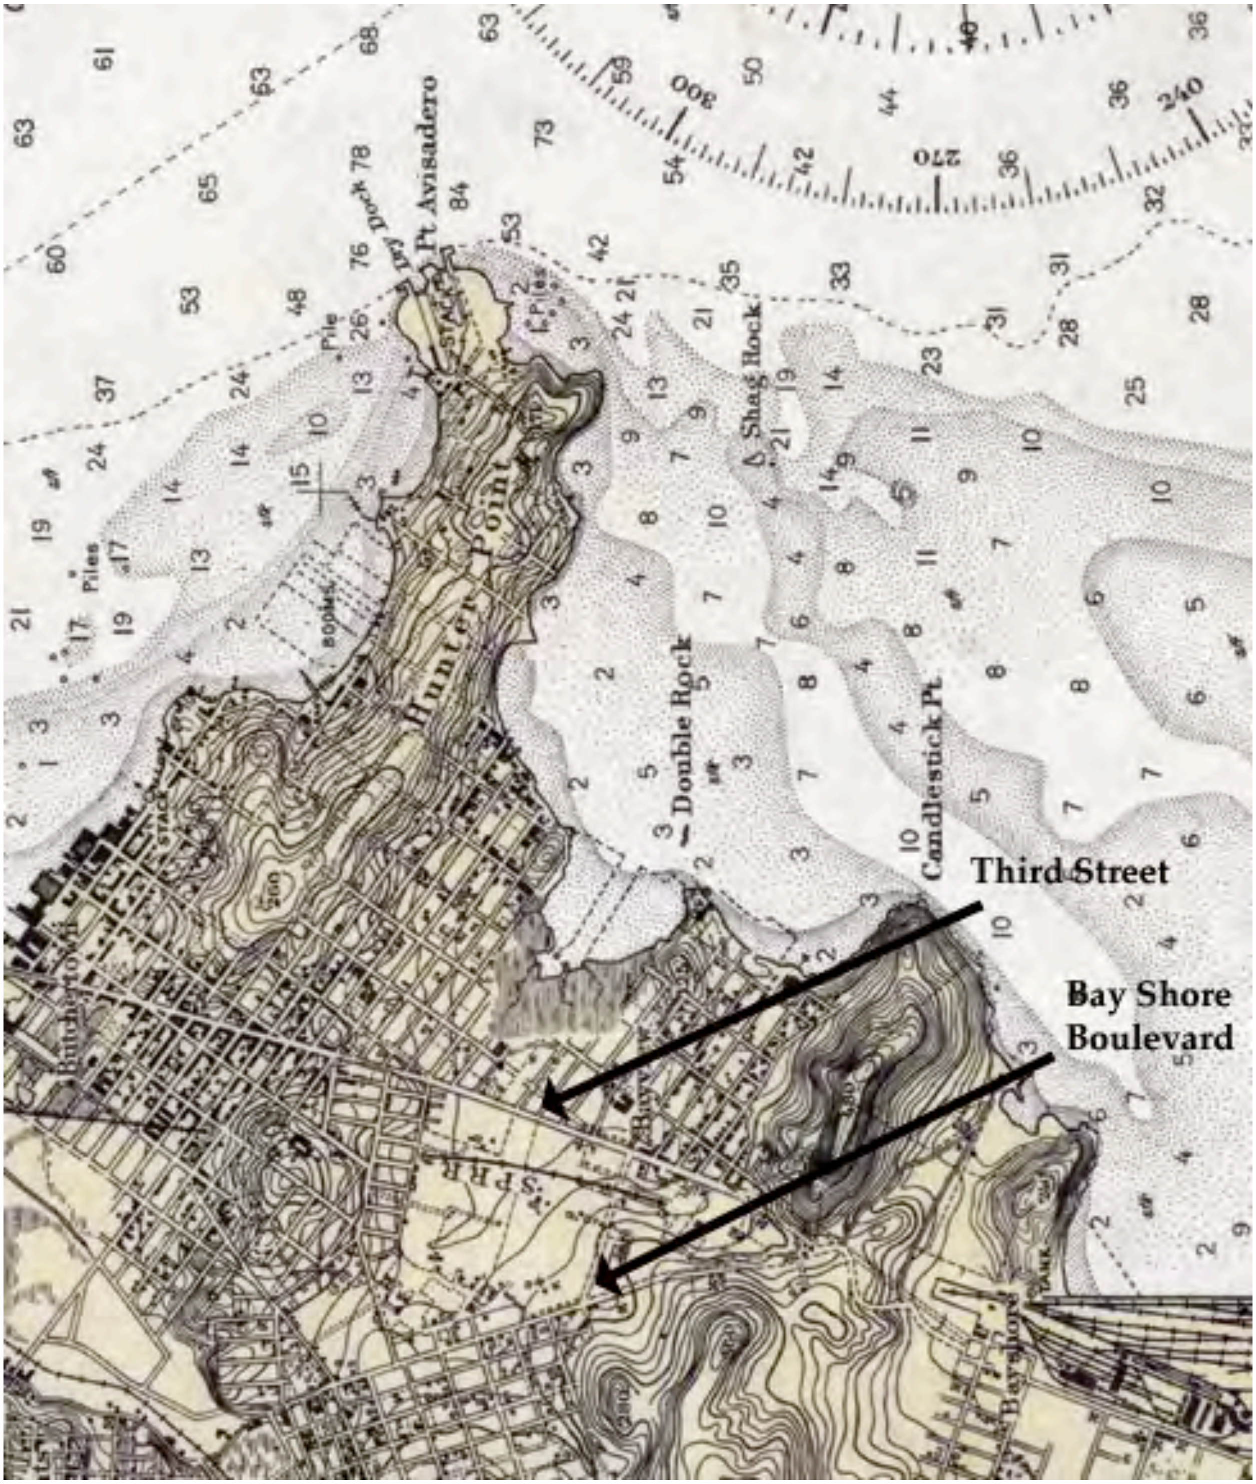

Figure 8. 1926 USGS map showing areas of increased development after the earthquake. Compare to Figure 6 and note the higher density development along Third Street.

because the district was not politically well connected, and because there were few public improvement projects happening anywhere in San Francisco because of the shaky financial environment of the Great Depression.[34]

Instead, the neighbors took matters into their own hands, just like they had on numerous past occasions.[35] This time, they undertook a cooperative grocery to address the poor access to food staples in the area. Their efforts met with limited success. The grocery came to symbolize the spirit and attitude of the district, something that was well praised in the popular media, but it did little to bring about long-lasting improvements. For that, they had to wait for the U.S. entrance into World War II.

COMMERCIAL DEVELOPMENT

Adequate transportation remained an obstacle to development well into the 20th century. However, development did occur to a limited extent. It was precisely because of the remoteness and relative isolation of the Bayview-Hunters Point area that it became a favored place to relocate necessary yet undesirable commercial uses. First this included the dairy farms, and then it was Butchertown (see Figure 9). In later years it became a favored industrial center and public works facility location.

BAY VIEW PARK

The area just north and west of the Alice Griffith Public Housing (between Third Street and the former water line) was first developed in 1863 as a high-class horse racing track known as Bay View Park. The racing oval was on soft ground, only partially dry, that gave it a reputed spring, enabling the horses to run record times. In a City filled with

[34] City and County of San Francisco, Planning Department, *Hunters Point Shipyard Reuse FEIR, Appendix E*, certified February 8, 2000, File No.1994.061E, p. E3.

[35] In 1920, after years of lobbying the City for a playground, the people of the Bayview district got tired of waiting. On February 21, 1920, they held the first Community Labor Day to clear a vacant lot at Railroad and Jerrold. It became the first community playground in San Francisco. "Bay View Citizens Build a Community Playground," *Community Service Recreation League Bulletin,* February/March 1920.

Figure 9. A view of a portion of Butchertown, c.1925. Photo used with permission from the Bancroft Library, University of California, Berkeley.

over a dozen horse racing venues, Bay View Park was thought to be one of the best. It boasted a hotel and grandstands in the latest architectural styles, and offered it own horse-drawn railroad to transport people from downtown San Francisco the hinterlands known as the Bayview (see Figure 10.)

Bay View Park had very influential investors, including George Hearst, father of William Randolph Hearst.[36] It was successful for many years and became a popular location for the City's elite. However, by 1880s, the track had been reclaimed by the sea.[37] Hearst, Crocker and other had grand plans for redevelopment of the area as a new "country" retreat for monied San Franciscans. Unfortunately, the land was not as desirable for residential development. Apparently, no one wanted to live in the swampy bottomlands so far from the City's core, in spite of the pleasant weather and wonderful views. Instead, Crocker turned his sights south to Hillsborough and the Bay View Park land remained undeveloped marshland until the eve of World War II.

Truck Farming

Before the advent of modern refrigerated transport, the costs and timeframes associated with shipping fresh fruits and vegetables limited where, when and how food could be transported. For San Francisco, food was supplied from farms around the Bay then sold at local markets, or door-to-door by individual vendors. The location of the farms on the periphery of the City was limited to those area blessed with a fresh water supply. Early on, most of these farms were in the Cow Hollow and Lake Merced sharing water with dairies. As San Francisco grew, it became apparent that relocating all agricultural pursuits to the unpopulated lands south of Market would remove the more unpleasant aspects of these businesses from residential areas. In the 1880s, San Francisco passed an ordinance to move the farms out of Cow Hollow.

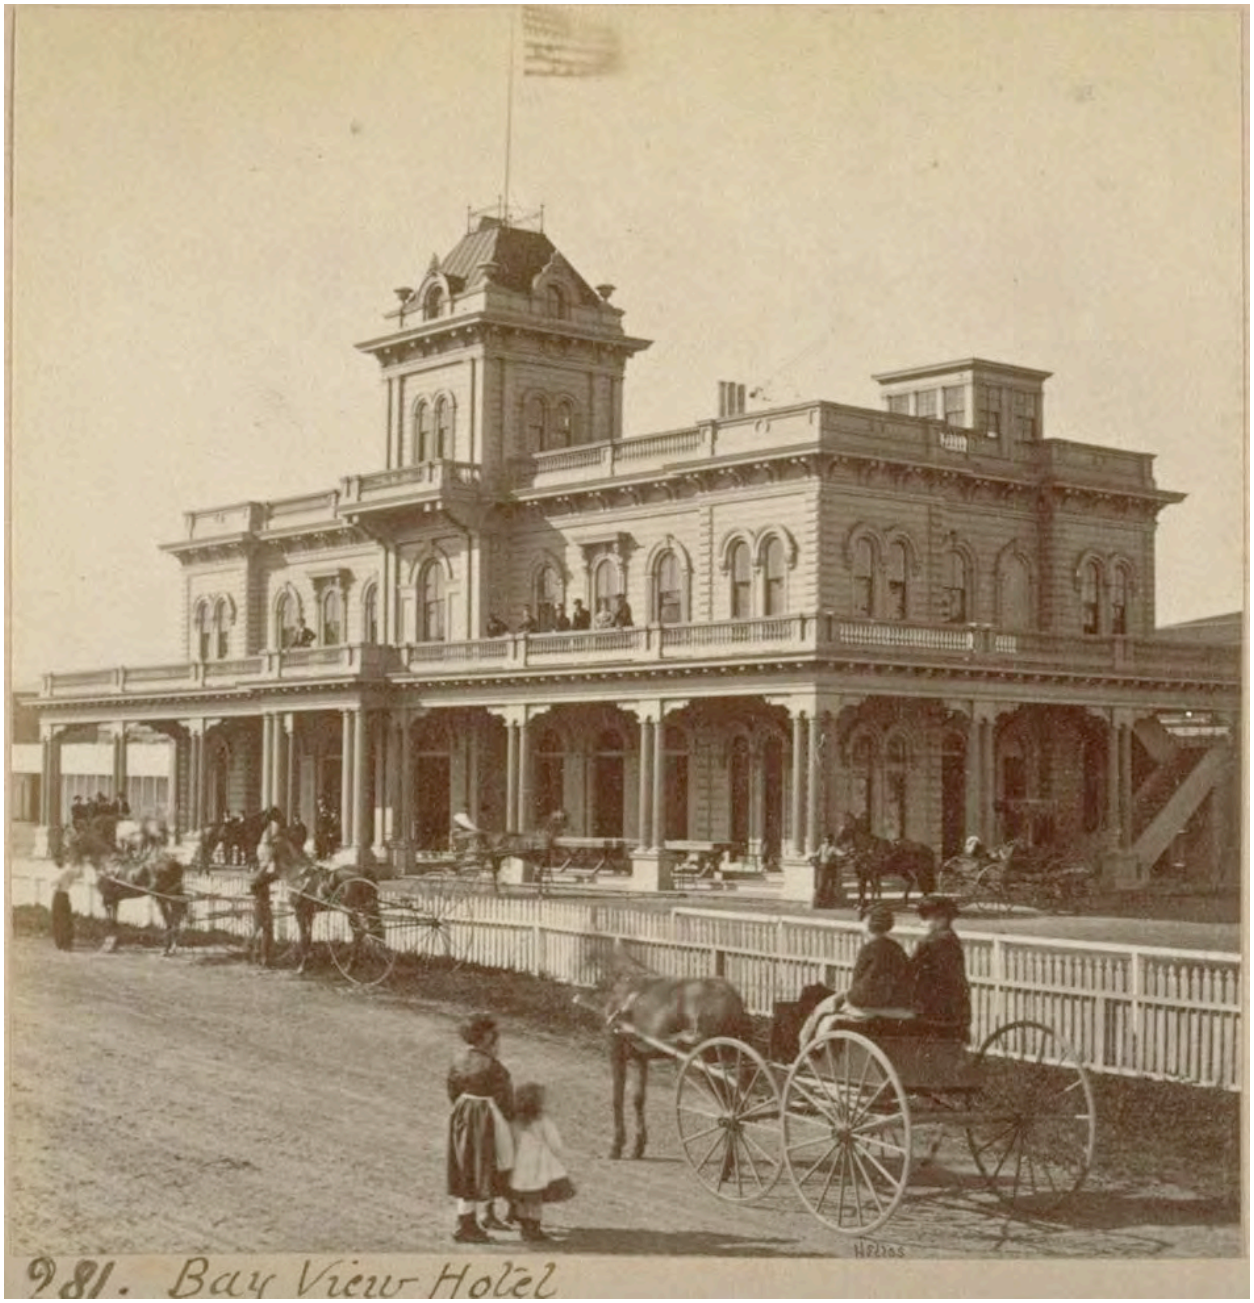

Figure 10. Bay View Hotel, San Francisco, c.1868-1880. Photo used with permission from the Bancroft Library, University of California, Berkeley.

One area that had both fertile land and ample fresh water was the Bayview area in the old pasturelands of Mission Dolores. It was here that the vegetable farms had their greatest concentration, providing San Francisco with a nearly constant supply of fresh fruits and vegetables to feed the rapidly expanding population.

Before 1870, the majority of vegetables were grown by Chinese immigrants on lands leased to them by real estate speculators. Sanborn maps up through the 1950s show many large plots labeled “vegetable gardens” or “nursery”. While many of the plots were tended by Chinese immigrants, they were not the only ethnic and cultural group to be drawn to the work. A smaller number of Italian and Portuguese citizens also grew vegetables for sale in the local markets.[38] The difference was that many of these families owned their land outright, a fact that allowed them to ascend into relative prosperity much more quickly than the Chinese farmers who immigrated with nothing and relied on a collective arrangement to amass land shared between several families.

After 1870, the proportions had changed and most of the farms were owned or operated by Italians. They tended to favor workers of similar backgrounds, hiring recent arrivals or family members to tend the fields. An account from the 1880s describes the typical market farm in the Bayview area.

“The Italian market gardens are chiefly located along the San Bruno Road, in the San Miguel Rancho, along the borders of the Presidio reservation, and in South San Francisco [Bayview]. There are a few small gardens operated by the Chinese in the neighborhood of Black Point [Candlestick Point] and between South San Francisco and Hunters Point. Where once the Chinese were the commonest sight with their vegetable cars heading for the market places, now they have been crowded out by the Italians and the Portuguese who have bought larger and larger plots of land. Like the Chinese, the

---

[38] Roger and Nancy Olmsted, Historical Consultants, *San Francisco Bayside Historical Cultural Resource Survey,* 1982, p. 114.

Italian laborers in the local gardens are content with a little – so far as wages are concerned. Most of these men live on the scene of their daily toil in light shanties, part of which is devoted to the storage of root crops and seeds, and the remainder to the domestic uses of the family."[39]

In 1868, the proliferation of the "market gardens" in the Bayview area was aided with the completion of the Potrero and Bayview Railroad through the center of the district. Until then the farmers were forced to move their goods either by horse and cart or via barge. As rail service and roads improved, the smaller farms were consolidated into larger operations. The 1913 Sanborn map (the first to show much of Bayview) labels a major portion of the land east of Railroad Avenue (Third Street) for vegetable production. As late as 1950, there were still commercial farms in the area, concentrated mostly near the Bay shore, and several of the larger growers had established greenhouses west of Railroad Avenue, closer to the railroad tracks and San Bruno Boulevard.

Butchertown[40]

The original Butchertown was located at Ninth and Brannan Streets in the south of Market area. After the Gold Rush swelled San Francisco beyond its humble beginnings at Yerba Buena Cove, this once remote district of the city proved to be more valuable for other forms of industry. Therefore, in 1871, the city passed an ordinance and amended the Municipal Health Code to move Butchertown to the banks of Islais Creek, away from the then residential and industrial centers of San Francisco, and could not contaminate the water supply of the city core.[41] The move resulted in a shift in

---

[39] "Market Gardens: Practically an Italian Monopoly," *San Francisco Chronicle*, November 17, 1889.
[40] Like many cities, San Francisco has traditionally concentrated certain industries in various enclaves. These enclaves then acquire nicknames derived from those industries. Butchertown is one of these examples where many different businesses associated with the butchering industry tend to be established in close proximity to each other.
[41] David Chavez & Associates, Archaeological Resources Investigation for the Bayview-Hunters Point Redevelopment Plan, San Francisco, California: Evans Avenue Addition, 2004, p. 5.

boatbuilding businesses along Islais Creek, where boatwrights moved east, further down Hunters Point to escape the worst of the "effects."[42]

Islais Creek was, in many ways, the ideal location for Butchertown. Although most parts of the slaughtered animals were used for one purpose or another, the industry still generated a large amount of biological waste. The slaughterhouses were constructed on long piers set over the mudflats of the tidal basin of Islais Creek. When the useful portions had been sent to processing plants nearby, the wastes were pushed onto the mudflats. Once here, the ebb and flow of the tides would carry the waste out into the Bay. This tidal scrubbing was so effective, that very little archaeological materials have been unearthed during construction in this area. Everything was swept out to the Bay.[43]

With the slaughterhouses, Butchertown also consisted of a host of related businesses including tallow works, glue factories, sausage factories, mattress manufacturers, tanneries and large stockyards. Most of the butchering was done on the piers over the Islais Creek running east from Railroad Avenue along the shoreline (roughly along present day Davidson and Evans Avenues.) The stockyards were west of Railroad Avenue (Third Street) near the present-day Caltrans railroad tracks. Easy railroad access was key to the transportation of cattle and livestock from the Central Valley and the south. Most were brought overland either on foot or via rail to the stockyards where they were held before slaughter. The stockyards in Butchertown were typically used for short-term holding. Tanneries, tallow and glue works were a bit further inland, on dry ground.[44] Most of the other early businesses and services, such as lodging houses, saloons and barbershops along Railroad Avenue (now Third Street) catered to the Butchertown workers.

[42] Kelly and VerPlanck, Historical Consultants, *India Basin Historic Survey*, 2008. p. 20.
[43] Roger and Nancy Olmsted, Historical Consultants, *San Francisco Bayside Historical Cultural Resource Survey,* 1982, p. 144.
[44] Sanborn Fire Insurance Maps: San Francisco, 1886, 1899, 1913, 1950.

One other commercial area that developed was in India Basin. Here a community developed around the shoreline and various marine industries such as boat building and fishing. The history and development of India Basin is covered in the next chapter.

PROPERTY TYPES

Building, structure and object types related to the discussion above would include, but are not limited to:

- Greenhouses
- Early residential buildings including farmhouses and rowhouses
- Early commercial buildings, mostly wooden frame, such as the Bayview Opera House
- Community buildings, including churches, halls and recreational facilities
- Hotels, Lodging Houses and Saloons, mostly wood frame, typically around Third Street, false fronts and Italianate detailing would have been common
- Street patterns
- Retaining walls
- Storage sheds
- Transportation facilities – loading platforms, docks, railbeds, tracks and tunnels

Most of the buildings from this pre-1941 period within the Project were removed in the building booms that occurred during World War II and in the immediate post-War period. The one major remnant that survives in much of its original form is the street grid and its naming convention.

Buildings from these periods within the boundaries of the Project are investigated, presented and evaluated more fully in Volume II of this report. This document, *Bayview Waterfront Plan Historic Resources Evaluation, Volume II: Resource Survey and Report*, also prepared by Circa: Historic Property Development, should be referenced for further information regarding specific buildings or architectural styles found within the Project.

CONCLUSIONS

The overall development of the individual districts within the Project before World War II was rather slow and measured. In spite of its superior weather, abundant water and wonderful Bay views, general access to the area greatly hampered its development as a residential neighborhood. Commercial enterprises were lacking because the overall population was too small to sustain them. Instead, specific industries developed in specific areas where the natural conditions were most suitable. Butchertown utilized the tidal basin of Islais Creek. Farming occurred on the flat lands. Recreational facilities developed at the ends of excursion rail lines. Other develops included India Basin for boat building and the tip of Hunters Point Hill for ship repairs. These industries each had a small community of workers associated with them, but no large-scale residential development occurred until the onset of World War II.

Updated: July 2009

V. INDIA BASIN[45]

India Basin is composed of approximately ten full and partial blocks ranging from Earl Street to the former Pacific Gas & Electric plant site along Jennings Street. Many of these blocks are occupied by small, light industrial enterprises and residential buildings. The area has historically been a small boatbuilding community since the middle of the 19th Century. This community was fairly self-sufficient, establishing their own churches, schools and social support network. Economically, they were dependent on the Bay for their livelihoods, whether they were involved with boat building or fishing. Today, several of the early religious institutions remain, as does at least one working boatyard and several residences from the 19th Century and early 20th Century. It remains a unique working landscape within the City of San Francisco.

EARLY HISTORY – BEFORE 1941

In 1868, proximity to the newly constructed drydocks at the end of Hunters Point, brought about real estate speculation for the entire neighborhood. That same year, in preparation for this devolvement, the State Board of Tide Land Commissioners named the inlet between Potrero Point and Hunters Point at the mouth of Islais Creek, “India Basin.” The land and submerged lots were set aside for “docks, piers slips, and basins, and other purposes of commerce.”[46] At that time there were already several small dwellings along the northern coastline of Hunters Point Hill. When the drydocks opened at the eastern end of Hunters Point Hill, several small roads and footpaths connected India Basin to both the drydocks and to the rail line along Third Street. The most widely used route followed approximately along the line of today’s Innes Avenue.[47]

---

[45] Most of the information in this section is paraphrased from the comprehensive historical context for India Basin prepared by Kelly and VerPlanck for The Bayview Historical Society. Specific references are provided as follows.
[46] Kelly and VerPlanck, Historical Consultants, *India Basin Historic Survey*, 2008. p. 16.
[47] U.S. Coast Survey Map, 1869.

Updated: July 2009

Development in the India Basin sub-area was driven largely by proximity to and availability of water. To this end, the industries that defined the history of India Basin were boatyards, breweries, and fishing.

BOATYARDS AT INDIA BASIN

The boatyards were active in India Basin for over three quarters of a century from the mid-19th Century to the early 20th Century.[48] For much of that time, they constituted one of the only stable communities beyond the boundaries of Butchertown in the area. Most boatwrights were of northern European descent from England, Holland, Germany and Scandinavia. Boatbuilding tended to be a trade that was passed down from father to son, creating a close-knit, multi-generational atmosphere. This community took pride in their work and was largely self-sufficient.

When the first boatyards opened in the 1850s, India Basin was largely unimproved shoreline property. Arriving over land involved a circuitous journey around Mission Bay and the marshes at the delta of Islais Creek. Even the opening of Long Bridge across Mission Bay in 1868 did little to improve the route for foot travelers. Once a person disembarked from the train along Third Street, there was still a walk of a mile or so to the boatyards. Extending beyond the boatyards a single road ran along the northern shore to the drydocks being completed at the tip of the point. As more and more yards opened, this last road was greatly improved but that was mostly because of the increased business at the drydocks rather than the need to better service the boatyards. By 1906, the area had remained largely stable in size for twenty years. This period from their establishment through the great earthquake represents the height of growth of the boat yards at India Basin (from the 1850s through 1906).

[48] A more detailed account of the names and dates of the various boatyards in India Basin is given in "India Basin Historic Survey," Kelly and VerPlanck, Historical Consultants, *India Basin Historic Survey*, 2008.

Individually, the boatyards at India Basin were rather small commercial operations. However, taken as a whole, they constituted one of the largest concentrations of shipwrights and shipbuilding services in San Francisco. Most specialized in the construction and repair of San Francisco Bay scow schooners. These unique craft were the workhorses of local maritime trade (see Figure 11**.)** The number and quality of roads through the region, combined with the difficult topography made shipment of goods over land an expensive and cumbersome process. Moving goods by water, however, was relatively cheap and efficient. The main difficulty was the wide marshlands that made much of the shoreline unusable. The scow schooners were developed with an adjustable and very shallow centerboard that had drew mere inches when fully retracted. Their flat decks, simple construction and efficient use of materials meant they could be built and maintained cheaply and that they could haul a variety of goods into shallow waters. To do so they sacrificed speed and agility, two qualities that were much less important on the protected waters along the shorelines of San Francisco Bay.[49]

The demise of the schooner building trade finally came in the late 1920s as roads were improved and truck shipping became more viable. The slow and steady schooner was becoming obsolete. Some retrofitting with gasoline-powered engines helped these crafts compete, but their relative instability under wind power made them highly unsuitable for the faster pace afforded by modern combustion engines. The early days of the Great Depression further weakened the schooner market. Some yards consolidated and specialized in boat repair and wooden pleasure craft. Most disappeared for good. Today only two boatyards remain visible along the India Basin shoreline: the Anderson & Cristofani and Allemand Brothers yards (see Figure 12).[50]

Spring Water and Breweries

South of India Basin, along the northern slope of Hunters Point Hill, is a sizable natural spring. It was tapped by the Hunter brothers as a source of fresh drinking water for both themselves, and any individual willing to pay them for it. As early as 1855, they sold the water rights to Independent Water Company of San Francisco for $50 per month. This company shipped out kegs of water to barges in India Basin for transport to downtown

San Francisco. The Hunter brothers also ran an early “bottled” water venture where ships would get a full supply of fresh water before heading out to sea.[51]

The ample supply of fresh drinking water, combined with a concentration of European immigrants, made India Basin and Third Street a prime location for small brewery operations. One of the most famous of these was the Albion Brewery at 881 Innes Avenue in India Basin (see Figure 13.) Englishman John Burnell started the Albion Ale and Porter Brewery in 1870 after purchasing the Hunters’ spring. There he set about crafting a traditional English beer, which was stored in the tunnels he excavated deep into the serpentine rock of the hillside. Burnell constructed an imposing limestone building complete with a tower and vast storage facilities. Being a sound businessman, Burnell also bottled the spring water for sale as part of the Albion Water Company. These popular businesses continued after his death in 1890, when his widow and sons took over operations. The end strike for this and the other breweries in the area was Prohibition in 1919. The site was abandoned shortly thereafter.[52]

The site was in ruins when French sculptor Adrien Alexander Voisin (1890-1979) purchased the property in 1933 and began a lifelong mission of rebuilding the “castle” and fashioning his elaborate gardens. Voisin and his heirs owned the property until 2005 when it was sold at auction. Today it continues to be used as a private residence and is listed as San Francisco Historical Landmark No.60.[53]

Shrimp Camps

Many Chinese came to the United States initially to work on the railroads, but a good number were experienced fisherman. The Chinese fishermen sought out the best locations for their efforts, including the northern slope of Hunters Point Hill. Shrimp fishing on San Francisco Bay began with Chinese harvesting bay shrimp sometime around 1870. The crustaceans were considered delicacies in China and most of the haul was intended for export. Eventually American settlers came to appreciate the dried shrimp as well, adding to demand. Because fishing for bay shrimp was a long and arduous process, there was little competition by European fisherman and the Chinese shrimping grounds were largely left alone.[54]

Shrimp camps were well established around the Bay by the 1880s. The most productive grounds were along the west side of the Bay at Hunters Point, Point San Bruno and Point San Mateo, and in the shallow coves of the northern Bay near San Rafael at Point San Pedro.[55] At Hunters Point, most were concentrated in the protected shallows along the northern shoreline of Hunters Point Hill, although some were reportedly along the south shore as well. They were typically arranged into camps of less than 50 men under a manager who oversaw the selection of fishing grounds and processing of the harvest. The men used large, funnel-shaped nets that were 18 feet high and up to 30 feet long, set out in the Bay along a line up to a mile long. Forty crews of five men each would work two full tidal cycles to catch the shrimp on the ebb and flow of the tide. It was difficult work lasting 12 to 14 hours a shift.[56]

[54] Roger and Nancy Olmsted, Historical Consultants, *San Francisco Bayside Historical Cultural Resource Survey*, 1982, p.119.
[55] Ibid.
[56] San Francisco Chronicle, July 23, 1893.

When the harvests were collected on shore, the shrimp were boiled in weak brine until they became pink, then laid out in the sun to dry. Customers could come to the camps, or the dried shrimp were packaged for sale in San Francisco or for export.

With little development pressure in the area, the shrimp camps continued well into the 20th century. The 1930 Census notes at least one shrimp camp in India Basin, housing approximately 30 workers.[57] It appears that tension was building around the shrimp camps, however. In 1939 the City undertook a “clean-up” campaign of the India Basin shrimp camps. At this time, the City deemed them unsanitary, had them condemned and the San Francisco Fire Department set ablaze the shrimp camps as the owners and their families stood by watching (see Figure 14.)[58]

Along with the shrimp camps, at least one commercial fishery was known to have existed in India Basin. Sanborn maps and photographs of the early California Dry Docks Company at the eastern end of Hunters Point Hill, identify a fish drying enterprise immediately adjacent to the drydock on the north side of the point. It had a series of buildings, including a bunkhouse, mess hall and drying shed.[59] It was slated for removal by 1913 when Drydock 3 was being planned. (See Chapter IV for more information about the construction of Drydock 3.)

As a relatively isolated community, most of the public services extended to India Basin were the result of related projects in the larger area. For instance, the first basic water service to the residences and businesses of India Basin did not occur until 1924 when the Spring Valley Water Company built a main line along a portion of Innes Avenue. Sewers soon followed, but neither water nor sewers extended up the slope of Hunters

Point Hill where several isolated residences continued to utilize wells and septic tanks. Paved roads were nonexistent until 1938 when a single route from Third Street to the Union Iron Works Drydocks was regraded and tarred.[60] This began to change when the Navy showed genuine interest in acquiring the drydocks for a major military base in the early 1930s.[61]

[60] Kelly and VerPlanck, Historical Consultants, *India Basin Historic Survey*, 2008. p. 29.
[61] It was purchased by the U.S. Navy in 1939 but not occupied by them until 1941.

WORLD WAR II (1941 – 1945)

After the United States entered World War II, the hillside blocks around India Basin were rapidly transformed. What was rocky land with a scattering of haphazardly sited residences became tidy rows of identical war dwellings. Circulation through the area was improved and expanded, with new streets and street patterns. Traffic increased substantially and the shoreline to the east was filled and reshaped. (See Chapters VI and VII for further discussion on the impact of World War II on the Shipyard and the development of housing.) In the middle of all this development, however, the physical changes to the specific blocks within the India Basin sub-area were limited. There are many houses, commercial and community facilities that remained as islands of the past and are covered in the earlier sections of this chapter.

POST – WWII (1941 – PRESENT)

By 1950, use or redevelopment of the war dwellings surrounding India Basin forever changed the community atmosphere. The demographics and social character of the area were much different than the boatwright community of before the war. In spite of this, several boatyards, including the Anderson & Cristofani Boat Building Co. (at 900 Innes Avenue) continued to operate and expand, demolishing several old structures and constructing a new warehouse, storage, administrative, woodworking and smithing shops. This operation became a vital link to the past for the remaining pre-war India Basin population. As a result, while much of the land in the area was being filled or planned for fill, this stretch of India Basin remained in its natural state.[62]

[62] In 1965, many of the lots north of Hudson between Griffith and Earl were filled with debris from the construction of I-280. This was done to avoid pending restrictions on the practice from the Bay Conservation and Development Commission (BCDC); Kelly and VerPlanck, Historical Consultants, *India Basin Historic Survey*, 2008. p. 38.

Updated: July 2009

PACIFIC GAS AND ELECTRIC

The Pacific Gas & Electric Company (PG&E) power plant at Hunters Point was originally constructed in 1929 by Great Western Power Company. Over the years it has been expanded to keep up with improvements in power generation techniques as well as to increase capacity. The following historical background is excerpted from the 2006 National Register eligibility assessment completed by Roland-Nawi Associates.

> "The development of electrical power in both the form of hydroelectric and steam generated production was a major technological innovation of the late 19th and early 20th Centuries. Its ramifications were enormous for the industrial sector of the economy and affected the way thousands of people lived. In California, especially northern California, Pacific Gas and Electric Company played a major role in the development and expansion of electric power generation and distribution. It has constructed a large system of power generating and transmission facilities throughout northern California from the late 19th Century until the present. In the 20th Century, the company had two important periods of expansion, each tied to a specific technology of electrical power generation. In the late 19th and early 20th Centuries the development of hydroelectric facilities dominated the industry. After 1950 there was a shift to modern steam generation and facilities designed for its production.
>
> "The first period of major expansion was 1900-1920. From the 1890s until World War II, power generation in California and the western United States concentrated on the exploitation of water resources. In California, major river systems originating in the Sierras provided a widely available and cheap source of energy. Private power corporations, including Great Western Power and PG&E, developed a number of dams, powerhouses,

substations, and transmission systems along these rivers. The great increase in the availability of hydropower during this period drove the need to establish a network of local distribution facilities in towns and cities served by the companies. In San Francisco, the 1906 earthquake destroyed most of the city's existing electric power infrastructure. As a result, a large number of hydroelectric substations had to be constructed in the city, with PG&E playing an important role in this rebuilding. During this period steam generation was a minor source of auxiliary power for the big power companies. Coal to fuel steam plants had to be imported from the Northeast and could not compete with water power.

"Following World War II a greatly increased demand for electrical power in California led to another period of facility expansion and a change in technology. In Northern California this expansion was led by PG&E which had become the primary supplier of electrical power in this part of the state. As noted above, prior to the war, steam generation was viewed mainly as a form of back-up in periods of low water supply. By the late 1940s the limits on potential new hydro sites and the development of technologies that made steam generation more efficient and more economical turned PG&E increasingly to this form of power. In the 1950s PG&E expended over one billion dollars in construction of new facilities, most concentrated on steam generation These plants were designed and engineered differently than past facilities to both cut costs and consolidate plant operations and control. The first part of this expansion was the development of four new power plants: Kearn (175 megawatts), Hunters Point (200 megawatts), Moss Landing (330 megawatts), and Contra Costa (330 megawatts). The Kern, Moss Landing and Contra Costa plants were new plants, while the Hunters Point plant was an addition to the existing facility.

Updated: July 2009

Figure 15. The Hunters Point PG&E plant during deconstruction, July 2007. The entire plant was removed by July 2008. Photo by Circa: Historic Property Development.

> "The PG&E Station P at Hunters Point includes a portion of the building from the 1920s period of expansion and a large portion that was constructed in the immediate post-war period."[63]

The post-war construction included an expansion in 1948 to house plant turbines, further modifications in the early 1950s for a steam generation unit and again in 1958 to

[63] Roland-Nawi Associates, PG&E Hunters Point Station P: Evaluation of Eligibility for Listing in the National Register of Historic Places, the California Register of Historical Resources, and for City of San Francisco Landmarks Designation, September 2006.

house another multi-story steam generator. An office wing has since been removed and replaced with a new office addition. The plant was closed in 2006 and demolished by 2008. The PG&E site is currently undergoing remediation (see Figure 15).

PROPERTY TYPES

Today, the India Basin sub-area consists of a mix of early residential and commercial buildings, along with open space and industrial uses. It is a mixed community that is transitioning from commercial and industrial uses, to a greater density of residential development. Most of the parcels slated for further historical evaluation in later phases of this project are either open space or devoid of any architectural elements.

Building, structure and object types related to the discussion above would include, but are not limited to:

- Warehouses
- Community properties – churches, schools, halls, etc.
- Wharfs
- Boat conveyances
- Early residential buildings
- Sheds
- Public housing
- Public staircases
- Development/siting patterns
- Street grid

The majority of the sub-area has been previously surveyed for historical resources.[64] Most studies have identified several residential and commercial buildings that are associated with the boat building industry and the early European immigrant community.

[64] For a more thorough and complete assessment of the historical context and related resources in India Basin, see Kelly and VerPlanck, Historical Consultants, *India Basin Historic Survey*, 2008.

Updated: July 2009

However, within the Project, no such resources remain. At this time, no architectural resources associated with the shrimp camps have been identified.

Buildings within the boundaries of the India Basin shoreline plan are investigated, presented and evaluated more fully in Volume II of this report. This document, *Bayview Waterfront Plan Historic Resources Evaluation, Volume II: Resource Survey and Report*, also prepared by Circa: Historic Property Development, should be referenced for further information regarding specific buildings or architectural styles found within the Project.

CONCLUSIONS

India Basin is most significant for its associations with the early maritime trades that once flourished along the entire San Francisco coastline. The relative isolation of India Basin, combined with its unusually close proximity to deep water channels, allowed these industries to survive for a much longer period of time than the residential neighborhoods that were slightly further south and west. Today, it is an enclave that represents what was a common grouping of residences built around a central commercial business. These businesses were often reflective of the nationalities of the surrounding communities – truck farms with Portuguese, Italian, and Chinese owners and workers, Butchertown with its Irish and Italian workers, etc. These communities each formed associations, churches, schools and social groups. India Basin is the last remaining vestige of the area prior to the radical transformation of World War II.

VI. HUNTERS POINT SHIPYARD

INTRODUCTION

Hunters Point Shipyard (Shipyard) occupies the eastern end of Hunters Point Hill. What was originally a narrow, steeply sloped finger of bedrock extending into San Francisco Bay has been transformed over the years into a flat expanse of reclaimed land. Part of the reclamation was accomplished through the leveling of portions of the original landform. Today, the Shipyard covers approximately 936 acres, of which approximately 493 acres are dry land and approximately 443 acres are under water.[65] By the time the Navy closed the Shipyard in 1974, the Shipyard contained over 337 industrial buildings, 57 housing and non-industrial buildings, 24,000 linear feet of pier, wall and wharf space, 21 repair berths, 10 additional deep water berths, 6 drydocks and a 225-ton crane (modified from the former 450-ton crane.)[66] As of July 2009, only a fraction of the original buildings and structures remain on the nearly 500 acres of available land.

The Shipyard has traditionally played a primary role in the development and definition of the Bayview and Hunters Point neighborhoods. In its early days as a private drydock, it was the largest single commercial entity in the Project vicinity as well as the largest and most modern drydock on the Pacific Coast.[67] This early enterprise represented a new era in maritime history, spanning from large wooden shipping craft to new steel-hulled vessels (see Figure 16.) After Navy acquisition in 1939, it brought national attention to the district and eventually resulted in the complete transformation of the economy and demographics of the area.

Naval interest in Hunters Point corresponded to a dramatic expansion in the size and important of the United States Navy, as well as a general increase in the military's presence on the West Coast. Continued Pacific military campaigns (Philippine War, World War I, World War II) only emphasized the importance of West Coast military facilities. As part of this, the Navy became affiliated with the Hunters Point drydocks during this period, first as a client of the privately held shipyard then as owner of the shipyard. The continued expansion and successful operation of Naval campaigns in the Pacific Ocean was dependent on the availability of ship-servicing capacity. In 1939, when the Navy purchased Hunters Point, the facility became only the third Naval shipyard on the West Coast and the only one south of Puget Sound capable of handing modern military ships.[68] It retained this status until well after World War II when the Navy changed its policies to rely on private shipyards instead of maintaining its own facilities.

As important as Hunters Point was to the World War II Naval campaigns, it gained significance in its own right in the post-war period through its role as home to the Naval Radiological Defense Laboratory (NRDL). This facility was borne out of necessity in the latter war years and grew into a major research facility dedicated to studying the physiological impacts of radiological exposure as well as the detection of and protection from such nuclear hazards. This facility was established at Hunters Point Shipyard because of its many geographic, political and logistical advantages, and operated there from 1944 to 1969. It was one of the only facilities of its kind in the United States in either private or military control, was recognized as a leading research facility on a national scale and played a major role in every U.S. nuclear weapons test during its 25-year history.

---

[68] Twelfth Naval District, Physical Properties Facilities and Services: naval Activities and Principal Offices, June 1948.

Together, these areas of importance are reflected in the built environment. There are a small number of buildings that pre-date the Navy and comprise an already identified potential historic district near Drydocks 2 and 3. The rest of the Shipyard building stock was historically almost evenly split between World War II era construction and post-war era construction, although recent demolitions have left more World War II structures at the expense of the post-war buildings. While not as impressive architecturally as the earlier drydock buildings, these later military buildings and structures carried out operations critical to the United States' success during World War II. After the War, the shipyard continued to contribute to the success of military campaigns both as a shipyard as home to RADLAB.

BRIEF MILITARY HISTORY IN SAN FRANCISCO BAY

Shortly after the discovery of San Francisco Bay, the Spanish began fortifying the headlands around the Golden Gate. The first of these establishments was the Presidio, started as a Spanish encampment in 1776 to protect the entrance to the Bay, and to guard the Mission several miles away. When Mexico won its independence from Spain in 1821, it set about further fortifying its new holdings in Alta California. In 1850, the United States took control of the Presidio. By the 1860s, they were constructing a naval base at Mare Island, the first such facility on the West Coast.

In 1885, President Cleveland's administration saw San Francisco Bay as second only to New York Harbor as vital to the nation's security.[69] The result was a number of small batteries and encampments along the coast and Bay shorelines. After the Spanish-American War (1898-1902) America's naval strength became a top national priority and San Francisco's strategic naval importance could not be denied. As a result, a massive expansion of military facilities throughout the region occurred during the first half of the

[69] United States Commission on Navy Yards and Naval Stations, *Additional Navy Yard on the Pacific* Coast: Message from the President of the United States transmitting report no.5 of the Commission of Navy Yards and Naval Stations, 1918.

20th Century. Part of this buildup included increased capacity for shipbuilding and repair, and hence the increased interest in the private drydocks at Hunters Point in the years leading up to World War II.

EARLY HISTORY AT THE SHIPYARD – PRE-1941

What became Hunters Point Naval Shipyard was originally two separate regions at the end of Hunters Point Hill: a small residential neighborhood and the drydocks. While most of the information contained in this document concentrates on the contributions of the drydocks to the overall development of the Shipyard it is important to recognize the residential portions of the military facility that pre-dated World War II. Information on the early residential development of the land within the Project is included after a brief discussion of the history of the drydocks.

CALIFORNIA DRY DOCK COMPANY

What would become the heart of Hunters Point Shipyard began in 1864 as the brainchild of A.W. Von Schmidt, a German engineer. He approached the South San Francisco Homestead and Railroad Association with the idea that a drydock in such close proximity to their land would bring industry (and workers needing housing) to the area. They readily agreed and donated ten acres to the project.[70] However, financing for the construction was more difficult to secure. Eventually, Von Schmidt partnered with a number of investors, including William Ralston and Lloyd Tevis, to form the California Dry Dock Company.

The drydock was largely cut from solid rock at the northeastern tip of Hunters Point (see Figure 17.) It was completed in late 1867 and brought great praise from local real estate speculators and promoters. The Hunter brothers built a small hotel at the tip of the point near the drydocks in anticipation of a flood of new settlers drawn by employment

opportunities at the drydocks. Around the hotel several residential and commercial buildings were erected (see Figure 18.)[71]

SAN FRANCISCO DRY DOCK COMPANY

The California Dry Dock Company operated through the end of the 19th century supported by a significant number of government contracts and also acted as a primary repair facility for U.S. Navy ships returning from various Pacific military missions. Around 1901, the company changed its name to the San Francisco Dry Dock Company and commenced construction of a second drydock, Drydock 2 (see Figure 19.) Completed in 1903, the facility became the most modern drydock on the Bay. While it was busy with increased business, its location was gaining the attention of military personnel in Washington, D.C. It was also attracting the attention of Charles Schwab (of Bethlehem Steel) who was concerned that his Potrero Point (Pier 70) shipbuilding operation was becoming inadequate to handle the most lucrative types of naval shipbuilding and repair contracts. In 1907, as he considered building additional facilities at Potrero Point, Schwab met William Babcock, president of the San Francisco Dry Dock Company.

A year later, Schwab purchased all the company stock for $1.875 million, becoming the sole owner of the drydocks at Hunters Point.[72] His close connections with President Woodrow Wilson and his position as director-general of the Emergency Fleet Corporation meant his shipyard and drydock facilities in San Francisco, as well as his shipyards in Alameda, were well placed in the years leading up to World War I.

The combination of the shipyard at the Potrero Point site and the drydocks at Hunters Point made the San Francisco Yards of Bethlehem Steel one of the largest combined facilities in the world.

NAVAL INTEREST INCREASES

After the Spanish-American War, President Theodore Roosevelt sent a fleet of U.S. Navy ships on a circumnavigation tour to demonstrate the power of the U.S. Navy. It was commonly referred to as the *Great White Fleet* and it served to establish the naval dominance of the United States as well as to show the technological capabilities of American engineers and shipyards. From a political standpoint, the 1907-1909 tour also built up domestic support for the development of naval bases on both coasts. At the time, the Navy had only two shipyards on the West Coast – Puget Sound Naval Shipyard in Bremerton, Washington and Mare Island Naval Shipyard in Vallejo, California.[73] If the U.S. was to dominate the seas with military might, it needed new facilities large enough to handle the massive steel ships then being manufactured. For the time being, the Navy contracted out the manufacture and maintenance of its fleet to shipyards such as Bethlehem Steel's San Francisco Yards.

In the Bay Area, Mare Island Naval Shipyard was seen as an important base, but it was incapable of handling the larger ships. It was plagued with shallow drafts as the result of decades of mining tailings being washed into the northern San Francisco Bay as well as by limited geographic space for physical expansion. Additional facilities were needed and various locations in and around San Francisco Bay were high on the Navy's list of considerations. In 1916, during World War I, Congress authorized the creation of a commission to further study locations for Navy Yards in the San Francisco Bay Area. It became known as the Helm Commission after its chair, Rear Admiral J. Helm.[74]

The commission looked at a variety of locations, including Alameda, Goat Island (now Yerba Buena Island), Richmond and Hunters Point. In spite of the strong, long-standing Naval tradition at Hunters Point, the commission ultimately voted in favor of Alameda as

---

[73] JRP Historical Consulting Services, Historic Context and Inventory and Evaluation of Buildings and Structures: Hunters Point Shipyard, September 1997, p. 11.
[74] Ibid.

the preferred location of the new shipyard. This recommendation was never acted upon, and the site eventually became the Naval Air Station at the western end of the island of Alameda.

In the meantime, the Navy compromised by further solidifying its relationship with Bethlehem Steel's drydocks at Hunters Point. It subsidized construction of new, larger facilities at Hunters Point in exchange for prioritized access to the privately owned site.[75] This arrangement enabled Bethlehem Steel to construct Drydock 3 in 1918.[76] This drydock was built by enlarging Drydock 1 (1867) and it greatly increased the ship repair capabilities of the Hunters Point facility.

The almost exclusive U.S. Navy access to the drydocks at Hunters Point worked out well during peacetime. However, following World War I, it became apparent that the size and destructive power of the world's navies had increased dramatically. As the ships became more sophisticated, so too did the repair facilities that kept them afloat. Realizing that they would eventually have to develop their own west coast facilities, the U.S. Navy once again began searching in earnest for the right locations.

The pressure for an established shipyard, capable of handling the world's largest fighting machines, increased dramatically as hostilities in Europe began to escalate at the end of the 1930s. To address the situation, the Navy purchased the Bethlehem Steel drydocks at Hunters Point in 1939 (see Figure 20.)

At the time, the entire site was approximately 48 acres and contained two drydocks. Anticipating involvement in the growing conflicts in Europe and the Pacific, the Navy began construction of supply buildings and storehouses along the drydocks (see Figure 21.) This construction was rather limited in size and scope due to extreme shortages of

emergency construction money and materials. All construction during this period at Hunters Point was done as money became available and used what were considered inexpensive materials to build temporary structures.[77] Improvements from this early-Navy period included a new assembly building just south of Drydock 2, latrines, a 50-ton crane and an 800-foot quay wall just south of Drydock 2, as well as smaller service-oriented buildings near the point (now since removed.)[78] The Bureau of Yards and Docks, a branch of the U.S. Navy, took on these projects. This bureau was responsible for the building and maintenance of the yards and Drydocks, as well as all support facilities related to ship construction, repair and maintenance. The majority of the Hunters Point Shipyard buildings of this pre-war period were built using standard plans developed by the Bureau of Yards and Docks. These early projects were still under construction when the Government terminated its lease to Bethlehem Steel in October 1941. The Navy took full control of the facility on December 18, 11 days after the bombing of Pearl Harbor.[79]

PRE-NAVY COMMUNITY

To handle the immediate need for barracks and residential accommodations, in 1942, the Navy acquired an entire neighborhood at the end of the ridge as part of the Hunters Point Naval Shipyard expansion. (This area was wholly contained within Parcel A of the Phase I Project.) The roughly 75-acre, flag-shaped area was bounded by Donahue Street to the west, Galvez Avenue to the north, Hill Drive to the east and Kirkwood Avenue to the south.[80] In total, 86 homes and 23 businesses became Naval property.[81]

The buildings were used for married officers' housing, military clubs and other social and recreational uses. Over the years, the Navy added several 1950s era residential buildings to this area as well.

Not much is known about the small community that lived on the end of Hunters Point Hill, overlooking the shipyards, drydocks and fishing operations. This neighborhood was the result of increased business at the Bethlehem Steel drydocks at Hunters Point (discussed in the preceding sections). According to a 1997 report, "the bulk of the houses in this area [dated] to the 1908-1939 period, with more being constructed during the 1930s than any other decade." The report noted 31 homes were constructed between 1909 and 1939, with 20 of these constructed in the 1930s.[82] Within these 20th Century buildings, there apparently were two earlier structures that were tentatively dated to the 1890s or early 1900s. Together, they formed an eclectic grouping of mostly one- and two-story revival-style homes.[83]

WORLD WAR II – 1941-1945

Hunters Point Shipyard was not initially intended to serve as a stand-alone facility. When first acquired, and throughout World War II, it was designated as an annex to the Mare Island Naval Shipyard.[84] To this end, the early work at Hunters Point was completed by servicemen stationed at Mare Island. As its role as a repair facility for large ships became more heavily in demand, Hunters Point Annex grew accordingly. Because Mare Island could not accommodate these larger ships, Hunters Point was a vital part in the Navy's shipyard facilities in San Francisco Bay. When Mare Island's

[84] Karl F. Kimbrough, Hunters Point Naval Shipyard: A Historical Analysis, August 1978, p. 9.

capacity for submarine repair was strained by the War, additional facilities were constructed at Hunters Point. Its role and importance as a separate facility was not established until December 1945, near the end of the war.[85] At this time the mission of the Shipyard was still highly focused on the repair and servicing of large ships (209 during World War II), even though it had expanded capabilities to handle smaller craft and submarines and had limited capabilities for the construction of new ships (4 during the World War II period.)[86]

In fulfillment of its role as an annex to Mare Island, Hunters Point was developed as a highly specific facility. It did not have the extensive administrative support buildings, personnel or training facilities of Puget Sound or Mare Island. It did not need such facilities with Mare Island so close by and with its historical relationship to this other Naval base. Instead, it continued to be developed as the most modern large-capacity shipyard on the West Coast. This is evidenced in the construction of Drydock 4, the largest drydock in the world at the time of its construction in 1943, and the erection of the 450-ton Bridge Crane (1948), also the largest in the world at the time of its construction.

DEVELOPMENT AND EXPANSION

Between 1939 and 1945, due to the anticipated involvement in World War II and subsequent battles along the Pacific Rim, Hunters Point Naval Shipyard was expanded from 48 acres to 583 acres.[87] This was accomplished by moving over 8 million cubic-yards of earth from the end of Hunters Point Hill to the shallow areas immediately north

---

[85] Ibid. p. 12. The Mare Island Annex at Hunters Point was then renamed the San Francisco Naval Shipyard.

[86] Mare Island produced 17 submarines, four submarine tenders, 31 destroyer escorts, 33 small craft, and over 300 landing craft. Many more were docked for repairs during this time and an exact figure could not be found. National Parks Service, “World War II in the San Francisco Bay Area,” http://www.nps.gov/history/nr/travel/wwIIbayarea/mar.htm. This is compared to 50 built and 384 total dockings at Puget Sound. National Parks Service, *National Register of Historic Places Nomination: Navy Yard Puget Sound*, December 1991.

[87] Building the Navy’s Bases in World War II: History of the Bureau of Yards and Docks and the Civil Engineer Corp, 1940-1946, Volume 1. 1947, p. 198.

and south of the drydocks. The northern area became the submarine servicing area and the southern portion formed what was to become the bulk of the Shipyard's usable land. (Figures 22-26 illustrate the rapid changes to the land mass in 1942.) These major dredging and engineering projects were completed simultaneously with dozens of other, more traditional construction projects completed in record time.

In 1941, $675,000 was appropriated for the construction of a new quay wall. However, the project was started in January 1942, immediately after the United States entered the war. In April 1942, the installation of 10 miles of sewer pipe and 10 miles of fresh-water lines was begun on the lands being leveled. The utility systems were further expanded in 1942 when connecting crane tracks were laid from old Drydocks 2 and 3 to those of the new 1092-foot drydock (Drydock 4), under construction at the time.

One of the major infrastructure projects during the World War II period was the laying of miles of railroad track within the Shipyard. These tracks allowed the massive ship propulsion and operational equipment to be moved from storage to installation facilities, as well as to transport such equipment from off-site foundries to Hunters Point. Even today, rail lines, spurs and beds remain scattered as reminders of the importance of the railroad to the everyday functioning of the Shipyard.

Beginning in 1942, the Navy commenced an extensive building campaign at the Shipyard. The bulk of the site's development took place during the emergency period of World War II and the majority of the buildings remaining at the Shipyard date to this period. The use of standardized designs and easily produced, readily accessible construction materials enabled military planners during the war to build a large number of buildings in highly condensed timeframes for the least amount of money.[88] According to a 1997 study of buildings and structures at Hunters Point Shipyard, nearly all of the

buildings at Hunters Point were constructed using these Bureau of Yards and Docks standardized plans.[89]

The World War II-era buildings at Hunters Point are a mixture of temporary, semi-permanent and permanent construction types. Because of the restricted use of critical materials, most of the structures completed during this time were temporary or semi-permanent facilities. All of the barracks, toilet facilities, and nearly all of the shops and warehouses were built according to standard plans. These plans, however, could be modified somewhat during and after construction to accommodate specific programmatic needs.[90] A number of structures built after the Second World War, including some large-scale industrial shop buildings and the basic facilities of the Naval Radiological Defense Laboratory, were designed as permanent buildings.

Shipyard Design

Though standardization was a key component in the rapid World War II-era Shipyard expansion, not all Shipyard buildings are of a standard Bureau of Yards and Docks plan. Throughout the course of the war, the Corps of Engineers and Bureau of Yards and Docks worked together to both develop designs that could be mass-produced, and, in an effort to provide federal employment opportunities during a time of scarce private construction projects, administering both architect-engineer (A&E) and construction contracts. The actual layout of individual buildings as well as plans for entire military bases commonly was turned over to private A&E firms. These firms could, and frequently did, use Navy or Army standardized plans, adapting them as needed to accommodate specific conditions at each individual base.[91] The main administration building (Building 101) for example is essentially a compilation of numerous modules,

---

[89] A review of drawings held at local Navy archives confirms these findings.
[90] JRP Historical Consulting Services, Historic Context and Inventory and Evaluation of Buildings and Structures: Hunters Point Shipyard, September 1997, p. 17.
[91] Ibid, p. 18.

each derived from standard Navy plans. Further, the warehouses in the 400-series section of the South Shipyard are essentially identical, though minor variations in plan and design are visible.[92]

A small number of important buildings were not constructed using standardized plans though still adhere to longstanding design traditions of the Navy and industrial manufacturing buildings in general. The designs for Buildings 253, 231 and 411, for example, were not specifically derived from standardized plans but nonetheless retain several features common to large manufacturing shops built by the Navy throughout the United States since the early 20th century.[93]

During the World War II-era, a variety of A&E firms were contracted by the Navy at HPS as well as at other military facilities throughout the Bay Area and the United States. The scarcity of civilian contracts during the war, and abundance of military design work for both architects and engineers, resulted in work for nearly every practicing architect in the state during that time. Many prominent architects and engineers were contracted by the military for design work during WWII owing to the profusion of Federal contracts available in support of the war effort. At Hunters Point Shipyard, buildings and structures were designed and built by a variety of nationally prominent and well-known Bay Area architects, engineers and contractors including: John H. Devitt (architect), Barrett & Hilp (contractors), Austin Willmott Earl (engineer), Albert Kahn Associated Architects, Timothy Pflueger (architect), Ernest J. Kump Co. (contractors), and Walter L. Huber & Edward K. Knapik. Many of these firms are well known for their work both before and after the World War II period.

[93] JRP, 18.

Barrett & Hilp

The San Francisco-based contracting firm of Barrett & Hilp was awarded the master cost-plus-fixed-fee (CPFF) contract for Hunters Point Shipyard by the Navy.[94] As such, this firm constructed the majority of the buildings on the shipyard; most were built using standard Bureau of Yards and Docks plans. J. Frank Barrett and Harry H. Hilp founded the construction company in 1912 with $450 in capital. The firm grew along with the Bay Area, constructing schools, office buildings, subdivisions and public buildings in addition to the anchorages for the Golden Gate Bridge. An advertisement for Barrett & Hilp in the November 1943 issue of *Architect and Engineer* indicates that the firm had constructed war housing, industrial plants for the war effort, dams and aqueducts, dry docks, hospitals, cantonments and one complete shipyard.[95] The firm split into two companies in 1953 and J. Frank Barrett passed away in 1959.[96]

Harry H. Hilp, a San Francisco native, began his construction career as a carpenter with Southern Pacific Railroad shortly after the 1906 earthquake. His 1976 obituary notes that the firm of Barrett & Hilp received governmental awards for the firm's emergency work at Mare Island, the South San Francisco Shipyard [Hunters Point] and elsewhere.[97] Both men were also highly active in civic and social affairs within San Francisco and the Bay Area.

W. L. Huber and E. K. Knapik

Walter L. (Leroy) Huber collaborated with Edward K. Knapik, both civil engineers, on Building 134 at Hunters Point Shipyard. A San Francisco native, Huber graduated from the University of California in 1905 and was fully involved in the massive post-earthquake rebuilding campaign a year later. In the 1920s he served as the structural

[94] The exact date of this awarded contract could not been verified.
[95] *Architect & Engineer*, November 1943, p. 11. Which shipyard the firm had completed by 1943 was not stated.

[97] "Civic Leader Harry H. Hilp Dies at 88," *San Francisco Chronicle*, 26 October 1976.

engineer for the University of California Medical Center, the Roosevelt Junior High, Balboa High and Alamo Schools in San Francisco and YWCA's in Oakland, Long Beach and Riverside. Huber died in 1960.[98] Archival research did not produce any biographical information on Edward K. Knapik.

Ernest J. Kump Co.

In 1944, the Navy issued an A & E contract to the firm of Ernest J. Kump Co. to design a new optical and Ordinance Shop to be joined to the 1942 Shipfitter's Shop (Building 211). Bay Area architect Ernest J. Kump, a San Joaquin Valley native, designed a number of buildings for the Navy and other military branches during WWII and was otherwise known for designing buildings, primarily schools, in the Fresno and Bakersfield areas. He gained national attention, however, in the immediate post-war period for his influential community college campus designs at Foothill and De Anza on the Peninsula, which were credited with being not only important achievements in school design but also seen as precursors of corporate "campus" layouts.[99]

Kump was also awarded an honor award for outstanding examples of American Architecture in 1955 by the AIA for the North Hillsborough School.[100] In addition to Kump's work for the Navy at Hunters Point, he designed a storage building at McClellan AFB in Sacramento (1940); defense housing in Vallejo (presumably for the Navy in relation to Mare Island) (1941); buildings at the Army Sierra Ordnance Depot, Susanville (1941); a second housing unit at Vallejo (1942); and a building for the Army Corps of Engineers in Suisun (1944), among others.

[99] JRP, p.6-7 on Building 253 and 211 DPR set.
[100] "Peninsula Architect Wins Top Honor," *San Francisco Chronicle*, 24 April 1955.

Albert Kahn Associated Architects, Inc.

The firm of Albert Kahn Associated Architects, Inc. consulted Building 411, the Shipfitters, Welders and Boilermakers shop. Based in Detroit, the firm, founded by noted industrial architect Albert Kahn, was likely hired for its expertise in the construction of large industrial manufacturing buildings, a building type pioneered by Kahn in the early 20th centuries. Building 411 was completed in 1947. Architect Albert Kahn died in 1942.

John H. Devitt

John H. Devitt, a San Francisco-based architect and acting architect for the City in the post WWII period, was contracted to design two restaurant buildings at Hunters Point Shipyard. Archival research located no other biographical information on Devitt.

Timothy Pflueger

Timothy Pflueger was one of the Bay Area's most famous architects through the 1920s, 1930s and until his early death in 1946, known for his extravagant designs in a wide variety of architectural styles. Earlier studies have indicated that Pflueger was one of the many architects to receive a contract for work at the shipyard during WWII. He was suspected to have designed Building 110, a barracks building, because of its vaguely streamlined design, which was unlike other barracks buildings remaining at the shipyard. However, research revealed that contractors Barrett & Hilp built this building from Bureau of Yards & Docks plans (Drawing #184767). One document found in the Navy's on-site archives at HPS indicates that Pflueger was involved in the design of the Beauty Salon and Chaplain's office additions to the rear of Building 505, the Navy Exchange Building in the South Shipyard area. The rest of this building is thought to have been designed using standard Bureau of Yards & Docks plans.

Navy records also indicate that Pflueger assisted in the design of a restaurant building at the shipyard, three of which are still extant (Buildings 125, 228 and 252). Archival research indicates that John H. Devitt was the primary architect for Buildings 125 and 228. Plan drawings for Building 252 were not located to confirm Pflueger's involvement in the design; however, the teardrop-shaped restaurant building is constructed with common materials and, beyond its unusual plan shape, is architecturally undistinguished, especially when compared to other extant Pflueger buildings in the Bay Area.

Austin Willmott Earl

Retained as the consulting structural engineer for a number of projects at Hunters Point Shipyard, Austin W. Earl received the Civilian Merit Award for his work during World War II for the Navy's Bureau of Yards and Docks. A 1906 graduate of the University of California, Earl became a recognized authority on waterfront and was responsible for the engineering of many industrial structures at Mare Island, Hunters Point and Port Chicago. At Hunters Point he served as the consulting engineer on such projects as the massive Shipfitters, Welders and Boilermakers shop (Building 411), the Paint and Oil Storage building (Building 810), and on the general tracks plan for the railroad craned and tracks, which ran throughout the shipyard. Earl was the founding president of the Consulting Engineers Association of California, which later helped organize the Consulting Engineers Council, a national organization.[101]

Circulation

As the Shipyard was expanded, two main entrances were created to provide access to the facilities, one on either side of Hunters Point Hill. At the north, the Main Gate was on King Avenue, just east of the intersection with Donahue Street. To the south, the South Gate was on Crisp Avenue, near the junction with Griffith Street. The hill created a

---

[101] "Austin Earl Dies – Noted Engineer," *San Francisco Chronicle*, 22 February 1965.

major natural barrier to quick access from one side of the Shipyard to the other. Consequently, uses were generally segregated and some facilities were duplicated to better serve their immediate surroundings and to improve general efficiency. Even so, the area around Fischer Avenue became a bottleneck as "[a]ll automobile, truck, crane and train traffic has to pass through this single corridor."[102]

ZONES OF USE

The overall site plan for the Shipyard was a direct product of the World War II expansion. Prior to the war effort, the sparse amount of available land at the site did not necessitate a comprehensive site planning strategy. However, with an increased amount of land made available through the reclamation process, site planning became a necessity and the result was an orderly arrangement of buildings and structures in functional groupings. The first and most important influence was access to the water. Since the primary charge of Hunters Point Shipyard during World War II was the repair and retrofit of ocean-going military vessels, access to the various berths had a large impact on the location of storage, shops and administration buildings. Of secondary concern was the movement of equipment and personnel between buildings. Rail lines traced throughout the Shipyard, following wharfs and extending into warehouses. The sometimes massive scale of equipment and materials required the use of cranes and motorized transportation mechanisms to move objects from ships to repair facilities and back again. The consequence of these influences was a compartmentalized base with specific use zones, reflected largely in the numbering system. In general, these zones were:

- Administration
- Submarine Repair
- Ship Repair and Outfitting

---

[102] City and County of San Francisco, Planning Department, *Hunters Point Shipyard Study Options for Future Use*, June 1974, p. 2-10-11.

- Warehousing, Supply and Industrial Support
- Residential
- Radiological

The numbering system, still in place, was instituted during the World War II period. Each series of numbers generally refers to a specific functional grouping of buildings. The 100 series of buildings were chiefly administrative buildings, located near the Main Gate, as well as the submarine repair-related buildings along the northern pier. Many of the administrative buildings in this series have been demolished though many of the submarine repair-related shops in the north portion of the Shipyard are still extant.

The 200 series is largely comprised of industrial shops and ancillary buildings between Drydocks 2 and 4 in the Ship Repair and Outfitting portion of the shipyard. This area was dedicated to the repair and overhaul of larger surface vessels and located between the most active drydock facilities (Dry Docks 2, 3 and 4), requiring minimum movement of ships and materials between the industrial shop buildings and waterfront operations.[103]

The 300 and 400 series buildings are industrial and warehouse buildings located in the Warehousing, Supply and Industrial Support area of the south Shipyard. This area was used for long period conversion work, new ship construction and for storing inactive vessels, all of which required less travel to and from the major shops.[104] A few large shop buildings, numerous supply storehouses and smaller industrial support facilities dominate this grouping of buildings.

There are relatively few remaining buildings in the 500, 600, 700, 800, and 900 series; these buildings were located along the western boundary of the Shipyard, generally

---

[104] Ibid.

north and south of the 400 series buildings.[105] The 500 and 600 series buildings were largely dedicated to residential and related uses in the south Shipyard and the 700 and 800 series buildings were either used for industrial support or storage purposes or for NRDL-related activities. Though no 900-series buildings remain at the Shipyard, records indicate that they included an Officers' Mess Building, various greenhouses and garden sheds, a bank and garage facilities.

Within these zones, a relative uniformity of building types, styles and materials existed. As the focus of the shipyard changed from Navy repairs to commercial ventures, some of this organization was lost. However, the general arrangement of buildings today still reflects the order imposed by World War II-era requirements and planning and a great deal of the original spatial organization is discernable in the built fabric.

WWII Period Summary

All of this construction was centered on the stated mission of Hunters Point Shipyard:

"For all classes of vessels: interim docking, shaft and propeller repairs, repairs of major underwater damage; for carriers: interim overhaul of about three to four weeks comparable to overhaul by repair vessels afloat."[106]

In general, that is what occurred. However, sometimes Hunters Point Shipyard was used to load and outfit ships prior to embarkation. This was the case on July 15, 1945, while the USS Indianapolis was docked at Hunters Point awaiting orders. On this day, components of the atomic bomb "Little Boy" were loaded aboard the Indianapolis for transport to the South Pacific. It was reported to have contained half of the available uranium in the United States, valued at over $300 million at the time. The ship left Hunters Pont at 6:30 AM the next morning but was held in San Francisco, awaiting the

---

[106] Ibid, p. 15.

results of the first atomic weapons test in New Mexico. The test was a success and the Indianapolis sailed out of the Golden Gate at 8:30 AM.[107] On August 6, 1945, the bomber Enola Gay dropped "Little Boy" on Hiroshima, essentially ending World War II.

POST-WWII – 1946 - PRESENT

The end of hostilities did not signal and end to construction or military duties at Hunters Point Shipyard. Many projects were underway when the war was starting to draw to a close. Consequently, the momentum of construction continued in 1944 and through 1945 and included most of the larger buildings on the site. Infrastructure was also added during this time and included wharfs, cranes, rail spurs and other facilities. Even after the end of hostilities with Japan, several projects were underway, including further increases in the land area through more leveling of the Hunters Point Hill.

Most immediately after the end of World War II, Hunters Point Shipyard, like the other deep-water shipyards, became one of the primary berthing sites for ships returning from the Pacific campaigns. Photographs from the time show dozens of ships of all sizes moored and tied up several deep at the various wharves, piers, docks and quay walls (see Figure 27.) The immediate task was to perform routine maintenance and ready the ships for a return to service. Those deemed beyond repair were salvaged for parts and disposed of. In spite of all the work that needed to be done, this process was abruptly suspended in the summer of 1946 when Hunters Point Shipyard became the domestic base for handling the aftermath of Operation Crossroads.[108] It required the formation of a special radiation safety office and program to handle radiologically contaminated vessels.[109] Hunters Point Shipyard was chosen because it was already the center for the Navy's radiological science research and it was close to the developing nuclear expertise at both the University of California at Berkeley and Stanford University. These

strategic advantages, and the results from Operations Crossroads, would change the history of the facility.

OPERATION CROSSROADS[110]

“Operation Crossroads” was the code name for a series of atomic weapons tests conducted at Bikini Atoll in the Marshall Islands in the middle of 1946.[111] It was designed to study the effect of atomic weapons detonation on ships and personnel, mainly for the purposes of developing effective defensive and detection measures. The tests included the detonation of two Nagasaki-sized atomic bombs under various conditions to study their impacts. Operation Crossroads was a major undertaking, involving approximately 42,000 personnel and more than 240 ships. Some ships were used as target vessels and some were used for support. The target vessels were placed as specified distances from the detonation site to determine what physical damage would be caused under various conditions. It was expected that some ships would be completely destroyed, while others would remain operational. The support ships were placed at what was thought to be safe distances for observation of the tests as well as for data collection after the explosions.

Test 1 was called Shot Able and it was dropped by plane and detonated above a specified target ship. Unfortunately it missed its mark and fell a half-mile from the intended target, sparing the brightly painted target ship from complete annihilation. Overall, while the concussion blast caused extensive physical damage to the target ships, the radiological contamination was relatively minor and much less than anticipated.

---

[110] The entirety of this and following relevant sections are paraphrased from Hunters Point Shipyard Historical Radiological Assessment, Section 6, unless otherwise noted.

[111] The Marshall Islands are a small Micronesian archipelago just west of the International Date line and just north of the equator in middle of the Pacific Ocean. They were occupied by the United States after World War II and used for extensive nuclear testing. The Republic of the Marshall Islands became self-ruling in 1979.

Test 2 was called Shot Baker. It was detonated 60 meters below the surface of the water, immediately under the target vessel. The results were wholly unexpected. The detonation spawned a massive steam bubble that generated a shockwave of water over 90 feet in height. It rolled over the land, the target ships and the support ships, contaminating everything with radioactive coral, sand, fissure material and unused plutonium. To this initial contamination was added additional damage when the support ships went in to survey the area and processed the radioactive water of Bikini Atoll's lagoon through their filtration systems.

The limited amount of shipyard support, expertise and equipment at Bikini Atoll was almost useless to address the massive decontamination problem. Work was begun to develop standards for the decontamination procedures while the remaining ships were moved to Kwajalein Atoll. The most heavily contaminated ships were sunk at Kwajalein Atoll. The rest underwent preliminary decontamination but the amount of work demanded a full shipyard to deal with the problem. Hunters Point Shipyard was chosen because it was already the center for the Navy's radiological science research and it was close to the developing nuclear expertise at both the University of California at Berkeley and Stanford University.

The prospect of hundreds of radiologically contaminated ships arriving at Hunters Point necessitated a great deal of planning and coordination. Many of the ships were anchored out in the Bay near Hunters Point while methods for testing, monitoring and carrying out decontamination were developed. Eventually several methods were used.

Decontamination by wet sandblasting was carried out where the contaminated surfaces were exposed and readily accessible. The sand was then either collected and packaged in 55-gallon drums, or it was deposited back into the Bay at ebb tide with no further treatment. For harder to reach places, such as pipes and systems components, an acid solution was used to remove any surface coatings. All this work was carried out in the largest Drydocks 3 and 4 as well as the smaller drydocks on the north side of the shipyard (6 in particular) and at other berthing stations if the work did not require strict containment. All in all, 18 target ships and 61 support ships returned to Hunters Point Shipyard for treatment.[112]

NAVAL RADIOLOGICAL DEFENSE LABORATORY (NRDL)[113]

Concurrent with the development of nuclear weapons, the Federal Government recognized the need to develop protection devices to shield soldiers and civilians from the ill effects of prolonged exposure to radioactivity. This included detection devices for those working with and exposed to radioactive materials as well as handling procedures for equipment containing radiological materials. Such devices were common throughout the Navy and included everything from radioluminescent paint to exit signs. Originally formed as one of the support teams for Operation Crossroads, the group charged with the development of protective and monitoring devices was called the Radiological Safety Section, or RSS for short. The RSS was tasked with the "development of radiation detection instrumentation, equipment for protection of personnel onboard ships, and development of methods and equipment for decontamination of ships."[114] All Bureaus of the Navy were assigned responsibility for support and implementation of the proposed organization. While the original charter was intended to support Operation Crossroads, the mission was soon expanded and the RSS became unofficially known as the RADLAB.

Hunters Point Shipyard was chosen as the base for the RSS because of its strategic location near both Berkeley and Stanford and the nuclear research being conducted at these campuses. Also, at the time, San Francisco was viewed as a "natural staging

[112] NAVSEA, Hunters Point Shipyard: Final Historical Radiological Assessment: History of the use of General Radioactive Materials, 1939-2003. 2004, p. 6-17.
[113] Ibid., pp. 6-22–6-33.

[114] Ibid., p. 6-22.

point for future Pacific Weapons tests."[115] Hunters Point Shipyard was also close to a major metropolitan area and had easy access, something the other testing facilities in the Southwest certainly lacked.

After Operation Crossroads decontamination was completed in 1948, the RADLAB was formalized as the Naval Radiological Defense Laboratory (NRDL) with an expanded mission that included "practical and applied research into the effects of radiation on living organisms and on natural and synthetic materials, in addition to continued decontamination experimentation."[116]

For the first few years, the NRDL operated under the command of the Commander of Hunters Point Shipyard. As the research objectives expanded and NRDL's role grew beyond addressing the needs of other shipyard operations, it was given a separate command in October 1950. The mission continued to broaden from its origins in ship decontamination and at the time NRDL was disestablished in 1969, the mission of NRDL was, "to perform research, development [sic], test, and [evaluate] the effects of nuclear explosions, natural and controlled nuclear processes, nuclear accidents and incidents, and related fields of science and engineering."[117] This came to embody the development of defensive measures for ships, personnel and shore installations. Over the course of the next decade, NRDL personnel were involved in all atomic weapons tests between 1950 and 1958, providing test support, primarily related to radiation safety and monitoring. In the process, NRDL became a pioneer in the development and use of radiation sources for detection and research means. Unlike most other military research facilities from this period, such as Los Alamos National Laboratory and Lawrence Livermore National Laboratory, NRDL was primarily concerned with gaining

[115] United States Navy, History of N.S. Naval Radiological Defense Laboratory: 1946-1958, p. 2.
[116] NAVSEA, Hunters Point Shipyard: Final Historical Radiological Assessment: History of the use of General Radioactive Materials, 1939-2003. 2004, p. 6-23.
[117] United States Navy, Disestablishment Report for Naval Radiological Defense Laboratory, San Francisco, California, March 1969, p. 1.

knowledge rather than producing hardware and weaponry.[118] Its staff members actively published and largely developed their own research plans to address the physiological impacts of the radiological hardware and devices being developed in other research facilities. NRDL continued to operate at Hunters Point Shipyard until 1969.

In addition to advancing the understanding of the effects of radiological exposure, the NRDL work directly influenced national, state and local public policy. "Many organizations, including the California Department of Public Health, California Highway Patrol, Office of Civil Defense, U.S. Public Health Service and the Atomic Energy Commission used the expertise of the NRDL and its personnel to develop regulations and controls governing the growing use of radioactive materials in the public sector.[119] In war preparedness, NRDL was a leader in the continued study of nuclear fallout, its properties, distribution, effects and remediation. To this end, at least one full-scale bomb shelter was constructed as a test platform for social, psychological, physiological and organizational experiments using volunteers. The most widely publicized event occurred in December 1959 when 100 men spent 14 days in the test bomb shelter. The results were used to fine tune emergency rationing and organizational recommendations throughout the country.[120] (The shelter's location, historical or actual, has not been determined. Its current status is unknown.)

While NRDL continued to expand in the post-World War II period, the rest of the facility maintained its original mission to support U.S. Navy ship-related needs. To this end, Hunters Point Shipyard continued to see improvements in the immediate postwar years.

Updated: July 2009

THE NAVY CLOSES HUNTERS POINT SHIPYARD

By the end of World War II, the Navy was developing Hunters Point as a compact, highly specialized facility that could use the broader range of services of the surrounding naval bases if necessary. It was exactly this highly specialized development that left it open to closure when its areas of expertise were no longer seen as useful, or had been superceded by development on other bases during the Korean and Vietnam war periods.

After the 1951, as the NRDL took over many of the buildings in the southern half of the facility, the maritime portions of Hunters Point Shipyard became primarily used for submarine repair. Work continued to decline in the 1960s and early 1970s as the Navy shifted back to using private shipyards and contractors rather than maintaining its own yards.[121] Some parts of the shipyard were converted to “peacetime” activities and were leased out to individual vendors and businesses. The Shipyard continued to employ between 5000 and 8000 people, mostly from the surrounding communities.[122] While this was a significant decrease from wartime highs, it still represented the largest employer in the southern areas of San Francisco. During this time, there was continual speculation concerning the closure of the facility. After years of study and last minute reprieves, the Navy officially closed the shipyard in June 1974.

In July of that same year, the City of San Francisco received a grant to fund a one-year reuse study for the Shipyard. Efforts were made to contact over 500 potential tenants throughout the United States and Canada, for the purposes of establishing a private ship repair venture at Hunters Point.[123] As a result, by 1976, the Navy entered into a long-term lease with Triple A Machine Shop. Triple A controlled most of the property

123 Ibid, p. 54.

until 1986 when the Navy reclaimed the property for the purposes of environmental remediation with the eventual goal of removing the property from Federal ownership.

HUNTERS POINT SHIPYARD TODAY

Today, what remains of the Shipyard is used for a multitude of purposes. On the north side of Hunters Point Shipyard Phase II are a series of artists studios housed in former dormitory buildings near the former submarine drydocks. Several large warehouse structures are also present on this side of the sub-area as well as the remains of Drydocks 5, 6, and 7 and what remain of the rail spurs that served the drydocks. At the eastern end of the peninsula is the previously identified National Register eligible Commercial Drydocks District, including the masonry pumphouse for Drydocks 2 and 3, as well as Drydocks 2 and 3. Immediately south of Drydock 2 is Building 231, one of the first buildings to be constructed by the Navy on the site. This potential district was identified in 1988 as part of a cultural resources survey of Bay Area Navy properties commissioned by the Navy.[124]

Immediately south of this potential district is the glass and steel Building 253. Most of the other buildings in this 200-series area are wood or steel framed shop buildings and support structures. South and west of Drydock 4 is the 450-ton crane, the Gun Mole Pier and a series of wood and steel frame shop buildings, warehouses, and assorted other World War II and post-World War II buildings. Some are used by various industrial concerns; others are vacant. The San Francisco Police Department maintains facilities in a new building in this area.

Most of the buildings are in usable condition and are fairly rectilinear in form. Constructed for industrial use, the warehouses and shops continue to be used for

storage or operation of heavy machinery. The smaller scale dormitory and administrative buildings on the north side of HPS are currently used for office and artist work space purposes. These buildings are primarily wood frame with wood and asbestos shingle cladding and remain in serviceable condition in spite of worn appearances.

One building of particular note, just outside the HPS, near the South gate of the Shipyard is Building 815, former home to RADLAB. This building was designed and constructed specifically to house the main NRDL laboratory facilities. It contained different levels of experimental rooms, animal control facilities, offices, and administrative rooms. Today it is owned by Datasafe Record Storage and Information Management, and is operated as a document storage warehouse.

PROPERTY TYPES

PRE-1941

Building, structure and object types related to the discussion above would include, but are not limited to:

- Early residential buildings including farmhouses and other detached buildings
- Street patterns
- Retaining walls
- Restaurants
- Retail shops
- Commercial buildings
- Early dry docks
- Industrial buildings used to house mechanical equipment
- Early Navy constructed warehouses

When the Navy purchased the Shipyard in 1939, they gained a fully functioning commercial facility. When they expanded this during World War II, they gained control of a distinct residential neighborhood as well as several commercial structures that provided services for that neighborhood. As such, there are pre-1941 properties within the Project.

The residential area transferred to the City of San Francisco in 2004 and was designated Parcel A in 2005 as part of the current Project. This area has since been cleared, graded and prepared for redevelopment. No pre-1941 residential properties remain within the Project boundaries. However, commercial buildings, including those related to the original dry docks, do remain. They are primarily constructed of brick, although the former restaurant (Building 109) is a wood frame and stucco clad building. Dry docks 2 and 3 and the rest of the Hunters Point Commercial Drydock Historic District are prime examples of the industrial development from this period. Building use types from this period include:

WORLD WAR II (1941-1945)

- Administrative – long rectangular wood frame buildings with wood siding, built from standard plans
- Residential – barracks, houses and related community buildings (churches, cafeterias, latrines, etc.) These could be simple wood frame buildings, concrete high rises, or metal Quonset huts.
- Utility – relatively small, simple, concrete buildings
- Later dry docks – smaller dry docks for submarines and larger for ship repair
- Warehouses – Wood or steel frame with corrugated metal cladding, often rectangular with monitor roofs
- Mechanical Shops – used for welding, equipment storage, etc. Similar in design to warehouses but smaller

- Shipbuilding and repair – shops, warehouses, equipment storage. These buildings would take various forms from standard plans to custom designed buildings. They range from steel frame buildings with wood or metal cladding to glass curtain wall structures that were architect-designed.
- Other/infrastructure: railroad and crane tracks, light standards, circulation patterns, etc.

After the United States entered into World War II, the Navy commenced a tremendous building campaign at Hunters Point Shipyard. The land was reconfigured: hills were leveled and water was replaced by dry land. The scarcity of materials during this period meant that most buildings were constructed of wood, were constructed quickly, and were designed for multiple functions. Most were built from standard Navy plans while local architects individually designed a few buildings. At the start of this study in 2007, most of the World War II era buildings remained in their original locations, however some have been demolished. See volume II of this document for further discussion of extant resources.

POST WORLD WAR II (1945-PRESENT)

- Administration and Support – more compact footprint, mostly concrete, includes offices, vehicle servicing stations, water and sewage treatment plants, etc.
- Ship repair and outfitting – mechanical sheds, warehouses, cranes, Butler buildings.
- Radiological Laboratories and support buildings - Very few buildings were constructed specifically for RADLAB but many existing buildings were utilized by the facility. They could include any of the above building types.

Building during the post-World War II period was somewhat limited though a number of buildings remain from this period. Immediately following the war, construction continued because the Navy was unable to complete their plans during the timeframe of the war. Projects already underway were completed and new ones were slow to begin. One exception to this was a few large concrete buildings dedicated to RADLAB uses – all have been demolished except for Building 815. Other exceptions were continued improvements to the dry docks and construction of at least one large crane (the 450-ton Bridge crane) for ship repair and unloading.

Buildings from these periods within the Shipyard boundaries and within the boundaries of the Project are investigated, presented and evaluated more fully in Volume II of this report. This document, *Bayview Waterfront Plan Historic Resources Survey Report*, also prepared by Circa: Historic Property Development should be referenced for further information regarding specific buildings or architectural styles found within the Project.

CONCLUSIONS

Hunters Point Shipyard is significant as a snapshot of the evolution of ship repair facilities on the West Coast. As originally constructed, it serviced wood-hulled ships of various sizes as well as early steam powered vessels. Subsequent improvements in 1901 and 1918 expanded the capabilities of the facility to address the largest steel-hulled commercial and military vessels of the time. This corresponded to a dramatic expansion in the size and important of the United States Navy, as well as a general increase in the military's presence on the West Coast. Continued Pacific military campaigns (Philippine War, World War I, World War II) only emphasized the importance of West Coast military facilities. In 1939, when the Navy purchased Hunters Point, it became only the third Naval shipyard on the West Coast and the only one south of Puget Sound capable of handling modern naval warcraft. For a period of nearly 50 years, (1901- post-World War II) Hunters Point was the primary Naval ship repair facility in California.

After World War II, Hunters Point gained significance in its own right through its role as home to the Naval Radiological Defense Laboratory (NRDL). This facility was borne out of necessity in the latter war years and grew into a major research facility dedicated to studying the physiological impacts of radiological exposure as well as the detection of and protection from such nuclear hazards. This facility was established at Hunters Point Shipyard because of its many geographic, political and logistical advantages, and operated there from 1944 to 1969. It was one of the only facilities of its kind in the United States in either private or military control, was recognized as a leading research facility on a national scale and played a major role in every U.S. nuclear weapons test during its 25-year history.

As space and building availability increased, so did its role in the advancement of military operations. Hunters Point Shipyard played a major role in the military and civilian use of radioactive materials during the period of most intensive nuclear research. NRDL was associated with all above-ground atomic testing from 1950-1958 as well as the development of practical detection devices and public policies that continue to influence the regulation of radioactive materials in the public sector today. It was a unique and highly respected facility, arising from Hunters Point Shipyard's strategic location, its state-of-the-art facilities, and its successful contributions during World War II. As a result, it continued to impact society well into the post-war years.

Today, a portion of the built environment from all three periods remains: pre-WWII, WWII and post-WWII. Drydocks 2 and 3 as well as their associated pump houses and support facilities, built in the pre-WWII period, have been determined eligible for listing on the National Register in previous studies as part of the Hunters Point Commercial Drydocks Historic District. Outside of this district, only Building 109 remains from the pre-World War II community that once occupied the end of the Point near the drydocks. From the World War II-era, many of the warehouses, shops, residential and other buildings and structures remain, particularly between Dry docks 2 and Drydock 4, and in the southern portion of the Shipyard. From the post-war period, most of the NRDL buildings and facilities have been removed as part of recent environmental remediation efforts. However the main NRDL building, Building 815, remains, although it is just outside the study area. Taken as a whole, the history of the Shipyard is still generally represented in its built environment, although some key portions, critical to the

Updated: July 2009

understanding of the shipyard as a whole, have been removed. Light industrial uses, artist studios, police training facilities, community storage, and some ship repair-related uses are currently found at the HPS.

VII. PUBLIC HOUSING

The Alice Griffith public housing (1962) is generally bounded by Carroll Avenue (north), Arelious Walker Drive (east), Gilman Avenue (south) and Hawes Street (west). A guard kiosk secures the property's Fitzgerald Avenue entrance at Cameron Way. The housing stock consists of 33 apartment buildings, constructed from standardized plans using five slightly different building types. The six Type A apartment and eight Type B buildings contain six apartments each, the four Type C buildings and seven Type E buildings have ten apartments per building, and the eight Type D buildings each contain seven apartments.

Alice Griffith public housing represents a cross between the first (pre-1941) and second (late 1960s-1970s) waves in public housing architecture in San Francisco; it was constructed in the same organizational and architectural manner of earlier projects, but was completed with stricter budgetary requirements put forth in a later period. It is indicative of the types of developments that were completed at Hunters Point on former military housing land. However, these developments differ greatly from those in other parts of the City built in the same period. The Bayview-Hunters Point public housing developments were planned to address an immediate shortage of housing that used existing, if temporary, housing units – the military dwellings. Over time, these projects were redeveloped and renamed but occupied the same sites. Their architecture is most similar to older forms of public housing; however, they were expected to function under a different set of expectations that were developing at the time.

To understand the present context for Alice Griffith public housing, it is important to first look at the institutional history of public housing in the United States. The roots of today's public housing were established in the early years of the Great Depression under the auspices of the New Deal programs. From this starting point, early public housing evolved into a rather codified system. This system was stripped down to its basic parts during World War II to provide for tens of thousands of temporary housing units for defense workers. After 1945, much of this temporary housing reverted to public housing, but the social and political climate had changed. Alice Griffith public housing represents a combination of the influences of these eras.

THE FIRST GENERATION OF PUBLIC HOUSING

THE BEGINNING – PUBLIC WORKS ADMINISTRATION (PWA)

The Great Depression put an extraordinary strain on the country's urban housing stock. With little money to invest in repairing or building new housing to accommodate the influx of people moving from rural areas to urban centers for work, the existing residential conditions went from marginal to deplorable in many cases. To combat rising unemployment and improve the economy though the construction of public highways and buildings, in June 1933, the Federal government passed the National Industrial Recovery Act (NIRA). Under this act, several key New Deal agencies were established to simultaneously provide jobs and improve the country's infrastructure. Title II of the act appropriated $3.3 billion for the creation of the Public Works Administration (PWA).[125] Under this agency, a special housing division was created to construct residential buildings that showcased the benefits of modern living. This agency's prime directive was to provide jobs while building housing for low-income families. It was not as concerned about economies of scale or economic design and construction.

In its brief history, the PWA completed seven low-income housing projects, all on the east coast. They were heavily influenced by European, specifically German, cooperative design and were fairly modern in their use of materials and arrangement. The designers were given wide latitude to develop creative solutions for layout, program and choice of materials. The results were well-designed, high-quality homes that, unfortunately, were

[125] Paul R Lusginan, "Public Housing in the United States, 1933-1949," *Cultural Resources Management* Bulletin, No. 1, 2002, p. 36.

out of the price range of most low-income families. In fact, only one of these original seven projects met the low-income tenant objective.[126]

1937 HOUSING ACT

In 1937, Congress passed the first United States Housing Act. This act established the United States Housing Authority (USHA) as a part of the Department of the Interior. It was this act that created the decentralized public housing governance structure that is still in existence today. It put the Federal government in the funding role while giving governance of the resulting housing to local housing authorities. "Under this decentralized program, local public housing authorities were given primary responsibility for initiating, designing, building, and operating their own housing projects, while the newly created United States Housing Authority provided program direction, financial support, and technical and design assistance."[127] This was done by issuing low-interest, 60-year loans for up to 90 percent of the development costs for public housing and slum clearance.[128] San Francisco was one of the first cities to apply for the Federal program, establishing the San Francisco Housing Authority (SFHA) in 1938.[129] This initial Federal program was highly influential on the modern public housing governance system even though it was short-lived. It resulted in over 370 projects throughout the country over the course of its three-year term.

The emphasis on design and modern living in the PWA projects created a strong backlash from social critics who saw the program as wasteful and the extras as luxuries that should not be included in public housing. Powerful lobbyists for the real estate industry also posed strong opposition to the act because they saw it as a threat to real estate and rental values near housing projects. Their fear was the low costs and low

rents of the projects would force the entire local market down.[130] As a result of the 1935 District Court ruling in United States v. Certain Lands in the City of Louisville, influential lobby groups, and other cost-conscientious interest groups, were able to affect strict expenditure limits on all USHA-funded construction to make sure it could not compete with the open rental market.[131] The ruling limited the power of the Government to exercise eminent domain to acquire land, which in turn, limited the funds available for the design and construction of the projects. As a result, strict limits were placed on costs. Projects were funded under the terms of $1000 per room or $4000 per dwelling unit, including all construction and land acquisition costs. These strict guidelines virtually mandated that systematic, "cookie cutter" design be used and that cost minimizing measures become paramount to maximizing the number of dwelling units that could be built. Individual designs for single-family dwellings gave way to more rectilinear, apartment-style residences all constructed in a similar form with simple details. However, in spite of this, the early public housing projects displayed a surprising quality of material, craftsmanship, and design.

Even in 1938, land values in San Francisco were discouragingly high. Meeting the required $1000/$4000 limits established by the USHA proved to be impossible even within the depressed real estate market. Therefore, from the beginning, SFHA had to rely on a combination of Federal and City money to acquire and develop public housing.[132] As a result, the first housing projects took longer to reach completion than in many early adopting cities on the east coast. However, in spite of the delay, in 1940 Holly Courts opened in the Bernal Heights neighborhood of San Francisco, becoming the first public housing project completed west of the Rocky Mountains under this system.[133]

Generally, site planning was considered an economical way to make the developments attractive and distinctive. At the time, two major types of planning predominated public housing design: the super-block and the court plan. The super-block was a common planning concept promoted in the European Modernist literature. In this plan, large parcels of land were bordered by streets that became the primary vehicular circulation paths to and around the area. Small, very limited vehicular access was sometimes provided to the interior of the block, but most often, the interior was only accessible by foot or bicycle. In this way, the bulk of the experience within the super-block was free from the noise, pollution and danger of traffic, creating a peaceful residential space. Most of the building mass was concentrated as well to leave as much of the super-block as possible open to public parks and communal spaces and to provide for uninterrupted vistas from residential windows and balconies.

The court plan traded the openness of the super-block for more intimate arrangements. In this plan, the buildings were placed along the periphery of the property, or arranged throughout the property, to create small courtyards between the building sections. These spaces were often protected from vehicular access, and were also thought to provide for a peaceful, more personal residential space. The courts were shared by the residents in the surrounding units, rather than by the entire project and allowed for easier supervision of children in the public spaces.

To guide the local housing authorities on site planning, design, management and maintenance issues, the USHA published numerous brochures and pamphlets on a variety of subjects from design to tool maintenance. Some public housing projects from this early era incorporated the suggested styles and layouts exactly and others had a more liberal interpretation. The whole program was viewed as a positive, socially responsible, progressive step to address poor living conditions throughout the country. Many prominent social critics, architects, planners and designers of the time either worked on or wrote about the public housing being built. In general, the expectation was for the units to serve as transitional housing for whole family units to move from poverty to the middle-class. The selection criteria were created to promote this ideal, and included interviews of the prospective tenants in their current living quarters as well as minimum income guidelines. People had to be gainfully employed and meet a certain level of self-sufficiency to qualify.[134]

The USHA was initially authorized for a period of three years. In 1939, when the process to extend the bill was starting to gain steam, Congress felt that the economy was improving sufficiently enough that it no longer needed the extra building stimulus provided by the USHA programs. It was not renewed. Instead, the government began to shift its focus from providing public housing to building defense-related housing in preparation for entering World War II.

WORLD WAR II AND WARTIME HOUSING

As part of the country's shift to a wartime condition, all housing construction was stopped to conserve construction materials for the war effort. This included all public housing projects then underway. Special provisions were made to those housing projects in strategic locations near defense bases and industrial zones. There, the housing projects were allowed to finish with the provision that all unoccupied units be made available for war housing. In this way, many public housing projects throughout the United States became part of the war effort. In most cases, these housing units were the best constructed and most comfortable of all the subsequent war housing options because they were constructed to last at least as long as the 60-year loan period. In San Francisco, Potrero Terrace and Sunnydale initially were used for wartime purposes when they opened in 1941, with Westside Courts and Valencia Gardens following in 1943.[135]

[135] "Beginning of the Housing Projects," Hunters Point Beacon, October 22, 1943.

Updated: July 2009

More war housing was desperately needed after the United States officially entered World War II in 1941, construction for war housing went into overdrive. By early 1942, to cut costs and minimize materials, the Armed Services built only "temporary" housing. It was estimated that utilizing such methodologies would cost only 20% of permanent housing construction.[136] However, even this level of construction effort became too time-consuming and costly in the most stressed areas, especially at Hunters Point. Demountable housing was the next option. In this method, all the building parts were constructed offsite and shipped as a unit. Once on site, they were unpacked and assembled in a matter of hours. Most utilized single-board construction and were one-story in height. This was most typically used for the single-workers housing. In mid-1944, when demountable housing could no longer be accommodated and "a limited duration need was definitely known, a minimum portable dwelling unit was utilized, which approximated an improved trailer-type accommodation."[137] Those workers and soldiers in the metal camping trailers shared the communal dining and social facilities in the single-workers' dormitories, although some small families were also assigned to the portable trailers.

The mandates for extreme speed and economy in war housing construction were handed down by provisions in the 1940 Lanham Act. This act appropriated $150 million to the Federal Works Agency to provide defense-related housing in the most congested and stressed cities. The provisions also placed strict limits on construction costs, with average costs per dwelling unit to less than $3750 per family unit, with no single unit exceeding $4500.[138] To emphasize the temporary nature of the housing authorized under the Lanham Act, it was amended in July 1943 to require that all housing built with its funding be demolished within two years after the war was over. This amendment

[137] Building the Navy's Bases in World War II: History of the Bureau of Yards and Docks and the Civil Engineer Corp, 1940-1946, Volume 1. 1947, p. 376.
[138] Robinson & Associates and Jeffery Shrimpton, Draft: Public Housing in the United States, 1933-1949: *A Historic Context*, August 14, 1997, p. 80.

Specifically forbade the units to be used as subsidized housing for low-income families after the end of World War II.[139] Between 1940 and 1944, the Lanham act was responsible for the construction of over 625,000 housing units.[140] Of these, over 580,000 units were considered temporary construction. The idea was that these units would be of such low construction quality that they would have to be removed from the housing market after the war, thus posing no long term competition to the existing housing markets in the effected cities.[141]

WAR HOUSING IN THE BAYVIEW-HUNTERS POINT AREA

Throughout World War II, Hunters Point Shipyard served as an annex to the naval facilities at Mare Island. When the shipyard was initially occupied by the Navy in 1941, housing for the shipyard workers was not an issue as most of them were stationed at Mare Island, lived in the area or commuted from other parts of San Francisco. Most were local residents or at least locally stationed. As Hunters Point Shipyard increased production it soon became a vital Navy property that was essential to the Pacific theater and it needed many more workers.

To house the workers, San Francisco's public housing projects were converted to defense-worker housing. Special permission was granted to the SFHA to finish construction on Valencia Gardens and Westside Court to provide housing for the rapidly increasing wartime population near Hunters Point. This was a temporary solution as these units were full almost immediately.

The first of the war housing construction projects to open was the Middle Point War Housing complex, along the Bay between Evans Avenue and Innes Avenue, in early 1943. In the next six months, five more war housing complexes opened on the north

[139] Ibid, p. 82.

and south slopes of Hunters Point Hill, at the eastern end of the point near the shipyard and in the flat lands near the Bay further south, including the Double Rock War Dwellings, the precursor to Alice Griffith public housing (see Figure 28.)

The family dwellings were all constructed according to very similar plans. Generally, they consisted of groups of two-story rectangular buildings with eight apartments to a building. There was a range from one to three bedrooms and they came either furnished or unfurnished. The families rented the apartments by the month for between $27.50 for a two-room, unfurnished unit to $42 for a furnished five-room unit.[142] Most of the complexes had at least one elementary school, childcare facilities and a community center that doubled as a health center for routine checkups and minor illnesses.

Ridge Point was the largest of the developments and occupied the ridge and both slopes of Hunters Point Hill. It was originally designed to have 250 buildings, each with eight apartments. The expected occupancy was 2000 families. To provide for these families in an area of the city notorious for its lack of services, the Navy constructed three elementary schools, three childcare centers and a community center, all dedicated to this single complex.

Other family-specific complexes included the Double Rock and Candlestick Cove War Dwellings. The Double Rock complex was designed for 69 buildings with a total capacity of 552 families. This project was located just south of Yosemite Slough between Donner Avenue and Gilman Avenue along the Bay. Candlestick Cove was larger, holding 118 buildings for 944 families. This site was just south of Candlestick Point. It was a desired spot for families with children because the project boasted its own beach. However, it also suffered from repeated minor landslides. That portion of Candlestick Point was eventually leveled by the Navy to prevent any more damage to the occupied units.

Figure 28. Hunters Point housing dedication ceremony, November 27, 1943. Photo used with permission from the San Francisco History Center, San Francisco Public Library.

Dormitory facilities were constructed for the single men and women who came to work at the shipyard. These were segregated by sex, as was the convention of the day. Both Harbor Slope near India Basin and South Gate along Oakdale Avenue, originally had seven long rectangular buildings. Each building was constructed of two wings connected by a central unit containing a cafeteria and common spaces.

Even the rapid six-month construction period of these housing complexes for over 2500 families failed to meet demand. Before they were finished in early 1944, money was appropriated for annexes to Double Rock (256 families), Middle Point (224 families) and South Gate (1000 more beds). However, this was not enough. However, by July 1944, the Navy was authorized to purchase camping trailers to place on 33 newly reclaimed acres of land in the southwest corner of Hunters Point (see Figure 29.) In the 12-month period between September 1943 and September 1944, the civilian population housed at Hunters Point Shipyard rose from 1550 to 12,245. In October 1944, 3000 more family units were planned and the annexes to the various housing complexes were reaching

Figure 29. This image shows the trailers that were used at Hunters Point as housing for shipyard workers. Similar accommodations were used at other shipyards in the Bay area. Compared with the private shipyards, the facilities at Hunters Point were relatively clean and sanitary with adequate bathing and restroom facilities in the immediate vicinity. Photo used with permission from the San Francisco History Center, San Francisco Public Library.

their limits (see Figure 30.) In the midst of all the construction, living conditions were mixed. People had clean, if basic, accommodations but little in the way of site improvements (see Figure 31).

AFRICAN-AMERICANS AT HUNTERS POINT – THE BEGINNING OF A CULTURAL SHIFT

In 1900, Italian families were the predominant ethnic and social group in the Hunters Point vicinity. This continued through the onset of World War II when the demographics of the area were dramatically altered. As a result of the tremendous recruiting efforts in the rural south for war industries employment, the Bayview-Hunters Point area saw a major increase in its African-American population. It is important to understand how dramatic a change this was for the area to provide some context for the current and historical social landscape, especially as it relates to the public housing communities.

PRE-1941

While there was a small African-American community in San Francisco before 1906, it lived in relative obscurity. Most were either freed slaves or children of freed slaves who came from the southern states. A smaller population was from northern states and born into freedom. In total, their numbers were small enough that the white majority did not see them as a viable threat, choosing instead to focus their racial aggressions on other ethnic groups, primarily the Chinese. While instances of discrimination were common before 1941, most African-Americans in San Francisco experienced more general freedoms than in other major metropolitan areas.[143]

At the turn of the 20th Century, 1,654 African-Americans lived in San Francisco.[144] This was actually a *decrease* from the prior decade. The job opportunities at this time were not a sufficient enough draw to entice people to leave their homes and strong social networks to make the long and expensive journey to the West Coast. Relative to Midwestern cities, San Francisco was geographically isolated, making travel more difficult. There was also more competition in San Francisco from other minority groups for unskilled and semi-skilled jobs.[145] When looking to move to urban environments for jobs or improved opportunities, Midwestern and Northeastern cities were closer, more accessible and better known to most southern African-Americans. Those who did make the journey often settled in Oakland or Los Angeles where the economic climate was more hospitable for people of color and there were more established African-American communities.

However, from 1910 to 1930, the African-American population of San Francisco grew by 131 percent with an additional change of 26 percent in the decade before World War

144 Ibid. p. 21. The total population of San Francisco in 1900 was around 340,000.
145 Ibid.

II.[146] While there were no specific “Black” neighborhoods, as the population increased, people started to concentrate in downtown, south of Market Street, North Beach and the Western Addition near Fillmore Street. By 1930, Fillmore Street had become “the hub of black life.”[147]

While Hunters Point was considered an undeveloped industrial backwater, it was a relatively open and welcoming community to southern African-Americans who came to work as porters for the Southern Pacific Railroad. At a time when many were openly faced with restrictions on where they could work and live, this predominantly Italian neighborhood left them in peace.

During the Great Depression of the 1930s, the African-American communities were hit harder than most other groups. This was because of the relatively tenuous employment situation in which many men found themselves. They were not allowed to join unions and were actively barred from many occupations and from all positions of authority. Coupled with the small numbers of Blacks in the area, this left them with no leverage to fight for change in a meaningful way. Consequently, when the New Deal came to San Francisco, African-Americans were disproportionately over-represented in most of the relief programs.[148]

WORLD WAR II

World War II created a sudden demand for all kinds of skilled and unskilled laborers. In theory, the demand was so great that traditional ethnic and racial segregation hiring and union membership policies were set aside. In reality, more creative ways to circumvent anti-discrimination mandates became prevalent. (See below for more information on the various Executive Orders prohibiting racial discrimination in wartime hiring.) In his study

of California's wartime labor, Davis McEntire, a professor at the University of California School of Social Work, "confirmed that Black workers were indeed 'slow to gain a foothold in the war industries, but as the manpower shortages intensified, the area of acceptance [was] steadily enlarged.'"[149]

Legally, the courts system put an end to labor union segregation policies in 1944. Joseph James, a Black shipyard worker and president of the San Francisco NAACP branch, spearheaded charges against the Boilermakers Union to challenge the constitutionality of their auxiliary unions.[150] In 1944, the Supreme Court of California upheld the ruling of the Marin Superior Court in the case of *James vs. Marinship*. That ruling stated that Blacks "must be admitted to membership under the same terms and conditions applicable to non-Negroes unless the union and the employer refrain from enforcing the closed shop agreement against them."[151]

In the middle of union battles on the waterfront and at the shipyards, more workers steadily poured into the area as a result of active recruitment by the Federal Government and by private industry occurred throughout the country. The most prolific of these recruitment entities was the War Manpower Commission.

From its establishment in 1942 through 1945, the War Manpower Commission was directly responsible for shifting 1.8 million American workers and their families to the West Coast. Between 1940 and July 1944, California (primarily the San Francisco and Los Angeles regions) saw an overall population gain of over 1.8 million people, by far

---

[149] Ibid, p. 144.
[150] Under the auxiliary system, Unions set up special chapters (auxiliaries) that were open to all minorities. The auxiliary members paid union dues and were sometimes hired for union jobs, but they received none of the collective bargaining or other benefits afforded to full Union members. In essence it was a second-class, separate but not-really equal arrangement that allowed the parent Unions to claim non-discrimination while practicing selective hiring practices.
[151] James vs Marinship Corp., 1944, as presented in full at http://www.claralaw.cpda.org/om_isapi.dll?hitsperheading=on&infobase=cases2.nfo&record=%7B2B4E4%7D&softpage=Document_Document, 2008

the largest increase in the country during the same period.[152] San Francisco saw its African-American population rise from approximately 5000 people in 1940 to over 43,000 by 1950.[153] Many of these new arrivals settled in Hunters Point, in defense-worker housing near the shipyard jobs.[154]

By 1943, nearly 16,000 African-American workers came to the Bay Area shipyards. In San Francisco, the number of Black families rose from 2,000 to over 12,000 in the same period. Much of this population growth occurred at the Hunters Point Shipyard where the total labor force grew from roughly 8,000 to over 18,000 by 1945.[155] To put this into perspective, this five-year population increase was "larger than the combined totals of every decennial census of San Francisco's black population in the previous nine decades."[156] By 1942, the Black population in the area began to rival the Italian population, at least in terms of raw numbers.

POST-WAR PERIOD

At the war's end in 1945, the shift was complete as African-Americans became the largest demographic group in Bayview-Hunters Point, a fact that remains today. Many current residents trace their families to this mid-century migration.

THE NAVY AND HOUSING SEGREGATION

For many of the white officers and shipyard workers, Hunters Point was the closest they had ever come to working and living with African-Americans. Strict racial segregation

housing policies were still the norm, even though small advances were being made in the workforce. This was true throughout the Bayview-Hunters Point wartime housing projects. This initially resulted in high tensions on all sides because of the rapid influx of people and the many unknown circumstances that arose as the Navy tried to deal with thousands of new workers and their families arriving every month. For security, a community police force was created. It was separate from the San Francisco Police Department but was only marginally affiliated with the Navy. At first it was composed of only white men, which was a point of contention for many of the Black residents and workers.

To combat these potential problems, the Navy and the SFHA added positions for African-American housing officers. Additionally, the Navy required all of its officers to undergo special training on race relations to raise awareness of the concerns of the Black community. These small efforts paid off and the Hunters Point housing became a model of “progressive” racially integrated (relatively) wartime housing.[157]

POST-WWII – A NEW ERA IN PUBLIC HOUSING

The restrictions of the Lanham Act enabled it to provide for many more units of housing than would have been possible under previous legislation. However, the nature of these housing units prevented them from doing more than addressing short-term housing needs. After the war, there were still a large number of people who lived in sub-standard housing but had no alternatives because the money slated for public housing construction had been diverted to temporary defense worker accommodations. Critics of the Lanham Act were quick to point out that temporary housing units had an uncanny ability to become de facto permanent housing for those who desperately needed shelter of any kind. They predicted that the temporary wartime housing would create the exact housing conditions that they were fighting – substandard, dangerous, urban slums.

[157] Albert Broussard, Black San Francisco: The Struggle for Racial Equality in the West, 1900-1954, 1993, pp. 174-176.

Unfortunately, their words came to fruition within just a few years, spawning a new era of public debate surrounding the public housing issue.

In 1949, Congress passed the Housing Act. This Act renewed federal subsidies to local housing authorities and once again closely linked public housing construction to urban development and slum clearance. In many cases, it was used to relocate families displaced by highway and urban renewal projects. Because many of the anticipated social benefits of public housing (moving families from poverty to the middle class, "improving" character for the children, etc.) failed to materialize, critic began to attack the public housing programs.

At the same time the USHA changed its federal polices regarding public housing and "SFHA began to shift away from its aim of creating public housing communities…By the 1960s, the SFHA, like the Federal government, has abandoned all facets of its initial plan for public housing to serve as a stepping-stone to middle-class 'respectability'."[158] The architecture began to reflect these changing views and utilized construction materials and methods that most economical. The result was projects with higher densities even in areas where land values did not necessarily require such developments. In many urban areas, this gave rise to a new construction type – the high-rise concrete developments of 1950s and 1960s.[159]

As this was taking place in the political and academic realm, there still existed an immediate need for housing, at all income levels, in the very early post-war years. Private development was building scores of housing developments for these families under the auspices of the National Housing Authority's financing programs and the G.I. Bill's loan provisions. However, much of this housing was not ready in time for the floods of veterans returning home. This shortage had been predicted well in advance,

[158] Amy Howard, Northern Shelter: Community, Identity and Spatial Politics in San Francisco Public *Housing, 1938-2000*, Dissertation, College of William and Mary, 2005, p. 12.
[159] Ibid, p. xiii.

but the materials and labor were not available to adequately address the problem. As a short-term solution, the government authorized the use of defense housing to be used by veterans awaiting other accommodations. This was considered a wartime use and the majority of these units remained under the control of the Federal government. This housing crisis was so great that even those units constructed under the Lanham Act as temporary housing was put into service. These were used not only for housing veterans, but also for sheltering other people displaced by wartime activities.

TRANSITION FROM WAR HOUSING TO PUBLIC HOUSING

By August 1945, over 10,000 units of temporary wartime housing had been constructed to serve the Hunters Point Shipyard. Special restrictions on building materials continued after the war until the material shortages could be overcome. Veterans and low-income housing remained some of the only viable construction options for private developers. This, combined with the Veterans Administration (VA) low-interest loans provided as part of the original 1944 Servicemembers' Readjustment Act (G.I. Bill) and the Federal Housing Administration (FHA) incentives, brought home ownership into the realm of possibility for thousands of people. By the time this first program ended in July 1956, over 2.4 million veterans had taken advantage of the home loan program.[160] As with the era of homestead associations of the 19th Century, Bayview-Hunters Point again became a place of speculative real estate, this time aimed at the working-class shipyard workers and returning veterans.

Rows of simple two-story, five-room Moderne houses appeared throughout the district (see Figure 32). Developers and real estate agents advertised in the community newspapers within the wartime housing complexes, for open houses, easy financing terms, and modern conveniences. This helped to shift some of the wartime workers into other sections of the neighborhood, while others moved elsewhere in the City or

returned home. This initial post-war phase happened fairly quickly, with families dispersing to new homes or to other regions. During this transition period, the Ridge Point war housing complex was used for Japanese-Americans returning from the internment camps. The Japanese Relocation Authority used the facility as a staging ground for those local Japanese who chose to return to the San Francisco peninsula (see Figure 33.)[161]

As the post-war period progressed, many of the temporary housing units were already showing signs of their impermanence. In spite of these conditions, in areas like San Francisco, housing was in such short supply that the Housing Act of 1950 provided for the transfer ownership of defense worker housing to local housing authorities rather than require their immediate demolition (as was originally required in the Lanham Act provisions.)[162] These units continued to operate as temporary and low-income housing well into the 1950s, being replaced only as funding became available.

The defense worker housing was officially transferred from the Federal government to the SFHA in 1954.[163] In this same year, SFHA received its first challenge over the quality of the housing projects in the Bayview-Hunters Point area.[164] In light of citizen protests and the undeniably poor conditions in Hunters Point, the SFHA began work with the Mayor's Citizens' Committee to address the process for disposing of the temporary housing within the City.[165] This process was slow and only partially addressed the rapidly deteriorating conditions in much of the Hunters Point housing units. By 1960, four of the original "temporary" housing complexes were still being used,

including the Double Rock War Dwellings.[166] A state law further extended the legal use of the Lanham Act buildings, allowing for demolition by 1970.[167] This was over two decades beyond the buildings' intended lifespan.

Indeed, a 1964 study of low-rent housing in San Francisco confirmed that all of the remaining war housing was substandard. Part of the problem was that operational funds for public housing in San Francisco were generated almost solely by rent receipts. Since the minimum income requirement had been abandoned as part of President Johnson's Great Society reforms, the profile of the public housing tenants had changed. Where the early projects were designed for traditional two-parent family units where the father was employed, these newer units were being increasingly occupied by single-mothers on some form of public assistance.[168]

The people who were in the greatest need were living in the worst conditions with little chance of improving their living situation without some increase in their rents.[169] In total numbers, there were over 2,600 people living in relinquished war housing in 1964; 36 percent were found to be living in "overcrowded conditions" and 90 percent of this total population was African-American.[170] This represented over half of the substandard dwelling units in the City at the time.

SFHA AND HOUSING SEGREGATION

African-Americans comprised much of the former war housing tenancy for several factors. The first was an increase in segregation policies within the general San

[170] Ibid. p. 4.

Francisco rental market. The second was the result of restrictive placement policies by SFHA. This policy followed established "neighborhood patterns," meaning they allowed settlement within the housing projects only if the applicant reflected the predominate ethnicity of the neighborhood, or if they were white. This resulted in a large number of African-Americans who were unable to find housing on the open market and were excluded from many neighborhoods with public housing. They became the largest demographic group in need of decent living quarters, but only one permanent housing project was open to them.[171] The "neighborhood pattern" policy affected not only low-income African-American families but gainfully employed, middle-income families as well. While some of the housing was relatively clean and modern, most was already being categorized as old and substandard. In spite of this, compared to the conditions found in the Fillmore District, the temporary wartime housing at Hunters Point was a significant improvement.[172]

The SFHA "neighborhood patterns" policy was the City's way to segregate housing in practice while condemning the practice in theory. It was not universally supported though. Longtime SFHA board member Alice Griffith resigned her post over the matter and became a voice opposing the policy in public debate.[173] It was in the early 1950s that the policy was legally challenged in the case *Banks vs. the San Francisco Housing Authority*. In this case, Mrs. Banks, an African-American woman, sued the SFHA when she and her family were denied housing at a new project in North Beach, a predominantly white neighborhood. The case went through a number of appeals. Eventually the District Court of Appeals upheld the State Superior Court's ruling in Mrs. Banks' favor in 1953. When the State Supreme Court refused to hear the case, the

[173] Ibid, p. 177.

District Court's ruling became binding, essentially ending the unofficial segregation policies of the San Francisco Housing Authority.[174] It did not, however, do much to improve the living conditions in the Hunters Point wartime buildings.

The SFHA recognized that there was an extreme shortage of quality housing in the City. Their first priority after the war was to complete the remaining six public housing projects designed before the war. This phase of construction included Ping Yuen in Chinatown, North Beach Place in North Beach, and Bernal Dwellings in the Mission. These complexes were all designed prior to World War II and were constructed of reinforced concrete and tended to be higher density arrangements because of the limited land availability in their respective neighborhoods.

The second phase of construction dealt with the problem of the temporary war dwellings. Publicly, SFHA considered "the replacement of war housing in the Hunters Point area with permanent post-war housing [to be] a definite part of the planning program."[175] In the Bayview-Hunters Point area, there was greater land availability, therefore the housing pattern tended to be of lower density. Increases in construction costs in the post-war period brought about a change in SFHA policy, to use wood frame with stucco construction, rather that reinforced concrete.[176] The first units to be replaced were part of the Navy Point War Dormitories at Kirkwood Avenue and Earl Street, in 1953. This complex was built under the new construction policy and was called simply "Hunters Point." It consisted of 317 apartments in a series of two- and three-story apartment buildings. This design became the standard for the area. In 1956, Hunters View and Harbor Slope opened up with 576 units, replacing the Middle Point and Harbor Slope War Dwellings along Innes Avenue. These units were largely constructed on existing foundations remaining from the demolition of the temporary war buildings.

[176] Carey & Co., Inc., Hunters View Housing Development: Historic Resource Evaluation, July 26, 2001 and updated September 10, 2007, p. 11.

The Alice Griffith Garden Homes replaced the Double Rock War Dwellings in 1962.[177] The South Basin war dwellings were razed and replaced with various light industrial buildings. Candlestick Cove was removed during the construction of Candlestick Park.

1966 – A PIVOTAL YEAR

By 1966, unemployment was reaching new levels within the Hunters Point community. The shipyard continued to lay off workers and few new local employment prospects moved into the area. At the same time, the living conditions in the various Hunters Point public housing projects continued to deteriorate as the last of the temporary wartime housing was still being occupied as low-income housing. Tensions were high when the San Francisco Housing Authority chose to evict Ollie Wallace and his young family. Growing social awareness and community empowerment throughout the 1960s in the African-America community brought a renewed sense of action to improve the deteriorating housing and economic situation around them. The Wallace family's predicament served as a rallying point for the Hunters Point projects community. Residents staged protests and mass sit-ins against the San Francisco Housing Authority Board of Directors. The unified efforts surprised not only City officials, but some in the larger Hunters Point community as well. In an area that had struggled to find a common identity or purpose, the seemingly unjust treatment of one young family served to highlight the general frustration of many families in the district.

The momentum continued to grow when a larger demonstration was organized to force the SFHA to review a much longer list of complaints by the residents of the Hunters Point housing. Media was alerted and for the first time, the plight of the residents in the public housing projects in Hunters Point was brought into the public view.

---

[177] Alice Griffith Garden Homes was the original name of the public housing development. Today it is commonly referred to as Alice Griffith public housing, the term used in most of this document.

City-wide, several other important civil-rights related events also served to bolster the Black community's sense of empowerment and determination to challenge the systems that were failing them. Earlier in 1966, the City enacted an ordinance prohibiting discrimination in firms contracting with the City. The NAACP staged a nationwide protest called Black Monday, to support Black employment in the construction unions.[178] Both directly impacted the predominately African-American Hunters Point and Fillmore neighborhoods, giving their residents support from other areas of the City and the country.

Within the community, the list of demands by the public housing residents was supported by other, newly formed community action groups, including the churches and the regional Economic Opportunity Council.[179] Their demands were modest – jobs, fair rent, improved infrastructure, and full economic and social enfranchisement – and represented the basic entitlement that most communities enjoyed without question. However, because such a large portion of the Hunters Point community depended in some capacity on City-sponsored or subsidized programs, they had to engage the City as a member of their community. Even at the time, the general African-American population acknowledged that "no single factor [had] contributed as much to unity and solidarity of San Francisco's negro population as had the intolerable housing condition that has been allowed to develop and continues to exist."[180]

PUBLIC HOUSING TODAY

The policy changes in the 1960s that lowered the income requirements of public housing tenants also contributed to an increased isolation of these communities. Most of the commentary from the period appears to dismiss the housing communities, and

fails to give credit to the strong social networks that often developed.[181] Bad press, political corruption, increasing crime rates and other negative factors changed the public perception of public housing, attaching to its residents a debilitating social stigma.

Recent efforts have been made to reverse these decades-old trends. In 1992, the Federal government began the HOPE VI (Housing Opportunities for People Everywhere) program with the goal of encouraging local housing authorities to partner with community groups to improve the most troubled public housing locations. HOPE VI supports redevelopment of public housing projects into mixed-use communities that provide a greater mix of economic and social strata within the larger community. Facilities for residents and non-residents would bring in a broader mix of people and reduce the negative connotations associated with public housing. In San Francisco, five HOPE IV grants were received from 1994 to 1999. They were used to redevelop SFHA projects in North Beach, the Mission, the Western Addition, Hayes Valley, and Bernal Heights.[182] This included the demolition and reconstruction of one of San Francisco's first public housing projects, Valencia Gardens. While the success of these projects has yet to be determined, the philosophies are now the predominant ones used in the planning of public housing. They are seen as a way to respond to the isolation that developed in the 1960s through the 1980s as well as a means to address the economic disparities and lack of community amenities that often found in traditional public housing complexes.

PROPERTY TYPES

Within the Project, only Alice Griffith Public Housing is present. It represents a combination of Pre-WWII and Post-WWII design philosophies. It is smaller than the projects constructed after the war, but has may of the stylistic traits of the pre-WWII

VIII. CANDLESTICK POINT

The Long-billed Curlew is a large North American shorebird that was common along the shoreline of San Francisco in the early part of the 20th Century. Locally it was known as the Candlestick Bird and it is after this waterfowl that Candlestick Point was named.[183] Prior to being known as the site of a professional sports stadium, it was a quarry, a landfill and a proposed site for a quarantine hospital. At the time, it seemed a likely place, far from major settled areas, to put such an institution. 50 years later it was again at the center of controversy as it became the site for San Francisco's first professional sports facility. Today, the area has a sports stadium, as well as a state park, an executive park and a small number of residences.

EARLY DEVELOPMENT

Around 1910, the City proposed Bay View Hill (now known as Candlestick Point) as the site of a new Detention Hospital for quarantining individuals with communicable diseases. The Crocker estate, who still retained ownership of the land from the 19th Century, opposed the project. They bargained with the City and donated the land for use as a public park to prevent the construction of the hospital near land they hoped to sell for subdivision when the time proved most profitable.[184] The park was dedicated in 1915 and was the first official City park in the Bayview-Hunters Point area.

During World War II, the hill lent its name to a housing complex known as the Candlestick Cove War Dwellings. These units were intended for families and boasted

views and private beaches for its residences. The complex was located on the south side of the point, right along the San Mateo/San Francisco County border.[185]

CANDLESTICK PARK

BASEBALL AND SAN FRANCISCO

Baseball has always been popular in San Francisco. For a long time the City sported several semi-professional teams that competed with other teams throughout California and the West Coast. The San Francisco Seals, enjoyed a long-lasting following in the first half of the 20th century. However, when the time came to lure a major league baseball team to San Francisco, the need for a new stadium was apparent. The largest stadium in the City at the time could seat only 18,600 people, nowhere near the capacity of other stadiums in other cities (see Figure 34.)[186] If San Francisco wanted a professional team, they needed to provide state-of-the-art facilities.

In 1954, voters approved a $5 million bond measure for the construction of a Major League Baseball stadium. This was done before any team had committed to moving to San Francisco. It was a major political gamble that was soon to pay off. When Major League Baseball approved an expansion of teams west of the Rocky Mountains, they opened the door to the eager San Francisco fans. Ultimately, the owner of the New York Giants agreed to move his team from New York City, where they competed with two other major league teams, to San Francisco where they would be the biggest show in town. At that same time, the Brooklyn Dodgers, agreed to move to Los Angeles, thus bringing their rivalry to California.

The San Francisco Giants began their relationship with the City in 1958, playing their first two seasons at Seals Stadium at 16th Street and Bryant Street. During this time, fill,

grading and construction began at Candlestick Point (see Figure 35.) Designed by architect John Bolles, Candlestick Park was the first baseball stadium to be entirely constructed out of reinforced concrete. The baseball stadium was finished at the end of the 1959 season, becoming the first Major League Baseball stadium on the west coast.[187] It was also reported to be one of the last dual use (baseball/football) stadiums built in the United States (for baseball and football). As soon as the season ended, the Giants left Seals Stadium to the bulldozers. Demolition began in November 1959 and was completed in early 1960, before the Giants had finished a single practice on their new field (see Figure 36.) Vice President Richard Nixon threw out the first pitch on April 12, 1960 at the Giants home opener. The Oakland Raiders football team played their 1961 season at Candlestick Park and the San Francisco 49ers football team made it their permanent home in 1971.

CONSTRUCTION

Then-Mayor George Christopher began investigation of possible stadium sites as early as May 1957. Charles Harney, one of San Francisco's most well known contractors offered his property on Candlestick Point to the City for $2.7 million. When studies showed that a site closer to the downtown was more expensive, the City took up Harney's offer and hired him as contractor for the project. The park was referred to as "Harney Stadium" during construction. However, a 1960 naming contest sponsored by the San Francisco City Recreation and Parks Commission resulted in the official name of "Candlestick Park."[188]

From opening day, Candlestick Park began to acquire a reputation for its harsh environment for both spectators and players alike. Strong gusts caused serious problems for the players during the 1961 All Star game. At that game, some of the

---

[187] Dodger Stadium was completed in 1962.
[188] Jones & Stokes, Bayview Transportation Improvements Project-Evaluation Exemption for Monster *Park*, May 15, 2007, p. 6.

nation's best ball players committed seven errors and the relief pitcher was nearly blown off of the mound.[189] This prompted the architect and the City to plan for various modifications to the stadium in attempts to improve conditions.

"In 1960, the seating capacity was 43,765 and by 1993, it has increased to 58,000. Originally the grandstand consisted of two main seating decks. The lower deck extended from behind home plate down the first base line to the right field foul pole, and down the third base line and around the left field foul pole into left center field. The upper deck extended from home plate down both the first and third base lines. A small section of bleachers was located in right center field. The field surface was bluegrass and the scoreboard was located above the hitter's backdrop in center field. Behind the bleachers on the north elevation was an employee parking area" (see Figure 37.)[190]

Bolles began working on plans to accommodate football games, expand the stadium and enclose the outfield as early as 1966. As part of the redesign, attempts were made to reduce some of the wind-contributing flaws of the initial construction. The stadium was enlarged in 1970-71 to accommodate the San Francisco Forty-Niners.[191] This expansion extended the grandstand seating, enclosed the outfield of the baseball park and installed retractable seating in right field. The bluegrass field was replaced with Astroturf. The modifications resulted in the stadium's current footprint. The 49ers played their first season in Candlestick Park during the 1971-1972 season, winning a NFC West title that year. At the time, the stadium could seat 58,000 football fans plus an additional 3,000 on the retractable seating, making it the largest stadium in the National League at the time (See Figure 38.)[192] In 1994, the stadium was further enlarged to accommodate up to 71,000 football fans. The stadium continued to do double duty as

home to the Giants for seven months of the year and for the 49ers for four months after. Often, during football preseason games or because of baseball playoffs, the field hosted both teams simultaneously. In the early 1990s, the Giants began to campaign for a new, baseball-only stadium closer to downtown San Francisco. They moved into their new stadium at Mission Bay in 2000 and remain there today. The 49ers continue to play football at Candlestick Park but are under negotiations for a new stadium.

JOHN S. BOLLES[193]

"In 1958, prominent Bay Area Architect John S. Bolles designed the stadium. Born in Berkley on June 25, 1905, Bolles obtained his bachelor's degree in Engineering from the University of Oklahoma in 1926, and graduated from Harvard with a Master's degree in Architecture in 1932. During the 1930s, he worked as a structural engineer in Oklahoma and as an archaeologist for the Oriental Institute of the University of Chicago on the excavations at Persepolis, the ancient capital of Persia, and for Washington's Carnegie Institute on a comprehensive study of one of the most important Mayan sites in the Yucatan.

"In the late 1930s, Bolles moved back to the Bay Area and joined his father's architectural firm. Father and son designed the Temple of Religion and the Christian Science Monitor building on Treasure Island for the 1939 Golden Gate International Exposition. In 1941, he passed the State of California Architectural license examination and between 1943 and 1945 Bolles served as project engineer for the Federal Public Housing Authority in San Francisco. During this time he also began collaborating with architect Joseph Francis Ward, a New Zealander, who has been associated with architect Albert Farr since 1922. Together, Bolles and Ward designed several residences in San Francisco during the 1940s and early 1950s. In 1954, Bolles began

[193] Jones & Stokes, Bayview Transportation Improvements Project-Evaluation Exemption for Monster Park, May 15, 2007, pp. 6-7.

working independently on commercial, industrial, and residential buildings. A Modernist, Bolles' work often displayed a bold incorporation of modern art and sculpture. Eventually he started his own firm in San Francisco called John S. Bolles and Associates. Noteworthy designs by Bolles in San Francisco include the 1959 Ping Yuen Annex housing project, Embarcadero Park, and the Anna Wadden Library (Bayview Branch of the San Francisco Public Library) built in 1969. He also designed a number of buildings in Northern California including the McGraw-Hill complex in Navato, the General Motors assembly plant in Fremont, Gallo Winery in Modesto, Downtown Plaza in Sacramento and several Macy's department stores. Additionally, Bolles designed the IBM campus in San Jose of which IBM Building 25 was found eligible for the [National Register of Historic Places, California Register of Historic Resources,] and is a San Jose Landmark candidate. While his work throughout Northern California is extensive, he is best known for designing Candlestick Park. Bolles died in 1983."

BEYOND SPORTS

Candlestick Park has played an important cultural role in the lives of San Franciscans beyond its nearly 40-year relationship with the Giants. It served as the site for numerous concerts, public events and other great sporting moments. On August 29, 1966, it hosted the Beatles last live concert. It is the only stadium in the United States to host six National Football Conference championship games, three NFL Western Division Championships, 12 National Football Conference West Conference Games, two MLB World Series, and MLB two All-Star games. It was just before Game 3 of the 1989 World Series between the Oakland Athletics and the San Francisco Giants that the Loma Prieta earthquake was broadcast to millions of homes around the world. Remarkably, the 7.1 magnitude earthquake caused minimal damage to Candlestick Park and none of the 65,000 spectators were injured. The World series was delayed 10 days while engineers verified the safety of the stadium.

CANDLESTICK POINT STATE RECREATION AREA

Candlestick Point State Park sits on land that was once covered by shallow Bay waters. The land was partially reclaimed as part of the Navy's ever expanding housing development in 1946. Parts of this land were reclaimed in anticipation of further shipyard needs, but were never used for improvements. The land was left open even as Candlestick Park grew up beside it. In 1973, the California legislature appropriated $10 million for the purchase of the land edging Candlestick Point. It was established as the first urban state recreation area in California in 1977.[194]

PROPERTY TYPES

Building, structure and object types related to the discussion above would include but are not limited to:

- Stadiums and recreational facilities
- Features associated with stadiums such as parking lots, gates, fencing
- Land grading and modification caused by reclamation projects
- Signage

Buildings found within the boundaries of the Project are investigated, presented and evaluated more fully in Volume II of this report. This document, *Bayview Waterfront Plan Historic Resources Evaluation, Volume II: Resource Survey and Report*, also prepared by Circa: Historic Property Development, should be referenced for further information regarding specific buildings or architectural styles found within the Project.

IX. CONCLUSIONS

The Bayview Waterfront Project encompasses contains a number of distinct geographic locations that share a common early history, but have evolved in different ways as a result of World War II. The period between 1941 and 1945 was a delineator in the development of the area, shaping the current identities of the various locations. It is important to understand the common background, although most of the architectural record from this period is scattered and not within the bounds of the current Hunters Point Shipyard Phase II Project. Of more importance, however, is the impact of World War II on the area and the physical reminders of the war years.

BEFORE 1941

CANDLESTICK POINT

At Candlestick Point, no architectural elements from the pre-1941 period have been identified. This area was largely created from fill after World War II. Those areas that were upland in the pre-war period were sparsely settled and largely used for industrial purposes.

ALICE GRIFFITH PUBLIC HOUSING

The current site of Alice Griffith public housing was mostly a swamp prior to its development during World War II. Some fringe areas of the property may have been used as part of the Bay View Park race track and hotel complex. However, nothing from this period remains.

HUNTERS POINT SHIPYARD

At HPS, several pre-World War II buildings remain. They are clear representatives of the commercial importance of the shipyard when it was solely contained within the bounds of the Bethlehem Steel drydocks at Hunters Point. Portions of the drydocks area remain from the 19th Century. These elements have previously been determined eligible for listing on the National Register and as such, are the most important resources within the Project boundaries. However, they are not the only resources that remain from the pre-World War II period. Building 109 and several large warehouse buildings near the drydocks were constructed prior to the war years.

INDIA BASIN

Most of India Basin dates to the pre-World War II period. The boatyards were established throughout the late 19th Century, mostly by northern European immigrants. Today there remains several intact architectural reminders from this period, including the Anderson-Cristofani boatyard and 900 Innes Avenue. Many other boatyards and fisheries were once found along this shoreline, but few have any visible physical presence as of 2008.

WORLD WAR II ERA (1941-1945)

CANDLESTICK POINT

During World War II, Candlestick Point was developed as a large multi-family housing complex for shipyard workers. These buildings were located along the southern shore, at the base of Bay View Hill. Landslides from the poorly graded and unstable hillside plagued the development and excavation was needed periodically to keep the units free from danger. Some areas to the east of the hill were filled in at this time, however much of the fill was not completed until the construction of Candlestick Park (see below.)

ALICE GRIFFITH PUBLIC HOUSING

A war housing complex was built on the shoreline near a dual rock outcropping just north of Candlestick Point, known as Double Rock, this eventually lent its name to the housing complex that was constructed nearby. Like the Candlestick Cove facilities, the Double Rock War Housing had its own schools, community centers, medical centers and play spaces for the children. It extended over the current Alice Griffith public housing site and further west. When the Double Rock Annex was completed around 1944, war housing extended approximately a block south and a block west from the current Alice Griffith public housing site. War housing complexes near Hunters Point, including Double Rock and Candlestick Cove, once contained over 12,000 living units of various types.

HUNTERS POINT SHIPYARD

The World War II period brought the most profound physical changes to the shipyard. The land was significantly increased while Hunters Point Hill was dramatically leveled. Rail lines were laid, warehouses built, and the largest drydock in the world were constructed in record time. Hundreds of ships were repaired and returned to battle and thousands of workers worked around the clock to meet the demands of the Navy and its ships. Most of the built fabric remaining in 2008 dates to this period. The buildings range in size from weighing stations to large warehouses and multiple level manufacturing facilities. It should also be noted that a large number of buildings at the Shipyard have been demolished since 2007.

INDIA BASIN

World War II greatly affected all the areas around India Basin, but there was relatively little effect on the built environment within India Basin. The boatyards continued to operate, although at a reduced capacity. The demand for larger ships resulted in the closing of the smaller yards and the consolidation of the remaining facilities. Those that survived into the post-WWII period did so by becoming specialty outfitters

AFTER 1945

CANDLESTICK POINT

Candlestick Point was transformed in the late 1950s when the New York Giants relocated to San Francisco. A new baseball stadium was constructed on filled land just east of Bay View Hill. Candlestick Park Stadium was designed by a well-respected local architect John Bolles and it is considered one of the high points of his work. Unfortunately, the stadium was poorly sited and suffered from inhospitable weather patterns. Alterations in the post-war period include enlarging the seating, enclosing the stadium and reconfiguration of the stands to accommodate football and well as baseball.

ALICE GRIFFITH PUBLIC HOUSING

Public housing in San Francisco struggled in the post-war period to meet the incredible demand by the post-WWII population. War housing was built to be temporary, however it became a permanent solution for many African Americans who could find no other housing alternative in San Francisco. Changes in public attitudes toward public housing brought about less support, both politically and financially, making construction of new, adequate housing facilities even more difficult. What is today known as Alice Griffith public housing was constructed in this era of turmoil and adjustment. It is designed according to older policies concerning public housing, but was meant to serve a very different population from similarly designed complexes built before World War II. Over the years, little has changed within the complex and some residents still remain from its opening in 1964.

HUNTERS POINT SHIPYARD

Hunters Point Shipyard continued to function as a Navy repair facility in the post-war period. It did not, however, continue to receive the same level of attention from the

Navy. Other, newer shipyards were developed in Southern California during the 1950s and 1960s. By 1974, HPS had become obsolete.

In the post-WWII period the Shipyard became home to the Navy's Radiological Defense Laboratory, NRDL. NRDL came to dominate much of the space on the shipyard, at one time occupying over three-dozen different buildings. In 1955, these operations were partially consolidated in the newly constructed Building 815. The research and scientific advancements that occurred as a result of experimentation within Building 815 had a direct impact on development of practical uses for nuclear materials as well as protective measures and public policy regarding exposure and handling of such materials. NRDL was a unique and highly influential enterprise that brought a new level of renown to Hunters Point Shipyard.

INDIA BASIN

The shoreline of India Basin, its commercial enterprises and residential building stock have seen few changes since World War II. It remains a small pocket of late 19th Century and early 20th Century architecture amidst recent development. The hills above India Basin were first developed in World War II for housing. In the post-war years, much of the housing was transferred to public housing uses. Today, some of this remains but is interspersed with new development as the neighborhood continues to evolve.

SUMMARY

The geographic extent of the Project cannot be understood in a linear history like some neighborhoods. It contains a wide variety of building types, historical uses and colorful characters that still shape its development today. In some cases all that remains from the early days is the street grid and the street names (Bayview District.) In other cases, the early days remain as the most visible and obvious identifier (India Basin.) Several areas within the Project boundaries didn't exist until World War II (most of the Shipyard), or later (Candlestick Point.) The one unifying historical factor is the impact of World War II. Today's community and architectural identities are largely shaped by the changes brought about because of World War II, and how those changes evolved in the post-war period. The result is a series of unique modern histories, forever linked by a common past.

I. INTRODUCTION

Circa: Historic Property Development was contracted by the San Francisco Redevelopment Agency and PBS&J in May 2007 to complete the Historical Context and Survey Report for the Bayview Waterfront Project (BWP) Environmental Impact Report (EIR). This project encompasses Candlestick Point, Hunters Point Shipyard and the India Basin Shoreline areas of San Francisco. The Candlestick Point-Hunters Point Shipyard Phase II Development Plan contains Candlestick Point State Park, Candlestick Stadium, the Alice Griffith public housing and most of Hunters Point Shipyard. The India Basin Shoreline plan includes parcels from the boundaries of Hunters Point Shipyard up to and including the Pacific Gas & Electric Hunters Point Plant, now under demolition. The purposes of this document are to provide historical background material (see *Bayview Waterfront Plan Historic Resources Evaluation, Volume I: Historic Context Statement for full historic context*) for the evaluation of potential historic resources within the Project and to inform the relevant sections of the Environmental Impact Report for the BWP. Evaluations for identified potential historic resources within the survey areas of the BWP can be found in Section V (Survey Results).

This survey report is focused on the existing built environment within the Candlestick Point, Hunters Point Shipyard (HPS), and India Basin Shoreline survey areas (see subsequent sections for specific location maps). In general, this study evaluates all areas where construction activities are planned. The survey report describes existing conditions with respect to known or potential historical resources in the project area and identifies the project's potential impacts. Findings from this technical study will facilitate preparation of the environmental impact report for the project being prepared by the San Francisco Redevelopment Agency (SFRA) pursuant to CEQA.

For a parallel discussion of prehistorical and historical archaeological studies and contexts, please see the archaeological context statement and survey report for the Project prepared by Archeo-Tec: Consulting Archaeologists.

Updated: October 2009

PROJECT DESCRIPTION

The following project description is quoted from Section II: Project Description of the Bayview Waterfront Project, Administrative Draft EIR I (June 2009). See Appendix A for full Project Description.

> "The Bayview Waterfront Project ("Project") proposes new plans for the Candlestick Point, Hunters Point Shipyard ("HPS"), and India Basin Shoreline areas of San Francisco. The Project encompasses an approximately 764-acre area east of U.S. 101 in the southeast area of the City and occupies the waterfront area from India Basin to the approximate western edge of Candlestick Point. The Project is comprised of two primary components: (1) the Candlestick Point – Hunters Point Shipyard Phase II Development Plan ("CP-HPS Development Plan" or "Development Plan") and (2) the India Basin Shoreline Plan ("India Basin Plan").

CANDLESTICK POINT – HUNTERS POINT SHIPYARD PHASE II DEVELOPMENT PLAN

> "The CP-HPS Development Plan is a project-level development being proposed by Lennar Urban; this EIR evaluates the Development Plan's environmental effects at a project level of detail. The Development Plan proposes a mixed-use community with a wide range of residential, retail, office, research and development, civic and community uses, and parks and recreational open space. A major component would be a new stadium for the San Francisco 49ers, a National Football League team. Additionally, new infrastructure would serve the development as necessary. This Development Plan is organized under two major sub-components: Candlestick Point and Hunters Point Shipyard Phase II (HPS Phase II).

Updated: October 2009

INDIA BASIN SHORELINE PLAN

"The Project also includes new land use controls for the India Basin Shoreline, also known as Bayview Hunters Point Redevelopment Survey Area C. The San Francisco Planning Department and the San Francisco Redevelopment Agency are the Project Sponsors for the India Basin Plan. Although the India Basin Shoreline was included in the BVHP Survey Area, it was not part of the BVHP Redevelopment Plan adopted in 2006. During the adoption process of the 2006 BVHP Redevelopment Plan amendment, it was determined that further community-based planning would be necessary before the India Basin Shoreline could be added into the *BVHP Redevelopment Plan*. As a result, the India Basin Shoreline remained a redevelopment survey area.

"Plans for the India Basin Shoreline would allow a largely industrial zoned area to support a mix of residential, commercial, and light industrial uses. The Project would amend the *BVHP Redevelopment Plan* to include Area C, other amendments to the existing *BVHP Redevelopment Plan*, amendments to the *General Plan*, and new zoning controls and design guidelines for the area. Taken together, these components constitute the India Basin Plan. The Plan assumes that various private parties would develop the India Basin area over time."[1]

PROJECT LOCATION

The following project location description has been quoted from Section II: Project Description of the Bayview Waterfront Project, Administrative Draft EIR I (June 2009). Figure titles have been altered for the purposes of this report. Maps indicating the boundaries for each survey area can be found in elsewhere in this report.

[1] PBS&J for SFRA, Bayview Waterfront Project, Administrative Draft EIR – June 2009, p. II-1 – II-3.

Updated: October 2009

Figure 1. Map showing regional overview of Project site. Figure prepared by Archeo-Tec and excerpted with permission from their companion document, *Historic Context for the Archeology of the Bayview Waterfront Project, San Francisco, California.*

Updated: October 2009

REGIONAL LOCATION

"Candlestick Point, HPS Phase II, and the India Basin Shoreline, comprise the southeasternmost portion of San Francisco; taken together, they are bordered by major features such as Heron's Head Park on the north, the Executive Park area and San Mateo County line on the south, Bayview Hill, the Bayview neighborhood, Yosemite Slough, and Hunters Point Hill on the west, and San Francisco Bay on the east. Figure 1, illustrates the regional location of the Project and the location of the Project within San Francisco. [The] Development Plan would comprise approximately 688 acres. The India Basin Plan area would comprise 76 acres. The sites together comprise approximately 764 acres, occupying the waterfront from the northern boundary of the India Basin Shoreline area to the western edge of Candlestick Point, and extending inland from the waterfront."[2]

CANDLESTICK POINT – HUNTERS POINT SHIPYARD PHASE II DEVELOPMENT PLAN

"The Candlestick Point area of the Development Plan is immediately east of Executive Park, with the Bayview neighborhood to the north, the HPS to the north and east, and Candlestick Point State Recreation Area (SRA) along the Bay frontage, shown in Figure 2. The Candlestick Point area of the Development Plan is generally bounded by Hawes Street to the northwest, Candlestick Cove and the San Francisco Bay to the south, South Basin to the east, and Jamestown Avenue to the southwest. The northern boundary of Hawes Street is limited to the San Francisco Housing Authority's (SFHA) Alice Griffith public housing site between Gilman and Carroll Avenues, which extends north from Arelious Walker Drive.

[2] PBS&J for SFRA, Bayview Waterfront Project, Administrative Draft EIR – June 2009, p. II-10 – II-12.

Updated: October 2009

"The HPS Phase II area is to the southeast of the Bayview Hunters Point neighborhood. As shown in Figure 2, the HPS Phase II area is generally bounded by the San Francisco Bay to north, south and east. The south end of the western boundary extends from Yosemite Slough along Arelious Walker Drive to approximately Crisp Avenue, excluding the University of California San Francisco (UCSF) property. The northern boundary generally extends along Crisp and Spear Avenues. The northernmost end of the HPS Phase II area is contiguous with Earl Street and the southeastern boundary of the India Basin Shoreline area."[3]

INDIA BASIN SHORELINE PLAN

"The India Basin Shoreline area is immediately north of the HPS Phase II. As shown in Figure 2, the India Basin Shoreline area is bounded generally by Jennings and Newhall Streets and Heron's Head Park to the north, the SFHA Hunters View public housing site and Innes Avenue to the west, and Earl Street to southeast. India Basin and San Francisco Bay forms the northeastern border."[4]

DOCUMENT ORGANIZATION

This document is organized into ten sections. Section I, the Introduction, provides project background and overview information and a summary of findings. Section II provides a more specific overview of the survey process including a discussion of the three survey sub-areas and methodology. A summary of historical background information is provided in Section III, though the full historic context is located in Volume I of this document. National, State and local guidelines and procedures for documenting and evaluating historical resources are outlined in Section IV Evaluative Framework and the findings of this survey are documented in Section V. Impacts and Mitigations are identified in Section VI, followed by Recommendations in Section VII.

The Bibliography & Resources (Section VIII), Preparer's Qualifications (Section IX), and Appendices (Section X) conclude the report.

EXECUTIVE SUMMARY

Circa surveyed three different sub-areas within the Bayview Waterfront Project Area to identify potential historic resources. The following summarizes survey findings for each sub-area.

Updated: October 2009

INDIA BASIN

A number of parcels within the India Basin survey area had recently been surveyed and evaluated by Kelley & VerPlanck: Historical Resources Consulting. The study identified four properties that appear to be eligible for listing on the California Register of Historical Resources: 702 Earl Street, 900 Innes Avenue[5], 911 Innes, and 967 Innes Avenue. The former Albion Brewery building at 881 Innes Avenue was found to appear eligible for listing on the National Register of Historic Places. The India Basin survey also identified a potential California Register-eligible historic district, the India Basin Boatyards.

Also located within the India Basin survey area boundaries is the site of the former Pacific Gas & Electric (PG&E) plant. This building, constructed in 1929, was determined not to be a historic resource by the San Francisco Planning Department staff in 2006 and the building demolished in 2008. The remaining parcels within the India Basin survey area are comprised of unimproved public shoreline open space, India Basin Shoreline Park, and vacant land. No other buildings or structures over 45 years old were identified.

CANDLESTICK POINT/ALICE GRIFFITH SURVEY AREA

The Candlestick Point survey area encompasses the Candlestick Park sports stadium (formerly Monster Park), the Alice Griffith Public Housing site and Candlestick Point State Recreation Area. Circa evaluated the Alice Griffith Housing site and found it ineligible for listing on the NRHP, the CRHR or as a local landmark. With exception of Candlestick Park stadium, no other resources over 45 years of age exist within the survey area.

Jones & Stokes completed a recent evaluation of Candlestick Park sports stadium and found the property to be ineligible for listing on the NRHP. The property has not been evaluated for California Register eligibility and has not been previously included or listed

[5] In early 2008, the Shipwright's cottage at 900 Innes Avenue became San Francisco Landmark #250.

in any local survey of historic properties. It was beyond the scope of this project to conduct any additional review of the Candlestick Park stadium, however, Circa recommends that the property be evaluated for eligibility for listing on the California Register of Historical Resources and for local listing.

HUNTERS POINT SHIPYARD

In 1997, an inventory and evaluation of buildings and structures at Hunters Point Shipyard identified approximately 225 extant buildings and structures. All buildings on Parcel A, with exception of Buildings 101 and 110, were demolished in 2006-2007 as part of Hunters Point Shipyard Phase I. In July 2007, Circa: Historic Property Development began work on the development of a historic context and historic resources survey and inventory of extant buildings and structures at the Hunters Point Shipyard. A total of 134 buildings and structures were identified as existing properties at the shipyard in 2007. Since that time four buildings are known to have been demolished and a total of 130 buildings and structures were known to be extant at the conclusion of Circa's evaluation work in April 2009. Out of this total, a potential California Register eligible historic district was identified that contains five buildings and two structures previously determined eligible for the National Register of Historic Places (NRHP), as well as four additional buildings previously unevaluated for listing on the California Register of Historical Resources (CRHR). The potential Hunters Point Commercial Dry Dock and Naval Shipyard Historic District is comprised of the following resources:

- Dry Dock 2 (Previously determined eligible for NRHP by SHPO in 1998)
- Dry Dock 3 (Previously determined eligible for NRHP by SHPO in 1998)
- Building 140 (Dry Dock No. 3 Pump House) (Previously determined eligible for NRHP by SHPO in 1998)
- Buildings 204 (Gate and Pump House) (Previously determined eligible for NRHP by SHPO in 1998)
- 205 (Dry Dock No. 2 Pump House) (Previously determined eligible for NRHP by SHPO in 1998)
- Buildings 207 (Latrine building) (Previously determined eligible for NRHP by SHPO in 1998)

- 208 (Shop Service, Tool Room and Canteen Building)
- Building 211 (Shipfitters/Electronics Shop)
- Building 231 (Inside Machine Shop)
- Building 253 (Optical, Electronics and Ordnance Building)
- Building 224 (air raid shelter, NRDL Annex)

In addition, Circa found that Dry Dock 4 retained a good degree of integrity enabling it to remain eligible for individual listing on the NRHP.

Of the 121 remaining buildings on the shipyard, 11 were less than 45 years old and six were found to lack integrity; these properties were not evaluated for significance. The remaining 104 buildings and four structures were evaluated for eligibility for listing at the national, state and local levels. None of the remaining buildings or structures were found to be individually eligible for listing on the NRHP, the CRHR or as San Francisco Landmarks. Further, they were not found to be eligible as contributors to a national, state or local historic district.

Updated: October 2009

II. SURVEY OVERVIEW

The historic resources survey areas included specific parcels, as specified by the San Francisco Redevelopment Agency and PBS&J/EIP. Locations and boundaries of each survey area are represented in Figure 2 (page 7). Individual survey area maps identifying parcel and survey boundaries for each survey area are located in Section V of this report.

METHODOLOGY

The methodology used for completion of this historic resources survey and inventory included a literature review of all related existing information, completion of a historic context, field survey work and additional property-specific research. Each of these methodologies is described below. The SFRA, PBS&J, and members of the project team conducted an initial "kick-off" tour of the project areas on July 12, 2007, which included an overview introduction to the general project area and brief tours of each specific study area.

INFORMATION GATHERING AND REVIEW

An extensive review of existing documents was conducted prior to and concurrent with the survey fieldwork. Primary and secondary source research, including review of historic maps, newspaper archives, historic photographs and plans, utility records, military records, and U.S. census data was conducted. Property information data, CHRIS/NWIC search results[6], previous survey and evaluation reports, historic context statements and other related documents were provided by the SFRA, PBS&J/EIP and the San Francisco Planning Department for incorporation into the historic context statement. Some properties within the survey area have been evaluated for historic significance by other historic preservation consultants in recent years; these evaluations are discussed further in Section V of this report.

---

[6] NWIC/CHRIS search conducted by Archeo-Tec (Access Agreement Number 07-1277, March 7, 2008) and resulting materials provided to Circa for review.

Updated: October 2009

Following review of existing documentation, additional property specific research was conducted to further develop the historic context. Research and other repositories consulted for the purposes of this study include the following (see Bibliography for complete list of resources):

- San Francisco Public Library (SFPL) – Main Branch and Bayview/Anna E. Walden Branch Library
- San Francisco History Center and Historical Photograph Collection, SFPL
- California Historical Society Archives
- J. Porter Shaw Library, San Francisco Maritime National Historic Park
- Navy BRAC Program Management Office West– Treasure Island
- Hunters Point Shipyard – Navy BRAC Drawing/document storage area (Building 383)
- National Archives and Records Administration (NARA) – San Bruno and College Park, MD
- University of California, Berkeley Libraries
- The Bancroft Library
- Environmental Design Archives and Library
- Earth Sciences and Map Library
- Engineering Library
- Navy Department Library, Naval Historical Center – Washington, D.C.
- San Francisco Planning Department

AGENCY CONSULTATION

See Appendix F for Agency Consultation/Notification list.

HISTORIC CONTEXT STATEMENT

An Administrative Draft of the Historic Context Statement was issued to PBS&J/EIP and SFRA for review in July 2008. The document was reviewed by the EIR consultant and by staff from the Historic Preservation division of the San Francisco Planning Department and all subsequent comments and changes have been addressed by Circa.

Updated: October 2009

The final draft is attached as *Bayview Waterfront Plan Historic Resources Evaluation, Volume I: Historic Context Statement.*

SURVEY FIELDWORK AND DOCUMENTATION METHODOLOGY

Prior to commencing fieldwork, Sheila McElroy, Principal, Circa: Historic Property Development; Becky Urbano, Preservation Services Manager with Garavaglia Architecture, Inc., and Sarah Hahn, Architectural Historian, Garavaglia Architecture, Inc., conducted an additional overview tour of Hunters Point Shipyard on May 7, 2008 to assess general conditions and to determine the general numbers and types of buildings and structures extant within the shipyard study area. Sheila McElroy and Sarah Hahn conducted specific site investigation of all survey areas in June 2008. At each site where buildings, structures, or objects were located, and as access was permitted, the consultants walked the site. Each building and structure was photographed and approximate dates of construction, architectural styles, primary character-defining features, conditions, and integrity were recorded. The consultant used survey maps and property information matrices provided by PBS&J and the SFRA to confirm whether potential resources were located within or adjacent to the study areas and to confirm addresses and other property data.

Circa then determined levels of condition and integrity for each property, comparing similar property types in order to organize extant buildings and structures into categories with high, medium and low integrity. Buildings with no to low integrity were not further researched or evaluated. Buildings with a medium to high degree of integrity were researched further as to use, the number remaining of that type, architectural merit and comparison to similar properties within the Hunters Point Shipyard and the Bay Area. These properties were also then evaluated to determine significance levels and whether they met National, California or local criteria for eligibility as historic resources. All properties were recorded on DPR Primary Record forms. Properties found to be significant were documented with District or Building Structure and Object Records. Though the Alice Griffith housing development was not found to be a historic resource, both Primary and BSO Record forms were prepared as requested (see Appendix A for all DPR forms).

Certain portions of the Shipyard were not accessible during the course of preparing this document due to hazardous waste remediation efforts and decontamination activities (see Figure 3.) Buildings and structures within these designated areas were identified and photographed by authorized Navy personnel. The photographs were then provided to Circa for use in the survey and evaluation process.

During the course of researching and preparing this technical report, four Shipyard buildings and some site features have been demolished as part of Navy environmental cleanup efforts. Most of what is discussed in the following sections is based on what remained of the built environment as of April 2009. This may or may not represent the state of the built environment as of the publishing of this report.

ADDITIONAL RESEARCH AND EVALUATION

Following completion of the *Bayview Waterfront Plan Historic Resources Evaluation, Volume I: Historic Context Statement*, Circa: Historic Property Development completed additional research related to supposed architect involvement in the design of certain buildings and structures at Hunter's Point Shipyard was conducted in April 2009 at the request of Planning Department staff. The following repositories were consulted to retain additional building-specific information:

- Navy Department Library/Naval Historical Center - Washington DC
- U.S. National Archives and Records Administration, College Park, MD and San Bruno, CA
- J. Porter Shaw Library, San Francisco Maritime National Historical Park
- Online Archive of California – Bancroft Library/UCB library holdings
- The California State Military Museum catalog
- Navy BRAC Program Management Office West– Treasure Island and Hunters Point Shipyard Drawing/document storage area (Building 383)
- San Francisco Public Library

Updated: October 2009

OFF LIMIT AREAS AT HUNTER'S POINT SHIPYARD

FIGURE 3

Figure 3. This map indicates the restricted access areas within the boundaries of the Naval controlled shipyard property. Map courtesy of PBS&J.

Updated: October 2009

Efforts were also made to locate a specific document by Edwin G. Schmidt titled *The History of the Development and Operation of a Naval Repair Yard at Hunters Point During World War II* (c.1946), which is referenced in existing documents related to Hunters Point Shipyard. Circa contacted and/or searched the local and national repositories listed above regarding the document, however a copy of the report was never located.

Updated: October 2009

III. HISTORICAL BACKGROUND

Please find more detailed historic context information in *Bayview Waterfront Plan Historic Resources Evaluation, Volume I: Historic Context Statement* of this document. The following Historical Background information is provided below for summary purposes.

INDIA BASIN SURVEY AREA

India Basin is composed of approximately ten full and partial blocks ranging from Earl Street to the former Pacific Gas & Electric plant site along Jennings Street. Many of these blocks are occupied by small, light industrial enterprises and residential buildings. The area has historically been a small boatbuilding community since the middle of the 19^{th} Century. This community was fairly self-sufficient, establishing their own churches, schools and social support network. Economically, they were dependent on the Bay for their livelihoods, whether they were involved with boat building or fishing. Today, several of the early religious institutions remain, as does at least one working boatyard and several residences from the 19^{th} Century and early 20^{th} Century.

Most of India Basin dates to the pre-World War II period (pre-1941). The boatyards were established throughout the late 19^{th} Century, mostly by northern European immigrants. Today there remains several intact architectural reminders from this period, including the Anderson-Cristofani boatyard and 900 Innes Avenue. Many other boatyards and fisheries were once found along this shoreline, but few have any visible physical presence as of 2008.

The Pacific Gas & Electric Company (PG&E) power plant at Hunters Point was originally constructed in 1929 by Great Western Power Company. Over the years it has been expanded to keep up with improvements in power generation techniques as well as to increase capacity. The plant was closed in 2006 and demolished by 2008. The PG&E site is currently undergoing remediation.

World War II greatly affected all the areas around India Basin, but there was relatively little effect on the built environment within India Basin. The boatyards continued to operate, although at a reduced capacity. The demand for larger ships resulted in the closing of the smaller yards and the consolidation of the remaining facilities. Those that survived into the post-WWII period did so by becoming specialty outfitters.

The shoreline of India Basin, its commercial enterprises and residential building stock have seen few changes since World War II. It remains a small pocket of late 19th Century and early 20th Century architecture amidst recent development. The hills above India Basin were first developed in World War II for housing. In the post-war years, much of the housing was transferred to public housing uses. Today, some of this remains but is interspersed with new development as the neighborhood continues to evolve.

CANDLESTICK POINT/ALICE GRIFFITH SURVEY AREA

CANDLESTICK POINT

The Long-billed Curlew is a large North American shorebird that was common along the shoreline of San Francisco in the early part of the 20th Century. Locally it was known as the Candlestick Bird and it is after this waterfowl that Candlestick Point was named.[7] Prior to being known as the site of a professional sports stadium, it was a quarry, a landfill and a proposed site for a quarantine hospital. At the time, it seemed a likely place, far from major settled areas, to put such an institution. 50 years later it was again at the center of controversy as it became the site for San Francisco's first professional sports facility. Today, the area has a sports stadium, as well as a state park, an executive park and a small number of residences.

At Candlestick Point, no architectural elements from the pre-1941 period have been identified. This area was largely created from fill after World War II. Those areas that

[7] San Francisco Department of Parks and Recreation website, *Welcome to Monster Park,* http://www.parks.sfgov.org/site/recpark_index.asp?id=18977, 2008.

were upland in the pre-war period were sparsely settled and largely used for industrial purposes.

During World War II, Candlestick Point was developed as a large multi-family housing complex for shipyard workers. These buildings were located along the southern shore, at the base of Bay View Hill. Landslides from the poorly graded and unstable hillside plagued the development and excavation was needed periodically to keep the units free from danger. Some areas to the east of the hill were filled in at this time, however much of the fill was not completed until the construction of Candlestick Park.

CANDLESTICK PARK

Candlestick Point was transformed in the late 1950s when the New York Giants relocated to San Francisco. A new baseball stadium was constructed on filled land just east of Bay View Hill. Well-respected local architect John Bolles designed Candlestick Park Stadium and it is considered one of the high points of his work. Unfortunately, the stadium was poorly sited and suffered from inhospitable weather patterns. Alterations in the post-war period include enlarging the seating, enclosing the stadium and reconfiguration of the stands to accommodate football and well as baseball. *Note: In addition to the historical background information provided in Volume I of this document, further discussion can be found in the evaluation completed by Jones & Stokes (Final Historic Property Survey Report, Bayview Traffic Improvements Project, Caltrans District 4, October 2007).* The evaluation is summarized in Section V of this report.

ALICE GRIFFITH PUBLIC HOUSING

In 1937, Congress passed the first United States Housing Act. This act established the Untied States Housing Authority (USHA) as a part of the Department of the Interior. It put the Federal government in the funding role while giving governance of the resulting housing to local housing authorities. San Francisco was one of the first cities to apply for the Federal program, establishing the San Francisco Housing Authority (SFHA) in 1938. By 1940, Holly Courts had opened, becoming the first public housing project completed west of the Rocky Mountains under this system.

Updated: October 2009

The USHA was initially authorized for a period of three years but was not renewed. Instead, by 1939, the government began to shift its focus from providing public housing to building defense-related housing in preparation for entering World War II. As part of this shift, all housing construction was stopped to conserve construction materials for the war effort. Special provisions were made to those housing projects in strategic locations near defense bases and industrial zones.

An ideal location because if its proximity to the Shipyard and general lack of development in the area, the Hunters Point neighborhood of San Francisco was transformed by the war housing boom. The first of the war housing construction projects to open was the Middle Point War Housing complex between Evans Avenue and Innes Avenue in early 1943. In the next six months, five more war housing complexes opened in the area, including the Double Rock War Dwellings, the precursor to today's Alice Griffith Housing Development. By the war's end in July 1945, over 10,000 units of temporary wartime housing had been constructed to serve the Hunters Point Naval Shipyard.

After the war, many war workers began to transfer out of the temporary housing units and into the single-family dwellings that were showing up throughout the district. By this time, many of the temporary housing units were already showing signs of impermanence. However, because housing was in such short supply, the Federal government made provisions in the Housing Act of 1950 to transfer ownership to local housing authorities rather than require their immediate demolition (as originally mandated). The defense worker housing was officially transferred from the Federal government to the SFHA in 1954. In this same year, SFHA received its first challenge over the quality of the housing projects in the Bayview-Hunters Point area. By 1960, four of the original "temporary" housing complexes were still being used, including the Double Rock War Dwellings.

To address the extreme shortage of quality housing in the city, the SFHA's first priority after the war was to complete the remaining six public housing projects designed before the war. This included Ping Yuen in Chinatown, North Beach Place in North Beach, and

Bernal Dwellings in the Mission. The second priority was to deal with the problem of the temporary war dwellings in the Hunters Point area. The first units to be replaced were part of the Navy Point War Dormitories at Kirkwood Avenue and Earl Street, in 1953. This new complex was called simply “Hunters Point.” It consisted of 317 apartments in a series of 2- and 3-story apartment buildings. This design became the standard for the area. In 1956, Hunters View and Harbor Slope opened up with 576 units, replacing the Middle Point and Harbor Slope War Dwellings along Innes Avenue. These units were largely constructed on existing foundations remaining from the demolition of the temporary war buildings. The Alice Griffith Garden Homes replaced the Double Rock War Dwellings in 1962.

Hertzka & Knowles and H.C. Baumann Associated Architects designed the Double Rock Low Rent Housing Project in 1953-4 and Douglas Bayliss designed the landscape. Construction of the approximately 250 units began in 1960 and was completed in October 1962. Initially referred to as Double Rock after the earlier temporary war housing development on the site, the project was later renamed after former SFHA board member Alice Griffith. Griffith opposed the SFHA’s restrictive placement known as “neighborhood patterns.” This policy allowed settlement within the housing projects only if the applicant reflected the predominate ethnicity of the neighborhood, or if they were White. In spite of the fact that the majority of the tenants were African-Americans who had difficulty finding housing because of rampant racial discrimination, only one permanent housing project, located in the Western Addition, was open to Blacks. The “neighborhood patterns” policy was the City’s way to segregate housing in practice while condemning the practice in theory. Alice Griffith resigned her post over the matter and became a voice opposing the policy in public debate.

Wayne Solomon Hertzka and William Howard Knowles formed Hertzka & Knowles, the San Francisco-based architecture firm in 1932. Hertzka, a Washington native born in 1907, earned his masters degree in architecture from MIT in Cambridge and became a registered architect in California in 1956. Knowles, born in 1909, completed his undergrad work at UC Berkeley and also earned his masters degree in architecture from MIT in 1932. Together the architects worked on a number of projects including 1 Bush Plaza, Anza Elementary School, the Mission BART stations and the Hotel Empire in San Francisco.

Herman C. Baumann started his architectural practice in San Francisco in 1924. A prolific architect, Baumann designed hundreds of apartment buildings in the Bay Area over his career. He also designed hotels and commercial buildings in San Francisco, Oakland and Sacramento. During WWII, Baumann held a contract with the U.S. Navy Bureau of Yards and Docks, designing a number of buildings at Mare Island and other Naval outposts in the Bay Area. After the war, Baumann designed several multi-family housing projects. He is likely best known for his Art Deco apartment houses such as 1895 Pacific Avenue and 1950 Clay Street in San Francisco and the Bellevue-Staten building in Oakland.

Douglas Bayliss is best known for his work in the “California School” of landscape architecture in which the more structures Beaux-Arts conventions were replaced with an approach that centered around the California climate and lifestyle. Bayliss graduated with a Landscape Architecture degree from the University of California, Berkeley in 1941 and began working with Thomas Church. It was during his tenure in Church’s firm that several government-funded housing projects were designed. Bayliss opened his own firm with wife Maggie Bayliss after the war and his projects over the next two decades included Washington Square in North Beach, San Francisco Civic Center Plaza, IBM Headquarters near San Jose and several BART stations. He is often credited along with Church, Garrett Eckbo and Robert Royston as one of the founders of the “California School” of modernism in Landscape Architecture.

Over the years, little has changed within the Alice Griffith Public Housing site and some residents still remain from its opening in 1962. Some upgrade work was completed in the 1980s, however the buildings appear to be in deteriorating condition. A new community facility has been constructed on the site in recent years.

Updated: October 2009

HUNTERS POINT SHIP YARD SURVEY AREA

PRE WWII PERIOD (PRE-1941)

At HPS, several pre-World War II buildings remain. They are clear representatives of the commercial importance of the shipyard when it was solely contained within the bounds of the Bethlehem Steel dry docks at Hunters Point. Portions of the dry docks area remain from the 19th Century. These elements have previously been determined eligible for listing on the National Register and as such, are the most important resources within the Project boundaries. However, they are not the only resources that remain from the pre-World War II period. Only one other building is extant related to the community that existed prior to the war years, Building 109; originally a restaurant that served the commercial dry dock community, the building was later used as the shipyard police station.

Existing Property Types from the Pre-1941 Period

The Hunters Point Shipyard closed in 1974. The residential area at the north part of the Shipyard was designated Parcel A as part of Phase 1 of the current Project. Within Parcel A and the adjacent Parcel B were at least two commercial buildings constructed to serve the residents of the area as well as the dry docks employees prior to Navy occupation. These two buildings served as restaurants in the pre-Navy period. The first was called The Venetian Villa (later Dago Mary's), and was located just inside the Phase 1 Hunters Point Shipyard (HPS) boundaries at the northeastern corner of Hudson Avenue and Galvez Avenue. The second was known as the Lincoln Restaurant and used as the Navy's police station after the Navy assumed ownership of the shipyard. Following transfer of Parcel A from City ownership to private hands circa 2005, the entire residential district and some Navy administration buildings were demolished and the land regraded as part of Phase 1 HPS.[8] Dago Mary's was demolished in 2008. The former Lincoln Restaurant, currently known as Building 109, a

[8] Buildings 101 and 110 were built by the Navy during the WWII period and are the only buildings still extant within Parcel A.

Spanish Revival style building built in 1934, is the only commercial building still extant at HPS and is near the northern entrance to Hunters Point Shipyard Phase II Area A.

Dry Docks 2 (1903) and 3 (1918) and Buildings 140 (1918), 204 and 205 (1901), and 207 (c.1930) have been previously determined eligible as contributors to a National Register historic district significant for its association with early commercial drydock operations at Hunters Point (see Figures 28 and 29.) These buildings, in addition to Building 208, a Tool Room constructed prior to the Navy's acquisition of the property and later remodeled, constitute the remainder of the pre-WWII buildings and structures within Hunters Point Shipyard sub-area.[9]

Figure 4. View of the Hunters Point dry docks as seen from Hunters Point Ridge, 1924. Dry Dock 2 is to the right in the image. Photo used with permission from the San Francisco History Center, San Francisco Public Library.

[9] Though previous studies listed construction dates for Buildings 207 and 208 as 1942 and 1943 consecutively, research conducted at the Navy archives at Treasure Island for the purposes of this review indicate that the buildings were actually acquired with the property and remodeled by the Navy in 1942 and 1943.

Updated: October 2009

Figure 5. View of Dry Dock 2, Photo: NAVSEA, 2004.

WORLD WAR II PERIOD

The World War II period brought the most profound physical changes to the shipyard. The land was significantly increased while Hunters Point Hill was dramatically leveled. Rail lines were laid, warehouses built, and the largest dry dock in the world (at that time) was constructed in record time. Hundreds of ships were repaired and returned to battle and thousands of employees worked around the clock to meet the demands of the Navy and its ships. Most of the built fabric remaining in 2008 dates to this period. The buildings range in size from small weighing stations to large warehouses and multiple level repair facilities. It should also be noted that a large number of buildings at the Shipyard have been demolished since the shipyard was decommissioned in 1976, many in recent years.

Zones of Use

As stated in Volume I: Historic Context of this report, the overall site plan for the Shipyard was a direct product of the World War II expansion. Prior to the war effort, the sparse amount of available land at the site did not necessitate a comprehensive site planning strategy. However, with an increased amount of land made available through the reclamation process, site planning became a necessity and the result was an orderly arrangement of buildings and structures in functional groupings. The first and most important influence was access to the water. Since the primary charge of Hunters Point Shipyard during World War II was the repair and retrofit of ocean-going military vessels, access to the various berths had a large impact on the location of storage, shops and administration buildings. Of secondary concern was the movement of equipment and personnel between buildings. Rail lines traced throughout the Shipyard, following wharfs and extending into warehouses. The sometimes massive scale of equipment and materials required the use of cranes and motorized transportation mechanisms to move objects from ships to repair facilities and back again. The consequence of these influences was a compartmentalized base with specific use zones, reflected largely in the numbering system (see Figure 6). In general, these zones were:

- Administration (100-series)
- Submarine Repair (100-series)
- Ship Repair and Outfitting (200-series)
- Warehousing, Supply and Industrial Support (300- and 400-series)
- Residential and related (500- and 600-series)
- Radiological (700- and 800-series)

Updated: October 2009

REPRESENTATIVE BUILDING TYPES FROM THE WWII PERIOD

Administrative

Figure 7. Building 101, Main Administration Building, Photo: Circa, 2008.

There are seven World War II-era Administrative buildings remaining at Hunters Point Shipyard. These include: Building 101 (see Figure 7) overlooking the heart of the Shipyard, Building 121 (the Submarine Offices and Apprentice School) in the Submarine Repair area, Buildings 129 and 132 (Submarine Pier offices) on Piers B and C, Building 154 (Area time office #1) in the Ship Repair and Outfitting area, Building 214 (The Accounting and Bond Office) southwest of Dry Dock 2, Building 215 (the Fire Station), and Building 238 (an office building) on the North Pier. All appear to have been built from standardized Bureau of Yards and Docks plans, except for Buildings 214 and 215. These buildings are quite similar to one another in design and materials and may have been designed as part of a larger A&E contract.[10]

The most prominent of these buildings, in terms of siting, is Building 101, the main Administration Building. It appears to be a standardized semi-permanent Bureau of Yards and Docks design, with a series of identical sections pieced together as wings projecting from a long central corridor. It is a wood frame building clad in wood shiplap siding and glazed with one-over-one wood windows. Most of the other administrative buildings also appear to be built around standard plans. Building and 121 closely resembles a World War II-era barracks designs, similar to buildings 103, 104 and 117. Buildings 129 and 132 are identical two-story office buildings on Piers B and C. Building 238 appears to be another office building located on the north pier but is not specifically

[10] Ibid, p. 22.

noted in Navy records. As previously noted, Buildings 214 and 215 are similar in design and research indicates that both are likely variations on standard plans.[11]

Figure 8. Building 110, Marine barracks.
Photo: Circa, 2008.

Residential and Related

As the Navy increased services at Hunters Point Shipyard, a vast increase in housing for enlisted men and their families was needed. This was beyond the thousands of units under construction for civilian shipyard workers. (See Volume I: Historic Context, Chapter VII: Housing, for more discussion on civilian housing construction during World War II). During the Shipyard's peak years of operation, residential and other related facilities for service personnel were located throughout the Shipyard, though chiefly concentrated in the 500 Series Area in the southwest corner of the shipyard and in the former neighborhood on the bluff. Facilities included not only barracks buildings for ships and submarine repair workers, apartment houses, officers quarters and family housing for non-commissioned personnel, but also recreational facilities, latrines, laundry and commissary facilities, a motion picture theater, a chapel, canteens and cafeterias, and a dental clinic.

Most of these buildings have been demolished in recent years because many were utilized by the NRDL as labs or storage facilities after they were no longer needed to service Navy personnel to the extent that they did during wartime. Today, only five barracks buildings remain at the site, most in the 100 series area in or near the Submarine repair Area. A more unique building in this grouping is Building 110, a stucco-clad Art-Deco style barracks building (see Figure 8), that was built from standard Bureau of Yards & Docks plans and housed the Marine detachment.[12] Typical of Navy

[11] Ibid, p. 23.
[12] Perhaps, since the Marine barracks building was more publicly visible than some of the other residential facilities because of its location on a main entry thoroughfare, a more distinctive design was chosen for the building.

Figure 9. Building 117, Submarine barracks. Photo: Circa, 2008.

base layout, the Marine barracks were situated near the entry gate since the Marines served as armed guard for the facility. The other barracks buildings are standard, rectangular-plan buildings (103, 104 and 117) (see Figure 9) that functioned primarily as the Submarine repair workers' barracks. One barracks building does exist in the south waterfront area: Building 500, a two-story, wooden World War II semi--permanent building that served as a Bachelor Officers' Quarters and canteen.

Figure 10. Building 226, Standard plan latrine. Photo: Circa, 2008.

Standard-plan wood frame latrine buildings (see Figure 10) are found throughout the shipyard as are cafeteria facilities like Building 228, the Central Cafeteria, located within the Ship Repair and Outfitting area of the Shipyard. Other remaining buildings include Building 120 in the Submarine Repair Area, constructed as a variation on standard Bureau of Yards and Docks Plans as the Enlisted Men's' Club and Building 505, which housed the Navy Exchange, Gymnasium, a bowling alley and laundry facilities.

Figure 11. Building 236 is typical of the Utility buildings found at the Shipyard. Photo: Circa, 2008.

Utility

A number of reinforced concrete utility buildings remain from the WWII period and are located throughout the Shipyard grounds. Relatively uniform in their utilitarian design, these building house substations, pump houses and switching stations. Generally constructed of reinforced concrete, most of these buildings lack windows and have a single metal access door (see Figure 11.)

Updated: October 2009

Dry Docks

Figure 12. Dry Dock 4, 2008. This was the largest drydock in the world when it was constructed in 1943. Photo: Circa, 2008.

Four dry docks were constructed at the Shipyard during WWII: Dry Docks 4, 5, 6 and 7. Dry docks, also known as graving docks, are used for the construction, maintenance, and repair of ships, submarines and other watercraft. When a ship is to be repaired, the dry dock is flooded by opening the gate at the mouth of the basin. After the vessel enters the basin, the watertight gate is closed and the dock is pumped dry, bringing the craft to rest on supporting blocks secured to the floor.

Dry Dock 4, constructed in 1943, is a multi-purpose graving dock designed especially to accommodate aircraft carriers (see Figure 12.) This massive dry dock is 1092 feet long, 142 feet wide and 53 feet deep. It was carved into the natural serpentine stone that comprises Hunters Point ridge and finished in concrete. Access steps are built into the sidewalls and the floor of the dock is flat. Crane tracks surround the dry dock, permitting the ships to be accessed from all angles.

Figure 13. The Submarine Repair Area, 1946. Photo used with permission from the San Francisco History Center, San Francisco Public Library (United States Navy Photograph.)

Dry docks 4, 5 and 6, (see Figure 13) the Submarine Dry docks, are located in the Submarine Repair Area of the Shipyard and were designed to fully service underwater craft and smaller surface vessels.[13] Built in

[13] Hunters Point Naval Shipyard Association, untitled report, c.1974, pp. 15-16. Included as an appendix to *Hunters Point Naval Shipyard: A Historical Analysis* by Karl F. Kimbrough, August 1978.

1944, these dry docks are much smaller than Dry Dock 4, measuring about 420' long and between 60' and 75' in width, with a simple "flap gate" design. Originally designed for submarine, the structures were modified to accept destroyers as well.[14]

Warehousing , Supply and Industrial Support

Figure 14. Building 400, a typical warehouse building at Hunters Point Shipyard. Photo: Circa, 2008.

As part of the daily operations, the Shipyard had to be prepared for work on a wide variety of ships, ship components and weaponry as well as supplying repaired vessels for their return to duty. Storage was essential to these operations, as evidenced by the immediate construction of storage facilities when the Navy assumed full command of the site in late 1941. A series of supply storehouses, somewhat varied in design, are located in the south shipyard area, a predictable occurrence in a base dedicated to the repair of ships. Nearly all were built along standard Bureau of Yards and Docks designs, modified on occasions to fit specific requirements. The predominant warehouse type is a rectangular plan, wood warehouse building with a monitor roof. This standard plan was used alone or in groupings of three. Buildings 400, 404, 405, 406 and 407, supply storehouses built in 1943 are the best remaining examples of this building type (see Figure 14.)

Figure 15. Rail spurs are common throughout the Shipyard, especially on the south side. Photo: Circa, 2008.

Railroad tracks entered the Shipyard from the western entrance and ran throughout the shipyard, providing an essential mechanism for the transportation of goods between storehouse, shops and dry dock facilities; much of this extensive network was still extant when the survey process started (see Figure 15.) Tracks run along the north

[14] The following information is taken from Building the Navy's Bases in World War II.

sides of the 400 series listed above and directly into Building 808, a large steel framed and sided warehouse just north of these buildings.

Shops, Shipbuilding and Repair

Figure 16. Building 230, a typical WWII shop building at Hunters Point Shipyard. Photo: Circa, 2008.

Figure 17. Building 123, a typical monitor roofed shop. Photo: Circa, 2008.

Figure 18. Building 241, a two-story shop with a shallow gable roof. Photo: Circa, 2008.

Aside from the supply storehouses, the shops buildings are the other most common building type at the Shipyard. Like the warehouses, nearly all were built along standard Bureau of Yards and Docks designs and modified to fit specific functional requirements. The shops are generally large buildings, some being very substantial in footprint as well as height. Functionally, the buildings were used for a wide variety of purposes, although they may be roughly classified into industrial support and processing uses.

Most of the buildings are wood or steel framed and clad in a combination of metal, wood or corrugated transite panels. A secondary siding of asbestos shingles has been applied over the original wood siding of many buildings. The industrial shops ranged in size from smaller gable-roofed buildings (see Figure 16) to massive monitor roofed shops (see Figure 17), to one- and two-story full height buildings with a shallow gable roof and shed wings (see Figure 18.)

Updated: October 2009

Figure 19. Building 351, completed in 1945 at the close of World War II. Photo: Circa, 2008.

There are a few examples of reinforced concrete shop buildings, though concrete was a scarce construction material during the war and was use sparingly. It was generally used when the building was to be used for the handling of flammable or energetic materials or because the building was scheduled for permanent status. Building 351 is a large reinforced concrete shop building, constructed as the Optical Shop in 1945 but never used for that purpose (see Figure 19.) It was later used as an electronics shop, NRDL Annex E and for general research laboratories.

Figure 20. Building 231, constructed by the Navy in 1942 as the first major shop at the Shipyard. Photo: Circa, 2008.

Possibly most notable are the three large curtain wall shop buildings, Buildings 253, 411 and 231 (see Post-WWII section below for discussion of Building 253 and 411). Building 231 (see Figure 20,) the Inside Machine Shop, was the first major shop building constructed by the Navy in 1942. Steel framed and clad in corrugated iron siding and corrugated safety glass, the rectangular plan building has a sawtooth roof and is glazed with steel industrial sash windows.

WWII Period Summary

All of this construction was centered on the stated mission of Hunters Point Shipyard:

> "For all classes of vessels: interim docking, shaft and propeller repairs, repairs of major underwater damage; for carriers: interim overhaul of about three to four weeks comparable to overhaul by repair vessels afloat."[15]

In general, that is what occurred. However, sometimes Hunters Point Shipyard was used to load and outfit ships prior to embarkation. This was the case on July 15, 1945, while the USS Indianapolis was docked at Hunters Point awaiting orders. On this day, components of the atomic bomb "Little Boy" were loaded aboard the Indianapolis for transport to the South Pacific. It was reported to have contained half of the available uranium in the United States, valued at over $300 million at the time. The ship left Hunters Pont at 6:30 AM the next morning but was held in San Francisco, awaiting the results of the first atomic weapons test in New Mexico. The test was a success and the Indianapolis sailed out of the Golden Gate at 8:30 AM.[16] On August 6, 1945, the bomber Enola Gay dropped "Little Boy" on Hiroshima, essentially ending World War II.

POST WWII PERIOD

Hunters Point Shipyard continued to function as a Navy repair facility in the post-war period. It did not, however, continue to receive the same level of attention from the Navy. Other, newer shipyards were developed in Southern California during the 1950s and 1960s. By 1974, HPS had become obsolete.

In the post-WWII period the Shipyard became home to the Navy's Radiological Defense Laboratory, NRDL. NRDL came to dominate much of the space on the shipyard, at one time occupying over three-dozen different buildings. In 1955, these operations were

[15] Ibid, p. 15.
[16] NAVSEA, Hunters Point Shipyard: Final Historical Radiological Assessment: History of the use of General Radioactive Materials, 1939-2003. 2004, p. 6-4.

Figure 21. Building 367 is constructed of two Quonset huts placed end-to-end. This building type was used for housing along the south shore of Hunters Point during World War II. Photo: Circa, 2008.

partially consolidated in the newly constructed Building 815. The research and scientific advancements that occurred as a result of experimentation within Building 815 had a direct impact on development of practical uses for nuclear materials as well as protective measures and public policy regarding exposure and handling of such materials. NRDL was a unique and highly influential enterprise that brought a new level of prominence to Hunters Point Shipyard.[17]

REPRESENTATIVE PROPERTIES FROM THE POST - WWII PERIOD

Though the bulk of the buildings and structures remaining at Hunters Point Shipyard date to the WWII period, a number of buildings, constructed to supplement ongoing Naval ship repair activities, remain from the post-war period.

Administration and Support

Some expansion of administrative and other worker support facilities occurred in the post-war period, mostly concentrated within the Warehousing, Supply and Industrial Support Area in the south Shipyard. Buildings 367 and 424, small administrative

[17] Building 815 is not located within the survey area.

Updated: October 2009

buildings, served shipyard workers as Work Control center #3 and Area Time Office #4, respectively. Comprised of two Quonset huts, Work Control Center #3 sits along the southern edge of Dry Dock 4 (see Figure 21.) Over 130 Quonset huts, also known as Homoja Homes, were once located in the residential (500 series) area of the south Shipyard. Of this once common building type at the shipyard, Building 367 is one of only two Quonsets remaining at the site. It is possible that the Navy relocated two Quonsets to create Building 367 after the WWII demand for worker housing had subsided.

Figure 22. Building 709, the Navy Exchange Gas Station, built in 1952. Photo: Circa, 2008.

Additional employee support facilities were also constructed during this period including Buildings 159, 710 and 370, temporary wood frame latrines. Building 709, the Navy Exchange Gas Station, is a unique service station building constructed in 1952 with Art Deco design features unusual for the date of construction (see Figure 22.)

Figure 23. Building 521. One of several utility buildings. It was constructed in 1948. Photo: Circa, 2008

Utility services at the Shipyard were also improved during the post-war period, most notably with the construction of Building 521, a reinforced concrete power plant in the south shipyard area (see Figure 23.) Built by Barnes Construction Company in 1948, the building is a prominent structure and one of the last standing in this formerly residential part of the shipyard. Other utility buildings completed during this period include a one-story brick salt water pump house (Building 523) near the South Slip and a concrete sewage pump station (Building 819) located just north of the Crisp Road and Spear Avenue intersection.

Updated: October 2009

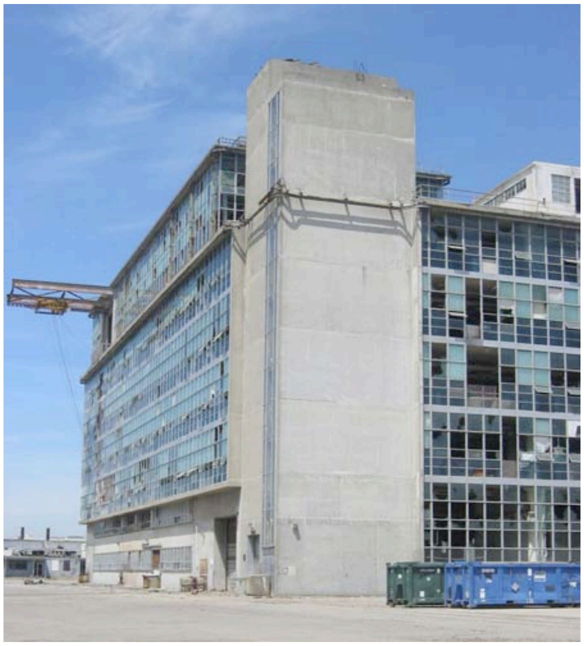

Figure 24. Building 253. The Optical, Ordnance and Electronics Building was built in 1947. Its green glass façade can still be seen from Highway 101. Photo: Circa, 2008.

Ship Repair and Outfitting

Several shipbuilding and repair-related buildings were constructed at the shipyard after 1945. These generally fall into two categories: large specialized shop buildings and smaller, pre-fabricated support buildings.

Buildings 253 and 411 are the most notable post-WWII industrial buildings at the shipyard, both visually and architecturally. They were planned, and in the case of Building 253, under construction during wartime but not completed until 1947 and hail from a long-standing Navy practice of designing large shops using the curtain wall system. The Navy's use of this form dates to the years just before World War I, when Albert Kahn, a pioneer in the field of American factory design, developed a curtain wall shop building for the Navy shipyard in Philadelphia. The Bureau of Yards and Docks quickly recognized the utility of the form for the metalworking, assembly, and other aspects of mass production that required large clear spans and ample natural light. The Bureau of Yards and Docks built curtain wall shops buildings at Mare Island, Terminal Island, Hunters Point, Puget Sound and other Naval shipyards throughout the country from World War I through the end of World War II.

Building 253, the Optical, Ordnance and Electronics Building, is a six-story, concrete framed, glass curtain wall building located in the Ship Repair and Outfitting area of the Shipyard (see Figure 24.) Designed by the architecture firm of Ernest J. Kump Co. and Mark Falk, structural engineer, the building cost over $2,000,000 to build. More than 80 percent of the structure's walls and roof are comprised of glass providing abundant natural light to the building interior. A large overhead crane attaches to the south side of the building and was used for external lifting of equipment. A periscope tower extends

Figure 25. Building 411 has been partially attributed to Albert Kahn & Associates Architects and Engineers, Inc. Photo: Circa, 2008.

vertically from the roof and was part of the sixth floor Optical Shop where rangefinders from naval ships were repaired and submarine periscopes calibrated by sighting on known points throughout the Bay Area.

Building 411 is a steel-framed curtain wall building located in the Warehousing, Supply and Industrial Support Area in the south Shipyard (see Figure 25.) According to an earlier evaluation of the building, it was designed in part by Albert Kahn and exhibits several common features of his industrial buildings including a saw tooth roof, bands of steel industrial sash windows and massive glazed industrial doors. The building housed the Shipfitters and Boilermakers Shop and Ship Repair shop as well as a civilian cafeteria, mold loft, radiography shop and storage areas. The plate yard was located directly north and assembly yard directly south of the building.

The second grouping of industrial buildings extant from the post-war period, and the most common building type, is the metal-sided Butler (or Butler-type) building. All of the Butler Buildings at Hunters Point date to the immediate post-war era (1947-1953) and include Buildings 156, 271, 274, 275, 323, 324, 368, 369, 415/416, 525, 526, 530 and 704. Butler Buildings are of varying sizes and are sometimes paired. This prefabricated, standard building was used on military bases throughout the nation in the immediate post-war era, when construction budgets were quite limited and were utilized for various industrial support activities and supply storage.

Radiological Laboratories

The NRDL primarily occupied buildings in the 800 and 700-series areas of the Shipyard, though portions of other buildings were utilized for NRDL storage, administrative offices and other purposes throughout the course of their work at Hunters Point. Many buildings in the 500-series area were used for radioactive waste storage, personnel decontamination, research and offices related to NRDL activities. The center for NRDL research, Building 815, also known as the Radiological Laboratory or RADLAB is still extant but located outside of the study area (see Figure 27). Buildings such as Building 820, the Navy Radiation Laboratory and Building 830, a Navy Biological Laboratory, as well as most of the 500 series buildings have been demolished in recent years. Extant NRDL related buildings include Buildings 707 and 708, NRDL animal research facilities and study colonies, and Building 366, which housed the NRDL Electronics Laboratory.[18]

Other

Warehousing and Supply

Building 813, built in 1947, is the only reinforced concrete warehouse built during the postwar period and stands on Parcel A, just north of the Warehousing, Supply and Industrial Support Area. This four-story warehouse is glazed with bands of industrial steel sash windows and functioned as a supply storehouse.

450-Ton Crane

Figure 26. 450-ton crane. Photo: Circa, 2008.

One of the more impressive structures built just after the WWII-era was a large bridge crane, installed on the 405-foot-wide Gun Mole Pier at the south waterfront area (see Figure 26). The bridge crane is constructed of riveted and welded braces and plates and measures 730 feet in length, rising 182 feet above the water. The fixed cantilevered arms at each end project 162.5 feet over the water on either side of the pier. The support towers are 35 feet by 50 feet at the base and are 320 feet apart across the pier. Two trolley cranes were self-contained units with a cab

[18] The area around Building 707 was known as the "707 Triangle." It was formed by the intersections of I Street, J Street and Manseu Street. It was used as a staging area for radiologically contaminated waste prior to its disposal at sea.

for the operator and cable extensions to lift and move large objects. The trolley cranes were removed in about 1970.[19]

Other buildings constructed in the post-war period include series of later pre-fabricated, metal-clad buildings, built near the base of the 450-ton bridge crane in the 1960s (Buildings 377, 379 and 380).

Figure 27. Building 815 was constructed in 1955 to consolidate laboratory and office facilities for NRDL. The building has historically been referred to as RADLAB. Photo used with permission from the San Francisco History Center, San Francisco Public Library.

[19] Bonnie Baumburg, Urban Programmers, National Register of Historic Places Nomination: 450-ton Bridge Crane, Hunters Point Shipyard, 1988. As cited in JRP Historical Resources Consulting Services, Historic Context and Inventory Evaluation of Buildings and Structures: Hunters Point Shipyard, September 1997. The crane is not currently listed on the NRHP.

IV. EVALUATIVE FRAMEWORK

Cultural resources are defined as buildings, sites, structures, or objects, each of which may have historical, architectural, archaeological, cultural, or scientific importance. Numerous laws, regulations, and statutes, on both the federal and state levels, seek to protect and target the management of cultural resources. Depending upon a variety of preconditions such as the inclusion of federal monies or significant effects on wetlands, federal or state law may be the primary governing code. These laws include the National Environmental Policy Act (NEPA), the National Historic Preservation Act (NHPA), and the California Environmental Quality Act (CEQA). For the purposes of the environmental documentation for the project, cultural resources are considered under Section 106 of the NHPA and CEQA.

SECTION 106 OF THE NATIONAL HISTORIC PRESERVATION ACT

Section 106 of the NHPA requires federal agencies and those they fund or have approval authority over to consider the effects of their actions on properties that may be eligible for listing or are listed in the NRHP. To determine whether an undertaking could affect NRHP-eligible properties, cultural resources (including archaeological, historical, and architectural properties) must be inventoried and evaluated for listing in the NRHP. Although compliance with Section 106 is the responsibility of the lead federal agency, others can undertake the work necessary to comply with Section 106. The Section 106 process entails the six primary steps listed below[20]:

- Initiate consultation and public involvement.
- Identify and evaluate historic properties.
- Assess effects of the project on historic properties.
- Consult with the SHPO regarding adverse effects on historic properties, resulting in a memorandum of agreement (MOA).

[20] Not all steps are necessary for all projects. If no historic properties are identified, no additional steps are taken. If the project will not have an adverse effect on historic properties, no MOA is necessary.

- Agency official (from USACE) submits the MOA to the Advisory Council on Historic Preservation (ACHP).
- Proceed in accordance with the MOA.

NATIONAL REGISTER OF HISTORIC PLACES (NRHP)

The National Register is the nation's master inventory of known historic resources. It is administered by the National Park Service (NPS) in conjunction with SHPO. The National Register includes listings of buildings, structures, sites, objects, and districts that possess historic, architectural, engineering, archaeological, or cultural significance at the national, state, or local level. The National Register criteria and associated definitions are outlined in National Register Bulletin Number 15: How to Apply the National Register Criteria for Evaluation. The following is a summary of Bulletin 15:

Generally, resources (structures, sites, buildings, districts and objects) over 50 years of age can be listed in the National Register provided that they meet the evaluative criteria described below. Resources can be listed individually in the National Register or as contributors to an historic district.[21] The National Register criteria are as follows:

A. Resources that are associated with events that have made a significant contribution to the broad patterns of history;

B. Resources that are associated with the lives of persons significant in our past;

C. Resources that embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

[21] A "contributor" is a building, site, structure, or object that adds to the historic associations or historic architectural qualities for which a property is significant. The contributor was present during the period of significance, relates to the documented significance of the property, and possesses historic integrity or provides important information about a period; or the contributor independently meets National Register criteria. A "non-contributor" does not add to the historic associations or historic architectural qualities as it was not present during the period of significance; it has experienced alterations, disturbances, additions, or other changes; or it does not independently meet the National Register criteria.

D. Resources that have yielded or may likely yield information important in prehistory or history.

Certain resources are not usually considered for listing in the National Register. These properties can be eligible for listing, however, if they meet special requirements, called Criteria Considerations (A-G), in addition to meeting the regular requirements (that is, being eligible under one or more of the four significance criteria and possessing historic integrity). Generally, such properties will qualify for the National Register if they fall within the following seven criteria considerations:

A. A religious property deriving primary significance from architectural or artistic distinction or historical importance;

B. A building or structure removed from its original location but which is significant primarily for architectural value, or which is the surviving structure most importantly associated with a historic person or event;

C. A birthplace or grave of a historical figure of outstanding importance if there is no appropriate site or building directly associated with his or her productive life;

D. A cemetery which derives its primary significance from graves of persons of transcendent importance, from age, from distinctive design features, or from association with historic events;

E. A reconstructed building when accurately executed in a suitable environment and presented in a dignified manner as part of a restoration master plan, and when no other building or structure with the same association has survived;

F. A property primarily commemorative in intent if design, age, tradition, or symbolic value has invested it with its own exceptional significance; or

G. A property achieving significance within the past 50 years if it is of exceptional importance.

When nominating a resource to the NRHP, one must evaluate and clearly state the significance of that resource to American history, architecture, archaeology, engineering, or culture. A resource may be considered individually eligible for listing in the NRHP if it meets one or more of the above listed criteria for significance and it possesses historic integrity. Historic properties must retain sufficient historic integrity to convey their significance.

The National Register recognizes seven aspects or qualities that define historic integrity:

- **Location**. The place where the historic property was constructed or the place where the historic event occurred.
- **Design**. The combination of elements that create the form, plan, space, structure, and style of a property.
- **Setting**. The physical environment of a historic property.
- **Materials**. The physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.
- **Workmanship**. The physical evidence of the crafts of a particular culture or people during any given period in history or prehistory.
- **Feeling**. A property's expression of the aesthetic or historic sense of a particular period of time.
- **Association**. The direct link between an important historic event or person and a historic property.

To retain historic integrity, a resource should possess several of the above-mentioned aspects. The retention of specific aspects of integrity is essential for a resource to convey its significance. Comparisons with similar properties should also be considered when evaluating integrity as it may be important in deciding what physical features are essential to reflect the significance of a historic context.

THE CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA)

The California Environmental Quality Act (CEQA) provides the legal framework by which historical resources are identified and given consideration during the planning process. The law was adopted in 1970 and incorporated in the Public Resources Code §§21000-21177. CEQA's basic functions are to:

- inform governmental decision makers and the public about the potential significant environmental effects of proposed activities;
- identify ways to reduce or avoid adverse impacts;
- offer alternatives or mitigation measures when feasible; and
- disclose to the public why a project was approved if significant environmental effects are involved.

CEQA applies to projects undertaken, funded or requiring an issuance of a permit by a public agency. The analysis of a project required by CEQA usually takes the form of an Environmental Impact Report (EIR), Environmental Impact Statement (EIS), Negative Declaration (ND), or Environmental Assessment (EA).[22]

CALIFORNIA REGISTER OF HISTORICAL RESOURCES (CRHR)

The CRHR is a guide to cultural resources that must be considered when a government agency undertakes a discretionary action subject CEQA. The CRHR helps government agencies identify and evaluate California's historic resources, and indicates which properties are to be protected, to the extent prudent and feasible, from substantial adverse change.[23] Any resource listed in, or eligible for listing in, the CRHR is to be considered during the CEQA process.

1. A cultural resource is evaluated under four CRHR criteria to determine its historical significance. A resource must be significant in accordance with the one or more of the following criteria (as defined in §15064.5(a)(3):

2. Is associated with events that have made a significant contribution to the broad pattern of California's history and cultural heritage;

3. Is associated with the lives of persons important in our past;

[22] http://www.aqmd.gov/ceqa/
[23] PRC §5024.1(a)

4. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or

5. Has yielded, or may be likely to yield, information important in prehistory or history.

In addition to meeting one or more of the above criteria, the CRHR requires that sufficient time must have passed to allow a "scholarly perspective on the events or individuals associated with the resource." Fifty years is used as a general estimate of the time needed to understand the historical importance of a resource.[24] The OHP recommends documenting, and taking into consideration in the planning process, any cultural resource that is 45 years or older.[25] As such, this report evaluates all resources 45 years or older for the purposes of CEQA.
