CRHR criteria are similar to National Register criteria, and are tied to CEQA, as any resource that meets the above criteria, and retains a sufficient level of historic integrity, is considered an historical resource under CEQA. Integrity is the authenticity of an historical resource's physical identity evidenced by the survival of characteristics that existed during the resource's period of significance. Historical resources eligible for listing in the California Register must meet one of the criteria of significance described above and retain enough of their historic character or appearance to be recognizable as historical resources and to convey the reasons for their significance. It is possible that historical resources may not retain sufficient integrity to meet the criteria for listing in the National Register, but they may still be eligible for listing in the California Register.[26]

Resources that are significant, meet the age guidelines, and possess integrity will generally be considered eligible for listing in the CRHR.

HISTORIC DISTRICTS

According to National Register Bulletin 15 (NRB15), a historic district "possesses a significant concentration, linkage, or continuity of sites, buildings, structures, or objects united historically or aesthetically by plan or physical development." Bulletin 15 continues:

CONCENTRATION, LINKAGE, & CONTINUITY OF FEATURES

> "A district derives its importance from being a unified entity, even though it is often composed of a wide variety of resources. The identity of a district results from the interrelationship of its resources, which can convey a visual sense of the overall historic environment or be an arrangement of historically or functionally related properties. For example, a district can reflect one principal activity, such as a mill or a ranch, or it can encompass several interrelated activities, such as an area that includes industrial, residential, or commercial buildings, sites, structures, or objects. A district can also be a grouping of archeological sites related primarily by their common components; these types of districts often will not visually represent a specific historic environment.

SIGNIFICANCE

> "A district must be significant, as well as being an identifiable entity. It must be important for historical, architectural, archeological, engineering, or cultural values. Therefore, districts that are significant will usually meet the last portion of Criterion C plus Criterion A, Criterion B, other portions of Criterion C, or Criterion D.

TYPES OF FEATURES

> "A district can comprise both features that lack individual distinction and individually distinctive features that serve as focal points. It may even be considered eligible if all of the components lack individual distinction,

provided that the grouping achieves significance as a whole within its historic context. In either case, the majority of the components that add to the district's historic character, even if they are individually undistinguished, must possess integrity, as must the district as a whole...A district can contain buildings, structures, sites, objects, or open spaces that do not contribute to the significance of the district. The number of noncontributing properties a district can contain yet still convey its sense of time and place and historical development depends on how these properties affect the district's integrity.

GEOGRAPHICAL BOUNDARIES

A district must be a definable geographic area that can be distinguished from surrounding properties by changes such as density, scale, type, age, style of sites, buildings, structures, and objects, or by documented differences in patterns of historic development or associations. It is seldom defined, however, by the limits of current parcels of ownership, management, or planning boundaries. The boundaries must be based upon a shared relationship among the properties constituting the district.

DISCONTIGUOUS DISTRICTS

A district is usually a single geographic area of contiguous historic properties; however, a district can also be composed of two or more definable significant areas separated by non-significant areas. A discontiguous district is most appropriate where:

- Elements are spatially discrete;
- Space between the elements is not related to the significance of the district; and
- Visual continuity is not a factor in the significance."[27]

[27] U.S. Department of the Interior, National Park Service. National Register Bulletin 15: How to Apply the National Register Criteria for Evaluation, Section IV. Online at : http://www.nps.gov/nr/publications/bulletins/nrb15/nrb15_4.htm#district (Accessed: 7.10.2009).

SAN FRANCISCO LANDMARKS AND HISTORIC DISTRICTS

According to the San Francisco Planning Department:

> "The City of San Francisco maintains a list of locally designated City Landmarks and Historic Districts, similar to the National Register of Historic Places but at the local level. Landmarks can be buildings, sites, or landscape features. Districts are defined generally as an area of multiple historic resources that are contextually united. The regulations governing Landmarks, as well as the list of individual Landmarks and descriptions of each Historic District, are found in Article 10 of the Planning Code."[28]

According to San Francisco Preservation Bulletin #5, the San Francisco Landmarks Advisory Board and the Planning Commission use the National Register Criteria for evaluating potential historic properties.

HISTORICAL RESOURCE STATUS CODES

Properties included in the survey were assigned California Historic Resource Status Codes. Status codes reflect the eligibility of a resource at a specific point in time (the time the evaluation was performed) and therefore do not necessarily reflect the eligibility of a resource at a later point in time. If a resource is altered and changed in the future, it may no longer be eligible for the same historic resource designation.

New California Historical Resource Status Codes were instituted by the California State Office of Historic Preservation effective August 2003. The updated codes were used for this study. All applicable codes were assigned in order to provide as much information as possible for local planning officials.

Updated: October 2009

V. SURVEY RESULTS

INDIA BASIN SURVEY AREA

DESCRIPTION

According to the Project Description, the India Basin Shoreline Plan area, also known as Bayview Hunters Point Redevelopment Area C, encompasses:

> "…approximately 76 acres, including approximately 59.5 acres that are privately owned, 7.2 acres that are publically owned, and about 9.3 acres in public right of way…Existing land uses include residential, industrial, unimproved public shoreline open space, India Basin Shoreline Park, and vacant land. Residential uses, with some commercial uses, generally front on Innes Avenue. Industrial uses are interspersed among residential uses near the shoreline, including a boatyard on India Basin east of Innes Avenue. Activities at the boatyard are limited by tidal flows and shallow water depth. The former PG&E Hunters Point Power Plant, on a 35-acre site near Jennings Street and Hunters Point Boulevard, has been dismantled. The adjacent existing PG&E switching station is operational. A former PG&E fuel tank site is directly across Hunters Point Boulevard from the PG&E power plant site. Heron's Head Park is immediately north of the area, with industrial uses and Port of San Francisco maritime uses further north.

> "There are many vacant and underused parcels in India Basin. One of the largest vacant properties is a 13.5-acre privately owned parcel fronting the Bay northeast of Innes Avenue and bisected by Arelious Walker Drive, just north of the HPS. This site was previously referred to as the "Ferrari Site" and more recently as the "India Basin Flats." The shoreline band adjacent

to India Basin Flats site is open space owned by the San Francisco Recreation and Park Department."[29]

PREVIOUS SURVEY FINDINGS

India Basin neighborhood

Kelley & VerPlanck Historical Resources Consulting recently completed a historical resources survey of a large portion of the India Basin neighborhood for the Bayview Historical Society. The complete historical background and findings of this survey are documented in the report titled *India Basin Survey, San Francisco, California (Final Report, 1 May 2008)*.[30] The findings of this survey are summarized as follows.

Kelley & VerPlanck (K&VP) surveyed a roughly six-block area of the India Basin neighborhood including 113 single-family, industrial, maritime, and vacant properties. The boundaries of the India Basin survey area include the San Francisco Housing Authority's (SFHA) Westbrook and Hunters Point housing projects to the west and south, Earl Street to the east, and Hudson Avenue to the north. It also includes portions of two partially submerged blocks between Hudson and Galvez Avenues. (See survey area map with parcel ID numbers below).

Out of the 113 properties surveyed, K&VP identified four properties that appear to be eligible for listing on the California Register of Historical Resources: 702 Earl Street (APN: 4644/001 & 011); 900 Innes Avenue (APN: 4646/003); 911 Innes Avenue (APN: 4653/019); and 967 Innes Avenue (APN: 4653/012A). In early 2008, the Shipwright's cottage at 900 Innes Avenue became San Francisco Landmark #250. The former Albion Brewery building at 881 Innes Avenue (APN 4654/013) was found to appear eligible for listing on the National Register of Historic Places. The India Basin survey also identified a potential historic district, the India Basin Boatyards. According to the Department of Parks and Recreation District Record form for the proposed district:

[29] PBS&J for SFRA, Bayview Waterfront Project, Administrative Draft EIR – June 2009, p. II-12.
[30] Kelly and VerPlanck, Historical Resources Consulting. *India Basin Survey*, *Final Report.* Prepared for the Bayview Historical Society (1 May 2008).

> "The India Basin boat yards are located on the southern side of India Cove in the India Basin neighborhood of San Francisco. The proposed district is comprised of eight parcels within an area bounded roughly by Hunters Point Boulevard, Innes Avenue, Fitch Street and Galvez Avenue. The core of the proposed district centers on the intersection of Hudson Avenue and Griffith Street, neither of which is an officially opened street according to the Department of Public Works. The eight parcels are identified by their APN (Assessor Parcel Number): 4629A/010, 4630/002 and 006, 4645/010, 010A, and 011; and 4646/001 and 002. Although the ownership of these parcels is divided between several different owners and two boat yards have occupied the area since the 1960s, the entire survey area historically operated as a single yard (Anderson & Cristofani) before ca. 1965 and will therefore be described and evaluated as a single continuous property. The proposed district slopes gently downhill from near Innes Avenue to India Cove and extends into open water. Most of the land was historically either submerged tidelands or tidal flats that have since been filled. Remnants of piers and wood pilings extend into the shallow waters of India Cove, an area still occupied by submerged water lots and unopened 'paper' streets."[31]

Kelley & VerPlanck found that "the boat yards of India Basin appear eligible for listing in the California Register under Criteria 1 (Events) and 3 (Design/Construction)…as the last remaining historic boat yard at India Basin, the center of the bay scow building and repairing industry from the early 1870s to the mid-1930s."[32]

Pacific Gas & Electric (PG&E) Plant – Hunters Point

Blocks 4580, 4604A, 4603A and a portion of Block 4602A (Parcel ID# 1, 8, 7 and 6) are owned by PG&E and are the site of the former PG&E Hunters Point Power Plant, a

Updated: October 2009

35-acre site near Jennings Street and Hunters Point Boulevard that has been dismantled. The existing PG&E switching station is operational. A former PG&E fuel tank site is directly across Hunters Point Boulevard from the PG&E power plant site (Parcel ID # 7).

San Francisco Planning Department staff determined that the PG&E power plant building, constructed in 1929, was not a historic resource in a memorandum dated October 26, 2006. The planning department finding supported an earlier evaluation completed in September 2006 by Roland Nawi Associates and the building was demolished in 2008.[33] No other historic resources are present on the former PG&E Hunters Point Power Plant site (Parcel ID# 1, 8, 7 and 6) (see Figure 28.)

CIRCA SURVEY RESULTS

The remaining parcels within the India Basin survey area are comprised of unimproved public shoreline open space, India Basin Shoreline Park, and vacant land. No buildings or structures over 45 years old were found. This includes the following parcels, as identified in the survey map above by ID numbers: 2-5, 9-16, 17-35, 37-40, 43-45, 47, 49, 50-52. As such, no evaluation of historic resources is necessary. A survey matrix with property information and survey ID numbers keyed to the map below is located in Appendix C of this report.

[33] See: Planning Department, *Historic Resources Evaluation Response Memorandum for 1000 Evans Avenue*, October 26, 2006. Also see: Roland Nawi Associates: Preservation Consultants, PG&E Hunters Point Station P Evaluation of Eligibility, September 2006. A copy of each document is available for public review by appointment at the Planning Department as part of Case File No. 2006.1297E.

Updated: October 2009

CANDLESTICK POINT SURVEY AREA

DESCRIPTION

The Candlestick Point survey area encompasses most of the Candlestick Point part of the BVHP Plan ("Area B"), including the Candlestick Park sports stadium (formerly Monster Park), the Alice Griffith Public Housing site and Candlestick Point State Recreation Area (See survey area map with parcel ID numbers below). According to the Project Description:

"The Candlestick Point area is approximately 267 acres, including the Alice Griffith public housing site. Current land uses in the Candlestick Point area include Candlestick Park stadium, owned by the City and County and leased by the San Francisco 49ers National Football League team, and associated parking lots and access roadways. The stadium and parking lot areas are under the jurisdiction of the San Francisco Recreation and Park Department. The area includes several privately owned parcels near Gilman Avenue and Arelious Walker Drive, north of the stadium. That area is primarily vacant and used for stadium parking. A recreational vehicle park occupies a portion of the site on Gilman Avenue. The Candlestick Point area also includes the Alice Griffith public housing site, which is bounded by Gilman Avenue on its southwest, Hawes Street on the northwest, Carroll Avenue on the northeast and Arelious Walker Drive on the southeast."[34]

Please see Figure 29 for a visual overview of the Candlestick Point survey area. A survey matrix with property information and survey ID numbers keyed to the map below is located in Appendix C of this report.

Updated: October 2009

Figure 29. Candlestick Point survey area showing lot lines and area boundaries. Base map courtesy of PBS&J.

PREVIOUS SURVEY FINDINGS

Candlestick Park

In May 2007, Architectural Historian Kathryn Hayley of Jones & Stokes completed a review of Monster Park (APN: 5000 001 30), a.k.a. Candlestick Park, for its eligibility for listing in the National Register of Historic Places (NRHP) as part of the Bayview Transportation Improvements Project.[35] This evaluation determined that Monster Park, which was constructed in 1960, did not meet the criteria that would qualify it as exceptional as a property that is less than 50 years of age. The conclusions are quoted below:

> "Although Candlestick/Monster Park is a well-known building in San Francisco, California, it does not appear to meet the threshold of NRHP exceptional significance for buildings less than 50 years old (Criterion G)…Although a number of culturally important events have occurred at Candlestick Park, in comparison to [other properties that have met this criterion such as the Whitney Museum of American Art in New York City], the building, one of many sports stadiums located in the United States, does not appear to embody qualities and characteristics (outstanding cultural, engineering or architectural significance) that would allow it to meet the 'exceptional significance' threshold, and therefore requires no further formal consideration.
>
> "In addition, Monster Park has been extensively altered since its initial construction in 1960, including ongoing maintenance and upgrades, the extensive expansion and enclosure of the structure in 1970, and the recent conversion of the park to a football-only facility. Because of these

[35] For full evaluation see: Memorandum, Kathryn Hayley to Meg Scantlebury, Re: Bayview Transportation Improvements Project – Evaluation Exemption for Monster Park (APN 5000 001 30) as per Attachment 4 of the Programmatic Agreement (15 May 2007). Memorandum in Appendix B of the Final Historic Property Survey Report, Bayview Traffic Improvements Project, Caltrans District 4, San Francisco, CA (October 2007), 1-13.

> changes, Monster Park does not appear to meet the high level of integrity necessary for the property to be considered exceptionally significant under NRHP Criterion G.[36]

The report concludes with the recommendation that the property be reevaluated for NRHP eligibility when it reaches the 50-year mark (in 2010). The property has not been evaluated for California Register eligibility and has not been previously included or listed in any local survey of historic properties.

Alice Griffith Public Housing

No previous studies have evaluated Alice Griffith Public Housing for eligibility for the National, State or local registers.

CIRCA SURVEY RESULTS

All parcels along the south side of the survey area (ID# 155, 134-143, 145-147, 150-154) and the large parcel that forms the eastern boundary (ID# 112) are State and privately owned property occupied by Candlestick Point State Recreation Area. The park is minimally developed with vehicle and pedestrian access paths. No buildings or structures over 45 years old are present.

The two parcels along the west side of Jamestown Avenue are vacant parcels that border the eastern side of Bayview Park. The south parcel (ID# 144) is owned by the City's Recreation and Park Department and the north parcel (ID# 148) is privately owned. No buildings or structures over 45 years old are present.

The four blocks bounded by Egbert Avenue (NE), Donahue Street (SE), Gilman Avenue (SW) and Arelious Walker Drive (NW) are occupied by vacant land used for parking lots and the Candlestick RV Park. The Candlestick RV Park property (parcel ID # 116-127, 129-130) is comprised of a paved parking area for RV parking and a modern building that faces Gilman Avenue. A sheltered storage area is located along the Egbert Avenue border. Just northwest of the RV Park are three vacant parcels (ID# 131-133) that

---

[36] Ibid, 9-10.

appear to be used for event parking. Two additional vacant parcels (ID# 114-115) and one largely open parcel (ID# 113) containing three modern storage buildings are located just northeast of this parking area. Across Aurelious Walker Drive, an additional parcel (ID# 111) is cleared and used for event parking. No buildings or structures over 45 years old are present.

The remaining parcels comprise Candlestick Park (ID# 149) and Alice Griffith Public Housing (ID# 110).

Candlestick Park

It was beyond the scope of this project to conduct any additional review of the Candlestick Park stadium, however, Circa recommends that the property be reevaluated for eligibility for listing on the National Register of Historic Places once it meets the 50-year mark in 2010. Additionally, since the California Office of Historic Preservation recommends recordation of buildings 45 years old or older, Circa recommends the building be evaluated for the California Register of Historical Resources and for local listing as a San Francisco Landmark

Alice Griffith Public Housing

At the time of this evaluation the property is 47 years old. In general, in order to qualify for listing on the National or California Registers, a property must be 50 years old, meet one of the four criteria for significance and retain integrity. Unless the property demonstrates exceptional significance, a property less than 50 years old is not eligible for listing. However, the California Office of Historic Preservation recommends the recordation of properties 45 years or older, recognizing that there is commonly a five year lag between resource identification and the date that planning decisions are made. As such, an evaluation has been provided below.

Description

The Alice Griffith Housing Development sits on a single large parcel in the Bayview-Hunters Point neighborhood of San Francisco. Set on a rise overlooking Monster Park to the south, the development is generally bound by Carroll Avenue (north), Arelious Walker Drive (east), Gilman Avenue (south) and Hawes Street (west). A guard kiosk secures the property's Fitzgerald Avenue entrance at Cameron Way. The housing stock consists of 33 apartment buildings, constructed from standardized plans using five slightly different building types. The six (6) Type A buildings and eight (8) Type B buildings contain six (6) apartments each, the four (4) Type C buildings and seven (7) Type E buildings have ten (10) apartments per building, and the eight (8) Type D buildings each contain seven (7) apartments. The buildings line a simple circulation network of streets including Double Rock Street, a cul-de-sac named after the geologic formation visible at low tide nearby. (This is also the name of the war housing development that occupied this site during WWII – see *Bayview Waterfront Plan Historic Resources Evaluation, Volume I: Historic Context Statement*).

Rectangular in plan, the concrete buildings are topped by a side-facing, gravel covered gable roof and exterior walls are clad primarily in stucco with board and batten panels surrounding the second-story windows. The number of windows per building varies by building type, though the metal sash windows are consistent throughout. These are three-lite vertical windows with central awning sash at the ground level and two-lite windows at the upper level with fixed transom and lower awning sash. Each building has a concrete front walk and entry step and a rear, shared rectangular concrete patio with concrete planters and clotheslines. Simple flat roofs project over both the front and rear entry porches. A community garden and basketball court are located along the east side of the development, and the modern Alice Griffith Opportunity Center building is located at the southeast corner, adjacent to the development's Griffith Street entrance. The housing development was completed in 1962 and rehabilitated in 1980. Common alterations include installation of metal screen doors and window bars at the first floor windows. Some window and door openings have been covered with plywood panels. Though most of the original concrete planters are still extant, the original plantings have not been maintained. The property appears to be in good to fair condition.

Updated: October 2009

Evaluation

Under Criterion A/1, archival research yielded no information indicating that Alice Griffith Housing complex is strongly associated with an event or pattern of events important to local or regional history, or to the cultural heritage of California or the United States. The development was one of a number of housing developments constructed as part of the San Francisco Housing Authority's (SFHA) post WWII campaign to replace temporary war housing and address the need for public housing in the city. Though associated with this pattern of events, "mere association with historic events or trends is not enough to qualify under this criterion, and the property's specific association must be considered important as well". Since the property is not notably associated with the SFHA's building campaign or public housing in San Francisco, the development does not appear to be eligible for listing on the NRHP/CRHR under Criterion A/1.

The subject property also does not appear to be eligible under Criterion B/2 for association with persons significant in local, state or national history. Although later named for former SFHA board member Alice Griffith, the housing equality advocate died in 1959 and therefore has no direct involvement with the housing development. The property is not directly associated with Griffith's productive life and is therefore not eligible for listing on the NRHP/CRHR under Criterion B/2.

The subject property does not notably embody the distinctive characteristics of a type, period, region or method of construction, or represent the work of a master or possess high artistic values. While representative of its period, the overall architectural design displays no exceptional design characteristics. Further, though the property was designed by notable architects (Hertzka & Knowles and H.C. Baumann Associated Architects) and a well-known landscape architect (Douglas Bayliss), it is not particularly illustrative of any one of their characteristic design styles. A property is not eligible as the work of a master simply because it was designed by a prominent architect. Therefore, the subject property does not appear to be eligible for listing on the NRHP/CRHR under Criterion C/3.

Archival research provided no indication that the property has the potential to yield information important to prehistory or history, therefore the property does not appear to be eligible for the NRHP/CRHR under Criterion D/4.

Additionally, for the reasons noted above, the Alice Griffith Housing site does not appear to be eligible for local listing as a San Francisco Landmark or historic district.

HUNTERS POINT SHIP YARD SURVEY AREA

The Hunters Point Shipyard is comprised of approximately 420 acres of dry land and contains many buildings and structures associated with ship repair including, berths, piers, dry docks, warehouses, industrial shops, administrative buildings, and other structures, largely from the World War II and immediate post-war eras. Several former Navy buildings are currently leased and occupied as artist studios. The Hunters Point Shipyard survey area primarily consists of Navy Parcels B, C, D and E; most of the residential, commercial and administrative buildings on Parcel A were demolished in 2006-2007. Parcel F is comprised of approximately 440 acres of submerged lands in the San Francisco Bay surrounding the central portion of HPS to the north, east, and south.[37] Figure 30 below illustrates the existing Navy parcels and survey boundaries. The entire Hunters Point Shipyard survey area is currently under the jurisdiction of the U.S. Navy.[38]

PREVIOUS EVALUATIONS

Two prior historic resource evaluation reports for HPS have been completed since it was decommissioned in the 1970s. Bonnie L. Baumberg, of Urban Programmers in San Jose, prepared an historic context and evaluation document for the Navy in 1988. The report, entitled, *Historical Overview of Hunters Point Annex, Treasure Island Naval Base and Descriptions of Properties that Appear to Qualify for Listing in the National Register of Historic Places*, included a historical overview and evaluation forms (DPR 523 forms)

[37] Portions of Parcel F in HPS Phase II are proposed for water-related uses.

Clement Designs, 2009

HUNTERS POINT SHIPYARD HISTORIC SURVEY AREA

FIGURE 30

Figure 30. Map of the Hunters Point Shipyard survey boundaries. Map courtesy of PBS&J.

for buildings and structures that appeared to qualify for listing in the National Register. That report found that the following four properties were eligible for listing on the NRHP:

1. Dry Dock #4
2. Building 253, the Ordinance and Optical Building
3. 450-Ton Bridge Crane
4. The “Hunters Point Commercial Dry Docks Historic District,” which included Dry Dock No. 2; Dry Dock No. 3; remnants of Dry Dock No. 1, Pumphouse No. 2 (Building 205); Pumphouse No. 3 (Building 140); a Paint and Tool building (Building 207); a gatehouse (building 204); and the seawall and wharves in the area. Two non-contributing elements were included within the boundaries of this district: a Tool Room (Building 208) and a Shop Building (Building 141).

The report further concluded that no other buildings or structures at HPS qualified for listing on the NRHP.

In a June 1993 response letter to Louis S. Wall of the Naval Facilities Engineering Command in San Bruno, California, Steade R. Craigo, Deputy State Historic Preservation Officer, concurred with the above historic resources survey findings that Dry Docks 2, 3 and 4; Pumphouses No. 2 (Building 205) and 3 (Building 140) and their respective pumping machinery; gatehouse Building 204; wharves; the site of the western tip of Dry Dock No.1; Paint and Tool building (Building 207); and Building 253 were eligible for inclusion on the NRHP as members of a historic district. The letter states that:

> “Each of these resources are significant reminders of the historic function of Hunters Point during its period of significance as both a private and military shipbuilding and dry dock facility. Dry Docks No. 2 and 3 and their respective structures have been suggested as a potential district apart from Dry Dock 4 and Building 253. This is because of the association of

> Dry Docks 2 and 3 with the commercial dry docking enterprises that arose [in that area] in 1866 (when Dry Dock No.1 was constructed) to 1940. This seems appropriate since Dry Dock No.4 and Building # 253 are more closely associated with [the World War II-era function of Hunters Point under the command of the U. S. Navy]."[39]

The letter also upheld the findings that Buildings 208 and 141 were not eligible for listing on the NRHP.

In September 1997, JRP Historical Consulting Services completed an updated report entitled, *Historic Context and Inventory and Evaluation of Buildings and Structures: Hunters Point Shipyard, San Francisco, California* for the Naval Facilities Engineering command in San Bruno, California. This report provided the following conclusion regarding properties previously found eligible for the NRHP.

1. Dry Dock #4: Dry Dock # 4 "appears to qualify for listing in the National Register [because] it was and is one of the largest structures of its type on the West Coast and made a significant contribution to the American war effort during World War II. It also retains a high degree of integrity." The California State Historic Preservation Officer (SHPO) concurred with this finding of eligibility.[40]

2. Building 253: "does not meet the criteria for listing in the National Register because it is not significant and because of modifications to it since 1988, attributable chiefly to vandalism and neglect." [The building was also not found to retain a level of significance or integrity that would make it eligible for listing on the NRHP].[41]

---

[39] Letter to Louis S. Wall of the Naval Facilities Engineering Command in San Bruno, California, from Steade R. Craigo, Deputy State Historic Preservation Officer, Re: Lease of Parcel A at the Naval Station Treasure Island Hunters Point Annex to the City of San Francisco, 16 June 1993.

[40] JRP Historical Consulting Services, *Historic Context and Inventory and Evaluation of Buildings and Structures: Hunters Point Shipyard, San Francisco, California. (*Completed for the Naval Facilities Engineering command in San Bruno, California, 1997), 3.

[41] Ibid, 4.

3. The 450-Ton Bridge Crane: "does not meet the criteria for listing on the National Register. The [SHPO] has agreed that the property does not meet the eligibility criteria for listing in the National Register because it lacks integrity." The traveling cranes were removed c.1970 and the basic bridge structure is all that remains of the original 1948 crane. In a 1993 letter to the Navy, acting SHPO Steade Craigo concurred that the structure had lost integrity and therefore did not qualify for listing in the National Register.[42]

4. The "Hunters Point Commercial Dry Docks Historic District": was found to appear eligible for listing in the NRHP with some revisions to the number of contributing buildings. JRP found that the following buildings contributed to the district: Dry Dock No. 2; Dry Dock No. 3; remnants of Dry Dock No. 1, Pump House No. 2 (Building 205); Pump House No. 3 (Building 140); a Paint and Tool building (Building 207); a gatehouse (Building 204). The seawall and wharves were found to no longer retain integrity and therefore no longer qualified as contributors to the district. It was further concluded that the remnants of Dry Dock 1 may or may not exist in the area, a fact that can only be proven by archaeological investigation, and therefore the location should be treated as an archaeologically sensitive area and potential contributing element of the historic district.

In a May 1998 letter to the Navy, the SHPO concurred with the Navy's findings that the Dry Dock 4 and the Commercial Dry Dock Historic District, which included as contributing structures Dry Dock 2, Dry Dock 3 and Buildings 140, 204, 205 and 207 appeared to qualify as eligible for inclusion in the NRHP.[43]

Currently, the following resources are listed in the Office of Historic Preservation Directory of Properties in the Historic Property Data File with the California Historical Resource Status Code of 2S2 – Individual property determined eligible for the NR by a consensus through Section 106 process and are currently listed on the CRHR:

[43] Louis S. Wall, Department of the Navy to Lee Keatinge, Advisory Council on Historic Preservation, October, 15 1998. Findings of May 29, 1998 letter from SHPO to Navy are stated in this letter.

Updated: October 2009

- Dry Docks No. 2 and No. 3 and associated wharves and seawalls;
- Pump Houses No. 2 and No. 3 (Buildings 205 and 140);
- the (potentially extant) western portion of Dry Dock 1 and;
- the Gatehouse (Building 204).

No other buildings at the Hunters Point Shipyard have been found to be eligible for listing on the NRHP. In these previous studies, however, none of the buildings at HPS have previously been evaluated for listing on the California Register of Historical Resources or for local listing.

CIRCA FINDINGS: RESOURCES PREVIOUSLY FOUND ELIGIBLE FOR NRHP

Note: See Appendix B for DPR forms and Appendix D for a survey matrix with property-specific information and CA Status codes.

Dry Dock 4

Circa concurs with the SHPO finding that Dry Dock 4 appears to qualify for individual listing in the National Register "[because] it was and is one of the largest structures of its type on the West Coast and made a significant contribution to the American war effort during World War II. It also retains a high degree of integrity." Buildings, structures and objects that have been officially determined eligible for listing on the NRHP are automatically considered eligible for listing on the California Register. As such, Dry Dock 4 qualifies as a historic resource for the purposes of CEQA.

Building 253

Circa has found that Building 253, the Optical & Ordnance Building, appears eligible as a contributor to a potential CRHR historic district. See discussion of Hunters Point Commercial Dry Dock and Shipyard Historic District below.

450-Ton Bridge Crane

Circa concurs with the SHPO finding that this crane structure does not meet the criteria for listing on the National Register because it lacks integrity. The traveling cranes were removed c.1970 and the basic bridge structure is all that remains of the original 1948 crane. Additionally, the bridge crane does not appear to have been significantly associated with people or events important to California or local history, and therefore does not appear to be eligible for listing on the CRHR (under Criteria 1 or 2) or for local listing. Because of later alterations, the bridge crane structure does not appear to qualify for listing on the CRHR (Criterion 3) or for local listing as a significant example of a type, period, or method of construction or a representative of a significant technological advance in engineering. As such, the bridge crane does not appear to qualify as a historic resource for the purposes of CEQA. However, the structure has been a prominent point of visual interest along the waterfront since it was constructed and as such may warrant special consideration in the local planning process.

Hunters Point Commercial Dry Dock and Shipyard Historic District

Overview

Hunters Point Shipyard (Shipyard) occupies the eastern end of Hunters Point Hill. What was originally a narrow, steeply sloped finger of bedrock extending into San Francisco Bay has been transformed over the years into a flat expanse of reclaimed land. Part of the reclamation was accomplished through the leveling of portions of the original landform. Today, the Shipyard covers approximately 936 acres, of which approximately 493 acres are dry land and approximately 443 acres are under water.[44] By the time the Navy closed the Shipyard in 1974, the Shipyard contained over 337 industrial buildings, 57 housing and non-industrial buildings, 24,000 linear feet of pier, wall and wharf space, 21 repair berths, 10 additional deep water berths, 6 dry docks and a 225-ton crane (modified from the former 450-ton crane.)[45] As of July 2009, only 137 buildings and structures remain extant on the shipyard property, including only five residential buildings and roughly 15 non-industrial buildings. The piers, seawalls, berths and wharves appear to be generally extant though portions have deteriorated significantly

[44] City and County of San Francisco, Planning Department, *Hunters Point Shipyard Reuse FEIR,* certified February 8, 2000, File No.1994.061E, pp. ES-1.
[45] City and County of San Francisco, Planning Department, *Hunters Point Shipyard Study Options for Future Use*, June 1974, p. 2-12.

due to neglect and exposure. The former 450-ton crane appears to be the last remaining large crane structure on the nearly 500 acres of available land.

The Shipyard has traditionally played a primary role in the development and definition of the Bayview and Hunters Point neighborhoods. In its early days as a private dry dock, it was the largest single commercial entity in the Project vicinity as well as the largest and most modern dry dock on the Pacific Coast.[46] This early enterprise represented a new era in maritime history, spanning from large wooden shipping craft to new steel-hulled vessels. After Navy acquisition in 1939, it brought national attention to the district and eventually resulted in the complete transformation of the economy and demographics of the area.

Naval interest in Hunters Point corresponded to a dramatic expansion in the size and importance of the United States Navy, as well as a general increase in the military's presence on the West Coast. Continued Pacific military campaigns (Philippine War, World War I, World War II) only emphasized the importance of West Coast military facilities. As part of this, the Navy became affiliated with the Hunters Point dry docks during this period, first as a client of the privately held shipyard then as owner of the shipyard. The continued expansion and successful operation of Naval campaigns in the Pacific Ocean was dependent on the availability of the facility's ship-servicing capacity. In 1939, when the Navy purchased Hunters Point, the facility became only the third Naval shipyard on the West Coast and the only one south of Puget Sound capable of handing modern military ships.[47] It retained this status until well after World War II when the Navy changed its policies to rely on private shipyards instead of maintaining its own facilities.

As important as Hunters Point was to the World War II Naval campaigns, it gained significance in its own right in the post-war period through its role as home to the Naval Radiological Defense Laboratory (NRDL). This facility was borne out of necessity in the

[46] "San Francisco Dry Dock: Its Location, Dimensions, Machinery, Etc.," *Daily Alta California*, April 16, 1867.
[47] Twelfth Naval District, Physical Properties Facilities and Services: Naval Activities and Principal Offices, June 1948.

latter war years and grew into a major research facility dedicated to studying the physiological impacts of radiological exposure as well as the detection of and protection from such nuclear hazards. This facility was established at Hunters Point Shipyard because of its many geographic, political and logistical advantages, and operated there from 1944 to 1969. It was one of the only facilities of its kind in the United States in either private or military control, was recognized as a leading research facility on a national scale and played a major role in every U.S. nuclear weapons test during its 25-year history.

Together, these areas of importance are reflected in the built environment. There are a small number of buildings that pre-date the Navy and comprise an already identified potential historic district near Dry Docks 2 and 3. The rest of the Shipyard building stock was historically almost evenly split between World War II era construction and post-war era construction, although recent demolitions have left more World War II structures at the expense of the post-war buildings. While not as impressive architecturally as the earlier dry dock buildings, these later military buildings and structures carried out operations critical to the United States' success during World War II. After the War, the shipyard continued to contribute to the success of military campaigns both as a shipyard as home to the Naval Radiological Defense Laboratory (NRDL, RADLAB).

District Description

The proposed Hunters Point Commercial Dry Dock and Naval Shipyard California Register Historic District is comprised of a collection of buildings, structures and objects associated with the area's transition from early commercial dry dock operation through its period of Radiological research. Hunters Point Shipyard began as the California Dry Dock Company in 1867-1868 when the first dry dock (Dry Dock #1) was cut from solid rock at the northeastern tip of Hunters Point. The dry dock facilities expanded in 1901-1903, when the newly formed San Francisco Dry Dock Company completed Buildings 204 (Gate and Pump House), 205 (Dry Dock No. 2 Pump House) and Dry Dock 2.[48] At the time it was the most modern dry dock on San Francisco Bay. Dry Dock 3 replaced

[48] Building 141, previously identified as a contributor to the potential NR district, has been demolished.

Dry Dock 1 in 1918, in response to an increase in Naval contracts.[49] Building 140 (Dry Dock No. 3 Pump House, 1918) was constructed in conjunction with this phase of development. Buildings 207 (Latrine building) and 208 (Shop Service, Tool Room and Canteen Building) were acquired with the property when the Navy took over in 1939 and were likely built c.1930. Navy records indicate that these two buildings were remodeled in 1942 and may have been moved to their current locations at that time. In 1939, in preparation for WWII, the Navy purchased the dry docks and adjacent support buildings. They then began the first direct government improvements (Building 231, 1942-1945) to expand the existing facilities. When the United States entered WWII in 1941, the Navy dramatically increased construction at Hunters Point to create a high tech shipyard capable of assisting with the maintenance and repair of the Pacific fleet.

The Historic District encompasses a range of buildings from each of the three primary periods of significance for Hunters Point Shipyard: early dry docks, Navy use during WWII, and radiological research in the WWII and post-WWII periods. This is represented by the early dry dock facilities (the previously identified Hunters Point Commercial Dry Dock District), the first building built by the Navy in preparation for WWII (Building 231, completed 1942), buildings important to the functioning of a high-tech mid-century Naval facility (the Optical, Electronics and Ordnance Building (Building 253, completed 1947), the original Shipfitters Shop (Building 211, completed 1942), and an air raid shelter (Building 224, completed 1944), later used for NRDL purposes. Buildings 224 and 253 were also utilized for radiological work at Hunters Point Shipyard in the post-war period. In addition, the chosen boundaries include relevant site features such as rail spurs, crane ways, light standards, bollards, dry dock pumping equipment and other built-ins, fencing and wharves. The remaining buildings (Buildings 214, 218 and 219) within the boundaries of the proposed historic district did not rise to a level of associative or architectural significance to qualify for inclusion.

[49] Dry Dock 3 was partially funded by the Navy to support the ever-increasing size of Naval vessels. This was done as a stop-gap measure while the Navy studied locations in the vicinity upon which to construct their own ship repair facilities.

Updated: October 2009

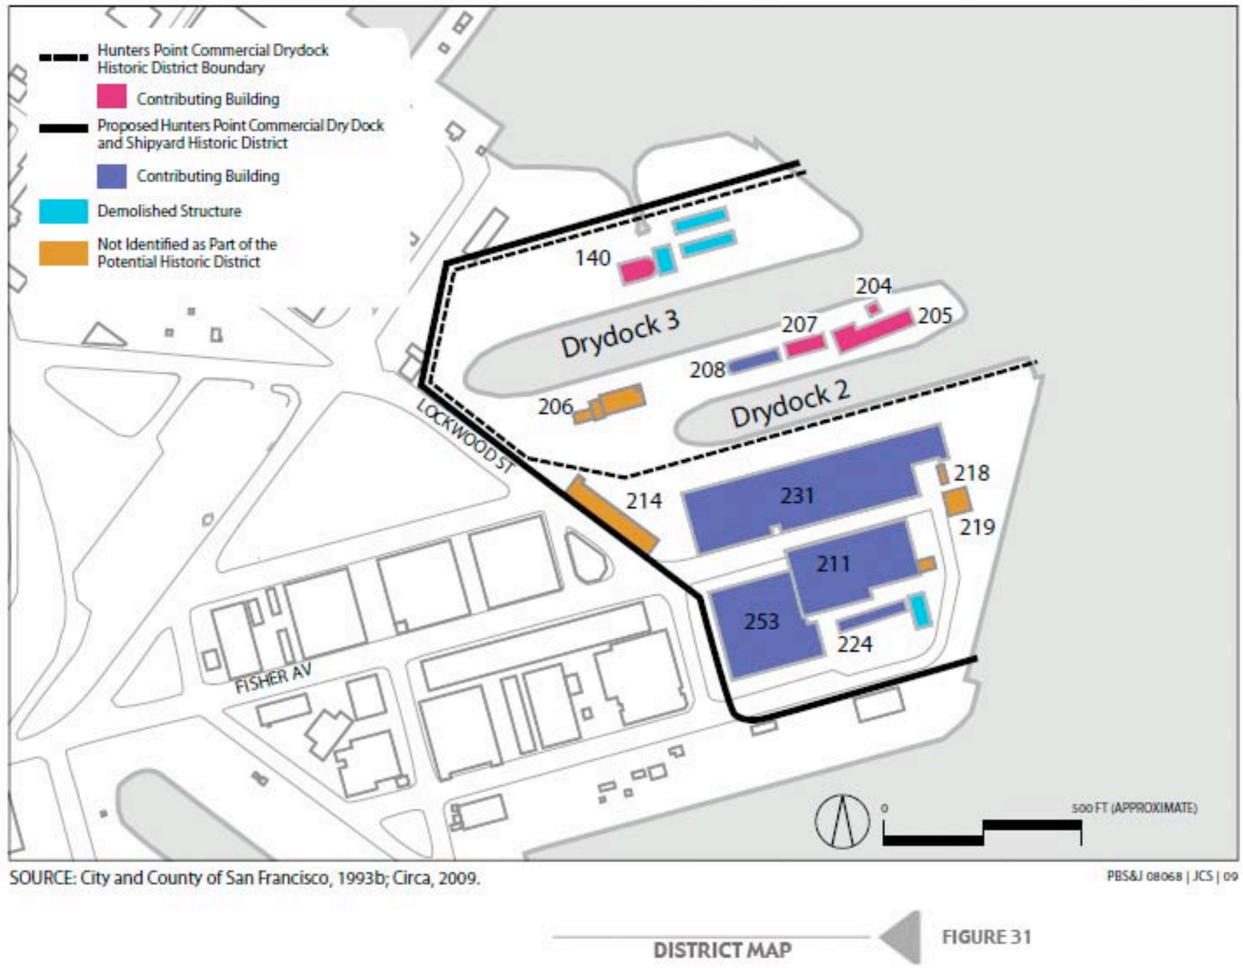

Figure 31. Map of the Hunters Point Shipyard Historic District boundaries. Map courtesy of PBS&J.

Boundary Justification

The proposed district is a potentially California Register-eligible district that circumscribes a previously identified, potentially eligible National Register Historic District (The Hunters Point Commercial Dry Docks Historic District). The boundaries of the new proposed California Register district encompass contributing buildings and structures determined in previous evaluations to be eligible for the National Register of Historic Places (Dry Dock 2, Dry Dock 3, Buildings 140, 204, 205, and 207) as a historic district under Criteria A and C. This eligibility was confirmed by the California State Historic Preservation Office (SHPO) and is therefore automatically considered as an eligible district for the California Register.

Updated: October 2009

This evaluation proposes to extend the existing National/California Register eligible district boundaries to include contributing buildings and site features constructed by the Navy in both the WWII and post-WWII periods that are significant under Criterion 1 and 3, therefore creating a larger California Register eligible historic district comprised of both NRHP eligible and CRHR eligible resources. The potential CRHR-eligible district possesses a significant concentration of buildings, structures and objects that together convey a visual sense of the overall historic environment that existed at the shipyard throughout the period of significance and includes representative buildings from all phases of development.

Period of Significance

The Period of Significance for the proposed expanded district is from 1903, the date of completion of the oldest extant buildings and structures at the Shipyard (Dry Dock 2, Buildings 204 and 205), through 1969, the year NRDL was decommissioned. Throughout this period, the proposed Hunters Point Commercial Dry Dock and Shipyard Historic District represents early commercial dry docking activities, state-of-the-art ship repair facilities and activities associated with a major national research institution (NRDL).

Evaluation

The Hunters Point Shipyard has a long history that began during a period of transition between wood-hulled sailing vessels and steel-hulled motor-driven vessels and ended with modern military warcraft. It serviced private ships during the height of water shipping on San Francisco Bay as well as military ships during four major wars/conflicts (Philippine-American War, World War I, World War II and the Korean Conflict.) During this time, it also served as a major radiological research facility that was unique within the United States military. This evaluation includes buildings that individually represent these various areas of significance and collectively demonstrate the broad spectrum of historical development at the Shipyard.

Updated: October 2009

The first building built by the Navy in preparation for WWII was Building 231 (1942-1945), the Inside Machine Shop. Constructed by the San Francisco-based firm of Barrett & Hilp and situated adjacent to Dry Dock 2, the curtain-wall building was for a brief period the only major functional shop at the Shipyard as the United States headed into WWII. Building 211 was also one of the first erected by the Navy. Constructed in 1942 by Barrett & Hilp, the building was the original Shipfitters Shop and is a good representation of the typical semi-permanent, monitor-roof shop building constructed throughout the Shipyard during the WWII era. Building 224, a concrete air raid/bomb shelter building built in 1944, and later used as an annex for the Naval Radiological Defense Laboratory (NRDL, RADLAB), is a unique representative of its type at the Shipyard. The only building within the proposed district completed after WWII is the Optical, Electronics and Ordnance Building (Building 253) finished in 1947 and attached to the west elevation of Building 211. This concrete frame curtain wall building, designed for the Navy by local architect Ernest J. Kump, was a highly specific repair and research facility. Related site features associated with the district include light standards, rail spurs, crane tracks, dry dock perimeter fencing, bollards and cleats.

According to the California Office of Historic Preservation, historic districts "consist of a significant concentration or continuity of associated historical resources. [They] may be recognized and documented at the time a survey is conducted, or they may become apparent only after several survey efforts reveal the historical relationships among the individually recorded resources in a given geographic region." National Register Bulletin No. 15, *How* to *Apply the National Register Criteria for Evaluation,* states that, "A district derives its importance from being a unified entity, even though it is often composed of a wide variety of resources. The identity of a district results from the interrelationship of its resources, which can convey a visual sense of the overall historic environment or be an arrangement of historically or functionally related properties."

The potential historic district encompasses a cross section of buildings, structures and objects, varying in age and function from the early commercial dry dock operations (1903), through the Shipyard's function as a high tech naval ship repair and decontamination facility in WWII, and as a ship repair and radiological research facility in the post WWII-period (1946-1969). The industrial buildings (140, 204, 205, 207, 208, 211, 231, 224 and 253), Dry Docks (#2 and #3), and other related site features represent a microcosm of the historical development and context of the Hunters Point Shipyard. The potential district contains previously determined National Register eligible buildings (automatically listed as a district on the California Register) as well as recommended contributors to a new expanded California Register Historic District. Though the condition of the buildings ranges from good to fair, the potential district as a whole retains a high degree of integrity of location, design, setting, workmanship, materials, association and feeling.

A district can comprise both features that lack individual distinction and individually distinctive features that serve as focal points. While buildings 207, 208, 231, 211, 224 and 253 may not be individually eligible for listing on the California Register, when combined with the historic dry docks and associated buildings, the district is a physical representation of the broad history of the Hunters Point Shipyard.

Note: no buildings remain from the earliest dry dock operations within the proposed historic district boundaries. Remnants of Dry Dock 1 (1868), which was replaced by Dry Dock 3 in 1918, may or may not exist in the area with sufficient potential to yield information that make the property eligible for the National Register. That point can only be proven through subsurface investigation. Until existence of the remnants of Dry Dock 1 has been demonstrated, its location should be treated as an archaeologically sensitive area and as a potential contributing element of the district.

CIRCA FINDINGS: RESOURCES PREVIOUSLY FOUND INELIGIBLE FOR NRHP

As part of the evaluation process, Circa completed additional research and analysis on a number of the more architecturally and/or functionally notable buildings from the Pre-WWII, WWII and Post WWII eras that retained a relatively good degree of integrity in order to determine if they displayed a level of significance that would make them individually eligible for listing on the NRHP, the CRHR or for local listing. These buildings and our evaluations are discussed below.

Updated: October 2009

Note: Please see DPR Primary A forms in Appendix B for photographs and physical descriptions of the following buildings. Those buildings that lacked integrity and those that are not yet 45 years old were not recorded but are noted in the matrix of shipyard buildings found in Appendix D.

Pre-WWII Buildings[50]

Building 109

Building 109 is a one-story, Spanish Revival style building constructed on Robinson Street in 1934. Triangular in plan and set into the hillside, the building is topped by a flat roof with Spanish-tiled parapets along the primary (south) elevation. The building was originally a restaurant that the Navy later adapted for use as a police station during World War II. Building 109 does not appear to qualify for listing in the NRHP, the CRHR or for local listing because it is not strongly associated with a significant historic event or person. Though the building is the only Spanish Revival style building at the shipyard, it is not a rare or distinctive example of the style. Additionally, original architectural elements appear to have been removed and some window openings have been infilled, alterations that have resulted in a diminished degree of historic integrity. As such, the building does not appear to be individually eligible for listing on the NRHP, CRHR or local register.

WWII-era Buildings[51]

Building 101 – Main Administration Building

This two-story Main Administration Building, built in 1943, sits on a rise overlooking the shipyard's heavy industrial center (200 series buildings). The compound plan building is organized around a central core that runs east to west, with five cross wings that extend across the core from north to south, creating courtyards on either side. Fenestration

[50] Except for Building 109, all other remaining Pre-WWII buildings are contributors to the Hunters Point Commercial Dry Dock and Shipyard Historic District.
[51] For buildings 224, 231 and 211 see District evaluation above. For Dry Dock 4 see evaluation discussion above.

consists primarily of paired, one-over-one wood windows and wood shiplap siding clads the exterior wall surfaces.

The building has had few major exterior alterations but records indicate that upgrade work (new roof, exterior paint, electrical and plumbing upgrades, minor interior upgrades) was completed in 1972-1973. Building 101 was the Main Administration Building for the Hunters Point shipyard providing general administrative oversight for daily operations the base. However, Hunters Point was an annex to the Mare Island Shipyard, which was the primary administrative headquarters for the Navy in the Bay Area during WWII.

Though somewhat architecturally interesting when compared to the other administrative buildings at the shipyard, Building 101 itself does not appear to have made a significant contribution to the ship repair function at Hunters Point during or after the WWII-era. Though it was the on site headquarters for the shipyard, most operations functions were directed from Mare Island. Research does not indicate that it was directly associated with any specific events notably important in the war effort or to post-war radiological research (Criterion A/1). The building was not found to be notably associated with persons significant to National, California, or local history (Criterion B/2) and is not a distinguished example of its type, period or method of construction (Criterion C/3). Built from a standardized plan, the building is similar to hundreds of other semi-permanent buildings built on Navy bases throughout the United States. Therefore, the building does not appear to qualify for individual listing on the National, California or local registers.

Building 110 Marine Barracks

Building 110 faces Robinson Drive, just west of Building 101. Its design is evocative of the Art-Deco style, although the construction date of 1943 places the building at the latter end of that stylistic period. Rectangular in plan and topped by a flat roof, the building is constructed of reinforced concrete. Contractors Barrett & Hilp built this standard mess hall/barracks building using Bureau of Yards & Docks Drawings #184765. Minor upgrade work was completed in the galley and shower areas of the building in 1951.

Though architecturally distinctive when compared to the other barracks buildings at the shipyard, Building 110 itself does not appear to have made a significant contribution to the ship repair function at Hunters Point during or after the WWII-era (Criterion A/1). The building was not found to be notably associated with persons significant to National, California, or local history (Criterion B/2) and is not a distinguished example of its type, period or method of construction (Criterion C/3). Built from a standardized Bureau of Yards & Docks plan, the building is similar to hundreds of other semi-permanent buildings built on Navy bases throughout the United States. Therefore, the building does not appear to qualify for individual listing on the National, California or local registers.

Building 134 Outside Machine Shop

Building 134, the Outside Machine and Diesel Engine & Gun Overhaul Shop is a two-story reinforced concrete building located at the southern end of the submarine repair area of the shipyard. Likely built using a standard plan, Walter L. Huber and Edward K. Knapik were the consulting civil engineers for this building. Though functionally related to the ship repair function of the shipyard, Building 134 itself does not appear to have made an individually significant contribution to the ship repair function at Hunters Point during or after the WWII-era (Criterion A/1). The building was not found to be notably associated with persons significant to National, California, or local history (Criterion B/2) and is not a distinguished example of its type, period or method of construction. Though Walter L. Huber was a noted local engineer, the building was likely built using standard plans and does not represent the work of a master or possess high artistic value. (Criterion C/3). Therefore, the building does not appear to qualify for individual listing on the National, California or local registers.

Building 214 Administration Building

Building 214, originally two separate buildings housing an administration building and a cafeteria, later functioned as an accounting office and a credit union. This two-story building was adapted from standard Bureau of Yards and Docks plans and is similar in design to Building 215, the fire station. Plan drawings in the Navy's archives indicate that Barrett & Hilp (contractors) designed a central addition to connect the existing

Administration and existing cafeteria buildings in 1942. Various interior alterations were also made at that time.[52]

Building 214 itself does not appear to have made a significant contribution to the ship repair function at Hunters Point during or after the WWII-era (Criterion A/1). The building was not found to be notably associated with persons significant to National, California, or local history (Criterion B/2) and is not a distinguished example of its type, period or method of construction (Criterion C/3). Built from a standardized Bureau of Yards & Docks plan, the building is similar to other semi-permanent buildings built on Navy bases throughout the United States during the WWII-era. Therefore, the building does not appear to qualify for individual listing on the National, California or local registers.

Building 215 HPSY Fire Station

Building 215 was constructed in 1942 to serve as the fire station for the base, a function that continues to this day. The second story addition was added shortly after construction and the building appears to be in good condition.

Building 215 itself does not appear to have made a significant contribution to the ship repair function at Hunters Point during or after the WWII-era (Criterion A/1). The building was not found to be notably associated with persons significant to National, California, or local history (Criterion B/2) and is not a distinguished example of its type, period or method of construction (Criterion C/3). Built from a standardized Bureau of Yards & Docks plan, the building is similar to other semi-permanent buildings built on Navy bases throughout the United States during the WWII-era. Therefore, the building does not appear to qualify for individual listing on the National, California or local registers.

Building 351/351A Electronics Shop

Building 351 is a reinforced concrete industrial building constructed in 1945 and enlarged, with the addition of Building 351A, in 1960. Building 351 is a three-story, rectangular plan building with a flat roof and a tall freight elevator tower at the northwest

[52] See Drawing nos.110457-110461 on microfiche at Treasure Island Navy BRAC office.

corner. Bands of concrete spandrels and continuous steel sash glazing stretch around the second and third stories of the north, west (front) and south elevations. The corner tower is given a vertical emphasis with the use of both projecting and incised decorative vertical bands and two, tall window openings with multi-pane steel sash windows. The vertical emphasis of the tower, enhanced by the raised, fluted vertical bands on either side of the tower, lend a slightly Art Deco feel to the building.

Structural engineer W.P. Day, a structural engineer from San Francisco who was primarily involved in bridge design during much of the 20th century, designed building 351. This building was originally planned to serve as the Ordnance and Optical Shops (prior to the construction of Building 253), but was never used for this purpose due to inadequacies in design resulting from miscommunication among Navy personnel.[53] Records indicate that the building was used primarily as the Electronics Shop after the war and as NRDL Annex E from the late 1940s to the early 1950s.

Though somewhat architecturally distinctive when compared to the other shops buildings at the shipyard, Building 351/351A itself does not appear to have made a significant contribution to the ship repair function at Hunters Point during or after the WWII-era (Criterion A/1). The building was not found to be notably associated with persons significant to National, California, or local history (Criterion B/2) and is not a distinguished example of its type, period or method of construction (Criterion C/3). The building also does not appear to be a significant example of engineering design by W. P. Day, who was known primarily for his work in bridge design. Therefore, the building does not appear to qualify for individual listing on the National, California or local registers.

Buildings 400, 404, 405, 406 and 407 – Supply Storehouses

Buildings 400, 404, 405, 406 and 407 are identical "Supply Storehouses," built in two rows, facing one another on "H" Street in the southern industrial area of the shipyard. All are rectangular and comprised of three identical sections with slight variations. Each

[53] JRP, DPR series form for Building 351/351A, p. 3 of 4.

section is a one-story, wood frame storehouse with monitor, sided in wood shiplap siding. Sliding industrial doors constructed with diagonal wood boards are located beneath each monitor, at either end of each building. Concrete and wood loading platforms attach to the buildings' north elevations, between the building and the adjacent rail spur.

Buildings 400, 404, 405, 406 and 407 do not appear to have made a significant contribution to the ship repair function at Hunters Point during or after the WWII-era (Criterion A/1). The buildings were not found to be notably associated with persons significant to National, California, or local history (Criterion B/2) and are not a distinguished example of their type, period or method of construction (Criterion C/3). Likely built from standardized Bureau of Yards & Docks plans, these supply storehouses are similar to other semi-permanent buildings built on Navy bases throughout the United States during the WWII-era. Therefore, the buildings do not appear to qualify for individual listing on the National, California or local registers.

<u>Building 505 Navy Exchange/Gymnasium</u>

Building 505, the Navy Exchange and Gymnasium, is located in the southern shipyard area. Generally U-shaped in plan, the wood frame building was originally clad in wood shiplap boards but is now covered with asbestos shingles. The various roof projections are topped with flat and shallow gabled roofs and the building is punctuated with vertical bands of awning type windows, many covered by plywood boards. Tennis courts, a basketball court and an archery field are located adjacent to the building at the north.

Navy records indicate that the building was reroofed in 1960 and exterior trim painted in 1970. Minor interior modifications were made in 1972 and 1973 including plumbing, electrical and general equipment upgrades. Navy records also indicate that Timothy Pflueger designed the barbershop and chaplain’s office portions of this otherwise standard plan building. These additions are located on the rear of the building and are architecturally compatible with the rest of the building.

Updated: October 2009

Though somewhat unique as one of the remaining personnel and social services buildings extant at the shipyard, Building 505 itself does not appear to have made a significant contribution to the ship repair function at Hunters Point during or after the WWII-era (Criterion A/1). The building was not found to be notably associated with persons significant to National, California, or local history (Criterion B/2) and is not a distinguished example of its type, period or method of construction (Criterion C/3). The involvement of notable architects and engineers in the design of military buildings during wartime was not uncommon and the portions of Building 505 designed by the firm of Timothy Pflueger are not distinguished examples of his work. Therefore, the building does not appear to qualify for individual listing on the National, California or local registers.

Building 809 Storehouse

Building 809 is a square plan, wood frame building with monitor roof and wood shiplap siding. Large, central, sliding industrial doors are located at each end, allowing for a railcar to pass through the length of the Engine House. Two, sliding, diagonal shiplap-clad industrial doors are also located on the north wall, facing the four rail spurs that run parallel to this elevation. A pair of silos, set between two temporary trailers, are set to the east of the building and a bridge crane structure and two ancillary buildings are located near the building's west end.

Though Building 809 appears to be in excellent condition and retains a high degree of integrity, individually it does not appear to have made a significant contribution to the ship repair or NRDL operations at Hunters Point during or after the WWII-era (Criterion A/1). The building was not found to be notably associated with persons significant to National, California, or local history (Criterion B/2) and is not a distinguished example of its type, period or method of construction (Criterion C/3). Likely from a standardized Bureau of Yards & Docks plan, the building is similar to hundreds of other semi-permanent buildings built on Navy bases throughout the United States. Therefore, the building does not appear to qualify for individual listing on the National, California or local registers.

Dry Docks 5, 6, and 7

Built in 1944, the chief function of Dry Docks 5, 6 and 7 was submarine repair, but it was also capable of housing destroyers and other relatively small vessels. Each dry dock is 420 feet by 60 feet, with a gate that is hinged at the bottom that flaps down to allow the vessel to enter. They were dewatered by four 20,000-gallons per minute (gpm) pumps. Two pumps were located at each side of the Bay end of the docks. Dry Docks 5, 6 (and possibly) 7 were used for decontamination of ships from OPERATION CROSSROADS and submarine repair (NAVSEA). Railroad spur lines run the length of each dock projection.

These Dry Docks do not appear to have achieved national, state or local significance for their role in submarine repair during the WWII-era (Criterion A/1) or as distinguished examples of naval engineering (CriterionC/3). The primary responsibility for submarine repair during the war was assigned to Mare Island and the submarine function at Hunters Point, by contrast, was relatively insignificant. As such, Dry docks 5, 6, and 7 do not appear eligible for listing on the NRHP, CRHR or for local listing.

Remaining Buildings

See tables on pages 91-92 below for findings evaluation for remaining WWII-era buildings.

Post WWII-era Buildings[54]

Building 411 Shipfitters, Welders & Boilermakers Building

Building 411 is a large, rectangular plan, steel framed curtain wall building, completed in 1947. Essentially four to five stories in height and topped by a bi-level sawtooth roof, the building has a concrete base and exterior walls clad in corrugated transite. Bands of multi-pane, steel sash windows stretch across each elevation of the principal building. Both the north and south elevations feature four sets of massive, multi-pane glazed,

[54] For the 450-Ton Bridge Crane see findings above.

steel sliding industrial doors. The eastern additions consist of two, two-story reinforced concrete buildings with vertical elevator shafts reaching four stories. Each building is glazed on both the first and second stories with continuous bands of steel, multi-pane industrial sash windows, the upper level with operable awning sashes in each window.

Austin Willmott Earl, a San Francisco Structural Engineer designed Building 411 for the Navy and Albert Kahn & Associates Architects & Engineers, Inc. appear to have been contracted as for additional design consultation. Retained as the consulting structural engineer for a number of projects at Hunters Point Shipyard, Austin W. Earl received the Civilian Merit Award for his work during World War II for the Navy's Bureau of Yards and Docks. Earl became a recognized authority on waterfront construction and was responsible for the engineering of many industrial structures at Mare Island, Hunters Point and Port Chicago. It is unclear to what extent the firm of Albert Kahn & Associates was involved in the design of this building, however, Albert Kahn himself was not involved n the design or construction for Building 411 as he died in 1942. The architectural plans are dated 1945 and the building was not completed until 1947. Barrett & Hilp constructed the building.

The sheer size of this massive industrial building distinguishes it from other shops buildings at the shipyard, however, Building 411 itself does not appear to have made a significant contribution to the ship repair function at Hunters Point during the WWII-era as it was not completed until 1947 (Criterion A/1). The building was also not found to be notably associated with persons significant to National, California, or local history (Criterion B/2). Further, it is not a distinguished example of its type, period or method of construction as steel framed, curtain wall shop buildings were a common building type for the Navy since World War I. While notable within the shipyard setting, other examples of this type can be found within the Bay Area (Mare Island) and throughout the United States. Additionally, the building is not significant as the work of a master. Austin W. Earl served as a supervising engineer in charge of the engineering section at Mare Island Naval Shipyard during World War I, where he designed many of the original seawall and harbor installations. In the early 1920s, he was the Chief Design Engineer for Alameda County, CA, where he worked on the Posey Vehicular Tunnel (a.k.a. the

"Posey Tube") connecting Oakland and Alameda, one of the first precast concrete tunnels to be constructed. After working with a private company in Vancouver, Canada, during the 1930s, Earl and opened his own firm as a consulting civil engineer in 1940. During World War II, Earl designed wharves, piers, ammunition and fuel storage facilities and other buildings for the U.S. Navy and received a Civilian Merit Award in recognition of his services.[55] As noted above, the building was not directly associated with the architect Albert Kahn and while likely designed using architectural and design principled pioneered by Kahn, Building 411 is not an example of his work. As such the building is not significant for architecture or engineering (Criterion C/3). Therefore, the building does not appear to qualify for individual listing on the National, California or local registers.

Building 521 – Power Plant, South Area

Building 521 is a reinforced concrete and steel building in the south shipyard area with a rectangular plan and a flat roof. A full-height water tank with metal stairs and bi-level walkways is attached to the north elevation and two metal smokestacks pierce the roof to the south. Both the east and west elevations feature three large, vertical stacks of multi-pane steel sash windows and each end has a wall of fixed, square, 25-lite windows arranged in a six-by-six block.

Built by Barnes Construction Company, Building 521 was completed in 1948 and appears to have been built from a standard plan. It is one of two suspected sites of fuel oil burning from three OPERATION CROSSROADS target ships. The power plant building itself does not appear to have made a significant contribution to the ship repair function at Hunters Point (Criterion A/1). The building was not found to be notably associated with persons significant to National, California, or local history (Criterion B/2) and is a typical utility building and not a distinguished example of its type, period or method of construction (Criterion C/3). Therefore, the building does not appear to qualify for individual listing on the National, California or local registers.

Updated: October 2009

Buildings 707 - Animal Hospital and waste disposal

Building 707 is a one-story, stucco clad, wood frame structure with a flat roof and irregular plan. It is located along the western edge of the shipyard in what is known as the "707 triangle".

From the beginning, NRDL occupied many buildings at the shipyard but in 1955, most of the 600 staff members moved into Building 815, which had been specifically design and built for NRDL activities and came to be known as the RADLAB. Building 707 was used as a storage and disposal facility for radioactive waste processing in the 1940s and 1950s. Animal studies were also a large component of NRDL research at the shipyard as animals were used as human substitutes for hazardous materials exposure experiments. Animals were raised and kept on site and Building 707 was used as an animal hospital and animal colony. While Building 707 is associated with the activities of NRDL at Hunters Point Shipyard, it was used for only one aspect of the research and did not house active test subjects; special rooms in Building 815 were designated for this purpose. As such, the building does not represent the depth of work completed at HPS by the nationally recognized NRDL and is not significant under Criterion A/1.

The building was not found to be notably associated with persons significant to National, California, or local history (Criterion B/2) and is not a distinguished example of its type, period or method of construction (Criterion C/3). Therefore, the building does not appear to qualify for individual listing on the National, California or local registers.

Building 709 Naval Exchange Gas Station

Building 709 is a one-story, reinforced concrete with Art Deco features. Set facing the intersection of Manseau and "I" Streets, the building has a number of large vehicular entrances, and smaller pedestrian entry openings. Any original doors and/or glazing for these openings are no longer extant and all other window and door openings are covered with plywood boards. What appears to be a decorative band of shaped metal wraps around the top of the building and two Art Deco-style pillars flank the central entrance. The metal ornament has rusted and is staining the exterior walls.

Updated: October 2009

Though architecturally distinctive when compared to the other shops buildings at the shipyard, Building 709 was completed in 1952 and does not appear to have made a significant contribution to the ship repair function at Hunters Point in the post WWII-era (Criterion A/1). The building was not found to be notably associated with persons significant to National, California, or local history (Criterion B/2) and, while interesting, is not a distinguished example of its type, period or method of construction (Criterion C/3). Furthermore, due to vandalism, removal of historic materials and exposure to the elements, this building has lost a significant amount of historic integrity. Therefore, the building does not appear to qualify for individual listing on the National, California or local registers.

Remaining Buildings

The following buildings comprise the remainder of buildings and structures extant at the Hunters Point Shipyard that are over 45 years of age. None of the buildings appear to qualify for individual listing on the NRHP, the CRHR, or for local listing. The following buildings have no known associations with events or persons important to the history of the Nation, California or the City and are not notable examples of architectural design or engineering.

Though the buildings were constructed as part of a vast support facility built to assist with the activities carried out at Mare Island and at Hunter's Point through 1974, simple association with historic events or trends is not enough, in and of itself, to qualify under Criterion A/1. Each property's specific association must also be considered important. Since none of the buildings appear to have made particularly significant contributions to the Navy's war effort or to the operations of the NRDL during that time, they don't exhibit a level of associative significance necessary for listing on the NRHP, CRHR or for local listing. From a design standpoint, the majorities of these buildings were built using standard Bureau of Yards & Docks plans or variations thereof and are similar to other WWII-era military installations located throughout the Nation. While some notable architects, engineers and contractors were involved in the design and construction of a number of buildings at the shipyard, this owes more to the fact that civilian architectural contracts were scarce during the WWII-era and military contracts abundant. Even in cases where noted architectural firms were involved in the design/construction process, it was common practice to use the many standardized Bureau of Yards & Docks plans available, adapting them to specific conditions at each base. As none of the buildings appear to be distinguished examples of their type, period or method of construction, do not represent the work of a master or possess high artistic value, they do not appear to be eligible for the NRHP, CRHR or for local listing under Criterion C/3. Further, many exhibit diminished integrity due to additions, alterations and exposure to the elements.

In general, the buildings do not qualify as contributors to a larger historic district because 1) better examples of these types of buildings are found within the proposed district, within the Bay Area, and on military bases throughout the United States; 2) inclusion of these buildings within the proposed historic district would not expand or augment the historic context or architectural value of the proposed historic district; and 3) the buildings do not retain enough integrity as a whole to justify an expansion of the proposed district.

Radiological Buildings

As discussed in Volume I: Historic Context of this document, the development and use of atomic weapons at the close of WWII had broad impacts beyond the use of weapons in Japan and in weapons testing. The military realized the immediate need of developing a facility to study the affects of atomic weapons on living organisms and military assets, as well as to develop defensive and protective measures against the effects of the weapons. In 1946, the Chief Naval Officer stipulated that a group be developed to study and advance radiological safety for the Navy; this group was first known as the Radiological Safety Section (RSS) and headquartered at Hunters Point Shipyard. The original charge of the RSS included the development of radiological detection instruments for use onboard ships and the development of methods and equipment to decontaminate ships and other equipment that had been exposed to radioactive matter. The RSS played a key role in the decontamination of OPERATION CROSSROADS ships at Hunters Point.

Updated: October 2009

By 1948, the RSS was formalized as National Radiological Defense Laboratory (NRDL) and the mission was greatly expanded with a new focus on practical and applied While NRDL activities were scattered throughout the shipyard, the headquarters for radiological study was Building 815. Many of the buildings used for NRDL purposes have been demolished in recent years as part of environmental remediation efforts. Building 815 is located just outside of the study area and was not evaluated as part of this report. However, Circa recommends that a full historic resource evaluation be completed for this building prior to any demolition proceedings as it is the best representative example to the work of the NRDL remaining at the shipyard site.

Demolished Buildings

A comparison of existing buildings with the matrix included in the 1997 Survey & Evaluation Report by JRP: Historical Resources Consulting indicates that buildings demolished since 1997 include the shipyard post office (Building 102), industrial shop buildings of various sizes, latrine buildings, a sentry house, small office/administration buildings, lab buildings, storage sheds, a service station, a particle accelerator building, an Officer's Club building, water tower, clocking stations and 44 single family residences. Much of this demolition, including the entire residential district on Parcel A, was demolished as part of Hunters Point Phase I in 2006. Many buildings have been recently demolished because they were utilized for research or decontamination purposes by the NRDL and removal was necessary as part of ongoing decontamination/environmental remediation efforts by the Navy. The following buildings were extant at the time of the initial site tour for this study on July 12, 2007 but have since been demolished: Building 365 (1951), Personnel Decontamination Center; Building 408 (1947), Furnace Shelter; Building 421 (1947), Oxygen Control Building; and Building 916 (c.1930), Dago Mary's restaurant. The most recent research trip to Hunters Point Shipyard in April 2009 indicated that portions of roadways have been removed. The extent to which remaining site features such as rail spurs, paved circulation paths, light standards and street signs have been removed since that time is unknown.

Buildings that Lack Integrity

The following buildings are small utility and storage buildings that exhibit low material integrity and were not evaluated for significance; Buildings 435, 436 and 437, equipment storage sheds; Miscellaneous sheds (Buildings C-K, C-G, C-J, C-F and C-I) near Building 229; Building 410, welder motor generator building; and Building 418, metal spray building.

Updated: October 2009

Buildings Under 45 years

The following buildings are under 45 years of age and were not evaluated for significance as part of this survey: Building 281 (1970) Electronics, Weapons, Precision Facility/Antenna Repair; Building 282 (c.1970) Antenna Abrasive Cleaning Unit; Building 360 (c.1970) Test Building; Building 381 (1985) Shock test facility, Building 383 (1985) Poseidon Shipping & Receiving, Building 384 (1986) Poseidon Engineering, Building 385 (1985) Poseidon Engineering, Building 439 (1973) Equipment Storage; Sheet Metal Shop, Building 600 (1971) Bachelor Enlisted Quarters, Building 606 (1989) Police Station, Building 821 (1965) NRDL Research X-ray Lab.

CONCLUSIONS

India Basin

A number of parcels within the India Basin survey area had recently been surveyed and evaluated by Kelley & VerPlanck: Historical Resources Consulting. The study identified four properties that appear to be eligible for listing on the California Register of Historical Resources: 702 Earl Street, 900 Innes Avenue[56], 911 Innes, and 967 Innes Avenue. The former Albion Brewery building at 881 Innes Avenue was found to appear eligible for listing on the National Register of Historic Places. The India Basin survey also identified a potential California Register-eligible historic district, the India Basin Boatyards.

Also located within the India Basin survey area boundaries is the site of the former PG&E plant. This building, constructed in 1929, was determined not to be a historic resource by the San Francisco Planning Department staff in 2006 and the building demolished in 2008. The remaining parcels within the India Basin survey area are comprised of unimproved public shoreline open space, India Basin Shoreline Park, and vacant land. No other buildings or structures over 45 years old were identified.

[56] In early 2008, the Shipwright's cottage at 900 Innes Avenue became San Francisco Landmark #250.

Updated: October 2009

Candlestick Point/Alice Griffith Survey Area

The Candlestick Point survey area encompasses most of the Candlestick Point part of the BVHP Plan ("Area B"), including the Candlestick Park sports stadium (formerly Monster Park), the Alice Griffith Public Housing site and Candlestick Point State Recreation Area. Circa evaluated the Alice Griffith Housing site and found it ineligible for listing on the NRHP, the CRHR or as a local landmark. With exception of Candlestick Park stadium, no other resources over 45 years of age exist within the survey area.

Jones & Stokes completed a recent evaluation of Candlestick Park sports stadium and found the property to be ineligible for listing on the NRHP. The property has not been evaluated for California Register eligibility and has not been previously included or listed in any local survey of historic properties. It was beyond the scope of this project to conduct any additional review of the Candlestick Park stadium, however, Circa recommends that the property be evaluated for eligibility for listing on the California Register of Historical Resources and for local listing.

Hunters Point Shipyard Survey Area

In 1997, an inventory and evaluation of buildings and structures at Hunters Point Shipyard identified approximately 225 extant buildings and structures. All buildings on Parcel A, with exception of Buildings 101 and 110, were demolished in 2006-2007 as part of Hunters Point Shipyard Phase I. In July 2007, Circa: Historic Property Development began work on the development of a historic context and historic resources survey and inventory of extant buildings and structures at the Hunters Point Shipyard. A total of 134 buildings and structures were identified as existing properties at the shipyard in 2007. Since that time four buildings are known to have been demolished and a total of 130 buildings and structures were known to be extant at the conclusion of Circa's evaluation work in April 2009. Out of this total, a potential California Register eligible historic district was identified that contains containing five buildings and two structures previously determined eligible for the National Register of Historic Places (NRHP), as well as four additional buildings previously unevaluated for listing on the California Register of Historical Resources (CRHR). The proposed Hunters Point

Updated: October 2009

Commercial Dry Dock and Naval Shipyard Historic District is comprised of the following resources:

- Dry Dock 2
- Dry Dock 3
- Building 140 (Dry Dock No. 3 Pump House)
- Buildings 204 (Gate and Pump House)
- 205 (Dry Dock No. 2 Pump House)
- Buildings 207 (Latrine building)
- 208 (Shop Service, Tool Room and Canteen Building)
- Building 211 (Shipfitters/Electronics Shop)
- Building 231 (Inside Machine Shop)
- Building 253 (Optical, Electronics and Ordnance Building)
- Building 224 (air raid shelter, NRDL Annex)

In addition, Circa found that Dry Dock 4 retained a level of integrity enabling it to remain eligible for individual listing on the NRHP. A summary of findings for significant buildings is provided in Table 3 on the following page.

Of the 121 remaining buildings, 11 were less than 45 years old and six were found to lack integrity; these properties were not evaluated for significance. The remaining 104 buildings and four structures were evaluated for eligibility for listing at the national, state and local levels. None of the remaining buildings or structures were found to be individually eligible for listing on the NRHP, the CRHR or as San Francisco Landmarks. Further, they were not found to be eligible as contributors to a national, state or local historic district.

VI. HISTORIC RESOURCE IMPACTS AND MITIGATIONS

INTRODUCTION

This section describes the historic resources identified within the project area as described and evaluated in Sections III-V of this report, and the potential impacts on these resources that may occur as a result of the project

PUBLIC NOTICING AND COMMENTS

PUBLIC NOTICING

A Notice of Preparation (NOP) of an Environmental Impact Report (EIR) and a Notice of Public Meetings for the was issued by the Redevelopment Agency and the Planning Department of the City and County of San Francisco in August 2007. Two Public Scoping Meetings were held on Monday, September 17, 2007, at the Southeast Community Facility, located at 1800 Oakdale Avenue at Phelps Street, San Francisco, 94124 and on Tuesday, September 25, 2007, at the Earl P. Mills Community Auditorium, 100 Whitney Young Circle, San Francisco, CA 94124. The purpose of the meeting was to receive comments on the scope and content of the environmental review to be conducted on the proposed Bayview Waterfront Project.

The Bayview Waterfront Project requires numerous review and approval actions from the San Francisco Redevelopment Agency, the City and County of San Francisco, regional agencies, state agencies, and federal agencies, including:

- San Francisco Redevelopment Agency Commission
- City and County of San of San Francisco Planning Commission
- Municipal Transportation Agency
- Recreation and Park Commission
- Public Utilities Commission
- San Francisco Housing Authority

- Port Commission
- Board of Supervisors
- Regional Agencies
- State Regional Water Quality Control Board
- San Francisco Bay Conservation & Development Commission
- Association of Bay Area Governments
- State of California
- Department of Parks & Recreation
- Department of Fish & Game
- Department of Transportation
- State Lands Commission
- Department of Toxic Substances Control
- Federal Agencies
- US Navy
- US Army Corps of Engineers
- US Fish & Wildlife Service
- US Department of Housing & Urban Development

PUBLIC COMMENTS

As of the publication of this report no comments have been received regarding historic resources.

CONSISTENCY WITH APPLICABLE POLICIES, PLANS, AND REGULATIONS

In addition to the National and State laws and regulations described in Section IV of this report, the City and County of San Francisco Planning Department has a number of Plans, Policies and Regulations to address the issue of consistency when determining if a property is a historic resource and if a proposed project will have an adverse effect on that resource. These include, but are not limited to:

- Preservation Bulletin No. 11 - Historic Resource Surveys
- Preservation Bulletin No. 16 - CEQA Review Procedures for Historic Resources
- The City of San Francisco Urban Design Element
- Draft Preservation Element of the General Plan
- Articles 10 and 11 of the San Francisco Planning Code
- Chapter 31: California Environmental Quality Act Procedures And Fees of the City And County Of San Francisco Municipal Code
- Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings or The Secretary of the Interior's Standards for Rehabilitating Historic Buildings

IMPACTS AND MITIGATION MEASURES

STANDARDS OF SIGNIFICANCE

A project is considered to have a significant impact on the environment if it would cause a substantial adverse change in the significance of a listed historic resource or resource eligible for listing such that the resource would lose its state or local designation or eligibility status. When evaluating the impacts of a project that affects a broader area it is necessary to consider the impacts on: individual resources, the immediate site context of individual resources, and the broader area context of groups of resources.

For the purposes of this EIR the following thresholds were used for determining significant impacts to cultural or historic resources.

CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA)

For the purposes of CEQA, resources eligible for or listed in the California Register are, by definition "historical resources." Additionally, resources included in a local register of historical resources or deemed significant (i.e., given a Status Code of 3 through 5 in a survey meeting the applicable policy requirements from the State Office of Historic Preservation) are presumed to be historically or culturally significant for purposes of CEQA. CEQA uses a time frame of 50+ years old as a reference point for determining the need to evaluate potential impacts on historic resources (California Code of Regulations Chapter 14 s 4852).

Under CEQA, a project that results in a "substantial adverse change in the significance of a historical resource may have a significant adverse effect on the environment (Public Resources Code Section 21084.1). The PRC defines "substantial adverse change" as "demolition, destruction, relocation or alteration" activities that would impair the significance of a historical resource (PRC Section 5020.1(q) and CEQA Guidelines Section 15064.5 (b) (1).

CEQA Section 10564.5 (b) (2) also defines activities that would impair the significance of a historical resource (i.e. that alter the physical characteristics that justify or account for its inclusion in the California Register or a local register) as follows:

The significance of a historical resource is materially impaired when a project:

A. Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its inclusion in, or eligibility for inclusion in the California Register of Historic Resources; or

B. Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historic resources pursuant to Section 5020.1(k) of the Public Resources Code or its identification in an historical resources survey meeting the requirements of Section 5024.1(g) of the Public Resources Code, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or

C. Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register of Historical

Resources as determined by a lead agency for purposes of CEQA." (CEQA Guidelines Section 15064.5(b)(2)(A)(B)(C).

According to CEQA, "generally, a project that follows the Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings or The Secretary of the Interior's Standards for Rehabilitating Historic Buildings...shall be considered as mitigated to a level of less than a significant impact on the historical resource." (CEQA Guidelines Section 15064.5 (b) (3).

PROJECT AND ALTERNATIVES DESCRIPTIONS

Project as Proposed

The Bayview Waterfront Project proposes new plans for the Candlestick Point, Hunters Point Shipyard, and India Basin Shoreline areas of San Francisco and are fully described in Appendix A. The two plans, the CP-HPS Development Plan and the India Basin Plan, are designed as separate development projects.

The CP-HPS Development Plan will require the demolition of a number of buildings, structures and objects within the plan area to implement the Urban Design Plan aspect. The Plan includes the retention of the Hunters Point Commercial Dry Docks Historic District. The Plan area will be comprised of approximately 688 acres. For purposes of this report it is assumed that Candlestick Park sports stadium is not historic based on findings in the Jones & Stokes evaluation.

The India Basin Plan assumes development would occur on large parcels of land that are currently vacant or underutilized along the shoreline. When combine the parcels will be comprised of approximately 764 acres available for development. For purposes of this report it is assumed that no demolition of the identified historic resources is planned in the India Basin Plan area.

Alternatives to the Project[57]

The primary intent of the alternatives evaluation, as stated in CEQA Guidelines Section 15126.6(a), is to "describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives." Further, CEQA Guidelines Section 15126.6(b) states, "the discussion of alternatives shall focus on alternatives to the project or its location which are capable of avoiding or substantially lessening any significant effects of the project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly."

Alternative 1: No Project

Alternative 1 assumes that the buildout allowed under San Francisco Proposition G, the legislation that enabled the CP-HPS Development Plan, would not be pursued. Development regulations and zoning would revert to the regulations that were in place prior to passage of Propositions E and F and establishment of the Candlestick Point Special Use District. The Yosemite Slough bridge would not be constructed, and the circulation network would not be substantially altered. No new uses would be constructed at Candlestick Point, and the land use composition at Hunters Point Shipyard would be substantially different than under the Development Plan, with greater emphasis on retail and mixed-use development, and less emphasis on R&D uses. Development at India Basin would proceed as allowed under existing zoning and land uses controls.

Alternative 2: Project with No Yosemite Slough Bridge

The land use plan for Alternative 2 would be the same as that proposed under the BWP for CP-HPS Phase II Development Plan and India Basin Shoreline Plan. The number of housing units and buildout floor areas for non-residential uses would be the same as

[57] The following Alternatives are quoted from the Candlestick Point - Hunters Point Shipyard Phase II Administrative Draft EIR Ia - August 2009.

under the BWP. Population generated by this alternative would also be the same as for the BWP. As with the Development Plan, the Candlestick Point SRA land exchange would be pursued, resulting in a shift in open space area to Hunters Point Shipyard, as well as the proposed increase in the area of total open space available in the Development Plan area.

<u>Alternative 3: Reduced Development, S.F. 49ers Remain at Candlestick Point</u>

Alternative 3 is a reduced intensity alternative. This alternative assumes that no new non-residential growth would occur at Candlestick Point and that new residential uses would be scaled down by approximately 85 percent. Buildout at Hunters Point Shipyard would be similar to buildout proposed under the Development Plan; however, there would be an approximately 50 percent increase in housing over the levels proposed in the Development Plan (1,350 additional units). Total housing proposed under this alternative would represent about half of the units proposed under the BWP, excluding residential uses proposed in the India Basin Shoreline Plan. Consequently, the population growth anticipated under this alternative would be less than for the Development Plan. Land uses and development controls proposed in the India Basin Shoreline Plan would remain as proposed under the BWP.

This alternative assumes that the 49ers football team would continue to utilize the existing Candlestick Park stadium. The Candlestick Point SRA land exchange would also be pursued, resulting in a shift in open space area to Hunters Point Shipyard, as well as an increase in the area of total open space available in the Development Plan area. This alternative would also include installation of a bridge across Yosemite Slough and related circulation improvements.

<u>Alternative 4: Reduced Development, No Bridge</u>

Land uses proposed under Alternative 4 would be similar to those proposed under the BWP; however, proposed floor areas for most uses would be approximately 30 percent smaller at full buildout in comparison to buildout of the Development Plan. The 30 percent reduction would also apply to residential units; as a result, the population growth anticipated under this alternative would be less than for the BWP. This alternative also includes preservation of three potentially historic structures at HPS.

Similar to Alternative 2, this alternative does not include construction of a bridge over Yosemite Slough. Access between the two sites would be facilitated by a new bus rapid transit route that would travel along Carroll Avenue, Ingalls Street, Thomas Avenue, and Griffiths Street. This route would also serve as the main connector between the two sites for vehicles and pedestrians.

Alternative 4 assumes a scaled-back residential and commercial development program at India Basin, with a greater amount of open space combined with lower density and intensity development. The neighborhood retail square footage remains the same as in the India Basin Shoreline Plan.

Alternative 5: 49ers Stay at Candlestick Point, No Parks Land Exchange

Alternative 5 assumes that the 49ers football team would continue to utilize the existing Candlestick Park stadium. The total number of housing units would be the same as for the Development Plan; however, because this alternative would not implement the Candlestick Point SRA land exchange approximately 1,350 units would be shifted from Candlestick Point to Hunters Point Shipyard. Because the land exchange would not occur, the land area available for development would be smaller. As a result, densities at Candlestick Point would be higher than under the Development Plan and would include more mid-rise structures and towers.

Similar to Alternative 2, this alternative does not include construction of a bridge over Yosemite Slough. Access between the two sites would be provided via a bus rapid transit system that would travel along Carroll Avenue, Ingalls Street, Thomas Avenue, and Griffiths Street. This route would also serve as the main connector between the two sites for vehicles and pedestrians.

Land uses and development controls proposed in the India Basin Shoreline Plan would remain as proposed under the BWP.

IMPACTS AND MITIGATION ANALYSIS

With the exception of Alternative 4: *Reduced Development, No Bridge*, the Project and Alternatives 1,2,3,5, and 6 are identical regarding impacts to historic resources. The following impacts therefore apply to the Project and Alternatives 1,2,3,5, and 6 collectively.

Impact 1

As proposed, future redevelopment within the CP-HPS Development Plan area will result in the demolition of historic resources that are eligible for the California Register and are contributors to a proposed historic district. This is considered a significant Impact because the approach demolishes and materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register of Historical Resources.

Mitigation Measure 1a

Retain the historic resources identified as being eligible for the California Register and enlarge the National Register historic district to retain the district's historic integrity.

Implementation of this mitigation measure will reduce this impact to a less-than-significant level.

Mitigation Measure 1b

Rehabilitate, reuse and maintain the National Register and California Register historic resources in a manner that is consistent with the Secretary of Interior's Standards for Rehabilitation. This includes site features such as rail spurs, crane ways, light standards, bollards, dry dock pumping equipment and other built-ins, fencing and wharves that convey the district's historic significance.

Implementation of this mitigation measure will reduce this impact to a less-than-significant level.

Mitigation Measure 1c

New construction adjacent to historic resources should be designed in a manner that is consistent with the Secretary of Interior's Standards for Rehabilitation. This includes massing and scale of adjacent new construction

Implementation of this mitigation measure will reduce this impact to a less-than-significant level.

Updated: October 2009

VII. RECOMMENDATIONS

The following recommendations were developed to be consistent with applicable policies, plans, and regulations regarding the proposed Bayview Waterfront Project, specifically the CP-HPS Development Plan area where there will be a significant impact due to demolition of buildings and structures that contribute to a potential California Register historic district.

According to CEQA demolition will result in the loss of historic significance because the historical resource will be materially impaired, therefore, it will result in a significant impact.

To reduce the impact to less than significant, and thereby meet CEQA requirements, the following recommendations are presented:

1. It is recommended that Alternative 4 replace the Project and Alternatives 1,2,3,5, and 6 as part of the CP-HPS Development Plan.
2. It is recommended that Mitigation Measure 6.3-1a, b and c be adopted.
3. To avoid a significant impact in the future, Candlestick Stadium should be evaluated for the California and local register.
4. To avoid a significant impact in the future, the RADLAB should be evaluated as an individual historic resource.
5. Due to the importance of the radiological testing context, comprehensive oral histories of past employees, particularly those directly associated with the planning and testing, should be completed, professionally archived and available for research.

IX. PREPARER'S QUALIFICATIONS

SHEILA MCELROY, Principal of Circa: Historic Property Development

Architectural Historian/Historic Preservation Specialist

Exceeds Qualification for Secretary of the Interiors Standards - for Architectural History

Ms. McElroy is dedicated to historic resource preservation by facilitating the revitalization and development of historic properties and districts. She has almost 20 years of historic preservation and architectural research, management and design-related experience with profit and non-profit corporations, including eight years of experience as executive director for Main Street towns.

Her responsibilities have included historic research, adaptive re-use, streetscape analysis, design assistance, and identification of funding resources. She works closely with local community development and planning departments, and historic commissions on issues of preservation planning, consistency with the Secretary of the Interior Standards, and historic resource development on a variety of projects.

Ms. McElroy earned a Master of Science Degree in Historic Preservation from the University of Pennsylvania, Philadelphia, PA, in 1987, with a concentration in Research and Documentation.

Her Bachelor of Art Degree is from Roger Williams College, Bristol RI, (1980) which included an emphasis on Historic Preservation, American Art, and History of Architecture. Supplemental studies included those at Columbia University, with classes in American Architectural History; Hunter College, History of American Art, and Museum Studies; The Cooper Hewitt Museum, classes in American Decorative Arts; the Main Street Certification Institute, National Main Street Center (National Trust for Historic Preservation) which included competitive sessions in design, economic restructuring, organization, and promotion.

Updated: October 2009

SARAH HAHN, Architectural Historian

Qualifies under the Secretary of the Interior's Professional Qualification Standards -

Architectural History

Ms. Hahn came to Garavaglia Architecture and Circa: Historic Property Development with a broad background in historic preservation, art history, graphic and fine arts. She is an Architectural Historian with a range of experience in the field including hands-on conservation both in the U.S. and abroad, preservation planning, interpretation and education, and extensive cultural resource documentation and evaluation. Ms. Hahn's work at Garavaglia Architecture and with Circa: Historic Property Development includes historic resource evaluations, design review, historic context statements, environmental analysis, Secretary of the Interior's Standards compliance review, historic structure reports and reconnaissance and intensive level survey work. Professional affiliations include the National Trust for Historic Preservation; the Society of Architectural Historians; and the California Preservation Foundation. Ms. Hahn's educational background includes a Master of Science in Historic Preservation from the University of Oregon and a Bachelor of Science in Graphic Design and Art History from the University of Evansville, Indiana.

BECKY URBANO, Architectural Historian, Conservator

Qualifies under the Secretary of the Interior's Professional Qualification Standards -

Architectural History

Ms. Urbano is a talented architectural conservator and historian with a solid background in historic preservation, materials investigation and historic documentation. Recognized for laboratory expertise as well as research, leadership and project management skills, her experience includes architectural conservation management plans, existing condition analysis, repair recommendations and documentation, construction specifications and identification of historic resources through field surveys and archival research.

Ms. Urbano's work at Garavaglia Architecture to date has included involvement with historic structure reports and multiple historic context statements. Her thorough research capabilities have been complemented by her excellent report and writing skills. She currently manages all preservation services, including technical reports and reviews at Garavaglia Architecture, Inc.

Ms. Urbano educational background includes a Masters of Science in Historic Preservation from Columbia University and a Bachelor of Arts in Physics from Middlebury College with Departmental Honors. She meets or exceeds the Secretary of the Interior's Professional Qualifications Standards for Architectural Historians.

Historic Resource Evaluation for Candlestick Park Sports Stadium, San Francisco, CA

INTRODUCTION

Circa: Historic Property Development has prepared this Historic Resource Evaluation (HRE) for the Candlestick Park Sports Stadium, or "Candlestick Park" (Assessor's Block 5000, Lot 001) as requested by PBS&J in conjunction with the Candlestick Point – Hunters Point Shipyard Phase 2 Waterfront Project Environmental Impact Report. Jones & Stokes evaluated the subject property in May 2007 for eligibility for listing on the National Register of Historic Places (NRHP) under Criteria Consideration G, since the building was less than fifty years of age at that time[1]. For a property to be eligible for listing on the National Register under Criterion G, exceptional significance must be demonstrated. Jones & Stokes found that Candlestick Park "did not appear to meet the threshold of NRHP exceptional significance for buildings less than 50 years old."[2] The 2007 Jones & Stokes report did not evaluate the property's eligibility for listing on the California Register of Historical Resources or as a San Francisco Landmark.

Andrew Hope, Principal Architectural Historian for the Caltrans District 4 office in Sacramento, completed a second evaluation of Candlestick Park at the request of State Historic Preservation Officer (SHPO) in January 2008. Like the Jones & Stokes report, this evaluation addressed only the National Register level of significance; however, the evaluation itself was quite thorough. Hope evaluated the property according to the standard criteria and concluded that while the subject property was found to meet National Register Criterion A (for association with the introduction of major league baseball on the west coast), and B (for association with the career of Willie Mays), "it lacks integrity to its period of significance under both criteria, due to the extensive alteration of the stadium in the early 1970s."[3] In a February 2008 letter from the California Office of Historic Preservation (OHP) to Jennifer Darcangelo of Caltrans District 4 in Oakland, OHP concurred with Caltrans' findings that Candlestick Park is not eligible for the National Register of Historic Places.[4] However, that conclusion was considered as an evaluation of the stadium as a structure less than fifty years old in 2008. Note: The Caltrans evaluation findings will be treated in the manner of a peer review in the Evaluation of Significance section of this report.

Candlestick Park stadium opened on April 12, 1960 and is 50 years old this year (2010). The stadium is presently subject to an evaluation for the National Register without Criteria Consideration G for exceptional significance. For the purposes of the California Environmental Quality Act (CEQA), "historical resources" are those properties that are listed in or formally

---

[2] Jones & Stokes, *Bayview Transportation Improvements Project (BTIP) – Evaluation Exemption for Monster Park*, Memo from Kathryn Hayley to Meg Scantlebury (15 May 2007), 9.
[3] Evaluation of Candlestick Park (Monster Park) For the Bayview Transportation Improvements Project, San Francisco City and County, California, January 2008 (DPR 523 set).
[4] Susan K. Stratton (for Milford Wayne Donaldson), OHP, to Jennifer Darcangelo, Caltrans, 6 February 2008, "Re: Determinations of Eligibility for the Bayview Transportation Improvements Project in the City and County of San Francisco, CA."

determined eligible for listing in the California Register of Historical Resources, or listed in an adopted local historic register. "Historical resources" also includes resources identified as significant in an historical resource survey meeting certain criteria.[5] To meet all levels of review required for the subject property, this HRE provides an evaluation of Candlestick Park for eligibility as a historic resource on the National, State and local levels.

Methodology
Circa: Historic Property Development Principal, Sheila McElroy and Garavaglia Architecture, Inc. Architectural Historian Sarah Hahn conducted a site visit and survey of the property's interior and exterior on January 30, 2010. Mike Gay, Chief Operations Engineer at Candlestick Park, led a tour of the property; Mr. Gay has been employed at Candlestick Park for the past 31 years. During this visit, the project team documented the building's configuration, architectural features, and alterations with photographs and field notes. Mr. Gay provided information about alterations to the property and a general historical overview. Selected historic and existing conditions photographs of the property can be found throughout the body of this document. See Appendix A for additional photographs of the subject property.

The San Francisco Planning Department and Department of Building Inspection provided selected copies of the property's building permit history for review. Since alterations have been made to the building almost continuously since it was originally constructed, and hundreds of building permit documents are on file with the City, only selected permit records were reviewed. All attempts were made to identify major alteration campaigns and review related building permits to establish a general record of alterations to the property. See Appendix B for building construction chronology matrix. (Note: this matrix is not meant to represent an exhaustive list of building alterations, but provides a record of notable changes to the building over time.)

No full size sets of original drawings were available for the subject property; however, the Department of Building Inspection uncovered a limited selection of reduced (11" x 17") plan drawings in their files. The 2007 Jones & Stokes report cited the John S. Bolles Collection held in the Special Collections Department at the Harvard University Graduate School of Design, Frances Loeb Library, in Cambridge, Massachusetts. The report noted that the author had contacted the library in an attempt to attain original drawings and other records related to Bolles' work on Candlestick Park, but the collection was in an unprocessed and inaccessible state. Circa also contacted this library in January 2010 to determine the current status of the collection and found that it remains unprocessed. Therefore, this evaluation has also been completed without the information from the John S. Bolles Collection.

Circa conducted additional archival research on the subject property and the following repositories/collections were used to complete the research process (see Bibliography section for complete list of resources):

- Department of Building Inspection, San Francisco (SF)
- SF Planning Department
- San Francisco Public Library (SFPL)
    - SF History Room
        - Biographical card files, vertical files by subject
        - SF Historical Photograph Collection
    - SF Chronicle Index (microfiche), SFPL
    - SF Chronicle/Examiner (microfilm), SFPL

Physical Description

Built in 1960, Candlestick Park is a sports stadium located at 490 Jamestown Avenue in the City and County of San Francisco and is owned by the same entity. It was originally built for baseball and is currently used primarily for football. The stadium is set on an irregularly-shaped parcel bound by Giants Drive and Gilman Avenue to the north, Hunters Point Expressway to the east, and Jamestown Avenue to the south and Jamestown Avenue/Giants Drive to the west. The large parcel, composed of artificial fill, is located adjacent to a large hill at the west, and bordered by Candlestick Point State Recreation Area to the east and south.

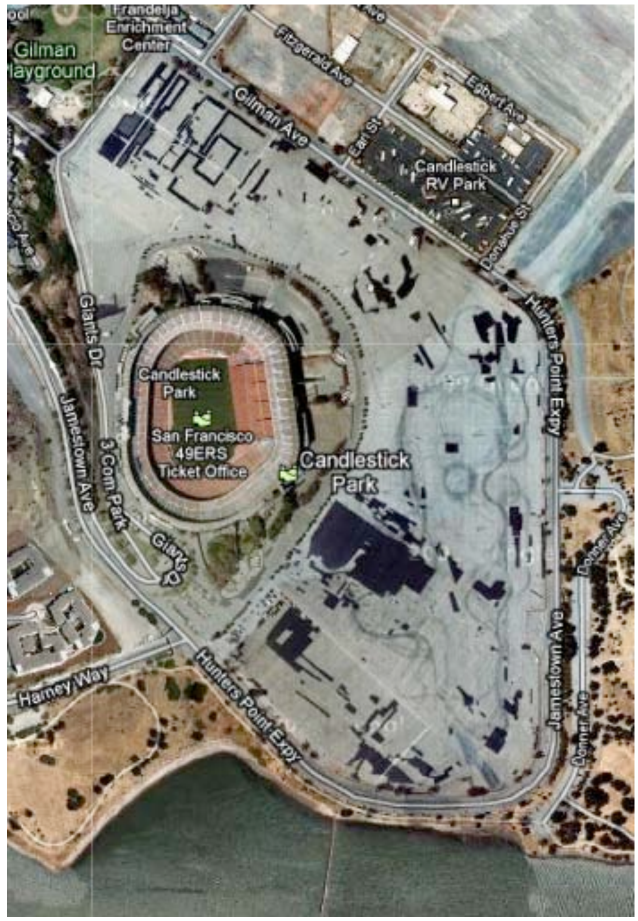

Figure 1. Aerial View, current configuration (Google maps, 2010).

The stadium is surrounded by a large, paved parking lot on the north, east, and south sides, with parking space for roughly 8,000 cars, 300 buses, 200 limousines, and 300 motor homes.[6] A chain link fence surrounds the parking lot periphery and overflow parking is located on separate parcels to the northeast. Landscaping around the stadium itself is minimal and consists primarily of clusters of trees around both the north and south (main) gates. A succession of trees defines the outside border of the main access road immediately surrounding the stadium. A guard kiosk is located at the west parking lot entrance, off Jamestown Avenue, near Gate A. Additional guard/parking attendant kiosks and accessory buildings are located at major parking lot entry points to the north, east, and south of the main parking lot.

The stadium is an enclosed, asymmetrical plan building with two main levels of seating. The upper deck seating is continuous around the perimeter of the stadium, and the lower deck has a section of retractable seating in the former right and right-center field areas. The upper deck is partially sheltered by a curved roof canopy. Curved concrete ribs support this roof and diagonal concrete braces, forming a continuous chevron-like band around the upper portion of the stadium, in turn support these ribs. An exterior concourse encircles the stadium at the upper level, between the chevron supports and the inner wall supporting the upper deck seating.[7]

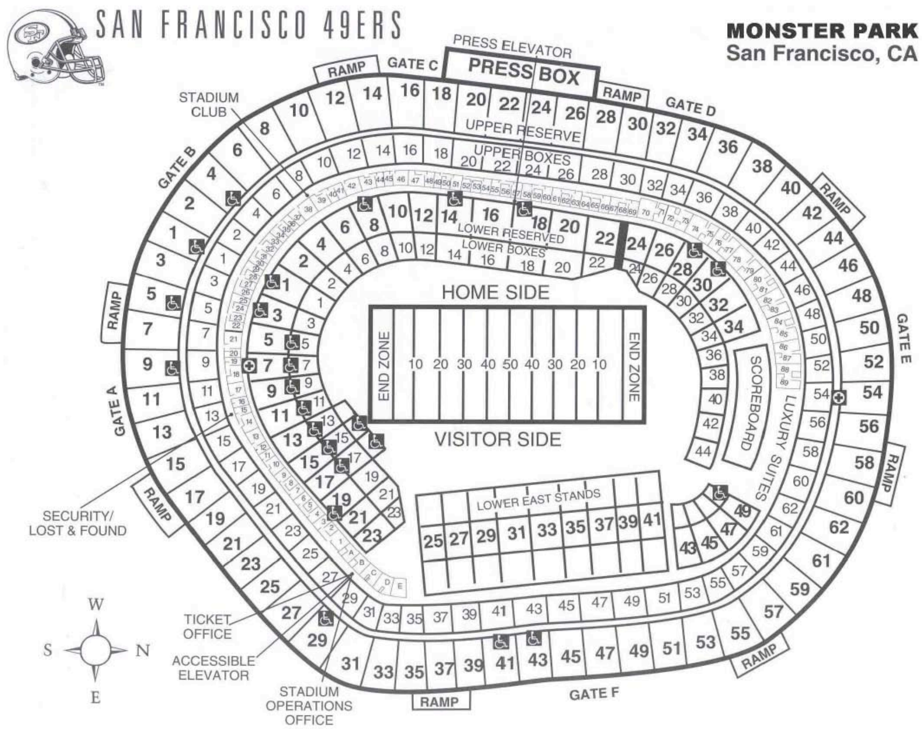

Figure 2. Candlestick Park seating map, courtesy of SF Recreation & Parks Website for Candlestick Park.

Six gates provide entrances into the stadium. The main entrances, with ticket booths and entry turnstiles, are Gates A, E, and F (south, north and east, respectively). On the south, east and north sides of the stadium, an extensive system of exterior ramps, stairs, and escalators provide access to the main entrances. Banks of lights on tall poles, standing just outside the stadium and extending above the stadium's roof, illuminate the playing field for night games.[8]

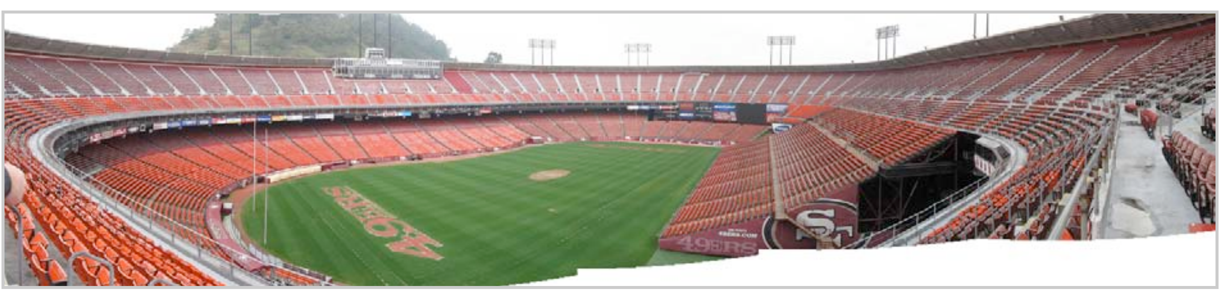

Figure 3. Interior panorama, looking northwest (Photo by Circa, January 2010).

The stadium has six escalators, three passenger elevators, and one freight elevator. There are four locker rooms, two first aid stations and 44 concession stands. The massive open-air structure is primarily comprised of reinforced concrete and steel. The current seating capacity is about 70,000. Orange plastic seats, located on multiple levels, encircle a 100-yard football field. The field is currently covered with natural grass turf. According to Chief Operations Engineer Mike Gay, Rye grass is used to cover the playing field in the winter months and Bermuda grass is used during the summer.

[8] Andrew Hope, *Evaluation of Candlestick Park, page 6 of 13*.

The west side of the stadium is the home side and the east side is for visiting fans. Enclosed suites wrap around the interior of the stadium, above the lower deck of seating, from the southeastern to the northwestern part of the building. The original baseball press box is located at the south end of the stadium in this bank of suites and has been remodeled for use by visiting press and private individuals. The current football press box is situated above the upper bank of stadium seats on the west side of the complex. The scoreboard is located at the north end of the stadium, between the upper and lower stands.

HISTORICAL BACKGROUND

Candlestick Point

The Long-billed Curlew is a large North American shorebird that was common along the shoreline of San Francisco in the early part of the 20th Century. Locally, it was known as the Candlestick Bird and it is after this waterfowl that Candlestick Point was named.[9] Prior to being known as the site of a professional sports stadium, it was a quarry, a landfill and a proposed site for a quarantine hospital, though the institution was never constructed. By the late 1950s, the area became the proposed site for San Francisco's first major league sports facility. As of this writing, the Candlestick Point vicinity is home to Candlestick Park stadium, Candlestick Point State Recreation Area, an RV park and residential buildings.

Figure 4. Seals Stadium, 1958 Photo used with permission from the San Francisco History Center, San Francisco Public Library.

Baseball in San Francisco

Baseball has always been popular in San Francisco. Through the late 19th and early 20th centuries, the City sported several semi-professional teams that competed with other teams throughout California and the West Coast. In 1930, the owner of the minor league San Francisco Seals built a baseball stadium in the Inner Mission at 16th Street and Bryant Street.[10] The Seals enjoyed a long-term following in the first half of the 20th century. However, when the time came to lure a major league baseball team to San Francisco, the need for a new stadium was apparent. The largest stadium in the City at the time, Seals Stadium could seat only 18,600 people, nowhere near the capacity of stadiums in other cities.[11] If San Francisco wanted a professional team, they needed to provide state-of-the-art facilities.

In 1954, voters approved a $5 million bond measure for the construction of a Major League Baseball stadium. This was done before any team had committed to moving to San Francisco. It was a major gamble that was soon to pay off. When Major League Baseball approved an

expansion of teams west of the Rocky Mountains, they opened the door to the eager San Francisco fans. Ultimately, Horace, Stoneham, the owner of the New York Giants, agreed to move his team from New York City, where they competed with two other major league teams, to San Francisco where they would be the City's only Major League Baseball team. At that same time, the Brooklyn Dodgers, agreed to move to Los Angeles, thus bringing their rivalry to California.

The newly renamed San Francisco Giants began their relationship with the City in 1958, playing their first two seasons at the existing Seals Stadium (demolished by 1960).[12] The new baseball stadium was finished at the end of the 1959 season and was the first stadium built for a Major League Baseball team on the West Coast, closely followed by the completion of Dodger Stadium in 1962.[13] Vice President Richard Nixon threw out the first pitch at the Giants home opening game on April 12, 1960.

Candlestick Park

Early Development

As part of a national trend starting in the 1950s, and through the 1980s, "Public subsidies to lure relocating teams to new areas became common. Municipalities usually provided large tracts of undeveloped land ...as new building sites."[14] After passage of the bond measure in 1954 and before any team had committed to moving to San Francisco then-Mayor George Christopher began investigation of possible stadium sites as early as May 1957. At that time, Charles Harney, one of San Francisco's most well known contractors, offered his property on Candlestick Point to the City for $2.7 million.[15] When studies showed that a site closer to the downtown was more expensive, the City decided to accept Harney's offer and hired him as contractor for the project. San Francisco architect John Savage Bolles was hired as the architect for the project.[16]

Charles Harney had been purchasing property in the Bayview-Hunters Point area since the 1930s and in 1953 acquired 40 acres, which brought his total land holdings in the area to 67 acres. A considerable amount of Harney's land was comprised of water lots when he purchased it, though he had filled most of it with artificial fill by the time he sold it to the City of San Francisco.[17] Harney was an avid sports fan and one of the original owners of the Oakland Raiders football team. He died in 1962. The park was initially referred to as "Harney Stadium" during the design and construction phases of development and is noted as such on the original plan drawings. However, a 1960 naming contest sponsored by the San Francisco City Recreation and Parks Commission resulted in the official name of "Candlestick Park." Harney Way, an access road that links the stadium site to U.S. 101, was named in his honor.[18]

---

[12] As soon as the season ended, the Giants left Seals Stadium to the bulldozers. Demolition began in November 1959 and was completed in early 1960, before the Giants had finished a single practice on their new field.

John S. Bolles

John S. Bolles was the architect for Candlestick Park stadium. Except where noted, the following biographical summary is quoted from the *Bayview Transportation Improvements Project-Evaluation Exemption for Monster Park*, by Jones & Stokes (15 May 2007

> In 1958, prominent Bay Area Architect John S. Bolles designed the stadium. Born in Berkley on June 25, 1905, Bolles obtained his bachelor's degree in Engineering from the University of Oklahoma in 1926, and graduated from Harvard with a Master's degree in Architecture in 1932. During the 1930s, he worked as a structural engineer in Oklahoma and as an archaeologist for the Oriental Institute of the University of Chicago on the excavations at Persepolis, the ancient capital of Persia, and for Washington's Carnegie Institute on a comprehensive study of one of the most important Mayan sites in the Yucatan.
>
> In the late 1930s, Bolles moved back to the Bay Area and joined his father's architectural firm. Father and son designed the Temple of Religion and the Christian Science Monitor building on Treasure Island for the 1939 Golden Gate International Exposition. In 1941, he passed the State of California Architectural license examination and between 1943 and 1945 Bolles served as project engineer for the Federal Public Housing Authority in San Francisco. During this time he also began collaborating with architect Joseph Francis Ward, a New Zealander, who has been associated with architect Albert Farr since 1922. Together, Bolles and Ward designed several residences in San Francisco during the 1940s and early 1950s. In 1954, Bolles began working independently on commercial, industrial, and residential buildings.[19]

Bolles was active in the local architectural community and served as Secretary of the San Francisco chapter of the American Institute of Architects (AIA) in 1945-46. He was honored as a Fellow of the AIA in 1963. The architect was also influential in public housing affairs of the 1960s and chaired San Francisco Planning and Urban Research (SPUR) committees on housing and redevelopment. He also designed a number of buildings for the San Francisco Housing Authority, including the extant high-rise senior housing complex at 2451 Sacramento Street in the Fillmore neighborhood.[20]

> A Modernist, Bolles' work often displayed a bold incorporation of modern art and sculpture. Eventually he started his own firm in San Francisco called John S. Bolles and Associates. Noteworthy designs by Bolles in San Francisco include the 1959 Ping Yuen Annex housing project, Embarcadero Park, and the Anna E. Waden Library (Bayview Branch of the San Francisco Public Library) built in 1969. He also designed a number of buildings in Northern California including the McGraw-Hill complex in Novato [most recently occupied by Birkenstock], the General Motors assembly plant in Fremont, Gallo Winery in Modesto, Downtown Plaza in Sacramento and several Macy's department stores. Additionally, Bolles designed the IBM campus in San Jose of which IBM Building 25 was found eligible for the [National Register of Historic Places, California Register of Historic Resources,] and is a San Jose Landmark candidate. While his work throughout Northern California is extensive, he is best known for designing Candlestick Park. Bolles died in 1983.[21]

[21] Jones & Stokes, *Bayview Transportation Improvements Project-Evaluation Exemption for Monster*

From opening day, Candlestick Park began to acquire a reputation for its harsh environment for both spectators and players alike. Strong gusts caused serious problems for the players during the 1961 All Star game. At that game, some of the nation's best ball players committed seven errors and the relief pitcher was nearly blown off of the mound and the stadium became known as "the cave of wind".[22]

Though Bolles did not complete an official wind study prior to construction, the architect included two notable design elements into the stadium plans in an attempt to combat the site's cool temperatures and gusty winds. The first was a heating system for the 20,000 reserved seats and the second was the rounded roof at the upper deck that was designed to act as a wind barrier. Unfortunately, both elements eventually proved to be unsuccessful.[23]

After the 1961 All Star game, a wind study of the stadium was conducted, which found that "local geographic features and the configuration of the structure itself was causing most, if not all of the negative wind effects. The study also indicated that these could have been prevented by sitting the facility a few hundred feet further to the north."[24]

Despite decades of criticism, Bolles cited Candlestick Park as his best work. A 1965 profile in the San Francisco Examiner states that Bolles "[was] proud and happy to have designed Candlestick Park…and [requested] all critics to stop worrying about it." The architect claimed, "It is not a building, but a sculpture."[25] However, the persistent wind problems and other technical issues soon prompted the architect [Bolles] and the City to plan for various modifications to the stadium in attempts to improve conditions.

John S. Bolles retired in 1978 and his eldest son, Peter P. Bolles, continued the practice, eventually moving it to Las Vegas. John Bolles died on March 5, 1983 at his home in Santa Rosa. For further discussion of Bolles career as an architect and for definition of the term "Master Architect" please see the Evaluation of Significance: Design/Construction sections of this report.

Construction History and Development

Stadium construction began in September 1958 and problems began almost immediately, including disagreements between Bolles and Harney about the facility's design and the construction schedule. Various delays, including "a San Francisco Grand Jury investigation into stadium financing and the postponed installation of the seats because of a Teamster strike," plagued the construction process. However, the stadium was finally completed at a cost of almost $15 million and the stadium opened on April 12, 1960.[26]

Figure 6. Candlestick Park under construction, 1959. Photo used with permission from the San Francisco History Center, San Francisco Public Library.

Alterations to the building have been ongoing since the building's initial construction. In 1960, the seating capacity was 43,765 and by the early 1970s, it had increased to 59,000 for baseball and 62,000 for football. Today it seats over 70,000 (a roughly 60% increase in seating capacity).[27] Originally, the grandstand of the boomerang-shaped stadium:

> … consisted of two main seating decks. The lower deck extended from behind home plate down the first base line to the right field foul pole, and down the third base line and around the left field foul pole into left center field. The upper deck extended from home plate down both the first and third base lines. A small section of bleachers was located in right center field. The field surface was bluegrass and the scoreboard was located above the hitter's backdrop in center field. Behind the bleachers on the north elevation was an employee parking area.[28]

Shortly after the stadium opened it was used for both baseball and football. In 1961, the National Football League's Oakland raiders played a season at Candlestick and Bolles began working on plans to accommodate both the SF Giants and the SF 49ers by expanding the stadium and enclosing the outfield as early as 1966.[29] As part of the redesign, attempts were made to reduce some of the wind-contributing flaws of the initial construction and the San Francisco Department of Building Inspection approved Bolles' redesign plans in 1969.[30]

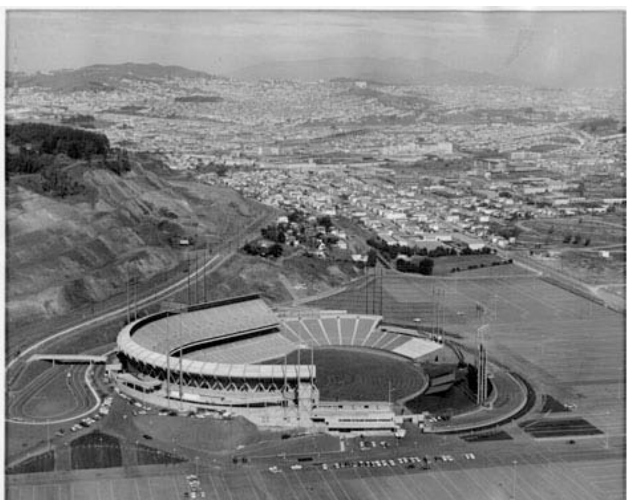

Figure 7. March 1960 view of the completed stadium, looking north. Photo used with permission from the San Francisco History Center, San Francisco Public Library.

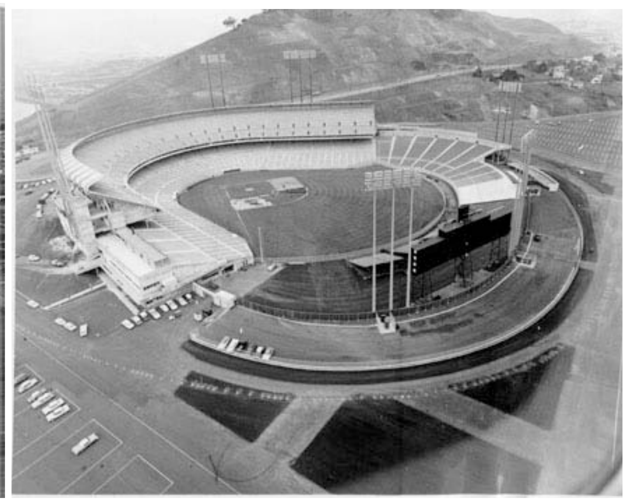

Figure 8. March 1960 view of the completed stadium, looking northwest. Photo used with permission from the San Francisco History Center, San Francisco Public Library.

The stadium was enlarged in 1970-71 to accommodate the San Francisco 49ers. This expansion cost the City $16.1 million. As part of this expansion:

> The upper deck was extended completely around the outfield and retractable seating installed in the right-center field area at the lower level. With the sidelines of the football field roughly parallel to the third base line, this retractable seating could be extended onto the outfield area for football games. The original scoreboard was removed and a new scoreboard installed between the lower and upper decks in the left-center field area.

[29] Since 1946, the 49ers had played their games in Kezar Stadium near Golden Gate Park.
[30] Jones & Stokes, *Bayview Transportation Improvements Project-Evaluation Exemption for Monster Park*, 8.

> The current exterior ramps and stairs on the north and northeast sides of the stadium were installed as part of this expansion.[31]

Additional alterations that occurred during the early 1970s renovation of the stadium include the replacement of the natural grass field with Astroturf; installation of 30,000 new plastic seats to replace the original wood seats; construction of a new main Gate A, eight new ticket booths and special gates for ticket holders; construction of two new escalator towers at Gates A and E; and construction of a new entrance at Gate F. A rubberized track surrounding the field was installed; all restrooms were rehabilitated and upgraded; the baseball press box was enlarged and rehabilitated; a new press box in the upper deck for football was constructed, and foundation work including grade increases and foundation improvements at the northern part of the stadium were completed.[32] Additional concrete ramps were also installed near Gate A at this time.[33] Evidence of the expansion of Gate A is seen in the ghosting on the concrete floor (See Appendix A for existing conditions photographs). The playing field was converted back to grass in the late 1970s.[34]

The 49ers played their first season in Candlestick Park during the 1971-1972 season, winning a NFC West title that year. At the time, the stadium could seat 62,000 for football games and 59,000 for baseball.[35] Over the next decades, the stadium continued to do double duty as home to the Giants for seven months of the year and for the 49ers for four months after. Often, during football preseason games or because of baseball playoffs, the field hosted both teams simultaneously. Maintenance and conversion of the stadium between sporting seasons was expensive, costing about $150,000 per conversion for field, locker room and amenities upgrades.[36] General alterations and routine modification were ongoing.

According to building permits, eleven new exit gates were installed at the building exterior in 1982 and steel columns were installed under the existing concrete wind canopy in 1984. A number of major alterations also began in the early 1990s and continued throughout the decade.[37]

In 1991, fifty-five suites were renovated, ADA upgrades were completed at Ramps 1-8 and eight restrooms were rehabilitated. In 1992, twenty-six additional suites were upgraded, the exterior concourse was widened, the football press box windows were altered, old concrete exit stairs on the main level were replaced with new concrete stairs and the baseball press box was again renovated. The year of 1993 saw modifications to Gates A through D; main level concourse widening; seat additions at the main level; media compound site improvements; construction of Plazas A, F and E; construction of restrooms and stairs at Gate C; and the closure of twenty-two vomitories at the upper level.[38] In 1994, the stadium was further enlarged at a cost of nearly $3 million to accommodate up to 71,000 football fans.

Figure 9. c.1980s postcard view.

As stated previously, general alterations and facilities upgrades have been ongoing since the stadium opened in 1960. Building permit, newspaper articles and an oral interview with Mike Gay, the Chief Operations Engineer at Candlestick since 1978 describe the following regular upgrades to the facility:

- Field turf changes (ongoing since the late 1970s early1980s - Bermuda grass is used in the summer and Rye grass in the winter
- Regular systems and signage upgrades
- Alterations to food/beverage vendor facilities
- Regular expansion, alteration and replacement of stadium seating
- Lighting and scoreboard upgrade and replacement
- Regular remodel/reconfiguration of suites, skyboxes, office spaces and restrooms

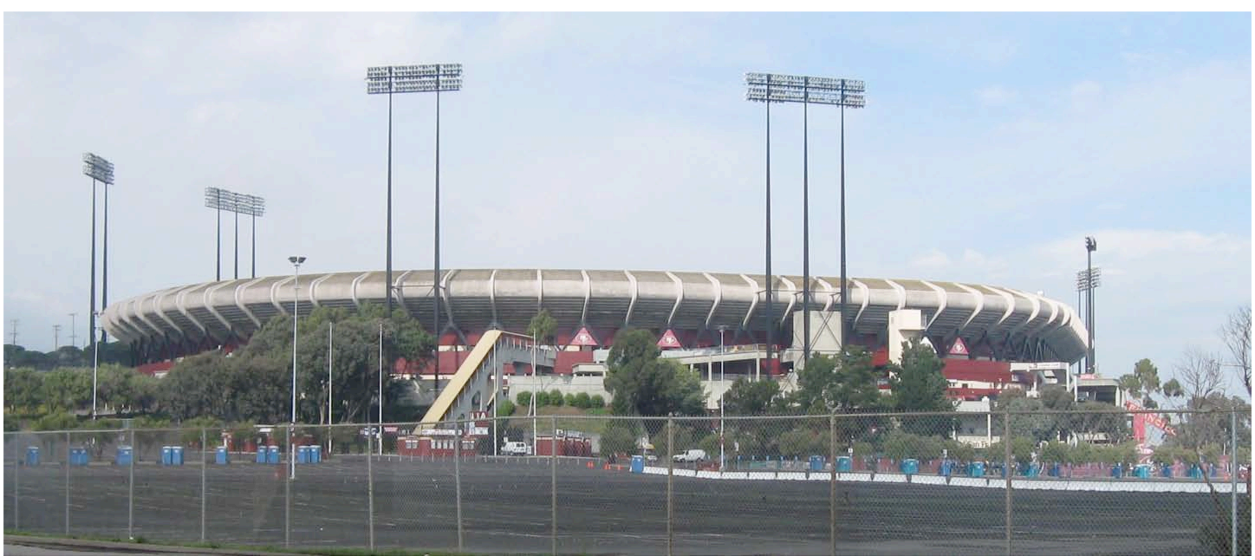

Figure 10. Current view, looking north from Hunters Point Expy. South parking lot then Gate A in foreground.

In the early 1990s, the Giants had begun to campaign for a new, baseball-only stadium closer to downtown San Francisco, though they did not leave Candlestick Park until 1999. They moved into their new stadium, now known as AT&T Park, at Mission Bay in 2000 and remain there today. The 49ers continue to play football at Candlestick Park, under a lease with the City and County of San Francisco. The Candlestick Point – Hunters Point Shipyard Phase II project under review would include a new 49ers stadium at Hunters Point Shipyard. However, the 49ers are also pursuing development of a new stadium in the City of Santa Clara.

Beyond Sports
Candlestick Park has played an important cultural role in the lives of San Franciscans beyond its nearly 40-year relationship with the Giants (1960-1999). It served as the site for numerous concerts, public events and other great sporting moments. On August 29, 1966, it hosted the Beatles last live commercial concert. It is the only stadium in the United States to host six National Football Conference championship games, three NFL Western Division Championships, 12 National Football Conference West Conference Games, two Major League Baseball World Series, and two Major League Baseball All-Star games. It was just before Game three of the 1989 World Series between the Oakland Athletics and the San Francisco Giants that the Loma Prieta earthquake was broadcast to millions of homes around the world. Remarkably, the 7.1 magnitude earthquake caused minimal damage to Candlestick Park and none of the 65,000 spectators were injured. The World Series was delayed 10 days while engineers verified the safety of the stadium.

EVALUATIVE FRAMEWORK

Evaluation Framework - National

The National Historic Preservation Act
The National Historic Preservation Act (NHPA), 16 U.S.C. §§ 470a to 470w-6, is the primary federal law governing the preservation of cultural and historic resources in the United States. The law establishes a national preservation program and a system of procedural protections that encourage the identification and protection of cultural and historic resources of national, state, tribal and local significance. Key elements of the act include:

- Establishment of a comprehensive program for identifying historic and cultural resources for listing in the National Register of Historic Places (NRHP).
- Creation of a federal-state/tribal-local partnership for implementing programs established by the act.
- Requirement that federal agencies take into consideration actions that could adversely affect historic properties listed or eligible for listing on the National Register of Historic Places, commonly known as the Section 106 Review Process.
- Establishment of the Advisory Council on Historic Preservation, which oversees federal agency responsibilities governing the Section 106 Review Process. [39]

The National Register Criteria for Evaluation
The National Register is the nation's master inventory of known historic resources. It is administered by the National Park Service (NPS) in conjunction with SHPO. The National Register includes listings of buildings, structures, sites, objects, and districts that possess historic, architectural, engineering, archaeological, or cultural significance at the national, state,

[39] National Trust for Historic Preservation website, *National Historic Preservation Act*, http://www.preservationnation.org/resources/legal-resources/understanding-preservation-law/federal-law/nhpa.html (accessed 25 February 2010).

or local level. The National Register criteria and associated definitions are outlined in National Register Bulletin Number 15: How to Apply the National Register Criteria for Evaluation. The following is a summary of Bulletin 15:

Criteria
Generally, resources (structures, sites, buildings, districts and objects) over 50 years of age can be listed in the National Register provided that they meet the evaluative criteria described below. Resources can be listed individually in the National Register or as contributors to an historic district.[40] The National Register criteria are as follows:

A. Resources that are associated with events that have made a significant contribution to the broad patterns of history;

B. Resources that are associated with the lives of persons significant in our past;

C. Resources that embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

D. Resources that have yielded or may likely yield information important in prehistory or history.

Integrity
When nominating a resource to the NRHP, one must evaluate and clearly state the significance of that resource to American history, architecture, archaeology, engineering, or culture. A resource may be considered individually eligible for listing in the NRHP if it meets one or more of the above listed criteria for significance and it possesses historic integrity. Historic properties must retain sufficient historic integrity to convey their significance.
The National Register recognizes seven aspects or qualities that define historic integrity:

- **Location**. The place where the historic property was constructed or the place where the historic event occurred.

- **Design**. The combination of elements that create the form, plan, space, structure, and style of a property.

- **Setting**. The physical environment of a historic property.

- **Materials**. The physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.

- **Workmanship**. The physical evidence of the crafts of a particular culture or people during any given period in history or prehistory.

[40] A "contributor" is a building, site, structure, or object that adds to the historic associations or historic architectural qualities for which a property is significant. The contributor was present during the period of significance, relates to the documented significance of the property, and possesses historic integrity or provides important information about a period; or the contributor independently meets National Register criteria. A "non-contributor" does not add to the historic associations or historic architectural qualities as it was not present during the period of significance; it has experienced alterations, disturbances, additions, or other changes; or it does not independently meet the National Register criteria.

- **Feeling**. A property's expression of the aesthetic or historic sense of a particular period of time.

- **Association**. The direct link between an important historic event or person and a historic property.

To retain historic integrity, a resource should possess several of the above-mentioned aspects. The retention of specific aspects of integrity is essential for a resource to convey its significance. Comparisons with similar properties should also be considered when evaluating integrity as it may be important in deciding what physical features are essential to reflect the significance of a historic context.

Evaluation Framework - California

<u>The California Environmental Quality Act (CEQA)</u>
The California Environmental Quality Act provides the legal framework by which historical resources are identified and given consideration during the planning process. The law was adopted in 1970 and incorporated in the Public Resources Code §§21000-21177. CEQA's basic functions are to:

- Inform governmental decision makers and the public about the potential significant environmental effects of proposed activities;
- Identify ways to reduce or avoid adverse impacts;
- Offer alternatives or mitigation measures when feasible; and
- Disclose to the public why a project was approved if significant environmental effects are involved.

CEQA applies to projects undertaken, funded or requiring an issuance of a permit by a public agency. The analysis of a project required by CEQA usually takes the form of an Environmental Impact Report (EIR), Environmental Impact Statement (EIS), Negative Declaration (ND), or Environmental Assessment (EA).[41]

<u>The California Register Criteria for Evaluation</u>
The California Register of Historical Resources is the official list of properties, structures, districts, and objects significant at the local, state or national level. California Register properties must have significance under one of the four following criteria and must retain enough of their historic character or appearance to be recognizable as historical resources and convey the reasons for their significance (i.e. retain integrity). The California Register utilizes the same seven aspects of integrity as the National Register. Properties that are eligible for the National Register are automatically eligible for the California Register. Properties that do not meet the threshold for the National Register may meet the California Register criteria.

1. Associated with events that have made a significant contribution to broad patterns of local or regional history, or cultural heritage of California or the United States;

2. Associated with the lives of persons important to the local, California or national history

[41] South Coast Air Quality Management District, CEQA, http://www.aqmd.gov/ceqa/ (accessed 25 February 2010).

3. Embodies the distinctive characteristics of a design-type, period, region, or method of construction, or represents the work of a master, or possesses high artistic value; or

4. Yields important information about prehistory or history of the local area, California or the nation.

In addition to meeting one or more of the above criteria, the CRHR requires that sufficient time must have passed to allow a "scholarly perspective on the events or individuals associated with the resource." Fifty years is used as a general estimate of the time needed to understand the historical importance of a resource.[42] The OHP recommends documenting, and taking into consideration in the planning process, any cultural resource that is 45 years or older.[43]

CRHR criteria are similar to National Register criteria, and are tied to CEQA, as any resource that meets the above criteria, and retains a sufficient level of historic integrity, is considered an historical resource under CEQA. Integrity is the authenticity of an historical resource's physical identity evidenced by the survival of characteristics that existed during the resource's period of significance. Historical resources eligible for listing in the California Register must meet one of the criteria of significance described above and retain enough of their historic character or appearance to be recognizable as historical resources and to convey the reasons for their significance. It is possible that historical resources may not retain sufficient integrity to meet the criteria for listing in the National Register, but they may still be eligible for listing in the California Register.[44] Resources that are significant, meet the age guidelines, and possess integrity will generally be considered eligible for listing in the CRHR.

To be listed on the California Register a formal application must be completed and sent to the State Historic Resources Commission (SHRC) for consideration. Consent of the property owner is not required, but a resource cannot be listed if the owner's objects. The SHRC can, however, formally determine a property eligible for the California Register if the resource owner objects.

Evaluation Framework - Local

City of San Francisco Criteria for Evaluation[45]
City and County of San Francisco criteria for evaluation of historic resources is based on Planning Code Section 1004(a)(1): having a special character or special historical, architectural or aesthetic interest or value.

The following information is quoted from *San Francisco Preservation Bulletin #5: Landmark and Historic District Designation Procedures*:[46]

> The City of San Francisco maintains a list of locally designated City Landmarks and Historic Districts, similar to the National Register of Historic Places but at the local level. Landmarks can be buildings, sites, or landscape features. Districts are defined generally

[42] CCR 14(11.5) §4852 (d)(2).
[43] California Office of Historic Preservation, 1995, p.2. Instructions for Recording Historical Resources. Office of Historic Preservation, Sacramento.
[44] California Office of Historic Preservation, 2006, p.2. California Register and National Register: A Comparison. Technical Assistance Series No. 6. California Department of Parks and Recreation, Sacramento. Assistance Series No. 6. California Department of Parks and Recreation, Sacramento.
[45] San Francisco Preservation Bulletin #5 is quoted here as no criteria for evaluation are presented in Article 10 of the San Francisco Planning Code. Article 10 establishes only the procedures for designation.
[46] This bulletin is available on the SF Planning Department website:
http://www.sfgov.org/site/planning_index.asp?id=24996.

as an area of multiple historic resources that are contextually united. The regulations governing Landmarks, as well as the list of individual Landmarks and descriptions of each Historic District, are found in Article 10 of the Planning Code.

A landmark may include any structure, landscape feature, site or area having historic, architectural, archaeological, cultural or aesthetic significance in the history of San Francisco, the State of California or the nation. Examples of local landmarks include such diverse structures as monumental as City Hall and the Ferry Building as well as small scaled, rare, surviving structures such as a Blacksmith Shop and a 1906 Refugee Shack.

According to San Francisco Preservation Bulletin #5, the San Francisco Landmarks Advisory Board and the Planning Commission use the National Register Criteria for evaluating potential historic properties.[47]

These criteria are quoted below for informational purposes. Properties considered historically significant are those:

Criterion A: that are associated with events that have made a significant contribution to the broad patterns of our history; or

Criterion B: that are associated with the lives of persons significant in our past; or

Criterion C: that embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

Criterion D: that have yielded, or may be likely to yield, information important in prehistory or history.[48]

EVALUATION OF SIGNIFICANCE

National Register of Historic Places (NRHP)

<u>Criterion A (Associative Value - Event)</u>:
To be considered for listing under Criterion A, a property must be associated with one or more events important within a defined historic context. Criterion A recognizes properties associated with single events, such as the founding of a town, or with a pattern of events, repeated activities, or historic trends, such as the gradual rise of a port city's prominence in trade and commerce. The event or trends, however, must clearly be important within the associated context: settlement, in the case of the town, or development of a maritime economy, in the case of the port city. Moreover, the property must have an important association with the event or historic trends, and it must retain historic integrity.[49]

---

[47] It should be noted that the San Francisco Landmarks Advisory Board was replaced by the Historic Preservation Commission in November 2008.
[48] San Francisco Preservation Bulletin No. 5: Landmark and Historic District Designation Procedures (page 6). SF Planning Department website: http://www.sfgov.org/site/planning_index.asp?id=24996.
[49] National Park Service, National Register Bulletin 15: How to Apply the National Register Criteria for Evaluation, Rebecca H. Shrimpton, ed., 2002.

The following is a direct quote from the historic resource evaluation completed by the California Office of Transportation (Caltrans) in 2008. The California Office of Historic Preservation (OHP) concurred with this finding in 2008. Circa: Historic Property Development also concurs with the finding.

> *Criterion A: Association with significant events - expansion of Major League baseball to the West Coast*
>
> Prior to the 1958 baseball season, the 16 Major League teams (eight in the American League and eight in the National League) were concentrated in the northeastern quarter of the country. The westernmost teams in 1957 were the Kansas City Athletics of the American League and the St. Louis Cardinals of the National League. The Athletics had relocated from Philadelphia only in 1955. The Brooklyn Dodgers and New York Giants, both of the National League, relocated to California prior to the start of the 1958 baseball season, with the Dodgers going to Los Angeles and the Giants to San Francisco.
>
> The Dodgers and Giants were not the first teams to move from one city to another. In addition to the previously mentioned Athletics, the Boston Braves moved to Milwaukee in 1953 and the St. Louis Browns moved to Baltimore in 1954, changing their name to the Orioles. However, the relocation of the Dodgers and Giants to the West Coast greatly expanded the geographical reach of Major League baseball. The two teams' move west reflected the rapid postwar population growth of California and other Western states, compared to the relatively slower rate of growth in the Northeast and Midwest.
>
> The Dodgers and Giants took advantage of the expanding market for professional sports in the West. The relocation of these two teams initiated the westward expansion of Major League baseball, which currently has teams in Houston, the Dallas-Fort Worth area, Denver, Phoenix, and Seattle, in addition to the California cities of San Diego, Anaheim, Los Angeles, Oakland, and San Francisco. The move to the West Coast in the late 1950s also reflected improvements in transportation, with the advent of jet travel making the nationwide distribution of sports teams feasible. In November of 1954, San Francisco's voters approved a bond measure for the construction of a baseball stadium, in the hope of enticing a major league team to move to their city. However, no team acted on this offer until 1957. Horace Stoneham, owner of the New York Giants, and Walter O'Malley, owner of the Brooklyn Dodgers, jointly considered moving to the West Coast at that time. It was thought that two teams needed to move in order to make the relocation economically feasible. The cost of travel to games would be prohibitive for a single team, with every other team in their league more than 1,500 miles away.
>
> On August 19, Stoneham announced his intention to move the Giants to San Francisco, and O'Malley announced on October 8 that the Dodgers would move to Los Angeles. The Dodgers played their home games from 1958 through 1961 at the Los Angeles Coliseum, until the completion of Dodger Stadium at Chavez Ravine in 1962. The Coliseum was built as a football stadium in the early 1920s and enlarged for the 1932 summer Olympics. Inserting a baseball diamond into the Coliseum was a difficult fit, with the left-field foul line only 250 feet from home plate to the outfield fence and the right-field line a very deep 390 feet. (Although distances to the outfield fences are not uniform among Major League ballparks, 330 feet is typical.)
>
> The Giants played their first two seasons in California at Seals Stadium, while Candlestick Park was under construction. Seals Stadium, built in 1931 at the comer of 16th and Bryant Streets, had been the home of the minor league San Francisco Seals of the Pacific Coast League. The city purchased the land at Candlestick Point in

southeastern San Francisco from Charles Harney, a contractor who also built the stadium. Construction began in September 1958 and the stadium opened on April 12, 1960. The cost of the new stadium was nearly $15 million.

The stadium was named Candlestick Park as a result of a naming contest run by the city's Recreation and Parks Department. It was renamed 3 Com Park in 1996, when the 3 Com Corporation paid for the naming rights. The Giants left the stadium after the 1999 season, moving to a new baseball-only stadium in the city's South-of-Market area. The Monster Cable Products Company bought the naming rights in 2004, and the stadium has been called Monster Park since that time.

...The stadium meets criterion A for its association with the expansion of Major League baseball to the West Coast in the late 1950s. Although the stadium was not ready for the Giants until the 1960 season, planning and financing began even before Stoneham's announcement of his intent to relocate the team to San Francisco, and the move was predicated on the city's construction of a stadium. Completed two years before Dodger Stadium in Los Angeles, Candlestick Park was the first stadium built for Major League baseball west of Kansas City.

Criterion A: Association with significant events - sporting, entertainment and other events

Sports stadiums and arenas are inherently important as the home field for their cities' professional sports teams. They are places of tradition and accumulated memories for thousands of sports fans, and an important component of each metropolitan area's civic identity. Candlestick Park has hosted many memorable sporting events since its opening in 1960. The Giants played two World Series' at the stadium, losing to the New York Yankees in 1962 and to the Oakland Athletics in 1989. The 1989 series was disrupted by the Loma Prieta earthquake, which occurred during the third game of the series with a sellout crowd at Candlestick Park. Although there was some damage to the stadium, no one at the game was injured. One of the greatest pitching duals of all time took place at Candlestick Park on July 2, 1963. Juan Marichal of the Giants and Warren Spahn of the Milwaukee Braves, both later inducted into the baseball Hall of Fame, battled for 16 innings. Neither team scored a run until a home run by Willie Mays in the bottom of the 16th inning gave the Giants a 1-0 victory. The most notable events in football occurred in 1980 and 1982. Described by sportswriter Nick Peters as "the greatest comeback in NFL history," the 1980 contest between the 49ers and the New Orleans Saints was 35-7 in favor of the Saints at halftime. Quarterback Joe Montana passed for 247 yards in the second half to tie the game which the 49ers won with an overtime field goal. Two years later, in a game against the Dallas Cowboys, Montana completed a touchdown pass to Dwight Clark, known simply as "the catch" to football fans, to give the 49ers their first conference championship. In addition to baseball and football games, Candlestick Park has hosted many other notable events, such as the last live performance of the Beatles in 1966 and a Mass celebrated by Pope John Paul II in 1987.

Although these events are important to those who witnessed them, they do not qualify Candlestick Park for National Register listing under Criterion A. Over time, any major sports stadium will accumulate its share of memorable contests, championship victories, records set and broken, and feats of athleticism. Only a stadium's greater age, and therefore its greater store of memorable events, distinguishes one stadium from another in this respect. Such events are the common legacy of all major sports stadiums, and they do not qualify their respective venues for National Register listing, either individually or collectively. In addition, all of the notable sporting, entertainment, and other events at Candlestick Park have occurred since 1960, and none are of such exceptional significance that they would qualify the stadium for National Register listing under criteria consideration G for properties that have achieved significance within the last fifty years.[50]

Criteria Consideration G: The National Register Criteria generally exclude properties that have achieved significance within the past fifty years unless they are of exceptional importance. "Fifty years is a general estimate of the time needed to develop historical perspective and to evaluate significance. This consideration guards against the listing of properties of passing contemporary interest and ensures that the National Register is a list of truly historic places." The phrase "exceptional importance" may be applied to the extraordinary importance of an event...or association [and] "properties that are more than fifty years old, but whose significant associations or qualities are less than fifty years old, must be treated under the fifty-year consideration." [51]

Despite the fact that the Caltrans evaluation was developed before the stadium reached the fifty-year mark, the same conclusions discussed above regarding to Criteria Consideration G can be applied. [52] A property does not become a resource simply by crossing the 50-year mark and a collection of notable, but not nationally significant events, does not qualify the stadium for listing on the National Register.

A national historical event occurred here during the 1989 World Series when the Loma Prieta earthquake of October 17, 1989 shook Candlestick Park and postponed the World Series between the Giants and Oakland A's. However, this event at the stadium was not one that changed, altered or influenced any aspect of San Francisco or Nation. Indeed, the quake had a much greater effect on buildings, structures, objects and people in other areas of San Francisco and Northern California than did the delay of a sporting event. While ESPN broadcast the quake at the stadium — through microwave feed, thereby changing the role of sport broadcasting[53] — more significant earthquake events occurred, including the deaths of 62 people in Northern California (including 42 deaths due to the collapse of the Cypress Freeway in Oakland), collapse of part of the Bay Bridge, injuries (3,757 people) and homelessness (3,000-12,000 people). [54] (Note: see below for discussion of Criterion G and the property's associations with important people that have achieved significance into a period less than fifty years.)

Candlestick Park appears to be eligible for the National Register under Criterion A for its association with the expansion of Major League baseball to the West Coast in the late 1950s/early 1960s.

Criterion B (Associative Value - Person):
Properties may be eligible for the National Register if they are associated with the lives of persons significant in our past. According to National Register Bulletin 15, persons "significant in our past" refers to individuals whose activities are demonstrably important within a local, State, or national historic context. Properties eligible under this criterion are usually those associated with a person's productive life, reflecting the time period when he or she achieved

[50] Andrew Hope, California Department of Transportation, DPR 523 A & B, January 2008.
[51] National Park Service Bulletin 15 (accessed 3.26.2010)
http://www.nps.gov/nr/publications/bulletins/nrb15/nrb15_7.htm#crit%20con%20g
[52] National Park Service Bulletin 15.
[53] http://search.espn.go.com/1989-world-series/ (accessed 22 March 2010).
[54] http://www.vibrationdata.com/earthquakes/lomaprieta.htm (accessed 22 March 2010).

significance. The best representatives usually are properties associated with the person's adult or productive life.[55]

The following is a direct quote from the historic resource evaluation completed by Caltrans in 2008. The California OHP concurred with this finding in 2008. Circa: Historic Property Development also concurs with the finding.

> Candlestick Park does not meet National Register Criterion B for association with any of the Giants former field managers or executive office personnel. With the exception of team owner Horace Stoneham's role in bringing Major League baseball to the West Coast, none of these people played significant roles in baseball history during their time in San Francisco. The movement of the Giants and Dodgers to the West Coast in 1958 is discussed above under Criterion A.
>
> The Giants had several outstanding players who spent a large part of their careers in San Francisco during the Candlestick Park years. Those players now in the baseball Hall of Fame include Orlando Cepeda, Juan Marichal, Willie Mays, Willie McCovey, and Gaylord Perry. Of these, Mays stands above the rest as one of the game's greatest players. His small circle of peers would include only the best players of all time, such as Ty Cobb, Babe Ruth, Joe DiMaggio, Ted Williams, and Hank Aaron. When he retired after the 1973 season, Mays was third on the career home run list with 660, trailing only Babe Ruth (714) and Hank Aaron (713). Mays is currently fourth on the list, having been passed by Barry Bonds. Mays' accomplishments during his Candlestick Park years include leading the National League in hits in 1960, runs scored in 1961, and home runs in 1962, 1964, and 1965. He received the Most Valuable Player award in 1965, and nine Gold Glove awards for fielding excellence, from 1960 through 1968.
>
> Candlestick Park meets National Register Criterion B for association with the career of Willie Mays. Starting with the New York Giants in 1951, Mays moved with the team to San Francisco and stayed until 1972, when he was traded to the New York Mets early in the season. He finished his playing career with the Mets, retiring after the 1973 season. Of his 22 seasons in the major leagues, Mays spent 14 full seasons and a small portion of a 15th in San Francisco, with Candlestick Park as his home field during all but two of these. Approximately 60 percent of his career home games were played at Candlestick Park, compared to approximately 25 percent at the Polo Grounds in New York, ten percent at Seals Stadium, and five percent at Shea Stadium in New York with the Mets. As the Polo Grounds and Seals Stadium are no longer extant, and Mays' tenure with the Mets was brief, Candlestick Park is the property most closely associated with his career and accomplishments in baseball. Mays' career at Candlestick Park began with the opening of the stadium in 1960, slightly less than 50 years ago, and continued to 1972, only 36 years ago. However, he is the one player in San Francisco Giants history whose achievements could be considered to be of exceptional significance in the history of baseball. In addition, enough time has passed to accurately evaluate the significance of Mays' career, and his stature among the greatest players of all time will not diminish in the future, even as later players surpass his accomplishments.

As discussed above, a property may be considered eligible for the National Register under Criteria Consideration G if the property achieved significance within the past fifty years and is of *exceptional importance*. The National Register discourages the nomination of such properties associated to a person still living unless sufficient scholarship and evidence of historical

---

[55] Matt Weintraub, "Giant Footprints: Building The New Ballpark Landscape In San Francisco" (M.A. Thesis, San Francisco State University, 2004)

perspective exist and whose active life in their field of endeavor is over. Further, Criteria Consideration G must be considered for a property that "continues to achieve significance into a period less than fifty years". [56] According to the National Park Service,

> …the more recently a property has achieved significance, generally, the more difficult it is to demonstrate exceptional importance. The case for exceptional importance is bolstered when there is a substantial amount of professional, documented materials on the resource and the resource type. A property listed in the National Register 10 or 15 years after it has achieved significance requires clear, widespread recognition of its value to demonstrate exceptional importance."[57]

Mays' career at Candlestick Park began with the opening of the stadium in 1960, 50 years ago at the time of this evaluation, and continued to 1972, 38 years ago. Other notable players associated with Candlestick Park have more recent associations with the property. As such, the evaluation below is discussed in terms of both Criterion B and Criteria Consideration G.

Mays is considered one of the greatest all-around players in the history of baseball and his achievements can "be considered to be of exceptional significance in the history of baseball." A simple library search for Mays identifies a substantial number of printed publications dedicated to Mays' life and career in baseball. Various biographies and historical studies exist that discuss the player's unique life story, as well as his place within the history of the sport and the larger social history of the nation during the span of his active career. As almost 40 years have passed since the end of Mays' baseball career at Candlestick and a number of documentary studies have been completed about his career in professional sports, Circa concurs with the above finding that Candlestick Park appears eligible for the National Register for association with Willie Mays under Criterion B/G. While Candlestick Park was found to meet National Register Criterion B/G for association with the baseball career of Willie Mays, its association to other sport figures within the past fifty years did not meet exceptional importance. This includes other notable players that are associated with Candlestick Park such as Barry Bonds, Joe Montana, and Jerry Rice.

Barry Bonds, left fielder in the National Baseball League, played for the San Francisco Giants from 1986 to 2007. He holds the record for the most career home runs, 756, and was voted Most Valuable Player seven times, the Hank Aaron Award three times, and Major League Player of the Year three times.[58] Bonds will become eligible for considerable for induction into the Baseball Hall of Fame in 2013.[59] Bonds played seven years at Candlestick (1993 -1999) and eight years at AT&T Park (2000-2007).

Joe Montana, quarterback in the National Football League, played for the San Francisco 49ers from 1979 to 1992. He led the 49ers to four Super Bowl wins (Super Bowls XVI, XIX, XXIII, and XXIV) and was named Super Bowl MVP three times. When he retired, he ranked fourth in career passing yardage (40,551 yards), attempts (5,391), and passing touchdowns (273). His 3,409 completions ranked third all-time, and his career passer rating of 92.3 was second all-time. He holds numerous records and awards including being name All-NFL three times, All-NFC

[56] National Park Service, National Register Bulletin 22: Guidelines for Evaluating and Nominating Properties that Have Achieved Significance within the Past Fifty Years, Carol D. Shull, ed., 1990. Online at http://www.nps.gov/nr/publications/bulletins/nrb22/nrb22_V.htm (accessed 3.26.2010). See also National Register Bulletin 15.

[57] National Register Bulletin 22.

[58] Baseball Reference.Com web site (accessed 14 March 2010) www.baseball-reference.com/players/b/bondsba01. shtml?redir.

[59] National Baseball Hall of Fame web site (accessed 14 March 2010) www.community.baseballhall.org/Page.aspx? pid=414.

five times, and voted to the Pro Bowl eight times. He was inducted into the Football Hall of Fame Class in 2000.[60] No Super Bowl games were ever played at Candlestick Park.[61]

Jerry Rice, wide receiver in the National Football League, played for the San Francisco 49ers from 1985-2000. When he retired, he was the most prolific wide receiver in NFL history with records for receptions (1,549); receiving yards (22,895 yards); most 1,000-yard receiving seasons (14); total touchdowns (208); and combined net yards (23,546). Rice holds many NFL playoff and Super Bowl records. He played in eight conference championships and four Super Bowls. He earned three Super Bowl rings with the 49ers and was named the Most Valuable Player of San Francisco's Super Bowl XXIII. He was inducted into the Football Hall of Fame in 2010.[62]

For Bonds, Montana, and Rice, all outstanding athletes in their own right, the case for *exceptional importance* under Criterion Consideration G cannot be made. All of their achievements have been made in the very recent past, and Bonds earned most of his awards when the team was based at AT&T Park. Joe Montana's active career ended eighteen years ago, Jerry Rice's ten years ago, and Barry Bonds' three years ago. Sufficient historical perspective does not exist to determine that Candlestick Park is exceptionally important for its association with these players.

Candlestick Park appears to be eligible for the National Register under Criterion B/Criteria Consideration G for association with the baseball career of Willie Mays.

<u>Criterion C (Design/Construction)</u>:
This criterion applies to properties significant for their physical design or construction, including such elements as architecture, landscape architecture, engineering, and artwork. To be eligible under Criterion C, a property must meet at least one of the following requirements: Embody distinctive characteristics of a type, period, or method of construction.

- Represent the work of a master.
- Possess high artistic value.
- Represent a significant and distinguishable entity whose components may lack individual distinction.

The following direct quotes are from the historic resource evaluation completed by Caltrans in 2008. The California OHP concurred with this finding in 2008. Circa: Historic Property Development also concurs with the finding.

> The stadium's designer, John S. Bolles, was a prominent Bay Area architect who began his independent practice in the mid-1950s. His varied practice included a number of corporate and industrial facilities, such as the Gallo Winery in Modesto, the General Motors assembly plant in Fremont, and the IBM complex in San Jose. [Jones & Stokes: Appendix B, p. 7.] However, as many of his designs (including Candlestick Park) are not yet 50 years old, it is premature to consider Bolles a "master" architect under National Register criterion C.
>
> Sports stadiums are a rare property type, with most metropolitan areas having only one or two, in addition to college and university stadiums. Consequently, they are difficult

[62] Football Hall of Fame web site (accessed 14 March 2010), www.profootballhof.com/hof/member.aspx?PlayerId=290.

to evaluate in a strictly local context. An evaluation of Candlestick Park under National Register criterion C therefore requires an understanding of its place in the evolution of baseball stadium design nationwide. There are presently 30 major league baseball stadiums (29 in the United States and one in Toronto) as well as several former stadiums that are still used for football or other events or are now vacant. None of the stadiums currently in use are listed on the National Register of Historic Places. However, two former stadiums have been listed: Municipal Stadium in Cleveland (built in 1931 and demolished in 1996) and Tiger Stadium in Detroit (built in 1912, [demolished 2008-09]). Of the three pre-World War II stadiums currently in use, Fenway Park in Boston (1912) and Wrigley Field in Chicago (1914) may be eligible for National Register listing, while Yankee Stadium in New York (1923) lacks integrity due to extensive renovations carried out in the 1970s.

A period of new stadium construction began with the Toronto Skydome of 1989 and accelerated with the opening of Oriole Park at Camden Yards in Baltimore in 1992. Oriole Park's neo-traditional design was extremely influential, leading to the construction of similar baseball stadiums in more than a dozen cities, including San Francisco. As a result, there are presently only nine current and three former major league baseball stadiums in the United States that are more than thirty years old, and only four of these are more than 50 years old.

The stadiums dating to the first half of the twentieth century were constructed of concrete and steel, and often consisted of a series of expansions undertaken over the course of several decades. They all had steel columns supporting their upper grandstands and roofs, creating obstructed-view seats below. These stadiums were generally located in older urban neighborhoods, accessible by streetcars. Only three new major league baseball stadiums were constructed in the 1950s. The earliest was Memorial Stadium in Baltimore, which opened in 1950 for the minor league Orioles and the professional football Colts. The upper deck was added in 1954, when the Major League St. Louis Browns relocated to Baltimore and became the Orioles. County Stadium in Milwaukee was built in 1953, when the Boston Braves relocated to that city. Finally, Metropolitan Stadium was constructed in suburban Minneapolis in1956, for the minor league Millers. It was expanded for the 1961 season when the Major League Washington Senators relocated to the Twin Cities and became the Minnesota Twins. The stadiums in Milwaukee and Minneapolis were similar in construction and appearance to the prewar stadiums, while Memorial Stadium in Baltimore had a distinctly modem appearance, with a somewhat sculptural use of concrete to support the upper deck.

Candlestick Park opened for use by the Giants in 1960. It exhibited some innovations in design, including a more extensive use of concrete than in most previous stadiums. The upper deck was pulled well back from the front of the lower deck, allowing columns to be placed near the rear of the lower-deck stands and greatly reducing the number of obstructed-view seats. The outer support for the upper deck consists of diagonal bracing, with each inverted "V" shape supporting a concrete rib that continues upward to support the curved roof that covers a portion of the upper deck. This was an even more distinctly modem, sculptural use of concrete than was seen at Baltimore a few years earlier.

Following the construction of Candlestick Park, a new stadium was completed in the City of Washington [D.C.] that housed the football Redskins beginning with the 1961 season and the expansion Senators of the American League beginning with the 1962 baseball season. Dodger Stadium in Los Angeles opened in 1962, and was followed by several new stadiums in the later 1960s, including Shea Stadium (New York Mets, 1964), the Astrodome (Houston Astros, 1965), Fulton County Stadium (Atlanta Braves, 1966), Busch Stadium (St. Louis Cardinals, 1966), and the Oakland Coliseum (Athletics, 1968). These new stadiums were typically located in outlying areas of their cities or in the suburbs, and were surrounded by extensive parking lots, in contrast to the urban settings of older stadiums. Designed for both baseball and football, these new stadiums were mostly circular or elliptical in plan. In the case of Shea Stadium and the Oakland Coliseum, they were built as a portion of a circle that could later be expanded to form a complete ring. These modern-era stadiums were all built with the upper tiers of seating pulled back farther from the playing field than the lower level, with concrete cantilevers allowing the complete elimination of interior columns. The Astrodome has the additional distinction of being the first stadium for baseball or football to be completely covered.

Candlestick Park does not meet National Register criterion C for its design qualities. In the evolution of baseball stadium design, Candlestick Park can more accurately be considered the last of the old-style ballparks rather than the first of the modern type, or a transitional design between the historic and modern types. The first entirely modern baseball stadiums were District of Columbia Stadium (renamed Robert F. Kennedy Memorial Stadium) and Dodger Stadium in Los Angeles. Although modern in appearance, Candlestick Park's innovations were limited and tentative. A heating system was installed as part of the original construction. This would have made Candlestick the first unenclosed but heated stadium, but the system never worked properly and was soon abandoned. More importantly, all of the modern stadiums are devoid of interior columns, eliminating the obstructed-view seats that are a problem for all of the older stadiums. Candlestick Park has interior columns, although they are located to reduce the number of obstructed view seats compared to earlier stadiums.

Candlestick Park accommodated both baseball and football even before its expansion for the San Francisco 49ers in the early 1970s. The Oakland Raiders, at that time part of the new American Football League, played their final three home games of 1960 and all of their 1961 home games at the stadium. However, the stadium is not significant in this regard, as dual-purpose stadiums were built both before and after Candlestick Park. In the years before professional football became the major sport that it is today, many football teams played in their cities' baseball stadiums. Most of those stadiums were not specifically designed for football, but could accommodate a football field and were often the only venue that provided a large seating capacity. Similarly, Candlestick Park could accommodate football but was designed and used primarily for baseball until the expansion of the early 1970s. At least two of the stadiums that predate Candlestick Park, Municipal Stadium in Cleveland and Memorial Stadium in Baltimore, were specifically designed for both sports. These two stadiums have the oval shape that is characteristic of football stadiums, with a somewhat widened oval to accommodate a baseball diamond.

Following the construction of Candlestick Park, the circular stadiums of the later 1960s and 1970s were all designed for both sports. In conclusion, Candlestick Park does not meet National Register Criterion C.

A property is eligible for listing under Criterion C if it embodies the distinctive characteristics of a type, period, or method of construction; represents the work of a master; possesses high artistic value; or, represents a significant and distinguishable entity whose components may lack individual distinction. As discussed above, the original baseball turned dual use stadium was not the first of its type or method of construction; it was neither the first concrete stadium nor a prototype for the multi-purpose stadiums that were built shortly after Candlestick Park was constructed.

With regard to consideration of the stadium as the work of a master, John S. Bolles was a prolific Bay Area architect whose San Francisco work includes the 1959 Ping Yuen Annex housing project, Embarcadero Park, and the Anna E. Waden Library in San Francisco. While he was a well-known architect within the Bay Area, sufficient time has not passed to sufficiently evaluate Bolles' status as a "master" architect. According to National Register Bulletin 15, a "master is a figure of generally recognized greatness in a field, a known craftsman of consummate skill, or an anonymous craftsman whose work is distinguishable from others by its characteristic style and quality." For a property to be eligible under this criterion it "must express a particular phase in the development of the master's career, an aspect of his or her work, or a particular idea or theme in his or her craft. A property is not eligible as the work of a master, however, simply because it was designed by a prominent architect."[63] Bolles' commissions were diverse over his nearly 40-year career and included commercial, industrial, site planning, interior design commissions and major residential projects, most of which incorporated modern art and sculpture. Some of his major clients included IBM, Macy's, General Motors, and Gallo and Paul Masson wineries.[64] The architect's active career ended only about 30 years ago and the historical value of Candlestick Park within the larger body of his work cannot be adequately assessed due to a lack of historical perspective. Despite the fact that the artist considered his original design for Candlestick Park more sculptural than architectural, the building does not possess high artistic value. Further, the building has been significantly altered from the original design and configuration. Therefore, Candlestick Park stadium is not considered the work of a master.

Candlestick Park does not appear to be eligible for the National Register under Criterion C for design/architecture.

Criterion D (Information Value):
Criterion D most commonly applies to properties that contain or are *likely* to contain information bearing on an important archeological research question.

Candlestick Park is situated on an area that is comprised largely of fill. The Candlestick Point – Hunters Point Shipyard Phase III EIR archaeological research found that archaeological resources expected to be found on the Candlestick Point site could have important research value and would, therefore, be legally significant under CEQA. Examples of research themes that have been proposed to which expected archaeological resources could contribute significant data include the spatial organization and historical development of Chinese fishing camps and prehistoric shell mounds. Any potential archeological resources that are covered by existing development will remain covered and unavailable unless the site is redeveloped. Adverse effects of construction-related activities to archaeological resources at Candlestick Point, including demolition of the stadium, would be less-than-significant through implementation of the Candlestick Point – Hunters Point Shipyard Phase III Archaeological Research Design and Treatment Plan.

Candlestick Park does not appear to be eligible for the National Register under Criterion D for Information Value.

California Register of Historical Resources (CRHR)
The California Register of Historical Resources and the National Register of Historic Places significance criteria are essentially the same. The California Register criteria are consistent with the National Register, however they "...have been modified for state use in order to include a range of historical resources which *better reflect the history of California* [emphasis added]." (California Code of Regulations (CCR) §4852)[65] It is recognized that a property may not retain enough integrity to meet the NRHP but they may still be eligible for listing in the California Register. The following criteria evaluation is based on Candlestick Park's significance as it relates primarily to California history. Resources that are significant, meet the age guidelines, and possess integrity will generally be considered eligible for listing in the CRHR.

<u>Criterion 1 (Events):</u>
Associated with events that have made a significant contribution to broad patterns of local or regional history, or cultural heritage of California or the United States.

As discussed in more detail under Criterion A above, Candlestick Park appears to meet Criterion 1 for its association with the expansion of Major League baseball to the West Coast in the late 1950s. Completed two years before Dodger Stadium in Los Angeles, Candlestick Park was the first stadium built for Major League baseball on the West Coast. Candlestick Park does not appear to be eligible for listing on the California Register for its association with events such as the 1989 earthquake during the World Series, "the Catch", the 1966 Beatles concert or a visit by Pope John Paul II in 1987. As stated by Andrew Hope, while "these events are important to those who witnessed them, they do not qualify [the property for] listing...Over time, any major sports stadium will accumulate its share of memorable contests, championship victories, records set and broken, and feats of athleticism."[66] Though notable, these events did not have an enduring impact on the State or region. Further, these events all happened less than fifty-years ago and do not rise to a level of significance that would make the subject property eligible for listing on the California Register.

Candlestick Park appears eligible for listing on the California Register of Historical Resources under Criterion 1 for association with the expansion of Major League baseball to the West Coast in the 1950s/1960s.

<u>Criterion 2 (People)</u>
Associated with the lives of persons important to the local, California or national history

As described in more detail above under Criterion B, Candlestick Park appears eligible for association with Willie Mays' baseball career. Mays' career at Candlestick Park began with the opening of the stadium in 1960, 50 years ago at the time of this evaluation, and continued to 1972, 38 years ago. Other notable players associated with Candlestick Park have more recent associations with the property.

Mays is considered one of the greatest all-around players in the history of baseball and his achievements can be considered to be of exceptional significance in the history of baseball. While Candlestick Park appears to meet California Register Criterion 2 for association with the baseball career of Willie Mays, sufficient time has not passed to understand the historical importance of other notable players that are associated with Candlestick Park such as Barry Bonds, Jerry Rice and Joe Montana.

---

[65] California Office of Historic Preservation, 2006, p.2. California Register and National Register: A Comparison. Technical Assistance Series No. 6. California Department of Parks and Recreation, Sacramento. Assistance Series No. 6. California Department of Parks and Recreation, Sacramento.
[66] Andrew Hope, California Department of Transportation, DPR 523 A & B, January 2008.

Barry Bonds, left fielder in the National Baseball League, played for the San Francisco Giants from 1986 to 2007. He holds the record for the most career home runs, 756, and was voted Most Valuable Player seven times, the Hank Aaron Award three times, and Major League Player of the Year three times.[67] Bonds will become eligible for considerable for induction into the Baseball Hall of Fame in 2013.[68] Bonds played seven years at Candlestick (1993 -1999) and eight years at AT&T Park (2000-2007).

Joe Montana, quarterback in the National Football League, played for the San Francisco 49ers from 1979 to 1992. He led the 49ers to four Super Bowl wins (Super Bowls XVI, XIX, XXIII, and XXIV) and was named Super Bowl MVP three times. When he retired, he ranked fourth in career passing yardage (40,551 yards), attempts (5,391), and passing touchdowns (273). His 3,409 completions ranked third all-time, and his career passer rating of 92.3 was second all-time. He holds numerous records and awards including being name All-NFL three times, All-NFC five times, and voted to the Pro Bowl eight times. He was inducted into the Football Hall of Fame in 2000.[69] No Super Bowl games were ever played at Candlestick Park.[70]

Jerry Rice, wide receiver in the National Football League, played for the San Francisco 49ers from 1985-2000. When he retired, he was the most prolific wide receiver in NFL history with records for receptions (1,549); receiving yards (22,895 yards); most 1,000-yard receiving seasons (14); total touchdowns (208); and combined net yards (23,546). Rice holds many NFL playoff and Super Bowl records. He played in eight conference championships and four Super Bowls. He earned three Super Bowl rings with the 49ers and was named the Most Valuable Player of San Francisco's Super Bowl XXIII. He was inducted into the Football Hall of Fame in 2010.[71]

For Bonds, Montana and Rice, all outstanding athletes in their own right, the case for CRHR listing under this criterion cannot be made because sufficient time has not passed to obtain a scholarly perspective on the importance of their achievements within their respective sports. All of their achievements have been made in the very recent past. Joe Montana's active career ended only eighteen years ago, Jerry Rice's ten years ago, and Barry Bonds three years ago. Sufficient historical perspective does not exist to determine that Candlestick Park is significant to the history of California for its association with these players.

Candlestick Park appears to be eligible for the California Register under Criterion 2 for association with the baseball career of Willie Mays.

<u>Criterion 3 (Design/Construction)</u>
Embodies the distinctive characteristics of a design-type, period, region, or method of construction, or represents the work of a master, or possesses high artistic value.

As discussed in greater detail under Criterion C above, Candlestick Park does not meet California Register Criterion 3 for its distinctive design/construction characteristics of design-type, period, region, or method of construction. Hope states that "Candlestick Park opened for use by the Giants in 1960. It exhibited some innovations in design, including a more extensive

use of concrete than in most previous stadiums. In the evolution of baseball stadium design, Candlestick Park can more accurately be considered the last of the old-style ballparks rather than the first of the modern type, or a transitional design between the historic and modern types... Although modern in appearance, Candlestick Park's innovations were limited and tentative..."[72] The original baseball stadium turned dual use stadium was not the first of its type or method of construction. The stadium has been extensively altered since the early 1970s, especially with the expansion and enclosure of the stadium seating, and removal of the baseball diamond and conversion to a football field. The formerly open outfield area was enclosed by the extension of the upper deck around the entire perimeter of the playing field. The expansion more than doubled the amount of upper-deck seating, and added both fixed and moveable lower-deck seating in the outfield areas. This resulted in the need for new ramps and stairs that significantly altered the stadium's exterior appearance.

John S. Bolles was a prolific Bay Area architect whose San Francisco work includes the 1959 Ping Yuen Annex housing project, Embarcadero Park, and the Anna E. Waden Library in San Francisco. While he was a well-known architect within the Bay Area, sufficient time has not passed to sufficiently evaluate Bolles' status as a "master" architect. According to National Register Bulletin 15, a "master is a figure of generally recognized greatness in a field, a known craftsman of consummate skill, or an anonymous craftsman whose work is distinguishable from others by its characteristic style and quality." For a property to be eligible under this criterion it "must express a particular phase in the development of the master's career, an aspect of his or her work, or a particular idea or theme in his or her craft. A property is not eligible as the work of a master, however, simply because it was designed by a prominent architect."[73]

Bolles' commissions were diverse over his nearly 40-year career and included commercial, industrial, site planning, interior design commissions and major residential projects, most of which incorporated modern art and sculpture. Some of his major clients included IBM, Macy's, General Motors, McGraw-Hill and Gallo and Paul Masson wineries.[74] The architect's active career ended only about 30 years ago and a number of his designs are not yet 50 years old. Because of this lack of historical perspective, it is premature to consider Bolles a "master" architect since the historical value of Candlestick Park within the larger body of his work cannot be adequately assessed. Despite the fact that the artist considered his original design for Candlestick Park more sculptural than architectural, the building does not possess high artistic value. Further, the building has been significantly altered from the original design and configuration.

Candlestick Park does not appear to be eligible for the California Register under Criterion 3 for design/architecture.

Criterion 4 (Information Potential):
Yields important information about prehistory or history of the local area, California or the nation.

Candlestick Park is situated on an area that is comprised largely of fill. The Candlestick Point – Hunters Point Shipyard Phase III EIR archaeological research found that archaeological resources expected to be found on the Candlestick Point site could have important research value and would, therefore, be legally significant under CEQA. Examples of research themes

[72] Hope, 11 of 13.
[73] National Register Bulletin 15.
[74] David Perry, "Bolles, John Savage," Encyclopedia of San Francisco, A Project of the SF Museum and Historical Society. Online at: http://www.sfhistoryencyclopedia.com/articles/b/bollesJohn.html (accessed 29 March 2010).

that have been proposed to which expected archaeological resources could contribute significant data include the spatial organization and historical development of Chinese fishing camps and prehistoric shell mounds. Any potential archeological resources that are covered by existing development will remain covered and unavailable unless the site is redeveloped. Adverse effects of construction-related activities to archaeological resources at Candlestick Point, including demolition of the stadium, would be less-than-significant through implementation of the Candlestick Point – Hunters Point Shipyard Phase III Archaeological Research Design and Treatment Plan.

Candlestick Park does not appear to be eligible for the California Register under Criterion 4 for information potential.

City of San Francisco Standards for Evaluation

City and County of San Francisco criteria for evaluation of historic resources is based on Planning Code Section 1004(a)(1): having a special character or special historical, architectural or aesthetic interest or value.

"The Code does not contain specific criteria on how to survey, identify, evaluate and document cultural resources. Consequently, the Landmarks Board recognized the need to adopt a uniform system to evaluate cultural resources once they are identified. To that end, in June 2000, the Landmarks Board adopted by Resolution 527, the Secretary of Interior's Standards, and the California State Office of Historic Preservation Recordation Manual (DPR 523 series) for use in Landmark and Historic District Designation Reports and nominations, and Structures of Merit nominations under Article 10 of the Planning Code."[75]

While the City of San Francisco Landmarks Preservation Advisory Board adopted the National Register criteria for evaluation as policy for evaluation, they did not adopt considerations or establish any bar by which significance is measured.

<u>Criterion A (Events):</u>
As discussed in more detail under National Register Criterion A above, Candlestick Park appears to meet Criterion A for its association with the expansion of Major League baseball to the West Coast in the late 1950s. Completed two years before Dodger Stadium in Los Angeles, Candlestick Park was the first stadium built for Major League baseball on the West Coast. Candlestick Park does not appear to be eligible for listing on the California Register for its association with events such as the 1989 earthquake during the World Series, "the Catch", the 1966 Beatles concert or a visit by Pope John Paul II in 1987. As stated by Andrew Hope, while "these events are important to those who witnessed them, they do not qualify [the property for] listing...Over time, any major sports stadium will accumulate its share of memorable contests, championship victories, records set and broken, and feats of athleticism."[76] Though notable, these events alone did not have an enduring impact on the City of San Francisco. Further, these events all happened less than fifty-years ago and do not rise to a level of significance that would make the subject property eligible for local listing under this criterion.

Candlestick Park appears to be eligible for local listing under Criterion A for association with the expansion of Major League Baseball to the West Coast in the late 1950s/early 1960s.

---

[75] San Francisco Preservation Bulletin No. 5: Landmark and Historic District Designation Procedures (page 6). SF Planning Department website: http://www.sfgov.org/site/planning_index.asp?id=24996.
[76] Andrew Hope, California Department of Transportation, DPR 523 A & B, January 2008.

Criterion B (People)
Associated with the lives of persons important to the local, California or national history

As described in more detail above under National Register Criterion B, Candlestick Park appears eligible for association with Willie Mays' baseball career. Mays' career at Candlestick Park began with the opening of the stadium in 1960, 50 years ago at the time of this evaluation, and continued to 1972, 38 years ago. Other notable players associated with Candlestick Park have more recent associations with the property.

Mays is considered one of the greatest all-around players in the history of baseball and his achievements can be considered to be of exceptional significance in the history of baseball. While Candlestick Park appears to meet local criteria for association with the baseball career of Willie Mays, sufficient time has not passed to understand the historical importance of other notable players that are associated with Candlestick Park such as Barry Bonds, Jerry Rice and Joe Montana.

For Bonds, Montana and Rice, all outstanding athletes in their own right, the case for local listing under this criterion cannot be made because sufficient time has not passed to obtain a scholarly perspective on the importance of their achievements within their respective sports. All of their achievements have been made in the very recent past. Joe Montana's active career ended only eighteen years ago, Jerry Rice's ten years ago, and Barry Bonds' three. Sufficient historical perspective does not exist to determine that Candlestick Park is significant to the history of San Francisco for its association with these players.

Candlestick Park appears to be eligible for local listing under Criterion B for association with the baseball career of Willie Mays.

Criterion C (Design/Construction)
Embodies the distinctive characteristics of a design-type, period, region, or method of construction, or represents the work of a master, or possesses high artistic value.

As discussed in greater detail under Criterion C above, Candlestick Park does not meet Criterion C for its distinctive design/construction characteristics of design-type, period, region, or method of construction. Hope states that "Candlestick Park opened for use by the Giants in 1960. It exhibited some innovations in design, including a more extensive use of concrete than in most previous stadiums. In the evolution of baseball stadium design, Candlestick Park can more accurately be considered the last of the old-style ballparks rather than the first of the modern type, or a transitional design between the historic and modern types... Although modern in appearance, Candlestick Park's innovations were limited and tentative..."[77] The original baseball stadium turned dual use stadium was not the first of its type or method of construction. The stadium has been extensively altered since the early 1970s, especially with the expansion and enclosure of the stadium seating, and removal of the baseball diamond and conversion to a football field. The formerly open outfield area was enclosed by the extension of the upper deck around the entire perimeter of the playing field. The expansion more than doubled the amount of upper-deck seating, and added both fixed and moveable lower-deck seating in the outfield areas. This resulted in the need for new ramps and stairs that significantly altered the stadium's exterior appearance.

John S. Bolles was a prolific Bay Area architect whose San Francisco work includes the 1959 Ping Yuen Annex housing project, Embarcadero Park, and the Anna E. Waden Library in San

[77] Hope, 11 of 13.

Francisco. While he was a well-known architect in San Francisco during his tenure, sufficient time has not passed to sufficiently evaluate Bolles' status as a "master" architect. According to National Register Bulletin 15, a "master is a figure of generally recognized greatness in a field, a known craftsman of consummate skill, or an anonymous craftsman whose work is distinguishable from others by its characteristic style and quality." For a property to be eligible under this criterion it "must express a particular phase in the development of the master's career, an aspect of his or her work, or a particular idea or theme in his or her craft. A property is not eligible as the work of a master, however, simply because it was designed by a prominent architect."[78]

Bolles' commissions, located throughout the Bay Area, were diverse over his nearly 40-year career and included commercial, industrial, site planning, interior design commissions and major residential projects, most of which incorporated modern art and sculpture. Some of his major clients included IBM, Macy's, General Motors, and Gallo and Paul Masson wineries.[79] The architect's active career ended only about 30 years ago and a number of his designs are not yet 50 years old. Because of this lack of historical perspective, it is premature to consider Bolles a "master" architect since the historical value of Candlestick Park within the larger body of his work cannot be adequately assessed. Despite the fact that the artist considered his original design for Candlestick Park more sculptural than architectural, the building does not possess high artistic value. Further, the building has been significantly altered from the original design and configuration.

Candlestick Park does not appear to be eligible for local listing under Criterion C for design/architecture.

<u>Criterion D (Information Potential)</u>
Yields important information about prehistory or history of the local area, California or the nation.

Candlestick Park is situated on an area that is comprised largely of fill. The Candlestick Point – Hunters Point Shipyard Phase III EIR archaeological research found that archaeological resources expected to be found on the Candlestick Point site could have important research value and would, therefore, be legally significant under CEQA. Examples of research themes that have been proposed to which expected archaeological resources could contribute significant data include the spatial organization and historical development of Chinese fishing camps and prehistoric shell mounds. Any potential archeological resources that are covered by existing development will remain covered and unavailable unless the site is redeveloped. Adverse effects of construction-related activities to archaeological resources at Candlestick Point, including demolition of the stadium, would be less-than-significant through implementation of the Candlestick Point – Hunters Point Shipyard Phase III Archaeological Research Design and Treatment Plan.

Candlestick Park does not appear to be eligible for local listing under Criterion D for information potential.

[78] National Register Bulletin 15.
[79] David Perry, "Bolles, John Savage," Encyclopedia of San Francisco, A Project of the SF Museum and Historical Society. Online at: http://www.sfhistoryencyclopedia.com/articles/b/bollesJohn.html (accessed 29 March 2010).

INTEGRITY

To retain integrity a property must have most of the seven aspects of integrity as defined by the National Register. Integrity must also be assessed with reference to the particular criteria under which significance is established. Caltrans, the State Office of Historic Preservation, and Jones & Stokes have all previously evaluated the property and found that Candlestick Park exhibits a significantly diminished level of integrity due to 35+ years of on-going alterations. These alterations, both major and minor, have resulted in a cumulative decrease of the property's material and design integrity.

Candlestick Park operates as an athletic facility, therefore, the activities and operations related to this function go beyond that of the fan's game-day experience in the stands. Food and beverage concessions, souvenir counters and comfort facilities add to the fans experience. VIP/hospitality suites allow for another level of the fan's experience for those who prefer a more private spectatorship. Crowd control is managed with multiple ticket booths and entry gates, and through circulation routes consisting of stairs, ramps, escalator and elevators, and a system of parking lots and access roads. The playing area consists of the playing field (in-field/out-field/field diamond/batter's box/pitcher's mound/dugout/bases for baseball, and field of play/sidelines/endlines/yard markers/endzones/goal posts/marker numbers for football), and surrounding the field are the seats, press boxes, scoreboards, and lights. Behind the scenes operations provide areas for broadcasting, interviews and video and audio taping, and operation and security offices. Not to be forgotten are the players support areas: locker rooms, weight rooms and lounge areas. These stadium operations characteristics were all considered in the analysis of integrity.

As discussed in previous sections above, Candlestick Park has been substantially altered since the early 1970s. These alterations, both major and minor, greatly diminished the park's integrity of design, setting, materials, workmanship, feeling, and association. While the initial expansion was carried out in a manner generally consistent with the original design, it significantly altered the stadium's original form and appearance.

Location
The property remains in the original location where it was constructed and therefore retains integrity of location.

Design
The stadium has been extensively altered over the course of thirty years since the early 1970s, especially with the enclosure of the stadium seating and removal of the baseball diamond for football use. "The formerly open outfield area was enclosed by the extension of the upper deck around the entire perimeter of the playing field. This closed off views to the north and northeast from within the stadium for both players and fans. The expansion more than doubled the amount of upper-deck seating, and added both fixed and moveable lower-deck seating in the outfield areas. In addition, extension of the upper deck and the resulting need for new ramps and stairs significantly altered the stadium's exterior appearance."[80] Nearly all of the support and operational aspects of the stadium have been significantly altered, removed and/or replaced.

A comparison of Figures 7 and 9 clearly illustrates the extensive changes to the stadium's exterior and playing field area. Appendix A, Figures 7-19, shows historic photos and examples of new additions/alterations. The enclosure of the outfield closed off views of the surrounding area for the players and fans. As a result, the stadium's original U-shaped form and is now

---

[80] Andrew Hope, *Evaluation of Candlestick Park, 11.*

irregular in plan and unrecognizable as a baseball field. Due to the extensive alterations over time, Candlestick Park is not a clear representation of its association with baseball (Criterion A/1); indeed, the only remnant of baseball use is the home team dugout with racks for bats and helmets (see Appendix A, Figure 20).

The property does not retain integrity of design.

Setting
The stadium is located on an 81-acre site and is surrounded by a paved parking lot with a chain link fence. Landscaping is minimal and consists primarily of clusters of trees around both the north and south (main) gates; a succession of trees defines the outside border of the main access road immediately surrounding the stadium. The setting has been altered due to the modification of the stadium envelope. The once U-shaped form is now an irregular oval, and nearly double its original size and height. The addition and alteration of existing gates around the building's perimeter have also altered the building's approach and appearance from the period of significance.

The property retains some integrity of the surrounding setting.

Materials
The stadium retains the original reinforced concrete and steel shell, but this original structure has been enlarged and altered over the course of 30-years. The majority of the character defining elements that characterize a baseball stadium (diamond field layout with bases, pitcher's mound, catcher's box, home plate, infield, outfield and foul lines; score board; original seating and press boxes; hospitality suites; concession stands; entrance/exist pavilions with turnstiles, ticket booths, stairwells, and elevators, etc.) have been removed or significantly altered since the 1970s. Extension of the upper deck required the addition of ramps, stairs and significantly altered the stadium exterior appearance, obscuring much of the original reinforced concrete.

The property does not retain integrity of materials.

Workmanship
Workmanship is the physical evidence of the crafts of a particular culture or people during any given period in history or prehistory. It is the evidence of artisans' labor and skill in constructing or altering a building, structure, object, or site. While Bolles considered Candlestick Park more sculptural than architectural, the building does not possess high artistic value or exhibit any particular craft or workmanship therefore this aspect does not apply.

The property does not retain integrity of workmanship.

Feeling
Candlestick Park was designed and constructed as a baseball stadium; its redesign to accommodate football was to maximize investment and is not a prototype of dual use. The enclosure of the stadium seating around the original outfield, reconfiguring of the seating and alteration of the diamond configuration eliminated the feeling of a baseball field. While it reflects the feeling of a stadium it does not reflect that of a *baseball* stadium and the property have been found significant for its association with the expansion of Major League Baseball to the West Coast and with baseball legend Willie Mays.

The property does not retain integrity of feeling.

Association
Candlestick Park's historic association was once that of the first major league baseball park on the West Coast. Its change to a dual purpose (baseball/football) and ultimate conversion for primary use as a football stadium has removed the park's baseball association.

The property's association with the introduction of Major League Baseball on the West Coast would not extend to the 1970s. By that time, there were Major League Baseball teams in Anaheim, Oakland, and San Diego, in addition to San Francisco and Los Angeles. The property's association with the career of Willie Mays would extend only to the early part of 1972, before Mays was traded to the New York Mets. Mays played only 19 games with the Giants in 1972 (out of a 162-game season), while playing 69 games with the Mets. Almost 99 percent of the home games that Mays played during his Candlestick Park years were in the pre-expansion stadium, with its open outfield and upper deck seating only in the infield areas.[81]

The property does not retain integrity of association.

SUMMARY

Candlestick Park was evaluated in May 2007 for eligibility for listing on the National Register of Historic Places (NRHP) under Criteria Consideration G, since the building was less than fifty years of age at that time. Jones & Stokes found that Candlestick Park "did not appear to meet the threshold of NRHP exceptional significance for buildings less than 50 years old."[82] At that time the stadium was not evaluated for its eligibility for listing on the California Register of Historical Resources or as a San Francisco Landmark.

In April 2008 Andrew Hope, Principal Architectural Historian for the Caltrans District 4 office in Sacramento, completed a second evaluation of Candlestick Park at the request of the California Office of Historic Preservation and only addressed the park's eligibility to meet the National Register level of significance. The California Office of Historic Preservation concurred that the stadium did not retain enough physical integrity to be considered a historic resource.

Circa: Historic Property Development finds these reports to be consistent and thorough. On the basis of those reports and the additional information gathered and evaluated in this HRE, Circa concludes that the property known as Candlestick Park Sports Stadium (Block 5000, Lot 001) does not retain enough integrity to adequately communicate its historical significance as representative of the expansion of Major League Baseball to the West Coast or association with the baseball career of Willie Mays. Since properties must both exhibit historical significance and retain integrity, Candlestick Park does not qualify as a historical resource at the National, State or local levels.

This concludes the evaluation for Candlestick Park. Please see the appendices attached.

APPENDIX B: Construction Chronology Matrix

Candlestick Park - Construction Chronology Matrix

Year	Alterations	Events
1953		By 1953, SF contractor Charles Harney owns a total of 67 acres in Candlestick point area
1954		Mayor George Christopher promises to build 40,000-seat stadium if major league baseball team moves to area; SF voters approve $5 million bond for stadium construction (Jones & Stokes)
1957		April - Mayor Christopher flies to NY to talk NY Giants owner Horace Stoneham into bringing the Giants to SF. May - Mayor George Christopher initiates surveys of possible sites to construct more specialized baseball facilities; City selects CP property owned by Harney as site for stadium and purchases land for $2.7 million; Harney hired as contractor for stadium construction
1958	Construction begins in September of this year; construction cost $15 million (Jones & Stokes)	John S. Bolles designs stadium.
1960	Install Stadium Club facilities (restaurant), (December 20 building permit), cost $190,000. Construct precast reinforced concrete traffic control tower on promenade level; cut doorway opening in exterior wall and construct boardwalk approach to tower (13 July building permit), cost $25,500	April 12 - Opening Day; first stadium built for a major league baseball team on west coast (dodger Stadium completed in 1962)
1961	Construction of "visual background fence behind the centerfield fence in Candlestick Park" (March 7 building permit, cost $36,200)	
1962		Charles Harney dies
1966		Aug 29 - Beatles' last live commercial concert. Bolles begins plans to expand and enclose the stadium for both football and baseball use

1967	Installation of bleachers for football (October 18 building permit), cost $10,000	
1968	Install additional seating (November 7 building permit), cost $19,000	
1969 - 1971	Stadium expanded to seat 62,000 during football games and 59,000 during baseball games (Parks website). Alterations: Astroturf installed in place of natural grass; 30,000 new red & orange plastic seats replace original wood; new main Gate A - eight new ticket booths and special gates for ticket holders; 2 new escalators at Gate A and at Gate E; Gate F, a new entrance, is constructed in right field section of park; moveable stands installed; rubberized track surrounding field installed; new scoreboard in left centerfield; restrooms rehabbed; press box enlarged and rehabbed; new press box in upper deck for football; new lights/extra light tower added. (SF Progress article); Foundation work (Nov 14 Building permit with John S. Bolles Assoc. as architect of record), cost $331,000.	Bolles' plan for new addition approved by SF Bureau of building Inspection
1971	Construct 28'6" x 107' electric scoreboard and new advertising panels at north side of stadium (24 November building permit), cost $130,000. Construct 4' x 109' scoreboard south side of stadium (24 November building permit), cost $14,000	SF 49ers (NFL) move in

1973	Excavation, paving and synthetic surfacing of outfield warning track (March 19 Building permit), cost $70,000. Install new restaurant, John Bolles Assoc. architects of record on building permits/drawings (April 23 building permit), cost $78,000. Note: unknown if restaurant still exists - no location map on scattered drawings available. Highly likely this restaurant has been remodeled/reconfigured since 1973.	
1977	Construct new food stand, lower level - concrete block walls, all new systems, rolling door over counter (February 16 building permit), cost $35,000; Rooms 400 & 401 on promenade remodeled; room 402 remodeled by the 49ers for office space; 406 remodeled with new metal roll up door for use as cushion storage (February 23 building permit), cost $40,000	
1979		Survey by Giants shows that 72 percent of fans said they would go to more games if stadium had a dome
1981	Misc. interior office improvements for SF Giants: new interior partitions, suspended ceiling, new lighting, new finishes (March 24 building permit), cost $36,000	
1982	Installation of eleven (11) exit gates at building exterior (September 8 building permit), cost $75,000	Giants Owner Robert Lurie proposes construction of a new stadium or putting a dome on Candlestick; Mayor Dianne Feinsteinforms Stadium Task Force to explore options for new stadium or dome for Candlestick

1983		SF Bureau of Architecture Department of Public Works and Interactive Resources, Inc., Structural Engineers issue a *Report on the Deterioration of Structural and Architectural Components at Candlestick Park* - report explores water penetration issues and resulting deterioration at Candlestick
1984	Steel columns installed under existing concrete wind baffle girders - part of seismic retrofit (March 29 building permit), cost $14,000	
1985	Various seismic improvements completed as per Feinstein's directives (Mike Gay)	Feinstein steps forward in favor of upgrading stadium facilities for $5 million
1986	Earliest suites installed - have been constantly upgraded since that time (Mike Gay)	SF 49ers threaten to leave Candlestick - team demands luxury suites for attendees, upgraded facilities (Mike Gay)
1987	Addition to football press box (Mike Gay)	
1989		October 17: World Series - SF Giants and Oakland A's/Loma Prieta Earthquake
1991	Fifty-five (55) suite renovations; sixteen (16) vomitory enclosures; modify eight (8) toilet rooms; ADA upgrades at ramp 1-8; conference facility to replace woodworking shop; convert existing Janitor's and storage closets to construct four new shops at Ramp 6 (January 31 building permit), cost $1,640,500.	

1992	Twenty-six (26) suites renovated; football press box windows renovated; luxury suites corridor renovation; concourse widening; Twenty-six (26) suites renovated; football press box windows renovated; luxury suites corridor renovation; baseball press box renovation; remove existing concrete exit stairs on main level and install new concrete exit stairs; baseball press box renovation; remove existing concrete exit stairs on main level; install new concrete exit stairs (January 21 building permit), cost $748,800	
1993	Modifications to Gates 'A' through 'D'; main level concourse widening; seat additions at main level; media compound site improvements; construct Plazas 'A', 'F' and 'E'; new Plaza restrooms & stairs at 'C' Gate; close twenty-two (22) vomitories at upper level (January 28 building permit), cost $2,400,000	Giants begin lobbying for new ball park
1994	Seat alterations; new C Gate stairs; new elevator and ADA improvements (January 1994 building permit) cost $2,689,000. Remodel approx. 2,200 s.f. of office space for Volume Services, located in lower level of CP (building plan set dated Sept. 24, 1995), Nilmeyer & Nilmeyer, architects	
1995	Modify 40 concession stands for handicap access (December 27 building permit), cost $116,100; remodel existing storage room for use as exercise room (July 13 building permit), cost $35,000)	

1996	Modification of stadium seating for disabled access - Sections 5 through 23, lower decks and Sections 1 through 30, upper decks (January 29 Building permit), cost $325,000	Candlestick renamed 3Com park
1997	Modify and install new seats in Sections 3, 5, 7, 8, 9, 14, 18, 19, 21, 28, 32, 34 - work included new accessible seats and handrails (February 13 building permit), cost $375,000	
1998		construction of new Giants ballpark in downtown SF begins
1999	Modify and install new seats in Sections 8, 16, 20, 31, 35, 39, 47 - work included new accessible seats, handrails and path of travel (January 1 building permit), cost $500,000	Sept 30 - last Giants game
2000	Stadium converted to football only facility	
2004		Stadium renamed Monster Park after Monster cable Products, Inc.
2009	construct hospitality seating at dugout ($20, 000)	
ONGOING ALTERATIONS: field turf changes have been ongoing since the 1980s. Regular systems and signage upgrades, as well as changes to food/beverage vendor facilities; remodeling of box seats; expansion, alteration and replacement of stadium seating; and lighting and scoreboard changes have been continual since stadium was constructed. Suites, skyboxes, office spaces and restrooms regularly upgraded, reconfigured and remodeled.		

Appendix J4 CIRCA, Rarity of HPS Military/Industrial Buildings, April 2010

Re: Rarity of HPS Military/Industrial Buildings

I. INTRODUCTION

On 16 December 2009, the City of San Francisco's Historic Preservation Commission (HPC) met to discuss the findings of the cultural resources element of the Draft Environmental Impact Report for the proposed Candlestick Park/Hunters Point Shipyard Phase II project. The Draft EIR analysis is based on the Circa: Historic Property Development's *Bayview Waterfront Project Historic Resources Evaluation: Volume II, Historic Resource Survey and Technical Report,* October 2009 (the Technical Report). The Technical Report evaluated the buildings and structures at HPS. Some structures at HPS have been previously identified as significant historic resources as part of the National Register of Historic Places (NRHP)-eligible Hunters Point Commercial Dry Dock Historic District ("identified historic district"). The Technical Report also identified the California Register of Historical Resource (CRHR)-eligible Hunters Point Commercial Drydock and Naval Shipyard Historic District. As stated in the Technical Report the proposed Hunters Point Commercial Drydock and Naval Shipyard Historic District represents the broad history of HPS. The potential Hunters Point Commercial Dry Dock and Naval Shipyard Historic District is comprised of a collection of buildings, structures, and objects associated with the area's transition from early commercial drydock operation through its period of radiological research. The district encompasses a range of buildings from each of the three primary periods of significance for HPS: early drydocks, Navy use in World War II, and radiological research in the World War II and post-war periods. One issue on which the HPC and other EIR commentators requested clarification was the possibility of a larger district. The HPC also raised a question regarding buildings at Hunters Point Shipyard (HPS) that were once considered common but had the potential to now be considered rare due to the extent of recent military base closures and their redevelopment.

As discussed in the Technical Report (p. 11-16), extensive research was conducted at multiple locations to complete *Bayview Waterfront Plan Historic Resources Evaluation, Volume I: Historic Context Statement* and *Bayview Waterfront Project Historic Resources Evaluation: Volume II, Historic Resource Survey and Technical Report* for the Bayview Waterfront Project (BWP) Environmental Impact Report (EIR). However, the Technical Report scope did not include site visits to other Bay Area military establishments for an in-depth review of existing buildings. To address the HPC's question about the "rarity" of the military/industrial buildings at Hunters Point Shipyard, Circa conducted additional research and site visits to further inform the findings. This memorandum discusses methodology in the following section, and addresses rarity and integrity ("larger district issue") findings in Section III.

Summary of Conclusions

As concluded in the Technical Report, Hunters Point Shipyard is significant to World War II (WWII) military history in the Bay Area, although most remaining buildings are related to ship repair functions as a support facility to the Mare Island Shipyard, Vallejo. Mare Island, and other Bay Area bases and shipyards were historically more significantly associated with the shipbuilding effort and earlier involved in the WWII campaign than HPS, such as those Alameda and Richmond.

Circa found that the most significant theme at HPS, and the one most unique to this site within the Bay Area, is the HPS's role as the National Radiological Defense Laboratory (NRDL) headquarters and radiological research facility (p. 95-96). Unfortunately, most of the buildings associated with the NRDL have been demolished. Beyond these buildings, the most significant remaining building with a direct association to the NRDL is RADLAB (Building 815). That building is located outside the Candlestick Park/Hunters Point Shipyard Phase II project site and will not be affected by Project development.

The boundaries of the proposed extended Hunters Point Commercial Dry Dock and Naval Shipyard California Register Historic District were identified in the Technical Report as encompassing a district that is contiguous, with buildings, structures and objects that are representative of all phases of historic development at Hunters Point Shipyard (through the period of significance) and retains a high level of integrity. While this is true of the proposed district, the same cannot be said of the remaining portions of HPS given the extent of loss of integrity and lack of rarity compared to buildings and districts at other intact military installations in the Bay Area.

II. METHODOLOGY

Rarity

To address the rarity issue, Circa proceeded to compare facilities at Bay Area military installations, using information from the National Park Service and the Base Realignment and Closure Commission (BRAC) website. According to the National Park Service's *World War II in the San Francisco Bay Area* website and the BRAC website, the San Francisco Bay Area's major contribution to WWII was shipbuilding. This was accomplished by a cooperative effort initially of "over 30 shipyards, large and small, and scores of machine shops, and metal and wood fabricators [that] joined together to create the world's largest combined shipbuilding complex...sprawled across hundreds of square miles"[1]. Initial research on several Bay Area bases showed that they are all at various levels of redevelopment, primarily with established

[1] National Park Service, *World War II Shipbuilding in the San Francisco Bay Area*, www.nps.gov/nr/travel/wwIIbayarea/shipbuilding.

redevelopment plans; many of these bases have been found eligible for the National Register or are listed National Register historic districts.

PBS&J staff made initial contact with selected municipalities or other agencies involved with re-use or redevelopment of Bay Area military establishments (both WWII Navy and Army installations). PBS&J conducted research on former bases that had approved redevelopment plans. Circa then reviewed relevant information on these military installation and compiled brief status summaries for each (see Findings section below for summaries). The establishments reviewed include the following:

- **Alameda Naval Air Station** (WWII Association)
- **Mare Island Naval Shipyard** (WWII and Shipbuilding)
- **Moffett Field Naval Air Station / Naval Air Station, Sunnyvale** (WWII Association)
- **Oakland/Alameda Annex** (WWII Association)
- **Department of Defense (DoD) Housing Facility, Novato** (WWII Association)
- **Presidio of San Francisco** (WWII Association)
- **Fort Cronkhite (Presidio)** (WWII Association)
- **Richmond Shipyards** (WWII and Shipbuilding)
- **Oakland Army Base** (WWII Association)
- **Treasure Island Naval Station** (WWII Association)

See below for links to applicable base plans.

After initial PBS&J contacts and research, Circa visited selected former WWII military installations that had the most potential to retain similar building types to those at HPS. These buildings were then were documented for comparative purposes. The general building types documented fell into three general categories: 1) warehousing, supply and industrial support, 2) shops/ship repair and outfitting (large machine/assembly shops, wood-clad shops and metal-clad shops), and 3) administrative, residential and personnel support services. Because of the standardization typical of WWII-era military architecture, buildings within these categories share many of the same functional and design characteristics. The characteristics are commonly found not just in WWII-era buildings on Naval sites but on Army bases, supply depots and other military installations of that period. These general categories exemplify the predominant building types extant at HPS outside of the proposed historic district boundary.

At HPS buildings categorized under the warehousing, supply and industrial support heading are generally located in the south shipyard area of HPS. Storage buildings are somewhat varied in design and nearly all were built along standard Bureau of Yards and Docks designs, modified on occasion to fit specific requirements. The predominant warehouse type is a rectangular plan, warehouse building with redwood shiplap siding, wood-sash windows or wood louver vents, and a monitor roof. This standard plan was used alone or in groupings of two or more.

Buildings categorized under the shops, ship repair and outfitting heading are represented at HPS in three general forms: large machine/assembly shops, wood clad shops and metal-clad shops. Like the warehouses, nearly all were built along standard Bureau of Yards and Docks designs and modified to fit specific functional requirements. The shops are generally rectangular plan buildings, some quite substantial in footprint as well as height. Most of the buildings are wood or steel framed and were originally clad in wood shiplap siding or corrugated steel panels. These shops range in size from smaller gable-roofed buildings with large vehicular entry doors and limited window openings, to one- and two-story full height shop buildings with shallow gabled roof monitors and shed-roofed side wings. The large machine/assembly shops are fewer in number and are either reinforced concrete or steel framed curtain wall shop buildings that are clad in a combination of corrugated steel or transite (cementitious) siding and corrugated safety glass.

Buildings categorized under the administrative, residential and personnel support services heading are typically one- to two-story buildings with wood shiplap siding, horizontal massing and flat or low-pitched gable roofs. These buildings are usually rectangular in plan or irregular plan buildings built in an additive fashion with boxlike additions projecting from a central building mass. This was common as the standardized plans developed by the Army and Navy were adapted by the architectural and engineering firms on site to meet specific circumstances at each military base.

Circa selected sites to visit determined by 1) proximity, 2) reasonably similar historic context and 3) the above-mentioned building typologies. The site visits were conducted at Mare Island Navel Shipyard, Richmond Shipyards, Alameda Naval Air Station and Oakland Army Base on February 19, 2010. A comparison matrix of extant similar building types found at these bases is included in Appendix A. This matrix demonstrates that a number of similar building types exist among the four sites, and that those located outside of the potential district boundaries at HPS are not the only or last remaining buildings of their type in the Bay Area. Because a building-by-building comparison of HPS buildings to those at other installations would be an extensive effort beyond the scope of this study, the general building typologies described above (and used in the matrix headings of Appendix A) identify general architectural features and functional typologies for comparative purposes. The survey matrix shows the results of the site visits to the above listed bases only, and does not include similar extant building types from other known Bay Area military installations. However, the comparative survey provides substantial information to support the conclusion.

Larger District

As noted above, the HPC and other EIR commentators raised the question of the potential of a larger district beyond the proposed extended Hunters Point Commercial Dry Dock and Naval Shipyard California Register Historic District (that also includes National Register eligible buildings) identified in the Technical Report. The following discusses the question of whether a larger CRHR-eligible historic district should be included.

As stated above, PBS&J staff made initial contact with selected Bay Area military establishments and conducted research on former bases that had approved redevelopment plans. This research found that Alameda Naval Air Station, Mare Island Navel Shipyard, Moffett Field Naval Air Station, Presidio of San Francisco, Fort Cronkhite, Department of Defense (DoD) Housing Facility (Novato) and the Richmond Shipyards all have historic districts that are either listed as a National Register Historic District (NRHD) or eligible as such. While the historic district evaluations were not reviewed, it is assumed that the district evaluations are competent and contain sound conclusions. Of the selected sites visited noted above Mare Island Navel Shipyard, Richmond Shipyards, and Alameda Naval Air Station have historic districts. Circa found Mare Island to have a superior, more comprehensive, and much larger collection of similar building types from the WWII period. All of the individual buildings retain a higher level of physical integrity and are within a significant concentration and continuity of physical development and context to constitute a historic district as compared to those at Hunters Point Shipyard.

A review of HPS maps and photographs from past time periods, as well as written documentation, demonstrates that substantial demolition occurred at HPS since 1974. Of the roughly 530 buildings/structures existent at the height of operation, over 400 have been demolished.[2] The 130 buildings remaining as of 2008 represent less than 25 percent of what was there originally. Circa compared the HPS documents to the established historic districts at military installations noted above. Only those remaining in the proposed extended Hunters Point Commercial Dry Dock and Naval Shipyard California Register Historic District best represent the HPS during the period of significance. The resulting data was applied against the National Register definition of and criteria for "historic districts". This topic is discussed below under Findings.

III. FINDINGS

Rarity Issue

Circa reviewed preliminary research on closed bases as summarized below.

The findings of the preliminary information survey are summarized using information from relevant redevelopment/reuse agencies and data from the BRAC website.

- **Name: Alameda Naval Air Station**
  Summary: Commissioned in 1940 and supported the Navy's defense until its closure in 1997. It contains a National Register eligible WWII Historic District. The Reuse Plan was adopted in 1996, http://www.alameda-point.com/AP.html

- **Name: Mare Island Naval Shipyard**
  Summary: Commissioned in 1854 for shipbuilding operations and was the first naval station on the Pacific Coast. The shipyard was closed in 1996. It contains a National Register Historic District with buildings built from 1854 until the end of WWII. The Specific Plan was adopted in 1999, amended 2008, http://www.ci.vallejo.ca.us/GovSite/default.asp?serviceID1=549

- **Name: Moffett Field Naval Air Station / Naval Air Station, Sunnyvale**
- **Summary:** Commissioned in 1933 to support a "lighter-than-air" program but was soon turned over for flight training and was used to support Navy aeronautical activities. The

[2] See NAVSEA, Hunters Point Shipyard. Final Historical Radiological Assessment: History of the use of General Radioactive Materials, 1939-2003. San Francisco, 2004. *Table 3-3: Current and Former Facilities at HPS by Building Number*.

air station was closed for Navy use in 1994 but has continued in research for NASA Ames Research Center. It contains the Shenandoah Historic District. The Redevelopment/Historic District Development Plan was adopted in 2002, http://www.researchpark.arc.nasa.gov/Public/publicDocs.html

- **Name: Oakland/Alameda Annex**
- **Summary:** Commissioned in 1941 for use as Army airport depot and later used by the Navy (1946) as a main supply center supporting the operation of fleets. The center was closed in 1998. As of the writing of this report no redevelopment plan was received however the BRAC office states that the "intended reuse includes residential and commercial/industrial components"[3]

- **Name: Department of Defense (DoD) Housing Facility, Novato**
- **Summary:** Commissioned in the early 1940s by the Air Force until 1974 when the Navy took over the housing and community services and the Army took over the runway and related structures. The center was closed in 1997. According to the Redevelopment Office " The 600 acre former military base is one of the most successful base reuse projects in the country. Over a billion and a half dollars in private investment in 10 years. Over 2,000 new homes ... one of the largest wetlands restoration projects in the history of the country; numerous recreational facilities, open space and trails and a museum; & affordable artist studios in an art center. The hangars have been redeveloped and renovated for office and technology space. A few sites and buildings remain vacant or underutilized."[4] As of the writing of this report no redevelopment plan was received however according to the City of Novato a plan was adopted in 1999.

- **Name: Presidio of San Francisco**
- **Summary:** Established by Spain in 1776 the Presidio became a Mexican outpost in 1822 and then taken over by the U.S Army in 1847. It is the oldest military installation in the west. The US Army closed the Presidio as a military base in 1994, and transferred it to the National Park Service. In 1996, the Presidio Trust Act gave jurisdiction of the 1,168-acre inland area of the Presidio to the Presidio Trust; the NPS continues to manage the shoreline. Congress created the Presidio Trust to manage the Presidio, with a focus on preservation and leasing of its buildings. The Presidio is a National Historic Landmark of which over 450 buildings are on the National Register. Since 1996, the Presidio Trust has managed and rehabilitated about 2/3 of the over 800 buildings at the Presidio. The Redevelopment/Management Plan was adopted in 2002, http://www.presidio.gov/trust/documents/environmentalplans/ptmp.htm

- **Name: Fort Cronkhite**
- **Summary:** The National Park Service considers Fort Cronkhite (along with Forts Baker and Barry) to be excellent examples of early coastal defense structures from 1918 until after 1945. Fort Cronkhite was closed in 1974, just after the property was listed in the

[4] Email communication Ron Gerber**,** Redevelopment Administrator, Community Development Department Planning Division, email: rgerber@cityofnovato.org

National Register of Historic Places as the Forts Baker-Barry-Cronkhite Historic District. It was then transferred to the National Park Service. The Golden Gate National Recreation Area (GGNRA) General Management Plan was adopted in 1980 http://www.nps.gov/goga/parkmgmt/completed-plans-and-projects.htm

- **Name: Richmond Shipyards**
- **Summary:** No shipyards existed in Richmond prior to WWII. The four Kaiser shipyards (some in partnership with the established Todd Shipyards) grew seemingly overnight between 1941-1942 to meet wartime demand. These private facilities closed in 1945. The Richmond Shipyard # 3 is part of the *Rosie the Riveter/World War II Home Front National Historical Park*, and is listed on the National Register. Its General Management Plan was released in January of 2009. The plan explores three different alternatives for developing and managing the new national park in Richmond, California, http://www.nps.gov/rori/parkmgmt/planning.htm

- **Name: Oakland Army Base**
- **Summary:** Commissioned in 1941 to augment the cargo facilities at Fort Mason in San Francisco. The facilities were closed in 1999. Much of former base is being used by lessees of the Port of Oakland and Oakland Redevelopment Agency to generate income for future development. The Oakland Army Base (Army Base) Redevelopment Area Plan was adopted in 2002, http://www.business2oakland.com/main/oaklandarmybase.htm

- **Name: Treasure Island Naval Station**
- **Summary:** The man-made island was constructed in 1936 for the purpose of hosting (along with Yerba Buena Island) the Golden Gate International Exposition Worlds Fair (1939-1940). The Navy acquired the island in 1942 for a primary use as a military personnel-processing center. The island was closed for Navy use in 1997 and is currently being maintained by Treasure Island Development Authority through a cooperative agreement with the Navy. A Development Plan and Term Sheet developed in 2006 and serves as the basis for the Redevelopment Plan. The final project approvals are expected in early 2011.

This preliminary review of existing military installations also helped to inform the sites chosen for the field survey. Selection of sites to visit was determined by 1) proximity, 2) reasonably similar historic context (WWII defense/ship repair/military architecture/radiological research) and 3) the above-mentioned building typologies.

In comparing the remaining buildings at Hunters Point Shipyard with similar buildings at the identified military installations, survey findings show that the buildings outside of the identified CRHR-eligible Hunters Point Commercial Dry Dock and Naval Shipyard Historic District are not the last remaining or best examples of their types. In most cases, the HPS buildings are inferior to similar buildings at other bases in regard to physical integrity and condition. Most, if not all, of the similar buildings at the other bases retain their original cladding materials – undamaged or obscured by secondary siding materials - and original wood windows, among other character defining features. Furthermore, Alameda Naval Air Station and Mare Island

Naval Shipyard both exhibit a high degree of overall integrity, retaining and reusing a number of administrative, residential, industrial and storage type buildings similar to those at HPS.

As can be seen in the chart in Appendix A, Mare Island has a superior, and more comprehensive, collection of similar shop, storehouse and residential and related building types from the WWII period, all with a higher level of physical integrity than those at Hunters Point Shipyard (see panorama view of shop/storage buildings at Mare Island below.

Figure 1. Mare island shop/storage buildings in historic district (photo by Circa, February 2010).

Various iterations of the warehousing, supply and industrial support buildings can be seen on other bases, as can similar wood and metal clad shop buildings. Similar examples of large machine/assembly shops are also seen at Mare Island, in the protected industrial historic district area. Better examples of WWII residential and related buildings, including barracks, can also be found at The Presidio, Fort Baker, or Fort Cronkhite.

Review of adopted redevelopment plans for the former bases and site visits show that many of these similar buildings types are being retained and are planned for reuse. Many have been successfully reused for years and are important contributors to the economic health of the reused military sites. A number of these sites have been found eligible for the National Register or are listed as National Register historic districts. Alameda Naval Air Station, Mare Island Navel Shipyard, Moffett Field Naval Air Station, Presidio of San Francisco, Fort Cronkhite, Department of Defense (DoD) Housing Facility and the Richmond Shipyards all have historic districts that contain WWII buildings currently being reused or planned for reuse. A number of the implemented redevelopment plans have preserved, rehabilitated and/or reused scores of buildings that are a model for economic success while retaining a high level of historic significance and integrity.

The remaining buildings outside of the identified CRHR-eligible Hunters Point Commercial Dry Dock and Naval Shipyard Historic District are not the last remaining or best examples of their types. The majority of the remaining buildings at the HPS are inferior to like-buildings at other Bay Area bases. In addition, similar buildings at the other bases retain their original materials and character-defining features at a higher level of integrity, and convey the historic context within their period of significance. All of the seven National Register (or NR eligible) historic districts historic are retaining, rehabilitating and reusing buildings similar to those at HPS.

LARGER DISTRICT ISSUE

The Technical Report found that the extant buildings located outside of the proposed Hunters Point Commercial Dry Dock and Shipyard Historic District do not qualify as contributors to a larger historic district because:

1) Better examples of these types of buildings are found within the proposed district, within the Bay Area, and on military bases through the United States;
2) Inclusion of these buildings within the proposed historic district would not expand or augment the historic context or architectural value of the proposed historic district;
3) The site does not retain enough integrity as a whole to justify an expansion of the proposed district.

As a whole, the physical integrity of Hunters Point Shipyard has been compromised as a result of ongoing demolition at the site since base closure. This loss of historic fabric includes the demolition of all buildings on Parcel A (except Building 101); the removal of numerous buildings and structures on Parcels B, C, and E; and the demolition of a significant number of buildings, structures and objects - including recent removal of sections of the roadway system, rail spurs, signage and light standards - on Parcel D. All dry dock cranes, with the exception of the bridge crane at the regunning pier, have also been removed from the site.[5] See below for recent photos showing roadway removal, and Appendix B for figures illustrating the extent of the site during wartime.

Figure 2. View south on Cochrane Street, looking toward west elevation of Building 351A (Photo by Mike Mentink, June 2008).

[5] Many of the remaining buildings have been leased for other uses since base closure. These later uses may have resulted in further degradation of the interior integrity of the buildings, though the extent to which interior alterations have altered original configurations unknown. Circa's survey work was limited to exterior review only.

Figure 3. View toward north elevation of building 411 (Photo by Mike Mentink, June 2008).

As discussed above, demolition has been a common factor at HPS since it was decommissioned as a Naval base in 1974. Of the roughly 530 buildings/structures that existed at the height of production at HPS, about 400 have been demolished. The 130 buildings remaining in 2008-9 represent less than 25 percent of the original built environment.

The 130 buildings remain outside the identified historic district 116 are categorized in Appendix C by the three building types, and identified by building number and original use. The remaining fourteen buildings that do not fall into these general categories are considered minor buildings (i.e. windowless substations or small pump houses) or have low integrity. They would not be considered primary contributors to a historic district.

- Building 122 (Substation "V" and Compressor Plant)
- Building 135 (Substation "G")
- Building 206 (Substation "A")
- Building 229 (Substation "L")
- Building 236 (Salt Water Pump House)
- Building 238 (Unknown)
- Building 300 (Substation "N")
- Building 306/306A (Substation "I")
- Building 308 (Salt Water Pump House)
- Building 412 (R.R. Scales)
- Building 521 (Power Plant - South Area)
- Building 523 (Fire Protection Pump Station)
- Building 707 (Animal hospital building; NRDL annex N; Animal colony; waste processing)
- Building 708 (NRDL Bio-med Facility/animal research; Animal psychology study colony)

Below is a summary listing of the buildings that have been lost since HPS was in full operation:[6]

Parcel A:

- A residential district containing about 50 residential buildings, some built in the early decades of the 20th century and others constructed by the Navy when it acquired the shipyard; these residential buildings were used as for married personnel quarters between 1939-1974 when HPS was an active Navy base. This collection of residential buildings included the following:

    - Buildings A-O – 17 Officers' Quarters
    - Buildings E, R and S-Z - Residences
    - Buildings R-3 to R-119 – 26 civilian residential quarters
    - Building 19 – Apartment house
    - 13 Homoja Homes (Quonset huts)
    - Associated greenhouses, garages, a water tank and gardener's tool houses

- Building 100 - Main Electrical Substation for Navy power
- Building 102 – Personnel building, Office of Naval Research, Security Administration and Post Office
- Building 106 – Watch tower, gatehouse
- Building 151 –Bus Shelter
- Building 158 - Sentry House and Main Gate
- Building 322 – Guard and Pass Office
- Building 805 – Guard Shelter/Personnel Shelter
- Building 816 – High Voltage Particle accelerator and Van De Graff Accelerator (RADLAB related)
- Building 818 – Water treatment plant
- Building 901 – Officers' Mess Building, Officers' Club and rental housing
- Building 908 – Garages, 5 cars
- Building 915 – Bank Building
- Building 916 – Chief Petty Officer's Club and Package Liquor Store
- Building 917 – Grocery Store
- Building 921 – Bachelor Officers Quarters
- Building S-807 – Small arms magazine

Parcel B:

- 23 Apartment Buildings – area shown as Soloman Village, adjacent to submarine repair area and across from residential district (Parcels A & B)

Final Historical Radiological Assessment: History of the Use of General Radioactive Materials, 1939-2003 (San Francisco, 2004) *Table 3-3: Current and Former Facilities at HPS by Building Number* and Appendix C: Historical Drawings and Photographs. Also, JRP Historical Consulting Services, *Historic Context and Inventory and Evaluation of Buildings and Structures: Hunters Point Shipyard*. Prepared for Engineering Field Activity West, Naval Facilities Engineering Command (September 1997), DPR forms; and 'Building List as of 30 June 1973: Hunters Point Naval Shipyard, San Francisco, California" by the Public Works Engineering Division (held at the San Francisco History Room, San Francisco Public Library).

- Building 27 - Clocking Station
- Building 105 – Watch tower/Gatehouse
- Building 108 – Temporary Marine Barracks and Electronics
- Building 114 – Submarine Barracks, Design Branch, Technical Library and Administrative Building
- Building 118 – Submarine Bachelor's Officers' Quarters and Administration
- Building 119 – Medical Stores and Temporary Training School and Infirmary
- Buildings 127, 144 – Latrines
- Building 131 – Substation "U"
- Building 141 – Dock Shipwrights' Shop
- Building 142 - Air Raid Shelter "A", Personnel Shelter
- Building 143 – Joiner/Carpenter Shop (DD3)
- Building 145 – Saltwater Pumphouse
- Buildings 150, 152 – Bus/Personnel Shelters
- Building 155 – Area Time Office #2
- Buildings 161, 162 – Maintenance service center and paint storage

Parcel C

- Buildings 34, 72 – Clocking Stations
- Building 111 – Lubricating Oil Pump house
- Building 112 – Diesel Oil Pump house
- Building 126 – Submarine Pier Office
- Building 201 – Tugmaster's Office and Administration Building
- Building 210 – Dispensary
- Building 232 – Bus shelter
- Building 234 – Ship Superintendent Office and Administration Building, latrine
- Building 235 – Shop 38 Central Tool Room Annex and General Warehouse
- Building 257 – Galvanizing Plant
- Building 270 – Paint Shop/Ship Repair Shop
- Various substations and storage facilities

Parcel D

- Building 305 – Storage
- Building 311 – Latrine, Ship Superintendent's Office and Administration building
- Building 313 – National Radiological Defense Laboratory (NRDL)
- Building 313A – RADIAC Instrument Development, Instrumentation Lab, Lab Offices
- Building 322 – NRDL Instrumentation Branch Offices
- Building 364 – Animal Irradiation Facility, Research Animal Facility
- Buildings 374-377 – Instrumentation and Control facilities
- Building 408 – Furnace Shelter
- Building 434 – Supply Storehouse
- Building 501 – Ships' Barracks and Teen Club
- Building 502 - Ships' Barracks
- Building 503 – Navy Exchange, Launderette, Ships Subsistence and Laundry
- Building 504 – Laundry office

- Building 519 –Chapel
- Building 522 – Bus shelter

Parcel E

- Building 506 – Housing, Navy Exchange and ROICC Offices; Low Power neutron Generator, Nuclear and Physical Chemistry Branch (NRDL)
- Building 507 – Public Works Office
- Building 508 – Locker Club, Barracks, Temporary Barracks, Employee Relations; NRDL Annex J
- Building 509 – Enlisted Personnel and Disbursing Office, Library
- Building 510/510A – naval investigation Service/Naval Ordinance Laboratory
- Building 511/511- Pacific Reserve Fleet Headquarters/Administrative building; material shelter and hobby shop
- Building 512 – Elementary School
- Building 513 – Ships Barracks
- Building 514 - Ships Barracks
- Building 515 - Ships Barracks
- Building 516 - Ships Barracks
- Building 517 – Marine Storage, NRDL Bio-med Lab, General Research Labs
- Building 518 – Motion Picture Theater
- Building 520 – Dental Clinic
- Building 524 – Pacific Reserve Fleet Supply Building and General Warehouse
- Building 803 – Commissary
- Buildings E-1 to E-120 - Homoja village - 120 Homoja huts (Quonset huts)
- Buildings M-1 to M-17 - 17 Homoja huts
- Buildings O-1 to O-38 - 38 Homoja huts
- Various warehouses and storage facilities

Given the historic contexts of early commercial docking facilities, state-of-the-art ship repair and activities associated with a major national research institution (NRDL), Circa considered the potential that HPS could contain a larger historic district. However, due to the lack of physical integrity (of the individual remaining buildings and the larger site as a functional whole) resulting from the factors listed below, it was concluded that only very few buildings retained enough integrity to warrant further evaluation as historic resources or consideration as contributors to a larger historic district. These factors include:

- extensive demolition of important buildings and structures;
- maintenance deferral/deterioration/neglect;
- extensive use of secondary (asbestos) siding on many of the buildings and/or removal or replacement of original features;
- removal of character-defining features of the site and the altered relationship between some of the buildings and structures.

For purposes of evaluating *physical* integrity of individual buildings at HPS, the following definitions for each level of integrity were developed. The seven aspects of integrity as identified by the National Park Service are location, design, setting, materials, workmanship, feeling, and association. These are discussed in the following section. This integrity evaluation scale was developed for use in the field to categorize buildings without having any information as to the property's associative significance (association with significant events/people). As such, discussion of the Association aspect of integrity is not included in the scale below. Integrity of location is also not discussed in the scale below as it is assumed, based on the lack of documentation to prove otherwise, that none of the HPS buildings were relocated. This scale deals with the more tangible qualities of physical integrity retention – those materials and features that are still extant and appropriate to the period. The Integrity Matrix in Appendix D identifies physical integrity as defined below only, for each of the remaining buildings.

> High: Buildings that exhibit an excellent degree of integrity of design, materials, feeling, workmanship and setting. Such buildings retain, to a high degree, original materials and features including exterior siding and window materials, architectural detailing and stylistic features. Their general setting and physical context is intact. These buildings may have modest alterations, additions and/or are in good to excellent physical condition (that has not had an impact on the structural condition) that have had little impact on the overall historic integrity of the property.

> Moderate: Buildings that exhibit a moderate degree of integrity of design, materials, feeling, workmanship and setting. Such buildings retain approximately 50 percent or more of the building's original materials, form and features including one or more of the following: exterior siding and window materials, architectural detailing and stylistic features. Their general setting and physical context is somewhat intact. These properties may have alterations or additions but the general form, massing and original stylistic features of the building – the basic elements that allow it to communicate its historic character - remain intact, and are in fair to good physical condition (that has not had an impact on the structural condition).

> Low: Buildings that exhibit a low or negligible degree of integrity of design, materials, feeling workmanship and setting. Buildings with low integrity are those with two or more of the following: removal and replacement of original windows with modern sash (vinyl or aluminum, usually), a majority of siding replacement, significant alterations to the setting/physical context and/or notably incompatible or out of scale additions, and/or are in poor to fair physical condition that has had an impact on the structural condition. Buildings that rank low are not considered to retain a degree of physical integrity that would warrant listing as an individual resource or as part of a district.

When assessing a potential historic resource, one must evaluate and clearly state the significance of that resource to American history, architecture, archaeology, engineering, or culture. A resource may qualify as a historic resource if it meets one or more of the applicable (National, state, or local) criteria for significance *and* possesses historic integrity. Historic properties must retain sufficient historic integrity to convey their significance. According to the Office of Historic Preservation's Technical Assistance Series Bulletin #6:

> Integrity is the authenticity of an historical resource's physical identity evidenced by the survival of characteristics that existed during the resource's period of significance.

> Historical resources eligible for listing in the California Register must meet one of the criteria of significance described above and retain enough of their historic character or appearance to be recognizable as historical resources and to convey the reasons for their significance. It is possible that historical resources may not retain sufficient integrity to meet the criteria for listing in the National Register, but they may still be eligible for listing in the California Register.[7]

The National Register recognizes seven aspects or qualities that define historic integrity:

- Location: The place where the historic property was constructed or the place where the historic event occurred.
- Design: The combination of elements that create the form, plan, space, structure, and style of a property.
- Setting: The physical environment of a historic property.
- Materials: The physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.
- Workmanship: The physical evidence of the crafts of a particular culture or people during any given period in history or prehistory.
- Feeling: A property's expression of the aesthetic or historic sense of a particular period of time.
- Association: The direct link between an important historic event or person and a historic property.

To retain historic integrity, a resource should possess several of the above-mentioned aspects. The retention of specific aspects of integrity is essential for a resource to convey its significance. Comparisons with similar properties should also be considered when evaluating integrity as it may be important in deciding what physical features are essential to reflect the significance of a historic context.

To assess a building's ability to contribute to a historic district, the above-listed attributes must be applied. Applying the identified historic contexts of early commercial docking facilities, state-of-the-art ship repair and activities associated with a major national research institution (NRDL), the 130 remaining buildings (more than 45 years old) located outside the identified Hunters Point Commercial Dry Dock and Shipyard Historic District were reviewed for their ability to be contributors to an extension of the proposed Historic District or as a separate historic district(s):

Location: Based on the lack of documentation to prove otherwise, it is assumed that none of the HPS buildings were relocated; therefore, they retain integrity for Location.

Design: The design of the remaining buildings outside the proposed historic district are primarily derived or adapted from standard plans from the Bureau of Yards & Docks. Better examples of these types of buildings are found within the proposed district, within the Bay Area, and on military bases through the United States. Because of alterations of individual buildings and

[7] Office of Historic Preservation, Department of Parks and Recreation. California Register and National Register: A Comparison. Technical Assistance Series No. 6.

extensive base wide demolition, the remaining HPS buildings display a significantly diminished degree of physical integrity and condition.

Setting: The physical integrity of the HPS site has been compromised as a result of ongoing demolition, including the demolition of all buildings but one on Parcel A; the removal of numerous buildings and structures on Parcels B, C, and E; and the demolition of a significant number of buildings, structures, and objects (sections of the roadway system, rail spurs, signage and light standards) on Parcel D. The remaining HPS buildings display a significantly diminished degree of integrity of Setting.

Materials: The materials of the remaining buildings outside the proposed Historic District are generally intact; however most of the buildings have secondary cladding materials and window alterations/replacement. Original machinery and other character defining features have been removed. In addition, most suffer from various degrees of deterioration and neglect, and many are in poor condition; they display a significantly diminished degree of integrity of Materials.

Workmanship: The remaining HPS buildings were built from standard plans from the Bureau of Yards & Docks and do not exhibit any particular evidence of "craft". They are inferior to similar buildings at other bases, and therefore they do not display integrity of Workmanship.

Feeling: Of the roughly 530 buildings and structures that existed at the height of operation at HPS, over 400 have been demolished. Due to the extensive demolition of at the site many of the 130 remaining buildings have lost their relationship to one another. In addition, sections of the roadway system, rail spurs, signage, light standards, and dock cranes have been removed, a cumulative impact that has further decreased the integrity of feeling at this former WWII Naval facility. Mare Island has a superior and more comprehensive collection of WWII-era buildings, all with a higher level of physical integrity and sense of place. The areas outside the identified historic district display a significantly diminished degree of integrity of Feeling.

Association: While the remaining buildings are linked to WWII military history, most remaining buildings are related to ongoing the HPS ship repair function as an annex to the shipyard at Mare Island. Other bases and shipyards were more directly associated with shipbuilding and earlier involvement with the WWII campaign and retain a higher level of physical integrity. Further, the site has not been used by the Navy since base closure in 1974 and has lost integrity of association.

In addition to its role in ship repair, HPS was uniquely associated with Cold-War-era radiological research and served as the NRDL headquarters. However, most of the buildings outside the identified historic district associated with the NRDL have been demolished and therefore do not retain integrity of Association with that context.

Therefore, the buildings extant at the HPS as of 2008-9 outside the identified historic district, and the larger shipyard site as a whole, do not retain a level of historic integrity to fully communicate their historic significance that would justify a larger historic district. HPS fails to meet the integrity criteria when compared to other military installations in the Bay Area that have similar buildings used for similar uses and that display higher levels of integrity that strongly convey their historic significance. Information based on records and plans, and site visits provide a substantial basis for concluding that the buildings at HPS are not rare such that they would be considered individual historic resources or contributors to a larger historic district.

It should also be noted that in the comparison of military installations it became apparent that while these bases supported integrated WWII activities during the period of significance, bases were also very self-sufficient in nature with their own chapels, movie theaters, recreational playing fields, housing, and personnel support facilities - as well as the industrial-related buildings. Due to extensive demolition, this pattern is no longer reflected in the built environment at HPS. Since the extant buildings located outside the identified historic district boundaries display (both individually and as a whole) a significantly diminished level of integrity, inclusion of the remaining buildings outside of the Historic District would diminish the integrity of the identified historic district as a whole.

Though HPS is significant to WWII military history in the Bay Area, most remaining buildings are related to ship-repair functions, as an annex to the shipyard at Mare Island. In addition to Mare Island, other bases and shipyards such as Alameda and Richmond, were more significantly associated with the shipbuilding effort and involved earlier in the WWII campaign than HPS.

Furthermore, in our professional opinion, the most significant theme at HPS, and the one most unique to this installation within the Bay Area, is the site's role as the NRDL headquarters and radiological research facility. As part of recent environmental remediation efforts, most of the buildings associated with the NRDL have been demolished. However, Dry Docks 2 and 3, Building 224 (bomb shelter, NRDL Annex K), and Building 253 (Optical, Ordinance and Electronics Shop), located in the identified potential historic district, were used in various functions by the NRDL. Beyond these buildings, the most significant remaining building with a clear association to the NRDL is Building 815 that is outside the project site.

The boundaries of the proposed historic district were identified as encompassing a district that is contiguous, with buildings, structures and objects that are representative of all phases of historic development at Hunters Point Shipyard (through the period of significance) and retains a high level of integrity. While this is true of the proposed district, the same cannot be said of the remaining portions of the shipyard given the widespread loss of integrity and lack of rarity compared to other intact military installations in the Bay Area.

Should there be any questions please contact me 415-362-7711.

Sincerely,

Sheila McElroy
Principal, Circa: Historic Property Development

APPENDIX A

Appendix A: Building Comparison Matrix

Building Category/Type	HUNTERS POINT SHIPYARD	MARE ISLAND	OAKLAND ARMY BASE	ALAMEDA NAVAL BASE
WAREHOUSING, SUPPLY AND INDUSTRIAL SUPPORT				
	 Building 400 (1943) - Supply storehouse  Building 404 (1943) - Supply storehouse  Building 810 (1943) - Paint and Oil Storage	 Building 527  Unnumbered storage buildings (1940s)  Unnumbered storage building (1940s)  Building 571 (1940s-1950s)	 Supply Storehouse 1 (1940s)  Supply Storehouse 2 (1940s)	 Building 91 and neighbor (1940s)

SHOPS, SHIP REPAIR & OUTFITTING

Large Machine/Assembly Shops

Building 411 (1947) - Shipfitters, Welders & Boilermakers Shop; Ship Repair Shop

Building 382 (1941) - Sub Assembly Shop

Building 231 (1942-1945) - Inside Machine shop; Ship Repair Shop
Located within proposedexpanded historic district

Building 386/388/390 (1920/1922/1922) - Forge Shop/Structural Shop/Shipfitting Shop

Building 351 (1945/1960 addition) - NRDL Annex E (late 1940s through early 1950s); Electronics Shop

Building 680 (1940) - Machine & Optical Shop/Masonry Industrial Shop

Building 503 (c.1940) - unidentified

Appendix A: Building Comparison Matrix

Wood-Clad Shops

Building 251 (1942) - Storage & Issue Building; Electricians' Shop

Unnumbered shop building (1940s)

Building 230 (1943) - Shop Service building; Machine Shop

Building 639 - wood-clad gabled shop building (1940s)

Metal-Clad Shops

Building 123 (1943) - Battery Overhaul & Storage

Building 213 (1917) - Storage/Metal Clad Industrial, Ordinance Storage or Warehouse

Unnumbered shop building (c.1950s?)

Building 274 (1950) - Sheetmetal Annex

Building 115 (1901) - Electric Shop

Building 366 (1952) - Boat Shop/plastic shop

Appendix A: Building Comparison Matrix

ADMIN, RESIDENTIAL & PERSONNEL SUPPORT SERVICES

Building 228 (1944) - Central Cafeteria

Building 737 (1944) - WAVES Officer's Subsistence/Barracks

Building 505 (1943) - Navy Exchange Building and Gymnasium

Building 115/116 (1943-44) - Submarine Applied Training School; Submarine Subsistence

Building 137 (c.1940s) - personnel services type

Building 500 (1943) - Barracks; Ship Officers Bachelors Quarters

Building 733 (1944) - WAVES Officer's Quarters/Barracks

Unnumbered U-plan building (c.1940s) - barracks/personnel services type

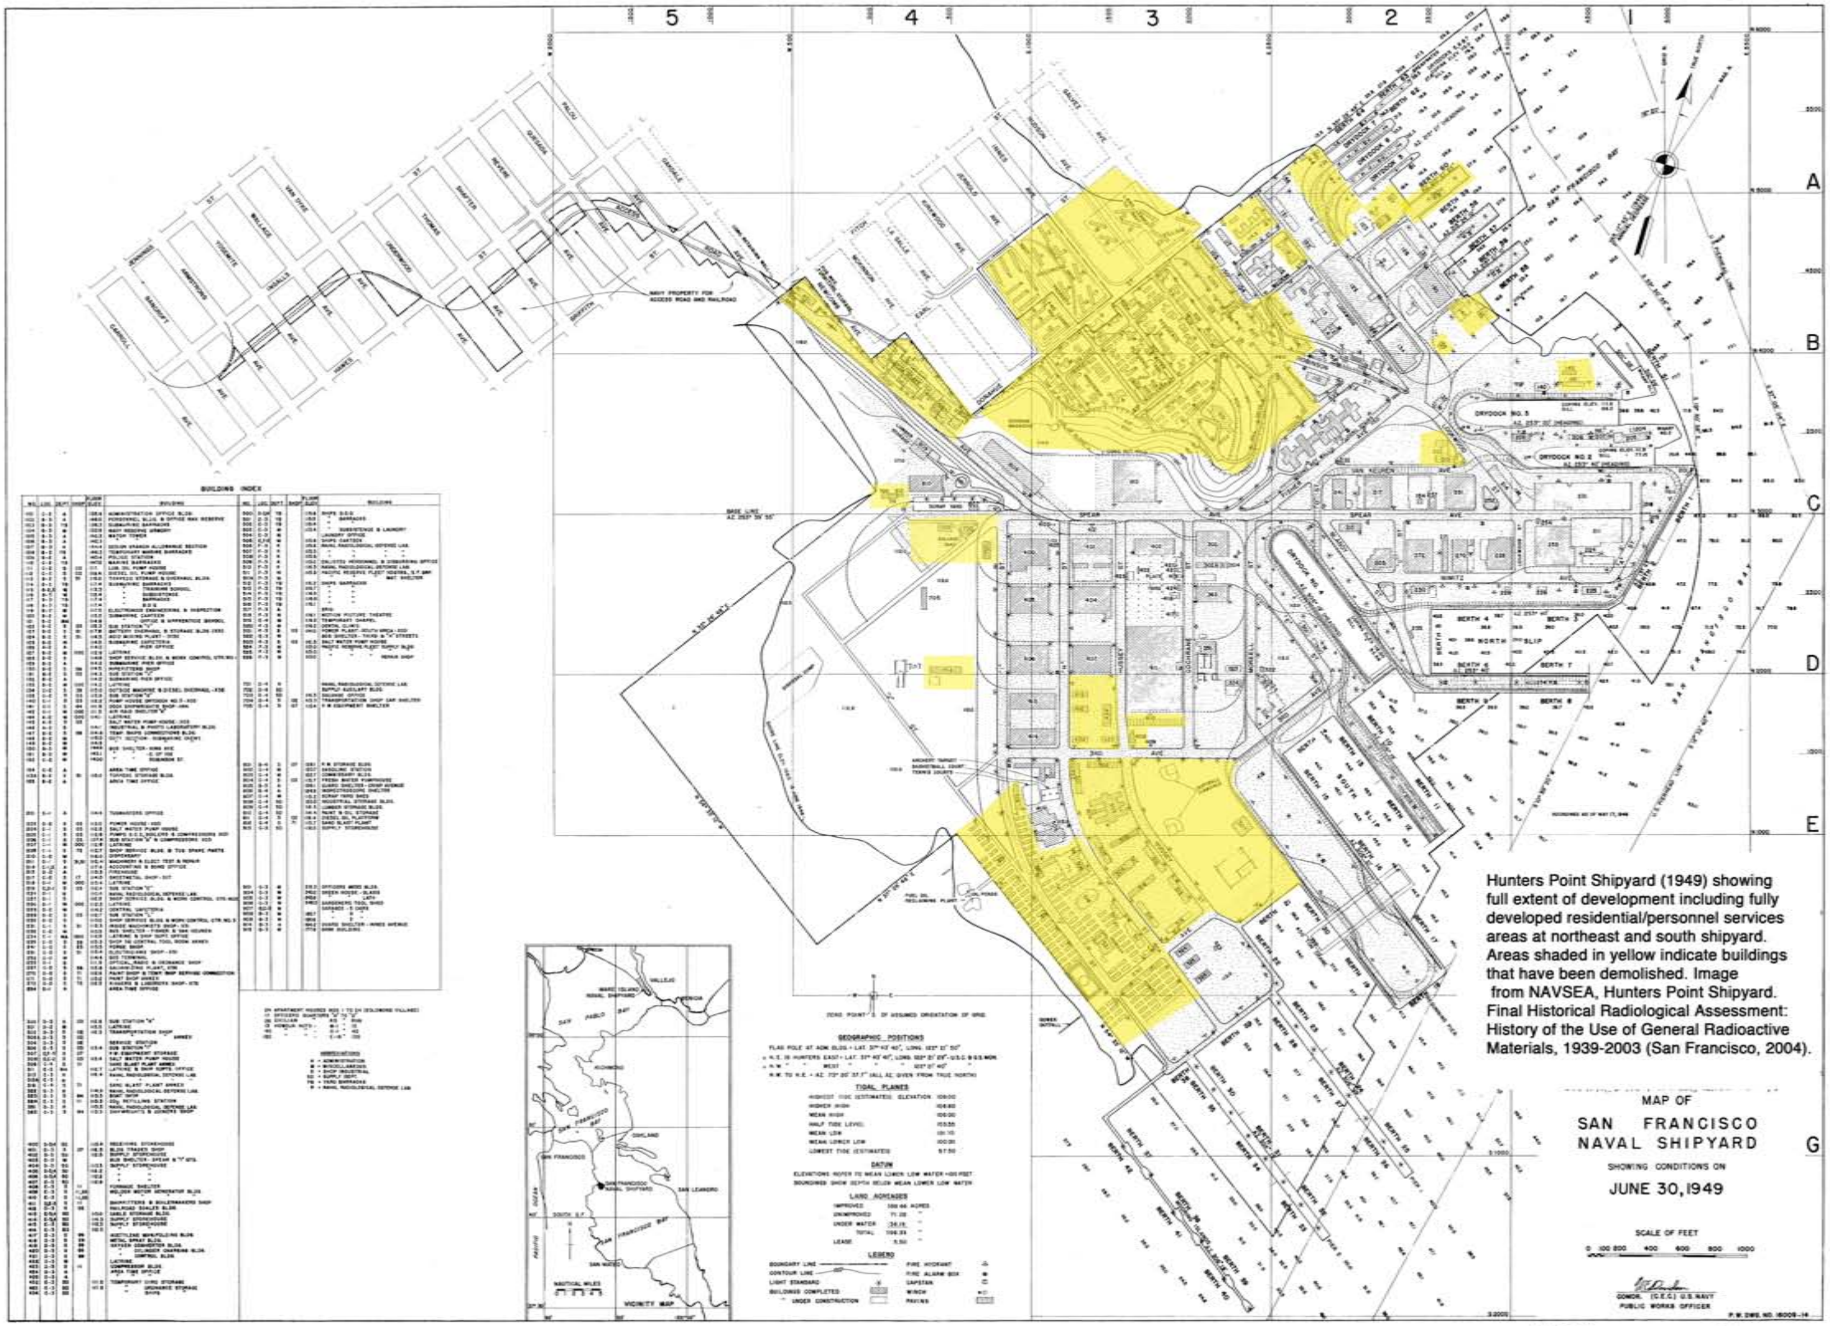
Building 117 (1943) - Submarine Barracks

Building 78 (c.1940s) - barracks

APPENDIX B

Appendix B: Photographs and Maps

Hunters Point Shipyard (ca. 1945) showing full extent of development. Image from NAVSEA, Hunters Point Shipyard. Final Historical Radiological Assessment: History of the Use of General Radioactive Materials, 1939-2003 (San Francisco, 2004).



Hunters Point Shipyard (1949) showing full extent of development including fully developed residential/personnel services areas at northeast and south shipyard. Areas shaded in yellow indicate buildings that have been demolished. Image from NAVSEA, Hunters Point Shipyard. Final Historical Radiological Assessment: History of the Use of General Radioactive Materials, 1939-2003 (San Francisco, 2004).

APPENDIX C

Appendix C: Buildings Listed by General Category

Warehousing, supply & industrial support		Shops, ship repair and outfitting		Administrative, Residential & Personnel support services	
Building 400	Supply storehouse	**Building 113**	Torpedo Storage & Overhaul/Tug Maintenance; non-destructive testing (X-ray) - NRDL related	**Building 101**	Administration Building, Civilian Cafeteria
Building 402	Supply storehouse	**Building 123**	Battery Overhaul & Storage; Substation "T"	**Building 103**	Submarine Barracks; Personnel Decontamination Center for OPERATION CROSSROADS
Building 404	Supply storehouse	**Building 128**	Substation "U"; Work Control Center #1; Shop Services; Ship Repair Shop	**Building 104**	U.S. Naval Reserve Training Center, Naval Reserve Armory; Submarine Barracks
Building 405	Supply storehouse	**Building 130**	Pipefitter's Shop; Shipbuilding & repair shop	**Building 109**	Lincoln restaurant; HPSY Police Station
Building 406	Supply storehouse	**Building 134**	Outside Machine Shop; Diesel Overhaul; Quality Assurance Offices	**Building 110**	Marine Barracks & Mess
Building 407	Supply storehouse	**Building 146**	Industrial Photo & Laboratory Building; Electronics Repair & Storage	**Building 116**	Submarine Applied Training School; Submarine Subsistence
Building 413	Supply storehouse; Cable storage building	**Building 156**	Rubber Shop; Pipefitters Shop Annex	**Building 117**	Submarine Barracks
Building 414	Supply storehouse; Mold loft (1945); radium storage area	**Building 217**	Sheetmetal Shop & Ship Repair Shop	**Building 120**	Canteen, Enlisted Men's Club
Building 415/416	Supply storehouse	**Building 225**	Shop Service building; Work Control Center #2	**Building 121**	Submarine Offices; Apprentice School; Submarine Repair Shop; Administration Building; Civilian Training center
Building 435	Equipment Storage; General Warehouse	**Building 230**	Shop Service building; Machine Shop	**Building 125**	"Submarine Cafeteria"
Building 436	Paint & lumber storage	**Building 241**	Boilermakers & Blacksmiths' Shop; Forge Shop; Ship Repair Shop	**Building 129**	Administration Building, Substation "U-2"; Submarine Pier Office (Pier B)

Appendix C: Buildings Listed by General Category

Building 437	Pipe Storage; General Warehouse	**Building 251**	Storage & Issue Building; Electricians' Shop (through 1950); Central Tool Room; Sheetmetal shop	**Building 132**	Submarine Pier Office; Substation "U-1"; Tug crew barracks (Pier C)
Building 704	Equipment holding shed; Radioactive Material Storage Area; Transportation Shop car shelter	**Building 258**	Pipefitter's Shop	**Building 154**	Area Time Office #1; Administration Building
Building 808	Industrial Storage building	**Building 271**	Paint Shop Annex; Equipment Storage; Sandblast Facility; Paint Lab	**Building 159**	Latrine
Building 809	Lumber Storage/Supply Storehouse	**Building 272**	Riggers & Laborers Shop	**Building 226**	Latrine
Building 810	Paint & Oil Storage	**Building 275**	Sheetmetal Annex	**Building 228**	Central Cafeteria/Civilian cafeteria
Building 813	Supply storehouse & office; general Warehouse	**Building 302**	Transportation Shop; Automotive Vehicle Maintenance Facility	**Building 252**	Bus Terminal; Golden Anchor Coffee Shop
Building 819/823	819: Sewage Dump Station A (1957); 823: Storage Building (1976)	**Building 303**	Transportation Shop Annex	**Building 274**	Decontamination Training Building; Office Space
		Building 323	Boat Shop; Shore Activities/Electronics	**Building 301**	Latrine
		Building 351/351A	NRDL Annex E (late 1940s through early 1950s); Electronics Shop; Chemical Technical Development Branch; General Research Labs	**Building 367**	Work Control Center #3; Administration building, field office
		Building 363	Shipwrights & Joiners Shop; Woodworkers shop	**Building 370**	Latrine
		Building 366	Boat Shop/plastic shop; NRDL Electronics Work Area; Radiography shop; Chemical Research Lab	**Building 378**	Latrine
		Building 368	Shop Service Building #1- Ship Repair Shop and Pipefitting Shop	**Building 424**	Area Time Office #4; Administration Building

Appendix C: Buildings Listed by General Category

		Building 369	Shop Service Building #2- Ship Repair Shop and Pipefitting Shop	**Building 500**	Barracks; Ship Officers Bachelors Quarters; Ships Canteen, Laundry;NRDL Admin. Offices
		Building 371	Transportation Shop Annex; automotive shop building	**Building 505**	Navy Exchange Building and Gymnasium; Bowling alley; canteen
		Building 411	Shipfitters, Welders & Boilermakers Shop; Ship Repair Shop; Civilian Cafeteria; Radiography	**Building 710**	Latrine
		Building 417	Acetylene Manifolding Building		
		Building 419	Oxygen Converter		
		Building 420	Oxygen Cylinder Charging		
		Building 530	Auto Hobby Shop		

APPENDIX D

Appendix D - Integrity Matrix

Building #	Name/Use	Built	Parcel	Integrity	Condition
Building 101	Administration Building, Civilian Cafeteria	1943	A	H	Good
Building 103	Submarine Barracks; Personnel Decontamination Center for OPERATION CROSSROADS	1943	B	M - asbestos shingle cladding over original redwood siding	Fait to good
Building 104	U.S. Naval Reserve Training Center, Naval Reserve Armory; Submarine Barracks	1943	B	M - asbestos shingle cladding over original redwood siding	Fair to good
Building 109	Lincoln restaurant; HPSY Police Station	1934	B	L - window infill/modifications, missing architectural details	Fair to poor condition
Building 110	Marine Barracks & Mess	1943	A	H	Good

Hunters Point Shipyard - Integrity Matrix

Building 113	Torpedo Storage & Overhaul/Tug Maintenance; non-destructive testing (X-ray) - NRDL related	1943	B	L - asbestos shingle cladding over original redwood siding (partial); window removal	Poor condition - building severely deteriorated
Building 115	"US Naval Reserve Drill Hall"; Submarine Training School	1944	B	M - asbestos shingle cladding over original redwood siding	Fair condition
Building 116	Submarine Applied Training School; Submarine Subsistence	1943	B	M - asbestos shingle cladding over original redwood siding	Fair condition
Building 117	Submarine Barracks	1943	B	M - asbestos shingle cladding over original redwood siding	Fair condition
Building 120	Canteen, Enlisted Men's Club	1943	B	L - wood shingle cladding over original redwood siding	Fair to poor condition

Hunters Point Shipyard - Integrity Matrix

Building 121	Submarine Offices; Apprentice School; Submarine Repair Shop; Administration Building; Civilian Training center	1944	B	L - asbestos shingle cladding over original redwood siding (partial); window modifications	Very poor condition
Building 122	Substation "V" and Compressor Plant	1944	B	M - addition	fair condition
Building 123	Battery Overhaul & Storage; Substation "T"	1943	B	H	fair condition
Building 125	"Submarine Cafeteria"	1944	B	H	fair condition
Building 128	Substation "U"; Work Control Center #1; Shop Services; Ship Repair Shop	1944	B	L - infilled bays; most windows missing	poor condition - building severely deteriorated

Hunters Point Shipyard - Integrity Matrix

Building 129	Administration Building, Substation "U-2"; Submarine Pier Office (Pier B)	1943	B	L - windows/doors missing	Pier B disentegrating; building in v. poor condition
Building 130	Pipefitter's Shop; Shipbuilding & repair shop	1944	B	L	most windows in monitor broken, building in v. poor condition
Building 132	Submarine Pier Office; Substation "U-1"; Tug crew barracks (Pier C)	1943	B	L - windows/doors missing	Pier C disentegrating; building in v. poor condition
Building 134	Outside Machine Shop; Diesel Overhaul; Quality Assurance Offices	1945	B	H	Good
Building 135	Substation "G"	1943	B	M - addition	Good
Building 146	Industrial Photo & Laboratory Building; Electronics Repair & Storage	1945	B	H	Fair condition

Hunters Point Shipyard - Integrity Matrix

Building 154	Area Time Office #1; Administration Building	1953	C	L - secondary siding, windows missing	Poor condition, building deteriorating
Building 156	Rubber Shop; Pipefitters Shop Annex	1953	B	M - addition	Fair condition
Building 159	Latrine	1956	B	M	Fair condition
Building 203	Powerplant-Substation "H"; oil fired heating plant; CROSSROADS ship fuel Burn	1943	C	H	Good
Building 206	Substation "A" & Compressors	1943	C	M - portion of building below water, deteriorated	Fair to poor condition
Building 215	Firestation #1 / Hunters Point Fire Department	1942	C	H	Good
Building 217	Sheetmetal Shop & Ship Repair Shop	1943	C	M - asbestos shingle over redwood	Fair condition

Hunters Point Shipyard - Integrity Matrix

Building 225	Shop Service building; Work Control Center #2	1943	C	L - windows broken/missing	Poor condition - building severely deteriorated
Building 226	Latrine	1943	C	M	Fair condition
Building 228	Central Cafeteria/Civilian cafeteria	1944	C	L - most windows/doors missing	Poor condition - building severely deteriorated
Building 229	Substation "L"	1943	C	L - addition; door missing	Poor condition
Building 230	Shop Service building; Machine Shop	1943	C	L - windows broken/missing	Poor condition - building severely deteriorated
Building 236	Salt Water Pump House	c.1943	C	H	G
Building 238	Unknown	c.1943	C	L - most windows/doors missing	Poor condition - building severely deteriorated

Hunters Point Shipyard - Integrity Matrix

Building 241	Boilermakers & Blacksmiths' Shop; Forge Shop; Ship Repair Shop	1945	C	L - secondary siding, windows missing	Poor condition - building severely deteriorated; interior machinery not extant
Building 251	Storage & Issue Building; Electricians' Shop (through 1950); Central Tool Room; Sheetmetal shop	1942	C	L - secondary siding, windows missing	Poor condition
Building 252	Bus Terminal; Golden Anchor Coffee Shop	1944	C	M - window modifications, secondary siding?	Fair condition
Building 258	Pipefitter's Shop	1948	C	L - full stucco cladding, multi-story addition w/ tower element	Fair condition
Building 271	Paint Shop Annex; Equipment Storage; Sandblast Facility; Paint Lab	1947	C	H	Fair condition
Building 272	Riggers & Laborers Shop	1942	C	M - asbestos shingle cladding over original redwood siding (partial); window removal	Fair to poor condition

Hunters Point Shipyard - Integrity Matrix

Building 274	Decontamination Training Building; Office Space	1950	D	M - window modifications	Fair condition
Building 275	Sheetmetal Annex	1953	C	M	Fair to poor condition
Building 280	Covered Sheet Metal Work Area	c.1945	C	L - wall missing	Poor condition - building deteriorated
Building 300	Substation "N"	1943	C	H	Good; concrete building, no windows.
Building 301	Latrine	1943	C	H	Fair condition
Building 302	Transportation Shop; Automotive Vehicle Maintenance Facility	1943	D	M - asbestos shingle cladding over original redwood siding (partial); windows missing, some door replacemnt	Fair condition
Building 303	Transportation Shop Annex	1944	D	L - secondary siding, windows/doors removed	Fair to poor condition
Building 304	Service/Gas Station	1943	D	L - secondary siding, doors removed	Poor condition - building severely deteriorated

Hunters Point Shipyard - Integrity Matrix

Building 306/306A	Substation "I"	1943	D	L - secondary siding, windows/doors missing; large addition	Poor condition - building severely deteriorated
Building 307	Electronic Storage; Public Works Equip. Storage; Electronic Assembly	1944	D	H	Good
Building 308	Salt Water Pump House; Fire Protection Pumping Station	1943	D	M - addition	Fair to good
Building 323	Boat Shop; Shore Activities/Electronics	1946	D	L - secondary siding, windows removed/replaced	Poor condition - building deteriorated
Building 324	CO2 Refilling Station	1946	D	L - window modifications	Poor condition - building deteriorated

Hunters Point Shipyard - Integrity Matrix

Building 351/351A	NRDL Annex E (late 1940s through early 1950s); Electronics Shop; Chemical Technical Development Branch; General Research Labs	1945/1960	D	M - addition	Fair to poor condition
Building 363	Shipwrights & Joiners Shop; Woodworkers shop	1943	D	M - secondary siding	Fair condition
Building 366	Boat Shop/plastic shop; NRDL Electronics Work Area; Radiography shop; Chemical Research Lab	1952	D	M - window modifications/removal	Fair condition
Building 367	Work Control Center #3; Administration building, field office	1953	C	H-M	Good
Building 368	Shop Service Building #1- Ship Repair Shop and Pipefitting Shop	1953	C	H	Good

Hunters Point Shipyard - Integrity Matrix

Building 369	Shop Service Building #2- Ship Repair Shop and Pipefitting Shop	1953	D	H	Good
Building 370	Latrine	1953	D	H	Good
Building 371	Transportation Shop Annex; automotive shop building	1953	D	M - siding modification?	Fair to good
Building 377	Work Shop & Poseidon Systems Test Engineering	1962	D	H	modern type
Building 378	Latrine	1963	D	M - secondary siding	Fair to good
Building 379	Instrumentatio n/Control - Poseidon Engineering	1962	D	M - siding modification?	Fair to good
Building 380	Work Shop & Poseidon Systems Test Engineering	1962	D	M - siding modification?	Fair to good
Building 400	Supply storehouse	1943	E	H	Good

Hunters Point Shipyard - Integrity Matrix

Building 401	Building trades shop/general warehouse; Public Works Shop	1943	D	M - asbestos siding over original redwood	Fair condition
Building 402	Supply storehouse	1943	D	H	Fair condition
Building 404	Supply storehouse	1943	D	H	Fair condition
Building 405	Supply storehouse	1943	E	H	Fair condition
Building 406	Supply storehouse	1943	E	H	Fair condition
Building 407	Supply storehouse	1943	D	H	Fair condition
Building 409/409A	Welder Motor Generator Building	1947	D	L - doors missing, all equipment removed	poor condition
Building 410	Welder Motor Generator Building	1947	D	L - portions of siding mission, all equipment removed	poor condition

Hunters Point Shipyard - Integrity Matrix

Building 411	Shipfitters, Welders & Boilermakers Shop; Ship Repair Shop; Civilian Cafeteria; Radiography	1947	D	M	Fair to good;cranes and other equipment removed
Building 412	R.R. Scales	1943	D	H	
Building 413	Supply storehouse; Cable storage building	1944	D	H	Fair condition
Building 414	Supply storehouse; Mold loft (1945); radium storage area	1944	E	M	Fair condition

Hunters Point Shipyard - Integrity Matrix

Building 415/416	Supply storehouse	1946-7	D	H	Fair condition
Building 417	Acetylene Manifolding Building	1947	D	L - full T-111 siding	Fair condition
Building 418	Metal Spray Building	1947	D	L - windows/doors missing; secondary siding	Fair condition
Building 419	Oxygen Converter	1947	D	M	Fair condition
Building 420	Oxygen Cylinder Charging	1947	D	L - front wall/portions of siding missing	Poor
Building 424	Area Time Office #4; Administration Building	1947	D	L - additions	Fair to poor
Building 435	Equipment Storage; General Warehouse	1946	D	L - doors missing, all equipment removed, secondary siding	Fair to poor
Building 436	Paint & lumber storage	1946	D	L - doors missing, all equipment removed, secondary siding	Fair to poor
Building 437	Pipe Storage; General Warehouse	1954	D	L - front wall/doors missing, secondary siding	Fair to poor

Hunters Point Shipyard - Integrity Matrix

Building 500	Barracks; Ship Officers Bachelors Quarters; Ships Canteen, Laundry;NRDL Admin. Offices	1943	D	L - most windows missing, doors & stairwells removed	Poor - building severely deteriorated
Building 505	Navy Exchange Building and Gymnasium; Bowling alley; canteen	1943	D	L - asbestos siding covering original redwood; missing windows	Poor - building severely deteriorated
Building 521	Power Plant - South Area	1948	E	H	Fair
Building 523	Fire Protection Pump Station; Salt Water pump house	1948	D	M - large portion of exterior wall missing	Poor - building deteriorated
Building 525	Pacific Reserve Fleet Supply Building	1948	D	H	Fair condition
Building 526	Pacific Reserve Fleet Repair Shop	1948	D	H	Fair condition
Building 527	Motor generator building on pier 2	1947	E	L - windows missing	Poor condition - building and pier severly deteriorated

Hunters Point Shipyard - Integrity Matrix

Building 530	Auto Hobby Shop	1953	D	M	Fair to good
Building 704	Equipment holding shed; Radioactive Material Storage Area; Transportation Shop car shelter	1946	E	H	Fair condition
Building 707	Animal hospital medical building; NRDL annex N; Animal colony; waste processing	1950	E	M - secondary siding?	Fair condition
Building 708	NRDL Bio-med Facility/animal research; Animal psychology study colony	1953	E	M - orig. doors removed	Fair to good
Building 709	Navy Exchange Gas Station	1952	E	L - glazing/doors removed; equipment stripped	Poor condition - building severely deteriorated
Building 710	Latrine	1948	E	L -windows/doors removed; interior stripped	Poor condition - building severely deteriorated

Hunters Point Shipyard - Integrity Matrix

Building 808	Industrial Storage building	1944	A	H	Good
Building 809	Lumber Storage/Supply Storehouse	1943	E	H	Fair to good
Building 810	Paint & Oil Storage	1943	E	M	Fair to good; adjacent building burned
Building 813	Supply storehouse & office; general Warehouse	1947	A	H	Good
Building 819/823	819: Sewage Dump Station A (1957); 823: Storage Building (1976)	1957/1976	D	L - addition	Fair condition
Other Major Structures:					
Drydocks 5, 6, 7	Ship repair - Submarines	1944	B	L - crane equipment and rail spur connections removed	Unknown

450 Ton Crane	altered	1948		L - altered	Unknown

Subject: Hunters Point Shipyard Phase II and Candlestick Point
San Francisco, California

PRELIMINARY GEOTECHNICAL REPORT

Dear Mr. Proud:

With your authorization, ENGEO is pleased to provide this preliminary geotechnical report for the planned development at Hunters Point Shipyard Phase II and Candlestick Point in San Francisco, California. This report discusses our findings based on the review of previous studies performed at the site and provides preliminary conceptual geotechnical recommendations to address the geologic constraints related to the proposed development. In addition, this report will help support the Environmental Impact Report (EIR) and planning process.

The report describes the geologic conditions based on limited field explorations performed over the past 30 years, identifies the geological and geotechnical concerns at the site, and provides a suite of potential conceptual geotechnical remediation solutions for the proposed development.

We are pleased to provide our services to you on this project and look forward to consulting further with you and your design team.

Very truly yours,

TABLE OF CONTENTS

INTRODUCTION

Purpose and Scope

The purpose of this Preliminary Geotechnical Report is to describe subsurface conditions anticipated within the currently planned development areas at Hunters Point Shipyard Phase II and Candlestick Point (Figure 1), identify the geotechnical hazards within the planned development areas, and identify some possible conceptual solutions to the geotechnical constraints associated with the proposed development. We have limited our discussion in this report to focus on the significant geotechnical issues that need to be addressed during the planning process as they relate to the proposed development. This report is intended for preliminary planning purposes only and for providing conceptual-level design recommendations during the EIR phase and initial phases of project planning. Design-level geotechnical studies will be required during development of construction plans.

Our scope of services included research and review of published literature, geologic maps, and previous geotechnical and environmental reports pertinent to the site. At Hunters Point, only limited shallow subsurface data was available, which did not provide sufficient information to accurately characterize the deeper stratigraphy of the site. In addition, geotechnical laboratory data for the site were limited and did not include the necessary data to fully characterize the soil properties. At Candlestick Point, pertinent geotechnical lab data and boring information were available from a limited number of borings based on the previously proposed stadium-mall development. The locations of these data points do not necessarily correspond to the critical areas of the current proposed development plan and additional subsurface exploration is required.

While generalized soil conditions for Parcels D and E at Hunter Point are presented, discussion of conceptual geotechnical solutions are briefly addressed since proposed development for this area may either consist of the 49ers Stadium or commercial development. In addition, we have not included an evaluation of the shoreline, existing bulkhead static or seismic stability at this time due to lack of subsurface information within these areas. Also, the off-site transportation improvements are not covered in the scope of this report and will require separate study.

Due to the limitations of the available data, this report is based primarily on geologic descriptions contained in previous reports and on our experience. We have modeled the available data to interpolate the stratigraphic profile across both sites; however, significant assumptions were made to characterize the subsurface conditions. A considerable amount of additional geotechnical exploration for all portions of the site is required before design-level recommendations can be provided.

This report was prepared for the exclusive use of Lennar Urban and its design team consultants. This document may not be reproduced in whole or in part by any means whatsoever, nor may it be quoted or excerpted without the express written consent of ENGEO Incorporated.

PLANNED DEVELOPMENT

Based on review of the tentative land use plan (Figure 2) prepared by IBI Group and ongoing discussions with Lennar, it is anticipated that development in Phase II of the Hunters Point Shipyard project will consist of 2,100 residential units, 60,000 square feet of neighborhood-serving retail, and 2,000,000 square feet of environmentally-sustainable light industrial and commercial facilities over a total of 495 acres. In addition, there is an NFL football stadium proposed, and the development plan includes preparation of the building pad and supporting utilities for the stadium. At Candlestick Point, the proposed development consists of 6,500 residential units, 585,000 square feet of regional retail, and a small amount of commercial facilities over a total of 276 acres. It is anticipated that building types will be a combination of low-, mid-, and high-rise buildings ranging from 2 to 40 stories for Candlestick Point and 2 to 32 stories for Hunters Point.

Significant public and recreational areas are also proposed in addition to the multi-story residential units and retail parking facilities presented in the tentative land use plan prepared by IBI Group. The development will include extensive infrastructure development including demolition of selected existing improvements, environmental remediation, geotechnical stabilization, site grading, utilities installation, transportation, and street system installation. New utility systems include low-pressure water, fire service, recycled water, sanitary sewer, storm drain, and dry utilities (gas, telephone, and telecommunications). A pedestrian and vehicular bridge is proposed to span over Yosemite Slough to provide connectivity between Hunters Point Shipyard Phase II and Candlestick Park. It is proposed that the deck of the bridge will span at an elevation ranging from approximately 12 feet to 14 feet (CCSF). Additionally, several off-site transportation improvements are not included in the scope of this report.

Development of the project is divided into various Parcels as illustrated in Figure 2. The Hunters Point Shipyard Phase II site will include Parcels 49, B, C, D, and E. Parcel B will consist of low to high-rise residential and mixed-use; Parcel C will consist primarily of mid-rise light industrial uses; development within Parcels D and E is uncertain at the time of this report, it may include a NFL Football stadium with associated parking and recreational open space. The proposed Candlestick Point site will consist of Parcels G, H, J, K, and L. Parcel G will consist of low- to mid-rise residential; Parcel H will consist of low- to high-rise residential and mixed-use; Parcel J will consist of mid- to high-rise residential; Parcel K will consist of low- to mid-rise retail and some commercial; and Parcel L will consist of low- to high-rise residential and mixed use.

At the time of this report, the City and County of San Francisco has just become incorporated into the FEMA program and Flood Insurance Rate Maps (FIRM) are being prepared. Preliminary FIRMs of the project site based on existing site grades were available for us to review. Base Flood Elevation (BFE) as shown on preliminary FEMA flood mapping is between elevation -1.60 and +0.59 feet CCSF datum within site boundaries. Variability in BFE is based on differences in wave setup and wave run-up at each transect as calculated by FEMA. The one percent flood event usually results from a combination of astronomical tides and wave run-up, as opposed to solely a 100-yr tide or a 100-yr storm wave event. Possible impacts of sea level rise were not taken into account in the FEMA study. Based on recommendations provided by Moffatt & Nichol, an additional 36-inches was added to the BFE in establishing proposed finish grades to account for sea level rise.

DATA SOURCE AND PREVIOUS STUDIES

Numerous exploratory investigations and geological mapping were performed by various parties within the project area. Due to the previously mentioned limitations of the available data, this report is based heavily on geologic descriptions contained in the following reports:

Hunters Point

- ENGEO - In a report dated December 31, 2002, ENGEO identified the pertinent subsurface conditions and possible geotechnical constraints based on earlier reports prepared on behalf of the U.S. Navy published by various groups. Additional data relating to the subsurface conditions within the Hunters Point Shipyard Project were gathered from other studies performed at the shipyard.

- ENGEO – Hunters Point Parcel A, a comprehensive geotechnical report prepared for the project area, dated October 2004, was used to prepare the enclosed geotechnical conceptual design.

Candlestick Point

- Treadwell and Rollo – A Geotechnical Investigation Report was prepared dated March 3, 1998. The investigation included drilling 16 test borings, advancing 18 cone penetration tests (CPT), and conducting five profiles of seismic refraction survey between August 5 and September 16, 1997.

- ENGEO 2006 – Various studies related to the proposed development at Candlestick Point.

GEOLOGIC CONDITIONS

The Hunters Point Shipyard Phase II and Candlestick Point project site is situated on the shore of the San Francisco Bay in the northern portion of the San Francisco Peninsula, which is bounded by San Francisco Bay to the east, and the Pacific Ocean to the west. The present day landforms and subsurface environment within the San Francisco Peninsula are primarily the product of tectonic activities associated with the San Andreas fault system and the hydrological setting. A combination of intense erosion and fluctuation of sea level has led to the characteristic deposits of soft and unconsolidated (young Bay Mud) material within the lower-lying areas along the Bay.

The topographic setting within the project boundaries at Hunters Point Shipyard Phase II can be described as relatively level with some minor slopes in the vicinity of Parcel A, located in the center of the Shipyard. Within the lower lying areas, elevations range from sea level to approximately 20 feet. The highest point within the project boundaries is elevation 36 feet on Galvez Avenue in Parcel B. The topographic setting within the project boundaries at Candlestick Point can be described as relatively level with some localized mounding in the park area near the shoreline. There are increasingly steep slopes to the west and a large elevated mound within the area of the Alice Griffith Housing Project within the future Parcel G. Elevations at Candlestick Point vary from sea level to 230 feet at the uppermost boundary of Parcel J. Reported elevations are based on City and County of San Francisco Datum (CCSF).

The site is located within the Coast Ranges geomorphic province of California, a region of northwest-trending, folded and faulted mountain ranges. The site is situated in a portion of the Coast Ranges that is underlain by Jurassic- and Cretaceous-age Franciscan bedrock including serpentinite, greenstone, chert, sandstone, and shale. As indicated on a published geologic map of the site by Bonilla, 1998 (Figure 3), Quaternary slope wash and ravine fill, which has slope stability implications, is mapped in swales along the sloping terrain.

In general, the lower-lying area, where the majority of the proposed development is to be situated, is underlain by a varying combination of five geologic units consisting of (1) artificial fill, (2) young Bay Mud deposits, (3) undifferentiated sedimentary deposits, (4) Old Bay Mud deposits, and (5) Franciscan complex bedrock. Thickness of these units varies widely across the site, but generally increases towards the coastline. The historic mapping depicted on Figure 5 shows the 1903 shoreline and the current shoreline which was established by filling over the years. Based on interpolation of limited data, we estimate that a fill thickness of 0 to 25 feet and Young Bay Mud thickness of 0 to 40 feet should be anticipated in some locations at Hunters Point Shipyard. At Candlestick Point, fill, which typically ranges from about 20 to 30 feet feet below ground surface with localized pockets of fill that extends down to 70 feet below the ground surface. The fill is underlain by young Bay Mud ranging from approximately 0 to 50 feet in thickness. A contour map showing the anticipated relative elevation to bottom of these underlying geologic units and the depths to competent bedrock is provided in Figures 6 and 7. A description of each strata is discussed below. Localized areas of deeper fill may be present throughout the site.

Fill

The fill (Qaf) was placed in conjunction with the land reclamation which began in the mid-1800s. The fill generally includes a mixture of native soil and bedrock-derived material consisting of silty sand with gravels with lenses of gravel and clays. Based on review of the subsurface information provided, the material varies in density from loose to medium dense. In some locations concrete, asphalt, metal objects, and other solid waste can be found. In localized areas along the shoreline, the fill may extend to depths as great as Elevation -70 ft (CCSF) below ground surface (Figure 6). Review of historical aerial photos suggests these locations correspond with areas where historic shoreline failure may have occurred during placement of the fill. Some sand layers within the fill material may be susceptible to liquefaction when subject to cyclic loading. This will be further discussed in subsequent sections of this report.

Young Bay Mud

The majority of the project site is underlain by compressible young Bay Mud beneath the fill (Figure 6). With the exception of the western portion of the site, where shallow bedrock outcrops are present, the Bay Mud thickness generally increases towards the bay. The Bay Mud is normally consolidated to slightly overconsolidated. Post-construction settlement as a result of consolidation of Bay Mud subjected to construction loading may have long-term detrimental effects on buildings and infrastructure within the project area. Further discussion of the effects and mitigation is provided in this report.

Alluvial Soil

Stiff to hard clay referred to as Old Bay Clay typically underlies the young Bay Mud. The Old Bay Clay is interbedded with dense sand, silty sand, or gravel layers.

Slope Wash and Ravine Fill

Bonilla (1971) mapped Quaternary slope wash and ravine fill (Qsr) throughout portions of low-lying areas and swales along the slopes to the west of the project. The approximate limits of slope wash and ravine fill are shown on the Regional Geologic Map, Figure 3. Slope wash and ravine fill are materials transported by erosion from slopes and ridges that are typically deposited in swales. Slope wash and ravine fill in the study area generally consist of sandy clay and clayey sand that are dense and slightly cemented.

Landslides

The slopes at the site vary in steepness from 2:1 (horizontal:vertical) to 1:1. As documented in previous ENGEO studies of the project area, localized areas of slope instabilities are observed within the project area. Many of these are deep-seated landslide complexes that have experienced numerous episodes of movement. Geologic Hazard mapping of the project area (Figure 4) shows that the slopes present at the site are susceptible to earthquake-induced landslides; furthermore, mapping by Bonilla shows areas within the project area to be underlain by landslide deposits. In addition, based on the observed debris at the toe of existing cut slopes, some of the steeper cut slopes, (steeper than 1½:1 horizontal:vertical), have experienced raveling and rock falls over a period of many years.

Bedrock

The site is underlain by Jurassic- and Cretaceous-age Franciscan bedrock, including greenstone, chert, sandstone, and shale, with serpentinite as the predominant rock type. Bedrock exposure can be found to the west of the project where the topographic elevation is higher. The depth from ground surface to bedrock can be over 200 feet towards the coastline (Figure 7).

Serpentinite – Extensive exposures of serpentinite bedrock (sp) are evident on existing cut slopes to the west of the Hunters Point project area as shown on the Regional Geologic Map, Figure 3. The friable to very strong bedrock varies from light green to black in color. Bedrock structure is somewhat chaotic with fractures and foliations in various orientations. Based on previous exploration performed in the area, localized zones of hard calcified bedrock ranging up to about 20 feet in diameter were observed.

Franciscan Sandstone and Shale – Franciscan sandstone and shale (KJs) are mapped at various locations on the western hills of the Candlestick Point and Hunters Point project area (Figure 3). The sandstone units are typically moderately strong to strong, moderately fractured and thickly bedded. The observed shale units are typically friable to weak, highly fractured to crushed, and thinly bedded.

Franciscan Greenstone – Franciscan greenstone (KJg) are mapped in various locations at Candlestick Point and Hunters Point. The greenstone units are typically moderately strong to strong, moderately fractured and thickly bedded.

Groundwater

The groundwater level in the lower-lying areas at Candlestick Point varies between 3 and 14 feet below ground surface, with an elevation of approximately -3 feet to -12 feet (Treadwell and Rollo, 1998). A series of groundwater monitoring wells were installed for environmental purposes within the Hunters Point development. Groundwater levels were reported to be within 3 to 21 feet below ground surface in the low-lying areas. Groundwater conditions are expected to vary depending on factors such as weather conditions, tides, time of year, and irrigation practices.

Data Gaps

Additional geotechnical borings will be needed in order to provide a site-specific mitigation program for the various geotechnical concerns and to develop recommendations for the design of deep and shallow foundations.

Seismic Hazards

The San Francisco Bay Area is a seismically active region; therefore, the site is expected to experience periodic minor earthquakes and a major earthquake on one of the nearby active faults during the service life of the structures. The major active faults in the area are the San Andreas and Hayward faults. For each segment of these faults, the distance from the site and estimated maximum moment magnitude, Mw, [Working Group on California Earthquake Probabilities (WGCEP) (2003) and Cao et al. (2003)] are summarized in the following table.

REGIONAL FAULTS AND SEISMICITY

Fault Segment	Approximate Distance from Site (km)	Direction from Site	Maximum Magnitude
North Hayward	18	East	6.9
Total Hayward	18	East	7.1
South Hayward	21	East	6.9
San Andreas - 1906 Rupture	12	West	7.9
San Andreas - Peninsula	12	West	7.1
San Andreas- North Coast South	22	West	7.6

Numerous earthquakes have been recorded in the San Francisco Bay area in the past. The San Francisco Earthquake of 1906 caused the most significant damage in the history of the Bay Area in terms of loss of lives and property damage. This earthquake created a surface rupture along the San Andreas Fault from Shelter Cove to San Juan Bautista, approximately 470 kilometers in length. It had a maximum intensity of IX, a moment magnitude of about 7.9, and was felt 560 kilometers away in Oregon, Nevada, and Los Angeles. The most recent earthquake to affect the Bay Area was the Loma Prieta Earthquake of 17 October 1989, centered in the Santa Cruz Mountains, which had a moment magnitude of 6.9.

In 2002, the Working Group on California Earthquake Probabilities (WGCEP 2003) at the U.S. Geologic Survey (USGS) predicted a 62 percent probability of a magnitude 6.7 or greater earthquake occurring in the San Francisco Bay Area by the year 2031. More specific estimates of the probabilities for different faults in the Bay Area are presented in the following table.

WGCEP (2003) ESTIMATES OF 30-YEAR PROBABILITY (2002 TO 2031)
OF A MAGNITUDE 6.7 OR GREATER EARTHQUAKE

Fault	Probability (percent)
Hayward-Rodgers Creek	27
San Andreas	21

PRELIMINARY CONCLUSIONS AND CONCEPTUAL DESIGN RECOMMENDATIONS

Based on review of limited geotechnical data, it is our opinion that the proposed development is feasible from a geotechnical perspective provided that sound geotechnical engineering practices are incorporated in the design and construction of the project. Our preliminary conclusions are based on a review of the proposed development plan, which includes specific building types and other site constraints. Mitigation options and foundation systems discussed herein are not limited to the options provided below and may be subject to change based on future exploration and modification of the development plan.

Based on our review of the subsurface conditions and the proposed development, we conclude that the following measures may be required to address the geotechnical constraint at the site: (1) surcharging to pre-consolidate areas underlain by compressible young Bay Mud to mitigate post-construction settlement, (2) over-excavation and compaction of surface fills to create uniform building subgrade conditions for selected building foundations and infrastructure, (3) use of stiffened mat or grade-beam foundations, either with or without geogrid subgrade reinforcement to mitigate the effects of differential settlement, (4) pile-supported structures for areas where alternative methods of site mitigation are either not feasible or cannot achieve desired performance economically, (5) corrective grading in areas where slope stability may be an issue, (6) possibly some ground densification to mitigate localized areas susceptible to liquefaction; however, there is insufficient data to evaluate this risk at this time, and (7) stabilization of the bay shoreline and waterfront retaining structures, as needed. It is anticipated that a combination of the above mitigation solutions will be incorporated in the construction of the various building types and improvements within the proposed development. Remedial grading and foundation alternatives are discussed in detail below. A summary of the geologic conditions and remediation recommendations for each parcel is provided in Appendix A of this report. However, various different types of grading and foundation alternatives may be appropriate for the proposed development. As such, Appendix A may be subject to modification upon completion of further subsurface exploration and geotechnical analyses.

Proposed Building Foundations

Selection of a foundation system for structures is dependent on: (1) the underlying soil and bedrocks ability to support the plan structure under both static and seismic loading conditions, (2) settlement of the foundation under building loads, and (3) aerial settlement due to filling to achieve minimum site finish grades. In areas where the Bay Mud and existing fill are absent or removed by remedial grading, shallow foundations on bedrock, compacted fill and stiff native soils will provide appropriate support to low- to mid-rise buildings. In areas that were reclaimed from the bay, structures that are supported on deep foundations that extend through the existing fill and Bay Mud will settle less than similar structures that are founded on shallow foundations above the Bay Mud. Alternately, ground improvement measures including surcharging and excavation and compaction of fill may be appropriate to mitigate settlement and allow for the use of shallow foundations for lighter structures as discussed below. As a result, the type of foundations to be used should be selected in consideration of the anticipated building load, new fill thicknesses, and the amount of tolerable settlement on a project-specific basis during final design.

Another consideration in the selection of the appropriate foundation system for new building is the potential to excavate and dispose of soil or groundwater that may contain hazardous materials. In addition, ground improvement such as surcharging or densification may temporarily raise groundwater levels, thereby influencing the movement of existing groundwater contaminant plumes. In areas where hazardous materials are suspected, it may be more cost effective to use a driven pile foundation, which generates less excavated soil than a shallow foundation and has less impact on existing contaminant plumes. Deep foundations will also reduce potential liquefaction-related foundation movement. Selection of appropriate foundation types for specific building areas should be conduced in consultation with the environmental remediation team.

For areas of the site closer to the bay waterfront, vertical and lateral deformations due to lateral spreading movements may be anticipated. The magnitude of such movements will be highly dependent on the stability of existing shoreline slopes, waterfront dikes and, in the case on the former Hunters Point Shipyard, on the stability of existing bulkheads and other waterfront retaining structures. Due to the potential for shoreline and bulkhead deformation, buildings adjacent to the shoreline should be supported on deep foundations. Mitigation may include a combination of reinforcing the existing shoreline retaining structures and/or locating improvements a sufficient distance away from the shoreline so that they will not be impacted should lateral spreading occur.

Where Bay mud thicknesses are greater than about 10 feet and where more than a few feet of new fill will be placed to attain new minimum site grades, it is our opinion most future structures that are three stories or more in height should be supported on deep pile foundations that extend through the Bay Mud and derive their support capacity by skin friction in the underlying stiff soils or by end bearing in bedrock. Low-rise buildings can likely be constructed on shallow mat foundations in areas of relatively uniform Bay Mud thickness provided that: (1) settlement due to areal filling is mitigated by surcharging prior to building construction and, (2) the upper portion of the existing fill is recompacted and reinforced with geogrid to created a uniform fill pad which is capable of distributing and attenuating long-term differential settlements.

Foundation alternatives for the different areas within the project are depicted on Figure 8 and summarized in the following table. These options may be subject to change based on data collected from future exploration. A summary of foundation alternatives and proposed geotechnical mitigation methods organized by subparcel area is provided in Appendix A.

AREA	TYPICAL SUBSURFACE CONDITIONS	PLANNED DEVELOPMENT TYPE	OTHER CONSIDERATIONS	SETTLEMENT MITIGATION AND FOUNDATION ALTERNATIVES
Candlestick Point	Existing Hillside, Shallow soil over bedrock, local fill associated with existing improvements	Low-rise residential	Hillside slope stability	Remedial grading to remove and compact exiting fill. Buildings on spread footings supported on compacted fill or bedrock.
Candlestick Point	Transitional area from fill over bedrock to Fill over shallow Bay Mud	Low-rise residential and mixed mid-rise residential and commercial	Surcharge with or without wicks to mitigate aerial settlement effects on foundations and infrastructure	Remedial grading to remove and compact exiting fill. Buildings utilize spread footings supported on compacted fill or bedrock. Heavier buildings on piles.
Candlestick Point	Fill over 5 to 40 feet of Bay Mud	Mid-rise residential and commercial	Need to consider effects of existing stadium foundations	Pile foundations.
Candlestick Point	Fill over 10 to 50 feet of Bay Mud	Mixed low-rise, mid-rise and high-rise residential	Surcharging with or without wicks to mitigate aerial settlement effects on infrastructure and pile downdrag	Low rise utilize mat foundations on geogrid-reinforced fill; mid-rise to high-rise supported on piles.
Candlestick Point	Fill over 10 to 60 feet of Bay Mud	Low-rise residential	Surcharge with or without wicks to mitigate aerial settlement effects on foundations and infrastructure	Low-rise utilize mat foundations on geogrid-reinforced fill, or densified soil.
Hunters Point	Fill over thin Bay mud	Low-rise residential	Excavation and ground improvement possibly limited by environmental contamination concerns	Low-rise on mat foundations on geogrid-reinforced fill, or pile foundations if excavation and ground improvement are restricted.
Hunters Point	Shallow soil over bedrock	Commercial and Research/ Development	Possible environmental contamination concerns	Spread footings on bedrock or compacted fill, possible piles where excavation is restricted
Hunter Point	Fill over thin Bay Mud near shoreline	Low-rise residential , Commercial and Research/ Development	Possible environmental contamination concerns, close proximity to waterfront bulkheads and walls with unknown integrity	Pile foundations, upgrade of waterfront retention

Proposed Bridge Infrastructure Foundations

The location of the proposed Yosemite Slough Bridge alignment is underlain by artificial fill and compressible Young Bay Mud of variable thicknesses. To support the loading conditions of the bridge that spans over the slough, it is anticipated that the bents and abutments be supported on pile foundation deriving support from subsurface material below the Bay Mud. In addition, to minimize the affects of settlement due to new fill loads associated with the road and bridge embankments, ground improvement measures may include surcharging and excavation and compaction of undocumented fills along the alignment. Additionally, soil cement mixed columns or light weight fill may be used at the abutment embankments to mitigate settlement.

Liquefaction

The project site is identified in a zone of high liquefaction risk by the State of California Geologic Survey as shown on Figure 4. Liquefaction occurs when loose to medium-dense, coarse-grained deposits and in some cases fine-grained deposits with low plasticity undergo cyclic loading during a seismic event, causing an increase in pore pressure and a resulting loss of shear strength.

Isolated layers of relatively clean loose sand within the existing fill and some sand layers within the Bay deposits are potentially susceptible to liquefaction and settlement during moderate to large earthquakes. Without ground improvement, these materials may be susceptible to sand boils, fissuring and settlement, resulting in the differential settlement of buildings and improvements (including underground utilities) that achieve bearing on/in these materials. Based on the limited existing data, it appears that settlement of up to 3 to 6 inches may be anticipated as a result of liquefaction of the loose sandy soils within the development areas of the Hunters Point Phase II and Candlestick Point. Differential settlement over a typical building footprint may be on the order of half the total settlement. Mitigation is possible using a variety of options including use of stiffened mat foundations that are designed to span localized zones of differential settlement or possibly by the use of ground improvement to densify susceptible soils beneath shallow foundations. Ground improvement, if required, may include Deep Dynamic Compaction (DDC) or other methods, as appropriate. Other types of ground improvement systems such as, stone columns, vibro-compaction, and ram aggregate piers may also be considered to mitigate susceptibility of structures to liquefaction. Alternatively, structures can derive support on material below the liquefiable material by the use of deep foundations. The need for and scope of liquefaction mitigation should be determined following subsequent investigation and in consultation with the environmental remediation team.

Hillside Stability

Based on geological mapping at a regional scale conducted by Bonilla, there are no mapped landslides within the project boundaries (Figure 3). However, based on our experience at an adjacent development, the slopes in the area are susceptible to deep-seated landsliding. In order to create buildable area for proposed buildings and streets, slopes on the site will be modified during site grading. The grading of proposed cut slopes could create instabilities that do not presently exist on site. In addition, earthquake-induced landsliding may occur as indicated on the USGS Geologic Hazards Map (Figure 4). To evaluate the impact of potentially unstable slopes to the proposed development, additional field mapping should be performed to gather information on the extent of the potential landslide areas. Site exploration to acquire strength characteristics may be necessary to facility slope stability analysis during future design phase studies.

- Corrective grading measures which include removal and recompaction, keying and benching engineered fill into competent materials, and installation of subdrainage.
- Appropriate site planning allowing for setbacks from possible slide areas.
- Construction of soil nail walls and rock bolting in susceptible areas.

- Construction of rockfall catch fences, rockfall mesh netting, or deflection walls.

Areas of seepage should be mitigated with appropriate subdrainage. Where complete removal and replacement of unstable slope materials are planned, the excavations should be observed by a Certified Engineering Geologist to verify removal of disturbed materials. Keyways, subexcavated benches, and locations of subdrainage should be designed in the field based on the slide plane depth and geometry. In general, graded slopes should be constructed at inclinations not exceeding 3:1 (horizontal to vertical). Slopes over 30 feet in height should be designed with intermediate surface terraces and lined v-ditches to control drainage.

Shoreline Stability

The existing shoreline consists of variable fill overlying relatively weak Bay Mud. Failures along various locations of the shoreline were observed during a recent site visit. In many areas there does not appear to be any engineered fill containment structure such as a perimeter dike. It appears that fill was progressively end-dumped or pushed with dozers over the bay deposits. This filling method has likely resulted in statically stable slopes with low factors of safety. Typical of similar fill conditions in the Bay, these bay front slopes will likely be subject to lateral deformation and subsidence during strong earthquake shaking. In many areas, the proposed structures are set back significantly from the bay shore; hence, the risk of significant movements effecting new pile-supported buildings located near the shoreline is low. However, specific geotechnical studies are required to evaluate shoreline stability and assess appropriate setbacks for improvements. Infrastructure and other facilities located along the shoreline will be subject to movement and resulting damage during a large earthquake. Where such movement is considered unacceptable, shoreline stabilization measures may be required.

There are numerous waterfront bulkheads and other retaining structures within the former Hunters Point Shipyard. Some of these structures suffered damage during the 1989 Loma Prieta

Earthquake. It is likely that analysis of the existing shoreline structures will indicate that they are susceptible to damage during future large earthquakes. The stability of the waterfront should be evaluated as part of ongoing geotechnical studies.

Consolidation Settlement of Young Bay Mud

Given the site history, we judge that primary consolidation settlement of the Young Bay Mud under the existing fill loads is essentially complete. Additional fill and/or building loads will result in a new sequence of consolidation settlements that will continue over a period of many years. These consolidation settlements can be mitigated by preloading or surcharging selected development areas. When properly implemented, the surcharge load will cause site settlement to occur prior to building and/or infrastructure construction. Prefabricated wick drains, installed prior to placement of the surcharge fill can be used to facilitate lateral drainage of the young Bay Mud, thereby accelerating the consolidation and decreasing the time required to complete the surcharge program.

Foundations and structures may be designed by the Structural Engineer to accommodate some additional movement as a result of long-term consolidation settlement. For these cases, it may be appropriate to increase surface grades to compensate for anticipated settlements. Similarly, it may be practical to increase design inverts for planned gravity utilities to accommodate potential settlements and maintain positive flow gradients.

Bedrock Rippability and Suitability

Based on field observations at the neighboring project and our experience in the area, it is our opinion in general bedrock should be rippable with conventional heavy construction equipment (such as a Caterpillar D-9). Localized well-cemented beds may be encountered that will require more ripping or rock-breaking effort. Trenching for utilities should be possible with conventional equipment. As noted above, localized well-cemented beds may be encountered that may necessitate use of heavy equipment. If significant areas of hard rock are encountered, rock blasting should be considered as an economical means of improving efficiency of excavation subject to the approval by the San Francisco Department of Public Health.

In general, soil and bedrock materials observed on the site appear suitable for use as engineered fill if properly processed.

Future Geotechnical Studies

As the project proceeds into subsequent phases of development, additional geotechnical studies will be necessary. These studies will include but are not limited to:

1. Preparation of preliminary geotechnical exploration reports. These reports will include an evaluation of:

   a. Physical properties of the typical soil material encountered in the subject area.

   b. Seismic considerations from nearby faults and current CBC seismic design criteria including determination of the Site Class and preparation of a site-specific seismic response analysis, an appropriate.

   c. Discussion of geotechnical constraints such as, compressible, expansive and/or liquefiable soils.

   d. Discussion of ground improvement alternatives (such as surcharging, densification, etc.) to mitigate geotechnical constraints including preliminary cost estimates, as appropriate.

   e. Preliminary fill compaction recommendations and drainage considerations for estimating purposes.

   f. Preliminary analysis of foundation type(s) for the proposed development including preliminary design criteria for project estimating purposes.

g. Preliminary assessment of shoreline stability.

h. Recommendations for further design-level studies.

As land planning progresses into development of a detailed layout, refining geotechnical/geological information by obtaining additional subsurface information will be essential to keep the planning process moving forward and identify impacts and mitigation measures associated with the grading layouts. Additional services will include but are not limited to:

- Preparation of detailed corrective grading and site improvement plans.
- Development of erosion control and storm water pollution prevention plans.
- Preparation or review of construction and permanent dewatering system designs.
- A review of final construction plans and specifications, including grading plans, foundation plans and calculations for conformance with the design level recommendations.
- Geotechnical observation and testing services during construction.
- Special inspection and materials testing services during construction.

These studies are important in expediting approval by governing agencies and achieving cost-effective construction.

EXPLANATION

Liquefaction

Areas where historic occurrence of liquefaction, or local geological, geotechnical and groundwater conditions indicate a potential for permanent ground displacements such that mitigation as defined in Public Resources Code Section 2693(c) would be required.

Earthquake-Induced Landslides

Areas where previous occurrence of landslide movement, or local topographic, geological, geotechnical and subsurface water conditions indicate a potential for permanent ground displacements such that mitigation as defined in Public Resources Code Section 2693(c) would be required.

ORIGINAL FIGURE PRINTED IN COLOR

Parcel	**L_1**
Area	Building Area 43.7 acres (70% building pad; 30% streets and parks)
Grades	Existing grades vary from +5 to -5 ft (CCSF) Final grades vary from +2.5 to +5.0 ft (CCSF)
Soil and Groundwater Condition	• Site consists of Artificial Fill underlain by Young Bay Mud over Older Alluvium/Stiff Bay Clay over Bedrock. • Thickness of Artificial Fill ranges from 30 ft to up to 70 feet. Bottom of Artificial Fill ranges from Elevation -30 ft to up to -70 (CCSF) ft in some isolated locations • Thickness of Young Bay Mud ranges from 10 ft to up to 60 feet. Bottom of Young Bay Mud ranges from Elevation -20 ft to -80 ft (CCSF) • Bedrock located at Elevation -70 ft to -220 ft (CCSF) • Groundwater Elevation between -6 ft to -9 ft (CCSF)
Proposed Development Type	Low-rise residential with ½ basement (5 ft deep) parking level. Anticipated 3 to 4 stories in building height. One high-rise building is anticipated to be located in block L6A with height of up to 38 stories.
Probable Remedial Grading Related to Infrastructure and Utilities Phase*	Surcharging to mitigate bay mud settlement due to new fill loads associated with proposed grades.
Expected Utilities Performance	• Surcharging will mitigate majority of long-term settlement and some secondary settlement • Minor settlement due to liquefaction and on-going long-term settlement may be expected • Some differential settlement of utilities between pile supported structure and external utilities may be expected • Flexible utilities connection for external utilities into pile supported structures • On-going long-term settlement of Bay Mud may require utilities to maintain positive gradient by increase in design inverts
Probable Remedial Grading Related to Foundation/Vertical Construction*	• Surcharging may be employed to mitigate bay mud settlement due to new building loads, design grade and secondary compression. For a duration of one year, assume surcharge of 5 ft above final grade in areas of cut and 15 ft above final grade in areas receiving fill The structures may either be supported on mat foundation underlain by over-excavated and recompacted existing fill for uniform support or on pile foundations. Foundation type will depend on surcharge effectiveness, bay mud thickness, and building loads. Assume a minimum overexcavation of 5 feet below basement slab. Building pad area utilizing shallow foundations may require reinforcement with 2 layers of geogrid. Remedial grading within building pad areas will be performed on a pad-by-pad basis and conducted during vertical construction. High-rise towers will be supported on deep foundations founded on competent material. Depth of foundation should be determined during design-level study.
Expected Geotechnical Performance	• Structures supported on mat foundations underlain by a layer of reinforced recompacted fill will experience acceptable amount of total and differential settlement due to on going bay mud consolidation, secondary compression and small amounts of possible seismic settlement. • Settlement of pile supported structures is not anticipated.
Other Considerations	• Previous exploration data shows concrete rubble maybe present within the artificial fill material. This rubble may need to be crushed on-site during grading operation if encountered within building envelopes. • Due to presences of shallow groundwater level, subgrade stabilization maybe required during excavation. Contingency to cost estimate should be applied to account for stabilization measures (i.e. dewatering, bridging).

**Note: Recommendations provided are based on our understanding of the site condition and the most conventional remedial approach in practice within the San Francisco Bay Area. Alternate remedial options are available and will is assessed during design-level study.*

Parcel	L_2
Area	Building Area 2.9 acres (90% building pad; 10% streets and parks)
Grades	Existing grades vary from -2 ft to +6 ft (CCSF) Final grades vary from +3.5 ft to +5.0 ft (CCSF)
Soil and Groundwater Condition	• Site consists of Artificial Fill underlain by Young Bay Mud over Older Alluvium/Stiff Bay Clay over Bedrock. • Thickness of Artificial Fill ranges from 20 ft to up to 40 feet. Bottom of Artificial Fill ranges from Elevation -20 ft to -40 ft (CCSF); • Thickness of Young Bay Mud can be up to 10 feet. Bottom of Young Bay Mud ranges from Elevation -20 ft to -40 ft (CCSF); • Bedrock located at Elevation -30 ft to -70 ft (CCSF); • Groundwater Elevation between -6 ft to -7ft (CCSF)
Proposed Development Type	Mid-rise mix-use structures constructed on-grade. Anticipated 6 to 12 stories in building height.
Probable Remedial Grading Related to Infrastructure and Utilities Phase*	No remedial grading is anticipated.
Expected Utilities Performance	• Settlement will occur rapidly. Post-construction settlement minimal. • Flexible utilities connection required
Probable Remedial Grading Related to Foundation/Vertical Construction*	Structures can be supported on pile foundations founded on competent material. Depth of foundation will be determined during design-level study.
Expected Geotechnical Performance	• Settlement of pile supported structures is not anticipated • Some differential settlement between structures and external utilities may be expected.
Other Considerations	No other considerations.

**Note: Recommendations provided are based on our understanding of the site condition and the most conventional remedial approach in practice within the San Francisco Bay Area. Alternate remedial options are available and will is assessed during design-level study.*

Parcel	K_1
Area	Building Area 7.5 acres (70% building pad; 30% streets and parks)
Grades	Existing grades vary from +4 ft to +50 ft (CCSF) Final grades vary from +5 ft to +25 ft (CCSF)
Soil and Groundwater Condition	Majority of the parcel underlain by Bedrock located at Elevation +10 ft to the northeast to +50 ft to the southwest (CCSF); Groundwater not anticipated.
Proposed Development Type	Mid-rise commercial structures constructed on-grade. Anticipated building heights are 2 to 6 stories.
Probable Remedial Grading Related to Infrastructure and Utilities Phase*	Local overexcavation of bedrock to a depth of 10 feet below finished grade for utilities is anticipated.
Expected Utilities Performance	No settlement is expected.
Probable Remedial Grading Related to Foundation/Vertical Construction*	• Structures may be supported on mat or spread footing foundations. Remedial grading within building pad areas will be investigated and selection of appropriate foundation approach on a pad-by-pad basis will be conducted during vertical construction. • Slope stability along steep slopes may require corrective grading or implementation of slope protection systems
Expected Geotechnical Performance	Structures supported on shallow foundation should expect minimal differential settlement if it is underlain by uniform backfill material (i.e. recompacted engineered fill)
Other Considerations	• Rippability of bedrock may require heavy equipment or blasting.

**Note: Recommendations provided are based on our understanding of the site condition and the most conventional remedial approach in practice within the San Francisco Bay Area. Alternate remedial options are available and will is assessed during design-level study.*

Parcel	K_2
Area	Building Area 15 acres (80% building pad; 20% streets and parks)
Grades	Existing grades vary from +1 to +25 ft (CCSF) Final grades vary from +3 to +18 ft (CCSF)
Soil and Groundwater Condition	• Site consists of Artificial Fill underlain by Young Bay Mud over Older Alluvium/Stiff Bay Clay over Bedrock. • Thickness of Artificial Fill ranges from 0 ft to up to 40 feet. Bottom of Artificial Fill extends to Elevation -40 ft (CCSF); • Thickness of Young Bay Mud up to 20 feet. Bottom of Bay Mud extends to Elevation -55 ft (CCSF); • Bedrock located at Elevation 0 ft to -100 ft (CCSF); • Groundwater Elevation between -6 ft to -8 ft (CCSF)
Development Type	Mid-rise commercial structures constructed on-grade. Anticipated 6 to 12 stories in building height.
Probable Remedial Grading Related to Infrastructure and Utilities Phase*	Local overexcavation of bedrock to a depth of 10 feet below finished grade for utilities is anticipated.
Expected Utilities Performance	• Some differential settlement between pile supported structures and external utilities. • Settlement will occur rapidly. Post-construction settlement minimal.
Probable Remedial Grading Related to Foundation/Vertical Construction*	• This is a transitional soil area. Foundation will vary from shallow to deep foundations. Remedial grading within building pad areas will be investigated and selection of appropriate foundation approach on a pad-by-pad basis will be conducted during vertical construction. • Proposed development may require modification of current slope configuration. Depending on the proposed grading, slope rebuilt with buttress or stabilization via retaining structures may be needed.
Expected Geotechnical Performance	• Settlement will vary based on selected foundation systems • Structures supported on shallow foundation should expect minimal differential settlement if it is underlain by uniform backfill material (i.e. recompacted engineered fill) • Settlement of pile supported structures is not anticipated
Other Considerations	Rippability of bedrock may require heavy equipment or blasting. In location currently occupied by the existing stadium, overexcavation maybe required to completely remove foundation elements.

**Note: Recommendations provided are based on our understanding of the site condition and the most conventional remedial approach in practice within the San Francisco Bay Area. Alternate remedial options are available and will is assessed during design-level study.*

Parcel	J
Area	Building Area 4 acres (70% building pad; 30% streets and parks)
Grades	Existing grades vary from +113 ft to +150 ft (CCSF) Final grades vary from +100 ft to +135 ft (CCSF)
Soil and Groundwater Condition	Majority of the parcel underlain by Bedrock located at Elevation +100 ft to the northeast to +150 ft to the southwest (CCSF); Groundwater not anticipated.
Proposed Development Type	Mid-rise residential structures constructed on-grade. Anticipated building heights are 6 to 18 stories.
Probable Remedial Grading Related to Infrastructure and Utilities Phase*	Local overexcavation of bedrock to a depth of 10 feet below finished grade for utilities is anticipated.
Expected Utilities Performance	No settlement is expected.
Probable Remedial Grading Related to Foundation/Vertical Construction*	• Structures may be supported on mat or spread footing foundations. Remedial grading within building pad areas will be investigated and selection of appropriate foundation approach on a pad-by-pad basis will be conducted during vertical construction. • Slope stability along steep slopes may require corrective grading or implementation of slope protection systems
Expected Geotechnical Performance	Structures supported on shallow foundation should expect minimal differential settlement if it is underlain by uniform backfill material (i.e. recompacted engineered fill)
Other Considerations	• Rippability of rock may require heavy equipment or blasting.

**Note: Recommendations provided are based on our understanding of the site condition and the most conventional remedial approach in practice within the San Francisco Bay Area. Alternate remedial options are available and will is assessed during design-level study.*

Parcel	H
Area	Building Area 56 acres (60% building pad; 40% streets and parks)
Grades	Existing grades vary from -5 ft to +7 ft (CCSF) Final grades vary from +3 ft to +5.5 ft (CCSF)
Soil and Groundwater Condition	• Site consists of Artificial Fill underlain by Young Bay Mud over Older Alluvium/Stiff Bay Clay over Bedrock. • Thickness of Artificial Fill ranges from 20 ft to up to 40 feet. Bottom of Artificial Fill ranges from Elevation -20 ft to -40 ft (CCSF); • Thickness of Young Bay Mud ranges from 10 ft to up to 50 feet. Bottom of Bay Mud ranges from Elevation -15 ft to -70 ft (CCSF); • Bedrock located at Elevation -50 ft to -220 ft (CCSF); • Groundwater Elevation between -6 ft to -9 ft (CCSF)
Proposed Development Type	Low-rise residential structures with basement parking level (10ft deep). Anticipated 3 to 4 stories in building height. Mid-rise and High-rise towers on podium with basement (10ft deep). Anticipated 6 to 12 stories in height for mid-rise buildings and up to 38 stories in height for high-rise towers. Basement under full blocks. Fill required locally within street footprint.
Probable Remedial Grading Related to Infrastructure and Utilities Phase*	• In general no remedial measures are required for infrastructure and utilities • May consider some surcharging or placement of lightweight fill in local deep mud areas where 3 or more feet of new fill is proposed
Expected Utilities Performance	• Minor settlement due to liquefaction and on-going long-term settlement may be expected • Accommodate utility and infrastructure settlement in as-built design grades • Some differential settlement between structure supported on pile foundation and external utilities • Flexible utility connections may be required • On-going long-term settlement of Bay Mud may require utilities to maintain positive gradient by increase in design inverts
Probable Remedial Grading Related to Foundation/Vertical Construction*	• In general no remedial measures are required for structures • Structures will be supported on pile foundations founded on competent material. Depth of foundation will be determined during design-level study.
Expected Geotechnical Performance	Structures will be supported on pile foundations. Settlement of the structures is not anticipated. Some differential settlement between structure and external utilities may be expected
Other Considerations	• Previous exploration data shows concrete rubble maybe present within the artificial fill material. Rubble may need to be crushed on-site or off-hauled during grading operation if encountered within building envelopes. • Due to presences of shallow groundwater level, subgrade stabilization maybe required during excavation. Contingency to cost estimate should be applied to account for stabilization measures (i.e. dewatering, bridging).

**Note: Recommendations provided are based on our understanding of the site condition and the most conventional remedial approach in practice within the San Francisco Bay Area. Alternate remedial options are available and will is assessed during design-level study.*

Parcel	G_1
Area	Building Area 11.6 acres (70% building pad; 30% streets and parks)
Grades	Existing grades vary from +0 to +15 ft (CCSF) Final grades vary from +5 to +16 ft (CCSF)
Soil and Groundwater Condition	• Site consists of Artificial Fill underlain by Young Bay Mud over Older Alluvium/Stiff Bay Clay over Bedrock. • Thickness of Artificial Fill ranges from 10 ft to up to 20 feet. Bottom of Artificial Fill ranges from Elevation -10 to -20 ft (CCSF); • Thickness of Young Bay Mud up to 10 feet. Bottom of Bay Mud extends to Elevation -20 ft (CCSF); • Bedrock located at Elevation -25 ft to -50 ft (CCSF); • Groundwater Elevation between -6 to -7 ft (CCSF)
Proposed Development Type	Low-rise residential structures constructed on-grade. Anticipated 3 to 4 stories in building height.
Probable Remedial Grading Related to Infrastructure and Utilities Phase*	Local overexcavation of bedrock to a depth of 10 feet below finished grade for utilities is anticipated.
Expected Utilities Performance	• Some differential settlement between structures and external utilities is expected • Settlement will occur rapidly. Post-construction settlement minimal. • On-going long-term settlement of Bay Mud may require utilities to maintain positive gradient by increase in design inverts
Probable Remedial Grading Related to Foundation/Vertical Construction*	This is a transitional soil area. Foundation will vary from shallow to deep foundations. Remedial grading within building pad areas will be investigated. Selection of appropriate foundation approach will be conducted on a pad-by-pad basis during vertical construction design phase.
Expected Geotechnical Performance	• Settlement will vary based on selected foundation systems • Structures supported on shallow foundation should expect minimal differential settlement if it is underlain by uniform backfill material (i.e. recompacted engineered fill)
Other Considerations	• Existing pile supported utility requires special consideration. Civil designers should consider minimizing fill proposed in proximity of existing utility. • Reconditioning of bay mud required for reuse. • Rippability of rock may require heavy equipment or blasting.

**Note: Recommendations provided are based on our understanding of the site condition and the most conventional remedial approach in practice within the San Francisco Bay Area. Alternate remedial options are available and will is assessed during design-level study.*

Parcel	G_2
Area	Building Area 25.6 acres (70% building pad; 30% streets and parks)
Grades	Existing grades vary from +10 to the east and +45 ft to the west(CCSF) Final grades vary from +16 to the east and +45 ft to the west (CCSF)
Soil and Groundwater Condition	• Majority of site consists of thin fill over bedrock. Lower portion of site consists of Artificial Fill underlain by Young Bay Mud over Bedrock. • Thickness of Artificial Fill ranges from 0 ft to up to 10 feet. Bottom of Artificial Fill extends to Elevation -10 ft (CCSF)Minimal Bay Mud up to 5 feet thick is expected Bedrock located at Elevation +45 ft to -10 ft (CCSF)
Proposed Development Type	Low-rise residential structures constructed on-grade. Anticipated 3 to 4 stories in building height.
Probable Remedial Grading Related to Infrastructure and Utilities Phase*	Local overexcavation of bedrock to a depth of 10 feet below finished grade for utilities is anticipated.
Expected Utilities Performance	Minimal infrastructure settlement
Probable Remedial Grading Related to Foundation/Vertical Construction*	Structures may be supported on spread footing or mat foundations on compacted fill. Remedial grading within building pad areas will be investigated. Selection of appropriate foundation approach will be conducted on a pad-by-pad basis during vertical construction design phase.
Expected Geotechnical Performance	Structures supported on shallow foundation should expect minimal differential settlement if it is underlain by uniform building material (i.e. recompacted engineered fill)
Other Considerations	Rippability of bedrock may require heavy equipment or blasting.

**Note: Recommendations provided are based on our understanding of the site condition and the most conventional remedial approach in practice within the San Francisco Bay Area. Alternate remedial options are available and will is assessed during design-level study.*

Parcel	B_1
Area	Building Area 36 acres (70% building pad; 30% streets and parks)
Grades	Existing grades vary from 0 to +5 ft (CCSF) over majority of the site; increases to 35 ft (CCSF) along the southwestern boundary. Final grades vary from +3.5 to +7.5 ft (CCSF)
Soil and Groundwater Condition	• Site consists of Artificial Fill underlain by Young Bay Mud over Older Alluvium/Stiff Bay Clay over Bedrock. • Thickness of Artificial Fill ranges from 0 ft to up to 10 feet. Bottom of Artificial extends to Elevation -10 ft (CCSF); • Thickness of Young Bay Mud up to 5 feet. Bottom of Bay Mud extends to Elevation -20 ft (CCSF); • Bedrock located at Elevation 0 to -50 ft (CCSF) • Groundwater Elevation between -3 to -7 ft (CCSF)
Proposed Development Type	Low-rise and mid-rise residential and mid-rise mix-use structures constructed on-grade. Anticipated 3 to 4 stories for low-rise and 6 to 8 stories for mid-rise.
Probable Remedial Grading Related to Infrastructure and Utilities Phase*	No remedial measures are required for infrastructure and utilities.
Expected Utilities Performance	• Some differential settlement between structure on piles and external utilities may be expected • Flexible utility connections required • On-going long-term settlement of Bay Mud may require utilities to maintain positive gradient by increase in design inverts
Probable Remedial Grading Related to Foundation/Vertical Construction*	• Low-rise structures can be supported on mat. Remedial grading within building pad areas will be investigated. Selection of appropriate foundation approach will be conducted on a pad-by-pad basis during vertical construction design phase. • Mid-rise structures can be supported on pile foundations founded on competent material. Depth of foundation will be determined during design-level study. • Proposed development may require modification of current slope configuration. Depending on the proposed grading, slope rebuilt with buttress or stabilization via retaining structures may be needed.
Expected Geotechnical Performance	• Structure on mat foundation will experience acceptable amount of total and differential settlement due to on-going bay mud consolidation, secondary compression and small amounts of possible seismic settlement. • Settlement of the structure supported on pile foundation is not anticipated.
Other Considerations	• Due to environmental constraints, overexcavation in this area may not be feasible. Consider pile foundation as an alternative to overexcavation • Rippability of bedrock may require heavy equipment or blasting.

**Note: Recommendations provided are based on our understanding of the site condition and the most conventional remedial approach in practice within the San Francisco Bay Area. Alternate remedial options are available and will is assessed during design-level study.*

Parcel	B_2
Area	Building Area 8 acres (80% building pad; 20% streets and parks)
Grades	Existing grades vary from 0 to +3 ft (CCSF) Final grades vary from +2.0 to +3.5 ft (CCSF)
Soil and Groundwater Condition	• Site consists of Artificial Fill underlain by Young Bay Mud over Older Alluvium/Stiff Bay Clay over Bedrock. • Thickness of Artificial Fill ranges from 0 ft to up to 10 feet. Bottom of Artificial Fill extends to Elevation -10 ft (CCSF); • Thickness of Young Bay Mud up to 20 feet. Bottom of Bay Mud extends to Elevation -30 ft (CCSF); • Bedrock located at Elevation of -25 to -100 ft (CCSF); • Groundwater Elevation between -3 to -8 ft (CCSF)
Proposed Development Type	Low-rise and one high-rise building at the east corner constructed on-grade. Anticipated 3 to 4 stories for low-rise and 20 to 60 stories for high-rise.
Probable Remedial Grading Related to Infrastructure and Utilities Phase*	No remedial measures are required for infrastructure and utilities.
Expected Utilities Performance	• Some differential settlement between structure and external utilities may be expected • Flexible utilities connection may be required for external utilities into pile supported structures • On-going long-term settlement of Bay Mud may require utilities to maintain positive gradient by increase in design inverts
Probable Remedial Grading Related to Foundation/Vertical Construction*	Structures will be supported on pile foundations founded on competent material. Depth of foundation will be determined during design-level study.
Expected Geotechnical Performance	Settlement of the structure is not anticipated.
Other Considerations	No other considerations.

**Note: Recommendations provided are based on our understanding of the site condition and the most conventional remedial approach in practice within the San Francisco Bay Area. Alternate remedial options are available and will is assessed during design-level study.*

Parcel	B_3
Area	Building Area 11 acres (100% streets and parks)
Grades	Existing grades vary from +1.5 to +20 ft (CCSF) Final grades will be result of minor cut and fill to achieve drainage
Soil and Groundwater Condition	• Site consists of Artificial Fill underlain by Young Bay Mud over Older Alluvium/Stiff Bay Clay over Bedrock. • Thickness of Artificial Fill ranges from 0 ft to up to 20 feet. Bottom of Artificial Fill extends to Elevation -20 ft (CCSF); • Thickness of Young Bay Mud up to 10 feet. Bottom of Bay Mud extends to Elevation -20 ft (CCSF); Bedrock located at Elevation of 0 to -50 ft (CCSF) Groundwater Elevation between -3 to -8 ft (CCSF)
Proposed Development Type	Openspace and supporting facilities constructed on-grade.
Probable Remedial Grading Related to Infrastructure and Utilities Phase*	No remedial measures are required for infrastructure and utilities.
Expected Utilities Performance	• Expect minor settlement due to on-going long term settlement from design fill load, liquefaction, secondary compression, and small amounts of possible seismic settlement. • Flexible utility connections required.
Probable Remedial Grading Related to Foundation/Vertical Construction*	No structures are planned for this area.
Expected Geotechnical Performance	N/A
Other Considerations	RAD impact area may restrict construction activities

**Note: Recommendations provided are based on our understanding of the site condition and the most conventional remedial approach in practice within the San Francisco Bay Area. Alternate remedial options are available and will is assessed during design-level study.*

Parcel	C_1
Area	Building Area 13.6 acres (80% building pad; 20% streets and parks)
Grades	Existing grades vary from 0 to +3 ft (CCSF) Final grades vary from +1.5 to +4.5 ft (CCSF)
Soil and Groundwater Condition	• Site consists of Artificial Fill underlain by Young Bay Mud over Older Alluvium/Stiff Bay Clay over Bedrock. • Thickness of Artificial Fill ranges from 0 ft to up to 10 feet. Bottom of Artificial Fill extends to Elevation -10 ft (CCSF); • Thickness of Young Bay Mud up to 10 feet. Bottom of Bay Mud extends to Elevation -10 ft (CCSF); • Bedrock located at Elevation ranging from 0 to -15 ft (CCSF); • Groundwater Elevation between -1 to -9ft (CCSF)
Proposed Development Type	Mid-rise commercial structures constructed on-grade approximately 6 to 8 stories in height.
Probable Remedial Grading Related to Infrastructure and Utilities Phase*	Local overexcavation of bedrock to a depth of 10 feet below finished grade for utilities is anticipated.
Expected Utilities Performance	• Some differential settlement between structures and external utilities is expected. • Settlement will occur rapidly. Post-construction settlement minimal. • On-going long-term settlement of Bay Mud may require utilities to maintain positive gradient by increase in design inverts
Probable Remedial Grading Related to Foundation/Vertical Construction*	This is a highly transitional soil area. Foundation will vary from shallow to deep foundations. Remedial grading within building pad areas will be investigated. Selection of appropriate foundation approach will be conducted on a pad-by-pad basis during vertical construction design phase.
Expected Geotechnical Performance	• Settlement will vary based on selected foundation systems. • Structures supported on shallow foundation should expect minimal differential settlement if it is underlain by uniform backfill material (i.e. recompacted engineered fill)
Other Considerations	• Due to presences of shallow groundwater level, subgrade stability maybe required during excavation. Contingency to cost estimate should be applied to account for stabilization measures (i.e. dewatering, shoring). • Environmental impacted zones located within this area. Environmental remediation of subsurface soils maybe required or alternatively buildings may be founded on deep foundations to avoid soil disturbance. • Reconditioning of bay mud required for reuse.

**Note: Recommendations provided are based on our understanding of the site condition and the most conventional remedial approach in practice within the San Francisco Bay Area. Alternate remedial options are available and will is assessed during design-level study.*

Parcel	C_2
Area	Building Area 25.8 acres (80% building pad; 20% streets and parks)
Grades	Existing grades vary from -1 to +2 ft (CCSF) Final grades vary from 0 to +2.5 ft (CCSF)
Soil and Groundwater Condition	• Site consists of Artificial Fill underlain by Young Bay Mud over Older Alluvium/Stiff Bay Clay over Bedrock. • Thickness of Artificial Fill ranges from 0 ft to up to 20 feet. Bottom of Artificial Fill extends to Elevation -20 ft (CCSF); • Thickness of Young Bay Mud up to 20 feet. Bottom of Bay Mud extends beyond Elevation -20 ft (CCSF); • Bedrock located at Elevation ranging from -15 to -60 ft (CCSF) • Groundwater Elevation between -6 to -10 ft (CCSF)
Proposed Development Type	Mid-rise commercial structures constructed on-grade approximately 6 to 8 stories in height.
Probable Remedial Grading Related to Infrastructure and Utilities Phase*	No remedial measures are required for infrastructure and utilities.
Expected Utilities Performance	• Settlement in areas of new fill will occur rapidly. Post-construction settlement minimal • Some differential settlement between structure and external utilities may be expected • Flexible utilities connection may be required for external utilities into pile supported structures • On-going long-term settlement of Bay Mud may require utilities to maintain positive gradient by increase in design inverts
Probable Remedial Grading Related to Foundation/Vertical Construction*	Structures may be supported on pile foundations founded on competent material. Depth of foundation will be determined during design-level study.
Expected Geotechnical Performance	Settlement of the structure is not anticipated.
Other Considerations	Environmental impacted zones located within this area, environmental remediation of subsurface soils maybe required or alternatively buildings may be founded on deep foundations to avoid soil disturbance.

**Note: Recommendations provided are based on our understanding of the site condition and the most conventional remedial approach in practice within the San Francisco Bay Area. Alternate remedial options are available and will is assessed during design-level study.*

Parcel	**49 Stadium**
Area	Building Area 33 acres (100% stadium)
Grades	Existing grades vary from -2.5 to +1.5 ft (CCSF) Final grades vary from +3.5 to +7.5 ft (CCSF)
Soil and Groundwater Condition	• Site consists of Artificial Fill underlain by Young Bay Mud over Older Alluvium/Stiff Bay Clay over Bedrock. • Thickness of Artificial Fill ranges from 10 ft to up to 30 feet. Bottom of Artificial Fill ranges from Elevation -10 to -30 ft (CCSF); • Thickness of Young Bay Mud up to 30 feet. Bottom of Bay Mud ranges from Elevation -30 to -50 ft (CCSF); • Bedrock located at Elevations of -15 to -125 ft (CCSF) • Groundwater Elevation between -5 to -10 ft (CCSF)
Proposed Development Type	Professional level sport facility with playing field.
Probable Remedial Grading Related to Infrastructure and Utilities Phase*	No remedial measures are required for infrastructure and utilities.
Expected Utilities Performance	• Minor settlement due to liquefaction and on-going long-term settlement may be expected • Some differential settlement between stadium on piles and external utilities may be expected • Flexible utilities connection may be required for external utilities into pile supported structures • On-going long-term settlement of Bay Mud may require utilities to maintain positive gradient by increase in design inverts
Probable Remedial Grading Related to Foundation/Vertical Construction*	Foundation design and criteria to be provide by others. Assume structure and playing field supported on deep foundations.
Expected Geotechnical Performance	Settlement on the orders of 6 inches is anticipated due to new design fill loads. This amount of settlement should be accounted for when selecting construction grades.
Other Considerations	• For purpose of construction estimate, assume stadium graded as relatively level building pad suitable to support temporary construction equipment and drain surface water. • Site grade needs to be adjusted to compensate for long-term settlement.

**Note: Recommendations provided are based on our understanding of the site condition and the most conventional remedial approach in practice within the San Francisco Bay Area. Alternate remedial options are available and will is assessed during design-level study.*

Parcel	49 Parking
Area	Building Area 87 acres (100% streets and parking)
Grades	Existing grades vary from 0 to +3.0 ft (CCSF) Final grades vary from +2.0 to +9.0 ft (CCSF)
Soil and Groundwater Condition	• Site consists of Artificial Fill underlain by Young Bay Mud over Older Alluvium/Stiff Bay Clay over Bedrock. • Thickness of Artificial Fill ranges from 10 ft to up to 50 feet. Bottom of Artificial Fill ranges from Elevation -10 to -50 ft (CCSF); • Thickness of Bay Mud ranges up to 40 feet. Bottom of Bay Mud extends to elevation -55 ft (CCSF); • Bedrock located at Elevation of -20 ft to -200 ft (CCSF) • Groundwater Elevation between -5 to -10 ft (CCSF)
Proposed Development Type	Turf and/or permeable pavement area for stadium parking with dual-use recreational and sports fields.
Probable Remedial Grading Related to Infrastructure and Utilities Phase*	No remedial measures are required for infrastructure and utilities.
Expected Utilities Performance	• Minor settlement due to liquefaction and on-going long-term settlement may be expected • Flexible utilities connection may be required for external utilities that enter stadium from transition area • On-going long-term settlement of Bay Mud may require utilities to maintain positive gradient by increase in design inverts
Probable Remedial Grading Related to Foundation/Vertical Construction*	No remedial measures are required for the parking area.
Expected Geotechnical Performance	Settlement on the order of 8 inches is anticipated due to new design fill loads. This amount of settlement should be accounted for when selecting construction grades.
Other Considerations	• For purpose of construction estimate, assume parking area graded at relatively level building pad suitable to support temporary construction equipment and drain surface water. • Site grade needs to be adjusted to compensate for long-term settlement.

**Note: Recommendations provided are based on our understanding of the site condition and the most conventional remedial approach in practice within the San Francisco Bay Area. Alternate remedial options are available and will is assessed during design-level study.*

Parcel	UC_1
Area	Building Area 6 acres (100% streets)
Grades	Existing grades vary from 0 to +3 ft (CCSF) Final grades vary from +5.0 to +10.0 ft (CCSF)
Soil and Groundwater Condition	• Thickness of Artificial Fill up to 10 feet. Bottom of Artificial Fill extends to Elevation -10 ft (CCSF); • Bedrock located at Elevation of -10 to -30 ft (CCSF) • Groundwater Elevation between -10 to -15 ft (CCSF)
Proposed Development Type	Utility Corridor
Probable Remedial Grading Related to Infrastructure and Utilities Phase*	Local overexcavation of bedrock to a depth of 10 feet below finished grade for utilities is anticipated.
Expected Utilities Performance	• Minor settlement due to liquefaction and on-going long-term settlement may be expected • Flexible utilities connection may be required for external utilities that transition to any pile supported structures
Probable Remedial Grading Related to Foundation/Vertical Construction*	No remedial grading planned for this area.
Expected Geotechnical Performance	N/A
Other Considerations	No other considerations

**Note: Recommendations provided are based on our understanding of the site condition and the most conventional remedial approach in practice within the San Francisco Bay Area. Alternate remedial options are available and will is assessed during design-level study.*

Parcel	UC_2
Area	Building Area 7 acres (100% streets and parks)
Grades	Existing grades vary from 0 to +50 ft (CCSF) Final grades vary from +5.0 to +50 ft (CCSF)
Soil and Groundwater Condition	• Thickness of Artificial Fill may range up to 5 feet. Bottom of Artificial Fill extends to Elevation -5 ft (CCSF) • Bedrock located at Elevation of at least 0 to +50 ft (CCSF) • Groundwater Elevation between -3 to -8 ft (CCSF)
Proposed Development Type	Utility Corridor
Probable Remedial Grading Related to Infrastructure and Utilities Phase*	Local overexcavation of bedrock to a depth of 10 feet below finished grade for utilities is anticipated.
Expected Utilities Performance	No settlement is anticipated
Probable Remedial Grading Related to Foundation/Vertical Construction*	No remedial grading planned for this area.
Expected Geotechnical Performance	N/A
Other Considerations	• Rippability of rock may require heavy equipment. • Presence of Serpentinite may require air quality monitoring during grading.

**Note: Recommendations provided are based on our understanding of the site condition and the most conventional remedial approach in practice within the San Francisco Bay Area. Alternate remedial options are available and will is assessed during design-level study.*

Parcel	YB
Area	Building Area 7 acres (100% bridge and street)
Grades	Existing grades vary from -3.0 to +5.5 ft (CCSF) Final grades a result of minor cuts and fills of up to 5 feet to achieve grades for drainage.
Soil and Groundwater Condition	• Site consists of Artificial Fill underlain by Young Bay Mud over Older Alluvium/Stiff Bay Clay over Bedrock. • Thickness of Artificial Fill ranges from 10 ft to up to 20 feet. Bottom of Artificial Fill ranges from Elevation -10 ft to -20 ft (CCSF) • Thickness of Artificial Fill ranges from 10 ft to up to 40 feet. Bottom of Bay Mud ranges from Elevation -20 ft to -60 ft (CCSF); • Bedrock located at Elevation of at least -50 to -150 ft (CCSF) • Groundwater Elevation between -3 to -8 ft (CCSF)
Proposed Development Type	Bridge and roadway corridor

Probable Remedial Grading Related to Infrastructure and Utilities Phase*	• Surcharging may be employed to mitigate bay mud settlement due to new fill loads associated with proposed grades.
	• Bridge abutments and bents may be supported on pile foundations
	• Abutment embankment stability and settlement will need to be addressed,
	  ○ Possible use of cement deep mixed columns to stabilize abutment embankment foundation soils
	  ○ Possible use of light weight fill to mitigate settlement
	  ○ Possible use of surcharge and wick drains to mitigate embankment settlement

Expected Utilities Performance	• Some on-going settlement expected on the approaches and abutments • Differential settlement between utilities and pile supported bridge deck on-grade bridge abutment embankments need will require flexible utility connections
Probable Remedial Grading Related to Foundation/Vertical Construction*	No remedial grading for pile supported structures is planned for this area.
Expected Geotechnical Performance of Foundations	Pile supported bridge structure will have limited settlement. Bridge approach and embankment may experience tolerable amounts of differential settlement.
Other Considerations	No other considerations.

**Note: Recommendations provided are based on our understanding of the site condition and the most conventional remedial approach in practice within the San Francisco Bay Area. Alternate remedial options are available and will is assessed during design-level study.*

Appendix M1 PBS&J and Baseline Stormwater Runoff Calculations, November 2009

Appendix M1: Stormwater Runoff Calculations

RUNOFF QUANTITY

Stormwater Runoff

Runoff is affected by physical characteristics such as the amount of impervious area, roughness of land surface, routing of flows, distance for flow to travel, and amount/intensity of precipitation. Runoff is typically calculated based on the Rational Method:

Flow Rate:

$Q = CiA$, where [1]

Q = the runoff rate (cubic feet per second, cfs)

C = the runoff coefficient

i = the rainfall intensity (inches per hour)

A = the drainage area (acres)

Runoff Coefficient

The runoff coefficient, C, is a factor representing the fraction of rainfall falling on the drainage area that will contribute to stormwater runoff instead of on-site storage or infiltration. It is directly related to the amount of impervious surface and can be calculated based on[1]:

$C = 0.05+0.9Ia$, where [2]

Ia = Impervious fraction (proportion of the drainage area that is impervious)

The runoff coefficient can also be determined from technical references for typical runoff coefficients based on land use types and characteristics. Runoff coefficients used in this report are based on both standard engineering references for land use types, as reported by Winzler and Kelly, and Equation 2, based on GIS estimates of impervious area. Winzler and Kelly values were used where possible and GIS impervious areas and Equation 2 were used only if necessary to characterize the drainage area.

For this analysis, the more detailed land use categories were combined into general categories as depicted in Table M1 (Land Use Categories Consolidation for Water Quality Analysis).

Table M2 (Estimated Project Site Characteristics for Runoff Calculations) lists the estimated existing and Project general land use, runoff coefficients, and drainage areas used in this analysis. Land use areas draining to the combined sewer and separate sewer systems were derived from GIS overlays of Figure III.M-1 (Combined and Separate Storm Sewer System and Receiving Water Bodies) of this EIR, aerial photographs, and Figure III.G-1 from the Candlestick Point Stadium and Retail/Entertainment Center EIR, prepared by ESA, Clement Designs, and Orion Environmental Associates.

Table M2 Estimated Project Site Characteristics for Runoff Calculations

		Existing		Project

i. Estimates of sheet flow directly to the Lower Bay are about 10 percent of the HPS Phase II site. This area has not been delineated and cannot be exactly determined. Therefore, the open space area was assumed to be the fraction contributing to sheet flow to the Lower Bay to provide a reasonable estimate since the sheet flow area is primarily the existing open space area. The same runoff coefficient for the HPS Phase II sheet flow area was assumed to be the same as for the Candlestick Point sheet flow area as determined by Winzler & Kelly 2009

Rainfall Intensity

Rainfall intensities during storm events vary with time since the beginning of the rainfall event and how big of a storm it is. The rainfall intensity (i) to use in calculations is typically derived from Intensity/Duration/Frequency (IDF) curves for rainfall events in the geographical region of interest. These IDF curves describe the rainfall intensity for various lengths of time in a storm event (e.g., 5 minutes, 15 minutes, 1 hour, and others), for specific design storm events (e.g., the 2-year storm event, 10-year storm event, and others); a different curve is used for the different design storm events. The length of time (duration) to use is the is usually equivalent to the "time of concentration" (t_c) for the drainage area; the t_c is the time it takes a drop of water at the top of the drainage area to make its way down to the bottom outlet.

Winzler and Kelly analyzed rainfall data from the Department of Water Resources gage #E70 7772 00 to determine the coefficients to describe the IDF curve to be used at the Project site. The rainfall intensity is therefore determined by:

$i = B / (D+t_c)^C$, where [3]

i = the intensity (inches per hour)

B, C, and D are coefficients fitted to monitoring data (see Table M3, below)

t_c = the time of concentration (minutes)

These values for the fitted coefficients identified by Winzler and Kelly are presented in Table M3 (Intensity/Duration/Frequency Curve Coefficients).

Table M3 Intensity/Duration/Frequency Curve Coefficients

	IDF Coefficient		
Design Storm	*B*	*D*	*E*
2 yr*	6.109	0.8	0.54174
5 yr	8.025	1.1	0.5637
10 yr	8.527	0.5	0.548078
100 yr	13.217	1	0.567912

SOURCE: Winzler & Kelly 2009

* Adjusted for partial duration series (see Handbook of Applied Hydrology , Ven Te Chow 1964, Figure 8-I-5 and Equation 8-I-44).

The time of concentration, used in Equation 4, was estimated for each drainage area based on best professional judgment by Winzler & Kelly and listed in Table M4 (Overall Estimated Time of Concentration).

Table M4 Overall Estimated Time of Concentration

Drainage Area	*Existing (minutes)*	*Project (minutes)*
Candlestick Point		
Combined Sewer	10	--
Separate Storm	7	9.4[a]
Sheet Flow	8	6
Hunters Point Shipyard		
Separate Storm	15	11.4[a]
Sheet flow	8[b]	8
Offsite Residential	10	10

SOURCE: Winzler & Kelly 2009

a. Area weighted-average of Winzler & Kelly selected values

b. Sheet flow time of concentration estimated as same as for Candlestick Point existing conditions

\- = not applicable

Runoff Volume

Calculation of storm runoff volume is similar to calculation of flow rate, except the entire storm depth is used instead of a rainfall intensity:

$V = CAd$, where [5]

V = Volume of water (acre-feet)

A = drainage area (acres)

C = composite runoff coefficient for drainage area

d = design rainfall depth (feet)

The design rainfall depth for the storm events evaluated is listed in Table M5 (Design Storm Rainfall Depths).

Table M5 Design Storm Rainfall Depths

Storm Event	*Design Rainfall Depth (inches)*
2-year	2.09
5-year	2.94
10-year	3.6
100-year	5.23
Annual Average	20.0[a]

RESULTS

Table M6 lists the estimated Project site flow rates calculated using Equations 1, 2, and 3 and data in Table M1 through Table M4. For Hunters Point Shipyard, flow rates in Table M6 (Estimated Peak Flow Rates for Existing and Project Conditions) do not include off-site flow from Parcel A (hilltop). The City has required the HPS Phase II development to treat and convey the 5-year storm event from Parcel A in the Project storm drain system, or 108 cfs of flow (5-year storm event) in addition to Project flows. However, the Parcel A flows are existing flows, currently draining to the separate storm system. Therefore, although the offsite flows (108 cfs) must be accounted for in the Project storm drain infrastructure design and must be treated as required, they are not included in this Table M6 because they are not Project site flows and are not affected by development of the Project.

Table M6	Estimated Peak Flow Rates for Existing and Project Conditions		
	Peak Flow Rate		
Storm Event	*Existing (cfs)*	*Project (cfs)*	*Project Increase (cfs [%])*[a]
Candlestick Point			
5-Year	477 (130)[c]	249 (0)[c]	-228 (-48%)
10-Year	545	284	-261 (-48%)
100-Year	783	408	-375 (-48%)
Hunters Point Shipyard[b]			
5-Year	644	448	-196 (-30%)
10-Year	730	509	-221 (-30%)
100-Year	1052	733	-319 (-30%)
Total[c]			
5-Year	1121	697	-424 (-38%)
10-Year	1275	793	-482 (-38%)
100-Year	1835	1141	-694 (-38%)

SOURCE: PBS&J 2009 and Winzler & Kelly 2009

a. A negative increase denotes a reduction in flow
b. Off-site flow from Parcel A is not included in these runoff calculations. Required Parcel A diversions into the HPS Phase II separate storm drain system would be 108 cfs.
c. Values in parenthesis denote the amount of total Candlestick Point site runoff flowing to the combined sewer system.

Table M7 (Estimated Storm Flow Volumes for Existing and Project Conditions) lists the storm flow volumes based on Equation 5 and Table M1, Table M2, and Table M5. Although the offsite flows (15.4 acre-feet) must be accounted for in the Project storm drain infrastructure design and must be treated as required, they are not included in this Table M7 because they are not Project site flows and are not affected by development of the Project.

LEED® Credit Flows

LEED® Credit 6.1. In accordance with LEED® Credit 6.1, the Project must reduce the 2-year 24-hour flow volume by 25 percent compared to existing conditions. As can be seen in Table M7, the Project would reduce the 2-year 24-hour storm volume by 41 percent. Although these calculations are based on estimated site characteristics, it is not likely that more detailed data would indicate a substantially lower reduction in 2-year 24-hour storm event flows. Therefore, it is expected that the Project would meet LEED® Credit 6.1 requirements.

LEED® Credit 6.2. In accordance with LEED® Credit 6.2, the Project must implement water quality BMPs to treat runoff from 0.75 inch of rainfall, or a rainfall intensity of 0.2 inch per hour, depending upon whether a volume-based treatment BMPs is used or a flow-rate-based treatment BMP is used.

Table M7 — Estimated Storm Flow Volumes for Existing and Project Conditions

	Flow Volume		
Storm Event	*Existing (acre-feet)*	*Project (acre-feet)*	*Project Increase (acre-feet [%])[a]*
Candlestick Point			
2-year	36	20	-16 (-44%)
5-Year	50	28	-22 (-44%)
10-Year	61	34	-27 (-44%)
100-Year	89	50	-39 (-44%)
Hunters Point Shipyard[b]			
2-year	64	39	-25 (-39%)
5-Year	90	54	-36 (-40%)
10-Year	110	66	-44 (-40%)
100-Year	160	97	-63 (-39%)
Total			
2-year	100	59	-41 (-41%)
5-Year	140	82	-58 (-41%)
10-Year	171	100	-71 (-42%)
100-Year	249	147	-102 (-41%)

SOURCE: PBS&J 2009 and Winzler & Kelly 2009

a. A negative number denotes a reduction in flow; slight differences (1 %) in percent reductions for different storm events for each site are because of rounding factors

b. Off-site flow from Parcel A is not included in these runoff calculations. Required Parcel A diversions into the HPS Phase II separate storm drain system would be 108 cfs.

Volume-based BMP design standards apply to BMPs whose primary mode of pollutant removal depends on the volumetric capacity of the BMP. Examples of BMPs in this category include detention basins, retention basins, and infiltration. Flow-based BMP design standards apply to BMPs whose primary mode of pollutant removal depends on the rate of flow of runoff through the BMP. Examples of BMPs in this category include swales, sand filters, screening devices, and many proprietary products.

For volume-based BMPs, the volume requirement for capturing and treating a 0.75-inch design storm is calculated by the using the Equation 5 and using 0.75 inch for the design rainfall depth.

For flow-based BMPs, the required flow rate BMPs must be designed to treat is runoff from a rain event equal to an intensity of 0.2 inch per hour of rainfall. The Rational Method (Equation 1 and Table 1 and Table 2) is used to determine the treatment flow rate, with the rainfall intensity of 0.2 inch per hour.

As such, if volume-based treatment BMPs are used, they must be designed to treat at least:

- 7 acre-feet from Candlestick Park, and
- 11 acre-feet from HPS Phase II
- 4 acre-feet from off-site area (Parcel A)

If flow rate BMPs are used, they must be designed to treat at least:

- 23 cfs from Candlestick Park, and
- 34 cfs from HPS Phase II
- 10 cfs from off-site area (Parcel A)

It should be noted that although the City requires conveyance of the 5-year storm event runoff from the off-site from Parcel A and treatment to LEED® Credit 6.2 requirements, this off-site area is not affected by the Project and would not included in the impacts analysis because this area is not part of the Project.

CSOs

Development of the Project would reduce the amount of stormwater runoff to the combined sewer system by diverting the 5-year storm event runoff from the portion of Candlestick Point flowing to the combined sewer system to a separate sewer system (130 cfs or 58,348 gallons per minute [gpm]) (Table M6). CSO events occur when the instantaneous flow rate in the combined sewer system exceeds 110 million gallons per day (mgd) with about 94 percent consisting of stormwater flows (refer to Section III.Q [Utilities] of this EIR). Eliminating the 5-year storm event flow, from the area draining to the combined sewer system, from combined sewer system flows would therefore reduce the potential for CSO events in the combined sewer system because CSOs occur primarily as a result of stormwater runoff. Development of the Project would also increase peak sewage flows to the combined system by up to 1,479 gpm from Candlestick Point and 979 gpm from HPS Phase II for a total of 2,458 gpm (Table III.Q-7 [Sewer Trunk Capacity and Project Maximum Peak Flows]). Therefore, even with the increased peak sewage flows with development of the Project, the Project would result in a net reduction of 55,890 gpm of flow to the combined sewer system during storm events. Given this large reduction in flow during the critical times when CSOs may occur (storm events), there would be no impact from Project sewage discharges to the combined sewer system CSOs and violation of the Wastewater Discharge Permit.

WATER QUALITY

In order to evaluate the Project effect on stormwater quality, annual pollutant loads were estimated for existing and Project conditions. The amount of runoff, along with the expected pollutant concentrations in stormwater runoff, as related to land use, can be used provide a relative measure of Project effects on stormwater pollutants following conversion from one land use type to another. Different land uses will have different average pollutant concentrations in stormwater runoff, along with a different amount runoff each year. For instance, according to the national median total suspended solids concentration in runoff from residential lands is 49 mg/L and the median concentration in industrial runoff is 81 mg/L.[2] In general, the annual amount of runoff can be calculated or modeled based on simple site characteristics. Pollutant concentrations in stormwater runoff are required for each land use category to provide the relative comparison criteria.

---

[2] Maester, A. and R. Pitt. 2005. The National Stormwater Quality Database, Version 1.1 A Compilation and Analysis of NPDES Stormwater Monitoring Information. Prepared for the U.S. EPA Office of Water, Septebmer 4, 2005. p. 7-12

Land use pollutant concentrations will vary, depending upon local or regional conditions and the precipitation regime.[3] Therefore, using a national average (e.g., NSQD v. 1.1) or many other reported values would not be appropriate for local/regional scale analyses because the Project area is in a semi-arid/Mediterranean climate regime. Unfortunately, stormwater monitoring studies typically do not measure or report stormwater runoff pollutant concentrations by land use and data is very limited. While the limited data can be used to address ***relative*** changes in land use (Project) effects on annual pollutant loads, it would not be suitable to use these values to identify specific effects on pollutant concentrations. Consequently, this analysis does not address potential land use change effects on pollutant concentrations but makes use of literature values for stormwater pollutant concentrations to estimate the ***relative*** effect on pollutant loads; it would not be suitable to use generalized numbers to estimate effects on concentrations that water quality objectives are based on.

The Simple Method

Stormwater pollutant loads are calculated based on the Simple Method.[4] The Simple Method was developed based on empirical relationships observed in data collected in the Washington, D.C. area for the Nationwide Urban Runoff Program (NURP) studies published by U.S. EPA in 1983. The Simple Method estimates pollutant loads for chemical constituents as a product of the annual runoff volume and pollutant concentration, as[5]:

$L = 0.226 * R * C * A$, where [5]

L = Annual load (pounds [lbs])

R = Annual runoff (inches [in])

C = Pollutant concentration (milligrams per liter [mg/L])

A = Area (acres)

0.226 = Unit conversion factor

For bacteria, the equation is slightly different, to account for the differences in units. The modified equation for bacteria is[6]:

$L = 1.03 * 10\text{-}3 * R * C * A$, where [6]

L = Annual load (Billion Colonies)

R = Annual runoff (in)

C = Bacteria concentration (#/100 ml)

A = Area (acres)

[3] Maester, A. and R. Pitt. 2005. The National Stormwater Quality Database, Version 1.1 A Compilation and Analysis of NPDES Stormwater Monitoring Information. Prepared for the U.S. EPA Office of Water, Septebmer 4, 2005. p. 34

1.03 * 10-3 = Unit conversion factor

The Simple Method calculates annual runoff as a product of annual runoff volume, and a runoff coefficient (Rv). Runoff volume is calculated as[7]:

R = P * Pj * Rv, where [7]

R = Annual runoff (inches)

P = Annual rainfall depth (inches)

Pj = Fraction of annual rainfall events that produce runoff (usually 0.9)

Rv = Runoff coefficient (identified as 'C' in Equations 1 and 2)

The annual precipitation at the Project site is 20.0 inches per year.[8] The runoff coefficient can be estimated from look-up tables or based on the amount of impervious surface using Equation 2 (identified as "C" in Equations 1 and 2). Areas and runoff coefficients for each drainage area and land use type analyzed are presented in Table M2.

Pollutant Concentrations

Pollutant concentrations used in this analysis were derived from a combination of Los Angeles County Department of Public Works (LACDPW) monitoring data and Bay Area Stormwater Management Agencies Association (BASMAA) data; the best available data for the area. As mentioned above, stormwater pollutant concentrations can vary as a function of climate regime and local/regional conditions. Therefore, it is important to use data that was generated from a study geographically close to the site of interest or otherwise similar in Project site/pollutant concentration site characteristics. The BASMAA data includes measurements from Alameda and Santa Clara County (Alameda County data were used for this assessment). However, this data is limited to only a few constituents. The LACDPW data includes more parameters to compare, but is not as geographically similar to the Project site. The National Stormwater Quality Database v. 1.1 was mined to see if sufficient data was available in EPA Rain Zone 6, the rain zone California is in, which could provide a more robust dataset that was not too limited by coming from a very different precipitation regime. However, this data was not used because insufficient information was available for the 'Open Space' land use category in U.S. EPA Rain Zone 6 (the U.S. EPR Rain Zone for California). For each parameter assessed, the same data set (either LACDPW or BASMAA) was used for all land use categories for that parameter. Therefore, even though the absolute pollutant loads may not be reflective of Project site conditions, the relative differences caused by changes in land use should reasonably reflect the Project changes in land use effect on stormwater quality. Table M8 (Pollutant Event Mean Concentrations in Stormwater Runoff by Land Use) lists the pollutant concentrations and data sources used in this analysis. It should be noted that not all constituents of concern were analyzed because of insufficient data (e.g., pesticides, inorganic

a. Where mg/L = milligrams per liter, ug/L = micrograms per liter, and MPN/100mL = most probable number (of colonies) per 100 milliliters.

ANNUAL POLLUTANT LOADS

Using Equations 5, 6, and 7 and data in Table M2 and Table M8, annual pollutant load from the Project site under existing land use conditions and Project conditions were calculated.

Candlestick Point

Table M9 (Potential Project Effect on Annual Pollutant Load from Candlestick Point) lists the Project effects on pollutants in stormwater runoff from Candlestick Point and annual runoff volume to each system. Runoff to the separate sewer system in Table M9 includes sheet flow runoff to the Bay.

Table M9 Potential Project Effect on Annual Pollutant Load from Candlestick Point

	Existing			*Project*		
					Overall Difference from Existing[a]	
Pollutant	*Combined (lbs)*	*Separate (lbs)*	*Total (lbs)*	*Total (lbs)*	*(lbs)*	*(%)*
Total Suspended Solids	*24,951*	*42,289*	67,240	59,500	-7,740	-12%

a. The 'Difference' columns denote the difference between Project and Existing annual pollutant loads; a negative number indicates that pollutant loads are lower with development of the Project compared to existing conditions.

Overall, except for ammonia, development of Candlestick Point, without considering BMP effects or removal of pollutants by the combined sewer system, would result in a reduction in annual stormwater pollutant load. However, because a portion of existing runoff flows to the water treatment plant (SWPCP), this portion of existing flows are treated prior to discharge to the Lower Bay. Comparison of Candlestick Point pollutant loads and existing pollutant loads from only the areas currently not receiving any treatment (flow to the separate sewer system and sheet flow to the Lower Bay) provides a better indication of potential Candlestick Point 'worst case' effects on water quality. Table M10 (Annual Pollutant Loads Piped and Sheet Flow Direct to the Lower Bay from Candlestick) lists these potential 'worst case' effects by comparing only those flows that currently receiving no treatment.

Table M10 Annual Pollutant Loads Piped and Sheet Flow Direct to the Lower Bay from Candlestick

Pollutant	Existing (lbs)	Project (lbs)	Project Difference from Existing (lbs)	Project Difference from Existing (%)
Total Suspended Solids	42,289	59,500	17,211	41%
Ammonia	51.1	124	73.0	143%
Nitrate+Nitrite as N	416	554	138	33%
Total Kjeldahl Nitrogen	448	790	342	76%
Total Nitrogen	864	1,344	480	56%
Dissolved Phosphorous	143	110	-32.5	-23%
Total Phosphorous	201	163	-37.8	-19%
Total Cadmium	0.413	0.340	-0.073	-18%

Fecal Coliforms (billions of colonies)	2,322,614	1,849,326	-473,288	-20%
Stormwater Volume (acre-feet)	177.5	171.4	-6.1	-3

SOURCE: PBS&J 2009
Loads directly to the Lower Bay

Therefore, considering just the Project effect on pollutants being discharged to a separate storm drain system or sheet flow to the Lower Bay, development at Candlestick Point, without BMPs, would increase the pollutant load for several pollutants including total suspended solids (+41 percent), ammonia (+143 percent), nitrate + nitrite (+33 percent), and total nitrogen (+56 percent) (Table M10). If BMPs are incorporated, they could further reduce stormwater pollutants. There is no information on BMP effectiveness for removing ammonia, however, several BMPs are effective at removing nitrogen sources. Table M11 (Expected BMP Pollutant Removal Rates) lists potential BMP pollution removal effectiveness for some potential Project BMPs

This increase is partially because the total amount of stormwater currently diverted to the combined system would be diverted to the storm drain system or sheet flow to the Lower Bay with development at Candlestick Point, resulting in about the same amount of runoff directly to the Lower Bay but with higher total suspended solids and total kjeldahl nitrogen (organic nitrogen) concentrations from the increased amount of open space land and higher nitrogen concentrations from the increased amount residential lands with development of Candlestick Point, compared to the mostly commercial land under existing conditions.

Unlike the HPS Phase II site, which is greatly constrained for use of infiltration BMPs because of shallow depth to groundwater, existing groundwater plumes, and extensive fill material, infiltration BMPs may be possible at the Candlestick Point site. Infiltration BMP effectiveness depends on many factors including the soil characteristics and type of infiltration BMP used and should not be used in areas where the depth to shallow groundwater is within 10 feet of the bottom of the infiltration device[9] or where infiltration rates are to low (not enough infiltration) or too fast (not enough filtration before reaching groundwater).

Even though the overall Candlestick development reduces total suspended solids (TSS) loads by about 12 percent without BMPs, in order to meet LEED® Credit 6.2 (80 percent TSS annual load removal) the Project would still have to implement additional BMPs that would further reduce annual pollutant loading by reducing TSS concentrations or decreasing runoff volumes via infiltration and/or evapotranspiration. In other words, Lennar Urban would still have to treat 7 acre-feet (or 23 cfs) of runoff with BMPs that can provide 80 percent TSS annual load removal at Candlestick Point. This could be met a variety of BMPs including vegetated swales or BMPs that use infiltration (where infiltration is not constrained by site characteristics).

Some of the types of BMPs being considered for implementation at the Project site include:

- **Dry Detention Ponds/Dry Ponds.** Dry detention ponds (a.k.a. dry ponds, extended detention basins, detention ponds, extended detention ponds) are basins whose outlets have been designed to detain stormwater runoff for some minimum time (e.g., 24 hours) to allow particles and associated pollutants to settle. Unlike wet ponds, these facilities do not have a large permanent pool of water. However, they are often designed with small pools at the inlet and outlet of the basin. They can also be used to provide flood control by including additional flood detention storage.
- **Infiltration Basin.** An infiltration basin is a shallow impoundment which is designed to infiltrate stormwater into the soil and use soils on the site as a filter media. Such a system collects the stormwater and allows it to percolate through the soils and back into the groundwater This practice is believed to have a high pollutant removal efficiency and can also help recharge the ground water. Infiltration basins can be challenging to apply on many sites, however, because of soils requirements. In addition, some studies have shown relatively high failure rates compared with other management practices. Because it depends on the native soils to filter and discharge the water, an infiltration system is not feasible for every site. The soil types, underlying geology, slopes, and hydrology of the site must be considered when designing an infiltration system.
- **Wetland Basins.** Stormwater wetlands (a.k.a. constructed wetlands) are structural practices similar to wet ponds that incorporate wetland plants into the design. As stormwater runoff flows through the wetland, pollutant removal is achieved through settling and biological uptake within the practice. Wetlands are among the most effective stormwater practices in terms of pollutant removal and they also offer aesthetic and habitat value. Although natural wetlands can sometimes be used to treat stormwater runoff that has been properly pretreated, stormwater wetlands are fundamentally different from natural wetland systems. Stormwater wetlands are designed specifically for the purpose of treating stormwater runoff, and typically have less biodiversity than natural wetlands in terms of both plant and animal life. Several design variations of the stormwater wetland exist, each design differing in the relative amounts of shallow and deep water, and dry storage above the wetland.

[9] SWRCB, 2003, Water Quality Order No. 2003-0005-DWQ, National Pollutant Discharge Elimination system (NPDES) General Permit No. CAS000004, Waste Discharge Requirements (WDRs) for Storm Water Discharges from Small Municipal Separate Storm Sewer Systems (General Permit), Attachment 4, p 10.

- **Biofilter.** Bioswales, vegetative buffers, constructed wetlands, bioretention devices and other types of stormwater filters that use biological components to treat and filter pollutants in stormwater runoff.
- **Vegetated Filter Strips.** Vegetated filter strips (grassed filter strips, filter strips, and grassed filters) are a type of biofilter. They consist of vegetated surfaces that are designed to treat sheet flow from adjacent surfaces. Filter strips function by slowing runoff velocities and filtering out sediment and other pollutants, and by providing some infiltration into underlying soils. Filter strips were originally used as an agricultural treatment practice, and have more recently evolved into an urban practice. With proper design and maintenance, filter strips can provide relatively high pollutant removal. One challenge associated with filter strips, however, is that it is difficult to maintain sheet flow, so the practice may be "short circuited" by concentrated flows, receiving little or no treatment.
- **Grassed Channels.** Grassed channels are a type of biofilter. Grassed channels are the most similar to a conventional drainage ditch, with the major differences being flatter side slopes and longitudinal slopes, and a slower design velocity for water quality treatment of small storm events. Of all of the options, grassed channels are the least expensive but also provide the least reliable pollutant removal. An excellent application of a grassed channel is as pretreatment to other structural stormwater practices. A major difference between the grassed channel and many other structural practices is the method used to size the practice. Most stormwater management water quality practices are sized by volume. This method sets the volume available in the practice equal to the water quality volume, or the volume of water to be treated in the practice. However, the grassed channel, is a flow-rate-based design. Based on the peak flow from the water quality storm, the channel should be designed so that runoff takes, on average, 10 minutes to flow from the top to the bottom of the channel.
- **Bioretention.** Bioretention devices are a type of biofilter. Bioretention areas are landscaping features adapted to provide on-site treatment of stormwater runoff. They are commonly located in parking lot islands or within small pockets of residential land uses. Surface runoff is directed into shallow, landscaped depressions. These depressions are designed to incorporate many of the pollutant removal mechanisms that operate in forested ecosystems. During storms, runoff ponds above the mulch and soil in the system. Runoff from larger storms is generally diverted past the facility to the storm drain system. The remaining runoff filters through the mulch and prepared soil mix. The filtered runoff can be collected in a perforated underdrain and returned to the storm drain system
- **Dry Swales.** Dry swales are a type of biofilter Dry swales are similar in design to bioretention areas. These designs incorporate a fabricated soil bed into their design. The native soil is replaced with a sand/soil mix that meets minimum permeability requirements. An underdrain system is installed at the bottom of the soil bed. This underdrain is a gravel layer that encases a perforated pipe. Stormwater treated in the soil bed flows into the underdrain, which routes this treated stormwater to the storm drain system or receiving waters. Dry swales are a relatively new design, but studies of swales with a native soil similar to the man-made soil bed of dry swales suggest high pollutant removal.
- **Media Filters.** Stormwater filters collect the water and pass it through a bed of sand or other media to remove contaminants from the water. Media filter devices typically include a sedimentation chamber and a filtering chamber containing the filter media. The media is housed in cartridge filters enclosed in concrete vaults, or in fixed beds such as sand filters. An assortment of filter media are available, including leaf compost, pleated fabric, activated charcoal, perlite,

amended sand and perlite, and zeolite. The most common type of stormwater filter is a sand filter, which may be constructed in a concrete structure or designed into a small detention area. The system functions by routing the stormwater through the filtering or sorbing medium, which traps particulates and/or soluble pollutants. While they are capable of excellent pollutant removal, filters are also susceptible to clogging and are costly to maintain.

- **Hydrodynamic Separators.** Hydrodynamic separators are structures designed to remove suspended sediments, oils, and floatable debris by physical processes. Usually installed as an underground structure, a hydrodynamic separator is most often used on sites with large paved areas where space is at a premium. This type of installation relies on sedimentation and flotation to remove and retain pollutants, and often includes proprietary flow controls and pollutant removal effectiveness is highly dependent upon the stormwater flow rate being similar to the device design treatment flow rate.
- **Pervious Pavement.** Permeable pavement is open graded asphalt or concrete with reduced fines and a special binder that allows for the rapid flow of water. Water is able to pass through the pavement by flowing through voids between the aggregate. Another way to construct a permeable paving surface is to use paver blocks. The paver blocks themselves are not permeable, but are installed with gaps between the pavers to allow stormwater to penetrate into the subsurface. The gap is integrated into the interlocking design of the paver blocks. Grid systems made of plastic grids filled with soil or aggregate are also used.

  Beneath the porous surface is an aggregate subbase underlain with geotextile fabric. The aggregate subbase is typically divided into an upper filter course comprised of fine aggregate, and a lower reservoir course comprised of larger aggregate. The geotextile fabric provides separation between the aggregate and soil beneath and structural stability. Stormwater runoff from the paved surface and adjacent impervious areas passes through the porous pavement to the aggregate reservoir where it is filtered and stored. The aggregate also serves as the road or parking area's support base and must be sufficiently thick to support traffic loads. Permeable pavement decreases runoff volume and peak discharge, filters pollutants, and may be used to recharge groundwater. Porous pavements reduce stormwater runoff volume and peak discharge by providing a storage reservoir and an opportunity for subsurface infiltration.

Table M11 lists pollutant removal rates by these various BMPs that are being considered for implementation.

Removal rates were calculated based on the difference between the median influent and effluent concentrations as reported in the International Stormwater Best Management Practices (BMP) Database, except where noted. It should be noted that these values are reported by general category of BMP. Exact type of BMP within each category, influent concentration, BMP sizing, and BMP siting will make a difference in actual BMP performance. However, from Table M11 it can be seen that implementation of BMPs or a suite of BMPs would be effective at removing pollutants in stormwater runoff sufficient to meet LEED® Credit 6.2 requirements. However, some BMPs that may be effective at removing TSS may actually increase other constituents of concern, such as nitrogen.

HPS Phase II

Table M12 (Potential Project Effect on Annual Pollutant Load From HPS Phase II) lists the effect of development at HPS Phase II on pollutants in stormwater runoff to the Lower Bay and annual runoff volumes. At HPS Phase II, all stormwater is currently discharged to the storm drain system and does not receive treatment prior to discharge.

Table M12 Potential Project Effect on Annual Pollutant Load From HPS Phase II

Pollutant	*Existing (lbs)*	*Project (lbs)*	*Project Difference from Existing (%)*	*Off-site Residential (lbs)*
Total Suspended Solids	304,776	113,803	-63%	*24,822*

SOURCE: PBS&J 2009

Development of HPS Phase II would substantially reduce the amount of stormwater runoff and pollution from the HPS Phase II site, for the parameters listed (assuming no residual contamination from prior Navy operations). Overall, development of HPS Phase II would reduce pollutants in stormwater runoff and impacts on water quality would not be substantial.

Additionally, Lennar Urban would have to divert stormwater runoff (up to the peak 5-year storm event) from the off-site Parcel A area through the Project storm drain system (Off-site Residential column in Table M12) and treat in accordance with LEED® Credit 6.2 requirements. Consequently, the Project storm drain system would have to be designed to convey and treat flow from this off-site area, which would improve stormwater quality conditions not associated with development of the project. The last column in Table M12 listed the current annual pollutant load from this off-site area. Any treatment of these flows would be a beneficial effect of the Project.

Even though the HPS Phase II reduces TSS by about 63 percent without BMPs, in order to meet LEED® Credit 6.2 (80 percent TSS annual load removal) development at HPS Phase II would still have to implement additional BMPs that would further reduce annual pollutant loading by reducing TSS concentrations or decreasing runoff volumes via infiltration and/or evapotranspiration. In other words, Lennar Urban would have to treat 11 acre-feet (or 34 cfs) of runoff with BMPs that can provide 80 percent TSS annual load removal at HPS Phase II. Additionally, in accordance with City requirements, the Project would have to treat 4 acre-feet (10 cfs) of off-site flows from Parcel A with BMPs that can provide 80 percent TSS annual load removal at HPS Phase II. This could be met a variety of BMPs, however, infiltration BMPs will likely be constrained over the majority of the HPS Phase II site.

Project

Table M13 (Potential Project Effect on Annual Stormwater Pollutant Load) lists the overall effect of development at the Project site on pollutants in stormwater runoff and annual runoff (combination of Table M9 and Table M12).

Table M13 Potential Project Effect on Annual Stormwater Pollutant Load

Pollutant	Existing (lbs)	Project (lbs)	Project Difference From Existing (lbs)	(%)

Stormwater Volume (acre-feet)	737.8	450.3	-287.4	-39%

SOURCE: PBS&J 2009

Development of Project would substantially reduce the amount of stormwater runoff and pollution from the Project site for the parameters listed (assuming no residual contamination from prior Navy operations). However, because a portion of existing runoff from Candlestick Point flows to the water treatment plant (SWPCP), this portion of existing flows are treated prior to discharge to the Lower Bay. Comparison of Project pollutant loads and existing pollutant loads from only the areas currently not receiving any treatment (flow to the separate sewer system and sheet flow to the Lower Bay) provides a better indication of potential Project 'worst case' effects on water quality. Table M14 (Annual Pollutant

Loads Piped and Sheet Flow Direct to the Lower Bay From the Project) lists these potential 'worst case' effects by comparing only those flows that currently receiving no treatment.

Table M14 Annual Pollutant Loads Piped and Sheet Flow Direct to the Lower Bay From the Project

			Project Difference from Existing	
Pollutant	*Existing (cfs)*	*Project (cfs)*	*(cfs)*	*(%)*
Total Suspended Solids	347,065	173,303	-173,762	-50%
Ammonia	676	284	-392	-58%
Nitrate+Nitrite as N	1,735	1,419	-316	-18%
Total Kjeldahl Nitrogen	4,474	1,923	-2,551	-57%
Total Nitrogen	6,209	3,341	-2,868	-46%
Dissovled Phosphorous	529	253	-276	-52%
Total Phosphorous	806	399	-407	-51%
Total Cadmium	2.29	0.85	-1.44	-63%
Total Chromium	33.7	13.4	-20.3	-60%
Total Copper	59.5	21.6	-37.9	-64%
Total Lead	140	64	-75.8	-54%
Total Nickel	28.1	16.8	-11.3	-40%
Total Zinc	684	251	-433	-63%
Fecal Coliforms (billions of colonies)	6,585,191	4,031,956	-2,553,235	-39%
Stormwater Volume (acre-feet)	643	450	-193	-30%

SOURCE: PBS&J 2009

From Table M14, it can be seen that even when considering just the Project effect on pollutants being discharged to a separate storm drain system or sheet flow to the Lower Bay, development of the Project, without BMPs, would reduce pollutant loads for all assessed parameters and impacts on water quality would not be substantial. If BMPs are incorporated, they could further reduce stormwater pollutants. Table M11 lists potential BMP pollution removal effectiveness for some potential Project BMPs.

Even though the Project reduces TSS by about 50 percent without BMPs, in order to meet LEED® Credit 6.2 (80 percent TSS annual load removal) the Project would still have to implement additional BMPs that would further reduce annual pollutant loading by reducing TSS concentrations or decreasing runoff volumes via infiltration and/or evapotranspiration. In other words, Lennar Urban would have to treat 30 acre-feet (or 45 cfs) of runoff with BMPs that can provide 80 percent TSS annual load removal at HPS Phase II. Additionally, in accordance with City requirements, the Project would have to treat 4 acre-feet (10 cfs) of off-site flows from Parcel A with BMPs that can provide 80 percent TSS annual load removal at HPS Phase II. This could be met a variety of BMPs, however, infiltration BMPs will likely be constrained over the majority of the HPS Phase II site. As noted above, some BMPs that may be effective at meeting the LEED® Credit 6.2 requirements may also result in higher discharges of other constituents of concern, such as nitrogen. Care must be taken to select BMPs that maximize pollutant removal of TSS and minimize increases in loads of other pollutants.

RECOMENDATIONS

Incorporate stormwater quality BMPs into the Storm Water Quality Management Plan to achieve 80 percent TSS annual load reduction from the 0.75 inch (or 0.2 inch per hour) runoff from the Project and off-site Parcel A, without increasing loads of nitrogen, metals, or bacteria compared to existing loads to the separate sewer system and sheet flow to the Lower Bay. Document that the selected BMPs, do not increase nitrogen, metals, or bacteria loads compared to existing loads to the separate sewer system and sheet flow to the Lower Bay (including off-site Parcel A). Calculations can be performed by modeling water quality runoff concentrations as affected by BMPs using the International Stormwater Best Management Practices (BMP) Database data, or by performing load calculations as presented in this document and BMP removal rates in Table M11. Additional BMPs and BMP removal rates can be used where supported by effectiveness studies as approved by the City.

Limit use of infiltration BMPs on the HPS Phase II site to areas where groundwater constraints are minimal and areas without fill material.

Appendix M2 BASELINE Water Quality Data Analysis, November 2009

Appendix M2 Water Quality Data Analysis

This Appendix is an evaluation of in-Bay pathogen indicator[1] quality data collected in the vicinity of the Project site as part of the City's Beach Water Quality Monitoring Program, and stormwater runoff data collected by the Navy and its tenants at the Hunters Point Shipyard in accordance with the requirements of the Industrial General Permit.

Beach Water Quality

Table M-1 through Table M-3 summarize the shoreline beach water quality monitoring data collected by the San Francisco Public Utilities Commission (SFPUC) and San Francisco Department of Public Health for the Beach Water Quality Monitoring Program[2] in the vicinity of the Project site. BASELINE obtained the data for this analysis from the SFPUC. The three sampling locations discussed in this Appendix are Jack Rabbit Beach (Station No. 301.2), Windsurfer Circle (Station No. 301.1), and Sunnydale Cove (Station No. 300.1). The sampling locations are shown on Figure III M-1. The sampling locations are in the proximity of combined sewer overflow outfall 043 (Candlestick Cove) and are south of outfall 042 (South Basin) (see Figure III.M-2).

Table M-1 through Table M-3 summarize the pathogen indicator data collected from 2004-2008 for total coliform, *Escherichia* coli (E. coli), and enterococcus bacteria. For this analysis, BASELINE separated the data into wet and dry weather samples, with wet weather samples defined as samples collected when the sum of the daily and 24-hour antecedent rainfall depths was greater than or equal to 0.1 inch (because generally smaller rain events are not likely to produce stormwater runoff). Dry weather samples represent data collected when the sum of the daily and 24-hour antecedent rainfall depths was less than 0.1 inch. Each table shows the number of samples, the number of non-detect results, the number of samples that exceeded the quantification range of the analysis (and were not diluted and reanalyzed; therefore the reported values are lower than actual concentrations and give the results a low bias), the average and median concentrations, and the coefficient of variation (CV) (i.e., the standard deviation divided by the average concentration; the CV provides an indication of data variability).

Generally among the three sampling locations, Jack Rabbit Beach has the lowest total coliform, E. coli, and enterococcus bacteria concentrations for both wet and dry weather, and Windsurfer Circle has the highest pathogen concentrations. Generally pathogen indicator concentrations are significantly higher in wet weather than in dry weather for all three stations.

The Water Quality Control Plan for the San Francisco Bay Basin (Basin Plan) includes water quality objectives for total coliform (and fecal coliform, which was not monitored as part of the Beach Water Quality Monitoring Program), but not for E. coli or enterococcus bacteria. For total coliform, the Basin

---

1 Although they are not generally harmful themselves, pathogen indicators indicate the possible presence of disease-causing bacteria, viruses, and protozoa.

2 San Francisco Public Utilities Commission, website: http://sfwater.org/detail.cfm/MC_ID/20/MSC_ID/198/MTO_ID/515/C_ID/3554, accessed August 3, 2009.

Plan objective states that the median concentration should be less than 240 Most Probable Number [MPN] per 100 milliliters [mL]. The wet weather median concentrations for total coliform at all three stations exceeded the Basin Plan objective; however the dry weather median concentrations did not exceed the objective. The Basin Plan also has a single sample objective, which is that no sample should exceed 10,000 MPN/100 mL. As indicated in Table M-1, 20 wet weather samples exceeded the Basin Plan objective for total coliform at Sunnydale Cove, 42 wet weather samples exceeded at Windsurfer Circle, and no wet weather samples exceeded the Basin Plan single sample objective at Jack Rabbit Beach. Eleven dry weather samples exceeded the single sample standard at Windsurfer Circle, two dry weather samples exceeded at Jack Rabbit Beach, and no dry weather samples exceeded the Basin Plan single sample standard for total coliform at Sunnydale Cove.

TABLE M-1
SUMMARY OF TOTAL COLIFORM DATA FOR SOUTH BASIN/CANDLESTICK POINT
2004-2008

Sample Location	Sunnydale Cove (Station No. 300.1)		Windsurfer Circle (Station No. 301.1)		Jack Rabbit Beach (Station No. 301.2)	
	Dry	Wet	Dry	Wet	Dry	Wet
No. Samples	231	95	250	108	223	71
No. Non-Detects	8	1	10	0	18	1
No. Samples that Exceeded Quantification Range of the Analysis(1)	0	11	5	30	1	0
Average [MPN/100 mL]	413	5,772	1,729	10,010	350	947
Coefficient of Variation (CV)(2)	2.1	1.5	2.7	1.0	5.1	1.4
Median [MPN/100 mL] (Basin Plan Standard median < 240)(3)	134	1,296	193	5,794	63	345
No. samples > 10,000 MPN/100 mL (Basin Plan Standard)(4)	0	20	11	42	2	0

Source: Statistical data analysis performed by BASELINE using analytical data provided by the San Francisco Public Utilities Commission.

Notes:

MPN = Most Probable Number as quantified by multiple-tube fermentation.

"Wet" and "Dry" samples were defined based on rainfall amounts. A "Wet "sample is defined as a sample collected when the sum of the daily and 24-hour antecedent rainfall depth was ≥ 0.1 inch. A "Dry" sample is defined as a sample collected when the rainfall depth was < 0.1 inch.

The sample detection limit was used to calculate statistics for non-detect concentrations. When a result was reported as > X MPN/100 mL, X was used to calculate statistics (see also Note 1).

(1) The sample result was reported as greater than the reported concentration because the result exceeded the quantification range of the analysis, and a dilution and reanalysis of the sample was not performed. Consequently, these results have a low bias.

(2) The Coefficient of Variation (CV) is the ratio of the standard deviation and the average concentration. A CV greater than 1.0 generally indicates high variability in the data.

(3) The Basin Plan objective is based on a minimum of five consecutive samples equally spaced over a 30-day period. This analysis compares the objective to the median of all data collected from 2004-2008.

(4) The Basin Plan objective states that no single sample should exceed 10,000 MPN/ml.

TABLE M-2
SUMMARY OF E. COLI DATA FOR SOUTH BASIN/CANDLESTICK POINT
2004-2008

Sample Location	Sunnydale Cove (Station No. 300.1)		Windsurfer Circle (Station No. 301.1)		Jack Rabbit Beach (Station No. 301.2)

Average [MPN/mL]	55	1,352	80	1,672	24	152
Median [MPN/mL]	10	98	10	217	10	31
Coefficient of Variation (CV)(2)	2.7	3.2	4.7	2.6	1.9	2.3

Source: Statistical data analysis performed by BASELINE using analytical data provided by the San Francisco Public Utilities Commission

Notes:

MPN = Most Probable Number as quantified by multiple-tube fermentation.

“Wet” and “Dry” samples were defined based on rainfall amounts. A “Wet “sample is defined as a sample collected when the sum of the daily and 24-hour antecedent rainfall depth was ≥ 1.0 inch. A “Dry” sample is defined as a sample collected when the rainfall depth was < 0.1 inch.

The sample detection limit was used to calculate statistics for non-detect concentrations. When a result was reported as > X MPN/100 mL, X was used to calculate statistics (see also Note 1).

The Basin Plan does not include water quality objectives for Enterococcus bacteria.

(1) The sample result was reported as greater than the reported concentration because the result exceeded the quantification range of the analysis, and a dilution and reanalysis was not performed. Consequently, these results have a low bias.

(2) The Coefficient of Variation (CV) is the ratio of the standard deviation and the average concentration. A CV greater than 1.0 generally indicates high variability in the data.

Hunters Point Shipyard Industrial Stormwater Discharge Quality

The Navy and tenants at the Hunters Point Shipyard (HPS) collect stormwater runoff water quality data in accordance with the Industrial General Permit (Water Quality Order No. 97-03-DWQ, NPDES General Permit No. CAS000001). The Industrial General Permit requires implementation of a stormwater monitoring program. In accordance with the General Permit, the discharger must:

- Collect samples from two storm events per year including the first storm of the wet season (from all outfalls producing a discharge), and any additional storm event (in the case of a deviation, the discharger must report why the first qualifying storm was not sampled and/or why a second storm was not sampled). Stormwater runoff samples must be collected within the first hour of discharge, and "qualifying" events must be preceded by three working days with no precipitation that causes a discharge.
- Analyze samples for total suspended solids (TSS), pH, conductivity, and total organic carbon (TOC); oil and grease may be substituted for TOC. Additional parameters, which are identified in Table D of the Industrial General Permit, may be required based on the facility's Standard Industrial Classification (SIC).
- Document and report the monitoring data in the Annual Report for Storm Water Discharges Associated with Industrial Activities, which must be submitted to the State Water Resources Control Board (if submitting electronically) or San Francisco Regional Water Quality Control Board (SFRWQCB) (if submitting a hardcopy report) by July 1 of each year.

The Draft Final 2005 Industrial General Permit (Draft Final Permit) contains parameter benchmark concentrations for certain constituents, which are derived from US EPA's Multi-Sector General Permit[3]. For this analysis, US EPA benchmarks[4] are compared to the HPS stormwater monitoring data to evaluate the magnitude of the concentrations, and average concentrations above benchmarks are considered to be elevated. However, the benchmarks will not take effect until Draft Final Permit is adopted.

Six Annual Reports for Storm Water Discharges Associated with Industrial Activity[5,6,7,8,9,10] representing the 2002-2003 through 2007-2008 reporting periods were available at the SFRWQCB for

3 The Multi-Sector General Permit is the industrial stormwater permit in areas where US EPA is the NPDES permit authority.

4 The Draft Final 2005 Industrial General Permit contains parameter benchmark concentrations for certain constituents that are derived from US EPA's Multi-Sector General Permit. The benchmarks will take effect when the Draft Final Permit is adopted. The benchmarks are not numeric discharge limits, but are used to assess if site Best Management Practices (BMPs) are effective for reducing concentrations of pollutants of concern. The Draft Permit requires that if runoff concentrations are above one or more benchmarks, the discharger must revise its Storm Water Pollution Prevention Plan (SWPPP) to include more effective BMPs, and collect samples from the next two consecutive qualifying storms.

6 Department of the Navy Base Realignment and Closure Program Management Office West, 2004-2005 *Annual Report for Storm Water Discharge Management IR-01/21, Industrial Landfill, Parcel E-2, Hunters Point Shipyard, San Francisco, California*, June 30, 2005. Prepared by AFA Construction Group/EEC.

7 Department of the Navy Base Realignment and Closure Program Management Office West, *2005-2006 Storm Water Monitoring Report, Hunters Point Shipyard, San Francisco, California*, June 2006.

review (including the inactive industrial landfill). The HPS includes many parcels that are leased to other entities and the Annual Reports identify the industrial tenants associated with each outfall. The industrial facilities have various SICs; therefore, the list of additional parameters monitored at each outfall depends on the SIC of the facilities discharging to the outfall. Table M-4 summarizes the eleven discharge locations sampled at the HPS and identifies which discharge locations are associated with the industrial landfill.

Stormwater runoff data from each outfall are summarized in Table A.M-5 through Table III.M-15. The tables include the number of samples collected, the number of non-detects, the average concentration, and the parameter benchmark from the 2005 Draft Final Permit. Data from one or more outfalls exceeded parameter benchmarks for conductivity, TSS, total copper, total zinc, and total lead. The benchmarks for conductivity and TSS were exceeded most frequently.

TABLE M-4
SUMMARY OF DISCHARGE LOCATIONS SAMPLED AT THE HPS FOR THE INDUSTIRAL GENERAL PERMIT

Outfall	Location
1	39-inch diameter pipe located east of Building 144 and west of Building 145. In 2007-02008, the location was changed to a gravel swale east of Building 144 and north of Building 146. The drainage area and associated industrial activities did not change.
7	33-inch diameter pipe east of Building 130 and northwest of Building 133, near Berth 55
16	30-inch diameter pipe east of Building 236 and west of the North Berthing Slip
19	24-inch diameter pipe southeast of Building 368, at Berth 14
20	42-inch diameter pipe southeast of Building 306, at Berth 15
33	72-inch diameter pipe west of the base of Pier 3
OLF1	Overland flow from parking lot west of Building 916 and the unpaved area north of Building 916
OF101/OLF101	Swale by entrance of wetland west of landfill cap (associated with Parcel E-2 and Landfill)
DP1	Catch basin downstream of UCSF Compound pipe inlet to the underground storm drain (associated with Parcel E-2 and Landfill)
DP2	Catch basin north of landfill cap and east of USCF Compound (associated with Parcel E-2 and Landfill)
DP4	18-inch diameter pipe south of landfill cap (associated with Parcel E-2 and Landfill)

Biological Technical Report

TABLE OF CONTENTS

LIST OF TABLES

LIST OF FIGURES

EXECUTIVE SUMMARY

The Candlestick Point–Hunters Point Shipyard Phase II (CPHPS) Development Plan (Project) is located on approximately 702-acre area east of US 101 in the southeast area of the City and County of San Francisco (City). It occupies the waterfront area from south of India Basin to Candlestick Cove. The Project proposed by Lennar Urban includes a mixed-use community with a wide range of residential, retail, office, research and development, civic and community uses, and parks and recreational open space. A major component would be a new stadium for the San Francisco 49ers National Football League (NFL) team. Additionally, new transportation and utility infrastructure would serve the Project including a bridge across Yosemite Slough. The description of the Project is organized under two major sub-components: Candlestick Point and Hunters Point Shipyard (HPS) Phase II.

For the purpose of this biological study, PBS&J reviewed conditions in the Project Site, as shown in Figure 1, Study Area. In addition, the study includes a more general review of conditions and in aquatic areas adjacent to the Project Site shoreline. The Project Site and the aquatic areas, including Yosemite Slough, are referred to as the "Study Area" in this report. PBS&J completed a biological study of the Project during the summer of 2007 and during 2008. This study included a field survey of the parcels, documenting existing habitats, the plants and animals occurring in those habitats, and any significant habitat types that may be protected by state and federal law. Additional studies reviewed by PBS&J for this project included a delineation of wetlands and other waters of the U.S. and a tree survey prepared by H. T. Harvey & Associates, and information on biological resources of the area described in other reports.

As shown in Figure 2, the Study Area supports six vegetation communities, in addition to urban/developed areas:

1. landscaped areas/ornamental plants;
2. non-native grassland;
3. freshwater wetland;
4. tidal salt marsh
5. nontidal salt marsh; and
6. mudflats/open water.

Landscaped/ornamental and non-native annual grassland habitats occupy much of Candlestick Point, while HPS Phase II and much of Candlestick Point consist largely of urban/developed areas. Small areas of freshwater wetlands and nontidal salt marsh are present on HPS Phase II, and narrow strips of tidal salt marsh are present along the shoreline at scattered places on Candlestick Point and portions of HPS Phase II.

Although the vegetation of the Project area is largely dominated by non-native plants, native plants and a number of native wildlife species are present on the site. No special-status plants have been recorded, and none are expected to occur, on the site, although several species of special-status animals are present.

Jurisdictional wetlands and other waters of the U.S./State are present on the site, including the tidal and non-tidal wetlands and the aquatic habitats that surround the site. Eelgrass beds and Essential Fish Habitat, both sensitive biological habitats, are also present on/adjacent to the site.

INTRODUCTION

The Candlestick Point–Hunters Point Shipyard Phase II (CPHPS) Development Plan (Project) is located on approximately 702-acre area east of US 101 in the southeast area of the City and County of San Francisco (City; see Figure 1). It occupies the waterfront area from south of India Basin to Candlestick Cove. The Project proposed by Lennar Urban includes a mixed-use community with a wide range of residential, retail, office, research and development, civic and community uses, and parks and recreational open space. A major component would be a new stadium for the San Francisco 49ers National Football League (NFL) team. Additionally, new transportation and utility infrastructure would serve the Project including a bridge across Yosemite Slough. The description of the Project is organized under two major sub-components: Candlestick Point and Hunters Point Shipyard (HPS) Phase II.

This report discusses biological resources present on and potentially affected by the proposed Project. Biological resources surveys were conducted to identify existing biological resources present on the site and to determine if habitats present on the site could support any special-status plant or wildlife species present in the region, and to document any occurrences of those species, if observed during the field survey. In addition, this report includes a summary of the applicable laws and regulations related to biological resources and the resource agencies responsible for their implementation.

METHODOLOGY

BIOLOGICAL RESOURCES STUDY

In order to assess existing conditions and potential Project-related impacts, PBS&J staff biologists conducted reconnaissance-level surveys of the Project site on August 9, 2007, May 5, 2008, and July 8, 2008. The Study Area for this biological resources analysis includes both developed and undeveloped portions of HPS Phase II and Candlestick Point, including the entire Candlestick Point State Recreation Area (CPSRA), as well as off-site open waters adjacent to the Project site that could be impacted by Project components (Figures 1 and 2). The off-site aquatic resources discussed include Yosemite Slough, the open water area between Candlestick Point and HPS Phase II (known as South Basin), and adjacent open waters that could be impacted by Project components. For purposes of the evaluation of sensitive species, the Study Area is defined as the Project site and a radius of up to 5 miles beyond the Project site. Surveys of Candlestick Point included the Candlestick Park stadium, Alice Griffith housing, the Candlestick Park State Recreation Area (including Yosemite Slough), Jamestown Avenue, and 16 acres near Gilman Avenue and Aurelious Walker Drive. Surveys of HPS Phase II included the Hunters Point Shipyard (Parcels A-E).

STUDY AREA HABITATS

Prior to visiting the Study Area, PBS&J biologists compiled a list of special-status plant and wildlife species that have the potential to occur in the vicinity of the Study Area. Sources consulted include the California Department of Fish and Game's (CDFG) Natural Diversity Database (CNDDB) for the US Geological Survey's (USGS) 7.5-minute San Francisco South and Hunters Point quadrangles; the California Native Plant Society (CNPS) electronic inventory for the USGS 7.5-minute San Francisco South and Hunters Point quadrangles; the US Fish and Wildlife Service (USFWS) Endangered and Threatened Species list for the USGS 7.5-minute San Francisco South and Hunters Point quadrangles; the *Final Report Yosemite Slough Watershed Wildlife Survey*, LSA, July 2004; the *Final Draft Significant Natural Resource Areas Management Plan*, Sections 6.17 and 6.18, San Francisco Recreation And Park Department, February 2006; the *Draft Wetlands Mitigation and Monitoring Plan*, Navy Base Realignment and Closure Program, November 2006; the *Hunters Point Shipyard and Candlestick Point State Recreation Area*, *Natural Environment Study Report for the Bayview Transportation Improvements Project*, Jones & Stokes, July 2007; the *Final Delineation of Wetlands and Other Waters*, H.T. Harvey & Associates, Revised 13 July 2009 and October 13, 2009; the *Draft Sustainability Plan* for the Project, Arup North America Ltd, March 2009; and Project plans and graphic renderings.

The CNDDB was re-checked in July 2009, and CNDDB records were mapped (Figure 3). Special-status species lists from the CNDDB, USFWS, and CNPS were re-checked on November 2, 2009 to determine whether any species that could potentially occur on the site were added to these databases between the date of initial consultation of these lists and the preparation of the updated report on November 2, 2009.

SURVEY METHODOLOGY

Surveys focused on identification of vegetation communities, special-status species or their potential habitat, and other biotic resources (i.e., potential wetlands or "other waters" of the US). During surveys, biologists walked transects through each habitat type while recording plant and wildlife species observed in field notes. On July 8, 2008, Navy personnel escorted a PBS&J staff biologist through HPS Phase II. The August 2007 and July 2008 surveys were in the dry season, when most annual, biennial, and perennial herbaceous plant species were dormant or had already died back, leaving only dried plant parts (i.e., leaves, stems, fruits) for identification. Lastly, a rare plant survey was conducted in May 2008. The survey was conducted by walking representative transects through the survey area while recording every plant species observed. Although the survey was conducted within the flowering window for the special-status species that could occur within the Project site, the unusually dry weather resulted in a shorter flowering period and thus, most annual, biennial, and perennial herbaceous plant species were dormant or had already died back for the growing season, leaving only dried plant parts (i.e., leaves, stems, fruits) for identification. If a plant species could not be identified in the field, diagnostic plant structures (i.e., fruits or morphology)

FIGURE 3 Candlestick Point - Hunters Point Shipyard Phase II EIR

SPECIAL-STATUS SPECIES OCCURENCES WITHIN 5 MILE RADIUS

were collected for further analysis. Some plants observed during the survey could only be identified to the Genus level.[1] Floristic references for identification included *The Jepson Manual: Higher Plants of California*[2], *Plants of the San Francisco Region*[3], and specimens documented during previous CNPS surveys.[4]

Information from the sources listed above and from PBS&J's reconnaissance-level surveys was used to identify and characterize existing conditions at the Project site, and accordingly, was substantially relied upon for this analysis. In particular, LSA's Yosemite Slough Watershed Wildlife Survey (2004) and the Final Delineation of Wetlands and Other Waters conducted by H.T. Harvey & Associates (2009) provided specific information about the Study Area. LSA coordinated a wildlife survey of the Yosemite Slough Watershed between January 2003 and April 2004.[5] The survey of the Yosemite Slough Watershed included both the entire CPSRA and adjacent open water areas between HPS Phase II and the peninsula that forms the eastern extension of CPSRA.[6] From north to south, the Yosemite Slough Watershed Wildlife Survey Study Area is roughly bordered by Thomas Avenue, Ingalls Street, Carroll Avenue, Fitch Street, Arelious Walker Drive, and the Hunters Point Expressway (Figure 1). Although this survey covered only a portion of the Project site, it provides the most comprehensive data set available regarding the occurrence of wildlife in the area, and is thus cited heavily in the descriptions of existing conditions in this section. Also, because the majority of the Project site that was not covered by the Yosemite Slough Watershed Wildlife Survey is developed, we expect wildlife communities elsewhere on the Project site to be similar or depauperate in comparison to, those documented within the Yosemite Slough Survey's study area.

H.T. Harvey & Associates prepared a delineation of wetlands and other jurisdictional waters potentially meeting the regulatory definition of Waters of the United States within a majority of the Project site (February 2009 and revised on July 13 and October 13, 2009).[7] Surveys were conducted in 2008 on September 25 and 26; November 5 and 6; and December 4, 5, and 19; and in 2009 on

---

[1] Plants that were identified to the Genus level are not special-status or rare plants, and, therefore, this taxonomic unit of classification does not affect the findings of this report.

[7] H.T. Harvey & Associates, *Hunters Point Shipyard and Candlestick Point State Recreation Area Final Delineation of Wetlands and Other Waters*, San Francisco, California, February 2009 and revised July 13, 2009 and October 13, 2009

January 29 and 30 and May 20. The delineation included the examination of the above-mentioned areas for wetlands using the routine determination method outlined in the US Army Corps of Engineers (USACE) Wetlands Delineation Manual. H.T. Harvey assessed topographic features, drainages, potential alterations to site hydrology, and areas of significant recent disturbance, and mapped the High Tide Line (HTL). The USACE verified the findings of the delineation with a Jurisdictional Determination dated August 31, 2009. The study area for H.T. Harvey's original wetland delineation did not include several limited areas that are now considered part of the Project site. As a result, H.T. Harvey expanded its original delineation by inspecting these additional areas in the field on October 8, 2009. H.T. Harvey & Associates has amended its wetland delineation report, and verification of jurisdictional boundaries in these additional areas by the USACE is pending. In addition, a tree survey[8] was conducted for the Project by H. T. Harvey & Associates within all of the Project site except the portion of CPSRA that is not subject to the land transfer and is not expected to be substantially modified.

Existing conditions are described with respect to observed plant species, vegetation communities, common aquatic habitats (i.e., mud flats, open water, and eelgrass (*Zostera marina*) beds), common wildlife (i.e.,. invertebrates, reptiles and amphibians, birds, and mammals), common aquatic resources (i.e., fish, shellfish, and mollusks), and sensitive species and habitats (sensitive plants, sensitive vegetation communities, sensitive wildlife [invertebrates, birds, terrestrial mammals, and marine mammals], and sensitive aquatic resources [mollusks, fish, and Essential Fish Habitat (see Sensitive Aquatic Resources)]).

RESULTS

OBSERVED PLANT SPECIES

As listed in Appendix D, a total of 187 vascular plant species were observed within the Project site during all of the biological surveys listed in the Setting section above, 103 of which are non-native. In addition, 66 of the non-native vascular plant species are considered to be invasive plant species.[9] Invasive plants are defined as those that were "moved by humans to another region." These invasive plants have a competitive advantage because they are no longer controlled by their natural predators, and can quickly spread out of control.[10] Widely scattered trees are present and appear to either be horticultural plantings associated with landscaping or represent locally naturalized

specimens. Calflora's on-line Plant Name Library was used for the scientific nomenclature for plant names in this section.[11]

VEGETATION COMMUNITIES

For purposes of the biological resources analysis, the Study Area is first described in terms of the vegetation communities it supports, as reflected by Table 1 (Vegetation Communities within the Study Area) and further discussed below. The vegetation communities are defined according to CDFG Wildlife and Habitat Data Analysis Branch List of California Terrestrial Natural Communities[12] and H.T. Harvey & Associates' wetland delineation for HPS Phase II and Candlestick Point.[13]

Figure 2, Study Area Habitats, presents a summary of the vegetation communities observed in the Study Area. This map is a compilation of previously prepared figures for the Study Area and field surveys conducted by PBS&J.[14,15] As depicted on Figure 2, the Study Area contains four non-aquatic vegetation communities: non-native annual grassland, landscaped areas/ornamental plants, salt marsh, and seasonal freshwater wetland. In addition, approximately 568.80 acres of the Study Area is "urban." This habitat is not classified as a "vegetation community" and is thus not included in the "vegetation communities" table. Urban habitat includes developed or paved areas. The Study Area also contains three aquatic habitats: mud flats, eelgrass beds, and open waters. Table 1 provides the total acreages of each vegetation community within the Study Area. A description of each of the vegetation communities follows this table.

In some cases, vegetation communities may also be considered sensitive vegetation communities. In those cases, and there are three such cases in this analysis, they are also discussed under Sensitive Vegetation Communities, which follows this discussion. The three sensitive communities within the Study Area include salt marsh, eelgrass beds, and seasonal freshwater wetland habitats (also discussed under Sensitive Vegetation Communities).

a. H.T. Harvey & Associates, *Hunters Point Shipyard and Candlestick Point State Recreation Area Final Delineation of Wetlands and Other Waters, San Francisco, California*, February 2009 and revised July 13 and October 13, 2009.

Acreage discrepancies between the data contained herein and the total approximate acreage of the Study Area are due to the conversion of data from non-GIS to GIS data.

This table does not include the acreage for developed/urban areas (568.80 acres) because this classification is not a recognized vegetation community for purposes of this EIR.

* The open waters located outside of the Project boundary include those adjacent to Candlestick Point, Hunters Point Shipyard, and Yosemite Slough.

Non-native Annual Grassland

Patches of non-native annual grassland habitat are found throughout the Project site and comprise 74.72 acres. Invasive, non-native grasses characterize this community, particularly at HPS Phase II due to the intensive disturbance associated with the Navy's ongoing remediation efforts. The vegetation within this grassland consists of a mixture of invasive annuals such as wild oat (*Avena fatua*), rip-gut brome (*Bromus diandrus*), soft chess (*B. hordeaceus*), rat-tail fescue (*Vulpia myuros*), and hare barley (*Hordeum murinum var. leporinum*). Broad-leaf species occurring within the grasslands consist of wild radish (*Raphanus sativus*), painted charlock (*R. raphanistrum*), black mustard (*Brassica nigra*), Mediterranean linseed (*Bellardia trixago*), cut-leaf plantain (*Plantago coronopus*), spring vetch (*Vicia sativa*), red valerian (*Centranthus ruber*), and Italian thistle (*Carduus pycnocephalus*). Additionally, garland chrysanthemum (*Chrysanthemum coronarium*) has naturalized across much of the grasslands and showy stands of these flowers are present throughout the entire CPSRA.

Small distinct colonies of native perennial bunch grasses grow in a few areas at HPS Phase II. Clusters of single species or a combination of species including purple needle grass (*Nassella pulchra*), blue wild rye (*Elymus glaucus*), and red fescue (*Festuca rubra*) grow sporadically throughout the Project site. These small isolated occurrences of native grasses are not large enough to warrant identification as a separate vegetation community. Portions of the Study Area, including uplands along Yosemite Slough, include ruderal vegetation such as fennel (*Foeniculum vulgare*) intermixed with non-native grasses such as wild oats and Italian rye (*Lolium multiflorum*). Shrubs, mainly coyote brush (*Baccharis pilularis*), are scattered throughout the upland surrounding Yosemite Slough area.

Landscaped Areas/Ornamental Plants

Landscaped areas make up about 44.67 acres of Candlestick Point and include areas landscaped with native and non-native ornamental shrubs and trees, particularly near the walking paths along the shoreline of Candlestick Point. The tree survey[16] was conducted for the Project identified trees primarily in areas mapped as "Landscaped/Ornamental", "Urban", and "Non-Native Annual Grassland" on Figure 2. For the purpose of this survey, a "tree" was defined as any stem of a woody plant with a tree-like (as opposed to shrubby) growth habit measuring at least 2 inches in diameter at a height of 4.5 feet above the ground. As a result, single trees with multiple stems measuring at least 2 inches in diameter were represented as multiple "trees," and the high number of trees recorded during this survey was driven largely by such multi-stemmed individuals. The tree survey recorded approximately 1,876 tree stems at least 2 inches in diameter on 1,027 individual plants on Candlestick Point and 724 tree stems at least 2 inches in diameter on 283 individual plants on HPS Phase II.

On Candlestick Point, the vast majority of these trees consisted of multi-stemmed lollypop trees (*Myoporum laetum*); eucalyptus (*Eucalyptus* spp.), pines (*Pinus* spp.), and olives (*Olea europeaea*) were also well represented on Candlestick Point. All four of these species are non-natives. The most common native trees on Candlestick Point are California live oak (*Quercus agrifolia*), flannel bush (*Fremontodendron californicum*), and California buckeye (*Aesculus californica*). Monterey pine (*Pinus radiata*) and ornamental cypress (*Cupressus* spp.) are also common, although neither is native to San Francisco. There are several specimens of the native California bay (*Umbellularia californica*) and blue elderberry (*Sambucus nigra* ssp. *caerulea*) as well. Non-native, ornamental lollypop trees (*Myoporum laetum*) grow along the northwestern edge of Candlestick Point, and Australian tea trees (*Leptospermum laevigatum*) are scattered along the trails of the CPSRA. Native shrubs include coyote bush, ornamental buckbrush (*Ceanothus* spp.), firethorn (*Pyracantha* spp.), coffeeberry (*Rhamnus californica*), hummingbird sage (*Salvia spathacea*), and black sage (*S. mellifera*) which grow along the paths in clusters that are a combination of planted and volunteer specimens. Non-native evergreen shrubs such as rockrose (*Cistus* spp.) are common throughout the Project site and in some locations have naturalized.[17]

On HPS Phase II, trees recorded during the tree survey were dominated by small, multi-stemmed toyon (*Heteromeles arbutifolia*; a native species, though the trees on HPS appear to be of an ornamental variety) and several non-natives, including London planetree (*Platanus* x *acerifolia*) and acacia (*Acacia* spp.).

---

[17] Naturalized plants are those that were originally installed as ornamental plantings but are now found growing 'naturally' in a variety of habitats.

Salt Marsh

Salt marsh habitat forms along the margins of estuaries and bays whose shorelines are shallow and protected. In the Study Area, it totals approximately 4.50 acres on site and 0.05 acre in areas of off-site (i.e., areas of Yosemite Slough outside of the Project boundary) Project work.[18] It occurs in limited areas along the shoreline where riprap does not extend to the waterline and prohibit the growth of vegetation, and in several nontidal areas in the southwestern portion of HPS. Narrow patches of salt marsh habitat, varying in length from 20 to 100 feet, occur sporadically along the shoreline of the Project site, and throughout Yosemite Slough.[19]

Salt marshes are often subject to tidal influences, and species composition of tidal salt marsh vegetation varies along gradients based on elevation. The amount of time an area is inundated determines the primary species of plants found there. The highest elevations typically support almost pure stands of pickleweed (*Salicornia virginica*), which also dominates the patches of nontidal salt marsh on HPS. Associated species that occur in the zone around the high tide elevation include salt grass (*Distichlis spicata*), European sea rocket (*Cakile maritima*), coastal gumweed (*Grindelia stricta*), and sea lavender (*Limonium californicum*). Slightly lower areas above the Mean High Water (MHW) elevation support cord grass (*Spartina* spp.). In the area above the HTL, common iceplant (*Carpobrotus edulis*) grows in some locations, carpeting the upland margins in a dense monoculture. The low growing shrub silver beach bur (*Ambrosia chamissonis*) also grows in the upland areas along the shoreline.

Seasonal Freshwater Wetland

Seasonal freshwater wetland habitat occupies 0.20 acre in two linear features at the southern and west-central margins of HPS Phase II. These wetlands are characterized by the presence of annual wetland grasses and forbs in depressions that hold water for a short to medium duration during the rainy season. One of these wetlands, in the southwestern portion of HPS Phase II, consists of pools that pools are shallow basins that lack drainage outlets. Seasonal water inundation in these pools creates a condition favoring hydrophytic (water-loving) plants such as spearscale (*Atriplex triangularis*), salt grass, bird's-foot trefoil (*Lotus corniculatus*), prickly ox-tongue (*Picris echioides*), saltmarsh bulrush (*Bolboschoenus robustus*), Italian ryegrass (*Lolium multiflorum*), rabbit's foot grass (*Polypogon monspeliensis*), and willow dock (*Rumex salicifolius*), as observed in HPS Phase II. The

second seasonal freshwater wetland, in the west-central part of HPS Phase II, consists of a narrow swale/ditch that is apparently fed by groundwater seepage.

COMMON AQUATIC HABITATS

Mudflats

Mud flats are the broad expanses of the San Francisco Bay bottom that are exposed during low tides. These areas are comprised of very soft sediments and do not support any vegetation other than eelgrass beds, which may occur within mud flats. Mud flats are an important habitat because they support a vast array of crustaceans, worms, and other invertebrates that are important food sources for resident and migratory shorebirds and waterfowl. Mud flats are exposed at low tides once or twice a day along the shore south of CPSRA and along the shorelines of Yosemite Slough and South Basin. These mud flats are relatively limited in extent compared to the vast mud flats present in other parts of San Francisco Bay, and as a result, numbers of shorebirds using these mud flats are low except for occasional, brief migratory pulses of birds.

Open Water (San Francisco Bay)

San Francisco Bay (also referred to as "the Bay" in this section) is the largest estuary on the California Coast, covering between 400 and 1,600 square miles depending on which bays are included.[20] Fresh water enters primarily through the Sacramento-San Joaquin Delta and mixes with seawater that enters via the Golden Gate. Tidal action and freshwater runoff determine the salinity of the Bay. For the purpose of this assessment, the term "open water" refers to unvegetated tidal areas located below the MHW elevation, which in this area is approximately 5.87 feet relative to the North American Vertical Datum of 1988 (NAVD88)[21] or 11.80 relative to the San Francisco City Datum (SFCD).[22] This is the same area regulated by the USACE under Section 10 of the *Rivers and Harbors Act*. These areas are subject to the normal ebb and flood of the tide. For example, mud flat habitats described above are a subset of open water aquatic habitats since these areas are inundated for at least half the tidal cycle; for this reason, acreages of mud flat and open water habitats are not distinguished in Table 1. Open water habitats support an array of relatively common estuarine/marine species from encrusting tunicates, sponges, and algae to bottom-dwelling fish such

[20] The Bay Institute, *About the Bay*. 2008. Website: http://www.bay.org/about_the_bay.htm. Accessed October 28, 2008.

[21] H.T. Harvey & Associates, *Hunters Point Shipyard and Candlestick Point State Recreation Area Final Delineation of Wetlands and Other Waters,* San Francisco, California, February 2009 and revised July 13, 2009 and October 13, 2009.

[22] San Francisco City Datum (SFCD) is a local vertical geodetic reference system specific to the City and County of San Francisco and formally established in 1964 as 8.616 feet above the National Geodetic Vertical Datum of 1929 (NGVD29), making it about 8.13 feet above mean sea level. The North American Vertical Datum was established in 1988 (NAVD88) and generally has replaced NGVD29 as a standard reference. Elevations expressed in NGVD29 may be converted to NAVD88 by adding 2.69 feet.

as the Pacific halibut (*Hippoglossus stenolepis*), flounder, and sole, to more open water fish such as the Pacific herring (*Clupea pallasi*), Pacific sardine (*Sardinops sagax*), and anchovies (*Anchoa* spp.). The on-site open waters are those nearshore areas below the MHW elevation where Project work could occur (i.e., sea wall enhancements and marina improvements). Off-site open waters within a 5-mile radius of the Project site were also considered for their potential to support sensitive species (as described under "Sensitive Species and Habitats" below). These areas are considered here because most of the sensitive species potentially occurring there have the ability to move to and from the Study Area at any time.

Eelgrass Beds

Eelgrass is an aquatic plant found on soft mud-bottom bays and estuaries along the Pacific coast. It occurs in both subtidal and intertidal areas of San Francisco Bay and approximately 1.99 acres of it occur within the Study Area.[23] Eelgrass beds are considered a sensitive resource and, therefore, are discussed in detail under Sensitive Species and Habitats.[24]

COMMON WILDLIFE

Invertebrates

Fourteen butterfly species were observed during the Yosemite Slough Watershed Wildlife Survey.[25] Common butterflies observed during that survey included cabbage whites (*Pieris rapae*), anise swallowtails (*Papilio zelicaon*), and common checkered skippers (*Pyrgus communis*). Other butterflies observed include mustard white (*Pieris napi*), orange sulphur (*Colias eurytheme*), California hairstreak (*Satyrium californicum*), gray hairstreak (*Strymon melinus*), western pygmy-blue (*Brephidium exile*), spring azure (*Celastrina ladon*), west coast lady (*Vanessa annabella*), red admiral (*Vanessa atalanta*), common buckeye (*Junonia coenia*), and common ringlet (*Coenonympha tullia*). Numerous other invertebrate species, including insects, crustaceans, worms, and other taxa, occur on the site as well.

Reptiles and Amphibians

The Yosemite Slough Watershed Wildlife Survey recorded three snake species, two lizard species, and one amphibian.[26] Reptiles and amphibians observed included California slender salamander

[26] Ibid.

(*Batrachoseps attenuatus*), southern alligator lizard (*Elgaria multicarinata*), western fence lizard (*Sceloporus occidentalis*), gopher snake (*Pituophis melanoleucus*), ring-necked snake (*Diadophis punctatus*), and western garter snake (*Thamnophis elegans*). The western fence lizard, California slender salamander, and southern alligator lizard were found in relatively high numbers, with survey maxima (i.e., the maximum number of individuals observed on a single survey) of 49, 43, and 21 individuals, respectively. However, the other species were represented by few individuals, suggesting that populations of these other species are sparse in the area.

Amphibians had the lowest diversity within the Yosemite Slough Watershed Survey area, with only one species observed (the California slender salamander).[27] The California slender salamander frequents grassland, chaparral, woodland, forest, and yards and vacant lots in some suburban areas. It takes refuge under logs, boards, bark, and in damp leaf litter and rotting logs. It lays its eggs in late fall and winter, often in communal nests.[28] The San Francisco Bay and the small seasonal wetlands on the site do not provide suitable aquatic habitat for amphibians, primarily due to high salinity. The few freshwater habitats on or near the Project site do not provide breeding habitat for amphibians such as frogs or toads, likely because of their very shallow and/or ephemeral nature.[29]

Reptiles also appeared to have relatively low diversity, with only five species observed. The abandoned fields, extensive debris (providing cover), and presence of prey (i.e., mice, invertebrates, salamanders) provide suitable habitat for these five species.[30] The upland areas, dominated by disturbed vegetation and non-native grassland, support the snake and lizard species.[31]

During one survey, 21 southern alligator lizards were observed in silvery beachweed along the shoreline of the South Basin (refer to Map 2 of the Yosemite Slough Watershed Wildlife Survey for a graphic representation of the location of the South Basin).[32] The lizards were all juveniles and may have been from a single clutch that had been laid in the silvery beachweed.[33]

Although the Yosemite Slough Watershed Wildlife Survey covered only Candlestick Point and the southern shoreline of HPS Phase II, it is expected that a lower abundance of these common reptile and amphibian species would be found within the disturbed areas within HPS Phase II than at Candlestick Point. Recent, intensive disturbance due to ongoing remediation activities has undoubtedly reduced populations of these species on HPS Phase II. A few individuals of these

[33] Ibid.

reptiles and amphibians may occur within the developed portions of the Project site, which represents approximately 80 percent of the overall acreage of the site, but numbers are expected to be very low in such low-quality habitat.

Birds

One hundred and eighteen bird species (which are named herein according to the American Ornithologists' Union Checklist of North American Birds[34] except for sensitive subspecies recognized by CDFG or USFWS) were observed during the Yosemite Slough Watershed Wildlife Survey.[35] Of these, 51 species were represented by a maximum count of five or fewer individuals, indicating that, for many bird species, the site is used by relatively low numbers of individuals.[36] The majority of the species observed were terrestrial species, followed by shorebirds, waterfowl, gulls and terns, and raptors (in descending order). Terrestrial habitats supported large numbers of some common bird species such as white-crowned sparrows (*Zonotrichia leucophrys*), western meadowlarks (*Sturnella neglecta*), and house finches (*Carpodacus mexicanus*). The landbirds that are most abundant on the site are those associated with the weedy, ruderal habitats dominating the Project site and those tolerant of the urbanization and associated disturbance resulting from the site's location. In contrast, very few Neotropical and other long-distance migrant songbirds were recorded during this study. Studies have documented that bird species diversity is closely associated with structural habitat complexity. Bird species diversity (a measure of the number of species in a given area) increases with increasing foliage height diversity (a measure of the number and diversity of vertical layers of vegetation in that area).[37,38] While this has been best studied in breeding birds, the structural complexity of habitat also influences the degree to which an area provides resources to migrant birds. Multi-layered vegetation, with well-developed ground, understory, and canopy layers, would support greater diversity of migrants than the structurally simple vegetation that dominates most of Candlestick Point and HPS Phase II. Also, breeding bird abundance is often closely associated with the density or volume of vegetation, with increasingly dense vegetation supporting more individual birds[39]. The sparse vegetation present on most of the Project site limits the value of the site to breeding and migratory birds. Numbers and diversity of landbirds on HPS Phase II are likely lower than on Candlestick Point owing to the recent, intensive disturbance and even lower abundance of trees and shrubs on HPS Phase II.

The waters of the South Basin and the Bay surrounding the Study Area are used by a variety of waterbirds, some of which are fairly abundant. Common waterbirds observed in these waters include double-crested cormorant (*Phalacrocorax auritus*), California gull (*Larus californicus*), greater scaup (*Aythya affinis*), ruddy duck (*Oxyura jamaicensis*), surf scoter (*Melanitta perspicillata*), and bufflehead (*Bucephala albeola*). While these birds forage primarily or solely in aquatic habitats, some species, such as cormorants, California brown pelicans (*Pelecanus occidentalis californicus*), gulls, and possibly terns roost in large numbers on piers on HPS Phase II. Small numbers (fewer than 10 pairs) of western gulls (*Larus occidentalis*) nest on two rocks in South Basin known as Double Rock. Shorebirds such as the western sandpiper (*Calidris mauri*), least sandpiper (*Calidris minutilla*), and dunlin (*Calidris alpina*) forage on intertidal mud flats and along the shoreline of Candlestick Point and the southern part of HPS Phase II, typically in low numbers but occasionally in higher numbers when migratory pulses of shorebirds are present in the Bay. The majority of the Study Area is developed or urbanized and supports relatively few species of birds.

In addition to the 118 bird species recorded during the Yosemite Slough Watershed Wildlife Survey, that survey's report listed an additional 36 species that had been recorded by a local birder, Mr. Alan Hopkins, over the past 20 years.[40]

Mammals

The most abundant mammal observed during the Yosemite Slough Watershed Wildlife Survey was the California ground squirrel (*Spermophilus beecheyi*). This species was observed along the shoreline and riprap areas of HPS Phase II and Candlestick Point, as well as in grassland and ruderal habitats and under trees and shrubs on Candlestick Point. The substrate along the shoreline is composed mostly of small rubble such as broken bricks that had been used as fill. Riprap composed of large rocks was placed along exposed sections of the shoreline, providing refugia for small mammals.[41] Other mammals observed during the survey included feral domestic cat (*Felis silvestris*), feral domestic dog (*Canis familiaris*), raccoon (*Procyon lotor*), striped skunk (*Mephitis mephitis*), harbor seal (*Phoca vitulina*), black-tailed jackrabbit (*Lepus californicus*), Botta's pocket gopher (*Thomomys bottae*), California vole (*Microtus californicus*), and Norway rat (*Rattus norvegicus*). Of the 10 species recorded by the LSA study, three are non-natives (domestic dog, domestic cat, and Norway rat); two are common urban-adapted species (raccoon and striped skunk); and one occurs infrequently in aquatic areas (harbor seal). Of the remaining four species, the Botta's pocket gopher and California vole were represented by no more than one individual on a given survey and thus may be uncommon

[41] Ibid.

on the site. As mentioned for reptiles and amphibians above, mammal diversity and abundance on HPS Phase II are expected to be lower than on Candlestick Point, as recent, intensive disturbance by remediation activities has likely reduced mammal populations there. The shorelines, vacant lots, and undeveloped ruderal/non-native grassland areas of HPS Phase II and CPSRA are surrounded by urban and industrial development, which limits the potential for dispersal of mammals in and out of the site. There are no CNDDB reports of the occurrence of any special-status mammal species in the Study Area.

COMMON AQUATIC RESOURCES

Fish, Crabs, and Mollusks

San Francisco Bay supports a diverse assemblage of fish species. These vary from resident fish such as assorted flat fish (flounder and sole) to a variety of rockfish (*Sebastes* spp.) and to migratory species such as Pacific herring, Pacific sardines, anchovies, and salmonids (*Oncorhynchus* spp.) which spend varying portions of their life cycle in the Bay. Estuaries provide important spawning habitat for fish and the San Francisco Bay is no exception. Pacific herring spawn in the Bay and support a small commercial fishery. Other fish for which adults spawn in the Bay include flounder, sole, and Pacific halibut. Juvenile sturgeon (*Acipenser* spp.) rear in the Bay for an undetermined length of time before moving to the ocean.

Shellfish found in the Bay and within the vicinity of the Study Area include Dungeness crab (*Cancer magister*), other rock crab, and shrimp. Dungeness are the target of an important commercial fishery in the open ocean and the Bay is important rearing habitat for young crab. Crab hatch in the Gulf of the Farallones and after several larval stages, migrate into the Bay and rear primarily in San Pablo and Suisun bays,[42] over 20 miles north of the Study Area.

The Bay also supports a variety of mollusks. These include native clams, mussels, oysters, and snails (gastropods). Some of these are native (i.e., bent-nosed macoma [*Macoma nasuta*], Olympia oyster [*Ostrea conchaphila*], and limpets [*Acmaea* spp.]) while others have been introduced either intentionally such as the Atlantic oyster (*Crassostrea virginica*) or unintentionally such as overbite clam (a.k.a. Asian clam; *Corbula amurensis*). Many of the clams use soft-bottom sediments and could be found on the seafloor near the Project site. Most oysters require a solid substrate for attachment. Suitable habitat for oysters and mussels is found throughout the Study Area on bulkheads, pilings, and riprap associated with the shoreline.

[42] California Department of Fish and Game (CDFG), 2009. Dungeness crabs (*Cancer magister*). Website: http://www.delta.dfg.ca.gov/baydelta/monitoring/cmag.asp. Accessed July 16, 2009.

In addition to the native fish and shellfish, the Bay supports a vast array of introduced species. Most of these have been introduced in ballast water of trans-Pacific traveling cargo ships. Species suspected of being ballast water introductions include Chinese mitten crab (*Eriocheir sinensis*), yellowfin goby (*Acanthogobius flavimanus*), and overbite clam. Other species, including striped bass (*Morone saxatilis*) and American shad (*Alosa sapidissima*), have been introduced to support sport fisheries. The complex interaction between introduced and native species within the Bay continues to be the topic of much debate and study.

The open water of the Study Area is part of or directly connected to the Bay and all of the Bay fish species can move freely into and out of the Study Area at any time. Because of this, the species assemblage within and adjacent to the Project site is expected to be representative of the central Bay as a whole.

The portion of the San Francisco Bay immediately adjacent to the Project site has been highly modified over the years to support commercial shipping, industrial uses, and US Naval activities, and virtually the entire shoreline of the Study Area is composed of fill of various kinds. As a result, the shorelines are almost exclusively comprised of bulkheads and riprap. Dredging of shipping channels has occurred within the nearshore areas. All of these actions have combined to reduce the aquatic habitat complexity. Reductions in habitat complexity reduce the number of species that routinely utilize a particular area,[43] and, therefore, the numbers of resident fish species within the Study Area are expected to be similar to other developed areas of the Bay.

Marine Mammals

The most common marine mammals within San Francisco Bay are harbor seals (*Phoca vitulina*) and California sea lions (*Zalophus californianus*), both of which are protected under the *Marine Mammal Protection Act*. The *Marine Mammal Protection Act* does not bestow a particular status designation for the species it protects, which is similar to the *Migratory Bird Treaty Act*. Instead, the *Marine Mammal Protection Act* and the *Migratory Bird Treaty Act* equally protect all marine mammals and native birds, respectively.

Harbor Seal (*Phoca vitulina*)

Harbor seals are year-round residents found throughout the Bay. They use haulouts scattered through the Bay to bask, rest, and use as pupping sites. The most frequently used pupping sites are in the North (Castro Rocks) and South bays (Mowry Slough); both sites are over 15 miles from the Study Area. Pupping season begins in late March and peaks in early May.[44] The closest haulout site

[44] Richmond Bay Bridge Harbor Seal Team. No date. Harbor Seal. Website: http://userwww.sfsu.edu/~halmark/educati.htm. Accessed October 31, 2008.

is on Yerba Buena Island, about 6 miles from the Project site.[45] There are no known haulout locations within the Study Area. During the 2003–2004 Yosemite Slough Watershed Wildlife Survey, LSA observed nine harbor seals in the outer South Basin (open water between Candlestick Point and HPS Phase II); however, no haulouts were detected during the survey.[46] No harbor seals or haulouts were observed during surveys by PBS&J biologists for this Project.

California Sea Lion (*Zalophus californianus*)

California sea lions do not breed in the Bay, preferring offshore islands such as the Channel Islands near Santa Barbara or the Farallon Islands, but sea lions forage and rest at various locations around the San Francisco Peninsula.[47] They are relatively social animals, frequently seen basking or foraging in large groups. On May 2, 2003, a total of ten sea lions were observed hauled out on a flat, floating structure in the outer South Basin.[48] Sea lions may occur in the Study Area, but the site does not support any known haulout locations.

SENSITIVE/JURISDICTIONAL VEGETATION COMMUNITIES AND HABITATS

Waters of the United States/State and Navigable Waters

The Study Area contains several categories of jurisdictional waters of the United States, including jurisdictional wetlands that are subject to Section 404 of the *Clean Water Act* (Section 404). The types of wetlands include salt marsh and seasonal freshwater wetlands. In addition, the Study Area also contains open waters of the San Francisco Bay, which are subject to both Section 404 of the *Clean Water Act* and Section 10 of the *Rivers and Harbors Act of 1899* (Section 10). Section 404 regulates the placement of fill into any "waters of the United States." Waters of the United States are broadly defined to include navigable waterways, their tributaries, lakes, ponds, and wetlands, including tidal waters and wetlands from the HTL seaward. Section 10 regulates the placement of fill into navigable waters of the United States, including tidal waters from the MHW elevation seaward. All of these wetlands and other waters are also regulated by the State under Section 401 of the *Clean Water Act* and under the *Porter-Cologne Water Quality Control Act*. A more detailed discussion of the regulations protecting wetlands and other waters is provided in the Regulatory Framework section below.

A wetland delineation was conducted by H.T. Harvey & Associates for the Study Area that distinguished jurisdictional wetlands and other waters of the United State/State.[49] The revised H.T. Harvey & Associates wetland delineation was submitted to the USACE in July 2009 and was verified in August 2009. The study area for that delineation included the Project site and the off-site areas where Project activities would occur (Figure 4). As indicated on Figure 4, the study area for H.T. Harvey's original wetland delineation did not included several limited areas that are now considered part of the Project site. As a result, H.T. Harvey expanded its original delineation by inspecting these additional areas in the field on October 8, 2009. H.T. Harvey & Associates has amended its wetland delineation report, and verification of jurisdictional boundaries in these additional areas by the USACE is pending.

According to USACE regulations and guidance, other waters may include lakes, seasonal ponds, channels, tributary waters, non-wetland linear drainages, and seasonal springs. Such areas are identified by the (seasonal or perennial) presence of standing or running water and generally lack hydrophytic vegetation.

In tidal waters, Section 404 other waters extend to the landward extent of vegetation associated with salt or brackish water or the HTL. The HTL is defined as the line of intersection of the land with the water's surface at the maximum height reached by a rising tide. The HTL may be determined, in the absence of actual data, by a line of oil or scum along shore objects, a more or less continuous deposit of fine shell or debris on the foreshore or berm, other physical markings or characteristics, vegetation lines, tidal gauges, or other suitable means that delineate the general height reached by a rising tide. The line encompasses spring high tides and other tides that occur with periodic frequency but does not include storm surges in which there is a departure from the normal or predicted reach of the tide due to the piling up of water against a coast by strong winds such as those accompanying a hurricane or other intense storm. Confirmation of this definition and approach used by the San Francisco District of the USACE in determining the MHW and HTL locations was obtained from the Regulatory Branch of the USACE on January 29, 2009.[50] The HTL represents the upper limit of Section 404 other waters and is approximately 1.5 to 2 vertical feet above the MHW mark.[51]

SOURCE: H.T. Harvey & Associates, *Hunters Point Shipyard and Candlestick Point State Recreation Area Final Delineation of Wetlands and Other Waters, San Francisco, California*, February 2009 and revised July 13, 2009 and October 13, 2009.

a. Total equals sum of Freshwater Wetland, Non-tidal Salt Marsh, Tidal Salt Marsh, and Other 404 Waters

b. On-site areas within Yosemite Slough refer to areas within the Study Area. Off-site areas within Yosemite Slough are those areas adjacent to the slough that are outside of the Study Area boundary.

SPECIAL-STATUS AND SENSITIVE SPECIES

The potential for special-status plant and wildlife species to occur within the Study Area was determined by assessing habitat suitability information collected during biological reconnaissance surveys conducted in August 2007 and July 2008, a rare plant survey conducted in May 2008, and a review of the CNDDB, CNPS Inventories, and USFWS databases, as previously described. In addition, approximately 29 wildlife surveys were conducted in the vicinity of Yosemite Slough between January 2003 and April 2004 (in association with the Yosemite Slough Watershed Wildlife Survey), and that survey's report included a list of additional bird species that had been observed by Mr. Alan Hopkins over the past 20 years.[52] The list of potentially occurring special-status species provided in Table 3 (Special-Status Species Potentially Occurring within the Study Area) is informed by all of these sources, as well as a search of known sensitive species occurrences within a 5-mile radius of the Project site.

[52] Golden Gate Audubon Society, *Final Report Yosemite Slough Watershed Wildlife Survey 2003–2004*, prepared by LSA, July 27 2004.

- Special-status species are defined as follows:
- Species listed, proposed, or candidate for listing as Threatened or Endangered by the USFWS pursuant to the federal *Endangered Species Act of 1973* (FESA), as amended
- Species designated by the USFWS as Species of Conservation Concern
- Species designated by the National Marine Fisheries Service (NMFS) as Species of Special Concern
- Species listed as Rare, Threatened, or Endangered by the CDFG pursuant to the *California Endangered Species Act of 1984* (CESA), as amended
- Species designated as Fully Protected under Sections 3511 (birds), 4700 (mammals), and 5050 (reptiles and amphibians) of the *California Fish and Game Code*
- Species designated by the CDFG as California Species of Special Concern
- Plant species listed as Category 1B and 2 by the CNPS; CNPS Category 3 and 4 species were not considered special-status species for the sake of this assessment, as they are not considered sufficiently rare on a regional level to warrant such status, though no such plants were recorded in the Study Area.
- Species not currently protected by statute or regulation, but considered rare, threatened or endangered under Section 15380 of the CEQA Guidelines (such as the Olympia oyster and Pacific herring)

Table 3 identifies the special-status plant and wildlife species that have been recorded or could occur within five miles of the Study Area, along with a description of their habitat requirements, protection status, and a brief description of each species' likelihood to be present within the Study Area. Several species known to occur within five miles of the Study Area and listed in Table 3 were determined not likely to occur or to be absent from the Study Area because (1) the site lacks suitable habitat or is outside of the species' range and, (2) no instances of such species were observed during any of the field surveys). Consequently, the detailed species' discussions and impact analysis in this technical report address only those species in Table 3 that have a "Low" or better probability to occur within the Study Area. Those species or habitats with a "Not Likely" or "Absent" likelihood of occurrence in Table 3 are not addressed further because they are not expected to occur on the Study Area or be affected by Project implementation.

Special-status species lists from the CNDDB, CNPS, and USFWS, originally consulted in 2008, appear in Appendices A, B, and C, respectively. These lists were re-checked on November 2, 2009 to determine whether any species that could potentially occur on the site were added to these databases between the date of initial consultation of these lists and the preparation of the updated

TABLE 3 SPECIAL-STATUS SPECIES POTENTIALLY OCCURRING WITHIN THE STUDY AREA

Common Name	Scientific Name	Status[a] Fed/ CA/ other	Habitat and Seasonal Distribution in California	Likelihood of Occurrence Within the Study Area
			Plants	
Adobe sanicle	*Sanicula maritima*	none/SR/1B.1	Chaparral, coastal prairie, meadows and seeps, and valley and foothill grasslands in association with clay or serpentine soils. 98–787 feet (30–240 meters); blooms February–May	**Not Likely.** Suitable habitat for this species occurs in the Study Area. However, there are no recorded occurrences of this species within 5 miles of the Study Area, and none were observed during rare plant surveys of suitable habitat in 2007 and 2008 by PBS&J.
Alkali milk-vetch	*Astragalus tener* var. *tener*	none/none/1B.2	Playas, valley and foothill grassland with adobe clay, and vernal pools with alkaline soils. 0–2051 feet (0–625 meters); blooms May–September.	**Not Likely.** Suitable habitat for this species does not occur in the Study Area.
Arcuate bush-mallow	*Malacothamnus arcuatus*	none/none/1B.2	Chaparral and cismontane woodland. 82–295 feet (25–90 meters); blooms April–September.	**Not Likely.** Suitable habitat for this species does not occur in the Study Area.
Beach layia	*Layia carnosa*	FE/SE/1B.1	Coastal dunes and coastal scrub with sandy soils. 0–197 feet (0–60 meters); blooms March–July.	**Not Likely.** Coastal scrub does not occur in the Study Area. This species was not observed during surveys conducted by PBS&J in 2007 and 2008.
Bent-flowered fiddleneck	*Amsinckia lunaris*	none/none/1B.2	Coastal bluff scrub, cismontane woodland, and valley and foothill grassland habitats. 10–1,640 feet (3– 500 meters); blooms March–June	**Not Likely.** Although there is one recorded occurrence of this species within 5 miles of the Study Area, no species of *Amsinckia* were observed during floristic surveys conducted in 2005 by CNPS[53] and in 2007 and 2008 by PBS&J.

TABLE 3 SPECIAL-STATUS SPECIES POTENTIALLY OCCURRING WITHIN THE STUDY AREA

Common Name	Scientific Name	Status[a] Fed/ CA/ other	Habitat and Seasonal Distribution in California	Likelihood of Occurrence Within the Study Area
Big-scale balsamroot	*Balsamorhiza macrolepis* var. *macrolepis*	none/none/1B.2	Occurs in chaparral, cismontane woodland, and valley and foothill grassland, sometimes in serpentine soil substrates at elevations ranging from 295–4,593 feet (90–1,400 meters); blooms March–June.	**Not Likely.** Although potentially suitable habitat and soil substrates are present, there are no recorded occurrences of this species within 5 miles of the Study Area; no species of *Balsamorhiza* were observed during floristic surveys conducted in 2005 by CNPS[54] and in 2007 and 2008 by PBS&J.
Blue coast gilia	*Gilia capitata* ssp. *chamissonis*	none/none/1B.1	Coastal dunes and coastal scrub. 7–656 feet (2–200 meters); blooms April–July.	**Not Likely.** Coastal scrub does not occur in the Study Area. There are no recorded occurrences of this species within 5 miles of the Study Area.
Bristly sedge	*Carex comosa*	none/none/2.1	Coastal prairie, marshes and swamps (along lake margins), and valley and foothill grassland. 0–2,051 feet (0–625 meters); blooms May–September.	**Not Likely.** Marsh habitat in the Study Area has been highly degraded. This species was not observed during surveys conducted by Caltrans in 2007.[55]
California seablite	*Suaeda californica*	FE/none/1B.1	Marshes and swamps with coastal salt marsh. 0–49 feet (0–15 meters); blooms July–October.	**Not Likely.** Marsh habitat in the Study Area has been highly degraded. This species was not observed during surveys conducted by Caltrans in 2007.[56]
Coastal triquetrella	*Triquetrella californica*	none/none/1B.2	A moss that occurs in coastal bluff scrub and coastal scrub. 33–328 feet (10–100 meters).	**Not Likely.** Coastal scrub does not occur in the Study Area.

TABLE 3 SPECIAL-STATUS SPECIES POTENTIALLY OCCURRING WITHIN THE STUDY AREA

Common Name	Scientific Name	Status[a] Fed/ CA/ other	Habitat and Seasonal Distribution in California	Likelihood of Occurrence Within the Study Area
Compact cobwebby thistle	*Cirsium occidentale* var. *compactum*	none/none/1B.2	Chaparral, coastal dunes, coastal prairie, and costal scrub. 16–492 feet (5–150 meters); blooms April–June.	**Not Likely.** Coastal scrub does not occur in the Study Area. No native species of *Cirsium* were observed during floristic surveys conducted in 2005 by CNPS[57] and in 2007 and 2008 by PBS&J.
Crystal Springs lessingia	*Lessingia arachnoidea*	none/none/1B.2	Cismontane woodland, coastal scrub, and valley and foothill grassland habitats, in association with serpentinite soils along roadsides. 197–656 feet (60–200 meters); blooms July–October	**Not Likely.** Although potentially suitable habitat and soil substrates are present, there are no recorded occurrences of this species within 5 miles of the Study Area; no species of *Lessingia* were observed during floristic surveys conducted by CNPS[58] and PBS&J in 2007 and 2008.
Diablo helianthella	*Helianthella castanea*	none/none/1B.2	Broadleafed upland forest, chaparral, cismontane woodland, coastal scrub, riparian woodland, and valley and foothill grassland. 197–4,265 feet (60–1,300 meters); blooms March–June.	**Not Likely.** Chaparral or oak woodland absent in Study Area.
Fountain thistle	*Cirsium fontinale* var. *fontinale*	FE/SE/1B.1	Openings in chaparral habitats; valley and foothill grassland habitats in association with serpentinite seeps. 295–574 feet (90–175 meters); blooms June–October	**Not Likely.** Although potentially suitable habitat and soil substrates are present, there are no recorded occurrences of this species within 5 miles of the Study Area; no native species of *Cirsium* were observed during floristic surveys conducted by CNPS[59] and PBS&J in 2007 and 2008.

TABLE 3 SPECIAL-STATUS SPECIES POTENTIALLY OCCURRING WITHIN THE STUDY AREA

Common Name	Scientific Name	Status[a] Fed/ CA/ other	Habitat and Seasonal Distribution in California	Likelihood of Occurrence Within the Study Area
Fragrant fritillary	*Fritillaria liliacea*	none/none/1B.2	Cismontane woodland, coastal prairie, coastal scrub, and valley and foothill grassland habitats often in association with serpentinite soils. 10–1,345 feet (3–410 meters); blooms February–April	**Not Likely.** Although there is one recorded occurrence of this species within 5 miles of the Study Area, no species of *Fritillaria* were observed during floristic surveys conducted by CNPS[60] and PBS&J in 2007 and 2008.
Franciscan manzanita	*Arctostaphylos hookeri* ssp. *franciscana*	none/none/1A	Coastal scrub with serpentinite soil substrates. 197–984 feet (60–300 meters); blooms February–April.	**Not Likely.** Serpentinite soil substrates do not occur within Study Area. No recorded occurrences of this species within 5 miles of the Study Area. No species of *Arctostaphylos* were observed during surveys conducted by Caltrans in 2007[61] and PBS&J in 2007 and 2008.
Franciscan onion	*Allium peninsulare* var. *franciscanum*	SLC/none/1B.2	Clay and serpentine soils on dry hillsides in woodlands and valley and foothill grasslands 170–984 feet (52–300 meters); blooms May–June.	**Not Likely.** Although potentially suitable habitat and soil substrates are present, there are no recorded occurrences of this species within 5 miles of the Study Area; no species of *Allium* were observed during floristic surveys conducted by CNPS[62] and PBS&J in 2007 and 2008.
Franciscan thistle	*Cirsium andrewsii*	none/none/1B.2	Broadleafed upland forest, coastal bluff scrub, coastal prairie, and coastal scrub habitats, often in association with serpentinite soils. 0–492 feet (0–150 meters); blooms March–July	**Not Likely.** Although potentially suitable habitat and soil substrates are present, there are no recorded occurrences of this species within 5 miles of the Study Area; no native species of *Cirsium* were observed during floristic surveys conducted by CNPS[63] and PBS&J in 2007 and 2008.

Common Name	Scientific Name	Status[a] Fed/ CA/ other	Habitat and Seasonal Distribution in California	Likelihood of Occurrence Within the Study Area
Hillsborough chocolate lily	*Fritillaria biflora* var. *ineziana*	none/none/1B.1	Cismontane woodland and valley and foothill grassland habitats in association with serpentinite soils. 492 feet (150 meters); blooms March–April	**Not Likely.** Known only from the Hillsborough area. Although potentially suitable habitat and soil substrates are present, there are no recorded occurrences of this species within 5 miles of the Study Area; no native species of *Fritillaria* were observed during floristic surveys conducted by CNPS[64] and PBS&J in 2007 and 2008.
Kellogg's horkelia	*Horkelia cuneata* ssp. *sericea*	none/none/1B.1	Closed-cone coniferous forest, chaparral, coastal dunes, and coastal scrub with sandy or gravelly openings. 33–656 feet (10–200 meters); blooms April–September.	**Not Likely.** Coastal scrub does not occur in the Study Area.
Marin western flax	*Hesperolinon congestum*	FT/ST/1B.1	Chaparral and valley and foothill grassland habitats in association with serpentinite soils. 16–1214 feet (5–370 meters); blooms April–July	**Not Likely.** Although there are recorded occurrences of this species within 5 miles of the Study Area, no species of *Hesperolinon* were observed during floristic surveys conducted by CNPS and PBS&J in 2007 and 2008.
Montara manzanita	*Arctostaphylos montaraensis*	none/none/1B.2	Chaparral and coastal scrub. 492–1,640 feet (150–500 meters); blooms January–March.	**Not Likely.** Coastal scrub does not occur in the Study Area. No species of *Arctostphylos* were observed during surveys conducted by Caltrans in 2007[65] and PBS&J in 2007 and 2008.
Most beautiful jewel-flower	*Streptanthus albidus* ssp. *permoenus*	none/none/1B.2	Chaparral, cismontane woodland, valley and foothill grasslands, often on serpentine soils. 361–3,281 feet (110–1,000 meters); blooms April–June.	**Not Likely.** Although potentially suitable habitat and soil substrates are present, there are no recorded occurrences of this species within 5 miles of the Study Area; no species of *Streptanthus* were observed during floristic surveys conducted by CNPS and PBS&J in 2007 and 2008.

TABLE 3 SPECIAL-STATUS SPECIES POTENTIALLY OCCURRING WITHIN THE STUDY AREA

Common Name	Scientific Name	Status[a] Fed/ CA/ other	Habitat and Seasonal Distribution in California	Likelihood of Occurrence Within the Study Area
Pacific manzanita	*Arctostaphylos pacifica*	none/SE/1B.2	Chaparral and coastal scrub. 1,083 feet (330 meters); blooms February–April.	**Not Likely.** Coastal scrub does not occur in the Study Area. Species of *Arctostaphylos* not identified during surveys.
Point Reyes bird's-beak	*Cordylanthus maritimus* ssp. *palustris*	none/none/1B.2	Coastal salt marsh. 0–33 feet (0–10 meters); blooms June–October.	**Not Likely.** Marsh habitat in the Study Area is of marginal quality and has been highly degraded. This species was not observed during surveys conducted by Caltrans in 2007.[66] Observed in adjacent off-site locations to the Yosemite Slough area according to the Yosemite Slough IS/MND.[67] Was not observed in the Yosemite Slough area during 2005 surveys conducted by LSA.
Presidio clarkia	*Clarkia franciscana*	FE/SE/1B.1	Occurs in coastal scrub and valley and foothill grassland, often on serpentine soils. 82–1,099 feet (25–335 meters); blooms May–July	**Not Likely.** Known from fewer than five occurrences. The closest two known populations are in the San Francisco Presidio approximately 6 miles northwest. Although potentially suitable habitat and soil substrates are present, there are no recorded occurrences of this species within 5 miles of the Study Area; no species of *Clarkia* were observed during floristic surveys conducted by CNPS[68] and PBS&J in 2007 and 2008.
Presidio manzanita	*Arctostaphylos hookeri ssp. ravenii*	FE/SE/1B.1	Chaparral, coastal prairie, and coastal scrub with serpentinite outcrops. 148–705 feet (45–215 meters); blooms February–March.	**Not Likely.** Serpentinite soil substrates do not occur within Study Area; however, there are no recorded occurrences of this species within 5 miles of the Study Area. Species of *Arctostaphylos* not identified during surveys.

TABLE 3 SPECIAL-STATUS SPECIES POTENTIALLY OCCURRING WITHIN THE STUDY AREA

Common Name	Scientific Name	Status[a] Fed/ CA/ other	Habitat and Seasonal Distribution in California	Likelihood of Occurrence Within the Study Area
Robust spineflower	*Chorizanthe robusta* var. *robusta*	FE/none/1B.1	Chaparral, cismontane woodlands (in openings), coastal dunes, coastal scrub with sandy or gravelly soil. 10–984 feet (3–300) meters; blooms April–September.	**Not Likely.** Coastal dunes are absent from the Study Area. Remnant dunes in the Study Area are disturbed habitat. This species was not observed during surveys conducted by PBS&J in 2007 and 2008.
Rose leptosiphon	*Leptosiphon rosaceus*	none/none/1B.1	Coastal bluff scrub. 0–328 feet (0–100 meters); blooms April–July.	**Not Likely.** Suitable habitat for this species does not occur in the Study Area.
San Bruno Mountain manzanita	*Arctostaphylos imbricata*	none/SE/1B.1	Chaparral and coastal scrub with rocky substrate. 902–1,214 feet (275–370 meters); blooms February–May.	**Not Likely.** Coastal scrub does not occur in the Study Area. Species of *Arctostaphylos* not identified during surveys.
San Francisco Bay spineflower	*Chorizanthe cuspidate* var. *cuspidata*	none/none/1B.2	Coastal bluff scrub, coastal dunes, coastal prairie, and coastal scrub with sandy soils. 10–705 feet (3–215 meters); blooms April–July (uncommon in August).	**Not Likely.** Coastal scrub does not occur in the Study Area.
San Francisco campion	*Silene vercunda* ssp. *verecunda*	none/none/1B.2	Coastal bluff scrub, chaparral, coastal prairie, coastal scrub, and valley and foothill grassland with sandy soil. 98–2,116 feet (30–645 meters); blooms March–June (uncommon in August).	**Not Likely.** Coastal scrub does not occur in the Study Area.
San Francisco Collinsia	*Collinsia multicolor*	none/none/1B.2	Closed-cone coniferous forest and coastal scrub (sometimes with serpentinite soil). 98–820 feet (30–250 meters); Blooms March–May.	**Not Likely.** Coastal scrub does not occur in the Study Area.
San Francisco gumplant	*Grindelia hirsutula* var. *maritima*	none/none/1B.2	Coastal bluff scrub, coastal scrub, and valley and foothill grassland habitats in association with sandy or serpentinite soils. 49–1,312 feet (15–400 meters); blooms June–September	**Not Likely.** Although there are a number of recorded occurrences of this species within 5 miles of the Study Area, this species was not observed during floristic surveys conducted by CNPS[69] and PBS&J in 2007 and 2008.

[69] Ibid.

TABLE 3 SPECIAL-STATUS SPECIES POTENTIALLY OCCURRING WITHIN THE STUDY AREA

Common Name	Scientific Name	Status[a] Fed/ CA/ other	Habitat and Seasonal Distribution in California	Likelihood of Occurrence Within the Study Area
San Francisco Lessingia	*Lessingia germanorum*	FE/SE/1B.1	Coastal scrub (remnant dunes). 82–295 feet (25–90 meters); blooms July–November (uncommon in June).	**Not Likely.** Coastal scrub does not occur in the Study Area. This species was not observed in sandy soil areas during surveys; no species of *Lessingia* were observed during floristic surveys conducted by CNPS[70] and PBS&J in 2007 and 2008.
San Francisco owl's-clover	*Triphysaria floribunda*	none/none/1B.2	Coastal prairie, coastal scrub, and valley and foothill grassland habitats in association with serpentinite soils. 33–525 feet (10–60 meters); blooms April–June	**Not Likely.** Although there is one recorded occurrence of this species within 5 miles of the Study Area, no species of *Triphysaria* has been observed during floristic surveys conducted by CNPS[71] and PBS&J in 2007 and 2008.
San Francisco popcornflower	*Plagiobothrys diffusus*	None/SE/ 1B.1	Occurs in coastal prairie and valley and foothill grassland. 197–1,181 feet (60–360 meters); blooms March–June.	**Not Likely.** Known from fewer than ten occurrences. Although potentially suitable habitat and soil substrates are present, there are no recorded occurrences of this species within 5 miles of the Study Area; no species of *Plagiobothrys* were observed during floristic surveys conducted by CNPS[72] and PBS&J in 2007 and 2008.
SanMateo thorn-mint	*Acanthomintha duttonii*	FE/SE/1B.1	Chaparral and valley and foothill grassland habitats, often on serpentinite soil substrates. 164–984 feet (50–300 meters); blooms April–June	**Not Likely.** Serpentinite soil substrates do not occur within Study Area, however there are no recorded occurrences of this species within 5 miles of the Study Area; species of *Acanthomintha* were not observed during floristic surveys conducted by CNPS[73] and PBS&J in 2007 and 2008.

TABLE 3 SPECIAL-STATUS SPECIES POTENTIALLY OCCURRING WITHIN THE STUDY AREA

Common Name	Scientific Name	Status[a] Fed/ CA/ other	Habitat and Seasonal Distribution in California	Likelihood of Occurrence Within the Study Area
Santa Cruz microseris	*Stebbinsoseris decipiens*	none/none/1B.2	Openings in broadleafed upland forest, closed-cone coniferous forest, chaparral, coastal prairie, coastal scrub, valley and foothill grasslands, sometimes on serpentine soils. 33–1,640 feet (10–500 meters); blooms April–May.	**Not Likely.** Although potentially suitable habitat and soil substrates are present, there are no recorded occurrences of this species within 5 miles of the Study Area; no species of *Stebbinsoseris* were observed during floristic surveys conducted by CNPS[74] and PBS&J in 2007 and 2008.
Short-leaved evax	*Hesperevax sparsiflora* var. *brevifolia*	none/none/2.2	Coastal bluff with sandy soil and coastal dunes. 0–705 feet (0–215 meters); blooms March–June.	**Not Likely.** Suitable habitat for this species does not occur in the Study Area.
White-rayed pentachaeta	*Pentachaeta bellidiflora*	FE/SE/List 1B.1	Occurs in cismontane woodland and valley and foothill grassland, often in serpentinite. 115–2034 feet (35–620 meters); blooms March–May	**Not Likely.** Although there is one recorded occurrence of this species within 5 miles of the Study Area, no species of *Pentachaeta* were observed during floristic surveys conducted by CNPS[75] and PBS&J in 2007 and 2008.
Sensitive Natural Communities				
Coastal brackish marsh (salt marsh)		CDFG Sensitive Habitat		**Known.** The Study Area supports representative assemblages of plant species associated with this community type. Degraded occurrences of this sensitive natural community are present along the southern portion of HPS Phase II site, along Yosemite Slough, and patches along the Candlestick Point shoreline.[76]
Invertebrates

TABLE 3 SPECIAL-STATUS SPECIES POTENTIALLY OCCURRING WITHIN THE STUDY AREA

Common Name	Scientific Name	Status[a] Fed/ CA/ other	Habitat and Seasonal Distribution in California	Likelihood of Occurrence Within the Study Area
Bay checkerspot butterfly	*Euphydryas editha bayensis*	FT/none/none Critical habitat	All habitats for the bay checkerspot are on shallow, serpentine-derived, or similar soils. These soils support the plants on which the caterpillars (larvae) feed the primary larval host plant is dwarf plantain (*Plantago erecta*). In many years, the plantain dries up and the larvae transfer to a second host plant, Indian paintbrush, or purple owl's clover (*Castilleja exserta* spp. *exerta*), which remains edible later in the season.	**Not Likely.** It is not likely that there is a sufficient population of plantain to support Bay checkerspot in the Study Area.[77] Sites that support this species provide greater topographic heterogeneity than the serpentine grassland in the Study Area. Although there are a number of recorded occurrences for this species within 5 miles of the Study Area, this species was extirpated from the closest location of historical occurrence (San Bruno Mountain) in the 1980's.
Callippe silverspot butterfly	*Speyeria callippe callippe*	FE/none/none	Occurs in grassland habitats around the northern Bay Area containing Johnny jump-up (*Viola pedunculata*), which is the larval host plant for this species.	**Not Likely.** Although there are a number of recorded occurrences within 5 miles of the Study Area, *V. pedunculata* has not been observed within the Study Area. In addition, although there are nearby occurrences, there is an insufficient population of this species' host plant within the Study Area to sustain a population of this species.[78]

[78] Ibid.

TABLE 3 SPECIAL-STATUS SPECIES POTENTIALLY OCCURRING WITHIN THE STUDY AREA

Common Name	Scientific Name	Status[a] Fed/ CA/ other	Habitat and Seasonal Distribution in California	Likelihood of Occurrence Within the Study Area
Mission blue butterfly	*Plebejus* [*Icaricia*] *icarioides missionensis*	FE/none/none	The adults feed on hairy false goldenaster (*Heterotheca villosa*), blue dicks (*Dichelostemma capitatum*), and seaside buckwheat (*Eriogonum latifolium*). They do not wander far from the three species of lupine that are the larval food plant: silver lupine (*Lupinus albifrons*), summer lupine (*L. formosus*), and many-colored lupine (*L. versicolor*). Females lay eggs throughout the mating flight. The eggs are laid singly on leaves, stems, flowers, and seedpods of lupine species.	**Not Likely.** Although there are a number of recorded occurrences for this species within 5 miles of the Study Area, including one from the Bayview Hill area, the Study Area does not support a substantial stand of lupine (*Lupinus* spp.) to support this species. [79] Isolated lupine plants intermixed within ruderal vegetation was observed along the Candlestick Point area, near Yosemite Slough. One or two lupine plants were observed in this area during the May 5, 2008 survey, but this would not constitute habitat for this species.
Monarch butterfly (wintering)[80]	*Danaus plexippus*	none/none/ESHA	Occur in many open habitats including fields, meadows, weedy areas, marshes, and roadsides. Adults migrate from August to October, flying south to hibernate along the California coast and in central Mexico. During migration and wintering, butterflies roost in trees and form huge aggregations. Caterpillars feed exclusively on milkweed (*Asclepias* spp.); early in the season, adults sip nectar from dogbane (*Apocynum* spp.), lilac (*Ceanothus* spp.), red clover (*Trifolium pratense*), *Lantana* spp., and thistles (*Cirsium* spp.). In the fall adults visit composites including goldenrods (*Solidago californica*), blazing stars (*Liatris spicata*), ironweed (*Vernonia* spp.), and tickseed sunflower (*Bidens* spp.).	**Known, but Not Likely roosting.** Although individuals have been observed on the site, there is no record of monarch butterfly autumnal (i.e., temporary bivouac site) or over-wintering use of the Study Area in the CNDDB and other records, including anecdotal observations. The nearest observations of such roosts are at Fort Mason, the Presidio of San Francisco, and Stern Grove. The modification of Hunters Point and Candlestick Park would not affect those sites.[81]

[79] United States Fish and Wildlife Service (USFWS), Endangered and Threatened Wildlife and Plants*: Proposed Determination of Critical Habitat for Six Butterflies and Two Plants*, 42 Federal Register 7972, February 8, 1977.

[80] Wintering habitat is considered an Environmentally Sensitive Habitat Area by the California Coastal Commission.

TABLE 3 SPECIAL-STATUS SPECIES POTENTIALLY OCCURRING WITHIN THE STUDY AREA

Common Name	Scientific Name	Status[a] Fed/ CA/ other	Habitat and Seasonal Distribution in California	Likelihood of Occurrence Within the Study Area
Myrtle's silverspot butterfly	*Speyeria zerene myrtleae*	FE/none/none	Occurs in grassland habitats around the northern Bay Area. The larval host plant is hookspur violet (*Viola adunca*). Adults feed on nectar from flowers including hairy gumweed, coastal sand verbena (*Abronia latifolia*), mints (or monardella) (*Monardella* spp.), bull thistle (*Cirsium vulgare*), and seaside fleabane (*Erigeron glaucus*).	**Not Likely.** There are no recorded occurrences of this species within 5 miles of the Study Area. The Study Area does not support the suitable host plants for this species.
San Bruno elfin butterfly	*Callophyrs* [*Incisalia*] *mossii bayensis*	FE/none/none	Endemic to the coastal mountains near San Francisco Bay. Eggs are laid in small clusters or strings on the upper or lower surface of broadleaf stonecrop (*Sedum spathulifolium*). The adult food plants have not been fully determined but Montara Mountain colonies are suspected to use Montara manzanita (*Arctostaphylos montaraensis*) and California huckleberry (*Vaccinium ovatum*).	**Not Likely.** There are a number of recorded occurrences for this species within 5 miles of the Study Area. However, the San Bruno elfin is found in the fog-belt of steep north facing slopes that receive little direct sunlight. It lives near prolific growths of the larval food plant, stonecrop, which is a low growing succulent. The Study Area does not support suitable larval and adult host plants.[82]
			Mollusks	
Black abalone	*Haliotes cracherodii*	FC/none/none	Endemic to Santa Barbara Channel Islands.	**Absent.** The Study Area is outside the range of this species.
White abalone	*Haliotes sorenseni*	FE/none/none	Rocky marine subtidal (to 200 feet deep) and extreme lower intertidal (below 15 feet deep) habitats. Current population extremely depleted.	**Absent.** The Study Area is too shallow and modified to provide suitable habitat.

[81] Monroe, M., Ranger, Muir Woods National Monument, telephone conversation with Todd Wong, July 16, 2008.
[82] Kobernus, P., Senior Biologist, TRA Environmental Sciences, Inc., email to PBS&J, August 30, 2007.

TABLE 3 SPECIAL-STATUS SPECIES POTENTIALLY OCCURRING WITHIN THE STUDY AREA

Common Name	Scientific Name	Status[a] Fed/ CA/ other	Habitat and Seasonal Distribution in California	Likelihood of Occurrence Within the Study Area
Olympia oyster	*Ostreola conchaphila*	none/none/CEQA	Native Olympia oysters were historically abundant in San Francisco Bay, and small populations of native oysters have been documented within the Bay. Suitable substrate includes solid surfaces to which the larvae can easily attach.	**High.** Because the larval forms of oysters are free-floating in the Bay and a large population exists south of the Study Area at Oyster Point Marina, native oysters are likely present on suitable substrate throughout the Study Area.
			Fish	
Pacific herring	*Clupea pallasi*	none/none/CEQA	Pacific herring generally enter the Bay from November through April of each year and spawn in intertidal and sub-tidal habitats.	**Known.** According to NMFS, known herring spawning areas within the Study Area include several piers and areas of shoreline both north and south of the proposed marina.
Chinook salmon –Spring-run ESU	*Oncorhynchus tshawytscha*	FT/ST/none	Central Valley streams with stable water supply, clean gravel, and good quality riparian habitat. Spawning occurs only in tributaries to the Sacramento River.	**Low.** The Study Area is outside the migratory corridor for this species. Adults migrate from the Golden Gate into the Sacramento River.
Chinook salmon –Winter-run ESU	*Oncorhynchus tshawytscha*	FE/ST/none Critical habitat	Central Valley streams with stable water supply, clean gravel, and good quality riparian habitat. Spawning occurs upstream of the Red Bluff Diversion Dam.	**Low.** The Study Area is generally outside the migratory corridor for this species. Adults migrate from the Golden Gate into the Sacramento River. Study Area is outside of designated critical habitat.
Chinook salmon –Fall/Late Fall-run ESUs	*Oncorhynchus tshawytscha*	SC/SSC/none	The most abundant Chinook in the Central Valley. Fall/Late fall-run fish spawn in streams with stable water supply, clean gravel, and good quality riparian habitat.	**Low.** The Study Area is generally outside the migratory corridor for this ESU. A population exists in the South Bay that would migrate past the Study Area on the way to and from the ocean. The origin and status of this population is unclear (refer to text).

TABLE 3 SPECIAL-STATUS SPECIES POTENTIALLY OCCURRING WITHIN THE STUDY AREA

Common Name	Scientific Name	Status[a] Fed/ CA/ other	Habitat and Seasonal Distribution in California	Likelihood of Occurrence Within the Study Area
Coho salmon—Central California ESU	*Oncorhynchus kisutch*	FE/SE/none	Spawning in accessible coastal streams, generally in areas with complex instream habitat, heavy forest cover, and high quality water. Juveniles rear in these areas for two years before migrating to the ocean.	**Absent.** This species does not currently exist in the San Francisco Bay.[83]
Delta smelt	*Hypomesus transpacificus*	FT/SE/none	Endemic to the Sacramento-San Joaquin Delta. Adults spawn in freshwater in the upper Delta. The rest of the year, they reside primarily in the interface between salt and freshwater of the Sacramento-San Joaquin Delta at salinities less than 2 parts per million.	**Absent.** The Study Area is outside the known range of this species.
Longfin Smelt	*Spirinchus thaleichthys*	none/ST/none	Native to San Francisco Bay. Adults spawn in upper estuary in early winter. Larvae are dispersed by downstream flow and distribution is determined by outflow. Adults found outside the Bay in some years.	**Moderate.** Based on a 2009 status review, distribution of larval fish is determined by outflow from the Sacramento-San Joaquin River Estuary where adults spawn.[84] As they develop swimming ability, they could disperse into the Study Area. They are captured as by-catch in the Bay for bay shrimp (*Crangon franciscorum*).
Green sturgeon	*Acipenser medirostris*	FT/SSC/none Proposed Critical Habitat	Migrates through the San Francisco Bay to spawning grounds in the upper Sacramento River. Juveniles move into the estuary and likely rear in San Francisco Bay.	**High.** The species likely forages in the Bay including the area near the Study Area. The Study Area is within proposed critical habitat for this species.

[83] Caltrans, Biological Assessment for the Bayview Transportation Improvements Project, Jones and Stokes, July 2007.
[84] California Department of Fish and Game (CDFG), *A Status Review of the Longfin Smelt (Spirinchus thaleichthys) in California, January 2009.*

TABLE 3 SPECIAL-STATUS SPECIES POTENTIALLY OCCURRING WITHIN THE STUDY AREA

Common Name	Scientific Name	Status[a] Fed/ CA/ other	Habitat and Seasonal Distribution in California	Likelihood of Occurrence Within the Study Area
Steelhead—Central California Coast DPS	*Oncorhynchus mykiss*	FT/none/none Critical habitat	Spawns in cool, clear, well-oxygenated streams. Juveniles remain in fresh water for one or more years before migrating to the ocean.	**High.** Juveniles and adult steelhead could be found in the open waters adjacent to the Study Area as they migrate to and from streams in the San Francisco Bay. Populations are known from relatively nearby creeks on the peninsula (i.e., San Francisquito Creek). The Study Area is within designated critical habitat for this DPS.
Steelhead—Central Valley DPS	*Oncorhynchus mykiss*	FT/none/none Critical habitat	Spawns in cool, clear, well-oxygenated streams. Juveniles remain in freshwater for one or more years before migrating to the ocean.	**Low.** Even though their primary migratory pathway is into the Sacramento River, juveniles and adult steelhead could potentially be found in the Bay near the Project. The Study Area is outside of designated critical habitat for this DPS.
Tidewater goby	*Eucyclogobius newberryi*	FE/SSC/none	Brackish water habitats along coast, fairly still but not stagnant water and high oxygen levels.	**Absent.** The shoreline of the Study Area is influenced by tidal activity. Brackish water habitat absent. Due to degradation lagoon/estuary habitat does not exist.[85]
Amphibians				
California red-legged frog	*Rana aurora draytonii*	FT/SSC/none	Permanent and semi-permanent freshwater habitats, such as creeks and cold-water ponds, with emergent and submergent vegetation.	**Not Likely.** Perennial freshwater habitat is absent from the Study Area. There are no CNDDB records for this species in the vicinity of the Study Area.
Reptiles				
Green turtle	*Chelonia mydas*	FT/none/none	Shallow water with sufficient submergent vegetation. Breeds on islands often but also on mainland sandy beaches.	**Absent.** Suitable habitat for this species does not occur in the Study Area.

[85] Caltrans, *Biological Assessment for the Bayview Transportation Improvements Project*, Jones and Stokes, July 2007.

TABLE 3 SPECIAL-STATUS SPECIES POTENTIALLY OCCURRING WITHIN THE STUDY AREA

Common Name	Scientific Name	Status[a] Fed/ CA/ other	Habitat and Seasonal Distribution in California	Likelihood of Occurrence Within the Study Area
Leatherback turtle	*Dermochelys coriacea*	FE/none/none	Marine, open ocean often near continental shelf. Nests on sloped sandy beaches often near deep water.	**Absent.** Suitable habitat for this species does not occur in the Study Area.
Loggerhead turtle	*Caretta caretta*	FT/none/none	Open ocean up to 500 miles off shore. Nests on sandy beaches seaward of well developed dunes.	**Absent.** Suitable habitat for this species does not occur in the Study Area.
Olive (=Pacific) ridley sea turtle	*Lepidochelys olivacea*	FT/none/none	Near shore less and 15 km. bottom dwelling sea turtle, nests on sandy beaches.	**Absent.** Suitable habitat for this species does not occur in the Study Area.
San Francisco garter snake	*Thamnophis sirtalis tetrataenia*	FE/ST/FP	Inhabits ponds, streams, rivers, and reservoirs, typically with riparian or emergent vegetation. Requires upland areas for aestivation and nesting, usually within 100 yards of permanent water source.	**Not Likely.** Suitable habitat for this species does not occur in the Study Area. There are no CNDDB records for this species in the vicinity of the Study Area.
Western pond turtle	*Actinemys marmorata*	none/SSC/none	Typically inhabit ponds, slow-moving streams and rivers, irrigation ditches, and reservoirs with abundant emergent and/or riparian vegetation.	**Not Likely.** Suitable habitat for this species does not occur in the Study Area. There are no CNDDB records for this species in the vicinity of the Study Area.
			Birds	
Alameda song sparrow	*Melospiza melodia pusillula*	none/SSC/none	Tidal salt marsh habitats along the edge of the Bay and streams where tidal flow effects the vegetation.	**Low.** Salt marsh along Yosemite Slough and the HPS shoreline provides marginal habitat for this species due to its limited extent. Song sparrows were observed between January 2003 and April 2004 along Yosemite Slough, however it is unknown whether these were Alameda song sparrows.
American peregrine falcon (nesting)	*Falco pergrinus anatum*	Delisted/SE (proposed delisted)/FP	Frequents bodies of water in open areas with cliffs and canyons nearby for cover and nesting. Known to nest on artificial substrates (bridges, buildings, etc)	**Known.** A pair of American Peregrine falcons was observed nesting in the Gantry Crane on Parcel D of the HPS Phase II site. The pair has raised several young at this location.[86]

[86] Nelson, G., Facility Coordinator, Navy, field visit with PBS&J, July 8, 2008.

TABLE 3 SPECIAL-STATUS SPECIES POTENTIALLY OCCURRING WITHIN THE STUDY AREA

Common Name	Scientific Name	Status[a] Fed/ CA/ other	Habitat and Seasonal Distribution in California	Likelihood of Occurrence Within the Study Area
Bank swallow (nesting)	*Riparia riparia*	none/ST/none	Nests in steep sandy banks where it excavates burrows.	**Not Likely.** Although individuals have been observed in the vicinity, the Study Area does not provide suitable nesting habitat.
Barrow's goldeneye	*Bucephala islandica*	none/SSC/none	Breeds in high central & northern Sierra Nevada Mountains, near wooded mountain lakes or large streams. Nest in tree cavities, such as a deserted nest-hole of a pileated woodpecker or flicker; also use nest boxes.	**Known.** Although observed near the site during migration and winter, the Study Area does not provide suitable nesting habitat and is well outside the species' breeding range.
Bryant's savannah sparrow	*Passerculus sandwichensis alaudinus*	none/SSC/none	Frequents low tidally influenced habitats, adjacent to ruderal areas, moist grasslands within and just above the fog belt, and grasslands.	**Low.** Salt marsh along Yosemite Slough and the HPS shoreline provides marginal habitat for this species due to its limited extent. Savannah sparrows were observed between January 2003 and April 2004 along Yosemite Slough, however it is unknown whether these were Bryant's savannah sparrows.
Burrowing owl	*Athene cunicularia*	none/SSC/none	Found in open, dry grasslands, deserts, and ruderal areas. Requires suitable small mammal burrows.	**Known.** This species has been observed in the past on Candlestick Point and at HPS, and suitable foraging habitat is present on the site. Although suitable conditions for nesting are present, the species is not known to have nested on the site. Currently, it is either absent, or it occurs sporadically as a non-breeding visitor.
California black rail	*Laterallus jamaicensis coturniculus*	none/ST/FP	Inhabits tidal salt marshes bordering larger bays, or other freshwater and brackish marshes, at low elevations.	**Not Likely.** Small mats of pickleweed adjacent to brackish wetlands are too limited in extent and too highly disturbed to provide suitable habitat. Tidal zone is very narrow.

TABLE 3 SPECIAL-STATUS SPECIES POTENTIALLY OCCURRING WITHIN THE STUDY AREA

Common Name	Scientific Name	Status[a] Fed/ CA/ other	Habitat and Seasonal Distribution in California	Likelihood of Occurrence Within the Study Area
California brown pelican (rookery and communal roosts)	*Pelecanus occidentalis californicus*	FPD/SPD[87]/FP	Typically in littoral ocean zones, just outside the surf line; nests on offshore islands.	**Known.** This species was observed roosting on piers within the Study Area. However, suitable nesting habitat for this species does not occur in the Study Area. The Study Area is outside this species' current breeding range.
California clapper rail	*Rallus longirostris obsoletus*	FE/SE/FP	Restricted to salt marshes and tidal sloughs; usually associated with heavy growth of pickle-weed; feeds on mollusks removed from the mud in sloughs.	**Not Likely.** Suitable habitat does not occur in the Study Area. Salt marsh is highly disturbed and limited in the Study Area. Yosemite Slough is a tidal slough, but suitable habitat for the rail is absent because the existing salt marsh in Yosemite Slough is very narrow and unsuitable. The lack of tidal channels within those marshes, feeding into Yosemite Slough further reduce habitat quality.
California least tern (nesting colony)	*Sternula antillarum browni*	FE/ST/FP	Nests on sandy, upper ocean beaches, and occasionally uses mud flats; forages on adjacent surf line, estuaries, or the open ocean.	**Not Likely.** Suitable nesting habitat does not occur in the Study Area. Individuals may forage in the open water adjacent to the Study Area.
Common loon	*Gavia immer*	none/SSC/none	Nesting locations at certain large lakes & reservoirs in interior of state, primarily in northeastern plateau region. Bodies of water regularly frequented are extensive, fairly deep, and produce quantities of large fish.	**Known.** Although observed near the site during migration and winter, the Study Area does not provide suitable nesting habitat and is well outside the species' breeding range.

[87] California Department of Fish and Game (CDFG) news release: *Fish and Game Commission votes to remove California brown pelican from State Endangered Species List*. February 17, 2009.

TABLE 3 SPECIAL-STATUS SPECIES POTENTIALLY OCCURRING WITHIN THE STUDY AREA

Common Name	Scientific Name	Status[a] Fed/ CA/ other	Habitat and Seasonal Distribution in California	Likelihood of Occurrence Within the Study Area
Harlequin duck (nesting)	*Histrionicus histrionicus*	none/SSC/none	Usually nests along shores of shallow, swift rivers with plentiful aquatic invertebrates.[88]	**Known.** This species was observed perching on the piers in the HPS Phase II site. However, the Study Area does not provide suitable nesting habitat for this species. The Study Area is outside this species' current breeding range.
Loggerhead shrike	*Lanius ludovicianus*	none/SSC/none	Prefers open country for hunting, with perches for scanning, and fairly dense shrubs and brush for nesting. Typically nests in broken woodlands, savannah, pinyon-juniper, Joshua tree, and riparian woodlands, desert oases, scrub, and wash.	**Known.** Non-native grasslands provide suitable foraging habitat. Loggerhead shrike has been observed by Alan Hopkins at the CPSRA.[89] Although suitable conditions for nesting are present, the species is not known to have nested on the site. Currently, it is either absent, or it occurs sporadically as a non-breeding visitor.
Marbled murrelet	*Brachyramphus marmoratus*	FT/SE/none	Mature, coastal coniferous forests for nesting; nearby coastal water for foraging; nests in conifer stands greater than 150 years old and may be found up to 35 miles inland; winters on subtidal and pelagic waters often well offshore.	**Absent.** Suitable habitat not present in the Study Area.
Northern harrier	*Circus cyaneus*	none/SSC/none	Coastal salt & fresh-water marsh. Nest & forage in grasslands, from salt grass in desert sink to mountain cienegas. Nests on ground in shrubby vegetation, usually at marsh edge; nest built of a large mound of sticks in wet areas.	**Known.** Salt marsh and ruderal habitats provide suitable foraging habitat for this species, which has been observed by Alan Hopkins at the CPSRA.[90] However, suitable breeding habitat is absent due to the limited extent of marsh, human disturbance, and vulnerability of this ground-nesting species to predation.

TABLE 3 SPECIAL-STATUS SPECIES POTENTIALLY OCCURRING WITHIN THE STUDY AREA

Common Name	Scientific Name	Status[a] Fed/ CA/ other	Habitat and Seasonal Distribution in California	Likelihood of Occurrence Within the Study Area
San Francisco yellowthroat	*Geothlypis trichas sinuosa*	none/SSC/none	Inhabits emergent wetland habitat, and is a resident and summer visitor in the San Francisco Bay area. Nests are usually placed on or within 8 cm (3 inches) of ground; and may be positioned over water in emergent aquatic vegetation, dense shrubs, or other dense growth.	**Moderate.** Salt marsh along Yosemite Slough and the HPS shoreline provides potential habitat for this species. The existing salt marsh provides marginal habitat due to its limited extent. Common yellowthroats were observed between January 2003 and April 2004 along Yosemite Slough, however it is unknown whether these were San Francisco yellowthroats.[91]
Short-eared owl	*Asio flammeus*	none/SSC/none	Found in swamplands, both fresh and salt; lowland meadows; irrigated alfalfa fields. Tule patches/tall grass needed for nesting/daytime seclusion. Nests on dry ground in depression concealed in vegetation.	**Known.** Salt marsh and ruderal habitats provide suitable foraging habitat for this species, which has been observed by Alan Hopkins at the CPSRA.[92] However, suitable breeding habitat is absent due to the limited extent of marsh, human disturbance, and vulnerability of this ground-nesting species to predation.
Short-tailed albatross	*Phoebastria albatrus*	FE/none/none	Pelagic; nests on offshore islands in north Pacific.	**Absent.** Suitable habitat does not occur in the Study Area.
Tricolored Blackbird	*Agelaius tricolor*	none/SSC/none	Highly colonial species, most numerous in central valley & vicinity. Largely endemic to California. Requires open water, protected nesting substrate, & foraging area with insect prey within a few km of the colony.	**Known.** Ruderal and developed areas on the site provide potential foraging habitat for this species, and the tricolored blackbird has been observed by Alan Hopkins at the CPSRA.[93] However, suitable nesting habitat is absent due to the lack of extensive freshwater marsh vegetation.

TABLE 3 SPECIAL-STATUS SPECIES POTENTIALLY OCCURRING WITHIN THE STUDY AREA

Common Name	Scientific Name	Status[a] Fed/ CA/ other	Habitat and Seasonal Distribution in California	Likelihood of Occurrence Within the Study Area
Vaux's swift	*Chaetura vauxi*	none/SSC/none	Redwood, Douglas fir, & other coniferous forests. Nests in large hollow trees & snags. Often nests in flocks. Forages over most terrains & habitats.	**Known.** Suitable nesting habitat does not occur in the Study Area. However, individuals may forage aerially over the Study Area.
Western snowy plover (nesting)	*Charadrius alexandrinus nivosus*	FT/SSC/none	Coastal beaches above the normal high tide line in flat, open areas with sandy or saline substrates; vegetation and driftwood are usually sparse or absent.	**Not Likely.** Extensive, open sandy substrate to provide nesting habitat within the Study Area is absent.
White-tailed kite	*Elanus leucurus*	none/none/FP	Preferred habitat is marshes and waste fields in the Central Valley and coastal plains of California.	**Known.** Non-native grasslands provide suitable foraging habitat. Large trees in the Study Area provide suitable nesting habitat for this species, although the species is not known to nest there.
			Mammals	
Blue whale	*Balaenoptera musculus*	FE/none/none	Coastal and pelagic environments frequently found on the continental shelf off the California coast.	**Absent.** Suitable habitat does not occur in the Study Area.
Finback whale	*Balaenoptera physalus*	FE/none/none	Pelagic; usually found 25 miles or more off shore.	**Absent.** Suitable habitat does not occur in the Study Area.
Guadalupe fur seal	*Arctocephalus townsendii*	FT/ST/FP	Rocky insular shorelines and sheltered coves.	**Absent.** Suitable habitat does not occur in the Study Area.
Right whale	*Eubalaena glacialis*	FE/none/none	Pelagic, occurs mainly over continental shelf in the Pacific Ocean.	**Absent.** Suitable habitat does not occur in the Study Area.
Salt marsh harvest mouse	*Reithrodontomys raviventris*	FE/SE/FP	Salt marshes with a dense plant cover or pickleweed or fat hen; adjacent to an upland site.	**Not Likely.** Small mats of pickleweed adjacent to brackish wetlands and salt marsh habitat in the Study Area are highly disturbed. This species has not been recorded on the Peninsula north of the Foster City/ San Mateo Bridge area in decades.
Sei whale	*Balaenoptera borealis*	FE/none/none	Pelagic; generally in deep water along continental shelf.	**Absent.** Suitable habitat does not occur in the Study Area.

TABLE 3 SPECIAL-STATUS SPECIES POTENTIALLY OCCURRING WITHIN THE STUDY AREA

Common Name	Scientific Name	Status[a] Fed/ CA/ other	Habitat and Seasonal Distribution in California	Likelihood of Occurrence Within the Study Area
Sperm whale	*Physeter catodon*	FE/none/none	Pelagic; prefers deep water but is sometimes found around islands or in shallow shelf waters.	**Absent.** Suitable habitat does not occur in the Study Area.
Steller sea-lion	*Eumetopias jubatus*	FT/none/none Critical habitat	Near shore, pelagic when in water. Otherwise on shore, talus or bare rocks. Critical habitat has been defined for stellar sea lion as a 20 nautical mile buffer around all major haulouts and rookeries, as well as associated terrestrial, air and aquatic zones, and three large offshore foraging areas.[94]	**Not Likely.** Suitable habitat does not occur in the Study Area. Designated critical habitat does not occur in the Study Area. The closest designated critical habitat for this species is the Farallon Islands, approximately 33 air miles east of the Study Area.
Western red bat	*Lasiurus blossevillii*	none/SSC/none	Roosts primarily in trees, less often in shrubs, adjacent to streams, fields, or urban areas. Preferred roost sites are protected from above, open below, and located above dark ground cover.	**Moderate.** Trees (such as eucalyptus) provide potential roost sites for solitary migrant individuals.

TABLE 3 SPECIAL-STATUS SPECIES POTENTIALLY OCCURRING WITHIN THE STUDY AREA

Common Name	Scientific Name	Status[a] Fed/ CA/ other	Habitat and Seasonal Distribution in California	Likelihood of Occurrence Within the Study Area

Other

ESHA Environmentally Sensitive Habitat Area by the California Coastal Commission
SLC California Native Plant Society (CNPS) Ranking Species of Local Concern
1B California Native Plant Society (CNPS) Ranking. Defined as plants that are rare, threatened, or endangered in California and elsewhere.
2 California Native Plant Society (CNPS) Ranking. Defined as plants that are rare, threatened, or endangered in California, but more common elsewhere.
3 California Native Plant Society (CNPS) Ranking. Plants About Which More Information is Needed—A Review List.
CEQA Species not currently protected by statute or regulation, but considered rare, threatened or endangered under Section 15380 of the CEQA Guidelines.

Recent modifications to the CNPS Ranking System include the addition of a new Threat Code extension to listed species (i.e., List 1B.1, List 2.2 etc.). A Threat Code extension of .1 signifies that a species is seriously endangered in California; .2 is fairly endangered in California; and .3 is not very endangered in California.

b. Likelihood of occurrence evaluations

*A rating of "**Known**" indicates that the species/natural community type has been observed on the site.*

*A rating of "**High**" indicates that the species has not been observed, but sufficient information is available to indicate suitable habitat and conditions are present in the Study Area and the species is expected to occur in the Study Area.*

*A rating of "**Moderate**" indicates that it is not known if the species is present, but suitable habitat exists in the Study Area.*

*A rating of "**Low**" indicates that species was not found during biological surveys conducted to date on the Project site and may not be expected given the species' known regional distribution or the quality of habitats located in the Study Area.*

*A rating of "**Not Likely**" indicates that the taxon would not be expected to occur in the Study Area because the Study Area does not include the known range or does not support suitable habitat.*

*A rating of "**Absent**" indicates that no recorded occurrences or suitable habitat(s) occur within the Study Area to support this species. These species are not discussed further in this document.*

report on November 2, 2009. As indicated by the updated lists, which are also included in the aforementioned appendices (with 2009 database results following the 2008 results), no new special-status species known or expected to occur on the Project site were identified by the updated database searches.

Special-status Plants

The USFWS, CNDDB, and CNPS reported 41 special-status plant species as potentially occurring within the US Geological Survey's 7.5-minute San Francisco South and Hunters Point quadrangles.

The Study Area is largely developed and most vegetation in the area was introduced as landscape plants and turf grass. Much of the Study Area, including virtually all of CPSRA, is located on Bay fill. Ruderal (disturbed) habitats and ornamental landscaping predominate in those portions that are not landscaped. Jones & Stokes conducted botanical habitat assessments of the Candlestick Point and HPS on October 29, 2004; March 1, 2006; October 6, 2006; and May 17, 2007.[95] PBS&J botanists conducted rare plant surveys for the Candlestick Point area in May 2008. The general absence of suitable habitat over a majority of the Study Area in conjunction with the absence of observed special-status plants, either as observed during focused surveys or cited in CNDDB species accounts, supports the conclusion that no sensitive plant species occur within the Study Area.

Special-status and Sensitive Wildlife

Invertebrates

Monarch Butterfly (*Danaus plexippus*)

Monarch butterflies gather in winter roosting sites along the California coast in relatively few locations, and thus roost sites that are used traditionally by large numbers of individuals are considered sensitive biological resources. Wintering sites in California are associated with wind-protected groves of large trees (primarily eucalyptus or pine) with nectar and water sources nearby, generally near the coast.

A total of seven monarch butterflies were observed during the Yosemite Slough Watershed Wildlife Survey.[96] Ms. Mia Monroe, a Ranger with the Muir Woods National Monument (US National Parks Service) and co-coordinator of the Monarch Campaign for the past 15 years, was contacted in July 2008 and July 2009 to inquire about any known monarch wintering roosts that occur in the Project

---

[95] Caltrans, *Natural Environmental Study Report for the Bayview Transportation Improvements Project*, Jones and Stokes, July 2007.

[96] Golden Gate Audubon Society, *Final Report Yosemite Slough Watershed Wildlife Survey 2003–2004*, prepared by LSA, July 27, 2004.

site. Ms. Monroe consulted with local monarch butterfly specialists and the Monarch Campaign Thanksgiving counts. The Monarch Campaign conducts surveys for peak monarch butterfly wintering population around the Thanksgiving holiday. Ms. Monroe reported there are no records of monarch butterfly autumnal (i.e., temporary bivouac site) nor over-wintering use of the Project site in the CNDDB or reported in other records, including anecdotal observations. The nearest observations of monarch butterfly roosts are at Fort Mason, the Presidio of San Francisco, and Stern Grove.[97]

Using the likelihood of occurrence definitions provided in Table 3, although individual monarch butterflies were observed, the sensitive winter roosting habitat is "not likely" to occur within the Study Area.

Birds

While the CNDDB reports no occurrences of any special-status bird species in the Study Area, special-status bird species have been recorded in the Study Area during the Yosemite Slough Watershed Wildlife Survey and by Alan Hopkins, as documented in that survey's report. Special-status bird species with potential to occur on the site are described below and are also summarized in Table 3. Although the harlequin duck (*Histrionicus histrionicus*), Barrow's goldeneye (*Bucephala islandica*), common loon (*Gavia immer*), yellow warbler (*Dendroica petechia*) and Vaux's swift (*Chaetua vauxi*) have all been observed within the site, these species are considered California Species of Special Concern only when breeding.[98] As they only occur within the site as non-breeders, none of them are discussed below, as they would be present only when they would not be considered Species of Concern.

Alameda Song Sparrow (*Melospiza melodia pusillula*)

The Alameda song sparrow is a CDFG Species of Special Concern. The Alameda song sparrow occurs only in the marshlands of the southern San Francisco Bay Region.[99] The primary range of the Alameda song sparrow extends from Coyote Creek, at the southern extremity of the Bay, northward along the west shore of South San Francisco Bay to Belmont Slough (south of the Study Area) and along the east shore to San Lorenzo. Song sparrows nest in dense riparian thickets,

[99] Walton, B., 1974. *Salt Marsh Song Sparrow Study.* California Department of Fish and Game (CDFG), 1974. Available at: http://nrm.dfg.ca.gov/FileHandler.ashx?DocumentVersionID=4696. Accessed July 21, 2008.

emergent wetlands (including salt marshes), and dense thickets of other vegetation.[100] The Alameda song sparrow uses tidal salt marsh habitats along the edge of the Bay and streams where tidal flow affects the vegetation. Candlestick Point and HPS Phase II provide potential habitat for this species in salt marshes along the shoreline, but due to the very narrow nature of tidal salt marsh in the Study Area, such habitat is marginal at best for this species. Song sparrows were observed between January 2003 and April 2004 along Yosemite Slough, but the observed sparrows may or may not be Alameda song sparrows.[101] Observations in April may be of breeding birds although nesting has not been documented. Given the marginal quality of habitat on the site, the site's isolation from more extensive marshes that may serve as source populations for Alameda song sparrows, and the sedentary nature of Alameda song sparrows, it is possible that these are the more widespread race *gouldii* or that they represent migrants or wintering individuals from other races that occur in the region during the non-breeding season. The CNDDB does not report occurrences of Alameda song sparrow in the Study Area.

Using the likelihood of occurrence definitions provided in Table 3, this species has a "low" likelihood to occur within the Study Area.

American Peregrine Falcon (*Falco peregrinus anatum*)

The American peregrine falcon is a state-listed endangered species and a CDFG fully protected species pursuant to Section 3511 of the *California Fish and Game Code*; however, the California Fish and Game Commission voted to remove the species from the state endangered species list on August 6, 2009. The bird has experienced a remarkable resurgence in California and other parts of North America. This striking recovery is due in large measure to the ban on the use of DDT in many places. The peregrine has recovered in North America to the point that the USFWS removed the species from the federal Endangered Species List on August 25, 1999.[102] A pair of American peregrine falcons has nested in the Gantry Crane on Parcel D of the Shipyard, and has raised several broods at this location over the years.[103] These birds forage widely over the entire Study Area, likely feeding primarily on rock pigeons (*Columba livia*) and waterbirds.

Using the likelihood of occurrence definitions provided in Table 3, this species is "known" to occur within the Study Area.

[103] Nelson, G., Facility Coordinator, Department of the Navy, field visit with PBS&J, July 8, 2008.

Bryant's Savannah Sparrow (*Passerculus sandwichensis alaudinus*)

Bryant's savannah sparrow is a CDFG Species of Special Concern. Bryant's savannah sparrow is a California endemic restricted to a narrow coastal strip from Humboldt Bay south to the Morro Bay; its center of abundance appears to be the San Francisco Bay area.[104] This sparrow occupies low tidally influenced habitats, adjacent ruderal areas, moist grassland within and just above the fog belt, and infrequently, drier grasslands. Adjacent to salt marshes this sparrow also occupies weedy spoil areas, canal banks, and bottomland pastures. In South San Francisco Bay, it nests mainly on levee tops grown to grasses and in areas of high pickleweed on levee banks. Bare ground, whether provided by tidal mud flats or upland interstitial areas between clumps of vegetation, appears to be an important component of occupied habitat. The Study Area provides potential habitat for this species in salt marshes along the shoreline, but because of the very narrow nature of tidal salt marsh in the Study Area only marginal quality habitat is available. Savannah sparrows were observed between January 2003 and April 2004 along Yosemite Slough, although the observed sparrows may or may not be Bryant's savannah sparrows.[105] Observations in April 2004 may be of breeding birds although nesting has not been documented. Given the marginal quality of habitat on the site and the site's isolation from more extensive marshes that may serve as source populations for savannah sparrows, it is possible that these represent migrants or wintering individuals from other races that occur in the region during the non-breeding season. The CNDDB does not report occurrences of the Bryant's savannah sparrow bird in the Study Area.

Using the likelihood of occurrence definitions provided in Table 3, this species has a "low" likelihood to occur within the Study Area.

Burrowing Owl (*Athene cunicularia*)

Burrowing owl, a CDFG Species of Special Concern, is an owl that dwells in generally flat, open, dry grasslands, pastures, deserts, and shrub lands, and in grass, forbs and open-shrub stages of pinyon-juniper and ponderosa pine habitats. Burrowing owls use communal ground squirrel and other small mammal burrows for nesting and cover, as well as artificial structures such as roadside embankments, levees, and berms. They can exhibit high site fidelity, often reusing burrows year after year. Occupancy of suitable burrowing owl habitat by breeding birds can be verified at a site by observation of a pair of burrowing owls during their breeding season (March to August) or, alternatively, by the presence of molted feathers, cast pellets, prey remains (rodents, small reptiles,

and large insects), eggshell fragments, or whitewash (guano), at or near a burrow. Burrowing owls are fairly tolerant of human activity near their nest burrows as long as suitable foraging habitat exists nearby. Owl populations have declined sharply in some portions of California during the past two decades (i.e., the San Francisco Bay Area, Sacramento County, San Joaquin County, etc.), but they have increased greatly in some agricultural counties (particularly Imperial). Field work for the *San Francisco Breeding Bird Atlas* in 1991-1993 did not detect breeding evidence by this species anywhere in the City.[106] The CNDDB does not report occurrences of this species in the area, but burrowing owls have been recorded previously on the site. Historically, they occurred in a rubble pile in the northeastern corner of Candlestick Point, and there have been sporadic sightings of the species in various locations on HPS as well. Breeding is not known to have occurred in the Study Area, and these individuals may all have been migrants and wintering individuals.[107] The frequency of occurrence has apparently declined in recent years, and although suitable breeding, roosting, and foraging habitat is present within the Study Area, the species does not currently breed here and occurs sporadically and in low numbers, at best.

Using the likelihood of occurrence definitions provided in Table 3, this species is "known" to occur within the Study Area.

California Brown Pelican (*Pelecanus occidentalis californicus*)

The California brown pelican is on the verge of recovery. It has been proposed for delisting by the Fish and Game Commission[108] and also recently proposed for delisting under the FESA.[109] It is fully protected by CDFG under Section 3511 of the *California Fish and Game Code*. The California brown pelican is found in estuarine, marine sub-tidal, and marine pelagic (deep) waters along the California coast. Pelicans nest from the Channel Islands of Southern California southward along the Baja California coast and in the Gulf of California to coastal southern Mexico.[110] The pelican builds nests of sticks on the ground, typically on islands or offshore rocks. Post-breeding adults and immature birds are found along the Pacific Coast from Oregon south into Baja, Mexico. This species has been observed perching on piers within HPS Phase II, particularly the three piers in the southeastern corner of HPS Phase II, and it forages within San Francisco Bay; however, the species has never nested as far north as the Bay and nesting habitat for this species is not present in the

Study Area. In addition, CNDDB does not report occurrences of California brown pelican communal roosts in the Study Area.

Using the likelihood of occurrence definitions provided in Table 3, this species is "known" to occur within the Study Area.

Loggerhead Shrike (*Lanius ludovicianus*)

The loggerhead shrike, a CDFG Species of Special Concern, is a common resident and winter visitor in lowlands and foothills throughout California and prefers open habitats with scattered shrubs, trees, posts, fences, utility lines, or other perches. Highest density occurs in open-canopied valley foothill hardwood, valley foothill hardwood-conifer, valley foothill riparian, pinyon-juniper, juniper, desert riparian, and Joshua tree habitats. It occurs only rarely in heavily urbanized areas, but is often found in open cropland. The *San Francisco Breeding Bird Atlas*, for which field work was conducted in 1991-1993, reported a record of possible breeding in the atlas block that included HPS and referred to a historical breeding record in the atlas block that includes Candlestick Point.[111] Low numbers of loggerhead shrikes have been observed on Candlestick Point and HPS by Alan Hopkins, and non-native grasslands provide suitable foraging habitat and on-site trees provide suitable nesting habitat for this species. However, there is no evidence of confirmed breeding in recent years, and the species currently occurs as an uncommon migrant and winter resident.[112]

Using the likelihood of occurrence definitions provided in Table 3, this species is "known" to occur within the Study Area. However, this species is considered a California Species of Special Concern only when breeding. Because it is currently known to occur in the Study Area only as a non-breeder, it would not be considered a Species of Special Concern in the Study Area.

Northern Harrier (*Circus cyaneus*)

The northern harrier, a CDFG Species of Special Concern, prefers coastal prairies, marshes, grasslands, swamps and other open areas. Although this species primarily eats small rodents (mice and voles), amphibians, small reptiles, small rabbits, and other birds, northern harriers will eat some invertebrates as well. Northern harriers usually return to the same area to nest in consecutive years. They nest on the ground in well-concealed locations, often near low shrubs or in tall clumps of vegetation. Nesting locations are usually in abandoned fields, wet meadows, and coastal and inland marshes. Wetlands and non-native grasslands provide suitable foraging habitat for small numbers of this species on the site, and northern harriers have been observed by Alan Hopkins in the Study

[111] San Francisco Field Ornithologists. 2003. *San Francisco Breeding Bird Atlas*.
[112] Personal Communication between from Alan Hopkins to Steve Rottenborn, July 10, 2009.

Area.[113] However, due to the extent of disturbance by humans and pets, the lack of extensive wetlands suitable for nesting, and the vulnerability of ground-nesting birds to predation in upland portions of the Study Area, harriers are not expected to nest there. Field work for the *San Francisco Breeding Bird Atlas* in 1991-1993 did not detect breeding evidence by this species anywhere in the City.[114]

Using the likelihood of occurrence definitions provided in Table 3, this species is "known" to occur within the Study Area. However, this species is considered a California Species of Special Concern only when breeding. Because it is currently known to occur in the Study Area only as a non-breeder, it would not be considered a Species of Special Concern in the Study Area.

San Francisco Common Yellowthroat (*Geothlypis trichas sinuosa*)

The San Francisco common yellowthroat is a California Species of Concern and is one of four subspecies of common yellowthroat that breed in California. The breeding range of the San Francisco common yellowthroat as described by Foster is bounded by Tomales Bay on the north, Carquinez Strait on the east, and Santa Cruz County on the south, which would include the Study Area.[115] Yellowthroats are found in freshwater marshes, coastal swales, swampy riparian thickets, brackish marshes, salt marshes, and the edges of disturbed weed fields and grasslands that border soggy habitats.[116] In the San Francisco Bay region as a whole, about 60 percent of yellowthroats breed in brackish marsh, 20 percent in riparian woodland/swamp, 10 percent in freshwater marsh, 5 percent in salt marsh, and 5 percent in upland vegetation.[117] The brackish marsh in the Study Area provides potential habitat for this species, although the limited extent of such habitat limits the possibility that the species currently breeds here. Common yellowthroats were observed between January 2003 and April 2004 during surveys along Yosemite Slough, though it is unknown whether these were San Francisco common yellowthroats or migrants/wintering birds of other races.[118] Field work for the *San Francisco Breeding Bird Atlas* in 1991-1993 did not detect breeding evidence by this species anywhere in the eastern part of the City, including the Project vicinity.[119]

119 San Francisco Field Ornithologists. 2003. *San Francisco Breeding Bird Atlas*.

Using the likelihood of occurrence definitions provided in Table 3, this species has a "moderate" likelihood to occur within the Study Area.

Short-eared owl (*Asio flammeus*)

The short-eared owl, a California Species of Concern, is usually found in open areas with few trees such as annual and perennial grasslands, prairies, meadows, dunes, irrigated lands, and saline and fresh emergent marshes. Its prey consists of small mammals, marsh birds, insects, reptiles, and amphibians.[120] The short-eared owl will usually nest on dry ground in a depression that is concealed in vegetation; occasionally the nest will be placed in a burrow. It requires dense vegetation for roosting and resting cover. This includes tall grasses, brush, ditches, and wetlands. Open, treeless areas containing elevated sites for perching are also needed. This species was observed by Alan Hopkins on the site[121] and the Study Area provides suitable foraging habitat for this species. As a result, short-eared owls are expected to forage occasionally in low numbers on the site. However, due to the extent of disturbance by humans and pets, the lack of extensive wetlands suitable for nesting, and the vulnerability of ground-nesting birds to predation in upland portions of the Study Area, short-eared owls are not expected to nest there. Field work for the *San Francisco Breeding Bird Atlas* in 1991-1993 did not detect breeding evidence by this species anywhere in the City.[122]

Using the likelihood of occurrence definitions provided in Table 3, this is "known" to occur within the Study Area. However, this species is considered a California Species of Special Concern only when breeding. Because it is currently known to occur in the Study Area only as a non-breeder, it would not be considered a Species of Special Concern in the Study Area.

Tricolored Blackbird (*Agelaius tricolor*)

The tricolored blackbird, a California Species of Concern, is a highly social, marsh-nesting bird that lives in flocks numbering from less than one hundred to many thousands. Tricolored blackbirds are permanent residents of California, but birds make extensive migrations and movements, both in the breeding season and in winter, within their restricted range.[123] Tricolored blackbirds live in large colonies, and they prefer open accessible water, a protected nesting substrate such as flooded, thorny or spiny vegetation, and a suitable foraging space providing insect prey within a few miles of nesting colonies. Nesting habitat includes cattails and bulrushes or ungrazed grasslands

[123] Shuford, W. D., and Gardali, T., editors. 2008. *California Bird Species of Special Concern: A ranked assessment of species, subspecies, and distinct populations of birds of immediate conservation concern in*

containing tall grasses. Other plant species that are used for nesting include young willow thickets and wild rose. This species has been observed by Alan Hopkins on the Study Area[124] and the site provides suitable foraging habitat for the species. However, no suitable breeding habitat is present, no colonies are known to occur in the area, and the *San Francisco Breeding Bird Atlas* did not confirm breeding by this species anywhere in the City.[125]

Using the likelihood of occurrence definitions provided in Table 3, this species is "known" to occur within the Study Area. However, this species is considered a California Species of Special Concern only when breeding. Because it is currently known to occur in the Study Area only as a non-breeder, it would not be considered a Species of Special Concern in the Study Area.

White-tailed Kite (*Elanus leucurus*)

The white-tailed kite is listed as a fully protected species under Section 3511 of the *California Fish and Game Code*. White-tailed kites feed on rodents, small reptiles, and large insects in fresh emergent wetlands, annual grasslands, pastures, and ruderal vegetation. They breed between February and October. Kites often roost, and occasionally nest, communally especially during the non-breeding season. Therefore, disturbance of a relatively small roost or nesting area could affect a large number of birds. The white-tailed kite can commonly be observed foraging in extensive open grasslands throughout most of the San Francisco Bay region. While white-tailed kites were not observed during surveys conducted by PBS&J biologists on the Project site, small numbers of individuals were observed during the Yosemite Slough Wildlife surveys.[126] The species is not known to nest on the site[127], but the grasslands and ruderal habitats on the Project site provide suitable foraging habitat for small numbers of non-breeding individuals that occasionally occur there.

Using the likelihood of occurrence definitions provided in Table 3, this species is "known" to occur within the Study Area.

[127] Personal Communication between from Alan Hopkins to Steve Rottenborn, July 20, 2009.

Terrestrial Mammals

Western Red Bat (*Lasiurus blossevillii*)

The only special-status bat species likely to occur within the Study Area is the western red bat (*Lasiurus blossevillii*). The western red bat is not known to breed in San Francisco, but the species is migratory, and red bats occur here during migration and possibly during winter. Western red bats are not colonial, and, thus, the species is expected to occur in the Study Area only in small numbers. They are known to roost in the foliage of a number of tree species, including eucalyptus. Potential habitat for this species is present within the eucalyptus and other mature trees within the Project site. However, most bat species are sensitive to human-generated disturbance. Identification of bats requires special surveys that were not conducted for this analysis. Therefore, the conservative assumption is that this species of sensitive bat is present within the Study Area.

Using the likelihood of occurrence definitions provided in Table 3, this species has a "moderate" likelihood to occur within the Study Area.

Mollusks

Olympia Oyster (*Ostreola conchaphila*)

Native Olympia oysters were historically abundant in San Francisco Bay. Oyster beds are a cornerstone in the benthic habitat, improving water quality, and providing habitat complexity that favors fish and vegetation. They also provide an important link between pelagic and benthic food webs. Their function in the estuarine food web—oyster beds generally increase fish abundance and thus make up an essential part of the Essential Fish Habitat (EFH)[128]—they are considered an important resource for the purposes of this technical report as only a few relict populations remain in the Bay.[129]

Recently, small populations of native oysters have been documented within the Bay.[130,131] Detailed surveys for native oysters were not conducted as part of this Project. Suitable habitat is distributed

[131] Latta, M., 2006. Personal communication with Marilyn Latta, Habitat Restoration Director, Save the Bay, with D. Ebert and others at a meeting on October 18, 2006.

throughout the shoreline of Study Area. Suitable substrate is solid surfaces to which the larvae can easily attach.[132] Because the larval forms of oysters are free-floating in the Bay and a large population exists south of the Study Area at Oyster Point Marina,[133] native oysters are likely present on suitable substrate throughout the Study Area.

Fish

Green Sturgeon (*Acipenser medirostris*)

The southern distinct population segment of green sturgeon (including those that reside in the Sacramento River) was listed as threatened under the FESA by NMFS on April 7, 2006.[134] Green sturgeon is a long-lived, anadromous, native fish that occurs in low numbers in the San Francisco Estuary and Sacramento River. Adults spawn in freshwater rivers from British Columbia south to the Sacramento River. In the Sacramento River, spawning occurs near Red Bluff and possibly in the Feather River. Larvae develop within these freshwater systems, migrate downstream, and remain in the estuaries for between 1 and 4 years before migrating to the ocean. Mature adults move into estuaries in the spring and spawning adults move up the rivers of their origins in late spring/early summer. Post spawning adults return to the estuary before migrating back to the ocean in late fall. Sub-adult fish also are thought to enter estuaries during summer and fall months. The Study Area is along the San Francisco Bay, which is a saltwater habitat; the Study Area does not support the necessary freshwater spawning habitat for adult fish.[135] Juvenile fish and sub-adults may rear in the adjacent waters of San Francisco Bay.

The NMFS designated critical habitat for green sturgeon on October 2009.[136] Specific areas designated as critical habitat include: coastal US marine waters within 60 fathoms depth (360 feet) from Monterey Bay, California, north to Cape Flattery, Washington, including the Strait of Juan de Fuca, Washington, to its United States boundary; the Sacramento River, lower Feather River, and lower Yuba River in California; the Sacramento-San Joaquin Delta and Suisun, San Pablo, and San Francisco bays in California; and certain coastal bays and estuaries in California, Oregon, and Washington. The areas designated comprise approximately 320 miles of freshwater river habitat, 897 square miles of estuarine habitat (including the San Francisco Bay), 11,421 square miles of

[135] Moyle, Peter B. *Inland Fishes of California*, 2002, University of California Press.

[136] National Marine Fisheries Service (NMFS), *Endangered and Threatened Wildlife and Plants: Final Rulemaking to Designate Critical Habitat for the Threatened Southern Distinct Population Segment of North American Green Sturgeon*. 74 Federal Register 52300, October 9, 2009.

marine habitat, and 135 square miles of habitat within the Yolo and Sutter bypasses.[137] Under the FESA, critical habitat includes those areas necessary to support the continued existence and recovery of this species. Critical habitat for green sturgeon includes all of San Francisco Bay. Critical habitat designations include the specific habitat and habitat functions that are necessary for the survival and recovery of the species; these are called primary constituent elements (PCEs). Within the estuarine category of critical habitat, the PCEs include food, flow, water quality, migratory pathways, depth, and sediment quality.[138] Food is an abundance of prey items, benthic invertebrates and shrimp, within the substrate upon which sturgeon can forage. Flow refers to ample movement of water within the estuary to allow adults to orient to the Sacramento River during their spawning migrations. Water quality refers to adequate levels of dissolved oxygen, salinity, and temperatures to allow for survival and growth. Water quality also includes low levels of contaminants that could affect survival or reproductive fitness. A migratory pathway refers to the fact that sturgeon migrate through the Bay to and from upstream spawning areas. The PCE for migratory pathways allows for safe and timely passage of fish between the ocean and upstream spawning areas, but it also includes localized movement of rearing and holding sturgeon within the Bay. The depth PCE refers to the variety of water depths required to provide suitable foraging, holding, and migratory areas. Sediment quality is important because sturgeons are benthic foragers (bottom feeders) and contaminant-free sediments support higher quality prey that do not affect the survival or reproductive fitness of the fish. The Study Area includes elements of all these PCEs. However, the sediment quality may be impaired by decades of industrial use, which has resulted in contamination. This in turn probably reduces the foraging quality.

Using the likelihood of occurrence definitions provided in Table 3, this species has a "high" likelihood to occur within the Study Area.

Chinook Salmon (*Oncorhynchus tshawytscha*)

Populations of Chinook salmon potentially found adjacent to the Project site fall into three Evolutionary Significant Units (ESUs): Winter-run, Spring-run, and Fall/late-Fall-run[139] Chinook salmon. The runs of Chinook are distinguished based on the timing of the adult return to freshwater on their spawning migration. At almost any time of year, there are Chinook at some life cycle stage or another within San Francisco Bay (Table 4 [Life Cycle Stages and Periods of Freshwater Residency for Chinook Salmon]). The occurrence of Chinook adjacent to the Project site could involve any of those life stages. Juvenile fish are more likely to be found adjacent to the Project site than adults because they are moving downstream from their natal streams and do not have the

[137] Ibid.

[138] Ibid.

[139] Fall and late-fall run Chinook are treated as a single ESU by NMFS.

same swimming ability as adults. Juvenile fish from the Sacramento River populations would be expected to occur in low numbers as they stray south of the Golden Gate. Small numbers of Chinook have also recently appeared in Coyote Creek and Guadalupe River, which are both tributaries to south San Francisco Bay near Alviso; these fish are derived from hatchery releases within the native range of the species, which did not include the South Bay.[140,141] Adult or juvenile fish from either of these populations would be expected to migrate through or past the Study Area on their way to and from the Pacific Ocean because the Study Area is between the Pacific Ocean and spawning sites in the South Bay. The overall likelihood of finding a substantial number of Chinook salmon within or adjacent to the Project site at any one time is relatively low because the open water of the Study Area is not considered suitable rearing habitat for either life stage. The residence time that either life stage may spend within or adjacent to the Project site is unknown.

TABLE 4 LIFE CYCLE STAGES AND PERIODS OF FRESHWATER RESIDENCY FOR CHINOOK SALMON

Species	Adult Migration (peak)	Spawning (peak)	Juvenile Freshwater Residency	Outmigration (peak)
Winter Run	Dec–July (Mar)	Apr–Aug (May–June)	5–10 months	July Oct
Spring Run	Mar–Sep (May–June)	Aug–Oct (Sep)	3–15 months	Nov–Mar (Jan–Mar)
Fall Run	June–Dec (Sep–Oct)	Sep–Dec (Oct–Nov)	1–7 months	Dec–Mar
Late Fall Run	Oct–Feb (Dec)	Jan–Apr (Feb–Mar)	7–13 months	Apr–June (Dec–Mar)

SOURCE: Moyle, 2002.

Winter-run Chinook are listed as endangered under the California and federal *Endangered Species Act*s. They spawn in the Sacramento River upstream of Red Bluff Diversion Dam and are distinguishable from other Chinook runs based on the timing of both upstream migration and the spawning season (Table 4). Prior to the construction of Shasta and Keswick dams in 1943 and 1955, respectively, winter-run Chinook spawned in the upper reaches of the Sacramento, McCloud, and

[140] Santa Clara County, *Santa Clara County Habitat Plan, 1st Administrative Draft* August 2008. Website: http://www.scv-habitatplan.org/www/site/alias__default/292/1st_administrative_draft_hcp.aspx. Accessed July 2009.

[141] National Marine Fisheries Service (NMFS). No Date. *Central Valley Chinook Salmon Distributions*. Southwest Regional Office. Website: http://swr.nmfs.noaa.gov/hcd/dist2.htm. Accessed July 17, 2009.

lower Pit rivers,[142] and Battle Creek. Presently, the majority of winter-run Chinook spawning occurs on the main stem of the Sacramento River between Keswick Dam and the Red Bluff Diversion Dam.[143] Designated critical habitat extends from Keswick Dam, Shasta County (River Mile 302) to Chipps Island (River Mile 0) at the westward margin of the Sacramento-San Joaquin Delta; all waters from Chipps Island westward to Carquinez Bridge, including Honker Bay, Grizzly Bay, Suisun Bay, and Carquinez Strait; all waters of San Pablo Bay westward of the Carquinez Bridge; and all waters of San Francisco Bay (north of the San Francisco/Oakland Bay Bridge) from San Pablo Bay to the Golden Gate Bridge. Critical habitat does not extend into the Study Area.

Spring-run Chinook salmon are listed as a threatened species under the California and federal ESAs. Spring-run Chinook enter the Sacramento River between March and September and move upstream into the headwaters, where they hold in pools until they spawn between August and October. Juveniles emigrate from the tributaries from mid-November through June; however, some juveniles spend a year in the streams and emigrate as yearlings the following October.[144] Typically, spring-run Chinook salmon use mid- to high-elevation streams that provide appropriate low water temperatures and sufficient flow, cover, and pool depth to allow over summering. Spawning occurs between August and October and, depending on water temperature, emergence occurs between November and March. Although Spring-run Chinook salmon emigration is highly variable, the emigration period extends from November to early May, with up to 69 percent of young-of-the-year out migrants passing through the lower Sacramento River between mid-November and early January.[145] Designated critical habitat extends from Keswick Dam, Shasta County (River Mile 302) to Chipps Island (River Mile 0) at the westward margin of the Sacramento-San Joaquin Delta; all waters from Chipps Island westward to Carquinez Bridge, including Honker Bay, Grizzly Bay, Suisun Bay, and Carquinez Strait; all waters of San Pablo Bay westward of the Carquinez Bridge; and all waters of San Francisco Bay (north of the San Francisco/Oakland Bay Bridge) from San Pablo Bay to the Golden Gate Bridge. Critical habitat does not extend into the Study Area.

Central Valley Fall and Late Fall-run Chinook salmon are not listed under the state or federal endangered species act but are classified as a Species of Special Concern. Fall-run Chinook salmon is the most abundant ESU, documented to comprise about 80 percent of the Sacramento Basin stock in the early 1980s. The ESU includes all naturally spawned populations of fall-run Chinook salmon in the Sacramento and San Joaquin River basins and their tributaries, east of Carquinez Strait,

California. Juvenile fall and late fall-run fish could stray into open waters within and adjacent to the Project site if they miss the entrance to the Golden Gate and the Pacific Ocean.

A small population of Chinook salmon has become established in recent years in Coyote Creek and the Guadalupe River.[146] The regulatory status of this population is unclear because the fall/late fall-run ESU only includes naturally spawned fish from upstream of Carquinez Strait. There is not an ESU that includes fish spawning within the tributaries of San Francisco Bay. These fish exhibit a fall-run pattern similar to the fall-run ESU of the Central Valley, and are apparently derived from wandering individuals, likely hatchery-released fish, from that ESU.[147] Regardless of where they came from or what their regulatory status may be, these fish would pass the Study Area on their way to and from the ocean.

Using the likelihood of occurrence definitions provided in Table 3, the spring-run, winter-run/ and fall/late fall-run of this species has a "High" likelihood to occur within the Study Area.

Central Valley Steelhead (*Oncorhynchus mykiss*)

Central Valley steelhead (rainbow trout) were federally listed as a threatened species in 1998[148] and this status was reaffirmed in 2006.[149] The Central Valley steelhead population is a Distinct Population Segment (DPS; aka ESU) that includes all naturally spawned populations of steelhead in the Sacramento and San Joaquin rivers and their tributaries. Final critical habitat, designated in September 2005 for this species, does not include the Study Area.[150] Critical habitat is designated by hydrologic unit, the closest of which to the Study Area is the Sacramento Delta Hydrologic Unit, over 25 miles north of the Project site.[151] Central Valley steelhead, especially juveniles, may occasionally stray into the South Bay during their migration to the ocean, but the area adjacent to the Project site is generally outside their migratory pathway.

Using the likelihood of occurrence definitions provided in Table 3, this species has a "low" likelihood to occur within the Study Area.

[151] Ibid.

Central California Coast Steelhead (*Oncorhynchus mykiss*)

The Central California Coast DPS of steelhead is a federally threatened species.[152] This DPS includes all naturally spawned populations of steelhead from the Russian River south to, and including, Aptos Creek and includes the populations within San Francisco Bay.[153] Steelhead begin their migration from the ocean when winter rains provide large amounts of cold water for migration and spawning. Peak migration period for adult fish is in mid-winter. They typically spawn in smaller streams and tributaries to mainstream rivers. Juvenile steelhead generally spends one to three years in freshwater before migrating to the ocean.[154]

It is highly likely that both adults and juvenile steelhead from this DPS could be found adjacent to the Project site. The closest potential steelhead spawning streams in South San Francisco Bay are San Mateo Creek (approximately 10 miles south of the Study Area), Alameda Creek (approximately 16 miles south of the Study Area), and San Francisquito Creek (approximately 22 miles south of the Study Area). Other South Bay watersheds that support populations of steelhead include the Coyote Creek and Guadalupe River watersheds. Because the Study Area is between their spawning and rearing streams and the Pacific Ocean, fish from any of these streams could be found in the Bay adjacent to the Project site during adult migrations from the Pacific Ocean to spawning sites or during juvenile migrations from their natal streams to the Pacific Ocean.

The final critical habitat designation for the Central California Coast steelhead DPS was issued on September 2, 2005.[155] The specific primary constituent elements considered in the designation were freshwater spawning sites, freshwater rearing sites, freshwater migration corridors, estuarine areas, nearshore marine areas, and offshore marine areas. The lateral extent of critical habitat in estuarine areas is the area inundated by extreme high tide. The Study Area is within the designated critical habitat for this species.

Using the likelihood of occurrence definitions provided in Table 3, this species has a "high" likelihood to occur within the Study Area.

Longfin Smelt (*Spirinchus thaleichthys*)

Longfin smelt were listed under the California Endangered Species account as a threatened species in March 2009. This species is endemic to the west coast of North America with small populations likely still present in the Klamath River and Russian River estuaries.[156] However, the bulk of the longfin smelt population appears to be in San Francisco Bay.[157] Adults spawn in the Sacramento-San Joaquin Estuary almost as far upstream as the City of Sacramento on the Sacramento River and to Turner Cut on the San Joaquin River.[158] Adults spawn in these upstream freshwater locations in early winter. The larval smelt are distributed downstream by natural river flow. Because of this, the higher the outflow of freshwater from the Sacramento-San Joaquin Delta, the greater the distribution of smelt in the Bay. As they mature, swimming ability improves and their distribution expands. Adults occur into the South Bay and are also found in the ocean just outside the Golden Gate.[159] This species could be found in the Study Area from spring to fall before adults return upstream to spawn.

Using the likelihood of occurrence definitions provided in Table 3, this species has a "moderate" likelihood to occur within the Study Area.

Pacific Herring (*Clupea pallasi*)

San Francisco Bay supports a small, yet productive commercial Pacific herring fishery. Pacific herring are not protected by either the state or the federal government; however, because herring are harvested for their roe, they are an important species in the economy of the San Francisco Bay Area and their populations are closely monitored by CDFG. Pacific herring are also an important species in the ecology of San Francisco Bay because herring, along with sardines and anchovies, are a primary food source for salmon and other sport fish. Pacific herring generally enter the Bay from November through April[160] of each year and spawn in intertidal and sub-tidal habitats.[161] The actual sites where Pacific herring spawn in San Francisco Bay change from year to year and spawning may occur within numerous locations around the Bay. The North Bay is typically the preferred spawning

area, although limited spawning has historically been observed at San Mateo Point.[162] The preferred substrate for herring spawning is eelgrass, followed by rocky seafloors, and lastly flat surfaces such as marina pilings, retaining walls, and bulkheads along the San Francisco Bay waterfront.[163] According to NMFS, known herring spawning areas within the area immediately adjacent to the Project site include several piers and areas of shoreline both north and south of the proposed marina (refer to Figure 5 [Pacific Herring Spawning Habitat]).[164] Where Figure 5 shows habitat as including piers, this refers to in-water portions of those structures. Also, the mapping data left gaps between the shoreline and the delineated habitat that is an artifact of the mapping. Spawning grounds could extend to the shoreline, especially in those areas where bulkheads define a vertical shoreline. The open channel to the northwest of the proposed marina between Blandy and E streets may be used by herring even though NMFS does not map it as spawning habitat.

OTHER SENSITIVE HABITATS

Essential Fish Habitat

The tidal aquatic habitats adjacent to the Project site are considered EFH by the NMFS for a species assemblage that includes anchovies, sardines, rockfish, sharks, sole, and flounder. Areas supporting the native Olympia oyster found in San Francisco Bay are also considered EFH by NMFS because oyster beds generally increase fish abundance. A more detailed discussion of the provisions of the Magnuson-Stevens Fisheries Conservation Act, by which effects on EFH are regulated, is provided below in the "Regulatory Framework" section.

Eelgrass Beds

Eelgrass occurs in both subtidal and intertidal areas of San Francisco Bay. The distribution of eelgrass has been mapped relatively recently (in 2003) and the results of this effort indicate that low-density eelgrass beds are found on the north side of Hunters Point peninsula offshore from the end of Earl Street and in a small patch in the South Basin.[165] Eelgrass beds form areas of important habitat for birds, fish, and crustaceans and are one of the preferred spawning habitats of Pacific

PACIFIC HERRING SPAWNING HABITAT

herring.[166] These plants also support grazing crustaceans, shrimp, and amphipods. Because it requires light for photosynthesis, eelgrass is limited by water clarity to depths of about 6 feet or less. Because little accurate information exists about the historic distribution of eelgrass beds, and because of their current relative scarcity and importance in the overall ecology of the Bay, both the USACE and CDFG consider eelgrass beds a sensitive resource.

WILDLIFE MOVEMENT

Wildlife movement activities usually fall into one of three movement categories: (1) dispersal (i.e., juvenile animals from natal areas, or individuals extending range distributions); (2) seasonal migration; and (3) local movements related to home range activities (foraging for food or water, defending territories, searching for mates, breeding areas, or cover). A number of terms have been used in various wildlife movement studies, such as "wildlife corridor," "travel route," "habitat linkage," and "wildlife crossing," to refer to areas in which wildlife move from one area to another. To clarify the meaning of these terms and facilitate the discussion of wildlife movement in this analysis, these terms are defined as follows:

- **Travel route**—A landscape feature (such as a ridgeline, drainage, canyon, or riparian strip) within a larger natural habitat area that is used frequently by animals to facilitate movement and provide access to necessary resources (i.e., water, food, cover, den sites). The travel route is generally preferred because it provides the least amount of topographic resistance in moving from one area to another. It contains adequate food, water, and/or cover while moving between habitat areas and provides a relatively direct link between target habitat areas.
- **Wildlife corridor**—A patch of habitat, usually linear in nature, that connects two or more habitat patches that would otherwise be fragmented or isolated from one another. Wildlife corridors are usually bounded by urban land areas or other areas unsuitable for wildlife. The corridor generally contains suitable cover, food, and/or water to support species and facilitate movement while in the corridor.
- **Habitat linkage**—Larger, landscape-level movement features (often referred to as "habitat or landscape linkages") can provide both transitory and resident habitat for a variety of species to a more substantial, or wider, land connection between two habitat areas. Habitat linkages allow for the periodic exchange of animals between habitat areas, which is essential to maintain adequate gene pools.
- **Wildlife crossing**—A small, narrow area, relatively short in length and generally constricted in nature, that allows wildlife to pass under or through an obstacle or barrier that otherwise hinders or prevents movement. Crossings may be manmade and include culverts, underpasses, drainage pipes, and tunnels to provide access across or under roads,

[166] Wyllie-Echeverria, S. and M. Fonseca. Eelgrass (*Zostera marina*) research in San Francisco Bay, California from 1920 to the Present. 2003.

highways, pipelines, or other physical obstacles. These often represent “choke points” along a movement corridor.

Surveys of the Project site did not identify any major or regional wildlife corridor/travel route. The Project site is surrounded by open water and urban development that isolate habitats in the Study Area from large expanses of similar habitats in undeveloped areas elsewhere along the San Francisco Bay shoreline and in the San Bruno Mountain State Park (approximately 2 miles to the southwest). There is localized movement, as ground-dwelling animals forage for food, mate, and move between habitat patches within the Project site. Although there is localized movement between Bayview Hill and the CPSRA, Bayview Hill is also isolated from larger expanses of habitat, and movement by mammals, reptiles, and amphibians between the site and any larger expanses of natural habitat (such as San Bruno Mountain to the southwest) is severely impeded by US-101 and other roads and urban development.

In addition, although bird flyways are not traditionally considered “wildlife movement corridors,” the San Francisco Bay’s wetlands and tidal lands serve as important habitat for bird species during migration through the Pacific Flyway. Many bird species use these areas as an annual stopover location for several days of rest and feeding prior to continuing migration. These habitats also provide critical staging areas for migratory species. Thus, the Study Area is a minor, but important component of the much larger Bay system that provides habitat for migratory birds.

REGULATORY FRAMEWORK

Federal

Section 404 of the Clean Water Act

Section 404 of the *Clean Water Act* (CWA) (33 *United States Code* [USC] §§ 1344) requires that a permit be obtained from the USACE prior to the discharge of dredged or fill materials into any "waters of the United States or wetlands." Waters of the United States are broadly defined in the USACE regulations to include navigable waterways, their tributaries, lakes, ponds, and wetlands. Wetlands are defined as: "Those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that normally do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas."[167] Wetlands that are not specifically exempt from Section 404 regulations (such as drainage channels excavated on dry land) are considered to be "jurisdictional wetlands." The USACE is required to consult with the USFWS, NMFS, Environmental Protection Agency, and State Regional Water Quality Control Board (SWRCB) in carrying out its discretionary authority under Section 404.

The USACE grants three types of permits: individual, general, and nationwide. Project-specific individual permits are required for certain activities that may have a potential for more than a minimal impact and necessitate a detailed application. A permit from the USACE would be required for any placement of fill in waters of the US as part of the Project.

Section 402 of the Clean Water Act

The primary mechanism in the CWA regulating the discharge of pollutants is the National Pollutant Discharge Elimination System (NPDES), which is administered by the Environmental Protection Agency (EPA). Under the NPDES program, a permit is required from EPA or an authorized state for the discharge of any pollutant from a point source into the waters of the US (33 USC §§1342). Storm water pollution prevention plans must be prepared for construction activities as part of the NPDES permitting process.

Section 401 of the Clean Water Act

Section 401 of the CWA (33 USC §§ 1341) requires a state-issued Water Quality Certification for all projects requiring a Section 404 permit, or other federal permit or license. There are nine Regional Water Quality Control Boards (RWQCBs) across the state that issue Water Quality Certifications for various actions within their respective region. The RWQCB, San Francisco Bay Region, issues

[167] US Army Corps of Engineers, *Definition of Waters of the United States*, 33 CFR 328, November 1986.

Section 401 Water Quality Certifications for the City and County of San Francisco. A Section 401 certification requires a determination that the Project will comply with all state water quality standards.

Federal Endangered Species Act (FESA)

The FESA was enacted in 1973. Under the FESA, the Secretary of the Interior and the Secretary of Commerce have the authority to list a species as threatened or endangered (16 USC 1533[c]). The FESA is administered by both the NMFS and the USFWS. The NMFS is accountable for animals that spend most of their lives in marine waters, including marine fish, most marine mammals, and anadromous fish such as Pacific salmon. The USFWS is accountable for all other federally listed plants and animals.

Pursuant to the requirements of FESA, a federal agency authorizing, funding or carrying out a project within its jurisdiction must determine whether any federally listed threatened or endangered species may be present within the Study Area and determine whether the agency's action could affect any federally listed species (16 USC 1536(a)(2), (3).) If the action would likely affect a listed species, the agency must consult with the USFWS or NMFS under Section 7 of the FESA to determine whether the action is likely to jeopardize the continued existence of the species or result in the destruction or adverse modification of designated critical habitat (16 USC 1536(a)(2).) Project-related adverse effects to these species or their habitats are typically considered significant under CEQA and thus would require mitigation.

The USFWS Regional Office in Sacramento maintains a list of "species of concern" that receive special attention from other federal agencies (i.e., NMFS) during environmental review, although they are not protected under FESA. Project-related impacts to such species could be considered significant under CEQA Guidelines section 15380 and could require mitigation.

Section 9 of the FESA prohibits any person or federal agency from "taking" endangered or threatened wildlife. The definition of "take" includes harassing, harming, hunting, shooting, wounding, killing, trapping, capturing, or collecting, or attempting to engage in any such conduct. A notable component of this definition is the definition of "harm." "Harm" in the definition of "take" means an act that actually kills or injures protected wildlife. Such acts may include significant habitat modification or degradation where it actually kills or injures wildlife by significantly impairing essential behavior patterns, including breeding, feeding, or sheltering.

Projects that would result in "take" of any federally listed threatened or endangered species are required to obtain incidental take authorization from NMFS or USFWS through either the Section 7 (interagency consultation) process described above or Section 10(a) (incidental take permit) of FESA. The Section 7 authorization process is used to determine if a project with a federal nexus would jeopardize the continued existence of a listed species and what mitigation measures would be required to avoid jeopardizing the species. The Section 10(a) process allows take of endangered species or their habitat when no other federal government action is involved. Because the Project could affect a federally listed species and would require a federal (Section 404) permit, pursuant to Section 7 of the FESA, the USACE must initiate consultation with USFWS or NMFS prior to carrying out its discretionary authority under Section 404 of the CWA.

Migratory Bird Treaty Act (MBTA)

The federal *Migratory Bird Treaty Act* (MBTA; 16 USC, Sec. 703, Supp. I, 1989) prohibits killing, possessing, or trading in any native bird that may occur within the Study Area except in accordance with regulations prescribed by the Secretary of the Interior. It is an international treaty for the conservation and management of bird species that migrate through more than one country, and is enforced in the United States by the USFWS. This act encompasses whole birds, parts of birds, and bird nests and eggs and provides protection to over 800 species in the United States. All native birds in the Study Area are protected by the MBTA.

Marine Mammal Protection Act

The *Marine Mammal Protection Act* (MMPA) was enacted in 1972 and amended through 2007(16 USC 1631). All marine mammals are protected by the MMPA, which prohibits their take in US Waters. Take is defined in the MMPA as "harass, hunt, capture, kill or collect, or attempt to harass, hunt, capture, kill or collect" [16 USC 1631 Section 3(13)]. This is a slightly different definition than the FESA, which also encompasses "attempts" to engage in these activities. Under the MMPA, "harassment" is further defined as any action that of pursues, torments, or annoys a marine mammal and which has the potential to injure or disturb a marine mammal or marine mammal stock in the wild including alteration of behavior patterns including migration, breathing, nursing, breeding, feeding, or sheltering [16 USC 1631 Section 3(18(A))].

Species that occur within San Francisco Bay on a regular basis that are protected by the MMPA include the harbor seal and the California sea lion. The MMPA would apply to the Project, because in-water construction activities such as pile driving could harass these animals.

Magnuson-Stevens Fisheries Conservation Act and Management Act

The NMFS has the authority to implement the *Magnuson-Stevens Fisheries Conservation and Management Act* (Public Law 94-264; MSA). The *Magnuson-Stevens Act* (MSA) was amended and reauthorized on January 12, 2007, by the *Magnuson-Stevens Fisheries Conservation and Management Reauthorization Act* (PL 109-479). The MSA was put into place to promote conservation and management of the Nation's fishery resources. The MSA established the Pacific Fishery

Management Council, which was tasked with creating the Pacific Coast Groundfish Fishery Management Plan (FMP).[168] The most recent amendment to the FMP was adopted by NMFS in May 2006.[169] The FMP develops recommendations for the management of groundfish fisheries, and in some cases, it contains specific fishery management recommendations. [170] In addition, the FMP addresses provisions in the MSA relating to EFH to ensure that fishery resources are managed through the regulation of EFH. The MSA defines EFH as "... those waters and substrate necessary to fish for spawning, breeding, feeding, or growth to maturity" [16 USC 1802 MSA Section 3(10)]. The terms in this definition have been further defined to include:[171]

- Aquatic habitat and associated physical, chemical, and biological properties that are used by fish (historically used areas may be included)
- Sediment, stream substrates, instream structure, and associated biological communities
- The habitat required to support a sustainable fishery including that particular species' place in a properly functioning ecosystem
- The habitat required to support a full life cycle for the species under consideration

The tidal aquatic habitats adjacent to the Project site are considered EFH by NMFS for a species assemblage that includes anchovies, sardines, rockfish, sharks, sole, and flounder.[172,173] Areas supporting the native Olympia oyster found in San Francisco Bay are also considered EFH by NMFS because oyster beds generally increase fish abundance. The NMFS consults with federal action agencies under the MSA in a process similar and often parallel to the Section 7 FESA consultation. Because the Project would modify designated EFH, consultation with NMFS under the MSA is anticipated and would be initiated by the USACE during the permitting process for the Project.

Section 10 of the Rivers and Harbors Act of 1899

Section 10 of the *Rivers and Harbors Act of 1899* (33 USC 403) gives the USACE jurisdiction over tidal waters of the US from the MHW elevation seaward (33 USC 403.382.4b). Specifically, it prohibits the construction, dredging, or fill of any navigable water without a permit from the USACE. This includes construction of breakwaters or marinas, installation of pilings, docks, or bridges, and excavation of existing substrates.

The Project would require placement of fill for bridge construction, shoreline revetments, breakwaters, installation of pilings and marina floats, and installation of gangways for access to the docks. All of these activities would be subject to the USACE jurisdiction under Section 10 of the *Rivers and Harbors Act*, and USACE authorization of these activities must be obtained through the permitting process for the Project.

State

California Endangered Species Act (CESA)

The CESA was enacted in 1984. Under the CESA, the California Fish and Game Commission has the responsibility for maintaining a list of threatened and endangered species. Pursuant to the requirements of CESA, an agency reviewing a project within its jurisdiction must determine whether any state-listed endangered or threatened species may be present in the Study Area and determine whether the Project would have an adverse affect on such species. In addition, CDFG encourages informal consultation on any project that may impact a candidate species. Peregrine falcons nest within the Study Area, as noted above, and are listed as endangered under the CESA, although the species is proposed to be delisted.

Section 2080 of the *California Fish and Game Code* prohibits “take” of any species that the commission determines to be an endangered species or a threatened species. Take is defined in Section 86 of the *California Fish and Game Code* as “hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill.” Sections 2081(b) and (c) of the *California Fish and Game Code* allow CDFG to issue an incidental take permit for a state-listed threatened or endangered species only if specific criteria are met, such as take incidental to an otherwise lawful activity. CESA emphasizes early consultation to avoid potential impacts to rare, endangered, and threatened species and to develop appropriate mitigation planning to offset project-caused losses of listed species populations and their essential habitats.

Fish and Game Code—Sections 1602, 3503, 3503.5, 3511, 3513, 4150, 4700, 5050, and 5515

California Fish and Game Code Section 3503 states that it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by the code. Birds of prey are further protected under *California Fish and Game Code* Section 3503.5, which states that "it is unlawful to take, possess, or destroy any birds in the order Falconiformes or Strigiformes (birds of prey) or to take, possess, or destroy the nest or eggs of any such bird, except as otherwise provided by this code or any regulation adopted pursuant thereto." Construction disturbance during the breeding season could result in the incidental loss of eggs or nestlings, or otherwise lead to nest abandonment. Disturbance that causes nest abandonment and/or loss of reproductive effort is considered take by CDFG. Similarly, Section 4150 of the *California Fish and Game Code* describes protections for nongame mammals.

California Species of Special Concern is a designation used by the CDFG for some declining wildlife species that are not state candidates for listing as threatened or endangered. This designation does not provide legal protection but signifies that these species are recognized as having special status by the CDFG. Under CEQA Guidelines (Section 15380), potential impacts to these species must be assessed.

California laws relating to Fully Protected species (i.e., Section 3511) were among the first attempts in the nation to provide additional protection to animals that were rare or faced possible extinction, predating even the FESA. Most fully protected species have also been given additional protection under more recent laws and regulations, and many have been listed under state and federal versions of the FESA. Fully Protected species (such as the peregrine falcon and white-tailed kite) may not be taken or possessed at any time and no licenses or permits may be issued for their take except for collecting these species for necessary scientific research and relocation of the bird species for the protection of livestock. Four sections of the *California Fish and Game Code* list 37 fully protected species (*California Fish and Game Code* Sections 3511, 4700, 5050, and 5515). Each of these statutes (1) prohibits take or possession "at any time" of the species listed in the statute, with few exceptions, (2) states that no provision of this code or any other law shall be construed to authorize the issuance of permits or licenses to "take" the species, and (3) states that no previously issued permits or licenses for take of the species "shall have any force or effect" for authorizing take or possession.

Section 1602 of the *California Fish and Game Code* requires a Streambed Alteration Agreement for any activity that may alter the bed and/or bank of a lake, stream, river, or channel. Typical activities that require a Streambed Alteration Agreement include excavation or fill placed within a channel, vegetation clearing, structures for diversion of water, installation of culverts and bridge supports, cofferdams for construction dewatering, and bank reinforcement. A Streambed Alteration Agreement would be required as part of the permitting process for this Project.

CEQA Guidelines Section 15380

Although threatened and endangered species are protected by specific federal and state statutes, CEQA Guidelines section 15380(b) provides that a species not listed on the federal or state list of protected species may be considered rare or endangered if the species can be shown to meet certain criteria. These criteria have been modeled after the definition in FESA and the section of the California Fish and Game Code dealing with rare or endangered plants and animals, and allows a public agency to undertake a review to determine if a significant effect on species that have not yet been listed by either the USFWS or CDFG (i.e., species of concern) would occur. Whether a species is rare, threatened, or endangered can be legally significant because, under CEQA Guidelines Section 15065, an agency must find an impact to be significant if a project would "substantially reduce the number or restrict the range of an endangered, rare, or threatened species." Thus, CEQA provides an agency with the ability to protect a species from a project's potential impacts until the respective government agencies have an opportunity to list the species as under an endangered species act, if warranted.

The CEQA Guidelines for biological resources are influenced by the California Native Plant Society's inventory of special-status plant species. CNPS maintains four species lists of varying rarity.[174] Vascular plants listed as rare or endangered by the CNPS,[175] but which have no designated status or protection under federal or state-endangered species legislation, are defined as follows:

List 1A	Plants Believed Extinct.
List 1B	Plants Rare, Threatened, or Endangered in California and elsewhere.
List 2	Plants Rare, Threatened, or Endangered in California, but more numerous elsewhere.
List 3	Plants About Which More Information is Needed - A Review List.
List 4	Plants of Limited Distribution - A Watch List.

In general, plants appearing on CNPS List 1 or 2 are considered to meet CEQA Guidelines section 15380 criteria and project effects to these species may be considered significant.

It is this section that provides for the inclusion of the various species of special concern and CNPS List 1 and 2 plants presented previously (Table 3).

174 Recent modifications to the CNPS Ranking System include the addition of a new Threat Code extension to listed species (e.g., List 1B.1, List 2.2 etc.). A Threat Code extension of .1 signifies that a species is seriously endangered in California; .2 is fairly endangered in California; and .3 is not very endangered in California.

175 California Native Plant Society, *California Native Plant Society's Inventory of Rare and Endangered Vascular Plants of California* (sixth edition), Sacramento, CA., 2001.

Porter-Cologne Water Quality Control Act

The *Porter-Cologne Water Quality Control Act* (California Water Code Sections 13000 et seq.) charges the SWRCB and the nine RWQCBs statewide with protecting water quality throughout California. Typically, the SWRCB and RWQCB act in concert with the USACE under Section 401 of the *Clean Water Act* in relation to permitting fill of federally jurisdictional waters. The US Supreme Court has acted to limit the regulatory jurisdiction of the USACE under Section 404 of the *Clean Water Act*.[176] This action did not limit the State's regulatory jurisdiction over Waters of the State.[177] Waters of the State are defined in Section 13050(e) of the *Porter-Cologne Water Quality Control Act* as "…any surface water or groundwater, including saline waters, within the boundaries of the state."

Wetlands are delineated in accordance with methodology presented in the 1987 *Corps of Engineers Wetlands Delineation Manual*[178] and *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region*.[179] Applicants have this delineation verified by the USACE and, in cases where an area meets the criteria to be considered a wetland, but the USACE does not have jurisdiction, the applicant is referred to the appropriate RWQCB. For the Study Area, the San Francisco Bay Regional Water Quality Control Board (SFRWQCB) could exercise its jurisdiction over wetlands where a project does not require a federal permit, but involves removal or placement of material into Waters of the State. The USACE has indicated that the waters and wetlands potentially impacted by the Project are subject to its jurisdiction. A Section 401 clean water certification or waiver would be required as part of the permitting process for this Project.

Regional and Local

The McAteer-Petris Act (California Government Code 66600–66682)

The *McAteer-Petris Act* created the San Francisco Bay Conservation and Development Commission (BCDC) in 1965. BCDC's mission is the preservation of San Francisco Bay from indiscriminate filling. BCDC's first task was compilation of a comprehensive study of the Bay and determination of how future development of the Bay should occur. This effort resulted in the San Francisco Bay Plan in 1968. In 1969 the findings and policies of the Bay Plan were incorporated into the *McAteer-Petris*

[176] United States Supreme Court (USSC), *Solid Waste Agency of Northern Cook County v. US Army Corps of Engineers*. 531 US 159(2001), also known as the "SWANCC decision."

[177] Guzy, G.S. and R.J. Andersen., *Memorandum from the Corps regarding: Supreme Court ruling concerning CWA jurisdiction over isolated waters.* Website: http://www.spn.usace.army.mil/regulatory/ swancc.pdf, 2001.

[178] Environmental Laboratory, *Corps of Engineers Wetlands Delineation Manual*. Technical Report Y-87-1, US Army Engineer Waterways Experiment Station. Vicksburg, Miss., 1987.

[179] US Army Corps of Engineers, *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0)*, Wetlands Regulatory Assistance Program, Vicksburg, Miss., September 2008.

Act, which was amended making BCDC a permanent state agency. The Bay Plan continues to evolve and remains the guiding document for BCDC's actions. Section 66610 of the *McAteer-Petris Act* establishes the boundaries of San Francisco Bay in relation to BCDC's jurisdiction. Essentially, all areas below the mean high tide line and an area within a shoreline band that extends landward for 100 feet from the mean high tide line are subject to their jurisdiction. Section 66632 of the *McAteer-Petris Act* establishes the permitting process for projects that would place fill in, on, or over any part of BCDC's jurisdiction as defined in Section 66610. Some aspects of the Project would be in the water or within the shoreline band and, therefore, subject to BCDC's jurisdiction.

Long Term Management Strategy for the Placement of Dredged Material in the San Francisco Bay Region (LTMS) Management Plan

In 1999, under the authority of the federal FESA, NOAA Fisheries and the USFWS, and the CDFG, under the CESA, completed a programmatic consultation for the Long Term Management Strategy for the Placement of Dredged Material in the San Francisco Bay Region (LTMS) Management Plan[180]. NOAA Fisheries, USFWS and CDFG concluded that the LTMS program was not likely to jeopardize the continued existence of listed species under their jurisdiction. The respective biological opinions provided an incidental take statement, which authorized the take of listed species that may inadvertently occur during dredging and dredged material disposal activities that adhere to the environmental work windows set forth in the LTMS Management Plan. Therefore, permitted dredging activities that conform to the Environmental Work Windows can be completed without the need to consult with the resource agencies under the FESA and the CESA. Any project proposing to conduct dredging activities outside of the LTMS environmental work windows is required to undertake either informal or formal consultation with the appropriate resource agencies (NOAA Fisheries, USFWS, and CDFG).

San Francisco Bay Trail Plan

Environmental Protection Policies of the San Francisco Bay Trail Plan relevant to the Project are listed below. [181]

> 23. The Committee is aware of the ecological value of wetlands; in many cases, they provide habitat for a variety of endangered species. In the San Francisco Bay Area, these areas serve as a vital link in the Pacific flyway for feeding, breeding, nesting and cover for migratory birds. To

[180] LTMS Environmental Work Windows Work Group. LTMS Informal work windows, Informal consultation preparation packet. Draft version 1.4. February 2004. Website: http://www.spn.usace.army.mil/conops/informal.pdf.

[181] Bay Trail Plan. 1999. Electronic file: http://baytrail.abag.ca.gov/baytrailplan.html#designguidelines. July 30.

avoid impacts in wetlands habitats, the Bay Trail should not require fill in wetlands, and should be designed so that use of the trail avoids adverse impacts on wetland habitats.

24. Future support facilities serving the Bay Trail should be designed and constructed in such a manner that they do not impact fish and wildlife resources, especially wetlands. These facilities should be located and designed in a way that no fill of wetlands will be required.

26. The path will not always follow the Bay shoreline; inland reaches may be more appropriate, especially for bicycle travel, in some parts of the San Francisco Bay region.

28. Where the alignment of the Bay Trail may more appropriately be located away from the shoreline in order to protect particularly sensitive habitats, access to shoreline areas may be possible by connecting the Bay Trail to existing loop trails and other interpretive facilities. These access points should be planned and designed to make clear the distinction between the continuous Bay Trail and the interpretive trail. (Features may include different trail surfaces, marked entry points to interpretive areas, expanded facilities for education and shoreline interpretation, signage, regulation and enforcement of regulations.)

29. Provision of land or funds for Bay Trail planning or construction shall not be considered mitigation for wetland losses.

Candlestick Point State Recreation Area General Plan

The following excerpt from the CPSRA General Plan is related to natural resource management:[182]

> It is the policy of the department to protect the scenic values and to enhance, manage, and protect the biotic and natural resources of the area, while fully realizing the potential of the area for fulfillment of outdoor recreation needs. A wetland restoration and management plan shall be developed for the area north and east of the extension of Yosemite Avenue to the Bay, an area known as the Nature Area. The plan shall include provisions for natural restoration and removal of debris, design of a shoreline configuration that provides a healthy intertidal action, revegetation, and wildlife habitat enhancement. This plan shall be developed in coordination with local, Bay protection, and wildlife agencies.

San Francisco Bay Plan

A summary of the policies of the San Francisco Bay Plan related to biological resources is provided below.

[182] State Department of Parks and Recreation. Candlestick Point State Recreation Area General Plan, March, 1988.

Policies Concerning Fish, Other Aquatic Organisms and Wildlife in the Bay, Tidal Marshes and Tidal Flats Around the Bay , and Subtidal Areas in the Bay [183]

The SFBCDC shall protect native fish species, other aquatic organisms, other listed wildlife species and their specific habitats under the *California Endangered Species Act* or federal *Marine Mammal Protection Act* within the Bay's tidal marshes, tidal flats, and subtidal habitat. To the greatest extent feasible, specific habitats such as tidal marsh, tidal flats, and subtidal habitats shall be conserved, restored, and increased. Specific habitats that are needed to conserve, increase or prevent the extinction of any native species, species threatened or endangered, species that the CDFG has determined are candidates for listing as endangered or threatened under the California *Endangered Species Act*, or any species that provides substantial public benefits, should be protected, whether in the Bay or behind dikes. In reviewing or approving habitat restoration programs the SFBCDC should follow the recommendations in the Baylands Ecosystem Habitat Goals and provide a diversity of habitats for native aquatic and terrestrial plant and animal species. For projects that may adversely affect an endangered or threatened plant, fish, other aquatic organism or wildlife species the SFBCDC should consult and give appropriate consideration to the recommendations of the California Department of Fish and Game and the US Fish and Wildlife Service or the National Marine Fisheries Service and not authorize projects that would result in the "taking" of any plant, fish, other aquatic organism or wildlife species listed as endangered or threatened pursuant to the state or federal endangered species acts, or species that are candidates for listing under the CESA, unless the project applicant has obtained the appropriate "take" authorization from the US Fish and Wildlife Service, National Marine Fisheries Service or the California Department of Fish and Game. However, the SFBCDC may permit a minor amount of fill or dredging in wildlife refuges, shown on the Plan Maps, necessary to enhance fish, other aquatic organisms and wildlife habitat or to provide public facilities for wildlife observation, interpretation and education.

Policies Concerning Shoreline Protection around the Bay[184]

New shoreline erosion control projects and the maintenance or reconstruction of existing erosion control facilities should be authorized if *(a)* the project is necessary to protect the shoreline from erosion; *(b)* the type of the protective structure is appropriate for the project site and the erosion conditions at the site; and *(c)* the project is properly designed and constructed. Professionals knowledgeable of the Commission's concerns, such as civil engineers experienced in coastal processes, should participate in the design of erosion control projects.

Policies Concerning Dredging in the Bay[185]

---

[183] SFBCDC, San Francisco Bay Plan, Reprinted February 2008.
[184] Ibid.
[185] Ibid.

Dredging and dredged material disposal should be conducted in an environmentally and economically sound manner. Dredgers should reduce disposal in the Bay and certain waterways over time to achieve the LTMS goal of limiting in-Bay disposal volumes to a maximum of one million cubic yards per year. The LTMS agencies should implement a system of disposal allotments to individual dredgers to achieve this goal only if voluntary efforts are not effective in reaching the LTMS goal. In making its decision regarding disposal allocations, the Commission should confer with the LTMS agencies and consider the need for the dredging and the dredging projects, environmental impacts, regional economic impacts, efforts by the dredging community to implement and fund alternatives to in-Bay disposal, and other relevant factors. Small dredgers should be exempted from allotments, but all dredgers should comply with the SFBCDC policies.

Yosemite Slough Restoration Plan

The Yosemite Slough Restoration Plan (2005) was developed on behalf of the State Parks Department, in accordance with the CPSRA GP. The restoration of Yosemite Slough would create the largest contiguous wetland area in San Francisco. The restoration project would help restore essential wildlife habitat, improve water quality, and prevent erosion along the shoreline of the City—an area of the bay where tidal wetlands have been most impacted and suffered the greatest loss due to urbanization.

Goals and objectives of the restoration include the following:

- Increase the area subject to tidal influence by excavating three areas that were formerly part of San Francisco Bay.
- Restore habitat diversity by adding 12 acres of tidally influenced wetlands and marsh area and remove chemically impacted soils from upland areas to improve the quality of existing habitat.
- Improve habitat for special-status species (i.e., western snowy plover and double-crested cormorants) by creating two nesting islands.
- Improve the quality of life for the surrounding community by creating a clean, beautiful local park for viewing wildlife habitat.
- Create an environmental area that local schools can use for field trips.
- Connect to the Blue Greenway, an important effort to build 13 miles of Bay Trail along the southern waterfront of the San Francisco Bay Trail.

City of San Francisco General Plan

The following goals and policies related to biological resources protection are included in the Environmental Protection Element of the *San Francisco General Plan*, and are relevant to the Project:

General

Objective 1 Achieve a proper balance among the conservation, utilization, and development of San Francisco's natural resources.

Policy 1.1 Conserve and protect the natural resources of San Francisco.

Policy 1.2 Improve the quality of natural resources.

Policy 1.3 Restore and replenish the supply of natural resources.

Policy 1.4 Assure that all new development meets strict environmental quality standards and recognizes human needs.

Bay, Ocean, and Shorelines

Objective 3 Maintain and improve the quality of the bay, ocean, and shoreline areas.

Policy 3.1 Cooperate with and otherwise support regulatory programs of existing regional, state, and federal agencies dealing with the Bay, Ocean, and Shorelines.

Policy 3.2 Promote the use and development of shoreline areas consistent with the General Plan and the best interest of San Francisco.

Land

Objective 7 Assure that the land resources in San Francisco are used in ways that both respect and preserve the natural values of the land and serve the best interests of all the City's citizens.

Policy 7.3 Require that filling of land adhere to the highest standards of soils engineering consistent with the proposed use.

Flora and Fauna

Objective 8 Ensure the protection of plant and animal life in the City.

Policy 8.1 Cooperate with and otherwise support the California Department of Fish and Game and its animal protection programs.

Policy 8.2 Protect the habitats of known plant and animal species that require a relatively natural environment.

Policy 8.3 Protect rare and endangered species.

San Francisco Municipal Code

Urban Forestry Ordinance

The City provides protection for trees around the City by way of its Urban Forestry Ordinance (Ord. 165-95, App. 5/19/95), Article 16, Sections 806 (Planting and Removal of Street Trees) through 810 (Significant Trees) of the *Public Works Code*. "Significant trees" are defined as trees within 10 feet of a public right-of-way that also meet one of the following size requirements: 20 feet or greater in height; 15 feet or greater in canopy width; or 12 inches or greater diameter of trunk measured at 4.5 feet above grade. Among the factors considered in the removal of significant trees are the following: their size, age, and species; visual and aesthetic characteristics; cultural or historic characteristics; ecological and location characteristics. Street trees are also protected by the City's Urban Forestry Ordinance and both require a permit for removal. The ordinance also provides a process for designating trees as landmark trees, and protects significant, landmark, and street trees during construction activities. This ordinance applies to limited areas of the Project site where there are significant trees, street trees, and/or landmark trees.

Planning Code

Section 143 of the San Francisco Planning Code requires the installation of one street tree for each 20 feet of property frontage along each street or alley, with any remaining fraction of 10 feet or more of frontage requiring an additional tree for the owner or developer of a new or relocated building, or a building with 20% or more floor area expansion in specified districts.[186] This ordinance applies to the R, SPD, RSD, NC, C-3, DTR, MUG, MUO, MUR, UMU, SLR, SLI, and SSO Districts.

DISCUSSION

This Biological Technical Report describes the existing biological resources of the CPHPS Project site and vicinity and the regulatory framework under which Project activities must be conducted. The Biological Resources Chapter of the Project's EIR will analyze impacts of the Project on these resources. In addition, pursuant to the regulations described in the "Regulatory Framework" section of this report, permits from various regulatory agencies must be obtained to authorize Project impacts to regulated resources.

[186] Amended by Ord. 414-85, App. 9/17/85; Ord. 69-87, App. 3/13/87; Ord. 115-90, App. 4/6/90; Ord. 298-08, File No. 081153, App. 12/19/2008.

APPENDIX C
USFWS SPECIAL-STATUS SPECIES LIST

Federal Endangered and Threatened Species that Occur in or may be Affected by Projects in the Counties and/or U.S.G.S. 7 1/2 Minute Quads you requested

Document Number: 080707032523

Database Last Updated: January 31, 2008

Quad Lists

HUNTERS POINT (448A)

Listed Species

Invertebrates

Icaricia icarioides missionensis
mission blue butterfly (E)

Incisalia mossii bayensis
San Bruno elfin butterfly (E)

Fish

Acipenser medirostris
green sturgeon (T) (NMFS)

Hypomesus transpacificus
delta smelt (T)

Oncorhynchus kisutch
coho salmon - central CA coast (E) (NMFS)

Oncorhynchus mykiss
Central California Coastal steelhead (T) (NMFS)
Central Valley steelhead (T) (NMFS)
Critical habitat, Central California coastal steelhead (X) (NMFS)

Oncorhynchus tshawytscha
Central Valley spring-run chinook salmon (T) (NMFS)
winter-run chinook salmon, Sacramento River (E) (NMFS)

Amphibians

Rana aurora draytonii
California red-legged frog (T)

Birds

Charadrius alexandrinus nivosus
western snowy plover (T)

Pelecanus occidentalis californicus
California brown pelican (E)

Rallus longirostris obsoletus
California clapper rail (E)

Sternula antillarum (=Sterna, =albifrons) browni
California least tern (E)

Mammals

Reithrodontomys raviventris
salt marsh harvest mouse (E)

SAN FRANCISCO SOUTH (448B)

Listed Species

Invertebrates

Euphydryas editha bayensis
Critical habitat, bay checkerspot butterfly (X)

Haliotes sorenseni
white abalone (E) (NMFS)

Icaricia icarioides missionensis
mission blue butterfly (E)

Incisalia mossii bayensis
San Bruno elfin butterfly (E)

Speyeria callippe callippe
callippe silverspot butterfly (E)

Speyeria zerene myrtleae
Myrtle's silverspot butterfly (E)

Fish

Acipenser medirostris
green sturgeon (T) (NMFS)

Eucyclogobius newberryi
tidewater goby (E)

Hypomesus transpacificus
delta smelt (T)

Oncorhynchus kisutch
coho salmon - central CA coast (E) (NMFS)

Oncorhynchus mykiss
Central California Coastal steelhead (T) (NMFS)
Central Valley steelhead (T) (NMFS)

Oncorhynchus tshawytscha
Central Valley spring-run chinook salmon (T) (NMFS)
winter-run chinook salmon, Sacramento River (E) (NMFS)

Amphibians

Rana aurora draytonii
California red-legged frog (T)

Reptiles

Caretta caretta
loggerhead turtle (T) (NMFS)

Chelonia mydas (incl. agassizi)
green turtle (T) (NMFS)

Dermochelys coriacea
leatherback turtle (E) (NMFS)

Lepidochelys olivacea
olive (=Pacific) ridley sea turtle (T) (NMFS)

Thamnophis sirtalis tetrataenia
San Francisco garter snake (E)

Birds

Brachyramphus marmoratus
marbled murrelet (T)

Charadrius alexandrinus nivosus
western snowy plover (T)

Diomedea albatrus
short-tailed albatross (E)

Pelecanus occidentalis californicus
California brown pelican (E)

Rallus longirostris obsoletus
California clapper rail (E)

Sternula antillarum (=Sterna, =albifrons) browni
California least tern (E)

Mammals

Arctocephalus townsendi
Guadalupe fur seal (T) (NMFS)

Balaenoptera borealis
sei whale (E) (NMFS)

Balaenoptera musculus
blue whale (E) (NMFS)

Balaenoptera physalus
finback (=fin) whale (E) (NMFS)

Eubalaena (=Balaena) glacialis
right whale (E) (NMFS)

Eumetopias jubatus
Steller (=northern) sea-lion (T) (NMFS)

Physeter catodon (=macrocephalus)
sperm whale (E) (NMFS)

Reithrodontomys raviventris
salt marsh harvest mouse (E)

Plants

Lessingia germanorum
San Francisco lessingia (E)

Candidate Species

Invertebrates

Haliotes cracherodii
black abalone (C) (NMFS)

County Lists

San Francisco County

Listed Species

Invertebrates

Haliotes sorenseni
white abalone (E) (NMFS)

Icaricia icarioides missionensis
mission blue butterfly (E)

Incisalia mossii bayensis
San Bruno elfin butterfly (E)

Fish

Acipenser medirostris
green sturgeon (T) (NMFS)

Eucyclogobius newberryi
tidewater goby (E)

Oncorhynchus kisutch
coho salmon - central CA coast (E) (NMFS)

Oncorhynchus mykiss
Central California Coastal steelhead (T) (NMFS)
Critical habitat, Central California coastal steelhead (X) (NMFS)
Critical habitat, Central Valley steelhead (X) (NMFS)

Oncorhynchus tshawytscha
Critical habitat, winter-run chinook salmon (X) (NMFS)
winter-run chinook salmon, Sacramento River (E) (NMFS)

Amphibians

Rana aurora draytonii
California red-legged frog (T)

Reptiles

Caretta caretta
loggerhead turtle (T) (NMFS)

Chelonia mydas (incl. agassizi)
green turtle (T) (NMFS)

Dermochelys coriacea
leatherback turtle (E) (NMFS)

Lepidochelys olivacea
olive (=Pacific) ridley sea turtle (T) (NMFS)

Birds

Charadrius alexandrinus nivosus
western snowy plover (T)

Diomedea albatrus
short-tailed albatross (E)

Pelecanus occidentalis californicus

California brown pelican (E)

Rallus longirostris obsoletus
California clapper rail (E)

Mammals

Arctocephalus townsendi
Guadalupe fur seal (T) (NMFS)

Balaenoptera borealis
sei whale (E) (NMFS)

Balaenoptera musculus
blue whale (E) (NMFS)

Balaenoptera physalus
finback (=fin) whale (E) (NMFS)

Eubalaena (=Balaena) glacialis
right whale (E) (NMFS)

Eumetopias jubatus
Critical Habitat, Steller (=northern) sea-lion (X) (NMFS)
Steller (=northern) sea-lion (T) (NMFS)

Megaptera novaeangliae
humpback whale (E) (NMFS)

Physeter catodon (=macrocephalus)
sperm whale (E) (NMFS)

Reithrodontomys raviventris
salt marsh harvest mouse (E)

Plants

Arctostaphylos hookeri ssp. ravenii
Presidio (=Raven's) manzanita (E)

Clarkia franciscana
Presidio clarkia (E)

Hesperolinon congestum
Marin dwarf-flax (=western flax) (T)

Lessingia germanorum
San Francisco lessingia (E)

Candidate Species

Invertebrates

Haliotes cracherodii

black abalone (C) (NMFS)

Key:

(E) *Endangered* - Listed as being in danger of extinction.

(T) *Threatened* - Listed as likely to become endangered within the foreseeable future.

(P) *Proposed* - Officially proposed in the Federal Register for listing as endangered or threatened.

(NMFS) Species under the Jurisdiction of the National Oceanic & Atmospheric Administration Fisheries Service. Consult with them directly about these species.

Critical Habitat - Area essential to the conservation of a species.

(PX) *Proposed Critical Habitat* - The species is already listed. Critical habitat is being proposed for it.

(C) *Candidate* - Candidate to become a proposed species.

(V) Vacated by a court order. Not currently in effect. Being reviewed by the Service.

(X) *Critical Habitat* designated for this species

Important Information About Your Species List

How We Make Species Lists

We store information about endangered and threatened species lists by U.S. Geological Survey 7½ minute quads. The United States is divided into these quads, which are about the size of San Francisco.

The animals on your species list are ones that occur within, **or may be affected by** projects within, the quads covered by the list.

- Fish and other aquatic species appear on your list if they are in the same watershed as your quad or if water use in your quad might affect them.
- Amphibians will be on the list for a quad or county if pesticides applied in that area may be carried to their habitat by air currents.
- Birds are shown regardless of whether they are resident or migratory. Relevant birds on the county list should be considered regardless of whether they appear on a quad list.

Plants

Any plants on your list are ones that have actually been observed in the area covered by the list. Plants may exist in an area without ever having been detected there. You can find out what's in the surrounding quads through the California Native Plant Society's online Inventory of Rare and Endangered Plants.

Surveying

Some of the species on your list may not be affected by your project. A trained biologist or botanist, familiar with the habitat requirements of the species on your list, should determine whether they or habitats suitable for them may be affected by your project. We recommend that your surveys include any proposed and candidate species on your list.

For plant surveys, we recommend using the Guidelines for Conducting and Reporting Botanical Inventories. The results of your surveys should be published in any environmental documents prepared for your project.

Your Responsibilities Under the Endangered Species Act

All animals identified as listed above are fully protected under the Endangered Species Act of 1973, as amended. Section 9 of the Act and its implementing regulations prohibit the take of a federally listed wildlife species. Take is defined by the Act as "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect" any such animal.

Take may include significant habitat modification or degradation where it actually kills or injures wildlife by significantly impairing essential behavioral patterns, including breeding, feeding, or shelter (50 CFR §17.3).

Take incidental to an otherwise lawful activity may be authorized by one of two procedures:

- If a Federal agency is involved with the permitting, funding, or carrying out of a project that may result in take, then that agency must engage in a formal consultation with the Service.

  During formal consultation, the Federal agency, the applicant and the Service work together to avoid or minimize the impact on listed species and their habitat. Such consultation would result in a biological opinion by the Service addressing the anticipated effect of the project on listed and proposed species. The opinion may authorize a limited level of incidental take.

- If no Federal agency is involved with the project, and federally listed species may be taken as part of the project, then you, the applicant, should apply for an incidental take permit. The Service may issue such a permit if you submit a satisfactory conservation plan for the species that would be affected by your project.

  Should your survey determine that federally listed or proposed species occur in the area and are likely to be affected by the project, we recommend that you work with this office and the California Department of Fish and Game to develop a plan that minimizes the project's direct and indirect impacts to listed species and compensates for project-related loss of habitat. You should include the plan in any environmental documents you file.

Critical Habitat

When a species is listed as endangered or threatened, areas of habitat considered essential to its conservation may be designated as critical habitat. These areas may require special management considerations or protection. They provide needed space for growth and normal behavior; food, water, air, light, other nutritional or physiological requirements; cover or shelter; and sites for breeding, reproduction, rearing of offspring, germination or seed dispersal.

Although critical habitat may be designated on private or State lands, activities on these lands are not restricted unless there is Federal involvement in the activities or direct harm to listed wildlife.

If any species has proposed or designated critical habitat within a quad, there will be a separate line for this on the species list. Boundary descriptions of the critical habitat may be found in the Federal Register. The information is also reprinted in the Code of Federal Regulations (50 CFR 17.95). See our critical habitat page for maps.

Candidate Species

We recommend that you address impacts to candidate species. We put plants and animals on our candidate list when we have enough scientific information to eventually propose them for listing as threatened or endangered. By considering these species early in your planning process you may be able to avoid the problems that could develop if one of these candidates was listed before the end of your project.

Species of Concern

The Sacramento Fish & Wildlife Office no longer maintains a list of species of concern. However, various other agencies and organizations maintain lists of at-risk species. These lists provide essential information for land management planning and conservation efforts.

More info

Wetlands

If your project will impact wetlands, riparian habitat, or other jurisdictional waters as defined by section 404 of the Clean Water Act and/or section 10 of the Rivers and Harbors Act, you will need to obtain a permit from the U.S. Army Corps of Engineers. Impacts to wetland habitats require site specific mitigation and monitoring. For questions regarding wetlands, please contact Mark Littlefield of this office at (916) 414-6580.

Updates

Our database is constantly updated as species are proposed, listed and delisted. If you address proposed and candidate species in your planning, this should not be a problem. However, we recommend that you get an updated list every 90 days. That would be October 05, 2008.

Important Information About Your Species List

How We Make Species Lists

We store information about endangered and threatened species lists by U.S. Geological Survey 7½ minute quads. The United States is divided into these quads, which are about the size of San Francisco.

The animals on your species list are ones that occur within, **or may be affected by** projects within, the quads covered by the list.

- Fish and other aquatic species appear on your list if they are in the same watershed as your quad or if water use in your quad might affect them.
- Amphibians will be on the list for a quad or county if pesticides applied in that area may be carried to their habitat by air currents.
- Birds are shown regardless of whether they are resident or migratory. Relevant birds on the county list should be considered regardless of whether they appear on a quad list.

Plants

Any plants on your list are ones that have actually been observed in the area covered by the list. Plants may exist in an area without ever having been detected there. You can find out what's in the surrounding quads through the California Native Plant Society's online Inventory of Rare and Endangered Plants.

Surveying

Some of the species on your list may not be affected by your project. A trained biologist and/or botanist, familiar with the habitat requirements of the species on your list, should determine whether they or habitats suitable for them may be affected by your project. We recommend that your surveys include any proposed and candidate species on your list. See our Protocol and Recovery Permits pages.

For plant surveys, we recommend using the Guidelines for Conducting and Reporting Botanical Inventories. The results of your surveys should be published in any environmental documents prepared for your project.

Your Responsibilities Under the Endangered Species Act

All animals identified as listed above are fully protected under the Endangered Species Act of 1973, as amended. Section 9 of the Act and its implementing regulations prohibit the take of a federally listed wildlife species. Take is defined by the Act as "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect" any such animal.

Take may include significant habitat modification or degradation where it actually kills or injures wildlife by significantly impairing essential behavioral patterns, including breeding, feeding, or shelter (50 CFR §17.3).

Take incidental to an otherwise lawful activity may be authorized by one of two procedures:

- If a Federal agency is involved with the permitting, funding, or carrying out of a project that may result in take, then that agency must engage in a formal consultation with the Service.

  During formal consultation, the Federal agency, the applicant and the Service work together to avoid or minimize the impact on listed species and their habitat. Such consultation would result in a biological opinion by the Service addressing the anticipated effect of the project on listed and proposed species. The opinion may authorize a limited level of incidental take.

- If no Federal agency is involved with the project, and federally listed species may be taken as part of the project, then you, the applicant, should apply for an incidental take permit. The Service may issue such a permit if you submit a satisfactory conservation plan for the species that would be affected by your project.

  Should your survey determine that federally listed or proposed species occur in the area and are likely to be affected by the project, we recommend that you work with this office and the California Department of Fish and Game to develop a plan that minimizes the project's direct and indirect impacts to listed species and compensates for project-related loss of habitat. You should include the plan in any environmental documents you file.

Critical Habitat

When a species is listed as endangered or threatened, areas of habitat considered essential to its conservation may be designated as critical habitat. These areas may require special management considerations or protection. They provide needed space for growth and normal behavior; food, water, air, light, other nutritional or physiological requirements; cover or shelter; and sites for breeding, reproduction, rearing of offspring, germination or seed dispersal.

Although critical habitat may be designated on private or State lands, activities on these lands are not restricted unless there is Federal involvement in the activities or direct harm to listed wildlife.

If any species has proposed or designated critical habitat within a quad, there will be a separate line for this on the species list. Boundary descriptions of the critical habitat may be found in the Federal Register. The information is also reprinted in the Code of Federal Regulations (50 CFR 17.95). See our Map Room page.

Candidate Species

We recommend that you address impacts to candidate species. We put plants and animals on our candidate list when we have enough scientific information to eventually propose them for listing as threatened or endangered. By considering these species early in your planning process you may be able to avoid the problems that could develop if one of these candidates was listed before the end of your project.

Species of Concern

The Sacramento Fish & Wildlife Office no longer maintains a list of species of concern. However, various other agencies and organizations maintain lists of at-risk species. These lists provide essential information for land management planning and conservation efforts. More info

Wetlands

If your project will impact wetlands, riparian habitat, or other jurisdictional waters as defined by section 404 of the Clean Water Act and/or section 10 of the Rivers and Harbors Act, you will need to obtain a permit from the U.S. Army Corps of Engineers. Impacts to wetland habitats require site specific mitigation and monitoring. For questions regarding wetlands, please contact Mark Littlefield of this office at (916) 414-6580.

Updates

Our database is constantly updated as species are proposed, listed and delisted. If you address proposed and candidate species in your planning, this should not be a problem. However, we recommend that you get an updated list every 90 days. That would be January 31, 2010.

Scientific Name	**Common Name**	**Native / Introduced (*Designates Invasive)**
Cercis occidentalis	redbud	Native
Chamomilla suaveolens	Pineapple weed	Introduced
Chenopodium album	Lamb's quarters	Introduced
Chlorogalum pomeridianum	Soap Root	Introduced
Chrysanthemum coronarium	Garland chrysanthemum	Introduced*
Cirsium vulgare	bull thistle	Introduced*
Cistus sp.	ornamental rock rose	Introduced
Claytonia perfoliata	Miner's lettuce	Native
Conium maculatum	poison hemlock	Introduced*
Convolvulus arvensis	field bindweed	Introduced*
Conyza canadensis	Horseweed	Native
Cortaderia jubata	Pampas grass	Introduced*
Cortaderia selloana	Uruguayan pampas grass	Introduced*
Cotula coronopidolia	Brass buttons	Introduced*
Crassula connata	Pygmy weed	Native
Crepis vesicaria	beaked hawksbeard	Introduced
Cupressus ssp.	Ornamental cypress	
Cynodon dactylon	bermuda grass	Introduced*
Cyperus eragrostis	tall flatsedge	Native
Dactylis glomerata	Orchard grass	Introduced*
Danthonia californica	California oatgrass	Native
Dichelostemma capitatum	Blue dicks	Native
Distichlis spicata	Salt grass	Native
Elymus glaucus	Blue wildrye	Native
Epilobium brachycarpum	Annual fireweed	Native
Epilobium ciliatum ssp. ciliatum	fringed willowherb	Native
Epilobium sp.	willowherb	Native
Eriodictyon californicum	Yerba Santa	Native
Eriogonum latifolium	coast buckwheat	Native
Erodium botrys	Filaree	Introduced*
Erodium cicutarium	Red stem filaree	Introduced*
Erodium moschatum	White stemmed filaree	Introduced*
Eschscholzia californica	California poppy	Native
Festuca arundinaceae	Tall Fescue	Introduced*
Festuca rubra	Red Fescue	Native
Filago gallica	narrowleaf cottonrose	Introduced
Foeniculum vulgare	fennel	Introduced*
Frankenia salina	Alkali Heath	Native
Fremontodendron californicum	Flannel bush	Native
Fumaria capreolata	White ramping fumitory	Native

APPENDIX D **Candlestick Point - Hunters Point Shipyard Phase II Project** **Plant Species Observed**		
Scientific Name	**Common Name**	**Native / Introduced (*Designates Invasive)**
Fumaria officinalis	Fumitory	Introduced*

DRAFT Parks, Open Space, and Habitat Concept Plan

Candlestick Point and Hunters Point Shipyard Phase II
San Francisco, CA

November 03, 2009

LENNAR URBAN

R | H | A | A

Cover image: View from The Neck area of the Candlestick Point State Recreation Area

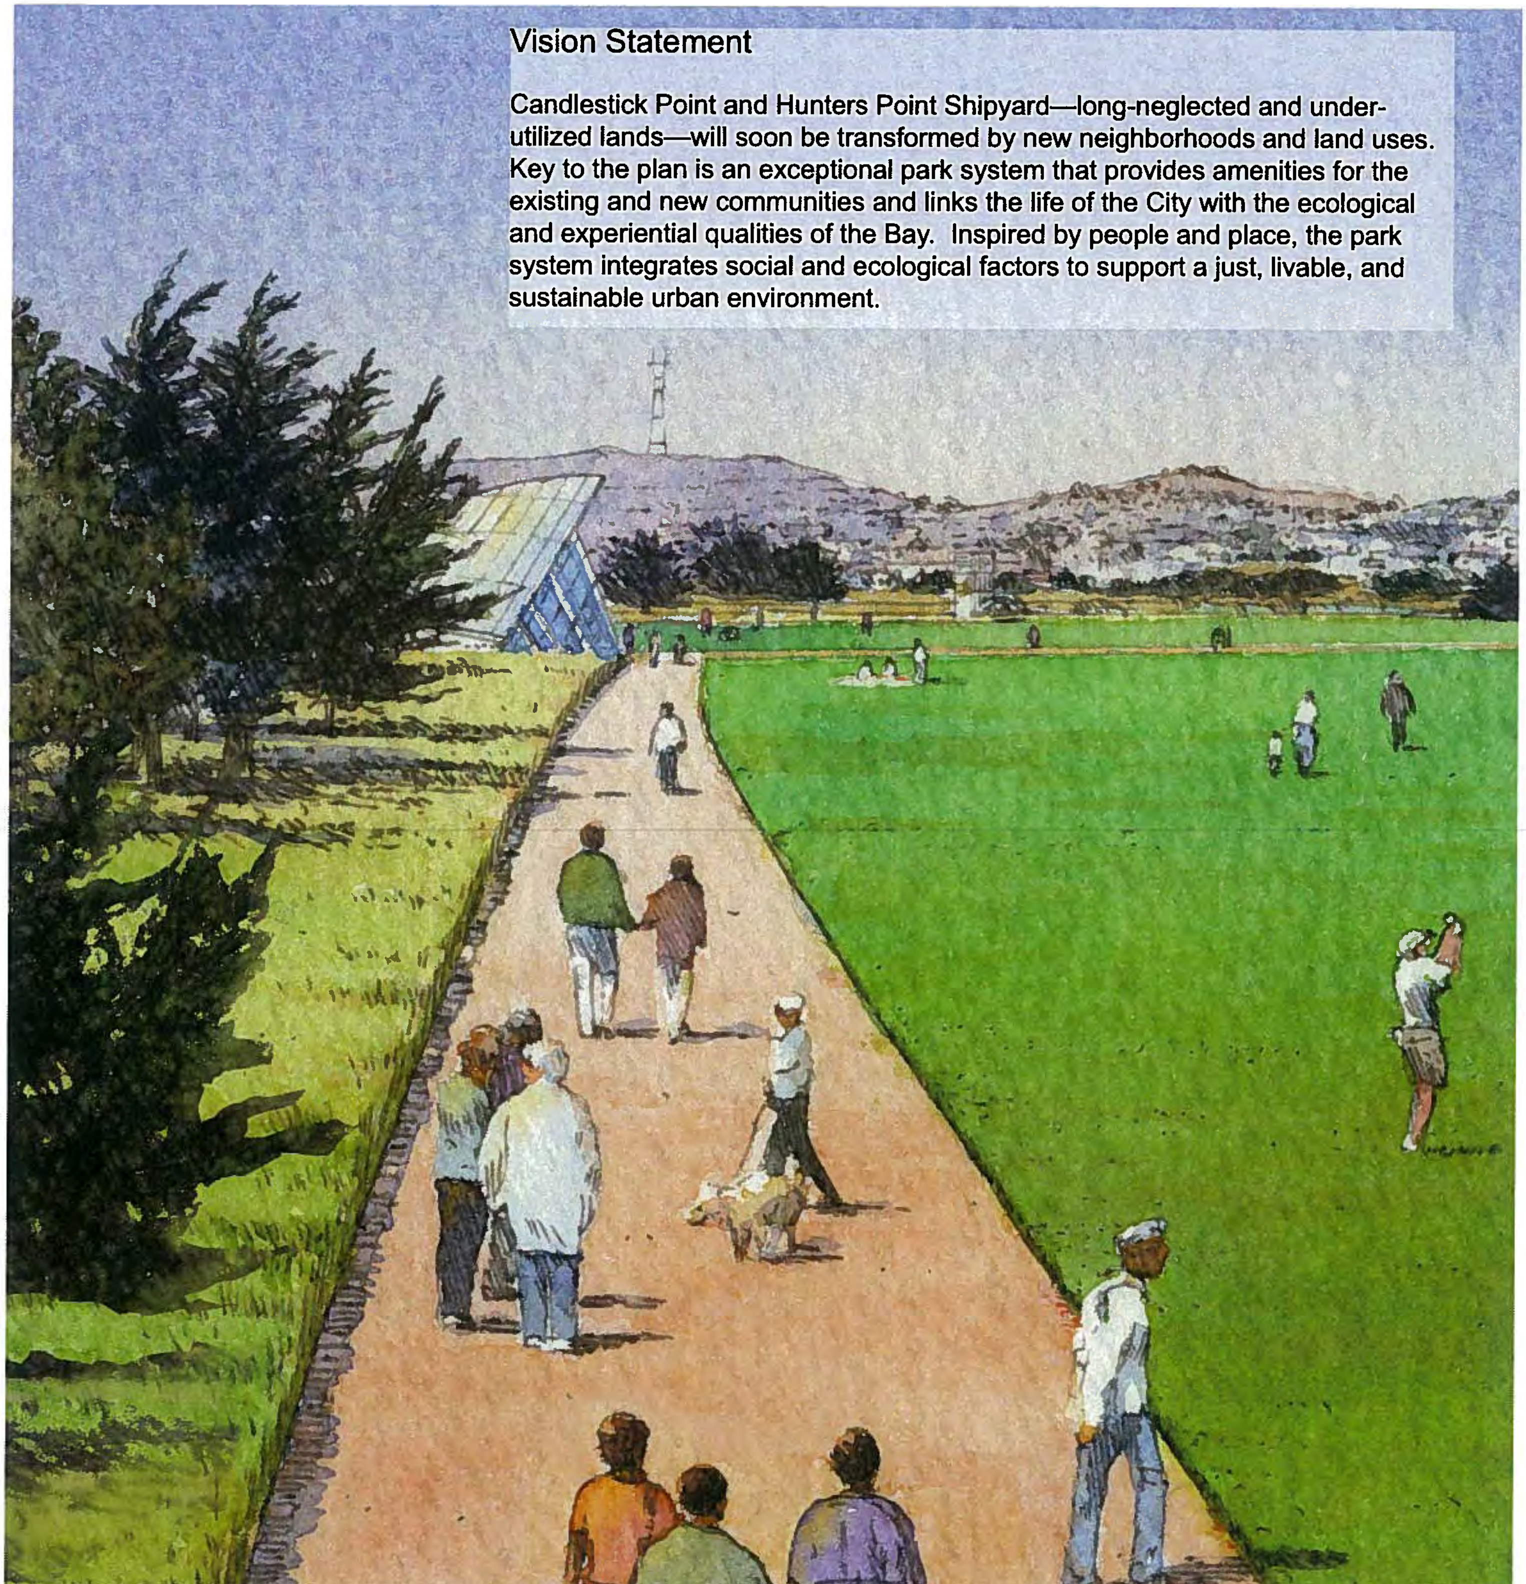
Contents

Introduction

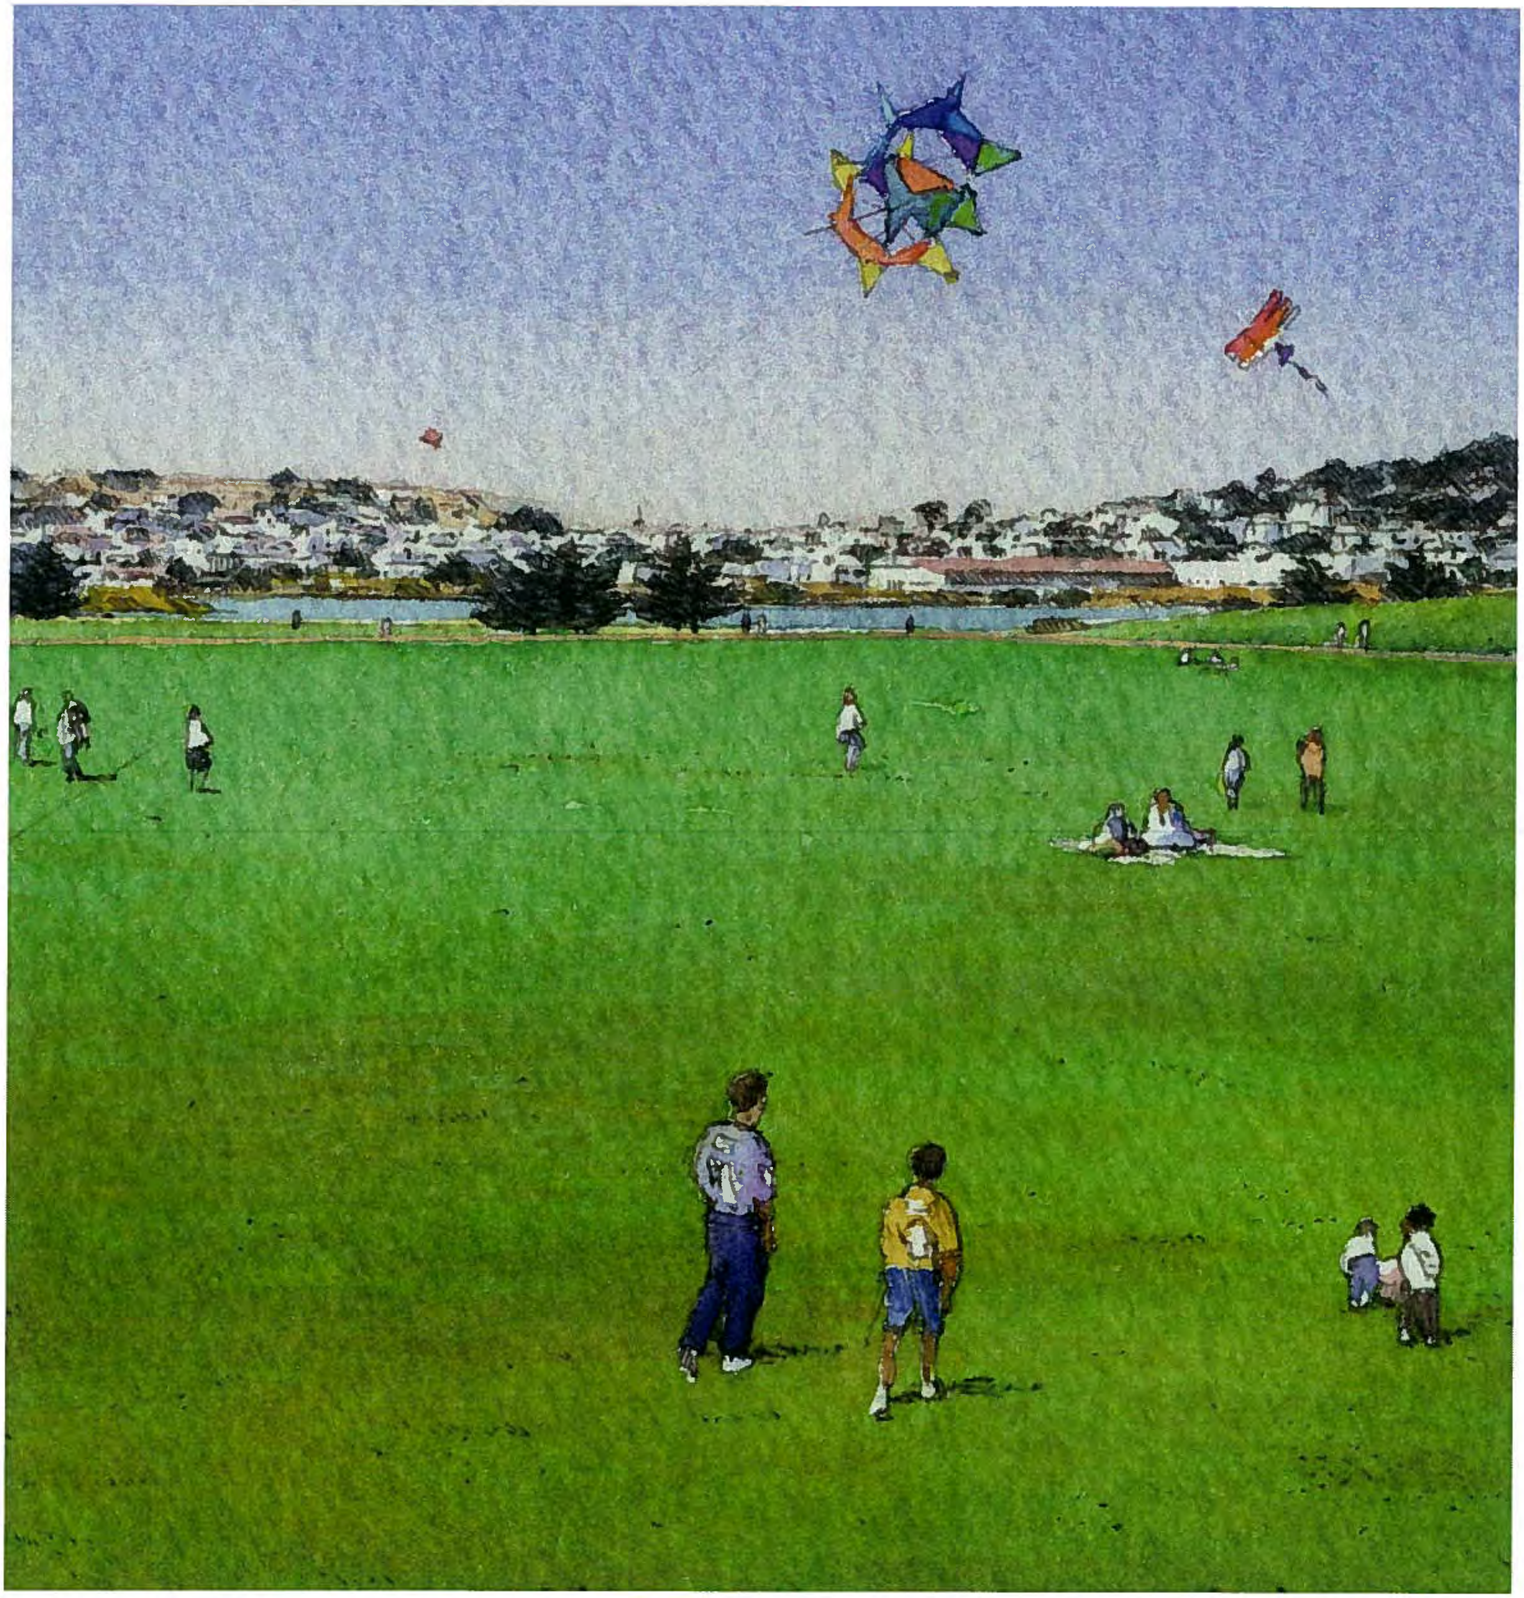
The Proposal

Vision Statement

Candlestick Point and Hunters Point Shipyard—long-neglected and under-utilized lands—will soon be transformed by new neighborhoods and land uses. Key to the plan is an exceptional park system that provides amenities for the existing and new communities and links the life of the City with the ecological and experiential qualities of the Bay. Inspired by people and place, the park system integrates social and ecological factors to support a just, livable, and sustainable urban environment.



View from the Great Meadow at the Last Rubble area of the Candlestick Point State Recreation Area



Plan Highlights

Extensive Parkland

Over 330 acres will be dedicated to new and improved parks, open space, and habitat areas. These areas cover over half the site's acreage and represent San Francisco's largest park development since Golden Gate Park.

Neighborhood Parks

New neighborhood parks will serve existing and future neighborhood residents with places for community gathering and a broad range outdoor recreation and leisure activities.

Sports Field Complex

A new Sport Field Complex will help to meet the City's unmet-demand for lit sports fields. The multi-use fields will accommodate youth, high-school, and adult intra-mural field sports and will be able to host regional tournaments.

Cultural Heritage Park

The Cultural Heritage Park will relate the history of Hunters Point to visitors from throughout the Bay Area and beyond. Historic buildings will be retained and may be used as museum spaces.

Trails Network

The San Francisco Bay Trail / San Francisco Blue Greenway will provide a continuous recreational multi-use trail along the Candlestick and Hunters Point waterfront filling a gap in the regional network planned to eventually encircle the entire Bay. Similarly, kayak and windsurf launch points will enhance access to the regionally-planned Bay Area Water Trail. For commuters and neighborhood cyclists, a secondary network of off-street multi-use trails will link parks and neighborhoods with the on-street bicycle network.

Candlestick Point State Recreation Area

Major renovation of the Candlestick Point State Recreation Area will transform it into the "Crissy Field" of southeast San Francisco with restored habitat areas and public access to the Bay.

Habitat Enhancements

New parks, open space, and habitat restoration areas will support the biodiversity and ecology of the San Francisco Bay shoreline. The plan features new native grasslands, wetlands, extensive planting of native trees and shrubs, and a net removal of bay fill.

Green Infrastructure and Urban Sustainability

Parks and open space will be designed as "green infrastructure" integrating urban design and infrastructure with natural systems. Elements of this system include, ecological stormwater treatment systems, vegetated parking, and streetside and median boulevard parks.

Parks, Open Space, and Habitat Plan

Introduction

Background

Purpose of the Document

The purpose of this draft document is to describe the intent of the parks and open space system of the Candlestick and Hunters Point Shipyard Phase II development project. Building on the *Candlestick Point/Hunters Point Shipyard Phase II Urban Design Plan*, and the *Draft Sustainability Plan*, the *Draft Parks, Open Space, and Habitat Master Plan* highlights aesthetic, social, recreational, and ecological opportunities and p rovides a framework for public parks, open spaces, and natural areas. A final version of this plan will be included as part of the Disposition and Development Agreement between the City of San Francisco, San Francisco Redevelopment Agency and Lennar.

Project Summary

The proposed Candlestick Point and Hunters Point Shipyard development project (CP HPS) is a 702-acre master-planned urban infill project proposed in the southeastern waterfront of San Francisco. The proposed development envisions two neighborhoods (Candlestick Point and Hunters Point Phase II) including housing, commercial, retail and office uses along with over 330 acres of parks and open space. Adjoining the existing Bayview and Hunters Point neighborhoods and bounded by San Francisco Bay, the plan emphasizes an extensive parks and open space system, including waterfront parks and trails along approximately 9 miles of shoreline.

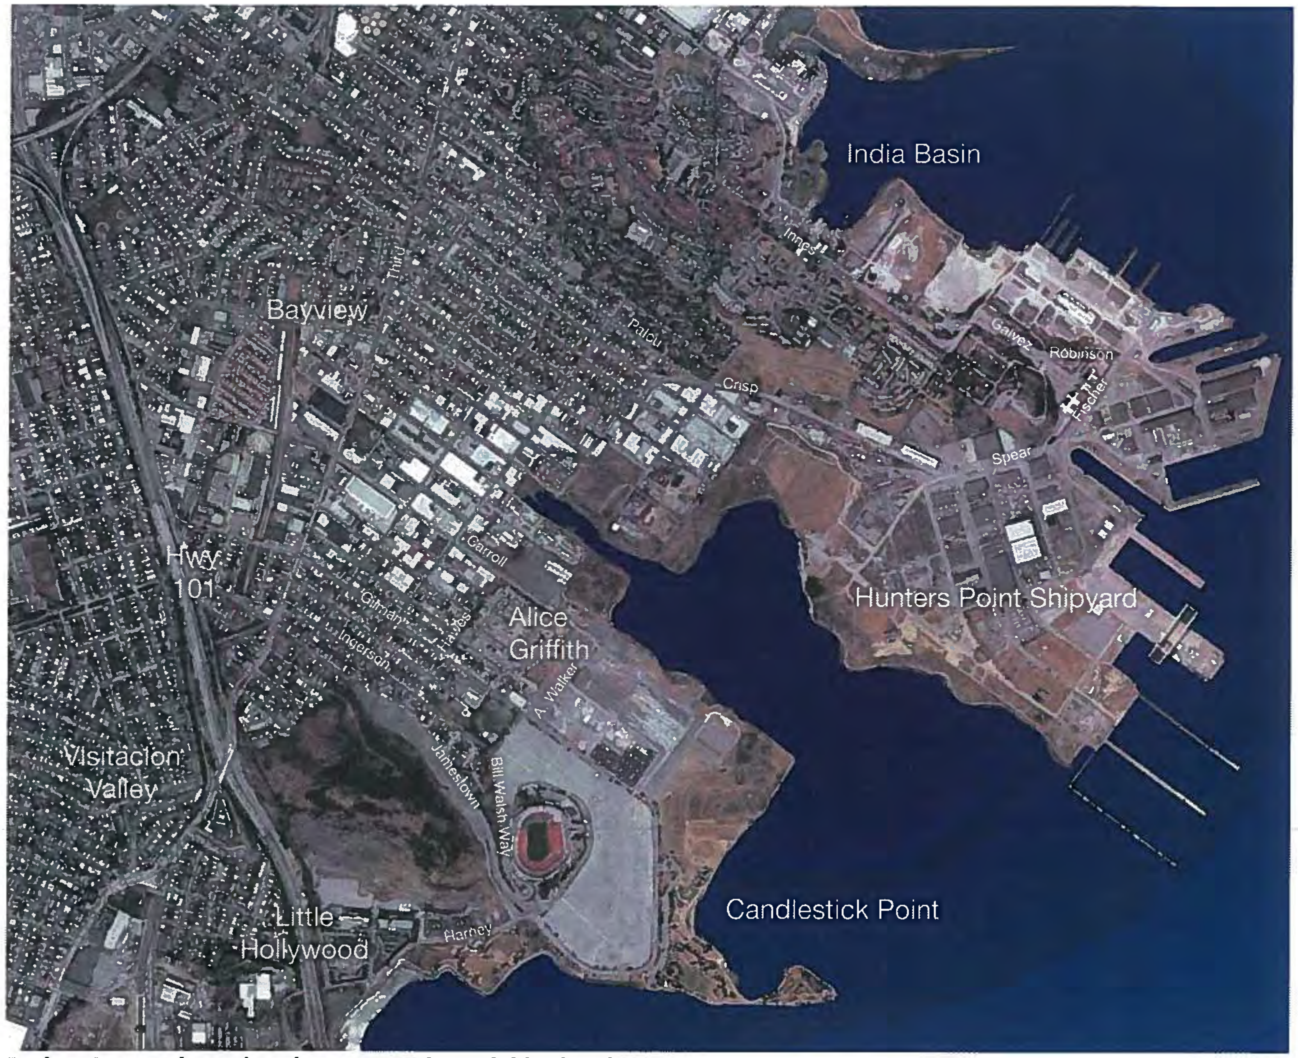
Setting

The Candlestick Point and Hunters Point Shipyard project site is located at the southeastern corner of the City of San Francisco, bounded by the San Francisco Bay to the east, India Basin to the north, Bayview Hill Park to the south, and the Hunters Point/Bayview community to the west. The site is the current location of Candlestick Park (the home of the San Francisco 49ers), Candlestick Park State Recreation Area and the former Hunters Point Naval Shipyards. The site is located in close proximity to Highway 101 (Bayshore Freeway) and is approximately 8 miles from downtown San Francisco.

Four major site adjacencies inform the future development of the Shipyard & Candlestick Point site. To the west, the Bayview Hunters Point neighborhood is a predominantly residential and industrial area and home to a diverse and transitioning population. The neighborhood grew dramatically during the second world war, as predominantly African American workers came to the shipyard for Navy-related jobs. The area has historically been under serviced.

To the east, the San Francisco Bay creates a well-defined natural edge to the project area.

Finally, both the Bayview Hill, and Hunters Point Hill create unique geographical limits to development. Bayview Hill is currently a city park area, with trails that wind to the top, overlooking the entire site. Hunters Point Hill is currently being developed as both the Hilltop and Hillside Phase I developments of Hunters



Project Area and Bayview / Hunters Point Neighborhood Area

Point Shipyard. The southeastern portion of the Hunters Point Hill is currently being developed as a park, which will link into the proposed Shipyard Phase II development.

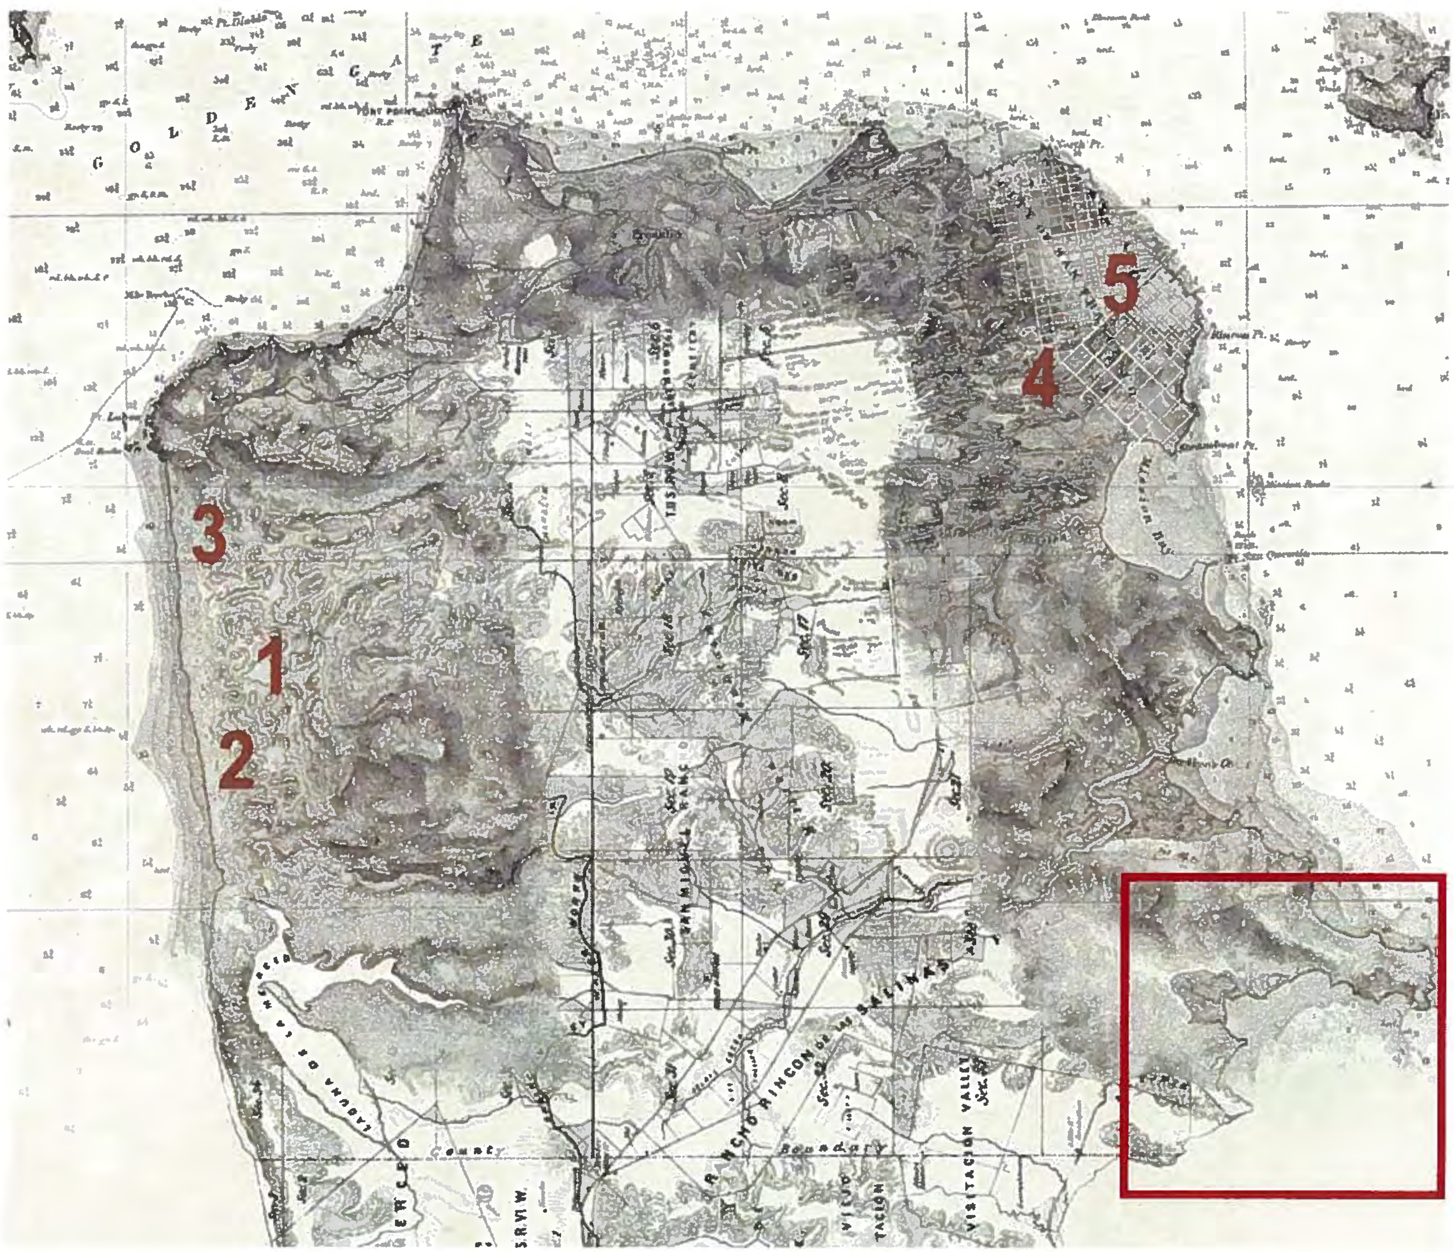
Planning Background and Development Program

The City's plan to revitalize the Hunters Point Shipyard and Candlestick Point is one of the most important development projects in the City's modern history because of both its scale and the scope of public benefits that it will deliver to a under-served community. For more than 30 years, both of these largely abandoned sites have done little to benefit the Bayview Hunters Point community or the City.

After more than a decade of planning efforts relating to these sites, in May 2007, the Mayor, the Board of Supervisors, the San Francisco Redevelopment

Agency Commission, and the two community-based advisory organizations with jurisdiction over these redevelopment project areas, the Hunters Point Shipyard Citizens Advisory Committee and the Bayview-Hunters Point Redevelopment Project Area Committee, endorsed a "Conceptual Framework" for the integrated redevelopment of Candlestick Point and the Hunters Point Shipyard. In June 2008, San Francisco voters overwhelmingly approved Proposition G, the Bayview Jobs, Parks and Housing Initiative which set forth guiding principles and an integrated development plan for the two sites, consistent with the Board and Mayor endorsed Conceptual Framework. In accordance with the Initiative, the proposed development program encompasses the following elements:

- Housing: Approximately 10,500 units throughout the site, including a mix of rental and for-sale homes, both below market-rate (about 32%) and market-rate. The affordable units will be built largely by the City's Redevelopment Agency to serve very-low to moderate-income households.
- Rebuild of the Alice Griffith Public Housing Development: This project will provide one-for-one replacement of existing units and will serve the same income levels as the current residents. This will ensure that eligible Alice Griffith occupants have the opportunity to move into new units.
- "Green" office space: Approximately 2.5 million sq. ft. of space for technology research is proposed for the Shipyard. The City intends to create a "green technology" cluster on this site. In addition, 150,000 sq. ft. of "green" office or other commercial space will be built on Candlestick Point.
- Regionally-focused retail: Approximately 635,000 sq. ft. on Candlestick Point.
- Neighborhood-focused retail: Approximately 125,000 sq. ft. on the Shipyard, including a retail town center, as well as an additional 125,000 sq. ft. on Candlestick Point.
- Hotel: 150,000 sq. ft. (220 rooms) on Candlestick Point.
- Artist studio space: Permanent new and renovated space for Shipyard artists.
- Parks: More than 330 acres of new and restored parks, open space and wildlife habitat.
- Marina: 300 slips on the Shipyard.
- Performance space: 10,000-seat venue on Candlestick Point.
- New stadium: Space for a new, 69,000-seat, world-class home for the 49ers and related "dual-use" active recreation fields and green parking areas on the Shipyard.



San Francisco Historic Map, 1860
Source: Creek & Watershed Map of San Francisco, SFPUC

Existing Resources & Setting

The places we know today as Candlestick Point and Hunters Point Shipyard have been shaped by many factors -- both natural and cultural. These existing resources inform the development plan which seizes the extraordinary opportunity for new and improved parks, open space, and habitat restoration.

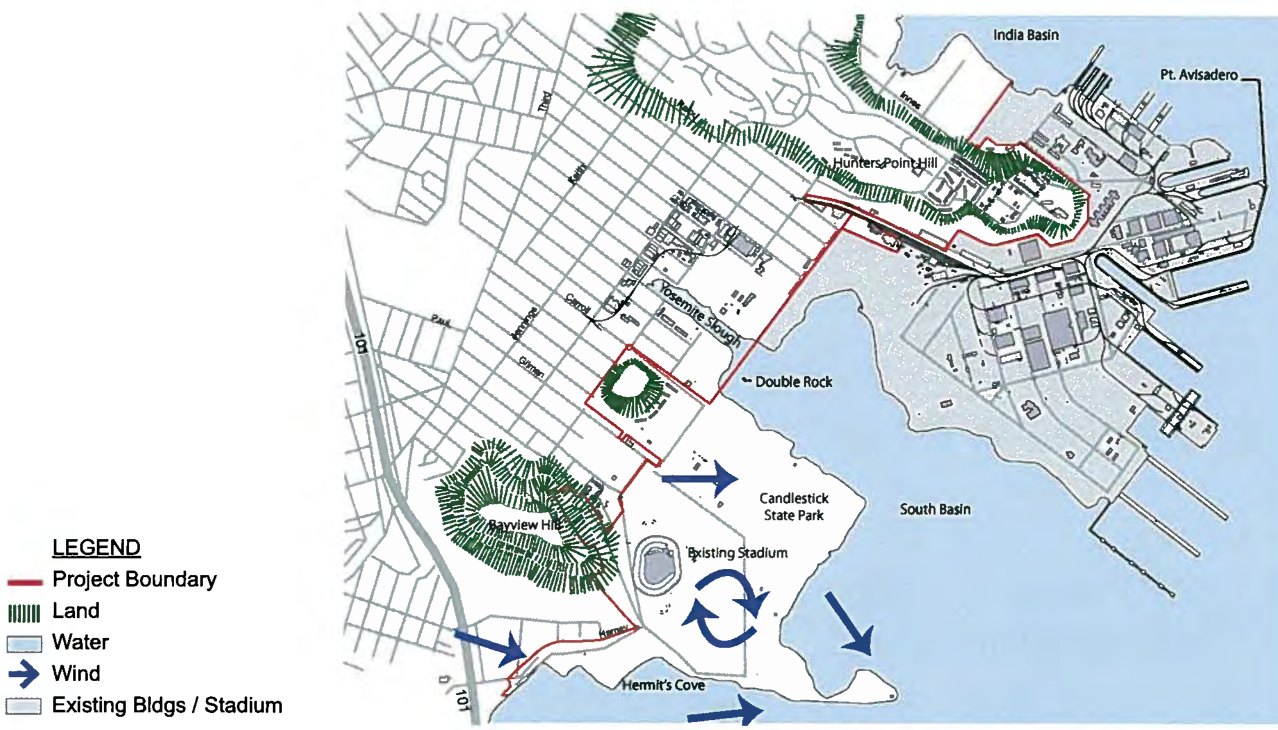
Natural & Cultural Resources

Land, Water and Climate

Geology & Groundwater Basins, circa 1850
Source: Creek & Watershed Map of San Francisco, SFPUC

Like many San Francisco neighborhoods, Candlestick Point and Hunters Point Shipyard are strongly defined by dramatic hills and the water's edge. Candlestick Point and Hunters Point are each peninsulas jutting out into the San Francisco Bay. Much of the area is bay fill surrounding the natural promontories of Bayview Hill and Hunters Point Hill. The fill areas are relatively flat and close to sea level. Bayview Hill, at over 400 above sea level is the most significant topographical feature in the southeast portion of the city. The south end of Hunters Point Hill rises to approximately 120 feet above sea level.

Between these peninsulas lies an open water area known as the South Basin. Yosemite Slough extends west of the South Basin and is the largest remnant of the extensive wetlands that existed along San Francisco's eastern shore prior to filling and urbanization. A small rock island called Double Rock sits at the southwest end of the South Basin near the mouth of Yosemite Slough.



Natural Features- land, water, & wind

The flatter lands of the site were largely constructed by filling of the Bay. The shoreline is major defining element of the site and is currently a mix of natural areas, most of which are part of the Candlestick Point State Recreation Area and industrial waterfront areas that are a remnant of the previous shipbuilding and naval activities of Hunters Point.

The form of the landscape contributes to the specific micro-climates – the south end of Candlestick Point is renowned for its winds which are funneled through gaps in the hills to the west. Hunters Point is more protected and is one of the warmer parts of the City.

Vegetation and Wildlife

Much of Candlestick Point and Hunters Point Shipyard are urbanized, and the areas with most natural vegetation and wildlife use are at the Candlestick Point State Recreation Area and the South Basin.

Candlestick Point State Recreation Area

Trees at the Candlestick Point State Recreation Area, mostly Monterey pine and Monterey cypress, provide nesting and foraging habitat for birds. The majority of birds nesting in these trees are common, urban-adapted species. During spring and fall, small numbers of migrant songbirds have been recorded foraging in these trees. California ground squirrels are common in the ruderal (human-disturbed) habitats at Candlestick Point, and the surrounding waters provide foraging habitat for grebes, ducks, gulls, terns, double-crested cormorants, and California brown pelicans.

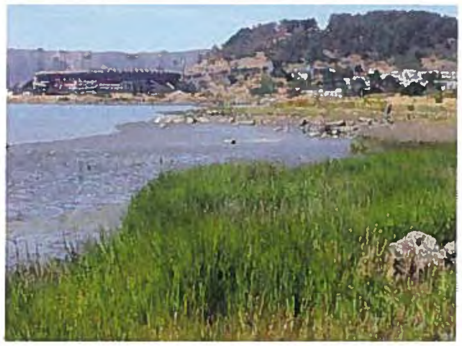
- Landscaped/Ornamental
- Non-Native Annual Grassland
- Urban
- Mudflats / Open Water
- Eelgrass
- NAP Not-a-Part

Study Area Habitats Map



South Basin

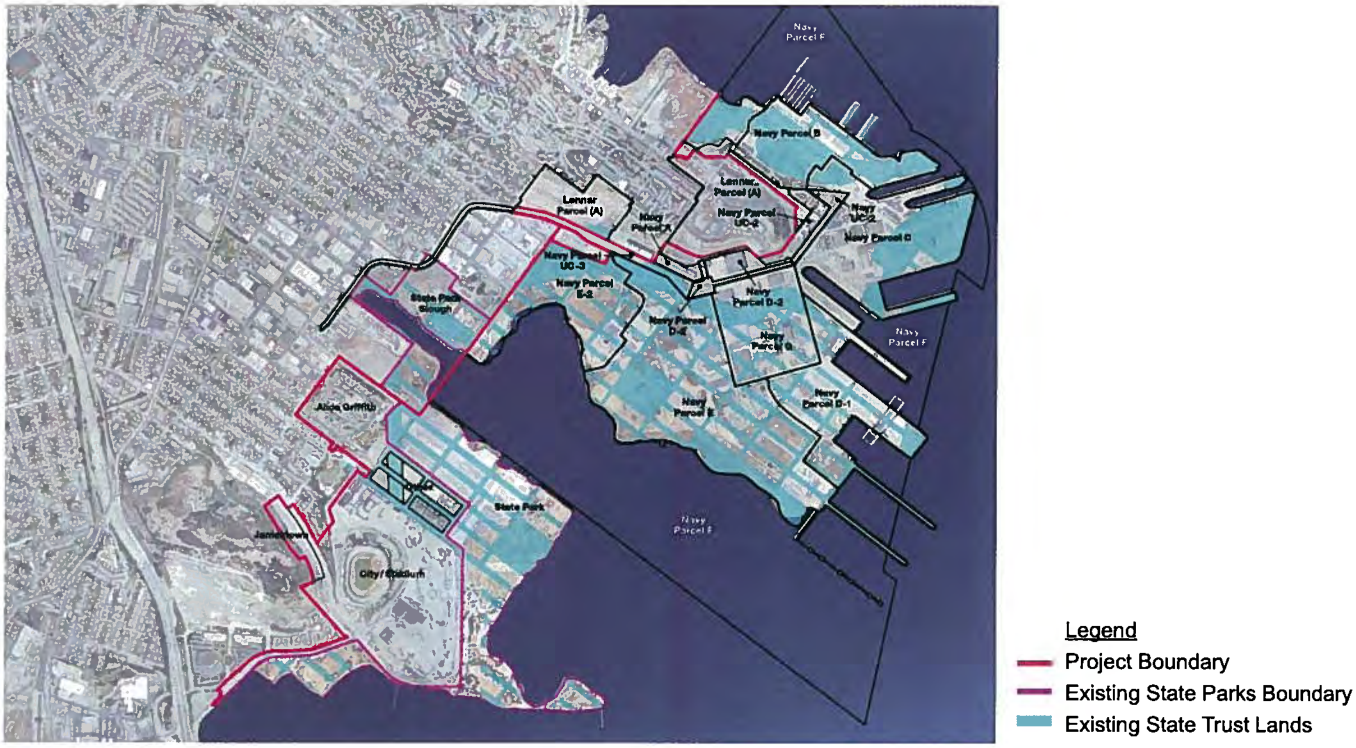
The South Basin provides aquatic foraging and loafing habitat for a number of species of waterbirds. Ducks, such as surf scoters, greater scaup, and lesser scaup, dive for shellfish and other benthic (bay-bottom) organisms, while western grebes, Clark's grebes, double-crested cormorants, California brown pelicans, and Caspian terns hunt for fish in these waters. Great blue herons and snowy egrets forage in the shallows. Intertidal mudflats are limited in extent, and occur primarily near the mouth of Yosemite Slough. These mudflats provide foraging habitat for many of the same shorebird species occurring in Yosemite Slough.

The small island known as "Double Rock" in the northwestern part of South Basin supports 10-15 pairs of nesting western gulls. Black oystercatchers forage, and may nest, on this island, and they feed on small rocky islands elsewhere along the edge of South Basin as well. Due to the presence of riprap and other debris along most of the shore of South Basin, beaches and tidal marsh are limited to small remnants. A few areas of tidal marsh, the broadest being along the Hunters Point shoreline north of the mouth of Yosemite Slough, are dominated by cordgrass, pickleweed, and marsh gumplant. These marsh remnants provide habitat for terrestrial garter snakes and foraging habitat for shorebirds and wading birds, but they are too small and isolated to support marsh-nesting species such as California clapper rails, salt marsh harvest mice, San Francisco common yellowthroats, and Alameda song sparrows.

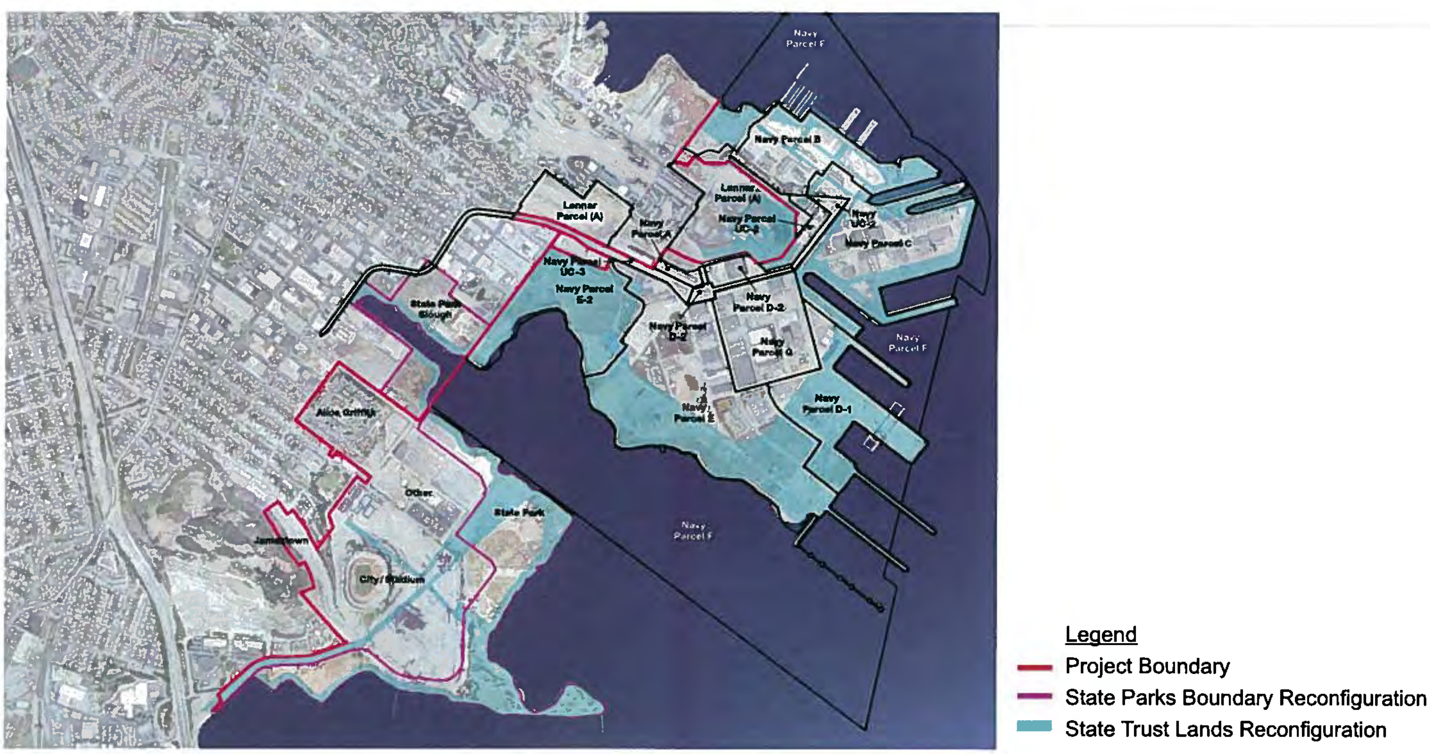
History and Culture

The Candlestick Point and Hunters Point Shipyard area has a rich history and a diversity of people have lived and worked here at the Bay's edge. The earliest known human presence in the Bay Area began nearly 12,000 years ago, and in the San Francisco area, nearly 6,000 years ago. The most common physical evidence of early indigenous culture is found in shellmounds, sites typically located at the Bay's edge near the mouth of streams where a variety of plant and animal resources were abundant. When the first Europeans arrived in the Bay Area, the project area was within the traditional territory of the indigenous Ohlone people.

When European settlement at Candlestick and Hunters Point began in the late 1840s/early 1950s the areas were primarily used as pastureland. The 1849 gold rush brought rapid growth to the City, and the City's maritime industry and boat building expanded south to India Basin. Italian and Chinese farmers moved into the Hunters Point area to farm vegetables to sell in the City center. The Chinese also established fish and shrimp farms along Hunters Point. By 1900, Hunters Point became established as a center for maritime activities and included shipyards and dry docks. The Navy's use of these facilities increased and it purchased the Bethlehem Steel dry docks in 1939. The Navy Shipyard expanded dramatically during World War II, leveling parts of Hunters Point Hill and filling the Bay to create new land between Hunters Point and Yosemite Creek. The existing African American community grew as many African Americans moved from the South to work at the shipyards. After World War II, the Shipyard became a center for the Navy's nuclear research. After it closed in 1974, the Naval Shipyard operated as a private ship-repair operation until 1986 when the Navy began current ongoing remediation efforts.



Existing Ownership Map



Existing Ownership Map with State Parks & State Trust Reconfiguration

Candlestick Point and Hunters Point Shipyard Today

Current Ownership and Land Uses

Hunters Point Shipyard (HPS)

The Hunters Point Shipyard Phase II area is currently under the jurisdiction of the US Navy, which is completing a clean-up of the site. Once complete, the Navy will convey the land to the City for development. For planning purposes, the Navy property has been sub-divided into smaller parcels (A-F), based on the time-line of the Navy clean up.

HPS includes 421 acres of dry land that contains several structures associated with World War II era uses: ship repair, storage and trucking, light manufacturing, construction, laboratories, scrap metal recycling, administrative and other former Navy uses. Several former Navy buildings are currently leased and occupied as studios by approximately 250 tenant artists. HPS Phase II also includes dry docks, piers and wharves, as well as repair berths.

Bordered by San Francisco Bay to the south, east, and north, land uses at India Basin to the west are varied. Light industry and residences adjoin Innes Avenue. To the southwest of the HPS Phase II area are neighborhoods with multi- and single-family housing. Land uses in the surrounding area—specifically the industrial uses along Crisp Road— historically provided a buffer between HPS activities and adjacent residential uses.

Candlestick Point

The 281-acres Candlestick Point Area is generally bounded by Hawes Street to the northwest, Candlestick Cove and the San Francisco Bay to the south, Jamestown Avenue to the southwest, and South Basin to the east. The site includes residences, public open space, and the Candlestick Park football stadium.

The area is bordered by two existing communities—Bayview to the north and Executive Park to the west. The Bayview community was developed during the 1950s and 1960s and is characterized by two and three-story single family and duplex dwellings west of Gilman and light industrial buildings generally east of Gilman. Gilman Park and Bayview Elementary School are located in the blocks between Gilman and Ingerson, north of Giants Drive. The Executive Park development began in 2004 and includes several office buildings and a four-story condominium project near Highway 101.

City Ownership

Several Candlestick Point parcels are currently owned and operated by departments of the City of San Francisco. The San Francisco Housing Authority owns and manages 256 units of public housing at the Alice Griffith site. The City's Department of Recreation and Parks manages the Candlestick Park Stadium. The 70,000-seat stadium and related surface parking lots are the home of the San Francisco 49ers professional football team. The facility is also used occasionally throughout the year for concerts and other performances.

Other City lands include the streets and right of ways managed by the Department of Public Works.

State Trust

Certain land and water areas within the project are "State Trust Lands." Early in its history, the California Legislature transferred tide and submerged lands in trust to cities and counties, which were then required to develop harbors to further state and national commerce. The State Lands Commission ensures that the areas held in trust by the City of San Francisco are available for the benefit of the people of California for uses that promote navigation, fisheries, waterborne commerce, natural resource protection, and water-related uses that attract the public to use and enjoy the waterfront. Recent state legislation, Senate Bill 792, provides for the reconfiguration of State Trust lands in the area.

State Parks

The 154-acre Candlestick Point State Recreation Area (CPSRA) is a part of the California State Parks System. The CPSRA contains approximately 72 developed acres along the shoreline with a network of paved and dirt paths, bathroom structures, picnic facilities, two fishing piers, paved lookout points, and a boat launch facility. The remaining acres have not been developed and are, in part, used for overflow stadium parking. Recent legislation, Senate Bill 792, authorized a reconfiguration of the CPSRA in exchange for project-provided park improvements and operating funding.

Private

Privately held lands include the Jamestown parcel and lands north of the stadium. The private parcels north of the stadium accommodate a 165-space RV site and an apartment block at Gilman Avenue and Arelious Walker Drive.

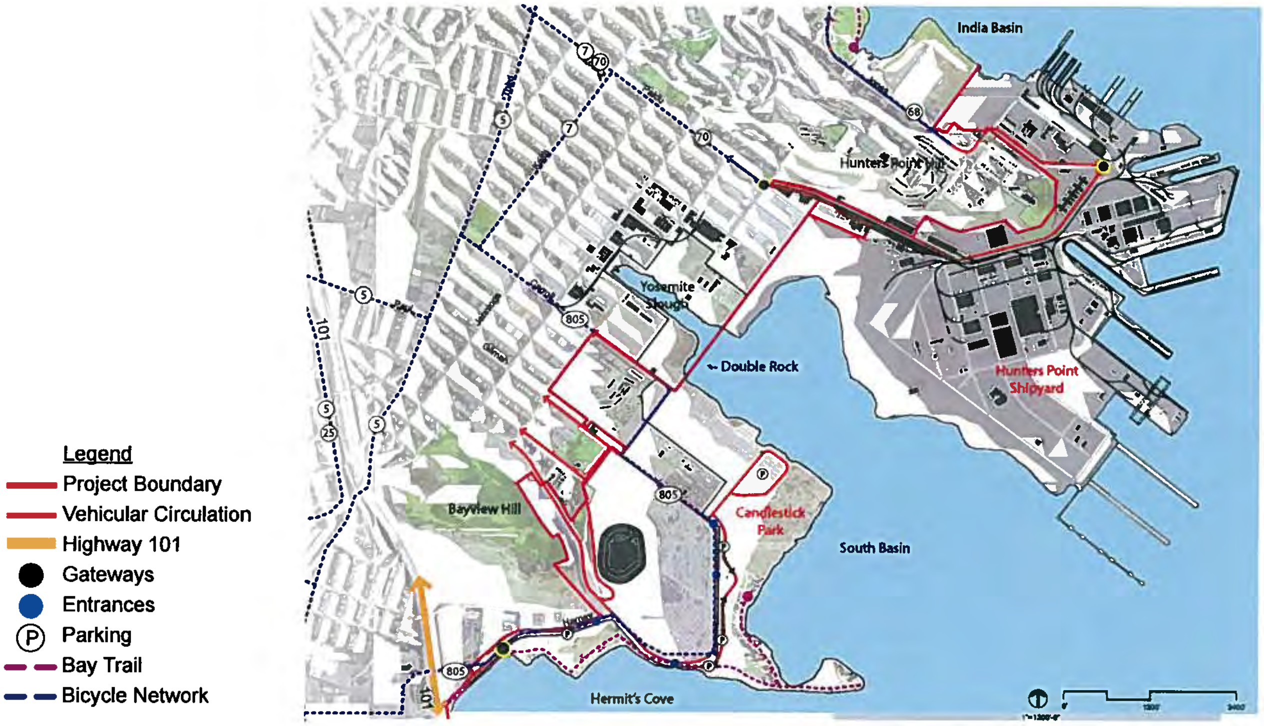
Access

Hunters Point Shipyard

Historically, access to the site was controlled for safety and security reasons, and most of the site remains fenced off, prohibiting public access from surrounding neighborhoods. Primary access to the southern portion of the site is provided by Crisp Road, Spear Avenue, and Fischer Avenue. Innes Avenue, Galvez Avenue, and Robinson Street provide access to the northern portion of the site. The HPS Phase II site lacks pedestrian amenities, such as sidewalks.

Candlestick Point

Access to most of Candlestick Point is limited to an arterial loop road (Gilman Avenue/Jamestown Avenue/Bill Walsh Way/Ingerson Avenue) that encircles the Candlestick Park stadium and parking lot. Carroll Avenue and Fitch Street provide access to the Alice Griffith housing complex. However, most non-arterial streets from the residential neighborhoods to the west of Candlestick Point reach a dead end before entering the site. Streets within the Alice Griffith housing complex are internally oriented, and for the most part, do not connect to surrounding streets. In addition, Bayview Hill creates a physical barrier to



Existing Access and Circulation

the south, limiting access from this direction, except at Harney Way. The lack of street connectivity, combined with the site's large, barren parcels, lack of sidewalks, and low level of on-site activity, make Candlestick Point relatively unwelcoming to pedestrian traffic.

Parks and Recreation

In spite of its striking geographic location, much of the park acreage that exists at Candlestick Point is underutilized, un-completed, or in need of repair. Citywide, the ability to construct new parkland has been constrained by San Francisco's population density and small land area. Active recreation fields are in particularly high demand throughout the City and the City has identified a need for new fields. Give its size, the redevelopment of the Candlestick Point and Hunters Point Shipyard offers an extraordinary opportunity to contribute to new and revitalized parks that will benefit existing neighborhood residents, new residents, and larger community of San Francisco and the region.

Existing Parks

Existing Parks

There are two existing parks within the project site – the Candlestick Point State Recreation Area (CPSRA), and the Candlestick Park Stadium. Existing users of these parks include the residents and employees in the Bayview Hunters Point neighborhood, as well as visitors from other parts of the City and the Bay Area. Recreational visitors from outside the neighborhood include 49ers football fans and other stadium event users, and windsurfers who use the CPRSA shoreline for Bay access.

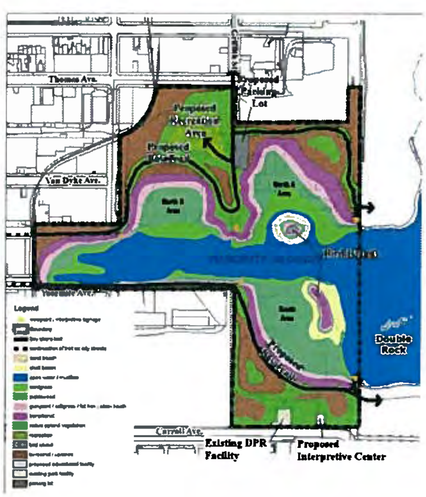
CPSRA is a former landfill on the shoreline of Candlestick Point that was purchased by the State in 1977 for development as a State recreation area. CPSRA includes picnic areas, a fitness course for seniors, a bike path, shoreline access to the Bay for water-dependent recreation, and recreational trails. The CPSRA provides neighborhood residents with access to open space along the Bay, but the recreational and aesthetic potential of this park is constrained by the industrial character of adjacent land uses and the availability of state resources. Much of the land at the CPSRA is unimproved. For example, land to the north and east of the Candlestick Park stadium are currently being used for stadium parking. Other portions of the site contain construction rubble and debris. As a result, existing CPSRA facilities are not fully utilized to their full potential as places for recreation and habitat. The community has expressed strong support for the restoration of Yosemite Slough, and design for this restoration initiative is underway. While Yosemite Slough is part of the CPSRA, it is not within the area to be improved by this project.

Hill Point Park rendering

Candlestick Park is the site of Candlestick Park stadium owned by the City Recreation and Parks Department and leased by the San Francisco 49ers National Football League team. The existing stadium, built in 1960, seats 70,000 and is used for football games and other non-football entertainment events. However, most of the year the stadium and it's parking lots are vacant and unused.

Other Parks Improvements and Initiatives

In addition to the CP-HPS Phase II improvements, a number of other projects are underway in the larger Bayview Hunters Point neighborhood and the City's southeast waterfront.



Yosemite Slough Restoration Project Plan

Hunters Point Shipyard Parcel 'A' is the first phase of improvements that is underway at the Shipyard. This project includes two sites on Hunters Point Hill, "Hilltop" and "Hillside," that will be linked with the overall CP-HPS parks system. Ramped pathways will connect Hilltop's Innes Court Park and Hillpoint Park with the HPS Phase II Boulevard Parks and Waterfront Promenade with connections to the greater parks system. At Hillside, ramped paths will descend from the neighborhood's Central Park and pocket parks, connecting with Crisp Road near the Phase II Grasslands Ecology Park.

With significant community involvement and support, the State Parks Foundations and the State Parks Department plan to restore the 34-acre Yosemite Slough area of the State Park, creating the largest contiguous wetland area in San Francisco. The project will restore wildlife habitat, improve water quality, and prevent erosion along the shoreline of the mostly urbanized bay shoreline of San Francisco. The slough restoration project also enhance shoreline access from the Bayview community, providing opportunities for nature education and viewing of wildlife habitat.

The San Francisco Bay Trail is a regional multi-use recreational trail that, when complete, will encircle San Francisco and San Pablo Bays with a continuous 400-mile network of bicycling and hiking trails. Existing segments of the San Francisco Bay Trail run from Heron's Head Park around the India Basin Shoreline, with a gap in the middle of the segment to near the north side of Hunters Point Shipyard. In addition, a segment of the trail runs from southeastern end of Candlestick Park south to Highway 101. On the southeast waterfront of San Francisco, the Neighborhood Parks Council (NPC) is promoting a "Blue Greenways" program to coordinate development of the Bay Trail and other neighborhood linkages. The Blue Greenway project envisions a trail corridor that provides an easily accessible waterfront trail for recreation, bay access, and enjoyment of public art.

Planning Issues and Concerns

There are a number of key issues related to the parks planning that have been identified by the project team and through input from public meetings, community organizations, individuals, and coordination with public agencies.

Habitat and Ecology

Although much of the site is occupied by urban land uses, and more natural areas are dominated primarily by non-native vegetation, the site is located in an ecologically important location along the San Francisco Bay shoreline, and it currently supports a number of wildlife species. The design of parks and open space needs to protect the natural qualities of the site while enhancing conditions for native plants and animals. Park and open space design can help manage pollutants in stormwater runoff, minimize the use of potable water for irrigation, restore native-dominated plant communities, and enhance habitat conditions for wildlife. Key issues include management of invasive plants, incorporation of native vegetation in restoration and landscaping, creation of a diverse array of habitats, and protection of plants, animals, and ecological processes during construction, maintenance, and increased human use of the site.

History and Culture

History

There are many stories to be told about the history of the area. These include Native American life at the Bay's edge, settlement of the area after the arrival of Europeans, and the Chinese fishing and shrimp harvesting, and maritime development. The most visible history today is that of the maritime development and the Naval Shipyard, evidenced in historic buildings, drydocks, cranes, and other structures. The parks and open space plan should be coordinated with the Navy's closure so that the sense of this history is not erased. The project will make a special effort to preserve and rehabilitate historic structures and to incorporate interpretive elements and historic markers that highlight significant, structures, events and public figures. In particular features and materials such as light standards, rail spurs, crane tracks, dry docks, bollards, and cleats may be retained and incorporated or re-used in the design of parks and open spaces.

Neighborhood Identity

Also important to the neighborhood is the expression of its African American cultural heritage. As park designs are developed there should be opportunities for the community to engage with designers to incorporate these themes into the park designs. The Northside Park at Hunters Point Shipyard will be developed with space for the International African Market Place and the park design will need to be coordinated with the operational needs of the market.

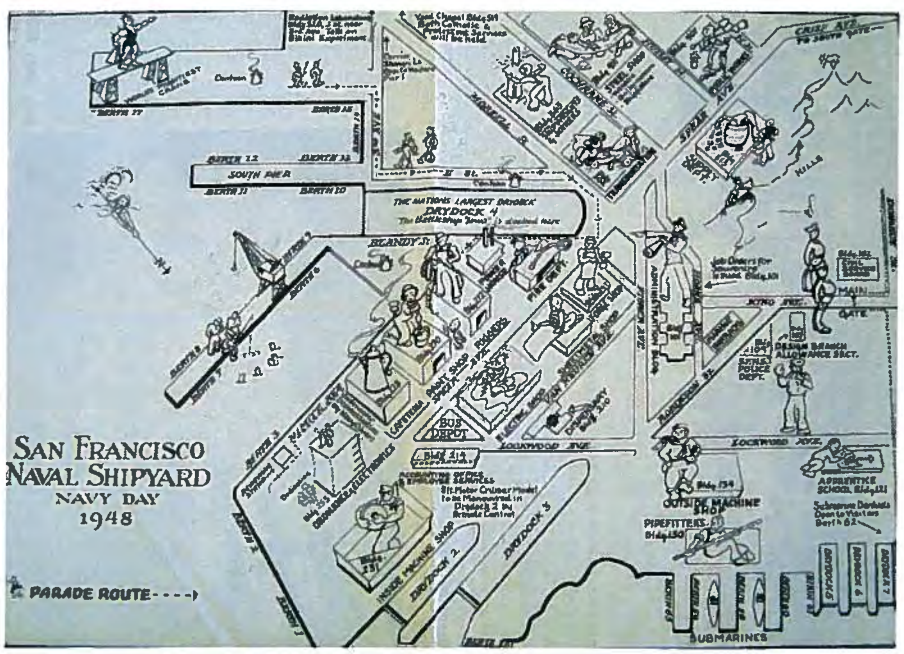
The Arts

With an outstanding landscape setting, a rich and layered history, and the thirty years presence of the Shipyard artist community, the parks and open spaces of Candlestick Point and Hunters Point Shipyard offer significant opportunities for public art. As the parks and open space plans develop, programs and opportunities for artists will be incorporated into the design of the parks. The City's Blue-Greenway Plan in particular has identified public art as a key component of the Bay Trail systems along the City's southeastern waterfront. The parks and open space design will also include spaces for outdoor performing arts such as music, dance, and theatre.

Programming and Partnerships

The development of parks, open space, and habitat areas will be enlivened by the participation of a variety of groups and organizations which may use these spaces. As park designs develop, there are opportunities for coordination and partnerships with organizations and projects such as the following:

- Community / neighborhood groups
- Outdoor field sports groups and leagues
- Marina operators
- Small boat, kayak and windsurf organizations
- Community ecology and restoration groups



- Bicyclists and skaters (rental, bike-sharing programs)
- Museums / historical societies
- Artists
- International African Marketplace
- Café / Restaurant / Cart vendors
- Community garden organizations
- Dog groups
- Local business
- Outdoor performance and event programmers

In addition to the types of community organizations listed above, the park design will also include coordination with a variety of public agencies, including the Bay Conservation and Development Commission (BCDC), the Association of Bay Area Governments Bay Trail Project, and California State Parks.

Planning for the Candlestick Point State Recreation Area will be tightly coordinated to create an interface between the State Parks system and the urban park and development that creates a synergy between them. While State Parks will produce a new master plan for the CPSRA, the development of the State Park and the other parks will be linked as part of a complete park system. For further discussion of this topic, see State Parks description under 'The Proposal' section.

Sea Level Rise

Recognizing the potential for sea level rise to impact project area in the future, a project specific study was undertaken to develop planning and design guidance through the various phases of the project. In planning for sea level rise at the park and shoreline edge, design considerations include: habitat, shoreline erosion, protection of park features, flooding, and the experiential quality of the Bay edge. The project's park sea level rise strategy is discussed in more detail in 'The Proposal' section of this document.

Hazardous Material Clean-up

The US Navy is responsible for the clean-up of its lands and state and federal regulators are responsible for making sure that the Navy's clean-up is safe for people and the environment. Coordination between the Navy's clean-up and the park programming and design will require ongoing coordination.

Relationship of this Plan with other Project Plans

There are a number of key issues and concerns that are not completely addressed in this document, but are more fully addressed in other project plans:

Sustainability

The design of the parks and open space system is closely related to many project-wide sustainability issues including: Economic Opportunity, Community Identity & Cohesion, Public Well-Being, Safety & Quality of Life, Accessibility & Transportation, Resource Efficiency, and Ecology. A framework for these issues, including goals, strategies, commitments and aspirational targets are fully discussed in the *Draft Sustainability Plan*.

Urban Design

Urban design, the form and shape and aesthetics of the development, have an important relationship to the design of the parks, open space, and habitat system. For more detail on these issues, refer to the forthcoming *Design for Development Plan*.

Transportation & Streetscape

Certain components of the park system such as bike and pedestrian trails and pathways are also a component of the transportation system. Conversely, some of the streets are designed with enhanced streetscapes which function as small linear "boulevard parks." Public transportation and automobile access are also important to the park system. A complete description of the project's transportation system is found in the *Transportation Plan*. The forthcoming *Streetscape Master Plan* will include more detail on the Boulevard Park Streets, and streetscape design features.

Utilities & Infrastructure

Some aspects of the park system are closely linked with infrastructure, for example: low-impact design stormwater treatment features and street design. More detail on the infrastructure system will be found in the forthcoming *Infrastructure Master Plan* and *Streetscape Master Plan*.

The Proposal

The Park System

Goals and Principles

The *Parks, Open Space, and Habitat Master Plan* has been developed to address the following goals and principles. These principles are organized by in relation to the by principles related to *planning*, *design*, and *process.*

Planning

These goals and principles relate to organization, size, shape, and arrangement of parks.

- **Connectivity**

  Create connections between parks and to regional open spaces including the state park and regional trail networks.

- **Walkability**

  Provide public open space within a short walking distance of all residents and employees.

- **Variety**

  Pursue opportunities to enhance existing and create new open spaces that include a variety of public plazas, courtyards and pocket parks in addition to larger public open spaces.

De sign

These goals and principles relate to the form and program of individual parks

- **Flexibility**

  Develop a park layout that allows multiple outdoor opportunities to occur within the same space.

- **Diversity**

  Provide a contrast of open space scale, design and program so each open space is unique to the character of its context.

- **Character**

  Create unique spaces that reflect the character of the community, support family and neighborhood gatherings as well as informal socializing.

- **Resource efficiency**

  Use materials and resources efficiently to minimize environmental impact and cost.

Process

These goals and principles relate to adaptation, growth, and change, and the organic evolution of the plans.

- **Community Involvement**

  Provide opportunities to involve the community in the design process for individual parks and opportunities to accommodate community-based programs and partnerships.

- **Interpretation and Education**

  Provide park facilities and opportunities that support learning about cultural history, ecology, and urban sustainability.

- **Urban ecological infrastructure**

  Integrate urban infrastructure with natural process to support urban sustainability. Parks and open spaces are a part of the city's 'green infrastructure' and will help regulate climate, control storm water, cleanse air and water, and provide habitat

- **San Francisco Bay Ecology**

  Enhance wildlife habitat to support the ecology of the San Francisco Bay, its wetlands, and the adjacent uplands.

Park & Open Space Framework

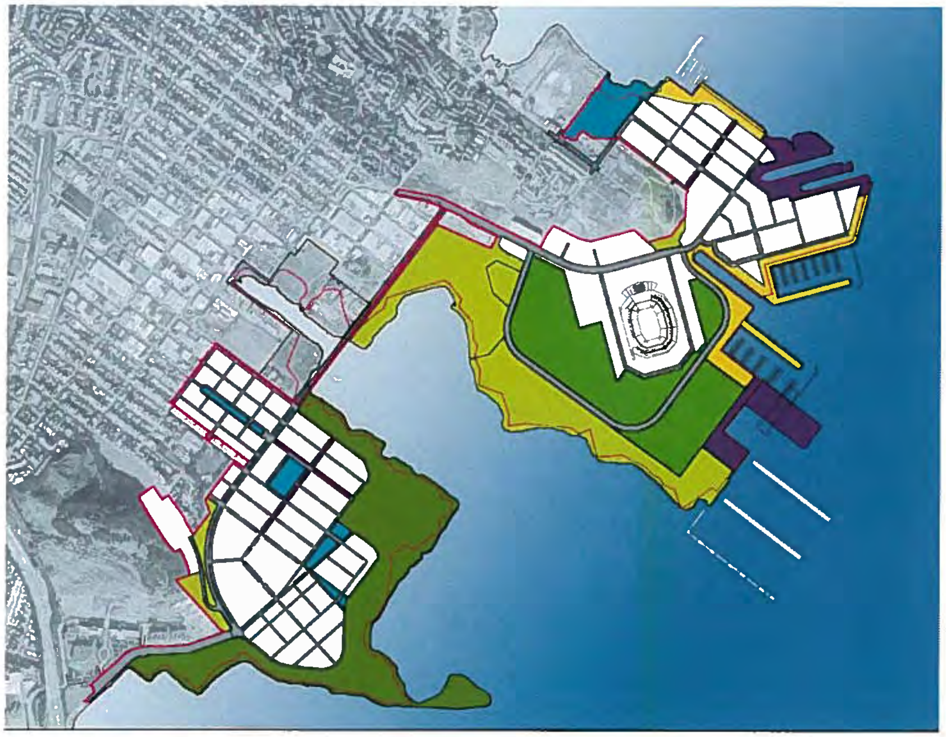
There are number of broad programmatic goals that are included in a complete park system. These include: recreation and leisure; historical remembrance, education, and celebration of culture; and stewardship and sustainability. Aspects of these broad park programs may be present in each park; however, based on opportunities, location, size, and needs, the park system has been designed to include the following eight components.

City Parks

City parks offer a mix of active and passive areas of open lawns, dog runs, play areas, community gardens, court games, and environmental education opportunities. These parks will serve the adjacent local neighborhood and will draw regular users from within a 10 minute walking radius. The City Parks adjacent to the waterfront will also attract visitors from other parts of San Francisco and beyond.

Cultural / Heritage Parks

The historical and cultural elements of these parks are designed to attract a broad range of visitors. In addition to regular neighborhood use, these parks draw visitors from throughout San Francisco, the Bay Area, and beyond.



Park & Open Space Framework

- City Parks
- Cultural / Heritage Parks
- Waterfront Promenades
- Sports & Multi-use Fields
- Habitat and Ecology Parks/Open Space
- Boulevard Parks and Streetscapes
- State Recreation Area
- Bay Trial
- Project Boudnary

Waterfront Promenades

The waterfront promenades are linear, urban spaces along the waterfront. They offer continuous waterfront access connecting to other urban areas and larger parks. They also contain features for discovery and amenities for resting and gathering. In addition to passers-through, these places attract neighborhood residents and workers.

Sports & Multi-Use Fields

The sports fields serve organized play for youth, high-school, and adult intra-mural sports. While soccer may be the most popular use the fields can accommodate other sports such as football, ultimate, and cricket. Multi-use fields are designed for informal uses such as kite-flying and picnicking, as well as accommodating larger organized festivals and events.

Habitat and Ecology Parks

These parks and open spaces facilitate the co-habitation of wildlife and humans in the city. While some areas may be designed to protect sensitive plants and wildlife, other sections may include trails, boardwalks, and overlooks, and provide facilities for nature education and picnicking.

Boulevard Parks and Streetscapes

Streets are important spaces in the life of the City. The boulevard parks are a special street type that includes expanded median or sidewalk areas that function as mini-parks -- providing spaces for neighborly socializing, games and play, and gardens. Streetscapes and boulevard parks will be described in greater detail in a separate *Streetscape Master Plan.*

State Recreation Area

Managed by the California State Parks Department, the State Recreation Area is focused on providing places for bay and nature-related outdoor recreation, education, and preservation and enhancement of natural habitats.

Bay Trail

While not a separate "park," the Bay Trail strings together the entire bayside park system, providing a linear park experience that is complete in itself; some users may experience the entire parkland mainly from the perspective of the trail. For others, the Bay Trail will provide points of entry into specific parks within the Candlestick Park and Hunters Point park system.

The Parks

The following descriptions provide a framework for and suggestion of the programmatic potential of the individual parks. It is, however, expected that the final park designs will evolve through a process of dialogue and engagement with existing and future residents. Program elements may be added or adjusted as needed, within the constraints of the individual sites.

Hunters Point Shipyard

Northside Park

Concept: Gathering of Community

Located at the north entry to the Shipyard, this park is a community meeting ground, linking the India Basin, Hilltop, and Shipyard communities with a place for sport, leisure, discovery, and sustenance. Celebrating the community's cultural heritage and promoting ethnic diversity and awareness, the theme of the African Diaspora may be expressed in stylized park structures, and interpretive feature and elements in paving, seat walls, or sculptural signage markers. The African Marketplace activates the center of the park with a "market street" promenade.

Activities & Program

The Northside Park provides a full set of active and passive uses. The most active park uses are located on stepping terraces at the southwestern side of the park. This area includes water-wise ornamental gardens, basketball, tennis, a children's playground, and restroom. The open-air African Marketplace forms and east-west promenade bringing visitors and activity into the heart of the park. A central lawn provides a flexible space multi-use space. The lower half of the park is within the State Trust lands, requiring more passive uses here. Along the Bay's edge, the park takes on a more natural character, with picnic/ barbeque areas and shade shelters and waterfront pathways.

Access & Circulation

The park has multiple entry points linking it with the adjacent neighborhoods. Extending from the intersection of the HPS neighborhood streets, a series of paths cross through the park. The Bay Trail connects the Waterfront Promenade to the south and will extend into the future India Basin Flats Park.

Connecting from Innes, pathways ramp down through gardens to the court games area. A possible future bike/pedestrian route through India Basin along the Hudson right of way may connect through the Northside Park creating another link between the India Basin and Hunters Point neighborhoods.

Sustainability Features

The park plan proposes native plantings near the bay's edge and ornamental, water-wise, demonstration gardens along the hillside.

1. Overlook Terrace with Lounge Chairs
2. Terraced Planting
3. Water-wise Ornamental Gardens
4. Seating Terrace
5. Tennis Courts
6. Basketball Courts
7. Playground
8. Restroom
9. Lawn Steps
10. Storage Pavilion
11. Information Kiosk / Pavilion
12. African Market
13. Flowering Gardens with Seating
14. Open Lawn
15. Group BBQ / Picnic Shade Pavilions
16. Picnic Meadow
17. Terraced Viewing Mound
18. Boardwalk at top of Revettment
19. City View Cafe

Northside Park
Park Area: 12.8 acres

N

0' 200' 400'

Scale: 1" = 200'

Waterfront Promenade North

Concept: Weaving Urban Neighborhoods with the Bay-front Promenade

The design of this park space weaves two primary influences: the continuity of the Bay Trail and the new Shipyard neighborhoods. This once active industrial waterfront will become a sequential landscape of outdoor urban rooms. Renovation of the existing wharf and the retention of industrial artifacts along the promenade will reinforce the historic qualities of the waterfront. Meanwhile, new landscape features such as small tree groves and native grassland and stormwater gardens will interlace a sense of the past with the present as residents and visitors walk, run, ride a bike, sit, play and reflect.

Activities & Program

In addition to the cycling, strolling or skating along the waterfront, the Northern Waterfront Promenade will provide places for rest, gathering, and leisure activities. Between the urban backdrop and the open bay, these spaces may include open lawns, gardens, seating areas, plaza spaces, and picnic/barbeque areas, and places for informal recreation and games.

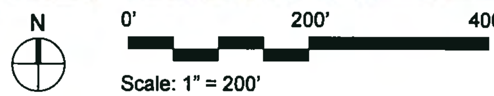
Access & Circulation

Access to the waterfront is provided at small plazas at the terminus of perpendicular streets and pedestrian mews, bringing pedestrian movement toward the waterfront. The grandest of these connections is at the Hunters Point Boulevard Parks. Extending from Galvez Street, the pedestrian paths and stormwater gardens of the Boulevard Parks terminate here at the Waterfront Park's central plaza space, and merge with the circulation of the waterfront promenade. Circulation along the promenade consists of series of main pathways running parallel to the water's edge: a Class 1 bicycle and pedestrian pathway adjacent to the urban edge, the Bay Trail closer to bay edge, and paths along the wharf.

Sustainability Features

The Northern Waterfront Promenade connects with the stormwater gardens system in the Boulevard Parks, detaining and cleansing street stormwater runoff before it reaches the Bay. The design of these features may include interpretive features that highlight the integration of urban and natural process. Reducing waste and consumption of new materials, the park design will seek to re-use and re-purpose historic materials and structures to the extent feasible. Plantings will focus on native and climate-adapted species that require minimal irrigation and provide habitat for insects and birds.

Waterfront Promenade North
Park Area: 7.1 acres

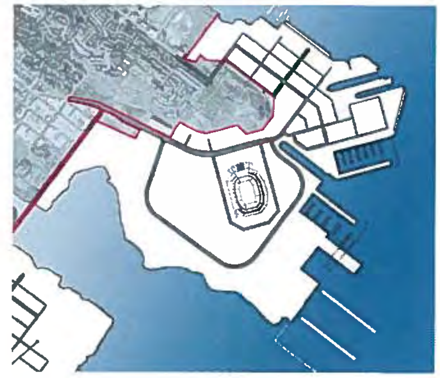


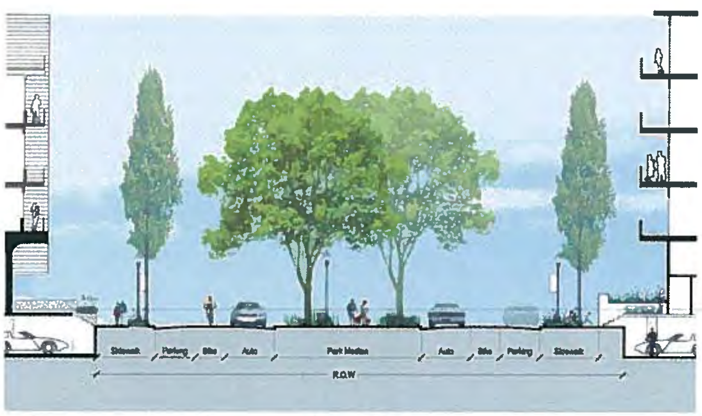
Scale: 1" = 200'

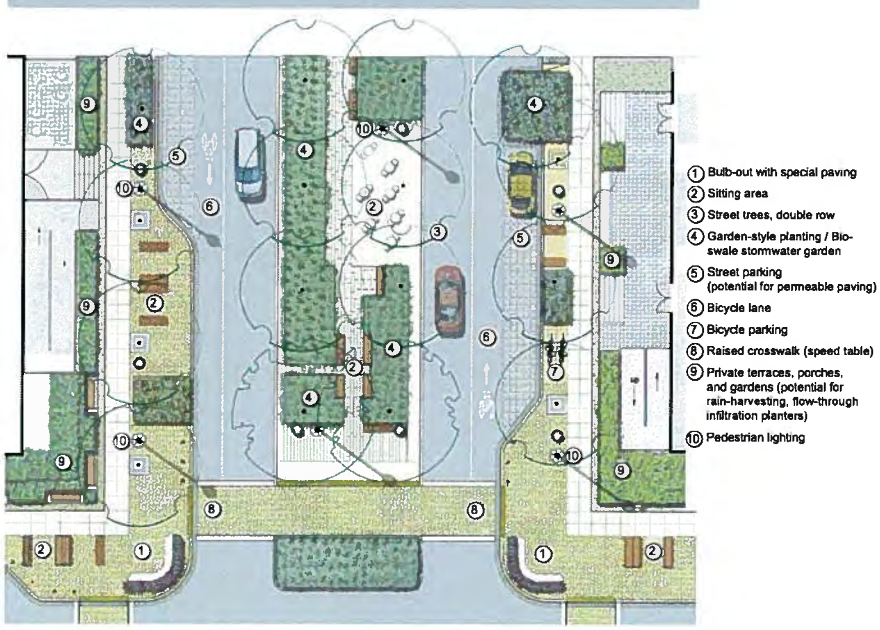
Hunters Point Boulevard Parks

Concept: The Street as a Neighborhood Living Room

A hybrid of street and park, the Boulevard Park Streets bring broad fingers of green space into the urban neighborhoods, linking interior parks with bay-front parks. The Hunters Point Boulevard Park Streets connect the Hunters Point Hilltop community with the waterfront Park. The streets has a strong pedestrian scale and quality, and serves as public 'front yards' and 'living rooms' for the neighborhood. In the center of a grand pedestrian-oriented street, large median spaces are designed as mini-parks with garden seating areas offering places for neighbors to meet and socialize. These parks also serve as 'ecological infrastructure,' bands of trees cleanse the air, while bioswales slow and cleanse storm-water before it enters the bay. The Boulevard Park Streets will be described in greater detail in the forthcoming *Streetscape Master Plan*.







Hunters Point Boulevard Parks
Park Area: 0.6 acres

N

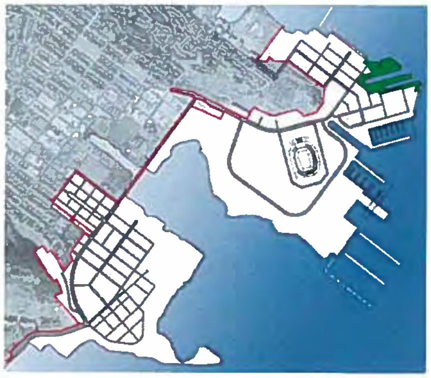
0' 200' 400'

Scale: 1" = 200'

Cultural Heritage Park

Concept: The Heart of Shipyard / Life and Work on the Waterfront

At the end of the Fisher Street neighborhood commercial corridor, and the nexus between the Hunters Point North Neighborhood and the Green Research and Development Center, the Cultural Heritage Park is the heart of the Shipyard. Here, the working history of the waterfront is evident in the historic structures and the grand scale of Drydocks 2 and 3. The park is a place to recognize the shipyard's importance to the people who worked there, and its significance to the nation, San Francisco, and the Bayview Hunters Point neighborhood. There are many stories that can be told here: stories of the Bay and its first people, the Chinese fishing communities, the shipyard and its workers, and the site's long Navy history. The design of this park will retain and reuse historic buildings, structures and materials as much as possible to preserve the spirit and essence of the place, and new design elements will have a modern, industrial character.



Activities & Program

The park's main program is for educational and cultural activity related to the site's history and the park will attract visitors from throughout the Bay Area and beyond. Users of the park can orient themselves to experience a specific historical use, scale, and aesthetic of the waterfront at the shipyard. Sculptural interpretive signage and kiosks, and other landscape elements may be used to describe this history in outdoor setting. Play areas for children will be interpretive and educational in nature. The historic buildings may be used for visitor centers, museums, or cafes, giving the park a distinct character and linking past and present uses. Space for a docked historical ship would further support the maritime experience.

Pumphouse at Drydock 3

Plaza spaces adjacent to the urban development can support a variety of outdoor event events and gatherings. A number of platform spaces support performance, gathering, informal seating and other spontaneous uses to occur simultaneously. Areas of open lawn provide flexible spaces and maintain open views to the grand scale of the dry docks which are the central feature of the park.

Historic Building between Drydock 2 & 3

Access & Circulation

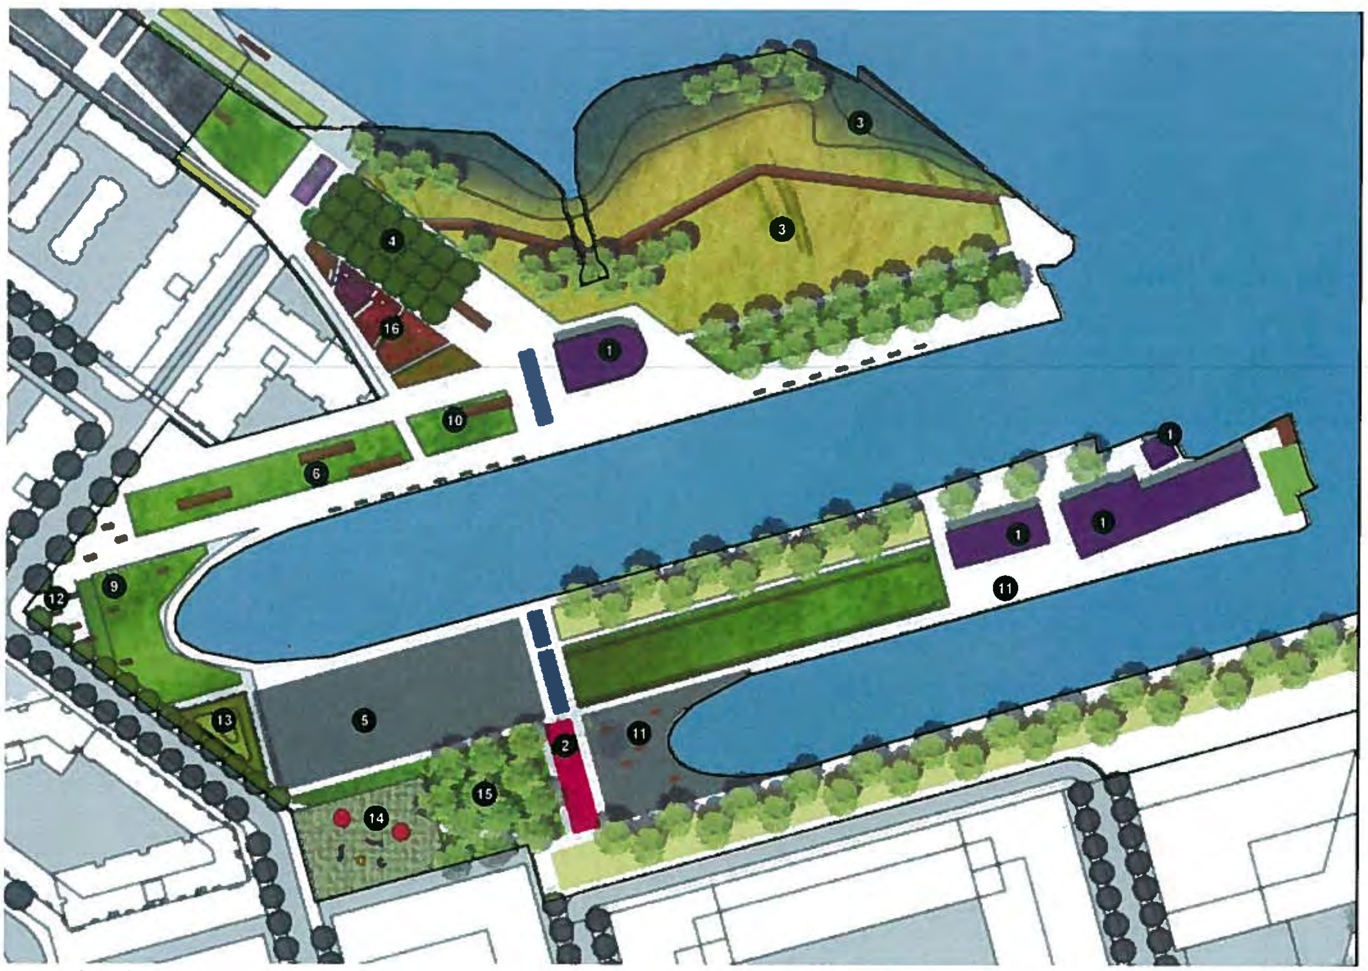
Access into the Cultural Heritage Park is multidirectional and accentuated by the meeting of two opposing city street grids at the Park's entrance. From the Bayview neighborhood, primary access to the park is by way of Crisp and Fisher, the HPS neighborhood commercial street and from Crisp and Spear through the Green Research and Development Center. Access from within HPS is possible via streets that terminate at the northeast and eastern boundaries of the park. The Bay Trail and Waterfront Promenades are integrated with the circulation of the Heritage Park and link it to other parks along the San Francisco Bay.

Precedent image

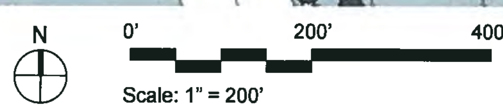
1. Historic Building/Visitor Center
2. Kiosk/Pavilion
3. Grassland / Naturalize Shoreline
4. Tree Grove
5. Multi-use event area
6. Lawn with seating plinths
9. Seating Plinth Lounging Terrace
10. Monolithic Timber Platforms
11. Interpretive Plaza
12. Entry Signage Pylon
13. Sculptural Landform
14. Playground
15. Tree Grove in Recycled Concrete and Gravel Paving
16. Gardens

Sustainability Features

The design of the park will preserve and re-use historic structures and materials such as paving and rails as much as possible. The ground plane may incorporate existing concrete slabs or recycled broken or crushed concrete. These features support the site's industrial character while diverting waste from landfills. Beyond these environmentally sustainable features, the park's central sustainable feature is about cultural sustainability – supporting the remembrance of the past with an understanding of how lives, land, and water, were shaped and reshaped here.

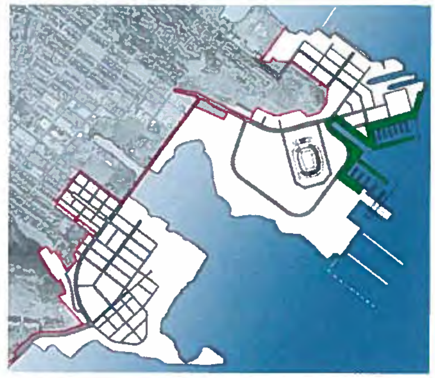


Cultural Heritage Park
Park Area: 15.6 acres



Waterfront Promenade South

Concept: Mingling and Promenade



The promenade is a place for interweaving of activities and visitors along the waterfront. The promenade is a sequential series of outdoor rooms, ecological gardens (raised planting beds emphasizing a native horticultural aesthetic and beauty), small tree groves, sculpture gardens, and sloped lawn panels for lounging and picnicking. Adjacent to the Green R&D center, the landscape program may highlight green-tech features in the landscape.

Activities & Program

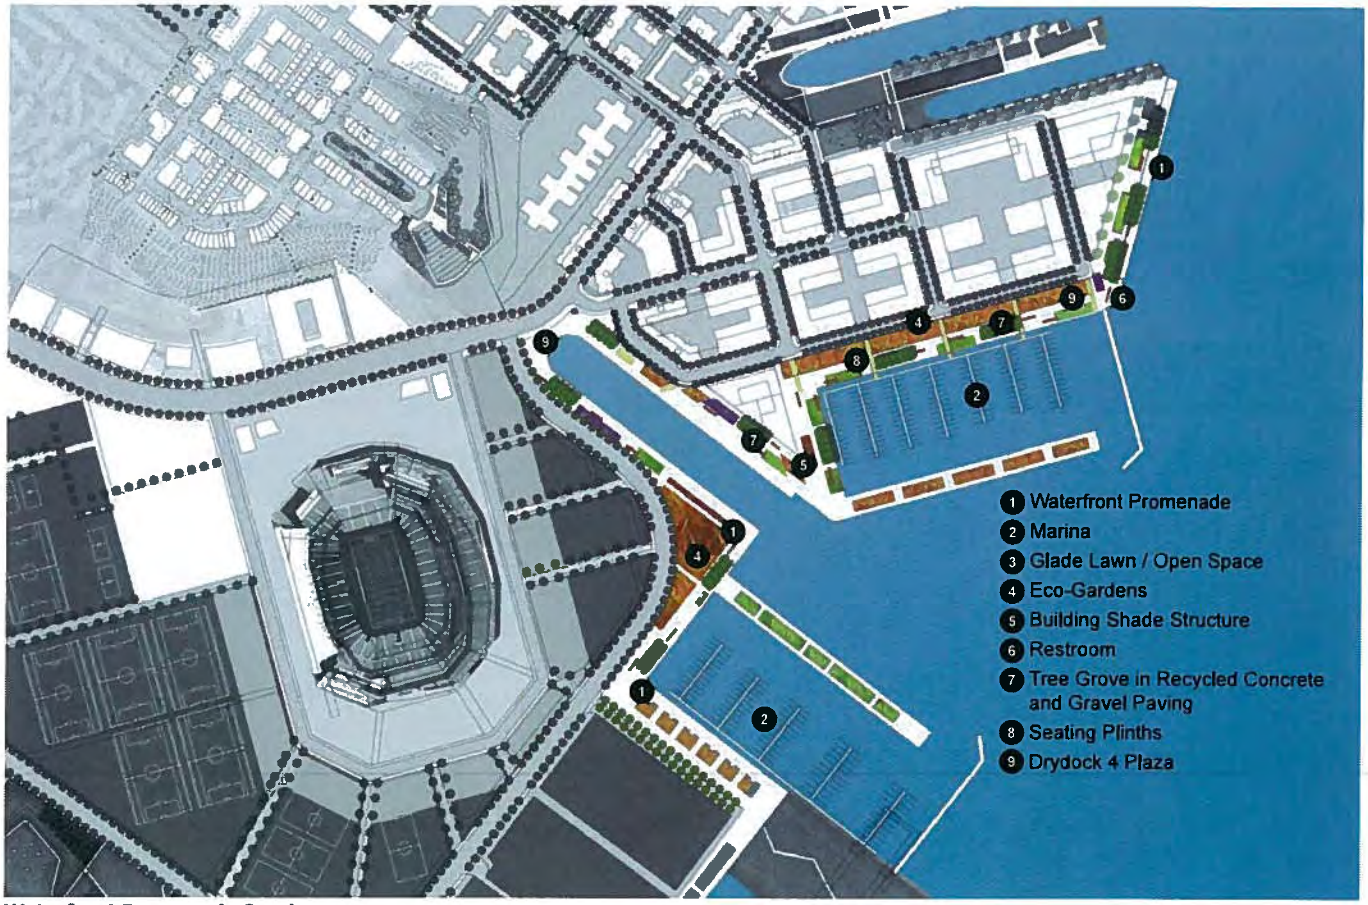
Uses and visitors in this area are diverse. Here one encounters researches from the Green R&D campus walking or sitting along promenade during lunch hours, breaks, or for inspiration, or at the start of an after-work jog. Sailors and maintenance crews socialize near entries to the marinas. Visitors, and hotel guests, exploring neighborhood streets and shopping along Fischer Avenue stroll along the Promenade or to an event at the Cultural Heritage Park. Soccer families, spectators, and those looking for a pick-up game, migrate to the Sports Field Complex along the promenade, and run into friends from the neighborhood. The variety of adjacent uses, beauty of the site, and comfortable places for seating and gathering accommodate serendipitous and spontaneous interaction among unlikely groups and friends, creating a truly successful urban place.

Access & Circulation

The Southern Waterfront Promenade creates a continuous link between the Cultural Heritage Park, Green Research & Development Campus, the Northern and Southern Marinas, the neighborhood commercial activity of Fischer Street, and the Sports Field Complex and Stadium. A main entry point onto the promenade is located at a plaza at the intersection of Spear, Fischer, and Crisp. Connections to the promenade also occur at adjacent streets and blocks. These intersections connect with that a series of pathway spaces parallel to the waterfront -- bicycle and pedestrian paths, and the Bay Trail.

Sustainability Features

Sustainable features include native plant design, stormwater gardens, and the reuse of existing materials as much as possible.



Waterfront Promenade South
Park Area: 22.4 acres

N

0' 700' 1400'

Scale: 1" = 700'

Community Sports Field Complex and Multi-Use Fields

Concept: 'Green' Stadium

Maximizing the use of limited urban land for recreation, the Sports Field Complex will provide much-needed community sports fields, while also accommodating game-day parking for the 49ers football stadium. The 'dual-use' of this area is an efficient and ecologically preferable use of land, eliminating the need for scores of acres dedicated to asphalt parking. A specially-designed soil and sub-grade will promote healthy, living grass while supporting game-day vehicular use. To prevent rutting and damage to the fields, the design will employ a fiber-reinforcement system that is incorporated into fast-draining, sandy soils. This system is commonly used to stabilize both professional and amateur football, soccer, and baseball fields, equestrian race tracks, and golf course greens.

Activities & Program

The sports fields will serve organized play for youth, high-school, and adult intra-mural sports. While soccer may be the most popular use the fields can accommodate other sports such as football, ultimate, and cricket. The facilities will also include warm-up fields, a field house, restrooms and food concessions. The multi-use fields are designed for informal uses such as kite-flying and picnicking, as well as accommodating larger organized festivals and events. The critical mass of the fields in combination with the adjacent waterfront parks, trails, picnic and barbeque areas and other leisure offerings make this an ideal sporting complex. During the 49ers football season and other major events at the stadium, the same site will host parking and tail-gating.

Murray Field Stadium, Scotland

Access & Circulation

In addition to the efficient vehicular circulation provided by its location on Crisp Avenue, the stadium site is also served by three parking structures. Circulation within the site is primarily organized around the Ring Road, which acts as a buffer between the Stadium/ Sports Complex and the Hunters Point Shipyard Parkland. On non-stadium game days, street parking is also possible along Ring Road, serving both the stadium area and the adjacent Grasslands Ecology Park sites.

Sustainability Features

The primary sustainability feature is the efficient, dual use of the site. Additionally, the minimization of paved parking areas accomplishes the following:

Eliminates exclusive use of large spaces for vehicular-only uses.

Reduces both urban heat island effect

In addition, the site strategy provides reduces runoff, treats and detaining stormwater.

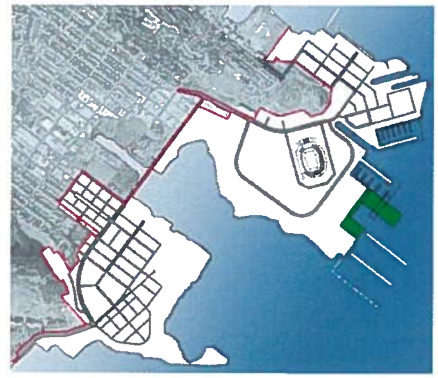
Waterfront Recreation and Education / Re-Gunning Crane Habitats



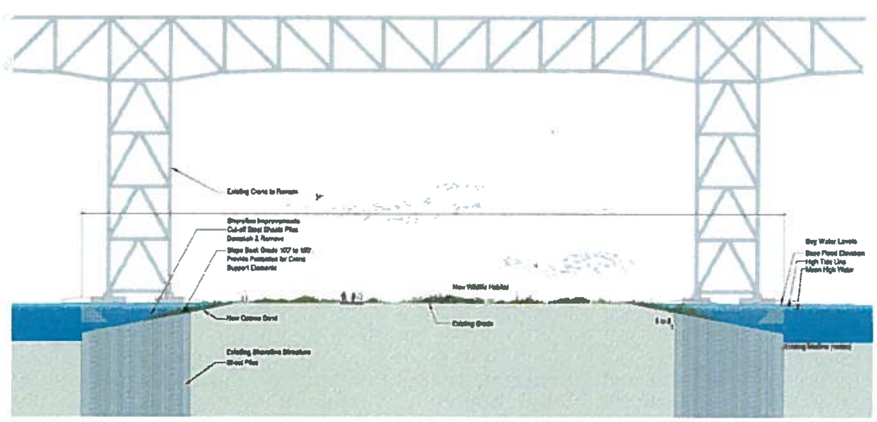
Concept: Landmark Resurgence of Nature

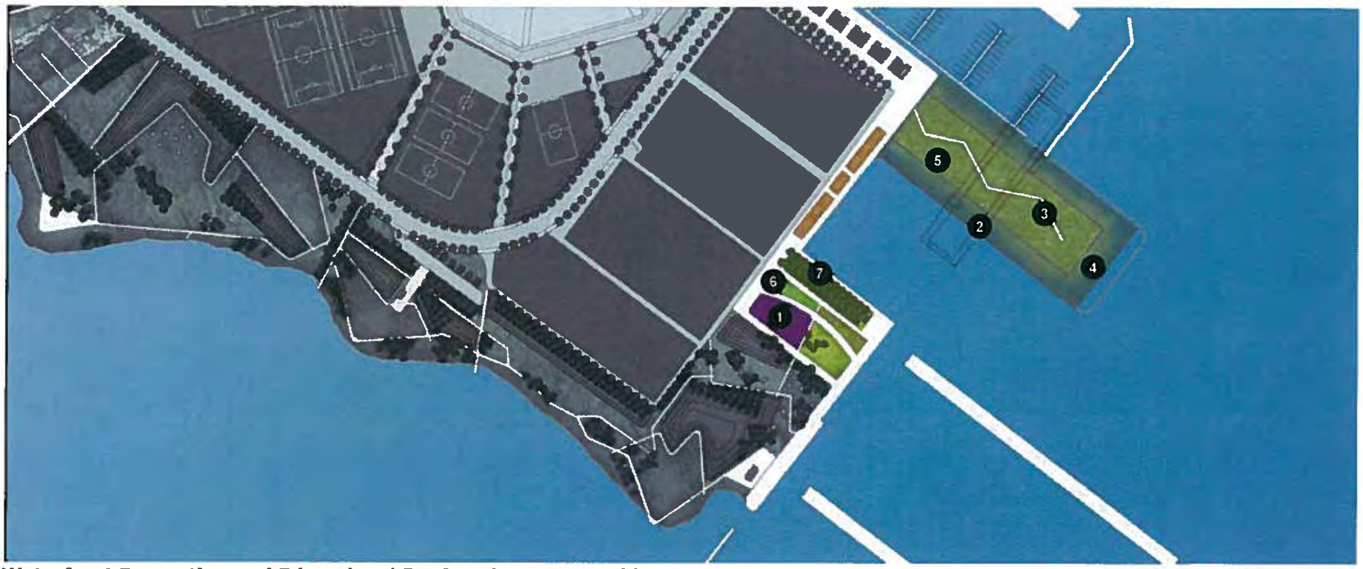
Focused on the spectacular 'Re-Gunning Crane' that forms the most powerful landmark in the cultural landscape of the shipyard, the Waterfront Recreation and Education Park is a knuckle in the park system plan. The park is designed to integrate the past industrial uses of the site, with future ecological processes that will gradually 'colonize' this area. While the Re-Gunning Crane will be left in place, the pier that surrounds it will be eroded – its walls removed and the ground will be laid back to allow water to create a fluid boundary for the former pier. As tidal wetlands and upland habitats take hold the Crane will seem to emerge from the water, and the giant machine will become a "gateway" to the bay and its ecology. The landmark Re-Gunning Crane provides a dramatic juxtaposition of the site's industrial history with the resurgence of nature at the Bay's edge.

Activities & Program

The primary activity of the site is educational. A trail will meander across the pier in a manner that off-sets the rectangular geometry of the pier, leading visitors under and through the crane to overlook points providing visitors with opportunities to view Bay wildlife. Interpretive displays will explain the history of the shipyard, and the ecology of the bay that was filled to create this man-made landmass. The site is intended to be used by small classes of students as well as introspective visitors. The waterfront educational area will also hold a small teaching marina, a boat house and classroom building where sailing and water related sports can be taught.

The re-gunning pier will be modified to produce a mixture of new open water, tidal wetlands, and upland habitats. The walls of the pier will be removed down to the existing mudline and the ground will be laid back to provide a gentle gradient consisting of open water and intertidal areas. Along portions of the shoreline protected from wind-wave action, wetland soils will be placed at appropriate elevations. Although native tidal salt marsh vegetation will likely colonize the site naturally, some planting with native salt marsh species will be





Waterfront Recreation and Education / Re-Gunning Crane Habitats
Park Area: 16.2 acres
(6.7 acres Waterfront Recreation and Education, 9.5 acres Re-Gunning Crane Habitats

1. Waterfront / Boat Learning Center
2. Re-Gunning Crane
3. Trail / Boardwalk
4. Tidal Wetlands
5. Upland Habitats
6. Open Lawn
7. Tree Grove and Seating

performed to increase the rate of marsh establishment. Portions of the pier subject to greater wave action will remain un-vegetated, providing substrate for benthic organisms such as oysters and foraging habitat for black oystercatchers and other shorebirds of rocky intertidal zones. The salt marsh/rocky intertidal zones will transition upward to a mosaic of dune sub-shrub, scrub, and grassland vegetation that will be planted on upland surfaces of the pier after appropriate soils are imported. These target plant communities consist of short-statured species that have low water use requirements to facilitate water conservation and that will provide habitat for sparrows and other landbirds, as well as some small mammals. The Re-Gunning Crane will be left in place and will continue to provide a nesting site for peregrine falcons, which have nested on the crane for several years.

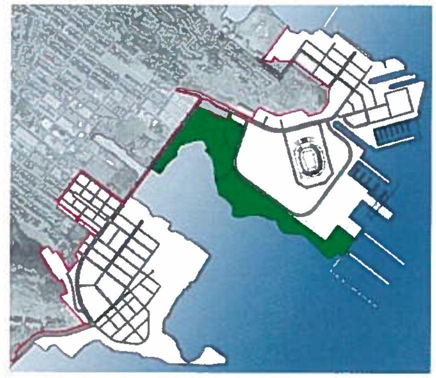
Access & Circulation

The Waterfront Recreation and Education Area will form a gateway in two directions. On one side will be the natural grasslands and wetlands of Parcel E. One the other will be the end of the Waterfront Promenades. This area will be easily accessible from the ring road surrounding the Sports Fields and Multi-use Lawn.

Sustainability Features

This Park area focuses on the use of native plants of the Bay and displays reconstructed habitats. The site's most important cultural feature – the Crane – is saved and showcased as a monument to the past uses of the land. Nearby, Piers 1, 2, and 3 will be cut off from the mainland providing a roosting place for waterbirds safe from predators.

Grasslands Ecology Park



Concept: Grasslands Ecology

Building on the planned restoration project at Yosemite Slough, the Grasslands Ecology Park will transform contaminated Navy lands on the north shore of the South Basin with vast new habitat areas, supporting biodiversity and the Bay ecosystem. Sculptural landforms, native grasslands, freshwater wetlands, shoreline mudflats and tidal wetlands, coastal scrub, and tree groves add to the diversity of habitats. The existing natural landscape is supplemented by designed landscape components such as clustered windbreaks and viewing mounds, shoreline overlooks and a sinuous network of pathways that support passive recreation uses. In addition, an interpretive eco-garden (a more formal planting of native species) designed to accommodate large outdoor classes creates a setting for the study of bayside habitats and ecology. These landscape strategies provide places from which to seek respite from the intensity of the City and connect with nature at the Bay's edge.

Activities & Program

The Grasslands Ecology Park provides overlapping environmental and programmatic benefits to the open space system at Hunters Point. Human activity here is programmed for passive recreation use: walking and bike riding along the Bay Trail, sitting aside windbreaks, and observation and study along the naturalized water edge. An area adjacent to the Stadium Ring Road may also include a large dog park, and dedicated picnic areas.

Within the Grasslands Ecology Park, at least 43 acres of native grassland will be restored by the removal of non-natives and planting of native grass and forb species. Trail setbacks, habitat fencing, screening, and signage will be used where needed to protect sensitive wildlife habitat and flora. Although trees and shrubs may be planted elsewhere within the Grasslands Ecology Park to provide a mosaic of habitats, woody plants that are planted or allowed to establish naturally within the grasslands will be limited to a few small, scattered patches of low-growing coastal scrub plants such as coyote brush, which will provide cover for wildlife that may otherwise forage in the grasslands.

Access & Circulation

Access into this park is facilitated by a parking lot on the east end of the park and ample off-street parking along the Stadium Ring Road. Another parking lot serves the west end near Crisp and the Stadium Ring Road. The multiple parking and access points allow for a variety of user scenarios: from families traveling to the Park and unloading bicycles for use along the Bay Trail to elderly visitors needing accessible waterfront connections to functional access for park maintenance crews.

The entrances to the park are informal in character, with numerous paths extending from the Ring Road sidewalk and continuing in multiple directions. Park users can choose a direct path toward the waterfront or a route that encompasses the organic layout of the Park. The Bay Trail experience is characterized by wetlands and the shoreline edge, bringing park users within close view of Bay wildlife and offering a discernibly less urban park condition.

Sustainability Features

A main focus of this park is to create new habitat areas and bring the experience nature to urban dwellers and to support nature education. Native plantings will also minimize the need for irrigation.

Grasslands Ecology Park
Park Area: 82.1 acres
(44.9 acres at Parcel E, 37.2 acres at Parcel E-2)

N

0' 700' 1400'

Scale: 1" = 700'

Candlestick Point

Alice Griffith Neighborhood Park

Concept: Neighborhood Commons

Alice Griffith Neighborhood Park serves as the community commons for the renewed Alice Griffith neighborhood. It is designed to become the outdoor living room of the community, where neighbors get to know each other, socialize and celebrate their commonalities and differences. The park's east-west orientation is purposeful – it acts as a link between the existing Bayview neighborhoods and the rebuilt Alice Griffith housing development, and it is hoped that the existing adjacent community will use this open space to connect with their new neighbors.

Access & Circulation

Centrally located to allow the neighborhood streets system to intersect the park in an even rhythm, the park is approachable and accessible from all sides. Entrances are highlighted at each intersection with invitational benches and shade groves, and a continuous E-W path links the park sections that span four blocks.

Activities & Program

Similar in width to the very successful South Park, it has a key mix of uses that will draw users of all ages and interests. The park offers a mix of active and passive uses including two multi-purpose open lawn areas, a play ground and tot lot, a fenced running area for small dogs, a shade pavilion with barbeques and picnic tables, and a basketball court.

Sustainability Features

The park also serves and ecological function for the new neighborhood. New streets are designed to drain to the park, where bio-swale storm water gardens will filter storm water before it reached the bay. These gardens have the opportunity to educate the residents about the impacts of urbanization on natural watersheds, and how designed interventions can mitigate some of that impact. Other key sustainability features at the park include a section for community gardens.

Candlestick Point Neighborhood Park

Concept: Neighborhood Recreation

Candlestick Point Neighborhood Park is designed to become the focal point of the new Candlestick North neighborhood. It is seen as the common "backyard' of the high density development that will surround it, where recreation and socialization are key community offerings.

Access & Circulation

The park is centrally located and can be reached by a few minute walk from anywhere within the CP North neighborhood. Adjacent Boulevard Park Streets provide connections to Alice Griffith Neighborhood Park two blocks to the west, and the State Park, two blocks to the north, and also two blocks to the east.

Activities & Program

The Neighborhood Park offers a mix of active and passive areas for users of diverse ages and interests; it includes a large multipurpose open lawn, available for Frisbee, soccer, and kite flying, playgrounds for tots and school age children, community gardens, seating areas, basketball courts and garden beds. A shade pavilion with adjacent picnic tables and BBQs will also be provided. A perimeter walk with benches will also allow a more passive interaction with park, where it will be possible to enjoy the outdoors in a more introspective and quiet fashion.

Sustainability Features

A central organizing feature of the park is a storm water garden that filters on site and adjacent street water. Climate-adapted garden beds can be organized as water wise demonstration gardens. Community garden plots give urban dwellers a place to get their hands dirty and enjoy the pleasures of growing fresh food and flowers.

Bayview Gardens / Wedge Park

Concept: "Central Square"

The Bayview Gardens/Wedge Park is the "Central Square" for Candlestick Point. Opening up from the Harney Way retail street, it provides dramatic views of Hunters Point and the Bay and provides a strong link between the urban development and the State Park.

Access & Circulation

Located at the seam of the two urban grids of the new development the Wedge Park can be easily accessed from all directions. The park is a key feature of the urban plan that stitches the urban neighborhoods together with the state park. This interface brings urbanity to the park core, and the park to the urban heart of the new development.

Activities & Program

The parks uses are primarily meant to encourage community gathering and neighborhood socializing. While tot lots and play grounds delight the children, the park also offers a comfortable and sophisticated place for the older generations – a central square where one comes to promenade, socialize, and people watch. A café and an interactive play fountain are the pivot point of the park, while ornamental gardens, and storm water rain gardens provide a sense of enclosure on the west side. Lawn areas with edge paths allow the set up of community fairs, farmers markets, music festivals, and art and food festivals. The design is intended as a flexible canvas that will encourage a variety of programs.

Sustainability Features

All parks within the new development, including most importantly this central square, will integrate sustainability in their design and maintenance. To facilitate this, several features are provided – such as storm water gardens, drought tolerant garden beds, shaded seating areas and use of lawn only where large gatherings are to be held.

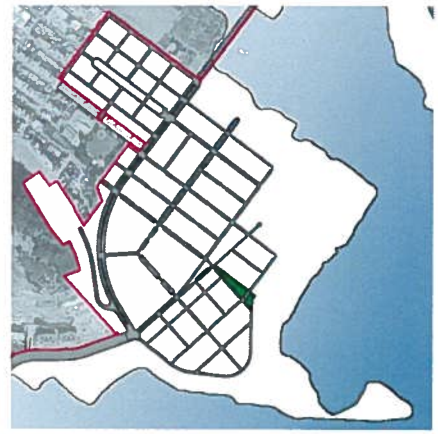
Mini-Wedge Park



Concept: Bayfront Connection

The Mini-Wedge Park serves as a primary connection between the urban core of the new Candlestick Point and the State Park beach area. A range of programs within an intimate setting produces a space that enlivens the neighborhood while also providing a critical connection between the urban parks and the bay edge.

Access & Circulation

Long linear paths run through the center of the park and along its northern edge, and carry pedestrians from neighborhood streets to the State Park waterfront. The wedge shape opens vistas from the density of the urban neighborhood into the expansive spaces and sweeping arc of the water's edge.

Activities & Program

The park's program strategy is focused on generating interaction among neighbors and visitors by providing varied activities within a relatively intimate scale. The programmatic gradient flows from active to passive as users move from the urban edge toward the water. A tot lot and dog run on the northwest side provide families with program-specific spaces. As visitors move toward the southeast, a generous lawn with trees promotes gathering, conversation and picnics.

Sustainability Features

A focus on sustainable stormwater management provides both an ecological and formal organizational structure for this park. A long bioswale runs the length of the space, intercepting and cleansing of stormwater from the adjacent neighborhood street before runoff enters the State Park Beach area.

Candlestick Point Boulevard Parks

A hybrid of street and park, the Boulevard Park Streets bring broad fingers of green space into the urban neighborhoods, linking interior parks with bay-front parks. These streets have a strong pedestrian scale and quality, and serve as public 'front yards' for the neighborhoods. Broad landscaped medians or sidewalks are designed as mini-parks with gardens seating areas offering places for parents to sit outside with their children or workers to eat lunch in the sun. These parks also serve as "ecological infrastructure," bands of trees cleanse the air, while bioswales slow and cleanse storm-water before it enters the bay. At Candlestick Point, one Boulevard Park street will link the Alice Griffith Neighborhood Park with Candlestick Neighborhood Park and the state park. On this street, the park space will be a 30-40' wide expanded sidewalk space on the north (sunny) side of the street. A second, perpendicular Boulevard Park Street will link the CP Retail Center with CP Neighborhood Park and the state park. The Boulevard Park Streets will be described in greater detail in the forthcoming *Streetscape Master Plan*.

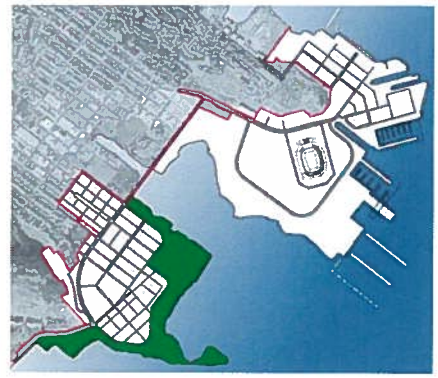
Candlestick State Recreation Area



Vision

The Candlestick Point recreation area is a unique opportunity in the State Park system and along the San Francisco Bay Shoreline to create a model urban recreation area that links city residents and regional visitors to the diversity of estuary and upland habitats of the Bay and demonstrates integrated sustainable design principles for reclaiming fill areas for park uses.

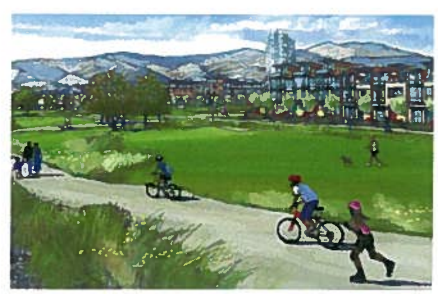
This *Concept Plan* proposes an integrated parks and open space system with improvements to the Candlestick Point State Recreation area that will support the State Park's goals of preserving and protecting the environment while encouraging urban dwellers to experience nature at the bay edge and providing opportunities for place-based outdoor recreation. With a seamless design approach, the park's existing well-used areas will be revitalized and new undeveloped bay edge parklands will be developed.

The park improvements will finally complete the original vision of Candlestick State Recreation Area – to bring the values of the State Park system to the city, to provide recreational and cultural facilities and to connect urban dwellers with the natural environment. Furthermore, the State Park is poised to be one of the state's finest urban waterfront parks, at the forefront of urban ecological design, managing urban stormwater while creating habitat and providing environmental education.

Design Coordination

While the State Parks Department will perform their own master planning process for the CPSRA, these plans will be coordinated with the City to realize the potential of this vision. The follow principles are proposed by the City of San Francisco to guide the planning and design of the park:

- Design city parks and state recreation areas to feel from a user perspective as one park system, despite potential programmatic and operational differences between jurisdictions.
- Develop a park that is programmed and designed for safe and active 18-24 hour daily use by the public.



- Design a pedestrian and bike accessible transition zone between all private development parcels and the park.
- Develop frequent routes into the park from the neighborhood aligning with the planned street network with major linkages with transit stops, bike routes and linear greenway features.
- Create a mixture of passive and active spaces that activate the open space drawing neighbors and visitors to the waterfront.
- Provide duplicative trail systems including linkage to a Class I bike and multi-use recreation trail as a transition between the neighborhood and State Park, a continuous Bay Trail close to the water, and multiple linkages between.

Candlestick Point State Recreation Area
Park Area: 96.7 acres (within project boundary)

- Install multiple human powered boat access boating including facilities for windsurfers south of Bayview Hill.
- Preserve and expand the existing pocket beach.
- Integrate stormwater treatment systems with the neighboring development to provide model/demonstration sustainability systems and habitat spaces.
- Utilize stainable design principles through park planning to expand the ecological functions of the recreation area and minimize resource consumption by park facilities, programs and users.
- Introduce limited commercial uses to provide food and recreational services for visitors.
- Balance dedicated parking facilities for the recreation area with available on and off street parking provided in the neighboring development and transit access to the area.
- Upgrade existing and install additional fishing a viewing piers into the bay.
- Provide multiple picnicking and barbecuing facilities to accommodate family and social gathering in multiple areas of the park, and consider larger scaled gathering opportunities for events.

Design Potential

The following describes the design potential for the CPSRA.

An extensive trail network, including the San Francisco Bay Trail will link areas within the park with the adjacent urban neighborhoods and the waterfront. Park visitors will enjoy open lawns and meadows, picnic areas, interpretive exhibits, outdoor classrooms, and community gardens. Overlooks, fishing piers, wetlands boardwalks, beaches, and windsurf and kayak launches invite visitors to the water's edge.

The State Parks design will feature a simple, sensitive, and expressive palette of landscape materials to allow the park to grow incrementally over time. Native grasslands, meadows, wooded groves, and more formal 'eco-gardens' will provide a system for choreographing the landscape experience. Landforms and windbreak plantings will structure the experience of place, framing views of the water, and offering refuge from wind and fog. Though identifiable as a State Park, distinct from the other city waterfront parks, the State Park has a strong role in the overall park network, linking and connecting with a variety of other city, neighborhood and community parks.

The 157-acre State Park is divided into many smaller sub-areas, described below.

Grasslands South

This area of the existing State Park is largely undeveloped and has been used for game-day stadium parking. A new Grasslands South area could be improved with native grasslands, glade lawns, and earthworks shaped to provide shelter from the wind and enhance views. Site features could include overlooks, restrooms, and parking.

Bayview Gardens North

Formerly developed as a boat launch, siltation of the South Basin has caused this use to be abandoned. The existing paved parking area is used for game-day stadium parking. Located between the bay and the proposed Bayview Gardens / Wedge Park, the Bayview Gardens North area offers the greatest integration of urban and naturalized open spaces anywhere in the open space system and will be a strong visual gateway to the State Parks and the bay. Bio-swales, storm water 'Eco-Gardens,' and a potential salt-marsh restoration are central features of this area.

The Last Rubble

Until recently, the Last Rubble area was characterized by large piles of rubble and debris, remnants of the site's previous use as a dumping ground. The California Integrated Waste Management Board completed a rubble and debris removal project in April 2009. As a result of this, the majority of the rubble and debris was either removed or crushed on site. This area of the State Parks remains underutilized and is not currently programmed for recreation, with the exception of a walking path. As the Last Rubble Area will be located adjacent to a substantial urban population, this area could be transformed into a new center for the State Park, with a wide variety of program elements.

The park ranger station/visitor's center could be located here as well as a "Great Meadow" for passive recreation and park events. Other features may include parking, picnic areas, overlook terraces, restrooms, and a restaurant/ café.

Wind Meadow

The Wind Meadow includes part of the existing State Park, including the Main Beach. This area will be reconfigured to meet the new urban development edge and interface with the Mini-Wedge neighborhood park. This area will contain a secondary entry and parking lot, and gateway entry kiosk for the State Park. Features here may include new restrooms, picnic areas, waterfront overlooks, expanded tidal wetlands, and access to the water.

Heart of the Park

The Heart of the Park is part of the existing developed State Park. New park area will be added and the existing landscape structure will be retained and enhanced. Planting and overall aesthetics will be improved, pedestrian pathways will be renewed and added, and program areas will be developed for greater use. Site features could include upgraded restrooms, overlook terraces, large and small group picnic areas, and an interpretive amphitheater.

The Point

The landscape of the Last Port will be revitalized with improvements focused on pedestrian circulation, safety and way finding; intensifying areas for increased use; improving the overall park aesthetics and landscape ecology; and reconnecting visitors to the bay shoreline. Native grasslands and shorelines will be restored and stabilized, providing areas for activities such as strolling, picnics, kite flying, and fishing.

The Neck

The existing Neck area is a narrow, eroded section of the State Park that includes a beach and pier. Park area will be added here to increase the width of the park and provide a continuous park experience along the shoreline. New features here could include a parking lot, windsurf/kayak launch, overlook, and picnic areas.

Last Port

The landscape of the Last Port will be revitalized with improvements focused on pedestrian circulation, safety and way finding; intensifying areas for increased use; improving the overall park aesthetics and landscape ecology; and reconnecting visitors to the bay shoreline. Native grasslands and shorelines will be restored and stabilized, providing areas for activities such as strolling, picnics, kite flying, fishing, and direct access to the bay for swimming, kayaking, and windsurfing.

Habitat Enhancement Measures

A number of measures will be implemented to enhance wildlife habitat conditions within the Project site. Wildlife enhancements would occur primarily in open space areas such as the Grasslands Ecology Park and other parks on the site, though enhancements such as removal of non-native invasive plants and planting of trees and shrubs will occur at scattered locations throughout the park as well. These enhancement measures will focus on areas outside the CPSRA, since the Project will neither impact directly, nor have control over enhancements in, the portion of the CPSRA that is not subject to the land transfer agreement. However, these or similar measures are recommended for the CPSRA as well to enhance habitat conditions there.

- **Control of non-native invasive species:**

  Most of the Project site is currently dominated by non-native plants. Several of these species, including acacias, wild oats, black mustard, bromes, iceplant, and pampas grass, are listed on the California Invasive Plant Council's Invasive Plant Inventory Database (http://www.cal-ipc.org/ip/inventory/weedlist.php). These species are particularly invasive, having the potential to out-compete native plants, expand over large areas, and significantly reduce the ecological value of natural areas on the site. These invasive, non-native species would be removed during initial habitat enhancement efforts to provide areas for creation of higher-quality habitats and to prevent their spread into restored native habitats. Monitoring and ongoing removal/control of these species would be implemented to ensure against the re-establishment and spread of these species on the Project site.

- **Restoration of grasslands:**

  To maintain habitat for grassland-associated wildlife species on the site, grasslands extensive enough to support such species would be maintained and enhanced through the restoration of native grasses. Within the Grasslands Ecology Park, at least 43 acres of native grassland will be restored by the removal of non-natives and restoration, through seeding and/or plugs, of native grass and forb species. Such grassland habitat would not be well manicured or regularly mown (e.g., it will have the appearance of native grassland, not lawn), and signage will be erected discouraging use of this area for recreational purposes. Although trees and shrubs will be planted elsewhere within the Grasslands Ecology Park to provide a mosaic of habitats, woody plants that are planted or allowed to establish naturally within the grasslands will be limited to a few small, scattered patches of low-statured coastal scrub plants such as coyote brush, which will provide cover for wildlife that may otherwise forage in the grasslands. These grasslands would be monitored annually for evidence of the presence of undesirable levels of woody and invasive plants, which will be removed when found to maintain dominance by native grasses and forbs.

Detailed design of the grassland restoration area will be performed by a qualified restoration ecologist. The planting palette for grassland areas will be developed after the precise location of the grasslands is determined and following a thorough examination of soil conditions (which may be modified by the Navy's remediation on HPS), drainage, and other factors. Examples of native grasses and forbs that could be included in planting plans for these grasslands include the following:

Yarrow (*Achillea millefolium*)

California brome (*Bromus carinatus*)

Paintbrush (*Castilleja subinclusa*)

Blue wildrye (*Elymus glaucus*)

Golden yarrow (*Eriophyllum confertiflorum*)

California poppy (*Eschscholzia californica*)

Red fescue (*Festuca rubra*)

Purshing's lotus (*Lotus purshianus*)

Miniature lupine (*Lupinus bicolor*)

Arroyo lupine (*Lupinus succulentus*)

California melic (*Melica imperfecta*)

Purple needlegrass (*Nasella pulchra*)

One-sided bluegrass (*Poa secunda*)

Chia (*Salvia columbariae*)

Bee plant (*Scrophularia californica*)

Checkerbloom (*Sidalcea malvaeflora*)

Blue-eyed grass (*Sisyrinchium montanum*)

Goldenrod (*Solidago spathulata*)

Three weeks fescue (*Vulpia microstachys*)

- **Increase in tree/shrub cover:**

Approximately 10,000 net, new trees, or more than four times the number currently present in the Project area, will be planted throughout the Project area. While some of these trees will be planted as street trees or for ornamental purposes, a large number will be planted specifically with wildlife habitat in mind. In conjunction with tree planting, numerous shrubs, forbs, and ground cover will be planted and maintained. Within parks such as the Grasslands Ecology Park (outside of the designated grassland restoration areas), trees, shrubs, and ground cover will be planted in clusters to provide dense, multi-layered clumps of vegetation that will provide food, cover, and roosting, nesting, and foraging sites for a variety of wildlife species. Though

Red-Tailed Hawk

Western Meadowlark

Yellow Warbler

these areas are expected to be used by mammals, reptiles, amphibians, and a variety of invertebrates, these plantings will be particularly beneficial as foraging and nesting habitat for birds. Increases in foliage height diversity and vegetation volume resulting from the planting of numerous trees and shrubs on the site, most of which currently supports little woody vegetation, would result in increases in the diversity and abundance of breeding and migratory birds.

Because the majority of the Project site is located on fill material derived from a variety of sources, soil quality is not optimal for plant growth in many areas. Prior to planting, the soils in a given area will be examined by a qualified soils scientist or horticulturist, and soil amendments will be provided as needed to ensure suitable conditions for growth of the desired plant species. On portions of HPS Phase II (e.g., the former landfill), planting of deep-rooted vegetation may be constrained by capping of the landfill. The cap may physically inhibit root growth, and piercing of the cap by roots would be undesirable to maintain the integrity of the cap. If necessary, soil would be imported into such areas to provide contoured mounds and ridges which would serve as planting substrates for deeper rooted trees. Detailed design of native revegetation areas will be performed by, or in consultation with, a qualified restoration ecologist.

Native vegetation shall always be favored in determining the appropriate trees, shrubs, and other vegetation to plant in certain areas. Native plant species often require less fertilizer, irrigation, and pesticides than many non-natives, and native plant species tend to provide more of the structural and dietary resources required by native animals than do non-native plants. The planting palette for particular areas will be developed on a site-specific basis, taking into account the target wildlife species, the size of the planting area, constraints on deep-rooted plants, the desire to maintain cover for habitat connectivity purposes, and other factors. Examples of native trees and shrubs that could be included in planting plans on the Project site include the following:

Gopher Snake

Big-leaf maple (*Acer macrophyllum*)

California buckeye (*Aesculus californica*)

Western redbud (*Cercis occidentalis*)

Coast live oak (*Quercus agrifolia*)

Valley oak (*Quercus lobata*)

Coast redwood (*Sequoia sempervirens*)

Toyon (*Heteromeles arbutifolia*)

Blue elderberry (*Sambucus mexicana*)

Chamise (*Adenostoma fasciculatum*)

California sagebrush (*Artemisia californica*)

Coyote brush (*Baccharis pilularis*)

California lilac (*Ceanothus thyrsiflorus*)

Buckwheat (*Eriogonum fasciculatum*)

Silk tassel (*Garrya elliptica*)

Silver bush lupine (*Lupinus albifrons*)

Sticky monkey-flower (*Mimulus aurantiacus*)

California wax myrtle (*Myrica californica*)

Coffeeberry (*Rhamnus californica*)

Lemonade berry (*Rhus trilobata*)

Fuchsia-flowering gooseberry (*Ribes speciosum*)

Black sage (*Salvia mellifera*)

However, site-appropriate non-native species that provide food or structural resources that are particularly valuable to native wildlife may also be considered. For example, flowers of eucalyptus trees and bottlebrush shrubs provide abundant nectar that is used by a variety of native birds, and that attracts insects that in turn serve as food for birds. Palm trees provide cavities (between the petioles of old fronds) that can serve as nesting sites for species such as barn owls and American kestrels. Monterey pine and Monterey cypress are not native to San Francisco, but both are native to limited areas along the Central California Coast. These hardy species are thus well adapted to climatic conditions on the Project site. Judicious incorporation of specific non-native plants within the native-dominated planting palette will allow for wildlife diversity to be maximized within the new planting areas. Non-native species used in landscaping will be species that are adapted to local conditions so that they also will require minimal irrigation, fertilizers, and pesticides.

- **Maintenance of habitat connectivity:**

  To help maintain habitat connectivity through the site, at least along the southern edge of HPS Phase II, in light of the roads, trails, and buildings that will be constructed in the Project area, vegetated areas providing cover for dispersing mammals, reptiles, and amphibians would be provided. In some areas, restored tidal marsh will provide some habitat connectivity along the shoreline. "Hardened" shoreline treatments, such as rock, will provide interstitial spaces that provide cover for these small animals as well. In addition, landscaping along the landward side of the shoreline treatments will provide vegetation that can serve as cover for these animals. To the extent feasible, potential obstacles to movement of small animals, such as fences, walls, curbs, and roads will be designed to allow for passage of animals across or through these features. On Candlestick Point, the SRA will be widened along the southwestern shoreline at an existing "pinch point". Revegetation of this area, and maintaining vegetation all along the CPRSA shoreline, would maintain habitat connectivity along the Candlestick Point shoreline as well.

- **Maintenance of refugia for waterbirds:**

  Waterbirds such as egrets, herons, and shorebirds forage along the Candlestick Point shoreline and along the southern shore of HPS Phase II. At low tide, these birds forage on exposed mudflats and beaches, while at high tide, they may congregate in areas providing high-tide roosting and/or foraging habitat. In planning for future trails, vistas, and other features/facilities that might concentrate human activities along the waterfront, it is important that human access to shoreline areas is not so pervasive that there are no undisturbed high-tide roosting areas for these birds. Therefore, at least one shoreline area where waterbirds can roost at high tide would be provided that is at least 200 feet from the nearest formal trail or shoreline observation area. Here, waterbirds would be able to roost on riprap, beach, or some other open area removed from concentrated human activity.

  In addition, the bases of the three piers in the southeastern corner of HPS Phase II will be removed to prevent mammals from accessing these piers. The remainder of each of these three piers will be left in place to provide roosting sites for gulls, cormorants, pelicans, and terns. Shorebirds and herons may roost on these structures as well. While waterbirds currently use these piers for roosting, the number of birds using these piers, particularly at night when mammalian predators such as raccoons are most active, may be limited by the ability of mammalian predators to access these piers. Removal of the bases of these piers will prevent the ability of mammals to access roosting birds. The increased security of the piers may also encourage some waterbirds to begin nesting on the piers. If birds show interest in using these piers as nesting sites, addition of nesting substrate such as gravel or shells in certain areas could further encourage nesting by waterbirds.

- **Provision of nest boxes:**

  Nest boxes for birds will be placed in appropriate locations throughout parks and open space areas. Nest boxes will range in size from larger boxes that will be suitable for use by barn owls and American kestrels to smaller boxes that would provide nest sites for chestnut-backed chickadees, tree swallows, and other birds.

Sanderling, Western Sandpipers

- **Creation of tidal marsh and high beach habitat**

  There are several opportunities for creating tidal marsh or high beach/dune habitat in the project area. Along the southern shoreline of HPS Phase II and portions of the shoreline of Candlestick Point that are not subject to high wave action, marsh soils will be placed on the outboard side of shoreline revetments that will be constructed to protect the shoreline. With limited planting of native salt marsh plants, but primarily through natural recruitment, narrow bands of tidal salt marsh will be created in these areas. More extensive tidal marsh could be created in a few "pockets" along the northern and eastern shores of Candlestick Point, where laying back the slope along the shoreline could allow for the creation of broader marsh that would transition upslope to dune scrub and upland habitats. These habitats will contribute organic matter to intertidal and subtidal habitats nearby, enhancing benthic animal populations and so improving foraging habitat for fish, shorebirds, and diving ducks. These vegetated bands would also provide foraging habitat for some small birds and cover for mammals.

- **Increase in open water habitat**

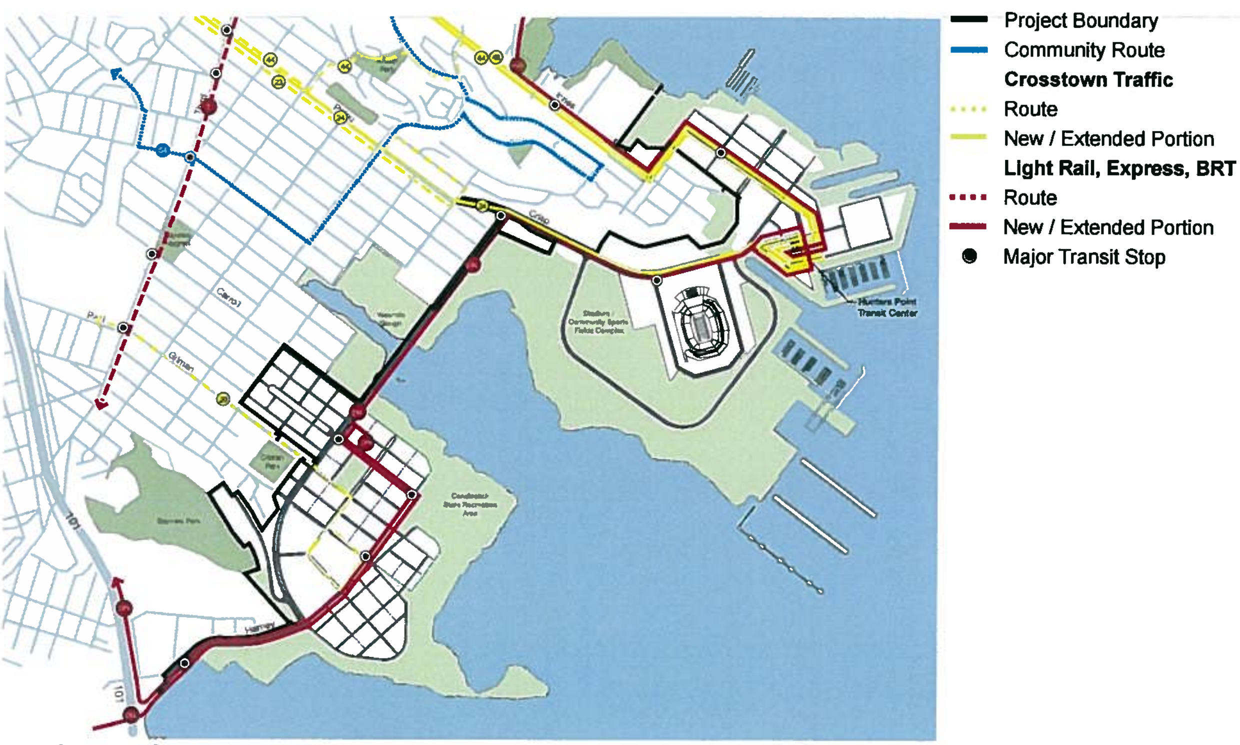
  Although the project includes the placement of fill in some wetlands and aquatic habitats for the purpose of constructing shoreline improvements, the Yosemite Slough bridge, and a marina, the project also includes the removal of fill and structures that currently exist in some locations. For example, along much of the eastern shoreline of HPS Phase II, existing pier walls will be removed and the edges of the existing shoreline "laid back". As a result, new subtidal and intertidal habitat will be created along portions of the shoreline currently occupied by fill, and the project as a whole will result in a net increase of 8 acres of open water that can serve as habitat for fish and benthic organisms.

Park and Shoreline Access Improvements

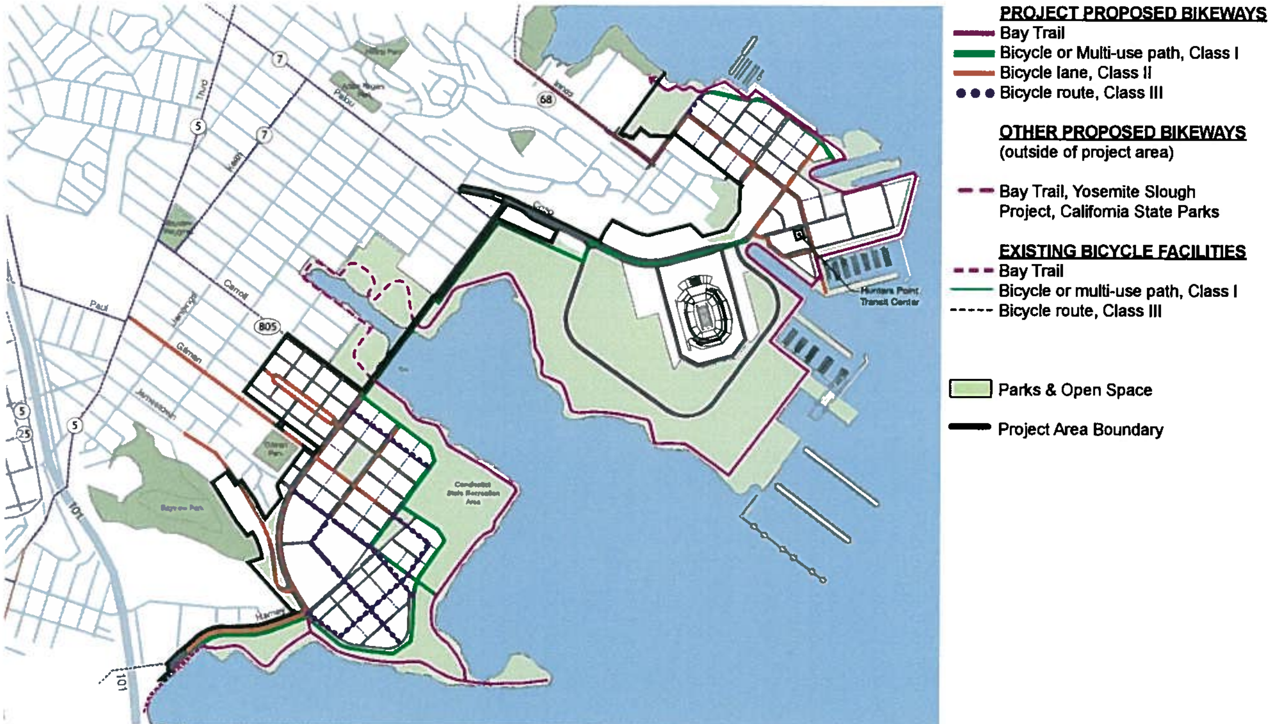
New parks and public spaces will be easily accessible to existing neighborhoods and visitors from other parts of the City and beyond. New pedestrian, bicycle, and transit improvements will provide healthy and sustainable modes of park access. Bike and pedestrian access throughout and between park areas will be coordinated to provide seamless connections. Note that in some places, such as Bayview Hill, extreme topographic challenges prevent direct bike and pedestrian trail connections.

Parking facilities at the State Park, Sports Field Complex, and Marina will be provide for visitors arriving from more distant areas with large groups, and recreational gear and supplies.

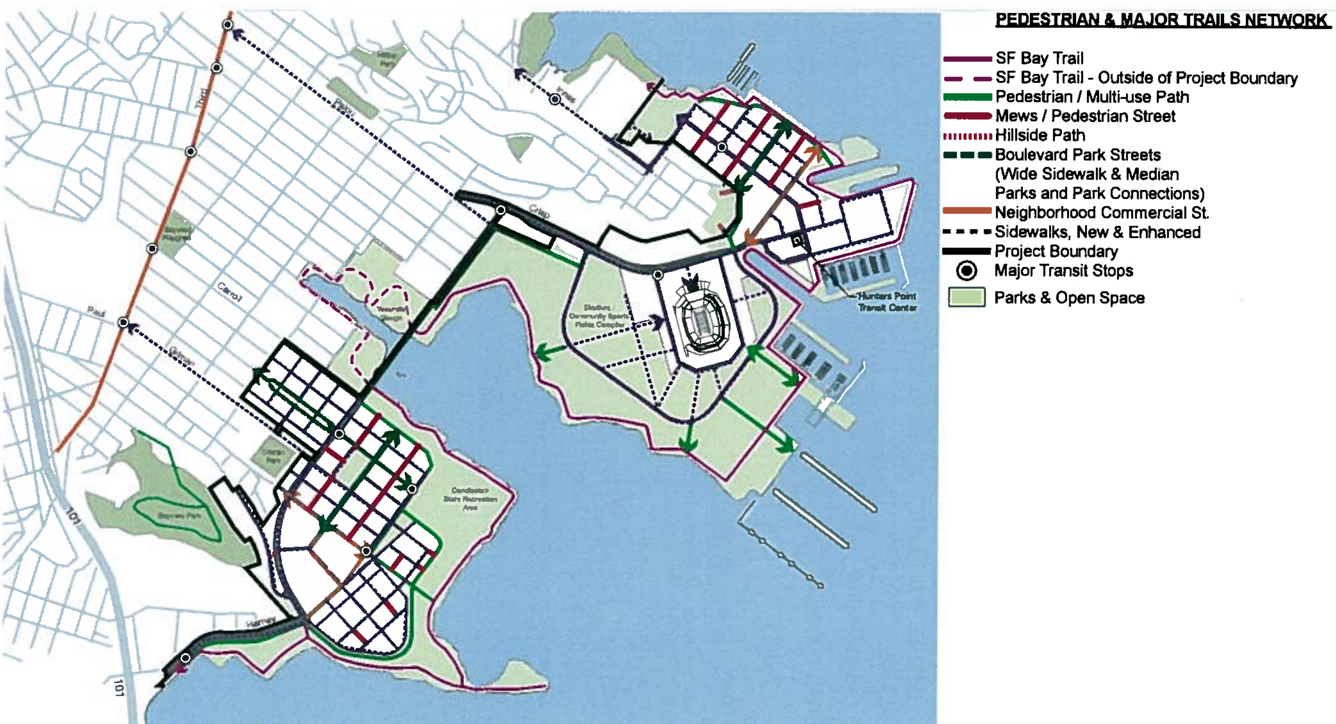
As one means of creating a quieter, healthier and more sustainable city, in some places there will be no automobile roadways between public and private property. In these places, the design of this edge will be carefully designed to create a clear delineation of public and private space, while encouraging full access and use of the public space.



Transit Network



Bikeways Network



Pedestrian & Major Trails Network

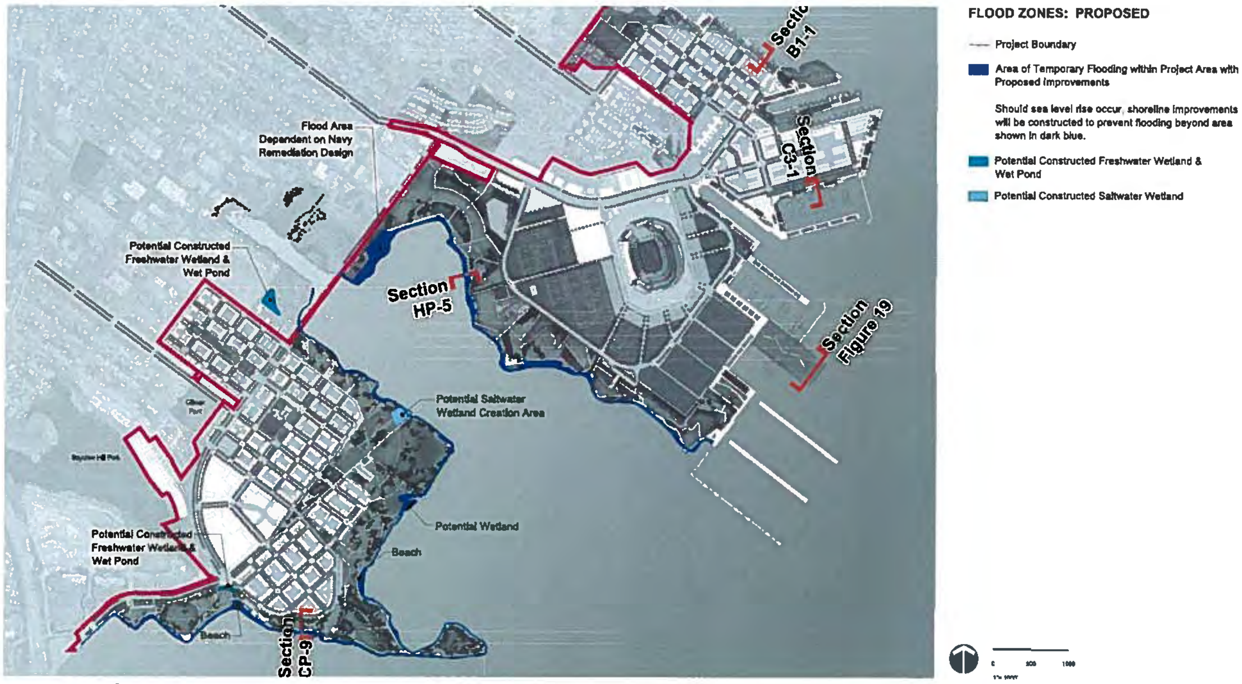
Sea Level Rise Strategy

A project-specific study was undertaken to develop a comprehensive approach to address future sea level rise. The study was based on an exhaustive review of the literature, recent guidance from regional agencies, and knowledge of coastal processes of San Francisco Bay. In almost all of the science reports reviewed, a 36-inch sea level rise increase would not be reached until after 2100. Even with the most aggressive projection of SLR that includes ice cap melt, the increase in sea level would reach 36 inches between the year 2075 and 2080.

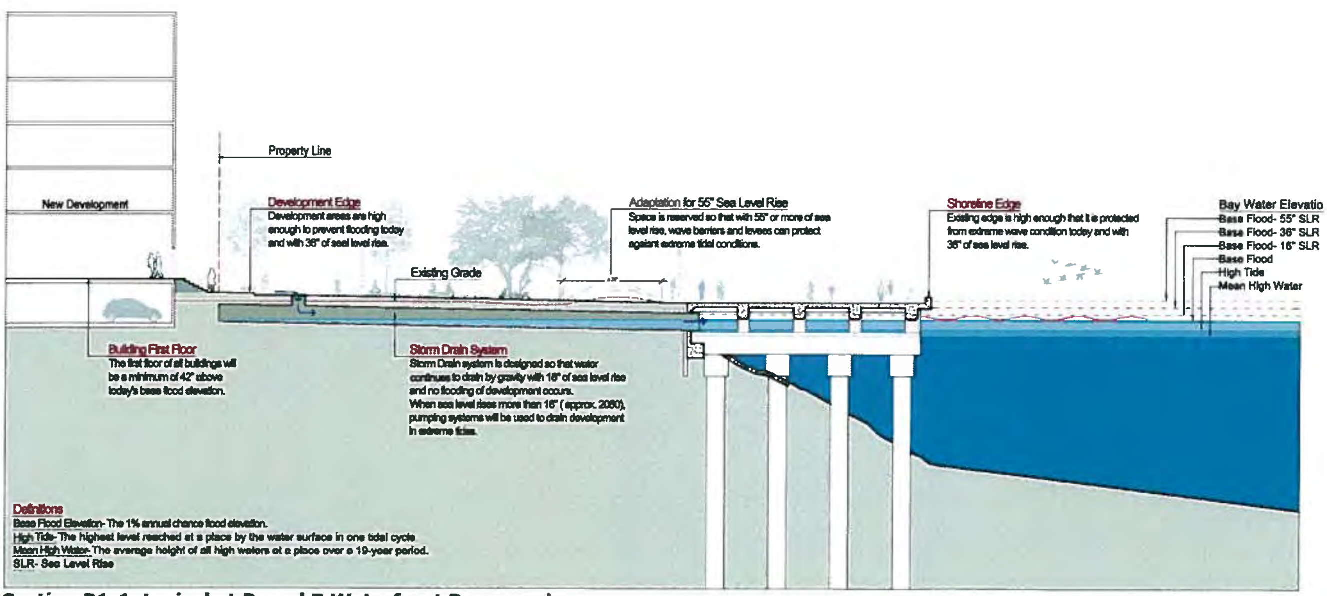
An allowance of 36 inches of sea level rise for establishing development grades was selected as an appropriate planning number for the project. All parking lots and streets will be at an elevation that is 36-inches higher than the present day base flood elevation (the 1% annual chance flood elevation).

In many areas of the existing shoreline, grades are already higher than the existing base flood elevation and would also be above the base flood elevation after 36 inches of sea level rise. The locations where grades are lower and where flooding would occur are the narrow State Parks Area just south of Hunters Point Expressway and the shoreline areas of Hunters Point Parcel E and E-2.

Existing Flood Map - 1% annual chance flood today and with 36" sea level rise without improvements

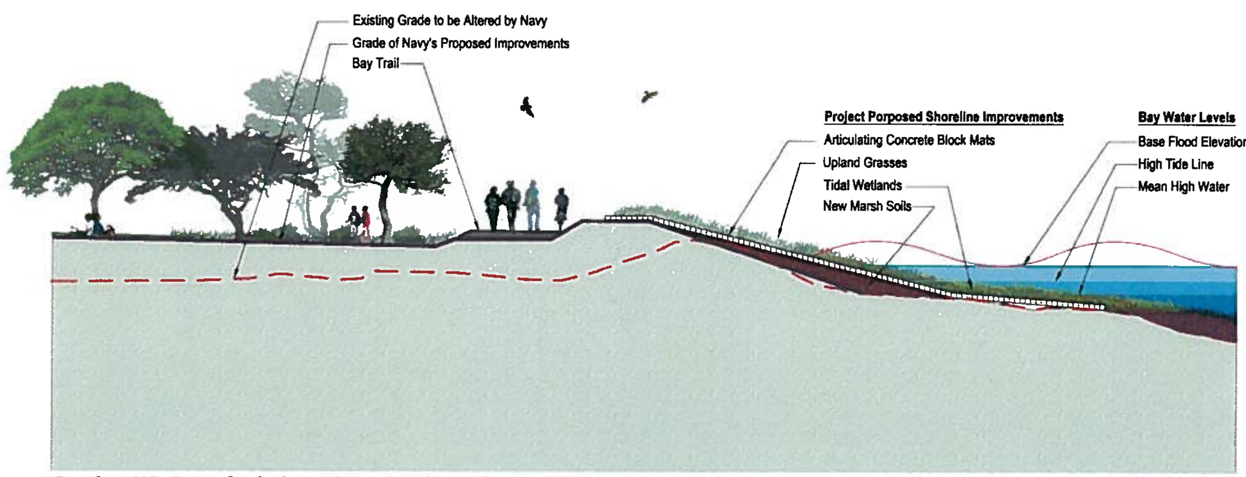


Proposed Flood Map - 1% annual chance flood at today's sea level, and 36" sea level rise



Section B1-1, typical at Parcel B Waterfront Promenade

The design of the park system will respond to future rising sea level by reserving an adaptive management zone in low shoreline areas. In some places this zone will allow for waters to rise and new wetland habitats to form. In other areas the zone will allow for mounding up to create protective embankments.



Section HP-8, typical along Grasslands Ecology Park, Parcel E / E-2

Materials & Elements

Planting

Plant selection will be specific to each location, based on microclimate and soil conditions and the program of the park. In general, park and open space plant selection will focus on native and climate-adapted species that require minimal water use and maintenance. Other factors that may influence plant selection include aesthetics, cultural significance, and habitat value.

Materials

Materials for paving, pathways, and park structures will be selected to reinforce and height the sense of place, minimize environmental impact, maximize durability, longevity and ease of maintenance. These materials may include recycled and salvaged materials such as reclaimed crushed or slab concrete, reclaimed wood, and re-purposed steel bollards and rails. New may include concrete, asphalt, decomposed granite, corten steel, stainless steel.

Furnishings

Park furnishings include elements such as site lighting, trash receptacles, bicycle racks, drinking fountains, signage, and benches. The set of furnishings may vary by park type (City Park, State Park, Ecology Park, Waterfront Promenade) as appropriate to heightening the sense of place. In general, furnishing will reflect a simple, modern, and timeless style. Like other materials, they will also be selected to minimize environmental impact, and maximize durability, longevity, and ease of maintenance.

EXECUTIVE SUMMARY

The City of San Francisco provides protection for trees by way of its Urban Forestry Ordinance (Ord. 165-95, App. 5/19/95), Article 16, Sections 806 (Planting and Removal of Street Trees) through 810 (Significant Trees) of the *Public Works Code*. The City's ordinances protect "landmark trees", "significant trees", and "street trees". Landmark trees are trees that are so designated by the City Board of Supervisors, based on a recommendation from the Urban Forestry Council, on the basis of their age, size, shape, species, location, historical association, visual quality, and other contribution to the City's character. Significant trees are defined as trees within 10 feet of a public right-of-way that also meet one of the following size requirements: 20 feet or greater in height; 15 feet or greater in canopy width; or 12 inches or greater diameter of trunk measured at 4.5 feet above grade. Street trees are defined as any tree growing within the public right-of-way, including unimproved public streets and sidewalks, and any tree growing on land under the jurisdiction of the Department of Public Works.

In October 2009, H. T. Harvey & Associates plant ecologists surveyed the Candlestick Point/Hunters Point Shipyard Phase II (CP/HPS) project area for trees protected by the City's ordinances. The survey covered the entire CP/HPS project area except for the portion of Candlestick Point State Recreation Area that is not subject to a land transfer associated with the project and that is thus not expected to be substantially modified by project activities. For the purpose of this survey, a "tree" was defined as any stem of a woody plant with a tree-like (as opposed to shrubby) growth habit measuring at least 2 inches in diameter at breast height (dbh; a height of 4.5 feet above the ground). As a result, single trees with multiple stems measuring at least 2 inches dbh were represented as multiple "trees".

For each woody stem at least 2 inches dbh, the diameter was measured with a Biltmore stick. Those stems with a dbh of 12 inches or greater automatically met one of the size criteria for a significant tree. For other stems for which the dbh was less than 12 inches, but the height was at least 20 feet (ft) or the crown width was at least 15 ft, these parameters were also recorded. Each individual tree was GPS-located.

The tree survey recorded 1,976 tree stems at least 2 inches dbh on 1,068 individual plants on Candlestick Point and 854 tree stems at least 2 inches dbh on 328 individual plants on Hunters Point Shipyard Phase II. Because single trees with multiple stems measuring at least 2 inches dbh were represented as multiple "trees," the high number of trees recorded during this survey was driven largely by such multi-stemmed individuals. Of these, 1,079 stems on Candlestick Point and 400 stems on Hunters Point Shipyard Phase II meet the size criteria for significant trees. Determination of which trees actually meet the criteria for significant trees and street trees will require a determination of which trees are on or within 10 feet of a public right-of-way or on other land under the jurisdiction of the Department of Public Works. No landmark trees are present on the project site.

INTRODUCTION

PROJECT AREA DESCRIPTION

The Candlestick Point/Hunters Point Shipyard Phase II (CP/HPS) project area is located within the City and County of San Francisco, California (Figure 1). The land areas are situated in southeastern San Francisco within the Bayview District directly adjacent to San Francisco Bay, east of Highway 101. The CP/HPS project area includes the Candlestick Point State Recreation Area (CPSRA).

SURVEY PURPOSE

The City of San Francisco provides protection for trees by way of its Urban Forestry Ordinance (Ord. 165-95, App. 5/19/95), Article 16, Sections 806 (Planting and Removal of Street Trees) through 810 (Significant Trees) of the *Public Works Code*. The City's ordinances protect "landmark trees", "significant trees", and "street trees". Landmark trees are trees that are so designated by the City Board of Supervisors, based on a recommendation from the Urban Forestry Council, on the basis of their age, size, shape, species, location, historical association, visual quality, and other contribution to the City's character. Significant trees are defined as trees within 10 feet of a public right-of-way that also meet one of the following size requirements: 20 feet or greater in height; 15 feet or greater in canopy width; or 12 inches or greater diameter of trunk measured at 4.5 feet above grade. Street trees are defined as any tree growing within the public right-of-way, including unimproved public streets and sidewalks, and any tree growing on land under the jurisdiction of the Department of Public Works.

The CP/HPS project is expected to result in impacts to some of the trees on the site that are subject to the City's Urban Forestry Ordinance. As a result, a tree survey is necessary to determine the number and location of trees on the site so that impacts to these trees can be avoided and minimized to the extent practicable during project planning, design, and construction, and so that the appropriate approvals can be obtained from the City to allow for the removal of trees that cannot be avoided. Thus, H. T. Harvey & Associates conducted a tree survey for all areas that could potentially be impacted by the project.

Candlestick Point / Hunters Point Shipyard
Tree Survey: Vicinity Map

Proj No. 2943-02	Date Nov. 2009	Figure 1
ML	N:\Projects\2943-02\Reports\Tree Survey	

SURVEY METHODS

In October 2009, H. T. Harvey & Associates plant ecologists surveyed the Candlestick Point/Hunters Point Shipyard Phase II (CP/HPS) project area for trees protected by the City's ordinances. The survey covered the entire CP/HPS project area except for the portion of Candlestick Point State Recreation Area that is not subject to a land transfer associated with the project and that is thus not expected to be substantially modified by project activities.

The City maintains a registry of designated landmark trees. H. T. Harvey & Associates contacted the City's Bureau of Urban Forestry to determine whether any such trees are present within the CP/HPS project area, and confirmed the response by viewing the map of landmark trees at http://www.sfenvironment.org/our_programs/interests.html?ssi=4&ti=8&ii=131.

The City's Urban Forestry Ordinance identifies size criteria for "significant trees", but no size criteria are given for "street trees". However, City Planning Code Sec. 143 states that trees planted as street trees within certain planning districts must be a minimum of 2-inch caliper. Therefore, for the purpose of this survey, a "tree" was defined as any stem of a woody plant with a tree-like (as opposed to shrubby) growth habit measuring at least 2 inches in diameter at breast height (dbh; a height of 4.5 feet above the ground). The City's Urban Forestry Ordinance does not indicate whether each stem of a multi-stemmed tree counts as a separate "tree"; to ensure that the appropriate data were collected, we considered each stem measuring at least 2 inches dbh to represent an individual "tree", even if multiple stems derived from a single plant.

For each woody stem at least 2 inches dbh, the diameter was measured with a Biltmore stick. Those stems with a dbh of 12 inches or greater automatically met one of the size criteria for a significant tree, and thus height and crown width were not estimated for such stems. For stems for which the dbh was less than 12 inches, but the height was at least 20 feet (ft) or the crown width was at least 15 ft, these parameters were also recorded. Each stem measuring at least 2 inches dbh on a tree that, in total, was at least 20 ft tall or had a crown width of at least 15 ft was considered a significant tree; thus, a single tree with five stems of 2 inches or greater dbh, and with a total crown width (from all stems) of at least 15 ft, was considered five separate significant trees for the sake of this survey.

Each individual tree was identified to species or genus where possible, though a few ornamentals could not be identified. Each tree was also GPS-located.

SURVEY RESULTS

The tree survey recorded 1,976 stems at least 2 inches dbh on 1,068 individual plants on Candlestick Point and 854 stems at least 2 inches dbh on 328 individual plants on Hunters Point Shipyard Phase II. Of these, 1,079 stems on Candlestick Point and 400 stems on Hunters Point Shipyard Phase II meet the size criteria for significant trees. Data for Candlestick Point and Hunters Point Shipyard Phase II are presented in Appendices A and B and summarized in Tables 1 and 2, respectively. The locations of individual trees are shown on Figures 2a and 2b.

Table 1. Trees species recorded on Candlestick Point.

Common Name	Scientific Name	No. of Individuals[1]	No. of Stems[2]	No. Potentially Significant Stems[3]
Acacia	*Acacia* sp.	57	97	67

Hunters Point Shipyard Tree Survey Results

Proj No. 2943-02	Date Nov. 2009	Figure 2b

ML N:\Projects\2943-02\Reports\Tree Survey

Because single trees with multiple stems measuring at least 2 inches dbh were represented as multiple "trees," the high number of trees recorded during this survey was influenced substantially by the number of multi-stemmed individuals. On Figures 2a and 2b, and in Appendices A and B, tree numbers correspond to individual plants, with some having multiple stems as detailed in Appendices A and B.

The large number of trees considered "significant" was largely the result of the way in which significant trees were defined for this survey; multiple stems of trees with a combined canopy width of 15 ft, or with at least one stem 20 ft tall, were all considered significant trees. Determination of which trees actually meet the criteria for significant trees and street trees will require a determination of which trees are on or within 10 feet of a public right-of-way or otherwise on land under the jurisdiction of the Department of Public Works.

According to the Bureau of Urban Forestry and review of the map on the City's landmark tree website (http://www.sfenvironment.org/our_programs/interests.html?ssi=4&ti=8&ii=131), no landmark trees are present on the project site.

SUBJECT: Potential Wind Conditions at Executive Park Development
Windsurfing Area Testing
San Francisco, California
ESA 208449

I. Introduction and Overview

A series of wind tunnel tests were performed in February 2009 for the Executive Park development proposed in the southeastern area of the City of San Francisco, near Candlestick Point. The wind tests were performed to study the wind conditions at a windsurfing launch site at the Candlestick Point State Recreation Area (CPSRA) and in the sailing area in the Bay to the southeast of the site. This study considered winds under the Existing development conditions, under the Project scenario, and under the Project with Cumulative development scenario.

The buildings now under construction, as well as the approved, but not yet constructed buildings in the vicinity of the site were considered to be part of the existing setting conditions. The conditions for the Project at the Executive Park site include demolition of 3 existing buildings and the construction of 13 separate buildings (or building clusters) with roof heights ranging from approximately 86 to 293 feet. The cumulative conditions include the Project plus structures proposed as part of the redevelopment of the Candlestick Point area located immediately north of the CPSRA windsurfing launch site.

Background and details of the test methods are presented in this technical memorandum in Section II, Background and Wind Test Protocols. Test results and discussion are presented in Section III, Test Cases and Study Results.

ESA

Summaries of Tests

Three development scenarios were modeled and tested in the atmospheric boundary layer wind tunnel. The scenarios are: 1) Existing Setting, 2) Project, and 3) Project plus Cumulative. Measurements of wind speed and wind turbulence were taken at points within a windsurfing test area defined by a 1,750 ft. by 2,500 ft. downwind measurement grid, anchored at the CPSRA windsurfing launch and landing area and reaching generally toward the South-southwest, covering an area of 100.44 acres of the Bay. With respect to wind testing of windsurfing areas, three of the standard wind test protocols were varied[1], for these reasons:

- Southwest winds blow onshore, across the Project site and toward Bay View Hill. A wind from the Southwest that blows across the Project site could not reach the windsurfing areas that lie to the south of Candlestick Point. Thus, neither the Project nor the Cumulative scenario would have any effect on winds in the windsurfing areas south of Candlestick Point for Southwest wind.

- For the West wind, the most southerly of the test grid locations were not measured. Those test grid locations far south of the launch area are crosswind to the West wind and are well outside of the area that could potentially be affected by development under either the Project or the Project plus Cumulative scenario.

- The windsurfing areas are relatively distant from the Project site, the closest grid point being approximately 2,000 feet distant. Even at the closest of the windsurfing test locations, it cannot reasonably be anticipated that meaningful differences can be found between the wind speed and turbulence measurements for the Project scenario and the measurements for the Alternative scenario. Therefore, both the Project scenario and the Alternative scenario wind conditions are well represented by either test scenario. The physical model used in the test was the Alternative scenario.

Existing Setting

The existing setting consists of the existing buildings on and in the vicinity of the Project site, including the St. Francis Bay development, other developments, including the Signature and Hanover projects, and St. Francis Bay Phase III. The existing setting also includes Candlestick Park stadium.

<u>Wind Speed</u>

- Northwest wind speeds in the test grid closer to shore range from 42% to 50% of overhead wind speed, increasing to between 55% and 60% of overhead wind speeds farther from shore. This pattern, with lower wind speeds nearer the shore, shows the combined "wind shadow" effect[2] of Bay View Hill, existing buildings and the Candlestick Park stadium. With increasing downwind distance, wind speeds recover.

- West-Northwest wind speeds in the test grid are generally between 55% and 60% of overhead wind speeds. A smaller "wind shadow" extends from the shore.

---

1 See the section "Model and Wind Testing Protocols" for more detail on these items.

2 The "wind shadow" is due to the local decrease in wind speed that results from redirected winds and drag that effectively decrease the speed of the wind as it passes over and around the hill, other landforms and vegetation, and the structures.

- West wind speeds in the test grid are generally between 55% and 60% of overhead wind speeds. A small "wind shadow" occurs close to the shore.

Wind Turbulence

- Northwest wind turbulence intensity[3] (TI) values between 22% and 26% occur in the test grid nearer the shore, in the "wind shadow", where wind speeds are low. TI values decrease downwind, generally as wind speeds increase. TI values range from 18% to 22% over about half of the grid area. TI values between 14% and 18% occur only in areas farthest downwind.

- West-Northwest wind TI values range from 14% to 18% over most of the test grid, with higher TI values, ranging from 18% to 22% in a 1.5-acre± area[4] near the shoreline at the northwest corner of the test grid. TI values are higher where wind speed is lower.

- West wind, TI values are between 14% and 18% over most of the test grid, with higher TI values, ranging from 18% to 22%, in a 1.5-acre± area near the shore, where wind speed is lower.

Project

This scenario consists of the demolition of three existing buildings and addition of the proposed Executive Park development projects.

Wind Speed

- Northwest wind speeds would decrease by 5% to 10% with the Project, compared to Existing wind speeds, in two areas of the grid well south of the CPSRA windsurfing launching and landing area. These two areas are two bands that extend part way across the grid; one more than 600 ft south and one more than 1,200 ft south-southwest of the CPSRA windsurfing launching and landing area. Northwest wind speeds in other areas of the grid would not decrease by more than 5%; in several patches, Northwest wind speeds would either not change or would increase slightly.

- West-Northwest wind speeds would decrease by 10% or more with the Project, compared to Existing wind speeds, in an area that includes the present CPSRA windsurfing launching and landing area. This 2.5-acre± area would extend as far as approximately 125 ft. from the shoreline. West-Northwest wind speed decreases of 5% to 10% would occur over nearly one-third of the grid area, while wind speed decreases of 0% to 5% would occur over approximately half of the grid area.

- West wind speeds over the entire grid area, except at the northwest tip of the grid, would not decrease by more than 5% from Existing wind speeds due to the Project.

Wind Turbulence

3 Wind turbulence intensity, as defined and used in Planning Code Section 148 is represented here by the abbreviation TI. See the discussion in Section II. Background and Test Protocols

4 The estimates of the test grid areas contained within various wind speed range and turbulence isopleths are approximations; the areas are flagged in this memorandum by the symbol ±, to indicate an approximate value.

- Northwest wind TI values would generally increase, just as wind speeds would generally decrease, under the Project scenario, as compared to Existing TI values. TI values would be between 26% and 30% at three spots in the northwest portion of the grid, generally where Northwest wind speeds would be lower. TI values would decrease downwind, just as wind speeds would increase. TI values would be between 22% and 26% over nearly one-quarter of the grid and between 18% and 22% over about three-quarters of the grid. TI values would range from 14% to 18% at two spots farthest downwind.

- West-Northwest wind TI values with the Project would range from 14% to 18% over a 40-acre± area at the south end of the grid, with higher TI values, ranging from 18% to 22%, over a 37-acre± area to the north. TI values of 22% to 26% would occur in a 10-acre± area along the shoreline, including the present CPSRA windsurfing launching and landing area. TI values would be between 26% and 30% in a 1-acre± area at the northwest corner of the grid, where wind speed would be low.

- West wind TI values between 18% and 22% would occur in a 17-acre±± area along the shoreline with the Project. This area would extend from the CPSRA windsurfing launching and landing area to the northwest corner of the grid. TI values would range from 14% to 18% over the rest of the grid area. Again, TI would be high where wind speed is low.

Project plus Cumulative

This scenario consists of the Project with the addition of Cumulative development proposed in the redevelopment area north of the CPSRA launch site and windsurfing area of the Bay. Candlestick Park Stadium would be demolished.

Wind Speed

- Northwest wind speeds would decrease by 10% to 20% under the Project plus Cumulative scenario, compared to Existing wind speeds, along an 7-acre± shoreline area that includes the present CPSRA windsurfing launching and landing sites and extending more than 300 ft. into the Bay there. Northwest wind speed decreases of 5% to 10% would occur over a nearly 36-acre± area of the grid. Northwest wind speeds in other areas of the grid would not decrease by more than 5%; in a 12-acre± area near the center of the grid, Northwest wind speeds would either not change or would increase slightly.

- West-Northwest wind speeds would decrease by 10% to 20%, compared to Existing wind speeds, along a 10-acre± shoreline area that includes the present CPSRA windsurfing launching and landing area, and would extend from approximately 125 ft. to 500 ft. into the Bay. West-Northwest wind speed decreases of 5% to 10% would occur over a nearly 27-acre± area of the grid, while wind speed decreases of 0% to 5% would occur over a 40-acre± area of the grid. Wind speed increases of 0% to 5% would occur in a nearly 6-acre± area at the south end of the grid

- West wind speeds would decrease by 5% to 10% at one spot on the shoreline at the northwest tip of the grid. West wind speeds over the rest of the grid area would not change by more than 5% from existing wind conditions due to the Project plus Cumulative scenario, compared to Existing conditions.

Wind Turbulence

- Northwest wind TI values would generally increase, just as wind speeds generally decrease, under the Project plus Cumulative scenario, compared to Existing turbulence. TI values would be between 26% and 30% at a more than 2-acre± area at the northwest corner of the grid. TI values would decrease downwind, as wind speeds would increase. TI values would be from 22% to 26% over a 27-acre± area of the grid. TI values would range from 18% to 22% over almost all of the remaining grid area.

- West-Northwest wind TI values with the Project plus Cumulative scenario would range from 14% to 18% over an 47-acre± area at the south end of the grid, with higher TI values, between 18% and 22%, over an 30-acre± area to the north. TI values from 22% to 26% would occur in a 20-acre± area along the shoreline, including the present CPSRA windsurfing launching and landing area. TI values would be between 26% and 30% in a 1-acre± area at the shoreline at the northwest corner of the grid.

- West wind TI values from 18% to 22% would occur in a 17-acre± area along the shoreline with the Project plus Cumulative scenario. This area would extend from the CPSRA windsurfing launching and landing area to the northwest corner of the grid. TI values would be between 14% and 18% over the rest of the grid area. Again, TI would be high where wind speed is low.

Wind Evaluation Criteria

There are no established criteria, in the *Planning Code* or in the California Environmental Quality Act Guidelines or elsewhere, to define the level of reduction in wind speed that would constitute a "significant adverse impact" under CEQA for windsurfing at the CPSRA or in the Bay. Similarly, there are no CEQA criteria to define the level of wind turbulence that would constitute a "significant adverse impact" under CEQA for windsurfing.

II. Background and Test Protocols

Background

The difference in pressure between two points on the earth causes air masses to move over the earth from the area of higher pressure to the area of lower pressure. This movement of large masses of air results in winds. The interaction of a moving air mass with the surface of the earth creates turbulence and slows the motion of that layer of air that is next to the surface. The slower-moving air near the surface, in turn, slows the next layer of moving air just above it. The turbulence propagates upward, with the result that higher wind velocities are associated with air at greater heights above the surface. This relationship between height and velocity is referred to as a wind velocity profile. The shape of the wind velocity profile created depends on the roughness of the surface over which the wind moves. Smooth surfaces, such as flat open ground or water bodies, do not slow wind flow nearly as much as do rough surfaces, such as urban development, so they have different wind speed profiles.

Winds that move over San Francisco encounter differing levels of roughness, and differing wind speed profiles, due to differing topography, vegetation and structures that all act to slow the wind near the ground and create turbulence. However, when those winds reach large areas of smooth, flat surfaces, such as open land or the Bay, wind speeds near the surface of the ground or water will increase and the level of turbulence will decrease. Of particular importance to site wind conditions is the topography of the vicinity, which includes 525-foot high Visitacion Knob, in McLaren Park to the west-northwest, and the ridge that extends from McLaren Park eastward to the 250-foot high Bayview Hill several hundred feet north of the Project site. In addition to the topography, the extensive low-rise development and the US 101 Freeway that lie to the west and northwest, as well as other approved buildings of similar size that will lie immediately north of the site will strongly affect the prevailing winds that reach the Project site. Most of the Project structures would be built on currently vacant land containing parking lots, and some of the proposed buildings would be larger than the three existing on-site buildings that would be demolished. The overall mass of the development and the size of the proposed structures can be large enough to affect ground-level winds nearby and to have some effect on wind conditions downwind in the Bay.

From the perspective of windsurfers, the presence of these existing landforms and buildings that already lie upwind of windsurfing areas represent "roughness" that controls the speed and turbulence of the winds that reach the nearby wind surfing area in the San Francisco Bay. The Project would add additional building masses to the proposed site near the shore of the Bay, and thereby increasing the effective roughness of the site and decreasing the speed of the wind across the site.

Wind tunnel testing was used to document the existing wind conditions in identified windsurfing areas and to determine the extent to which those existing wind conditions would be altered by proposed development.

Existing Climate and Wind Conditions

While the wind conditions at the Project site are not the same as those in downtown San Francisco, wind conditions at the site can be related to the wind conditions at the old San Francisco Federal Building, just over 5 miles to the north, to account for the differences in wind speed. Correction factors have been calculated for the hourly wind speed and direction data collected at the old San Francisco Federal Building to allow the computation of pedestrian wind speeds at the Executive Park site and to allow comparisons of those statistics with the *Planning Code* criteria for pedestrian comfort and safety in the vicinity of the site. In addition to the wind data from the old San Francisco Federal Building, an hourly wind data record is available for the meteorological station at the San Francisco International Airport, approximately 6 miles to the south, where hourly wind speed and direction data also are collected. While the wind conditions of the Executive Park site are not identical to wind conditions at SFO, wind speed information at SFO is helpful in understanding the general wind conditions in the Bay at a location where winds are not as strongly affected by topography and structures.

The time of interest for sail boarding typically extends from the late spring well into fall, April 1st through November 1st, for times of day from 6 am until 7 pm, mainly during daylight hours. The wind data for the old San Francisco Federal Building consider a similar general daily interval, but does not differentiate by season; on the other hand, the summary of the data for the San Francisco Airport meteorological station discusses only the season from April 1st through November 1st. and the times of day from 6 am until 7 pm.

Old San Francisco Federal Building

Average winds speeds in San Francisco are the highest in the summer and lowest in winter. However, the strongest peak winds occur in winter. The highest average wind speeds occur in mid-afternoon and the lowest in the early morning. Westerly to northwesterly winds are the most frequent and strongest winds during all seasons. Of the 16 primary wind directions, four have the greatest frequency of occurrence and subsequently make up the majority of the strong winds that occur. These winds are Northwest, West-Northwest, West, and West-Southwest.

Data describing the speed, direction, and frequency of occurrence of winds were gathered at the old San Francisco Federal Building at 50 United Nations Plaza (at a height of 132 ft.) during the six-year period, 1945 to 1950. Measurements taken hourly and averaged over one-minute periods have been tabulated for each month (averaged over the six years) in three-hour periods using seven classes of wind speed and 16 compass directions. Analysis of these data shows that during the hours from 6:00 a.m. to 8:00 p.m., about 70% of all winds blow from five of the 16 directions as follows: Northwest (NW), 10%; West-Northwest (WNW), 14%; West (W), 35%; West-Southwest (WSW), 2%; Southwest (SW), 9%; and all other winds, 28%. Calm conditions occur 2% of the time. More than 90% of measured winds over 13 mph blow from these directions. Wind speeds and directions in the Project vicinity are altered by the topography of Bayview hill. The steps needed to adjust for these differences are described under the discussion of Wind Speed Profile Adjustments.

San Francisco International Airport

An examination of six years of record (78,638 hourly observations) of the hourly wind speeds and wind directions measured at the weather station at the San Francisco Airport meteorological station was used to establish the general frequency of occurrence of winds during the time of interest for sail boarding. A total of 23,935 hours of record for times of day from 6 am until 7 pm, mainly during the daylight hours, daily for April 1st through November 1st, was used to establish baseline wind conditions for the site vicinity. The highest average wind speeds occur in mid-afternoon and the lowest in the early morning. Westerly to northwesterly winds are the most frequent and strongest winds during all seasons. Of the 16 primary wind directions, four have the greatest frequency of occurrence as well as they make up the majority of the strong winds that occur; these are Northwest, West-Northwest, West and West-Southwest winds.

Analysis of these data shows that during the hours from 6:00 a.m. to 7:00 p.m., about 73.3% of all winds blow from five of the 16 directions, as follows: Northwest (NW), 19.0%; West Northwest (WNW), 27.6%; West (W), 15.9%; West Southwest (WSW), 6.7%; Southwest (SW), 4.0%; and all other winds, 24.4%. Calm conditions occur 2.3% of the time. When only wind speeds of 9 knots (10 mph) or more are considered, these percentages decrease by about 2% for each major direction: Northwest (NW), 17.0%; West Northwest (WNW), 24.6%; West (W), 13.8%; West Southwest (WSW), 4.4%; and Southwest (SW), 2.4%.

Wind Speed Evaluation Criteria

The comfort of pedestrians varies under different conditions of sun exposure, temperature, clothing, and wind speed. Winds from 8 to 13 mph will disturb hair, cause clothing to flap, and extend a light flag mounted on a pole. The top of this speed range marks a boundary beyond which pedestrians generally consider winds to be objectionable. By contrast, comfort seems less an objective and stronger winds are typically more valued in wind-powered activities such as windsurfing. Wind speeds of 13 mph or more are usually considered desirable for wind-powered activities, such as paragliding and hang-gliding, as well as for windsurfing. Typically, the more skilled the participant, the more higher the wind speed desired.

Wind speed effects on land and water-related uses of the Candlestick Point State Recreation Area (CPSRA) shoreline and Bay areas vary with the specific use. Sailing requires wind, and the more proficient the sailor, the more wind seems to be preferred. Wind direction is also important to windsurfing, in that an adverse wind direction can make it more difficult to launch, to reach a desirable sailing area or to return to the launch site. Wind is necessary to launch and land, but if winds are too strong at the launch site, beginners and less-skilled windsurfers could find it difficult to do either.

There appear to be no specific criteria for minimum wind speeds to support "good" sailing. Rather, for highly skilled windsurfers, it appears to be the case that the more wind in the sailing area, the better. If a project were to cause substantial wind speed reductions over much of a major windsurfing area or at an irreplaceable launching or landing site, the utility of the CPSRA and Bay as an important windsurfing area could be adversely affected. Similarly, there are no known criteria to determine the level of wind turbulence acceptable for windsurfing.

San Francisco Planning Code and CEQA Requirements

San Francisco *Planning Code* Section 148, Reduction of Ground-Level Wind Currents, contains requirements that are used for evaluation of wind impacts for the purposes of CEQA in San Francisco. Section 148 defines comfort and hazard criteria for pedestrian areas and defines the wind speeds in terms of equivalent wind speeds[5], an average wind speed (mean velocity), adjusted to include the level of gustiness and turbulence.

5 Equivalent mean wind speed is defined as the mean wind speed, multiplied by the quantity (one plus three times the turbulence intensity) divided by 1.45. This amplifies the equivalent mean wind speed values when turbulence intensity is greater than 15%. The *Planning Code* protocol definition of turbulence intensity differs from that in engineering use. There, the value used by the *Planning Code* (turbulence intensity / mean velocity) is called the "relative intensity of turbulence" or the "turbulence level". Regardless, references to Turbulence Intensity or TI in this Memo will follow the *Planning Code* protocol definition, unless otherwise noted.

There are no established criteria in the *Planning Code* to define the level of reduction in wind speed that would constitute a "significant adverse impact" under CEQA for windsurfing at the CPSRA or in the Bay.[6]

Just as there are no San Francisco criteria to define minimum wind speeds necessary to support windsurfing, nor are there established criteria to define the level of reduction in wind speed that would constitute a "significant adverse impact" under the California Environmental Quality Act (CEQA) for windsurfing at CPSRA or the Bay.

Model and Wind Testing Protocols

A 1:600 scale (1-inch to 50-foot scale) model of the Project site vicinity and a substantial downwind reach into the Bay was constructed in order to simulate the Project and its existing and future contexts. The test model included two configurations of the Project, for the purposes of conducting pedestrian wind testing. See Figures 1 and 2. The test model also included that portion of the Bay, extending southward from the Project site to approximately 1,000 ft. east of the launch area of the Candlestick Point State Recreation Area (CPSRA). The scale model of the Project and surrounding area was constructed by ESA from building plans provided by the Project architects. The windsurfing test area was defined by a 1,750 ft. by 2,500 ft. downwind grid, anchored at the CPSRA launch area and reaching generally toward the South-southwest. The scale models were then tested in an atmospheric boundary layer wind-tunnel facility at the University of California-Davis, under the direction of Bruce White, Ph.D. These wind tests, however, were performed independent of the University.

Three development scenarios were modeled and tested in the atmospheric boundary layer wind tunnel. The scenarios are: 1) Existing Setting, 2) Project, and 3) Project plus Cumulative.

With respect to the wind testing of effects on the wind surfing areas, three of the usual wind test protocols were varied, as follows, for the reasons stated here:

- For windsurfing area testing, the Southwest wind was not tested. The Southwest wind blows onshore toward the flank of Bay View Hill, and parallel to Harney Way at the Project site, so Southwest winds that blow across the Project site could not reach windsurfing areas that lie to the south of Candlestick Point. For that reason, under Southwest wind conditions neither the Project scenario nor the Cumulative scenario could have any effect on winds in the windsurfing areas that lie south of Candlestick Point.

- For the West wind direction, the test grid locations far south of the launch area are crosswind to the West wind and are considered to be well outside of the area that could potentially be affected by either the Project or the Project plus Cumulative scenarios. For that reason, test points that lie more than 1,500 feet south of the launch area were not measured for the West wind. The validity of this reasoning is verified by the test data, which show little north-south variation in the wind speeds for those points measured.

- The windsurfing areas are relatively distant from the Project site, the closest point being approximately 2,000 feet from the Project site boundary. At such distances, even at the closest of the test locations in the

[6] ~~The City of Burlingame, in an EIR that evaluated the effects of a proposed shoreline development on windsurfing, applied the~~ following standard of significance for the purposes of that EIR: "A reduction of 10% or more in wind speeds at irreplaceable launching and landing sites, or a reduction in wind speed of 10% or more over large portions of transit routes or primary board sailing areas would be a significant adverse impact."

ESA

windsurfing area grid, it cannot reasonably be anticipated that meaningful differences can be found between the wind speed and turbulence measurements for the Project scenario and the wind speed and turbulence measurements for the Alternative scenario[7]. For this reason, to determine the possible Project effect on wind in windsurfing areas, both the Project scenario and the Alternative scenario wind conditions are well represented by a single scenario. The physical model used in the test was the Alternative, which is the same as the Project, except that Alanna Way is realigned and there is a revised design for one proposed Project building (Building 8) located in the southwest corner of the Project site.

[7] A simple analysis of the decay of the wind speed reduction *vs.* distance from the center of the site of Building 8 for each of the two scenarios, the Project and the Alternative, shows that the wind speed reductions for each scenario converge to values that differ by less than 20% at a ground distance of less than 900 ft. and to within 4% at a distance of less than 1,200 ft. By extrapolation, these differences between Project and Alternative would be less than 1% at any point in the windsurfing test grid, more than 2,000 ft. from the center of the Building 8 site. This 1% difference cannot be considered to be meaningful, because it is well within the range of uncertainty of the individual wind speed measurements. Therefore the effects of the Project and the Alternative would be the same.

Test Procedure

The test procedure consisted of orienting the selected configuration of the model in the atmospheric boundary layer wind-tunnel and measuring the wind speed at each of the test locations with a hot-wire anemometer. Hot-wire measurements were taken at most of the same surface points for all test configurations and wind directions. However, as noted above, test measurement points were varied to suit the specific needs for each wind direction.

The wind tunnel allows testing of natural atmospheric boundary layer flow past surface objects such as buildings and other structures. The tunnel has an overall length of 22 meters (m) (72 feet), a test section of 1.22 m (4 feet) wide by 1.83 m (6 feet) high, and an adjustable false ceiling. The adjustable ceiling and turbulence generators allow speeds within the tunnel to vary from 1 meter per second (m/s) to 8 m/s, or 2.2 mph to 17.9 mph.

Wind-speed measurements at each test location were made with a hot-wire anemometer, an instrument that directly relates rates of heat transfer to wind speeds by electronic signals that are proportional to the magnitude and steadiness of the wind. The hot-wire probe was calibrated to an accuracy of within 2% before the test procedure was begun. The hot-wire probe measured the analog voltage at a rate of 1,000 times per second for approximately 30 seconds at each test location. When converted to digital signals, this measurement provided approximately 30,000 individual voltage samples that were averaged and the root mean square calculated for each test location. These data, when converted to velocity using the calibration curves, provided the mean wind velocity and the turbulence intensity values used to calculate equivalent wind speed under the *Planning Code*. In that calculation, turbulence intensity (TI) is expressed as a percentage of mean velocity[8].

By measuring both the mean wind speeds and corresponding turbulence intensities, high wind speeds and gustiness (changes in wind speeds over short periods of time) could be determined. The ratio of near-surface speed to reference wind speed was calculated from the hot-wire measurements. The inherent uncertainty of measurements made with the hot-wire anemometer close to the surface of the model is ±5% of the true values.

These values were compared with measurements of the free-stream wind, measured at a scale height in excess of 1,500 feet, near the center of the wind tunnel. As a result, each wind tunnel measurement resulted in a ratio that relates the speed of surface-level wind to the speed of the free-stream wind. These wind speed ratios (called R-values here) are the primary output data of wind tunnel tests. The R-values, the ratios, are usually substantially less than 1.00 because, due to boundary layer effects, wind speeds at pedestrian level are usually much less than the speed of the free-stream wind[9].

Note that it is possible to correlate these wind speed ratios for each wind direction to the wind speeds actually measured at the reference elevation, in this case the height of the wind instrumentation at the San Francisco station, and then to convert them into representative values of wind speed on and around the Project site, as is done to compare with wind comfort and safety criteria under the *Planning Code*.

8 The *Planning Code* protocol definition is: Turbulence Intensity, TI = root mean square (velocity) / mean velocity. This definition differs from that in engineering use, as noted in a prior footnote.

9 For the purposes of comparison, in most cases where a wind hazard condition is found at a pedestrian location in San Francisco, at least one or more of the corresponding directional R-values exceeds 0.50. It is extraordinary to find an R-value that exceeds 0.70.

However, for the purposes of this analysis, it is of more use just to make direct comparisons between the ratios obtained for each wind direction and each scenario. Since each windsurfer can know the wind direction under which they sail, the change in the wind speed could be determined by comparing the ratios measured for the Project test with the ratios for Existing Conditions each for the relevant wind direction. The comparisons are made by dividing the ratios for each test point of the Project scenario by the corresponding ratio for the corresponding point of the Existing Condition. When expressed as a percentage, these ratios of the R-values are a simple measure of the percentage change in wind speed that would result from the Project.

In addition to wind speed and turbulence, the energy content of the wind can also be determined from the wind tunnel tests. Just as the wind speed is proportional to the R-values, the energy of the wind is proportional to the third power of the R-values. In a case where the wind speed would be reduced by 10%, the energy in that wind would be reduced by 27%. However, for the purposes of this analysis, R-values are studied because they relate directly to the most commonly used indicator, the speed of the wind.

With respect to the ability of wind tunnel testing to accurately simulate the wind conditions relevant to wind surfing, it has been well documented in the scientific literature that the atmospheric boundary layer wind-tunnel can correctly represent wind velocity, wind turbulence and the power spectrum of the wind.

Wind Speed Profile Adjustments

To obtain the proper scaling of calculated pedestrian level equivalent wind speeds, adjustments must be made to correct for differences between the relationship between height above the ground and wind speed (called "the wind speed profile") at the Civic Center weather station and the wind speed profile at the Project site. This study does not involve calculating equivalent wind speeds at pedestrian level, so it is not necessary to make corresponding corrections for the wind speed profile at the Project site. The following wind test cases and study results reflect the use of unadjusted values.

III. Test Cases and Study Results

Introduction

Wind-tunnel tests to measure wind speeds in the windsurfing area were conducted for three scenarios: the Existing Setting, Project, and Project plus Cumulative. As discussed previously in Model and Wind Testing Protocols, both the Project and the Alternative wind conditions are well represented by the same test scenario. The physical model tested was the Alternative scenario. For the reasons discussed previously, all further discussion in this Technical Memorandum will refer to this test scenario as the "Project" scenario.

Executive Park Wind Test . 208449

Figure 3
Study Area with Wind Tunnel Measurement Points

Up to 44 locations were measured for each of the various scenarios and wind directions. Considering the spatial relationship of the proposed development to the Bay and the windsurfing launch area, the wind tests focused on the effects of west (W), west-northwest (WNW), and northwest (NW) winds, the three wind directions that could be most affected by proposed development. Southwest winds are onshore winds and would not affect wind in the windsurfing areas, so southwest winds were not studied.

Test Locations

The 44 windsurfing test locations form an 8 by 11 grid, with 250 ft. spacing between each of the possible individual test points (see Figure 3). The test grid is oriented generally north-northeast by south-southwest, with the coordinate origin located approximately 1,000 ft. northwest of the primary windsurfing launch site at CPSRA. Boards launched here proceed in a southwesterly or south-southwesterly direction. The test grid area aligns with the shoreline near the windsurf launch area and covers the area of the Bay described as an important windsurfing area, based on information provided by Mr. Peter Thorner of the San Francisco Boardsailing Association (*Candlestick Sailing Tracks)*, attached to this document). The area within the 1,750 by 2,500 ft. test grid is 100.44 acres.

As described in Test Procedure, hot-wire measurements were taken at selected surface points for each of the three test configurations and three wind directions. As noted previously, the most southerly of the test points were not measured for the West wind direction as these locations are considered to be outside the area potentially affected by the Project scenario and the Project plus Cumulative scenario.

Test Results

The wind tunnel test outputs for each of the three scenarios produced three sets of detailed data tables, one set for each of the three wind directions. Data from these tables were plotted to figures that illustrate the existing conditions and changes that would result from implementation of Project, and also show the effects from cumulative development in the Candlestick Point area.

Figure 3 shows the measurement point locations in relation to the Project site and vicinity. Summary information about the wind tunnel test results are illustrated in the figures and details are discussed in the text that follows.

R Values
West Wind
Existing Setting

Test 1: Existing Setting

Wind Speed

The R-values under the Existing Setting for each of three wind directions: Northwest, West-Northwest and West are as follows:

- Northwest wind R-values vary from 0.39 to 0.58, indicating that the wind speed near the surface of the Bay is between 39% and 58% of the speed of the free-stream wind flowing high overhead.
- West-Northwest wind R-values range between 0.47 and 0.60 (47% to 60% of the free-stream wind).
- West wind R-values range from 0.51 to 0.61 (between 51% and 61% of the free-stream wind).

The R-values, as plotted in Figures 4, 5 and 6, are generally lower closer to the shoreline, due to the effects of the topography, rough ground surface and buildings in slowing the wind[10] as it moves over the land. The combined effects are most pronounced for Northwest wind. The depression of the R-values at the northeast corner of the grid defines the existing wind-shadow from the Candlestick Park stadium, located northwest of the CPSRA launch area.

Wind Turbulence

Values of turbulence intensity (TI) were measured for the Existing Setting for each of three wind directions: Northwest, West-Northwest and West. No TI values[11] were found that were less than 14% and no TI values reached 30%. Because the TI values fell close together, and because there was no reason to make finer distinctions, TI values are arbitrarily grouped within four 4%-wide "zones" or "areas" for plotting; each with a numerical identifier, as follows:

Area "1" - TI = 26% to 30%,

Area "2" - TI = 22% to 26%,

Area "3" - TI = 18% to 22%, and

Area "4" - TI = 14% to 18%.

Figures 7, 8 and 9 show plots of based on these isopleths of the turbulence intensity (TI) values measured for the Existing Setting under each of three wind directions: Northwest, West-Northwest and West. In general, the highest values of turbulence occur near the shore with the lower values occurring downwind. The highest peak TI values occur under Northwest winds. Lower peak TI values and smaller coverage areas occur for West-Northwest winds, while still lower peak values and much smaller coverage areas occur for West winds.

10 Vegetation, which was not included in the wind test model, can further increase wind drag and substantially decrease wind speeds.

11 The formula Planning Code Section 148 uses to compute "equivalent wind speed" assumes a baseline value of 15% for TI. Values of TI from wind testing of buildings in the Downtown typically exceed 15% and TI values in the range of 30% to 50% are not uncommon.

- Northwest wind TI values range from 26% near the shore to 14% downwind. The highest TI values (22% to 26%) cover 13-acre±s at the northwest corner of the grid, near the shoreline. The high TI is likely the result of the downwind "shadow" of the Bay View Hill, existing buildings at Executive Park and the existing Candlestick Park stadium. Lower TI values (18% to 22%) cover approximately half of the grid area, generally extending the downwind shadow of existing features. TI values range between 14% and 18% over the remaining one-third of the grid, in those areas farthest downwind. See Figure 7.

- West-Northwest wind TI values range from 14% to 18% over about three-quarters of the grid area, with TI values between 18% and 22% covering one-quarter of the grid close to shore, and 22% to 26% in a less than half-acre± area at the shoreline at the northwest tip of the grid. See Figure 8.

- West wind TI values range from 14% to 18% over almost all of the area, with higher TI values (18% to 22%) in a 1.5 acre± area near the shoreline at the northwest corner of the grid. See Figure 9.

Test 2: Project

The Project setting consists of plans provided by the architects that were added to the existing setting. The Project includes the demolition of three buildings in the existing setting and the construction of 13 separate buildings (or building clusters) and would range in height from approximately 86 to 293 feet. Some of the buildings would have internal courtyards, walkways, and other common areas.

Wind Speed

The R-values for each wind direction under the Project scenario[12] are as follows:

- Northwest wind R-values range from 0.40 to 0.57 (compared to Existing R-values of 0.39 to 0.58).
- West-Northwest wind R-values range from 0.39 to 0.59 (compared to Existing R-values of 0.47 to 0.60).
- West wind R-values range from 0.47 to 0.60 (compared to Existing R-values of 0.51 to 0.61).

As is evident above, the actual changes in the ranges of R-values between the Existing conditions and the Project scenario for each wind direction are typically not large. Because it is difficult to interpret the changes in the R-values by visually comparing two R-value plots, such as of Project and Existing conditions, it is more instructive to consider the change[13] between R-values for the Project scenario and the corresponding R-values for the Existing conditions, expressed as a percent of the Existing R-values. This method amplifies and clearly shows the relatively small percentage changes in R-values that occur over the area of the grid. Five isopleth values for percentage change in R-value were selected to cover the range of variation and to show sufficient detail to serve the analysis purposes of this study. The four bands or ranges formed by the five isopleths are as follows:

Area "1" - % Change in R-value = +5% to 0%,

Area "2" - % Change in R-value = 0% to -5%,

Area "3" - % Change in R-value = -5% to -10%, and

Area "4" - % Change in R-value = -10% to -20%.

Plots of these percentage differences in R-values are shown in Figures 10 through 12. Because R-values are proportional to wind speed, these plots also show real percentage changes in wind speed.

- For Northwest wind, the largest increase in measured R-values with the Project was 4.6%. The areas marked "1" and "2" in Figure 10 represent changes in R-values, and in wind speed, ranging from an increase of 4.6% to a decrease of 5%. The next largest, area "3", would undergo a decrease in R-values of 5% to 10% (a change in R-values in the range of -5% to -10%).
- For West-Northwest wind, the largest increase in R-values with the Project was 2.4%. Areas "1" and "2" in Figure 11 represent changes of +2.4% to -5% in R-values, and in wind speed. The next largest, area

[12] Plots of the R-values for each wind direction under the Project scenario are presented in Figures 22, 23 and 24, in Appendix 1.

[13] Difference = (R-value$_{project}$ – R-value$_{existing}$). The "change" is then the difference divided by R-value$_{existing}$.

"3", would undergo changes in R-values of -5% to -10%. Area "4", bordering the shoreline, would undergo changes in R-values of -10% to -20%. Area "4" is 2.5 acres± in size, about 2.5% of the area of the grid.

- For West wind, the largest increase in R-values was 2.9%, in area "1" on Figure 12. However, almost all of the grid, area "2" on Figure 12, shows changes of 0% to -5% in R-values, and in wind speed, with the Project.

In summary, the Project scenario would result in wind speed changes, relative to Existing wind speeds, ranging from an increase of 4.6% to a decrease of 10% for Northwest, West-Northwest and West winds over most of the area of the grid. For West-Northwest winds, an area near the shoreline representing approximately 2.5% of the grid area experiences changes in wind speed from -10% to -20%.

Wind Turbulence Intensity

Values of turbulence intensity (TI) were measured for the Project scenario under each of three wind directions: Northwest, West-Northwest and West. No TI values were 14% or less and no TI values were 30% or more.

Figures 13, 14 and 15 show plots that use the predefined TI isopleths, to plot the turbulence intensity (TI) values measured for the Project under each of three wind directions: Northwest, West-Northwest and West. In general, turbulence increases, with the highest values of turbulence occur near the shore and lower values occurring downwind. As in the Existing setting, the highest peak TI values occur under Northwest winds. Lower peak TI values and smaller coverage areas occur for West-Northwest winds, while still lower peak values and much smaller coverage areas occur for West winds.

- Northwest wind TI values with the Project range from 30% near shore to 14% in isolated downwind locations. The highest TI values (22% to 26% and 26% to 30%) cover approximately 25-acre±s along half of the west side of the grid Figure 13, near the shoreline. The Project clearly adds to the high TI of the Existing scenario. Lower TI values (18% to 22%) extend to cover approximately three-quarters of the grid area. TI values range between 14% and 18% over the remaining 3-acre±s of the grid, in two isolated areas far downwind.

- West-Northwest wind TI values with the Project range from 14% to 18% over about half of the grid area, with TI values between 18% and 22% covering over one-third of the grid close to shore, 22% to 26% in more than an 11-acre± area at the shoreline along the northern end of the grid, and reaching 26% to 30% in a half-acre± area at the northwest tip of the grid. See Figure 14.

- West wind TI values with the Project were 14% to 18% over about three-quarters of the area, with higher TI values (18% to 22%) in a 23-acre± area at the northwest corner of the grid. See Figure 15.

Test 3: Project plus Cumulative

This scenario consists of the Project together with cumulative development proposed directly north of the windsurfing area in the vicinity of the existing Candlestick Park stadium. In this scenario, the existing Candlestick Park stadium would be demolished.

Wind Speed

The R-values for the Project plus Cumulative scenario[14] for each wind direction are as follows:

- Northwest wind R-values range from 0.35 to 0.57 (compared to Existing R-values of 0.39 to 0.58).
- West-Northwest wind R-values range from 0.40 to 0.59 (compared to Existing R-values of 0.47 to 0.60).
- West wind R-values range from 0.47 to 0.59 (compared to Existing R-values of 0.51 to 0.61).

Comparative plots, showing the ratios of the R-values for the Project plus Cumulative scenario against the R-values for Existing conditions are shown in Figures 16, 17 and 18. These plots clearly show the differences in R-values, as percentage changes. Because of the relationship of R-values to wind speed, Figures 16, 17 and 18 also show true percentage changes in wind speed.

- For Northwest wind, the largest increase in R-values measured was +9.9%. The areas "1" and "2" in Figure 16 show changes that range from +9.9% to -5% in R-values, and in wind speed for the Project plus Cumulative scenario. The next largest, area "3", would undergo changes in R-values of -5% to -10%. Areas marked "4" would undergo changes in R-values of -10% to -20%. Area "4" is also located immediately offshore, but is smaller in comparison to that for the West-Northwest wind. Areas with changes of -10% to -20% for the Northwest wind occupy 7.2 acres±, 7.2% of the grid.
- For West-Northwest wind, the largest increase in R-values measured was +2.4%. The areas marked "1" and "2" in Figure 17 represent changes of +2.4% to -5% in R values, and in wind speed for the Project plus Cumulative scenario. The next largest area, marked "3", would undergo changes in R-values of -5% to -10%. Areas marked "4" would undergo changes in R-values of -10% to -20%. Area 4 extends from the shoreline to approximately 250 feet offshore, occupying a 10 acre± area, 10% of the area of the grid.
- For West wind, the largest increase in R-values measured was +2.7%. Almost the entire grid is area "2" in Figure 18, which shows changes are in the range of 0% to -5% in R-values and in wind speed for the Project plus Cumulative scenario.

In summary, wind speed changes due to the Project plus Cumulative scenario mostly results in wind speed changes ranging from no change to a 10% decrease in wind speed. A 10-acre± area near the shoreline would experience changes in wind speed from -10% to -20% with West-Northwest winds, and a similar 7.2-acre± shoreline area would experience wind speed changes from -10% to -20% with Northwest winds.

[14] Plots of R-values under the Project plus Cumulative scenario are presented in Figures 25, 26 and 27, in Appendix 1.

Figures 19, 20 and 21 use the five predefined TI isopleths to map the turbulence intensity (TI) values for the Project plus Cumulative scenario and each of three wind directions. In general, turbulence increases, with the highest values of turbulence occur near the shore and lower values occurring downwind.

- Northwest wind TI values range from near 30% near shore to 14% in isolated downwind locations for the Project plus Cumulative scenario. TI values would be between 26% and 30% at a more than 2-acre area at the northwest corner of the grid. TI values from 22% to 26% would cover approximately 27-acres along half of the west side of the grid, near the shoreline. Lower TI values (18% to 22%) would extend to cover the remaining area of the grid.

- West-Northwest wind TI values for the Project plus Cumulative scenario would range from 14% to 18% over a 47-acre± area at the south end of the grid, with TI values between 18% and 22% over a 30-acre± area to the north. TI values from 22% to 26% would occur in a 20-acre± area along the shoreline, including the present CPSRA windsurfing launching and landing area. TI values would be from 26% to 30% in a 1-acre± area at the shoreline at the northwest corner of the grid.

- West wind TI values between 18% and 22% would occur in a 17-acre± area along the shoreline for the Project plus Cumulative scenario. This area would extend from the CPSRA windsurfing launching and landing area to the northwest corner of the grid. TI values would be between 14% and 18% over the rest of the grid area. TI would be high where wind speed is low.

Appendix P2 Senate Bill 792 Tidelands and submerged lands: City and County of San Francisco: Hunters Point Naval Shipyard and Candlestick Point, October 11, 2009

Senate Bill No. 792

CHAPTER 203

An act to repeal Section 5006.8 of the Public Resources Code, to repeal Section 3 of Chapter 2 of the Statutes of 1958 of the First Extraordinary Session, to repeal Chapter 1046 of the Statutes of 1998, to repeal Chapter 464 of the Statutes of 2002, and to repeal Chapter 435 of the Statutes of 2003, relating to tidelands and submerged lands.

[Approved by Governor October 11, 2009. Filed with Secretary of State October 11, 2009.]

LEGISLATIVE COUNSEL'S DIGEST

SB 792, Leno. Tidelands and submerged lands: City and County of San Francisco: Hunters Point Naval Shipyard and Candlestick Point.

(1) Existing law grants to the City and County of San Francisco the right, title, and interest of the State of California in and to certain tidelands and submerged lands in trust for certain purposes. The State Lands Commission has jurisdiction over tidelands and submerged lands of the state.

The Hunters Point Shipyard Conversion Act of 2002 granted to, and vested in, the San Francisco Redevelopment Agency, all of the state's right, title, and interest in the Hunters Point trust lands, and, upon conveyance by the federal government to the agency, in appurtenances located on Hunters Point submerged lands, subject to the public trust and the terms and conditions of the act. The Hunters Point Shipyard Public Trust Exchange Act approved an exchange of public trust lands within the Hunters Point Shipyard, whereby certain trust lands that meet specified criteria and are not useful for public trust purposes are freed from the public trust and may be conveyed into private ownership, and certain other lands that are not public trust lands and that are useful for public trust purposes are made subject to the public trust. Existing law authorizes the Director of Parks and Recreation to enter into agreements concerning the development of a project in the City and County of San Francisco and partly within the Candlestick Point State Recreation Area.

This bill would repeal the Hunters Point Conversion Act of 2002 and the Hunters Point Shipyard Public Trust Exchange Act. The bill would also repeal the provision authorizing the Director of Parks and Recreation to enter into agreements concerning that project in the City and County of San Francisco.

This bill instead would grant to, and vest in, the San Francisco Redevelopment Agency, all of the state's right, title, and interest in Candlestick Point and the former Hunters Point Naval Shipyard trust lands, as revised, and, upon conveyance by the federal government to the agency, in appurtenances located on Hunters Point submerged lands, subject to the public trust, and the terms and conditions of this bill.

This bill would also approve an exchange of public trust lands within the lands conveyed, whereby certain trust lands or interests in lands that meet specified criteria and are not now useful for public trust purposes will be freed from the public trust and may be conveyed into private ownership, and certain other lands or interests in lands that are not now public trust lands and that are useful for public trust purposes will be made subject to the public trust.

The bill would require the agency to deposit all moneys collected by the agency arising out of the use or operation of any of the trust lands into a special fund maintained by the agency. The bill would require the agency to prepare an annual statement of financial conditions and operations and to submit the statement to the State Lands Commission each year on or before October 1.

The bill would authorize the Director of Parks and Recreation to enter in an agreement to transfer to the agency or the City and County of San Francisco an interest in state property held by the department within the Candlestick Point State Recreation Area upon the director making certain findings.

This bill would provide that upon the termination of the redevelopment plan for the project area, consisting of the former shipyard, the Hunters Point submerged lands, and Candlestick Point, or by January 1, 2050, whichever is earlier, the agency shall transfer any trust lands in which it holds fee title to the city, unless the commission approves a later date.

(2) The bill would state findings and declarations of the Legislature regarding the need for special legislation.

The people of the State of California do enact as follows:

SECTION 1. The following definitions apply for purposes of this act:

(a) “1958 Act” means Chapter 2 of the Statutes of 1958 of the First Extraordinary Session.

(b) “Agency” means the San Francisco Redevelopment Agency, or any successor redevelopment agency with jurisdiction over the project area.

(c) “Applicable statutory trust” means either of the following:

(1) Where the agency is the trustee, the terms and conditions of the state’s trust grant to the agency under this act.

(2) Where the city is the trustee, the Burton Act trust.

(d) “BCDC” means the San Francisco Bay Conservation and Development Commission.

(e) “Burton Act” means Chapter 1333 of the Statutes of 1968, as amended.

(f) “Burton Act lands” means all those lands within the project area, or immediately adjacent to the project area, owned in fee by the city and held subject to the Burton Act.

(g) "Burton Act transfer agreement" means that certain agreement dated January 24, 1969, between the state and the city, relating to the transfer of the Port of San Francisco from the state to the city, and any amendments to that agreement in accordance with its terms.

(h) "Burton Act trust" means the statutory trust imposed by the Burton Act, and any additional restrictions on use and alienability created by the Burton Act transfer agreement, by which the state conveyed to the city, in trust and subject to certain terms, conditions, and reservations, the state's interest in certain tidelands, including filled lands, and lands dedicated or acquired by the city as assets of the trust. The Burton Act trust does not include the requirements of Section 12 of the Burton Act.

(i) "Candlestick Point" means all that real property situate in the City and County of San Francisco, State of California, described as follows:

Beginning at the intersection of the northeasterly line of Underwood Avenue (formerly 21st Avenue, 80 feet wide) with the southeasterly line of Arelious Walker Drive (formerly F Street, or Fitch Street, 64 feet wide); thence southwesterly along the southeasterly line of said Arelious Walker Drive 1400 feet to a point laying on the northeasterly line of Bancroft Avenue (formerly 26th Avenue, 80 feet wide), said point being also the most westerly corner of the lands designated and shown as "Parcel 1" on that certain map entitled "Record of Survey – Hunters Point Shipyard" and filed in Book "Z" of Maps, at pages 135 through 147, Document No. 2000-G845126 in the office of the City and County of San Francisco Recorder; thence southeasterly along the northeasterly line of said Bancroft Avenue 2592 feet to the northeasterly extension of the northwesterly line of Boalt Street (formerly B Street, 64 feet wide); thence southwesterly along said extension and said northwesterly line of said Boalt Street 35 feet to a point laying on the boundary of those certain lands commonly known as "Candlestick Point State Recreation Area" and described under Exhibit "1" in that certain Quitclaim Deed from the City and County of San Francisco to the State of California, recorded in the office of County Recorder of said county in Book D633 of Official Records, at Image 1952; thence generally southwesterly, southeasterly, southerly and westerly along said boundary of said "Candlestick Point State Recreation Area", in all of its courses, to a point on the San Francisco – San Mateo County boundary line as said line is shown on that certain Board of Tide Land Commissioners map entitled "Map of the Salt Marsh and Tide Lands and Lands Lying Under Water South of Second Street", a copy of which is filed in Map Book "W", pages 46 and 47, in the office of the City and County of San Francisco Recorder, from which point the point of beginning of said boundary described in said Exhibit "1" bears North 44˚39'58" East 103.85 feet, more or less; thence westerly along said county line 15 feet, more or less, to the southeasterly line of Harney Way as shown on that certain map entitled "Map Showing the Opening of Harney Way from Jamestown Avenue to County Line", filed January 28, 1965, in Map Book "U" at pages 64 and 65, in the office of the City and County of San Francisco Recorder; thence continuing westerly along said county line 178.79 feet; thence leaving said county line

North 44˚39’58” East 592.16 feet; thence North 45˚36’16” East 300.04 feet; thence North 56˚25’37” East 104.39 feet; thence North 61˚40’38” East 137.37 feet; thence North 76˚48’21” East 159.25 feet to a point laying at the westerly terminus of the course labeled “North 86˚19’02” West 87.60 feet” on the northerly line of Harney Way as shown on that certain Final Map entitled “Map of San Francisco Executive Park II”, filed in Map Book “X”, pages 8 through 11, Document No. D168468, in the office of the City and County of San Francisco Recorder; thence easterly along the northerly line of said Harney Way, in all of its courses, to the southwesterly line of the lands of Leonoudakis as described in that certain document filed in the office of the City and County of San Francisco in Reel I751 of Official Records, at Image 599, Document No. 2004-H839983, (Lot 008, Assessor’s Block 5023); thence northwesterly along said southwesterly line to the southeasterly line of the lands of Leonoudakis as described in that certain document filed in the office of the City and County of San Francisco in Reel I751 of Official Records, at Image 598, Document No. 2004-H839982, (Lot 8, Assessor’s Block 4977); thence southwesterly and northwesterly along the southeasterly and southwesterly lines of said lands of Leonoudakis to the most southerly corner of the lands of the City and County of San Francisco designated and shown as Lot 6 on Assessor’s Block 4977; thence northwesterly and northeasterly along the southeasterly and northwesterly lines of said lands of the City and County of San Francisco to the southwesterly corner of Lot 276, as shown on that certain Parcel Map filed in Parcel Map Book 45 at page 10, Document No. 2001-G962714, in the office of the City and County of San Francisco Recorder; thence northwesterly along the boundary of said Lot 276, in all of its courses, to the most northerly corner of said lot, being also a point laying on the southwesterly line of Jamestown Avenue; thence northwesterly along the southwesterly line of Jamestown Avenue 135 feet, more or less, to a point; thence northeasterly and perpendicular to the last course 89 feet to the intersection of the southeasterly line of Coronado Street with the northeasterly line of Jamestown Avenue as shown on that certain map entitled “Map Showing the Widening and Extension of Jamestown Avenue from Hunters Point Expressway to Redondo Street” filed in Map Book “U” at pages 60 through 63, in the office of the City and County of San Francisco Recorder; thence southeasterly along said northeasterly line of Jamestown Avenue 725 feet, more or less, to a point; thence northeasterly along a line laying parallel and 350 feet southeasterly of the southeasterly line of Griffith Street (formerly G Street, 64 feet wide), 660 feet to the Line of Ordinary High Tide of 1869 as said line is shown, but not labeled, on that Board of Tide Land Commissioners Block Map No. 9 filed in Map Book “W” at pages 11 through 13, in the office of the City and County of San Francisco Recorder; thence northeasterly along said line, in all of its courses, to the southwesterly line of the lands of the San Francisco Housing Authority designated and shown as Lot 20 on Assessor’s Block 4884; thence northwesterly along a line laying parallel with and distant 100 feet northeasterly of the northeasterly line of Gilman Avenue (formerly 31st

Avenue, 80 feet wide), being also the southwesterly line of said lands of the San Francisco Housing Authority, to the northwesterly line of Hawes Street (formerly H Street, 64 feet wide); thence northeasterly along said northwesterly line of Hawes Street 1020 feet to the northeasterly line of Carroll Avenue (formerly 27th Avenue, 80 feet wide); thence southeasterly along said northeasterly line of Carroll Avenue 728 feet to a point laying on the southeasterly line of Griffith Street (formerly G Street, 64 feet wide), said point laying also at a deflection in the northwesterly boundary of said “Candlestick Point State Recreation Area”; thence in a general northerly and westerly direction, along the boundary of said “Candlestick Point State Recreation Area” as described under Exhibit “1” in said Quitclaim Deed recorded in the office of the City and County of San Francisco Recorder, in Book D633 of Official Records, at page 1952, the following courses: northeasterly along said southeasterly line of Griffith Street 760 feet to the southwesterly line of Yosemite Avenue (formerly 24th Avenue, 80 feet wide); thence northwesterly along said southwesterly line of Yosemite Avenue to the point of beginning of that parcel of land described in the Quitclaim Deed from the United States of America to Julio and Anita Ricci, recorded March 8, 1961 in Book A235, page 208 of Official Records of the City and County of San Francisco; thence northeasterly, parallel with the southeasterly line of Ingalls Street (formerly I Street), 80 feet to a point laying on the northeasterly line of Yosemite Avenue distant thereon southeasterly 205 feet from said southeasterly line of Ingalls Street, said point being the most westerly corner of that certain parcel of land described as Parcel 3523 in the Grant Deed dated November 30, 1979 from R.C. Scarver and Terese Scarver to the State of California recorded February 8, 1980 as Document No. 73057 in Book C942, page 746 of Official Records of the City and County of San Francisco; thence northeasterly along the northwesterly line of said parcel to the most northerly corner of said parcel, said point laying in the southwesterly line of Wallace Avenue (formerly 23rd Avenue, 80 feet wide); thence northeasterly, parallel with said southeasterly line of Ingalls Street, 80 feet to the most westerly corner of the land described as Parcel 3 in the deed from Hibernia Bank to Mike Garza recorded December 20, 1977 in Book C488, page 303 of Official Records of the City and County of San Francisco, said point laying on the northeasterly line of Wallace Avenue, distant thereon 205 feet southeasterly of said southeasterly line of Ingalls Street; thence southeasterly along said northeasterly line of Wallace Avenue to the southeasterly line of Hawes Street (formerly H Street, 64 feet wide); thence northeasterly along said southeasterly line of Hawes Street, 464 feet to the southwesterly line of Underwood Avenue (formerly 21st Avenue, 80 feet wide); thence leaving said “Candlestick Point State Recreation Area” boundary, northeasterly 80 feet to the northeasterly line of said Underwood Avenue; thence southeasterly along the northeasterly line of said Underwood Avenue 75 feet to a point laying on said “Candlestick Point State Recreation Area” boundary; thence along said “Candlestick Point State Recreation Area” boundary the following courses: northeasterly along a line parallel and distant 75 feet southeasterly from said southeasterly line of Hawes Street, 200 feet to the southwesterly line of Thomas Avenue (formerly 20th Avenue, 80 feet wide); thence southeasterly along said southwesterly line of Thomas Avenue, to the northwesterly line of Griffith Street (formerly G Street, 64 feet wide); thence southwesterly along said northwesterly line of Griffith Street, 200 feet to the northeasterly line of Underwood Avenue (80 feet wide); thence southeasterly along said northeasterly line of Underwood Avenue 664 feet to the northwesterly line of said Arelious Walker Drive; thence leaving said "Candlestick Point State Recreation Area" boundary, northeasterly along said northwesterly line of Arelious Walker Drive, 280 feet to the northeasterly line of said Thomas Avenue; thence southeasterly along said northeasterly line of Thomas Avenue, 64 feet to a point laying on the boundary of said "Candlestick Point State Recreation Area"; thence southwesterly along said boundary and the southeasterly line of said Arelious Walker Drive, 280 feet to the Point of Beginning.

Excepting therefrom any portion lying outside said City and County of San Francisco.

(j) "City" means the City and County of San Francisco, a charter city and county, and includes the City and County of San Francisco acting by and through its Port Commission.

(k) "Commission" means the State Lands Commission.

(*l*) "Community Redevelopment Law" means Part 1 (commencing with Section 33000) of Division 24 of the Health and Safety Code.

(m) "Department" means the Department of Parks and Recreation.

(n) "Director" means the Director of Parks and Recreation.

(o) "Hillside open space" means that area of land so designated as depicted in the diagram in Section 25 of this act.

(p) "Hunters Point submerged lands" means all that real property situate in the City and County of San Francisco, State of California, described as follows:

Beginning at the intersection of the northeasterly prolongation of the southeasterly line of Earl Street (64 feet wide) with the 1948 Bulkhead Line as shown on the map entitled "Real Estate Summary Map NAVFAC Drawing No. 1045757" on file at the Department of the Navy, WESTDIV, San Bruno, California; thence southeasterly along said 1948 Bulkhead Line and the northeasterly line of that certain property conveyed in declaration of taking, Civil Action No. 22147 as shown on said summary map to a line parallel with and 450 feet southeasterly of the southeasterly line of Boalt Street (64 feet wide); thence southwesterly along said parallel line to the northeasterly line of the land described in the deed filed in Book 3677 of Official Records at page 349 in the Office of the County Recorder of said county, said northeasterly line being the arc of a curve, concave southwesterly and having a radius of 1,800 feet; thence southeasterly and southerly along said arc to the southeasterly prolongation of the northeasterly line of Evans Avenue (80 feet wide); thence northwesterly along said prolongation and said northeasterly line of Evans Avenue to the 1941 Bulkhead Line as shown on said summary map; thence southerly along said 1941 Bulkhead Line to the northeasterly line of that certain property conveyed in declaration of taking, Civil Action No. 36272 as shown on said summary map; thence southeasterly along said northeasterly line to said 1948 Bulkhead Line as shown on said summary map; thence southerly along said 1948 Bulkhead Line to the line dividing the City and County of San Francisco from the County of San Mateo; thence easterly along said county line to the United States Pierhead Line as shown on the map entitled “Hunters Point Naval Shipyard, General Development Map, Key Map No. 1174922” on file at the Department of the Navy, Western Division San Bruno, California; thence northeasterly and northwesterly along said Pierhead Line as shown on said General Development Map to said northeasterly prolongation of the southeasterly line of said Earl Street (64 feet wide); thence southwesterly along said prolongation of the southeasterly line of said Earl Street to the said 1948 Bulkhead Line and the point of beginning.

(q) “Project” means the integrated development of a combination of uses on Candlestick Point and the shipyard, including, but not limited to, residential, commercial, public trust, and recreational uses, in accordance with the redevelopment plan.

(r) “Project area” means the shipyard, Hunters Point submerged lands, and Candlestick Point.

(s) ”Proposition G” means Proposition G, also known as the “Mixed Use Development Project for Candlestick Point and Hunters Point Shipyard,” approved by the voters of the city in June 2008.

(t) “Public trust” or “trust” means the common law public trust for commerce, navigation, and fisheries.

(u) “Redevelopment plan” means the Hunters Point Shipyard Redevelopment Plan, and those portions of the Bayview-Hunters Point Redevelopment Plan pertaining to the redevelopment of Candlestick Point, adopted by the agency pursuant to Chapter 4.5 (commencing with Section 33492) of the Community Redevelopment Law, as those plans may be amended from time to time.

(v) “Reserved street area” means a portion of the reserved streets.

(w) “Reserved streets” means all those portions of the trust lands that were reserved to the state for street purposes by the Board of Tidelands Commissioners pursuant to the “Act to survey and dispose of certain salt marsh and tide lands belonging to the State of California,” Chapter 543 of the Statutes of 1868, as depicted on the map entitled “Map of the Salt Marsh and Tide Lands and Lands Lying Under Water South of Second Street and Situate in the City and County of San Francisco” prepared by the Board of Tide Land Commissioners and dated March 19, 1869.

(x) “Shipyard” or “Hunters Point Shipyard” means all that real property situate in the City and County of San Francisco, State of California, described as follows:

Beginning at the intersection of the southeasterly line of Fitch Street (64 feet wide) with the northeasterly line of Palou Avenue (80 feet wide), said intersection also being in the southerly line of the Lands of Lowpensky as described in that document filed in the Office of the County Recorder of said County in Book D238 Official Records at page 80; thence easterly along the southerly line of said Lands of Lowpensky to the southeasterly corner of the said Lands of Lowpensky being also the southwesterly corner of the Lands of the Regents of University of California as described in that document filed in the Office of the County Recorder of said County in Book C562 Official Records at page 582; thence easterly, northerly and northwesterly along the southerly, easterly and northeasterly lines of said Lands of the Regents to the northwesterly corner of said Lands of the Regents and also being the northeasterly corner of said Lands of Lowpensky. Thence northwesterly along the northeasterly line of said Lands of Lowpensky to the most westerly corner of said Lands of Lowpensky, being also a point in the northeasterly line of said Palou Avenue; thence northwesterly along the northeasterly line of said Palou Avenue to the southeasterly line of Griffith Street (64 feet wide); thence northeasterly along the southeasterly line of said Griffith Street 200 feet to the southwesterly line of Oakdale Avenue (80.00 feet wide); thence northwesterly along the southwesterly line of said Oakdale Avenue, 32 feet to the centerline of said Griffith Street; thence northeasterly along the centerline of said Griffith Street 600 feet to the centerline of McKinnon Avenue (80 feet wide); thence southeasterly along the centerline of said McKinnon Avenue 664 feet to the centerline of said Fitch Street (64 feet wide); thence northeasterly along the centerline of said Fitch Street 320 feet to the northeasterly line of La Salle Avenue (80 feet wide); thence southeasterly along the northeasterly line of said La Salle Avenue, 632 feet to the northwesterly line of Earl Street (64 feet wide) and an angle point in the northwesterly boundary of Inchon Village as shown on the “Map of Inchon Village” filed in the Office of the County Recorder of said County in Book 17 of Condominium Maps at pages 112 through 130; thence southwesterly along the northwesterly boundary of said Inchon Village to the centerline of McKinnon Avenue (80 feet wide) and the most northerly corner of the Lands of Crisp Building, Inc., described in that certain document filed in the Office of the County Recorder of said County in Book D767 Official Records at page 1051; thence southwesterly, southeasterly and northeasterly along the northwesterly, southwesterly and southeasterly lines of said Lands of Crisp Building, Inc. to the most easterly corner of said Lands of Crisp Building, Inc., being also the most southerly corner of the land shown on the “Parcel Map of Inchon and Solomon Village” filed in the Office of the County Recorder of said County in Book 17 of Parcel Maps at page 77 and the centerline of said McKinnon Avenue; thence northeasterly along the southeasterly line of said Inchon and Solomon Village to the most easterly corner of said Inchon and Solomon village and the southwesterly line of Innes Avenue (80.00 feet wide); thence northwesterly along the southwesterly line of said Innes Avenue 641 feet to the centerline of said Earl Street (64 feet wide); thence northeasterly along the centerline of said Earl Street 40 feet to the centerline of said Innes Avenue; thence southeasterly along the centerline of said Innes Avenue 32 feet to the southeasterly line of said Earl Street; thence northeasterly along the southeasterly line of said Earl Street and its prolongation 3,151 feet to the 1948 Bulkhead Line as shown on the map entitled “Real Estate Summary Map NAVFAC Drawing No. 1045757” on file at the Department of the Navy, WESTDIV, San Bruno, California; thence southeasterly along said 1948 Bulkhead Line and the northeasterly line of that certain property conveyed in declaration of taking, Civil Action No. 22147 as shown on said summary map 2,553 feet more or less to a point on a line parallel with and 450 feet southeasterly of the southeasterly line of Boalt Street (64 feet wide), thence southwesterly along said parallel line a distance of 52 feet more or less to the northeasterly line of the land described in the deed filed in Book 3677 of Official Records at page 349 in the Office of the County Recorder of said County, said northeasterly line being the arc of a curve, concave southwesterly and having a radius of 1,800 feet; thence southeasterly and southerly along said arc to the southeasterly prolongation of the northeasterly line of Evans Avenue (80 feet wide); thence northwesterly along said prolongation and said northeasterly line of Evans Avenue, to the 1941 Bulkhead Line as shown on said summary map; thence southerly along said 1941 Bulkhead Line, to the northeasterly line of that certain property conveyed in declaration of taking, Civil Action No. 36272 as shown on said summary map; thence southeasterly along said northeasterly line to said 1948 Bulkhead Line as shown on said summary map; thence southerly along said 1948 Bulkhead Line to the line dividing the City and County of San Francisco from the County of San Mateo; thence westerly along said county line 127 feet more or less to the southeasterly prolongation of the northeasterly line of Bancroft Avenue (80 feet wide); thence northwesterly along said prolongation and said northeasterly line of said Bancroft Avenue 7,484 feet more or less to the southeasterly line of said Fitch Street (64 feet wide); thence northeasterly along the southeasterly line of said Fitch Street 2,800 feet to the point of beginning.

(y) “State” means the State of California.

(z) “State property” means the property or interests in property owned by the state located within the project area, and includes both proprietary land and sovereign land.

(aa) “State recreation area” means the Candlestick Point State Recreation Area.

(ab) “Tidelands” means tide and submerged lands.

(ac) “Trustee” means the owner and trust administrator of trust lands granted pursuant to this act or the Burton Act, and is either the agency, with respect to lands owned by the agency, or the city, with respect to lands owned by the city.

(ad) “Trust lands” means all lands, including tide and submerged lands, within the project area that are presently, or upon conveyance out of federal ownership will be, subject to the public trust. Following a trust exchange, trust lands shall include all lands within the project area that have been impressed with the trust pursuant to the exchange, and shall not include any lands that have been removed from the trust pursuant to the exchange.

SEC. 2. The Legislature finds and declares all of the following:

(a) The purpose of this act is to facilitate the productive reuse of the lands within the areas of San Francisco known as Candlestick Point and the former Hunters Point Naval Shipyard in a manner that furthers the purposes of the public trust and the Community Redevelopment Law. To effectuate this purpose, this act grants the state's sovereign interest in the lands comprising the shipyard to the agency upon the transfer of those lands out of federal ownership, and approves and authorizes the commission, provided that it makes the necessary findings supporting the exchange, to carry out an exchange of lands that will place or confirm the public trust on lands within the project area with substantial value for the public trust, and terminate the public trust in project area lands that are no longer useful for trust purposes. This act also authorizes the director on behalf of the department to enter into an agreement to transfer certain lands within the Candlestick Point State Recreation Area to the agency or the city, provided that the agreement provides an overall benefit to the state recreation area and meets certain other conditions set forth in this act.

(b) The project area, including both the shipyard and Candlestick Point, encompasses lands that were historically tidelands subject to the public trust, as well as historic uplands that were not subject to the trust. Beginning in 1861, certain of the area's tidelands were conveyed into private ownership by the state pursuant to various state statutes. Portions of those tidelands were subsequently filled and reclaimed. The trust status of portions of the reclaimed tidelands is uncertain. Due to differences in the various statutes authorizing the conveyance of certain portions of the tidelands into private ownership, as well as other historical circumstances, some of the reclaimed tidelands, including lands located well inland from the current shoreline, have remained subject to the public trust, while other reclaimed tidelands, including most of the lands adjacent to the shoreline, may have been freed from the trust. In addition, a portion of the lands that are subject to the trust consist of reserved streets that were mapped but never built, and a railroad right-of-way, forming a grid pattern that is not consistent with the existing or planned street system for the lands, and most of these lands are no longer useful for trust purposes.

(c) In 1939, the United States began acquiring lands for purposes of constructing and operating what came to be known as the Hunters Point Naval Shipyard. The shipyard was used primarily as a United States Navy industrial operation for the modification, maintenance, and repair of ships. The shipyard was closed in 1974, resulting in adverse economic impacts on the economic base of the surrounding Bayview Hunters Point neighborhood. Pursuant to Section 2824(a) of the National Defense Authorization Act for fiscal year 1991, as amended by Section 2834 of the National Defense Authorization Act for fiscal year 1994, the United States Navy is authorized to convey the shipyard, or portions of the shipyard, to the city or to a local reuse authority approved by the city. The agency is the approved local reuse authority for the shipyard. Pursuant to a 2004 conveyance agreement with the agency, the United States Navy has conveyed a portion of the shipyard to the agency and has agreed to transfer the remainder to the agency following hazardous materials remediation.

(d) The state's sovereign interest in the filled tidelands at Candlestick Point consists primarily of reserved streets and portions of a former railroad right-of-way. In 1958, the state, through the 1958 Act, authorized the sale of a portion of these lands to the city for the purpose of developing a sports stadium. The state received consideration for the sale. The intent of the 1958 Act was to terminate the public trust on the transferred lands, but the statute required that the lands be used only for purposes of general statewide interest. Pursuant to the 1958 Act, the city acquired the lands free of the trust and constructed the stadium commonly referred to as Candlestick Park, which is now nearing the end of its useful life.

(e) In 1968, the Legislature enacted the Burton Act, which granted the state's remaining interest in tidelands within the city, including the state's sovereign interests in the portion of Candlestick Point outside of the stadium site, to the city, subject to the public trust and the Burton Act trust. In 1973, the Legislature authorized the department to acquire and develop real property at Candlestick Point for the state park system. The state subsequently acquired private lands along the shoreline of Candlestick Point to create the Candlestick Point State Recreation Area. In 1984, the city conveyed back to the state those lands within the state recreation area boundaries that the city had acquired under the 1958 Act and the Burton Act. The state recreation area was the first California state park unit developed in an urban environment and is a critical component of the state park system. At present, however, much of the state recreation area is underutilized and in need of substantial restoration and improvement.

(f) The shipyard and Candlestick Point are adjacent to one another and are located on either side of South Basin, with a common boundary at Yosemite Slough. Together, they comprise approximately 760 acres and make up the largest area of underused land in the city. The shipyard, once a source of economic opportunity for the surrounding Bayview Hunters Point community, has stood dilapidated and abandoned for over 30 years and now stands as a barrier to public health, open space, and the waterfront, and a blight on one of San Francisco's poorest communities. The revitalization of Candlestick Point has been contemplated for over 10 years to create much needed economic and public benefits, affordable housing for Bayview Hunters Point residents, and other tangible benefits to the Bayview Hunters Point community. The stadium at Candlestick Point is nearing the end of its useful life and is in need of replacement, the nearby public housing development at Alice Griffith requires a complete rebuilding, and the restoration and improvement of the adjoining state recreation area has been a long-time goal of the state, the city, and the Bayview Hunters Point community.

(g) Until 2007, efforts to redevelop the shipyard and Candlestick Point proceeded separately from one another. In 1997, the agency and the city adopted the Hunters Point Shipyard Redevelopment Plan to provide for the economic revitalization of the shipyard upon its transfer out of federal ownership. In anticipation of the transfer of the shipyard to the agency, the Legislature enacted the Hunters Point Shipyard Conversion Act of 2002 (Chapter 464 of the Statutes of 2002), and the Hunters Point Shipyard Public Trust Exchange Act (Chapter 435 of the Statutes of 2003), which together granted in trust to the agency all of the state's sovereign interest in certain lands within and adjacent to the shipyard and authorized a shipyard-wide public trust exchange, subject to certain terms and conditions.

(h) Chapter 1046 of the Statutes of 1998, which repealed and added Section 5006.8 of the Public Resources Code, was enacted for the purpose of facilitating the redevelopment of Candlestick Point in accordance with Propositions D and F, which were approved by voters of the city on June 3, 1997. Those measures authorized development of a stadium, retail and entertainment center, and associated support uses on the site. In 2006, the city and the agency adopted the Bayview Hunters Point Redevelopment Plan, which included provision for a stadium project consistent with Propositions D and F. Subsequently, the primary tenants of the stadium, the San Francisco Forty Niners, announced their intention to build a new stadium in a location other than Candlestick Point.

(i) In 2007, the city and the agency undertook a new, integrated planning effort for the shipyard and Candlestick Point, which resulted in the adoption of a conceptual framework for development. The conceptual framework calls for a mixed use project on the project area that will provide, among other things, much needed parks and open space, including a major renovation of the state recreation area to enhance access by residents and visitors to the waterfront; new business and employment opportunities; new housing opportunities affordable for residents of the neighboring Bayview Hunters Point community; a site for a new sports stadium on the shipyard, with alternative uses if the San Francisco Forty Niners elect to build a new stadium elsewhere; and other economic and public benefits for the community and the city as a whole and the statewide public.

(j) In June 2008, the voters of the city approved Proposition G, the "Mixed Use Development Project for Candlestick Point and Hunters Point Shipyard." Proposition G repealed Propositions D and F and promulgated city policy encouraging the timely development of the project area with a mixed-use project including: over 300 acres of public park and open space; between 8,500 and 10,000 homes; about 700,000 square feet of retail space; about 2,150,000 square feet of green office, science and technology, research and development, and industrial space; a possible arena or other public performance site; a site in the shipyard for a new stadium for the San Francisco Forty Niners; and additional green office, science and technology, research and development, and industrial space, or additional housing, if a new stadium is not built. Proposition G specifically contemplated a mix of stacked flats, attached town homes and, in appropriately selected locations, low-rise, mid-rise, and high-rise towers, to help ensure the economic feasibility of the development and provide a varied urban design. Proposition G also made it city policy that the project be consistent with the following objectives: producing tangible community benefits for residents of the

Bayview Hunters Point neighborhood and the city; reconnecting the shipyard and Candlestick Point with the Bayview Hunters Point neighborhood and protecting the Bayview Hunters Point neighborhood character for existing residents; producing substantial new housing, both affordable and market-rate, and encouraging the rebuilding of the Alice Griffith Housing Development; incorporating environmental sustainability; encouraging the San Francisco Forty Niners to remain in San Francisco; and requiring the project to be financially sound, with or without a new stadium.

(k) This legislation is necessary for the successful redevelopment of the project area and to realize the resulting public benefits, including, but not limited to, the elimination of blight, the provision of affordable housing, the creation of new public open space, and increased public access to the waterfront. This legislation is also needed to improve the configuration of the public trust lands in furtherance of trust purposes.

(*l*) The existing configuration of trust and nontrust lands within the project area is such that the purposes of the public trust cannot be fully realized. A substantial portion of the reclaimed trust lands are interior lands that have been cut off from access to navigable waters, or are reserved streets laid out in a grid pattern that is not useful to the trust. Most of these lands are no longer needed or required for the promotion of the public trust. Other lands within the project area adjacent to the waterfront or otherwise of high value to the public trust are currently not subject to the public trust. Absent a trust exchange, substantial portions of the lands within the shipyard that are located along the waterfront or are otherwise of high value to the public trust would be free of the public trust, would not be required to be put to uses consistent with the public trust, and could be cut off from public access. In addition, certain interior lands not useful for trust purposes would be restricted and could not be used for residential or other nontrust uses essential to the redevelopment of the project area.

(m) A trust exchange resulting in the configuration of trust lands substantially similar to that depicted on the diagram in Section 25 of this act maximizes the overall benefits to the trust, without interfering with trust uses or purposes. Following the exchange, the entire waterfront within the project area, as well as certain interior lands that have high trust values, will be subject to the public trust. The lands that will be removed from the trust pursuant to the exchange have been cut off from navigable waters, are no longer needed or required for the promotion of the public trust, and constitute a relatively small portion of the granted lands within the city. This act requires the commission to ensure that the lands added to the trust pursuant to the exchange have a monetary value equal to or greater than the monetary value of the lands taken out of the trust.

(n) Several historic buildings in the shipyard have been identified by the State Historic Preservation Officer as contributors to the Hunters Point Commercial Drydock Historic District. These contributor buildings convey a sense of the shipyard's early maritime history, enhance the open-space experience along the waterfront, and should be preserved and restored. Uses of the contributor buildings that support their preservation and restoration, but which are not otherwise consistent with the trust, may be authorized under certain conditions set forth in this act.

(o) The hillside open space provides substantial value to the trust as an open space and recreational resource affording exceptional views of San Francisco Bay and the waterfront. To protect the trust value of the hillside open-space area, it is important that significant view corridors to the waterfront be protected and adequate public access be provided in the manner set forth in this act.

(p) The state recreation area is presently in need of substantial improvement, restoration, and reconfiguration. A substantial portion of the park currently serves as a parking area for stadium events. In other areas, the park does not contain enough land adjacent to the shoreline to provide the desired level of public access. The park lacks needed improvements, and many of the improvements that do exist are in a state of disrepair. Proposition G calls for improving and restoring the state recreation area, including enhancing access to the waterfront for public use, providing views of San Francisco Bay, and extending the Bay Trail system through the park. This act approves a reconfiguration of the state recreation area and to that end authorizes the director to enter into an agreement for the transfer of state recreation area lands to the agency or the city in exchange for park improvements, funding for park operation and maintenance, lands to be added to the state recreation area, and other consideration, provided the agreement will result in an overall benefit to the park and meets the other requirements of this act regarding the transfer of state recreation area lands.

(q) This legislation advances the statewide purposes of the Community Redevelopment Law and the public trust, and is in the best interests of the people of this state.

SEC. 3. Section 5006.8 of the Public Resources Code is repealed.

SEC. 4. Chapter 464 of the Statutes of 2002, The Hunters Point Shipyard Conversion Act of 2002, as amended by Chapter 435 of the Statutes of 2003, is repealed.

SEC. 5. Chapter 435 of the Statutes of 2003, The Hunters Point Shipyard Public Trust Exchange Act, is repealed.

SEC. 6. (a) All of the state's right, title, and interest, acquired by virtue of its sovereignty, in any trust lands in which the agency holds or acquires fee title, is hereby granted to and vested in the agency, subject to the public trust and the terms and conditions of this act.

(b) Upon conveyance by the federal government to the agency of any piers or other appurtenances located in part on Hunters Point submerged lands, the grant of the state's right, title, and interest in the Hunters Point submerged lands to the city pursuant to the Burton Act is revoked, and all of the state's right, title, and interest in those lands is granted to and vested in the agency, subject to the public trust and the terms and conditions of this act.

(c) The agency shall hold the trust lands in trust for the benefit of all the people of the state for purposes of commerce, navigation, and fisheries, and for other public trust purposes, subject to the terms and conditions of this act. Any trust lands held by the agency pursuant to this act shall not be subject to the Burton Act trust.

SEC. 7. Notwithstanding Section 6359 of the Public Resources Code or any other provision of law, the grant of the state's interest in trust lands to the agency pursuant to this act shall be deemed effective as follows:

(a) On January 1, 2010, with respect to trust lands held in fee by the agency on that date.

(b) With respect to trust lands acquired by the agency after January 1, 2010, upon the agency's acquisition of those lands.

(c) With respect to the Hunters Point submerged lands, upon conveyance by the federal government to the agency of any piers or other appurtenances located in part on the Hunters Point submerged lands, at which time any prior grant of the state's right, title, and interest in the Hunters Point submerged lands to the city pursuant to the Burton Act shall be deemed revoked and the lands shall cease to be subject to the Burton Act trust.

SEC. 8. (a) The agency may use, conduct, operate, maintain, manage, administer, regulate, improve, lease, and control (collectively referred to as "use") the trust lands and do all things necessary in connection with that authority that conform with the terms of this act and the public trust. Except as provided in this act, the agency shall use the trust lands only in a manner that is consistent with, necessary and convenient for, or incidental or ancillary to, the purposes of the public trust.

(b) In the management, conduct, operation, and control of the trust lands, or any improvements, betterments, or structures on the trust lands, the agency shall make no discrimination in rates, tolls, or charges for a use or service in connection with that management.

SEC. 9. The agency shall not grant, convey, give, or alienate the trust lands, or any part of the lands, to an individual, firm, corporation, or governmental agency (not including the commission) for any purpose, except as provided in this act or as otherwise provided by statute.

SEC. 10. There is reserved in the people of the state the right to hunt and fish in and over the waters on the trust lands, together with the right of convenient access to the waters over the trust lands for those purposes.

SEC. 11. The state shall reserve from the grant made in Section 6 of this act, and from any other conveyance pursuant to this act of the state's interest, or any portion of the state's interest, in any lands, all minerals and all mineral rights in the lands of every kind and character now known to exist or hereafter discovered, including, but not limited to, oil and gas and rights thereto, together with the sole, exclusive, and perpetual right to explore for, remove, and dispose of those minerals by any means or methods suitable to the state or to its successors and assignees, except that, notwithstanding the Burton Act or Section 6401 of the Public Resources Code, this reservation shall not include the right of the state or its successors or assignees in connection with any mineral exploration, removal, or disposal activity, to do either of the following:

(a) Enter upon, use, or damage the surface of the lands or interfere with the use of the surface by a grantee or by the grantee's successors or assignees.

However, a lease, franchise, permit, or license of the property shall contain a provision specifying at least one point from which, and the manner in which, the right of ingress or egress to the subsurface deposits may be exercised, which point or points may be outside the area of the leasehold, franchise, permit, or license, as long as the point or points are adequate to permit the rights reserved to the state to be exercised.

(b) Conduct any mining activities of any nature whatsoever above a plane located 500 feet below the surface of the lands without the prior written permission of a grantee of the lands or the grantee's successors or assignees.

SEC. 12. The state has the right to use, without charge, any transportation, land or storage improvements, wharves, docks, piers, slips, quays, or other improvements constructed upon the trust lands, for a vessel or other watercraft, aircraft, or railroad owned or operated by the state.

SEC. 13. (a) The state reserves the right to amend, modify, or revoke any and all rights in the trust lands granted to the agency under this act.

(b) No amendment or revocation, in whole or in part, of the granted rights in the trust lands, or any transfer of trust lands between the agency and the city, shall impair or affect the rights or obligations of third parties, including debt, security, or bond holders, lessees, lenders for value, and holders of contracts conferring the right to the use or occupation of, or the right to conduct operations upon or within, the trust lands, arising from leases, contracts, or other instruments lawfully entered into prior to the effective date of the amendment, revocation, or transfer. For purposes of this section, the term "bonds" includes, without limitation, tax increment bonds, revenue bonds, certificates of participation, and any other bonds or forms of indebtedness secured by or payable from, in whole or in part, revenues derived from trust lands.

(c) If a lease, contract, or other instrument described in subdivision (b) is in effect on the effective date of an amendment or revocation of the granted rights in the trust lands, the state, at its option exercised by and through the commission, may succeed to the agency's interest in the lease, contract, or instrument. Otherwise, the agency's interest in the instrument, property, and revenue shall continue during the term or other period during which the instrument shall remain in effect. If a lease, contract, or other instrument described in subdivision (b) is in effect on the effective date of a transfer of trust lands between the agency and the city, the transferee shall succeed to the transferor's interest in the lease, contract, or other instrument, unless the agency and the city agree otherwise. An action taken by the state, or a transfer of trust lands between the agency and the city, shall not cause the agency or the city to breach or default under a lease, contract, or instrument in effect on the effective date of an amendment or a revocation. All bonds or securities issued by the agency or the city and payable out of revenues from the trust lands shall continue to be so payable, directly or indirectly, and secured in all respects as provided in the proceedings for their issuance, and the revenues of the trust lands shall be pledged and applied to the payment of the bonds or securities in all respects as though no amendment or revocation had taken place.

SEC. 14. The agency may grant franchises, permits, privileges, licenses, easements, or leasehold interests (leases) in connection with the trust lands, or any part of the trust lands, each for a term not exceeding 66 years. A lease of the trust lands shall be solely for uses that are consistent with, necessary and convenient for, or incidental or ancillary to, the purposes of the public trust, except that a lease may be entered into for other uses if the agency has made all of the following determinations:

(a) There is no immediate trust-related need for the property proposed to be leased.

(b) The proposed lease is of a duration of no more than five years and provides that the agency shall have the right to terminate the lease in favor of trust uses as trust needs arise.

(c) The proposed lease prohibits the construction of new structures or improvements on the subject property that, as a practical matter, could prevent or inhibit the property from being converted to a permissible trust use if necessary.

(d) The proposed use of the leased property would not interfere with commerce, navigation, fisheries, or any other existing trust use or purpose.

SEC. 15. (a) Notwithstanding any other provision of this act or the Burton Act, the buildings, or any portion of a building, identified by the State Historic Preservation Officer as contributors to the Hunters Point Commercial Drydock Historic District, commonly known as the Gatehouse (Building 204), Pumphouse 2 (Building 205), Pumphouse 3 (Building 140), and the Tool and Paint Building (Building 207), may be used or leased for purposes not otherwise consistent with the public trust, provided the trustee makes a finding that there are no trust uses available that would allow for the restoration and preservation of the space. A lease renewal, extension, or granting of a new lease for a nontrust purpose shall require a new finding that no trust uses are then available that would allow for the restoration and preservation of the building, or a part of it.

(b) If a building described in subdivision (a) is used for a nontrust purpose, and is remodeled, renovated, or used in a manner that is inconsistent with the Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring and Reconstructing Historic Buildings, the building shall be put to a public trust use from the commencement of the inconsistent remodel, renovation, or use, unless the continued nontrust use is authorized to continue under Section 14 of this act, if the agency is the trustee, or under the Burton Act, if the city is the trustee.

(c) If a building described in subdivision (a) is demolished, subsequent use of the land and any replacement structure shall be consistent with the public trust and the applicable statutory trust.

SEC. 16. (a) The agency shall deposit all moneys collected by the agency arising out of the use or operation of any of the trust lands, including all revenues derived from leases or other rights to use or occupy the lands, into a special fund maintained by the agency. The agency shall use the money in or belonging to the fund only for uses and purposes consistent with the public trust and the requirements of this act.

(b) The agency shall prepare an annual statement of financial conditions and operations and submit it to the commission each year on or before October 1. The statement shall include a statement of all revenues and expenditures related to trust lands and trust assets, including obligations incurred, but not yet paid.

(c) The requirements of this section implement and do not supersede the requirements of Section 6306 of the Public Resources Code.

SEC. 17. (a) The agency may exchange portions of the trust lands with a state agency, political subdivision, person, entity, or corporation, or the United States or a political subdivision of the United States, for other lands, if the agency determines, and the commission adopts a resolution finding and declaring, all of the following:

(1) The portions of the trust lands or interests in lands to be exchanged out of the trust have been filled and reclaimed, are cut off from access to the waters of San Francisco Bay and are no longer in fact tidelands or submerged lands or navigable waterways, are relatively useless for trust purposes, and constitute a relatively small portion of the granted lands within the city.

(2) The lands or interests in lands to be acquired by the agency have a monetary value equal to or greater than the value of the lands for which they are to be exchanged and are useful for the particular trust purposes authorized by this act.

(3) No substantial interference with trust uses and purposes, including public rights of navigation and fishing, will ensue by virtue of the exchange.

(4) The lands or interests in lands to be acquired by the agency in the exchange will provide a significant benefit to the public trust.

(5) The exchange is otherwise in the best interest of the state.

(b) Upon adoption of the resolution by the commission, the lands conveyed by the agency shall be free from the public trust, and the lands received by the agency in exchange shall be held subject to the public trust and to the terms of this act.

(c) The exchange authority granted by this section shall be in addition to, and shall not operate as a limitation on, the exchange authority granted by Sections 20 to 25, inclusive, of this act.

SEC. 18. Upon written agreement between the agency and the city, acting by and through its Port Commission, the agency may transfer to the city some or all of the trust lands in which the agency holds fee title, provided that the commission has approved the transfer. All of the right, title, and interest granted to the agency under this act in any lands transferred to the city under this section shall, upon transfer, be granted to and vest in the city. The city shall hold the transferred lands subject to the public trust and shall assume authority as trustee over those lands. Lands transferred to the city pursuant to this section shall be subject to the Burton Act trust and shall cease to be subject to the terms and conditions of this act, except that Sections 13 and 15 of this act shall remain applicable to those lands. Nothing in this section shall preclude the city from including trust lands held by the city as part of an exchange authorized by this act.

SEC. 19. (a) Notwithstanding the restriction on alienation in the Burton Act or any other provision of law, upon approval by the commission, the city may transfer to the agency some or all of the Burton Act lands. All of the right, title, and interest granted to the city under the Burton Act in any lands transferred to the agency under this section shall, upon transfer, be granted to and vest in the agency. The agency shall hold the transferred lands subject to the public trust and the requirements of this act, and shall assume authority as trust administrator over those lands. Lands transferred to the agency under this section shall cease to be subject to the Burton Act trust.

(b) Notwithstanding subdivision (a), no later than the date on which the redevelopment plan terminates as to the entirety of the project area or January 1, 2050, whichever is earlier, the agency shall transfer any trust lands in which it holds fee title to the city and the city shall become the sole grantee of the trust lands, unless the commission approves a later date by which the agency shall transfer trust lands to the city. The city shall hold the transferred trust lands subject to the Burton Act trust and the lands shall cease to be subject to the terms and conditions of this act, except that Sections 13 and 15 of this act shall remain applicable to those lands. This subdivision shall not apply to any trust lands for which fee title is held by the state. This subdivision shall not affect the rights and obligations of the agency pursuant to the Community Redevelopment Law.

SEC. 20. The Legislature hereby approves an exchange of public trust lands within the project area, whereby certain trust lands that meet the criteria set forth in this act and therefore are not now useful for public trust purposes will be freed from the public trust and of the associated restrictions on use and alienation, and certain other lands that are not now public trust lands and that are useful for public trust purposes will be made subject to the public trust, provided that the commission determines that the exchange furthers the public trust and approves the exchange and that all of the following conditions are met:

(a) The exchange results in a configuration of trust lands substantially similar to that shown on the diagram in Section 25 of this act.

(b) The lands to be subject to the public trust are configured so as to be accessible from the streets as finally configured in the project area.

(c) The exchange otherwise complies with the requirements of this act.

(d) The exchange is consistent with and furthers the purposes of the public trust and this act.

SEC. 21. All lands exchanged into the trust under this act shall be held by the trustee subject to the public trust and the applicable statutory trust, and all lands exchanged out of the trust under this section shall be free of the public trust and the applicable statutory trust.

SEC. 22. The precise boundaries of the lands to be taken out of the trust and the lands to be put into the trust pursuant to the exchange shall be determined by the trustee or trustees with authority over the lands to be exchanged, subject to the approval of the commission. The commission is authorized to settle by agreement with the trustees any disputes as to the location of the mean high tide line in its last natural state, the boundaries of tidelands conveyed into private ownership pursuant to various statutes, and any other boundary lines which the commission deems necessary to effectuate the exchange.

SEC. 23. (a) The commission is authorized to approve an exchange of public trust lands within the project area that meets the requirements of this act. Pursuant to this authority, the commission shall establish appropriate procedures for effectuating the exchange. The procedures shall include, but are not limited to, provisions for ensuring that lands or interests in lands at the shipyard are not exchanged into the trust until either of the following has occurred:

(1) All remedial action necessary to protect human health and the environment with respect to the hazardous substances on the land has been completed as determined by the United States Environmental Protection Agency, the California Department of Toxics Substances Control, and the regional water quality control board, pursuant to the Federal Facilities Agreement for the shipyard dated January 22, 1992, as amended, and the United States has provided a warranty in accordance with Section 9620(h)(3)(A) of Title 42 of the United States Code.

(2) The United States has obtained a warranty deferral, approved by the Governor in accordance with Section 9620(h)(3)(C) of Title 42 of the United States Code, involving land for which the commission has determined to execute a certificate of acceptance of title, and the commission finds that sufficient liability measures and implementation measures will be in place upon the completion of the exchange. Prior to approving a warranty deferral, the Governor and the Department of Toxic Substances Control, the regional water quality control board, or other appropriate state oversight agency with expertise in hazardous materials remediation shall confer and consult with the commission to reasonably ensure that the terms of the warranty deferral and underlying documents and agreements provide sufficient standards and financial assurances to ensure that the remediation of any affected trust lands will be completed in a manner consistent with the intended public trust use of these lands and in a reasonable period of time.

(b) The commission may not approve the exchange of any trust lands unless it finds all of the following:

(1) The portions of the trust lands or interests in lands to be exchanged out of the trust have been filled and reclaimed, are cut off from access to the waters of San Francisco Bay and are no longer in fact tidelands or submerged lands or navigable waterways, are relatively useless for public trust purposes, and constitute a relatively small portion of the granted lands within the city.

(2) The lands or interests in lands to be impressed with the public trust have a monetary value equal to or greater than the monetary value of the lands or interests in lands to be exchanged out of the trust. In the event that the monetary value of the lands or interests in lands to be exchanged out of

the trust is greater than the monetary value of the lands or interests in lands to be exchanged into the trust, the commission may consider a deposit of funds into the Land Bank Fund established pursuant to Section 8610 of the Public Resources Code to be held solely for acquisition of property, in an amount equal to the difference in value.

(3) No substantial interference with trust uses and purposes, including public rights of navigation and fishing, will ensue by virtue of the exchange.

(4) The lands or interests in lands impressed with the public trust will provide a significant benefit to the public trust and are useful for the particular trust purposes authorized by this act.

(5) The configuration of trust lands within the project area upon completion of the exchange is substantially similar to the configuration shown on the diagram in Section 25 of this act, includes all lands within the project area that are presently below mean high tide, and consists of lands suitable to be impressed with the public trust.

(6) The final layout of streets in the project area will provide access to the public trust lands and be consistent with the beneficial use of the public trust lands.

(7) Streets and other transportation facilities located on public trust lands shall be designed to be compatible with the public trust and to serve primarily public trust purposes of access to shoreline improvements and shoreline circulation rather than serving nontrust purposes.

(8) Any surveys or legal descriptions required for the parcels in conjunction with the exchange shall be approved by the commission.

(9) Each trustee who owns or will own fee title in any of the lands to be exchanged has approved the exchange.

(10) The exchange otherwise complies with the requirements of this act.

(11) The exchange is consistent with and furthers the purpose of the public trust and this act.

(12) The exchange is otherwise in the best interest of the statewide public.

(c) The commission may impose additional conditions on the exchange authorized by this act if the commission determines that these conditions are necessary to protect the public trust. At a minimum, the commission shall ensure all of the following:

(1) The streets and other transportation facilities located on trust lands are designed to be compatible with the public trust.

(2) The trust values of the hillside open space are preserved. To this end, the commission shall ensure all of the following:

(A) The final trust configuration maintains reasonable public pedestrian and vehicular access between the hillside open space and the waterfront, and in addition, between the top of the hillside open space and other areas of the city.

(B) View corridors are maintained and protected so that visitors to the hillside open space can enjoy substantial vistas of San Francisco Bay.

(C) Direct vehicular and pedestrian access from the lower portions of the shipyard to the top of the hillside open space area is provided.

(D) No liability to owners of adjacent upslope property, for subjacent support or otherwise, is created by virtue of the trustee's taking title to the hillside open space.

(E) No moneys from the trust fund described in Section 16 of this act may be used to provide direct benefit to the residential development or to other uses of the nontrust portion of the hilltop area adjacent to the hillside open space, or to offset or mitigate impacts caused by those uses.

(F) Street parking on the parkway adjacent to the top of the hillside open space may not be restricted for residential parking and shall remain accessible to the public for regional and statewide use. In addition, adequate parking areas accessible to the public to support regional and statewide use of the hillside open space shall be dedicated in an area adjacent to the lower portion of the hillside open space. Public access to the hillside open space and the availability of parking accessible to the public shall be publicized with appropriate signage.

(d) For purposes of effectuating the exchange authorized by this section, the commission is authorized to do all of the following:

(1) Receive and accept on behalf of the state any lands or interest in lands conveyed to the state by the parties to the exchange agreement, including lands that are now and that will remain subject to the public trust.

(2) Convey by patent all of the right, title, and interest of the state in lands that are to be free of the public trust and applicable statutory trust, upon completion of an exchange of lands as authorized by this act and as approved by the commission.

(3) Convey to the trustee or trustees by patent all of the right, title, and interest of the state in lands that are to be subject to the public trust and the applicable statutory trust upon completion of an exchange of lands as authorized by this act and as approved by the commission, subject to the terms, conditions, and reservations as the commission may determine are necessary to meet the requirements of this act.

(4) Receive and accept from the department any lands or interests in lands within the state recreation area, as it may be reconfigured by the director pursuant to Section 26, that are to be subject to the public trust upon completion of an exchange of lands as authorized by this act and as approved by the commission.

(5) Transfer to the department any lands or interests in lands within the state recreation area, as it may be reconfigured by the director pursuant to Section 26, that are to be free of the public trust upon completion of an exchange of lands as authorized by this act and as approved by the commission.

(e) The exchange authorized by this section may include lands adjacent to the project area to the extent consistent with the purposes of this act and approved by the commission. Lands outside the project area that are impressed with the trust as part of an exchange authorized by this act shall be deemed trust lands for purposes of this act.

(f) If the department holds an interest in any of the lands to be received or conveyed by the exchange authorized by this section, the department shall be a party to the exchange agreement.

(g) Nothing in this act shall be construed as conditioning or otherwise limiting the authority of the state, the city, or the agency to undertake a public trust exchange or other conveyance authorized by any other provision of law, including, but not limited to, Section 17 of this act.

SEC. 24. An exchange of public trust land pursuant to Section 23 of this act may proceed in multiple phases, provided that with respect to each phase, the commission, in addition to the findings required by Section 23 of this act, finds both of the following:

(a) The cumulative monetary value of all of the lands or interests in lands exchanged into the trust in the proposed phase and completed phases is equal to or greater than the cumulative monetary value of all of the lands or interests in lands exchanged out of the trust in the proposed phase and completed phases. If, in connection with the approval of the exchange agreement or a completed phase of the exchange, the commission has previously determined the value of any lands that have been or are proposed to be exchanged, the commission, for purposes of making the finding required by this subdivision, shall utilize the value of those lands as previously determined by the commission, adjusted for inflation using an appropriate inflation index as determined by the commission.

(b) The lands or interests in lands exchanged into the trust at each phase are configured in a way that furthers the purposes of the overall exchange, including, but not limited to, having access to streets as finally configured in the project area.

SEC. 25. The following diagram is a part of this act:

PRINTER PLEASE NOTE: TIP-IN MATERIAL TO BE INSERTED

SEC. 25.2. If the commission has not approved the trust exchange authorized by Section 23 of this act by January 1, 2020, Section 20 and Sections 22 to 25, inclusive, of this act shall terminate and shall no longer be effective, unless an extension not to exceed five years is approved by the commission.

SEC. 25.5. (a) For purposes of Section 3 of Article X of the California Constitution, the Legislature hereby finds and declares that the reserved streets in Candlestick Point were reserved to the state solely for street purposes, and that those portions of the reserved streets that are found by the commission to meet the criteria set forth in paragraph (1) of subdivision (b) are no longer useful or necessary for navigation purposes.

(b) The trustee may, pursuant to Section 3 of Article X of the California Constitution, sell any portion of the reserved street areas within Candlestick Point free of the public trust and the applicable statutory trust. A sale made pursuant to this section shall not be effective unless and until the commission, at a regular open meeting with the proposed sale as a properly scheduled agenda item, finds all of the following:

(1) The reserved street area has been filled and reclaimed, is cut off from access to the waters of San Francisco Bay, and is no longer needed or required for the promotion of the public trust, and no substantial interference with the public trust uses and purposes will ensue by virtue of the sale.

(2) Termination of the trust in the reserved street area occurs in conjunction with or subsequent to a land exchange authorized by this act and approved by the commission.

(3) Termination of the trust in the reserved street area is substantially consistent with the proposed trust land configuration depicted in Section 25 of this act, as finally approved by the commission.

(4) The trustee will receive consideration for the sale equal to or greater than the fair market value of the land or interest sold.

(c) Any moneys received by the trustee for a sale pursuant to this section shall be deposited in a separate account in the fund required by Section 16 of this act or Section 4 of the Burton Act, and shall be expended only for acquisition of lands by the trustee or public access improvements on trust lands, or other uses and purposes consistent with the public trust and applicable statutory trust as determined by the commission. The funds in the special account may not be expended for overhead or administration costs by the trustee.

(d) The total reserved street area sold pursuant to this section shall not be more than 20 percent of the total reserved street areas in Candlestick Point.

(e) For purposes of this section, the term “sale” includes, without limitation, a sale, lease, transfer, or other conveyance of land or interest in land.

(f) Nothing in this section shall be construed as imposing additional requirements or limitations on the conveyance of reserved street areas free of the public trust and applicable statutory trust as part of an exchange authorized by this act or otherwise authorized by law.

(g) The Legislature hereby finds that the conditions set forth in this section will protect the public interest in accordance with Section 3 of Article X of the California Constitution.

SEC. 26. (a) The Legislature hereby approves a reconfiguration of the state recreation area in substantial conformance with the diagram included as Section 27 of this act, provided that the requirements of this section are met. Notwithstanding any other provision of law, the director may authorize the removal of land from the state recreation area, and may enter into an agreement to convey to the agency or the city an interest in the state property so removed, provided that the director makes in writing all of the following findings:

(1) (A) The state will receive consideration consisting of the forms set forth in paragraph (2) and having a value that equals or exceeds the greater of either of the following:

(i) The fair market value of the state property conveyed.

(ii) Fifty million dollars ($50,000,000). If the state property is to be conveyed in phases pursuant to paragraph (3) of subdivision (h), the minimum consideration under this clause shall be prorated for the state property conveyed at each phase, in proportion to the total area of state property to be conveyed under the agreement.

(B) The consideration referenced in clause (ii) of subparagraph (A) is not intended to be reflective of the fair market value of the property and shall not be used as a basis for determining value in any appraisal of the property.

(2) The form of consideration for the state property conveyed pursuant to paragraph (1) consists of the following:

(A) The provision of future funding for the operation and maintenance of the state recreation area.

(B) The cost of planning and constructing improvements to the state recreation area that enhance its use as a public park, which may include, without limitation, walking and biking trails, picnic facilities, recreational equipment, piers, overlooks, visitor centers, amphitheaters, entryways, restrooms, concession facilities, site furnishings, landscaping, habitat restoration, infrastructure, and improvements to protect the state recreation area from the effects of sea level rise, provided that these sea level rise improvements primarily benefit the state recreation area.

(C) Land within the project area to be added to the state recreation area.

(D) The amount of any reimbursement paid to the state by or on behalf of the city or the agency for the state's legal, transactional, planning, or other costs associated with actions carried out pursuant to this section.

(E) Monetary consideration, if determined appropriate by the director and if the monetary consideration received under this paragraph is dedicated and used for planning, improvement, maintenance, or operation of the state recreation area.

(3) The agreement will provide an overall benefit to the state recreation area and will further the objective of preserving the park's natural, scenic, cultural, and ecological values for present and future generations.

(4) The reconfiguration of the state recreation area will substantially conform to the configuration shown on the diagram included as Section 27 of this act, and as more particularly illustrated on the map on file with the city's planning department entitled "Proposed State Park Land Exchange" and dated September 3, 2009, for the area depicted on the map; provided, however, that the director may agree to additional modifications of the park configuration if the modifications are consistent with the overall financial feasibility of the project and the director determines that the modifications are necessary to fulfill the state recreational purposes of the state recreation area, taking into account public access, circulation and parking needs; wildlife habitat values; future sea level rise and the proposed responses thereto; and other relevant factors.

(5) The project, including the reconfiguration of the state recreation area, will not result in a significant adverse effect on biological resources, and will include habitat enhancement measures to benefit migratory birds and other wildlife. In making this determination, the director shall take into consideration any mitigation measures incorporated into the project during the environmental review process pursuant to the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code).

(6) Any applicable requirements of the Land and Water Conservation Fund Act of 1965 (16 U.S.C. Sec. 460l-4 et seq.) have been satisfied.

(7) It is the intent of this act that approximately 20 percent of the total consideration value required by paragraph (1) be in the form of operation and maintenance funding pursuant to subparagraph (A) of paragraph (2). If the agreement contains a lower amount of operation and maintenance funding, the director shall provide a report to the Legislature explaining the reasons for determining that the lower amount is appropriate in light of the overall benefits of the agreement.

(b) The director shall modify the boundaries of the state recreation area as necessary to reflect any conveyances made pursuant to this section.

(c) Notwithstanding any other provision of law, the director, on behalf of the department, and the commission, may acquire, convey, or transfer real property pursuant to the agreement authorized by this section, provided that the other requirements of this section are met, and the fair market value of any real property acquired or transferred has been determined by an appraisal prepared by the commission or an appraisal approved by the commission or the Real Estate Services Division of the Department of General Services and prepared by an independent appraiser certified by the Office of Real Estate Appraisers pursuant to Part 3 (commencing with Section 11300) of Division 4 of the Business and Professions Code. For purposes of compliance with this subdivision, the director may rely on an appraisal prepared in connection with a trust exchange authorized by this act.

(d) If the commission holds an interest in any of the lands to be removed from the state recreation area, the commission shall be a party to any agreement authorized by this section.

(e) The agreement authorized by this section may be combined with a trust exchange agreement authorized by this act. Pursuant to a trust exchange agreement, the department may transfer to the commission any lands or interests in lands within the reconfigured state recreation area that are to be subject to the public trust, and may receive and accept from the commission lands within the reconfigured state recreation area that are to be free of the public trust. Notwithstanding any other provision of law, the commission may lease to the department for state park purposes any trust lands it owns within the reconfigured state recreation area for a term not exceeding 66 years.

(f) The requirements of this section shall govern an agreement entered into, or conveyance made pursuant to the agreement, and shall supersede any other provision of law pertaining to the department's authority to acquire or transfer real property, or to enter into an agreement to acquire or transfer real property, including, but not limited to, Article 1 (commencing with Section 11000) of Chapter 1 of Part 1 of Division 3 of Title 2 of the Government Code, Part 11 (commencing with Section 15850) of Division 3 of Title 2 of the Government Code, and Chapter 1 (commencing with Section 5001) and Chapter 1.695 (commencing with Section 5096.500) of Division 5 of the Public Resources Code, or as those provisions may be hereafter amended.

(g) Notwithstanding anything to the contrary in Section 5002.2 of the Public Resources Code, the department is not required to revise the general plan for the state recreation area prior to taking any action pursuant to this section, including, but not limited to, the approval of an agreement authorized by this section, the acquisition, conveyance or transfer of interests in real property pursuant to such agreement, or the modification of the state recreation area boundary. Nothing in this act shall be construed as exempting the development of new facilities within the state recreation area from compliance with the general plan revision requirements of Section 5002.2 of the Public Resources Code.

(h) (1) Neither the director, on behalf of the department, nor the commission shall convey out-of-state ownership an interest in land within the state recreation area pursuant to this section prior to the receipt by the state of consideration meeting the value requirements of paragraph (1) of subdivision (a), except as provided in this subdivision.

(2) For consideration in the form of construction of future park improvements or in the form of the provision of future funding for operation and maintenance, a binding and enforceable commitment to construct the improvements or to provide the funding shall be deemed to satisfy the requirements of this subdivision if the director determines that adequate financial assurances have been provided to ensure that work will be completed or the funds will be provided, as specified in the agreement. Financial assurances under this paragraph may include, without limitation, performance or other surety bonds, insurance, or financial guarantees.

(3) (A) The agreement may provide for phased conveyances if the total consideration received by the state, or committed in accordance with

paragraph (2) of this subdivision, at or before each phase meets the value requirements of paragraph (1) of subdivision (a) with respect to the state property conveyed in that phase and any prior phases. For purposes of implementing this paragraph, if the consideration is based on fair market value, the director shall use the fair market value of the state recreation area lands as determined by the director at the time the agreement is approved.

(B) If the agreement provides for phased conveyances, the consideration tendered to the state at each phased closing may be in any of the forms set forth in paragraph (2) of subdivision (a), or any combination of those forms, as may be established by the agreement, if the agreement requires consideration meeting all of the requirements of paragraph (2) of subdivision (a) to be tendered prior to the final closing. For purposes of this subparagraph, final closing means a closing after which all of the state property within the state recreation area to be conveyed under the agreement will have been conveyed.

(i) Any monetary consideration received by the department pursuant to an agreement authorized by this section shall be deposited in a separate account maintained by the department and shall be expended only for planning, improvement, maintenance, or operation of the state recreation area.

(j) In order to allow public review of and comment on the findings required by subdivision (a), the director shall cause proposed findings to be published in the California Regulatory Notice Register no less than 30 days prior to making final findings. The director shall also cause the final findings to be published in the California Regulatory Notice Register.

SEC. 27. The following diagram is a part of this act:

PRINTER PLEASE NOTE: TIP-IN MATERIAL TO BE INSERTED

SEC. 27.5. Nothing in this act shall be construed as requiring the director or the commission to enter into any agreement authorized by this act.

SEC. 28. (a) The Legislature finds that the lands conveyed to the city pursuant to the 1958 Act have been cut off from water access, are relatively small in area, have been filled and reclaimed as part of a highly beneficial program of harbor development, and are no longer useful for public trust purposes. The Legislature further finds and confirms that the lands conveyed pursuant to the 1958 Act are free from the public trust.

(b) The Legislature finds and declares that the project will further the important statewide interests in redevelopment, the elimination of blight, the provision of affordable housing opportunities, the generation of new sales tax revenues, property taxes and other tax revenues to the state and state agencies, the creation of thousands of new jobs, and enhanced access of the public to use and enjoy the state recreation area, and that the development of the project will further the statewide purposes contemplated in Section 3 of the 1958 Act. The Legislature further finds and declares that it is necessary and in furtherance of important statewide interests for any restrictions or other encumbrances on title arising from Section 3 of the 1958 Act to be eliminated so as to facilitate disposition of property within the project area in furtherance of development of the project.

(c) At the request of the city or the agency, the executive officer of the commission shall, on behalf of the state, reasonably cooperate with the requesting parties to cause to be prepared and recorded any necessary deeds, patents, agreements, or other instruments for the purpose of removing any deed restrictions or other encumbrances on title arising from Section 3 of the 1958 Act.

SEC. 29. Section 3 of Chapter 2 of the Statutes of 1958 of the First Extraordinary Session is repealed.

SEC. 30. Chapter 1046 of the Statutes of 1998 is repealed.

SEC. 31. An exchange or other agreement made pursuant to this act is hereby found to be of statewide significance and importance. Therefore, no ordinance, charter provision, or other provision of local law inconsistent with this act applies to that exchange or agreement.

SEC. 31.5. (a) Notwithstanding any other provision of law, the requirements of subdivision (f) of Section 10310 of Title 14 of the California Code of Regulations shall be deemed satisfied for any part of the project requiring a BCDC permit if the agency submits in a form acceptable to BCDC an approved development and disposition agreement for the project, any required amendments to the redevelopment plan, and city final approval of all conforming amendments to the city's general plan, planning code, and zoning maps.

(b) Notwithstanding any other provision of law, the requirement of subdivision (g) of Section 66605 of the Government Code and of Section 11721, Appendix F of Title 14 of the California Code of Regulations, that an applicant for a BCDC permit demonstrate adequate legal interest in the underlying property shall be deemed satisfied if the agency submits in a form acceptable to BCDC an agreement authorized by Section 23 or 26 of this act, provided the agreement is fully executed, all parties with an interest in the property are parties to the agreement, and the terms of the agreement allow the applicant to undertake the proposed construction and uses for which the permit is sought.

(c) This section does not affect BCDC's jurisdiction and authority, or its discretion to approve, disapprove, or condition a permit application subject to this section in accordance with applicable law.

SEC. 32. (a) Nothing in this act may be construed to nullify the city or the agency's obligations for increasing, improving, and preserving the community's supply of low- and moderate-income housing imposed by the Community Redevelopment Law, including, but not limited to, the requirements of Sections 33334.2 and 33413 of the Health and Safety Code.

(b) Nothing in this act shall be construed as creating an exemption from or in any way modifying the requirements of the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code).

SEC. 33. Nothing in this act may be construed to authorize residential uses or other nontrust uses on public trust land except as provided in Sections 14 and 15.

SEC. 33.5. This act shall not be construed as creating a cloud on title to any real property within the project area in which the state has no claim of interest.

SEC. 34. A deed, patent, agreement, or other instrument executed in furtherance of this act, or an action of the city, state, or agency, to approve the use, lease, or conveyance of a city, state, or agency property subject to this act, or any portion thereof, or to approve project agreements, grant entitlements or permits, or issue bonds or other indebtedness in connection with the use and development of that property, shall be conclusively presumed to be valid unless held to be invalid in an appropriate proceeding in a court of competent jurisdiction to determine the validity of the agreement commenced within 60 days after the recording of the agreement.

SEC. 35. (a) An action may be brought under Chapter 4 (commencing with Section 760.010) of Title 10 of Part 2 of the Code of Civil Procedure to establish title to any lands conveyed pursuant to this act, or by the parties to any agreement entered into pursuant to this act to confirm the validity of the agreement. Notwithstanding Section 764.080 of the Code of Civil Procedure, the statement of decision in the action shall include a recitation of the underlying facts and a determination as to whether the conveyance or agreement meets the requirements of this act, Sections 3 and 4 of Article X of the California Constitution, if applicable, and any other law applicable to the validity of the agreement.

(b) For purposes of Section 764.080 of the Code of Civil Procedure and unless otherwise agreed in writing, an agreement entered into pursuant to this act shall be deemed to be entered into on the date it is executed by the executive officer of the commission, or, if the commission is not a party, by the director, who shall be the last of the parties to sign prior to the signature of the Governor. The effective date of the agreement shall be deemed to be the date on which it is executed by the Governor pursuant to Section 6107 of the Public Resources Code.

(c) An action may be brought under Chapter 9 (commencing with Section 860) of Title 10 of Part 2 of the Code of Civil Procedure to determine the legality and validity of a deed, patent, agreement, or other instrument executed in furtherance of or authorized by this act, or an action of the city or agency to use, lease, or convey any property, or to approve project agreements, grant entitlements or permits, or issue bonds or other indebtedness in connection with the use and development of that property. Before the filing of an action, the Attorney General, the director, and the executive officer of the commission shall be provided written notice of the action and a copy of the complaint. An action authorized by this subdivision may be combined with an action authorized by subdivision (a).

SEC. 36. If a provision of this act, or its application to a person, property, or circumstance, is held invalid by a court, the invalidity or inapplicability of that provision shall not affect any other provision of this act or the application of that provision to any other person, property, or circumstance, and the remaining portions of this act shall continue in full force and effect, unless enforcement of this act as so modified by and in response to that invalidation would be grossly inequitable under all of the circumstances, or would frustrate the fundamental purposes of this act.

SEC. 37. It is the intent of the Legislature that the department shall give strong consideration to keeping open Candlestick Park State Recreation Area any time the department undertakes the process of identifying state parks or state recreation areas for closure, whether seasonal, partial, full, or otherwise. This consideration is based upon the funding provided in Section 26 for operation and maintenance of Candlestick Park State Recreation Area.

SEC. 38. The Legislature finds and declares that, because of the unique circumstances applicable only to the lands described in this act, a statute of general applicability cannot be enacted within the meaning of subdivision (b) of Section 16 of Article IV of the California Constitution. Therefore, this special statute is necessary.

1.0 INTRODUCTION

The City of San Francisco (City or San Francisco), and San Francisco Redevelopment Agency are conducting an environmental review under the requirements of the California Environmental Quality Act (CEQA) for the proposed Candlestick Point-Hunters Point Shipyard Phase II Project (proposed project or CP-HPS II). This water supply assessment (WSA) will provide information for use in the CEQA analysis for this proposed project. The environmental review for the proposed project includes an assessment of the available water supply to serve the proposed project. The requirements for a WSA are set forth in the California Water Code (Water Code) Sections 10910 et seq.

A WSA connects water supply and land use planning with the environmental review process. The law also reflects the growing awareness of the need to incorporate water supply and demand analysis at the earliest possible stage in the land use planning process. The core of this law is an assessment of whether available water supplies are sufficient to serve the demand generated by a project, as well as the reasonably foreseeable cumulative demand in the region over the next 20 years under a range of hydrologic conditions.

This WSA provides information on the available water supply to serve the proposed project based on Water Code Sections 10631, and 10910 et seq.

This document is divided into six sections: Introduction, Water Supply Sources, Demand Analysis, Supply and Demand Comparison, Conclusion of Analysis and Findings. The Introduction describes the proposed project and water supply planning under Water Code 10910 et al.

1.1. Project Location, Land Use, Zoning and Characteristics

1.1.1. Project Location

Candlestick Point and Hunters Point Shipyard project sites comprise approximately 702 acres in the southeastern portion of San Francisco (see Figure 1-1 for the regional and local project location). Taken together, they are bordered by major features such as India Basin on the north, the Executive Park area and San Mateo County line on the south; Bayview Hill, the Bayview neighborhood, Yosemite Slough, and Hunters Point Hill on the west; and, San Francisco Bay on the north and the east.

1.1.2. Project Sites

1.1.2.1. Candlestick Point

The Candlestick Point area is immediately east of Executive Park, with the Bayview neighborhood to the north, the Hunters Point Shipyard to the northeast, and Candlestick Point State Recreation Area (SRA) along the Bay frontage generally on the east. The Candlestick Point site is generally bounded by Hawes Street to the northwest and Jamestown Avenue to the southwest, and the Candlestick Cove and South Basin areas of the Bay comprise the south and east boundaries, respectively.

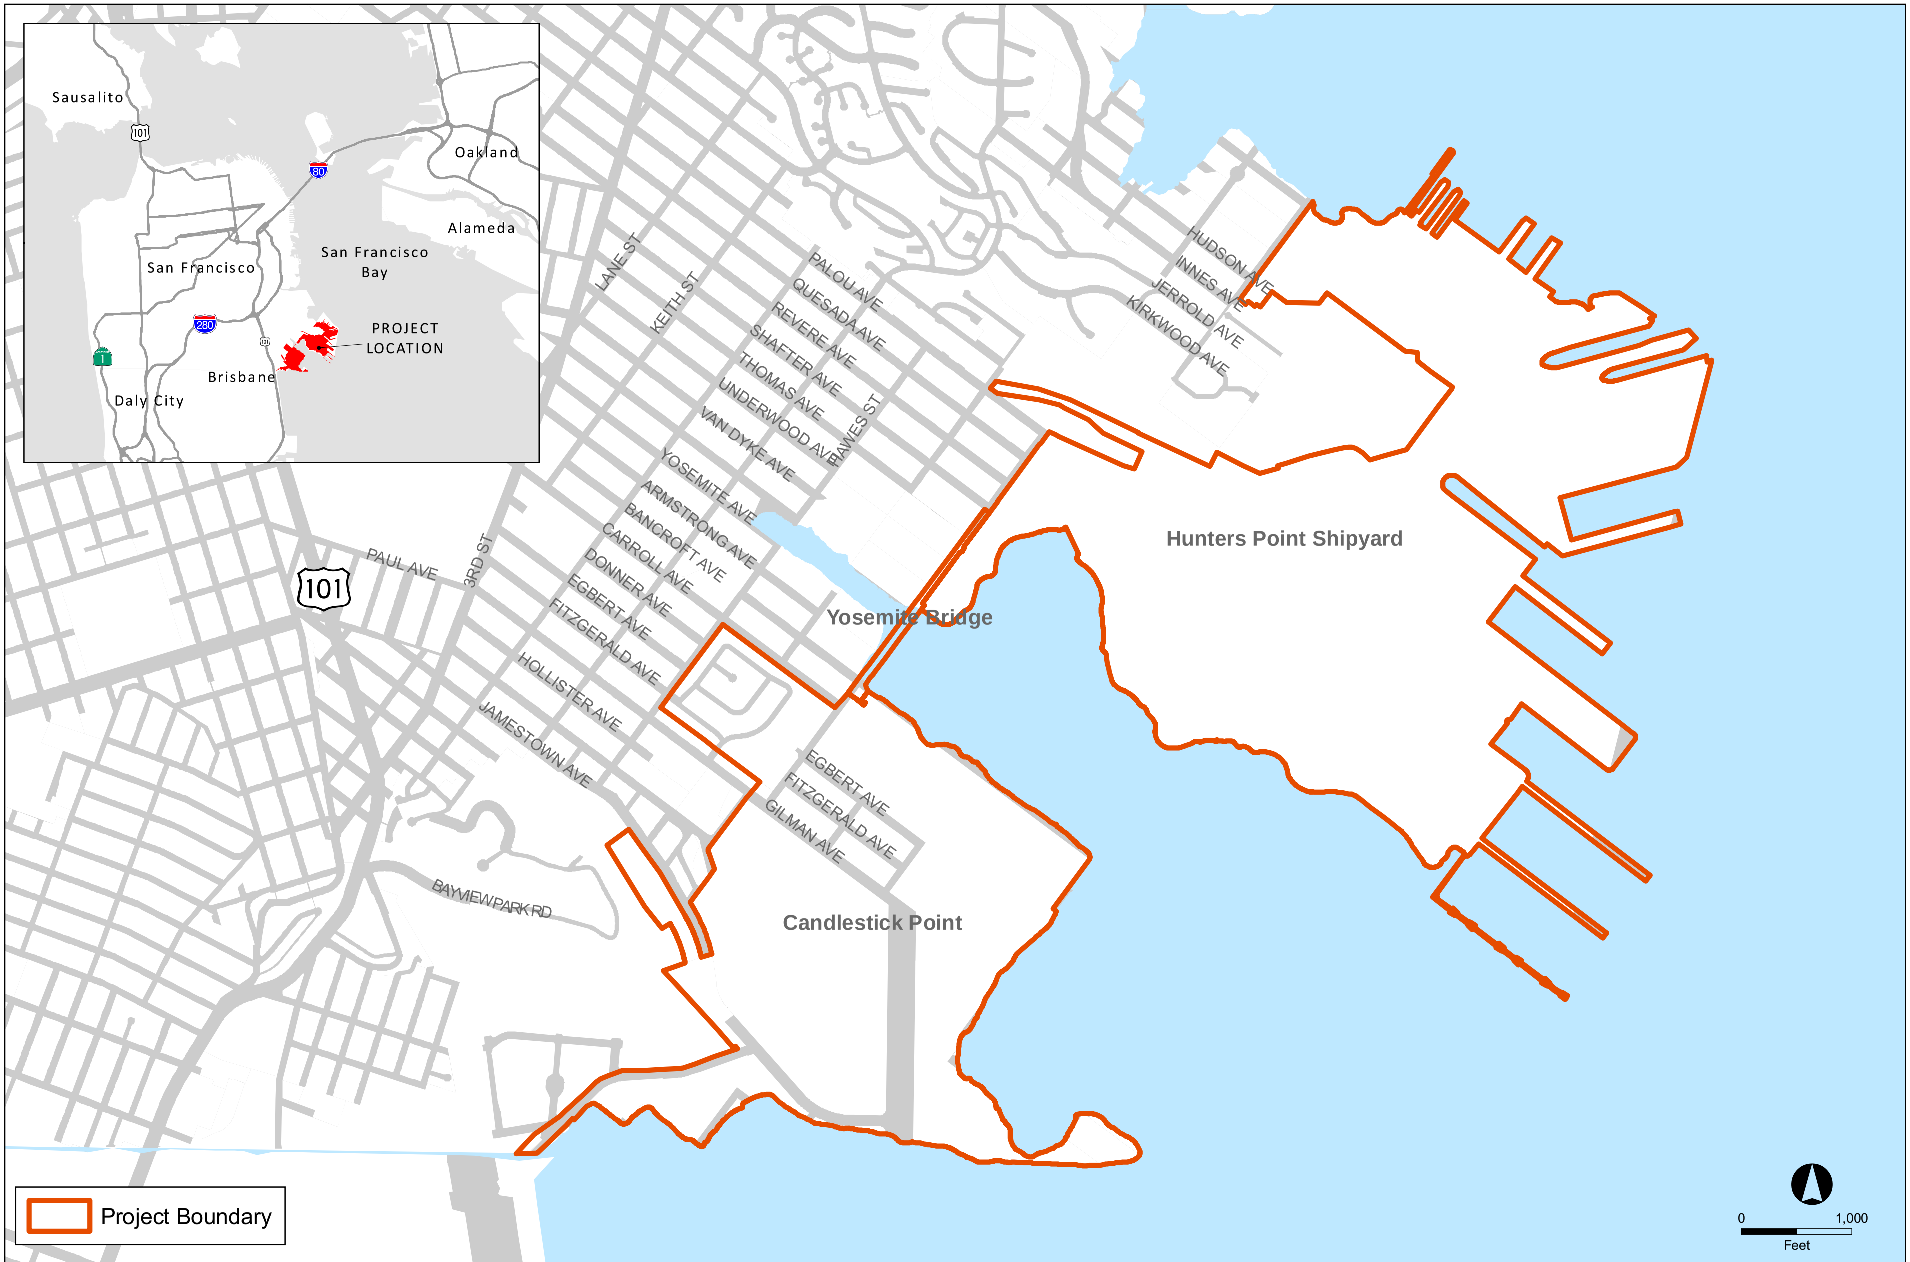

FIGURE **1-1**

Regional and Project Location

0D432500

Bayview WSA

1.1.2.1. Hunters Point Shipyard Phase II

The Hunters Point Shipyard area is to the southeast of the Hunters Point neighborhood. The Hunters Point Shipyard site is generally bounded by San Francisco Bay to the north, east, and south. The south end of the western boundary extends from Yosemite Slough along Arelious Walker Drive north to approximately Crisp Road, excluding the University of California San Francisco (UCSF) property. The inland northern boundary generally extends along Crisp Road and Spear Avenue. The northernmost end of the HPS Phase II area is contiguous with Earl Street.

1.1.3. Proposed Project Land Use Information

The proposed project would consist of nine districts: five in Candlestick Point and four in Hunters Point Shipyard Phase II. Table 1-1 presents the overall land use distribution.

Table 1-1: Project Proposed Land Uses

Land Use	Candlestick Point	Hunters Point Shipyard Phase II	Total
Residential (DU)			
Residential Density Range I (15 to 75 units per acre)	1,325	680	2,005
Residential Density Range II (50 to 125 units per acre)	2,865	1,415	4,280
Residential Density Range III (100 to 175 units per acre)	2,000	265	2,265
Residential Density Range IV (175 to 285 units per acre)	1,660	290	1,950
Total	**7,850**	**2,650**	**10,500**
Commercial Uses			
Retail			
Regional Retail (gsf)	635,000	~	635,000
Neighborhood Retail (gsf)	125,000	125,000	250,000
Total	**760,000**	**125,000**	**885,000**
Hotel (150,000 gsf)	220 rooms		220 rooms
Office (gsf)	150,000	~	150,000
Community Uses/Services (gsf)	50,000	50,000	100,000
Research & Development (gsf)			
Office	~	835,000	835,000
Laboratory	~	835,000	835,000
Light Industrial	~	835,000	835,000
Total		**2,500,000**	**2,500,000**
Artist Center and Studios			
Artist's Studios		225,000	225,000
Artist Education Center		30,000	30,000
Total	**~**	**255,000**	**255,000**
Parks & Open Space (acres)			
New Parks	8.1	140.0	148.1
New Sports Fields and Waterfront Recreation	~	91.6	91.6
New and Improved State Parkland at CP	96.7 acres	~	96.7
Total	**104.8**	**231.6**	**336.4**
Ferry Terminal	~	1	1
Marina (slips)	~	300	300
Stadium (seats)		69,000	69,000
Performance Venue (75,000 gsf)	10,000 seats		10,000 seats

Notes:
gsf = gross square feet; DU = dwelling units
Source: Lennar Urban, 2009.

Figure 1-2 illustrates the land use plan.

- **Residential:** The proposed project would consist of 10,500 for-sale and rental residential units, including approximately 6,899 market-rate units and approximately 3,345 below market rate and 256 public housing replacement units. The units would range in size from studios to four bedrooms. Units include 2- and 3-story townhomes over parking, 3- to 5-story low-rise flats over podium parking, 8- to 14-story mid-rise flats, and 22- to 42-story high-rise towers. Depending on their location, lower floors of all residential building types (other than townhomes) could include commercial uses.
  - Residential Density Range I (15 to 75 units per net acre): Housing types would typically include townhomes, flats, and lofts
  - Residential Density Range II (50 to 125 units per net acre): Housing types would typically include low-rise flats and lofts
  - Residential Density Range III (100 to 175 units per net acre) Housing types would typically include low and mid-rise flats or low-rise flats and high-rise buildings
  - Residential Density Range IV (175 to 285 units per net acre): Housing types would typically include low-rise flats and high-rise buildings
- **Regional Retail.** A regional retail center of up to 635,000 gross square feet (gsf) is proposed on Candlestick Point. Retailers could include a variety of general merchandise, apparel, furniture and home furnishings, food service and restaurants, and entertainment related businesses to serve the regional market.
- **Neighborhood Retail.** Neighborhood retail sites are designated at both Candlestick Point and Hunters Point Shipyard, and in addition, small-scale neighborhood retail uses could be established throughout the project site depending on demand. Up to 250,000 gsf of neighborhood retail could include convenience goods (e.g. food, drugs and groceries) and personal services (e.g. laundry, dry cleaning, barbering, and shoe repair) for daily needs of the immediate neighborhood.
- **Community Services.** Up to 100,000 gsf of fire, police, healthcare, day-care, places of worship, senior centers, library, recreation center, community center, and performance center uses at sites designated for community serving use on both Candlestick Point and Hunters Point Shipyard.
- **Research and Development.** Hunters Point Shipyard Phase II would be the site of up to 2,500,000 gsf of a possible wide range of businesses including, but not limited to, emerging industries and technologies such as green technology and biotechnology.
- **Hotel.** A 220-room hotel is proposed at Candlestick Point Center.
- **Office.** Up to 150,000 gsf of office uses on Candlestick Point could include but not be limited to professional offices, real estate offices, and financial services.
- **Performance Venue/Arena.** A 10,000-seat venue for theatre productions, concerts, speaking engagements, educational events, or sporting events is proposed on Candlestick Point.
- **Artist's Studios/Artist Education Center.** Up to 255,000 gsf of artist's studios and an artist education center is proposed on Hunters Point Shipyard.
- **Parks and Open Space.** The Project would include an estimated 336 acres of new public parks and open space, sports fields, and improvements to the Candlestick Point Recreation Area.

Bayview WSA

09028 | JCS | 09

- **Parking.** Parking would be provided as structured parking for residential uses, (as structured and on-street parking for commercial uses) for dedicated stadium use, and as general parking.
- **Marina.** A 300-slip marina is proposed at Hunters Point Shipyard. A marina could include utilities at each slip. Landside amenities could include a classroom facility for restrooms, showers and to sailing instruction.
- **Ferry Terminal.** A ferry terminal and dock to accommodate Water Emergency Transportation Authority (WETA) vessels is proposed at Hunters Point Shipyard. The terminal building could include ticketing kiosks, real-time transit information, and public restrooms.

1.1.4. Proposed Research and Development Variant Information

The Research and Development (R&D) Variant assumes that the Stadium would not be constructed at the HPS Phase II site; instead, additional R&D uses emphasizing emerging technologies would be developed. With the R&D Variant, the 69,000-seat Stadium proposed under the proposed project would not be constructed. Instead, the R&D Variant would result in construction of an additional 2,500,000 gross square feet of R&D uses above what is currently proposed in the HPS South neighborhood district. Table 1-2 lists the additional R&D space that would be constructed at the HPS South neighborhood district under the R&D Variant; all other proposed project land uses remain unchanged.

Table 1-2: Proposed R&D Variant

Land Use	Candlestick Point	Hunters Point Shipyard Phase II	Total
Research & Development (gsf)			
Office	~	1,665,000	1,665,000
Laboratory	~	1,665,000	1,665,000
Light Industrial	~	1,665,000	1,665,000
TOTAL		**5,000,000**	**5,000,000**

All other proposed project land uses remain unchanged.

1.2. Water Supply Planning

Senate Bill 610 was passed into law on January 1, 2002. This law reflects the need to incorporate water supply and demand analysis at the earliest possible stage in the planning process. SB 610 amended portions of the Water Code, including Section 10631, which contains the Urban Water Management Planning Act, as well as adding Sections 10910, 10911, 10912, 10913, and 10915, which describe the required elements of a WSA. Upon signing this bill and a related bill not applicable to the proposed project, Governor Gray Davis stated, “Most notably, these bills will coordinate local water supply and land use decisions to help provide California’s cities, farms, and rural communities with adequate water supplies. Additionally, these bills increase requirements and incentives for urban water suppliers to prepare and adopt comprehensive management plans on a timely basis.”[1]

Senate Bill 610 is designed to build on the information that is typically contained in an Urban Water Management Plan (UWMP). The amendments to Water Code Section 10631 were designed to make WSAs and UWMPs consistent. A key difference between the WSAs and UWMPs is that UWMPs are required to be revised every five years, in years ending with either zero or five, while WSAs are required as part of the environmental review process for each

1 Department of Water Resources. 2003. Guidebook for Implementation of SB 610 and SB 221 of 2001.

individually qualifying project. As a result, the 20-year planning horizons for each type of document may cover slightly different planning periods than other WSAs or the current UWMP. Additionally, not all water providers who must prepare a WSA are required to prepare an UWMP.

1.2.1. SB 610 Water Supply Assessment

The SB 610 water supply assessment process involves answering the following questions:

- Is the project subject to CEQA?
- Is it a project under SB 610?
- Is there a public water system?
- Is there a current UWMP that accounts for the project demand?
- Is groundwater a component of the supplies for the project?
- Are there sufficient supplies available to serve the project over the next 20 years?

1.2.1.1. "Is the Project Subject to CEQA?"

The first step in the SB 610 process is determining whether the project is subject to CEQA. SB 610 amended Public Resources Code Section 21151.9 to read: "Whenever a City or county determines that a project, as defined in Section 10912 of the Water Code, is subject to this division [i.e., CEQA], it shall comply with part 2.10 (commencing with Section 10910) of Division 6 of the Water Code." The City of San Francisco and the San Francisco Redevelopment Agency have determined that the proposed project is a project subject to CEQA. The information contained in this assessment will be used to inform and support the Environmental Impact Report (EIR) for the proposed project, and will be appended thereto.

1.2.1.2. "Is It a Project Under SB 610?"

The second step in the SB 610 process is to determine if a project meets the definition of a "Project" under Water Code Section 10912 (a). Under this section, a "Project" is defined as meeting any of the following criteria:

1. A proposed residential development of more than 500 dwelling units;
2. A proposed shopping center or business establishment employing more than 1,000 persons or having more than 500,000 square feet (ft^2) of floor space;
3. A commercial building employing more than 1,000 persons or having more than 250,000 ft^2 of floor space;
4. A hotel or motel with more than 500 rooms;
5. A proposed industrial, manufacturing, or processing plant, or industrial park, planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 ft^2 of floor area;
6. A mixed-use project that includes one or more of these elements; or
7. A project creating the equivalent demand of 500 residential units.

Alternately, if a public water system has less than 5,000 service connections, the definition of a "Project" also includes any proposed residential, business, commercial, hotel or motel, or industrial development that would account for an increase of 10 percent or more in the number of service connections for the public water system. The proposed project is a mixed-use project that would include one or more of these elements listed above, specifically, "the proposed project exceeds residential development of more than 500 dwelling units" and for that reason, it meets the requirements as a "Project" under the Water Code.

1.2.1.3. "Is There a Public Water System?"

The third step in the SB 610 process is determining if there is a "public water system" to serve the project. Section 10912 (c) of the California Water Code states: "[A] public water system means a system for the provision of piped water to the public for human consumption that has 3,000 or more service connections." The San Francisco Public Utilities Commission (SFPUC) is a public water system that serves the City and County of San Francisco, including the proposed project area. The SFPUC's Retail service area is shown in Figure 1-3. The SFPUC provides water to both retail and wholesale water customers. A population of over 2.5 million people within the counties of San Francisco, San Mateo, Santa Clara, Alameda, and Tuolumne rely entirely or in part on the water supplied by the SFPUC.

Retail Customers: The SFPUC's retail water customers include the residents, business, and industries located within the corporate boundaries of the City and County of San Francisco (City). In addition to these customers, retail water service is also provided to other customers located outside of the City, such as Treasure Island, the Town of Sunol, San Francisco International Airport, Lawrence Livermore Laboratory, Castlewood, and Groveland Community Services District.

Wholesale Customers: The SFPUC sells water to wholesale customers under terms of the recently renegotiated Water Supply Agreement together with individual water sales contracts. Since 1970, the SFPUC has supplied approximately 65 percent of the total wholesale customer water demand. Some of the wholesale water customers are entirely reliant on the SFPUC for their water supply.

1.2.1.4. "Is There a Current UWMP That Accounts for the Project Demand?"

Step four in the SB 610 process involves determining if there is a current UWMP that considers the projected water demand for the project area. The Water Code requires that all public water systems providing water for municipal purposes to more than 3,000 customers or supplying more than 3,000 acre-feet annually must prepare an UWMP, and the plan must be updated at least every five years on or before December 31 in years ending in five and zero.

Water Code Section 10910 (c)(2) states: "If the projected water demand associated with the proposed project was accounted for in the most recently adopted urban water management plan, the public water system may incorporate the requested information from the urban water management plan in preparing the elements of the assessment required to comply with subdivisions (d),(e),(f), and (g) [i.e., the WSA]." The SFPUC 2005 UWMP is currently available online.[2]

FIGURE **1-3**

SFPUC Service Area within City and County of San Francisco

0D432500

Bayview WSA

As of late 2008, the SFPUC concluded that its 2005 UWMP no longer accounted for every qualifying project within San Francisco including the land use changes at the proposed project area. Therefore, any qualifying projects not accounted in the 2005 UWMP will require preparation of a WSA that documents the SFPUC's current and projected supplies when compared to projected demands associated with new growth not covered in the 2005 UWMP including agriculture and industrial uses. When the 2005 UWMP was prepared, the redevelopment plan at Candlestick Point and Hunters Point Shipyard did not encompass the entire development of the proposed project; therefore, this WSA analyzes the change in demand at the project site under the proposed project.

1.2.1.1. "Is Groundwater a Component of the Supplies for the Project?"

This section addresses the requirements of Water Code Section 10910 (f), paragraphs 1 through 5, which apply if groundwater is a source of supply for a proposed project. As required by Water Code Section 10910 (f) a description and status of the local groundwater basin is discussed below. Groundwater is a minor component of water supply for the SFPUC and for the proposed project. A discussion of the SFPUC's groundwater supply programs is included in Sections 2.6.2.1 and 3.4 of this WSA.

In April 2005, the SFPUC completed the Final Draft North Westside Basin Groundwater Management Plan (GWMP), which identified opportunities for increasing groundwater production in San Francisco. The GWMP included a Plan Element to regularly report on groundwater conditions in the North Westside Groundwater Basin. Since completion of the GWMP, the SFPUC prepared two annual reports on the condition, status and water supply programs involving the North Westside Groundwater Basin.

Groundwater Basin Descriptions

The City and County of San Francisco are located over seven groundwater basins: Westside, Lobos, Marina, Downtown, Islais Valley, South San Francisco, and Visitation Valley. The Lobos, Marina, Downtown, and South San Francisco Basins are located completely within City limits; the remaining basins extend into San Mateo County. The basins are part of the larger San Francisco Bay Hydrologic Region, as defined by the Department of Water Resources (DWR) in its Bulletin 118. DWR Bulletin 118 describes the groundwater resources of the state and provides individual basin descriptions. DWR has not identified any of the basins listed above as being in overdraft or as being adjudicated.[3]

The following information is from the SFPUC's *2008 Annual Groundwater Monitoring Report Westside Basin.* See Appendix A for the entire report.

> The Westside Basin is about 40 square miles in area and includes four major geologic units. These units are the Jurassic - Cretaceous Franciscan Complex, Pliocene Merced Formation, Pleistocene Colma Formation, and Pleistocene to recent Dune Sands. There are also minor, yet widespread, units of recent alluvium along stream channels. Groundwater development has primarily occurred in the Colma and Merced Formations. The Merced Formation is the primary water-producing aquifer in the basin; however, the Colma Formation is also of interest since Lake Merced is incised within this formation. As a result of the difficulty of differentiating the contacts between the Dune Sands, the Colma Formation, and the Merced Formation, the precise thickness of the Colma Formation and Dune Sands overlying the Merced Formation has not been determined. Groundwater in the vicinity of Lake Merced, and north to Stern Grove and Golden Gate Park, is encountered at relatively shallow depths (ranging from approximately 5 to

3 Department of Water Resources. Groundwater Management Technical Assistance – Adjudicated Basins. http://www.groundwater.water.ca.gov/technical_assistance/gw_management/#adbasins

60 feet). South of Lake Merced, the depth to groundwater can exceed 300 feet below ground surface (bgs).

Phillips, et al. (1993) defined each of the groundwater basins in San Francisco as a continuous body of unconsolidated sediments and the surrounding surface drainage area. All seven major groundwater basins identified in San Francisco are open to the Pacific Ocean or San Francisco Bay. The landward parts of the groundwater basins generally are bounded horizontally and vertically by bedrock, which is assumed to be relatively impermeable compared with unconsolidated marine and alluvial deposits. Groundwater flow may occur between basins where the bedrock ridge that constitutes the boundary is subterranean. The north-south topography and bedrock height defined by the Coast Ranges generally forms an east-west hydrologic boundary through San Francisco.

The western part of San Francisco is divided into the Westside and Lobos Basins on the basis of a northwest-trending bedrock ridge through the northeastern part of Golden Gate Park. The bedrock ridge has several small surface expressions, and bedrock altitude data indicate that the ridge is continuous, though subterranean. Some degree of hydraulic connection is possible between the two basins where the ridge is not exposed at the land surface, but the degree of connection probably is minimal. The Westside Basin extends south to Burlingame and Hillsborough. Well drillers' logs for the San Bruno area indicate a deep sandy unit overlain by about 200 feet of predominantly fine-grained clays. Correlation of the deeper sand deposits is unclear; however, surficial mapping may indicate a relationship to exposures of sand/gravel deposits in the Burlingame area, which are mapped as non-marine Santa Clara Formation (Brabb and Pampeyan, 1983). A southward-extending ridge of Franciscan bedrock appears to separate San Bruno from the San Francisco Bay to the east. The upper fine grained beds appear to be Holocene to Late Pleistocene estuarine deposits of the San Francisco Bay (LSCE, 2004).

The subsurface configuration of the various geologic units in the Westside Basin has been delineated in a series of geologic cross-sections based on a combination of lithologic logs; water well drillers' reports, and geophysical logs (LSCE, 2004 and 2006). Lithologic units and other significant features in the basin are illustrated in geological cross-section form. In the northern Westside Basin, in San Francisco, there are up to three aquifer units separated by two distinctive fine-grained units, the –100-foot clay and the W-Clay (LSCE, 2004). The aquifer units are generally designated as: 1) The "Shallow aquifer", which is present to an elevation of approximately –100 feet mean sea level (msl) (located above the –100-foot clay), in the vicinity of Lake Merced and the southern portion of the Sunset District of San Francisco; 2) The "Primary Production aquifer", which overlies the W-Clay; and 3) The "Deep aquifer" which underlies the W-Clay. In the Daly City area, the –100-foot clay is absent, and the aquifer system is primarily composed of the Primary Production aquifer and the Deep aquifer. Further to the south, in the South San Francisco area, the W-Clay is absent and the Primary Production aquifer is split into shallow and deep units, separated by a fine-grained unit at an elevation of approximately 300 feet below msl. The primary production aquifer in the San Bruno area is located at an elevation less than 200 feet below msl, and it underlies a thick, surficial fine-grained unit comprised of clay, sandy clay, and sand beds.

1.2.1.2. "Are There Sufficient Supplies to Serve the Project Over the Next 20 Years?"

Water Code Section 10910 (c)(4) states: "If the City or county is required to comply with this part pursuant to subdivision (b), the water assessment for the project shall include a discussion with regard to whether the total projected water supplies, determined to be available by the City or county for the project during normal, single dry and multiple dry water years during a 20-year projection, will meet the projected water demand associated with the proposed project, in addition to existing and planned future uses, including agricultural and manufacturing uses."

The SFPUC, based on the analysis in this WSA, concludes that are adequate supplies to serve the proposed project, including existing demand and planned future uses in the SFPUC's Retail service area through 2030. However, after 2030 in multiple dry-year events, the SFPUC would have to implement its demand management programs to reduce demand to meet projected supply curtailments.

As required, the next step in the SB 610 process is to prepare the assessment of the available water supplies, including the availability of these supplies in all water-year conditions over a 20-year planning horizon, and an assessment of how these supplies relate to project-specific and cumulative demands over that same 20-year period. In this case, the period is 20 years and covers the years 2010 to 2030.

There are three primary areas addressed in a water supply assessment:

- relevant water supply entitlements, water rights, and water contracts;
- a description of the available water supplies; and,
- an analysis of the demand placed on those supplies, both by the project and on a cumulative basis.

Water entitlements and contracts are addressed in Section 2 and demand analysis is discussed in Section 4. Section 6 contains conclusions and findings.

2.0 WATER SUPPLY

This section presents the local climate conditions and reviews the SFPUC's water supply sources, entitlements, water rights and contracts.

2.1. Climate

San Francisco has a Mediterranean climate. Summers are cool and winters are mild with infrequent rainfall. Temperatures in the San Francisco area average 58 degrees Fahrenheit annually ranging from the mid-40s in winter to the mid-70s in late summer. Strong onshore winds in summer keeps the air cool, generating fog through September. The warmest temperatures generally occur in September and October. Rainfall in the San Francisco area averages about 20 inches[4] per year and is generally confined to the "wet" season, from late October to early May. Except for occasional light drizzles from thick marine stratus clouds, summers are nearly completely dry. Coastal fog helps reduce summer irrigation requirements. A summary of temperature and rainfall data for the City of San Francisco is included in Table 2-1.

Table 2-1: City of San Francisco Climate Summary

	Maximum Average Temperature (°F)[a]	Minimum Average Temperature (°F)[a]	Average Monthly Rainfall (inches)[1]
January	55.8	42.5	4.38
February	59.1	44.9	3.63
March	61.2	46.1	2.81
April	63.9	47.6	1.37
May	66.8	50.2	0.39
June	70.0	52.7	0.11
July	71.5	54.1	0.02
August	72.1	55.0	0.05
September	73.4	54.8	0.18
October	70.2	51.9	0.96
November	62.9	47.4	2.36
December	56.4	43.2	3.76
Annual Average	**65.3**	**49.2**	**20.00**

Note:
1. Source: Western Regional Climate Center – San Francisco. Data from 1/1/1937 to 12/31/2008.

According to the Department of Water Resources, eleven droughts have occurred in California since 1850.[5] The year 1977 is recognized as the driest single year of California's measured hydrologic record. The most recent multi-year statewide drought took place between 1987 and 1992. Droughts exceeding three years are relatively rare in Northern California; however, even localized droughts in Northern California have extensive repercussions for water agencies dependent upon Sierra Nevada snowpack and spring runoff.

5 Department of Water Resources. Background: Droughts in California. http://watersupplyconditions.water.ca.gov/background.cfm, accessed September 2007.

2.2. Water Supply Entitlements, Water Rights and Contracts

Water Code Section 10910 (d)(1) states: "The assessment required by this section shall include an identification of any existing water supply entitlements, water rights, or water service contracts relevant to the identified water supply for the proposed project, and a description of the quantities of water received in prior years by the public water system, or the City or county if either is required to comply with this part pursuant to subdivision (b), under the existing water supply entitlements, water rights or water service contracts."

2.3. Introduction to the SFPUC Water Supply Sources

The Regional Water System (RWS) currently delivers an annual average of approximately 265 million gallons of water per day (mgd), with approximately 85 percent of that water supply provided by the Hetch Hetchy system, which diverts water from the Tuolumne River. The balance (of approximately 15 percent) comes from runoff in the Alameda Creek watershed, which is stored in the Calaveras and San Antonio reservoirs, and runoff from the San Francisco Peninsula, which is stored in the Crystal Springs, San Andreas, and Pilarcitos reservoirs (which also provide storage for water delivered from the Hetch Hetchy Project). A small portion of retail demand is met through locally produced groundwater, used primarily for irrigation at local parks and on highway medians, and recycled water, which is used for wastewater treatment process water, sewer box flushing, and similar wash down operations. The SFPUC also retails groundwater (pumped from the Pleasanton well field) to the Castlewood development in Alameda County.

2.3.1. Surface Water Rights

The City and County hold pre-1914 appropriative water rights to store and deliver water from the Tuolumne River in the Sierra Nevada and locally from the Alameda and Peninsula watersheds. The City and County also divert and store water in the San Antonio Reservoir under an appropriative water right license granted by the State Water Resources Control Board (SWRCB) in 1959.

Appropriative water rights allow the holder to divert water from a source to a place of use not connected to the water source. These rights are based on seniority and use of water must be reasonable, beneficial, and not wasteful. In 1914, California established a formal water rights permit system, which is administered by the SWRCB. The SWRCB has sole authority to issue new appropriative water rights but cannot define property rights created under a pre-1914 appropriative water right.

The 1912 Freeman Report identified the ultimate diversion rate from the Tuolumne River to the Bay Area as 400 mgd and the City used this as the basis for designing the export capacity of the Hetch Hetchy project. The City has sufficient water rights for current diversions and the ultimate planned diversion rate of the Hetch Hetchy Project.

The federal Raker Act, enacted on December 19, 1913, grants to the City rights-of-way and public land use on federal property in the Sierra Nevada Mountains to construct, operate, and maintain reservoirs, dams, conduits, and other structures necessary or incidental to developing and using water and power. It also imposes restrictions on the City's use of the Hetch Hetchy Reservoir, including (among others) the requirement that the City recognize the senior water rights of the Turlock and Modesto Irrigation Districts (TID and MID) to divert water from the Tuolumne River. Specifically, the Raker Act requires the City to bypass certain flows through its Tuolumne River reservoirs to TID and MID for beneficial use. By agreement, the City, TID, and MID have supplemented these Raker Act obligations to increase the TID and MID entitlements to account for other senior Tuolumne River water rights and to allow the City to "pre-pay" TID and

MID their entitlement by storing water in the Don Pedro water bank. The City is required to bypass inflow to TID and MID sufficient to allow these districts to divert 2,416 cfs or natural daily flow, whichever is less, at all times (as measured at La Grange), except for April 15 to June 13, when the requirement is 4,066 cfs or natural daily flow as measured at La Grange, whichever is less.

2.4. Water Supply Considerations

The SFPUC prepared a Program Environmental Impact Report (PEIR) under CEQA for the Water System Improvement Program (WSIP). (A discussion of the WSIP follows in Section 2.7.1). At the request of the SFPUC, the San Francisco Planning Department studied the Phased WSIP Variant as part of the environmental analysis. The SFPUC identified this variant in order to consider a program scenario that involved full implementation of all proposed WSIP facility improvement projects to insure that the public health, seismic safety, and delivery reliability goals were achieved as soon possible, but phased implementation of a water supply program to meet projected water purchases through 2030. Deferring the 2030 water supply element of the WSIP until 2018 would allow the SFPUC and its wholesale customers to focus first on implementing additional local recycled water, groundwater, and demand management actions while minimizing additional diversions from the Tuolumne River.

The Phased WSIP Variant establishes a mid-term planning milestone in 2018 when the SFPUC would reevaluate water demands through 2030 in the context of then-current information, analysis, and available water resources. The SFPUC currently delivers on an annual average approximately 265 million gallons per day (mgd) from local watersheds (Peninsula and Alameda Creek) and the Tuolumne River Watershed. By 2030, demand on the SFPUC system is expected to increase to annual average of 300 mgd. The Phased WSIP Variant would meet the projected 2018 purchase requests of 285 mgd from the RWS by capping purchases at 265 mgd; the remaining 20 mgd would be met through water conservation, recycling, and groundwater use—10 mgd by Wholesale Customers and 10 mgd in the City. Before 2018, the SFPUC and the Wholesale Customers will engage in a new planning process to re-evaluate water system demands and supply options, including conducting additional studies and environmental reviews necessary to address water supply needs after 2018. Therefore, this WSA assumes the SFPUC will limit purchases to an annual average of 265 mgd from the RWS watersheds.

2.5. SFPUC Regional Water System

In 1934, San Francisco combined the Hetch Hetchy system and Spring Valley system to create the SFPUC RWS. The rights to local diversions were originally held by the Spring Valley Water Company, which was formed in 1862. The RWS is owned and operated by the City and County.

On average, the Hetch Hetchy Project provides over 85 percent of the water delivered and the balance approximately 15 percent is met through the Bay Area reservoirs. The RWS delivers an annual average of approximately 265 mgd – 81 mgd serves the Retail customers within the City and County of San Francisco and the other 184 mgd is delivered to the Wholesale customers. The RWS currently delivers water to 2.5 million users in Tuolumne, Alameda, Santa Clara, San Mateo, and San Francisco counties.

The RWS is a complex system, shown in Figure 2-1, and supplies water from two primary sources:

- Tuolumne River through the Hetch Hetchy Reservoir, and
- Local runoff into reservoirs in Bay Area reservoirs in the Alameda and Peninsula watersheds.

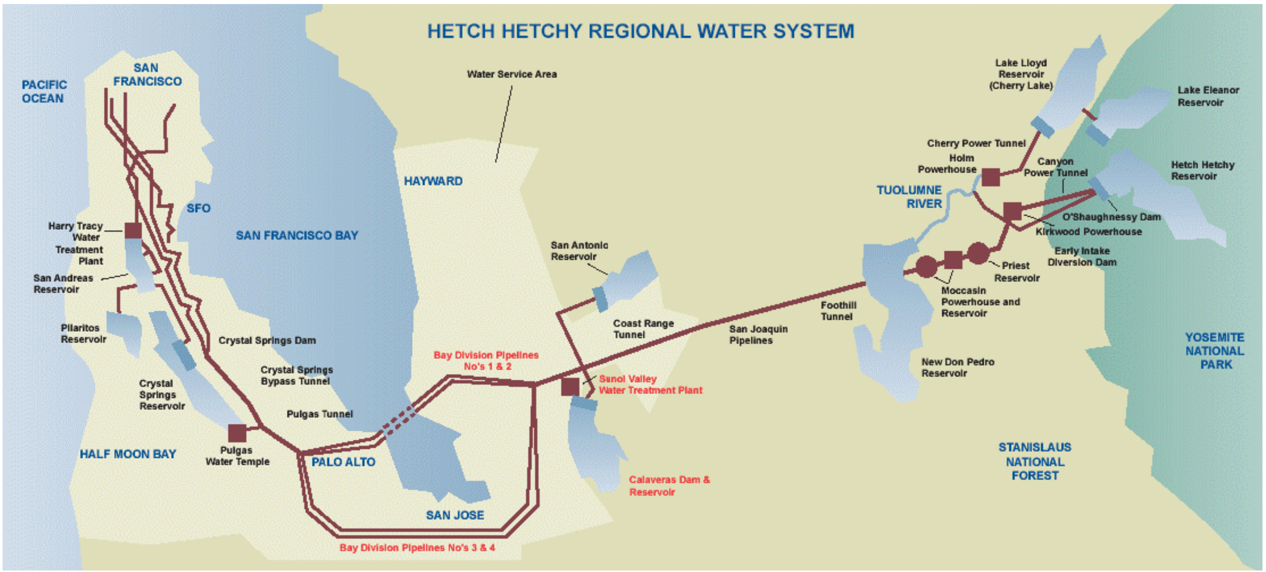

Figure 2-1: Regional Water Supply System

Water from Hetch Hetchy Reservoir, through the Hetch Hetchy facilities represents the majority of the water supply available to the SFPUC. On average, the Hetch Hetchy Project provides over 85 percent of the water delivered to the Bay Area. During droughts the water received from the Hetch Hetchy system can amount to over 93 percent of the total water delivered.

Bay Area reservoirs provide on average approximately 15 percent of the water delivered by the SFPUC RWS. The local watershed facilities are operated to conserve local runoff for delivery. On the San Francisco Peninsula, the SFPUC utilizes Crystal Springs Reservoir, San Andreas Reservoir, and Pilarcitos Reservoir to capture local watershed runoff. In the Alameda Creek watershed, the SFPUC constructed the Calaveras Reservoir and San Antonio Reservoir. In addition to capturing runoff, San Antonio, Crystal Springs, and San Andreas reservoirs also provide storage for Hetch Hetchy diversions. The local watershed facilities also serve as an emergency water supply in the event of an interruption to Hetch Hetchy diversions.

2.5.1. Local Groundwater

San Francisco overlies all or part of seven groundwater basins. These groundwater basins include the Westside, Lobos, Marina, Downtown, Islais Valley, South, and Visitation Valley basins. The Lobos, Marina, Downtown, and South basins are located wholly within the City limits, while the remaining three extend south into San Mateo County. The portion of the Westside Basin aquifer located within San Francisco is commonly referred to as the North Westside Basin. With the exception of the Westside and Lobos basins, all of the basins are generally inadequate to supply a significant amount of groundwater for municipal supply because of low yield.

Early in its history, San Francisco made significant use of local groundwater, springs, and spring-fed surface water. However, after the development of surface water supplies in the Peninsula and Alameda watersheds by Spring Valley Water Company and the subsequent completion of the Hetch Hetchy Reservoir and aqueduct in the 1930's, the municipal water supply system has relied almost exclusively on surface water from local runoff, the Alameda and Peninsula watersheds, and the Tuolumne River watershed. Local groundwater use, however, has continued in the City primarily for irrigation purposes. The San Francisco Zoo and Golden

Gate Park use groundwater for non-potable purposes. Current use accounts for annual average of approximately 2.5 mgd.

About one (1) mgd of groundwater is delivered to Castlewood Country Club from well fields operated by the SFPUC in Pleasanton and drawn from the Central Groundwater Sub Basin in the Livermore/Amador Valley. These wells are metered and have been in operation for several decades. For purposes of water accounting and billing, these deliveries to Castlewood are accounted for as part of San Francisco's Retail Customer base. Castlewood groundwater supplies are used entirely within Castlewood and not available for use in the City and County of San Francisco.

2.5.2. Local Recycled Water

From 1932 to 1981, the City's McQueen Treatment Plant provided recycled water to Golden Gate Park for irrigation purposes. Because of changes in regulations the City closed the McQueen plant and discontinued use of recycled water in Golden Gate Park. Currently, recycled water from the SFPUC's Southeast Water Pollution Control Plant is used on a limited basis for wash-down operations and is provided to construction contractors for dust control and other nonessential construction purposes. Current use of recycled water for these purposes in the City is less than one mgd.

2.5.3. Local Water Conservation

The SFPUC is committed to demand-side management programs and the City's per capita water use has dropped by about one-third since 1977 due, in part, to these programs. The first substantial decrease came following the 1976-77 drought in which gross per capita water use dropped from 160 to 130 gallons per capita per day (gpcd). Despite continuous growth in the City since then, water demands have remained lower than pre-drought levels.

A second substantial decrease in water use within the City occurred as a result of the 1987-92 drought when a new level of conservation activities resulted in further water use savings. It is anticipated that through the continuation and expansion of these programs, per capita water use will continue to decrease into the future. Current gross per capita water use within the City is 91.5 gpcd with residential water use calculated to be approximately 57 gpcd, the lowest use of any major urban area in the State.

The SFPUC's demand management programs range from financial incentives for plumbing devices to improvements in the distribution efficiency of the system. The conservation programs implemented by the SFPUC are based on the California Urban Water Conservation Council's list of fourteen Best Management Practices identified by signatories of the Memorandum of Understanding Regarding Urban Water Conservation in California executed in 1991.

2.6. Water Supply Reliability and Improvements

To improve dry-year supplies and ensure that the future water needs of its retail and wholesale customers will be met in a more reliable and sustainable manner, the SFPUC has undertaken water supply projects in the WSIP. In addition, the SFPUC is looking to diversify and enhance the City's water supply portfolio through the development of local water supplies, such as recycled water, groundwater, and water conservation.

2.6.1. Water System Improvement Program and the Phased WSIP Variant

The WSIP is a multi-billion dollar, multi-year, capital program to upgrade the RWS. The program will deliver improvements that enhance the SFPUC's ability to provide reliable, affordable, high quality drinking water to its 27 wholesale customers and regional Retail customers in Alameda, Santa Clara, and San Mateo counties, and to 800,000 Retail customers in San Francisco, in an environmentally sustainable manner.

As required under CEQA, the San Francisco Planning Department prepared a PEIR for the WSIP. The PEIR evaluated the potential environmental impacts of the proposed WSIP and identified potential mitigations to those impacts. The PEIR also evaluated several alternatives to meet the SFPUC service area's projected increase in water demand between now and 2030. The water supply improvement options investigated included 10 alternatives using various water supply combinations from the local watersheds; the Tuolumne and Lower Tuolumne; ocean desalination; and additional recycled water, groundwater, and conservation.

The PEIR was certified by the San Francisco Planning Commission on October 30, 2008. On the same day the SFPUC adopted the Phased WSIP Variant option. (Appendix B contains the SFPUC Commission Agenda Item for approval of the PEIR)

2.6.1.1. Phased WSIP Variant

At the request of the SFPUC, the San Francisco Planning Department studied the Phased WSIP Variant as part of the environmental analysis. The SFPUC identified this variant in order to consider a program scenario that involved full implementation of all proposed WSIP facility improvement projects to insure that the public health, seismic safety, and delivery reliability goals were achieved as soon possible, but phased implementation of a water supply program to meet projected water purchases through 2030. Deferring the 2030 water supply element of the WSIP until 2018 would allow the SFPUC and its wholesale customers to focus first on implementing additional local recycled water, groundwater, and demand management actions while minimizing additional diversions from the Tuolumne River.

The Phased WSIP Variant establishes a mid-term planning milestone in 2018 when the SFPUC would reevaluate water demands through 2030 in the context of then-current information, analysis and available water resources. The SFPUC currently delivers on an annual average approximately 265 million gallons of water per day from local watersheds (Peninsula and Alameda Creek) and the Tuolumne River Watershed. By 2030, demand on the SFPUC system is expected to increase to an annual average of 300 million gallons of water per day. The Phased WSIP Variant would meet the projected 2018 purchase requests of 285 mgd from the RWS by capping purchases from the watersheds at 265 mgd; the remaining 20 mgd would be met through water efficiencies and conservation, water recycling and local groundwater use—10 mgd by Wholesale Customers and 10 mgd in the City and County. Before 2018, the SFPUC and the Wholesale Customers will engage in a new planning process to reevaluate water system demands and supply options, including conducting additional studies and environmental reviews necessary to address water supply needs after 2018.

The Phased WSIP Variant includes the following key program elements:

- Full implementation of all WSIP facility improvement projects.
- Water supply delivery to RWS customers through 2018 only of 265 mgd average annual target delivery originating from the watersheds. This includes 184 mgd for the Wholesale Customers and 81 mgd for the Retail Customers.
- Water supply sources include: 265 mgd average annual from the Tuolumne River and local watersheds and 20 mgd of water conservation, recycled water and local groundwater developed within the SFPUC's service area (10 mgd Retail; 10 mgd wholesale).

- Dry-year water transfers of 2 mgd coupled with the Westside Groundwater Basin Conjunctive Use Project.
- Re-evaluation of 2030 demand projections, potential RWS purchase requests and water supply options by December 31, 2018 and a separate SFPUC decision in 2018 regarding RWS water deliveries after 2018.
- The ability to impose financial penalties is included in the new Water Supply Agreement to limit water sales to an average annual of 265 mgd from the watersheds.

The additional 10 mgd of supplies produced in San Francisco by implementation of the local WSIP programs have been included in this WSA. This WSA assumes WSIP local water supplies will be in place in the timeframes stated in the SFPUC WSIP, with this assumption total Retail supplies increase to 94.50 mgd in 2015 and remain constant over the 20-year planning horizon. Projects related to these efforts are detailed below. WSIP programs, financials and progress-to-date is presented in Appendix C.

2.6.2. Local Groundwater Projects

2.6.2.1. San Francisco Groundwater Supply Project

The San Francisco Groundwater Supply Project would provide up to 4 mgd of local groundwater water to improve reliability during drought or maintenance conditions, as well as ensure that a reliable, high-quality source of water is available in the case of an earthquake or other emergency. The project proposes the construction of up to six wells and associated facilities in the western part of San Francisco to extract up to 4 mgd of groundwater water from the Westside Groundwater Basin for distribution in the City. The extracted groundwater, which would be used both for regular and emergency water supply purposes, would be disinfected and blended in small quantities with imported surface water before entering the municipal drinking water system. The environmental review for this project begins in November 2009.

2.6.2.2. Lake Merced Water Level Restoration Project

The goal of the Lake Merced Water Level Restoration Project is to protect and balance the beneficial uses of Lake Merced by providing a more stable water level regime using groundwater and stormwater, rather than supplies provided through the RWS.

2.6.2.3. Local Recycled Water Projects

In March 2006, the SFPUC updated the Recycled Water Master Plan (RWMP) for the City. The 2006 RWMP identified where and how San Francisco could most feasibly develop recycled water in the City and provided strategies for implementing the recycled water projects that were identified.

The proposed Westside, Harding Park and Eastside Recycled Water Projects would provide up to 4 mgd of recycled water to a variety of users in San Francisco. Recycled water will primarily be used for landscape irrigation, toilet flushing and industrial purposes. The Harding Park Project has completed environmental review, and the Westside Project will begin environmental review in late 2009 or early 2010.

The proposed Westside Project would bring recycled water from the proposed recycled water treatment facility in Golden Gate Park to the San Francisco Zoo, Golden Gate Park, and Lincoln Park Golf Course. Recycled water would be used for irrigation at all three sites; additionally, it would be used for non-potable uses in Golden Gate Park at the California Academy of Sciences. The proposed Harding Park Recycled Water Project would use available recycled water from the North San Mateo County Sanitation District (NSMCSD) located in Daly City, to irrigate Harding Park and Fleming Park golf courses in San Francisco. The SFPUC has partnered with the NSMCSD for this proposed project.

Currently, the SFPUC is conducting a recycled water demand assessment on the Eastside of San Francisco. The assessment examines the potential uses of recycled water for irrigation, toilet flushing, and commercial applications. The WSIP contains funding for planning, design, and environmental review for the San Francisco Eastside Recycled Water Project.

2.6.3. Local Water Conservation

The SFPUC has also increased its water conservation programs in an effort to achieve new water savings by 2018. The SFPUC's conservation program is based on the Demand Study that identified water savings and implementation costs associated with a number of water conservation and efficiency measures. The Demand Study evaluated the costs and benefits of implementing 48 different conservation measures using an end-use model. The results indicated that local conservation programs implemented through 2030 could cumulatively reduce Retail purchases from the SFPUC RWS by 4.5 mgd in year 2030. These new conservation programs include high-efficiency toilet replacement in low-income communities, plumbing retrofits in compliance with the 1992 California plumbing code and water efficient irrigation systems in municipal parks. Through its expanded conservation program, the SFPUC anticipates reducing gross per capita consumption from 91.5 gpcd to 87.4 gpcd by 2018 for an average daily savings of approximately 4.0 mgd.

2.6.4. Summary of New Local Water Supply Programs

As previously stated, the SFPUC anticipates that the expanded groundwater and recycled water production, and increased conservation programs will provide the City with an additional 10 mgd of local WSIP water supplies. As quantified in Table 2-2 with implementation of the WSIP, the SFPUC expects to have in these local WSIP supplies in place by 2015. These programs and projects are reliable in all hydrologic conditions and are not subject to RWSAP reductions or curtailments. (Appendix C contains the Summary of the WSIP Projects, a Quarterly Progress Report [April – June 2009] and other progress-to-date information)

Table 2-2: WSIP Water Supply Sources (mgd)

WSIP Water Supplies	2010	2015	2020	2025	2030
Groundwater	0.0	2.0	2.0	2.0	2.0
Recycled Water	0.0	4.0	4.0	4.0	4.0
Conservation	0.0	4.0	4.0	4.0	4.0

2.7. Total SFPUC Retail Water Supplies

Table 2-2 summarizes the SFPUC's total water supplies now and over the 20-year planning period. In 2010, prior to the development of the 10 mgd of local supplies, the SFPUC can access an annual average 84.50 mgd from all sources discussed above. Beginning in 2015, when the WSIP water supply sources are readily available, the SFPUC's Retail water supplies increase to 94.5 mgd. These supplies are assumed to be available in the quantities listed in Table 2-2. The SFPUC intends to use these supplies to meet its Retail customer demands.

Figure 2-1 is a graphical representation of the SFPUC's current supply sources and the WSIP local supply sources. As shown in Figure 2-2, the supplies grow from 84.5 mgd in 2010 to 94.5 mgd as the WSIP local supplies are brought into the SFPUC Retail supply system. The figure shows the total supplies increasing in 2015 and holding constant over the 20-year planning horizon.

Table 2-2: SFPUC Water Supplies 2010 – 2030 (mgd)

Water Supply Sources	2010	2015	2020	2025	2030
Current Water Supply Sources					
SFPUC RWS (Surface water: Tuolumne River, Alameda & Peninsula)(1)	81.0	81.0	81.0	81.0	81.0
Groundwater Sources

Total Retail Supply (Current and WSIP Supplies)	**84.5**	**94.5**	**94.5**	**94.5**	**94.5**

Notes:
1. RWS surface water supplies are subject to reductions due to below-normal precipitation. This may affect dry year supplies - model shows supply reduction occurs in year 2 of multiple dry year event. (Source: SFPUC 2008 WSIP Phase Variant Supply limitation)
2. Groundwater serves irrigation to Golden Gate Park, SF Zoo, and Great Highway Median. (Source: 2005 SFPUC UWMP Table 8B page 43)
3. A Groundwater reserve of 0.5 mgd for irrigation purposes will remain as part of SFPUC's non-potable groundwater supply. (Source: SFPUC 2008 WSIP Phase Variant)
4. Castlewood current and projected use remains unchanged over 20 year planning horizon. (Source: 2005 SFPUC UWMP Table 8B page 43)
5. 2.0 mgd of groundwater treated and blended for Potable water supply purposes. (Source: 2005 SFPUC UWMP Table 8B page 43)
6. 2.0 mgd of new groundwater developed as part of the new local supply target. (Source: SFPUC 2008 WSIP Phase Variant Supply Target)
7. 2.0 mgd of Recycled used for irrigation at Golden Gate Park, SF Zoo, Great Highway Median, and 2.0 mgd for other non-potable purposes. (Source: SFPUC 2008 WSIP Phase Variant Supply Target)

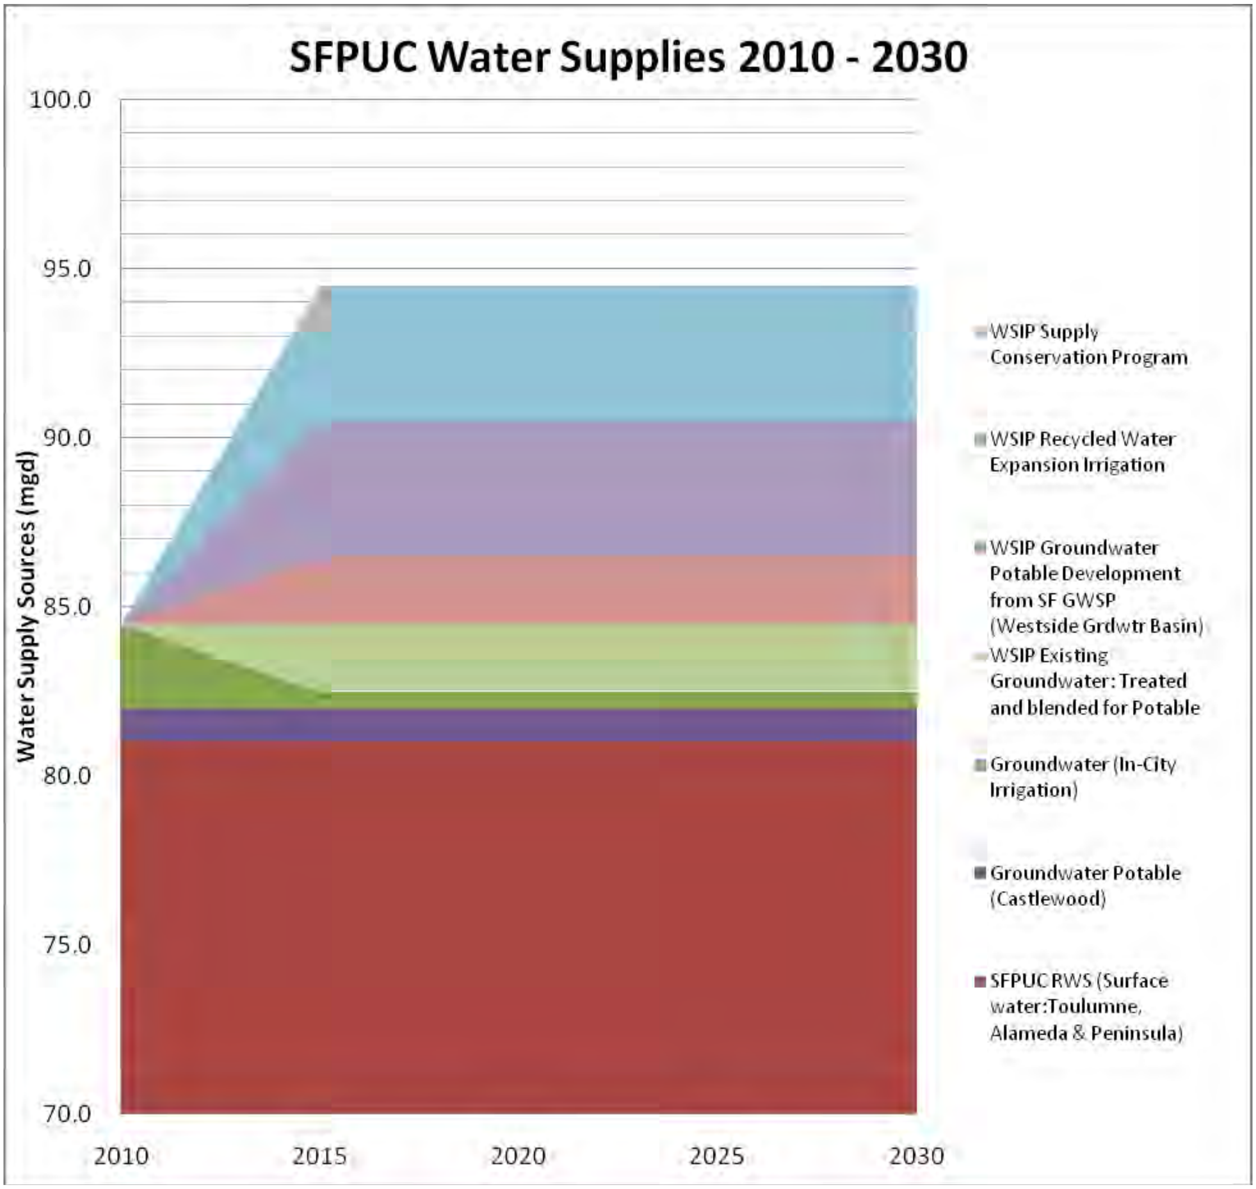

Figure 2-2: SFPUC Water Supplies

2.7.1. New Drought Supplies

As outlined above, the WSIP includes development of dry-year supplies for the RWS – these supplies would be readily available during dry years when the watershed supplies are cutback due to below-normal precipitation. The PEIR also included an analysis of dry-year water supply transfers from the senior water rights holders (MID and TID) on the Tuolumne River in 2018; a groundwater conjunctive use project; and, a regional desalination project. The latter two projects are described in greater detail in Section 3.4. The SFPUC is currently investigating the possibility of a dry-year water transfer with MID and TID in 2018.

3.0 DROUGHT SUPPLY PLANNING AND WATER SUPPLY RELIABILITY

3.1. Overview

The SFPUC water supply system reliability is expressed in terms of its ability to deliver water during droughts. Reliability is defined by the amount and frequency of water delivery reductions required to balance customer demands with available supplies in droughts. The SFPUC has a reliability goal of meeting dry-year delivery needs while limiting rationing to a maximum 20 percent system-wide reduction in water service during extended droughts.

The total amount of water the SFPUC has available to deliver to its retail and wholesale customers during a defined period of time is dependent on several factors. These include the amount of water that is available to the SFPUC from natural runoff, the amount of water in reservoir storage, and the amount of water that must be released from the SFPUC's system for commitments to purposes other than customer deliveries, such as releases below Hetch Hetchy reservoir to meet the Raker Act and fishery purposes.

The SFPUC operates its system to optimize the reliability and quality of its water deliveries. Hetch Hetchy Reservoir operations are guided by two principal objectives: collection of Tuolumne River water runoff for diversion to the Bay Area; and fulfillment of the SFPUC's downstream release obligations. To conserve runoff, Hetch Hetchy Project reservoirs are drawn down beginning in early winter, relying on the recurrence and forecast of snow melt to guide drawdown releases. Similarly, the RWS Bay Area reservoirs are operated to conserve watershed runoff. As such, reservoirs are drawn down during the winter period to capture storms and reduce the potential for spilling water out of the reservoirs. In the spring, excess Hetch Hetchy water supply (snowmelt) is transferred to three of the Bay Area reservoirs, capable of receiving the water, to fill any unused reservoir storage.

Prior to the late 1970's, droughts did not seriously affect the ability of the SFPUC to sustain full deliveries to its customers. However, as the 1987-1992 drought progressed and reservoir storage continued to decline, it became apparent that continued full deliveries could not be sustained without the risk of running out of water before the drought ended.

To provide some level of assurance that water could be delivered continuously throughout a drought (although at reduced levels), the SFPUC adopted a drought planning sequence and associated operating procedures that trigger different levels of water delivery reduction rationing relative to the volume of water actually stored in SFPUC's reservoirs. Each year, during the snowmelt period, the SFPUC evaluates the amount of total water storage expected to occur throughout the RWS. If this evaluation finds the projected total water storage to be less than an identified level sufficient to provide sustained deliveries during drought, the SFPUC may impose delivery reductions or rationing.

SFPUC's UWMP assumes "firm" delivery "as the amount the system can be expected to deliver during historically experienced drought periods."[6] The 1987 to 1992 drought is the basis for this plan, plus an additional period of limited water availability.[7] The SFPUC plans its water deliveries assuming that the worst drought experience is likely to recur and then adds an additional period of limited water availability. An 8.5-year drought scenario is referred to as the "design drought" and is ultimately the basis for SFPUC's water resource planning and modeling.

6 San Francisco Public Utilities Commission. December 2005. *Urban Water Management Plan*. p. 21.
7 San Francisco Public Utilities Commission. December 2005. *Urban Water Management Plan*. p. 21.

The "design drought" is based on the 1986-1992 drought plus 2.5 years of "prospective drought", which includes 6 months of recovery period.[8]

3.1.1. Water Shortage Allocation Plan

During a drought, it is expected that the retail and wholesale customers would experience a reduction in the amount of water received from the RWS. The amount of this reduction has been dictated by existing contractual agreements between the SFPUC and the Wholesale Customers, as detailed in the existing Water Shortage Allocation Plan (WSAP). The WSAP provides specific allocations of available water between the retail and wholesale customers collectively associated with different levels of system-wide shortages, as shown in Table 3-1.

Table 3-1: WSAP Allocation

Level of System-Wide Reduction in Water Use Required	Share of Available Water	
	SFPUC Share	Wholesale Customers Share (collectively)
5% or less	35.5%	64.5%
6% through 10%	36.0%	64.0%
11% through 15%	37.0%	63.0%
16% through 20%	37.5%	62.5%

In addition to providing an allocation method, the plan also includes provisions for transfers, banking and excess use charges.

Under the WSAP, SFPUC retail customers would experience no reduction in deliveries at a 10 percent shortage. However, during a 20 percent system-wide shortage, the retail customers would experience a 1.9 percent reduction in retail deliveries. This assumes the development of the additional 10 mgd of local supplies in the retail service area. These additional supplies are not subject to a reduction under the WSAP as the WSAP only allocates water from the RWS. Table 3-2 compares SFPUC RWS retail supplies during normal, single dry year, and multiple dry year periods.

Table 3-2: 2005 – 2030 SFPUC Retail Allocations in Normal, Dry and Multiple Dry Years

	Normal Year		Single Dry Year		Multiple Dry Year Event					
					Year 1		Year 2		Year 3	
	mgd	%	mgd	%	mgd	%	mgd	%	mgd	%
2010	81.0	100%	81.0	100.0%	81.0	100.0%	79.5	98.1%	79.5	98.1%
2015	81.0	100%	81.0	100.0%	81.0	100.0%	79.5	98.1%	79.5	98.1%
2020	81.0	100%	81.0	100.0%	81.0	100.0%	79.5	98.1%	79.5	98.1%
2025	81.0	100%	81.0	100.0%	81.0	100.0%	79.5	98.1%	79.5	98.1%
2030	81.0	100%	81.0	100.0%	81.0	100.0%	79.5	98.1%	79.5	98.1%

Notes:
1. In 2010 the retail allocation of RWS supply is reduced to 81 mgd to reflect the retail allocation under the 2018 Phased WSIP Variant. 10 mgd of recycled water, groundwater, and conservation will be implemented by 2015 to make up for the loss in RWS supply. The 10 mgd of local supply is not subject to reduction under the WSAP.
2. Under the WSAP, the SFUPC retail allocations at a 10 percent shortage are 85.86 mgd. However, due to the Phased WSIP Variant, only 81 mgd of RWS supply is shown. The remaining supply can be transferred to the Wholesale Customers under the terms of the Water Supply Agreement.

Source: San Francisco Public Utilities Commission. 2005. Urban Water Management Plan for the City and County of San Francisco. p. 54-57 and discussions with SFPUC staff.

8 San Francisco Public Utilities Commission. April 2000. *Water Supply Master Plan*. p. 22.

The WSAP has been carried forward in the new Water Supply Agreement for system-wide shortages of up to 20 percent. For shortages in excess of this amount, the Water Sales Agreement provides that the SFPUC may allocate water in its discretion.

3.2. Retail Water Shortage Allocation Plan

San Francisco has established criteria that relate water deliveries to water supply and the SFPUC's objectives to manage water deliveries during extended drought. These criteria provide guidance to the SFPUC for the determination of the annual availability of water. The structure of the criteria was developed during the course of the 1987-92 drought period and incorporates procedures which were implemented during actual operations.

The established water delivery criteria incorporate a three-level staging of delivery reductions: the first stage is associated with voluntary actions by customers and the second and third stages are associated with mandatory rationing programs enforced by the SFPUC. Depending on the level of water demand and the desired maximum delivery reduction, one, two or all three of the stages are required. These criteria have been found to be viable through computer simulation of historical drought events and resultant SFPUC operations.

Based on past drought experience and the established criteria, San Francisco's Retail Water Shortage Allocation Plan (RWSAP) was adopted to formalize the three-stage program of action to be taken in San Francisco to reduce water use during a drought.

In accordance with the RWSAP, prior to the initiation of any water delivery reductions in San Francisco, whether it be initial implementation of reduction delivery or increasing the severity of water shortage, the SFPUC would outline a drought response plan that would address the following: the water supply situation; proposed water use reduction objectives; alternatives to water use reductions; methods to calculate water use allocations and adjustments; compliance methodology and enforcement measures; and, budget considerations. This drought response will be presented at a regularly scheduled SFPUC Commission meeting for public input. The meeting will be advertised in accordance with the requirements of Water Code Section 6066 of the Government Code, and the public will be invited to comment on the SFPUC's intent to reduce deliveries.

Depending on the level of water demand and the desired objective for water use reduction, one, two, or all three stages of the RWSAP may be required.

Stage 1 (Voluntary)

- System-wide demand reductions of 5-10 percent experienced
- Voluntary rationing request of customers
- Customers are alerted to water supply conditions
- Remind customers of existing water use prohibitions
- Education on, and possible acceleration of, incentive programs

Stage 2 (Mandatory)

- System-wide demand reductions of 11-20 percent experienced
- All Stage 1 actions implemented
- All customers receive an "allotment" of water based on the Inside/Outside allocation method (based on base year water usages for each account)

- Water use above the "allocation" level will be subject to excess use flow restrictor devices and shut-off of water

Stage 3 (Mandatory)

- System-wide demand reductions of 20 percent or greater experienced
- Same actions as in Stage 2 with further reduced allocations

3.3. Urban Water Management Planning Act (Water Code Section 10632)

Pursuant to the Urban Water Management Planning Act (Water Code Section 10632), water suppliers with an existing dry year shortage contingency plan can implement subsequent stages of demand reduction measures listed in its UWMP as a strategy to balance supply and demand. The WSAP and the RWSAP, contained in Section 9 of the SFPUC's 2005 UWMP is the SFPUC's dry year shortage contingency plan that allows the SFPUC to reduce water deliveries to customers and implement demand reductions during periods of water shortage. Therefore, when a supply deficit occurs, the SFPUC would follow its adopted water shortage contingency plans (WSAP and RWSAP) to implement drought-planning sequences and associated operating procedures that trigger different levels of water delivery reduction rationing relative to the volume of water actually stored in the SFPUC reservoirs. These delivery reductions allow the SFPUC to maintain water in storage over an extended period. In addition, under the RWSAP, the SFPUC would balance Retail supply curtailments by reducing demand.

3.4. Dry Year Water Supply Projects

As discussed in Section 2.7, the SFPUC, as part of the WSIP, has currently engaged the following projects or programs as methods to improve RWS dry-year supplies. Within the WSIP, the SFPUC addressed the development of supplies to be utilized during dry year events. These plans include the use of recycled water as component of a conjunctive use program and participation in the development of Bay Area desalination plant. Each of these plans is discussed below.

3.5. Development of Dry Year Supplies

3.5.1. Groundwater Storage and Recovery Project

The proposed Regional Groundwater Storage and Recovery Project would balance the use of both groundwater and surface water to increase water supply reliability during dry years or in emergencies. The proposed project is located in San Mateo County and is sponsored by the SFPUC in coordination with its partner agencies, the California Water Service Company, City of Daly City and City of San Bruno. The partner agencies currently purchase wholesale surface water from the SFPUC and also independently operate groundwater production wells for drinking water and irrigation.

The proposed Regional Groundwater Storage and Recovery Project would extract groundwater from the South Westside Basin groundwater aquifer in San Mateo County. The project would consist of installing up to 16 new recovery well facilities in northern San Mateo County to pump stored groundwater during a drought. During years of normal or heavy precipitation, the proposed project would provide surface water to the partner agencies in order to reduce the amount of groundwater pumped. Over time, the reduced pumping would result in the storage of approximately 61,000 acre-feet of water (more than the supply contained in the Crystal Springs Reservoir on the SFPUC Peninsula Watershed). This would allow recovery of this stored water at a rate of up to 7.2 mgd for a 7.5-year dry period. The water would be in compliance with the California Department of Public Health requirements for drinking water supplies. This project would include construction of well pump stations, disinfection units, and piping. This project is currently undergoing environmental review.

3.5.2. Desalination

The SFPUC's investigations of desalination as a water supply source have focused primarily on the potential for regional facilities. The proposed Bay Area Regional Desalination Project is a joint venture between the SFPUC, Contra Costa Water District, East Bay Municipal Utility District, and the Santa Clara Valley Water District. The regional desalination project would: provide an additional source of water during emergencies; provide a supplemental water supply source during extended droughts; allow other major water facilities to be taken out of service for maintenance or repairs; and increase supply reliability by providing water supply from a regional facility. The Bay Area Regional Desalination Project would have an ultimate total capacity of up to 65 mgd.[9]

9 EBMUD, "Desalination Project", www.ebmud.com/water_&_environment/water_supply/current_projects/desalination_project/default.htm, accessed July 30, 2009.

4.0 WATER DEMAND OVERVIEW

The SFPUC provides wholesale water service to 27 Bay Area water agencies located in Alameda, San Mateo and Santa Clara Counties (Wholesale Customers), and also serves as the retail water supplier for the City. This section shows the calculated water demand for the proposed project as well the calculated water demand projections for San Francisco based on recent housing and population forecasts within the entire system.

4.1. Overview

Over 2.5 million people in Bay Area counties currently rely on water supplied by the SFPUC RWS. The water supplied by the RWS comes from sources in the Bay Area (reservoirs with local runoff) and water from the Tuolumne River watershed. The water is of excellent quality and reasonable cost, and is a positive factor in attracting businesses, new residents, and industry to the Bay Area.

In addition to providing wholesale water supply, the SFPUC provides retail water service to residents, businesses, and institutions within the City limits, as well as to a number of residential and commercial accounts in the Bay Area and the Sierra Nevada foothills.

Wholesale Customers: The SFPUC provides wholesale water service to 27 Bay Area water agencies in Alameda, San Mateo, and Santa Clara Counties under the terms of a recently renegotiated Water Supply Agreement. The SFPUC supplies approximately 65 percent of the total wholesale customer water demand. Some of the wholesale water customers rely entirely on the SFPUC for their water supplies.

Retail Customers: The SFPUC's retail water customers include the residents, businesses, and industries within the municipal boundaries of the City and County. In addition to these customers, retail water service is also provided to other customers in the Bay Area and Sierra Nevada foothills. These accounts include the San Francisco International Airport and the San Francisco County Jail in San Mateo County, the unincorporated Town of Sunol and Lawrence Livermore Laboratory in Alameda County, and the Groveland Community Services District in Tuolumne County. In addition, the SFPUC retails groundwater (pumped from the Pleasanton well field) to the Castlewood development in Alameda County.

Historically, approximately 96 percent of the SFPUC's retail water demands have been met through deliveries from the SFPUC RWS. A small portion of San Francisco's demand is met through locally produced groundwater and secondary treated recycled water. The groundwater is used primarily for irrigation at local parks and on highway medians. The recycled water is used mostly at municipal facilities for wastewater treatment process water, sewer box flushing, and similar wash down operations.

4.2. Historical System Demand

Table 4-1 presents the historical water demands in the SFPUC Retail service area in fiscal years 2000-2008 and shows the changes in demands over this same year period. As shown in Table 4-1, over the last eight years, total demand in the Retail service area has decreased by 7.9 mgd.

Table 4-1: SFPUC Water Demands (mgd)

Fiscal Years[1]	2000	2001	2002	2003	2004	2005	2006	2007	2008
In City Retail Total	83.3	84.2	84.2	81.3	78.4	78.4	78.1	75.5	75.3

4.3. Proposed Project Water Demand

The project sponsor's water resource consultants provided the expected water use of the proposed project under different development scenarios. An independent analysis was performed as a part of the Water Supply Availability Study (Appendix D) by analyzing similar land uses and assigning a demand factor for each use. The results of the independent analysis conclude that the demand estimates provided by the project sponsors are reliable. Proposed project implementation is expected by 2015 and build-out is expected by 2030.

Table 4-2 and Table 4-3 estimate the projected water demand at the project site with compliance to the California plumbing code and San Francisco's Green Building Ordinance. Each of the demand scenarios is described below.

Table 4-2: Water Demands for Proposed R&D Variant (mgd)(1)

Land and Facility Uses	Units/Area	Candlestick Point (mgd)	Hunters Point & Shipyard (mgd)	Total (mgd)

Table 4-2 presents the proposed project demand under the R&D Variant, which estimates a conservative demand based on higher end-use of Research & Development (R&D) at the project site. Total demand at the project site is estimated at 1.99 mgd. Annual potable demand is estimated at 2,230.0 acre-feet per year.

Existing demand at the project site is reported at 0.3 mgd.[10] Therefore, the net change in daily demand at the project site under the R&D Variant is estimated at 1.69 mgd or an annual potable demand is 1,893.7 acre-feet per year.

Table 4-3 presents the proposed project demand with development of a new NFL stadium (Stadium) in place of an additional 2.5 million square feet of R&D space. Total demand at the project site is estimated at 1.67 mgd. Annual potable demand is estimated at 1,871.3 acre-feet per year.

Existing demand at the project site is reported at 0.3 mgd.[11] Therefore, the net change in daily demand at the project site under the Stadium development is estimated at 1.67 mgd or an annual potable demand is 1,893.7 acre-feet per year. The net change in demand is estimated at 1.37 mgd or 1,535.2 acre-feet per year.

4.4. Potential Recycled Water of Proposed Project

As described in the WSAS, on-site recycled water facilities developed at the project site could be used to offset the potable water demand. It is estimated that recycled water demand could be at least 0.89 mgd; however, this is contingent upon the level of development at the project site. At this time, on-site recycled water facilities are in the planning stages and have not been

10 SFPUC billing information from staff. July 2009.
11 SFPUC billing information from staff. July 2009.

fully evaluated; therefore, this WSA provides a conservative water supply analysis without on-site recycled water at the project site. It should be noted, that recycled water, generated on-site is considered additional water supply sources beyond the SFPUC's WSIP recycled water supplies.

4.5. City of San Francisco Retail Water Demand Analysis

To update the water supply and demand estimates provided in the 2005 UWMP, the SFPUC developed a Water Supply Availability Study (Appendix D) The WSAS incorporates new water supply information (per the Phased Variant WSIP) and generates new estimates of future water demand, which were based on new population and employment estimates, including several major development proposals not anticipated in the 2005 UWMP, including the proposed project (abbreviated as CP-HPS II), Treasure Island-Yerba Buena Island (TI-YBI) and Parkmerced.

To update future water demand, the WSAS compared the estimates of residential households and employees used in the 2005 UWMP with new population and employment forecasts provided by the San Francisco Planning Department,[12] which were designed to closely match the recently adopted Association of Bay Area Governments (ABAG) Projections 2009 target, but taken into account local knowledge of projects currently in various stages of the entitlement process. Updated water demand estimates were then generated, which included the incremental future growth that was not previously included in the 2005 UWMP estimates.

The new demand estimates also incorporate the results of the 2004 Demand Report, which analyzed water demands associated with each retail customer sector and included development of a water use model. The water use model accounts for demand at the end use level (such as individual toilets and showers), and established water use rates for specific units, including multiple family residential households and employees, the latter of which is used to estimate non-residential water demands. The WSAS used an average of these water use rates over the next 20 years (2010-2030) to establish a water use rate for multi-family residential households of 98.7 gpd, and a water use rate for employees of 42.42 gpd. With these unit rates, future water demand can be estimated from changes in the number of residential households and/or employees in San Francisco.

4.5.1. Water Demand of Major Development Projects and Incremental Growth

Upon buildout in 2030, the development at the CP-HPS II project site and two other large development projects represent the majority of new growth in San Francisco above the 2030 growth projected in the 2005 UWMP. Table 4-4 shows the total water demand of the proposed project, the R&D Variant and other proposed developments currently in the SF Planning development pipeline. The CP-HPS II project includes a number of different development scenarios, the estimated water demands of the two main proposed development scenarios are also shown in Table 4-4.

As stated previously, the Demand Report analyzed water demand associated with each Retail customer sector and established per unit-use rates. As such, between 2010 and 2030, the SFPUC used a per-unit use rate average of 98.7 gpd per household for multi-family residential demands. As shown in Table 4-4, the 98.7 gpd per household rate was applied to the incremental growth of 2,387 new dwelling units throughout the City resulting in a demand of 0.24 mgd in 2030.

12 San Francisco Planning Department, Projections of Growth by 2030, July 9, 2009 (included as Appendix A to the Water Supply Availability Study).

Table 4-4: 2030 Water Demand Increase within San Francisco (Proposed Project, R&D Variant, Other Development Projects and Incremental Growth) (mgd)

Development	Water Demand (mgd)(1)			
	Stadium		R&D Variant	
	Projected Demand	Demand with Non-Residential Adjustment (1.18)(7)	Projected Demand	Demand with Non-Residential Adjustment (1.40)(7)
CP-HPS II(2)	1.67	1.04	1.99	1.04
Treasure Island – Yerba Buena Island(3)	1.70	1.17	1.70	1.17
Parkmerced(4)	0.98	0.94	0.98	0.94
Development Subtotal	**4.38**	**3.16**	**4.67**	**3.16**
Existing Demand at Development Sites(5)	-1.51	-1.51	-1.51	-1.51
Net Development Subtotal	**2.87**	1.64	**3.17**	1.66
Incremental Growth in SF (City and County)(6)	0.24	0.24	0.24	0.24
Net Change in Water Demand with Non-Residential Adjustment(7)	~	**1.88**(7)	~	**1.89**(7)

Notes:
1. Average annual demands. Residential water demands for the proposed projects were provided to the City by project developer. They were also developed using an end use model on a per unit or per employee basis. The developer demands were independently reviewed by PBS&J and the SFPUC as part of this Study, and appear consistent with the SFPUC demand estimates. (Appendix D [WSAS Appendix B])
2. CP-HPS Phase II Arup – Winzler & Kelly Water Demand Memo September 25, 2009 (Appendix D [WSAS Appendix B])
3. Treasure Island Technical Memo Section 7 August 2009. (Appendix D [WSAS Appendix B])
4. Parkmerced Water Demand Spreadsheet from August 2009 (Appendix D [WSAS Appendix B])
5. Existing demand provided by SFPUC from current billing records (CP-HPS = 0.3 mgd) (TI-YPI = 0.25 mgd) (Parkmerced = 0.71 mgd) (Appendix D [WSAS Appendix B])
6. Derived by SFPUC staff based on approximately 2,387 dwelling units at 98.7 gpd. (Appendix D [WSAS Appendix B])
7. To avoid double-counting the water demand associated with the 2009 SF Planning Non-Residential Employment Projections and the non-residential demand calculated in the developer estimates at each of the Project sites, the total water demand at each of the developments was adjusted to remove the non-residential demands. This study assumes all non-residential demand is accounted for in the 2009 SF Planning Non-Residential Employment Projections.

At the CP-HPS II project site in 2030, total potable demand is calculated at 1.67 mgd for the Stadium development and 1.99 mgd for the R&D Variant development. In that same year, under either development scenario, residential demand at the CP-HPS II project site is estimated to be 1.04 mgd. As shown in Table 4-4, in 2030 the total net change in demand of 1.89 mgd accounts for demand related to new development less existing demand, and includes a non-residential demand adjustment to avoid double-counting the SF Planning employment in 2030.[13]

4.5.2. Water Demand of Residential Projections

[In an effort to represent development implementation over the 20-year planning horizon (2010–2030), this WSA assumes that residential growth and demand would occur at a linear rate over the same 20-year period without accounting for market force influences or changes in local economics.

Table 4-5 presents the residential growth projections included the 2005 UWMP and the 2009 growth projections developed by the SF Planning department. As shown in Column A, residential growth in 2010 is estimated at 344,306 units, builds to 351,608 units in 2015 and then grows continually to 373,513 units by 2030. As shown in Column C, under the linear growth assumption, by 2015 new residential units are estimated to increase by 7,447 units, and

13 To avoid double-counting the water demand associated with the 2009 SF Planning Non-Residential Employment Projections and the non-residential demand calculated in the developer estimates at each of the proposed development sites, the total water demand at each of the developments was adjusted to remove the non-residential demands. This WSA assumes all non-residential demand is accounted for in the 2009 SF Planning Non-Residential Employment Projections.

continue to increase proportionally over the next 15 years to 29,787 units in 2030. Of these 29,787 units, 27,400 are proposed in the large development projects and account for the majority of new residential growth in 2030. The balance of 2,387 is projected as Incremental Growth throughout the San Francisco. As presented in Column A+C, San Francisco can expect 359,055 units in 2015, and based on the 2009 SF Planning Projections estimate, total residential units would be 403,330 by 2030.

Table 4-5: Projections for Residential Growth and Residential Demand

Year	2005 UWMP Projections (DU)[1]	2005 UWMP Demand (mgd)[2]	2009 SF Planning Projections (DU)[3]	2009 SF Planning Demand (mgd)[4]	Total Residential (DU)[5]	Total Demand (mgd)[6]
	A	B	C	D	A+C	B+D
2010	344,306	44.7	0	0	344,306	44.70
2015	351,608	43.8	7,447	0.47	359,055	44.27
2020	358,910	43.2	14,894	0.95	373,804	44.15
2025	366,211	42.9	22,340	1.42	388,551	44.32
2030	373,513	42.9	29,787	1.89	403,300	44.79

Notes:
DU = Dwelling Units
1. Single and Multiple Family Residential Unit Projections from SFPUC 2005 UWMP(Table 2, page 7)
2. Estimated Demand generated by Residential Unit Projections from SFPUC 2005 UWMP (Table 8B, page 43)
3. Residential Units Projections from 2009 SF Planning (In 2030 - Projects (CP-HPS II (10,500 DU); TI-YBI (8,000 DU) and Parkmerced (total 8,900 DU) including Incremental Growth (2,387 DU) linear distribution over 20-year (2010-2030) planning period (Appendix D [WSAS Table 5-2])
4. Estimated Demand generated by Projects (from developer estimates) and Incremental Growth (98.7 gpd per household) linear distribution over 20-year (2010-2030) planning period (Appendix D [WSAS Tables 5-4 and 5-6])
5. Total Residential Unit Projections (2005 UWMP + 2006 SF Planning) residential units over the 20-year planning horizon. (Appendix D [WSAS Table 5-2])
6. Total Projected Water Demand generated by all new residential units over the 20-year planning horizon. (Appendix D [WSAS Table 5-6])
Source: Developed by PBS&J and SFPUC, October 2009.

Column B shows the residential water demand projected in the 2005 UWMP; demand deceases from 44.7 mgd in 2010 to 42.9 in 2030 because of plumbing fixture retrofits in existing residences and higher water efficiency fixtures at new developments, including the development at the project site. As shown in Column D, water demand Table 4-5, new residential water demand commences in 2015 at 0.47 mgd and progresses to 1.89 mgd in 2030. Column B+D shows the total residential demand, accounting for demand from the 2005 UWMP and 2009 SF Planning Projections over the 20 year planning period.]

[In 2030, total residential demand is estimated to be 44.79 mgd. In that same year, the proposed project's estimated residential demand of 1.04 mgd would increase average daily demand by 2.3 percent (1.04/44.79).]

4.5.3. Water Demand of Non-Residential Employment Projections

Between 2010 and 2030, SFPUC used an average of 42.42 gallons per day (gpd) per employee for non-residential water demands (Appendix D). As shown in Table 4-6, the 42.42 gpd per employee water demand rate was applied to the growth in jobs over the 20-year planning horizon. In 2015, demand is expected to be 30.52 mgd and by 2030, water demand generated through employment is expected to reach 31.73 mgd. To avoid double-counting the non-residential demand calculated in the developer estimates at each of the development sites, this WSA assumes all non-residential demand is accounted for in the 2009 SF Planning Non-Residential Employment Projections.

[In 2030, total non-residential demand is estimated to be 31.73 mgd. In that same year, at buildout, the proposed project's estimated non-residential demand of 0.95 mgd would increase average daily demand by 2.9 percent (0.95/31.73).]

Table 4-6: Water Demand for Non-Residential Employment Projections

Employment Projections and Non-Residential Demand	2010	2015	2020	2025	2030
SF Planning Employment Total[(1)] (jobs)	712,145	719,447	726,749	734,050	748,100
Non-Residential - Business/Industrial Demand[(2)] (mgd)	30.21	30.52	30.83	31.14	31.73

Notes:
1. Table 5-1 2009 SF Planning Projections (Appendix D)
2. Average of 42.42 gallons per day (gpd) per employee for non-residential water demands. (Appendix D])

4.5.4. SFPUC Total Retail System Demand

The SFPUC incorporated the 2009 SF Planning projections for residential and non-residential growth in San Francisco into the WSAS to assess the results of the SF Planning projections and its effects on the City's water demand. The totals of the previous tables (Table 4-4 and Table 4-6) along with demand data from the 2005 UWMP is incorporated in the City's total Retail demand shown in Table 4-7. The table represents the anticipated growth in demand commencing in 2010 and extending over the 20-year planning horizon to 2030.

Table 4-7: SFPUC Retail Demand (mgd)

Users, Facilities and Entities	Projected Water Demand (mgd)				
	2010	2015	2020	2025	2030
Residential Demand (Single & Multiple Family)[(1)]	44.70	43.80	43.20	42.90	42.90
New Residential Demand generated by Projects and Incremental Growth[(2)(4)]	-	0.47	0.95	1.42	1.89
Subtotal	44.70	44.27	44.15	44.32	44.79
Non-Residential - Business/Industrial Demands[(3,4)]	30.21	30.52	30.83	31.14	31.73
Subtotal	**74.91**	**74.79**	**74.97**	**75.46**	**76.52**
Unaccounted-for System Losses	7.30	7.30	7.30	7.30	7.30
Subtotal	**82.21**	**82.09**	**82.27**	**82.76**	**83.82**
Other Retail Demands[(5)]	4.90	4.90	4.90	4.90	4.90
Lawrence Livermore Laboratory; Groveland CSD[(6)]	1.20	1.20	1.20	1.20	1.20
City Irrigation Demand[(7)]	2.5	2.5	2.5	2.5	2.5
Castlewood Community Demand[(8)]	1.0	1.0	1.0	1.0	1.0
Total Retail Demand	**91.81**	**91.69**	**91.87**	**92.36**	**93.42**

Notes:
1. Residential Demands (Source: 2005 SFPUC UWMP Table 8B, page 43.)
2. See Table 4-4. Multiple Family – [In 2030 Incremental Growth of 0.24 mgd + (CP-HPS II 10,500 DU) 1.04 mgd + (TI-YBI 8,000 DU) 1.17 mgd + (Parkmerced 8,900 total DU) 0.94 mgd = 3.40 mgd] Existing Demand is 1.51 mgd at all sites. [3.40 mgd – 1.51 = 1.89 mgd] as shown in Table 4-2 (Sources: ARUP Water Demand Memo for CP-HPS Phase II September 25, 2009; Parkmerced Water Demand Spreadsheet June 30, 2009; Treasure Island Water Technical Report December 2008 Updated August 2009.)
3. See Table 4-6. Agriculture, Mining, Construction, Manufacturing, Transportation, Wholesale & Retail Trade, F.I.R.E., Services, Gov't including Builders – Contractors and Docks – Shipping. (Source: Adapted from 2009 ABAG Employment Projections in conjunction with SF Planning, July 2009) As developed in the Demand Study, SFPUC derived the employment water demands by taking the ABAG employment projections and multiplying by 42.42 gallons per employee per day and is consistent with SFPUC's demand projection methodology.
4. See Table 4-6. Non-residential (jobs/employment) demands at major project sites were assumed to be contained in the 2009 ABAG Employment projections. Growth in demand is incrementally increased to reflect the growth in jobs over the 20-year planning horizon. To avoid double-counting the water demand associated with the 2009 SF Planning Non-Residential Employment Projections and the non-residential demand calculated in the developer estimates at each of the Project sites, the total water demand at each of the developments was adjusted to remove the non-residential demands. This study assumes all non-residential demand is accounted for in the 2009 SF Planning Non-Residential Employment Projections. Table 4-4 shows the net change in water demand at the Project sites and the adjusted change in water demand without non-residential demand. Adapted by PBS&J and SFPUC September 2009 from ARUP Water Demand Memo for CP-HPS Phase II September 25, 2009; Parkmerced Water Demand Spreadsheet June 30, 2009; Treasure Island Water Technical Report December 2008 Updated August 2009.

7. City Irrigation at Golden Gate Park, Great Highway Median and SF Zoo. (Source: 2005 SFPUC UWMP Table 8B, page 43.)
8. Castlewood Community demand served by wells in the Pleasanton well field.

Source: 2005 SFPUC UWMP Table 8B, page 43.

As shown in Table 4-7, incremental residential growth demand and demand at each of large development sites commences in 2015 at 0.47 mgd and progresses to 1.89 mgd in 2030. In

2015, demand drops slightly due to a reduction in total residential demand. The non-residential demand commences in 2010 at 30.21 mgd, increases to 30.83 mgd and culminates at 31.73 in 2030.

Table 4-7 shows total Retail demands for the SFPUC beginning in 2010 at 91.81, and then drops slightly in 2015 because of a drop in residential demand and then increases to 91.87 mgd in 2020. In 2030, total Retail demand is expected to be 93.42 mgd. In that same year, the proposed project's total demand of 1.67 mgd would increase average daily demand by 1.8 percent (1.67 mgd/ 93.42 mgd); alternatively, the R&D Variant's demand of 1.99 mgd would increase the average daily demand by 2.1 percent (1.99/94.42 mgd).

5.0 COMPARISON OF AVAILABLE WATER SUPPLIES VERSUS DEMAND

Section 10910 (c)(3) of the Water Code states, "the water supply assessment for the project shall include a discussion with regard to whether the public water system's total projected water supplies available for normal, dry and multiple dry water years during a 20-year projection will meet the projected water demand associated with the proposed project, in addition to the public water system's existing and planned future uses, including agricultural and manufacturing uses."

5.1. Supply and Demand Comparison

Table 5-1 compares the SFPUC Retail supplies and demand during normal, single dry year, and multiple dry year periods, as required by Water Code Section 10910 (c)(3). Section 2.7 discusses the SFPUC's total water supplies now and over the 20-year planning period. In 2010, prior to the development of the 10 mgd of local WSIP supplies, the SFPUC has access to annual average of 84.5 mgd from all water supply sources. Beginning in 2015, when the WSIP water supply sources are readily available, the SFPUC's Retail water supplies increase to 94.5 mgd. These supplies are assumed to be available in the quantities listed in Table 5-1. The SFPUC intends to use these supplies to meet its Retail customer demands.

The demand estimates in this Study show that the 2009 SF Planning projections result in an increase in City Retail demand. As stated previously, by 2030 Retail demand is estimated at 93.42 mgd. This increase, however, does not change the findings in the 2005 UWMP, which estimated demand at 93.4 mgd in 2030.[14] As shown in Table 5-1, the SFPUC can meet the current and future demands of its Retail customers in normal years, single dry-years and nearly all multiple dry-year events with the exception of years 2 and 3 after 2030. A discussion of an anomaly that occurs in 2010 follows Table 5-1 below.

As modeled in Table 5-1, the deficit shown in 2010 is the result of reducing the RWS supply to 81 mgd as per the Phased WSIP Variant, without full development of the additional 10 mgd of new WSIP supplies. It is expected that 10 mgd of local WSIP supply sources will be developed and available for use in San Francisco by 2015. However, Retail demand is currently lower than the 2010 projected demand (Fiscal Year 2007-2008 use was 83.9 mgd). If Retail demand exceeds the available RWS supply of 81.0 mgd between 2010 and 2015, and total RWS deliveries exceed 265 mgd between 2010 and 2015, the Water Supply Agreement allows the SFPUC to purchase additional water with the payment of an Environmental Surcharge. Notably, total RWS deliveries in Fiscal Year 2007-2008 were 256.7 mgd, which is 8.3 mgd below the 265 mgd watershed delivery goal.

As discussed in Section 3, in time of system-wide shortages due to drought conditions, the WSAP provides a fair and reasonable method for allocating water between the SFPUC's Retail service area and its wholesale customers (collectively). As shown in Table 5-1, after 2030, pursuant to the SFPUC's WSAP, Retail customers would experience no reduction in deliveries at a 10 percent RWS Retail supply curtailment. However, during a 20 percent RWS shortage when Retail RWS supplies are reduced by 1.9 percent to 79.5 mgd, the Retail customers would experience a 1.5 mgd reduction in RWS Retail deliveries. The SFPUC, as part of the WSIP, adopted a water reliability objective of no greater than 20-percent rationing in any one year of a drought. The RWS rationing reduction of 1.9 percent is well within the SFPUC's 20-percent reliability objective.

14 SFPUC 2005 Urban Water Management Plan Table 8B, p. 43.

Table 5-1: Projected Supply and Demand Comparison - Normal, Dry, and Multiple Dry Years (mgd)

	Retail Supply and Demand	Normal Year	Single Dry Year	Multiple Dry Year Event		
				Year 1	Year 2	Year 3
2010	RWS Supply(1)	81.00	81.00	81.00	79.50	79.50

	Surplus/(Deficit)	**1.08**	**1.08**	**1.08**	**-0.42(8)**	**-0.42(8)**

Notes:
1. RWS Supply SFPUC (Table 2-2)
2. Groundwater Uses for In-City Irrigation and Castlewood (Table 2-2).
3. Total Retail Supply from SFPUC Water Supplies Table 2-2.
4. SFPUC Retail Demand from Table 4-7.
5. The deficit shown in 2010 is the result of reducing the RWS supply to 81 mgd per the Phased WSIP Variant, without full development of the additional 10 mgd of new WSIP supplies. 10 mgd of new sources will be developed and available for use in San Francisco by 2015. However, Retail demand is currently lower than the 2010 projected demand (FY 07/08 use was 83.9 mgd). If Retail demand exceeds the available supply of 84.5 mgd between 2010 and 2015, the Water Supply Agreement allows the SFPUC to purchase additional water from the RWS. If combined Retail and Wholesale RWS deliveries exceed 265 mgd, the SFPUC Retail customers would be required to pay an Environmental Surcharge for RWS deliveries over 81 mgd (Total RWS deliveries in FY07/08 were 256.7 mgd).
6. Groundwater Supplies at Castlewood and In-City Irrigation (Table 2-2).
7. WSIP Supply Sources (Recycled Water (4.0 mgd; Groundwater (2.0 mgd Existing and 2.0 from NWGWP, and WSIP Water Efficiency and Conservation (4.0 mgd) (Table 2-2).
8. Deficit occurs in year 2 and 3 of multiple dry year event, SFPUC implements its Drought Year Water Shortage Contingency Plans - RWSAP and WSAP to balance supply and demand under this projected shortfall as described in Section 3.0.

As shown in Table 5-1, under this multiple dry-year event scenario,[15] it is possible that the SFPUC will not be able to meet 100 percent of its Retail demand. After 2030, as modeled in this WSA, a supply shortfall of 0.42 mgd is anticipated to occur in the second and third year of a multiple dry-year event due to RWS supply curtailments.

15 Multiple dry-year events are defined as a three-year event per UWMP requirements. SFPUC determined that a multiple dry-year event is years 2-4 of SFPUC's 8.5 year design drought. SFPUC can meet 100 percent of deliveries in the first year of such an event.

Pursuant to the Urban Water Management Planning Act (Water Code Section 10632), water suppliers with an existing dry year shortage contingency plan can implement subsequent stages of demand reduction measures listed in its UWMP as a strategy to balance supply and demand. The WSAP and the RWSAP, contained in Section 9 of the SFPUC's 2005 UWMP is SFPUC's dry year shortage contingency plan that allows the SFPUC to reduce water deliveries to customers and implement demand reductions during periods of water shortage. Therefore, to overcome the potential 0.42 mgd supply deficit expected after 2030, the SFPUC would follow its adopted water shortage contingency plans (WSAP and RWSAP) to implement drought-planning sequences and associated operating procedures that trigger different levels of water delivery reduction rationing relative to the volume of water actually stored in the SFPUC reservoirs. These delivery reductions allow the SFPUC to maintain water in storage over an extended period. In addition, under the RWSAP, the SFPUC would balance Retail supply curtailments by reducing demand.

Table 5-2 was extracted from Table 5-1 to demonstrate the additional conservation necessary to balance supply and demand under the RWSAP in 2030. When the SFPUC implements its RWSAP, as shown in Table 5-2, Retail customers would be required to reduce daily demand by approximately 0.44 percent to balance demand against the supply shortfall. Stage 1 of the RWSAP in Section 3.2 requests voluntary conservation of at least 5 percent up to 10 percent. The 0.44 percent needed falls within Stage 1 and as modeled no further conservation would be required.

Table 5-2: 2030 Supply and Demand with Implementation of WSAP and RWSAP (mgd)

Retail Supply and Demand[1]	Normal Year	Single Dry Year	Multiple Dry Year Event		
			Year 1	Year 2	Year 3
RWS Supply	81.00	81.00	81.00	79.50	79.50
Groundwater	3.50	3.50	3.50	3.50	3.50
WSIP Supply Sources	10.00	10.00	10.00	10.00	10.00
Total City Supply	94.50	94.50	94.50	93.00	93.00

6.0 CONCLUSION OF ANALYSIS AND FINDINGS

There is an anticipated increase in the SFPUC supply reliability over the next 20 years as a result of the SFPUC implementing the water supply improvements in the WSIP and local water supply projects. Over this same period, demand in SFPUC's Retail service area will continue to increase as well. This is the result of growth in housing developments, population increases and employment opportunities throughout San Francisco.

In 2030, the proposed project's demand of 1.67 mgd would increase average daily demand by 1.8 percent; alternatively, the R&D Variant's demand of 1.99 mgd would increase the average daily demand by 2.1 percent. This increase, however, does not affect the ability of the SFPUC to meet the demand of its Retail customers. Beginning in 2015, when the WSIP water supply sources are readily available, the SFPUC's Retail water supplies increase to 94.5 mgd. The SFPUC intends to use these supplies to meet its Retail customer demands. As shown in Table 5-1, the SFPUC has sufficient supplies to meet current and planned future uses in normal year, single dry and all multiple dry-year events with the exception of years 2 and 3 after 2030.

After 2030, as shown in Figure 6-1, under a multiple dry-year event the SFPUC will experience a 0.42 mgd supply deficit (demand exceeds supply) and would not be able to meet 100 percent of its Retail demand including the proposed project. The water supply deficit is related to increasing demand throughout the SFPUC's Retail service area and the policy decision to limit RWS deliveries from the watersheds until 2018. This WSA used a conservative assumption and extended the decision to limit deliveries to 2030 (Annual average RWS limit is 265 mgd [81 mgd in SFPUC's Retail service area and 184 mgd in the Wholesale service area]).

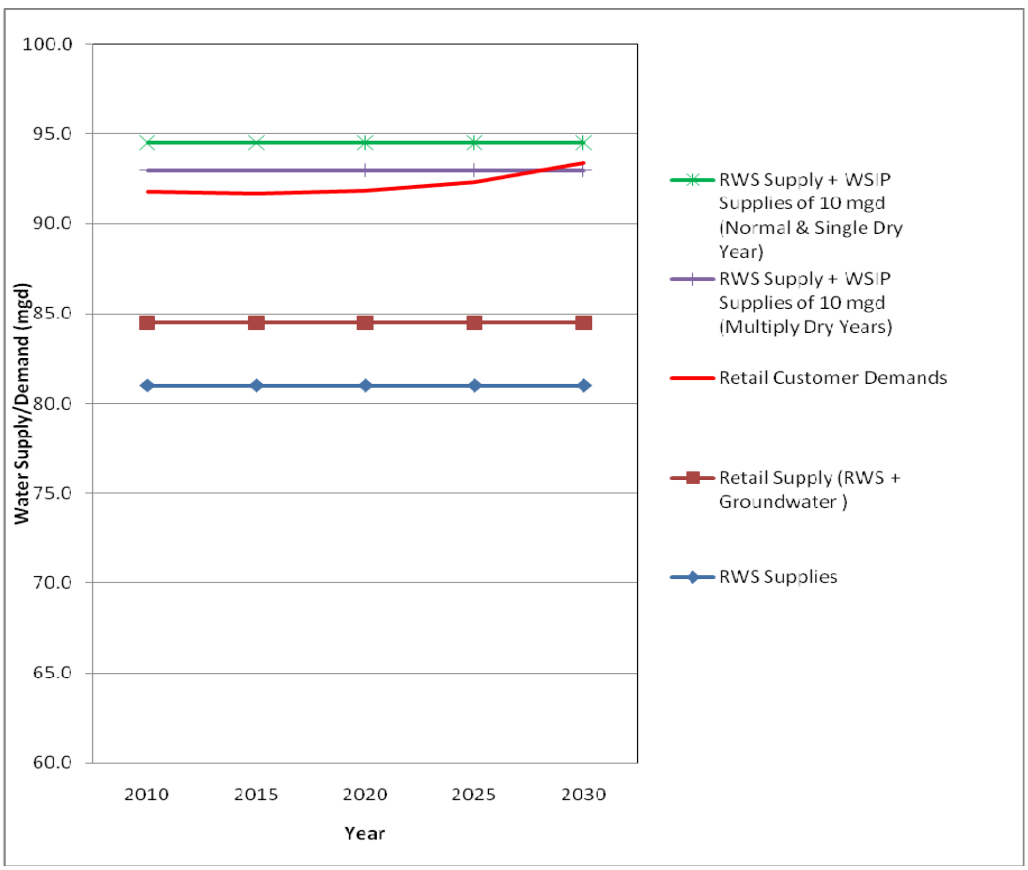

Figure 6-1: Comparison of Supply and Demand over 20 years

Pursuant to the Urban Water Management Planning Act (Water Code Section 10632), water suppliers with an existing dry year shortage contingency plan can implement subsequent stages of demand reduction measures listed in its UWMP as a strategy to balance supply and demand. The WSAP and the RWSAP, contained in Section 9 of the SFPUC's 2005 UWMP is the SFPUC's dry year shortage contingency plan that allows the SFPUC to reduce water deliveries to customers and implement demand reductions during periods of water shortage. Therefore, to overcome the potential 0.42 mgd supply deficit expected after 2030, the SFPUC would follow its adopted water shortage contingency plans (WSAP and RWSAP) to implement drought-planning sequences and associated operating procedures that trigger different levels of water delivery reduction rationing relative to the volume of water actually stored in the SFPUC reservoirs. These delivery reductions allow the SFPUC to maintain water in storage over an extended period. In addition, under the RWSAP, the SFPUC would balance Retail supply curtailments by reducing demand.

As discussed previously, the SFPUC has water rights and entitlements that are more than adequate to meet existing and projected future demand throughout the SFPUC's Retail service area. With completion of the WSIP projects, the SFPUC will have the capacity to reliably deliver potable water to meet customer purchases up to an annual average of 300 mgd. However, due to conditions of approval in the WSIP PEIR, the SFPUC is limiting deliveries from the watersheds until at least 2018. Prior to 2018, the SFPUC will engage in a new planning process to re-evaluate water system demand and water supply options. As a part of this process, San Francisco will conduct additional environmental studies and CEQA review as appropriate to address the SFPUC's recommendation regarding water supply and proposed water system deliveries after 2018.

This WSA concludes that the SFPUC has adequate supplies based on water rights and entitlements and adopted plans for local water supply projects to meet Retail demand in all years with the exception of a potential shortfall occurring after 2030 under a multiple dry-year event. In the event of a supply shortfall, the SFPUC, through its WSAP and RWSAP can impose supply curtailments and subsequent stages of demand reductions to balance demand against curtailed supplies.

6.1. WSA Findings

Regarding the availability of water supplies to serve the proposed project, beginning in 2015 the SFPUC finds as follows:

- In years of average and above-average precipitation, and including development of the SFPUC's local WSIP water supply sources, the SFPUC has adequate supplies to serve 100 percent of normal, single dry and multiple dry year demand up to 2030.[16]
- In multiple-dry-year events after 2030, when the SFPUC imposes reductions in its supply, the SFPUC has in place the WSAP and RWSAP to balance supply and demand.
- With the WSAP and RWSAP in place, and the addition of local WSIP supplies, the SFPUC finds it has sufficient water supplies available to serve its Retail customers including the demand of the proposed project, and existing and planned future uses.

16 The deficit shown in 2010 is the result of reducing the RWS supply to 81 mgd per the Phased WSIP Variant, without full development of the additional 10 mgd of new WSIP supplies. 10 mgd of new sources will be developed and available for use in San Francisco by 2015. However, Retail demand is currently lower than the 2010 projected demand (FY 07/08 use was 83.9 mgd). If Retail demand exceeds the available supply of 84.5 mgd between 2010 and 2015, the Water Supply Agreement allows the SFPUC to purchase additional water from the RWS. If combined Retail and Wholesale RWS deliveries exceed 265 mgd, the SFPUC Retail customers would be required to pay an Environmental Surcharge for RWS deliveries over 81 mgd (Total RWS deliveries in FY07/08 were 256.7 mgd).

ACKNOWLEDGEMENTS

The Westside Basin Annual Groundwater Report for 2008 was prepared by the San Francisco Public Utilities Commission (SFPUC) in cooperation with the City of Daly City, California Water Services Company (South San Francisco District) and the City of San Bruno. This report summarizes the results of water level elevation monitoring, water quality sampling and analysis, and additional field activities conducted within the basin for 2008.

Obiajulu Nzewi prepared this report under the direction of Jeff Gilman and Greg Bartow.

1.0 INTRODUCTION

This report presents the results of the 2008 Annual Groundwater Monitoring for the Westside Basin. The Westside Groundwater Basin extends from Golden Gate Park in San Francisco to the City of Burlingame in San Mateo County, and is an important municipal and irrigation water supply for the respective communities and businesses that overlie the Basin (Figure 1).

As part of continuing agency coordination and public education, it is intended that the preparation of this annual report, along with future annual reporting and supplemental technical reports, will provide regular summaries of overall basin conditions. The annual report is intended to provide information summarizing basin-wide groundwater pumping in the basin, describe groundwater levels and quality in the different aquifer systems that are present in the basin, and describe surface water conditions, most notably in Lake Merced. In addition to reporting of hydrogeologic conditions, the data-gathering network will be modified as necessary to provide a comprehensive review of basin conditions. Additionally, monitoring activities will be coordinated with ongoing and future project-specific monitoring activities to ensure an efficient, comprehensive monitoring program.

1.1 Background

Over the last several years, there has been a significant increase in data collection efforts and cooperative management of groundwater and interrelated surface water resources in the Westside Basin among the San Francisco Public Utilities Commission (SFPUC), the City of Daly City (Daly City), California Water Service Company (Cal Water, municipal water purveyor to South San Francisco, the Town of Colma and a portion of unincorporated San Mateo County), and the City of San Bruno (San Bruno). The initial data collection efforts included increased monitoring of groundwater and lake level elevations in the northern Westside Basin and the initiation of a basin-wide, semi-annual monitoring program that has involved the cooperative efforts of the SFPUC, Daly City, Cal Water, and San Bruno beginning in spring 2000. Part of the increased management effort was the preparation of the 2005 Final Draft North Westside Groundwater Basin Management Plan, which included a Plan Element to regularly report on groundwater conditions in the Westside Basin (SFPUC, 2005).

In 2006, the SFPUC, in cooperation with Daly City, Cal Water, and San Bruno, prepared a report entitled “Hydrogeologic Conditions in the Westside Basin, 2005” (LSCE, 2006). That report provided an overview of historical, current and planned activities related to groundwater use within the Basin, and described the hydrogeologic conditions of the Westside Basin as of 2005. Since 2007, the SFPUC Water Resources Division has prepared the annual groundwater monitoring reports in cooperation with Daly City, San Bruno, and Cal Water.

The monitoring program has expanded to monitor changes in groundwater levels and quality resulting from the recycled water program and the pilot conjunctive use program and to assist the SFPUC in quantifying the change in groundwater storage resulting from the above projects.

The physical barriers to seawater intrusion that are evident west of Daly City (as a result of faulting and steeply dipping beds of the Merced Formation) are not as evident in the North Westside portion of the basin, where the beds do not exhibit pronounced dips, and faults are further offshore. In that light, the expansion of the monitoring program included the construction of monitoring wells along the coast from Daly City to Golden Gate Park to monitor for the potential occurrence of seawater intrusion resulting from ongoing groundwater use and planned groundwater development within the North Westside Basin. Monitoring for the potential occurrence of seawater intrusion on the San Francisco Bay-side (Bay Side) of the basin was implemented by the City of San Bruno in 2006. In the fall of 2006, two new well clusters were installed by San Bruno at locations in the San Francisco Airport and within Burlingame. These wells are monitored semi-annually by San Bruno.

For convenience, the portion of the Westside Groundwater Basin north of the San Francisco/ San Mateo County line is referred to as the North Westside Groundwater Basin. The portion of the Westside Basin located south of the County line is referred to as the South Westside Groundwater Basin.

1.1.1 Planned and Ongoing Projects

The purpose and scope of the monitoring program has evolved to monitor changes in the groundwater system resulting from the following planned and ongoing projects:

Proposed Westside Basin Recycled Water Project

The proposed Westside Recycled Water Project is part of the SFPUC's Water System Improvement Program. It would deliver highly treated recycled water to a variety of customers through a system of pipelines, pump stations, storage tanks, and reservoirs. The system would bring recycled water from the proposed water treatment facility in Golden Gate Park to the San Francisco Zoo, Golden Gate Park, and Lincoln Park and Golf Course. The recycled water would be used for irrigation at all three sites, as well as non-portable uses at the Zoo and at the California Academy of Sciences.

In 2004, the North San Mateo County Sanitation District (NSMCSD), a subsidiary of Daly City, constructed facilities at its wastewater treatment plant to produce recycled water. The plant currently provides recycled water that is used for irrigation purposes at the Lake Merced Golf Club, the Olympic Club Golf Course, and the San Francisco Golf Club, as well as other landscaped areas in Daly City. These recycled water customers use less than 1 million gallons of recycled water per day on average. The plant has the capacity to produce up to 2.8 million gallons of recycled water per day. As a result, the NSMCSD has recycled water available to irrigate the Harding Park and Fleming Golf Courses, while still meeting the needs for its current recycled water customers.

Daly City and the SFPUC are proposing to expand the NSMCSD's recycled water distribution system in order to provide recycled water for irrigation purposes to the Harding Park and Fleming Golf Courses. Recycled water would replace potable water from the SFPUC's Regional Water System currently being used for irrigation at these locations. The proposed project facilities would include:

- Distribution Facilities: The project would require a new pump station at the Harding Park Maintenance Yard, and approximately 4,800 feet of 18-inch distribution pipeline along Lake Merced Boulevard.
- Storage Reservoir: The project would require construction of a new 700,000 gallon underground recycled water storage tank at Harding Park Maintenance Yard.
- Back-up Connection: The project would require construction of a back-up connection to SFPUC potable water distribution system.

San Francisco Groundwater Supply Project

As part of the San Francisco Groundwater Supply Project, the SFPUC proposes the construction of up to six wells and associated facilities in the western part of San Francisco. The wells would extract up to 4 million gallons per day (mgd) of water from the Westside Basin. The extracted groundwater, which would be used both for regular and emergency water supply purposes, would be blended with imported surface water before entering the municipal drinking water system. The project would provide a new source of water and improve reliability during system maintenance and drought conditions.

South Westside Basin Conjunctive Use Project

The purpose of the project is to develop a groundwater supply in the South Westside Basin for use during drought conditions. In normal and wet years, the SFPUC will supply supplemental surface water to Daly City, Colma, San Bruno, and the California Water Service Company (South San Francisco District) to be used in place of groundwater pumping. The reduced pumping during the normal and wet years would thereby increase the volume of groundwater in storage that can be pumped in dry years.

The proposed project includes construction of 16 groundwater wells with a total capacity of 7.2 mgd. Five of the wells would be connected to the Daly City water system, six (or three each) will be connected to the water systems of Cal Water and San Bruno, and five would be connected to the SFPUC transmission system. Treatment may be required at some of the wells for the removal of manganese. Additionally, the project would include nearly 9,800 feet of water distribution piping to make the necessary connections.

In October 2008, five new monitoring well clusters were installed at the following locations as part of this project:

- CUP-10A located within SFPUC Right of Way in Daly City
- CUP-18 located within SFPUC Right of Way at Colma Blvd. in Colma;
- CUP-19 located within SFPUC Right of Way at Serramonte Blvd. in Colma;
- CUP-22A located within SFPUC Right of Way at Hickey Blvd. at Camaritas Road, in South San Francisco; and.
- CUP-36-1 located within SFPUC Right of Way at Southwood Drive in South San Francisco.

The well construction permits, as-built construction details, lithologic and geophysical logs, and summaries of groundwater quality are presented in Appendix D. Subsequent monitoring events will incorporate these wells into the monitoring network to enhance characterization of groundwater conditions in the southern portion of the basin.

1.2 Municipal Water Agencies

The SFPUC is responsible for providing a reliable, high quality water supply for the City and County of San Francisco (San Francisco). The SFPUC also provides water to a large network of wholesale customers that extend from Daly City, adjacent to San Francisco, south through the Peninsula to Santa Clara County, and up the southeast side of San Francisco Bay through Alameda County to Hayward. The SFPUC water supply system supplies all of the San Francisco municipal demand and about two-thirds of the total water demands of its wholesale customers (SFPUC, 2005). Total water demand of retail customers in San Francisco is nearly 94 million gallons per day (mgd), or about 105,000 acre-feet per year (afy), which represents a significant decrease in water demand from recent drought periods (SFPUC, 2005). The total water requirements of the Bay Area wholesale customers in 2005 were estimated to be about 282 mgd, or about 316,000 afy (SFPUC, 2005).

Since the 1990's the SFPUC, Daly City, Cal Water and San Bruno have worked cooperatively on Westside Basin investigations, monitoring and coordinated projects. Daly City, Cal Water, and San Bruno have typically included groundwater from the Westside Basin for municipal water supply in combination with SFPUC-imported surface water. The City of Daly City's Department of Water and Wastewater Resources is responsible for the management and operation of Daly City's drinking water supply system. The City of San Bruno's Water Division of the Public Works Department is responsible for the management and operation of San Bruno's drinking water supply system. Cal Water is an investor-owned utility that serves South San Francisco, Colma and a very small part of Daly City.

2.0 SITE DESCRIPTION AND HYDROGEOLOGICAL SETTING

2.1 Hydrogeologic Setting

The Westside Basin is about 40 square miles in area (Figure 1) and includes four major geologic units. These units are the Jurassic - Cretaceous Franciscan Complex, Pliocene Merced Formation, Pleistocene Colma Formation, and Pleistocene to recent Dune Sands. There are also minor, yet widespread, units of recent alluvium along stream channels. Groundwater development has primarily occurred in the Colma and Merced Formations. The Merced Formation is the primary water-producing aquifer in the basin; however, the Colma Formation is also of interest since Lake Merced is incised within this formation.

As a result of the difficulty of differentiating the contacts between the Dune Sands, the Colma Formation, and the Merced Formation, the precise thickness of the Colma Formation and Dune Sands overlying the Merced Formation has not been determined. Groundwater in the vicinity of Lake Merced, and north to Stern Grove and Golden Gate Park, is encountered at relatively shallow depths (ranging from approximately 5 to 60 feet). South of Lake Merced, the depth to groundwater can exceed 300 feet below ground surface (bgs).

Phillips, et al. (1993) defined each of the groundwater basins in San Francisco as a continuous body of unconsolidated sediments and the surrounding surface drainage area. All seven major groundwater basins identified in San Francisco are open to the Pacific Ocean or San Francisco Bay. The landward parts of the groundwater basins generally are bounded horizontally and vertically by bedrock, which is assumed to be relatively impermeable compared with unconsolidated marine and alluvial deposits. Groundwater flow may occur between basins where the bedrock ridge that constitutes the boundary is subterranean. The north-south topography and bedrock height defined by the Coast Ranges generally forms an east-west hydrologic boundary through San Francisco.

The western part of San Francisco is divided into the Westside and Lobos Basins on the basis of a northwest-trending bedrock ridge through the northeastern part of Golden Gate Park. The bedrock ridge has several small surface expressions, and bedrock altitude data indicate that the ridge is continuous, though subterranean. Some degree of hydraulic connection is possible between the two basins where the ridge is not exposed at the land surface, but the degree of connection probably is minimal. The Westside Basin extends south to Burlingame and Hillsborough. Well drillers' logs for the San Bruno area indicate a deep sandy unit overlain by about 200 feet of predominantly fine-grained clays. Correlation of the deeper sand deposits is unclear; however, surficial mapping may indicate a relationship to exposures of sand/gravel deposits in the Burlingame area, which are mapped as non-marine Santa Clara Formation (Brabb and Pampeyan, 1983). A southward-extending ridge of Franciscan bedrock appears to separate San Bruno from the San Francisco Bay to the east. The upper fine grained beds appear to be Holocene to Late Pleistocene estuarine deposits of the San Francisco Bay (LSCE, 2004).

The subsurface configuration of the various geologic units in the Westside Basin has been delineated in a series of geologic cross-sections based on a combination of lithologic logs, water well drillers' reports, and geophysical logs (LSCE, 2004 and 2006). Lithologic units and other significant features in the basin are illustrated in geological cross-section form in Figure 2.

In the northern Westside Basin, in San Francisco, there are up to three aquifer units separated by two distinctive fine-grained units, the –100-foot clay and the W-Clay (LSCE, 2004). The aquifer units are generally designated as:

1) The "Shallow aquifer", which is present to an elevation of approximately –100 feet mean sea level (msl) (located above the –100-foot clay), in the vicinity of Lake Merced and the southern portion of the Sunset District of San Francisco;

2) The "Primary Production aquifer", which overlies the W-Clay; and

3) The "Deep aquifer" which underlies the W-Clay.

In the Daly City area, the –100-foot clay is absent, and the aquifer system is primarily composed of the Primary Production aquifer and the Deep aquifer.

Further to the south, in the South San Francisco area, the W-Clay is absent and the Primary Production aquifer is split into shallow and deep units, separated by a fine-grained unit at an elevation of approximately 300 feet below msl. The primary production aquifer in the San Bruno area is located at an elevation less than 200 feet below msl, and it underlies a thick, surficial fine-grained unit comprised of clay, sandy clay, and sand beds.

2.2 Lake Merced

Lake Merced is incised in the Shallow aquifer and is composed of four lakes: North Lake, East Lake, South Lake, and Impound Lake. A narrow channel connects the North and East Lakes, thereby creating equal water elevations in both lakes. A conduit between North Lake and South Lake allows water to flow between the lakes when the elevation in either lake is approximately 3.35 feet, San Francisco City datum[1]. When lake levels are below that elevation, these two lakes are separated and typically exhibit different elevations. South Lake and Impound Lake are separated below an elevation of approximately 4.26 feet, San Francisco City datum, by a levee that contains the Ingleside combined sewer pipeline and the foundation of a pedestrian walkway. Soil has accumulated on the foundation to an elevation of approximately 5 feet, San

[1] City Datum = NAVD88-11.37ft.

Francisco City datum. When either lake level is above that 5-foot elevation, water flows freely underneath the pedestrian walkway to connect both lakes.

Until the early 1900's, Lake Merced was one continuous body of water fed by local runoff and springs, with an outflow to the ocean in the form of a stream located at the northwestern end of North Lake. The stream flowed westward toward the ocean through the present-day location of the San Francisco Zoo and Sloat Boulevard. The springs that fed the lake were primarily located on the eastern side and in the southern portion of Lake Merced, causing a primary flow direction through the lake from the south to the north. In contrast, the current flow direction through the lakes is reversed, largely as a result of urban growth in the vicinity of Lake Merced, which has resulted in reduced recharge from springs and increased pumpage in the Primary Production aquifer south of Lake Merced. The urbanization of the watershed has also resulted in the emplacement of large amounts of fill that now impede spring discharge in the lake, and the diversion of an increasing amount of storm water away from Lake Merced and into the ocean or wastewater treatment plant. These diversions began with the construction of the Vista Grande Canal and Tunnel by the Spring Valley Water Works in 1897, and have continued with successive urban development in San Francisco and northern San Mateo County. The development of the watershed has also affected groundwater recharge from precipitation, which previously infiltrated and recharged the Shallow aquifer to a greater extent. As a result of all the preceding, the amount of subsurface inflow into Lake Merced, which in the early 1900's was manifested as spring inflow, has been reduced. The reduction in subsurface recharge to Lake Merced results in short-term lake levels being more sensitive to fluctuations in precipitation, since direct precipitation, along with shallow groundwater inflow, are the primary lake recharge mechanisms.

2.3 Pine Lake

Pine Lake is located north/northeast of Lake Merced in the westernmost portion of the Stern Grove and Pine Lake Park. Pine Lake (also known as Laguna Puerca) is one of San Francisco's few natural lakes. It is a small, shallow lake approximately three (3) acres in size. The lake has historically been overgrown with aquatic plants, which have periodically been removed. The San Francisco Recreation and Park Department has recently implemented a park improvement program for the Stern Grove and Pine Lake Park area. In November 2004, the Recreation and Park Department augmented lake levels over a 15-day period using groundwater pumped from a nearby well located east of Pine Lake. The lake addition was part of a study to evaluate the rate of lake level decline following a water addition. Approximately 25 acre-feet were discharged to the lake, which would theoretically raise the lake by about 8 feet. Nearby groundwater monitoring showed a corresponding increase in groundwater levels of about 5 feet in the Shallow aquifer.

We understand that the San Francisco Recreation and Park Department intends to resume groundwater pumping at the newly rehabilitated Pine Lake well in the near future, to once again augment the water level in Pine Lake.

SFPUC will cooperate with the Recreation and Park Department to measure future groundwater pumping from the Pine Lake well.

3.0 HISTORICAL GROUNDWATER DEVELOPMENT

By the early 1900's, wells had been constructed north, east, and south of Lake Merced for farming and drinking water supply. During that time, Spring Valley Water Company had two wells located near the Lake Merced outlet. Spring Valley pumpage was only about 100 afy (Bartell, 1913). The total of Lake Merced, Sunset District, and Golden Gate Park pumpage averaged 400 to 500 afy. In the early 1930s, the San Francisco Board of Public Works installed production wells in the Sunset District with a pumping capacity of about 6 mgd (6,700 afy). Groundwater withdrawals for emergency (drought) purposes averaged about 5 mgd (5,600 afy) from October 1930 through October 1935, but were discontinued after the availability of Hetch Hetchy water in the mid-1930s.

Beginning in the early 1950's, post-World War II development of Daly City and farther south onto the Peninsula was met with an increase in groundwater pumping and imported water deliveries from the SFPUC. Groundwater pumping increased from about 1,000 afy to nearly 5,000 afy between 1950 and 1970 (Kirker, Chapman & Associates, 1972). Since then, Daly City's groundwater pumping has ranged between approximately 3,000 and 5,000 afy, where it remained until October 2002, when an increase in SFPUC system water replaced the majority of Daly City's groundwater supply in normal and wet years as part of a demonstration conjunctive use pilot program among San Francisco, Daly City, Cal Water in South San Francisco, and the City of San Bruno. The conjunctive use pilot program ended in 2004. However, a subsequent agreement extended the project with Daly City, which received supplemental surface water until May 2007 when deliveries were suspended due to dry year water conditions. SFPUC plans to continue this demonstration program in Daly City. Daly City groundwater pumping totaled about 3,600 acre-feet (af) for 2008.

Groundwater pumping by Cal Water in South San Francisco has progressively declined from about 2,200 afy in 1947, to about 1,600 afy in 1969, to about 1,200 afy in 2002, to zero in 2003 (Figure 3). The decreases in groundwater pumping have been offset by increases in SFPUC system water deliveries. In early 2003, groundwater pumping in South San Francisco was discontinued as part of the same conjunctive use pilot program described above, with local surface water supplies replacing pumped groundwater. Groundwater pumping for municipal supply in South San Francisco resumed once again in March 2008 and totaled 206 af during 2008.

Pumping in San Bruno ranged from approximately 1,700 to 3,100 afy from 1997 through 2001 (Figure 3). In 2002, San Bruno decreased groundwater pumping to approximately 1,240 acre feet (af) and further decreased groundwater production to about 550 af in 2003 and 2004 as part of the pilot conjunctive use program. San Bruno resumed pumping after cessation of the demonstration conjunctive use program in that part of the basin in early 2005. In 2008 San Bruno pumped approximately 2,100 af of groundwater.

Total municipal pumping in the Westside Basin, as shown in Figure 3, was about 7,500 afy from the mid-1970s to the mid-1980s, and then ranged generally between about 6,000 and 8,000 afy until 2001. From 2002 to 2007, municipal pumping was reduced as part of the conjunctive use pilot program. In spring 2007, due to the dry 2006/2007 winter conditions, the SFPUC discontinued supplemental water delivery to Daly City, and Daly City resumed pumping from its municipal wells. Major groundwater production areas and historical groundwater pumping in the Westside Basin are presented on Figure 1 and Figure 3, respectively. Recent municipal groundwater usage is shown on Figure 4.

In addition to municipal water supply pumping in the Westside Basin, groundwater has historically been developed for irrigation supply and other non-potable uses, most notably on golf courses around Lake Merced, on the cemeteries in Colma, in Golden Gate Park and at the San Francisco Zoo. All unmetered, groundwater pumping for irrigation supply has been estimated infrequently. Kirker Chapman (1972) estimated golf course and cemetery pumping to be about 5,000 afy in 1969, and Yates, et al. (1990) estimated Golden Gate Park pumping to be about 1,000 afy during the late 1970's and 1980's. Adding those estimates to metered municipal pumping, as illustrated in Figure 3, suggests that total pumping was almost 15,000 afy in the late 1960's [assuming that Golden Gate Park pumping was similar in the late 1960's to the late 1970's and 1980's, as reported by Yates, et al. (1990)]. Assuming irrigation pumping to not substantially have changed until 2005 as discussed below, total pumping could be considered to have been about 6,000 afy more than municipal pumping, or in the range of about 12,000 to 14,000 afy from the mid -1980's through 2001.

Between 2002 and 2004, municipal pumping significantly decreased as part of the conjunctive use pilot program, to around 2,000 afy. From 2005 to May 2007 supplemental SFPUC water continued to be delivered to Daly City. In 2005, initial deliveries of recycled water for golf course irrigation largely eliminated groundwater use at the courses around Lake Merced, leaving the cemeteries, the San Francisco Zoo, and Golden Gate Park as the notable pumpers for irrigation and other non-potable uses, using an estimated 3,000 afy. The combination of the conjunctive use demonstration project and recycled water deliveries for golf course irrigation resulted in the combination of metered and estimated pumping in the basin declining to about 6,000 af in 2005, and approximately 5,400 af in 2006. Following discontinuation of the conjunctive use pilot program with Daly City in May 2007, approximately 7,500 af of groundwater was pumped in 2007.

4.0 GROUNDWATER PUMPING, USAGE AND DEVELOPMENT - 2008

In 2008, groundwater pumping in the Westside Basin was primarily for municipal supply to Daly City, Cal Water (South San Francisco), and San Bruno, as well as for irrigation and other non-potable uses by the San Francisco Zoo, Golden Gate Park, golf courses, and cemeteries, as described below and summarized in Table 2.

The SFPUC is planning to develop 4 mgd of regular groundwater supply from the North Westside Basin. As part of this plan, a test well was constructed at the South Sunset Playground in June 2007 and a second test well was completed at the West Sunset Playground in 2008. The West Sunset Playground test well is 12-inches in diameter, with a total depth of about 370 feet bgs. The test well is screened from 160 to 200 feet bgs and from 210 to 360 feet bgs.. The well construction permit, as-built construction details, lithologic logs and geophysical logs, and a summary of groundwater quality are presented in Appendix D.

4.1 City of Daly City

From its highest historical pumping of around 5,000 afy through most of the 1960's, Daly City's pumping was near constant, around 4,500 afy, through the 1970's and 1980's. Slightly more variable in the 1990's, when it generally declined to around 4,000 afy, Daly City's pumping has been most notably reduced since 2001, when it initially decreased to about 2,700 afy in 2002, followed by further decreases to between 700 and 1,500 afy in 2003 through 2005. The decreases in 2003 through 2005 were associated with the conjunctive use pilot program, which continued in Daly City through May 2007. Groundwater pumping in Daly City during calendar year 2008 totaled about 3,600 af compared to about 2,600 af for 2007 (when Daly City only pumped for a portion of the year). The history of pumping in Daly City is illustrated in Figure 3 and Figure 4.

4.2 City of South San Francisco

Municipal groundwater pumping in South San Francisco is provided by Cal Water, which also serves Colma and small parts of Daly City. Historical pumping by Cal Water decreased from the late 1940's through 2002, from about 2,200 afy to about 1,200 afy. As part of the pilot conjunctive use project with the SFPUC, Cal Water discontinued groundwater pumping for water supply purposes in 2003 and 2004. The conjunctive use pilot program ended in South San Francisco in early 2005. Cal Water resumed groundwater pumping in March 2008. Groundwater pumping by Cal Water during calendar year 2008 totaled 206 af.

4.3 City of San Bruno

Over the long term, groundwater pumping in San Bruno has generally ranged between about 550 and 3,100 afy since the late 1940's. As part of the conjunctive use pilot program, San

Bruno reduced pumping to approximately 550 af in 2003 and 2004. After cessation of the conjunctive use pilot program in San Bruno in early 2005, groundwater pumping in San Bruno increased to about 1,700 af for that year. Groundwater pumping in San Bruno has amounted to approximately 1,950 af for 2006, 2,350 af for 2007, and 2,100 af for 2008.

4.4 San Francisco Zoo

The San Francisco Zoo uses groundwater for irrigation and Zoo operations. Landscape irrigation along part of the Great Highway is also supplied by groundwater. Since the mid-1990s, the water needs of the Zoo and the landscaping along the Great Highway have been met by Well No. 5, which is located at the Zoo and is operated and maintained by the San Francisco Recreation and Park Department. Groundwater meter data started being recorded in February 2005. In 2005 and 2006, annual groundwater pumping was reported at approximately 400 af and approximately 350 af, respectively. For 2008, metered groundwater pumping at the Zoo was approximately 260 af. This amount compares to about 620 af for 2007, and represents a decrease of about 42% compared to 2007 pumping (Table 2). The reason for the significant decrease in pumping at the SF Zoo is not readily apparent. SFPUC and Zoo staff are reviewing 2008 groundwater and surface water use in an attempt to understand these differences in 2008 groundwater use compared to 2007.

4.5 Golden Gate Park and Pine Lake

Groundwater is pumped in Golden Gate Park for irrigation and to maintain artificial lakes within the park. The Golden Gate Park wells are operated and maintained by the San Francisco Recreation and Park Department. Groundwater is pumped from three wells located at Elk Glen Lake, near North Lake, and near the South Windmill. Historically groundwater pumping data were not maintained for the Golden Gate Park wells. In 2005 meters were installed in all three production wells to quantify groundwater pumping in the park. Historical groundwater pumping in Golden Gate Park has previously been estimated to be approximately 1,100 afy (Yates, et al., 1990). For 2008, approximately 1,300 af of metered groundwater was pumped at the South Windmill Replacement well, the North Lake well, and the Elk Glen Lake well. This compares to about 830 af pumped from these wells in 2007 and represents an increase of about 57% over 2007 values. Total metered pumping in 2008 was calculated based on weekly flowmeter readings collected by the SFPUC from the three afore mentioned production wells. In accordance with recommendations made in the 2007 Annual Report, the SFPUC coordinated with Rec Park and retained Jensen Instruments (a licensed contractor) to service and calibrate the electronic flow totalizers at the North Lake and South Windmill Replacement wells. Service and calibration was conducted under the observation of SFPUC and Rec Park staff in November 2008.

In addition to Golden Gate Park, we understand that the Recreation and Park Department intends to resume groundwater pumping at the newly rehabilitated Pine Lake well sometime in the near future, to once again augment levels at the Pine Lake. SFPUC will cooperate with the Recreation and Park Department to measure future groundwater pumping from the Pine Lake well.

4.6 Golf Courses

There are six (6) golf courses in the Westside Basin that use groundwater for irrigation. These include the Lake Merced Golf Club, the Olympic Club Golf Course, the San Francisco Golf Club, the California Golf Club, the Golden Gate Park Golf Course and the Green Hills Country Club. In 2004, recycled water was made available to Lake Merced Golf Club, the Olympic Club Golf Course, and the San Francisco Golf Club by adding a tertiary level of treatment at the North San Mateo County Sanitation District (a subsidiary of the City of Daly City) Wastewater Treatment Plant and by installing a distribution system from the treatment plant to these respective golf courses.

In 2008, a total of 516 af of recycled water and 91 af of pumped groundwater were used by the Olympic Club Golf Course and the San Francisco Golf Club to meet irrigation needs. According to data provided by the City of Daly City, the Lake Merced Golf Club used about 78 af of recycled water in 2008. Annual pumping data for 2008 was not available from the Lake Merced Golf Club. A summary of golf course water use is presented in Table 1. Groundwater pumping data have not been requested from the California Golf Club for this report. However, based on the Recycled Water Feasibility Study (Carollo Engineers, September 2008), the pumping is estimated at 206 af per year. The Golden Gate Park Golf Course is irrigated with groundwater as part of the overall park irrigation. No pumping data have been requested from the Green Hills Country Club, located in Millbrae, within the southwestern portion of the basin.

4.7 Cemeteries

There are about 600 acres of cemeteries in Colma, most of which have historically been, and continue to be, irrigated with groundwater. Based on the Recycled Water Feasibility Study (Carollo Engineers, September 2008), the average annual groundwater pumping by cemeteries in Colma is estimated at 787 afy. Golden Gate National Cemetery has not been irrigated using groundwater for more than 20 years (personal communication on 9/7/07 between Greg Bartow (SFPUC) and Clifford Schem (US Dept. of Veterans Affairs, Nat'l Cemetery Administration)).

4.8 Summary

Total 2008 groundwater pumping in the Westside Basin is estimated at 8,500[2] af. Metered water use indicates that the cities of Daly City, South San Francisco, and San Bruno used approximately 5,900 af of groundwater in 2008, while the two metered golf courses in the Lake Merced area used approximately 91 af of groundwater and 516 af of recycled water during calendar year 2008.According to data provided by the City of Daly City, the Lake Merced Golf Course used approximately 78 af of recycled water in 2008. Annual pumping data for 2008 was not available from the Lake Merced Golf Club but is estimated at about 37 af based on 2007 metered groundwater use. A general comparison between the combinations of metered and estimated historical pumping, and more completely metered pumping in 2005, 2006, 2007 and 2008, is presented in Table 1 and 2.

Total 2008 reported metered pumping in the Westside Basin was approximately 8,550 af. This consists of metered pumping at the three wells in Golden Gate Park, the San Francisco Zoo well, Daly City, San Bruno, Olympic Club Golf Course, and San Francisco Golf Club, and estimated groundwater pumping at the Lake Merced Golf Club based on 2007 values. To date the SFPUC and cooperating municipal pumpers have not requested annual pumping information from the other irrigation pumpers in the Westside Basin. However, based on estimates compiled by Carollo Engineers (Carollo Engineers, September 2008), the other pumping in the South Westside Basin is estimated at about 1,000 afy. Pumping within the Westside Basin not described (e.g., private homeowner wells, groundwater remediation extraction wells, and construction dewatering wells) is assumed to be negligible compared to the municipal and large-scale irrigation uses.

5.0 GROUNDWATER MONITORING AND TESTING PROGRAM

Groundwater monitoring within the Westside Basin consists of groundwater elevation and water quality monitoring conducted on a semi-annual basis (conducted during the spring and fall each year). Monitoring of groundwater elevations and various water quality parameters is conducted throughout the Westside Basin to evaluate the potential for seawater intrusion, and define lake-aquifer interaction. The monitoring program is also conducted to assess general conditions in the basin resulting from ongoing pumping, the conjunctive use program pilot and the recycled water program. The groundwater elevation monitoring well network is listed in Table 3, and approximate well locations are shown on Figure 5. These include both dedicated monitoring wells and inactive production wells. Measurements are collected manually on a quarterly or semi-annual basis in some wells, and daily through the use of electronic pressure transducers in other wells. Groundwater elevation hydrographs of all the wells monitored in 2008 are presented in Appendix A. All groundwater elevations are presented relative to the North American Vertical Datum of 1988 (NAVD88).

In addition to monitoring groundwater elevation data, groundwater sampling and analysis were conducted from select wells to monitor concentrations of various analytes and physical parameters of groundwater within the Westside Basin. The groundwater quality testing network is shown on Figure 21. Results of these analyses are used to monitor and evaluate the potential for seawater intrusion and general groundwater quality. Groundwater samples collected by the SFPUC for the North Westside Basin were done so in accordance with the "Sampling and Testing Protocol" for the Westside Basin (Appendix C).

Select groundwater samples were tested for some or all of the following constituents:

- General Minerals including: total alkalinity, calcium, magnesium, sodium, potassium, bicarbonate as $CaCO_3$, chloride, and sulfate;
- Iron and manganese (total and dissolved fractions);
- Nitrate;
- General parameters including: specific conductance, pH, total dissolved solids (TDS), and hardness;
- Bromide;
- Orthophosphate, and
- Boron.

Select groundwater elevation data are summarized in hydrographs illustrated on Figures 6 to 15, and groundwater elevation contour maps are presented on Figures 16 to 19. Results of chemical analyses on select groundwater samples are summarized in Tables 6 to 9.

6.0 COASTAL AND BAY SIDE WATER LEVEL MONITORING

6.1 Coastal Water Level Monitoring

Groundwater level measurements are being collected from a coastal monitoring well network in the western part of the basin, along the Old Great Highway (near Kirkham, Ortega, and Taraval Streets), the north-western part of Golden Gate Park, at the Oceanside Wastewater Treatment Plant, at the San Francisco Zoo, at Fort Funston, and at Thornton Beach. Fieldwork was conducted in accordance with the "Sampling and Testing Protocol for the Westside Basin" presented in Appendix C.

Groundwater elevation hydrographs of the Kirkham, Ortega, Taraval, and Zoo monitoring wells are presented in Figures 6 through 9, respectively. These hydrographs also include chloride concentrations from the water quality monitoring conducted at these wells. The water quality data are further discussed in Section 7.1. Figures 6 through 9 show the history of groundwater levels in the coastal monitoring wells since installation of wells at those four sites.

Groundwater elevations within the Shallow aquifer at all four coastal wells increased slightly or remained virtually unchanged seasonally compared to observed 2007 levels, and continued to trend above sea level in all wells. Groundwater levels within the Primary Production aquifer and Deep aquifer at the following wells increased in 2008 from the observed seasonal low levels of 2007, as follows:

- Kirkham MW-255 (Figure 6b) increased from a seasonal low of 3.2 ft (September 2007) to 5.2 ft (July 22, 2008);

- Kirkham MW-385 (Figure 6c) increased from a seasonal low of 2.9 ft (September 2007) to 5.2 ft (September 22, 2008);

- Kirkham MW-435 (Figure 6d) increased from a seasonal low of -0.5 ft (September 2007) to 2.4 ft (June 2008);

- Groundwater levels in Ortega MW-475 (Figure 7d) increased from a seasonal low of -4.7 ft in September 2007 to 1.0 ft (May 2008).

- Taraval MW-530 (Figure 8d) increased from a seasonal low of -9.0 ft (September 2007) to -2.0 ft (May 2008); and

- Zoo Monitoring Well MW-565 (Figure 9c) increased from a seasonal low of -13.5 ft (September 2007) to -6.0 ft (May 2008);

At their lowest measured levels of 2008, groundwater elevations at Taraval MW-530 (-2.0 ft), and Zoo Monitoring Well MW-565 (-6.0 ft) were below sea level. In addition, observed groundwater levels at the South Windmill monitoring well MW-57 and MW-140 remained below sea level and were similar to the recorded 2007 levels (Appendix A). Groundwater levels in MW-57, located in close proximity to the South Windmill Replacement well, dropped below sea level for the first time in 2007 since water level measurement began in 1989.

The observed increase in water level elevations in the Primary Production and Deep aquifers at the Kirkham, Ortega, Taraval, and Zoo wells, are likely a result of the following factors:

- Decreased pumping of groundwater at the SF Zoo production well, from 616 af in 2007 to 260 af in 2008 (Table 2), resulting in reduced drawdown and impact on the nearby coastal monitoring wells screened in the Primary Production and Deep aquifer;

- Although total groundwater use at the Golden Gate Park increased from about 827 af in 2007 to 1,294 af in 2008 (Table 2), there was a slight shift in pumping patterns caused by the shutdown of the South Windmill Replacement production well to more inland locations at various times in 2008, and

- A corresponding increase in pumping at the North Lake production well in Golden Gate Park resulted in less observed drawdown of water levels in the coastal monitoring wells. Pumping at the North Lake production well increased from about 224 af in 2007 to 645 af in 2008, while pumping at the South Windmill Replacement production well decreased from 596 af in 2007 to 558 af in 2008. Pumping at the Elk Glenn production well located in the central portion of the Golden Gate Park, increased from 7 af in 2007 to 91 af in 2008.

With the exception of the South Windmill monitoring well MW-57 and MW-140, groundwater elevations measured at wells screened within the Shallow aquifer in 2008 were all above sea level. Groundwater elevation contours for the Shallow aquifer measured during the spring and fall 2008 monitoring events are presented on Figures 16 and 17, respectively.

Groundwater levels at coastal monitoring wells screened in the Primary Production aquifer increased in 2008 compared to observed 2007 levels. Groundwater elevation contours for the Primary Production aquifer measured during the spring and fall 2008 monitoring events are presented on Figures 18 and 19, respectively.

Groundwater levels at the two coastal wells screened in the Deep Aquifer (Taraval MW-530, and Zoo MW-565), increased compared to observed 2007 levels but remain below sea level.

In general, coastal groundwater levels in most of the wells on the Pacific Ocean side of the Westside Basin are sufficiently high (above sea level) to indicate a lack of potential for seawater intrusion. However groundwater levels in monitoring wells near the southwestern corner of Golden Gate Park were below sea level in the Shallow aquifer (South Windmill monitoring well MW-57 and MW-140). In the Shallow and Primary Production aquifers, the continued depression of groundwater levels appears to be the result of increased and concentrated pumping in the western part of Golden Gate Park. In addition, below-normal winter precipitation in 2006, 2007 and 2008 further reduced aquifer recharge, and increased the need for irrigation pumping. Continued concentrated pumping in Golden Gate Park and the resulting depression of groundwater levels below sea level indicates a potential for seawater intrusion.

Increased water level elevations observed in all monitoring wells screened in the Primary Production and Deep aquifer within the coastal monitoring system for 2008 reinforces the goal for more sustainable and decentralized pumping at the SF Zoo and Golden Gate Park. This would allow previously depressed water levels to continue to rise and reduce the potential for sea water intrusion, and create more sustainable groundwater conditions in the North Westside Basin.

The coastal monitoring wells located at Fort Funston and Thornton Beach have groundwater elevations above sea level. The aquifers at these locations appear to be hydraulically separated from the main portion of the Westside Basin by faults and resultant steeply dipping geologic units, which act as hydraulic barriers to flow (LSCE, 2004). Groundwater elevations in the Fort Funston monitoring wells (Fort Funston –S and Fort Funston –M) continue to exhibit a generally increasing trend in the Upper Merced Formation and a virtually constant water level elevation in the Middle Merced Formation. Groundwater elevation monitoring at the Thornton Beach well MW 225 (screened in the Primary Production aquifer) and MW 670 (screened in the Deep aquifer) indicates that groundwater levels in both aquifers continue to rise in this area and remain well above sea level. Groundwater hydrographs for all wells monitored in 2008 are presented in Appendix A.

6.2 Bay Side Water Level Monitoring

Additional monitoring on the Bay Side of the Westside Basin was implemented by the City of San Bruno in 2006. In the fall of 2006, two new well clusters were installed and monitored by the City of San Bruno at locations in the San Francisco Airport (SFO) and within Burlingame (Figure 5). These wells were positioned to enhance monitoring of groundwater levels and water quality parameters along the San Francisco Bay side of the basin. Details of field activities, well installation activities and resulting monitoring in November 2006 and April 2007, were presented in “San Bruno Groundwater Monitoring Wells: Installation and Monitoring, An AB 303 Project Report”, prepared for the City of San Bruno by WRIME, Inc. and dated April 2007.

In February 2008, groundwater elevations were measured in the two monitoring well clusters: SFO (S and D) and Burlingame (S, M, and D). Groundwater elevations measured during this event in wells SFO-S and SFO-D were 2.29 and -29.18 feet (NAVD88), respectively. Groundwater elevations measured during this event in wells Burlingame (S, M, and D) were 3.37, 1.52, and -3.95 ft (NAVD88), respectively. Groundwater elevations measured during the August 2008 monitoring event in wells SFO-S and SFO-D were 1.78 and -30.07 ft (NAVD88), respectively. Groundwater elevations measured at wells Burlingame –S, M, and D during the August event; were 1.64, -0.82, and -4.65 ft (NAVD88), respectively. Fieldwork was conducted by WRIME Inc in accordance with the “San Bruno Seawater Intrusion Monitoring Wells: Sampling Plan”, prepared for the City of San Bruno by WRIME, Inc. dated April, 2007.

6.3 Lake Merced and Lake-Aquifer Monitoring

The water level elevations in Lake Merced in 2009 ranged from about 16.27 feet to 18.30 feet (NAVD88 datum). Lake levels are presented on Figure 20. Observed 2008 lake levels are fairly similar to observed levels in 2007, and continue to show a generally upward trend from seasonal low levels in 2002. These lake level elevations are above the 14 to 16 foot (NAVD88) interim lake level range established by the SFPUC.

Lake-aquifer monitoring around Lake Merced is accomplished by a combination of continuous and periodic monitoring of water levels in each of the three lake bodies, and by a combination of continuous and intermittent monitoring of groundwater levels in a network of dedicated monitoring wells around the lake complex, as illustrated in Figure 5.

Measured groundwater elevations in wells screened in the Shallow aquifer around the Lake. during the spring 2008 event, ranged from 13.34 feet (LMMW-9SS) to 29.31 ft above sea level (LMMW-7SS). For the fall 2008 event groundwater elevations ranged from 12.76 feet (LMMW-9SS) to 28.75 feet (LMMW-7SS). In the underlying Primary Production aquifer, groundwater elevations in the vicinity of Lake Merced ranged from -5.75 feet (LMMW-3D) to 14.63 feet (LMMW-2D) during the spring 2008 event. For the fall 2008 event, measured groundwater elevations in the Primary Production aquifer in the vicinity of Lake Merced ranged from -9.01 feet (LMMW-3D) to 13.48 feet (LMMW-2D).

For 2008, Shallow aquifer groundwater elevations around the Lake ranged from about 1.2 ft below to 12.7 ft above the interim Lake levels. Groundwater levels in the Primary Production aquifer around the lake ranged from about 23 ft below to 0.5 ft below the interim Lake levels. Groundwater elevations in the Primary Production aquifer were also in general lower than levels measured in the Shallow aquifer and the lake, indicative of a potential for flow from the Shallow aquifer-Lake system toward the underlying aquifer in which nearby production wells are primarily completed.

Hydrographs of two wells screened in the Shallow and Primary Production aquifers (LMMW-1S and LMMW-1D, respectively) that monitor groundwater elevations in the vicinity of Lake Merced are presented on Figure 12. Groundwater elevations in both aquifers continue to exhibit a generally upward trend from their 2002 levels. However groundwater levels in wells screened in the Primary Production and Deep Aquifer located near the southern portion of Lake Merced (e.g. LMMW-3D) decreased compared to 2007 values (Appendix A). This appears to be a result of increased and continued groundwater pumping by the City of Daly City.

6.4 South Westside Basin Water Level Monitoring

As part of the Westside Basin Monitoring Program, water levels in 9 wells screened in the Primary Production aquifer are typically monitored in the South Westside Basin. These wells were initially monitored by the San Mateo County Department of Environmental Health, starting in 2000. Since 2002 these wells have been monitored as part of the SFPUC's groundwater monitoring program. These wells consist of: LMMW-6D, DC 1 (Westlake), DC 8, and Park Plaza (MW-460) located in Daly City; SS1-02 and SS1-20 located in South San Francisco; SB-12 in San Bruno, and UAL 13C and UAL 13D located at the San Francisco International Airport. In 2006, two new well clusters (SFO and Burlingame) were installed by the City of San Bruno to fill data gaps in their own monitoring program. In the summer of 2007 SFPUC installed a monitoring well cluster consisting of 4 wells, at the South San Francisco Linear Park in South San Francisco.

In October 2008, SFPUC installed five new monitoring well clusters at the following locations:

- CUP-10A located within SFPUC Right of Way in Daly City;
- CUP-18 located within SFPUC Right of Way at Colma Blvd in Colma;
- CUP-19 located within SFPUC Right of Way at Serramonte Blvd in Colma;
- CUP-22A located within SFPUC Right of Way at Hickey Blvd at Camaritas Road, in South San Francisco; and
- CUP-36-1 located within SFPUC Right of Way at Southwood Drive in South San Francisco.

The five monitoring well clusters were completed at depths ranging from 151 to 710 feet bgs. These well clusters were installed as part of the Water System Improvement Program, Groundwater Conjunctive Use Project well installation and will be incorporated in the SFPUC's Westside Basin monitoring program. Permits, well construction details, lithologic logs and geophysical logs from these monitoring wells are presented in Appendix D.

Water level measurements for the wells screened within the Primary Production aquifer and monitored during the spring 2008 event [LMMW-6D, DC 1 (Westlake), Park Plaza MW-460, DC 8, SB-12, SS 1-02, and SSFLP MW-220] indicate that groundwater elevations were below sea level. Groundwater elevations ranged from -15.54 feet (LMMW-6D) to -185.23 feet (SB-12 Elm

Avenue) relative to mean sea level during the spring event. Groundwater elevation contours in the Primary Production aquifer for the spring 2008 event are presented on Figure 18. Groundwater elevations during the fall 2008 monitoring event indicate that elevations in these wells ranged from -19.84 feet (LMMW-6D) to –194.94 feet (SB-12 Elm Avenue). Groundwater elevation contours in the Primary Production aquifer for the fall 2008 event are presented on Figure 19. Groundwater elevation hydrographs for all the wells monitored during the spring and fall 2008 events are presented in Appendix A.

7.0 GROUNDWATER QUALITY MONITORING

Groundwater quality data for the Westside Basin are primarily from a combination of historical water quality analyses, mostly from municipal supply wells, and from the semi-annual monitoring program that was initiated throughout the basin in May 2000. The program has expanded to include additional wells as they have been constructed. Program wells are illustrated in Figure 21 and listed in Table 5, and they reflect the location of both production and dedicated monitoring wells. Results of groundwater quality monitoring in 2008 are presented below.

7.1 Coastal Groundwater Quality

Monitoring of groundwater levels and groundwater quality at the coastal monitoring wells located along the Great Highway near Kirkham, Ortega, and Taraval streets, and at the San Francisco Zoo, as well as in the southwestern portion of Golden Gate Park, is conducted to detect the potential for seawater intrusion. Groundwater samples from these wells were tested for specific conductance, total dissolved solids (TDS) and chloride in the spring and fall 2008. Results of groundwater quality testing for the coastal monitoring wells are presented in Table 6. Chloride concentrations and groundwater elevations in 2008, as well as records since the inception of coastal monitoring (2004), are plotted on hydrographs presented in Figures 6 through 9.

Chloride concentrations for 2008 ranged from 19 mg/l (SF#32-Ortega MW400) to 178 mg/l (SF#57-USGS South Windmill MW-57). Detected chloride concentrations in the coastal monitoring wells generally ranged from 19 mg/l to 69 mg/l, with the exception of the SF#57-USGS South Windmill MW-57, which had concentrations of 150 mg/l (spring 2008) and 178 mg/l (fall 2008). For the shallow coastal wells (screened between 50 to 150 feet), chloride concentrations ranged from 30 mg/l (SF#30-Grt Hyw/Ortega MW-125) to 178 mg/l (SF#57-USGS South Windmill MW-57) (Table 6).

The chloride concentrations measured in 2008 are within historical ranges at all the wells sampled, except for the USGS South Windmill MW-57 well. All chloride concentrations are below the state of California secondary drinking water standard of 250 mg/l and are also well below 500 mg/l, a commonly referenced concentration indicative of seawater intrusion. Although groundwater levels continue to be depressed below sea level in the deeper part of the aquifer system and chloride concentrations at the Zoo, and the USGS South Windmill MW-140 well located in the southwestern portion of Golden Gate Park are slightly higher than the other monitoring locations along the coast, none appear to be suggestive of seawater intrusion at the present time. The total dissolved solids (TDS) concentrations and specific conductance values in these wells are all within historical ranges and below established secondary drinking water standards.

The chloride, TDS and specific conductance values in the USGS South Windmill MW-57 well show an increase in concentration that may be an early indication of seawater intrusion. Efforts are underway between the SFPUC and the SF Recreation and Park Department to develop a recycled water supply for Golden Gate Park, and to distribute groundwater pumping further away from the coast.

7.2 General Basin Conditions

Groundwater quality is monitored in a network of production and monitoring wells as described above and illustrated in Figure 21. Groundwater samples were collected from wells used to assess general basin conditions in the spring (April, May, and June) 2008. The analytical results are summarized in Tables 7 and 8. With the exception of nitrate (as $N0_3$) concentrations detected in DC#01 - A St (Daly City) and one of the South San Francisco wells SS#08 - SS 1-19, groundwater quality generally meets the maximum contaminant levels (MCLs) of primary drinking water standards set by California Department of Public Health.

The South San Francisco Linear Park (SSFLP) wells (MW-120, 220, 440, and 520) were sampled and analyzed for iron and manganese in the spring and fall 2008. Detected total iron concentrations ranged from 0.013 mg/l (SSFLP MW-520) to 0.161 mg/l (SSFLP MW-120), while detected total manganese concentrations ranged from 0.147 mg/l (SSFLP MW-220) to 0.825 mg/l (SSFLP MW-120). In addition groundwater samples from the well cluster at the South San Francisco Linear Park were tested for dissolved iron and manganese. Detected dissolved iron concentrations ranged from 0.005 (SSFLP MW-520) to 0.063 mg/l (SSFLP MW-120). Detected dissolved manganese concentrations at these wells ranged from 0.139 mg/l (SSFLP MW-220) to 0.805 mg/l (SSFLP MW-120). Detected concentrations of total and dissolved manganese in these wells exceed the secondary MCL of 0.05 mg/l. Detected iron and manganese concentrations are summarized on Table 8.

The 2008 water quality results for specific conductance, TDS, and chloride for Daly City well (DC#11 – Westlake DC2), South San Francisco well SS#08 - SS 1-19 , and San Bruno well SB#06 - SB-17 Corporation Yard are combined with available historical data and illustrated in Figures 22 through 24, respectively. South San Francisco well SS#05 – SS 1-14, which is typically sampled as part of the monitoring program, was offline. Production well SS#08 – SS 1-19 located within the same well field was sampled instead. Results from this well have been appended to the historical data available from SS 1-14 and are presented in Figure 23 and 25. The 2008 and historical nitrate data for the above wells and the Vale well (Daly City) are illustrated in Figure 25.

7.2.1 City of Daly City

In Daly City, the available data extend back to the mid 1970's (Table 7 and Figures 22 and 25), but are too sporadic to derive any substantive conclusions about trends or changes. During the spring 2008 monitoring event, detected nitrate concentrations ranged from 10 mg/l in DC#06 - Jefferson to 131 mg/l in DC#01 - A St. Nitrate concentrations in DC#01 - A St exceeded the primary MCL of 45 mg/l. With the exception of well DC#06- Jefferson, which remained essentially unchanged (from 9.4 to 10 mg/l), detected nitrate concentrations decreased slightly with respect to the 2007 sampling results in three of the four wells sampled during this event. Specific conductance increased slightly in three of the four wells sampled compared to 2007 levels. Chloride concentrations ranged from 56 mg/l (DC#06-Jefferson) to 122 mg/l (DC#11 Westlake DC 2). Except for DC#06- Jefferson, which showed a decrease from 80 to 56 mg/l, detected chloride concentrations increased slightly in all of the Daly City wells sampled during this event. Ongoing monitoring will delineate whether the recent data are indicative of changing, temporary, or anomalous conditions in that area. The monitoring program will continue to examine these trends in subsequent events.

7.2.2 City of South San Francisco

For the South San Francisco area, records from Cal Water date back to the late 1950's (Table 7 and Figures 23 and 25). Chloride concentrations for the spring 2008 monitoring event ranged from 63 mg/l (SSFLP 440) to 176 mg/l (SSFLP 120). Chloride concentrations in the South San Francisco area, have consistently been higher than elsewhere in the basin. Historically specific conductance and TDS concentrations in well SS#05 SS 1-14 have fluctuated more than chloride and appeared to exhibit a generally upward trend since the 2000 monitoring event. During the 2008 spring monitoring event, wells SS#05-SS1-14, and SS#10-SS1-21 were undergoing repair and consequently were not sampled. Two other production wells SS #08-SS 1-19 and SS #09-SS 1-20 located in the same well field, were sampled in their place. The specific conductance at the two production wells sampled in South San Francisco during the spring 2008 monitoring event was 993 µmhos/cm (SS#08 – SS 1-19) and 863 µmhos/cm (SS#09 – SS 1-20). Analysis detected 47 mg/l (SS#08 – SS 1-19) and 35 mg/l (SS#09 – SS 1-20) of nitrate respectively. The detected nitrate concentration at well SS#08 – SS 1-19 is slightly above the primary MCL of 45 mg/l (Table 7). Ongoing monitoring will delineate whether the recent data are indicative of changing, temporary, or anomalous conditions in that area.

7.2.3 City of San Bruno

In San Bruno, available groundwater quality data extend back to 2000 (Table 7, Figures 24 and 25). Interpretation of the records since 2000 (Figure 24) suggests fairly constant conditions. For 2008, chloride concentrations were 57 mg/l and 84 mg/l at SB 17 Corporation Yard and SB 20

Lions Field Park, respectively. Reported chloride concentrations increased slightly at the SB-17 well and decreased at the Lions Field Park well, but remained within historical ranges. The nitrate concentrations were 6 mg/l and 1 mg/l in SB-17 and SB 20, respectively. Detected nitrate concentrations in the two wells sampled during the spring 2008 event are well below the primary MCL of 45 mg/l (Table 7 and Figure 25). At present, we understand that the City of San Bruno is treating groundwater pumped from well SB#08 - SB 20 for manganese.

As part of the City of San Bruno's Bay side monitoring program, the two well clusters installed in 2006 were sampled by WRIME, Inc in August 2008. A summary of chemical testing results was provided by WRIME Inc on behalf of the City of San Bruno (Figure 7). Chloride concentrations and groundwater elevations beginning in 2006 for the Burlingame and SFO wells are plotted on hydrographs presented in Figures 10 and 11 respectively.

7.3 Recycled Water

The initiation of recycled water deliveries in 2004 for golf course irrigation around Lake Merced, which resulted in meeting about most of irrigation demand at the private courses in 2008, had raised a question regarding potential impact of recycled water application on the underlying groundwater. Initial evaluation of this question in 2005 consisted of a comparison between recycled water quality and background (current) groundwater quality in monitoring wells near the golf courses. Groundwater monitoring of these four wells continued in 2008. Available data on recycled water quality collected in 2005, and nearby dedicated monitoring wells sampled at least annually between 2004 and 2008, are presented in Table 9. Based on comparison of those data, the water quality of recycled water and groundwater is sufficiently similar that no substantial change in groundwater quality would appear to be expected as a result of recycled water application. For the available data, constituent concentrations in the recycled water are within, or slightly higher than, those in the underlying groundwater (Table 9). Ongoing monitoring of recycled water quality and underlying groundwater will permit interpretation of changes that may occur in the future.

8.0 SUMMARY AND PROPOSED ACTIVITIES FOR 2009

This report is the annual report on groundwater conditions in the Westside Basin, prepared by the SFPUC in cooperation with Daly City, San Bruno, and Cal Water (cooperating agencies).

8.1 Groundwater Monitoring

The groundwater monitoring and reporting program will continue to be implemented in accordance with the recommendations presented in the 2005 annual report (LSCE, 2006). Semi annual sampling and various water level measurements will be conducted in 2009 to assess general groundwater conditions in the Westside Basin, as well as to continue to evaluate the adequacy of the entire program. In 2009, the cooperating agencies will assess the need for expanding the monitoring program within the southern part of the Basin, and continue to incorporate water level elevation and water quality data from any future wells installed within these jurisdictions (e.g. the five new well clusters installed in October 2008 in the southern portion of the basin as part of the Conjunctive Use Project). The scope and frequency of the groundwater monitoring program are presented on Tables 10 and 11.

8.2 Coastal Monitoring

Continued semi-annual monitoring of coastal water quality (primarily TDS, specific conductance, and chloride) conducted during the spring and fall (Table 11) will be coupled with quarterly-to-daily water level measurements from the existing coastal monitoring well locations (Table 10).

8.3 Lake Merced

For 2009 the existing monitoring program at Lake Merced will be continued, with collection of lake level data from South Lake and Impound Lake in accordance with recommendations of the 2005 annual report. Groundwater measurements will be recorded daily and quarterly in accordance with the current program (Table 10). More frequent measurements may be appropriate as part of any artificial water additions to the lake or aquifer hydraulic testing. Such changes will be implemented as necessary.

8.4 General Basin Conditions and In-Lieu Conjunctive Use Program

The SFPUC will continue to monitor daily water levels of key wells in the Daly City, South San Francisco, and San Bruno areas (Table 10), along with annual water quality monitoring (Table 11). In the southern portion of the Westside Basin, there remains a need for quantification of pumping at the cemeteries in Colma and at the California Country Club, to complete the current understanding of significant pumping in the Westside Basin.

8.5 Recycled Water Program

SFPUC will continue monitoring recycled water quality and groundwater quality in the areas of recycled water use on an annual basis (Table 11). Although initial data show recycled water quality and groundwater quality to be fairly similar, continued monitoring will provide data to evaluate whether any trends develop as a result of the use of recycled water for irrigation purposes. For 2009, we will add testing for nitrate as $N0_3$ to the monitoring of groundwater quality in areas of planned recycled water use (e.g. LMMW -2S and LMMW-2D located at the Harding Park Golf Course in San Francisco).

8.6 Bay Side Monitoring

The City of San Bruno will continue to monitor the Bay Side wells in the southeastern portion of the Westside Basin on a semi-annual basis, in general accordance with the Westside Basin monitoring program and transmit this data to the SFPUC for inclusion in the annual groundwater monitoring reports.

APPENDIX B SFPUC AGENDA ITEM FOR APPROVAL OF THE WATER SYSTEM IMPROVEMENT PROJECT OCTOBER 31, 2008

AGENDA ITEM
Public Utilities Commission
City and County of San Francisco

DEPARTMENT Water Enterprise AGENDA NO. __________

MEETING DATE October 30, 2008

SUMMARY OF PROPOSED COMMISSION ACTION

Approve the Phased Water System Improvement Program (Phased WSIP) Goals and Objectives and **Adopt** California Environmental Quality Act (CEQA) Findings, including a statement of overriding considerations and the Mitigation Monitoring and Reporting Program (MMRP).

DESCRIPTION OF ACTION

Program Approval

The Phased WSIP is a variant of the originally proposed WSIP and includes full implementation of the WSIP facility projects to ensure that the public health, water quality, seismic safety, and delivery reliability goals are achieved, with phased implementation of the water supply portion of the program. Under the Phased WSIP, the SFPUC will establish an interim, mid-term implementation horizon of 2018. The Phased WSIP includes water supply delivery to wholesale and retail customers through 2018.

The Phased WSIP goals and objectives are founded on two fundamental principles pertaining to the existing regional water system: (1) maintain a clean, unfiltered water source from the Hetch Hetchy system and (2) maintain a gravity-driven system.

The overall goals of the Phased WSIP for the regional water system are to:

- Maintain high-quality water and a gravity-driven system
- Reduce vulnerability to earthquakes
- Increase delivery reliability
- Meet customer water supply needs
- Enhance sustainability
- Achieve a cost-effective, fully operational system

APPROVAL:

PERFORMING ORGANISATION		FINANCE	Todd Rydstrom
COMMISSION SECRETARY	Michael Housh	GENERAL MANAGER	Ed Harrington

A table presenting the Phased WSIP goals and objectives as they relate to the program goals is included in the Resolution for this action. The system performance objectives describe and, in some cases, more specifically quantify, what the regional water system proposes to achieve under the Phased WSIP. The performance objectives guide the water supply actions, facility improvements, operations, and maintenance requirements included in the Phased WSIP.

To meet the program goals and objectives the Phased WSIP includes the following program elements:

- Full implementation of WSIP facility improvement projects.
- Water supply delivery to regional water system customers through 2018 with an average annual target delivery of 265 mgd originating from the watersheds. This includes 81 mgd for the retail customers and 184 mgd for the wholesale customers.
- Water supply sources include: 265 mgd average annual delivery from the Tuolumne River watershed and the local watersheds plus 20 mgd of conservation, recycled water, and groundwater developed in the service area (10 mgd retail; 10 mgd wholesale).
- Implementation of delivery and drought reliability elements of the WSIP, including dry-year water transfers coupled with the Westside Groundwater Basin Conjunctive Use project, will meet the drought-year goal of limiting rationing to no more than 20 percent on a systemwide basis.
- Reevaluation of 2030 demand projections, potential regional system demand (purchase requests), and water supply options by 2018, and SFPUC decision in 2018 regarding regional water system deliveries after 2018.
- Financial incentives to limit water sales to an average annual amount of 265 mgd from the SFPUC watersheds.

Adoption of CEQA Findings

The City Planning Department prepared and the Planning Commission will be asked to certify on October 30, 2008, a Program Environmental Impact Report (PEIR) for the WSIP as required under CEQA, the CEQA Guidelines and Chapter 31 of the San Francisco Administrative Code. In order to comply with CEQA requirements, as part of the approval of the WSIP, the Commission must adopt the CEQA Findings, including a statement of overriding considerations, and the MMRP, attached to the Resolution as Attachments A and B, respectively.

The Final PEIR (consisting of the Draft PEIR and the Comments and Responses document) identified potentially significant impacts resulting from water supply and system operations and construction of WSIP facility improvement projects. The potentially significant impacts that would result from implementation of the recommended Program, or the "Phased WSIP" are described in Chapter 13 of the Final PEIR and are included in the Findings. The Final PEIR identified mitigation measures to substantially reduce or eliminate many of the significant impacts identified in the PEIR. The CEQA Findings provide for adoption of the mitigation measures by the SFPUC and the MMRP provides information and allocates responsibility for implementing all of the mitigation measures proposed in the Final PEIR for the Phased WSIP.

Significant and unavoidable impacts are described in Section IV of the CEQA Findings attached to the Commission Resolution as Attachment A. Therefore, this Commission will need to adopt a Statement of Overriding Considerations, included in the CEQA Findings Section VI, explaining why the Commission has decided to approve the Phased WSIP notwithstanding these significant and unavoidable environmental impacts.

RECOMENDATION

SFPUC staff recommends that the Commission approve the Phased WSIP Goals and Objectives and adopt the CEQA Findings, including the statement of overriding considerations, and the MMRP.

CONTEXT OF THIS ACTION

The SFPUC began development of the Water System Improvement Program (WSIP) in the late 1990's through a series of studies, reports, and authorizations. In 1998, the SFPUC initiated a water supply planning effort, culminating in the Water Supply Master Plan (WSMP), issued in April 2000. The WSMP recommended a water resource strategy of demand management, facilities improvements, and development of additional supplies. Concurrent with the WSMP efforts, reliability studies of the water system facilities were performed to assess their vulnerability to earthquakes, landslides, fire, flood, and power outages.

These efforts led to the preparation of a Long-Term Strategic Plan for Capital Improvements, a Long-Range Financial Plan, and a Capital Improvement Program, approved and adopted by the San Francisco Public Utilities Commission on May 28, 2002 under Resolution No. 02-0101. The Capital Improvement Program identified 37 regional water system projects and 40 local (in-City) projects. The resolution authorized and directed the General Manager (GM) of the SFPUC to proceed with development and implementation of the strategic and financial plans, as well as the capital improvement program with such additions or changes as the GM and Commission deemed necessary or desirable.

Planning efforts for the Water System Improvement Program gained momentum in 2002 with the passage of Propositions A and E, San Francisco ballot measures that approved financing for water system improvements and long-term stewardship of the public utilities. Specifically, Proposition A was a revenue bond authorizing the City of San Francisco to borrow money to pay for improvements to its water system. The improvements cited in the bond measure included: upgrading and retrofitting the system's infrastructure against earthquake damage; upgrading the regional system's ability to store and convey water to the Bay Area; ensuring future water quality standards are met; and increasing water system capacity.

Proposition E was a charter amendment related to Proposition A that reinforced the SFPUC's charge to rehabilitate the aging water system in order to ensure reliable water delivery in the future and provided the agency the ability to finance the improvements. Proposition E's goals and objectives included clauses maintaining SFPUC's stewardship of the system as well as the requirements to provide reliable water, optimize the system's ability to withstand disasters, and improve drinking water quality. In addition, the charter amendment required the development of long-term capital, financial, and strategic plans to ensure accountability by the SFPUC, ensuring that the utility is being operated efficiently in accordance with best public utility practices. Prior to the ballot measures, the SFPUC prepared long-term capital, financial, and strategic plans, which were adopted on May 28, 2002. These initiatives provided the impetus to move the WSIP forward, founding the system performance objectives in the water system reliability requirements of Proposition E.

Also in 2002, the state legislature approved three bills reflecting wholesale customer concerns over risk of failure of the water system in a major earthquake. Governor Davis approved these bills in September of 2002, including Assembly Bill No. 1823, the Wholesale Regional Water System Security and Reliability Act.

Additional studies refined the scope and magnitude of the Water System Improvement Program since completion of the WSMP. A November 2004 technical report on wholesale customer water demand projections updated 2030 planning horizon demands. A 2004 analysis of system performance under various operating conditions also assessed the effectiveness of the proposed regional water projects to meet program objectives. Concurrently, development of a draft regional operational strategy/principles document delineated current and future system operating goals, constraints, and strategies.

From October 2004 to January 2005, the Commission held a series of public workshops to present these studies. At the final workshop the Commission provided direction on system performance objectives for the program. Based upon the system performance objectives the scope, schedule, and budget of the program were refined, allowing the San Francisco Public Utilities Commission (SFPUC) to provide a description of the Water System Improvement Program. On February 28, 2005, the SFPUC endorsed the WSIP.

Subsequently, the San Francisco Planning Department prepared the PEIR to evaluate the potential environmental effects of the WSIP pursuant to and in accordance with California Public Resources Code Sections 21000 et. Seq. (CEQA), Title 14 of the California Code of Regulations Sections 15000 et. seq. (CEQA Guidelines) and the provisions of Chapter 31 of the San Francisco Administrative Code. Attachment A to the Commission's Resolution approving the Program contains detailed information about the CEQA process and preparation of the PEIR.

During the environmental review process, the SFPUC and the Planning Department received many comments expressing strong concern about, and opposition to, a decision now to divert more water from the SFPUC watersheds. The SFPUC staff considered carefully those concerns and the long term needs of the water system, including the customers' needs as well as protection of natural resources. In order to accomplish urgently needed physical rehabilitation and maintenance of the system and to improve asset management and delivery reliability now, the SFPUC staff recommends immediate implementation of all of the WSIP facility improvement projects. In order to carefully consider the long term decision of whether to divert more water from the watersheds, the SFPUC staff believes that the water supply decision should now be a limited one for the next 10 years and then the SFPUC will reconsider the long term water supply decision by 2018. In the next 10 years, the SFPUC will explore and develop other water supply options, including conservation, recycling and groundwater programs.

The Phased WSIP Variant facility improvement projects remain the same irrespective of the water supply decision now and in 2018. To meet the system performance objectives for water quality, seismic reliability and delivery reliability, the SFPUC must implement the Phased WSIP Variant facility improvement projects that provide physical system capacities to meet the performance objectives. Design of WSIP project facilities is driven by all four of the program goals -- the need to improve system performance for seismic reliability and water delivery reliability as well as maintaining high water quality standards and meeting water supply goals. All four of these goals are factored in to the decision on how to size the WSIP's individual facilities. The SFPUC must move forward with the WSIP facilities as proposed, to meet average demand of up to 300 mgd, in order to improve seismic and water delivery reliability, meet current and future water quality regulations, provide for additional system conveyance for maintenance and meet water supply reliability goals for year 2030 and possibly beyond. The SFPUC must consider current needs as well as possible future changes and unplanned outages and design a system that achieves a balance among the numerous objectives, functions and risks a water supplier must face.

The Phased WSIP Variant also includes implementation of delivery and drought reliability elements of the WSIP, including dry-year water transfers coupled with the Westside Groundwater Basin Conjunctive Use project, to meet the drought-year goal of limiting rationing to no more than 20 percent on a systemwide basis. While average annual deliveries from the SFPUC watersheds would be limited to 265 mgd such that there would be no increase in diversions from the Tuolumne River to serve additional demand, there would be a small increase in average annual Tuolumne River diversions of about 2 mgd over existing conditions in order to meet the delivery and drought reliability elements through 2018.

PUBLIC UTILITIES COMMISSION

City and County of San Francisco

RESOLUTION NO. ____________________

WHEREAS, the San Francisco Public Utilities Commission approved and adopted a Long-Term Strategic Plan for Capital Improvements, a Long-Range Financial Plan, and a Capital Improvement Program on May 28, 2002 under Resolution No. 02-0101; and

WHEREAS, the San Francisco Public Utilities Commission determined the need for the Water System Improvement Program (WSIP) to address water system deficiencies including aging infrastructure, exposure to seismic and other hazards, maintaining water quality, improving asset management and delivery reliability, and meeting customer demands; and

WHEREAS, Propositions A and E passed in November 2002 by San Francisco voters and Assembly Bill No. 1823 was also approved in 2002 requiring the City and County of San Francisco to adopt a capital improvement program designed to restore and improve the regional water system; and

WHEREAS, the San Francisco Public Utilities Commission staff developed a variant to the WSIP referred to as the Phased WSIP; and

WHEREAS, the two fundamental principles of the program are 1) maintaining a clean, unfiltered water source from the Hetch Hetchy system, and 2) maintaining a gravity-driven system; and

WHEREAS, the overall goals of the Phased WSIP for the regional water system include 1) Maintaining high-quality water and a gravity-driven system, 2) Reducing vulnerability to earthquakes, 3) Increasing delivery reliability, 4) Meeting customer water supply needs, 5) Enhancing sustainability, and 6) Achieving a cost-effective, fully operational system; and

WHEREAS, on October 30, 2008, the Planning Commission reviewed and considered the Final Program Environmental Impact Report (PEIR) in Planning Department File No. 2005.0159E, consisting of the Draft PEIR and the Comments and Responses document, and found that the contents of said report and the procedures through which the Final PEIR was prepared, publicized and reviewed complied with the provisions of the California Environmental Quality Act (CEQA), the CEQA Guidelines and Chapter 31 of the San Francisco Administrative Code ("Chapter 31") and found further that the Final PEIR reflects the independent judgment and analysis of the City and County of San Francisco, is adequate, accurate and objective, and that the Comments and Responses document contains no significant revisions to the Draft PEIR, and certified the completion of said Final PEIR in compliance with CEQA, the CEQA Guidelines and Chapter 31 in its Motion No. _____; and

WHEREAS, this Commission has reviewed and considered the information contained in the Final PEIR, all written and oral information provided by the Planning

Department, the public, relevant public agencies, SFPUC and other experts and the administrative files for the WSIP and the PEIR; and

WHEREAS, the WSIP and Final PEIR files have been made available for review by the San Francisco Public Utilities Commission and the public, and those files are part of the record before this Commission; and

WHEREAS, San Francisco Public Utilities Commission staff prepared proposed findings, as required by CEQA, (CEQA Findings) and a proposed Mitigation, Monitoring and Reporting Program (MMRP), which material was made available to the public and the Commission for the Commission's review, consideration and action; and

WHEREAS, the Phased WSIP includes the following program elements: 1) full implementation of all WSIP facility improvement projects; 2) water supply delivery to regional water system customers through 2018; 3) water supply sources (265 million gallons per day (mgd) average annual from SFPUC watersheds, 10 mgd conservation, recycled water, groundwater in San Francisco, and 10 mgd conservation, recycled water, groundwater in the wholesale service area); 4) dry-year water transfers coupled with the Westside Groundwater Basin Conjunctive Use project to ensure drought reliability; 5) re-evaluation of 2030 demand projections, regional water system purchase requests, and water supply options by 2018 and a separate SFPUC decision by 2018 regarding water deliveries after 2018; and, 6) provision of financial incentives to limit water sales to an average annual 265 mgd from the SFPUC watersheds through 2018; and

WHEREAS, the SFPUC staff has recommended that this Commission make a water supply decision only through 2018, limiting water sales from the SFPUC watersheds to an average annual of 265 mgd; and

WHEREAS, before 2018, the SFPUC would engage in a new planning process to re-evaluate water system demands and water supply options. As part of the process, the City would conduct additional environmental studies and CEQA review as appropriate to address the SFPUC's recommendation regarding water supply and proposed water system deliveries after 2018; and

WHEREAS, by 2018, this Commission will consider and evaluate a long-term water supply decision that contemplates deliveries beyond 2018 through a public process; and

WHEREAS, the SFPUC must consider current needs as well as possible future changes, and design a system that achieves a balance among the numerous objectives, functions and risks a water supplier must face, including possible increased demand in the future; now, therefore, be it

RESOLVED, this Commission hereby adopts the CEQA Findings, including the Statement of Overriding Considerations, attached to this Resolution as Attachment A and incorporated herein as part of this Resolution by this reference thereto, and adopts the Mitigation Monitoring and Reporting Program attached to this Resolution as Attachment B and incorporated herein as part of this Resolution by this reference thereto; and, be it

FURTHER RESOLVED, this Commission hereby approves a water system improvement program that would limit sales to an average annual of 265 mgd from the watersheds through 2018, and the SFPUC and the wholesale customers would collectively develop 20 mgd in conservation, recycled water, and groundwater to meet demand in 2018, which includes 10 mgd of conservation, recycled water, and groundwater to be developed by the SFPUC in San Francisco, and 10 mgd to be developed by the wholesale customers in the wholesale service area; and, be it

FURTHER RESOLVED, As part of the Phased WSIP, this Commission hereby approves implementation of delivery and drought reliability elements of the WSIP, including dry-year water transfers coupled with the Westside Groundwater Basin Conjunctive Use project, which meets the drought-year goal of limiting rationing to no more than 20 percent on a system-wide basis; and, be it

FURTHER RESOLVED, This Commission hereby approves the Phased Water System Improvement Program, which includes seismic and delivery reliability goals that apply to the design of system components to improve seismic and water delivery reliability, meet current and future water quality regulations, provide for additional system conveyance for maintenance and meet water supply reliability goals for year 2018 and possibly beyond; and, be it

FURTHER RESOLVED, This Commission hereby approves the following goals and objectives for the Phased Water System Improvement Program:

Phased WSIP GOALS AND OBJECTIVES

Program Goal	System Performance Objective
Water Quality – *maintain high water quality*	• Design improvements to meet current and foreseeable future federal and state water quality requirements. • Provide clean, unfiltered water originating from Hetch Hetchy Reservoir and filtered water from local watersheds. • Continue to implement watershed protection measures.
Seismic Reliability – *reduce vulnerability to earthquakes*	• Design improvements to meet current seismic standards. • Deliver basic service to the three regions in the service area (East/ South Bay, Peninsula, and San Francisco) within 24 hours after a major earthquake. Basic service is defined as average winter-month usage, and the performance objective for design of the regional system is 229 mgd. The performance objective is to provide delivery to at least 70 percent of the turnouts in each region, with 104, 44, and 81 mgd delivered to the East/South Bay, Peninsula, and San Francisco, respectively. • Restore facilities to meet average-day demand of up to 300 mgd within 30 days after a major earthquake.

Program Goal	System Performance Objective
Delivery Reliability – *increase delivery reliability and improve ability to maintain the system*	• Provide operational flexibility to allow planned maintenance shutdown of individual facilities without interrupting customer service. • Provide operational flexibility to minimize the risk of service interruption due to unplanned facility upsets or outages. • Provide operational flexibility and system capacity to replenish local reservoirs as needed. • Meet the estimated average annual demand of up to 300 mgd under the conditions of one planned shutdown of a major facility for maintenance concurrent with one unplanned facility outage due to a natural disaster, emergency, or facility failure/upset.
Water Supply – *meet customer water needs in non-drought and drought periods*	• Meet average annual water demand of 265 mgd from the SFPUC watersheds for retail and wholesale customers during non -drought years for system demands through 2018. • Meet dry-year delivery needs through 2018 while limiting rationing to a maximum 20 percent system-wide reduction in water service during extended droughts. • Diversify water supply options during non-drought and drought periods. • Improve use of new water sources and drought management, including groundwater, recycled water, conservation, and transfers.
Sustainability – *enhance sustainability in all system activities*	• Manage natural resources and physical systems to protect watershed ecosystems. • Meet, at a minimum, all current and anticipated legal requirements for protection of fish and wildlife habitat. • Manage natural resources and physical systems to protect public health and safety
Cost-effectiveness – *achieve a cost-effective, fully operational system*	• Ensure cost-effective use of funds. • Maintain gravity-driven system. • Implement regular inspection and maintenance program for all facilities.

And, be it

FURTHER RESOLVED, This Commission authorizes and directs SFPUC staff to design and develop WSIP facility improvement projects consistent with the Phased WSIP Goals and Objectives.

I hereby certify that the foregoing resolution was adopted by the Public Utilities Commission at its meeting of October 30, 2008

S.1 Introduction and Purpose of the PEIR (Chapter 1)

The San Francisco Public Utilities Commission (SFPUC) proposes to adopt and implement the Water System Improvement Program (WSIP or proposed program) to increase the reliability of the regional water system that serves 2.4 million people in San Francisco and the San Francisco Bay Area. The WSIP would improve the regional system with respect to water quality, seismic response, water delivery, and water supply to meet water delivery needs in the service area through the year 2030 and would establish level of service goals and system performance objectives. The WSIP would implement a proposed water supply option, modify system operations, and construct a series of facility improvement projects. The proposed program area spans seven counties—Tuolumne, Stanislaus, San Joaquin, Alameda, Santa Clara, San Mateo, and San Francisco.

The San Francisco Planning Department, Major Environmental Analysis (MEA) Division, determined that implementation of the WSIP could have a significant effect on the environment and therefore required preparation of a Program Environmental Impact Report (PEIR) in compliance with the California Environmental Quality Act (CEQA). This PEIR is intended to provide the public and responsible and trustee agencies with information about the potentially significant environmental effects of the proposed program, to identify possible ways to minimize the potentially significant effects, and to describe and evaluate feasible alternatives to the proposed program.

S.2 Program Description (Chapter 3)

Need for and Objectives of the Program

The City and County of San Francisco (CCSF), through the SFPUC, owns and operates a regional water system that extends from the Sierra Nevada to San Francisco and serves retail and wholesale customers in San Francisco, San Mateo, Santa Clara, Alameda, and Tuolumne Counties. The existing regional system includes over 280 miles of pipelines, over 60 miles of tunnels, 11 reservoirs, 5 pump stations, and 2 water treatment plants. The SFPUC currently delivers an annual average of about 265 million gallons per day (mgd) of water to its customers. The source of the water supply is a combination of local supplies from streamflow and runoff in the Alameda Creek watershed and in the San Mateo and Pilarcitos Creeks watersheds (referred to together as the Peninsula watersheds), augmented with imported supplies from the Tuolumne River watershed. Local watersheds provide about 15 percent of total supplies and the Tuolumne River provides the remaining 85 percent. **Figure S.1** shows the general location of the SFPUC regional system and water supply watersheds.

The SFPUC serves about one-third of its water supplies directly to retail customers, primarily in San Francisco, and about two-thirds of its water supplies to wholesale customers by contractual agreement. The wholesale customers are largely represented by the Bay Area Water Supply and Conservation Agency (BAWSCA), which consists of 27 total customers, shown in **Figure S.2**. Some of these wholesale customers have other sources of water in addition to what they receive from the SFPUC regional system, while others rely completely on the SFPUC for supply.

While the SFPUC has historically met and is currently serving its customers' water demands, there are numerous factors contributing to the need for a comprehensive, systemwide program such as the WSIP. In order to continue to provide reliable water service to its customers, the SFPUC must plan for the future as well as address existing, known deficiencies, including the following:

- *Aging Infrastructure*. Many of the components of the SFPUC regional water system were built in the 1800s and early 1900s. As the system ages, its reliability decreases and the risk of failure increases.

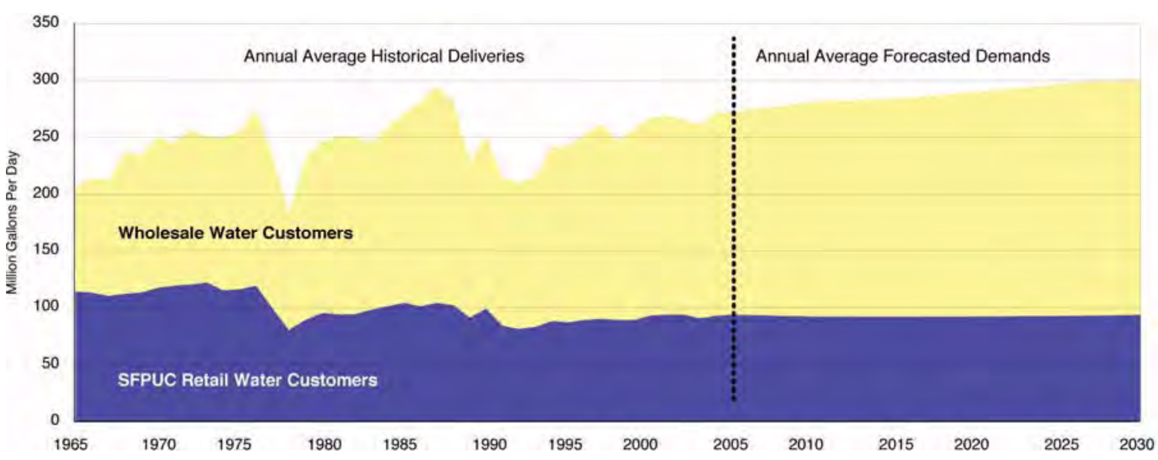
Figure S.2
SFPUC Water Service Area -
San Francisco and SFPUC Wholesale Customers

- *Exposure to Seismic and Other Hazards*. The system crosses five active earthquake faults, and many of the existing facilities do not meet modern seismic standards. The California Division of Safety of Dams (DSOD) imposed operating restrictions on two of the system's reservoirs, Calaveras and Lower Crystal Springs Reservoirs, due to seismic and flood control safety hazards, respectively. The restricted operations at these reservoirs reduce local storage capacity and impair normal system operations.

- *Water Quality*. The regional system currently meets or exceeds existing water quality standards. However, system upgrades are needed to improve the SFPUC's ability to maintain compliance with current water quality standards and to meet anticipated future water quality standards.

- *Delivery Reliability*. The system requires additional redundancy (i.e., backup) of some critical facilities to ensure sufficient operational flexibility to carry out adequate system inspection and maintenance and to be adequately prepared in the event of an earthquake, system failure, or other emergency. These critical facilities are necessary to meeting day-to-day customer water supply needs, and increased operational flexibility is needed in order to maintain service to all customers during a full range of operating conditions.

- *Customer Water Demand*. The regional system currently has insufficient water supply to meet customer demand during a prolonged drought, and this situation will worsen in the future without the WSIP. Additional supplies are needed to satisfy current demand in drought years as well as to meet future demand. Water demand among SFPUC retail and wholesale customers is projected to increase over the next 25 years, from an average annual demand of about 366 mgd to 417 mgd in 2030. Of this total projected demand in the SFPUC service area, retail and wholesale customers would purchase an annual average of about 300 mgd from the SFPUC system in 2030, compared to 265 mgd in 2005, as shown in **Figure S.3**. Thus, the SFPUC would need to provide additional water supplies to serve a projected average annual increase in purchase requests of 35 mgd by 2030.



SFPUC Water System Improvement Program ■ 203287

SOURCE: SFPUC, 2007b

Figure S.3
Annual Average Historical and
Projected Future Customer Purchase Requests

To address these challenges, the SFPUC must replace or upgrade numerous system facilities, add some new facilities, and expand its water supply portfolio—thus the need for the WSIP. In 2005, the SFPUC developed goals and objectives for the WSIP based on a planning horizon through 2030. The goals and objectives are founded on two fundamental principles pertaining to the existing regional water system: (1) maintaining a clean, unfiltered water source from the Hetch Hetchy system, and (2) maintaining a gravity-driven system. The overall goals of the WSIP are to:

- Maintain high-quality water
- Reduce vulnerability to earthquakes
- Increase delivery reliability and improve the ability to maintain the system
- Meet customer water supply purchase requests in nondrought and drought periods
- Enhance sustainability in all system activities
- Achieve a cost-effective, fully operational system

To further these program goals, the WSIP includes objectives that address system performance in the areas of water quality, seismic reliability, delivery reliability, and water supply through the year 2030. **Table S.1** presents the WSIP goals and objectives. The WSIP also includes proposed levels of service for the regional water system, which are intended to further define the system performance objectives through 2030 and provide design guidelines for the facility improvement projects. The levels of service (shown in Table 3.5, in Chapter 3, Program Description) address water quality, seismic response after a major earthquake, delivery during system maintenance, average annual water supply, regional system firm yield, and drought-year rationing.

Key program elements are summarized below and described in more detail in Chapter 3 (also see the SFPUC's 2006 *Water System Improvement Program* and 2007 *Water Supply Options* reports).

- *Water Supply*. Proposed water supply option to meet customer purchase requests during both nondrought and drought years.

- *System Operations*. Proposed system operations strategy to achieve water quality, seismic response, and delivery reliability performance objectives under a range of operating conditions, including the following scenarios: day-to-day, maintenance, unplanned outage, earthquake or other emergencies, and drought.

- *Facilities*. Proposed facility improvement projects to repair, upgrade, and, in some cases, expand the regional system facilities to reliably meet level of service goals and system performance objectives and to provide a cost-effective, fully operational water system.

Proposed Water Supply

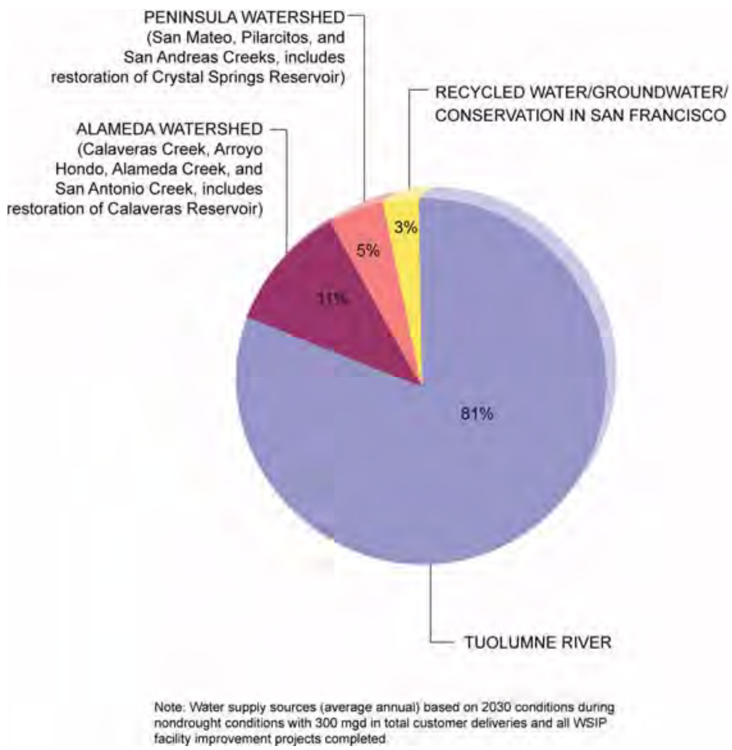
Under the WSIP, the SFPUC proposes to meet the increased 35 mgd in purchase requests by continuing to maximize use of local watershed supplies, increasing diversions from the Tuolumne River under its existing water rights, and developing new local resources consisting of a combination of additional conservation, water recycling, and groundwater supply programs in

TABLE S.1
WSIP GOALS AND OBJECTIVES

Program Goal	System Performance Objective
Water Quality – *maintain high water quality*	• Design improvements to meet current and foreseeable future federal and state water quality requirements. • Provide clean, unfiltered water originating from Hetch Hetchy Reservoir and filter all other surface water sources. • Continue to implement watershed protection measures.
Seismic Reliability – *reduce vulnerability to earthquakes*	• Design improvements to meet current seismic standards. • Deliver basic service to the three regions in the service area (East/South Bay, Peninsula, and San Francisco) within 24 hours after a major earthquake. Basic service is defined as average winter-month usage, and the performance objective for the regional system is 229 million gallons per day (mgd). The performance objective is to provide delivery to at least 70 percent of the turnouts (i.e., water diversion connecting points from the regional system to customers) in each region, with 104, 44, and 81 mgd delivered to the East/South Bay, Peninsula, and San Francisco regions, respectively. • Restore facilities to meet average-day demand of 300 mgd within 30 days after a major earthquake.
Delivery Reliability – *increase delivery reliability and improve the ability to maintain the system*	• Provide operational flexibility to allow planned maintenance shutdown of individual facilities without interrupting customer service. • Provide operational flexibility to minimize the risk of service interruption due to unplanned facility upsets or outages. • Provide operational flexibility and system capacity to replenish local reservoirs as needed. • Meet the estimated average annual demand of 300 mgd for 2030 under the conditions of one planned shutdown of a major facility for maintenance concurrent with one unplanned facility outage.
Water Supply – *meet customer water needs in nondrought and drought periods*	• Meet average annual water purchase requests of 300 mgd from retail and wholesale customers during nondrought years for system demands through 2030. • Meet dry-year delivery needs through 2030 while limiting rationing to a maximum 20 percent systemwide reduction in water service during extended droughts. • Diversify water supply options during nondrought and drought periods. • Improve use of new water sources and drought management, including use of groundwater, recycled water, conservation, and transfers.
Sustainability – *enhance sustainability in all system activities*	• Manage natural resources and physical systems to protect watershed ecosystems. • Meet, at a minimum, all current and anticipated legal requirements for protection of fish and other wildlife habitat. • Manage natural resources and physical systems to protect public health and safety.
Cost-effectiveness – *achieve a cost-effective, fully operational system*	• Ensure cost-effective use of funds. • Maintain gravity-driven system. • Implement regular inspection and` maintenance program for all facilities.

SOURCE: SFPUC, 2005.

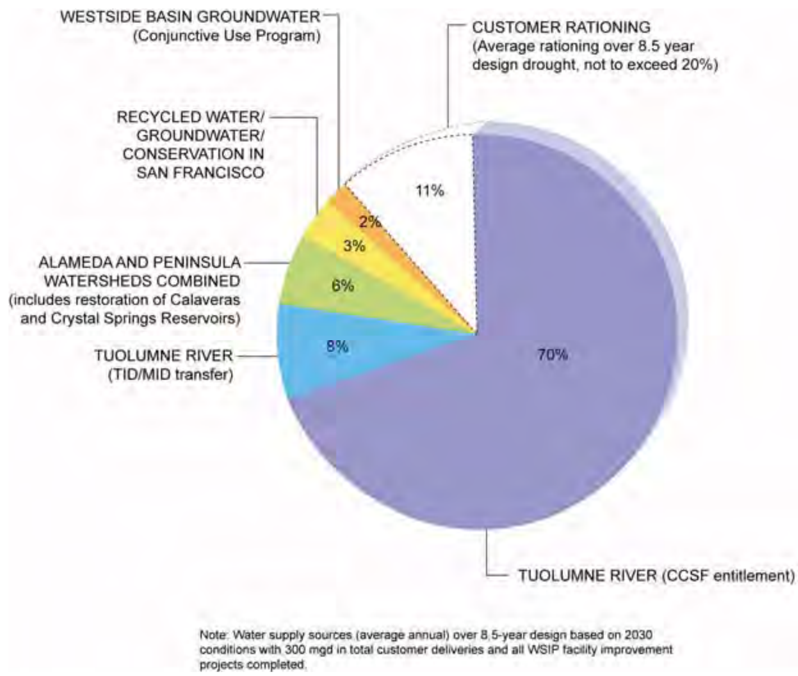
San Francisco, as shown in **Figure S.4**. The water recycling and groundwater supply programs would be developed as part of the proposed facility improvement projects. This combination of water supply sources is expected to fully meet customer purchase requests during nondrought years through 2030. However, based on recent experience, these water supply sources would not be adequate during drought periods. The WSIP level of service goals include a policy to limit customer rationing to a maximum of 20 percent systemwide in any one year of a drought.



SFPUC Water System Improvement Program . 203287

Figure S.4
WSIP Water Supply Sources, Nondrought Years

To provide adequate water supply to customers during a prolonged drought, the WSIP includes supplemental sources to augment the nondrought-year water supplies described above. The SFPUC proposes to secure a water transfer with the Turlock Irrigation District (TID) and/or Modesto Irrigation District (MID) to provide supplemental dry-year water from the Tuolumne River. Further, the SFPUC proposes to implement a groundwater banking program in the Westside Groundwater Basin in San Mateo County. Under this program, SFPUC wholesale customers that utilize the Westside Groundwater Basin would use supplemental surface water supplies in nondrought years to reduce their groundwater pumping and allow for in-lieu groundwater banking; these wholesale customers could then increase their groundwater pumping in drought years and reduce their demand for surface water supply in those years. In addition, two of the WSIP facility improvement projects involve the restoration of historical operating capacities at two of the system reservoirs, Calaveras and Lower Crystal Springs Reservoirs, which would further augment drought supplies for the regional system. As shown in **Figure S.5**, during drought years under the WSIP, the SFPUC would also include up to 20 percent systemwide rationing.



SFPUC Water System Improvement Program . 203287

Figure S.5
WSIP Water Supply Sources, Drought Years

Proposed System Operation Strategy

Operation of the regional water system is affected by numerous factors, including fluctuations in customer demand; meteorological and hydrologic conditions; physical facilities and infrastructure capacity and maintenance requirements; and multiple institutional parameters. The WSIP addresses the condition of the physical facilities and infrastructure while planning for and taking into account these various factors. The operating strategy addresses four components of system operation: water supply and storage, water quality, water delivery, and asset management.

Under the WSIP, general day-to-day operation of the regional water system would be similar to existing operations but would provide for additional facility maintenance activities and improved emergency preparedness. Implementation of the program would allow for a refinement of the operations strategy to meet the WSIP goals and objectives and would thereby increase system reliability and provide additional flexibility for scheduling repairs and maintenance. The proposed operations strategy would also include a multistage drought response program during an extended drought. Under the WSIP, regional system operations would continue to comply with all applicable institutional and planning requirements, including:

- Complying with all water quality, environmental, and public safety regulations
- Maximizing the use of water from local watersheds
- Assigning a higher priority to water delivery over hydropower generation
- Meeting all downstream flow requirements

Proposed Facility Improvement Projects

The WSIP includes 22 facility improvement projects along the regional system, from Oakdale Portal in Tuolumne County on the east end to San Francisco on the west. The projects, described in **Table S.2**, have been identified as necessary to achieve the level of service goals and system performance objectives of the WSIP. **Figure S.6** indicates the location of each facility improvement project.

Standard Construction Measures

The SFPUC has established standard construction measures that would be implemented as part of all WSIP projects. The main objective of these measures is to minimize potential disruption of surrounding neighborhoods during construction and to reduce impacts on environmental resources to the extent feasible. The construction measures would be implemented individually for the facility improvement projects; some measures might not be applicable to some projects, while some projects would require the development of more detailed construction measures and implementation steps as the individual projects are designed. The standard construction measures to be included in WSIP construction contracts address the following topics: neighborhood notice, seismic and geotechnical studies, onsite air and water quality measures during construction, groundwater, traffic, noise, hazardous materials, biological resources, cultural resources, and project site (i.e., the use of non-CCSF-owned land during construction).

Proposed Construction Schedule

Figure S.7 presents a preliminary master schedule of the construction phases for the facility improvement projects. The SFPUC developed the preliminary schedule to assure that water delivery service is maintained throughout construction of the numerous projects, but is preparing schedule refinements and adjustments as the projects are further developed and more information is known about construction requirements. All WSIP projects are scheduled to be completed by the end of 2014. The acquisition of supplemental water supplies during droughts would be implemented as needed to match the water supply needs of the retail and wholesale customers (see Chapter 5, Section 5.1) and is not included on the construction schedule.

TABLE S.2
WSIP FACILITY IMPROVEMENT PROJECTS

No.[a]	Project Title	Principal Type of Facility/ Objectives[b]	Location of Preferred Project[c]	Project Description
San Joaquin Region				
SJ-1	Advanced Disinfection	Treatment / Water Quality	Tesla Portal	This project would provide for the planning, design, and construction of a new advanced disinfection facility for the Hetch Hetchy water supply to comply with the new federal drinking water regulatory requirements contained in the Long Term 2 Enhanced Surface Water Treatment Rule. This regulation is designed to provide treatment for the parasite *Cryptosporidium*. The project is in the planning phase and the SFPUC is evaluating applicable technologies and possible locations to identify the most technologically sound and cost-effective alternative. In addition, the project includes planning and conceptual engineering for providing advanced disinfection facilities at the Sunol Valley and Harry Tracy Water Treatment Plants (WTPs). This project may be combined with the Tesla Portal Disinfection Station project along with portal modifications, and the need for the Lawrence Livermore Supply Improvements project may be affected by the location and technology selected for this project.
SJ-2	Lawrence Livermore Supply Improvements	Treatment / Water Quality	Thomas Shaft	This project includes design and construction of treatment upgrades for the water supplied to the Lawrence Livermore Laboratory. The project would construct water treatment facilities from the Thomas Shaft of the Coast Range Tunnel. An advanced disinfection facility planned at an upstream location under the Advanced Disinfection project could affect project design.
SJ-3	San Joaquin Pipeline System	Pipeline / Water Supply, Delivery Reliability	Isolated locations along the existing San Joaquin Pipeline corridor	The preferred project would generally be located within the existing San Joaquin Pipeline (SJPL) right-of-way and would include: • Construction of a new 6.4-mile-long, up to 86-inch-diameter fourth San Joaquin Pipeline parallel to the existing three pipelines at the east end of the pipelines, starting at Oakdale Portal, and associated portal modifications. • Construction of two additional crossover facilities between the San Joaquin Pipelines within the existing right-of-way, both located in Stanislaus County, with one about 20 miles east of Modesto and the other about 15 miles west of Modesto, and improvements at the existing Roselle Crossover. • Construction of a new 10-mile-long, up to 86-inch-diameter fourth San Joaquin Pipeline parallel to the existing three pipelines at the west end of the pipelines ending at Tesla Portal. This project would provide additional facilities to upgrade the hydraulic capacity of the San Joaquin Pipeline system to 314 mgd (and a 271-mgd average during system maintenance when a pipeline segment must be taken out of service) and to provide redundancy for prestressed concrete cylinder pipe for reliability. Note: While the current preferred alternative would construct 16 miles of pipeline, as much as 22 miles of pipeline could be constructed depending on the results of a conditions assessment of the existing pipelines.
SJ-4	Rehabilitation of Existing San Joaquin Pipelines	Pipeline / Water Supply, Delivery Reliability	Rehabilitation could occur anywhere along the pipeline corridor, which extends from Oakdale Portal to Tesla Portal	Reconditioning/rehabilitation of the existing San Joaquin Pipelines. There are three existing pipelines, each 47.7 miles long, extending from Oakdale Portal to Tesla Portal: • SJPL-1, riveted steel pipe, 56- to 72-inch internal diameter • SJPL-2, reinforced concrete pipe and welded steel pipe, 61- to 62-inch internal diameter • SJPL-3, prestressed concrete cylinder pipe and welded steel pipe, 78-inch internal diameter

TABLE S.2 (Continued)
WSIP FACILITY IMPROVEMENT PROJECTS

No.[a]	Project Title	Principal Type of Facility/ Objectives[b]	Location of Preferred Project[c]	Project Description
San Joaquin Region (cont.)				
SJ-5	Tesla Portal Disinfection Station	Treatment / Water Quality, Seismic Reliability	Tesla Portal	This project includes the planning, design, and construction of new disinfection facilities for the Hetch Hetchy water supply. The project would replace and upgrade the existing disinfection facilities at the Tesla Portal Disinfection Facility to meet current seismic, safety/fire, and building code standards. The preferred project would include construction of: • New control building and storage room • Pump houses • Chemical storage tanks and feed equipment and sampling systems • Emergency generator, including primary and standby power supplies • Access road It should be noted that the design and location of the Advanced Disinfection project would affect the design and location of this project.
Sunol Valley Region				
SV-1	Alameda Creek Fishery Enhancement	Other / Water Supply, Sustainability	Structural Alternatives: Alameda Creek in Sunol Valley, downstream of Calaveras Dam	This project would recapture the water released as part of the Calaveras Dam project and return it back to the regional system for use. A number of structural and non-structural recovery alternatives are under consideration for this project, including: a water recapture facility downstream of the Sunol Valley WTP, conjunctive groundwater use, horizontal collector wells, or other groundwater recovery systems yet to be defined. Other alternative designs for this project could be developed.
SV-2	Calaveras Dam Replacement	Storage / Water Supply, Delivery and Seismic Reliability	Sunol Valley, immediately downstream of existing dam	This project would provide for the planning, design, and construction of a replacement dam at Calaveras Reservoir to meet seismic safety requirements. The new dam would provide for a reservoir with the same storage capacity as the original reservoir (96,800 acre-feet), but the replacement dam would be designed to accommodate enlargement of the dam in the future. The preferred project would include construction of: • New earthfill dam • New intake tower and new outlet valve for water releases for instream flow requirements • New or rehabilitated outlet works for seismic safety and improved operations and maintenance As part of this project, Calaveras Reservoir would be operated to release up to 6,300 acre-feet per year (5.5 mgd) of water to Alameda Creek in support of fisheries.
SV-3	Additional 40-mgd Treated Water Supply	Treatment / Water Quality, Delivery Reliability	Sunol Valley WTP and pipeline to connect to the Alameda Siphons or Irvington Tunnel	This project would provide for the planning, design, and construction of an additional 40 mgd of treatment capacity at the Sunol Valley WTP. The project would increase the sustainable capacity of the Sunol Valley WTP to 160 mgd. The planning-level study would evaluate treatment operations protocol and an alternative treatment process. The project would include either retrofitting the existing facilities with a membrane treatment process or expanding the existing facilities with: • New flocculation and sedimentation system • Upgrade of existing filters or addition of three new filters and a new flow distribution chamber

TABLE S.2 (Continued)
WSIP FACILITY IMPROVEMENT PROJECTS

No.[a]	Project Title	Principal Type of Facility/ Objectives[b]	Location of Preferred Project[c]	Project Description
Sunol Valley Region (cont.)				
SV-3 (cont.)				• New filtered water and backwash piping Additionally, the project would include: • New chemical feed and piping system • Upgrade of the electrical supply system • Miscellaneous piping, valves, and mechanical and electrical work • Approximately two miles of 78-inch-diameter pipe to connect to the Alameda Siphons or Irvington Tunnel
SV-4	New Irvington Tunnel	Tunnel / Delivery and Seismic Reliability	Sunol Valley to Fremont, parallel to and just south of the existing Irvington Tunnel	This project would construct a new tunnel parallel to and just south of the existing Irvington Tunnel to convey water from the Hetch Hetchy system and the Sunol Valley WTP to the Bay Area. The new tunnel would be a redundant water transmission facility to the existing Irvington Tunnel. The preferred project would include construction of: • New 18,200-foot-long, 10-foot-diameter tunnel • New portal at the east end adjacent to the existing Alameda West Portal in the Sunol Valley with connections to the existing Alameda Siphons and proposed new siphon • New portal at the west end adjacent to the existing Irvington Portal in Fremont with connections to the existing Bay Division Pipelines and proposed new pipeline (Bay Division Pipeline Reliability Upgrade) • Valves and equipment to control and monitor flows • Modifications to the existing Alameda West and Irvington Portals
SV-5	SVWTP – Treated Water Reservoirs	Storage and Treatment / Delivery Reliability	North of the Sunol Valley WTP	This project would provide for the planning, design, and construction of new treated water storage reservoirs at the Sunol Valley WTP to comply with requirements of the California Department of Health Services. The preferred project would include construction of: • One 5-million-gallon chlorine contact basin • Two 8.75-million-gallon storage basins • New inlet and outlet piping and reservoir drainage system • Pipe bridge over Alameda Creek • Chemical (ammonia and chlorine) storage and feed system • Backup filter washwater supply and filter washwater supply system • Instrumentation and controls and miscellaneous pumping appurtenances to integrate the reservoirs into the existing treatment plant • Expansion of the existing Sunol Valley WTP electrical substation • Two 750-kilowatt diesel-powered emergency generators

TABLE S.2 (Continued)
WSIP FACILITY IMPROVEMENT PROJECTS

No.[a]	Project Title	Principal Type of Facility/ Objectives[b]	Location of Preferred Project[c]	Project Description
Sunol Valley Region (cont.)				
SV-6	San Antonio Backup Pipeline	Pipeline / Delivery and Seismic Reliability	Sunol Valley between San Antonio Reservoir and San Antonio Pump Station	This project would consist of three proposed facilities: (1) San Antonio Backup Pipeline, a new pipeline (size undetermined) from San Antonio Reservoir to San Antonio Pump Station, about two miles long; (2) San Antonio Creek discharge facilities (improvements allowing for the discharge of Hetch Hetchy water and associated road improvements); and (3) Alameda East Portal vent overflow pipeline and portal modifications.
Bay Division Region				
BD-1	Bay Division Pipeline Reliability Upgrade	Pipeline and Tunnel / Water Supply, Delivery and Seismic Reliability	Along existing Bay Division Pipelines Nos. 1 and 2 easement from Fremont to Redwood City	This project would construct a new Bay Division Pipeline No. 5 (BDPL No. 5) from Irvington Tunnel Portal in Fremont to Pulgas Tunnel Portal near Redwood City, consisting of 16 miles of new pipeline and 5 miles of tunnel under San Francisco Bay. Portions of the section of BDPL No. 1 between Edgewood Valve Lot and Pulgas Valve Lot would be removed (approximately 1.4 miles), and existing aboveground and submarine sections of BDPL Nos. 1 and 2 over the five-mile-long section from Newark Valve House to Ravenswood Valve House would be decommissioned (decommissioning is not part of this project). The redundancy provided by the project would increase the overall transmission capacity of the Bay Division Pipeline system. The preferred project would include construction of: • New welded-steel pipeline, approximately 72 inches in diameter, extending along the seven-mile reach from Irvington Portal to Newark Valve Lot, located within the existing SFPUC right-of-way of BDPL Nos. 1 and 2 • New “Bay Tunnel” segment of BDPL No. 5, approximately 120 inches in diameter, extending five miles from Newark Valve Lot to Ravenswood Valve Lot, crossing under San Francisco Bay and adjacent marshlands; BDPL Nos. 1 and 2 would tie into the tunnel at both ends and would be decommissioned between Newark and Ravenswood Valve Lots • New welded-steel pipeline, approximately 60 inches in diameter extending along the nine-mile reach from Ravenswood Valve Lot to Pulgas Portal, located within the existing SFPUC right-of-way of BDPL Nos. 1 and 2 • New facilities at eight valve vault lots along the alignment, containing new concrete vaults and control structures that house electrical control panels, isolation valves, mechanical equipment, and cross-connections between BDPL No. 5 and the existing Bay Division Pipelines • Two flow metering vaults at or near Mission Boulevard (in Fremont) and Pulgas Portal areas • New Isolation valves and piping for connecting BDPL No. 5 to Irvington and Pulgas Portals

TABLE S.2 (Continued)
WSIP FACILITY IMPROVEMENT PROJECTS

No.[a]	Project Title	Principal Type of Facility/ Objectives[b]	Location of Preferred Project[c]	Project Description
Bay Division Region (cont.)				
BD-2	BDPL Nos. 3 and 4 Crossovers	Valve House / Delivery and Seismic Reliability	Three locations adjacent to where BDPL Nos. 3 and 4 traverse Guadalupe River, Barron Creek, Bear Gulch Reservoir	This project would construct three additional crossover facilities along BDPL Nos. 3 and 4 to provide operational flexibility for maintenance or during emergencies. The new crossover facilities would reduce the length of pipe to be removed from service, either for maintenance or for emergencies, and would reduce the duration of outages. Each crossover facility would include construction of: • Four mainline valves and one cross-connect valve • Automatic controlled actuators • Discharge facilities to enable release of water that meets water quality discharge requirements within discrete pipeline segments to surface waters, either for maintenance or emergencies
BD-3	Seismic Upgrade of BDPL Nos. 3 and 4 at Hayward Fault	Pipeline / Seismic Reliability	Along existing BDPL Nos. 3 and 4 in Fremont	This project would provide for the planning, design, and construction of upgraded, seismically resistant sections of the BDPL Nos. 3 and 4 where they cross the Hayward fault. The replacement pipelines would be located between the two new crossover/isolation valves that would be built as part of BDPL Nos. 3 and 4 Crossover/Isolation Valve at Hayward Fault project (a WSIP project determined to be independent of the PEIR). In addition to the replacement pipelines, a new bypass pipeline between the two new crossover/isolation valve vaults could also be built as part of one of the several alternatives being considered for this project.
Peninsula Region				
PN-1	Baden and San Pedro Valve Lots Improvements	Valve House / Delivery and Seismic Reliability	Baden Valve Lot, South San Francisco, San Pedro Valve Lot, Daly City	This project would upgrade valve vaults, valves, and piping at the existing Baden and San Pedro Valve Lots to meet current seismic standards. Work could also be performed at the Pulgas Pump Station and Pulgas Valve Lot as part of transmission reliability. The project would include a new pressure-reducing valve at one of the locations to allow transfer of water between high and low pressure zones from the Harry Tracy WTP to the Peninsula under an emergency scenario.
PN-2	Crystal Springs/ San Andreas Transmission Upgrade	Pipeline / Delivery and Seismic Reliability	Lower Crystal Springs Reservoir to San Andreas Reservoir, including Crystal Springs Pump Station	This project would consist of seismic improvements of facilities that convey water from Crystal Springs Reservoir to the Harry Tracy WTP. This project would increase the transmission capacity of the existing raw water pipeline from Crystal Springs Reservoir to San Andreas Reservoir in order to reliably supply 140 mgd of raw water for treatment at the Harry Tracy WTP. The project would include: • Repair of Upper Crystal Springs Dam discharge culverts • Upgrade and repair of Lower Crystal Springs Dam outlet structures and tunnels conveying water to Crystal Springs Pump Station • Replacement or refurbishment of Crystal Springs Pump Station • Upgrade and repair of the chemical system and Crystal Springs chlorine emergency feed • Improvements to the Crystal Springs/San Andreas Pipeline, including replacement of approximately 1,350 feet of 66-inch-diameter pipeline, general renewal of the remaining pipeline, and addition of new manholes, blowoff valves, and isolation valves; or construction of a new redundant pipeline along a new alignment.

TABLE S.2 (Continued)
WSIP FACILITY IMPROVEMENT PROJECTS

No.[a]	Project Title	Principal Type of Facility/ Objectives[b]	Location of Preferred Project[c]	Project Description
Peninsula Region (cont.)				
PN-2 (cont.)				• Seismic and hydraulic upgrade and repair of San Andreas outlet facilities • Addition of fish screens on the outlet structures for both Crystal Springs and San Andreas Reservoirs • Repair of two pipelines that convey raw water from San Andreas Reservoir to the Harry Tracy WTP raw water pump station
PN-3	HTWTP Long-Term Improvements	Treatment / Water Quality, Delivery and Seismic Reliability	Harry Tracy WTP	This project would be a seismic retrofit and rehabilitation of the existing building and facility to provide long-term reliability and process improvements. The project would increase the sustained treatment capacity of the plant from 120 to 140 mgd for 60 days. The proposed improvements would include: • Replacement and upgrade of the ozone generation system for primary disinfection • Replacement or upgrade of the existing sedimentation basins at the same location • Improvements to sludge handling facilities • New, redundant pipeline from the treatment works to the finished water storage reservoir • Raw water pump station improvements • Upgrade and replacement of electrical and instrumentation components, including improvements to process and plant security facilities
PN-4	Lower Crystal Springs Dam Improvements	Storage / Water Supply and Delivery Reliability	Lower Crystal Springs Dam	This project would consist of major repairs and improvements to Lower Crystal Springs Dam to provide adequate protection of the dam and downstream areas from the probable maximum flood, as defined by the California Division of Safety of Dams (DSOD). The DSOD has placed operational restrictions on the dam, and the capacity of the reservoir is limited to 58,400 acre-feet. The project would restore the historical reservoir capacity of 69,300 acre-feet. The project would be coordinated with San Mateo County, which is concurrently planning the replacement of the existing county bridge built above the crest of the dam. Project elements would include: • Lowering the existing parapet wall on either side of the existing spillway to lengthen the overflow weir (central spillway) from the reservoir • Raising the remaining parapet walls and adding two new spillway bays, one on each side of the existing central spillway • Enlarging the spillway stilling basin to accommodated the probable maximum flood • Installing four gates (with control building) or installing a fixed weir within the spillway to restore the historical storage capacity

TABLE S.2 (Continued)
WSIP FACILITY IMPROVEMENT PROJECTS

No.[a]	Project Title	Principal Type of Facility/ Objectives[b]	Location of Preferred Project[c]	Project Description
Peninsula Region (cont.)				
PN-5	Pulgas Balancing Reservoir Rehabilitation	Storage / Water Quality, Delivery and Seismic Reliability	Pulgas Balancing Reservoir and mouth of Laguna Creek at south end of Upper Crystal Springs Reservoir	This project would provide for the planning, design, and construction of improvements to the existing Pulgas Balancing Reservoir and associated facilities. The project would include: • Modifications to the inlet/outlet piping (Phase 1, currently under construction) • Design and construction to rehabilitate and/or expand the discharge channel to Crystal Springs Reservoir (or to install a parallel channel) (Phase 2) • Geotechnical investigations, design, and construction of recommended seismic improvements, including repair/replacement of the reservoir walls, floor, and roof (Phase 3) • Restoration of a six- to eight-acre sediment catchment basin in Laguna Creek to also serve as sustainable habitat for San Francisco garter snake and California red-legged frog, including culvert replacement, sediment removal, revegetation, and protective measures to avoid impacts on sensitive species (Phase 4) • Modification of the existing dechlorination process, including modifications to the chemical feed system to enable pH adjustment and dechlorination system to operate reliably (Phase 5)
San Francisco Region				
SF-1	San Andreas Pipeline No. 3 Installation	Pipeline / Delivery and Seismic Reliability	Daly City to San Francisco	This project would replace the out-of-service Baden-Merced Pipeline, which is beyond repair, and would construct a new pipeline extension of the existing San Andreas Pipeline No. 3 from San Pedro Valve Lot in Daly City to Merced Manor Reservoir in San Francisco. It would also connect the existing San Andreas Pipeline No. 2 at Sloat Boulevard in San Francisco and install an additional pipeline to serve the water turnouts along San Andreas Pipeline No. 2. The project would provide seismic reliability and system redundancy for Peninsula and San Francisco customers. The project would include: • New 3.8-mile-long, 36-inch-diameter pipeline • Approximately 0.27 mile of 36-inchdiameter pipeline for three connections between San Andreas Pipelines Nos. 2 and 3 • Removal of the Baden-Merced Pipeline where the new San Andreas Pipeline No. 3 alignment matches the Baden-Merced alignment • Less than 0.1 mile of 12- to 16-inch-diameter new pipeline for five branch connections to user turnouts (three turnouts to Daly City, two turnouts to San Francisco distribution lines) • Installation of line valves and vaults, manholes, cathodic protection and monitoring stations, sample taps, air valves, blowoffs, and other pipeline appurtenances
SF-2	Groundwater Projects	Other / Water Supply	West side of San Francisco and northern San Mateo County	This project includes three groundwater projects: Lake Merced, Local Groundwater, and Regional Groundwater. • The Lake Merced project would address raising the level of Lake Merced in San Francisco using a supplemental source of water, such as treated stormwater, recycled water, groundwater, or SFPUC system water.

TABLE S.2 (Continued)
WSIP FACILITY IMPROVEMENT PROJECTS

No.[a]	Project Title	Principal Type of Facility/ Objectives[b]	Location of Preferred Project[c]	Project Description
San Francisco Region (cont.)				
SF-2 (cont.)				• The Local Groundwater Projects would include development of 2 mgd of new local groundwater for blending with water in the potable water system in San Francisco. An estimated four wells and well stations would be constructed to develop this new local groundwater. This project would also include the use of an additional 2 mgd of groundwater through replacement of existing irrigation wells at the San Francisco Zoo, Golden Gate Park, and/or other locations, once recycled water were available for irrigation (to be developed under the Recycled Water Projects). Two existing wells would be modified to enable emergency supply to local residents in the event of a major earthquake or other disaster. This project would include the pipelines, water treatment equipment, and controls needed to add the groundwater to the municipal supply. The additional water supply developed under this project would be used during both nondrought and drought years. • As part of a regional conjunctive-use project, the SFPUC would construct about 10 new groundwater production wells in San Mateo County to develop about 6 mgd of potable groundwater for use as a supplemental drought-year supply. In nondrought years under this project, the SFPUC would provide potable water from the regional system to customers in Daly City, San Bruno, and South San Francisco to substitute for groundwater currently used for municipal purposes, thereby reducing groundwater pumping and allowing the groundwater basin to recharge naturally. In drought years, the groundwater would be available for local use to supplement the regional system water. This project would require agreements with the affected agencies see (Section 3.13).
SF-3	Recycled Water Projects	Other / Water Supply, Sustainability	Various locations on west side of San Francisco	This project includes recycled water projects in San Francisco and other locations. Projects include Westside Baseline and Harding Park/Lake Merced. This project would provide treatment, storage, and distribution facilities for about 4 mgd of recycled water to users on the west side of San Francisco. Primary users would include Golden Gate Park, Lincoln Park, Lincoln Park Golf Course, Harding Park Golf Course, San Francisco Zoo, Sunset Boulevard medians, and San Francisco State University. As described under Groundwater Projects, the SFPUC is also investigating appropriate sources of supply for increasing and maintaining Lake Merced lake levels, including recycled water that has undergone advanced treatment.

a The numbering system is consistent, to the extent possible, with that presented in the Notice of Preparation (NOP) regarding preparation of an environmental impact report on the WSIP issued in September 2005. However, due to a regrouping of the projects after publication of the NOP, some projects have been renumbered.
b General types of facilities. Objectives refer to the WSIP objectives met by each project; see Table S.1 for a complete description of WSIP goals and objectives.
c See Figure S.6 for the approximate locations of preferred projects; many of the projects are still in development, and the SFPUC may ultimately consider other design options.

RE: WSIP Regional Projects Quarterly Report
4th Quarter / Fiscal Year 2008-2009

Enclosed is the Water System Improvement Program (WSIP) Regional Projects Quarterly Report for the 4th Quarter of Fiscal Year 2008-2009. The primary intent of the report is to provide the Commission, stakeholders and the public with a status summary of the program's regional projects for the period of April 5, 2009 through July 1, 2009.

Report Organization

The report has three main sections. The *Program Summary* section includes a program overview and performance summary, and a program update on the following topics: program management, planning/design, environmental, right-of-way, construction and project achievements. The *Regional Summary* section provides a regional performance summary for each WSIP region, and an update on each region's planning, environmental, design and construction efforts. The *Project Status* section contains the Quarterly Project Status Reports (PSRs) for all regional projects.

June 2009 Revised WSIP

This Quarterly Report incorporates all changes to the WSIP Regional Program made in the June 2009 Revised WSIP and approved by the San Francisco Public Utilities Commission (SFPUC) on July 28, 2009, including project name changes, modification of the WSIP organizational structure, the addition of a new regional project, and revised budgets and schedules.

The names of two regional projects were changed as part of the adoption of the June 2009 Revised WSIP. The name changes are as follows:

- Project CUW30103: Groundwater Project C - South Westside Basin changed to Regional Groundwater Storage and Recovery
- Project CUW35201: Alameda Creek Fishery Enhancement changed to Upper Alameda Creek Filter Gallery

In the June 2009 Revised WSIP and as reflected in the enclosed report, all of the WSIP Water Supply Region Projects, except for Project CUW30103: Regional Groundwater Storage and Recovery Project, moved from the Regional Program to the Local Program. Project CUW30101: Regional Groundwater Storage and Recovery Project was moved to the San Francisco Regional Region.

One regional project was added as part of the adoption of the June 2009 Revised WSIP to ensure the program continues to meet the level of service (LOS) goals established for the program. Project CUW36702: Peninsula Pipelines Seismic Upgrade, which was included in the Peninsula Region, will provide the seismic reliability required for key transmission pipelines that transport water from the Harry Tracy Water Treatment Plant (HTWTP).

It should be noted that the approved June 2009 Revised WSIP does not include revisions to all project budgets and schedules. Projects with cost and schedule variances that can potentially be mitigated were not re-baselined (i.e., changes to the budget and schedule of these projects were not made). Therefore the Baseline (Approved) Budget and/or and Baseline (Approved) Schedule for those projects remain the same and cost and/or schedule variances are recorded in the enclosed report based on the latest project forecasts.

Major changes were made to the scope, schedule, and/or budget of four regional projects as part of the June 2009 Revised WSIP. These changes are summarized below.

Significant scope changes were made to the WSIP's two San Joaquin Pipelines (SJPLs) projects to maximize the reliability of the overall system, provide additional maintenance flexibility and facilitate construction.

Project CUW37301: San Joaquin Pipeline System – The revised project scope includes the addition of a 6.7-mile, 78-inch diameter pipeline (referred to as the Eastern Segment) from Oakdale Portal to a new connection point corresponding to the end of the pre-stressed concrete cylinder pipe (PCCP) segment of SJPL No. 3. This change allowed for the downsizing of the 10.3-mile Western Segment from a 96-inch to a 78-inch diameter pipeline. Also added to the project scope are new valve facilities on SJPL Nos. 3 & 4 along the Eastern Segment to allow for better control of system pressure. The project budget has been increased $7,708,570 to $278,055,413. The project approved completion date remains the same (March 25, 2014) and the first construction contract for this project will be advertised in November 2009.

Project CUW37302: Rehabilitation of Existing San Joaquin Pipelines – The benefits provided by the increased scope of the SJPL System Project allowed for a reduction of the scope of this project without compromising levels of service. The revised project scope includes the rehabilitation of the Roselle Crossover Facility, the repair of the system's cathodic protection system, and the upgrade of the system's SCADA system. It also includes more detailed development of the SJPL Condition Assessment and Maintenance Program to enhance system sustainability. Finally, project funding is also set aside for additional priority work on the existing pipelines, which will be identified upon conclusion of the conditions assessment in December 2009. This resulted in a reduction of the project budget of $58,147,236 to $31,852,309. The project approved completion date remains the same (June 30, 2014). Bids for the first construction package for the Roselle Crossover Facility were received in June 2009 and contract award is scheduled for July 2009.

Project CUW37401: Calaveras Dam Replacement – The scope has been revised to include a flow bypass tunnel at the Alameda Creek Diversion Dam to provide minimum bypass flow in Alameda Creek. This additional scope was one of the mitigation requirements adopted as part of the WSIP Programmatic Environmental Impact Report (EIR). Delivery of this project has been impacted significantly by the need to address the potential presence of steelhead trout in the Alameda Creek Watershed and the presence of high concentrations of Naturally Occurring Asbestos (NOA) at the project site. It should be noted that formal consultation with the National Marine Fisheries Service (NMFS) is now required for this project. These issues have a substantial cumulative effect on both ongoing pre-construction activities and upcoming construction work in the field that resulted in a 42-month delay in the project schedule (revised completion date of December 4, 2015), and a $101,688,640 increase in the project budget (revised project budget of $409,444,761). The project schedule calls for publication of the project Draft EIR in September 2009 and advertisement for construction in August 2010.

Project CUW36701: Harry Tracy Water Treatment Plant (HTWTP) Long-Term Improvements – The discovery of a new strand of the Serra Fault in the vicinity of the plant's two treated water reservoirs (TWRs) triggered the need for additional investigations which confirmed that additional improvements were required to address seismic risks and ensure compliance with the program's Levels of Service (LOS) goals. As a result, the following scope revisions were proposed and adopted: abandon two existing TWRs and build a new 11.0 mg TWR, seismically retrofit pipelines in the vicinity of the Serra Fault, and build interim improvements to address short-term seismic risks. The scope changes resulted in a $183,303,228 increase in the project budget (revised project budget of $359,063,409). The project approved completion date remains the same (June 12, 2014). The project EIR is being prepared and 35% design has been completed. Advertisement for construction is scheduled for April 2011.

It is important to underscore that the project scopes in the June 2009 Revised WSIP continue to meet all the LOS goals established for the system. No changes were made to the program's LOS goals to accommodate project scope revisions.

<u>Status and Performance Summary</u>

The program performance metrics for planned and actual performance had to be updated following approval of the June 2009 Revised WSIP. It should be noted that incorporation of the revised schedule and cost baselines resulted in a slight reduction of the planned and actual performance metrics from what was reported in the previous WSIP Quarterly Report. Overall, actual performance (16.6%) on the program is tracking very close to planned performance (16.7%). Planning activities are nearing completion at 96%, whereas environmental, design and construction efforts are 67%, 75% and 6% complete, respectively. As of July 1, 2009, there are two (2) regional projects in the Planning Phase, eleven (11) in the Design Phase, six (6) in the Bid & Award Phase, five (5) in the Construction Phase, two (2) in the Close-Out Phase, eight (8) regional projects have been completed, one (1) project has not been initiated, and eleven (11) are active in multiple phases.

The approved WSIP Regional Program completion date is December 4, 2015 and the current forecast completion date is the same. The approved WSIP Regional Program budget is $3,514,026,000 and the current forecast at completion is $3,532,336,000 ($18,310,000 over the approved budget). The total approved WSIP budget (Local and Regional Programs including Finance Cost) is $4,585,556,000 and the current total forecast at completion is $4,608,583,000 ($23,027,000 over the approved budget).

Major program milestones reached during this reporting quarter include:

Environmental Approvals:
- CUW36103: Pulgas Balancing - Structural Rehabilitation and Roof Replacement (Mitigated Negative Declaration)

Construction Contract Advertised:
- CUW36103: Pulgas Balancing - Structural Rehabilitation and Roof Replacement
- CUW36401: Lawrence Livermore Water Quality Improvement
- CUW38001: BDPL No. 3 and 4 - Crossovers
- CUW37901: San Andreas Pipeline No. 3 Installation
- CUW38601: San Antonio Pump Station Upgrade

Construction Contract Awarded:
- CUW35901: Alameda Siphon #4
- CUW37201: University Mound Reservoir - North Basin
- CUW37901: San Andreas Pipeline No. 3 Installation
- CUW38001: BDPL Nos. 3 and 4 Crossovers

Construction Notice to Proceed Issued
- CUW36102: Pulgas Balancing - Discharge Channel Modifications
- CUW39101: Baden & San Pedro Valve Lot Improvements

The WSIP Team continues to work collaboratively with other City Departments, the SFPUC Regional Wholesale customers, and all program stakeholders to ensure the successful delivery of the WSIP.

TABLE OF CONTENTS

1.0 PROGRAM SUMMARY

1.1 PROGRAM OVERVIEW

The Water System Improvement Program (WSIP) is a multi-billion dollar, multi-year capital program to upgrade the City of San Francisco's regional and local drinking water systems. The program will deliver improvements that enhance the City's ability to provide reliable, affordable, high quality drinking water to its 27 wholesale customers and regional retail customers in Alameda, Santa Clara, and San Mateo Counties, and to 800,000 retail customers in San Francisco, in an environmentally sustainable manner. The proposed WSIP is structured to cost-effectively meet water quality requirements, improve seismic and delivery reliability, and achieve water supply goals.

This Fourth (4th) Quarterly Report for Fiscal Year (FY) 2008-2009 presents the progress made on the WSIP regional projects between April 5, 2009 and July 1, 2009. The program's schedule and budget were last approved by the San Francisco Public Utilities Commission (SFPUC or Commission) on July 28, 2009.

June 2009 Revised WSIP:
Consistent with other large and complex infrastructure programs, the WSIP needs to periodically go through a comprehensive review and revision. The process of formally approving new project scopes, schedules and budgets is referred to as re-baselining. Making periodic adjustments in the WSIP through a re-baselining process is required to:

- incorporate the latest available information, including new project scopes, risk mitigation measures and value engineering proposals;
- capture low construction bids in revised project budgets;
- provide more realistic project baselines for performance measurements;
- ensure that adequate funding is available in future supplemental appropriations; and
- ensure compliance with the California Water Code #73500 (Assembly Bills 1823 and 2437).

The adjustments to the program scope, schedule and budget reflected in the June 2009 Revised WSIP were based on an analysis of monthly forecasting and change management data over the past two quarters and a program re-alignment review undertaken by the WSIP Senior Management Team in April 2009. A Notice of Public Hearing describing proposed changes to regional project schedules and scopes was posted on June 26, 2009, in compliance with the notification requirements of the California Water Code. Additional material of proposed cost changes were subsequently posted on July 23, 2009. The June 2009 Revised WSIP was adopted by the SFPUC Commission on July 28, 2009. The approval included an endorsement of recommendations made by the Bay Area Water Supply and Conservation Agency

(BAWSCA). For more information on the program changes adopted by the SFPUC Commission, refer to documents posted on the SFPUC Website under following headings:

Web Address: (http://sfwater.org/detail.cfm/MC_ID/35/MSC_ID/397/C_ID/4660)

- Notice of public Hearing 7/28/09: Proposed Revisions to the WSIP-2
- Notice of public Hearing 7/28/09: Proposed Revisions to the WSIP-1

This Quarterly Report incorporates all changes to the WSIP Regional Program approved as part of the June 2009 Revised WSIP, including project name changes, modification of the WSIP organizational structure, the addition of a new regional project, and revised budgets and schedules.

The name of two regional projects was changed as part of the adoption of the June 2009 Revised WSIP. The name changes are as follows:

- Project CUW30103: Groundwater Project C - South Westside Basin changed to Regional Groundwater Storage and Recovery
- Project CUW35201: Alameda Creek Fishery Enhancement changed to Upper Alameda Creek Filter Gallery

In the June 2009 Revised WSIP, all of the WSIP Water Supply Region Projects, except for CUW30103 – Regional Groundwater Storage and Recovery Project, moved from the Regional Program to the Local Program. The CUW30101 - Regional Groundwater Storage and Recovery Project was moved to the San Francisco Regional Region.

One regional project was added as part of the adoption of the June 2009 Revised WSIP to ensure the program continues to meet the (LOS) goals established for the program. CUW36702 - Peninsula Pipelines Seismic Upgrade, which was included in the Peninsula Region, will provide the seismic reliability required for key transmission pipelines that transport water from the Harry Tracy Water Treatment Plant (HTWTP).

It should be noted that the approved June 2009 Revised WSIP does not include revisions to all project budgets and schedules. Projects with cost and schedule variances that can potentially be mitigated were not re-baselined (i.e., changes to the budget and schedule of these projects were not made). Therefore the Baseline (Approved) Budget and/or and Baseline (Approved) Schedule for those projects remain the same and cost and/or schedule variances continue to be reported based on the latest project forecasts.

1.0 PROGRAM SUMMARY

1.2 PROGRAM PERFORMANCE

The overall performance of the WSIP at the program and regional level is assessed using the Earned Value Management (EVM) method. EVM has the unique ability to combine measurements of scope, schedule, and cost in a single integrated system. It allows the WSIP Management Team to (1) measure the amount of work actually performed on the program, (2) forecast the program's cost and completion date using historical and statistical projections, (3) determine how well the program is "performing" compared to its original plan, and (4) forecast how well the program will perform in the future. The Earned Value (or Budgeted Cost of Work Performed) is the cost originally budgeted to accomplish the work completed by the report date. In other words, it is the value of the work completed and it is defined as the percent of work accomplished multiplied by the Approved Budget for that work. Planned Value (or Budgeted Cost of Work Scheduled) is the budgeted cost for the work scheduled to be performed by the report date. The Actual Cost (or Actual Cost of Work Performed) is cost incurred to accomplish the work completed by the report date. EVM uses a number of calculations, indices and variances to assess performance. The Schedule Performance Index (SPI) reported herein is a measure of how well the program is doing in terms of following the WSIP approved schedule. It is calculated by dividing the Earned Value by the Planned Value.

At the project-level, WSIP performance is measured using both the EVM and the reporting of schedule and cost variances. These variances are not based on EVM calculations but instead on an overall progress assessment by Project Managers. Appendices D and E include a summary of schedule and cost variances for all WSIP Regional Projects. The "Schedule Variance of WSIP Regional Project" Table in Appendix D summarizes the schedule variance between the projects' Approved Finish Date and the Current Forecast at Completion (or Forecasted Completion Date). The "Cost Variance of WSIP Regional Projects" Table in Appendix E summarizes the cost variance between the projects' Approved Budget and Current Forecast at Completion (or Forecasted Cost at Completion).

Current Program Performance

WSIP activities during the reporting quarter continued to focus primarily on environmental review and design efforts. To date, planning of the WSIP Regional Program is approximately 96% complete, whereas environmental review/permitting, design and construction efforts are about 67%, 75% and 6% complete, respectively. The Schedule Performance Index (SPI) for the Regional Program is 0.99, indicating that 99% of the overall work planned was performed as of the end of this reporting quarter.

1.0 PROGRAM SUMMARY

Earned Value exceeds Actual Cost to date by $31.5 million. The Planned versus Actual % Completion of all phases of the WSIP Regional Program are summarized in Table 1.1.

Table 1.1 Program Performances (1, 2)

			July 1, 2009	
			% Planned	**% Actual**
Project Management			42.6%	42.8%
Planning			97.3%	96.4%
Environmental			70.1%	66.5%
Right-of-Way			33.4%	30.4%
Design			75.8%	74.6%
Bid & Award			39.0%	39.9%
Construction Management			6.1%	6.1%
Construction			6.1%	6.2%
Close-Out			23.4%	21.8%
Program Management			36.0%	35.9%
Program Cumulative			**16.7%**	**16.6%**

Comparison with last quarter data not provided because program baseline was changed and such comparison would not be meaningful.

Notes:

1. Includes performance from San Joaquin, Sunol Valley, Bay Division, Peninsula, and San Francisco Regional Regions.
2. See Appendix A.2 (Definition and How to Read PSR's) for explanation of percentage calculations.

Overall, the actual performance of the Project Management, Planning, Design, Bid & Award, Construction Management, Construction, and Program Management Phases is tracking planned performance relatively well. The Environmental, Right-of-Way, and Close-out Phases are slightly behind schedule.

The overall Environmental Phase delay is associated with the complex environmental issues to be thoroughly analyzed under the California Environmental Quality Act (CEQA). No delays have been experienced to date in the environmental permits to be issued by various Federal, State and Regional Resource Agencies prior to construction. The delay recorded for the Environmental Phase is due to the addition of a 3rd Admin

1.0 PROGRAM SUMMARY

Draft EIR, a screen check review, and extended review periods requested by Division of Major Environmental Analysis for CUW35901 - New Irvington Tunnel, CUW38101 - SVWTP Expansion & Treated Water Reservoir, and CUW35401 – Lower Crystal Springs Dam Improvements Projects. It should be noted that CUW35901 - New Irvington Tunnel and CUW38101 - SVWTP Expansion & Treated Water Reservoir projects were not re-baselined for schedule under the June 2009 Revised WSIP.

The delay recorded for the ROW Phase is to a great extent a carryover from the delay in the Environmental Phase since some land entitlement and encroachment removal actions cannot be initiated until after a project has formally been approved following CEQA certification. It should be noted that the ROW Phase has not delayed any project to date.

The delay recorded for the Close-Out Phase is attributed to 2 projects – CUW37001 – Pipeline Repair & Readiness Improvements, and CUW35801 – Sunset Reservoir – North Basin. In both cases, additional construction work had to be completed, which delayed the Close-Out Phase. It should be noted that both projects were not re-baselined for schedule under the June 2009 Revised WSIP.

The relative progress of the different regions is summarized in Table 1.2.

Table 1.2 Regional Performance (1)

			July 1, 2009	
			% Planned	**% Actual**
San Joaquin Region	Comparison with last quarter data not provided because program baseline was changed and such comparison would not be meaningful.		17.1%	16.7%
Sunol Valley Region			12.3%	12.0%
Bay Division Region			14.6%	14.8%
Peninsula Region			14.8%	14.8%
San Francisco Regional Region			48.7%	48.5%
System-Wide			30.1%	29.0%
Regional Program Cumulative			**16.7%**	**16.6%**

Notes:
1. See Appendix A.2 (Definition and How to Read PSR's) for explanation of percentage calculations

1.0 PROGRAM SUMMARY

All regions are tracking within +/_ 10% of early planned performance, which is considered acceptable. The delay recorded for San Joaquin Region is due to slippage in attainment of the Draft Environmental Impact Report (DEIR) certification for CUW37301 – San Joaquin Pipeline System Project, which was resulted from a couple of weeks delay in completion of response to public review comments. However, the San Francisco Planning Commission certified the EIR for the CUW37301 – San Joaquin Pipeline System Project on 07/14/09. The overall delay recorded for the Sunol Valley Region is due to delays in the Environmental Phase of the CUW35901 - New Irvington Tunnel and CUW38101 - SVWTP Expansion & Treated Water Reservoir Projects. The delay recorded for the San Francisco Regional is due to delay in completion of Close-out phase for CUW35801 – Sunset Reservoir – North Basin. However, the Sunset Reservoir was placed in active service on January 16, 2009. The delay recorded for the System-Wide Region is due to delay in the Planning Phase of CUW39401 – Watershed Environmental Improvement Program. It should be noted that in accordance with the June 2009 Revised WSIP adopted by the SFPUC Commission on July 28, 2009, the baseline (approved) schedules for all above mentioned projects were not changed.

Project Phase Status

As of July 1, 2009, there are two (2) projects in the Planning Phase, eleven (11) projects in the Design Phase, six (6) projects in the Bid and Award Phase, five (5) projects in the Construction Phase, two (2) projects in the Close-Out Phase, eight (8) projects are completed, one (1) project has not been initiated, and eleven (11) projects have multiple active phases. As of July 1, 2009, one (1) project has not initiated their Environmental Phase, twenty (20) are undergoing environmental review, and twenty-two (22) have completed their Environmental Phase.

1.0 PROGRAM SUMMARY

Table 1.3 Projects Status

CUW	Project	Active Phase	Environmental Phase
San Joaquin Region			
36401	Lawrence Livermore Water Quality Improvement	Bid & Award	Completed
37301	San Joaquin Pipeline System	Design	Active
37302	Rehabilitation of Existing San Joaquin Pipelines	Planning, Design, Bid & Award	Active
38401	Tesla Treatment Facility	Design, Construction	Completed
38701	Tesla Portal Disinfection Station (combined with 38401)	Combined with 38401	Not Applicable
Sunol Valley Region			
35201	Upper Alameda Creek Filter Gallery	Planning	Active
35501	Standby Power Facilities - Various Locations	Construction	Completed
35901	New Irvington Tunnel	Design	Active
35902	Alameda Siphon #4	Bid & Award	Active
37001	Pipeline Repair & Readiness Improvements	Completed	Completed
37401	Calaveras Dam Replacement	Design	Active
37402	Calaveras Reservoir Upgrades (Completed)	Completed	Completed
37403	San Antonio Backup Pipeline	Design	Active
38101	SVWTP Expansion & Treated Water Reservoir	Design	Active
38102	SVWTP Calaveras Road (Deleted)	Deleted	Not Applicable
38103	SVWTP New Pipeline	Combined with 38101	Not Applicable
38201	SVWTP Treated Water Reservoir (Combined with CUW38101)	Combined with 38101	Not Applicable
38601	San Antonio Pump Station Upgrade	Bid & Award	Completed
Bay Division Region			
35301	BDPL Nos. 3 & 4 Crossover/Isolation Valves	Close-Out	Completed
35302	Seismic Upgrade of BDPL Nos. 3 & 4	Design	Active

1.0 PROGRAM SUMMARY

CUW	Project	Active Phase	Environmental Phase
36301	SCADA System - Phase II	Design, Bid & Award, Construction	Active
36302	System Security Upgrades	Planning, Design, Bid & Award, Construction	Active
36801	BDPL Reliability Upgrade - Tunnel	Design, Bid & Award	Active
36802	BDPL Reliability Upgrade - Pipeline	Design, Bid & Award	Part of 36801
36803	BDPL Reliability Upgrade - Relocation of BDPL Nos. 1 & 2	Bid & Award	Completed
38001	BDPL Nos. 3 and 4 Crossovers	Bid & Award, Construction	Completed
38901	SFPUC/EBMUD Intertie	Close-Out	Completed
39301	BDPL No. 4 Condition Assessment PCCP Sections	Completed	Completed
Peninsula Region			
35401	Lower Crystal Springs Dam Improvements	Design	Active
35601	New Crystal Springs Bypass Tunnel	Construction	Completed
35701	Adit Leak Repair - Crystal Springs/Calaveras (Completed)	Completed	Completed
36101	Pulgas Balancing - Inlet/Outlet Work (Completed)	Completed	Completed
36102	Pulgas Balancing - Discharge Channel Modifications	Construction	Completed
36103	Pulgas Balancing - Structural Rehabilitation and Roof Replacement	Design, Bid & Award	Active
36104	Pulgas Balancing - Laguna Creek Sedimentation (Closed)	Closed	Completed
36105	Pulgas Balancing - Modifications of the Existing Dechlorination Facility	Design	Active
36501	Cross Connection Controls	Completed	Completed
36601	HTWTP Short-Term Improvements - Demo Filters (Completed)	Completed	Completed
36602	HTWTP Short-Term Improvements - Remaining Filters (Combined with CUW36603)	Combined with 36603	Not Applicable

1.0 PROGRAM SUMMARY

CUW	Project	Active Phase	Environmental Phase
36603	HTWTP Short-Term Improvements - Coagulation & Flocculation/ Remaining Filters	Construction	Completed
36701	HTWTP Long-Term Improvements	Design	Active
36702	Peninsula Pipelines Seismic Upgrade	Not Initiated	Not Initiated
36901	Capuchino Valve Lot Improvements (Completed)	Completed	Completed
37101	Crystal Springs/San Andreas Transmission Upgrade	Design	Active
37801	Crystal Springs Pipeline No. 2 Replacement	Design	Active
37901	San Andreas Pipeline No. 3 Installation	Bid & Award	Completed
39101	Baden and San Pedro Valve Lots Improvements	Construction	Completed
San Francisco Regional Region			
30103	Regional Groundwater Storage and Recovery	Design, Bid & Award, Construction	Active
35801	Sunset Reservoir - North Basin	Construction, Close-Out	Completed
37201	University Mound Reservoir - North Basin	Bid & Award	Completed
System-Wide Region			
38801	Programmatic EIR	Completed	Completed
38802	Habitat Reserve Program	Design, Construction	Active
39401	Watershed Environmental Improvement Program	Planning	Not Initiated

1.0 PROGRAM SUMMARY

1.3 PROGRAM UPDATE

Program Management

During the reporting quarter, WSIP Program Management efforts continued to focus on several key activities including program level contracts, various ongoing program control initiatives, and system shutdown planning and public and contractor outreach efforts. In addition, efforts were spent on addressing follow up comments provided by regulatory agencies and the Bay Area Water Supply & Conservation Agency (BAWSCA) on the WSIP proposed changes, as well as on a number of other activities related to the implementation of the program.

The 2nd Quarter - Fiscal Year 2008-2009 (Q2-FY08/09) Regional Projects Quarterly Report listed commitments that were made to the California Department of Public Health (CDPH) and the California Seismic Safety Commission (CSSC) in response to their concerns about the program changes approved in 2008. Progress was made during the last quarter on some of the commitments to CDPH that were included in a letter to them from the SFPUC on November 13, 2008, as reported below:

Conduct independent technical review for the CUW35902 - Alameda Siphon #4 project to assure seismic reliability; investigate potential additional capital and operational response improvements that may increase seismic reliability in the Sunol Valley; create and implement a seismic response strategy for the Sunol Valley, as well as update Operational Response Plans to address response procedures including operation of WSIP facilities following major seismic events. A review by seismic design experts was performed for the Alameda Siphon #4 project, focusing on the adequacy of the design to withstand a Calaveras design earthquake. In the draft report "Draft: Seismic Review of Alameda Siphon #4 Project" (URS, March 12, 2009), the Review Team concluded that an "acceptable standard of care" was applied to the design, and that the "project uses appropriate technology to achieve the WSIP goals." The report was finalized May 21, 2009. In addition to this review, the Sunol Valley Seismic Reliability Assessment final draft was completed May 2009. It presents the results of various reviews and evaluations that the SFPUC has conducted regarding the level of seismic reliability that will be provided in the Sunol Valley following completion of the WSIP. The intent is to:

- Verify the adequacy of the existing and proposed facilities and operational requirements to meet their intended purposes in satisfying the seismic reliability level of service (LOS) goals.
- Identify potential weaknesses.

- Identify additional improvements that might increase reliability beyond the requirements of the seismic reliability LOS goals.

There has been a significant amount of detailed evaluation and design performed to date on the individual facilities in the Sunol Valley so that these facilities comply with the seismic reliability LOS goals. However, in some cases, reliability may be further increased through a combination of synergistic improvements to multiple projects, including both capital and operational, that would not be achievable by a single project. Key recommendations from the document have been incorporated or are being considered for incorporation in several projects.

Progress was made during the last quarter on the SFPUC's commitments to the CSSC that were included in a letter to the CSSC dated November 13, 2008. During the past quarter, SFPUC facilitated URS Consultants' presentation on their approach to the design of a seismically reliable pipeline at the Bay Division Pipelines Nos. 3 and 4 Hayward Fault crossing to the independent Seismic Safety Task Force (SSTF), as well as AECOM's approach to seismic reliability modeling and analysis. The Seismic Safety Task Force will be following up with written recommendations regarding "Revised General Seismic Requirements for Design of New Facilities and Upgrade of Existing Facilities – Revision 1" (SFPUC, December 22, 2008) in the next quarter. In addition, they will also provide their written recommendations regarding the proposed reduction of redundant seismically reliable pipeline at the Bay Division Pipelines Nos. 3 and 4 Hayward Fault crossing.

SFPUC staffs are scheduling to meet with the SSTF again in the next quarter to follow up on two remaining items:

a) Magnitude of design earthquakes for WSIP projects impacted by the Calaveras Fault;
b) Size and consistency of design fault displacements at pipeline crossings. The SSTF confirmed in a meeting on May 11, 2009 that the size of design fault displacements used for WSIP projects is reasonable and consistency has been maintained among projects, and the SSTF indicated they will be providing written recommendations in the upcoming quarters.

During the CSSC meeting on October 28, 2008, the SFPUC concurred with the CSSC that two issues warranted evaluations by external experts/consultants:

a) **Redundancy of the Alameda Siphon Project and alternative connections between the Sunol Valley Water Treatment Plant and the Irvington Tunnel.** A draft report titled, "Sunol Valley Seismic Reliability Assessment" by CH2M Hill has been completed. The final draft report was completed in May 2009. As discussed above, key recommendations from the document have been incorporated or are being considered for incorporation in several projects.

b) **Faulting and slope stability issues at the Harry Tracy Water Treatment Plant (HTWTP): Status of the two reports for HTWTP is as follows:**
   - "Draft Seismic Risk Assessment for Treated Water Reservoirs" by Exponent Failure Analysis Associates (December 2008). Final draft report was submitted to SFPUC at the end of June 2009. The consultant will issue the final report this quarter.
   - "Supplemental Fault Rupture Hazard Assessment" by William Lettis & Associates, Inc. was finalized in March 2009.

The SFPUC continued to prepare a Preliminary Official Statement in anticipation of issuing the second round of WSIP bonds in August 2009. The expected total bond size is an estimated $375 million in one or more series and proceeds will be used to defease outstanding commercial paper as well as continue funding WSIP capital projects.

During this reporting period, ongoing efforts aimed at improving the WSIP Program Controls System and processes included the following accomplishments: (1) Performing a thorough and systematic analysis of program scope, cost and schedule to generate the proposed program changes; (2) establishing detailed project baselines for monitoring, controlling and reporting purposes; (3) providing online "dashboard" access to the Construction Management Consultants to view respective projects schedule at the program level; and (4) holding cost estimating training sessions.

Planning efforts associated with system shutdowns continued during the reporting quarter. The WSIP Management Team held multiple meetings with the SFPUC Water Enterprise to coordinate the planning, scheduling, staffing, and work-around plans for the WSIP system shutdowns required through 2014. A number of special shutdown meetings were also held to plan for the Coast Range Tunnel shutdown in January 2010. The WSIP Master System Shutdown schedule and a summary of the changes made to the schedule since it was last updated in October 2008 was issued and distributed to the BAWSCA on May 8, 2009.

WSIP Communications orchestrated two major groundbreaking events for regional projects in the Peninsula and San Joaquin Regions during the quarter. These events resulted in significant media coverage regarding WSIP. Additionally, Communications collaborated with the WSIP Construction Management team in the first of several orientation trainings for staff and consultant teams managing WSIP projects in construction. Communications also activated its program consultant to audit Communications planning and execution in all regions and implement new action plans and procedures for WSIP communications in the field.

The groundbreaking for the CUW35601- New Crystal Springs Bypass Tunnel coincided with the anniversary of the 1906 earthquake and was collaboration with US Geological Survey as well as San Mateo Board of Supervisors. The event received widespread media coverage. In May 2009, the USGS prominently displayed WSIP projects and efforts to seismic retrofit the regional water system as part of its annual open house that drew 10,000 guests. In San Joaquin, the Mayor of San Francisco and President of the San Joaquin Board of Supervisors along with representatives of the U.S. Environmental Protection Agency (EPA) broke ground for the CUW38401 - Tesla Treatment Facility Project near Tracy, CA. Again, this event brought significant media attention to WSIP around the state.

San Joaquin regional Communications Liaison coordinated briefings before the Stanislaus and San Joaquin Board of Supervisors, Riverbank City Council and respective Irrigation Districts' Commissions. In the Sunol region, briefings continue with key Alameda County representatives and the Sunol Citizens Advisory Committee. Additionally, Communications is planning an event with the Sunol School to kick-off the first WSIP project in the Sunol Valley: CUW35902 - Alameda Siphon #4. As the Bay Division region prepares for environmental certification hearings, Communications is taking the lead to arrange final meetings with all municipalities and counties on the Memorandums of Understanding (MOU) for CUW36801/36802 - BDPL Reliability Upgrade – Tunnel/Pipeline Projects. In the Peninsula region, Communications is onsite regularly at New Crystal Springs Tunnel site, as well as focusing on outreach around Daly City and Sawyer Camp Trail projects. With final approval of CUW 37901 - San Andreas Pipeline #3 Installation Project, Communications is refining outreach plans for 4.4 mile pipeline between Daly City and San Francisco's Stonestown neighborhood.

Coordination with the Arts Commission Civic Design Review Committee has produced a design charrette for water supply groundwater projects. This innovative solution will help streamline approvals for more than 20 ground well sites in northern San Mateo County and within San Francisco.

Social marketing continues to be an increasingly popular platform to promote the WSIP projects among neighbors and others. Upcoming refinements to the WSIP website will enable visitors to access blogs quicker for project updates. Additionally, WSIP will add an environmental section to highlight environmental management on projects throughout the regions.

Contracting Outreach staff held a successful Contractor's Fair on April 1 in San Mateo, coordinating with both the Peninsula Builder's Exchange and the WSIP Small Business Advisory Committee. More than 75 contractors and primes from the area attended as did San Mateo Supervisor Rose Jacobs Gibson. Throughout the quarter, this team certified 13 new local business enterprise (LBE) contractors and subcontractors in the regions. Since July 1, 2008, 103 LBE contractors have been certified.

Contracting Outreach also assisted with numerous pre-bid conferences for WSIP Projects. In June, the team hosted another successful Contractor's Breakfast with a film highlighting labor's successful involvement within WSIP and the strides SFPUC has made to improve the contracting process. WSIP's presence at Rapid Excavation and Tunneling Conference (RETC), also in June, provided national exposure to several upcoming WSIP projects that will be out for bid in the coming year.

Planning/Design

Planning and design efforts continue with most projects achieving their key scheduled milestones. All regional projects with the exception of two projects (CUW35201 – Upper Alameda Creek Filter Gallery and CUW39401 – Watershed Environmental Improvement Program) have now entered the Design Phase. During this reporting period, the Design Phase for the CUW37901 - San Andreas Pipeline No. 3 Installation, and CUW38601 - San Antonio Pump Station Upgrade Projects were completed. The 35% design package for the CUW35302 – Seismic Upgrade of BDPL Nos. 3 & 4 Project, and the 95% design package for the CUW38401 – Tesla Treatment Facility, CUW36301 – SCADA System – Phase II, CUW35401 – Lower Crystal Springs Dam Improvements, CUW38101 – SVWTP Expansion & Treated Water Reservoir, and CUW5901 – New Irvington Tunnel Projects were all completed.

In addition, the construction bid packages for the CUW36401 - Lawrence Livermore Water Quality Improvement, CUW37302 - Rehabilitation of Existing San Joaquin Pipelines (Roselle Crossover), CUW37901 - San Andreas Pipeline No. 3 Installation, CUW36103 -Pulgas Balancing – Structural Rehabilitation and Roof Replacement, and CUW38601 - San Antonio Pump Station Upgrade Projects were advertised.

A Cooperative Agreement with Caltrans District 4 for proposed improvements in connection with WSIP within the State Highway System ROW was executed on February 19, 2009, and will be effective through December 31, 2017. To date, WSIP has received sixteen (16) encroachment permits from Caltrans. As a part of this agreement, the SFPUC agreed to establish a Construction Zone Enhancement Enforcement Program (COZEEP), working with the California Highway Patrol (CHP) for traffic safety on State highways. This quarter, an agreement with the California Highway Patrol (CHP) to provide the COZEEP services during construction of the improvements has been drafted. This agreement will help facilitate construction around State highways by providing supplemental CHP officers to assist the SFPUC and its contractors in the management of traffic in order to enhance the safety of motorists, pedestrians, and construction workers.

To ensure all WSIP projects share a common contract basis, the Engineering Management Bureau (EMB) has completed work on the "baseline template" for the Division 0 (Procurement and Contracting Requirements) and Division 1 (General Requirements) Specifications.

Environmental

Keeping the environmental review process on track with scheduled performance has been one of the program's greatest challenges. This challenge encompasses the following factors: (1) the early decision to conduct the Pre-Construction Phases (planning, design, and environmental) for the WSIP in parallel. Although this approach saves time overall and is practiced on major infrastructure programs, it requires several iterations of environmental reviews as design progresses and projects scopes are modified. (2) Preparation of the Draft PEIR in parallel with individual project EIRs. Additional time was needed to accomplish the necessary level of consistency of individual documents with the PEIR. (3) New environmental resource issues surfaced during report preparation that was initially excluded from consideration. For example, Steelhead fisheries analyses, previously anticipated to be completed under a separate permitting process, are now required for completion of the environmental review for the CUW37401 - Calaveras Dam Replacement Project. (4) Inadequate consultant resources have resulted in prolonged document reviews by the Major Environmental Analysis Division of the San Francisco Planning Department (MEA) and termination of two consultant contracts. Having released two consulting firms, the transition to new consultants extended the schedule. (5) Several projects were delayed as a result of the decision by MEA to prepare EIRs instead of Mitigated Negative Declarations (MNDs) on some projects, thus prolonging the Environmental Phase.

The SFPUC Bureau of Environmental Management (BEM) continues to work closely with the SFPUC Water Enterprise, MEA, the Office of the City Attorney and the environmental consultants to mitigate delays in the environmental review process. In addition to hiring new consultants for some projects, additional consultants have been hired to supplement MEA's staff and to supplement some existing consulting contracts.

During the reporting quarter, significant progress was made in certification of several Environmental Impact Reports (EIRs), completion and publication of several Draft EIRs and receipt of other California Environmental Quality Act (CEQA) clearances. Specific CEQA review accomplishments include the following:

The San Francisco Planning Department approved the Mitigated Negative Declaration (MND) for the CUW36103 – Pulgas Balancing - Structural Rehabilitation and Roof Replacement Project on May 14, 2009.

The San Francisco Planning Commission certified the Environmental Impact Report for the CUW37901 – San Andreas Pipeline No. 3 Installation - Project on April 2, 2009

Response to Comments documents were published for the CUW37301 - San Joaquin Pipeline System and CUW36801/CUW36802 – BDPL Reliability Upgrade – Tunnel/ Pipeline Projects on May 14, 2009 and June 18, 2009 respectively.

The Notice of Preparation (NOP) document for the Environmental Impact Report for CUW30103 - Regional Groundwater Storage and Recovery Project was published on June 22, 2009.

Draft Environmental Impact Reports (EIR) were published for the CUW35901 – New Irvington Tunnel and CUW38101 – SVWTP Expansion & Treated Water Projects, both on June 1, 2009.

Resource agency permitting involves the environmental permits that must be obtained prior to construction from the following agencies: US Army Corps of Engineers (USACE), the US Fish and Wildlife Service (USFWS), the National Marine Fisheries Service (NMFS), the State Historic Preservation Officer (SHPO), the California Department of Fish and Game (CDFG), and the Regional Water Quality Control Board (RWQCB).

Significant progress was made on environmental permitting activities. Specific permitting accomplishments during the reporting period are summarized below.

<u>*Permits Applications Submitted:*</u>

- CUW36801 – BDPL Reliability Upgrade - Tunnel:
    - USACE submitted Letter to SHPO for 106 concurrence

- CUW 35901 - New Irvington Tunnel:
  - Submitted 404 Application to USACE
  - Submitted Biological Assessment to USFWS
- CUW37401 – Calaveras Dam Replacement:
  - Submitted Draft Biological Assessment to NMFS
  - Submitted Section 404 Individual Permit Application to the USACE
  - Submitted Biological Assessment to USFWS
- CUW 38101 – SVWTP Expansion & Treated Water Reservoir:
  - Submitted 404 Application to USACE
  - Submitted Biological Assessment to USFWS

Permits Received:

- CUW35902 – Alameda Siphon #4:
  - Completed 401 Water Quality Certification from the RWQCB
- CUW37401 – Calaveras Dam Replacement:
  - Received Approval on Second Supplemental Wetland Delineation Report for verification

Environmental Construction Compliance Management

During this reporting period, the WSIP Environmental Construction Compliance Manager (ECCM) coordinated completion of the Environmental Mitigation Section of the Contract Specifications for one (1) project (CUW36801 – BDPL Reliability Upgrade – Tunnel (East Bay Segment)) and four (4) others are in progress (CUW35901 – New Irvington Tunnel, CUW37301 - San Joaquin Pipeline System, CUW36801 – BDPL Reliability Upgrade – Tunnel (Peninsula Segment), and CUW38101 – SVWTP Expansion & Treated Water Reservoir Projects). Preconstruction planning efforts focused on finalizing environmental construction compliance contracts for Peninsula Region and performing other tasks supporting the environmental compliance program for this region. In addition, agency coordination/reporting and minor project modification approvals supported pre-construction and construction phases for the CUW35601 - New Crystal Springs Bypass Tunnel, CUW38401 - Tesla Treatment Facility, CUW36102-Pulgas Balancing - Discharge Channel Modifications, CUW39101 - Baden and San Pedro Valve Lots Improvements, and CUW38001 – BDPL No. 3 & 4 Crossovers Projects. A training manual for Environmental Inspectors was developed.

Right-of-Way

The ROW engineering, surveys and appraisals have been completed for the CUW36801 - BDPL Reliability Upgrade - Tunnel Project. The project passes through the lands of

USFWS, State Lands, Mid-Peninsula Open Space, Sam-Trans and Leslie Salt. Each of these ownerships will involve different and challenging land acquisition processes.

Encroachment removal activities continues for the CUW36802 - BDPL Reliability Upgrade - Pipeline Project. The Right-of-Way (ROW) Team is now focusing on the remaining difficult encroachments and is diligently working with the City Attorney's Office to find solutions for removal which may include litigation if absolutely necessary. The ROW Team is also mapping and appraising the Bay Road parcel and the City of Fremont Access Road.

The appraisal process was completed for the CUW38001 - BDPL No. 3 & 4 - Crossovers Project and the land acquisition process is underway. Negotiations resulted in a successful settlement on the Guadalupe site in Santa Clara. Discussions continue with Cal Water.

The ROW Team received the final alignment for the CUW35901 - New Irvington Tunnel Project and the ROW mapping has been completed. A significant portion of the appraisal work is underway on this project and the Project Team is meeting with the property owners to explain the ROW process. Initial relocation planning has also commenced.

A ROW Encroachment Team was set up for the CUW37301 - San Joaquin Pipeline System Project. Sixty-nine (69) encroachments have been identified and contact has been initiated via letter and personally. ROW engineering and surveys work have commenced and are ongoing. The appraisal process was also initiated on this project.

Overall, the ROW Team is making steady progress; however, delays in the environmental review of some projects have impacted the ROW Team's ability to initiate some tasks that require CEQA approval first.

Construction

Significant efforts continued on implementing the construction management (CM) approach, structure, processes, procedures and systems, and recruiting the consultants and staffing required managing all upcoming construction activities.

Pre-construction planning:
Pre-construction planning efforts focused on: (1) finalizing of CM Procedures based on the WSIP CM Plan: 46 out of 49 procedures are posted as final on the WSIP section of the SFPUC website (sfwater.org/WSIP) and the SFPUC network drives; (2) implementing

the SFPUC revised construction specifications (Perfectus Version 3 for Division 0 and Division 1) on WSIP projects; (3) updating the CM Staffing Plan to manage consultant needs and internal hiring/re-assignment requirements based on schedule update of several WSIP projects and the transition of City staff to CMB; and (4) implementing the WSIP CM Management Information System (CMIS) to provide efficient and consistent management of various CM processes such as submittals, requests for information, written communications, and changes. Preparation of CM Construction Procedures is 98% complete as of the end of the reporting quarter. A thorough QA review has been completed and revisions to incorporate all comments are currently in progress for the WSIP Business Processes, CM Procedures, and the CM Plan.

<u>Construction Management Information System (CMIS)</u>:
The WSIP CMIS continued to be transitioned into use on WSIP projects. The CMIS was implemented on the following projects:

- CUW35601 - New Crystal Springs Bypass Tunnel Project, which had its NTP in December 2008.

- CUW38401 - Tesla Treatment Facility Project, which had its construction NTP in March 2009.

- CUW39101 - Baden and San Pedro Valve Lot Improvements Project, which had its NTP in April 09.

- CUW36102 –Pulgas Balancing - Discharge Channel Modifications Project, which had its NTP in April 09.

As of this reporting quarter, a total of about 80 individuals consisting of construction contractors, CM Consultants and SFPUC WSIP employees had received CMIS training.

<u>CM Contract Agreements and Progress</u>:
Significant efforts were made continuing to select and put in place Construction Management Consultants for the WSIP. As of the end of the quarter, the following CM Contract Agreements were in effect:

- CS-910: Construction Management (CM) Services for WSIP - San Francisco Region/Local;
- CS-912: Construction Management (CM) Services for WSIP - New Crystal Springs Bypass Tunnel Project;
- CS-913: Construction Management (CM) Services for WSIP - Bay Tunnel Project;

- CS-914: Construction Management (CM) Services for WSIP – Bay Division Region;
- CS-917: Construction Management (CM) Services for WSIP - San Joaquin Region

Two other Contract Agreements for CM services were awarded and were in process of negotiations:
- CS-915R: Sunol Regional Construction Management (CM) Services and
- CS-918: Construction Management (CM) services for WSIP - New Irvington Tunnel Project.

An additional contract Agreement for CS-916: Peninsula Regional Construction Management (CM) Services has been advertised and is in the selection process for ranking and award to the most qualified proposer.

Three (3) other Construction Management (CM) services RFPs have yet to be advertised: CS-911R Calaveras Dam, HTWTP Long-term Improvement project and Seismic Upgrade of BDPL No. 3 & 4. (CS numbers have not been assigned to the last two projects).

<u>Partnering/Disputes Review Advisors (DRA)/Disputes Review Boards (DRB)</u>:
Formal partnering and informal partnering is being conducted with Project CM teams including CM Consultants, City CM Staff and Construction Contractors. Additionally, alternative dispute resolution methods involving independent third party Disputes Review Advisors or Disputes Review Boards are being put into place on all medium to large WSIP construction contracts.

<u>Supplier Quality Surveillance (SQS)</u>:
During this reporting period, Parsons as a part of their Pre-construction services has developed SQS Plans for scoping independent third party quality assurance in SFPUC and Construction Contractor vendor fabrication facilities which are providing permanent plant equipment and materials for WSIP construction projects. This is being done to assure that complex equipment and equipment critically needed as a prerequisite to major system shutdowns is delivered on time and to specified quality requirements. SQS Plans for the following projects were developed this reporting period:
- CUW38401 - Tesla Treatment Facility
- CUW37301 – San Joaquin Pipeline System (Contract 1)
- CUW35902 - Alameda Siphon #4
- CUW38001 - BDPL Nos. Crossovers
- CUW39101 – Baden and San Pedro Valve Lots Improvements

1.0 PROGRAM SUMMARY

Program Construction Management:
AECOM began work as Program Construction Management (PCM) team in March, 2009 providing management oversight of construction and implementation of the WSIP CM Plan and processes at the program level. As of June 30, 2009, the PCM team is fully mobilized.

WSIP Construction Management Training:
The first Construction Management (CM) Orientation and Training Session was conducted in June, 2009. The session provided a one-day hands-on workshop to provide a practical overview and working knowledge of the WSIP CM Plan and Procedures, key contractual and regulatory requirements, and the CM role in implementing these in a correct and consistent manner. These sessions will continue to be provided as Project CM teams are mobilized and put in place.

Project Achievements

Planning Phase Completed:
- None

Environmental Phase Completed:
- CUW37901 - San Andreas Pipeline No. 3 Installation
- CUW38801 - Programmatic EIR

Design Phase Started:
- None

Design Phase Completed:
- CUW37901 - San Andreas Pipeline No. 3 Installation
- CUW38601 - San Antonio Pump Station Upgrade

Construction Contract Advertised:
- CUW36103 - Pulgas Balancing - Structural Rehabilitation and Roof Replacement
- CUW36401 - Lawrence Livermore Water Quality Improvement
- CUW38001 – BDPL No. 3 and 4 – Crossovers
- CUW37901 - San Andreas Pipeline No. 3 Installation
- CUW38601 - San Antonio Pump Station Upgrade

Construction Contract Awarded:

1.0 PROGRAM SUMMARY

- CUW35901 – Alameda Siphon #4
- CUW37201 - University Mound Reservoir - North Basin
- CUW37901 - San Andreas Pipeline No. 3 Installation
- CUW38001 - BDPL Nos. 3 and 4 Crossovers

Construction Final Completion:
- None

1.0 PROGRAM SUMMARY

2.0 SUB PROGRAM SUMMARY

2.5 WATER SUPPLY

Overall, the Water Supply projects are on schedule with an actual completion of 8.0% as compared to a planned completion of 8.8%. The Schedule Performance Index (SPI) for the Region is 0.91. This indicates that 91% of the work planned was performed as of the end of the reporting quarter. Earned Value exceeds actual costs to date by $2.1 million. The table below summarizes the overall progress of the Water Supply Sub Program during the reporting quarter.

Table 2.5 Sub Program Performance – Water Supply

			July 1, 2009	
			% Planned	**% Actual**
Project Management			26.5%	24.6%
Planning			65.6%	63.7%
Environmental			27.3%	16.0%
Right-of-Way			3.0%	0.5%
Design			7.8%	7.2%
Bid & Award			0.0%	0.0%
Construction Management			2.3%	2.3%
Construction			2.2%	2.2%
Close-Out			0.0%	0.0%
Program Cumulative			**8.8%**	**8.0%**

Comparison with last quarter data not provided because program baseline was changed and such comparison would not be meaningful.

In accordance with the June 2009 Revised WSIP adopted by the SFPUC Commission on July 28, 2009, a Water Supply sub program comprising of seven (7) projects was added to the Local projects. The following changes were made to the Baseline (Approved) Budget and Schedule of the seven (7) projects in this sub program:

<u>Projects with Changes to Baseline (Approved) Schedule and Budget</u>

- CUW30201 – San Francisco Westside Recycled Water
- CUW30204 – Harding Park Recycled Water

<u>Projects with Changes to Baseline (Approved) Schedule</u>

2.0 SUB PROGRAM SUMMARY

- CUW30102 – San Francisco Groundwater Supply

Projects with Changes to Baseline (Approved) Budget

- CUW30101 – Lake Merced Water Levels Restoration
- CUW30202 – Recycled Water Project – Pacifica (Closed)

Projects with No Changes to Baseline (Approved) Budget and Schedule

- CUW39001 – SF Bay Area Desalination Plant (On Hold)

Additionally, one (1) new project, CUW30205 – San Francisco Eastside Recycled Water was added to this sub program.

Planning
Planning phase is slightly behind schedule with an actual completion of 63.7% versus 65.6% for planned. Planning Phase activities for the CUW30201 – San Francisco Westside Recycled Water–completed the Final Preliminary Project Scope Description. Planning activities for the CUW30101 –Lake Merced Water Levels Restoration involve revision to the Draft CER.

Environmental
Environmental phase is behind schedule with an actual completion of 16.0% versus 27.3% for planned. Environmental Phase activities for the CUW30201 –Recycled Water Project – San Francisco Project resumed this quarter after the scope revision. The Administrative Draft EIR was issued for internal review for CUW30204 – Harding Park Recycled Water.

Design
Design phase is behind schedule with an actual completion of 7.2% versus 7.8% for planned. CUW30102 – San Francisco Groundwater Supply project team completed the 35% design milestone this quarter. For CUW30204 – Harding Park Recycled Water, 95% design completion is anticipated by next quarter.

Construction
Construction phase is on schedule with an actual completion of 2.2% versus 2.2% for planned. There were no significant Construction Phase activities on any of the projects in the Water Supply Sub Program.

3.5 WATER SUPPLY

Quarterly Project Status Report

As of July 1, 2009

Title: **CUW30101 - Lake Merced Water Level Restoration**	PE: Debra Temple, DPW
PM: Betsey Eagon	CM: Ben Leung
Phone: 415-554-1871	EPM: Yin Lan Zhang
AB1823: No	PCE: JP Torres

PROJECT STATUS:

Project Description:

The project consists of the development of a plan for operations and maintenance; construction of a stormwater treatment wetland, which will yield approximately 315 acre-feet (103 MG) per year for lake augmentation; and installation of up to two groundwater wells that will be used as the secondary water source to fill the lake.

Planning Status:

* The project is in the conceptual engineering phase. The Draft Conceptual Engineering Report (CER) is currently being revised, and the lake demand and a lake level response model were updated.
* The Final CER and the Planning Phase are expected to be completed by 10/01/09.

Environmental Status:

* The San Francisco Planning Department determined that this project requires an Environmental Impact Report (EIR).
* Environmental review is underway.

Right-of-Way Status:

* This project requires no land acquisitions and no encroachment removal actions.
* Discussions are being held with SFPUC Real Estate Services, City Attorney's office, and landowners to determine potential Right-of-Way and land acquisition/leasing issues.

Design Status:

* The Design Phase was initiated and procurement of the design consultant is underway.
* Bid Advertisement Date: Current Forecast: 04/23/12 / Approved: 10/17/11

Construction Status:

* Construction NTP Date: Current Forecast: 09/24/12 / Approved: 03/26/12
* The main Construction Phase has yet to be initiated. Construction costs to date reflect installation of an interim lake fill de-chlorination system completed in early 2005.

Major Issues/Potential Obstacles and Recommended Solutions:

* None at this time.

Schedule Variances:

In accordance with the June 2009 Revised WSIP adopted by the SFPUC Commission on July 28, 2009, the baseline (approved) schedule for this project was not changed.

The following variances are between the Current Forecast Date and Approved Finish Date:

* The 1-month variance for the Planning Phase is due to the additional work required for updating the design criteria and completing the conceptual design.
* The 6-month variance for the Project Management , Bid & Award , Construction Management , Construction and Closeout Phases is due to the inclusion of a Right-of-Way Phase.

Cost Variances:

* None at this time.

Title: **CUW30102 - San Francisco Groundwater Supply**	PE: Debra Temple, DPW
PM: Jeff Gilman	CM: Ben Leung
Phone: 415-551-2952	EPM: Yin Lan Zhang
AB1823: No	PCE: JP Torres

PROJECT STATUS:

Project Description:

This project consists of two phases, each delivering an annual average of 2 mgd. The first phase consists of building three or four new groundwater well stations in the San Francisco Sunset District or Golden Gate Park. All stations will include a building to house the well pump and electrical equipment, with two stations having an additional room for chemical disinfection. Buried piping will be installed to connect the well stations to the Sunset Reservoir. The second phase, consisting of improvements or replacement of two or more irrigation wells in Golden Gate Park, will be operational when the existing wells are no longer needed for irrigation (after implementation of the CUW30201 – San Francisco Westside Recycled Water Project). The facilities in Golden Gate Park will allow groundwater currently used for irrigation to be used as a potable water source. Improvements to the facilities at the existing San Francisco Zoo Well No. 5 have been completed, allowing this well to serve as an emergency potable water source.

Planning Status:

* The Planning Phase was completed on 12/12/06.

Environmental Status:

* The San Francisco Planning Department determined that this project requires an Environmental Impact Report (EIR).
* Environmental review is underway.

Right-of-Way Status:

* This project requires no land entitlement actions and no encroachment removal actions. However, funding is allocated for encroachment permits and other similar activities.
* Completed a Memorandum of Understanding with the San Francisco Recreation and Park Department (RPD) to address use of existing wells, selection of additional well station sites, pipeline routes and groundwater management in Golden Gate Park.

Design Status:

* Completed the 35% design of well stations and pipelines for the South Sunset Playground, West Sunset Playground, and Lake Merced Pump Station (first project phase). The 65% design for this phase is expected to be completed in the next reporting quarter.
* Began review of two existing irrigation wells and well stations in Golden Gate Park (second project phase) and the conceptual design for modifications to use these wells as a potable supply.
* Bid Advertisement Date: Current Forecast: 07/01/11 / Approved: 07/01/11

Construction Status:

* Construction NTP Date: Current Forecast: 12/19/11 / Approved: 12/19/11
* The main Construction Phase has yet to be initiated. Construction costs to date reflect installation of coastal groundwater monitoring wells, construction of Zoo Well No. 5 improvements, and construction of test wells at South Sunset Playground, West Sunset Playground and Lake Merced Pump Station.

Major Issues/Potential Obstacles and Recommended Solutions:

* Reaching concurrence with the RPD on a new well station site and pipeline routes in Golden Gate Park. Additional meetings with RPD staff and resolution of well site/pipeline routes are anticipated in the next reporting quarter.

Schedule Variances:

* None at this time.

Cost Variances:

In accordance with the June 2009 Revised WSIP adopted by the SFPUC Commission on July 28, 2009, the baseline (approved) construction budget for this project was not changed.
* The $4.7M variance between the Current Forecast Cost and the Approved Budget for the Construction Phase is due to revising the pipeline construction estimates based on increased lengths of pipeline routes and to the escalation associated with the extended environmental review period.

Title: **CUW30201 - San Francisco Westside Recycled Water**	PE: L. Wong
PM: Barbara Palacios	CM: Ben Leung
Phone: 415-554-0718	EPM: Scott MacPherson
AB1823: No	PCE: JP Torres

PROJECT STATUS:

Project Description:

This project consists of a new recycled water treatment facility at the western end of Golden Gate Park (the site of the former Richmond-Sunset Water Pollution Control Plant), along with the associated distribution system components to produce and deliver an annual average of approximately 2 mgd of recycled water to Golden Gate Park, Lincoln Park, and the SF Zoo. The proposed treatment scheme includes membrane filtration, reverse osmosis, and ultraviolet light disinfection. A 1.6 MG recycled water storage reservoir will be located underneath the treatment facility. Distribution pumping facilities will be located at the new facility, and will pump recycled water to the customers through approximately 5 to 6 miles of new pipelines. The project also includes the retrofitting of the existing irrigation systems to bring them in compliance with Title 22 regulations. The treatment facility includes additional capacity to serve potential future customers such as the Presidio Golf Course, although distribution system components to serve the Presidio are not part of the project scope.

Planning Status:

* SFPUC met with the Recreation & Park Department (RPD) in April 2009 to respond to their comments on the draft Project Scope Description. The Final Preliminary Project Scope Description was completed in June 2009.

Environmental Status:

* The San Francisco Planning Department determined that this project requires an Environmental Impact Report (EIR).

Right-of-Way Status:

* This project requires no land entitlement actions and no encroachment removal actions.

Design Status:

* Work on the 10% Design Report was initiated in May 2009.
* Bid Advertisement Date: Current Forecast: 06/09/11 / Approved: 06/09/11

Construction Status:

* Construction NTP Date: Current Forecast: 11/21/11 / Approved: 11/21/11
* The Construction Phase has yet to be initiated.

Major Issues/Potential Obstacles and Recommended Solutions:

* In June 2009, the RPD raised concerns regarding the exact placement of the treatment facility within the Richmond-Sunset site, noting potential visual impacts from nearby recreational areas. Uncertainties in the siting of the facility could delay aspects of the 10% Design effort, if not addressed immediately. The SFPUC will work with RPD to develop a comprehensive site plan that addresses space needs for the new recycled water facility, the existing South Windmill groundwater well facility (to be converted to potable supply as part of the CUW30102 - San Francisco Groundwater Supply Project), and future recreational uses for the site.

Schedule Variances:

* None at this time.

Cost Variances:

* None at this time.

AB1823: No	PCE: JP Torres

PROJECT STATUS:

Project Description:

The SFPUC, in partnership with North Coast County Water District, is implementing the Pacifica Recycled Water Project. The primary project elements will include a pump station at the recycling plant, a 400,000 gallon above-ground storage tank, and approximately 17,000 feet of pipe up to 18 inches in diameter. The project will also include site retrofits necessary for the use of the recycled water. North Coast County Water District is responsible for the design, environmental review and construction of this project. This project was closed in October 2008. The final project expenditures have been actualized in this Quarterly Report. The project will be completed using funds from the Water Enterprise capital budget instead of the WSIP budget. (No change from the last Quarterly Report)

Quarterly Project Status Report

As of July 1, 2009

Title: **CUW30204 - Harding Park Recycled Water**	PE: Sam Young
PM: Barbara Palacios	CM: Ben Leung
Phone: 415-554-0718	EPM: Antonia Fairbanks
AB1823: No	PCE: Mike Elwin

PROJECT STATUS:

Project Description:

The SFPUC, in partnership with the City of Daly City, is implementing the Harding Park Recycled Water Project. This project consists of providing the infrastructure needed to convey water supplied from the existing recycled water facility in Daly City (that is operated by the North San Mateo Sanitation District) to Harding Park. The project consists of approximately 4,700 feet of 18-inch pipe, a 700,000-gallon buried storage reservoir at the park, and two irrigation pumps. The golf course has already been retrofitted to accommodate the use of recycled water; however, some additional retrofits may be required at the park to meet regulatory requirements. The City of Daly City is the agency responsible for the design, environmental review and construction of this project.

Planning Status:

* The Planning Phase was completed on 10/07/08.

Environmental Status:

* The City of Daly City has determined that this project requires an Environmental Impact Report (EIR).
* The Administrative Draft EIR was issued in June 2009 for internal review.

Right-of-Way Status:

* This project requires no land entitlement actions and no encroachment removal actions.

Design Status:

* The design team is currently working on the 95% design package, scheduled to be issued in August 2009.
* Bid Advertisement Date: Current Forecast: 11/10/09 / Approved: 11/10/09

Construction Status:

* Construction NTP Date: Current Forecast: 04/06/09 / Approved: 04/06/09
* The Construction Phase has yet to be initiated.

Major Issues/Potential Obstacles and Recommended Solutions:

* The SFPUC has not been able to secure Phase I/Phase II design approval from the Civic Design Review Committee of the Arts Commission; this could lead to a delay in the completion of the final bid package. The SFPUC will schedule a follow-up meeting with members of the Civic Design Review Committee to better understand their concerns with the architectural design concept, and identify features/concepts that will gain Phase I/II/III design approval in July 2009.

Schedule Variances:

* None at this time.

Cost Variances:

* None at this time.

SUMMARY AND FINDINGS

Summary

In an effort to streamline the water supply planning process within the City and County of San Francisco (San Francisco or City), the San Francisco Public Utilities Commission (SFPUC) adopted a resolution in 2002 and 2006 to allow for all development projects requiring a Water Supply Assessment (WSA) under Water Code Section 10910 et seq. to rely solely on the adopted Urban Water Management Plan (UWMP) without having to go through the process of preparing individual WSAs. SB 610 provides a nexus between the regional land use planning process and the environmental review process. The core of this law is an assessment of whether available water supplies are sufficient to serve the demand generated by a project, as well as the reasonably foreseeable cumulative demand in the region over the next 20 years under a range of hydrologic conditions.

The San Francisco Planning Department (SF Planning) and the San Francisco Redevelopment Agency are currently engaged in planning for various proposed land development projects throughout San Francisco that go beyond those future developments considered in the 2005 UWMP update. As a result of these new developments, the SFPUC concluded that its 2005 UWMP no longer accounted for every project requiring a WSA (qualifying project) within San Francisco. Therefore, during this interim period until the 2010 UWMP is prepared, any qualifying projects not accounted in the 2005 UWMP will require preparation of a WSA per Water Code Sections 10910 – 10915 that considers the SFPUC's current and projected supplies when compared to projected demands associated with new growth not covered in the 2005 UWMP.

This Water Supply Availability Study (Study) was developed as an interim period study and follows the format of a WSA. The Study captures the most current water supply planning and demand information, analyzes the various projected change in water demands associated with each qualifying project within San Francisco, evaluates overall supply and demand, assesses the sufficiency of supply, and prepares a conclusion based on the analysis. Upon completion of the Study, a WSA for each qualifying project can rely on the information and conclusions of this Study.

Findings

The 2009 SF Planning projections result in a Retail demand in 2030 of 93.42 mgd (Section 5.0), which is only slightly greater than the 2030 demand estimates projected in the 2005 UWMP. This increase, however, does not change the results of the 2005 UWMP. The SFPUC can still meet the current and future demand of its Retail customers in years of average or above-average precipitation. During a multiple dry year event;[1] however, it is possible that the SPFUC will not be able to meet 100 percent of the Retail demand in 2030. This Study shows the results of implementation of SFPUC's local supply reliability improvements under all hydrologic

1 Multiple dry-year event is defined as a three-year hydrologic condition of below-normal rainfall per the Urban Water Management Planning Act.

conditions beginning in 2010 and extending to 2030. The ability to meet the demand of the Retail customers is in large part due to the development of 10 mgd of local supplies in the City through implementation of the Water Supply Improvement Program (WSIP). These addition sources of groundwater, recycled water, and conservation supplies are essential to provide the City with adequate supply in dry year periods, as well as improving supply reliability during years with normal precipitation.

In years with normal or above-normal precipitation, the City has sufficient supplies to serve its Retail customers. As shown in Table 6-1 (Section 6.0), the supply shortfall shown in 2010 is the result of reducing the Regional Water System (RWS) supply to 81 mgd per the condition of the Phased WSIP Variant, without full development of the additional 10 mgd of additional local supplies available in 2015. However, Retail demand is currently lower than projected 2010 demand of 91.81 mgd – demand in Fiscal Year 2007-2008 was 83.9 mgd.

During a multiple dry-year event as shown in Table 6-1, it is possible that the SFPUC will not be able to meet the full demands of its Retail customers in 2030, and will therefore have to impose reductions on its Retail supply. Under the Water Supply Allocation Plan (WSAP), Retail customers would experience no reduction in RWS deliveries within a 10 percent RWS shortage. However, during a 20 percent system-wide shortage, the Retail customers would experience a 1.9 percent reduction in Retail deliveries. This difference is due to the development of the additional 10 mgd of local supplies in the Retail service area. These additional local supplies are not subject to a reduction under the WSAP, as the WSAP only allocates water from the RWS.

The qualifying projects (Candlestick Point-Hunters Point Shipyard Phase II (CP-HPS II), Treasure Island-Yerba Buena Island (TI-YBI), and Parkmerced) anticipate developing new recycled water projects to help offset potable demand. These new projects could produce up to 1.5 mgd of recycled water. By reducing potable water demand through the use of recycled water, these projects have the ability to eliminate the City's overall water shortage during multiple dry year periods.

Regarding the availability of water supplies to serve the City, beginning in 2015 the SFPUC finds as follows:

- In years of average and above-average precipitation and including development of SFPUC's local WSIP water supply sources the SFPUC has adequate supplies to serve 100 percent of normal, single dry and multiple dry year demand up to 2030.[2]
- In multiple-dry-year events after 2030, when the SFPUC imposes reductions in its supply, the SFPUC has in place the WSAP and RWSAP to balance supply and demand.

2 The deficit shown in 2010 is the result of reducing the RWS supply to 81 mgd per the Phased WSIP Variant, without full development of the additional 10 mgd of new WSIP supplies. 10 mgd of new sources will be developed and available for use in San Francisco by 2015. However, Retail demand is currently lower than the 2010 projected demand (FY 07/08 use was 83.9 mgd). If Retail demand exceeds the available supply of 84.5 mgd between 2010 and 2015, the Water Supply Agreement allows the SFPUC to purchase additional water from the RWS. If combined Retail and Wholesale RWS deliveries exceed 265 mgd, the SFPUC Retail customers would be required to pay an Environmental Surcharge for RWS deliveries over 81 mgd (Total RWS deliveries in FY07/08 were 256.7 mgd).

- If recycled water is implemented as proposed at each of the major development project sites, then it is assumed that potable water demands for the City can decrease by up to 1.5 mgd; thereby, eliminating potential multiple dry-year deficit after 2030.
- With the WSAP and Retail Water Supply Allocation Plan (Section 4)in place, and the addition of local WSIP supplies, the SFPUC finds it has sufficient water available to serve the Retail customers including the demand of its Retail existing customers and planned future uses.

1.0 INTRODUCTION

1.1 Purpose

In an effort to streamline the water supply planning process within the City and County of San Francisco (San Francisco or City), the San Francisco Public Utilities Commission (SFPUC) adopted a resolution in 2002 and 2006 to allow for all development projects requiring a Water Supply Assessment (WSA) under SB 610 to rely solely on the adopted Urban Water Management Plan (UWMP)[3] without having to go through the process of preparing individual WSAs. SB 610 Water Code Section 10910 et seq. provides a nexus between the regional land use planning process and the environmental review process. The law also reflects the growing awareness of the need to incorporate water supply and demand analysis at the earliest possible stage in the land use planning process. The core of this law is an assessment of whether available water supplies are sufficient to serve the demand generated by a project, as well as the reasonably foreseeable cumulative demand in the region over the next 20 years under a range of hydrologic conditions.

The City of San Francisco Planning Department (SF Planning) and the San Francisco Redevelopment Agency are currently engaged in planning for various proposed land development projects that go beyond those future developments considered in the 2005 UWMP update. These developments, which include the Candlestick Point-Hunters Point Shipyard Phase II project (CP-HPS II), the Treasure Island-Yerba Island project (TI-TBI) and the Parkmerced project, hereinafter referred to as Projects, along with additional development throughout San Francisco account for 29,787 new dwelling units in 2030. As proposed, the Projects would contribute 27,400 new dwelling units to San Francisco's housing inventory. Additional development throughout the City accounts for the remaining 2,387 new dwelling units hereinafter referred to as Incremental Growth.

As a result of these new developments, the SFPUC concluded that its 2005 UWMP no longer accounted for every project requiring a WSA (qualifying project) within San Francisco. The SFPUC will not be preparing an updated UWMP until 2010. Therefore, during this interim period, any qualifying projects not accounted in the 2005 UWMP will require preparation of a WSA per Water Code Sections 10910 – 10915 that documents the SFPUC's current and projected supplies when compared to projected demands associated with new growth not covered in the 2005 UWMP.

The SFPUC determined that a WSA for the entire City and County service area, prepared pursuant to Water Code Sections 10910-10915, is the preferred method to evaluate supply and demands over a 20-year planning horizon. However, the Water Code Sections pertain to WSAs for qualifying projects, whereas the SFPUC needs a report to document its current and

---

3 California law requires that UWMPs be prepared and submitted in years ending with fives (5) and zeros (0). Pursuant to Water Code Section 10644(a), the SFPUC prepared and adopted its UWMP in 2005. The next UWMP is due prior to December 31, 2010.

projected supplies when compared to projected demands associated with new growth not covered in the 2005 UWMP. Therefore, this Water Supply Availability Study (Study) was developed and modeled on the format of a WSA. The Study captures the most current water supply planning and demand information, analyzes the various projected change in water demands associated with each qualifying project within San Francisco, evaluates overall supply and demand, assesses the sufficiency of supply, and prepares a conclusion based on the analysis. Upon completion of the Study, a WSA for each qualifying project can rely on the information and conclusions of this Study.

1.2 Previous SFPUC Water Resource Studies

In recent years, the SFPUC has been engaged in numerous water resource planning efforts focused on regional and local supplies options and demand management measures, which could potentially reduce the amount of water the SFPUC imports through the Regional Water System (RWS) to meet its Retail water demands. The current status of major local water supply planning efforts is summarized below:

- **San Francisco Retail Water Demands and Conservation Potential**: In November 2004, the SFPUC prepared the "City and County of San Francisco Retail Water Demands and Conservation Potential" study (Demand Report) to project SFPUC future Retail water demands through the year 2030. The study employed a disaggregated water use forecasting procedure, drawing from actual water use data, and reflects current and projected demographics and employment data, changes in use due to existing plumbing codes, and water use trends. The study also identified water savings and implementation costs associated with a number of water conservation measures. Much of the methodologies in the Demand Report became the backbone of the demand analysis used in the SFPUC's 2005 UWMP.

- **Groundwater Planning**: In April 2005, the SFPUC completed the Final Draft North Westside Basin Groundwater Management Plan (GWMP), which identified opportunities for increasing groundwater production in San Francisco.

- **Recycled Water Master Plan Update**: The SFPUC prepared the 2006 Recycled Water Master Plan for the City and County of San Francisco (RWMP). The plan provided guidance for San Francisco in the development of recycled water projects within the City and County. The 2006 RWMP included an assessment of potential recycled water users City-wide and focused on identifying future recycled water projects in the City.

- **Urban Water Management Plan**: The 2005 UWMP addressed SFPUC's Retail water needs and evaluated sources of water supply, described efficient uses of water, demand management measures, and implementation strategies. The projections in the UWMP employed the demand and conservation estimates contained in the Demand Report, and the potential for groundwater and recycled water developed in the aforementioned studies to help in meeting projected demands. For consistency with the UWMP demand analysis, this Study used some of the same demand methodologies as presented in Section 5.2 of this Study.

- **Sewer Master Plan**: The SFPUC is preparing a Sewer System Master Plan (SSMP). The SSMP will present a long-term strategy for the management of the City's wastewater and storm water and identify capital improvements to be implemented over the next 25 to 30 years. The development of the SSMP will also incorporate proposed recycled water projects in the area. The identification and evaluation of potential wastewater management alternatives include an assessment of opportunities to implement recycled water projects to supply potential recycled water users identified in the 2006 RWMP. Environmental review of the Draft SSMP is anticipated to be complete in 2011.

- **Diversifying Retail Water Supply Portfolios**: In May 2006, the SFPUC prepared the "Diversifying San Francisco's Retail Water Supply Portfolio: Technical Memorandum". The study brought together planning data from existing planning projects, such as the North Westside Basin Groundwater Management Plan and the Recycled Water Master Plan, and summarized the potential local water supply options for San Francisco (including recycled water, groundwater, conservation and desalination projects). The memo also presented the implications of implementing different combinations of these local supply options, in terms of costs, ratepayer impacts and drought impact.

- **Water System Improvement Program (WSIP)**: On October 30, 2008, SFPUC certified the Final PEIR for the WSIP, a multiple year, system-wide capital improvements program. Many aspects of the WSIP are rooted in the 2000 Water Supply Master Plan and various water system vulnerability studies. The WSIP investigated the potential options of developing local water resources such as water recycling, groundwater, desalination and improved conservation to meet SFPUC purchase requests or demands.

1.3 Study Outline

This Study is an assessment of whether available water supplies are sufficient to serve the SFPUC's existing and planned Retail water system future uses within San Francisco, including agricultural and manufacturing uses, over the next 20 years under a range of hydrologic conditions. This Study employs the same disaggregated water use forecasting procedures as the Demand Report but incorporates an update of the end-use numbers presented in the Demand Report based on updated housing and employment projections.

This document is divided into six sections as follows:

1. Introduction
2. Water Supply
3. Potential Impact of Climate Change on SFPUC Supply
4. Drought Planning and Water Supply Reliability

5. San Francisco Growth Projections and Water Demand Analysis
6. Supply and Demand Comparison and Conclusion

2.0 WATER SUPPLY

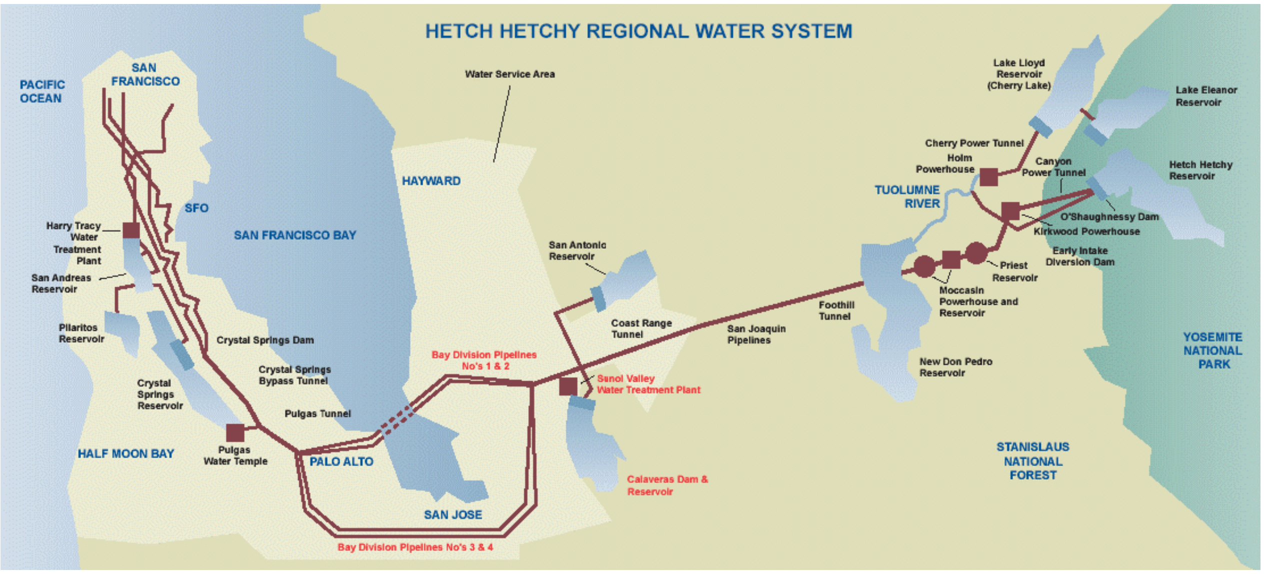
This section reviews San Francisco's existing and projected water supplies. The Regional Water System (RWS) is owned and operated by the City and County of San Francisco, under direction of the SFPUC. Historically, approximately 96 percent of the SFPUC's Retail water demands have been met through deliveries from the RWS. A small portion of San Francisco's water supply portfolio is produced through local groundwater and secondary treated recycled water. The groundwater is used primarily for irrigation at local parks and on highway medians. The recycled water is used mostly at municipal facilities for wastewater treatment process water, sewer box flushing and similar wash down operations.

In 1934, San Francisco combined the Hetch Hetchy system and Spring Valley system to create the SFPUC RWS. The rights to local diversions were originally held by the Spring Valley Water Company, which was formed in 1862.

The RWS currently delivers an annual average of approximately 265 mgd to 2.5 million users in Tuolumne, Alameda, Santa Clara, San Mateo, and San Francisco counties. The RWS is a complex system, shown in Figure 2-1, and supplies water from two primary sources:

- Tuolumne River through the Hetch Hetchy Reservoir, and
- Local runoff into reservoirs in Bay Area reservoirs in the Alameda and Peninsula watersheds.

Figure 2-1: Regional Water Supply System



Water from Hetch Hetchy Reservoir, through the Hetch Hetchy facilities represents the majority of the water supply available to the SFPUC. On average, the Hetch Hetchy Project provides over 85 percent of the water delivered to the Bay Area. During droughts the water received from the Hetch Hetchy system can amount to over 93 percent of the total water delivered.

Bay Area reservoirs provide on average approximately 15 percent of the water delivered by the SFPUC RWS. The local watershed facilities are operated to conserve local runoff for delivery. On the San Francisco Peninsula, the SFPUC utilizes Crystal Springs Reservoir, San Andreas Reservoir, and Pilarcitos Reservoir to capture local watershed runoff. In the Alameda Creek watershed, the SFPUC constructed the Calaveras Reservoir and San Antonio Reservoir. In addition to capturing runoff, San Antonio, Crystal Springs, and San Andreas reservoirs also provide storage for Hetch Hetchy diversions. The local watershed facilities also serve as an emergency water supply in the event of an interruption to Hetch Hetchy diversions.

2.1 Water Rights

The City and County hold pre-1914 appropriative water rights to store and deliver water from the Tuolumne River in the Sierra Nevada and locally from the Alameda and Peninsula watersheds. The City and County also divert and store water in the San Antonio Reservoir under an appropriative water right license granted by the State Water Resources Control Board (SWRCB) in 1959.

Appropriative water rights allow the holder to divert water from a source to a place of use not connected to the water source. These rights are based on seniority and use of water must be reasonable, beneficial, and not wasteful. In 1914, California established a formal water rights permit system, which is administered by the SWRCB. The SWRCB has sole authority to issue new appropriative water rights but cannot define property rights created under a pre-1914 appropriative water right.

The 1912 Freeman Report identified the ultimate diversion rate from the Tuolumne River to the Bay Area as 400 mgd and the City used this as the basis for designing the export capacity of the Hetch Hetchy project. The City has sufficient water rights for current diversions and the ultimate planned diversion rate of the Hetch Hetchy Project.

The federal Raker Act, enacted on December 19, 1913, grants to the City certain rights-of-way and public land use on federal property in the Sierra Nevada Mountains to construct, operate and maintain reservoirs, dams, conduits and other structures necessary or incidental to developing and using water and power. It also imposes restrictions on the City’s use of the Hetch Hetchy Reservoir, including (among others) the requirement that the City recognize the senior water rights of the Turlock and Modesto Irrigation Districts (TID and MID) to divert water from the Tuolumne River. Specifically, the Raker Act requires the City to bypass certain flows through its Tuolumne River reservoirs to TID and MID for beneficial use. By agreement, the City, TID and MID have supplemented these Raker Act obligations to increase the TID and MID entitlements to account for other senior Tuolumne River water rights and allow the City to “pre-pay” TID and MID their entitlement by storing water in the Don Pedro water bank. The

City is required to bypass inflow to TID and MID sufficient to allow them to divert 2,416 cfs or natural daily flow, whichever is less, at all times (as measured at La Grange), except for April 15 to June 13, when the requirement is 4,066 cfs or natural daily flow as measured at La Grange, whichever is less.

2.2 Current Water Supply Sources

2.2.1 The Regional Water System

The RWS, as described above, provides nearly 96% of San Francisco's Retail water supplies from the Hetch Hetchy Reservoir and local Bay Area reservoirs in the Alameda and Peninsula watersheds. On average, the Hetch Hetchy Reservoir provides over 85 percent of the water delivered and Bay Area reservoirs provide approximately 15 percent of the water delivered. The RWS delivers an annual average of 265 mgd – 81 mgd serves the Retail customers within the City and County of San Francisco and the other 184 mgd is delivered to the Wholesale suburban customers on the San Francisco Bay Peninsula.

2.2.2 Local Groundwater

San Francisco overlies all or part of seven groundwater basins. These groundwater basins include the Westside, Lobos, Marina, Downtown, Islais Valley, South and Visitation Valley basins. The Lobos, Marina, Downtown and South basins are located wholly within the City limits, while the remaining three extend south into San Mateo County. The portion of the Westside Basin aquifer located within San Francisco is commonly referred to as the North Westside Basin. With the exception of the Westside and Lobos basins, all of the basins are generally inadequate to supply a significant amount of groundwater for municipal supply due to low yield.

Early in its history, San Francisco made significant use of local groundwater, springs, and spring-fed surface water. However, after the development of surface water supplies in the Peninsula and Alameda watersheds by Spring Valley Water Company and the subsequent completion of the Hetch Hetchy Reservoir and aqueduct in the 1930's, the municipal water supply system has relied almost exclusively on surface water from local runoff, the Alameda and Peninsula watersheds, and the Tuolumne River watershed. Local groundwater use, however, has continued in the City primarily for irrigation purposes. The San Francisco Zoo and Golden Gate Park use groundwater for non-potable purposes.

About one mgd of groundwater is delivered to Castlewood Country Club from well fields operated by the SFPUC in Pleasanton and drawn from the Central Groundwater Sub Basin in the Livermore/Amador Valley. These wells are metered and have been in operation for several decades. For purposes of water accounting and billing, these deliveries to Castlewood are accounted for as part of San Francisco's Retail Customer base.

2.2.3 Local Recycled Water

From 1932 to 1981, San Francisco's McQueen Treatment Plant provided recycled water to Golden Gate Park for irrigation purposes. Due to changes in regulations the City closed the

McQueen plant and discontinued use of recycled water in Golden Gate Park. Currently in San Francisco, disinfected secondary-treated recycled water from the SFPUC's Southeast Water Pollution Control Plant is used on a limited basis for wash-down operations and is provided to construction contractors for dust control and other nonessential construction purposes. Current use of recycled water for these purposes in San Francisco is less than one mgd.

2.2.4 Local Water Conservation

The SFPUC is committed to demand-side management programs and San Francisco's per capita water use has dropped by about one-third since 1977 in part due to these programs. The first substantial decrease came following the 1976-77 drought in which gross per capita water use dropped from 160 to 130 gpcd. Despite continuous growth in San Francisco since then, water demands have remained lower than pre-drought levels.

A second substantial decrease in water use within San Francisco occurred as a result of the 1987-1992 drought when a new level of conservation activities resulted in further water use savings. It is anticipated that through the continuation and expansion of these programs, per capita water use will continue to decrease into the future. Current gross per capita water use within San Francisco is 91.5 gallons per capita per day (gpcd) with residential water use calculated to be approximately 57 gpcd, the lowest use of any major urban area in California.

The SFPUC's demand management programs range from financial incentives for plumbing devices to improvements in the distribution efficiency of the system. The conservation programs implemented by the SFPUC are based on the California Urban Water Conservation Council's list of fourteen Best Management Practices identified by signatories of the Memorandum of Understanding Regarding Urban Water Conservation in California, executed in 1991.

2.3 Water System Improvements and New Supply Reliability

To ensure that the future water needs of its Retail and wholesale customers will be met in a more reliable and sustainable manner, the SFPUC has undertaken water supply projects in the Water System Improvement Program (WSIP) to improve dry-year supplies, and is diversifying San Francisco's water supply portfolio through the development of local water supplies such as increasing recycled water and groundwater production, and bolstering water conservation. Many of the water supply and reliability projects evaluated in the WSIP were originally put forth in SFPUC's Water Master Plan (2000), then summarized in the 2005 UWMP and then investigated further in a Technical Memorandum Diversifying San Francisco's Retail Water Supply Portfolio (May 2006). In addition, specific water resource reports were prepared and released as well. Specifically, in 2005, SFPUC prepared a Recycled Water Master Plan, which updated the 1996 Recycled Water Master Plan and also prepared the North Westside Basin Groundwater Management Plan. Water supply elements of the WSIP are summarized below. The WSIP and its Program Environmental Impact Report are available for review at www.sfwater.org and www.sfgov.org. Sections of the WSIP Phased Variant to support the summaries in this Study are appended hereto.

2.3.1 Water System Improvement Program and the Phased WSIP Variant

The WSIP is a multi-billion dollar, multi-year, capital program to upgrade the RWS. The program will deliver improvements that enhance the SFPUC's ability to provide reliable, affordable, high quality drinking water to its 27 wholesale customers and regional Retail customers in Alameda, Santa Clara, and San Mateo counties, and to 800,000 Retail customers in San Francisco, in an environmentally sustainable manner.

As required under CEQA, SF Planning prepared a Program Environmental Impact Report (PEIR) for the WSIP. The PEIR evaluated the potential environmental impacts of the proposed WSIP and identified potential mitigations to those impacts. The PEIR also evaluated several alternatives to meet the SFPUC service area's projected increase in water demand between now and 2030. The water supply improvement options investigated included 10 alternatives using various water supply combinations from the local watersheds; the Tuolumne and Lower Tuolumne; ocean desalination; and additional recycled water, groundwater, and conservation.

The PEIR was certified by the SF Planning Commission on October 30, 2008. On the same day the SFPUC adopted the Phased WSIP Variant option.

2.3.1.1. Phased WSIP Variant

At the request of the SFPUC, SF Planning studied the Phased WSIP Variant as part of the environmental analysis. The SFPUC identified this variant in order to consider a program scenario that involved full implementation of all proposed WSIP facility improvement projects to insure that the public health, seismic safety, and delivery reliability goals were achieved as soon possible, but phased implementation of a water supply program to meet projected water purchases through 2030. Deferring the 2030 water supply element of the WSIP until 2018 would allow the SFPUC and its wholesale customers to focus first on implementing additional local recycled water, groundwater, and demand management actions while minimizing additional diversions from the Tuolumne River.

The Phased WSIP Variant establishes a mid-term planning milestone in 2018 when the SFPUC would reevaluate water demands through 2030 in the context of then-current information, analysis and available water resources. The SFPUC currently delivers on an annual average approximately 265 million gallons of water per day from local watersheds (Peninsula and Alameda Creek) and the Tuolumne River Watershed. By 2030, demand on the SFPUC system is expected to increase to an annual average of 300 million gallons of water per day. The Phased WSIP Variant would meet the projected 2018 purchase requests of 285 mgd from the RWS by capping purchases from the watersheds at 265 mgd; the remaining 20 mgd would be met through water efficiencies and conservation, water recycling and local groundwater use—10 mgd by Wholesale Customers and 10 mgd in the City and County. Before 2018, the SFPUC and the Wholesale Customers will engage in a new planning process to reevaluate water system demands and supply options, including conducting additional studies and environmental reviews necessary to address water supply needs after 2018.

The Phased WSIP Variant includes the following key program elements:

- Full implementation of all WSIP facility improvement projects.
- Water supply delivery to RWS customers through 2018 only of 265 mgd average annual target delivery originating from the watersheds. This includes 184 mgd for the Wholesale Customers and 81 mgd for the Retail Customers.
- Water supply sources include: 265 mgd average annual from the Tuolumne River and local watersheds and 20 mgd of water conservation, recycled water and local groundwater developed within SFPUC's service area (10 mgd Retail; 10 mgd wholesale).
- Dry-year water transfers of 2 mgd coupled with the Westside Groundwater Basin Conjunctive Use Project.
- Re-evaluation of 2030 demand projections, potential RWS purchase requests and water supply options by December 31, 2018 and a separate SFPUC decision in 2018 regarding RWS water deliveries after 2018.
- The ability to impose financial penalties is included in the new Water Supply Agreement to limit water sales to an average annual of 265 mgd from the watersheds.

The additional 10 mgd of supplies produced in San Francisco by implementation of the WSIP are considered secure and have been included in this Study. This Study assumes the WSIP local supplies will be in place in the timeframes stated in the SFPUC WSIP, with this assumption total Retail supplies increase to 94.50 mgd in 2015 and remain constant over the 20-year planning horizon. Projects related to these efforts are detailed below.

2.3.2 Local Groundwater Projects

2.3.2.1. San Francisco Groundwater Supply Project

The San Francisco Groundwater Supply Project would provide up to 4 mgd of local groundwater water to improve reliability during drought or maintenance conditions, as well as ensure that a reliable, high-quality source of water is available in the case of an earthquake or other emergency. The project proposes the construction of up to six wells and associated facilities in the western part of San Francisco to extract up to 4 mgd of groundwater water from the Westside Groundwater Basin for distribution in the City. The extracted groundwater, which would be used both for regular and emergency water supply purposes, would be disinfected and blended in small quantities with imported surface water before entering the municipal drinking water system. The environmental review for this project will begin in November 2009.

2.3.2.2. Lake Merced Water Level Restoration Project

The goal of the Lake Merced Water Level Restoration Project is to protect and balance the beneficial uses of Lake Merced by providing a more stable water level regime using groundwater and stormwater, rather than supplies provided through the RWS.

2.3.3 Local Recycled Water Projects

The proposed Westside, Harding Park and Eastside Recycled Water Projects would provide up to 4 mgd of recycled water to a variety of users in San Francisco. Recycled water will primarily be used for landscape irrigation, toilet flushing and industrial purposes. The Harding Park Project has completed environmental review, and the Westside Project will begin environmental review in late 2009 or early 2010.

The proposed Westside Project would bring recycled water from the proposed recycled water treatment facility in Golden Gate Park to the San Francisco Zoo, Golden Gate Park, and Lincoln Park Golf Course. Recycled water would be used for irrigation at all three sites; additionally, it would be used for non-potable uses in Golden Gate Park at the California Academy of Sciences. The proposed Harding Park Recycled Water Project would use available recycled water from the North San Mateo County Sanitation District (NSMCSD) located in Daly City, to irrigate Harding Park and Fleming Park golf courses in San Francisco. The SFPUC has partnered with the NSMCSD for this proposed project.

Currently, the SFPUC is conducting a recycled water demand assessment on the Eastside of San Francisco. The assessment examines the potential uses of recycled water for irrigation, toilet flushing, and commercial applications. The WSIP contains funding for planning, design, and environmental review for the San Francisco Eastside Recycled Water Project.

2.3.4 Local Water Conservation

The SFPUC has also increased its water conservation programs in an effort to achieve new water savings by 2018. The SFPUC's conservation program is based on the Demand Study (Section 1.2) that identified water savings and implementation costs associated with a number of water conservation and efficiency measures. The Demand Study evaluated the costs and benefits of implementing 48 different conservation measures using an end-use model. The results indicated that local conservation programs implemented through 2030 could cumulatively reduce Retail purchases from the SFPUC RWS by 4.5 mgd in year 2030. These new conservation programs include high-efficiency toilet replacement in low-income communities, plumbing retrofits in compliance with the 1992 California plumbing code and water efficient irrigation systems in municipal parks. Through its conservation program, the SFPUC anticipates reducing gross per capita consumption from 91.5 gpcd to 87.4 gpcd by 2018 for an average daily savings of nearly 4.0 mgd.

2.3.5 Summary of Local WSIP Water Supply Programs

As previously discussed, SFPUC anticipates that the expanded groundwater and recycled water production, and increased conservation programs will provide the City with an additional 10 mgd of local water supplies. As quantified in Table 2-1 with implementation of the WSIP, SFPUC expects to have in these local supplies in place by 2015. These programs and projects are reliable in all hydrologic conditions and are not subject to RWSAP reductions or curtailments.

Table 2-1: WSIP Water Supply Sources (mgd)

WSIP Water Supplies	2010	2015	2020	2025	2030
Groundwater	0.0	2.0	2.0	2.0	2.0
Recycled Water	0.0	4.0	4.0	4.0	4.0
Conservation	0.0	4.0	4.0	4.0	4.0
Total WSIP Local Supplies	**0.0**	**10.0**	**10.0**	**10.0**	**10.0**

2.3.6 Total SFPUC Retail Water Supplies

Table 2-2 summarizes SFPUC's total water supplies now and over the 20-year planning period. In 2010, prior to the development of the 10 mgd of local supplies, SFPUC can access an annual average 84.50 mgd from all sources discussed above. Beginning in 2015, when the WSIP water supply sources are readily available, the SFPUC's Retail water supplies increase to 94.5 mgd. These supplies are assumed to be available in the quantities listed in Table 2-2. SFPUC intends to use these supplies to meet its Retail customer demands.

Table 2-2: SFPUC Water Supplies 2010 - 2030

Current Water Supply Sources	2010	2015	2020	2025	2030
SFPUC RWS (Surface water: Tuolumne River, Alameda & Peninsula) (1)	81.0	81.0	81.0	81.0	81.0
Groundwater Sources					
Groundwater (In-City Irrigation Purposes)	2.5(2)	0.5(3)	0.5(3)	0.5(3)	0.5(3)
Groundwater at Castlewood(4)	1.0(4)	1.0(4)	1.0(4)	1.0(4)	1.0(4)
Groundwater: Treated for Potable – Previously used for In-City Irrigation purposes(5)	0.0	2.0	2.0	2.0	2.0
Groundwater Subtotal	**3.5**	**3.5**	**3.5**	**3.5**	**3.5**
Current Water Supply Subtotal	**84.5**	**84.5**	**84.5**	**84.5**	**84.5**
WSIP Water Supply Sources					
Groundwater Development: Potable from SF GWSP (Westside Groundwater Basin)(6)	0.0	2.0	2.0	2.0	2.0
Recycled Water Expansion Irrigation(7)	0.0	4.0	4.0	4.0	4.0
Supply Conservation Program	0.0	4.0	4.0	4.0	4.0
WSIP Supply Subtotal	**0.0**	**10.0**	**10.0**	**10.0**	**10.0**
Total Retail Supply (Current and WSIP Supplies)	**84.5**	**94.5**	**94.5**	**94.5**	**94.5**

(1) RWS surface water supplies are subject to reductions due to below-normal precipitation. This may affect dry year supplies - model shows supply reduction occurs in year 2 of multiple dry year event. (Source: SFPUC 2008 WSIP Phase Variant Supply limitation)

(2) Groundwater serves irrigation to Golden Gate Park, SF Zoo, and Great Highway Median. (Source: 2005 SFPUC UWMP Table 8B page 43)

(3) A Groundwater reserve of 0.5 mgd for irrigation purposes will remain as part of SFPUC's non-potable groundwater supply. (Source: SFPUC 2008 WSIP Phase Variant)

(4) Castlewood current and projected use remains unchanged over 20 year planning horizon. (Source: 2005 SFPUC UWMP Table 8B page 43)

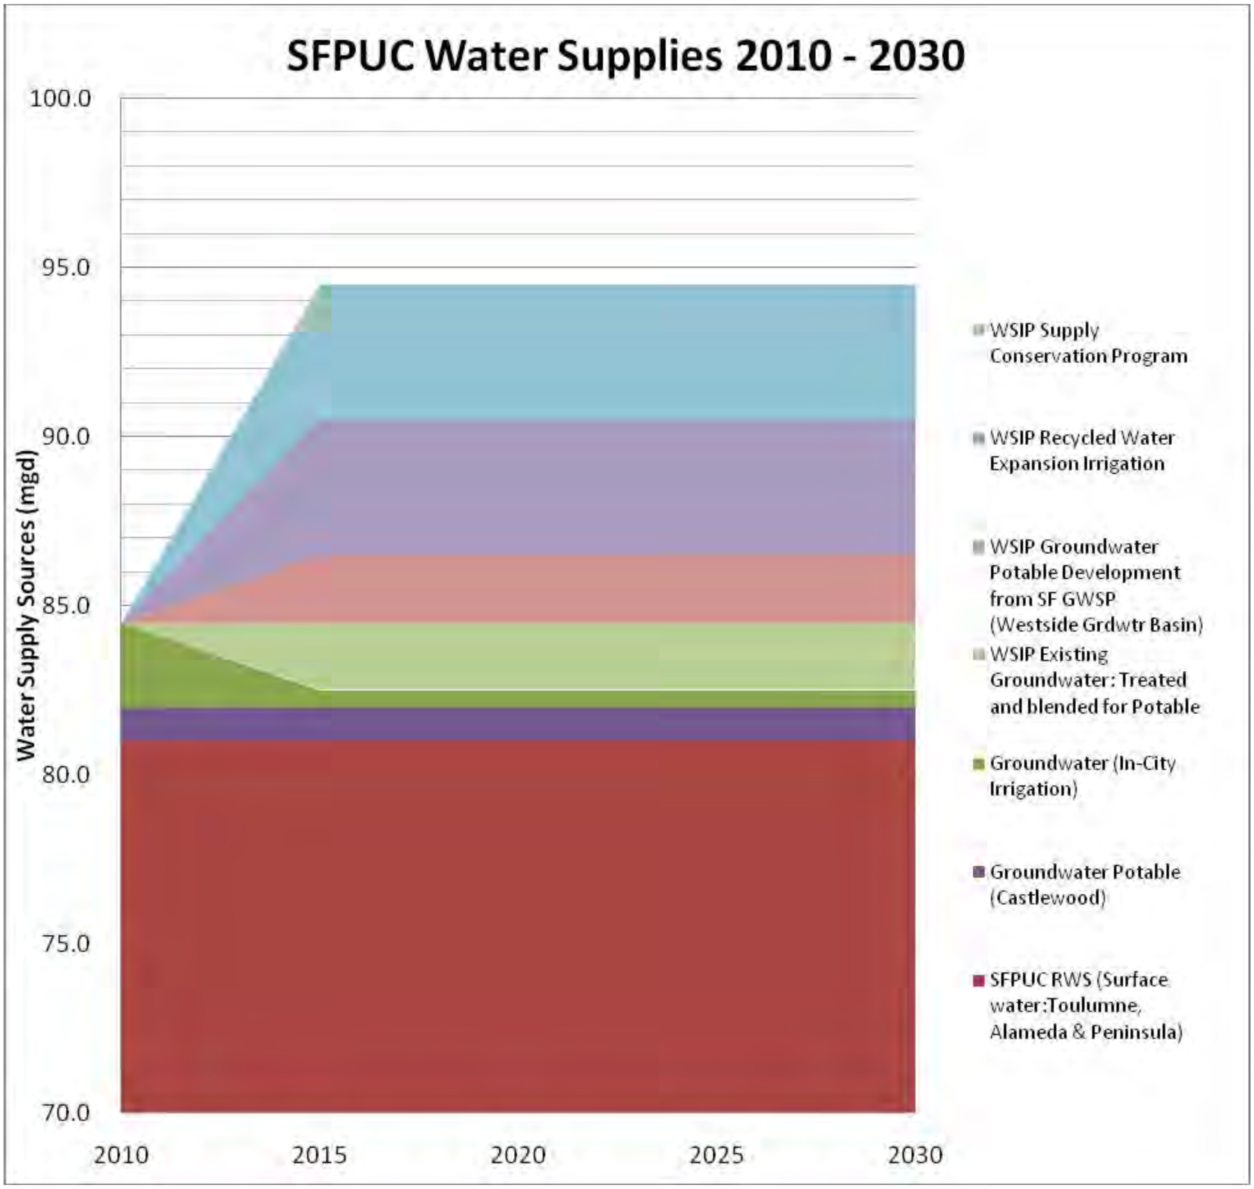
(5) 2.0 mgd of groundwater treated and blended for Potable water supply purposes. (Source: 2005 SFPUC UWMP Table 8B page 43)

(6) 2.0 mgd of new groundwater developed as part of the new local supply target. (Source: SFPUC 2008 WSIP Phase Variant Supply Target)

(7) 2.0 mgd of Recycled used for irrigation at Golden Gate Park, SF Zoo, Great Highway Median, and 2.0 mgd for other non-potable purposes. (Source: SFPUC 2008 WSIP Phase Variant Supply Target)

Figure 2-1 is a graphical representation of the SFPUC's current supply sources and the WSIP local supply sources. As shown in Figure 2-2, the supplies grow from 84.5 mgd in 2010 to 94.5 mgd as the WSIP local supplies are brought into the SFPUC Retail supply system. The figure shows the total supplies increasing in 2015 and holding constant over the 20-year planning horizon.

Figure 2-2: SFPUC Water Supplies



2.3.7 Dry Year Water Supply Projects

The WSIP water supply program includes development of dry-year supplies for the RWS. The PEIR included an analysis of dry-year water supply transfers from the senior water rights holders on the Tuolumne River (MID and TID); a groundwater conjunctive use project; and a regional desalination project. The latter two projects are described below. The SFPUC is investigating the possibility of a dry-year water transfer with MID and TID for 2 mgd in 2018. The WSIP provides funding for the Groundwater Storage and Recovery Project.

2.3.7.1. Groundwater Storage and Recovery Project

The proposed Regional Groundwater Storage and Recovery Project would balance the use of both groundwater and surface water to increase water supply reliability during dry years or in emergencies. The proposed project is located in San Mateo County and is sponsored by the SFPUC in coordination with its partner agencies, the California Water Service Company, City of Daly City and City of San Bruno. The partner agencies currently purchase wholesale surface water from the SFPUC and also independently operate groundwater production wells for drinking water and irrigation.

The proposed Regional Groundwater Storage and Recovery Project would extract groundwater from the South Westside Basin groundwater aquifer in San Mateo County. The project would consist of installing up to sixteen new recovery well facilities in northern San Mateo County to pump stored groundwater during a drought. During years of normal or heavy precipitation, the proposed project would provide surface water to the partner agencies in order to reduce the amount of groundwater pumped. Over time, the reduced pumping would result in the storage of approximately 61,000 acre-feet of water (more than the supply contained in the Crystal Springs Reservoir on the SFPUC Peninsula Watershed.) This would allow recovery of this stored water at a rate of up to 7.2 million gallons per day for a 7.5-year dry period. The water would be in compliance with the California Department of Public Health requirements for drinking water supplies. The proposed project would include construction of well pump stations, disinfection units, and piping. The proposed project is currently undergoing environmental review.

2.3.7.2. Desalination

The SFPUC's investigations of desalination as a water supply source have focused primarily on the potential for regional facilities. The proposed Bay Area Regional Desalination Project is a joint venture between the SFPUC, Contra Costa Water District, East Bay Municipal Utility District, and the Santa Clara Valley Water District.

The regional desalination project would provide an additional source of water during emergencies, provide a supplemental water supply source during extended droughts, allow other major water facilities to be taken out of service for maintenance or repairs, and increase supply reliability by providing water supply from a regional facility. The Bay Area Regional Desalination Project would have an ultimate total capacity of up to 65 mgd.[4]

4 EBMUD, "Desalination Project", http://www.ebmud.com/water_&_environment/water_supply/current_projects/desalination_project/default.htm, accessed July 30, 2009.

3.0 POTENTIAL IMPACT OF CLIMATE CHANGE ON SFPUC SUPPLY AVAILABILITY

The issue of climate change has become an important factor in water resources planning in the State, and it is being considered during planning for the RWS. There is evidence that increasing concentrations of greenhouse gases have caused and will continue to cause a rise in temperatures around the world, which will result in a wide range of changes in climate patterns. Moreover, there is evidence that a warming trend occurred during the latter part of the 20th century and will likely continue through the 21st century. These changes will have a direct effect on water resources in California, and numerous studies on climate change have been conducted to determine the potential impacts water resources. Based on these studies, climate change could result in the following types of water resource impacts, including impacts on the RWS and associated watersheds:

- Reductions in the average annual snowpack due to a rise in the snowline and a shallower snowpack in the low- and medium-elevation zones, such as in the Tuolumne River basin, and a shift in snowmelt runoff to earlier in the year,
- Changes in the timing, intensity, and variability of precipitation, and an increased amount of precipitation falling as rain instead of as snow,
- Long-term changes in watershed vegetation and increased incidence of wildfires that could affect water quality,
- Sea level rise and an increase in saltwater intrusion,
- Increased water temperatures with accompanying adverse effects on some fisheries,
- Increases in evaporation and concomitant increased irrigation need, and
- Changes in urban and agricultural water demand.

However, other than the general trends listed above, there is no clear scientific consensus on exactly how global warming will quantitatively affect State water supplies, and current models of State water systems generally do not reflect the potential effects of global warming.

The SFPUC staff performed an initial evaluation of the effect on the Regional Water System of a 1.5-degree Celsius (°C) temperature rise between 2000 and 2025. The temperature rise of 1.5°C is based on a consensus among many climatologists that current global climate modeling suggests a 3°C rise will occur between 2000 and 2050 and a rise of 6°C will occur by 2100. The evaluation predicts that an increase in temperature of 1.5°C will raise the snowline approximately 500 feet every twenty-five years. The elevation of the watershed draining into Hetch Hetchy Reservoir ranges from 3,800 to 12,000 feet above mean sea level, with about 87 percent of the watershed area above 6,000 feet. In 2000 (a normal hydrologic year in the 82-year period of historical record), the average snowline in this watershed was approximately 6,000 feet during the winter months. Therefore, the SFPUC evaluation indicates that a rise in temperature of 1.5°C between 2000 and 2025 will result in less or no snowpack between 6,000 and 6,500 feet and faster melting of the snowpack above 6,500 feet. Similarly, a temperature rise of 1.5°C between 2025 and 2050 will result in less or no snowpack between 6,500 and 7,000 feet and faster melting of the snowpack above 7,000 feet.

The SFPUC climate change modeling indicates that about 7 percent of the runoff currently draining into Hetch Hetchy Reservoir will shift from the spring and summer seasons to the fall and winter seasons in the Hetch Hetchy basin by 2025. This percentage is within the current interannual variation in runoff and is within the range accounted for during normal runoff forecasting and existing reservoir management practices. The additional change between 2025 and 2030 is not expected to be detectible. The predicted shift in runoff timing is similar to the results found by other researchers modeling water resource impacts in the Sierra Nevada due to warming trends associated with climate change.

Based on these preliminary studies and the results of literature reviews, the potential impacts of global warming on the RWS are not expected to affect the water system operations through 2030. SFPUC hydrologists are involved in ongoing monitoring and research regarding climate change trends and will continue to monitor the changes and predictions, particularly as these changes relate to water system operations and management of the RWS. The SFPUC has developed a workplan to further advance its research on the effects of climate change on the RWS.

4.0 DROUGHT PLANNING AND WATER SUPPLY RELIABILITY

The SFPUC water supply system reliability is expressed in terms of its ability to deliver water during droughts. Reliability is defined by the amount and frequency of water delivery reductions required to balance customer demands with available supplies in droughts. The SFPUC has a reliability goal of meeting dry-year delivery needs while limiting rationing to a maximum 20 percent system-wide reduction in water service during extended droughts.

The total amount of water the SFPUC has available to deliver to its Retail and wholesale customers during a defined period of time is dependent on several factors. These include the amount of water that is available to the SFPUC from natural runoff, the amount of water in reservoir storage, and the amount of water that must be released from the SFPUC's system for commitments to purposes other than customer deliveries, such as releases below Hetch Hetchy reservoir to meet the Raker Act and fishery purposes.

The SFPUC operates its system to optimize the reliability and quality of its water deliveries. Hetch Hetchy Reservoir operations are guided by two principal objectives: collection of Tuolumne River water runoff for diversion to the Bay Area; and fulfillment of the SFPUC's downstream release obligations. To conserve runoff, Hetch Hetchy Project reservoirs are drawn down beginning in early winter, relying on the recurrence and forecast of snow melt to guide drawdown releases. Similarly, the Regional Water System Bay Area reservoirs are operated to conserve watershed runoff. As such, reservoirs are drawn down during the winter period to capture storms and reduce the potential for spilling water out of the reservoirs. In the spring, excess Hetch Hetchy water supply (snowmelt) is transferred to three of the Bay Area reservoirs, capable of receiving the water, to fill any unused reservoir storage.

Prior to the late 1970's, droughts did not seriously affect the ability of the SFPUC to sustain full deliveries to its customers. However, as the 1987-1992 droughts progressed and reservoir storage continued to decline, it became apparent that continued full deliveries could not be sustained without the risk of running out of water before the drought ended.

To provide some level of assurance that water could be delivered continuously throughout a drought (although at reduced levels), the SFPUC adopted a drought planning sequence and associated operating procedures that trigger different levels of water delivery reduction rationing relative to the volume of water actually stored in SFPUC reservoirs. Each year, during the snowmelt period, the SFPUC evaluates the amount of total water storage expected to occur throughout the RWS. If this evaluation finds the projected total water storage to be less than an identified level sufficient to provide sustained deliveries during drought, the SFPUC may impose delivery reductions or rationing.

4.1 Water Shortage Allocation Plan (WSAP)

During a drought, it is expected that the Retail and wholesale customers would experience a reduction in the amount of water received from the RWS. The amount of this reduction has been dictated by existing contractual agreements between the SFPUC and the Wholesale Customers, as detailed in the existing WSAP. The WSAP provides specific allocations of available water between the Retail and wholesale customers collectively associated with different levels of system-wide shortages, as shown in Table 4-1.

Table 4-1: WSAP Allocation

Level of System-Wide Reduction in Water Use Required	Share of Available Water	
	SFPUC Share	Wholesale Customers Share (collectively)
5% or less	35.5%	64.5%
6% through 10%	36.0%	64.0%
11% through 15%	37.0%	63.0%
16% through 20%	37.5%	62.5%

In addition to providing an allocation method, the plan also includes provisions for transfers, banking and excess use charges.

Under the WSAP, SFPUC Retail customers would experience no reduction in deliveries at a 10 percent shortage. However, during a 20 percent system-wide shortage, the Retail customers would experience a 1.9 percent reduction in Retail deliveries. This assumes the full development of the additional 10 mgd of local WSIP supplies in the Retail service area. These 10 mgd of local supplies are not subject to reduction under the WSAP as the WSAP only allocates water supplies from the RWS. Table 4-2 shows SFPUC RWS Retail supply schedule during normal, single dry year, and multiple dry year periods.

The WSAP has been carried forward in the new Water Supply Agreement for system-wide shortages of up to 20 percent. For shortages in excess of this amount, the Water Supply Agreement provides that the SFPUC may allocate water in its discretion.

4.2 Retail Water Shortage Allocation Plan

San Francisco's Retail Water Shortage Allocation Plan (RWSAP) was adopted to formalize a three-stage program of action to be taken in San Francisco to reduce water use during a drought. In accordance with the RWSAP, prior to the initiation of any water delivery reductions in San Francisco, whether it be initial implementation of reduction delivery or increasing the severity of water shortage, the SFPUC would outline a drought response plan that would address the following: the water supply situation; proposed water use reduction objectives; alternatives to water use reductions; methods to calculate water use allocations and adjustments; compliance methodology and enforcement measures; and budget considerations.

Table 4-2: 2005 – 2030 SFPUC Retail Allocations in Normal, Dry and Multiple Dry Years

	Normal Year		Single Dry Year		Multiple Dry Year Event(2) Year 1		Year 2		Year 3	
	mgd	%	mgd	%	mgd	%	mgd	%	mgd	%
2010(1)	81.0	100	81.0	100.0	81.0	100.0	79.5	98.1	79.5	98.1
2015	81.0	100	81.0	100.0	81.0	100.0	79.5	98.1	79.5	98.1
2020	81.0	100	81.0	100.0	81.0	100.0	79.5	98.1	79.5	98.1
2025	81.0	100	81.0	100.0	81.0	100.0	79.5	98.1	79.5	98.1
2030	81.0	100	81.0	100.0	81.0	100.0	79.5	98.1	79.5	98.1

(1) In 2010 the Retail allocation of RWS supply is reduced to 81 mgd to reflect the Retail allocation under the 2018 Phased WSIP Variant. 10 mgd of recycled water, groundwater, and conservation will be implemented by 2015 to make up for the loss in RWS supply. The 10 mgd of local supply is not subject to reduction under the WSAP.

(2) Under the WSAP, the SFUPC Retail allocations at a 10 percent shortage are 85.86 mgd. However, due to the Phased WSIP Variant, only 81 mgd of RWS supply is shown. The remaining supply can be transferred from or to the Wholesale Customers under the terms of the Water Supply Agreement.

Source: San Francisco Public Utilities Commission. 2005. Urban Water Management Plan for the City and County of San Francisco. p. 54-57 and discussions with SFPUC staff.

This drought response will be presented at a regularly scheduled SFPUC Commission meeting for public input. The meeting will be advertised in accordance with the requirements of California Water Code Section 6066 of the Government Code, and the public will be invited to comment on the SFPUC's intent to reduce deliveries.

Depending on the level of water demand and the desired objective for water use reduction, one, two or all three stages of the RWSAP may be required.

<u>Stage 1 (Voluntary)</u>

- System-wide demand reductions of 5-10 percent experienced
- Voluntary rationing request of customers
- Customers are alerted to water supply conditions
- Remind customers of existing water use prohibitions
- Education on, and possible acceleration of, incentive programs

<u>Stage 2 (Mandatory)</u>

- System-wide demand reductions of 11-20 percent experienced
- All Stage 1 actions implemented
- All customers receive an "allotment" of water based on the Inside/Outside allocation method (based on base year water usages for each account)
- Water use above the "allocation" level will be subject to excess use of flow restrictor devices and shut-off of water

Stage 3 (Mandatory)

- System-wide demand reductions of 20 percent or greater experienced
- Same actions as in Stage 2 with further reduced allocations

5.0 SAN FRANCISCO GROWTH PROJECTIONS AND WATER DEMAND ANALYSIS

This section shows the calculated water demand projections for San Francisco based on recent housing and employment forecasts.

5.1 Revised City of San Francisco Growth Projections

The SFPUC has recently evaluated projected demands and incorporated the updated San Francisco Planning projections for residential and non-residential growth contained in a memorandum from SF Planning to SFPUC dated July 9, 2009 (Appendix A). This analysis results in a 2030 growth projection that differs from the 2005 UWMP. Table 5-1 compares 2030 growth projections between the 2005 UWMP and the 2009 growth projections developed by the SF Planning department. As shown in Table 5-1 new residential growth is expected to increase by 29,787 units. The 27,400 new residential units proposed in three Projects account for the majority of new residential growth in 2030. In contrast, the 2009 employment projections result in net loss of 47,300 new employment opportunities in 2030.

Table 5-1: 2030 SF Planning Projections for Households and Employment

Residential Units		**2030 Projection**
2005 UWMP(1)		373,513
2009 SF Planning Projections(2)		403,300
	Net Change	**29,787**(3)
Non-Residential Population		**2030 Projection**
2005 UWMP(4)		795,400
2009 SF Planning Projections(5)		748,100
	Net Change	**-47,300**

(1) 2005 Urban Water Management Plan residential projections were based on ABAG Projections 2002 and Citywide Policy Analysis and Planning, San Francisco Planning Department, Land Use Allocations 2002.

(2) 2009 Residential Projections were developed by the San Francisco Planning Department and designed to closely match the recently adopted ABAG Projections 2009 target, but taking into account local knowledge of projects currently in various stages of the entitlement process, commonly referred to as the Development Pipeline. (Appendix A)

(3) Of the new residential units the Projects account for 27,700 units and new incremental growth accounts for 2,387 units.

(4) 2005 Urban Water Management Plan non-residential projections were based on ABAG 2030 employment projections and linearly extrapolated for 2020 and 2030.

(5) Revised 2009 Non-Residential Projections were developed by the San Francisco Planning Department and based on ABAG 2009 Employment projections for 2030. (Appendix A)

5.1.1 2009 Residential Projections

As stated previously, the SF Planning and the San Francisco Redevelopment Agency are currently engaged in planning for various proposed land development projects. These Projects, as well as Incremental Growth throughout San Francisco, account for 29,787 new dwelling units in 2030. As proposed, the Projects would contribute 27,400 new dwelling units to San Francisco's housing inventory. The Incremental Growth throughout the City accounts for the remaining 2,387 new dwelling units (Appendix B).

The updated 2030 City growth projection shown in Table 5-1 reflects an increase in residential households from the 2005 UWMP forecast but an overall decrease in non-residential (employment) population. As shown in Table 5-2, the residential growth at the Projects commences in 2015 with 6,850 new dwelling units and continues to grow to 27,400 in 2030, essentially growing by 6,850 over each five-year period. In addition, this Study also assumes that the incremental growth throughout San Francisco would occur in the same manner. As shown in Table 5-2, the incremental growth commences in 2015 with 597 new dwelling units and continues to grow to 2,387 in 2030, essentially growing by 597 over each five-year period.

Table 5-2: Projects and Incremental Growth within San Francisco

Residential Units	2010	2015	2020	2025	2030
Residential Units [(1)]	344,306	351,608	358,910	366,211	373,513
Residential Units for Projects[(2)]	0	6,850	13,700	20,550	27,400
Residential Units for Incremental Growth[(3)]	0	597	1,194	1,790	2,387
Subtotal (Projects and Incremental Growth)		***7,447***	***14,894***	***22,340***	***29,787***
Total New Residential Units	**344,306**	**359,055**	**373,803**	**388,552**	**403,300**

[(1)] 2005 UWMP residential unit projections shown in Table 5-1. Source: 2005 SFPUC UWMP Table 2, page 7
[(2)] Residential Units of Projects (CP-HPS II 10,500 units); (TI-YBI 8,000 units); (Parkmerced 8,900 total units)
[(3)] Incremental Growth accounts for 2,387 new units.

5.1.2 2009 Employment Projections

The updated 2030 City growth projection shown in Table 5-1 reflects an increase in residential households from the 2005 UWMP forecast but an overall decrease in non-residential (employment) population. These changes mirror the changes in the Association of Bay Area Governments (ABAG) projections. ABAG projections are used for various planning purposes by many of the cities in the nine-county area covered by ABAG. ABAG publishes regional projections and employment and growth every two years. Projections developed after 2002 incorporate a fundamental shift in ABAG's projection methodology. Rather than taking existing local land use policy as a given (as had previously been the case), in the projections following the 2002 projections, ABAG assumes that local policy will be amended in the future to adopt "smart growth" principles. Specifically, the projections assume that higher density growth will be focused in urban core areas, and that more housing will be produced in those areas, compared to that previously assumed. The result of these assumptions is to increase the expected population in already developed areas. Another difference reflected in the later projections is a more current and accurate reflection of the internet industry (dot com era), as well as the effect of the current recession on employment projections.

Table 5-3 shows the progression of growth in employment opportunities forecasted in San Francisco based on SF Planning's 2009 Employment Projections (Appendix B). Beginning in 2015 employment is projected to increase to 719,145 jobs, and then by 2025 employment is expected to grow to 734,050 jobs. As projected, and shown in Table 5-3 employment in San Francisco is expected to reach 748,100 jobs.

Table 5-3: Non-Residential Employment Projections

Non-Residential Employment Projections	2010	2015	2020	2025	2030
SF Planning Employment Total[1] (jobs)	712,145	719,447	726,749	734,050	748,100

[1] Table 5-1 2009 SF Planning Projections based on ABAG 2030 Employment projections

5.2 City of San Francisco Retail Water Demand Analysis

Retail water demands in the 2005 UWMP were based on the findings of the Demand Report. The Demand Report analyzed water demand associated with each Retail customer sector and then forecasted demand over a 25-year planning horizon using data provided by the City, and the SFPUC. The demand projections were developed using a water use model, which initially established a base-year water demand at the end-use level (such as toilets, showerheads, other lavatory hardware and household fixtures), calibrated the model to initial conditions, and forecasted future water demand based on projected demand of existing water service accounts and future population growth.

This Study updates the 2005 UWMP water demand forecasts in 2010 through 2030 to reflect San Francisco's three major development Projects (CP-HPS II, TI-YBI, and Parkmerced) and incremental growth projected to occur throughout the City, and the 2009 San Francisco non-residential planning projections (based on ABAG 2009 Employment Projections) for 2030. Tables 5-4 and 5-5 show the results of the demand forecasts at the Project sites; anticipated incremental growth expected to occur throughout the City and growth in demand generated through employment opportunities (jobs).

5.2.1 Water Demand of Projects and Incremental Growth

The Projects are proposed as mixed-use residential redevelopment projects within San Francisco. Each project sponsor provided land use plans or reports to the City that include residential unit counts, commercial spaces, and public facilities. These same plans and reports estimated potable water demand along with other land use information. Residential water demands for the Projects were provided to the City by the Project developers, and were developed using an end use model on a per-unit or per-employee basis. The Project demands were independently reviewed by PBS&J and the SFPUC as part of this Study, and appear consistent with the SFPUC demand estimates. See Appendix B for the methodology used in the Project demand estimates.

Upon buildout in 2030, these Projects represent the majority of new growth in San Francisco above the 2030 growth projected in the 2005 UWMP. As shown in Table 5-4, overall water demand at each of the Project sites is estimated at 1.99 mgd (CP-HPS II); 1.70 mgd (TI-YBI) and 0.98 mgd at Parkmerced. The CP-HPS II includes a number of different development scenarios, the estimated water demands of the three main CP-HPS II development scenarios are also shown in Table 5-2.

The Demand Report (see Section 1.2) analyzed water demands associated with each Retail customer sector and established per unit-use rates. As such, between 2010 and 2030, SFPUC used a per-unit use rate average of 98.7 gpd per household for multi-family residential demands. As shown in Table 5-4, the 98.7 gpd per household rate was applied to the incremental growth of 2,387 new dwelling units throughout the City resulting in a demand of 0.24 mgd in 2030.

Table 5-4: 2030 Water Demand of the Projects and Incremental Growth within SF City and County (mgd)

Projects and Incremental Growth[1]	Water Demand (mgd)					
	Stadium		R&D Variant		Housing Variant	
	Project Water Demand	Non-Residential Adjustment (1.18)[7]	Project Water Demand	Non-Residential Adjustment (1.40)[7]	Project Water Demand	Non-Residential Adjustment (1.15)[7]
CP-HPS II[2]	1.67	1.04	1.99	1.05	1.66	1.04
TI – YBI[3]	1.70	1.17	1.70	1.17	1.70	1.17
Parkmerced[4]	0.98	0.94	0.98	0.94	0.98	0.94
Projects Subtotal	**4.38**	**3.16**	**4.67**	**3.16**	**4.34**	**3.16**
Existing Demand at Project Sites[5]	-1.51	-1.51	-1.51	-1.51	-1.51	-1.51
Net Development Subtotal	**2.87**	1.64	**3.16**	1.65	**2.83**	1.64
Other Growth in SF (City and County)[6]	0.24	0.24	0.24	0.24	0.24	0.24
Net Change in Water Demand with Non-Residential Adjustment[7]		**1.88**[7]		**1.89**[7]		**1.88**[7]

(1) Average annual demands. Residential water demands for the proposed projects were provided to the City by project developer. They were also developed using an end use model on a per unit or per employee basis. The developer demands were independently reviewed by PBS&J and the SFPUC as part of this Study, and appear consistent with the SFPUC demand estimates. (Appendix B)
(2) CP-HPS Phase II Arup – Winzler & Kelly Water Demand Memo September 25, 2009 Appendix B
(3) Treasure Island Technical Memo Section 7 August 2009. Appendix B
(4) Parkmerced Water Demand Spreadsheet from August 2009 Appendix B
(5) Existing demand provided by SFPUC from current billing records
(6) Derived by SFPUC staff based on approximately 2,387 dwelling units at 98.7 gpd. August 2009 Appendix X
(7) To avoid double-counting the water demand associated with the 2009 SF Planning Non-Residential Employment Projections and the non-residential demand calculated in the developer estimates at each of the Project sites, the total water demand at each of the developments was adjusted to remove the non-residential demands. This study assumes all non-residential demand is accounted for in the 2009 SF Planning Non-Residential Employment Projections.

For conservative water supply planning purposes, this Study uses the highest total water demand adjusted for non-residential uses[5] of 1.89 mgd associated with the R&D Variant at CP-HPS II. The net change in demand accounts for existing uses at the project site and a non-residential demand adjustment.

5.2.2 Water Demand of Non-Residential Employment Projections

As shown above in Table 5-1, the SF Planning and ABAG projected new job growth in the San Francisco based on the employment changes in the San Francisco Bay Area as described in Section 5.1.1 above.

Demand projections for overall City growth were based on 2010-2030 average per-unit use factors of the Demand Report. The Demand Report analyzed water demands associated with each Retail customer sector and established per unit-use rates. As such, between 2010 and 2030, SFPUC used an average of 42.42 gallons per day (gpd) per employee for non-residential water demands. In an effort to represent the employment opportunities over the 20-year planning horizon this Study assumes that the non-residential employment sector would grow at a linear rate over the same planning period without accounting for market force influences and changes in local economics. As shown in Table 5-5, the 42.42 gpd per employee water demand rate was applied to the growth in jobs over the 20-year planning horizon. In 2015, demand is expected to be 30.52 mgd and by 2030, water demand generated through employment is expected to reach 31.73 mgd.

Table 5-5: Water Demand for Non-Residential Employment Projections

Employment Projections and Non-Residential Demand	2010	2015	2020	2025	2030
SF Planning Employment Total[(1)] (jobs)	712,145	719,447	726,749	734,050	748,100
Non-Residential - Business/Industrial Demand[(2)] (mgd)	30.21	30.52	30.83	31.14	31.73

(1) Table 5-1 2009 SF Planning Projections
(2) Average of 42.42 gallons per day (gpd) per employee for non-residential water demands.

5.2.3 SFPUC Total Retail System Demand

The SFPUC incorporated the 2009 SF Planning projections for residential and non-residential growth in San Francisco into this Study to assess the results of the SF Planning projections and its effects on the City's water demand. The previous tables (5-3 and 5-4) along with demand data from the 2005 UWMP is incorporated in the City's total Retail demand. The results of these 2009 demand forecasts are shown in Table 5-6. The table represents the anticipated growth in demand commencing in 2010 and extending over the 20-year planning horizon to 2030.

5 To avoid double-counting the water demand associated with the 2009 Non-Residential Planning Projections and the non-residential demand calculated in the developer estimates at each of the Project sites, the total water demand at each of the developments was adjusted to remove the non-residential demands. This study assumes all non-residential demand is accounted for in the 2009 Non-Residential SF Planning Projections. Table 5-2 shows the net change in water demand at the Project sites and the adjusted change in water demand without non-residential demand.

As shown in Table 5-6, incremental residential growth demand and demand at the Project sites commences in 2015 at 0.47 mgd and progresses to 1.89 mgd in 2030. In 2015, demand drops slightly due to a reduction in total residential demand. The non-residential demand commences in 2010 at 30.21 mgd, increases to 30.83 mgd and culminates at 31.73 in 2030.

Table 5-6 shows total Retail demands for SFPUC beginning in 2010 at 91.81, and then drops slightly in 2015 because of a drop in residential demand and then increases to 91.87 mgd in 2020. By 2030, Retail demand will be approximately 93.42 mgd.

Table 5-6: SFPUC Retail Demand (mgd)

Users, Facilities and Entities	**Projected Water Demand (mgd)**				
	2010	**2015**	**2020**	**2025**	**2030**

Castlewood Community Demand[(8)]	1.0	1.0	1.0	1.0	1.0
Total Retail Demand	**91.81**	**91.69**	**91.87**	**92.36**	**93.42**

(1) Residential Demands (Source: 2005 SFPUC UWMP Table 8B, page 43)

(2) See Table 5-4. Multiple Family – [In 2030 Incremental Growth of 0.24 mgd + (CP-HPS II 10,500 DU) 1.04 mgd + (TI-YBI 8,000 DU) 1.17 mgd + (Parkmerced 8,900 total DU) 0.94 mgd = 3.40 mgd] Existing Demand is 1.51 mgd at all sites. [3.40 mgd – 1.51 = 1.89 mgd] as shown in Table 4-2 (Sources: ARUP Water Demand Memo for CP-HPS Phase II September 25, 2009; Parkmerced Water Demand Spreadsheet June 30, 2009; Treasure Island Water Technical Report December 2008 Updated August 2009)

(3) See Table 5-5. Agriculture, Mining, Construction, Manufacturing, Transportation, Wholesale & Retail Trade, F.I.R.E., Services, Gov't including Builders – Contractors and Docks – Shipping. (Source: Adapted from 2009 ABAG Employment Projections in conjunction with SF Planning, July 2009) As developed in the Demand Study, SFPUC derived the employment water demands by taking the ABAG employment projections and multiplying by 42.42 gallons per employee per day and is consistent with SFPUC's demand projection methodology.

(4) See Table 5-5. Non-residential (jobs/employment) demands at major project sites were assumed to be contained in the 2009 ABAG Employment projections. Growth in demand is incrementally increased to reflect the growth in jobs over the 20-year planning horizon. To avoid double-counting the water demand associated with the 2009 SF Planning Non-Residential Employment Projections and the non-residential demand calculated in the developer estimates at each of the Project sites, the total water demand at each of the developments was adjusted to remove the non-residential demands. This study assumes all non-residential demand is accounted for in the 2009 SF Planning Non-Residential Employment Projections. Table 5-4 shows the net change in water demand at the Project sites and the adjusted change in water demand without non-residential demand. Adapted by PBS&J and SFPUC September 2009 from ARUP Water Demand Memo for CP-HPS Phase II September 25, 2009; Parkmerced Water Demand Spreadsheet June 30, 2009; Treasure Island Water Technical Report December 2008 Updated August 2009

(8) Castlewood Community demand served by wells in the Pleasanton well field. (Source: 2005 SFPUC UWMP Table 8B, page 43)

5.2.4 Potential Recycle Water Demand of the Projects

In addition to providing estimated potable water demands, each of the Projects also provided the City with estimated recycled water demands. Each of the Projects anticipates developing new recycled water projects to help offset potable demand. As shown in Table 5-7, the Projects may produce up to 1.49 or 1.5 mgd of recycled water.

Table 5-7: Potential Recycled Water Demand of the Projects (mgd)

Development	**Recycled Water Demand[1] (mgd)**
CP-HPS II	0.89
TI-YBI	0.38
Parkmerced	0.22
Total	**1.49**

Notes: Average annual recycled water demand.
(1) Sources: ARUP Water Demand Memo for CP-HPS Phase II September 25, 2009; Parkmerced Water Demand Spreadsheet June 30, 2009; Treasure Island Water Technical Report December 2008 Updated August 2009. Appendix B

The recycled water potential shown in Table 5-7 is considered additional recycled water sources and have not been included as part of SFPUC's local WSIP supplies. In the event that recycled water is produced at the Project sites, recycled water could offset as much as 1.5 mgd in total City potable demand. This Study provides a conservative analysis of SFPUC's Retail supplies and demands and, as such, evaluates the City's demands to include the proposed projects without recycled water.

This page intentionally left blank.

6.0 SUPPLY AND DEMAND COMPARISON

This section compares the SFPUC's Retail water supplies and demands through year 2030.

6.1 Supply and Demand Comparison

Table 6-1 compares SFPUC Retail supplies and demand during normal, single dry year, and multiple dry year periods. Section 2.3.6 discusses SFPUC's total water supplies now and over the 20-year planning period. In 2010, prior to the development of the 10 mgd of local supplies, SFPUC can access an annual average 84.50 mgd from all water supply sources. Beginning in 2015, when the WSIP water supply sources are readily available, the SFPUC's Retail water supplies increase to 94.5 mgd. These supplies are assumed to be available in the quantities listed in Table 6-1. SFPUC intends to use these supplies to meet its Retail customer demands.

The demand estimates in this Study show that the 2009 SF Planning projections result in an increase in City Retail demand. As stated previously, by 2030 Retail demand is estimated at 93.42 mgd. This increase, however, does not change the findings in the 2005 UWMP, which estimated demand at 93.4 mgd in 2030.[6] As shown in Table 6-1, the SFPUC can meet the current and future demands of its Retail customers in normal years, single dry-years and nearly all multiple dry-year events with the exception of years 2 and 3 in 2030.

As modeled in Table 6-1, the deficit shown in 2010 is the result of reducing the RWS supply to 81 mgd as per the Phased WSIP Variant, without full development of the additional 10 mgd of new WSIP supplies. It is expected that 10 mgd of new sources will be developed and available for use in San Francisco by 2015. However, Retail demand is currently lower than the 2010 projected demand (Fiscal Year 2007-2008 use was 83.9 mgd). If Retail demand exceeds the available RWS supply of 81.0 mgd between 2010 and 2015, and total RWS deliveries exceed 265 mgd between 2010 and 2015, the Water Supply Agreement allows the SFPUC to purchase additional water with the payment of an Environmental Surcharge. Notably, total RWS deliveries in Fiscal Year 2007-2008 were 256.7 mgd, which is 8.3 mgd below the 265 mgd watershed delivery goal.

As shown in Table 6-1, during a multiple dry-year event[7] commencing in 2030, it is possible that the SFPUC will not be able to meet 100 percent of Retail demand in 2030. As modeled, a supply shortfall of 0.42 mgd is anticipated to occur in the second and third year of a multiple dry-year event. To overcome the potential 0.42 mgd supply deficit during multiple dry-years in 2030, the SFPUC will implement their adopted drought planning sequence and associated operating procedures that trigger different levels of water delivery reduction rationing relative to the volume of water actually stored in SFPUC reservoirs. If the SFPUC determines the projected total water storage to be less than an identified level sufficient to provide sustained deliveries during drought, the SFPUC may impose delivery reductions or rationing. The WSAP and RWSAP allow the SFPUC to reduce water deliveries to customers during periods of water shortage to

6 SFPUC 2005 Urban Water Management Plan Table 8B, page 43.

7 Multiple dry-year events are defined as a three-year event per UWMP requirements. SFPUC determined that a multiple dry-year event is years 2-4 of SFPUC's 8.5 year design drought. SFPUC can meet 100 percent of deliveries in the first year of such an event.

achieve a positive balance of supplies and demands. Under WSAP, the RWS supply curtailment in multiple dry years of 1.5 mgd to 79.5 mgd, results in a 1.9 percent reduction as shown in Table 4-2. The SFPUC, as part of the WSIP, adopted a water reliability objective of no greater than 20 percent rationing in any one year of a drought.

Table 6-1: Projected Supply and Demand Comparison - Normal, Dry, and Multiple Dry Years (mgd)

				Multiple Dry Year Event		
	Retail Supply and Demand	Normal Year	Single Dry Year	Year 1	Year 2	Year 3

(1) RWS Supply (SFPUC Water Supplies Table 2-2)
(2) Groundwater Uses for In-City Irrigation and Castlewood (SFPUC Water Supplies - Table 2-2)
(3) Total Retail Supply (SFPUC Water Supplies Table 2-2)
(4) SFPUC Retail Demand (SFPUC Retail Demand Table 5-6)
(5) The deficit shown in 2010 is the result of reducing the RWS supply to 81 mgd per the Phased WSIP Variant, without full development of the additional 10 mgd of new WSIP supplies. 10 mgd of new sources will be developed and available for use in San Francisco by 2015. However, Retail demand is currently lower than the 2010 projected demand (FY 07/08 use was 83.9 mgd). If Retail demand exceeds the available supply of 84.5 mgd between 2010 and 2015, the Water Supply Agreement allows the SFPUC to purchase additional water from the RWS. If combined Retail and Wholesale RWS deliveries exceed 265 mgd, the SFPUC Retail customers would be required to pay an Environmental Surcharge for RWS deliveries over 81 mgd (Total RWS deliveries in FY07/08 were 256.7 mgd).
(6) Groundwater Supplies at Castlewood and In-City Irrigation (SFPUC Water Supplies Table 2-2)
(7) WSIP Supply Sources (Recycled Water (4.0 mgd; Groundwater (2.0 mgd Existing and 2.0 from NWGWP, and WSIP Water Efficiency and Conservation (4.0 mgd) (see SFPUC Water Supplies Table 2-2)
(8) Deficit occurs in year 2 and 3 of multiple dry year event, SFPUC implements its Drought Year Water Shortage Contingency Plans - RWSAP and WSAP to balance supply and demand under this projected shortfall as described in Section 4.0

6.2 Conclusion and Findings

The updated 2009 SF Planning projections results in a Retail demand in 2030 of 93.42 mgd, which is only slightly greater than the 2030 demand projections estimated in the 2005 UWMP. This increase, however, does not change the results of the 2005 UWMP. In years with normal or above-normal precipitation, the City has sufficient supplies to serve their Retail customers.[8] The ability to meet the demands of the Retail customers is in large part due to the development of 10 mgd of local WSIP supplies in the Retail service area. These new sources of groundwater, recycled water, and water conservation are essential to provide the City with adequate supply in dry year periods, as well as improving supply reliability during years with normal precipitation. Although the 2005 UWMP considered the 10 mgd of new WSIP sources in terms of system-wide drought-planning, the WSIP supplies were not assigned to either the Retail or Wholesale Customers directly as it was not known how the resources would be used. As presented in this Study, with the adoption of the Phased WSIP Variant, the WSIP supplies can now be applied to meet Retail demands. In addition, due to the nature and development of the local supplies, these WSIP supply sources are not subject to reduction under the WSAP.

During a multiple dry-year event, however, it is possible that the SFPUC will not be able to meet 100 percent of demand from its Retail customers in 2030, and will therefore have to impose reductions on its Retail supplies. Under the WSAP, SFPUC Retail customers would experience no reduction in deliveries at a 10 percent RWS shortage. However, during a 20 percent system-wide shortage, the Retail customers would experience a 1.9 percent reduction in Retail deliveries. Table 6-1 compared SFPUC Retail supplies during normal, single dry year, and multiple dry year periods. The main difference between 2010 and subsequent planning years (2015–2030) is due to the development of the additional 10 mgd of local WSIP supplies in the Retail service area. These WSIP local supplies are not subject to a reduction under the WSAP, as the WSAP only allocates water from the RWS, which is subject to reductions.

The Projects anticipate developing new recycled water projects to help offset potable demand. These new projects may produce up to 1.5 mgd of recycled water. By reducing their potable water demands through the use of recycled water, these projects have the ability to eliminate the City's overall water shortage during multiple dry year periods.

8 The deficit shown in 2010 is the result of reducing the RWS supply to 81 mgd per the Phased WSIP Variant, without full development of the additional 10 mgd of new WSIP supplies. 10 mgd of new sources will be developed and available for use in San Francisco by 2015. However, Retail demand is currently lower than the 2010 projected demand (FY 07/08 use was 83.9 mgd). If Retail demand exceeds the available supply of 84.5 mgd between 2010 and 2015, the Water Supply Agreement allows the SFPUC to purchase additional water from the RWS. If combined Retail and Wholesale RWS deliveries exceed 265 mgd, the SFPUC Retail customers would be required to pay an Environmental Surcharge for RWS deliveries over 81 mgd (Total RWS deliveries in FY07/08 were 256.7 mgd).

Regarding the availability of water supplies to serve the City, beginning in 2015 the SFPUC finds as follows:

- In years of average and above-average precipitation and including development of SFPUC's local WSIP water supply sources the SFPUC has adequate supplies to serve 100 percent of normal, single dry and multiple dry year demand up to 2030.[9]
- In multiple-dry-year events after 2030, when the SFPUC imposes reductions in its supply, the SFPUC has in place the WSAP and RWSAP to balance supply and demand.
- If recycled water is implemented as proposed at each of the major development project sites, then it is assumed that potable water demands for the City can decrease by up to 1.5 mgd; thereby, eliminating potential multiple dry-year deficit after 2030.
- With the WSAP and RWSAP in place, and the addition of local WSIP supplies, the SFPUC finds it has sufficient water supplies available to serve its existing Retail customers and planned future uses.

9 The deficit shown in 2010 is the result of reducing the RWS supply to 81 mgd per the Phased WSIP Variant, without full development of the additional 10 mgd of new WSIP supplies. 10 mgd of new sources will be developed and available for use in San Francisco by 2015. However, Retail demand is currently lower than the 2010 projected demand (FY 07/08 use was 83.9 mgd). If Retail demand exceeds the available supply of 84.5 mgd between 2010 and 2015, the Water Supply Agreement allows the SFPUC to purchase additional water from the RWS. If combined Retail and Wholesale RWS deliveries exceed 265 mgd, the SFPUC Retail customers would be required to pay an Environmental Surcharge for RWS deliveries over 81 mgd (Total RWS deliveries in FY07/08 were 256.7 mgd).

Growth Projections Letter from San Francisco Planning Department

SAN FRANCISCO
PLANNING DEPARTMENT

1650 Mission St.
Suite 400
San Francisco,
CA 94103-2479

Reception:
415.558.6378

Fax:
415.558.6409

Planning
Information:
415.558.6377

July 9, 2009

Michael P. Carlin
Deputy General Manager, SFPUC
1155 Market St, 11th Floor
San Francisco, CA 94103

Subject: Projections of growth by 2030

Dear Michael:

Thank you for your letter dated March 11, 2009 requesting the Planning Department's projections of growth by 2030 in order to satisfy your mandates in connection with assessing water supply and demand in the years to come, and more specifically for preparing water supply assessments for individual projects moving forward.

The Planning Department routinely prepares projections for the purposes of analyzing impacts of plans and projects undergoing the environmental review process. While the assumptions of these sets may vary depending on the circumstances surrounding a specific project, the Department recently completed a citywide projection capturing citywide growth expectations by 2030 designed to closely match the recently adopted ABAG Projections 2009 target, but taking into account local knowledge of projects currently in various stages of the entitlement process, commonly referred to as the development pipeline. Table 1 shows the projections for 2030.

Table 1 Development Projections

	2000	2005	2030	Growth 2000-2030	Growth 2005-2030
Households	329,700	341,478	403,292	73,592	61,814
HH Population	756,976	783,441	916,800	159,824	133,359
Jobs	642,500	553,090	748,100	105,600	195,010

Source: ABAG, San Francisco Planning Department

As the question may arise whether particular projects were included, the Planning Department for the purposes of these numbers assumed full buildout over the course of the forecast period of three large development programs currently undergoing environmental review, namely Treasure Island, Bayview Waterfront, and Park Merced projects.

More generally, we included entitled pipeline projects, and projects larger than 500 units, or large commercial projects per criteria set forth in California Water Code §10912(a) as these are the projects for which individual water supply assessments would otherwise need to be made in the near future.

We are looking forward to continuing the larger regional growth dialogue with PUC and other regional stakeholders.

Sincerely,

John Rahaim
Director of Planning

APPENDIX B

Major Projects Water Demand Estimates from Project Sponsors

[Candlestick Point/Hunter's Point Shipyard; Parkmerced; Treasure Island-Yerba Buena Island]

To	Lennar -	Reference number 131878/RRJ	
cc		File reference	
From	Rowan Roderick-Jones/Manish Dalia x 27222 (San Francisco)	Date October 15, 2009	
Subject	**Candlestick Point / Hunters Point Shipyard Phase II** **Water Demand Memorandum** **Revision # 16**		

1 Purpose

This Water Demand Memorandum (Memo) presents a summary approach, references, assumptions, and results of calculations undertaken by Arup to estimate a range of potential water demands and sanitary sewer flows for the Candlestick Point/Hunters Point Shipyard (CP/HPS) Development including the Proposed Project as well as the R&D and Housing Variants.

The Memo establishes a historical baseline condition and makes adjustments to account for current California building code requirements as well as the San Francisco Green Building Ordinance. The basis for these analyses and the results are presented herein.

Arup worked in conjunction with Winzler & Kelly to develop water demand and sanitary sewer flow values appropriate for use in engineering design.

2 Approach

To develop reasonable water demand estimates for the CP/HPS development the following steps were taken.

1) The Proposed Project was divided into land uses as identified in Table 1. Two project variants exclude the stadium. The R&D Variant also includes an additional 2,500,000 square feet of research and development space, as shown in Table 2. The Housing Variant does not include any additional program but shifts 1,350 housing units from Candlestick Point to Hunters Point, as shown in Table 4. The methodology for developing water demands was the same for the Proposed Project and Project Variants.
2) A **Historical Benchmark** demand was estimated for each land use based on a series of assumptions and references. Key references used were:
    a. The Urban Water Management Plan for the City of San Francisco
    b. The SFPUC Wholesale Customer Demand Projections Technical Report (URS, 2004)
    c. The City of Los Angeles CEQA Threshold Guide, 2006
    d. The EPA, Onsite Wastewater Treatment Systems Manual, 2002

A number of other references were also used and these are provided at the end of this memorandum. Arup collected information from a number of sources and selected a method of estimating demands that we believed to be appropriate and reasonable for the area. Assumptions and references are provided in Section 4.

3) The demands were then distributed between indoor and outdoor end uses which were estimated based on published data in the SFPUC Wholesale Customer Demand Projections Report (URS 2004). End use distributions for the stadium and performance venues were assumed rather than taken directly from the SFPUC's projections. The distribution ratios are provided in Table 23 and Table 25.

4) Next, the Historical Benchmark was adjusted to an **Adjusted to California Codes** scenario using new fixture flow rates from California and Federal Buildings standards as well as the International Plumbing Code.

5) The Adjusted to California Codes demand estimate does not include the requirements of the **San Francisco Green Building Ordinance (SFGBO)**. The SFGBO is based on LEED for New Construction (LEED NC) and requires a 50% reduction in landscape irrigation demands. The SFGBO does not specify what code is to be used as the baseline for irrigation demands. Therefore the current code was assumed to be equivalent to the irrigation amount allowed under the California Water Efficient Landscape Ordinance. This rule was assumed to be applicable to both private and public landscape irrigation. In addition, the SFGBO requires a 30% reduction in potable water demand. The SFGBO does not provide specific language as to which portions of demand are to be included in the 30% reduction. However, the intention of the similar LEED NC credit (Water Efficiency Credit 3) is to reduce building water demand by 30%. The total 30% reduction in building water efficiency may be achieved by any number of means including improved fixture efficiency, mechanical building efficiency, or by providing an alternative water supply. The demand estimates, when adjusted for the SFGBO represent the final demands for the Proposed Project and Project Variants.

   The SFGBO demand was developed by using the California code as a baseline and using a trajectory or possible means of water saving strategies and/or alternative water supplies to achieve the SFGBO. The assumptions and references used to make these adjustments are provided in Table 27.

6) Potential reclaimed water demands as well as sewage generation were determined based on end use distributions.

The results of the study are presented at the beginning of this report. References and Assumptions used for making the demand estimations are provided after the results in Section 3.

3 Results

This section provides the results of the water demand assessment. The results are provided by land use as well as by end use (fixture type). The overall results for the proposed project are summarized by Figure 1. Similar summaries for the two project variants are provided in Figure 3and Figure 5.

Table 4: Potable water demands for Proposed Project and Project Variants.

	Proposed Project Demand (MGD)	R&D Variant Demand (MGD)	Housing Variant Demand (MGD)
Historical Baseline	2.95	3.47	2.92
Adjusted to California Codes	2.46	2.92	2.44
Adjusted to San Francisco Green Building Ordinance	1.67	1.99	1.66

The above table indicates that the R&D Variant will have the highest potable water demands under the requirements of the SFGBO of 1.99 MGD.

Figures 1 through 3 provide the Proposed Project and Project Variant demands for the Historical Benchmark, the Adjusted to California Codes and the San Francisco Green Building Ordinance cases. They also illustrate the Sustainable Case trajectory defined by the step down line. The first five steps in the “sustainable Case” step-down graph are demand reduction strategies while the later five steps are achieved by utilizing alternative water supplies. Additional demand breakdowns by land use and end use are provided in Table 5 through Table 14 for the Proposed Project and Project Variants. Reclaimed water demands and sanitary flows by end use for the Proposed Project are provided in Table 16 through Table 22.

Please note that in all reported annual water demand and sanitary flow data in Table 5 through Table 22 are in million gallons per day (MGD) and are rounded to the nearest 0.01 millionth gallon. When reporting the calculations within the tables slight rounding errors on the order of 0.01 MGD may occur.

4 Assumptions and References

This section describes assumptions used to:

1) Estimate historical baseline demands;
2) Distribute the historical baseline demands to specific end uses such as toilets, showers, irrigation etc…;
3) Adjust the historical baseline demands to current California code; and
4) Adjust the to-code demands to a sustainable case wherein efficiency measures such as efficient fixturesare applied. The efficiency measures applied in the Sustainable Case have been tailored to meet the demand reduction requirements of the SFGBO.

Table 20: Assumptions for estimating water demands by land use for the Historical Benchmark case .

Assumptions Summary for Historical Benchmark Demand Estimation						
Land use	**ID#**	**Description**	**Value**	**Unit**	**Reference or Assumption**	**Notes**
Residential						
	1	No. of residents per unit - low density	2.33	residents	Mundie & Associates, 2009	
	2	No. of residents per unit - medium density	2.33	residents	Mundie & Associates, 2009	
	3	No. of residents per unit - high density	2.33	residents	Mundie & Associates, 2009	
	4	Average consumption per capita	62	gallons per day (gp)	SFPUC, 2005	
	5	Average outdoor water use for single family residences	10	%	SFPUC, 2005	Note reference states that average demand is less than 10%
Regional Retail						
	1	Regional Retail jobs creation	350	Square feet (sqft)/job	Economic and Planning Systems, 2009.	
	2	Area of retail space per customer	22	sqft/customer	British Standards Institution. 2006	
	3	Sewage generation per employee	10	gpd	EPA, 2002	Sewage generation is only a fraction of overall consumption
	4	Sewage generation per visitor	2	gpd	EPA, 2002	EPA sites 2 gpd / parking spot. Sewage generation is only a fraction of overall consumption
	5	Average outdoor water use for non-residential customers	43	percent	URS, 2004.	
	6	Ratio of sewage generation to total water consumed on site	57	percent	Assumed based on URS 2004.	Required to convert sewage generation to total water consumption. Conservative in that a small portion of water consumed indoors would not go to sanitary sewer

Neighborhood Retail						
	1	Neighborhood retail jobs creation	270	sqft/job	Economic and Planning Systems, 2009.	
	2	Area of retail space per customer	22	sqft/customer	British Standards Institution. 2006	
	3	Sewage generation per employee	10	gpd	EPA, 2002	Sewage generation is only a fraction of overall consumption
	4	Water generation per visitor	2	gpd	EPA, 2002	EPA sites 2 gpd / parking spot. Sewage generation is only a fraction of overall consumption
	5	Average outdoor water use for non-residential customers	43	percent	URS, 2004.	Sewage generation is only a fraction of overall consumption
	6	Ratio of sewage generation to total water consumed on site	57	percent	Assumed based on URS 2004.	Required to convert sewage generation to total water consumption. Conservative in that a small portion of water consumed indoors would not go to sanitary sewer
Office						
	1	Office job creation	276	sqft/job	Economic and Planning Systems, 2009.	
	2	Residential jobs creation	25	Units/job	Economic and Planning Systems, 2009.	
	3	Water consumption per employee	85	gpd	URS, 2004.	
	4	Average outdoor water use for non-residential customers	43	percent	URS, 2004.	
	5	Ratio of sewage generation to total water consumed on site	57	percent	Assumed based on URS 2004.	Required to convert sewage generation to total water consumption. Conservative in that a small portion of water consumed indoors would not go to sanitary sewer
Community Uses						

	1	Community use job creation	276	sqft/job	Assumed similar to office	Actual Community uses are not finalized therefore community use water demands have been estimated in a similar manner as office land use.
	2	Water consumption per employee	85	gpd	Assumed similar to office	
	3	Average outdoor water use for non-residential customers	43	percent	Assumed similar to office	
	4	Ratio of sewage generation to total water consumed on site	57	percent	Assumed similar to office	Required to convert sewage generation to total water consumption. Conservative in that a small portion of water consumed indoors would not go to sanitary sewer
Research and Development						
	1	R&D jobs creation (office)	267	sqft/job	Economic and Planning Systems, 2009.	
	2	Sewage generation per employee for office R&D space	85	gpd	URS, 2004.	Sewage generation is only a fraction of overall consumption
	3	Average outdoor water use for non-residential customers for all R&D	43	percent	URS, 2004.	Sewage generation is only a fraction of overall consumption
	4	Ratio of sewage generation to total water consumed on site	57	percent	Assumed based on URS 2004.	Assumption is conservative in that some water consumed indoors would not go to sanitary sewer
	5	Type of R&D Spaces	1/3,1/3, and 1/3	Fraction	Email from Lennar	From email correspondence with Lennar it has been assumed that 1/3 of the R&D space will be office, 1/3 will be wet laboratory, and the remaining 1/3 will be light production which is similar to industrial.
	6	Water Usage for Wet Laboratory R&D Space	0.547	gpsfd	2020 UC Berkeley LRDP Draft EIR (http://www.cp.berkeley.edu/LRDP_2020 draft.htm) - Table 4.13-1	Source provided by Winzler & Kelly. The report states that 0.32 is for sustainable lab case with efficient fixtures built in, and calculations were worked backwards to calculate the BAU.
	7	Water usage profile for	Varies	%	URS, 2004	The water usage profile for wet lab

		Wet Lab Space				space has been assumed to be the average of the commercial and industrial usage profile.
	8	Water Usage for Light Projection R&D Space	0.1	gpsfd	City of Los Angeles, L.A. CEQA Threshold Guide, 2006, Exhibit M.2. - 12 Sewage Generation Factors	
Hotel						
	1	Hotel job creation	700	sqft/job	Economic and Planning Systems, 2009	
	2	Average guest room size	600	sqft	Assumed	This includes the space for reception, kitchens and conference facilities
	3	Average guests / room	1.9	guests	Assumed	
	4	Sewage generation per guest	50	gpd	EPA, 2002	Sewage generation is only a fraction of overall consumption
	5	Sewage generation per employee	10	gpd	EPA, 2002	Sewage generation is only a fraction of overall consumption
	6	Average outdoor water use for non-residential customers	43	percent	URS, 2004.	Sewage generation is only a fraction of overall consumption
	7	Ratio of sewage generation to total water consumed on site	57	percent	Assumed based on URS 2004.	Required to convert sewage generation to total water consumption. Conservative in that a small portion of water consumed indoors would not go to sanitary sewer
Artist Studios						
	1	# of artists	252	people	Lennar, 2009	
	2	Consumption per artist	85	gpd	URS, 2004.	
Parks and Open Space						
	1	Total irrigation demand from landscape architect	350,180	gpd	Per landscape irrigation prepared by RHAA 7/31/08	
Football Stadium						
	1	Football games / year	10	Home games	Economic and Planning Systems, 2009.	
	2	Attendance at football games	69000	people	Economic and Planning Systems, 2009.	

	3	Other venues per year	20	Other venues	Economic and Planning Systems, 2009.	
	4	Attendance at other venues	37500	people	Lennar, 2009	
	5	Employees (football day)	3625	people	Stadium Staffing Numbers from SF 49ers, (Lennar, 2009)	Includes 2900 employees and 725 media personnel
	6	Employees (event day)	1,922	people	Pro-rated using football day attendance and employees on football days	
	7	Employee (nonevent days)	48	people	Stadium Staffing Numbers from SF 49ers, (Lennar, 2009)	
	8	No. of players/performers (event day)	200	people	Assumed	100 people per team for players and staff. Assumed same number for other event days
	9	Stadium average daily irrigation	23979	gpd	Marty Laporte, 2009	
	10	Sewage generation per seat and employee on game days	4	gpd	EPA, 2002.	EPA value is for "auditorium" Sewage generation is only a fraction of overall consumption
	11	Ratio of sewage generation to indoor water consumption	95	percent	Assumed based on URS 2004.	Required to convert sewage generation to total water consumption. Conservative in that a small portion of water consumed indoors would not go to sanitary sewer
	12	Water consumption per permanent employee per day	85	gpd	URS, 2004.	
Performance Venue						
	1	Performance venue job creation	40	seats/job	Economic and Planning Systems, 2009.	
	2	Performance events per year	250	events	Economic and Planning Systems, 2009.	
	3	Employees - typical day	7	people	Assumed	Prorated to be similar to stadium
	4	Visitors per performance	10,000	people	Per CP/HPS development program, 2009	

	6	Water consumption per permanent employee per day	85	gpd	URS, 2004.	
	7	Sewage generation per seat and employee on event days	4	gpd	EPA, 2002.	EPA value is for "auditorium". Sewage generation is only a fraction of overall consumption
	12	Ratio of sewage generation to indoor water consumption	95	percent	Assumed based on URS 2004.	Required to convert sewage generation to total water consumption. Conservative in that a small portion of water consumed indoors would not go to sanitary sewer
Sanitary Sewer						
	1	Percent of indoor consumption to sanitary sewer	100%	Percent	Assumed per URS 2004 and conversations with W&K	
	2	Cooling demands assumed to contribute to sanitary sewer. (Non Res)			Assumed per conversations with W&K	Though some losses may occur, 100% of cooling demand is assumed to go to sanitary sewer

Table 23: End use demand distributions by land use (URS 2004)

Table 3-3
End-Use Data - Initial Percentage Assumptions

End Use	Initial Percentages by Customer-Billing Category				
	Single-Family Residential	Multi-Family Residential	Commercial	Industrial	Institutional
Indoor Usage

Table 27: Assumptions used to adjust between water demand scenarios

	Historical Benchmark		Adjusted to CA Code		SFGBO		
	Max Flow or Quantity	Note / Reference	Max Flow or Quantity	Note / Reference	Max Flow or Quantity	Note/Reference	Unit
Plumbing Fixture							
Lavatory faucet, private	2.5		2.2	2007 California Plumbing Code	1.5	EPA WaterSense	gpm at 60 psi
Lavatory faucet, public, (metering)	0.25		0.25	2006 International Plumbing Code	0.2	CA Green Building Standard 2008	gallon per metering cycle
(not metering)	0.6		0.5	IPC	0.5	n.a.	gpm at 60 psi
Shower head	3.125	URS 2004*	2.5	2007 California Plumbing Code	1.75	EPA WaterSense	gpm at 80 psi
Sink faucet	2.5		2.2	Plumbing Code	1.5	EPA WaterSense	gpm at 60 psi
Urinal	2	URS 2004*	1	2007 California Plumbing Code	0.125	EPA Water Sense	gallon per flushing cycle
Water closet	3.5	URS 2004*	1.6	2007 California Plumbing Code	1.28	EPA Water Sense and CA Green Building Standard 2008	gallon per flushing cycle
Other Appliances							
Dishwasher (Residential)	7		6	US Department of Energy 2007	4	Energy Star	gallons/cy capacity
Dishwasher (Commercial)	1.75		1.46	Energy Star	0.92	Energy Star	gallons per rack
Laundry	36.4	URS 2004	26	(US Federal Standard by 2011)	18	n.a. (calc)	gal/load
Laundry	13.2		8.5	CA Green Building Standard 2008	6	EPA Water Sense	gal/load-cf (Water Factor)
Irrigation							
Private Lands		Based on water demand distribution		California Water Efficient Landscape Ordinance (CWELO)	50%	CA Green Building Standard 2008	Fractional reduction compared to CWELO
Public Open Space		Per Landscape Architect Estimates		Per Landscape Architect Estimates - Note that this is less than CWELO	50%	CA Green Building Standard 2008	Fractional reduction compared to CWELO

Table 24: Other assumptions used to adjust the CA code demand to the SFGBO

Improved Cooling Efficiency		
Total fraction demand reductiont due to building envelope improvement measures and improved cooling technologies	0.25	
Reduced Losses		
Fractional demand reduction due to new piping and metering	0.25

Residential (Indoor)	272	0.74	50.1	0.14	322	0.88
Non-Residential	12	0.03	-	-	12	0.03
Irrigation	-	-	31	0.09	31	0.09
	284	0.78	82	0.22	365	1.00

FULL BUILD-OUT: (w/efficient fixtures)

	POTABLE		NON-POTABLE		TOTAL	
	MG/yr	mgd	MG/yr	mgd	MG/yr	mgd
Residential (Indoor)	227	0.62	85.6	0.23	313	0.86
Non-Residential	8	0.02	3.6	0.01	12	0.03
Irrigation	-	-	31	0.09	31	0.09
	236	0.65	121	0.33	356	0.98

Notes: Existing demands calculated from residential billing records 2006-7 and irrigation billing records 2005-2006.

Future non-potable demand includes toilet flushing in new units, all laundry, and all irrigation.

7. WATER SYSTEM

7.1 Existing System

7.1.1 Existing Water Supply

There are two existing sources of water supply serving Treasure Island. The primary supply is provided by the San Francisco Public Utilities Commission (SFPUC) through an existing 10-inch diameter steel pipe attached to the western span of the Bay Bridge. Water is pumped across the bridge by a pumping station located at 475 Spear Street in San Francisco. The station contains four pumps each rated at 900 gpm. The station can run a maximum of two pumps at a time for a maximum station output of 1,800 gpm.

The existing back up supply of water is provided by the East Bay Municipal Utility District (EBMUD) through a 12-inch diameter ductile iron main connected to an EBMUD water meter at Beach Street in Emeryville. From this location, water is delivered to a pump station located at Pier E23 of the existing Bay Bridge in Oakland. Water is then pumped through a 12-inch diameter steel pipe attached to the eastern span of the Bay Bridge. This water supply charges the fire hydrants on the Bridge and is connected to the existing water tanks on YBI for an emergency backup water supply. The maximum flow rate for this system is reported to be 1,500 gpm. There is currently an agreement in place between EBMUD and the Navy that limits the average annual flow 61 gallons per minute to maintain water quality in the line on the bridge. Actual average annual flows are well below that limit, at approximately 35 gpm.

7.1.2 Existing Water Storage

There are currently four existing concrete reservoirs on Yerba Buena Island that service both Yerba Buena Island and Treasure Island. Combined they have a total design capacity of approximately 6.5 million gallons to serve as both the potable and fire protection water supplies for Treasure Island and Yerba Buena Island. However, all of the tanks are in varying states of disrepair and cannot operate to their full design capacity. The actual operating storage capacity is approximately 1.9 million gallons with another 0.5 million gallons dedicated for fire protection. The design capacities, operating capacities, and operating elevations of the existing reservoirs are shown in Table 7.1.

Table 7.1 – Existing Reservoir Data

Reservoir Number	Design Capacity (million gallons)	Current Operating Capacity (million gallons)	Operating Elevation Range (NAVD88)	Primary Service
227	3.0	0.0	252.5 to 255.5	TI
162	2.0	1.3	322.0 to 327.0	YBI
168	0.5	0.5	356.0 to 359.0	Fire Reserve
242	1.0	0.6	247.0 to 251.0	TI/YBI

The elevations of the existing reservoirs provide an operating pressure of approximately 100-115 psi on TI and 80 psi on YBI (pressures at the higher areas of YBI are achieved with booster pumps).

The existing water storage tanks range in age from 60 to 85 years, and studies indicate that they are all in poor condition and will require either major rehabilitation or replacement.

7.1.3 Existing Water Distribution System

The original piping systems for a separate potable water and fire protection system for the Islands was constructed in 1939 out of copper, galvanized steel, and asbestos cement pipe. In 1990, the two systems were combined and the pipe material replaced with PVC pipe. Many of the individual building services and irrigation services originally constructed out of galvanized steel, however, have not been replaced. The relatively new PVC pipe system will be utilized on an interim basis during the initial phases of construction, but will eventually be replaced at the full build out of the project.

7.2 Proposed Domestic Water System

7.2.1 Proposed Water Demand

The estimated water demand for the proposed Land Use Plan is presented on Table 7.2. This estimate includes demand for the new development as well as the existing demand for the Department of Labor and the Coast Guard. The demand factors for the various facilities are indicated in the notes at the bottom of the table. The project will include the use of recycled water for irrigation and appropriate plumbing in the commercial use buildings. The potable demand factors included in Table 7.2 account for the use of water conserving fixtures in all buildings, the use of recycled water for toilet flushing and other non potable water uses in commercial buildings, and the use of recycled water for irrigation uses where appropriate. Recycled water demands are shown in Table 9.1 and 9.2A of Section 9, Recycled Water System.

As shown on Table 7.2, the average daily demand is estimated to be 1.08 millions gallons per day, or 753 gallons per minute (gpm). Because of the size of the proposed development, the relatively homogeneous use, and the use of recycled water for the irrigation needs, the project will use a maximum day demand factor of 1.2 times the average daily demand. Therefore, the maximum daily demand is 1.3 million gallons per day or 904 gpm.

The project will be designed to provide fire flow of 3,500 gallons per minute. This will be adequate to accommodate new construction. The existing Buildings 2 and 3 are designated to remain and will be retrofitted with appropriate supplemental fire protection systems when they are remodeled for commercial use. The fire protection systems designs for these structures will need to consider the building construction, use, and available fire flow.

7.2.2 Proposed Water Supply

7.2.2.1 Primary Water Supply

The existing SFPUC pump station in San Francisco and 10-inch line on the western span of the Bay Bridge is adequate to provide the required water supply to the project at full buildout and will continue to be the primary supply of water to Treasure Island. As with other water systems in the City, the SFPUC will need to monitor the condition of the pump station and supply line and perform routine maintenance and repairs to ensure reliable service to the islands.

7.2.2.2 Secondary Water Supply Source

The proposed secondary water supply to Treasure Island will continue to be from the EBMUD service in Oakland. Caltrans' construction of the new eastern span of the Bay Bridge, the Eastern Span Seismic Safety Project (ESSSP), is requiring modifications to the EBMUD service near the bridge abutment in Oakland and across the bridge. The new improvements will include:

- Relocation of the water main to the new Bay Bridge abutment.
- New pump station near the new bridge abutment in Oakland.
- New stub and shut off valve on YBI near column line XXX of the new bridge structure.

All of these items will be constructed as part of the ESSSP in cooperation with the SFPUC, and are not considered part of this project.

In addition to the secondary water source improvements associated with the new Bay Bridge project, the alignment of the secondary water source on YBI will be revised to as shown on Figure 7.1. The new alignment will follow North Gate Drive and Macalla Road to the new water tank locations.

The EBMUD back-up system will be capable of delivering approximately 1,800 gpm during emergency conditions. The system will continue to operate within the existing limit of 61 gallons per minute in average annual flow. This modest routine use is needed to maintain the water quality in the line across the Bay Bridge.

Table 7.2 Treasure Island Redevelopment Project Water Demand (8,000 Residential Units +100,000 sf office)

DESCRIPTION OF USE			POTABLE WATER DEMAND			RECYCLED WATER DEMAND	TOTAL WATER DEMAND	SEWER DEMAND	NOTES
Land Use	No.	Unit	Average Daily Demand (gpd)	Average Daily Demand (gpm)	Maximum Daily Demand (gpm) (Note 12)	Average Daily Demand (gpd)	Average Daily Demand (gpd)	Average Daily Demand (gpd)

Notes:

1 50 gallons per capita per day (gpcd), based on water conserving projections for 2030, based on 8000 units at 2.33 residents per dwelling unit. Population per dwelling unit based on City average from Demands Report Includes 30,000 gpd irrigation (CMG 8/7/09 spreadsheet)

2 Potable use based on 265 gpd/room; this includes all uses within the hotel. Recycled use based on 7 gallons recycled water per room per day (toilet flushing). Assumes no grounds for irrigation. Water demand based on AWWA standards.

3 Potable water demand based on 0.07 gpd/sf. Recycled water demand based on 0.375 gpd/sf. Reference : CCSF Retail Demands Rept Nov 2004

4 4 Allowance for misc. open space buildings not included elsewhere, including the YBI Historic Buildings, kiosks, warming hut, etc. Estimated potable use is based on 1 person per 200 SF, 20 gpcd total water use, minus 5 gpcd recycled water for toilets.

6 Potable use based on 400 persons per day at 15 gpcd total water use, minus recycled water use (toilets) at 5 gpcd

7 1 Student per 100 SF, 20 gpd per students

8 Value based on 2007 monthly demand provided by S. Larano, SFPUC.

9 Value provided by S. Larano, SFPUC.

10 Potable demand at 100 gpd/acre. Irrigation demand at 180,000 gpd for TI (CMG 8/7/09 spreadsheet).

11 Potable demand at 100 gpd/acre. Irrigation demand at 60,000 gpd (CMG 8/7/09 spreadsheet).

12 Maximum daily demand 120% of average daily demand

14 Based on 400 slips, day use only (no live aboard). 50 gpd per slip

7.2.3 Proposed Water Storage

The existing water tanks that serve YBI and TI are in poor condition and need major repair or replacement in order to serve the proposed project. To meet current SFPUC requirements, the Project will replace the existing water storage tanks in phases. The new water storage tanks will be sized to serve both the proposed new uses, as well as the existing uses that will remain.

The SFPUC water storage requirements for Treasure Island will be 2 days of maximum daily demand plus 4 hours of fire flow, or approximately 3.4 million gallons of storage.

The redundant water source from EBMUD provides an equal, compatible, and reliable back up water source to Treasure Island. If either SFPUC or EBMUD system is taken off line for maintenance, power interruptions, or damage due to earthquake, the other source will continue to supply 1,800 gpm, sufficient to meet the peak daily demands for the development. In the extremely unlikely event that both water supplies are taken down at the same time, then 2 days of maximum daily demand plus four 4 hours of fire storage should be sufficient to bridge the time for repairs or evacuation of the Island. It should also be noted that in such an event of extreme emergency, the consumption of potable water would likely be much lower than the calculated average demand shown in Table 7.2. Assuming reasonable reductions in retail, hotel, public and cultural uses that would naturally result following events of dire emergency the potable emergency demand would be significantly less than the average demand under normal conditions.

In addition to the normal operational storage requirements described above, the storage design will also need the ability to accommodate the maintenance of storage tanks. During maintenance, one tank, or portions of a tank, will need to taken out of service. During these regularly scheduled maintenance periods the SFPUC requires that the Treasure Island project maintain a minimum storage of 1 day maximum daily demand plus 4 hours of fire storage, or approximately 2.1 million gallons, at all times.

In order to meet the emergency and maintenance storage requirements, the water storage will be provided in two tanks. The existing 1.0 million gallon, circular, steel water storage tank adjacent to Macalla Road will be replaced with a new 1.0 million gallon, above grade, circular, steel water storage tank in the existing location. The remainder of the storage will be in a 2.4 million gallon water storage tank located at a higher elevation on YBI. Two locations are being considered for this tank as shown on Figure 7.2. The final location of this tank will be determined during the Master Planning phase of the project. The 2.4 million gallon tank will be divided into two 1.2 million gallon cells to accommodate maintenance and provide a minimum of 2.2 million gallons of storage at all times during maintenance. Together, the two tanks will provide 3.4 million gallons of storage. The final sizes, configuration and locations of the water storage tanks are described in more detail in the "Treasure Island and Yerba Buena Island Water Service Area Master Plan and Tank Siting Study" (Appendix E)

The upper storage tank (2.4 million gallons) will be supplied by water pumped directly from the 10-inch supply line from San Francisco, and the back up supply from EBMUD during emergencies. Supply to the lower, 1.0 million gallon tank will flow from the 2.4 million gallon tank by gravity. Because of the elevation of the 1.0 million gallon tank, it is likely that there will need to be a pressure reducing valve between the tank and the Treasure Island service area. The 2.4 million gallon tank is not high enough to provide service with adequate pressure to the upper portions of YBI. Fire flow and domestic demands to these YBI areas will be provided by an adjacent booster pump station with multiple pumps and emergency generator.

7.2.4 Proposed Domestic Water Distribution System

Through phased development of YBI and Treasure Island the existing PVC water distribution system will be replaced with a new ductile iron water system installed to SFPUC standards. Based on preliminary calculation, we anticipate that new water mains will range in size from 8 inches at minimum to a maximum size of 24 inches. A conceptual layout of the proposed domestic water distribution system is shown on Figure 7.1.

The California Code of Regulations, Title 22, requires that the water distribution system be capable of delivering the maximum daily demand coincident with the required fire flow. Based on the preliminary demand calculations described above, the proposed water system will be designed to deliver the maximum daily demand of 882 gpm along with the design fire flow of 3,500 gpm with a minimum residual pressure of 20 pounds per square inch to the fire hydrants on the Island.

7.3 Proposed Bay Water Auxiliary Water Supply System (AWSS)

Treasure Island and YBI do not currently have an AWSS system for fire protection. The project proposes to construct a new bay water AWSS system on TI as a backup fire protection system in the unlikely event of an extended total disruption of water supplies to Treasure Island. AWSS is not planned for Yerba Buena Island due to its steep topography, smaller size and development, and proximity to storage tanks and water supply lines on the Bay Bridge. The exact nature of the AWSS system is still being discussed with the San Francisco Fire Department (SFFD). It is expected that TI's AWSS may provide the following:

- A pump station with a salt-water intake pipe
- Two pipe manifolds for connection to fireboats
- Up to twenty-nine fire hydrants
- A main trunk pipe connecting the pump station, manifolds, and fire hydrants
- Three suction hydrants

The proposed bay water AWSS system discussed with TIDA, SFPUC and SFFD is shown on Figure 7.3. A brief description of the main elements of the AWSS system are as follows:

Pump Station and Intake Structure

The AWSS pump station and intake structure will be capable of continually charging the system and delivering 3,500 gpm of bay water at a maximum pressure of 125 psi. The pump station will include a diesel emergency power generator and additional pumps to provide redundancy during emergencies.

The water is drawn through a horizontal, large diameter draft tube (steel or concrete pipe) with a trash rack on the end to prevent uptake of debris. The draft tube connects to the vertical pump pit (precast concrete box or large diameter manhole), in which the pump intake pipe is located. A retractable fish screen may be included at the interface of the draft tube and the pump pit to prevent fish from entering into the pump system. Portions of the pump station will be contained in a pump house, for protection from weather and damage. See Figure 7.3.1.

Distribution Piping

A dedicated underground piping system will distribute the bay water within the developed areas of TI; dedicated bay water AWSS hydrants will be provided along the distribution route.

Fireboat Manifolds

The fireboat manifolds will be located near the ferry quay and near Pier 1. The manifolds will allow the fireboats to connect to the AWSS system and charge the lines in the unlikely event the pump station fails or additional flow/pressure is required in the system. When connected to the pipe manifold, the fireboat will draw salt water via its on-board pumps which may have a minor effect on the natural environment; this is assumed to be inherent to the operation of the fireboat and is beyond the scope of the AWSS.

Suction Hydrants

Three suction hydrants will be located around the perimeter of Treasure Island that will allow fire trucks to draft water directly from the Bay. Suction hydrants, also called Bay Suction connections, allow fire engines to draft water directly from the Bay. The hydrant is similar to typical fire hydrants, however there is no connection to a pressurized, piped water supply – the hydrant is connected to an intake pipe leading into the Bay. To prevent debris from entering the intake pipes, the end of the pipe may be fitted with a screen. See Figure 7.3.1.

Potential Bay Regulatory Issues

Construction and operation of the AWSS may potentially affect the Bay environment. Descriptions of the potential temporary and permanent effects on the environment, as well as ways in which those effects could possibly be reduced, are described below:

1. Temporary Construction Effects:
   Construction of the draft tube and suction hydrant pipes will require temporary shoreline excavation in the vicinity of the intakes, construction of temporary shoring,

and backfill/replacement of existing shoreline revetment. See Figure 7.3.2 – 4 for approximate areas of potential effect. Measures to reduce the possible temporary environmental effects of this work could include:

- Limit the amount of disturbed area below the mean high water mark as much as feasible.
- Prohibit the use of materials that may reduce water quality
- Follow erosion control plans to keep sediment from entering the Bay
- Follow site maintenance plans to eliminate construction debris from entering the Bay

2. Permanent Construction Effects
   The pump station draft tube and suction hydrant intake pipes will permanently extend through the shoreline revetment into the bay (below low water). This will be similar to other pipe penetrations through the shoreline for storm drain outfalls. Measures to reduce the possible permanent effects on the environmental from this work, could include:
   - Limit the amount of permanent improvements below the mean high water mark as much as feasible.
   - Prohibit the use of materials that may reduce water quality

3. AWSS Operational Effects
   The intake structures have the potential to create a vortex at the end of intakes (pump station draft tube and suction hydrant intake pipes) which could constitute a hazard at the water surface if not addressed. To prevent this, the end of the intakes could be enlarged or otherwise designed to prevent vortex formation.

a. There may be potential effects on fish during the regular testing of the AWSS system. The effect will depend largely on the anticipated usage of the AWSS, which will depend on the frequency and duration of scheduled tests of the system. For short-duration tests to verify the operational functionality of the system, measures – such as fish screens – to prevent fish uptake may not be necessary. If fish screens are required, the affect on fish in the Bay will depend on the design of the fish screen in accordance with the following parameters:
   - Size of openings (based on species and size of fish to be protected);
   - Porosity (percent open area of screen face);
   - Approach velocity (perpendicular to screen face);
   - Sweeping velocity (parallel to screen face).

   In the event that the AWSS is operated to suppress actual fires, the system will be used for a longer duration than that used for periodic testing; consequently, the effect on the environment could be greater. However, it is assumed that any effects that occur as a result of an actual emergency will be acceptable as a unique, singular event, and that the emergency needs will govern.

The final designs for the AWSS intake structures will be submitted to the appropriate agencies for review and approval prior to construction. The permitting agencies will include the Bay Conservation and Development Commission (BCDC), Army Corps of Engineers, Regional Water Quality Control Board, California Department of Fish and Game, and United States Fish and Wildlife Service.

7.4 Phases for Water System Construction
The new water infrastructure to support development of the project will be installed in phases to match development of the project. The existing land uses on Treasure Island will continue to utilize the existing water distribution system with temporary connections to the new system and temporary water infrastructure where required to maintain the existing uses until they are demolished or permanent connections can be made. Water storage will be brought on-line as required to support the water demands of the project as it develops.

7.5 Master Utility System Plans and Master Fire Protection Plan
A Water System Master Plan will be prepared in coordination with the SFPUC and the SFFD during the development of the DDA. The Water System Master Plan will include detailed calculation to size pipes, domestic water system layout, proposed water tank locations and project phasing. The Master Plan is not expected to substantially change the supply, storage and distribution of water described here.

7.6 Sustainability Goals
The construction of the secondary water source from EBMUD, combined with the reconstruction of the entire water storage and delivery system on Yerba Buena and Treasure Islands will provide a robust water supply to sustain and protect the island community. This new system combined with water conserving fixtures within the new buildings, and the maximum feasible use of recycled water for the landscape areas and commercial buildings within the core development area (see below) will meet, or exceed, the goals described in the Sustainability Plan.

Appendix Q2 Arup, Amendment to Water Demand Memorandum #16—Variant 2A (Housing/R&D Variant), April 28, 2010

To	Lennar -	Reference number 131878/RRJ	
cc		File reference	
From	Rowan Roderick-Jones/Manish Dalia x 27222 (San Francisco)	Date April 28, 2010	
Subject	**Candlestick Point / Hunters Point Shipyard Phase II** Amendment to Water Demand Memorandum #16—Variant 2A (Housing/R&D Variant)		

1 Purpose

An option to Variant 2 (Housing Variant)—Variant 2A (Housing/R&D Variant)—has been identified that would allow for additional R&D uses on the stadium site, along with housing, in the event the 49ers do not choose to develop a stadium in the HPS Phase II area. This addendum to the Candlestick Point / Hunters Point Shipyard Phase II Water Demand Memorandum Revision #16, October 15, 2009, provides a water demand estimate for Variant 2A, the Housing/R&D Variant.

As compared to the Housing Variant 2, the Housing/R&D Variant (Variant 2A) would relocate 275 residential units from Candlestick Point to HPS Phase II and redistribute 50 residential units within Candlestick Point. The Housing/R&D Variant (Variant 2A) would not develop the uses in the Jamestown District of Candlestick Point that would occur under the Housing Variant (Variant 2).

An additional 500,000 square feet (sf) of R&D land use would be constructed on the stadium site as compared to the Housing Variant (Variant 2), for a total of 3,000,000 sf of R&D uses at the HPS Phase II site. The Draft EIR analyzed a total of 5,000,000 sf of R&D uses under the R&D Variant 1, and 2,500,000 sf under the Housing Variant (Variant 2); therefore, the increased amount of R&D square footage under the Housing/R&D Variant (Variant 2A) (e.g., 3,000,000 sf) would fall within the range of development programs analyzed by the R&D Variant (Variant 1) and the Housing Variant (Variant 2).

The total amount of park acreage with the Housing/R&D Variant (Variant 2A) would be 326.6 acres, which represents a decrease of approximately 10 acres as compared to the Project (which would provide 336.4 acres) and about 22.8 acres less than the Housing Variant (Variant 2) (which would provide 349.4 acres) because of increased development on the stadium site.

2 Approach

To develop reasonable water demand estimates for the CP/HPS development the following steps were taken.

1) The Project Variant was divided into land uses as shown in Table 1.

2) A **Historical Benchmark** demand was estimated for each land use based on a series of assumptions and references. Key references used were:

   a. The Urban Water Management Plan for the City of San Francisco

   b. The SFPUC Wholesale Customer Demand Projections Technical Report (URS, 2004)

c. The City of Los Angeles CEQA Threshold Guide, 2006

d. The EPA, Onsite Wastewater Treatment Systems Manual, 2002

A number of other references were also used and these are provided at the end of this memorandum. Arup collected information from a number of sources and selected a method of estimating demands that we believed to be appropriate and reasonable for the area. Assumptions and references are provided in Section 4.

3) The demands were then distributed between indoor and outdoor end uses which were estimated based on published data in the SFPUC Wholesale Customer Demand Projections Report (URS 2004). End use distributions for the stadium and performance venues were assumed rather than taken directly from the SFPUC's projections. The distribution ratios are provided in Table 8 and Table 9.

4) Next, the Historical Benchmark was adjusted to an **Adjusted to California Codes** scenario using new fixture flow rates from California and Federal Buildings standards as well as the International Plumbing Code.

5) The Adjusted to California Codes demand estimate does not include the requirements of the **San Francisco Green Building Ordinance (SFGBO)**. The SFGBO is based on LEED for New Construction (LEED NC) and requires a 50% reduction in landscape irrigation demands. The SFGBO does not specify what code is to be used as the baseline for irrigation demands. Therefore the current code was assumed to be equivalent to the irrigation amount allowed under the California Water Efficient Landscape Ordinance. This rule was assumed to be applicable to both private and public landscape irrigation. In addition, the SFGBO requires a 30% reduction in potable water demand. The SFGBO does not provide specific language as to which portions of demand are to be included in the 30% reduction. However, the intention of the similar LEED NC credit (Water Efficiency Credit 3) is to reduce building water demand by 30%. The total 30% reduction in building water efficiency may be achieved by any number of means including improved fixture efficiency, mechanical building efficiency, or by providing an alternative water supply. The demand estimates, when adjusted for the SFGBO represent the final demands for the Proposed Project and Project Variants.

   The SFGBO demand was developed by using the California code as a baseline and using a trajectory or possible means of water saving strategies and/or alternative water supplies to achieve the SFGBO. The assumptions and references used to make these adjustments are provided in Table 10.

6) Potential reclaimed water demands as well as sewage generation were determined based on end use distributions.

The results of the study are presented at the beginning of this report. References and Assumptions used for making the demand estimations are provided after the results in Section 3.

Table 1: CP/HPS Land Use Program (Housing/R&D Variant)

		Hunters Point Shipyard	Candlestick Point	Project Total
Land Use				
Residential				
	Density, 15-75 units per acre (units)	1,320	940	2,260

3 Results

This section provides the results of the water demand assessment. The results are provided by land use as well as by end use (fixture type). The overall results for the proposed project are summarized by Figure 1.

Figure 1 provides the Variant 2A demands for the Historical Benchmark, the Adjusted to California Codes and the San Francisco Green Building Ordinance cases. It also illustrates the Sustainable Case trajectory defined by the step down line. The first five steps in the "Sustainable Case" step-down graph are demand reduction strategies while the later five steps are achieved by utilizing alternative water supplies. Additional demand breakdowns by land use and end use are provided in Table 2 through Table 4. Reclaimed water demands and sanitary flows by end use for the Proposed Project are provided in Table 5 through Table 6.

Figure 1: Water demand results summary (Housing/R&D Variant)

4 Assumptions and References

This section describes assumptions used to:

1) Estimate historical baseline demands;
2) Distribute the historical baseline demands to specific end uses such as toilets, showers, irrigation etc…;
3) Adjust the historical baseline demands to current California code; and
4) Adjust the to-code demands to a sustainable case wherein efficiency measures such as efficient fixtures are applied. The efficiency measures applied in the Sustainable Case have been tailored to meet the demand reduction requirements of the SFGBO.

Table 7: Assumptions for estimating water demands by land use for the Historical Benchmark case .

Assumptions Summary for Historical Benchmark Demand Estimation						
Land use	**ID#**	**Description**	**Value**	**Unit**	**Reference or Assumption**	**Notes**
Residential						
	1	No. of residents per unit - low density	2.33	residents	Mundie & Associates, 2009	
	2	No. of residents per unit - medium density	2.33	residents	Mundie & Associates, 2009	
	3	No. of residents per unit - high density	2.33	residents	Mundie & Associates, 2009	
	4	Average consumption per capita	62	gallons per day (gp)	SFPUC, 2005	
	5	Average outdoor water use for single family residences	10	%	SFPUC, 2005	Note reference states that average demand is less than 10%
Regional Retail						
	1	Regional Retail jobs creation	350	Square feet (sqft)/job	Economic and Planning Systems, 2009.	
	2	Area of retail space per customer	22	sqft/customer	British Standards Institution. 2006	
	3	Sewage generation per employee	10	gpd	EPA, 2002	Sewage generation is only a fraction of overall consumption
	4	Sewage generation per visitor	2	gpd	EPA, 2002	EPA sites 2 gpd / parking spot. Sewage generation is only a fraction of overall consumption
	5	Average outdoor water use for non-residential customers	43	percent	URS, 2004.	
	6	Ratio of sewage generation to total water consumed on site	57	percent	Assumed based on URS 2004.	Required to convert sewage generation to total water consumption. Conservative in that a small portion of water consumed indoors would not go to sanitary sewer

Neighborhood Retail						
	1	Neighborhood retail jobs creation	270	sqft/job	Economic and Planning Systems, 2009.	
	2	Area of retail space per customer	22	sqft/customer	British Standards Institution. 2006	
	3	Sewage generation per employee	10	gpd	EPA, 2002	Sewage generation is only a fraction of overall consumption
	4	Water generation per visitor	2	gpd	EPA, 2002	EPA sites 2 gpd / parking spot. Sewage generation is only a fraction of overall consumption
	5	Average outdoor water use for non-residential customers	43	percent	URS, 2004.	Sewage generation is only a fraction of overall consumption
	6	Ratio of sewage generation to total water consumed on site	57	percent	Assumed based on URS 2004.	Required to convert sewage generation to total water consumption. Conservative in that a small portion of water consumed indoors would not go to sanitary sewer
Office						
	1	Office job creation	276	sqft/job	Economic and Planning Systems, 2009.	
	2	Residential jobs creation	25	Units/job	Economic and Planning Systems, 2009.	
	3	Water consumption per employee	85	gpd	URS, 2004.	
	4	Average outdoor water use for non-residential customers	43	percent	URS, 2004.	
	5	Ratio of sewage generation to total water consumed on site	57	percent	Assumed based on URS 2004.	Required to convert sewage generation to total water consumption. Conservative in that a small portion of water consumed indoors would not go to sanitary sewer
Community Uses						

	1	Community use job creation	276	sqft/job	Assumed similar to office	Actual Community uses are not finalized therefore community use water demands have been estimated in a similar manner as office land use.
	2	Water consumption per employee	85	gpd	Assumed similar to office	
	3	Average outdoor water use for non-residential customers	43	percent	Assumed similar to office	
	4	Ratio of sewage generation to total water consumed on site	57	percent	Assumed similar to office	Required to convert sewage generation to total water consumption. Conservative in that a small portion of water consumed indoors would not go to sanitary sewer
Research and Development						
	1	R&D jobs creation (office)	267	sqft/job	Economic and Planning Systems, 2009.	
	2	Sewage generation per employee for office R&D space	85	gpd	URS, 2004.	Sewage generation is only a fraction of overall consumption
	3	Average outdoor water use for non-residential customers for all R&D	43	percent	URS, 2004.	Sewage generation is only a fraction of overall consumption
	4	Ratio of sewage generation to total water consumed on site	57	percent	Assumed based on URS 2004.	Assumption is conservative in that some water consumed indoors would not go to sanitary sewer
	5	Type of R&D Spaces	1/3,1/3, and 1/3	Fraction	Email from Lennar	From email correspondence with Lennar it has been assumed that 1/3 of the R&D space will be office, 1/3 will be wet laboratory, and the remaining 1/3 will be light production which is similar to industrial.
	6	Water Usage for Wet Laboratory R&D Space	0.547	gpsfd	2020 UC Berkeley LRDP Draft EIR (http://www.cp.berkeley.edu/LRDP_2020 draft.htm) - Table 4.13-1	Source provided by Winzler & Kelly. The report states that 0.32 is for sustainable lab case with efficient fixtures built in, and calculations were worked backwards to calculate the BAU.
	7	Water usage profile for	Varies	%	URS, 2004	The water usage profile for wet lab

		Wet Lab Space				space has been assumed to be the average of the commercial and industrial usage profile.
	8	Water Usage for Light Projection R&D Space	0.1	gpsfd	City of Los Angeles, L.A. CEQA Threshold Guide, 2006, Exhibit M.2. - 12 Sewage Generation Factors	
Hotel						
	1	Hotel job creation	700	sqft/job	Economic and Planning Systems, 2009	
	2	Average guest room size	600	sqft	Assumed	This includes the space for reception, kitchens and conference facilities
	3	Average guests / room	1.9	guests	Assumed	
	4	Sewage generation per guest	50	gpd	EPA, 2002	Sewage generation is only a fraction of overall consumption
	5	Sewage generation per employee	10	gpd	EPA, 2002	Sewage generation is only a fraction of overall consumption
	6	Average outdoor water use for non-residential customers	43	percent	URS, 2004.	Sewage generation is only a fraction of overall consumption
	7	Ratio of sewage generation to total water consumed on site	57	percent	Assumed based on URS 2004.	Required to convert sewage generation to total water consumption. Conservative in that a small portion of water consumed indoors would not go to sanitary sewer
Artist Studios						
	1	# of artists	252	people	Lennar, 2009	
	2	Consumption per artist	85	gpd	URS, 2004.	
Parks and Open Space						
	1	Total irrigation demand from landscape architect	350,180	gpd	Per landscape irrigation prepared by RHAA 7/31/08	
Football Stadium						
	1	Football games / year	10	Home games	Economic and Planning Systems, 2009.	
	2	Attendance at football games	69000	people	Economic and Planning Systems, 2009.	

	3	Other venues per year	20	Other venues	Economic and Planning Systems, 2009.	
	4	Attendance at other venues	37500	people	Lennar, 2009	
	5	Employees (football day)	3625	people	Stadium Staffing Numbers from SF 49ers, (Lennar, 2009)	Includes 2900 employees and 725 media personnel
	6	Employees (event day)	1,922	people	Pro-rated using football day attendance and employees on football days	
	7	Employee (nonevent days)	48	people	Stadium Staffing Numbers from SF 49ers, (Lennar, 2009)	
	8	No. of players/performers (event day)	200	people	Assumed	100 people per team for players and staff. Assumed same number for other event days
	9	Stadium average daily irrigation	23979	gpd	Marty Laporte, 2009	
	10	Sewage generation per seat and employee on game days	4	gpd	EPA, 2002.	EPA value is for "auditorium" Sewage generation is only a fraction of overall consumption
	11	Ratio of sewage generation to indoor water consumption	95	percent	Assumed based on URS 2004.	Required to convert sewage generation to total water consumption. Conservative in that a small portion of water consumed indoors would not go to sanitary sewer
	12	Water consumption per permanent employee per day	85	gpd	URS, 2004.	
Performance Venue						
	1	Performance venue job creation	40	seats/job	Economic and Planning Systems, 2009.	
	2	Performance events per year	250	events	Economic and Planning Systems, 2009.	
	3	Employees - typical day	7	people	Assumed	Prorated to be similar to stadium
	4	Visitors per performance	10,000	people	Per CP/HPS development program, 2009	

	6	Water consumption per permanent employee per day	85	gpd	URS, 2004.	
	7	Sewage generation per seat and employee on event days	4	gpd	EPA, 2002.	EPA value is for "auditorium". Sewage generation is only a fraction of overall consumption
	12	Ratio of sewage generation to indoor water consumption	95	percent	Assumed based on URS 2004.	Required to convert sewage generation to total water consumption. Conservative in that a small portion of water consumed indoors would not go to sanitary sewer
Sanitary Sewer						
	1	Percent of indoor consumption to sanitary sewer	100%	Percent	Assumed per URS 2004 and conversations with W&K	
	2	Cooling demands assumed to contribute to sanitary sewer. (Non Res)			Assumed per conversations with W&K	Though some losses may occur, 100% of cooling demand is assumed to go to sanitary sewer

Table 8: End use demand distributions by land use (URS 2004)

Table 3-3
End-Use Data - Initial Percentage Assumptions

End Use	Initial Percentages by Customer-Billing Category

1 Introduction

This report contains a brief description of potential water quality impacts resulting from changes in frequency, duration or volume of combined sewer overflows (CSOs) from the City's combined sewer system (CSS). Potential changes in CSOs were reviewed in response to predicted changes in the sanitary flow and storm runoff from the proposed redevelopment of Candlestick Point (CP) and Hunters Point Shipyard (HPS). This Technical Memorandum (TM) summarizes the results of a hydrologic modeling analysis and presents a comparison between the base case and with-project scenarios.

2 Base Case Scenario

The Base Case scenario for comparison represents the existing Bayside system including development at Hunters Point through Phase I, Mission Bay at full build-out, and construction of the Sunnydale Tunnel. It does not include additional reasonable foreseeable future developments.

3 With-Project Scenario

The hydrologic analysis was premised on a number of assumptions including type and extent of proposed uses, stormwater and sanitary flow discharge destinations and other pertinent information as outlined in Tables 1 and 2. Contributing areas were determined based on Figure 1—CP/HPS Project Area, and are organized into two main subareas as described below.

Figure 1. CP/HPS Project Area

Source: Lennar Urban

3.1 Candlestick Point Subarea

Currently, all of the Alice Griffith Housing Development, portions of the State Park, and portions of the Stadium site contribute storm runoff to the City's CSS. With the proposed project, these flows will be removed from the City system, and all future stormwater flows will be discharged to the Bay with a portion of the flow receiving treatment prior to discharge (Lennar Urban, "LID Stormwater Opportunities Study", June, 2009).

Currently, the CP site contributes sanitary sewage to the CSS via gravity sewers from three locations: the stadium, the Alice Griffith housing development, and the RV Park on State Park grounds. The existing sanitary flows from these three sources are as follows:

- The existing annual average sanitary flow from the stadium is assumed as 23,285 gpd (ARUP, "Candlestick Point/ Hunters Point Shipyard Phase II Water Demand Memorandum Revision # 15, September 25, 2009).
- The existing sanitary flow from the housing development is calculated based on 256 units at a rate of 101.9 gpd/unit (SFPUC Multi-Family Residential estimates for 2010, "householdcons.xls").

- The existing sanitary flow from the State Park RV Park is based on average monthly meter data for the period January, 2007 through September, 2009 provided by SFPUC (via email from Hayden Kam, September 30, 2009).

3.2 Hunters Point Shipyard Subarea

Currently, no stormwater flows (other than infiltration and inflow to the sanitary system) from HPS are directed to the City CSS. The proposed project and both variants maintain separation of stormwater flows from the City CSS. All sanitary flows from HPS are currently pumped to the City system via force main on Crisp Road discharging just upstream of the Hunters Point Tunnel. For the purpose of this analysis, the existing sanitary flows from HPS are assumed to be 0.154 mgd on average based on SFPUC meter data for the period July 1, 2001, through June 30, 2002 (SFPUC, "Annual Metered Sewage Discharge.xls").

Table 1. Hydrologic Model Dry Weather Inputs—Sanitary Flows to the City CSS

	Future[1] (mgd)	Base Case[2] (mgd)	Net increase (mgd)
Proposed Project			
Candlestick Park	0.57	0.0517	0.518
Hunters Point	0.39	0.154	0.236
R & D Variant			
Candlestick Park	0.57	0.0517	0.518
Hunters Point	0.61	0.154	0.456
Housing Variant			
Candlestick Park	0.49	0.0517	0.438
Hunters Point	0.48	0.154	0.326

4 Analysis and Results

The proposed redevelopment scenario described above was analyzed with the aid of the Bayside Planning computer model. Model results of primary importance to this project include the frequency, volume and duration of combined sewage overflow (CSO) from the Yosemite Basin, and the total CSO volume for the entire Bayside. Other Bayside basins are not impacted by the proposed redevelopment. The results of the computer analysis are summarized in Table 3.

Table 3. Hydrologic Model Results

	Yosemite CSO			Bayside CSO
	MG/yr	#/year	hours/yr	MG/yr
Base Case	5.3	1	2	890
Proposed Project	3.1	0.64	1.17	877
R & D Variant	3.1	0.64	1.18	878
Housing Variant	3.1	0.64	1.17	877

The model results indicate a predicted decrease in CSO volume, frequency, and duration of CSO in the Yosemite Basin, and a decrease in overall CSO volume for the entire Bayside, for the proposed project and both variants. While the total dry weather (sanitary) flows are expected to increase, the CSO frequency, duration, and volume are all expected to decrease. The proposed diversion of wet weather flows away from the combined system offset the increase in dry weather flows. This may not be the case during the construction period if enough new units are constructed (increasing the sanitary flows) before the separated stormwater management system is complete. Through the course of interim development, a balance will need to be kept between the increase in sanitary flows and the decrease in stormwater runoff.

Executive Summary

The Candlestick Point-Hunter's Point Shipyard Phase II Development Plan (CP-HPS Plan) is a proposed mixed use community to be built in the western area of San Francisco County. The CP-HPS Plan consists of two project areas: Candlestick Point (CP) and Hunter's Point Shipyard (HPS). The site is part of a redevelopment of the previous uses at the site. CP-HPS Plan will result in approximately 10,500 residences at full build out with 256 existing residences being replaced for a total of 10,244 net new residences. The development will also include commercial (i.e., office and retail uses) space. The CP-HPS Plan includes demolition of Candlestick Park. The Project includes having the Stadium rebuilt in the HPS project area. Two different project variants are considered if no Stadium is rebuilt. Project Variant 1 will place additional research and development space at HPS. Project Variant 2 will change the distribution of residences between CP and HPS but will keep the overall total number of residences the same as the Project. This development will result in both one-time and annual direct and indirect emissions of greenhouse gases (GHGs). The term, "direct emissions of GHGs" refers to GHGs that are emitted directly as a result of CP-HPS Plan and include land use change and construction emissions. Indirect emissions are those emissions that CP-HPS Plan entitlement will enable, but that are not controlled by CP-HPS Plan proponent. This report discusses the scientific developments surrounding global climate change and provides an inventory surveying the emissions that would result from approving CP-HPS Plan.

There is a general scientific consensus that most current global warming is the result of human activity on the planet. This man-made, or anthropogenic, warming is primarily caused by increased emissions of GHGs that keep the earth's surface warm. This is called "the greenhouse effect" and contributes to global climate change.

Residents and the employees and patrons of commercial and municipal buildings and services use electricity, heating, and are transported by motor vehicles. These activities directly or indirectly emit GHGs. The most significant GHG emissions resulting from such residential and commercial developments are emissions of carbon dioxide (CO_2), methane (CH_4) and nitrous oxide (N_2O). GHG emissions are typically measured in terms of tonnes of CO_2 equivalents (CO_2e), calculated as the product of the mass emitted of a given GHG and its specific global warming potential (GWP).

The emissions inventory presented in this report is consistent with the methodologies established by the California Climate Action Registry (CCAR), where possible. The CP-HPS Plan emissions inventory considers nine categories of direct and indirect GHG emissions: emissions due to vegetation changes, emissions from construction activities, residential building emissions, non-residential building emissions, mobile source emissions, municipal emissions, area sources, solid waste, and transit services. The emissions from construction and vegetation change are one-time emissions events. The other emissions occur annually throughout the life of CP-HPS Plan. The electrical power for the CP-HPS Plan development will be supplied by Pacific Gas and Electric Company (PG&E). Accordingly, indirect GHG emissions from electricity usage are calculated using the PG&E carbon-intensity factor.

A variety of methods are employed to develop a complete GHG emissions inventory. In addition to well-established emission factors for certain activities and emission estimates based on similar activities in other representative communities; several emissions estimation software programs are used. These include EMFAC, OFFROAD, and Urban Emissions Model (URBEMIS).

Emissions from the various aspects of CP-HPS Plan are presented in Table ES-1. Both the one-time emissions and emissions that are expected to occur each year after build-out of the CP-HPS Plan development are presented. There are 98,587 tonnes of CO_2e one-time emissions. The annual emissions from the use of the development amount to 154,639 tonnes CO_2e/year. Of the annual emissions, slightly more than 68% result from vehicular emissions associated with residential activities, and 29% result from the energy use associated with residential and non-residential buildings. If the one-time emissions are annualized assuming a 40-year development life (which is likely low), then the one-time emissions account for approximately 2,465 tonnes, or 2% of the annual emissions. Taking these annualized one-time emissions into account, the annual emissions are 157,104 tonnes/year.

Emissions from the various aspects of Variant 1 are presented in Table ES-2. Both the one-time emissions and emissions that are expected to occur each year after build-out of the CP-HPS Plan development are presented. There are 98,587 tonnes of CO_2e one-time emissions. This is the same for all project scenarios since there were not different estimates of construction equipment. The annual emissions from the use of the development amount to 178,651 tonnes CO_2e/year. Of the annual emissions, slightly more than 67% result from vehicular emissions associated with residential activities, and 29% result from the energy use associated with residential and non-residential buildings. If the one-time emissions are annualized assuming a 40-year development life (which is likely low), then the one-time emissions account for approximately 2,465 tonnes, or 2% of the annual emissions. Taking these annualized one-time emissions into account, the annual emissions are 181,115 tonnes/year.

Emissions from the various aspects of Variant 2 are presented in Table ES-3. Both the one-time emissions and emissions that are expected to occur each year after build-out of the CP-HPS Plan development are presented. There are 98,587 tonnes of CO_2e one-time emissions. This is the same for all project scenarios since there were not different estimates of construction equipment. The annual emissions from the use of the development amount to 157,509 tonnes CO_2e/year. Of the annual emissions, slightly more than 70% result from vehicular emissions associated with residential activities, and 26% result from the energy use associated with residential and non-residential buildings. If the one-time emissions are annualized assuming a 40-year development life (which is likely low), then the one-time emissions account for approximately 2,465 tonnes, or 2% of the annual emissions. Taking these annualized one-time emissions into account, the annual emissions are 159,974 tonnes/year.

This inventory was prepared as a worst-case analysis. For example, it assumes that all emissions from CP-HPS Plan are "new," in the sense that, absent the development of CP-HPS Plan, these emissions would not occur except for the 256 replacement residences and associated emissions and traffic associated with the stadium. Given the global nature of GHG emissions, “new” global GHG emissions are those caused by economic growth and population growth (births); local development projects accommodate such growth.

As an example of why these are worst-case emissions, these emissions are estimated assuming that the carbon intensity of the electricity supply system and transportation system do not change in the future beyond the changes anticipated from the 20% Renewable Portfolio Standard in 2010 and Pavley vehicle emission standards. This assumption is clearly an over-simplification, as the measures incorporated into California Global Warming Solutions Act of 2006 (AB 32) mandate change in both areas and would reduce future GHG emissions from the development.

1 Introduction

The Candlestick Point-Hunter's Point Shipyard Phase II Development Plan (CP-HPS Plan) will result in one-time and annual (direct and indirect) emissions of GHGs. Direct emissions of GHGs refers to GHGs that are emitted directly as a result of CP-HPS Plan and include land use change and construction emissions. Indirect emissions are those emissions that CP-HPS Plan entitlement will enable, but that are not controlled by CP-HPS Plan proponent. This report discusses the scientific developments surrounding global climate change and provides an estimate of an emissions inventory that would result from entitling CP-HPS Plan. This report also places the emissions inventory from CP-HPS Plan into context.

Residents, employees, and patrons of commercial and municipal buildings use electricity, heat their homes and water (typically with natural gas), and are transported in motor vehicles, all of which directly or indirectly emit GHGs. The principal green house gases resulting from such developments are emissions of carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O). CO_2 is considered the most important GHG, due primarily to the large emissions produced by fossil fuel combustion, especially for the generation of electricity and powering of motor vehicles. CH_4 and N_2O are also emitted by fossil fuel combustion, though their emissions are much less significant than CO_2. CH_4 is also emitted from the transmission, storage, and incomplete combustion of natural gas.

The effect that each of these gases can have on global warming is a combination of the mass of their emissions and their global warming potential (GWP). GWP indicates, on a pound for pound basis, how much a gas is predicted to contribute to global warming relative to how much warming would be predicted to be caused by the same mass of CO_2. CH_4 and N_2O are substantially more potent GHGs than CO_2, with GWPs of 21 and 310, respectively.[1] In emissions inventories, GHG emissions are typically reported in terms of pounds (lbs) or tonnes[2] of CO_2 equivalents (CO_2e). CO_2e are calculated as the product of the mass emitted of a given GHG and its specific GWP. While CH_4 and N_2O have much higher GWPs than CO_2, CO_2 is emitted in such vastly higher quantities that it accounts for the majority of GHG emissions in CO_2e, both from residential developments and human activity in general.

The CP-HPS Plan is located within the Bay Area Air Quality Management District (BAAQMD) jurisdiction. However, as BAAQMD guidelines for the preparation of GHG inventories have not yet been developed, this inventory has been developed consistent with the methodologies established by the California Climate Action Registry (CCAR) where possible[3]. When guidance from the CCAR is lacking, methodologies established by the Intergovernmental Panel on Climate Change (IPCC)[4] and best available science are used. Legislation and rules regarding

[1] GWP values from IPCC's Second Assessment Report (SAR, 1996) are still used by international convention and are used in this protocol, even though more recent (and slightly different) GWP values were developed in the IPCC's Third Assessment Report (TAR, 2001)

[2] In this report, "tonnes" will be used to refer to metric tonnes (1,000 kilograms). "Tons" will be used to refer to short tons (2,000 pounds).

[3] BAAQMD released Draft Air Quality Guidelines in September 2009 that includes some guidance for the preparation of GHG inventories. The methods described in the draft guidelines are similar to the methodologies used in the CP-HPS Plan GHG Inventory.

[4] The WMO and the UNEP established the IPCC in 1988; it is open to all members of the United Nations and WMO.

climate change, as well as scientific understanding of the extent to which different activities emit GHGs, continue to evolve; as such, the inventory in this report is a reflection of the guidance and knowledge currently available.

At the entitlement stage of a development, while the number of homes, the approximate size of commercial areas and the locations of both are known, the exact designs of the homes, businesses and facilities are not. Even so, the types of buildings and the types of facilities at the future CP-HPS Plan site can be used for developing an estimate of CP-HPS Plan's anticipated GHG emissions. Energy used in a building depends in part on the built environment; however, actual future emissions from the site will depend heavily upon the future homeowners' and business owners' habits. Because the actual future occupants and their habits are not yet known, average current behavior is assumed. Given the current regulatory environment and the media focus on global climate change, it is likely that the actual future occupants will be more sensitive to the GHG emissions caused by their activities and, therefore, their activities will result in lower GHG emissions than average current behavior shows.

1.1 Emissions Inventory

The CP-HPS Plan emissions inventory considers the following categories of GHG emissions:

- emissions due to land use (vegetation) changes,
- emissions from construction activities,
- residential building operations emissions,
- non-residential building operations emissions,
- mobile source operations emissions,
- municipal operations emissions,
- area sources (fireplaces and lawn maintenance) emissions,
- solid waste disposal, and
- transit services.

In addition, an estimate of "life-cycle" GHG emissions from building materials is presented. Life cycle emissions include all of the emissions caused by the existence of a product or project, for example, GHG emissions from the processes used to manufacture and transport materials used in the buildings and infrastructure. This estimate is to be used for comparison purposes only and is not included in the final inventory as these emissions would be accounted for under California Global Warming Solutions Act of 2006 (AB 32) in other industry sectors. In addition, life-cycle analyses inherently involve many uncertainties. For example, in a life-cycle analysis for building materials, somewhat arbitrary boundaries must be drawn to define the processes considered in the life-cycle analysis.[5] Although life-cycle emission estimates can provide a broader view of a project's emissions, life cycle analyses often double count emissions that might be attributable to other sectors in a comprehensive analysis. The applicability of information to a specific

5 For instance, in the case of building materials, the boundary could include the energy to make the materials, the energy used to make the machine that made the materials, and the energy used to make the machine that made the machine that made the materials.

geographic location, climatic zone and building type can influence the life-cycle GHG emissions. Further uncertainty of life-cycle analyses come from some basic choices, such as the useful life of a building or road which can substantially change the outcome of the life-cycle analysis.

The inventory does not consider whether the emissions from CP-HPS Plan are "new" in the sense that, absent the development of CP-HPS Plan, these emissions may not occur. However, emissions from electricity use and construction worker commuting are included.

The timeframe over which GHGs are emitted varies from category to category, which is taken into consideration in the emissions inventory. For most of the categories, GHGs will be emitted every year that the development is inhabited. For these categories (residential buildings, non-residential buildings, mobile sources, municipal services, area sources, solid waste disposal, and transit service), the inventory includes estimates of annual GHG emissions from ongoing development operations. GHG emissions from two of the categories, construction and changes in vegetation, are one-time events that will not be part of the development's ongoing activity. These one-time emissions can be divided by the estimated lifetime of CP-HPS Plan to allow direct comparison of these two emissions classes. The inventory presents estimates of these one-time emissions, converts them to annualized estimates, and integrates them into an annual inventory.

It is worth noting that the GHG emissions estimates assume there are no reductions in GHG-generating activities over time. This is clearly unlikely, and presents a conservative analysis, given the expected reductions in GHG emissions from most activities that will take place over the years due to future regulations, greater public awareness and the likely increasing costs of energy. For example, the emissions estimated for electricity consumption assumes that there will not be an increase in energy production from renewables beyond the existing 20% Renewable Portfolio Standard (RPS) in 2010 or non-GHG producing sources; this is not realistic, given the mandates of AB 32, and other regulatory development, as discussed later in this report.

A variety of methods are employed to develop a complete GHG emissions inventory. In addition to well established emission factors for certain activities and emission estimates based on similar activities in other representative communities; several emissions estimation software programs are used. These include EMFAC, OFFROAD, and Urban Emissions Model (URBEMIS). Later sections of the report describe these models and other estimation methods. The major emissions sources that exist in residential developments are described later in this report.

1.2 Comparison of GHG Emissions

Because, to date, the BAAQMD and ARB has not established significance thresholds for GHG emissions under the California Environmental Quality Act (CEQA), the proposed GHG emissions from CP-HPS Plan are compared to other inventories to gain perspective on the impact these emissions may have[6]. To evaluate CP-HPS Plan's GHG emissions, the CP-HPS

[6] Both BAAQMD and ARB have recently released proposed significance thresholds, but these have not been finalized at this time.

Plan inventory is compared with ARB Scoping Plan No Action Taken (NAT) scenario. The CP-HPS Plan inventory is also compared with emissions thresholds associated with regulations being developed by the California Air Resources Board (ARB) pursuant to AB 32 to determine if the development is likely to be consistent with rules propagated for California to meet its 2020 emissions reduction goal. In addition to absolute emissions, emissions per capita are compared with the current average per capita emissions of California residents. Finally, to understand the large-scale significance of CP-HPS Plan's GHG emissions, the inventory is compared to state, national and global inventories.

1.3 Report Description

This report contains six sections. Following this introduction, Sections 2 details the state of climate change science. Section 3 presents the results of the CP-HPS Plan GHG Inventory. Section 4 compares these results to various benchmarks to gain perspective on what impact the CP-HPS Plan development will have on overall GHG emissions. Section 5 analyzes the impact of regulatory developments on CP-HPS Plan's GHG emissions. Finally, the main findings from the report are summarized in the conclusion which is Section 6.

2 State of Science

This section summarizes the scientific issues surrounding climate change and global warming. It also provides a discussion of the actions and phenomena that contribute to climate change and puts into context global, national, and state emissions of GHGs.

2.1 Global Climate Change

Global warming and *global climate change* are both terms that describe changes in the earth's climate. *Global climate change* is a broad term used to describe any worldwide, long-term change in the earth's climate. This change could be, for example, an increase or decrease in temperatures, the start or end of an ice age, or a shift in precipitation patterns. The term *global warming* is more specific than *global climate change* and refers to a general increase in temperatures across the earth. Though global warming is characterized by rising temperatures, it can cause other climatic changes, such as a shift in the frequency and intensity of rainfall or hurricanes. Global warming does not necessarily imply that all locations will be warmer. Some specific, unique locations may be cooler even though the world, on average, is warmer. All of these changes fit under the umbrella of global climate change.[7]

While global warming can be caused by natural processes, there is a general scientific consensus that most current global warming is the result of human activity on the planet.[8] This man-made, or anthropogenic, warming is primarily caused by increased emissions of "GHGs" that keep the earth's surface warm. This is called "the greenhouse effect." The greenhouse effect and the role GHGs play in it are described below.

2.2 The Greenhouse Effect

Greenhouses allow sunlight to enter and then capture some of the heat generated by the sunlight's impact on the earth's surface. The earth's atmosphere acts like a greenhouse by allowing sunlight in, but trapping some of the heat that reaches the earth's surface. When solar radiation from the sun reaches the earth, much of it penetrates the atmosphere to ultimately reach the earth's surface; this solar radiation is absorbed by the earth's surface and then re-emitted as heat in the form of infrared radiation.[9] Whereas the GHGs in the atmosphere let solar radiation through, the infrared radiation is trapped by greenhouses gases, resulting in the warming of the earth's surface.[10] This phenomenon is referred to as the "greenhouse effect".

The earth's greenhouse effect has existed far longer than humans have and has played a key role in the development of life. Concentrations of major GHGs, such as CO_2, CH_4, N_2O, and water vapor have been naturally present for millennia at relatively stable levels in the

[7] Other definitions of "Greenhouse Effect" and "Global Warming" can be found on Merriam-Webster online: http://www.m-w.com/. A definition for "Climate Change" can be found on dictionary.com which uses Webster's New Millennium™ Dictionary of English, Preview Edition (v 0.9.6).

[8] From the IPCC "Climate Change 2007: The Physical Science Basis, Summary for Policymakers." Available online at: http://www.ipcc.ch/pdf/assessment-report/ar4/wg1/ar4-wg1-spm.pdf

[9] All light, be it visible, ultraviolet, or infrared, carries energy.

[10] Infrared radiation is characterized by longer wavelengths than solar radiation. Greenhouse gases reflect radiation with longer wavelengths. As a result, instead of escaping back into space, greenhouse gases reflect much infrared radiation (i.e., heat) back to Earth.

atmosphere, adequate to keep temperatures on Earth hospitable. Without these GHGs, the earth's temperature would be too cold for life to exist.

As human industrial activity has increased, atmospheric concentrations of certain GHGs have grown dramatically. Figure 2-1 shows the increase in concentrations of CO_2 and CH_4 over time. In the absence of major industrial human activity, natural processes have maintained atmospheric concentrations of GHGs, and, therefore, global temperatures at constant levels over the last several centuries.[11] As the concentrations of GHGs increase due to human activity, more infrared radiation is trapped, and the earth is heated to higher temperatures. This is the process that is described as human-induced global warming.

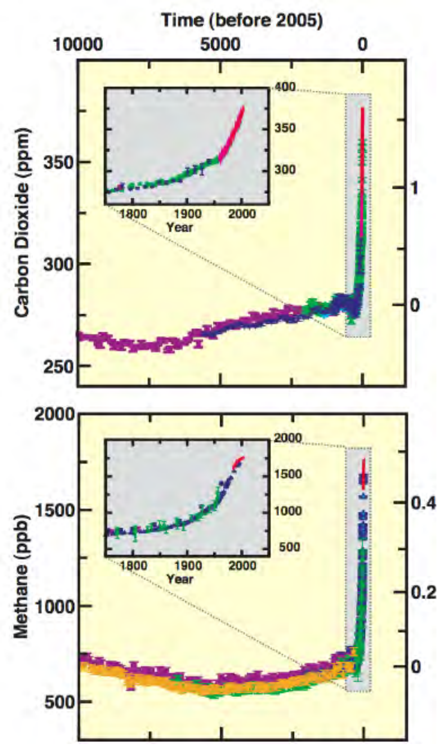

Figure 2-1. Carbon dioxide and methane concentrations have increased dramatically since the industrial revolution.[12]

In 2007, the IPCC began releasing components of its Fourth Assessment Report on climate change. In February 2007, the IPCC provided a comprehensive assessment of climate change science in its Working Group I Report.[13] It states that there is a scientific consensus that the global increases in GHGs since 1750 are mainly due to human activities such as fossil fuel use, land use change (e.g., deforestation), and agriculture. In addition, the report states that it is likely that these changes in greenhouse gas concentrations have contributed to global warming.

[11] Examples of natural processes include the addition of GHGs to the atmosphere from respiration, fires, and decomposition of organic matter. The removal of greenhouse gases is mainly from plant and algae growth and absorption by the ocean.

[12] Adapted from figure SPM-1 of the IPCC "Climate Change 2007: The Physical Science Basis, Summary for Policymakers." Available online at: http://www.ipcc.ch/pdf/assessment-report/ar4/wg1/ar4-wg1-spm.pdf

[13] Available online at: http://www.ipcc.ch/ipccreports/ar4-wg1.htm

Confidence levels of claims in this report have increased since 2001 due to the large number of simulations run and the broad range of available climate models.

2.3 Greenhouse Gases and Sources of Their Emissions

The term "GHGs" includes gases that contribute to the natural greenhouse effect, such as CO_2, CH_4, N_2O, and water, as well as gases that are only man-made and that are emitted through the use of modern industrial products, such as hydrofluorocarbons (HFCs), chlorinated fluorocarbons (CFCs), and sulfurhexafluoride (SF_6). These last three families of gases, while not naturally present in the atmosphere, have properties that also cause them to trap infrared radiation when they are present in the atmosphere, thus making them GHGs. These six gases comprise the major GHGs that are recognized by the Kyoto Accords (water is not included).[14] There are other GHGs that are not recognized by the Kyoto Accords, due either to the smaller role that they play in climate change or the uncertainties surrounding their effects. Atmospheric water vapor is not recognized by the Kyoto Accords because there is not an obvious correlation between water concentrations and specific human activities. Water appears to act in a positive feedback manner; higher temperatures lead to higher water concentrations, which in turn cause more global warming.[15]

The effect each of these gases has on global warming is a combination of the volume of their emissions and their GWP. GWP indicates, on a pound for pound basis, how much a gas will contribute to global warming relative to how much warming would be caused by the same mass of CO_2. CH_4 and N_2O are substantially more potent than CO_2, with GWPs of 21 and 310, respectively. However, these natural GHGs are nowhere near as potent as SF_6 and fluoromethane, which have GWPs of up to 23,900 and 6,500 respectively.[16] GHG emissions are typically measured in terms of mass of CO_2e. CO_2e are calculated as the product of the mass of a given GHG and its specific GWP.

The most important greenhouse gas in human-induced global warming is CO_2. While many gases have much higher GWPs than the naturally occurring GHGs, CO_2 is emitted in such vastly higher quantities that it accounts for 85% of the GWP of all GHGs emitted by the United States.[17] Fossil fuel combustion, especially for the generation of electricity and powering of motor vehicles, has led to substantial increases in CO_2 emissions and thus substantial increases in atmospheric CO_2 concentrations. In 2005, atmospheric CO_2 concentrations were about 379 parts per million (ppm), over 35 percent higher than the pre-industrial concentrations of about 280 ppm.[18] In addition to the sheer increase in the volume of its emissions, CO_2 is a major factor in human-induced global warming because of its lifespan in the atmosphere of 50 to 200 years.

---

[14] This Kyoto Protocol sets legally binding targets and timetables for cutting the greenhouse-gas emissions of industrialized countries. The US has not approved the Kyoto treaty.

[18] Page 2 of the IPCC "Climate Change 2007: The Physical Science Basis, Summary for Policymakers."

Concentrations of the second most prominent GHG, CH_4, have also increased due to human activities such as rice production, degradation of waste in landfills, cattle farming, and natural gas mining. In 2005, atmospheric levels of CH_4 were more than double pre-industrial levels, up to 1774 parts per billion (ppb) as compared to 715 ppb.[19] CH_4 has a relatively short atmospheric lifespan of only 12 years, but has a higher GWP than CO_2.

Nitrous oxide concentrations have increased from about 270 ppb in pre-industrial times to about 319 ppb by 2005.[20] Most of this increase can be attributed to agricultural practices (such as soil and manure management), as well as fossil-fuel combustion and the production of some acids. Nitrous oxide's 120-year atmospheric lifespan increases its role in global warming.

Besides CO_2, CH_4, and N_2O; there are several gases and categories of gases that were not present in the atmosphere in pre-industrial times but now exist and contribute to warming. These include CFCs, used often as refrigerants, and their more stratospheric-ozone-friendly replacements, HFCs. Fully fluorinated species, such as SF_6 and tetrafluoromethane (CF_4), are present in the atmosphere in relatively small concentrations, but have extremely long life spans of 50,000 and 3,200 years each, making them potent GHGs.

2.4 Current and Projected Climatic Impacts of Global Warming

A strong indication that global warming is currently taking place is the fact that the top seven warmest years since the 1890s occurred after 1997. Furthermore, a warming of about 0.2°C per decade is projected by currently accepted models.

There is a scientific consensus that global climate change will increase the frequency of heat extremes, heat waves, and heavy precipitation events. Other likely direct effects include an increase in the areas affected by drought and by floods, an increase in tropical cyclone activity, a rise in sea level, and recession of polar ice caps. The impacts of global warming have already been demonstrated by substantial ice loss in the Arctic.[21] Figure 2-2 shows the rise of global temperatures, the global rise of sea level, and the loss of snow cover from 1850 to the present.

[19] Page 4 of the IPCC "Climate Change 2007: The Physical Science Basis, Summary for Policymakers."
[20] Page 4 of the IPCC "Climate Change 2007: The Physical Science Basis, Summary for Policymakers."
[21] Statistics from IPCC Working Group I and II Reports.

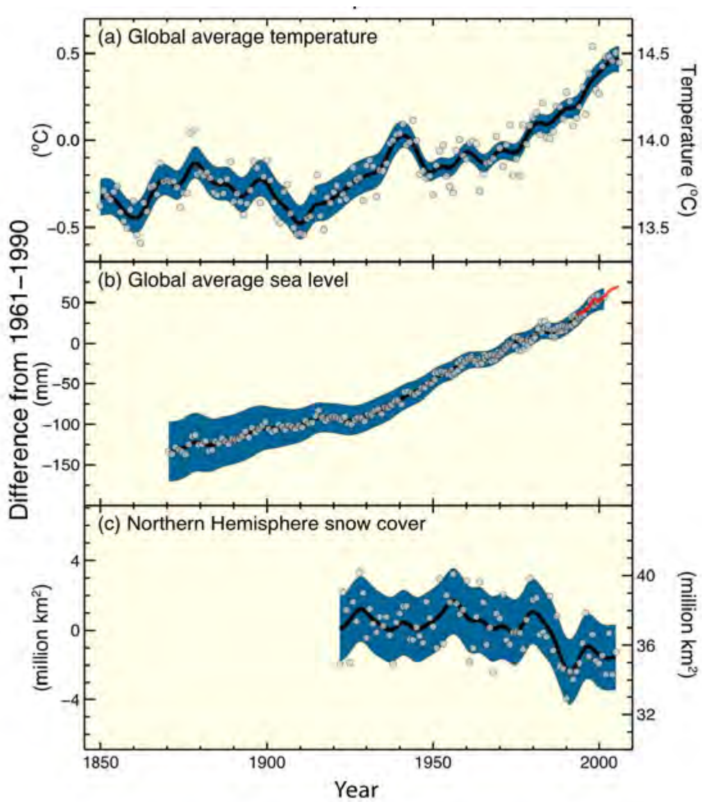

Figure 2-2. Global warming trends and associated sea level rise and snow cover decrease.[22]

2.5 Socioeconomic Impacts of Global Warming

Global temperature increases may have significant negative impacts on ecosystems, natural resources, and human health. Ecosystem structure and biodiversity will be compromised by temperature increases and associated climatic and hydrological disturbances.[23] The availability and quality of potable water resources may be compromised by increased salinisation of ground water due to sea-level rises, decreased supply in semi-arid and arid locations, and poorer water quality arising from increased water temperatures and more frequent floods and droughts.[24] These impacts on freshwater systems, in addition to the effects of increased drought and flood frequencies, can reduce crop productivity and food supply.

In addition to compromising food and water resources, there are other means through which climatic changes associated with global warming can affect human health and welfare. Warmer temperatures can cause more ground-level ozone, a pollutant that causes eye irritation and respiratory problems. Ranges of infectious diseases will likely increase and some areas will face greater incidences of illness and mortality associated with increased flooding and drought events.

[22] Figure SPM-3 of the IPCC "Climate Change 2007: The Physical Science Basis, Summary for Policymakers."
[23] From the IPCC Working Group II Report.
[24] From the IPCC Technical Paper VI: "Climate Change and Water". Available online at: http://www.ipcc.ch/pdf/technical-papers/climate-change-water-en.pdf

In its April 2007 Working Group II Report, the IPCC provided an assessment of the "current scientific understanding of impacts of climate change on natural, managed and human systems, the capacity of these systems to adapt and their vulnerability".[25] Here, the IPCC states that although some people will gain and some will lose because of global climate change, the overall change will be one of social and economic losses. California in particular is an area that could be negatively impacted by global warming. Global warming could alter the seasonal pattern of snow accumulation and snowmelt, which serve as primary sources for California's drinking water and irrigation water supplies. The scientific community projects extensions in the periods of high forest fire risk. Climatic changes would also affect agriculture, a major California industry, which could result in economic losses. For example, the heat wave in July 2006 is estimated to have cost the California dairy industry in excess of one billion dollars.[26]

IPCC Fourth Assessment Report

It is important to recognize that the climatic conditions experienced by the Project over its designed lifetime are likely to be substantially different from those observed over the past century. Consequently, it is useful to consider the implications of changing climatic conditions for Project performance. Scenarios[27] for 2100 modeled in the IPCC Fourth Assessment Report (FAR) include:

Temperature Increase

- Low Emissions Scenario: 1.8°C (best estimate), with a range of 1.1°C to 2.9°C
- High Emissions Scenario: 4.0°C (best estimate), with a range of 2.4°C to 6.4°C

Sea Level Rise

- Low Emissions Scenario: 0.18 to 0.38 meters (range)
- High Emissions Scenario: 0.26 to 0.59 meters (range)

Potential implications for the Project include:

Sea level: Rising sea levels could directly impact the proposed Project due to its close proximity to the coast and relative elevation.

Temperature: Rising temperatures could have a variety of impacts, including stress on sensitive populations (e.g., sick and elderly), additional burden on building systems (e.g., demand for

[25] Available online at: http://www.ipcc-wg2.org/index.html
[26] Office of the Governor.
[27] Future GHG emissions are the product of very complex dynamic systems, determined by driving forces such as demographic development, socio-economic development, and technological change. Their future evolution is highly uncertain. Scenarios are alternative images of how the future might unfold and are an appropriate tool with which to analyze how driving forces may influence future emission outcomes and to assess the associated uncertainties. They assist in climate change analysis, including climate modeling and the assessment of impacts, adaptation, and mitigation. The possibility that any single emissions path will occur as described in scenarios is highly uncertain. More information on the IPCC's selection of scenarios is available at http://www.ipcc.ch/ipccreports/sres/emission/index.htm.

conditioning), and, indirectly, increasing emissions of greenhouse gases and criteria pollutants associated with energy generation. It is not possible to reliably quantify these risks at this time.

Precipitation: Climate change is expected to alter seasonal and inter-annual patterns of precipitation. These changes continue to be one of the most uncertain aspects of future scenarios. For this Project, the most relevant direct impacts are likely to be changes in the timing and volume of stormwater runoff and changes in demand for irrigation. It is not possible to reliably quantify the implications of these changes at this time.

Wildfire: Changes in temperature and precipitation may combine to alter risks of wildfire. Changes in wildfire hazard have the potential to impact the Project; however, it is not possible to reliably quantify the implications of these changes at this time.

Water supply reliability: Changes in temperature and precipitation may also influence seasonal and inter-annual availability of water supplies. Consequently, it is reasonable to consider that climate change may affect water supply reliability. It is not possible to reliably quantify these risks for the Project at this time.

2.6 Impacts from Climate Change

The California Natural Resources Agency (CNRA)[28] recently prepared a document that discusses the impacts of climate change upon California, as well as California's climate adaptation strategy. The categories below are topics emphasized in the November 2008 Executive Order (S-13-08) which called on state agencies to develop California's first strategy to identify and prepare for these expected climate impacts. Adaptation strategies are addressed in the next section of this technical report.

2.6.1 Rising Temperatures

New projections by MIT modelers which predict a median probability of surface warming of 5.2 °C by 2100, which is much higher than previous modeling completed in 2003. [29] Researchers modeled temperature changes specifically related to California.[30] The model predicted greater temperature increases in summer than winter, and larger increases inland compared to the coast.

2.6.2 Tipping Elements

The CNRA emphasized "tipping elements", which bring about "abrupt changes that could push natural systems past thresholds beyond which they could not recover". According to the CNRA, there are four main events that could bring about abrupt environmental changes. Each of these four has a particular tipping temperature at which the event is likely to occur. The consequence

of crossing each threshold could cause a 7-12 m rise in sea level over the course of several centuries as shown in the table below.

Tipping elements that could trigger abrupt environmental changes.

Additional Warming (ºF)	Environmental Change	Length of Time
1-3	Rapid Arctic sea ice melt	10 years
2-4	Irreversible melting of the Greenland Ice Sheet	300+ years
5-9	Irreversible melting of the West Antarctic Ice Sheet	300+ years
5-7	Amazon forest die-back	None given
6-11	Intensification of ENSO cycles	None given

2.6.3 Extreme Natural Events

In addition, CNRA reports that extreme natural events are likely to occur, including higher nighttime temperatures and longer, more frequent heat waves overall; 12-35% decrease in precipitation levels by mid- to late-21st century; increased evaporation and faster incidences of snowmelt that will increase drought conditions, and more precipitation in the form of rain as compared to snow that will decrease water storage in California during the dry season and increase flood events during the wet season.[31]

2.6.4 Precipitation Changes and Rivers

CNRA also states that climate change will intensify California's "Mediterranean climate pattern", with the majority of annual precipitation occurring between November and March and drier conditions during the summer.[32] This will increase droughts and floods and will affect river systems. One of the ways to quantify potential impacts related to river system was through calculating a rise in water temperature and its effects on fisheries resources. [33]

2.6.5 Sea Level Rise

CNRA states that sea level rise can cause damage to coastal communities and loss of land, which could reach tens of billions of dollars per year in direct costs and trillions of dollars of assets in collateral risk. [34] Current calculations of sea level rise from 1900 to 2000 estimate

approximately 7 inches along the California coast. [35] Further, up to 55 inches of sea-level rise globally by the end of the 21st century is predicted under the continued higher emission assumption models.

2.6.6 Low Sea Ice Levels

The CNRA states says that substantial sea ice melting from Greenland and the West Antarctic Ice Sheet has the potential to further raise sea levels. The sea ice extent in the Western Nordic Seas (i.e., Greenland, Norway, and Iceland Seas) is at the lowest level observed in the last 800 years. The implication being that a substantial reduction in sea ice in the Arctic sea promotes alterations in atmospheric circulation and precipitation patterns that extend to the mid-latitudes (e.g., the California coast). Additionally, it was reported that the variations in sea ice extent are correlated with changes in sea surface temperatures and atmospheric and ocean heat transport from the North Atlantic. [36]

The West Antarctic Ice Sheet is a marine-based ice sheet with edges that flow into floating ice shelves. Both the main sheet and the surrounding shelves have been showing signs of shrinking and collapsing due to global warming. Researchers have tracked the fate of at least nine shelves that have receded or collapsed around the Antarctic peninsula in the past 50 years. [37]

2.6.7 Ocean Chemistry

The CNRA also notes that an emerging effect from climate change may be acidification of the ocean. In turn, acidification will affect the ability of hard-shelled invertebrates to create their skeletal structures. [38] The implications of this change being major losses to shellfish industries, and shifts in food resources for ocean fisheries. The primary contributing factors were cited as increasing levels of CO_2 and weather pattern shifts. Increases in CO_2 results in increased uptake by the oceans, which result in decreased pH (acidification). Weather pattern shifts change the amount of calcium carbonate being delivered by rivers from sources stored in rocks, which further exacerbates the ability of invertebrates to form calcified shells. [39]

2.6.8 Permafrost Thaws

One of the main contributing factors to CO_2, outside of human influences, is melting permafrost. When permafrost thaws, it releases carbon into soil or beneath lakes and releases CO_2 and methane into the atmosphere. Scientists are now estimating that there is more than twice the

total amount of carbon stored in permafrost as there is in atmospheric carbon dioxide, and "could amount to roughly half those resulting from global land-use change during this century".[40]

2.7 California-specific Adaptation Strategies

The CNRA[41] discusses California's climate adaptation strategy. General themes from the report regarding adaptation strategies are summarized below although the report also includes many specific examples of how California may adapt to a changing climate.

Because climate change is already affecting California and current emissions will continue to drive climate change in the coming decades, regardless of any mitigation measured that may be adopted, the necessity of adaptation to the impacts of climate change is recognized by the state of California. The *2009 California Climate Adaptation Strategy Discussion Draft* begins what will be an on-going process of adaptation, as directed by Gov. Schwarzenegger's Executive Order S-13-08. The goals of the strategy are to analyze risks and vulnerabilities and identify strategies to reduce the risks. Once the strategies are identified and prioritized, government resources would be identified. Finally, the strategy includes identifying research needs and educating the public.

Climate change risks are evaluated using two distinct approaches: (1) projecting the amount of climate change that may occur using computer-based global climate models and (2) assessing the natural or human system's ability to cope with and adapt to change by examining past experience with climate variability and extrapolating this to understand how the systems may respond to the additional impact of climate change. The major anticipated climate changes expected in the State of California include increases in temperature, decreases in precipitation, particularly as snowfall, and increases in sea level, as discussed above. These gradual changes will also lead to an increasing number of extreme events, such as heat waves, wildfires, droughts, and floods. This would impact public health, ocean and coast resources, water supply, agriculture, biodiversity and the transportation and energy infrastructure.

Key preliminary adaptation recommendations included in the *Strategy* are as follows:

- Appointment of a Climate Adaptation Advisory Panel;
- Improved water management in anticipation of reduced water supplies, including a 20% reduction in per capita water use by 2020;
- Consideration of project alternatives that avoid significant new development in areas that cannot be adequately protected from flooding due to climate change;
- Preparation of agency-specific adaptation plans, guidance or criteria by September 2010;
- Consideration of climate change impacts for all significant state projects;
- Assessment of climate change impacts on emergency preparedness;

[40] Schuur, E.A.G. et al. 2008. Vulnerability of Permafrost Carbon to Climate Change: Implications for the Global Carbon Cycle. BioScience. 58(8): 701-714.
[41] California Natural Resources Agency. 2009 California Climate Adaptation Strategy. Discussion Draft.

- Identification of key habitats and development of plans to minimize adverse effects from climate change;
- Development of guidance by the California Department of Public Health by September 2010 for use by local health departments to assess adaptation strategies;
- Amendment of Plans to assess climate change impacts and develop local risk reduction strategies by communities with General Plans and Local Coastal Plans; and
- Inclusion of climate change impact information into fire program planning by state fire fighting agencies.

2.8 Global, National, and California-wide GHG Emissions Inventories

Worldwide emissions of GHGs in 2004 were 26.8 billion tonnes of CO_2e.[42] In 2004, the US emitted about 7 billion tonnes of CO_2e or about 24 tonnes of CO_2e per year per person.[43] Over 80% of the GHG emissions in the US are comprised of CO_2 emissions from energy related fossil fuel combustion. In 2004, California emitted 0.492 billion tonnes of CO_2e, or about 7% of the US emissions.[44] If California were a country, it would be the 16th largest emitter of GHGs in the world.[45] This large number is due primarily to the sheer size of California. Compared to other states, California has one of the lowest per capita GHG emission rates in the country. This is due to California's higher energy efficiency standards, its temperate climate, and the fact that it relies on substantial out-of-state energy generation.

In 2004, 81% of greenhouse gas emissions (in CO_2e) from California were comprised of CO_2 emissions from fossil fuel combustion, with 4% comprised of CO_2 from process emissions. CH_4 and N_2O accounted for 5.7% and 6.8% of total CO_2e respectively, and high GWP gases[46] accounted for 2.9% of the CO_2e emissions. Transportation is by far the largest end-use category of GHG emissions. Transportation includes that used for industry (i.e., shipping) as well as residential use.

2.9 Potential for Reduction of GHG Emissions

In May 2007, the IPCC produced its Working Group III Report on the "scientific, technological, environmental, economic and social aspects" of reducing GHG emissions to alleviate climate change.[47] The report concluded that, even with current policies for sustainable development and mitigation of climate change, global GHG emissions will continue to grow over the next several decades.

3 Greenhouse Gas Inventory

This section describes the methods that ENVIRON International Corporation (ENVIRON) used to estimate GHG emissions from CP-HPS Plan after development and full build out for the Project, Variant 1, and Variant 2. It includes some aspects that are fully within the control of Lennar Urban, such as grading and the placement of utilities; some aspects that are in control of the individuals building the houses and commercial buildings, such as construction emissions; and some aspects for which control over emissions is shared by the developers and the residents, such as energy use in the built environment and emissions from traffic by the development's future residents and employees in the commercial areas. In addition, an estimate of "life-cycle" GHG emissions (i.e., GHG emissions from the processes used to manufacture and transport materials used in the buildings and infrastructure) is presented. This estimate is to be used for comparison purposes only and is not included in the final inventory as these emissions would be attributable to other industry sectors under AB 32. The inventory does not consider whether the emissions from the development are "new" in the sense that, absent the development, the emissions may not occur. Each aspect of the GHG inventory is described in this section. Actual GHG emissions at full build-out at CP-HPS Plan are expected to be substantially lower due to regulatory developments; therefore, the GHG emissions reported in this section are a conservative estimate.

3.1 Evaluation of "New" Emissions

Given the global nature of GHG impacts, it is difficult to determine which emissions from a given project are "new" on a global scale. As described in this section, there are methods of estimating emissions from certain aspects of projects, such as that from the additional vehicle travel associated with CP-HPS Plan. However, it is not clear how to determine what proportion of those emissions are truly additional, or new, in the global sense, or what proportion of those emissions would have occurred globally without CP-HPS Plan.

Analyses for evaluating the airborne criteria pollutant impacts of new projects for inclusion in environmental documents have already, in a sense, addressed the issue of what is "new". However, the impacts of GHG emissions differ from those of criteria pollutants in that they are a function of global concentrations rather than local concentrations and, therefore, specific locations of where emissions occur is less important than for criteria pollutants. The calculation of "project" criteria pollutants (oxides of nitrogen, sulfur oxides, carbon monoxide, volatile organic compounds, lead, and particulate matter) in air quality emissions inventories for use in EIRs has a long history. The South Coast Air Quality Management District (SCAQMD) first published a comprehensive manual on the analysis of air quality impacts in 1993, and the Bay Area Air Quality Management District (BAAQMD) followed in 1999. Other smaller districts have prepared detailed guidance documents that describe the methods that should be used to calculate emissions inventories for EIRs from projects, including residential and commercial projects.

The goal of estimating emissions of criteria pollutants from projects is to understand whether there are significant new emissions in California's air basins, which have a limited ability to absorb additional criteria pollutant emissions without adverse air quality impacts. A review of how air quality analyses typically address the issue of whether emissions are "new" is instructive as to how to address the emissions of GHGs. However, unlike with criteria pollutants, the impacts of GHG emissions are a function of their global concentrations, rather than local concentrations. Thus, the question of whether or not a project's GHG impacts are significant, both on a project basis and on a cumulative basis, must be asked based on global, rather than basin-wide, considerations.

When evaluating the air quality impacts for a new project, such as a residential development, the vehicular emissions associated with the residents as they work and shop within the basin are counted as new emissions in traditional air quality analyses, even if those new residents would have moved from another house in the same air basin. The typical rationale for this approach is that the new residential development represents growth in the basin. As a result, all emissions associated with its residents' vehicle travel should be counted as new emissions, even if this might lead to some over-counting of criteria pollutant emissions from CP-HPS Plan.

World rankings of nations' GHG emissions generally depend on which gases are accounted for, and whether land use changes are considered. Without considering land use changes, in recent years, the US has been the top GHG-emitting country in the world. When all of the developing countries are grouped together, they contribute approximately 52% of the world-wide GHG emissions.[48]

To understand the global scale impact of GHGs, it is useful to understand that the increase of new GHG emissions globally is caused by economic and population growth. Emission growth rates are the highest among developing countries. While GHG emissions in developed countries were unchanged over the 1990-2002 period, emissions increased by 47% in developing countries during that same time period. Emissions in China grew about 50% during that time period -- preliminary estimates show that China's GHG emissions increased 35% in 2003 and 2004 alone. This increase in developing country GHG emissions is due to the increasing demand for higher standards of living as a result of GDP growth, requiring more vehicles and greater electricity demand. Also, developing countries often lack the technology or capital to utilize energy efficient products or to construct cleaner burning power plants. GHG emissions in China are growing slightly faster than primary energy use as the fuel mix increasingly favors coal, a high-carbon fuel. China accounts for 39% of projected increase between 2004 and 2030, and will overtake the United States as the world's biggest emitter before 2010.[49]

In the developed world, GHG increases are directly tied to population growth. Therefore, it makes sense to consider operational emissions (including vehicular emissions) from new residences as growth, as residences are rarely removed from the housing supply once constructed. There are exceptions, such as when one housing development replaces another, and, in those cases, the replacement residential development need not be considered growth. There are 256 existing residential dwelling units that are directly being replaced in the CP-HPS Plan. These replacement dwelling units and associated GHG emissions are therefore not considered in the net new GHG emission inventory. Due to the fact that older buildings are less

48 Baumert, K.A., T. Herzog, J. Pershing. 2005. Navigating the Numbers: Greenhouse Gas Data and International Climate Policy. (http://www.wri.org/climate/pubs_description.cfm?pid=4093)

49 http://www.iea.org/textbase/weo/fact_sheets/fs_GlobalEnergyTrends.pdf (accessed June 12, 2007) *World Energy Outlook 2006: Fact Sheet- Global Energy Trends The World's Energy Future: Where Are We Headed?*

energy efficient than newer buildings, this will result in an overestimate of CP-HPS Plan emissions.

However, it is not clear that non-residential (i.e. office space, retail space, and industrial buildings) development should be considered new growth for vehicular travel purposes. To the extent that non-residential development serves existing residential development, its vehicular travel may not be new. For instance, if the new non-residential area serves an area with a high residential/ non-residential balance, then this new non-residential growth will reduce shopping and work trip lengths and will reduce GHG emissions associated with mobile sources. If, however, the new non-residential area results in longer trips for its workers and shoppers than they would have previously made, then it adds GHGs emissions. Non-residential development that could potentially increase VMT would be facilities that draw trips from far away that otherwise would not be made. A theme park, for example, may be viewed as such a development.

In this report, it is assumed that the new non-residential area serves an area with a high residential/ non-residential balance. Therefore, this new non-residential growth likely will reduce shopping and work trip lengths from existing residences, and can reduce GHG emissions associated with mobile sources. Since the stadium is a replacement of an already existing stadium it would not considered to be a new facility that would draw trips from far away that otherwise would not be made since these trips are already being made. Therefore, there is not expected to be an increase in VMT associated with the construction of the new stadium. However, if the stadium is not built, as in Variants 1 and 2, there would be a reduction in trips drawn from afar. These reductions are not considered in the estimation of emissions from Variants 1 and 2. The music venue in CP is considered new non-residential facility that could draw trips that otherwise would not be made. The trips associated with customers and employees of the music venue are considered in the inventory.

The approach described above is different than that for criteria emissions. For criteria pollutants, if new emissions move into the basin, although there is a reduction in criteria emissions elsewhere, these emissions are new to the basin and therefore counted. For GHGs, if the emissions simply moved from one basin to another, the emissions would not be new on a global scale. To evaluate the sustainability of new non-residential developments, one must ask if the shoppers' and workers' travel distances to the new non-residential development are longer or shorter than the distances those same individuals currently travel to their non-residential areas. Since the CP-HPS Plan is an infill development, it is likely that its establishment will not lengthen shopping trips.

To the extent that new non-residential development serves new residential development, much of the non-residential vehicle travel would already be counted in the evaluation of the new residential development. Although the vehicle trips would be already counted elsewhere, the operational emissions from heating and cooling the non-residential areas would be considered to be new, as there are new non-residential buildings that goes along with growth in residential areas.

This report presents two methods for analyzing the GHG emissions from VMT. The first method includes all residential and non-residential land use categories except for the stadium trips since these already exist and will only be displaced. The alternative analysis which is an assessment of the "new" emissions associated with growth assumes GHG emissions from VMT serving non-residential areas will only be counted if the non-residential areas contribute to greater VMT as a result of their locations. If the non-residential development lowers VMT, then it will be considered to have a zero or negative GHG contribution as a result of the fact that it has generated shorter operational vehicle trip lengths than would have otherwise occurred. It should be noted that as CP-HPS Plan is a mixed use community, this issue does not directly affect CP-HPS Plan VMT calculations; all VMT from net new CP-HPS Plan residents are calculated regardless of internal or external destinations or purpose of trip.

3.2 Units of measurement: Tonnes of CO_2 and CO_2e

The term "GHGs" includes gases that contribute to the natural greenhouse effect, such as CO_2, CH_4, N_2O, and water, as well as gases that are only man-made and that are emitted through the use of modern industrial products, such as hydrofluorocarbons (HFCs) and CFCs. The most important greenhouse gas in human-induced global warming is CO_2. While many gases have much higher GWPs than CO_2, CO_2 is emitted in such vastly higher quantities that it accounts for 85% of the GWP of all GHGs emitted by the United States.[50]

The effect each of these gases has on global warming is a combination of the volume of their emissions and their GWP. GWP indicates, on a pound for pound basis, how much a gas will contribute to global warming relative to how much warming would be caused by the same mass of CO_2. CH_4 and N_2O are substantially more potent than CO_2, with GWPs of 21 and 310, respectively. GHG emissions are typically measured in terms of mass of CO_2e. CO_2e are calculated as the product of the mass of a given GHG and its specific GWP.

In many sections of this report, including the final summary sections, emissions are presented in units of CO_2e either because the GWPs of CH_4 and N_2O were accounted for explicitly, or the CH_4 and N_2O are assumed to contribute a negligible amount of GWP when compared to the CO_2 emissions from that particular emissions category.

In this report, "tonnes" will be used to refer to metric tonnes (1,000 kilograms). "Tons" will be used to refer to short tons (2,000 lbs).

Additionally, exact totals presented in all tables and report sections may not equal the sum of components due to independent rounding of numbers.

3.3 Resources

To estimate GHG emissions from CP-HPS Plan, ENVIRON directly or indirectly relied primarily on four different types of resources: emissions estimation guidance from government-sponsored organizations, government-commissioned studies of energy use patterns, energy surveys by other consulting firms, and emissions estimation software. These sources are described below.

---

[50] Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2004, U.S. Environmental Protection Agency. Available online at: http://yosemite.epa.gov/oar/globalwarming.nsf/UniqueKeyLookup/RAMR6MBSC3/$File/06_Complete_Report.pdf

3.3.1 Emissions Estimation Guidance

This inventory was developed using guidance from two government-sponsored organizations to assist in the estimation of GHG emissions. The first is the CCAR, which was established by the California Legislature to assist willing parties in estimating and recording their GHG emissions to use as a baseline for meeting future emissions reduction requirements. Publications by the CCAR include not only recommendations on how to compile a GHG emissions inventory, but also relevant data on energy use and emissions that are utilized in this protocol. The second organization is the IPCC, which was established in 1988 by the United Nations Environment Programme (UNEP) and the World Meteorological Organization (WMO). The IPCC's main role is to assess information on climate change which is synthesized in IPCC reports, including methodology reports. These reports also include relevant emission factors and specific scientific data that can be used to estimate GHG activities from various activities.

3.3.2 Emissions and Energy Use Studies

For estimating emissions based on electrical and natural gas energy use, literature information on patterns of energy use must often be employed. Studies commissioned by the CEC provide data on energy use patterns associated with municipal activities, natural resource distribution, and other activities that will take place in CP-HPS Plan. These data were used to estimate energy use patterns which were applied to the specific characteristics of CP-HPS Plan to estimate GHG emissions. In addition to CEC studies, studies performed by individual municipalities or scientific organizations are also used in this report.

3.3.3 Emissions Estimation Software

The ARB, the SCAQMD, and other public and private organizations have developed several software programs to facilitate the calculation of emissions from construction, motor vehicles, and urban developments by streamlining emissions estimation from these sources. This inventory was developed using several models to estimate GHG emissions from the CP-HPS Plan development. These are the OFFROAD2007 model, the EMFAC model, and the URBEMIS model. The features of each of these models are described below.

OFFROAD – OFFROAD2007 is the most recent version of a model developed by the ARB to estimate the activity and emissions of off-road mobile emissions sources, such as construction equipment. OFFROAD contains a database of default values for horsepower, load factor, and hours per day of operation and can calculate emission factors based on the type of equipment and year of use.

EMFAC – EMFAC, also developed by ARB, compiles real fleet data on the county-level for the state of California, including vehicle model year distributions, vehicle class (e.g., light-duty auto (LDA), medium-duty truck, heavy-heavy-duty truck) distributions, and emission rate information to generate fleet-average emission factors for most criteria pollutants and CO_2. EMFAC2007 is the newest version of the program. Emission factors from EMFAC depend on the vehicle class, vehicle technology, speed, year of operation, average ambient air temperature, and relative humidity.

URBEMIS – The URBEMIS software was created by SCAQMD, although it is used by other air districts as well. It estimates emissions associated with different aspects of urban development. The Operational Data module in URBEMIS calculates emissions from mobile sources operating during the use of a development based on emission factors from EMFAC and traffic use information specific to a development. Mobile source emissions during the construction phase are calculated separately in the construction module of URBEMIS. URBEMIS provides county, air district / air basin, or state wide averages for number of daily trips per housing unit and per student at an elementary school in the absence of more specific information from traffic engineers. URBEMIS also provides air district-specific default values for vehicle fleet characteristics (vehicle class distribution and technology categories) and travel conditions (average trip length, trip speed, and relative frequency of each type of trip). URBEMIS (Version 9.2.2), uses EMFAC2007 emission factors and calculates CO_2 emissions using District-specific default parameters for various inputs including vehicle fleet characteristics and travel conditions.

In addition to mobile source emissions, URBEMIS can also calculate emissions associated with the construction phase of a development and emissions from area sources, such as fireplaces, once the development is operational. The URBEMIS construction module enables separate emissions calculations from each of the three typical stages of any construction project: demolition, site grading, and building construction. Based on the timing of construction and size of the development, URBEMIS defaults can be used to estimate emissions. Alternatively, the user can override these defaults by entering specific information about the construction project, such as what types and numbers of equipment are going to be used. In terms of area sources, URBEMIS is equipped to estimate GHG emissions from three types of GHG-emitting area sources based either on program defaults or more specific project information inputted by the user. These uses are natural gas fuel combustion, hearth fuel combustion, and landscaping equipment.

3.4 Indirect GHG Emissions from Electricity Use

As noted above, indirect GHG emissions are created as a result of electricity use. When electricity is used in a building, the electricity generation typically takes place offsite at the power plant; electricity use in a building generally causes emissions in an indirect manner. The CP-HPS Plan development is supplied power by Pacific Gas and Electric Company (PG&E). Accordingly, indirect GHG emissions from electricity usage are calculated using the PG&E carbon-intensity factor of 574 lb CO_2e per MW-hr which is an adjustment of PG&E's 2007 carbon-intensity factor of 636 to account for the 20% Renewable Portfolio Standard required by 2010.[51] This emission factor takes into account the current mix of energy sources used to generate electricity for PG&E and the relative carbon intensities of these sources.[52] Table 5-1 details the calculations for the carbon-intensity factor used.

---

[51] California Climate Action Registry (CCAR) Database. Pacific Gas and Electric Company 2007 PUP Report. 2008.

[52] When calculating indirect emissions due to electricity usage, it is important to consider that indirect emissions from using a given amount of electricity will vary with the fuel-mix used to produce electricity. For example, CO_2 emissions per kW-hr from a coal-fired power plant are significantly higher than CO_2 emissions per kW-hr from a natural gas-fired power plant. Therefore, to most accurately estimate GHG emissions from the CP-HPS Plan development, the carbon intensity of the specific mix of energy sources PG&E uses to generate electricity was used to calculate emissions since PG&E is the most likely source of electricity for CP-HPS Plan.

3.5 Vegetation Change

This section presents the calculation of the positive GHG emissions associated with planting new trees at the CP-HPS Plan development. The CP-HPS Plan is on land classified as settlement as classified by the IPCC publication Guidelines for National Greenhouse Gas Inventories (IPCC Guidelines).[53] There will be no changes in the land use classification. The overall CO_2 emissions due to vegetation change will result from the amount that can be expected to be sequestered by new plantings. The amount of CO_2 emissions sequestered by new plantings is discussed in this section.

In this section of this report, the units CO_2 and CO_2e are used interchangeably. CH_4 and N_2O are assumed to contribute a negligible amount of GWP when compared to the CO_2 emissions from vegetation change.

3.5.1 Calculating CO_2 Sequestration by Trees

Planting individual trees on residential property and elsewhere in the CP-HPS Plan will sequester CO_2. Changing vegetation as described above results in a one-time carbon-stock change. Planting trees is also considered to result in a one-time carbon-stock change. Table 3-1 presents default annual CO_2 sequestration rates on a per tree basis, based on values provided by the IPCC. An average of 0.035 tonne CO_2 per year per tree can be assumed for trees planted, if the tree type is not known.

Urban trees are only net carbon sinks when they are actively growing. The IPCC assumes an active growing period of 20 years. Thereafter, the accumulation of carbon in biomass slows with age, and will be completely offset by losses from clipping, pruning, and occasional death. Actual active growing periods are subject to, among other things, species, climate regime, and planting density. In this report, the IPCC default value of 20 years will be assumed. Note that trees may also be replaced at the end of the 20-year cycle, which would result in additional years of carbon sequestration. However, this would be offset by the potential net release of carbon from the removal of the replaced tree.

Approximately 10,000 new net trees will be planted in CP-HPS Plan community.[54] Planting these trees in the community will sequester approximately 7,000 tonnes CO_2. This was calculated by using the average tree sequestration rate of 0.035 tonne CO_2 per year per tree and assuming 20 years of growth. This sequestration brings the net CO_2 emissions from vegetation to -7,000 tonnes (or a net decrease in the amount of CO_2 released). The net CO_2 emissions from vegetation changes are presented in Table 3-1.

3.6 Construction Activities

This section describes the estimation of GHG emissions from construction activities at CP-HPS Plan. GHG emissions from construction phases are largely attributable to fuel use from construction equipment and worker commuting.

---

[53] Available online at http://www.ipcc-nggip.iges.or.jp/public/2006gl/vol4.htm
[54] Site-specific planting data provided by Lennar Urban.

CO_2 emissions associated with different aspects of urban development can be estimated using a combination of software programs. The OFFROAD2007[55] and the EMFAC2007[56] models are used to generate emission factor data for construction equipment and motor vehicles, respectively. These values serve as inputs for the URBEMIS[57] model, which estimates emissions from several different aspects of urban development including from construction sources based on emission factors and information specific to the development.

In this section of this report, the units CO_2 and CO_2e are used interchangeably for diesel construction equipment because CH_4 and N_2O are assumed to contribute a negligible amount of GWP when compared to the CO_2 emissions from construction equipment. For worker commuting, CH_4 and N_2O are explicitly calculated and therefore CO_2 and CO_2e for worker commuting are not equal.

3.6.1 Estimating GHG Emissions from Construction Equipment

This section describes how emissions from off-road equipment used during grading, building construction, and paving are calculated. It is important to note that GHG calculations are intended to estimate long-term emissions, while air quality emission calculations are intended to estimate worst-case daily scenarios. As such, the methodology presented in this section of the report will be different than the approach listed in the corresponding air quality section.

ENVIRON calculated emissions from construction equipment using the URBEMIS methodology. ENVIRON was provided with the number and type of equipment that will be used in the construction of CP-HPS Plan, as well as the duration of the different construction phases.[58] ENVIRON assumed that each piece of equipment will operate for 8 hours a day, five days a week during a given phase duration. An equipment hour is defined as one hour of a piece of equipment being used. Table 3-2 contains specifications for each type of construction equipment (horsepower, load factor, and GHG emission factor) provided by OFFROAD2007 and describes the detailed GHG calculations. CO_2 emissions for each type of construction equipment were calculated as follows:

> *Equipment Emissions [grams] = Total equipment-hours * emission factor [grams per brake horsepower-hour] * equipment horsepower * load factor*[59]

The contributions of CH_4 and N_2O to overall GHG emissions is likely small (< 1% of total CO_2e) from diesel construction equipment,[60] and were therefore not included in this calculation.

The total GHG emissions from all construction equipment are 56,403 tonnes CO_2 at CP and 42,895 tonnes CO_2 at HPS for a total of 99,298 tonnes CO_2.

[57] Urban Emissions Model (URBEMIS) (Version 8.7 – 2002 / Version 9.2.4 – 2008). Jones & Stokes Associates. Prepared for: South Coast Air Quality Management District. http://www.urbemis.com

[58] Received from MacTech.

[59] Load factor is the percentage of the maximum horsepower rating at which the equipment normally operates.

[60] California Climate Action Registry (CCAR). 2009. *General Reporting Protocol*. Version 3.1. ENVIRON estimates these emissions to be less than 1% of total GHG contributions for diesel fueled equipment.

3.6.2 GHG Emissions from Worker Commuting

Emissions from worker commuting are associated with workers involved in all construction subphases. GHGs are emitted from worker vehicles in two ways: running emissions, produced by driving the vehicle, and startup emissions, produced by turning the vehicle on. The majority of worker commute emissions are running emissions. Table 3-3 details emission calculations for worker commutes.

Total running emissions from worker commuting during each phase were calculated by estimating the total Vehicle Miles Traveled (VMT) by construction workers, and then multiplying this value by the representative GHG emission factors for the vehicles they are expected to drive. The total VMT by construction workers for a given phase is calculated as follows:

VMT = Number of worker trips x average one-way commute length x 2 commutes/day

The number of workers and duration of each subphase was provided to ENVIRON by MacTech. The length of the average one-way commute was assumed to be 14.9 miles[61].

After total VMT for CP-HPS Plan is calculated, GHG emissions for this development can be calculated from the following equation:

CO_2 emissions = VMT * [0.5 * EF_{LDA} + 0.5 * EF_{LDT2}]

Where:

VMT = vehicle miles traveled
EF_{LDA} = emission factor of light duty autos
EF_{LDT2} = emission factor of light duty trucks: up to 8500 GVW

The CO_2 calculation involves the following assumptions:

a. URBEMIS defaults assume that half of the workers commute with light duty trucks (LDTs) and half commute in light duty autos (LDAs).[62]

b. The emission factor depends upon the speed of the vehicle. The URBEMIS default value of 30 miles per hour was used.

c. EMFAC emission factors from the year 2011 were used for EF_{LDA} and EF_{LDT2}.

Startup emissions are CO_2 emitted from starting a vehicle. GHG emissions from startup for this development can be calculated from the following equation:

CO_2 emissions = Number of Work trips * [0.5 * EF_{LDA} + 0.5 * EF_{LDT2}] * 2 commutes/day

For construction workers during all phases, the startup emissions were calculated using the following assumptions:

[61] This represents the home-based work trip length provided by Fehr and Peers for San Francisco.
[62] Page A-9 of the URBEMIS user manual.

a. The number of round trips were equal to the number of worker days,

b. The breakdown in vehicles was 50% light duty autos and 50% light duty trucks,

c. Two engine startups per day with a 12 hour wait before each startup.[63]

The USEPA recommends assuming that CH_4, N_2O, and HFCs account for 5% of GHG emissions from on-road vehicles, taking into account their GWPs.[64] To incorporate these additional GHGs into the calculations, the total GHG footprint was calculated by dividing the CO_2 emissions by 0.95.

Table 3-3 summarizes the emission calculations for worker commutes. The total amount of GHG emissions from worker commuting during all phases is a one-time emission of 1,807 tonnes at CP and 2,265 tonnes at HPS for a total of 4,073 tonnes.

3.6.3 Hauling

Hauling involves removing material from the site during construction phases. Based on information provided to ENVIRON by MacTech, it is estimated that there will be 44,060 hauling trips for CP-HPS Plan. The number of trips is multiplied by the roundtrip length to determine total VMT. After total VMT for the hauling at CP-HPS Plan is calculated, CO_2 emissions from mobile running for this development can be calculated from the following equation:

CO_2 emissions from mobile running = VMT * EF_{HHD}

Where:

VMT = vehicle miles traveled (based on 14.6 miles round trip distance)
EF_{HHD} = emission factor of heavy heavy-duty trucks

The CO_2 calculation involves the following assumptions:

a. URBEMIS defaults assume that hauling trips use heavy heavy-duty trucks (HHDs).[65]

b. The emission factor depends upon the speed of the vehicle. The URBEMIS default value of 30 miles per hour was used.

c. EMFAC emission factors from the year 2011 were used for EF_{HHD}.

Startup emissions are CO_2 emitted from starting a vehicle. Startup emissions for hauling trips were calculated using the following assumptions:

---

[63] The emission factor grows with the length of time the engine is off before each ignition.
[64] USEPA. 2005. *Emission Facts: Greenhouse Gas Emissions from a Typical Passenger Vehicle.* Office of Transportation and Air Quality. February.
[65] Page A-12 of the URBEMIS user manual.

a. The breakdown in vehicles was all heavy heavy-duty trucks,

b. Two engine startups per day with a 12 hour wait before each startup.[66]

The USEPA recommends assuming that CH_4, N_2O, and HFCs account for 5% of GHG emissions from on-road vehicles, taking into account their GWPs.[67] To incorporate these additional GHGs into the calculations, the total GHG footprint was calculated by dividing the CO_2 emissions by 0.95. The total amount of GHG emissions from hauling is a one-time emission of 1,316 tonnes of CO_2e at CP and 901 tonnes of CO_2e at HPS for a total of 2,216 tonnes of CO_2e as shown in Table 3-4.

Table 3-5 shows total one-time GHG emissions for construction, including off-road equipment, worker commuting, and hauling to be 59,526 tonnes CO_2e at CP and 46,061 tonnes CO_2e at HPS for a total of 105,587 tonnes CO_2e for the CP-HPS Plan development.

3.6.4 Uncertainties in Construction GHG Emissions Calculations

ENVIRON was provided with the phase length and number of each type of construction equipment during construction of buildings.[68] The number of construction equipment, worker and haul trips represent MacTech's estimates at time of this report. The calculations also used default values and settings from URBEMIS. This includes no consideration for reductions in GHG emissions due to new regulations and changes in off-road construction equipment and vehicles used for worker commuting and haul trips. As such, these values are somewhat uncertain.

3.7 GHG Emissions Associated with Residential Buildings

This section describes the methods used to estimate the GHGs associated with activities in residential buildings.

The amount of energy—and, therefore, the amount of associated GHG emissions emitted per dwelling unit— will vary with the type of residential building. Accordingly, information on the type of residential buildings that are planned for CP-HPS Plan is required to estimate GHG emissions. The main residential buildings at CP-HPS Plan provided by Lennar Urban are condos, townhomes, and other multi-family homes.

GHGs are emitted as a result of activities in residential buildings when electricity and natural gas are used as energy sources. Combustion of any type of fuel emits CO_2 and other GHGs directly into the atmosphere; when this occurs in a residential building, it is a direct emission source[69] associated with that building. GHGs are also emitted during the generation of electricity from fossil fuels. When electricity is used in a residential building, the electricity generation typically takes place offsite at the power plant; electricity use in a residential building generally causes emissions in an indirect manner.

---

[66] The emission factor grows with the length of time the engine is off before each ignition.
[67] USEPA. 2005. *Emission Facts: Greenhouse Gas Emissions from a Typical Passenger Vehicle.* Office of Transportation and Air Quality. February.
[68] Provided by MacTech.
[69] California Climate Action Registry (CCAR) General Reporting Protocol (GRP), Version 3.1 (April). Available at: http://www.climateregistry.org/resources/docs/protocols/grp/GRP_3.1_January2009.pdf, Chapter 8

While fuel combustion generates CH_4 and N_2O, the emissions of these GHGs typically comprise less than 1% of CO_2e emissions from electricity generation and natural gas consumption.[70] Fuel oil, kerosene, liquefied petroleum gas, and wood can also be used as fuels, but will likely contribute only in small amounts as combustion sources within residential buildings. Wood burning hearths are addressed in the area sources section of this report.

Energy use in residential buildings is divided into (1) energy consumed by the built environment, and (2) energy consumed by uses that are independent of the construction of the building, such as plug-in appliances. In California, Title 24 governs energy consumed by the built environment, including the HVAC system, water heating, and some fixed lighting. Non-building or 'plug-in' energy use can be further subdivided by specific end-uses (refrigeration, cooking, lighting, etc.). Energy use for each was calculated separately, as described in the following sections. The resulting energy use quantities were then converted to GHG emissions by multiplying by the appropriate emission factors, incorporating information on local electricity production and adjusted to account for the 20% Renewable Portfolio Standard required by 2010.[71]

In this section, the units CO_2 and CO_2e are used interchangeably for residential buildings because CH_4 and N_2O are assumed to contribute a negligible amount of GWP when compared to the CO_2 emissions from residential buildings.

3.7.1 Estimate of Residential Energy Use Intensity

ENVIRON developed CO_2 intensity values (i.e., CO_2 emissions per Dwelling Unit per year) for the residential building types found in CP-HPS Plan using the California Energy Commission Consultant Report entitled 'California Statewide Residential Appliance Saturation Study (RASS)'.[72] The methods that were used and the assumptions that were made in estimating energy use are described below.

3.7.2 Energy Use in the Built Environment

New Californian homes must be designed to meet building energy efficiency standards (Title 24). Compliance with Title 24 is determined from the total daily valuation (TDV) of energy use in the built-environment (on a per square foot per year basis). The regulated energy uses include space heating and cooling, domestic hot water heating, and hard-wired lighting. TDV energy use is a parameter that reflects the burden that a building imposes on an electricity supply system. In general, there is a larger electricity demand and, hence, stress on the supply system during the day (peak times) than at night (off peak). To account for this variation, the calculation of TDV assigns different weights for energy used at different times. For example, a building that uses a given amount of electricity during the peak mid-day period will have a higher TDV value

[70] Ibid. Tables C1 and C2. The methane and nitrous oxide emission factors are negligible compared to the total CO_2 emission factor for electricity generation in California.

[71] The PG&E specific emission factor for electricity deliveries is 636 lbs CO_2/MWh. From the California Climate Action Registry Database: Pacific Gas and Electric Company 2007 PUP Report. 2008. Although this emission factor accounts for only CO_2, the emissions associated with N_2O and CH_4 contribute to less than 1% of the electricity generation CO_2e emissions. Available at: https://www.climateregistry.org/CARROT/public/Reports.aspx This emission factor has been adjusted to 574 lbs CO_2/MWh to account for the 20% RPS required by 2010.

[72] Kema-Xenergy, Itron, RoperASW. California Statewide Residential Appliance Saturation Study (RASS) Volume 2, Study Results, Final Report. June 2004. 300-00-004.

than a building using an equivalent amount of electricity during off-peak hours. Title 24 determines compliance by comparing the energy use of a modeled (or ‘proposed’) home to a minimally Title 24 compliant ‘standard home’ of equal dimensions. Title 24 focuses on building energy efficiency per square foot; it places no limits upon the size of the house or the actual energy used per dwelling unit.

To determine Title 24 compliance for space heating, space cooling, and domestic hot water systems, data from RASS was used to calculate the total energy use per dwelling unit. Estimates for hard-wired lighting will be discussed later in this section. The study estimates the unit energy consumption (UEC) values for individual households surveyed and also provides the saturation number for each type of end-use. The saturation number indicates the proportion of households that have a demand for each type of end-use category.

The most applicable data provided in RASS was used to estimate the UEC values for dwelling units at CP-HPS Plan. Where available, data for multifamily, 5+ unit apartment types in climate zone 5, which is the climate zone in which San Francisco is located, was used. If multifamily or climate zone 5 data was not available, then all household or statewide data was used, respectively. The RASS dataset is comprised of older buildings, which are typically less energy efficient (on a per square foot basis) than newer buildings constructed to meet increasingly stricter efficiency standards. Although the homes used for RASS are likely less energy efficient than Title 24-compliant buildings, the energy use estimates were used to represent 2001 Title-24 compliant homes. The Title 24 standards have been updated twice (in 2005 and 2008) since RASS, and CEC has published reports estimating the percentage deductions in energy use resulting from these new standards[73,74]. Because buildings at CP-HPS Plan would conform to the most updated (and most stringent) standards, ENVIRON accounted for the impact of the Title 24 updates by deducting the estimated percentage savings from the RASS energy use estimates.

RASS provides the annual electricity use per dwelling unit for various heating, cooling, and domestic hot water subcategories. ENVIRON calculated the total electricity demand for each category by multiplying the UEC and saturation values and summing the products for each end-use subcategory within each category. End-use subcategories used to calculate the electrical heating UEC value include conventional electric heating, electrical heat pump space heating, auxiliary heating, and furnace fan. Subcategories included in the cooling category include central air, room air, and evaporative cooling. RASS also provides the UEC values for natural gas usage used for heating and domestic hot water. The same method was used to calculate natural gas usage for each Title 24 category as described above. Natural gas subcategories used to estimate natural gas UEC heating values include primary heat and auxiliary heat; domestic hot water natural gas includes conventional gas water heat.

[74] California Energy Commission. 2007. Impact Analysis: 2008 Update to the California Energy Efficiency Standards for Residential and Nonresidential Buildings. Available at: http://www.energy.ca.gov/title24/2008standards/rulemaking/documents/2007-11-07_IMPACT_ANALYSIS.PDF

Title 24 compliant electricity use on a per dwelling unit basis is 542 kWh per dwelling unit per year. Natural gas use in Title 24 compliant residences on a per dwelling unit basis is 39 MBtu per dwelling unit per year.

Lennar Urban has committed to making all new homes 15% more energy efficient than Title 24 requirements, i.e., 15% more energy efficient on a TDV basis. ENVIRON assumed that all households would uniformly use 15% less annual energy. These calculations are shown in Table 3-6. Title 24 compliant energy use was calculated using the UEC values and saturation values from RASS as described above. These calculations include energy use for heating, air conditioning, DHW. These energy use numbers were then each multiplied by 0.85 to account for Lennar Urban's commitment to a 15% energy efficiency improvement over Title 24. This improvement over Title 24 reduces the electricity use to 286 kWh per year per dwelling unit. For natural gas, this improvement over Title 24 reduces usage on a per dwelling unit basis to 28 MBTU per year per dwelling unit. The calculations for major appliances and plug-in energy use are discussed in the next sections.

3.7.3 Energy Use for Major Appliances and Plug-Ins

Typical major household appliances provided in new residential units include refrigerator, clothes washer and dryer, dishwasher, and cooking range. These are typical appliances provided with a new residential unit that the developer has some control over. Energy demand from using these major appliances is based on UEC and saturations values from RASS.

Table 3-7 summarizes the estimated major appliance energy use for dwelling units at CP-HPS Plan. The annual electricity use of major appliances, taking into account the various types of housing proposed for the CP-HPS Plan, is 971 kWh per year per dwelling unit. In addition the annual natural gas use of major appliances is 3.1 MBtu per dwelling unit.

Lennar Urban has committed to requiring Energy Star appliances for all major appliances rated by Energy Star in newly built residences when the builder supplies appliances with the new home. This includes refrigerators, dishwashers, and clothes washers. There is no Energy Star rating for dryers at this time since there is no significant difference in energy use between different dryer models. Energy Star ratings also are not available for cooking ranges. The average energy improvement for Energy Star rated appliances over standard appliances as reported in Energy Star Annual Report was used to determine the percent reduction in energy use from major appliances.

In addition to major appliances, additional loads such as lighting, office equipment, plug-in cooking equipment and electronics other plug-in electricity loads, such as lighting in a miscellaneous category are also part of the anticipated energy use for a residential development. Similar to the major appliances above, energy use values for plug-in appliances are based on the UEC and saturation values for the miscellaneous category in RASS. The annual electricity use for plug-in appliances (miscellaneous) and lighting is 1,783 kWh for per dwelling unit.

Table 3-8 summarizes the combined energy use including the Title 24 systems, major appliances, and plug-ins. It should be noted that the estimates for residential plug-in energy-use presented here are likely overestimates. The estimates are based upon technologies that were available during the RASS survey, which was conducted in 2003. Future equipment models are likely to be more energy-efficient than current models. If future CP-HPS Plan residents install Energy Star appliances, use more energy efficient equipment, and replace incandescent lights with fluorescent lights, the actual electricity use for plug-ins will be lower than is estimated here. Conversely, future residents may have more small plug-ins (e.g. MP3 player, cell phone, miscellaneous equipment) that could somewhat offset the savings from more energy efficient equipment. However, because refrigerators, lighting, and large appliances contribute to the bulk of the electricity load, and these types of equipment will likely improve in energy efficiency in the future, the estimates presented here are still likely overestimates.

Table 3-8 shows the calculations for the improvement in energy use from Lennar Urban's commitment to a 15% improvement over Title 24 and their commitment to requiring Energy Star major appliances where available. This results in a 12% reduction in electricity use from Energy Star and a combined electricity savings of 9% when compared to a 2005 Title 24 compliant building with current carbon intensity values for electricity use.

3.7.4 Estimation of Annual Greenhouse Gas Emissions from Residential Buildings

Energy use data from Tables 3-8 were multiplied by the emission factors presented in Table 3-9 to generate CO_2 intensity values (i.e., CO_2 emissions per dwelling unit) for each building type. The builder has control over a portion of the estimated energy use for a residential building, the built environment and the initial major appliances. As shown in Table 3-10, the homes that are 15% more energy efficient than Title 24 have lower CO_2 emissions. When combined with Energy Star appliances, as shown in Table 3-10 the dwelling units emit 23% less CO_2 per year than current standard homes for the built environment and major appliances. As shown in Table 3-10, when plug-in loads are considered, dwelling units emit 20% less CO_2 per year, than the current Title 24 compliant homes without energy star appliances.

Table 3-11 shows the yearly CO_2 emissions from CP-HPS Plan by incorporating the aforementioned emission factors and the number of dwelling units for each building type for Title 24 systems and all plug-in energy. The number of dwelling units reflects only the net new units and does not consider the 256 replacement dwelling units. With15% improvements over Title 24, Energy Star appliances annual CO_2 emissions would be reduced to 19,035 tonnes (2.5 tonnes per unit) for CP, 6,642 tonnes (2.5 tonnes per unit) for HPS. The total emissions in this scenario would be 25,677 tonnes per year.

Variant 1 will be the same as the Project with a total of 25,677 tonnes per year. Variant 2 shifts 1,350 dwelling units from CP to HPS. The total net new units at CP will be 6,244 dwelling units with annual CO_2 emissions of 15,651 tonnes per year. HPS will have 4,000 dwelling units with annual CO_2 emissions of 10,026 tonnes per year. The total residential GHG emissions for Variant 2 is 25,677 tonnes CO_2e. This is shown in Table 3-12.

3.7.5 Uncertainties in Residential Building GHG Calculations

Several factors lead to uncertainties in the above analysis. These are described below. As described below, it is believed that these uncertainties result in conservative estimates of the GHG emissions for the residential buildings at CP-HPS Plan.

- Although all buildings in the development will be Title 24 compliant, Title 24 does not specify building dimensions (e.g. size, height, or orientation). Title 24 also provides significant flexibility for window types, window amounts, insulation choice, and other parameters. This uncertainty is not expected to either overestimate or underestimate emissions. Title 24 grants enough flexibility that if a designer puts in more windows than is 'allowed' under the prescriptive measures, the energy efficiency losses can be offset by improving the window quality, or installing a more efficient HVAC system. Although the designs of each residence are not yet known, each home will be Title 24 compliant, and thereby all design features of the home that make it less energy efficient will be offset by design features that make it more energy efficient.
- This analysis did not account for TDV of energy use. As such the reductions in GHG emissions may or may not be quantitatively reflective of the reductions if TDV is accounted for.
- Energy use will vary considerably depending upon the design of the home. The residential units to be built in CP-HPS Plan will vary considerably in size, layout, and overall design. The parameters used here are intended to represent the anticipated energy use of the homes. As such, energy use from the homes that will actually be built in CP-HPS Plan could be different.
- Built environment energy use will vary considerably depending upon the home owners' habits regarding energy use. For instance, homeowners determine the set point of thermostats, the duration of showers, and the usage of air conditioning, among other things. Lennar Urban will have little, if any, influence over these choices made by the homeowner. Current median behavior attributes were assumed for this report. To the extent that individuals are becoming more energy conscious, this will tend to overestimate energy use in the future.
- Plug-in energy use will also vary considerably depending upon the appliances, lights, and other plug-ins installed by the homeowner. Lennar Urban will have little, if any, influence over these choices made by the homeowner. As above, the current median behavior attributes are represented here. To the extent that individuals are becoming more energy conscious, or appliances are becoming more energy efficient, the estimates provided here will tend to overestimate energy use in the future.
- The energy use of the replacement dwelling units will likely be lower than the energy use of the new buildings. This reduction in energy use for the replacement dwelling units has not been accounted for and thus the estimate of energy use is conservative.

3.8 GHG Emissions Associated with Non-Residential Buildings

Non-residential buildings include all structures except residences that may exist in a development such as government, municipal, commercial, retail, and office space. This section describes the methods used to estimate the GHGs associated with activities in non-residential buildings.

The amount of energy used and the associated GHG emissions emitted per square foot of available space vary with the type of non-residential building. For example, food stores are far more energy intensive than warehouses, which have little climate-conditioned space. The CP-HPS Plan description provided data[75] summarizing the general non-residential building categories planned for CP-HPS Plan and the area of floor space planned for each building type. For new developments, the exact types of buildings are typically unknown. As such, not all building categories that may actually exist in CP-HPS Plan are represented below. However, all of the non-residential building area is accounted for, and the tables provided in this section present the differences in energy intensities from building type to building type. The types of non-residential buildings as provided to ENVIRON are:

a. Office

b. Retail

c. Research and Development

d. Artist Studios

e. Community Services

f. Hotel

g. Stadium

h. Performance Venue

Similar to the case for residential buildings, GHGs are emitted as a result of activities in non-residential buildings for which electricity and natural gas are used as energy sources. Combustion of any type of fuel emits CO_2 and other GHGs directly into the atmosphere; when this occurs in a non-residential building this is a direct emission source[76] associated with that building. GHGs are also emitted during the generation of electricity from fossil fuels. When electricity is used in a non-residential building, the electricity generation typically takes place offsite at the power plant; electricity use in a non-residential building generally causes emissions in an indirect manner.

While fuel combustion generates CH_4 and N_2O, the emissions of these GHGs typically comprise less than 1% of CO_2e emissions from electricity generation and natural gas consumption.[77]

---

[75] The CP-HPS Plan description was used to estimate total square footage of buildings.
[76] California Climate Action Registry (CCAR) General Reporting Protocol (GRP), Version 3.1 (January 2009). Available at: http://www.climateregistry.org/resources/docs/protocols/grp/GRP_3.1_January2009.pdf , Chapter 8
[77] Ibid., Tables C1 and C2. The methane and nitrous oxide emission factors are negligible compared to the total CO_2 emission factor for electricity generation in California.

Fuel oil, kerosene, liquefied petroleum gas, and wood can also be used as fuels, but generally contribute only in small amounts as combustion sources within non-residential buildings. As such, these minor emissions are not accounted for here.

Similar to energy use in residential buildings, energy use in non-residential buildings is divided into energy consumed by the built environment and energy consumed by uses that are independent of the construction of the building such as plug-in appliances. In California, Title 24 governs energy consumed by the built environment, mechanical systems, and some fixed lighting. Non-building energy use, or "plug-in" energy use can be further subdivided by specific end-use (refrigeration, cooking, office equipment, etc.). The following two steps were performed to quantify the energy use due to non-residential buildings:

1. Calculate energy use from systems covered by Title 24[78] (HVAC system, water heating system, and the lighting system).
2. Calculate energy use from office equipment, plug-in lighting, and other sources not covered by Title 24.

The resulting energy use quantities were then converted to GHG emissions by multiplying by the appropriate emission factors obtained by incorporating information on local electricity production.[79] The total GHG emissions for non-residential buildings in CP-HPS Plan is estimated to be 18,028 tonnes CO_2 per year. Variant 1 is estimated to be 27,418 tonnes CO_2 per year. Variant 2 is estimated to be 16,226 CO_2 per year. The following sections describe the methodologies employed to estimate GHG emissions.

In this section of this report, the units CO_2 and CO_2e are used interchangeably for non-residential buildings because CH_4 and N_2O are assumed to contribute a negligible amount of GWP when compared to the CO_2 emissions from non-residential buildings.

3.8.1 Estimate of Non-residential Energy Use Intensity

ENVIRON developed CO_2 intensity values (CO_2 emissions per sqft per year) for building types found in CP-HPS Plan using data from the California Commercial End-Use Survey (CEUS) except for the Stadium.[80] The methods that were used to estimate these emissions for CP-HPS Plan are described below.

3.8.1.1 CEUS Database

The overall electricity use for the building types except for the Stadium was calculated based on data provided by the CEC.[81] The CEUS data is based on a survey conducted in 2002 of

---

[78] Title 24, Part 6, of the California Code of Regulations: California's Energy Efficiency Standards for Residential and Nonresidential Buildings. http://www.energy.ca.gov/title24/

[79] The PG&E specific emission factor for electricity deliveries is 636 lbs CO_2/MWh. From the California Climate Action Registry Database: Pacific Gas and Electric Company 2007 PUP Report. 2008. Although this emission factor accounts for only CO_2, the emissions associated with N_2O and CH_4 contribute to less than 1% of the electricity generation CO_2e emissions. Available at: https://www.climateregistry.org/CARROT/public/Reports.aspx This emission factor has been adjusted to 574 lbs CO_2/MWh to account for the 20% RPS required by 2010.

[80] California Energy Commission (CEC). California Commercial End-Use Survey Results. Data available from Itron Inc. at http://capabilities.itron.com/CeusWeb/Chart.aspx

[81] Workbooks for "PGE – FCZ5" downloaded from http://capabilities.itron.com/CeusWeb/Chart.aspx for all building categories. Access 7/15/2009.

existing buildings. Each building type has a characteristic electricity and natural gas use per square foot of building space. Electricity use per square foot (electricity intensity) for each building sample was extracted from the CEUS data. Similarly, the natural gas use per square foot (natural gas intensity) for each building sample was also extracted.

For this analysis, energy use was based upon buildings in California climate zone 5. Table 3-13 lists the breakdown of electricity use among several end uses for electricity in various non-residential building types. Table 3-14 lists the percentage breakdown of end uses for natural gas in various non-residential building types. The end use data provide an estimate of the percent of the total energy use comprised by Title 24 regulated (built environment) and plug-in electricity in each building type. The Title 24-regulated electricity use (cooling, space heating, water heating, lighting, ventilation) and the non-built electricity use (office equipment, refrigeration, cooking, etc.) are presented in Table 3-16. The Title 24-regulated natural gas use and the non-built natural gas use (primarily from cooking) are presented in Table 3-16.

3.8.1.2 Stadium

The Stadium energy use estimates are based on San Francisco Climate Action Plan which lists 1990 energy use for the Stadium. The Stadium electricity use in 1990 was 5.1 million kWhr per year and natural gas use was 9 million kBtu per year[82]. The new Stadium will likely be more energy efficient than the old Stadium built in 1960. It was assumed that the new Stadium would use 20% less electricity than the old Stadium based on estimates from other new football stadiums[83]. Although the Stadium in 1990 housed both football and baseball, and the new Stadium is anticipated to house only football, no reduction in energy use has been assumed. Accordingly, this is likely an overestimate of Stadium energy use.

The electricity and natural gas use per square foot for each building type are converted to GHG emissions as shown in the next section.

3.8.2 Estimation of Annual Greenhouse Gas Emissions from Non-Residential Buildings

Lennar Urban has committed to making all new non-residential buildings 15% more energy efficient than Title 24 2008 standards, or 15% more energy efficient on a TDV basis. Although ENVIRON is aware that annual energy use and TDV energy do not necessarily scale linearly with each other, as discussed in the residential section, ENVIRON assumed that all sources covered by Title 24 would uniformly use 15% less annual energy. These calculations are shown in Table 3-16. Non-Title 24 regulated energy use is assumed to still use the same amount of energy as a minimally Title 24 compliant building. There is no credit taken for any Energy Star appliances in the non-residential building category since it is difficult to determine which appliances may be present in the various non-residential building categories. In addition, these are generally not supplied with the building. Baseline Title 24 usage rates shown in this table have been adjusted to reflect improvements in Title 24 building codes since their introduction in

[82] San Francisco Department of the Environment and San Francisco Public Utilities Commission. 2004. Climate Action Plan for San Francisco.

[83] The new stadium to be used by the New York Jets and Giants is expected to reduce energy consumption by 30%. The new stadium to be used by the Dallas Cowboys is expected to reduce energy use by 20%.

2002. CEC discusses average savings for improvements from 2002 to 2005 ("Impact Analysis for 2005 Energy Efficiency Standards") as well as from 2005 to 2008 ("Impact Analysis 2008 Update to the California Energy Efficiency Standards for Residential and Nonresidential Buildings"). ENVIRON used these CEC average savings percentages to account for reductions in energy use due to Title 24. The average savings percentages are: for electricity: 8.5% reduction in 2005 and 4.9% reduction in 2008; for natural gas: 5.8% reduction in 2005 and 9.4% reduction in 2008. This methodology results in a reduction of energy use for all building types. Because plug-ins are not covered under Title 24, the decrease in energy use is typically less than 15%, yet still substantial.

Energy use data from Table 3-16 were multiplied by the emission factors presented in Table 3-15 to generate CO_2 intensity values (CO_2 emissions per sqft building area). The results are shown in Table 3-16. The CO_2 intensity values presented in Table 3-15 represent the non-residential building types in CP-HPS Plan described earlier.

Table 3-17 also shows the yearly CO_2 emissions from CP-HPS Plan by incorporating the emission factors developed as discussed above and the square footage of each of the main building categories. The total annual GHG emissions for CP will be 4,263 tonnes CO_2 per year. The total annual GHG emissions for HPS will be 13,766 tonnes CO_2 per year. This is a total of 18,028 tonnes CO_2 per year for CP-HPS Plan.

Variant 1 replaces the Stadium with an additional 2.5 million square feet of R&D space for a total of 5 million square feet of R&D space at HPS. CO_2 emissions are shown in Table 3-18. The CO_2 emissions at HPS for Variant 1 are 23,155 tonnes CO_2 per year for a total of 27,418 tonnes CO_2 per year for Variant 1.

Variant 2 replaces the Stadium with housing units. CO_2 emissions are shown in Table 3-19. The CO_2 emissions at HPS for Variant 2 are 11,963 tonnes CO_2 per year for a total of 16,226 tonnes CO_2 per year for Variant 2.

3.8.3 Uncertainties in Non-residential Building GHG Calculations

Several factors lead to uncertainties in the above analysis. These are described below.

- For new developments, the exact types of buildings are typically unknown. As such, not all building categories that may actually exist in CP-HPS are represented in this analysis. However, all of the commercial building area is accounted for and the best available assessment of the building type composition of CP-HPS Plan was used. The tables provided in this section present the differences in energy intensities from building type to building type.
- Although it is unknown exactly how the buildings will be designed, each building will be Title 24 compliant. Therefore all design features of the building that make it less energy efficient will be offset by design features that make it more energy efficient.
- The exact energy use for the new Stadium is only an estimate based on past energy use of the old Stadium and estimates in typical energy improvements claimed for other new football stadiums. In addition, the uses in the old Stadium included baseball, whereas the new Stadium uses will not include baseball.

3.9 Mobile Sources

This section estimates GHG emissions from mobile sources in CP-HPS Plan. The mobile source emissions considered for this project will be from the typical daily operation of motor vehicles by CP-HPS Plan residents and non-residents.

ENVIRON estimated GHG emissions based upon all miles traveled associated with net new CP-HPS Plan residential and non-residential trips regardless of internal or external destinations or purpose of trip. Traffic patterns, trip rates, and trip lengths are based upon information from the Candlestick Point-Hunter's Point Shipyard Phase II Development Transportation Study.[84]

ENVIRON estimated alternative GHG emissions which only accounts for the "new" emissions associated with growth. These GHG emissions are based upon all miles traveled by net new CP-HPS Plan residents regardless of internal or external destinations or purpose of trip.

For this alternative GHG emissions, it is assumed that new non-residential (i.e. office space, retail space, and industrial buildings) area serves an area with a high residential/ non-residential balance. Therefore, this new non-residential growth will not, independent of the new residential areas, result in new shopping and work trips. Since the Stadium is replacing Candlestick Park, this is not considered to cause new trips from far away. If the Stadium is not built at HPS, it is assumed that a new Stadium will be built elsewhere in the Bay Area and it is unknown if the trips will be shorter or longer for attendees. The music venue in CP is considered to be a new non-residential facility that could draw trips that otherwise would not be made. The trips associated with customers of the music venue are considered in the inventory. Accordingly, new non-residential space in the CP-HPS Plan development area will not contribute to mobile GHG emissions except for the music venue. However, the emissions from heating and cooling the non-residential areas would be considered to be new, as that would reflect growth in non-residential areas that goes along with growth in residential areas. Accordingly, GHG emissions from VMT serving non-residential areas will only be counted if the non-residential areas contribute to greater VMT as a result of its location such as the music venue. It should be noted that as CP-HPS Plan is a mixed use community, this issue does not directly affect CP-HPS Plan VMT calculations; all VMT from net new CP-HPS Plan residents is calculated regardless of internal or external destinations or purpose of trip.

The CCAR GRP[85] recommends estimating GHG emissions from mobile sources at an individual vehicle level, assuming knowledge of the fuel consumption rate for each vehicle as well as the miles traveled per car. Since these parameters are not known for a future development, the CCAR guidance can not be used as recommended.

For mobile sources, CH_4 and N_2O are explicitly calculated, multiplied by their respective GWP, and added to the CO_2 emissions, to result in total CO_2e emissions from mobile sources.

[84] CHS Consulting Group, Fehr and Peers, and LCW Consulting. 2009. Candlestick Point-Hunter's Point Shipyard Phase II Development Transportation Study.

[85] California Climate Action Registry (CCAR). 2009. *General Reporting Protocol*. Version 3.1. January.

3.9.1 Estimating VMT from Mobile Sources

This section explains the general approach used to estimate VMT made by the residents of CP-HPS Plan. Underlying data for the calculations were taken from the Candlestick Point-Hunter's Point Shipyard Phase II Development Transportation Study provided to ENVIRON.[86]

Traditional traffic models focus upon designing roads and planning a development such that traffic delays will be avoided during peak travel hours. Traditional traffic analyses also provide the total number of daily vehicles on a road which can then be used to calculate toxic or criteria emissions that may have localized health effects. Several steps must be taken to go from a traditional traffic model to a set of calculations that describe VMT made by CP-HPS Plan residents and non-residents.

The first step is to adjust the traffic report trips to account for project design features that reduce trips. As the traditional traffic analysis only predicts weekday driving patterns, this step is to account for differences in weekend and weekday driving patterns. The third step accounts for how many of these trips may be taken using modes of transportation other than cars. The final step is to take all of these parameters into account and calculate the final VMT from CP-HPS Plan residents. These four steps are summarized below:

1. Determine trip rates based on reductions for project design features.
2. Determine the difference in weekend and weekday driving patterns.
3. Determine how many trips are taken by modes other than cars.
4. Calculate final VMT based upon the above scenarios.

The following section describes, in more detail, how these four steps were carried out. An additional step is necessary for the alternative analysis which only considers the "new" GHG emissions associated with growth. This step is to disaggregate the traffic information that is contained in the original traffic report into trips made by CP-HPS Plan residents and into trips made by non-CP-HPS Plan residents as well as the number of trips for attendees of the music venue.

3.9.1.1 Determine trip rates based on reductions for project design features

The Candlestick Point-Hunter's Point Shipyard Phase II Development Transportation Study provided to ENVIRON included an estimate of the trip rates incorporating the project design features at CP-HPS. The trips and VMT calculated includes all trips and VMT generated by net new CP-HPS Plan residential and non-residential land uses. Once the number of trips is determined, the trip type is important. For example, a home based work (HBW) trip is a trip directly from home to work with no stops in-between, or directly from work to home. A home based shopping trip (HBS) is a trip directly from home to shopping or from shopping to home. A home based other trip (HBO) is a trip directly from home to another destination such as school. Non-home based (NHB) trips are trips between work and other types of destinations such as going to the bank during one's lunch hour. For all trip types, directionality is unimportant. The

[86] CHS Consulting Group, Fehr and Peers, and LCW Consulting. 2009. Candlestick Point-Hunter's Point Shipyard Phase II Development Transportation Study.

distribution of residential trip types follow the MTC 2030 model defaults where HBW trips account for 32% of trips, HBO are 47% of trips, and NHB are 21% of trips. Non-residential trip types are HBW account for 26% of trips, HBO accounts for 28% of trips, and NHB are 27% of trips.

3.9.1.2 Determine the difference in weekend and weekday driving patterns

Since the trip rates are based on weekday conditions, ENVIRON calculated weekend traffic by applying differences between the weekend and the weekday traffic based upon a report by Sonoma Technologies.[87] Weekend traffic on major highways was assumed to be 80% of the weekly capacity, and weekend traffic on small streets was assumed to be 80% of weekly capacity[88]. No adjustment to driving patterns was done for the music venue since this is on a per event basis.

3.9.1.3 Determine how many trips are taken by modes other than cars

It is likely that a portion of the CP-HPS Plan residents would take public transportation when travelling out of CP-HPS Plan. Lennar Urban has committed to enhancements of the public transportation in the region. The Candlestick Point-Hunter's Point Shipyard Phase II Development Transportation Study made an estimate of the total number of vehicle trips taking into account use of several alternative modes including public transit, bicycles, and carpooling.

3.9.1.4 Alternative GHG Emissions Analysis: Dis-aggregate the trips made by CP-HPS Plan residents from trips made by people that do not live in CP-HPS Plan.

As discussed above, the trips generated by the net new residents of CP-HPS Plan represent growth. However, new non-residential areas do not necessarily represent growth since people would already be taking these trips. The new non-residential areas will only serve to displace the location of trips with the exception of the music venue. The music venue will create trips that would otherwise not occur. The trips by attendees of the music venue are therefore counted. The total number of trips of attendees to the music venue was provided by Fehr and Peers and assumes 150 events per year. Therefore we will only account for trips generated from the residential land uses to determine the GHG emissions from CP-HPS Plan. To the extent that those trips visit commercial areas, both inside and outside of the CP-HPS Plan, they will be counted.

3.9.1.5 Calculate final VMT based upon the above scenarios

Each type of trip is associated with an average trip length as estimated by Fehr and Peers based on the Caltrans Household Travel Survey for San Francisco County. Total vehicle miles traveled (VMT) were calculated by multiplying the number of trips by the average trip length for each type of trip.

---

[87] Sonoma Technologies, Inc. 2004. Correction and Analysis of Weekend/Weekday Emissions Activity Data in the South Coast Air Basin. May.

[88] A conservative adjustment for weekend travel was assumed for all the trips since information was not available to distinguish between trips on major highways and trips on small streets. The Sonoma Technologies report gives a range of values, but does not present a weighted value, thus a conservative percent reduction in the number of trips was selected.

VMT = Number of Trips * Average Trip Length

The average trip length for HBW is 14.9 miles, HBO is 9.1 and NHB is 9.5. Vehicle trips that are internal to the project area were assumed to be 1 mile. The music venue attendees were assumed to have a trip length of 9.1 miles, the same as the HBO trip length. The value calculated here includes all VMT generated by net new CP-HPS Plan residential and non-residential land use commuting within CP-HPS Plan and all VMT generated by CP-HPS Plan residents and nonresidents commuting to and from CP-HPS Plan as well as attendees of the music venue. The total VMT for CP-HPS Plan residents and non-residents is 309,166,932 as shown in Table 3-20. Using an alternative method, each CP-HPS Plan dwelling unit generates 13,467 VMT per year. The total VMT for CP-HPS Plan residents is 137,958,003 as shown in Table 3-21. For Variant 1, the total VMT for CP-HPS Plan residents and non residents is 351,783,194 VMT per year as shown in Table 3-22. Using the alternative method to estimate trips from residents only for Variant 1, the net new dwelling units would generate 13,720 VMT per year per dwelling unit for a total of 140,548,884 VMT as shown in Table 3-23. For Variant 2, there would be a total of 322,690,366 VMT from residents and nonresidents as shown in Table 3-24. Using the alternative approach for Variant 2, the net new dwelling units would generate 13,557 VMT per year for a total of 138,880,220 VMT as shown in Table 3-25. This VMT was multiplied by the appropriate emission factors in the next section to calculate GHG emissions from mobile sources at CP-HPS Plan.

3.9.2 Estimating GHG Emissions from Mobile Sources

The CO_2 emissions from mobile sources were calculated with the trip rates, trip lengths and emission factors for running and starting emissions from EMFAC2007 as follows:

CO_2 emissions = VMT * $EF_{running}$

Where:

VMT = vehicle miles traveled
$EF_{running}$ = emission factor for running emissions

The CO_2 calculation involves the following assumptions:

- The emission factor depends upon the speed of the vehicle. Here, it was assumed that trips were 30 miles per hour.
- EMFAC emission factors from the year 2020 were used for $EF_{running}$ based on San Francisco County fleet mix and adjusted to account for Pavley Vehicle Standards (see Appendix B for details).

Startup emissions are CO_2 emitted from starting a vehicle. Startup emissions were calculated using the following assumptions:

- The number of starts is equal to the number of trips made annually.
- The breakdown in vehicles was EMFAC fleet mix for San Francisco County in 2020.

- The emission factor for startup was calculated based on a conservative assumption of long waits between starts.

Fleet distribution types are from EMFAC2007 from the year 2020, a year selected to represent full build out. Tables 3-20, 3-22, and 3-24 shows the CO_2 emissions from vehicles associated with residents and nonresidents of CP-HPS Plan, Variant 1, and Variant 2 as calculated according to the methodology described above. Table 3-21, 3-23, and 3-25 shows the alternative analysis of the CO_2 emissions from vehicles associated with residents and music venue only of CP-HPS Plan, Variant 1, and Variant 2 as calculated according to the alternative methodology described above.

Nitrous oxide, CH_4, and HFCs[89] are also emitted from mobile sources. The USEPA recommends assuming that CH_4, N_2O, and HFCs account for 5% of mobile source GHG emissions, taking into account their GWPs.[90] Therefore, CO_2 emissions in Table 3-20 through 3-25 were divided by 0.95 to account for non-CO_2 GHGs. Vehicles associated with the CP-HPS Plan development will emit approximately 105,520 tonnes CO_2e per year. Vehicles associated with the Variant 1 will emit approximately 119,918 tonnes CO_2e per year. Vehicles associated with the Variant 2 will emit approximately 110,068 tonnes CO_2e per year. The alternative analysis estimates that vehicles associated with the CP-HPS Plan will emit approximately 47,049 tonnes CO_2e per year, Variant 1 will emit approximately 47,886 CO_2e per year, and Variant 2 will emit approximately 47,347 CO_2e per year. A sample EMFAC run for San Francisco County is given in Appendix B.

3.9.3 Uncertainty Analysis

In an effort to evaluate the assumptions described in the section it should be noted that changes in estimated fleet distribution and emission factors will likely improve based on anticipated regulations, over and above those currently enacted in law.

3.9.4 Transit Area

Emissions from the transit area are associated with increased public transport needed to service the CP-HPS Plan development. GHGs are emitted from public buses when the vehicles are in transit and when the vehicles are idling at the curbside. Table 3-26 details the emission calculation for transit area. This is based on the net new miles and trips made by transit servicing the CP-HPS Plan. The details of the net new transit service are described in Table 3-27 as provided by Fehr and Peers. Since San Francisco uses carbon free electricity to power its electric buses and trolleys, the mileage and idling time from these vehicles is not quantified.

Total running emissions from transit buses were calculated by multiplying the net new miles and idling time from the CP-HPS Plan by the GHG emission factors for urban buses.

$$CO_2 \text{ emissions} = VMT * EF_{BUS,running} + Idling * EF_{UBUS,idling}$$

Where:

---

[89] HFCs can be emissted from air conditioning systems.

[90] USEPA. 2005. *Emission Facts: Greenhouse Gas Emissions from a Typical Passenger Vehicle.* Office of Transportation and Air Quality. February. (http://www.epa.gov/otaq/climate/420f05004.pdf)

VMT = net new vehicle miles traveled (from Fehr and Peers)

$EF_{BUS,running}$ = running emission factor for urban buses

Idling = net new idling time (from Fehr and Peers)

$EF_{BUS,idling}$ = idling emission factor for buses

The CO_2 calculations involve the following assumptions:

- $EF_{BUS,running}$ and $EF_{BUS,idling}$ are based on EMFAC emission factors from the year 2020
- The diesel buses servicing CP-HPS will be diesel-hybrid buses that reduce fuel usage by 25%[91]
- San Francisco transit buses use B20 (20% biodiesel, 80% petroleum diesel).[92]
- Startup emissions are expected to be minimal because transit buses are expected to operate the full day.

The idling emission factor for EMFAC's school bus was used for $EF_{BUS,idling}$ because the idling emission factor is not available for urban buses.

The USEPA recommends assuming that CH_4, N_2O, and HFCs account for 5% of GHG emissions from on-road vehicles, taking into account their GWPs.[93] To incorporate these additional GHGs into the calculations, the total GHG footprint was calculated by dividing the CO_2 emissions by 0.95.

The total amount of GHG emissions from the transit area is estimated to be 1,730 tonnes of CO_2 per year.

3.10 Municipal Sources

This section explains estimates for emissions stemming from municipal sources such as drinking water and wastewater supply and treatment, lighting in public areas, and municipal vehicles.

3.10.1 Water and wastewater supply and treatment systems

In general, the majority of municipal sector GHG emissions are related to the energy used to convey, treat and distribute water and wastewater. Thus, these emissions are generally indirect emissions from the production of electricity to power these systems. Additional emissions from wastewater treatment include CH_4 and N_2O, which are emitted directly from the wastewater.

The amount of electricity required to treat and supply water depends on the volume of water involved. According to Lennar Urban, the development would generate a total water demand of 0.90 and 0.77 million gallons per day (mgd) for CP and HPS, respectively. Three processes are

---

[91] SFMTA Climate Action Plan. Draft for Public Review, December 19, 2008.

[92] Based on CCAR recommendations, emissions from burning biodiesel are not included in emissions estimation. EMFAC emission factors are further reduced by 20% to account for the use of B20.

[93] USEPA. 2005. *Emission Facts: Greenhouse Gas Emissions from a Typical Passenger Vehicle.* Office of Transportation and Air Quality. February.

necessary to supply potable water to residential and commercial users: (1) supply and conveyance of the water from the source; (2) treatment of the water to potable standards; and (3) distribution of the water to individual users. After use, the wastewater is treated and reused as reclaimed water. Any reclaimed water produced is generally redistributed to users via pumping.

Indirect emissions resulting from electricity use were determined by multiplying electricity use by the CO_2 emission factor provided by the local electricity supplier, Pacific Gas and Electric Company, (PG&E). Energy use for different aspects of water treatment (e.g. source water pumping and conveyance, water treatment, distribution to users) was determined using the stated volumes of water and energy intensities values (i.e., energy use per unit volume of water) provided by reports from the California Energy Commission (CEC). The emission factors and GHG emissions for all these processes are shown in Table 3-28. The annual emissions from water treatment and distribution, and wastewater treatment are approximately 257 and 230 tonnes CO_2e per year for CP and HPS, respectively. Variant 1 will have the same emissions for CP and 324 tonnes CO_2e per year for HPS. Variant 2 will have 225 and 257 tonnes CO_2e for CP and HPS, respectively. Details on the emissions generated by specific aspects of water treatment and supply systems are provided in the following sections.

3.10.2 Potable Water Source Supply and Conveyance

Most of the water supply in San Francisco is supplied by the Hetch Hetchy system. Supply and conveyance of water from the Hetch Hetchy system has minimal energy usage because it is delivered by gravity. Supplying and conveying water in CP-HPS Plan is estimated to have 0 tonnes of CO_2e emissions per year (see Tables 3-28 through 3-30).

3.10.3 Potable Water Treatment and Distribution

Treating and distributing potable water in CP-HPS Plan are estimated to account for 115 tonnes[94] and 103 tonnes[95] of CO_2e emissions per year, respectively. Variant 1 will be 115 and 146 tonnes of CO_2e emissions per year for treating and distributing potable water. Variant 2 will be 101 and 115 tonnes of CO_2e emissions per year for treating and distributing potable water. Based on the estimated potable water demand, these energy intensity factors, and the PG&E-carbon intensity factor adjusted for the Renewable Portfolio Standard, GHG emissions from potable water treatment and distribution were calculated as shown in Tables 3-28 through 3-30.

3.10.4 Wastewater Treatment

Emissions associated with wastewater treatment include indirect emissions necessary to power the treatment process and direct emissions from degradation of organic material in the

---

[94] Emission factor for water treatment is based on information provided in CEC 2006 and the electricity generation emission factor from Pacific Gas and Electric. This factor is applied to potable water demand. California Energy Commission. 2006. Refining Estimates of Water-Related Energy Use in California. PIER Final Project Report. Prepared by Navigant Consulting, Inc. CEC-500-2006-118. December.

[95] Emission factor for water distribution is based on information provided in CEC 2006 and the electricity generation emission factor from Pacific Gas and Electric. This factor is applied to potable water demand. California Energy Commission. 2006. Refining Estimates of Water-Related Energy Use in California. PIER Final Project Report. Prepared by Navigant Consulting, Inc. CEC-500-2006-118. December.

wastewater. Wastewater treatment indirect emissions in CP-HPS Plan are estimated to account for 268 tonnes of CO_2e emissions per year. Specifically, emissions are estimated to be 141 and 127[96] tonnes of CO_2e emissions per year for CP and HPS, respectively. Variant 1 wastewater treatment indirect emissions are estimated to account for 319 tonnes of CO_2e per year. Variant 2 wastewater treatment indirect emissions are estimated to account for 264 tonnes CO_2e emissions per year. Wastewater treatment direct emissions in CP-HPS Plan are estimated to account for zero tonnes of CO_2e emissions per year since all methane emissions from the wastewater at the Southeast Wastewater Treatment Plant is burned at the flare station or cogeneration plant and non methane emissions are directly emitted from the wastewater as directed by the plant's air permit.

Indirect GHG emissions from the electricity necessary to power the wastewater treatment process were calculated for CP-HPS Plan. Wastewater in San Francisco is handled by the Southeast Pollution Control Plant. The electricity required to operate wastewater treatment plant is estimated to be 1,688 kW-hr per AF[96]. Based on the expected amount of wastewater requiring treatment[97], this energy intensity factor and the PG&E carbon-intensity factor adjusted to account for the Renewable Portfolio Standard, indirect emissions due to wastewater treatment were calculated as shown in Tables 3-28 through 3-30.

Direct emissions from wastewater treatment include emissions of CH_4 and N_2O. All direct methane emissions from the Southeast Pollution Control Plant are burned either at the flare station or cogeneration plant. Therefore, there will be no direct emissions from the wastewater treatment plant.

Variant 1 is expected to have a water demand of 1.11 mgd at HPS. Table 3-29 shows the CO_2 emissions associated with Variant 1. Variant 2 is expected to have a water demand of 0.77 mgd at CP and 0.88 mgd at HPS. Table 3-30 shows the CO_2 emissions associated with Variant 2.

3.10.5 Public Lighting

Lighting sources contribute to GHG emissions indirectly, via the production of the electricity that powers these lights. Lighting sources considered in this source category include streetlights, traffic signals, area lighting for parks and lots, and lighting in public buildings. The emission factor for public lighting is shown in Tables 3-28 through 3-30. Data from a report by the City of Duluth shows that the amount of electricity demanded for all types of public lighting is 149 kW-hr per capita per year.[98] Lennar Urban has committed to using energy efficient street lighting in

[96] Emission factor for wastewater treatment are from the energy requirements for the Southeast Pollution Control Center provided in a Request for Proposals. This information was provided in "SFPUC Hetch Hetchy Water and Power RFP - Solar Photovoltaic Renewable Energy Plant at the Southeast Water Pollution Control Plant Agreement No. DB-101". All of the direct methane emissions from the wastewater treatment plant are burned at the flare station or cogenerations plant.

[97] Assumed 91% of the water treated is to be reclaimed.

[98] Skoog., C. 2001. This factor was calculated by summing the total electricity needs for municipal uses and dividing by the Duluth population. The Duluth population was calculated by dividing the city's reported GHG emissions by its reported per capita emissions.

CP-HPS Plan. This will reduce street lighting electricity demand by 16%[99]. Using this study, the PG&E-specific carbon-intensity emission factor adjusted for 20% RPS and the expected CP-HPS Plan population of 23,869, emissions from public lighting were calculated.[100] Thus, the CP-HPS Plan-specific emission factor for public lighting would be 0.037 tonnes CO_2e per capita per year. Public lighting emissions in CP-HPS Plan are estimated to account for 878 tonnes CO_2 per year. This is the same for Variant 1 and Variant 2 since the total population will be the same. This number is likely a conservative estimate since CP-HPS Plan is a master-planned compact community may require a lower number of lights than the City of Duluth.

3.10.6 Municipal Vehicles

GHG emissions from municipal vehicles are due to direct emissions from the burning of fossil fuels. Municipal vehicles considered in this source category include vehicles such as police cars, fire trucks, and garbage trucks. The emission factor for municipal vehicles is shown in Tables 3-28 through 3-30. Data from reports by Medford, MA; Duluth, MN; Northampton, MA; and Santa Rosa, California[101] show that the CO_2 emissions from municipal vehicles would be approximately[102] 0.05 tonnes per capita per year. Using these studies and the expected CP-HPS Plan population of 23,869, emissions from municipal vehicles in CP-HPS Plan were calculated. Municipal vehicle emissions in CP-HPS Plan are estimated to account for 1,194 tonnes CO_2e per year. This is the same for Variant 1 and Variant 2 since the total population will be the same.

In total, all municipal sources including water, wastewater, public lighting and municipal vehicles for CP-HPS Plan is expected to produce 2,559 tonnes of CO_2e annually. Variant 1 is expected to produce 2,653 tonnes of CO_2e annually. Variant 2 is expected to produce 2,553 tonnes of CO_2e annually.

3.11 Area Sources

Area sources emissions stem from hearths (including gas fireplaces, wood-burning fireplaces, and wood-burning stoves) and small mobile fuel combustion sources such as lawnmowers. Fuel combustion associated with these sources produce direct GHG emissions. Since all of the housing units are multi-family, URBEMIS does not estimate a significant amount of emissions from lawn maintenance equipment and these have not been quantified. Since emissions from natural gas-fired stoves and natural gas heating are already included in the residential

---

[99] The resultant energy savings is calculated from the annual energy costs found on page 4 of NYSERDA's 2002 How-to Guide to Effective Energy-Efficient Street Lighting.

[102] In an effort to be conservative, the largest per capita number from these four reports was used.

sources[103], calculations based on the URBEMIS method for the remaining types of area sources, natural gas fireplaces was performed.

CP-HPS Plan will have natural gas fireplaces in 10% of its net new residential units based on estimates from Lennar Urban. Wood-burning stoves or fireplaces are prohibited. Direct GHG emissions from these sources were estimated by multiplying the energy use per year by the CO_2 emission factor for natural gas combustion. Annual energy use was determined by the number of fireplaces, the average energy use of each fireplace, and the URBEMIS default fireplace usage rate value of 200 hours/year. In the absence of site-specific energy use values for fireplaces at CP-HPS Plan, the URBEMIS default values of 20,000 BTU/hour/fireplace for multi-family residences was used. Table 3-31 shows an estimated 217 tonnes CO_2 will be generated annually by fuel combustion in natural-gas fireplaces. Variant 2 will have the same total emissions as CP-HPS Plan, but will be distributed in CP and HPS differently as shown in Table 3-32.

3.12 Emissions from Solid Waste Disposal

The residents and non-residential uses at the development will generate waste. A large percentage of this waste will be diverted from landfills either by waste generation reduction, recycling, and composting. San Francisco currently diverts a large portion of its waste generated and has goals to even further reduce the amount of waste sent to a landfill. The remainder of the waste not diverted will be disposed of at a landfill. Landfills emit GHG emissions associated with the anaerobic breakdown of material. The waste disposal rates for the various land uses at the development were estimated based on values reported by the Center for Integrated Waste Management Board (CIWMB)[104]. If no waste disposal rates could be found, waste generation rates for that land use were used. These are likely over-estimates since they do not account for the waste that would be diverted from a landfill. The waste disposal rates were multiplied by the non-biogenic emissions associated with the Altamount Landfill in 2005 which is 0.00674 tonnes of CO_2e emissions per metric ton of waste per year[105]. Tables 3-33 through 3-35 detail the calculation of GHG emissions associated with the waste disposal for CP-HPS Plan, Variant 1 and Variant 2 respectively. The total GHG emissions are anticipated to be 907, 1,038, and 1,038 tonnes CO_2e per year for CP-HPS Plan, Variant 1, and Variant 2 respectively. These estimates are likely conservative given the fact that future residents will be more conscious of waste and the aggressive goals for waste reduction in San Francisco. In addition, this estimate does not account for the carbon sequestration that will occur as a result of disposal of carbon in the landfill that will not degrade.

[105] Based on information provided by BAAQMD.

3.13 Emissions Sources Not Quantified in Inventory

Several emissions sources were not quantified in this inventory, due to their estimated relatively small[106] contribution to GHG emissions. These sources include emissions from recreational sources and refrigeration leaks which are described in more detail below[107].

3.13.1 Pools and Recreation Centers

The CP-HPS Plan Specific Plan includes neighborhood community areas and parks which may also include pools and recreation centers. At the entitlement stage of development, the degree of uncertainty in the potential end-uses of these recreational areas make a meaningful quantification of GHG emissions difficult. As a result of this uncertainty, ENVIRON did not quantify these emissions at this time.

3.13.2 Refrigeration Leaks

Emissions associated with leaks of high global warming potential gases such as from refrigeration leaks were not quantified. At the entitlement stage of development, the degree of uncertainty in the potential facilities with sources that may have refrigeration leaks make a meaningful quantification of GHG emissions difficult. In addition, since refrigeration systems will be new, they are likely efficient and should be designed to reduce the amount of leaks of high global warming potential gases. As a result of this uncertainty and likely small level of emissions, ENVIRON did not quantify these emissions at this time.

3.14 Project Design Features that Reduce GHG Emissions

The CP-HPS Plan development incorporates many design features to reduce GHG emissions. This section describes the design features that were incorporated into this analysis either directly or indirectly. This section also lists those features that were not quantified in this analysis, but would likely yield further GHG emissions reductions.

3.14.1 Project Design Features whose Emissions Reductions were Incorporated into the Analysis

3.14.1.1 Reductions in emissions from mobile sources

- Provide neighborhood serving retail.
- Provide automobile, public transportation, and pedestrian connections between the Shipyard, Candlestick Point and the larger Bayview neighborhood.
- The Urban Design Plan used at CP-HPS Plan will reduce its footprint and allow for transportation and open space corridors.
- Integrating land use patterns with multimodal street networks that would facilitate walking and cycling for internal trips and transit for trips of greater distance.
- Extend existing Muni routes to better serve the CP-HPS Plan area; increase frequencies on existing routes to provide more capacity; and complement those existing routes with

[106] Typically less than 1% of the overall inventory based upon previous studies.
[107] Black carbon was also not considered. Major sources of black carbon emissions are not present at CP-HPS Plan.

new transit facilities and routes that would serve the CP-HPS Plan's proposed land use program and transit demand.

3.14.1.2 Vegetation preservation

- The project is a redevelopment project and will not result in the conversion of any new land to settlement.
- Up to 10,000 trees new trees will be planted at CP-HPS Plan.

3.14.1.3 Energy Savings

- Homes and businesses will exceed the 2008 Standards for Title 24 Part 6 energy efficiency standards by at least 15%.
- Where appliances are offered by homebuilders, Energy Star appliances will be installed.
- Energy efficient street lighting will be used.

3.14.2 Project Design Features whose Emissions Reductions were not Incorporated into the Analysis but would yield further GHG emissions savings

While these project design features have not been quantified as part of this GHG emissions inventory, they are part of CP-HPS Plan and will likely result in further GHG emission reductions.

3.14.2.1 Reductions in emissions from mobile sources

- Transportation Demand Management Plan to reduce the auto use and encourage residents, employees and visitors to use alternative modes of travel, such as transit, walking, and bicycling.

3.14.2.2 Energy Savings

- The energy savings resulting from the replacement of 256 older homes with new more energy efficient homes.

3.14.2.3 Water Conservation

- The CP-HPS Plan would provide a network of reclaimed-water mains for dual plumbing in commercial buildings and for irrigation of landscaped areas. Reclaimed water mains would distribute reclaimed water with a source expected to be developed by the City.

3.15 Summary of Emissions from CP-HPS Plan

Emissions from the various aspects of CP-HPS Plan are presented in Table 3-36. One-time vegetation emissions are estimated to be -7,000 tonnes CO_2. One-time construction emissions are estimated to be 105,587 tonnes CO_2e. Emissions from residential buildings are estimated to be 25,677 tonnes CO_2e per year, or 17% of the annual project emissions. Emissions from non-residential buildings are estimated to be 18,028 tonnes CO_2e per year, or 12% of the annual project emissions. Emissions from mobile sources are estimated to be 105,520 tonnes CO_2e per year, or 69% of the annual project emissions. Emissions from municipal sources (water distribution, public lighting, and municipal vehicles) are estimated to be 2,559 tonnes CO_2e per year, or 2% of the annual project emissions. Emissions from area sources (fireplaces) are estimated to be 217 tonnes CO_2e per year, or less than 0.2% of the annual project emissions. Emissions from the additional transit services are estimated to be 1,730 tonnes CO_2e per year, or less than 1% of the annual project emissions. Emissions from waste disposal at landfills are estimated to be 907 tonnes CO_2e per year, or 1% of the annual project emissions.

Also noted in Table 3-36 is whether the emissions are attributable to a one-time action or are anticipated to occur on an annual basis, during each year after the full build-out of the development. The only one-time emissions are associated with construction and land use change emissions. There are 98,587 tonnes of CO_2e one-time emissions. The annual emissions from the use of the development amount to 154,639 tonnes. Of this, 68% result from vehicular emissions associated with residential activities. Approximately 29% result from the energy use associated with residential and non-residential buildings. If the one-time emissions are annualized assuming a 40-year development life (which is likely low) then the one-time emissions account for approximately 2,465 tonnes, or 2% of the annual emissions. Taking these one-time emissions into account, the annual emissions are 157,104 tonnes per year.

Emissions from the CP-HPS Plan using the alternative method for estimating mobile source is shown in Table 3-37. The annual emissions from the use of the development amount to 96,168 tonnes. Taking one-time emissions into account, the annual emissions are 98,633 tonnes per year.

Emissions from the various aspects of Variant 1 are presented in Table 3-38. Both the one-time emissions and emissions that are expected to occur each year after build-out of the CP-HPS Plan development are presented. There are 98,587 tonnes of CO_2e one-time emissions. The annual emissions from the use of the development amount to 178,651 tonnes CO_2e/year. Of the annual emissions, slightly more than 67% result from vehicular emissions associated with residential activities, and 29% result from the energy use associated with residential and non-residential buildings. If the one-time emissions are annualized assuming a 40-year development life (which is likely low), then the one-time emissions account for approximately 2,465 tonnes, or 2% of the annual emissions. Taking these annualized one-time emissions into account, the annual emissions are 181,115 tonnes/year.

Emissions from Variant 1 using the alternative method for estimating mobile source is shown in Table 3-39. The annual emissions from the use of the development amount to 106,619 tonnes. Taking one-time emissions into account, the annual emissions are 109,084 tonnes per year.

Emissions from the various aspects of Variant 2 are presented in Table 3-40. Both the one-time emissions and emissions that are expected to occur each year after build-out of the CP-HPS Plan development are presented. There are 98,587 tonnes of CO_2e one-time emissions. The annual emissions from the use of the development amount to 157,509 tonnes CO_2e/year. Of the annual emissions, slightly less than 70% result from vehicular emissions associated with residential activities, and 26% result from the energy use associated with residential and non-residential buildings. If the one-time emissions are annualized assuming a 40-year development life (which is likely low), then the one-time emissions account for approximately

2,465 tonnes, or 2% of the annual emissions. Taking these annualized one-time emissions into account, the annual emissions are 159,974 tonnes/year.

Emissions from Variant 1 using the alternative method for estimating mobile source is shown in Table 3-41. The annual emissions from the use of the development amount to 94,789 tonnes. Taking one-time emissions into account, the annual emissions are 97,254 tonnes per year.

It is important to note that these emissions are estimated assuming that the carbon intensity of the electricity supply system and transportation system do not in the future change beyond that which is required by enacted legislation. This assumption is clearly incorrect, as AB 32 and other legislative and regulatory mandates will result in GHG emission reductions in both areas.

AB 32 requires that GHG emissions from California be reduced to 1990 levels by 2020. This represents a reduction of approximately 28.5% from projected 2020 growth. The goals of AB 32 are likely to be reached by increasing renewable or non-carbon producing electricity production, and changing the transportation system to rely on a set of increasingly lower carbon fuels. As most of the carbon footprint of CP-HPS Plan results from either transportation or electricity use, these carbon emissions are likely overestimated as a result of the implementation measures of AB 32. Section 4 puts CP-HPS Plan emissions in context and includes an analysis of the CP-HPS Plan compared to a ARB Scoping Plan No Action Taken (NAT) scenario following the regulations considered by ARB in adopting the 2020 No Action Taken scenario as part of the Scoping Plan for AB32.

Furthermore, Governor Schwarzenegger's Executive Order S-3-05 set a target to reduce GHG emissions by 2050 to levels 80% less than the 1990 levels. It is likely that future measures will be implemented to reach this goal that similarly may result in reductions of GHG emissions for sources in CP-HPS Plan beyond those stated in this report. This is further discussed in Section 5 of this report.

3.16 Life Cycle Emissions of Building Materials

An estimate of "life-cycle" GHG emissions (i.e., GHG emissions from the processes used to manufacture and transport materials used in the buildings and infrastructure) is presented in this section and attached as Appendix C. This estimate is to be used for comparison purposes only and is not included in the final inventory as these emissions would be attributable to other industry sectors under AB 32. For instance, the concrete industry is required by law to report emissions and undergo certain early action emission reduction measures under AB 32. Furthermore, for a life-cycle analysis for building materials, somewhat arbitrary boundaries must be drawn to define the processes considered in the life-cycle analysis.[108] Recognizing the uncertainties associated with a life-cycle analysis, the California Air Pollution Control Officers Association (CAPCOA) released a white paper which states: "The full life-cycle of GHG emissions from construction activities is not accounted for in the modeling tools available, and

[108] For instance, in the case of building materials, the boundary could include the energy to make the materials, the energy used to make the machine that made the materials, and the energy used to make the machine that made the machine that made the materials.

the information needed to characterize GHG emissions from manufacture, transport, and end-of-life of construction materials would be speculative at the CEQA analysis level.[109]"

The calculations and results discussed here and presented more fully in Appendix C are estimates and should be used only for a general comparison to the overall GHG emissions estimated in the Climate Change Technical Report. Life Cycle Assessment (LCA) emissions vary based on input assumptions and assessment boundaries (e.g., how far back to trace the origin of a material). Assumptions made in this report are generally conservative. However, due to the open-ended nature of LCAs, the analysis is highly uncertain.

Appendix C is an ENVIRON report that evaluates the life cycle GHG emissions associated with the building materials for this project. The life cycle GHG emissions include the embodied energy from the materials manufacture and the energy used to transport those materials to the site. The report then compares the life cycle GHG emissions to the overall annual operational emissions. The materials analyzed in the report include materials for 1) residential and non-residential buildings, and 2) site infrastructure. This report calculates the overall life cycle emissions from construction materials to be approximately 3,068 to 16,285 tonnes CO_2 / year. This represents 2 to 10% of the annualized GHG emissions from the CP-HPS Plan area.

The report estimated the life cycle GHG emissions for buildings by conducting an analysis of available literature on LCAs for buildings. According to these studies, approximately 75 - 97% of GHG emissions from buildings are associated with energy usage during the operational phase; the other 3 - 25% of the GHG emissions are due to material manufacture and transport. Using the GHG emissions from the operation of buildings, 3% to 25% of building emissions corresponds to approximately 0.9 - 9% of the project emissions.

The report calculated the life cycle GHG emissions for certain components of infrastructure (roads, storm drains, utilities, gas, electricity, and cable). This analysis considered the manufacture and transport of concrete only, as ENVIRON assumed that other construction materials such as steel would be present in much smaller quantities. The majority of the emissions for infrastructure result from the manufacture of concrete. If a 40 year lifespan of the infrastructure is assumed, the total annualized emissions from embodied energy in infrastructure materials are approximately 1.1% of the project emissions.

The overall life cycle emissions, annualized by 40 years, are 3,068 to 16,285 tonnes CO_2 / year, or 2 – 10% of the annualized GHG emissions from the CP-HPS project. The bulk of these emissions (0.9 - 10%) are from general life cycle analysis studies and do not reflect specific information from CP-HPS.

Again, note that the calculations and results presented in this life cycle report are estimates and should be used only for a general comparison to the overall GHG emissions estimated in the Climate Change Technical Report. LCA emissions vary based on input assumptions and assessment boundaries (e.g., how far back to trace the origin of a material). Assumptions made

[109] CAPCOA. 2008. CEQA & Climate Change: Evaluating and Addressing Greenhouse Gas Emissions from Projects Subject to the California Environmental Quality Act. Available online at: http://www.capcoa.org/ceqa/?docID=ceqa&PHPSESSID=df1348d6f7eff0fc2a8263d19f6d10dd

in this report are generally conservative. However, due to the open-ended nature of LCAs, and the fact that literature evaluation, not site specific studies were used to analyze the embodied energy, the analysis should be considered to yield highly uncertain results. Additionally, these estimates likely double count emissions from other industry sectors.

4 Inventory in Context

4.1 CP-HPS Plan Greenhouse Gas inventory in Context

The BAAQMD has published draft significance thresholds for GHG emissions applicable to development projects. However, at this time these standards and screening thresholds for residential/commercial projects are still under consideration. Accordingly, this section is intended to place the GHG emissions from the proposed residential development in context with respect to intensity, consistency with AB 32 goals, and magnitude. For the intensity comparison, we compare the built environment emissions with that from ARB Scoping Plan No Action Taken scenario comparison of standard energy use for buildings in California in the same climate zone. In addition, we compare anticipated mobile emissions to current San Francisco County mobile emissions and emissions savings from water usage in the development. For comparison with AB 32 goals, we compare the GHG emissions with the overall reductions levels mandated under AB 32. Finally, the emissions from CP-HPS Plan at build-out are compared to California and global GHG emissions in order to put CP-HPS Plan emissions in a global context.

4.2 Characterization of Emissions

In 2004, 81% of greenhouse gas emissions (in CO_2e) from California were comprised of CO_2 emissions from fossil fuel combustion, with 4% comprised of CO_2 from process emissions. CH_4 and N_2O accounted for 5.6% and 6.8% of total CO_2e respectively, and high GWP gases[110] accounted for 2.9% of the CO_2e emissions. Transportation is by far the largest end-use category of GHGs. Transportation includes that used for industry (i.e., shipping) as well as residential use.

4.3 Comparison with AB 32-mandated Emissions Limits

AB 32 requires that statewide GHG emission in 2020 be equal to 1990 levels. California-wide GHG emissions in 1990 were 0.427 billion tonnes.[111] It is projected that emissions in 2020 under a No Action Taken scenario accounting for growth will be 0.596 billion tonnes[112]. This would require a 28.5% decrease in emissions by 2020 to achieve AB 32 goals. The population in California is projected to be 42,210,000 in 2020. In order to achieve AB 32 mandated goals, the per capita emissions would have to be 10.1 tonnes CO_2e (see Table 4-1 for calculation details). This includes emissions from the agricultural and manufacturing sector, as well as industrial transportation, allocated on a per capita basis.

CP-HPS Plan has estimated emissions of 154,639 tonnes per year, or 6.5 tonnes per capita per year, 4.5 tonnes per service population per year, or 15.1 tonnes per dwelling unit.[113] Variant 1 has estimated emissions of 178,651 tonnes per year, or 7.5 tonnes per capita per year, 4.4 tonnes per service population per year, or 17.4 tonnes per dwelling unit. Variant 2 has estimated emissions of 157,509 tonnes per year, or 6.6 tonnes per capita per year, 4.6 tonnes per service population per year, or 15.3 tonnes per dwelling unit per year. The California per

[112] http://www.arb.ca.gov/cc/inventory/data/forecast.htm#summary_forescast
[113] Based upon 23,869 residents and 10,373 jobs (this excludes the 357 jobs associated with the stadium since these are existing jobs). Variant 1 will have 16,638 jobs and Variant 2 will have 10,379 jobs.

capita CO_2 emissions includes industries such as heavy industry, refining, and transportation of materials while the CP-HPS Plan per capita CO_2 emissions do not include these emissions. AB 32 will be reducing emissions in a variety of different ways, including increasing energy efficiency and introducing more renewable energy sources. It is difficult to compare CP-HPS Plan per capita emissions to the AB 32 goals as it is not clear what fraction of the reduction will be achieved in which sectors, and what portion will be achieved from energy efficiency and what fraction will be achieved by renewable resources. This is discussed more fully below.

4.4 ARB Scoping Plan No Action Taken Comparison

In order to put the GHG emission inventory into context and justify an improvement heading towards meeting the reduction goals set for 2020, it is necessary to compare the GHG emission inventory expected for CP-HPS Plan to the GHG emissions that would occur from a community that would be built today without CP-HPS Plan design features and energy reduction commitments made by Lennar Urban. This baseline comparison is referred to as No Action Taken (NAT) which follows the regulations considered by ARB in developing its 2020 No Action Taken estimate as part of the Scoping Plan. This represents the GHG emission inventory if things were continued to be built according to current standards. The major categories of the GHG emission inventory are considered separately. These include residential and non-residential buildings, mobile sources, municipal lighting, and water sources. The remaining categories include municipal vehicles and area sources. These categories represent a small fraction of the total inventory and do not have appropriate emission factors to quantify the reductions that are likely to occur at CP-HPS Plan compared to NAT.

4.4.1 Vegetation

Lennar Urban has committed to planting 10,000 new trees. The NAT analysis for vegetation assumes that this commitment is not taken.

4.4.2 The Built Environment

The energy use and GHG emissions from the modeled homes for CP-HPS Plan were compared to the energy use and GHG emissions from minimally Title 24 compliant 2005 buildings using the current carbon intensity factor for electricity (no Renewable Portfolio Standard adjustment)[114]. It was also assumed that the comparison homes had standard appliances instead of Energy Star appliances. The same assumptions used to evaluate the energy use from the RASS survey is used for the NAT analysis. CP-HPS Plan is 24% better than the NAT home for energy use covered by Title 24. In addition, when major appliances are considered, the homes of CP-HPS Plan are 23% better than the NAT homes. When the rest of plug-in energy use is considered, CP-HPS Plan homes are 20% better than the NAT homes. These comparisons are summarized in Tables 3-11 and 3-12. It is important to recognize that areas in which the developer has control over the energy use, building envelope and major appliances, show an improvement over NAT. This comparison does not take into account that the energy use of occupants is expected to change as people become more conscious of energy use and climate change issues, and more sensitive to the cost of energy, and use less energy.

[114] The 2005 version of Title 24 is what was in effect at the time that ARB developed the Scoping Plan 2020 No Action Taken.

CO_2 emissions per dwelling unit for CP-HPS Plan homes are approximately 2.5 tonnes per dwelling unit per year. For the NAT housing, emissions are approximately 3.2 tonnes per dwelling unit per year. CP-HPS Plan homes, per dwelling unit, emit approximately 0.64 tonnes less CO_2 per year than the NAT housing.

Homes in CP-HPS Plan are 20% more energy efficient than the current NAT. As such, CP-HPS Plan residential units are heading toward meeting AB 32 goals on a per dwelling unit basis, without any decrease in GHG intensity from energy production beyond the 20% Renewable Portfolio Standard for 2010, which is likely to occur. It also does not account for changes in occupant behavior.

A similar comparison for non-residential buildings compares CP-HPS Plan non-residential buildings energy use and GHG emissions from a minimally 2005 Title 24 compliant building using the current carbon intensity factor for electricity (no Renewable Portfolio Standard adjustment). Unlike residential homes, the developer has little control over the appliances and plug-in energy use that will occur in the buildings. When typical plug-in energy use is considered for the non-residential buildings, CP-HPS Plan is 18% better than NAT, Variant 1 is 17% better than NAT and Variant 2 is 17% better than NAT. This does not account for non-residential occupants using energy efficient appliances.

There are some uncertainties and limitations that need to be pointed out for the residential and non-residential building NAT comparison. ENVIRON used survey data of existing buildings to represent future building energy use. ENVIRON made an attempt to adjust the baseline energy use value for residential and non-residential buildings based upon CEC reports indicating improvements in Title 24 building codes. The existing building stock is likely less efficient than the requirements for new buildings under Title 24. To the extent that CP-HPS Plan's mix changes the calculated savings may differ.

4.4.3 Transportation

Consistent with one of the options in the OPR Guidance, this section discusses a comparison of project emissions with the goals of AB 32. Since the Stadium is replacing Candlestick Park, this is not considered to cause new trips from far away. If the Stadium is not built at HPS, it is assumed that a new Stadium will be built elsewhere in the Bay Area and it is unknown if the trips will be shorter or longer for attendees.

Vehicle emissions will be reduced in the future regardless of the development location, as the implementation of AB 32 will require improvements in vehicle mileage, increased use of public transit, and the incorporation of low-carbon fuels into the transportation fuel supply[115]. Transportation emissions presented here are based upon EMFAC2007 values, which are based upon past vehicle emission trends and do not incorporate the known regulatory actions as described above. In fact, on a VMT basis, EMFAC2007 assumes that CO_2 emissions in 2030 are slightly higher than they are currently. This is clearly unlikely, given the mandates of AB 32 and the likelihood of federal regulation.

[115] The Low Carbon Fuel Standard (LCFS) mandated under Governor Schwarzenegger's Executive Order S-01-07 and currently being developed by the California Air Resources Board (ARB) requires a reduction in carbon intensity of California's transportation fuels by at least 10% by 2020.

ENVIRON estimated the trip rate for a NAT scenario assuming that the number of trips made assuming none of the trips use alternative transportation or internal to the project site development due to the transit, pedestrian and bicycle pathways and mixed of uses. These modified trip rates were applied to the same methodology outlined for the traffic calculations including the weekend trip rate adjustment. The same number of trips to the music venue was assumed for the NAT scenario. Table 4-2 shows a total VMT for the NAT scenario as 516,667,601 miles per year. The emission factor uses the EMFAC2007 value for 2020 with no adjustments. The NAT scenario would release 258,330 tonnes of CO_2e per year. CP-HPS Plan represents a 59% reduction in VMT and CO_2e emissions per year compared to NAT. Table 4-3 shows the calculations for Variant 1 which estimates a release of 277,459 tonnes of CO_2e per year. Table 4-4 shows the calculations for Variant 2 which estimates a release of 257,568 tonnes per CO_2e per year.

4.4.4 Water and Wastewater

The NAT comparison for water and wastewater treatment and distribution was based on a the same water usage as the CP-HPS Plan due to the incorporation of San Francisco Green Building Ordinance. Tables 4-5 through 4-7 show the calculations for the NAT scenario. A report by the Consortium for Energy Efficiency (CEE) estimates that 15 to 30% of water energy use savings will come as a result of water use efficiency improvements.

4.4.5 Public Lighting

The NAt comparison for public lighting assumes that energy efficient street lights will not be used. Tables 4-5 through 4-7 shows the CO_2e emissions for public lighting for the NAT scenario as 1,023 tonnes CO_2e per year. Table 4-5 through 4-7 shows CP-HPS Plan's public lighting is 14% less than NAT.

Overall for the municipal category CP-HPS Plan is 7% better than NAT. Variant 1 is 7% and Variant 2 is 7%.

4.4.6 Transit Service

The NAT comparison of transit service assumes that the project will use regular diesel buses and diesel fuel. The estimate of emissions for the NAT scenario is shown in Table 3-23. The NAT transit service emissions are 2,884 tonnes CO_2e per year. CP-HPS Plan is 40% better than NAT transit service emissions.

Tables 4-8 through 4-10 summarize the comparisons between CP-HPS Plan, Variant 1, Variant 2 and the NAT scenarios discussed in this section. When all emissions, including those where a NAT analysis was not able to be performed are considered, CP-HPS Plan shows a 51% improvement over NAT. Variant 1 shows a 49% improvement over NAT. Variant 2 shows a 50% improvement over NAT. Further discussions on how these emissions will be reduced based on current and future regulations not considered under the NAT scenario are discussed in Section 5. These regulations are likely to allow CP-HPS Plan to achieve its share in meeting AB 32 goals and head to the further emission reduction goals of Executive Order S-03-05.

4.5 Comparison with State, Global, and Worldwide GHG Emissions

The emissions from CP-HPS Plan at build-out are compared to California and global GHG emissions to put the emissions from CP-HPS Plan in context. CP-HPS Plan's annual emissions are approximately 154,639 metric tonnes CO_2e per year, and 98,587 tonnes of one-time emissions. If the one-time emissions are annualized by a development lifetime of 40 years (2,465 tonnes CO_2e per year), the overall yearly emissions are approximately 157,104 tonnes CO_2e per year. This is equivalent to approximately 6.5 tonnes per capita per year.[116]

Worldwide emissions of GHGs in 2004 were 26.8 billion tonnes of CO_2e per year.[117] In 2004, the US emitted about 7 billion tonnes of CO_2e.[118] Over 80% of the GHG emissions in the US are comprised of CO_2 emissions from energy related fossil fuel combustion. In 2004, California emitted 0.480 billion tonnes of CO_2e, or about 7% of the US emissions. 157,104 tonnes of CO_2e per year from CP-HPS Plan would be approximately 0.00058% of the world wide emissions, 0.0022% of the United State's emissions, or 0.032% of California's annual GHG emissions.

[116] Assuming a CP-HPS Plan population of 23,869.

5 Impact of Regulatory Developments on CP-HPS Plan's GHG Inventory

There are a number of regulatory developments on both the federal and state level that will impact GHG emissions at CP-HPS Plan. For example, the Pavley Standards, and the Energy Independence and Security Act of 2007 all affect vehicle emissions, and because this is enacted legislation, these were incorporated into the estimated emissions from the CP-HPS Plan.

Executive order S-03-05 mandates that California emit 80% less GHGs in 2050 than it emitted in 1990. As of 2004, California was emitting 12% more GHG emissions than in 1990. For California to emit 80% less than it emitted in 1990, the emissions would be only 18% of the 2004 emissions. Accounting for a population growth from 35,840,000 people in 2004 to approximately 55,000,000 people in 2050, the emissions per capita would have to be only 12% of what they were in 2004. This means 88% reductions in per capita GHG emissions from today's emissions intensities must be realized in order to achieve California's 2050 GHG goals. Clearly, energy efficiency and reduced vehicle miles traveled will play important roles in achieving this aggressive goal, but the decarbonization of fuel will also be necessary.

The extent to which GHG emissions from traffic at CP-HPS Plan will change in the future depends on the quantity (e.g. number of vehicles, average daily mileage) and quality (i.e. carbon content) of fuel that will be available and required to meet both regulatory standards and residents' needs. As discussed above, renewable power requirements, the low carbon fuel standard, and vehicle emissions standards will all decrease GHG emissions per unit of energy delivered or per vehicle mile traveled. In this section we discuss the impact that future regulated fuel decarbonization may have on vehicular emissions at CP-HPS Plan.

The California Energy Commission (CEC) published "State Alternative Fuels Plan"[119] in which it noted the existence of "challenging but plausible ways to meet 2050 [transportation] goals." The main finding from this analysis is that reducing today's average per capita driving miles by about 5 percent (or back to 1990 levels), in addition to the decarbonization strategies listed below, would achieve S-03-05 goals of 80% below 1990 levels. The approach described below is directly[120] from the CEC report.

An 80 percent reduction in GHG emissions associated with personal transportation can be achieved even though population grows to 55 million, an increase of 50 percent. The following set of measures could be combined to produce this result:

1. Lowering the energy needed for personal transportation by tripling the energy efficiency of on-road vehicles in 2050 with:

   a. Conventional gas, diesel, and flexible fuel vehicles (FFVs) averaging more than 40 miles per gallon (mpg).

---

[119] State Alternative Fuels Plan. December 2007 CEC-600-2007-011-CMF. Available online at: http://www.energy.ca.gov/2007publications/CEC-600-2007-011/CEC-600-2007-011-CMF.PDF

[120] Ibid. Page 67 and 68.

b. Hybrid gas, diesel, and FFVs averaging almost 60 mpg.

c. All electric and plug-in hybrid electric vehicles (PHEVs) averaging well over 100 mpg (on a greenhouse gas equivalents (GGE) basis) on the electricity cycle.

d. Fuel cell vehicles (FCVs) averaging over 80 mpg (on a GGE basis).

2. Moderating growth in per capita driving, reducing today's average per capita driving miles by about 5 percent or back to 1990 levels.
3. Changing the energy sources for transportation fuels from the current 96 percent petroleum-based to approximately:

   a. 30 percent from gasoline and diesel from traditional petroleum sources or lower GHG emission fossil fuels such as natural gas.

   b. 30 percent from transportation biofuels.

   c. 40 percent from a mix of electricity and hydrogen.

4. Producing transportation biofuels, electricity, and hydrogen from renewable or very low carbon-emitting technologies that result in, on average, at least 80 percent lower life cycle GHG emissions than conventional fuels.
5. Encouraging more efficient land uses and greater use of mass transit, public transportation, and other means of moving goods and people.

The measures described above are the types of measures that will yield required reductions. Although these types of measures are expected to occur and are consistent with the CP-HPS Plan development plan, CP-HPS Plan is not claiming any credit for these measures.

5.1 Renewable Power Requirements

A major component of California's Renewable Energy Program is the Renewables Portfolio Standard (RPS) established under Senate Bills 1078 (Sher) and 107 (Simitian). Under the RPS, certain retail sellers of electricity are required to increase the amount of renewable energy each year by at least 1% until 20% by December 31, 2010. Executive Order S-14-08 sets an even higher goal of 33% by 2020. Renewable sources of electricity include wind, small hydropower, solar, geothermal, biomass, and biogas. The increase in renewable sources for electricity production will decrease indirect GHG emissions from CP-HPS Plan because electricity production from renewable sources is generally considered "carbon neutral."[121] For purposes of this semi-quantitative analysis, ENVIRON assumes that the production of electricity from these renewable sources does not produce any net emissions of CO_2.

[121] There is some debate on the carbon neutrality of using biomass and biogas for electricity production. While some may argue that the carbon released as CO_2 from biomass or biogas combustion originated from the atmosphere and thus does not contribute any net additional carbon to the atmosphere, others argue that the combustion still releases CO_2 into the atmosphere and thus cannot be ignored. For sake of the semi-quantitative analysis presented here, we assume that electricity production from renewable sources is carbon neutral. However, this should not be interpreted as a policy judgment for either argument.

The utility provider for the CP-HPS Plan development is assumed to be PG&E as the CP-HPS Plan Specific Plan is situated largely in San Francisco County. As shown in Table 5-1, 11% of the energy delivered by PG&E was procured from renewable sources in 2007.[122] Total electricity delivery for that year was 79,450,904 megawatt-hours (MWh). Based on PG&E's 2007 Power/Utility Protocol (PUP) Report to the CCAR[123], their CO_2 emissions per total power delivered was 636 lbs CO_2/MWh. Considering the total amount of energy delivered and the percentage of energy from renewables, ENVIRON estimated that once the 20% renewables target for 2010 was achieved, that CO_2 emission factor would decrease to 574 lbs CO_2/MWh. In addition, if the proposed 33% renewables target for 2020 was achieved, the CO_2 emission factor would decrease even further to 481 lbs CO_2/MWh. These represent indirect GHG emissions reductions by approximately 10% and 24%, respectively.

5.2 Low Carbon Fuel Standard (LCFS)

As mentioned previously, the LCFS requires a reduction in carbon intensity of transportation fuels by at least 10% by 2020. The LCFS encompasses the life cycle emissions for fuels (i.e., "well-to-wheel"). Thus, not only does it include the vehicle tailpipe emissions from the use of the fuel, it also includes all the energy used to produce, process, and transport the fuel. By design, the implementation of the LCFS would decrease the overall GHG emissions for California. However, its impact on vehicle tailpipe emissions is not obvious. As the CP-HPS Plan GHG inventory only considers the vehicle tailpipe emissions, and not the life cycle emissions for transportation, it is difficult to quantitatively assess the impacts of the LCFS on the inventory. The LCFS will directly affect the emission factor and the fuel economy since alternate fuels will have various energy/carbon content. Fuels identified as possible alternatives to conventional gasoline and diesel include biodiesel, ethanol E85, and compressed natural gas (CNG). According to a study by TIAX, LLC, well-to-wheel GHG emissions for E85 derived from Midwest corn feedstock and CNG from North America would be expected to be roughly 22% and 30% lower relative to reformulated gasoline.[124]

Table 5-2 presents a few scenarios to illustrate the impact of LCFS on tailpipe emissions at CP-HPS Plan. The baseline scenario represents the current vehicle miles traveled at CP-HPS Plan. Total annual vehicle miles travelled (VMT) is 309,166,932 miles per year for this scenario we will assume a fleet distribution of 95% gasoline vehicles and 5% diesel vehicles and a fleet average emission factor. The GHG inventory for vehicle tailpipe emissions in this scenario is approximately 56,881 metric tonnes CO_2 per year.[125] The GHG emissions depend on the emission factors for each fuel (kg CO_2/gallon of fuel), average fuel economy (miles per gallon), and the VMT.[126]

[122] The renewable energy distribution is based on 2007 data available at: http://www.pgecorp.com/corp_responsibility/reports/2007/environment/energy-future.html
[123] Available at: http://www.climateregistry.org./CarrotDocs/
[124] California Energy Commission (CEC) and California Air Resources Board (ARB). 2007. State Alternative Fuels Plan. Commission Report. CEC-600-2007-011-CMF. December.
[125] This figure only includes CO_2 and not CO_2e and does not include start-up emissions for purposes of comparison to this analysis.
[126] The emissions estimated in Table 5-2 here are derived differently compared to emissions calculated from the EMFAC model runs for the CP-HPS Plan inventory; the estimated emissions for the baseline scenario are roughly within 10% of the vehicle emissions developed using EMFAC. This difference is likely due to improvements in vehicle technology estimated for 2011. However, for purposes of this semi-quantitative analysis, this should be

Scenario A represents a replacement of conventional California diesel with biodiesel. While the emission factor for biodiesel is lower (9.52 kg CO_2/gal) compared to conventional California diesel (9.96 kg CO_2/gal), the average fuel economy of vehicles running on California diesel is higher (7.9 mpg) than for vehicles running on biodiesel (7.1 mpg).[127,128] The result is that the overall tailpipe vehicle emissions at CP-HPS Plan would increase slightly if California diesel were replaced by biodiesel. This is a case where the overall life cycle analysis GHG emissions for biodiesel are lower than that for conventional California diesel, but the actual tailpipe emissions would be slightly higher.

Scenario B represents a replacement of conventional California gasoline with an 85% ethanol blend (E85). Compared to conventional California gasoline, E85 has a lower emission factor on a per gallon basis (6.10 kg CO_2/gal)[129] but also a lower fuel economy (15.2 mpg)[130] due to the lower energy content of E85. The resulting tailpipe emissions at CP-HPS Plan in this scenario would be roughly 7.2% lower than the baseline scenario. In this case the decreased fuel economy for E85 vehicles was more than offset by the lower emission factor, resulting in lower tailpipe emissions.

Scenario C represents a replacement of conventional California gasoline with compressed natural gas (CNG). Compared to conventional California gasoline, CNG has a lower emission factor on a per equivalent gallon basis (6.86 kg CO_2/equivalent gallon).[131] The current commercially available car running on CNG has a higher fuel economy (28 mpg)[132] than that for the average gasoline vehicle. The resulting tailpipe emissions at CP-HPS Plan in this scenario would be over 53% lower than the baseline scenario. In this case, the increased fuel economy for CNG and the lower emission factor both contribute to the lower tailpipe emissions.

These scenarios illustrate that the alternative fuels available in the future can have different effects on vehicle tailpipe emissions which is accounted for in the CP-HPS Plan GHG inventory. The degree of impact on the CP-HPS Plan's GHG inventory can be slight to moderate depending on the fuel mix available. The semi-quantitative analysis presented here is only speculative. As a first-order assumption, this analysis does not account for improvements in vehicle technology (i.e., emission factors and fuel economy are constant) or changes in VMT for CP-HPS Plan's population. In reality, vehicle technologies are likely to improve and VMT will

---

acceptable since the emissions presented in this table are only for comparative purposes and are not meant to represent actual emissions at CP-HPS Plan.

127 Emission factors for fuels were from the California Climate Action Registry (CCAR) General Reporting Protocol (GRP) Version 3.1 (2009)

128 Average fuel economy data for biodiesel from the Department of Energy website: http://www.fueleconomy.gov/feg/biodiesel.shtml
Average fuel economy data for diesel-fueled vehicles obtained from fuel usage and VMT projections for 2008 from the California Department of Transportation report "California Motor Vehicle Stock, Travel, and Fuel Forecast" available at: http://www.dot.ca.gov/hq/tsip/smb/documents/mvstaff/mvstaff05.pdf

129 Emission factors for fuels were from the California Climate Action Registry (CCAR) General Reporting Protocol (GRP) Version 3.1 (2009)

130 Average fuel economy data for E85 from the Department of Energy website: http://www.fueleconomy.gov/feg/ethanol.shtml

131 Emission factors for fuels were from the California Climate Action Registry (CCAR) General Reporting Protocol (GRP) Version 3.1 (2009)

132 Fuel economy for a 2008 Honda Civic fueled by CNG available at: http://www.fueleconomy.gov/feg/byfueltype.htm

increase as CP-HPS Plan’s population increases. Nevertheless, the LCFS, by definition, should result in lower overall GHG emissions in California. However, these emission reductions are not reflected in CP-HPS Plan’s GHG inventory.

6 Conclusion

ENVIRON prepared an emissions inventory for the CP-HPS Plan development and the two project Variants. This emissions inventory was prepared consistent with the methodologies established by the CCAR where possible. The CP-HPS Plan emissions inventory considers nine categories of GHG emissions: emissions due to vegetation changes, emissions from construction activities, residential emissions, commercial building emissions, mobile source emissions, municipal emissions, area source emissions, transit service emissions, and waste disposal emissions. Emission from recreation centers were not calculated since they are a small fraction of the overall inventory. The emissions from construction and land use change would be one-time emissions events, while the other emissions would occur annually, throughout the life of CP-HPS Plan. An assessment of the impact of rules to reduce GHG intensity in electricity production and vehicle use was also included.

A variety of methods were employed to develop the GHG emissions inventory. In addition to well established emission factors for certain activities and emission estimates based on similar activities in other representative communities, several different estimation software were used. These included EMFAC, OFFROAD, and URBEMIS.

Emissions from the various components of the CP-HPS Plan development are presented in Tables 3-36. There are 98,587 tonnes of CO_2e one-time emissions. The annual emissions from the use of the development amount to 154,639 tonnes CO_2e/year. Of the annual emissions, slightly more than 68% result from vehicular emissions associated with residential activities, and 29% result from the energy use associated with residential and non-residential buildings. If the one-time emissions are annualized assuming a 40-year development life (which is likely low), then the one-time emissions account for approximately 2,465 tonnes, or 2% of the annual emissions. Taking these annualized one-time emissions into account, the annual emissions are 157,104 tonnes/year. As discussed below, these figures reflect conservative assumptions that likely overstate the GHG emissions that would result from this project.

Emissions from the various aspects of Variant 1 are presented in Table 3-38. Both the one-time emissions and emissions that are expected to occur each year after build-out of the CP-HPS Plan development are presented. There are 98,587 tonnes of CO_2e one-time emissions. The annual emissions from the use of the development amount to 178,651 tonnes CO_2e/year. Of the annual emissions, slightly more than 67% result from vehicular emissions associated with residential activities, and 29% result from the energy use associated with residential and non-residential buildings. If the one-time emissions are annualized assuming a 40-year development life (which is likely low), then the one-time emissions account for approximately 2,465 tonnes, or 2% of the annual emissions. Taking these annualized one-time emissions into account, the annual emissions are 181,115 tonnes/year. As discussed below, these figures reflect conservative assumptions that likely overstate the GHG emissions that would result from this project.

Emissions from the various aspects of Variant 2 are presented in Table 3-40. Both the one-time emissions and emissions that are expected to occur each year after build-out of the CP-HPS Plan development are presented. There are 98,587 tonnes of CO_2e one-time emissions. The annual emissions from the use of the development amount to 157,509 tonnes CO_2e/year. Of the annual emissions, slightly more than 70% result from vehicular emissions associated with residential activities, and 26% result from the energy use associated with residential and non-residential buildings. If the one-time emissions are annualized assuming a 40-year development life (which is likely low), then the one-time emissions account for approximately 2,465 tonnes, or 2% of the annual emissions. Taking these annualized one-time emissions into account, the annual emissions are 159,974 tonnes/year. As discussed below, these figures reflect conservative assumptions that likely overstate the GHG emissions that would result from this project.

Compared to California's 2020 NAT per capita emissions, 14.1 tonnes CO_2e per capita, a 28.5% decrease in emissions by 2020 is required to achieve AB 32 goals. In order to achieve AB 32 mandated goals, the per capita emissions would have to be 10.1 tonnes CO_2e. CP-HPS Plan has estimated emissions of 154,639 tonnes per year, or 6.5 tonnes per capita per year.[133] This estimate does not include emissions from heavy industry, refining, or commercial transportation that are included in the California figure of 10.1 tonnes CO_2e per capita.

As a result of the various design elements incorporated into the CP-HPS Plan project, the development approaches AB 32's goal of 28.5% below NAT in several areas. For example, as designed, homes in CP-HPS Plan are expected to be 20% more energy efficient than the current housing stock in California, as shown in Tables 4-8 through 4-10. The non-residential units are 17-18% more energy efficient than the average California non-residential buildings stock. Vehicular emissions from CP-HPS Plan residents are 57-59% less per dwelling unit than NAT. Additionally, CP-HPS Plan's municipal sources are 16-18% better than NAT which does not include water efficiency measures and energy efficient street lighting. Transit services are 40% better than NAT. The emission savings combined for CP-HPS Plan represent a 51% for CP-HPS, 49% for Variant 1 and 50% for Variant 2 reduction from a NAT situation without taking into consideration changes in emission factors, occupant energy use reductions, and categories that do not permit a NAT comparison for at this time. It should be noted that each estimate was developed using a different methodology; any conclusions based upon a comparison of these numbers should note the difference in methodologies. It is yet unclear as to how to compare construction, waste disposal, and area emissions to AB 32 mandated goals.

The GHG emission inventory for CP-HPS Plan was based on several conservative assumptions. In addition, anticipated state and federal regulatory developments are expected to result in lower GHG emissions from CP-HPS Plan than are represented in this analysis. California's Renewables Portfolio Standard (RPS) anticipated 33% target for 2020 will also decrease CP-HPS Plan's GHG inventory from electricity use. Reaching the anticipated 2020 target would result in a decrease of roughly 24%.

Thus, while the CP-HPS Plan project already comes close to achieving the GHG levels necessary to achieve AB 32's mandates, upon implementation of existing and anticipated legislative and regulatory mandates, actual emissions associated with CP-HPS Plan will likely be considerably lower.

[133] Assuming a population of 23,869 residents in CP-HPS Plan.

Table 3-1
CO_2 Sequestration Capacity of New Vegetation Plantings
Candlestick Point-Hunters Point Shipyard Phase II Development Plan
San Francisco, CA

Vegetation Species[1]	IPCC Species Class Designation	Sequestered CO_2 / Unit[2] [tonne/unit/year]	Unit	Total Quantity of New Vegetation[1]	Unit	CO_2 Sequestration Capacity of New Vegetation[3] [tonne]
Miscellaneous	Miscellaneous Trees	0.035	trees	10,000	trees	7,000
Total	-	-		**10,000**	**trees**	**7,000**

Notes:
1. Lennar Urban has committed to planting 10,000 net new trees in the development.
2. Species class-specific sequestration values are provided in Table 8.2 of "2006 IPCC Guidelines for National Greenhouse Gas Inventories, Volume 4". For species that do not appear in Table 8.2, the species was classifed as "miscellaneous" and the average value of all listed data was used.
3. An active growing period of 20 years was assumed for the new trees planted.

	Water Truck	479	0.57	35,805	568.3	5,556
	Total					**42,895**
Overall Emissions from Construction Equipment						**99,298**

Notes:
1. The list of equipment during each construction phase was provided by Mactech.
2. The equipment-hour of individual equipment is calculated based on the phase duration.
3. The values of Horsepower, Load Factor, and Emission Factor of each type of equipment are from OFFROAD2007 defaults.
4. The CO_2 Emission calculation formula for each piece of equipment is:
   CO_2 Emission = Equipment Hours x HP x Load Factor x Emission Factor x Unit Conversion Factor
5. Assume $CO_2 = CO_2e$ because the contribution of CH_4 and N_2O to overall GHG emissions is likely small (< 1% of total CO_2e) from diesel construction equipment.

Abbreviations:
bhp - brake horsepower
CH_4 - methane
CO_2 - carbon dioxide
CO_2e - carbon dioxide equivalent
g - gram
GHG - Greenhouse Gas
hr - hour

Table 3-3
GHG Emissions from Worker Commutes
Candlestick Point-Hunters Point Shipyard Phase II Development Plan
San Francisco, California

Location	Worker Round Trips[1]	Trip Length [2]	EF^3_{LDA}		EF_{LDT2}		CO_2 Emissions[4]		Total CO_2 Emissions	Total CO_2e Emissions[5,6]
			Running	Startup	Running	Startup	Running	Startup		
		(miles)	(g/mile)	(g/trip)	(g/mile)	(g/trip)	(tonne)			
Candlestick Point	144,870	29.8	340	209	424	259	1,649	68	1,717	1,807
Hunter's Point Shipyard	181,588	29.8	340	209	424	259	2,067	85	2,152	2,265
Total									**3,869**	**4,073**

Notes:
1. Worker trips were calculated based on the average number of workers and duration of each project phase as provided by Mactech.
2. The roundtrip length is 29.8 miles based on the Home-Work trip lenth for San Francisco provided by Fehr and Peers.
3. The running emission factor depends on the speed of the vehicle. The emission factor used in this calculation refers to the URBEMIS 9.2.4 default vehicle speed: 30 MPH.
The startup emission factor depends on the settling period before driving. The startup emissions were conservatively calculated based on a 12 hour wait before each engine startup.
4. GHG Running Emission calculation formula: GHG Emission = Roundtrips x Trip Length x (0.5 x EF_{LDA} + 0.5 x $EF_{LDT2})_{Running}$
GHG Startup Emission calculation formula: GHG Emission = Worker Trips x (0.5 x EF_{LDA} + 0.5 x $EF_{LDT2})_{Startup}$
URBEMIS 9.2.4 assumes that LDA and LDT have a 50:50 mixing ratio.
5. $CO_2e = CO_2 / 0.95$: The United States Environmental Protection Agency (USEPA) recommends assuming that CH_4, N_2O, and HFCs account for 5% of GHG emissions from on-road vehicles, taking into account their global warming potentials.
6. The emission factor values of calendar year 2011, the anticipated start date of the project, were used for all calculations.

Abbreviations:
CH_4 - methane
CO_2 - carbon dioxide
CO_2e - carbon dioxide equivalent
g - gram
GHG - Greenhouse Gas
EF - Emission Factor
HFC - hydro fluorocarbons
hr - hour
LDA - Light Duty Auto
LDT - Light Duty Truck
MPH - Miles per hour
URBEMIS - Urban Emissions Model

Table 3-4
GHG Emissions from Hauling Trips
Candlestick Point-Hunters Point Shipyard Phase II Development Plan
San Francisco, California

Location	Hauling Round Trips[1]	Trip Length[2]	EF^3_{HHD}		CO_2 Emissions[4]		Total CO_2 Emissions	Total CO_2e Emissions[5,6]
			Running	Startup	Running	Startup		
		(miles)	(g/mile)	(g/trip)	(tonne)			
Candlestick Point	26,158	14.6	1,610	389	1,230	20	1,250	1,316
Hunter's Point Shipyard	17,902	14.6	1,610	389	842	14	855.6	901

Notes:
1. Hauling trips are calculated based on information provided by Mactech.
2. Trip length is based on URBEMIS default for San Francisco consumer non-work of 7.3 miles one way.
3. The running emission factor depends on the speed of the vehicle. The emission factor used in this calculation refers to the URBEMIS 9.2.4 default vehicle speed: 30 MPH.
   The startup emission factor depends on the settling period before driving. The startup emissions are conservatively calculated based on a 12 hour wait before each engine startup.
4. URBEMIS 9.2.4 assumes that all haulers drive heavy-heavy-duty trucks.
   CO_2 Running Emission calculation formula: CO_2 Emission = trips x trip length x $EF_{HHD\text{-}Running}$
   CO_2 Startup Emission calculation formula: CO_2 Emission = Hauler Trips x $EF_{HHD\text{-}Startup}$
5. $CO_2e = CO_2 / 0.95$: The United States Environmental Protection Agency (USEPA) recommends assuming that CH_4, N_2O, and HFCs account for 5% of GHG emissions from on-road vehicles, taking into account their global warming potentials.
6. The emission factor values of calendar year 2011, the anticipated start date of the project, are used for all calculations.

Abbreviations:
CH_4 - methane
CO_2 - carbon dioxide
CO_2e - carbon dioxide equivalent
g - gram
GHG - Greenhouse Gas
EF - Emission Factor
GVW - Gross Vehicle Weight
HFC - Hydro Fluorocarbons
HHD - Heavy-Heavy Duty
hr - hour
MPH - Miles per hour

Multifamily CP	422	5	115	542	19.8%	435	22.7%	336	286	22.2	17.1	39.3	6.7%	36.7	10%	33.0	28.1
Multifamily HPS	422	5	115	542	19.8%	435	22.7%	336	286	22.2	17.1	39.3	6.7%	36.7	10%	33.0	28.1

Notes:
1. Based on information provided by Lennar Urban.
2. Based on the California Residential Appliance Saturation Survey (RASS), which collected data from over 21,100 households statewide. When available, RASS data tabulated for multifamily homes in the climate zone in which the CP-HPS Plan would be located (Climate Zone 5) were considered in this analysis. Otherwise, the average of all household types or statewide values were used.
3. Homes can be heated using electricity and/or natural gas. Homes can also use water heaters that use electricity and/or natural gas. The mix of types is based on the RASS report saturation percentage.

4. Reductions are taken with the assumption that the RASS estimate reflects heating/cooling/hot water electricity use for homes that are minimally compliant with 2001 Title 24 Standards (this version was the most current at the time of the RASS study). More than 90% of the homes that participated in the survey were constructed before 1997. Because older homes tend to use more energy, the numbers shown here may overestimate actual energy use at a new development such as Bayview Waterfront.
5. Based on report by California Energy Commission on estimated first-year electricity savings due to 2005 standards for single-family and multi-family homes, relative to 2001 standards.
6. Based on California Energy Commission report on estimated first-year electricity savings due to 2008 standards for single-family and multi-family homes, relative to 2005 standards.
7. There is an additional 15% improvement over Title 24 for the Candlestick Pointand Hunter's Point Shipyard.

Abbreviations:
CP - Candlestick Point
DU - Dwelling
HPS -Hunter's Point Shipyard
IB - India Basin
kW-hr - kilowatt-hour
MBTU - million british thermal units
RASS - Residential Appliance Saturation Survey

Table 3-8
Energy Use per Residential Dwelling Unit
Candlestick Point-Hunters Point Shipyard Phase II Development Plan
San Francisco, California

Title 24 Compliance	Dwelling Type	Electricity Delivered[1,2]					Natural Gas Delivered[1,2]		
		Heating, Cooling, and Domestic Hot Water	Hard Wired Lighting[3]	Major Appliances	Plug-ins[3,4]	Total	Heating and Domestic Hot Water	Gas Dryers and Oven Ranges	Total
		[kW-hr / DU / year]					(MBTU natural gas / DU / year)		
Minimally Title 24 Compliant (2005)	Multifamily CP	435	429	971	1,783	3,617	37	3	40
	Multifamily HPS	435	429	971	1,783	3,617	37	3	40
Minimally Title 24 Compliant (2008)	Multifamily CP	336	429	971	1,783	3,518	33	3	36
	Multifamily HPS	336	429	971	1,783	3,518	33	3	36
15% Better Than Title 24 and Energy Star Appliances[5]	Multifamily CP	286	364	853	1,783	3,285	28	3	31
	Multifamily HPS	286	364	853	1,783	3,285	28	3	31
Percentage Improvement over Title 24 (2005)	Multifamily CP	34%	15%	12%	0%	9%	15%	--	14%
	Multifamily HPS	34%	15%	12%	0%	9%	15%	--	14%

Notes:

1. Energy use shown is based on the California Residential Appliance Saturation Survey (RASS), which collected data from over 21,100 households statewide. Only RASS data tabulated for the multifamily homes in the climate zone in which Bayview Waterfront would be located (Climate Zone 5) were considered in this analysis.
2. For energy uses that can be electric or natural gas the mix of types is based on the RASS report saturation percentage.
3. Hard wired lighting is assumed to be all outdoor lighting and half of the energy for indoor lighting listed under miscellaneous electricity load in the RASS report. The other indoor lighting is assumed to be plug-ins. Lighting is 60% of the miscellaneous electricity load according to the RASS report.

4. "Plug-ins" refers to electricity use associated with plug-in lighting, plug-in appliances, and miscellaneous electric loads. This energy use is calculated based on the RASS report.
5. Lennar Urban has committed to a 15% improvement in energy use in the building envelope over 2008 Title 24 standards and inclusion of energy star appliances for Candlestick Point and Hunter's Point Shipyard.

Abbreviations:
CP - Candlestick Point
DU - Dwelling Unit
HPS -Hunter's Point Shipyard
IB - India Basin
kW-hr - kilowatt-hour
MBTU - million british thermal units
RASS - Residential Appliance Saturation Survey

Table 3-9
Emission Factors for Different Energy Sources for Buildings with Renewable Portfolio Standards
Candlestick Point-Hunters Point Shipyard Phase II Development Plan
San Francisco, California

Energy Source	Source Units	lb CO_2/source unit
Electricity[1]	(kW-hr)	0.636
Electricity RPS[2]	(kW-hr)	0.574
Natural Gas[3]	(MBTU)	117.0

Notes:
1. Emission factor for electricity provided by Pacific Gas and Electric, obtained from the California Climate Action Registry Database.
2. Emission factor for electricity has been adjusted to account for the 20% Renewable Portfolio Standard Required of electricity providers by 2010.
2. Emission factor for natural gas was obtained from California Climate Action Registry Reporting Protocol, Table C6.

Abbreviations:
kW-hr - kilowatt-hour
lb - pound
MBTU - million British thermal units
RPS - Renewable Portfolio Standards
