
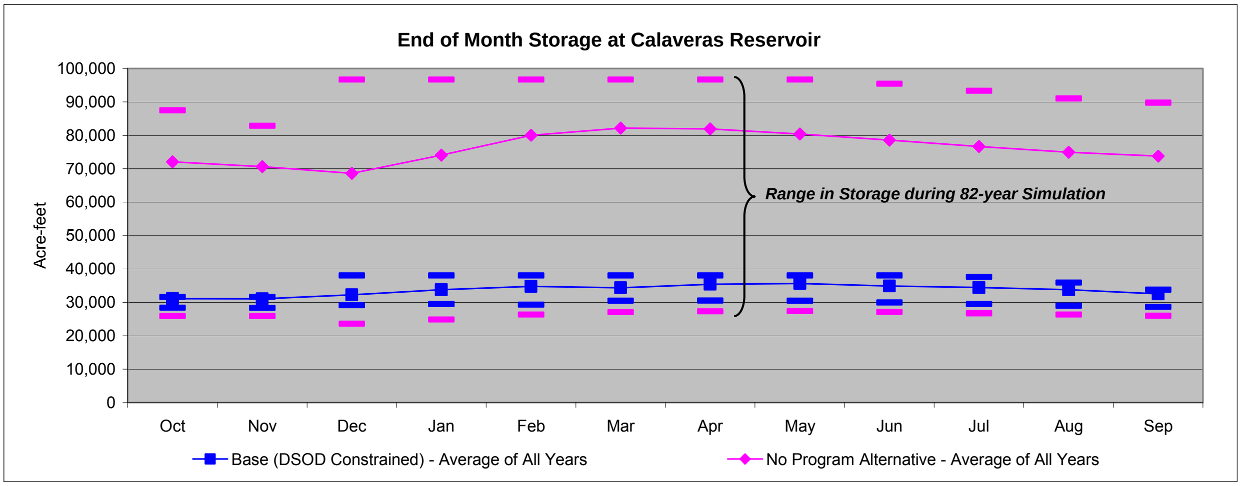
when the local watershed runoff is minimal. The lesser capacity of the SJPL in the alternative setting would also constrain the ability to offset the need for diversions from Calaveras Reservoir during the replenishment period. The difference in storage between the alternative and WSIP settings and the base setting is due to the restoration of the operational capacity of Calaveras Reservoir. Under both the alternative and WSIP settings, the full capacity of Calaveras Reservoir would be available, and a greater range in storage operation would occur. Figure 2.6-2 illustrates the average monthly storage in Calaveras Reservoir for the 82-year simulation, and the range in storage for each month for the alternative and base settings.

Figure 2.6-2



Compared to the WSIP setting, there would potentially be less release to Calaveras Creek below Calaveras Dam in the alternative setting. Both settings have fishery releases that are not included in the base setting. However, due to a greater draw down of Calaveras Reservoir storage in the alternative setting as compared to the base setting, more regulation of local watershed runoff is possible and fewer and smaller releases in excess of the fishery release would occur. Table 2.6-1 illustrates the difference in releases to Calaveras Creek between the alternative and WSIP settings. Supplementing the Figure 2.6-1 representation of Calaveras Dam stream releases and Table 2.6-1 is Table 2.6-2, illustrating releases for the alternative and WSIP settings, and the difference in releases between the two. Table 2.6-3 provides the same form of information for the alternative and base settings. The notable difference in releases between the alternative and base settings is the addition of the required flows to satisfy the 1997 Memorandum of Understanding (MOU) and the reduction of stream releases during wetter-year/wetter-season flows due to the restoration of Calaveras Reservoir operational capacity.

There would be greater Alameda Creek diversions to Calaveras Reservoir in the alternative setting compared to the WSIP setting. This circumstance is related to the occurrence of less Calaveras Reservoir storage in the alternative setting. With lower storage, there are more opportunities and need to divert from the Alameda Creek watershed. Coincidentally, with the increase in the diversion at Alameda Creek Diversion Dam, flow spilling past the diversion dam would decrease in the alternative setting. Table 2.6-4 illustrates the difference in flow below the Alameda Creek Diversion Dam between the alternative and WSIP settings. Table 2.6-5 illustrates the difference in flow below Alameda Creek Diversion Dam between the alternative and base settings. In this comparison, the reduction in flow below the diversion dam is due to the additional diversions to Calaveras Reservoir resulting from the restoration of reservoir operating capacity. Table 2.6-6 and Table 2.6-7 illustrate the flow past the Alameda Creek Diversion Dam comparing the alternative, WSIP, and base settings by year type and the average of all years.

Table 2.6-1

Difference in Total Stream Release from Calaveras Reservoir (Acre-feet)

No Program minus WSIP

Comparing the alternative and WSIP settings, differences in releases from Calaveras Dam to the stream and differences to spills at Alameda Creek Diversion Dam would result in differences in flow below the Alameda Creek and Calaveras Creek confluence. Table 2.6-8 illustrates the flow below the confluence for the alternative and WSIP settings. Fishery releases for the 1997 MOU are assumed in both of the settings; the differences in flow are attributable to the effect of greater draw down of Calaveras Reservoir in the alternative setting. Table 2.6-9 provides the same form of information for the alternative and base settings. The notable differences between the alternative and the base settings (comparable to the difference between the WSIP and base settings) are the addition of required stream flows for the 1997 MOU and the reduction of wetter-year/wet season flows due to the restoration of Calaveras Reservoir storage.

A flow recapture facility in Alameda Creek below Calaveras Reservoir is incorporated in the alternative and WSIP settings. This facility is assumed to recapture flows explicitly released from Calaveras Dam for the 1997 MOU. The effect of the recapture is a reduction in the flow that occurs below the confluence of Alameda and Calaveras Creeks, but only to the extent that releases were explicitly made from Calaveras Reservoir for the 1997 MOU. Flows below this diversion have been estimated and noted as the flow above the Alameda and San Antonio confluence. Table 2.6-10 illustrates the flow at this location for the alternative and WSIP settings. Table 2.6-11 provides the same form of information for the alternative and base settings. The flows identified at this location indicate flow occurring below the confluence of Alameda and Calaveras Creeks (described above), with the addition of estimated stream accretions between the Alameda and Calaveras Creek confluence and the Alameda and San Antonio Creek confluence, less the water assumed to be recaptured (diverted) by the SFPUC from the creek.

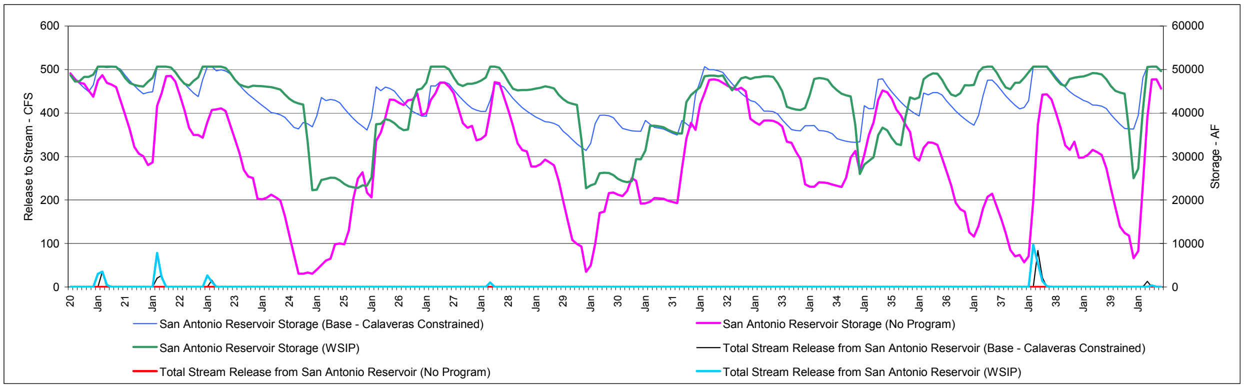
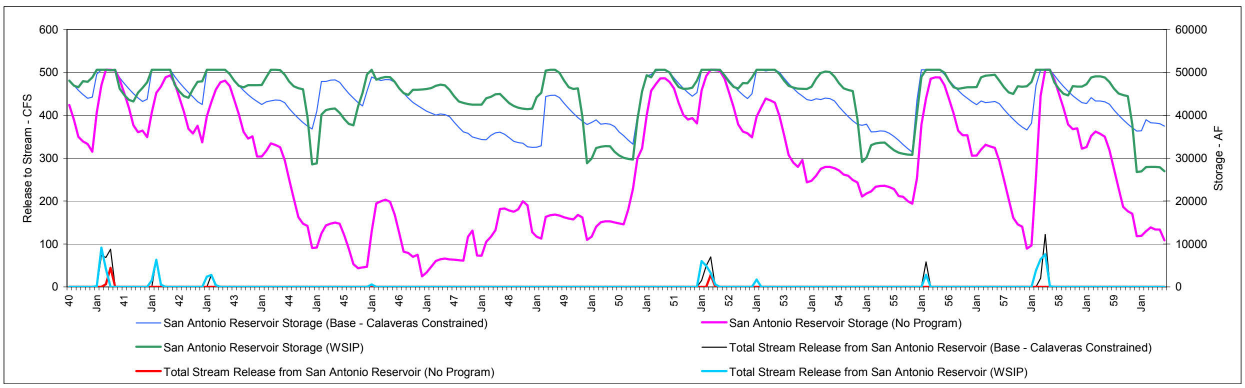
Compared to the WSIP setting, San Antonio Reservoir operations in the alternative setting generally mirror the trend of differences experienced for Calaveras Reservoir operations. Figure 2.6-3 illustrates a chronological trace of the simulation of San Antonio Reservoir storage and stream releases from San Antonio Dam. Shown in Figure 2.6-3 are the results for the WSIP, alternative, and base settings. Similar to the difference in Calaveras Reservoir storage between the alternative and WSIP settings, the difference in San Antonio Reservoir storage between the settings is mostly caused by the interaction of the increased demand served by the system’s resources (300 mgd for the variant and a net 290-mgd demand for the WSIP form many years) and the difference in conveyance capacity of the SJPL. Mirroring the Calaveras Reservoir effect, the systematic decrease in reservoir storage in most years is due to the additional demand drawing more water from the Bay Area reservoirs during the summer when the SJPL is operating at maximum capacity. The relative draw down of San Antonio Reservoir storage and Calaveras Reservoir storage is a matter of discretion to a degree. However, operational strategy would draw storage more quickly from San Antonio Reservoir, recognizing that San Antonio Reservoir can be replenished not only from its own watershed but also from diversions from the SJPL and Calaveras Reservoir. Modeling reflects this strategy.

Figure 2.6-3
San Antonio Reservoir Storage and Stream Release

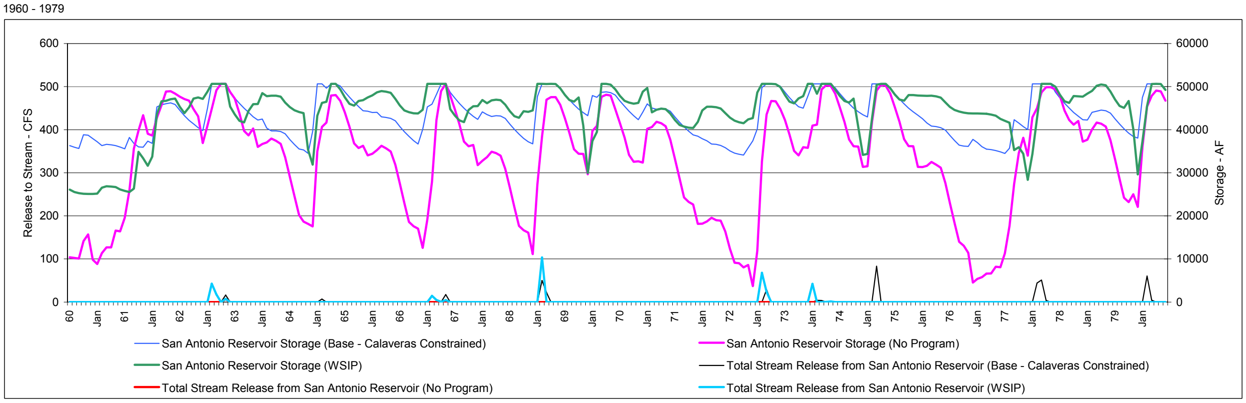
1920 - 1939



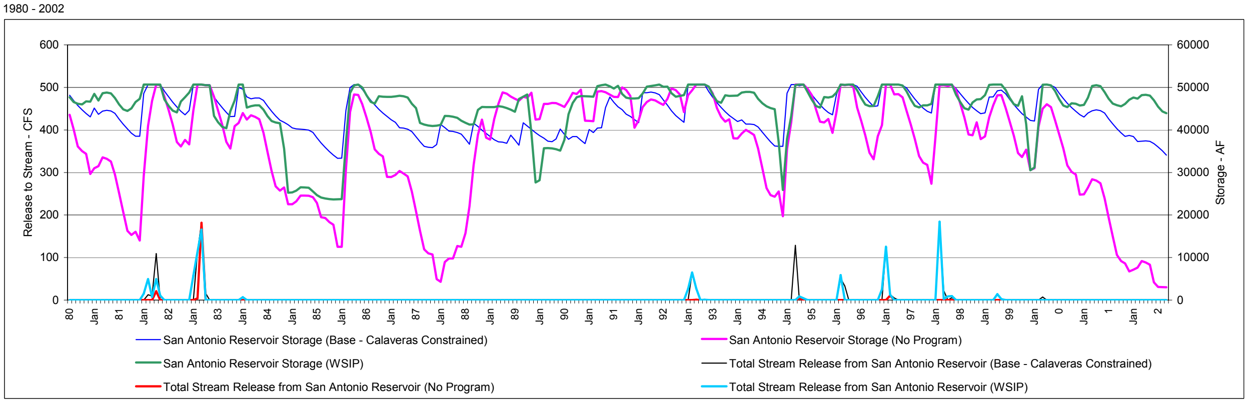
1940 - 1959



1960 - 1979

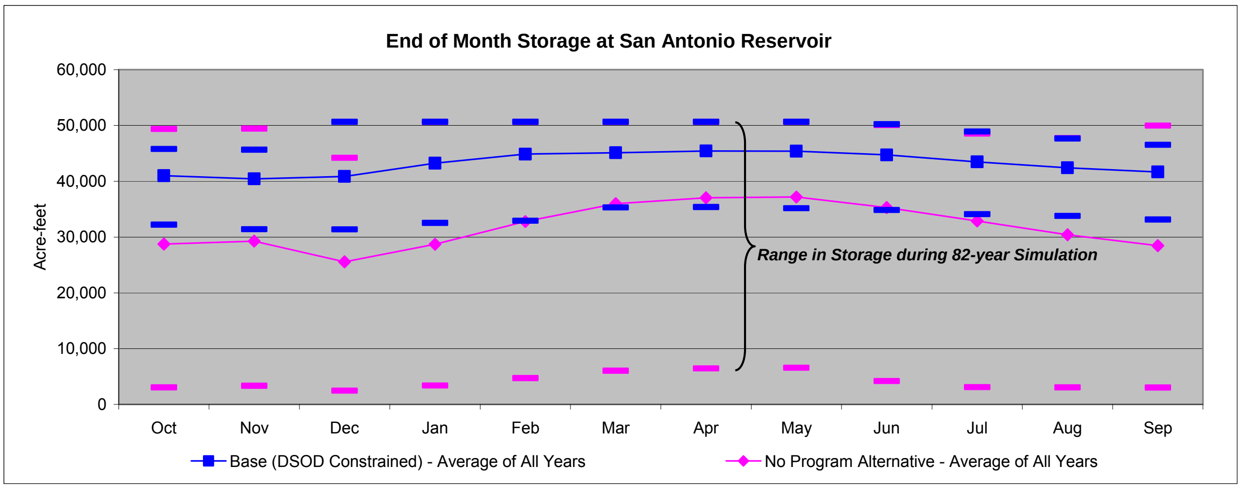


1980 - 2002



The difference in storage between the alternative and WSIP settings and the base setting is due to the restoration of the operational capacity of Calaveras Reservoir. In the base setting, the limited operating storage capacity at Calaveras leads to a different operation at San Antonio Reservoir, one that retains relatively more stored water for system demands when the draw from Calaveras Reservoir is constrained due to limited storage. There is also a notable difference in storage operation between the alternative and WSIP settings and the base setting due to assumed maintenance. Assumed systematic maintenance of Hetch Hetchy conveyance facilities constrains diversions to the Bay Area from Hetch Hetchy every fifth year in the WSIP setting. In the alternative setting, maintenance occurs, in a different fashion, every year. The reduction in diversion from Hetch Hetchy during these periods is accommodated in the system by drawing additional water from the Bay Area reservoirs. The proportionate share of this operation is evident in the tracing of San Antonio Reservoir storage for the alternative and WSIP settings. Figure 2.6-4 illustrates the average monthly storage in San Antonio Reservoir for the 82-year simulation, and the range in storage for each month for the alternative and base settings.

Figure 2.6-4



Very little change in stream releases below San Antonio Reservoir is anticipated between the alternative and WSIP settings. Table 2.6-12 illustrates the modeled release to San Antonio Creek from San Antonio Reservoir for the two settings and the differences for the average release during a year type. With a lower reservoir operation at times during the winter, as seen in Figure 2.6-4, an increase in the ability to regulate reservoir inflow and avoid stream releases is expected. Given the sometimes rigid constraints within the modeling assumptions, the model will overestimate the frequency and magnitude of stream releases from San Antonio Reservoir under any of the investigated settings. The flexibility that would occur in actual operations would likely avoid most of the releases represented by the model. The modeled stream releases from San Antonio Reservoir and difference between releases for the alternative and base setting are shown in Table 2.6-13. The differences between the two settings reflect a general decrease in modeled releases. This modeled circumstance reflects the different resulting storage operation between the two settings, as seen in Figure 2.6-3. In some circumstances, the base setting storage at San Antonio Reservoir during a period could be higher than projected for the alternative setting during the same period. This circumstance could lead to an occasionally greater modeled release for the base setting, which would be reflected in the results. As described above, the model will overestimate the frequency and magnitude of releases from San Antonio Reservoir, and the actual releases from San Antonio Reservoir in any setting and the difference between settings are expected to be minor.

Flow below the confluence of Alameda and San Antonio Creeks is influenced by releases from San Antonio Creek and flow arriving at the location from Alameda Creek, which includes upstream impairment by SFPUC operations and facilities. Table 2.6-14 illustrates the flow below the confluence for the alternative and WSIP settings, and the differences in flow between the two.

Table 2.6-15 illustrates the same information in comparing the alternative and base settings. Table 2.6-14 illustrates the modeled differences in flow that occur between the alternative and WSIP settings that are predominantly affected by the greater draw down of East Bay reservoirs in the alternative setting, while Table 2.6-15 illustrates the relatively larger differences in flow that could occur between the alternative and base settings. Those differences are particularly due to the combined effects of the restoration of Calaveras Reservoir operating capacity and the additional East Bay reservoir storage space available in the alternative setting.

2.7 Crystal Springs and San Andreas Reservoirs

There are differences in Crystal Springs Reservoir operations between the alternative and WSIP settings. Figure 2.7-1 illustrates a chronological trace of the simulation of Crystal Springs Reservoir storage and stream releases from Crystal Springs Dam. Shown are the results for the WSIP, alternative, and base settings. Fundamental to the difference in storage operations between the WSIP setting and the alternative and base settings is the restoration of reservoir operation capacity in the WSIP setting, which does not occur in the alternative and base settings.[4] The result is the operation of Crystal Springs Reservoir at a lower maximum storage in the alternative and base settings. A second difference in Crystal Springs Reservoir storage between the alternative and WSIP setting is caused by the interaction of the increased demand served by the system's resources (300 mgd for the alternative and a net 290-mgd demand for the WSIP in many years) and the lesser conveyance capacity of the SJPL and Bay Division Pipelines (BDPLs). Generally, the systematic decrease in reservoir storage is due to the additional demand drawing more water from the Bay Area system reservoirs during the spring and summer when the SJPL is operating at maximum capacity. A portion of this additional draw is focused on Crystal Springs Reservoir. Subsequent to this additional draw of storage, Hetch Hetchy would attempt to replenish the Bay Area system reservoirs. However, there are modeled circumstances when the coincidence of SJPL or BDPL capacity constraints would inhibit the ability to replenish Crystal Springs Reservoir storage. During these periods, Crystal Springs Reservoir storage would be lower in the alternative setting than in the WSIP setting. The magnitude of the additional draw of storage from Crystal Springs Reservoir is partially dependent on modeling assumptions that proportion the use of storage among the Bay Area system reservoirs. In actual operations, some of the differences in result may not occur as system operators and prevailing hydraulic and hydrologic conditions may direct the operational effect of the different demand to an alternative apportionment of effect among the reservoirs. However, operation strategy prefers the retention of storage in the Peninsula Reservoirs, similar to the strategy used by the model. Figure 2.7-2 illustrates the average monthly storage in Crystal Springs Reservoir for the 82-year simulation, and the range in storage for each month for the alternative and WSIP settings.

[4] The Lower Crystal Springs Dam Improvements project is included in the alternative, but was not modeled. With the project included in the alternative the hydrologic effects at Crystal Springs Reservoir would be comparable to the WSIP setting.

Figure 2.7-1
Crystal Springs Reservoir Storage and Release

Figure 2.7-2

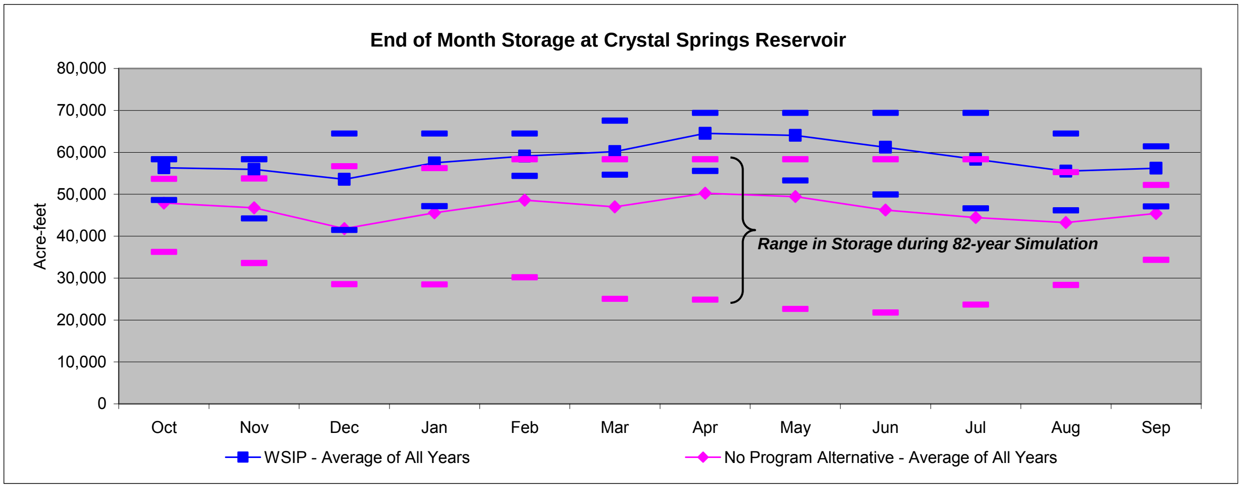

Figure 2.7-3 illustrates the average monthly storage in Crystal Springs Reservoir for the 82-year simulation, and the range in storage for each month for the alternative and base settings. The alternative setting would result in reservoir storage operating at a lower average storage than the base setting, and the range of operating storage would have a lower expected minimum in the alternative setting.

Figure 2.7-3

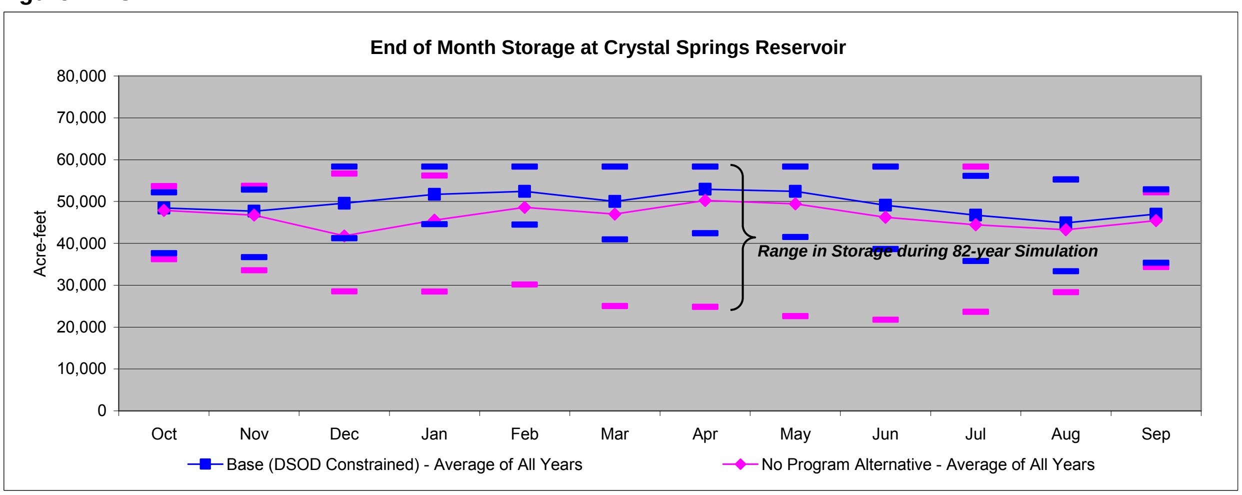

Table 2.7-1 illustrates the modeled alternative and WSIP stream releases from Crystal Springs Reservoir and the differences between the two settings. Modeling results indicate that, during a month in a year, either an increase or decrease in the occasional release could occur. The potential difference is attributed to whether the different resulting storage in the reservoir was higher or lower within the operating range of the two settings. Part of the difference in modeled Crystal Springs Reservoir storage is due to modeling assumptions for the proportionate balancing of storage among the Bay Area reservoirs, and the coincidence of assumed system-wide maintenance with less than favorable hydrologic conditions. In actual operations, it is anticipated that system operators would manage the reservoir system such that stream releases would be minimal under any setting, with the effect that essentially no difference would occur between the alternative and WSIP settings. Similarly, Table 2.7-2 illustrates the stream releases for the alternative and base settings, and the difference in modeled flows between the two settings. A greater draw down in Crystal Springs Reservoir storage would lead to an increased potential to regulate reservoir inflow, which would lead to less risk in needing to make stream releases. However, as described above, actual system operations would attempt to minimize releases under any setting; thus, the difference in releases between the alternative and base setting would be minimal, if any.

Reservoir storage at San Andreas Reservoir would follow a systematic filling and lowering each year; however, there would be a difference in draw down between the alternative and WSIP settings, primarily due to the effects of different system-wide maintenance within each setting. Figure 2.7-4 illustrates a chronological trace of the simulation of San Andreas Reservoir storage and stream releases from San Andreas Dam. Shown in Figure 2.7-4 are the results for the WSIP, alternative, and base settings. There are no projected stream releases from San Andreas Reservoir in any setting. Compared to the base setting, Figure 2.7-4 illustrates the difference in storage operation every fifth year for the WSIP setting and every year for the alternative setting. These operations are the result of Hetch Hetchy conveyance maintenance, which is assumed to occur systematically in the alternative and WSIP settings. The maintenance constrains the amount of Hetch Hetchy water supplied to serve water demands in the Bay Area. As discussed previously, during these winter periods, the Bay Area reservoir system accommodates the reduction in imported supply by serving the Bay Area water deliveries with the local watersheds' runoff and storage. At San Andreas Reservoir, the serving of water demand affects the reservoir when additional required water production at Harry Tracy Water Treatment Plant (Harry Tracy WTP) associated with the WSIP or the alternative exceeds the ability to maintain San Andreas Reservoir storage with pumping from Crystal Springs Reservoir. In the modeling, the conveyance capacity from Crystal Springs Reservoir is assumed to be same among all of the settings. The additional water demand of the WSIP and alternative require additional production from Harry Tracy WTP to be drawn from San Andreas Reservoir.

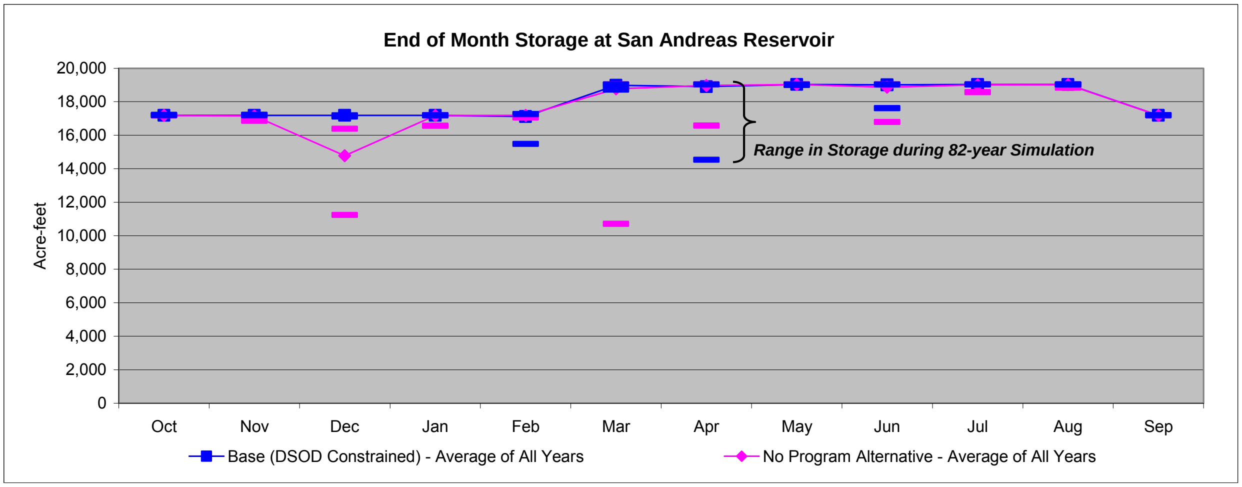
Figure 2.7-5



2.8 Pilarcitos Reservoir

Coastside County Water District's (Coastside CWD's) water demand and its SFPUC purchase request are projected to increase within the WSIP planning horizon of year 2030. With the context of the 2030 purchase request of 300 mgd, Coastside CWD's portion has been estimated at about 3 mgd. This projected purchase request is approximately 1 mgd greater than its current purchase request. Recognizing the current physical constraints to deliveries from the SFPUC to Coastside CWD and the ongoing planning activities in the watershed, the precise means of serving Coastside CWD's additional purchase request and the resultant potential changes to the operation of SFPUC facilities and their affected environs are unknown.[5]

Assuming a range of potential means to serve the additional purchase request from Coastside CWD, the following potential hydrologic effects to SFPUC facilities and their affected environs have been identified:

- Due to limited yield from Pilarcitos Reservoir, additional diversions would be required from Crystal Springs Reservoir.
- If deliveries to Coastside CWD from Pilarcitos Reservoir increase during the winter season, these deliveries could potentially reduce storage in Pilarcitos Reservoir, thereby potentially reducing diversions to the San Mateo Creek watershed. Although the increased delivery would increase releases to Pilarcitos Creek from Pilarcitos Dam for a period of time, the increase would subsequently lead to a reduction in spills past Stone Dam.
- Additional wintertime deliveries could also potentially impair the ability to provide carry-over storage into the summer season from Pilarcitos Reservoir, and subsequently lead to an acceleration of the beginning of the season when releases to Pilarcitos Creek from Pilarcitos Reservoir consist only of the passage of reservoir inflow.
- An increase in summertime deliveries from Pilarcitos Creek could also accelerate the beginning of the season when releases to Pilarcitos Creek from Pilarcitos Reservoir consist only of the passage of reservoir inflow.

In the No-program setting, Coastside CWD would increase its purchase request to the same level as that of the WSIP setting. Due to an increase in the frequency of system-wide delivery shortages in the alternative setting, less water would be delivered to Coastside CWD; thus, a slight lessening of hydrologic effects would occur with the alternative as compared to the WSIP.

[5] See "Analysis of SFPUC Pilarcitos/Coastside County Water District Operations", Memorandum by Daniel B. Steiner, March 8, 2007.

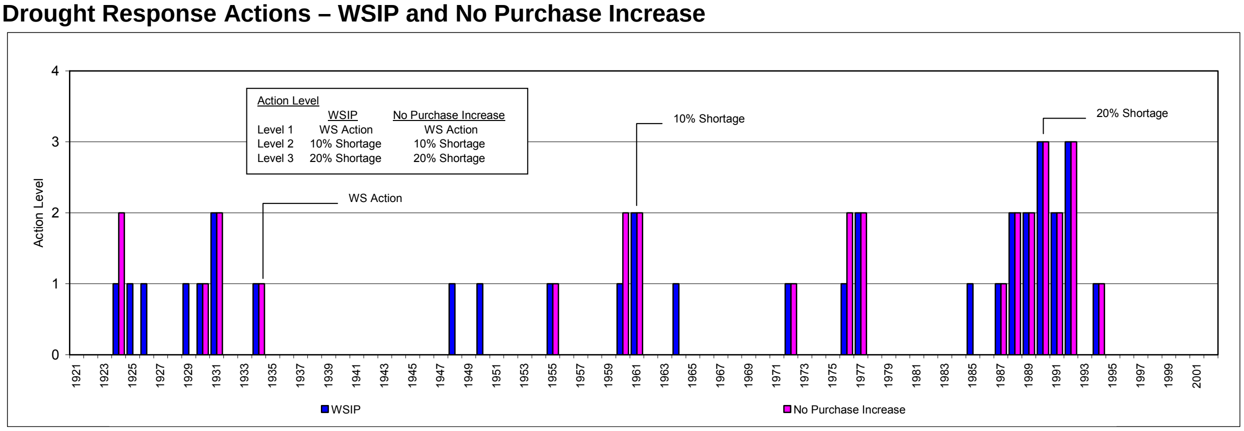
3. CEQA Alternative 2 – No Purchase Request Increase

CEQA Alternative 2 – No Purchase Request Increase Alternative (No Purchase Increase) would limit the SFPUC's wholesale customers' future purchases to the terms of the existing Master Water Sales Agreement. Under that agreement, the wholesale customers may purchase up to 184 mgd on an average annual basis, subject to reductions in the event of a drought, water shortage, earthquake, other natural disaster, or rehabilitation and maintenance of the system. Under the alternative, the customer purchase requests for 2030 would be 184 mgd for the wholesale customers instead of 209 mgd. It is assumed that the total customer purchase requests to be served by the regional system by 2030 would be 275 mgd, consisting of 184 mgd for the wholesale customers and 91 mgd for the retail customers. The increased water demand would be served through additional Tuolumne River diversions, increased use of local watershed supplies from restoration of Calaveras Reservoir, and 10 mgd from recycled water, groundwater, and conservation projects in San Francisco (RRGWC). Supplemental supplies would include implementation of the Westside Basin Groundwater Program and a water transfer with the TID/MID similar to the proposed program. Compared to the WSIP setting, the only project not included is the Lower Crystal Springs Dam improvement project (PN-4).[6]

3.1 Water Deliveries and Drought Response Actions

Compared to the WSIP setting, the regional system's resources are required to serve a net 265-mgd demand (275 mgd purchase request minus 10 mgd of RRGWC) instead of a net 290-mgd demand. As part of the formulation of this alternative, the water transfer from MID/TID was sized to provide the same frequency and severity of water shortages (percentage-wise) for the alternative as that of the WSIP setting during the Design Drought (although system-wide water deliveries are a net 265 mgd in the alternative setting as compared to the WSIP setting delivery of a net 290 mgd). This objective required the water transfer to be sized at 1,500 acre-feet per year. With a water supply formulated about comparable to that provided for the WSIP setting, only proportionately smaller for a lesser demand, the implementation of rationing and the severity of rationing from the SFPUC system during drought periods would be about the same. However, this result does not speak to the regional shortage of water that would occur by the SFPUC system not supplying the full purchase request of 300 mgd. Although the results indicate that SFPUC customers would experience essentially the same shortages in supply from the SFPUC system in the future as they currently experience, the ability of SFPUC customers to cope with these projected shortages in the future may be less depending on the resources and measures implemented by the customers to fill in the gap between their 300-mgd purchase request and the purchase request served in this alternative (275 mgd). Table 1-1 illustrates the comparison of the drought response actions for the proposed program and the alternative. Figure 3.1-1 illustrates the occurrence of drought response actions for the simulated 82-year historical period (1921-2002).

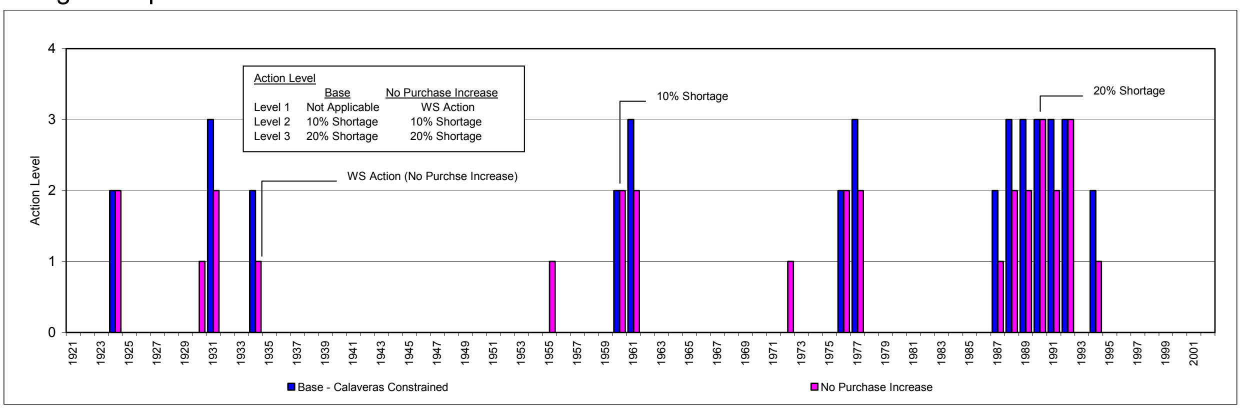
Figure 3.1-1
Drought Response Actions – WSIP and No Purchase Increase



[6] The Lower Crystal Springs Dam Improvements project is also included in the alternative but was not included in the HH/LSM modeling.

In Figure 3.1-1, years with bars showing a “1” or greater level of action indicate periods when a supplemental water supply action is initiated. In both settings, the water supply action is the use of the Westside Groundwater Basin Program to supplement SFPUC water deliveries. Also occurring in both settings is the water transfer supplemental supply from MID/TID. Action levels greater than “1” indicate the imposition of delivery shortages (rationing) to SFPUC customers. Although SFPUC customers would experience the same frequency and severity of shortages (percentage-wise) during the Design Drought in both settings, the frequency of shortage in other drought periods would slightly increase in the alternative setting. The triggering of the Westside Basin Groundwater Program supplemental supply would occur more frequently in the WSIP setting. Both of these differences are an outcome of a slightly different interaction between differing available supplies and demands. The same form of information is shown in Figure 3.1-2 in comparing the alternative and the “Base - Calaveras Constrained” (existing) settings. There is no level 1 action level in the base setting. Without supplemental resources, the existing system only has delivery shortage measures available to cope with drought. In the base setting, the shortage measure is imposed during level 2 (10 percent) and level 3 (20 percent). These percentages of shortage are applied to both the alternative and the base settings for these action levels, and they are applied to the same level of net water demand (265 mgd). During this simulation period, rationing above 20 percent is not required in either setting; however, in the alternative setting, the occurrence of additional water supplies lessens the frequency and severity of water delivery shortages.

Figure 3.1-2
Drought Response Actions – Base and No Purchase Increase



Not illustrated in Figure 3.1-2 but shown in Table 1-1 are the delivery shortages anticipated during the entire SFPUC Design Drought. During the Design Drought, the base setting does not have a viable operation without exceeding a 20-percent shortage level. The base setting exceeds the 20-percent shortage level (requires 25 percent rationing) during the last 18 months of the Design Drought. The alternative would viably provide deliveries without exceeding a 20-percent shortage level.

The difference in water deliveries between the proposed program and the alternative is shown chronologically for the 82-year simulation in Table 3.1-1. Less water would be delivered to the region by the SFPUC in all years, a result of serving a lesser purchase request (275 mgd instead of 300 mgd, and a lesser net demand 265 mgd instead of 290 mgd). The difference would have to be met from non-SFPUC system water supplies and measures. Comparing the alternative setting to the base setting, Table 3.1-2 illustrates the difference in water deliveries between the two settings. The increases in deliveries in the alternative setting occur due to an improvement in water delivery reliability, which reduces the severity of water shortages. The results also indicate periods in which additional deliveries occur to replenish the Westside Basin Groundwater Program. The occasional reductions in deliveries indicate periods when the Westside Basin Groundwater Program is offsetting SFPUC demands during a level 1 action circumstance. The 265-mgd net demand is being served during these periods; however, the regional system experiences a reduction in delivery associated with the Westside Basin Groundwater Program offsetting demands. The shifting in the pattern of deliveries (evident during years when there is no increase in total annual delivery) indicates the anticipated seasonal effect of RRGWC within the pattern of the projected future, albeit limited, purchase request.

3.2 Diversions from Tuolumne River

The metric for illustrating the SFPUC diversion from the Tuolumne River Basin (Tuolumne) is the flow through the San Joaquin Pipeline (SJPL). Inherent to this alternative is a net water demand essentially equal to the base setting, which is less than the demand served by the proposed program. Table 3.2-1 illustrates the difference in diversions to the SJPL between the proposed program and the alternative settings. In both settings, the conveyance capacity of the SJPL is increased compared to the base setting. During the summer, the SJPL would essentially operate at the same maximum rate in both the alternative and WSIP settings to minimize draw down of Bay Area reservoir storage. A few exceptions occur during the summer of drought periods when the alternative is serving a lesser demand than occurs in the WSIP setting. Overall, compared to the WSIP setting, the alternative setting would divert less water from the Tuolumne.

Table 3.2-2 illustrates the difference in diversions to the SJPL between the alternative and base settings. Evident in the operation is the increase in summer diversions associated with an increase in the conveyance capacity of the SJPL. As described above, with the increase in SJPL conveyance capacity, summer diversions would increase to retain storage in the Bay Area reservoirs. With the demand of the alternative approximately the same as the base setting, the increase in summer diversions to the SJPL result in reduced diversions during the late summer and fall. The differences in December diversions are largely the result of maintenance occurring in the alternative setting (lessening available conveyance capacity), which does not occur in the base setting. The increase in diversion during the winter and spring results from the need to replenish Bay Area reservoir storage after the maintenance, and then from the need to top off Bay Area reservoir storage prior to summer. Overall, there would be an increase in average annual diversions to the SJPL in the alternative setting, which is associated with the improvement in water delivery reliability.

The average monthly diversion through the SJPL by year type for the 82-year simulation for the proposed program and the alternative settings, and the difference between the two settings, is illustrated in Table 3.2-3. Table 3.2-4 illustrates the same information for the alternative and base settings.

Table 3.2-1

Difference in Total SJPL (Acre-feet)

No Purchase Increase minus WSIP

3.3 Hetch Hetchy Reservoir and Releases

Compared to the WSIP setting, the alternative setting would draw less water from the Tuolumne due to the lesser demand. This circumstance would lead to less draw from Hetch Hetchy Reservoir in the alternative setting in all years. Figure 3.3-1 illustrates a chronological trace of the simulation of Hetch Hetchy Reservoir storage and stream releases. Shown in Figure 3.3-1 are the results for the WSIP, alternative ("No Purchase Increase"), and base ("Base – Calaveras Constrained") setting. Supplementing the Figure 3.3-1 representation of Hetch Hetchy Reservoir storage are Table 3.3-1 Hetch Hetchy Reservoir Storage (No Purchase Increase), Table 3.3-2 Hetch Hetchy Reservoir Storage (WSIP), and Table 3.2-1 Difference in Hetch Hetchy Reservoir Storage (No Purchase Increase minus WSIP). Table 3.2-2 is provided to illustrate the difference in Hetch Hetchy Reservoir storage between the base and alternative settings.

Table 3.3-3 illustrates that, by the end of summer, storage in Hetch Hetchy Reservoir associated with the alternative setting would be greater than the storage in the WSIP setting, although typically an increase of less than 3,000 acre-feet. In about 20 percent of the years, storage would be greater by 3,000 acre-feet or more. The relatively minor increases in storage are attributable to years when summer diversions are the same in both settings (SJPL operating at maximum capacity) but less water is being diverted in the fall due to the lesser water demand. The larger increases in storage are associated with drought periods during which the differences in underlying demand and water delivery shortages between the WSIP and alternative settings are greater.

Through the fall and winter, storage in Hetch Hetchy Reservoir would be the same or be higher. Hetch Hetchy Reservoir would fill by the end of May during approximately 72 percent of the years, which would negate any difference in storage from carrying into the next summer. Figure 3.3-2 illustrates the difference in reservoir storage averaged by year type for the comparison of the alternative to the WSIP setting. Also shown is the average difference in storage for the two settings during the 82-year simulation.

Table 3.3-4 illustrates the difference in Hetch Hetchy Reservoir storage between the alternative and base settings. Immediately after Hetch Hetchy Reservoir is filled (May or June, and then continuing through July), there would only be occasional differences in storage at the reservoir, typically a decrease of less than 10,000 acre-feet. This indicates that the same amount of water is being passed through the reservoir, regardless of the size of the conveyance capacity of the SJPL. Water not diverted to the SJPL would return to the Tuolumne River and flow to Don Pedro Reservoir. In the late summer and early fall, there would consistently be a slight difference (lower) in storage levels between the two settings, as additional diversions to the SJPL would retain Bay Area reservoir storage. Some of this additional storage depletion would be ameliorated later in the fall and into winter as SJPL diversions are reduced due to lower Bay Area reservoir replenishment needs and less conveyance system maintenance. Storage becomes greater in November and December of the alternative setting due to the assumed system-wide maintenance that occurs in the alternative and does not occur in the base setting. Subsequent to December, the storage gain occurring in the alternative setting again becomes affected as replenishment of Bay Area reservoir storage resumes. In non-wetter years, there is a difference in storage between the alternative and base settings; the alternative setting results in a lower storage in the reservoir by the end of April. Figure 3.3-3 illustrates the difference in reservoir storage averaged by year type for the comparison of the alternative to the base setting. Also shown is the average difference in storage for the two settings during the 82-year simulation. Figure 3.3-4 illustrates the average monthly storage in Hetch Hetchy Reservoir for the 82-year simulation and the range in storage for each month for the variant and base settings.

The difference in storage in Hetch Hetchy Reservoir attributed to the diversion effects of the alternative would manifest in differences in releases from O’Shaughnessy Dam to the stream. A different amount of available reservoir space in the winter and spring due to the alternative would lead to a different ability to regulate inflow, thus potentially changing the amount of water released to the stream that is above minimum release requirements. Figure 3.3-1 illustrates the stream release from O’Shaughnessy Dam for the WSIP, alternative, and base settings. Table 3.3-5 illustrates the difference in stream releases between the alternative and WSIP settings. Compared to the WSIP setting, the alternative exhibits an incrementally greater stream release, predominantly during May or June, which reflects the months when releases to the stream above excess of minimum release requirements are made in anticipation of the reservoir being filled. Exceptions during which incrementally larger reductions in releases to the stream occurs are considered anomalous within modeling, the results of only shifting releases from one month to the next. The increase in releases is the result of a less depleted reservoir, which is the result of lesser demands between the settings.

Table 3.3-6 illustrates the difference in stream release between the alternative and base settings. In this comparison, releases could be either greater or lesser than depicted for the base setting, and these differences would occur predominantly during May or June. Generally, Hetch Hetchy Reservoir storage would be slightly lower during non-wetter years, leading to a reduction in stream releases during non-wetter years if a release occurs. During wetter years, the releases are projected to increase. The differences, either increases or decreases, are a result of the coincidence of the several parameters affecting the release of water from the reservoir, including system-wide water demands, conveyance capacity and maintenance assumptions, and the watershed’s hydrology.

Table 3.3-5 illustrates the difference in stream release between the alternative and WSIP settings, expressed in terms of a monthly volume (acre-feet) of flow. Table 3.3-7 illustrates the same information and the average monthly stream release for the alternative and WSIP setting, expressed in average monthly flow (cfs). Table 3.3-5 illustrates that the difference in monthly flow below O’Shaughnessy Dam could range up to an increase of approximately 30,000 acre-feet. Considering the manner in which releases are determined and made to the stream, quantifying the effect of these changes in terms of average monthly

Table 3.3-4

Difference in Hetch Hetchy Reservoir Storage (Acre-feet) — No Purchase Increase minus Base - Calaveras Constrained

flow (cfs) is not always meaningful.[7] When comparing the alternative to the WSIP setting, a change in the volume of release from O'Shaughnessy Dam to the stream would likely result in the initiation of the release being delayed or initiated earlier by a matter of days. Typical springtime releases, when initiated, amount to a release up to 3,000 cfs (approximately 6,000 acre-feet over the span of a day). Assuming that a change in release volume equates to a delay or an earlier initiation of releasing 6,000 acre-feet per day, the difference in stream release between the alternative and WSIP would be up to an additional 5 days of release. Normally, the effect of this change in release would not affect the year's peak stream release rate during a year. Table 3.3-8 illustrates the average monthly stream release for the alternative and base setting, and differences, expressed in average monthly flow (cfs). Table 3.3-6 illustrates that the difference in monthly flow below O'Shaughnessy Dam between the alternative and base settings could range from an increase of approximately 16,000 acre-feet to a decrease of approximately 29,000 acre-feet. Using the same metric as described above to estimate the delay or addition in the number days of release to the stream, the alternative could lead to an effect ranging from an increase of 3 days of release to a decrease of up to 5 days, compared to the base setting.

3.4 Lake Lloyd and Lake Eleanor

Compared to the operation of the WSIP, the operation of Lake Lloyd and Lake Eleanor are simulated to be only slightly different for the alternative. Figure 3.4-1 illustrates a chronological trace of the simulation of Lake Lloyd storage and stream releases. Shown in Figure 3.4-1 are the results for the WSIP, alternative, and base settings. The operation resulting from the alternative is essentially the same as the WSIP setting, including during drought. Although the level of delivery between the alternative and base settings is essentially the same (net 265-mgd demand) during the 1987-1992 drought, water delivery reliability has been improved in the alternative setting, resulting in a similarity to the WSIP setting in the draw down of Lake Lloyd during this period. Although less water is delivered during this period in the alternative setting compared to the WSIP setting, more water is delivered in the alternative setting than in the base setting. The additional draw of water reduced the amount of water released from Hetch Hetchy Reservoir to Don Pedro Reservoir in the alternative setting, which, for satisfaction of MID/TID entitlements to inflow, was met with additional releases from Lake Lloyd, similar to the WSIP setting. The result that the amount of additional release from Lake Lloyd associated with the alternative appears approximately the same as in the WSIP setting in this instance is partially a factor of modeling discretion in that HH/LSM makes release decisions in the form of block amounts of releases. Additional refinement of modeling assumptions would likely produce a result that places Lake Lloyd storage during this drought period more equally between the base setting and WSIP setting results. Otherwise, the results for Lake Lloyd storage are essentially the same between the WSIP and alternative settings.

Figure 3.4-2 illustrates the almost identical operation of Lake Eleanor for the alternative and WSIP settings. Also shown in Figure 3.4-2 is the operation for the base setting. Any difference that occurs in the Lake Eleanor operation would be caused by a small change in operation at Lake Lloyd that would affect the operation of the Cherry-Eleanor Tunnel between the two watersheds. Any difference that occurs in the simulations is more associated with modeling discretion than with any substantive difference in operation.

Supplementing the Figure 3.4-1 representation of Lake Lloyd stream releases is Table 3.4-1, illustrating releases for the alternative and WSIP settings, and the difference in releases between the two settings. Table 3.4-2 provides the same form of information for the alternative and base settings. With essentially no change in reservoir operations, stream releases would not be different.

3.5 Don Pedro Reservoir and La Grange Releases

A change in Don Pedro Reservoir operation is caused by changes in inflow to the reservoir. The changes in inflow to the reservoir are the result of net changes within the operation of the upstream SFPUC facilities, described previously, and other changes in SFPUC operations associated with diversions to the Holm, Kirkwood, and Moccasin Powerhouses. Figure 3.5-1 illustrates a chronological trace of the simulation of Don Pedro Reservoir storage and Tuolumne River stream releases from La Grange Dam. Shown in Figure 3.5-1 are the results for the WSIP, alternative, and base settings. Supplementing the Figure 3.5-1 representation of Don Pedro Reservoir storage are Table 3.5-1 Don Pedro Reservoir Storage (No Purchase Increase), Table 59 Don Pedro Reservoir Storage (WSIP), and Table 3.5-2 Difference in Don Pedro Reservoir Storage (No Purchase Increase minus WSIP). Table 3.5-3 is provided to illustrate the difference in Don Pedro Reservoir storage between the base and alternative settings.

Table 3.5-2 illustrates that, throughout many years, the storage in Don Pedro Reservoir associated with the alternative setting would differ from the storage in the WSIP setting, and that this difference would almost always be more storage. Table 3.5-3 illustrates that the alternative setting results for Don Pedro Reservoir storage are close to the storage results depicted for the base setting, although typically lower than the base setting. Compared to the WSIP setting, the differences in storage indicate increases to the inflow of Don Pedro Reservoir, which are due to lesser demands and SJPL diversions in the alternative setting. The increases in inflow typically occur during the winter through early summer. Compared to the base setting, the alternative would result in typically less inflow to Don Pedro Reservoir during non-wetter years, and particularly during drought periods when more water is diverted to the SJPL in the alternative setting. Less inflow leads to less reservoir storage.

Figure 3.5-1 and Table 3.5-4 illustrate that, during drought sequences, reduction to inflow to Don Pedro Reservoir can accumulate from year to year. Compared to the base setting, the alternative would result in lower Don Pedro Reservoir storage during drought periods. Figure 3.5-2 illustrates the difference in reservoir storage averaged by year type for the comparison of the alternative to the WSIP settings. Also shown is the average difference in storage for the two settings during the 82-year simulation. Figure 3.5-3 illustrates the same information for the comparison between the alternative and the base settings.

Figure 3.5-2

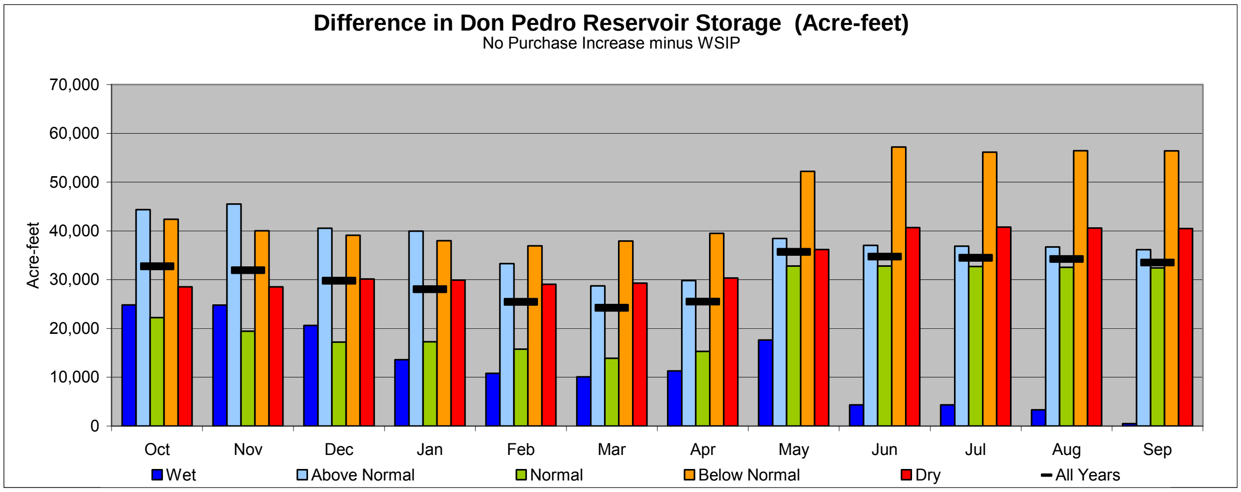

Figure 3.5-3

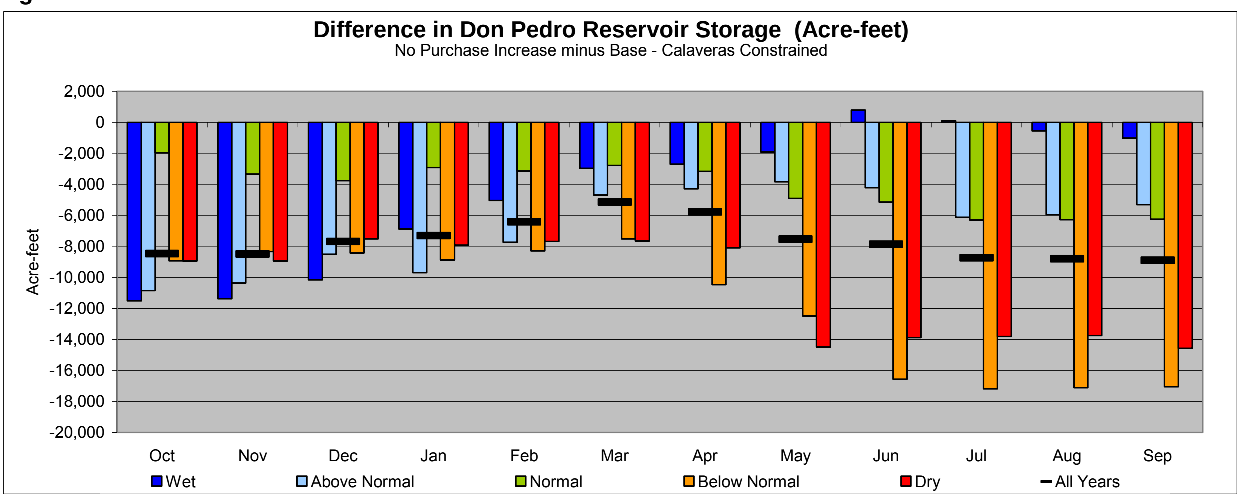

Figure 3.5-4 illustrates the average monthly storage in Don Pedro Reservoir for the 82-year simulation, and the range in storage for each month for the alternative and base settings.

The difference in storage in Don Pedro Reservoir attributed to the upstream effects of the alternative would manifest in differences in releases from La Grange Dam to the stream. A different amount of available reservoir space in the winter and spring due to the alternative would lead to a different ability to regulate inflow, thus potentially changing the amount of water released to the stream that is above minimum release requirements. During periods when inflow differs and Don Pedro Reservoir is at maximum storage capacity within the flood control storage limitation, a change in inflow directly manifests as a change in release from La Grange Dam (a change of either more or less flow). Figure 3.5-1 illustrates the stream release from La Grange Dam for the WSIP, alternative, and base settings.

Table 3.5-4

Difference in Don Pedro Reservoir Storage (Acre-feet)

No Purchase Increase minus Base - Calaveras Constrained

Figure 3.5-4

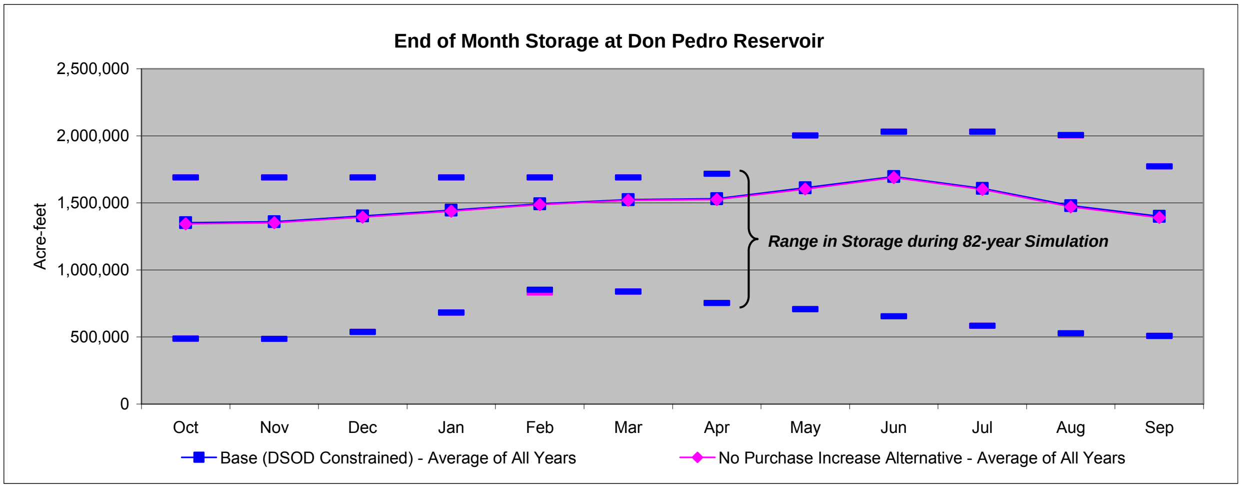

Table 3.5-5 illustrates the difference in stream releases between the alternative and WSIP settings. Compared to the WSIP setting, the alternative exhibits an incrementally larger stream release, predominantly during some months of the early-winter-through-June period, which reflects the months when releases to the stream above minimum release requirements are made due to flood control or in anticipation of the reservoir being filled. Table 3.5-6 illustrates the same information in comparing the alternative and WSIP settings, with years ranked in descending order of the San Joaquin River Index. Illustrated is the finding that differences in releases to the Tuolumne River from La Grange Dam would occur only when there are releases above minimum FERC flow requirements. This circumstance typically occurs only in above-normal and wet years, and predominantly during early winter through June. During other year types and during summer and fall, releases would be maintained at minimum FERC flow requirements regardless of the setting. Compared to the WSIP setting, the large potential reduction in flow following an extended drought period is reduced with the alternative because the amount of water delivered by the SFPUC during these periods is less than in the WSIP setting, but is still more than in the base setting.

As described above concerning Don Pedro inflow and storage, compared to the base setting, the alternative setting would lead to an additional draw of storage due to SFPUC diversions that are greater than in the base setting in drought periods. Although the reduction in storage would not greatly accumulate, greater replenishment of Don Pedro Reservoir storage is needed in about 30 percent of the years of the 82-year simulation. Occasionally, an increase in releases would occur. This circumstance would occur because of the shift in timing of SJPL diversions due to the increased conveyance capacity. The effect is an occasional additional release of water from Hetch Hetchy Reservoir in the winter, which then manifests as an additional release from Don Pedro Reservoir. Table 3.5-7 illustrates the difference in stream releases between the alternative and base settings, depicting the predominance of reductions to flow. Table 3.5-8 illustrates the same information, ranked in descending order of the San Joaquin River Index.

Table 3.5-5 and Table 3.5-7 illustrate the difference in stream release between the alternative, WSIP, and base settings, expressed in terms of a monthly volume (acre-feet) of flow. Table 3.5-9 illustrates the same information and the average monthly stream release for the alternative and WSIP settings, expressed in average monthly flow (cfs). Table 3.5-10 presents the same information in comparing the alternative and base settings. In comparing the alternative to the WSIP setting, the difference in monthly flow below La Grange Dam could range from an increase of approximately 123,000 acre-feet to a decrease of approximately 7,000 acre-feet. Considering the manner in which releases are determined and made to the stream, quantifying the effect of these changes in terms of average monthly flow (cfs) is not always meaningful. Similar to the operation of releases below O'Shaughnessy Dam, a change in the volume of release from La Grange Dam to the stream would likely result in the initiation of the release being delayed or accelerated by a matter of days. Assuming that a change in release volume equates to a delay or acceleration of releasing 6,000 acre-feet per day, the difference in stream release from La Grange Dam between the alternative and WSIP would be an additional day of delay in releases or up to almost an

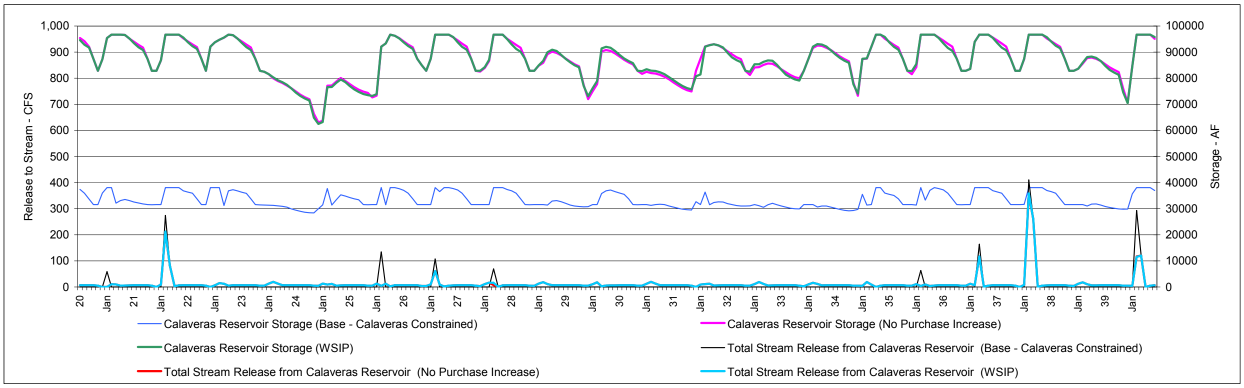
added month of release. Normally, the effect of a change in release would not affect the year's peak stream release rate during a year. However, infrequently, the alternative's effect on stream releases could manifest as an elimination of all flow during a year or as the only provision of flow that occurs in excess of minimum FERC flow requirements. Compared to the base setting, the alternative's effect to stream flow ranges from a reduction to releases (a potential delay in release of 10 days) to an increase in releases (a potential additional 5 days of release).

3.6 Calaveras and San Antonio Reservoirs, Alameda Creek and Downstream

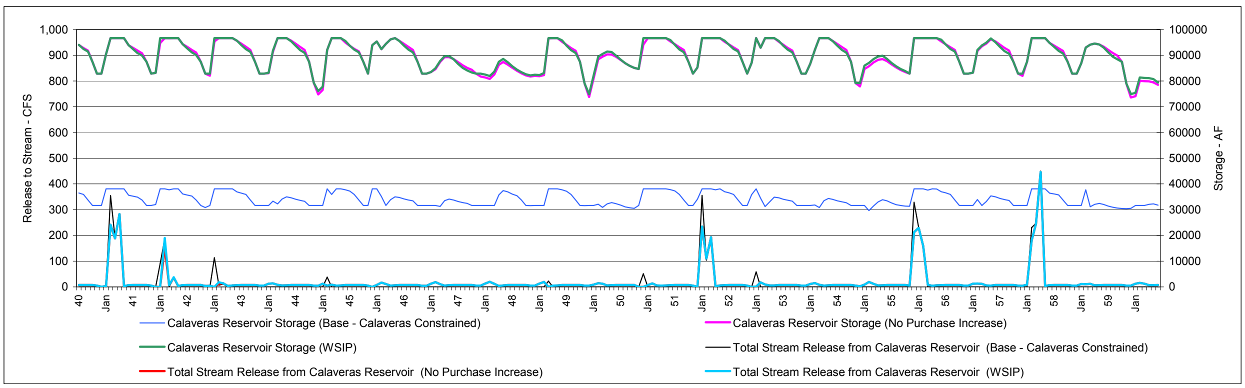
Compared to the WSIP setting, the operation of Calaveras Reservoir in the alternative setting is almost identical. Figure 3.6-1 illustrates a chronological trace of the simulation of Calaveras Reservoir storage and stream releases from Calaveras Dam. Shown in Figure 3.6-1 are the results for the WSIP, alternative, and base settings. Recognizing the different levels of system-wide deliveries served in each setting, the near identical operation of Calaveras Reservoir resulting from the two settings indicates that Calaveras Reservoir operations are mostly influenced by the principles that manage local watershed production. The differences in reservoir operation during the droughts of the 1960s and 1976-1977 are the result of modeling assumptions that balance reservoir storage among SFPUC reservoirs and the selection of the monthly SJPL conveyance rate. It is anticipated that the difference in Calaveras Reservoir operation in actual operations would be minimal, if at all.

Figure 3.6-1
Calaveras Reservoir Storage and Stream Release

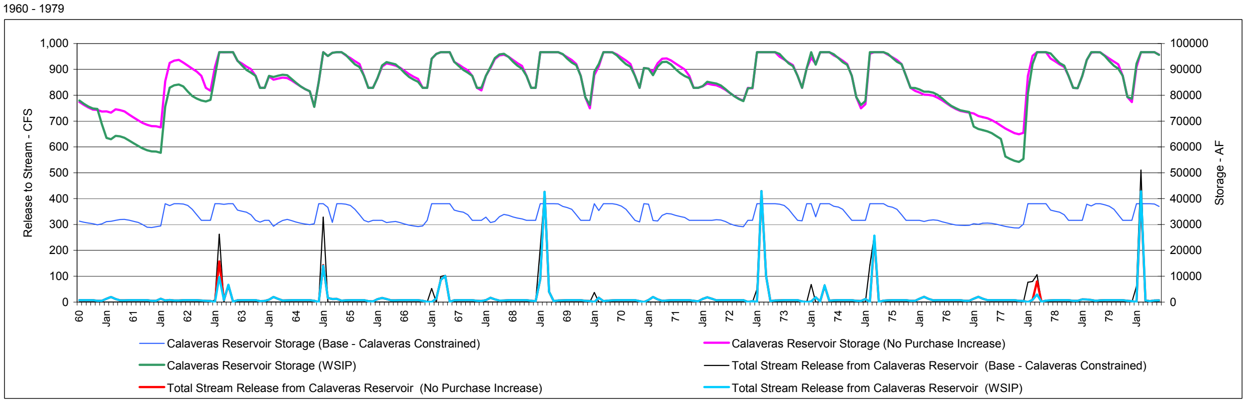
1920 - 1939



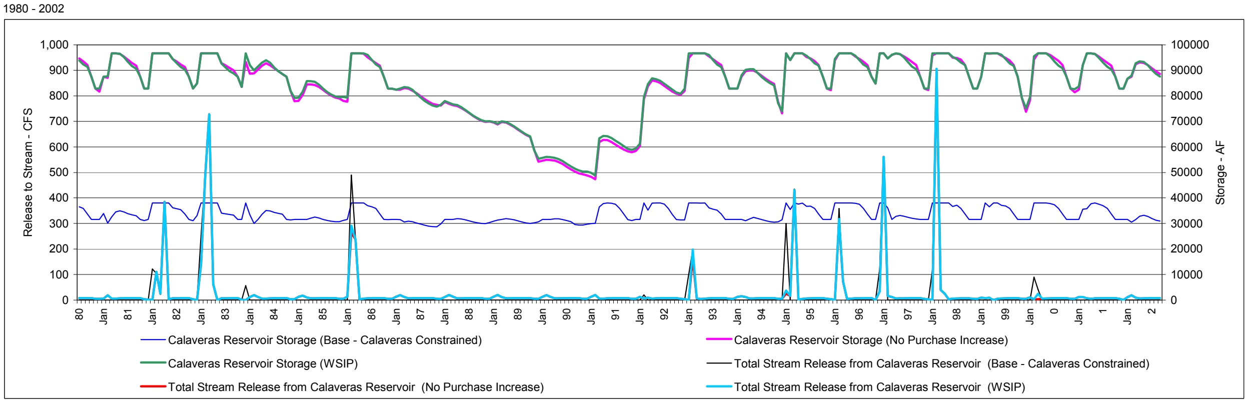
1940 - 1959



1960 - 1979

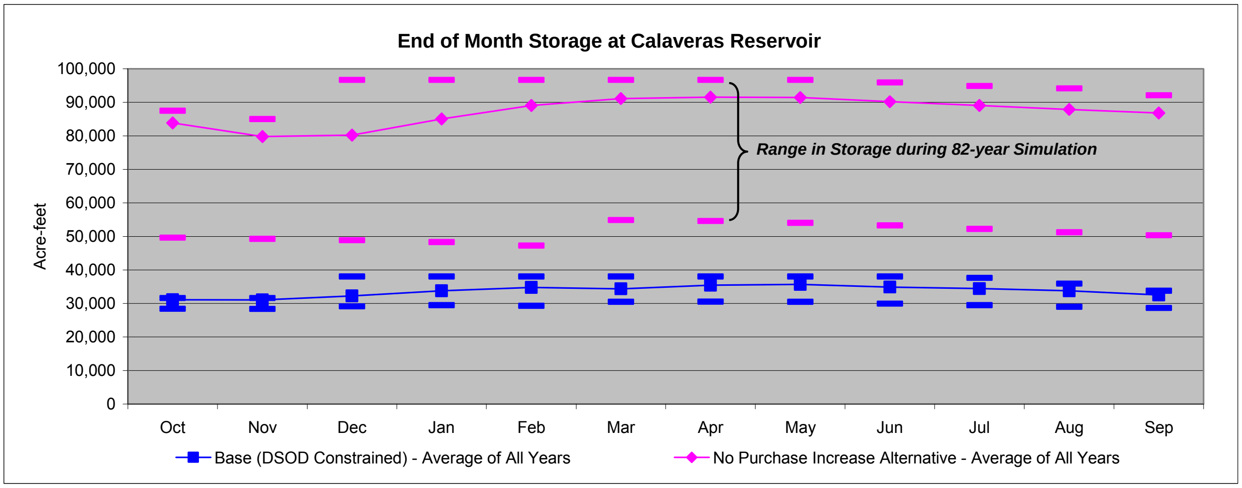


1980 - 2002



The difference in storage between the alternative and WSIP settings and the base setting is due to the restoration of the operational capacity of Calaveras Reservoir. Under both the alternative and WSIP settings, the full capacity of Calaveras Reservoir would be available, and a greater range in storage operation would occur. Figure 3.6-2 illustrates the average monthly storage in Calaveras Reservoir for the 82-year simulation, and the range in storage for each month for the alternative and base settings.

Figure 3.6-2



Compared to the WSIP setting, there would potentially be more or less release to Calaveras Creek below Calaveras Dam in the alternative setting. Both settings have fishery releases that are not included in the base setting. Calaveras Reservoir storage in the alternative setting is sometimes more and sometimes less than in the WSIP setting; however, in either direction the difference is minor. Table 3.6-1 illustrates the difference in releases to Calaveras Creek between the alternative and WSIP settings (considered non-substantial). Supplementing the Figure 3.6-1 representation of Calaveras Dam stream releases and Table 3.6-1 is Table 3.6-2, illustrating releases for the alternative and WSIP settings, and the difference in releases between the two. Table 3.6-3 provides the same form of information for the alternative and base settings. The notable difference in releases between the alternative and base settings is the addition of the required flows to satisfy the 1997 MOU and the reduction of stream releases during wetter-year/wetter-season flows due to the restoration of Calaveras Reservoir operational capacity.

There would be very little if any difference in Alameda Creek diversions to Calaveras Reservoir in the alternative setting compared to the WSIP setting. With essentially the same storage conditions between the two settings, there would be no difference in diversions from the Alameda Creek watershed. With no difference in the diversion at Alameda Creek Diversion Dam, flow spilling past the diversion dam would be the same in the alternative setting. Table 3.6-4 illustrates the difference in flow below the Alameda Creek Diversion Dam between the alternative and WSIP settings (considered non-substantial).

Table 3.6-5 illustrates the difference in flow below Alameda Creek Diversion Dam between the alternative and base settings. In this comparison, the reduction in flow below the diversion dam is due to the additional diversions to Calaveras Reservoir resulting from the restoration of reservoir operating capacity. Table 3.6-6 and Table 3.6-7 illustrate the flow past the Alameda Creek Diversion Dam, comparing the alternative, WSIP, and base settings by year type and the average of all years.

Comparing the alternative and WSIP settings, differences in releases from Calaveras Dam to the stream and differences to spills at Alameda Creek Diversion Dam would result in differences in flow below the Alameda Creek and Calaveras Creek confluence. Table 3.6-8 illustrates the flow below the confluence for the alternative and WSIP settings. The modeled difference of these parameters has been described above as being non-substantial; thus, the combined effect of the differences at the confluence is considered non-substantial. Fishery releases for the 1997 MOU are assumed in both of the settings. Table 3.6-9 provides the same form of information for the alternative and base settings. The notable differences between the alternative and base settings (comparable to the difference between the WSIP and base settings) are the addition of required stream flows for the 1997 MOU and the reduction of wetter-year/wet season flows due to the restoration of Calaveras Reservoir storage.

A flow recapture facility in Alameda Creek below Calaveras Reservoir is incorporated in the alternative and WSIP settings. This facility is assumed to recapture flows explicitly released from Calaveras Dam for the 1997 MOU. The effect of the recapture is a reduction in the flow that occurs below the confluence of Alameda and Calaveras Creeks, but only to the extent that releases were explicitly made from Calaveras Reservoir for the 1997 MOU. Flows below this diversion have been estimated and noted as the flow above the Alameda and San Antonio confluence. Table 3.6-10 illustrates the flow at this location for the alternative and WSIP settings. The flow changes at this location are consistent with the changes noted for below the confluence of Alameda and Calaveras Creeks. These flow changes are considered non-substantial. Table 3.6-11 provides the same form of information for the alternative and base settings. The flows identified at this location indicate flow occurring below the confluence of Alameda and Calaveras Creeks (described above), with the addition of estimated stream accretions between the Alameda and Calaveras Creek confluence and the Alameda and San Antonio Creek confluence, less the water assumed to be recaptured (diverted) by the SFPUC from the creek.

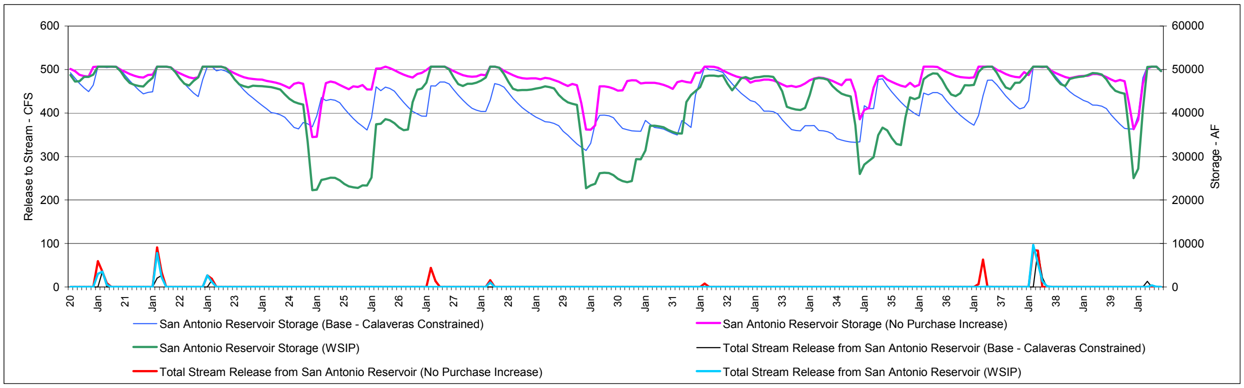
Compared to the WSIP setting, the alternative's San Antonio Reservoir operation would draw less from storage on an annual basis, and particularly during cyclic maintenance. Figure 3.6-3 illustrates a chronological trace of the simulation of San Antonio Reservoir storage and stream releases from San Antonio Dam. Shown in Figure 3.6-3 are the results for the WSIP, alternative, and base settings. The difference in San Antonio Reservoir storage between the alternative and WSIP settings is mostly caused by the lesser demand of the alternative. Considering that Calaveras Reservoir storage is essentially the same between the settings, the difference in San Antonio Reservoir storage indicates the operational strategy to affect storage in San Antonio Reservoir more than storage in the other SFPUC Bay Area reservoirs. San Antonio Reservoir would retain more storage in the alternative setting compared to the WSIP setting.

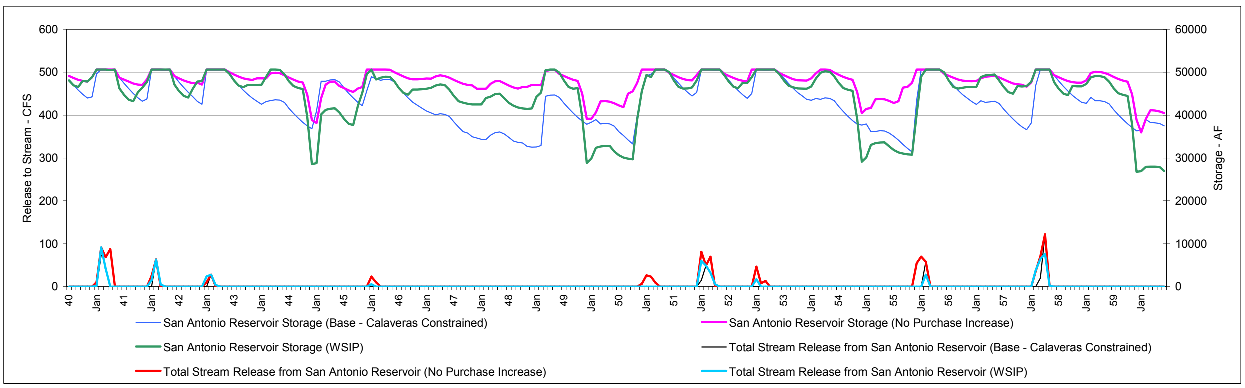
The difference in storage between the alternative and WSIP settings and the base setting is due to the restoration of the operational capacity of Calaveras Reservoir. In the base setting, the limited operating storage capacity at Calaveras Reservoir leads to a different operation at San Antonio Reservoir, one that retains relatively more stored water for system demands when the draw from Calaveras Reservoir is constrained due to limited storage. There is also a notable difference in storage operation between the alternative and WSIP settings and the base setting due to assumed maintenance. Assumed systematic maintenance of Hetch Hetchy conveyance facilities constrains diversions to the Bay Area from Hetch Hetchy every year, and particularly during every fifth year in the WSIP and alternative settings.

Figure 3.6-3
San Antonio Reservoir Storage and Stream Release

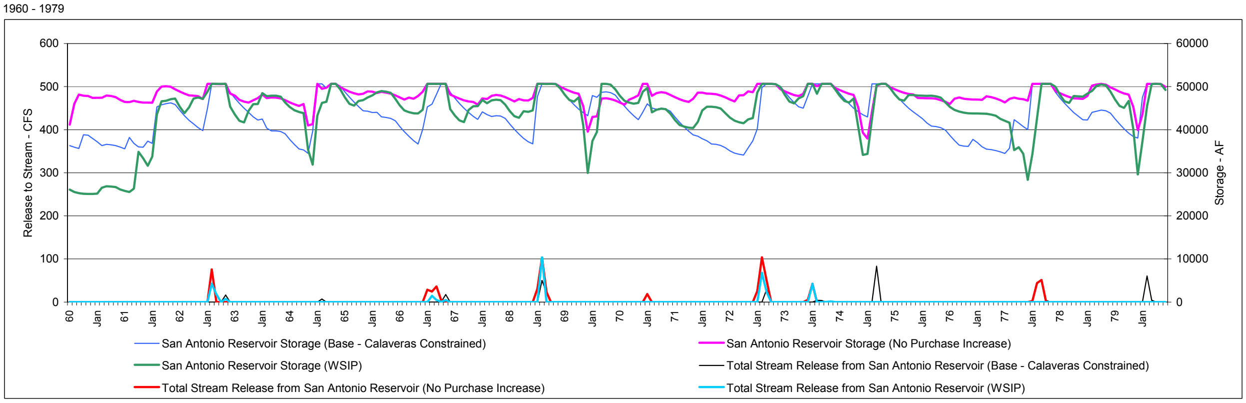
1920 - 1939



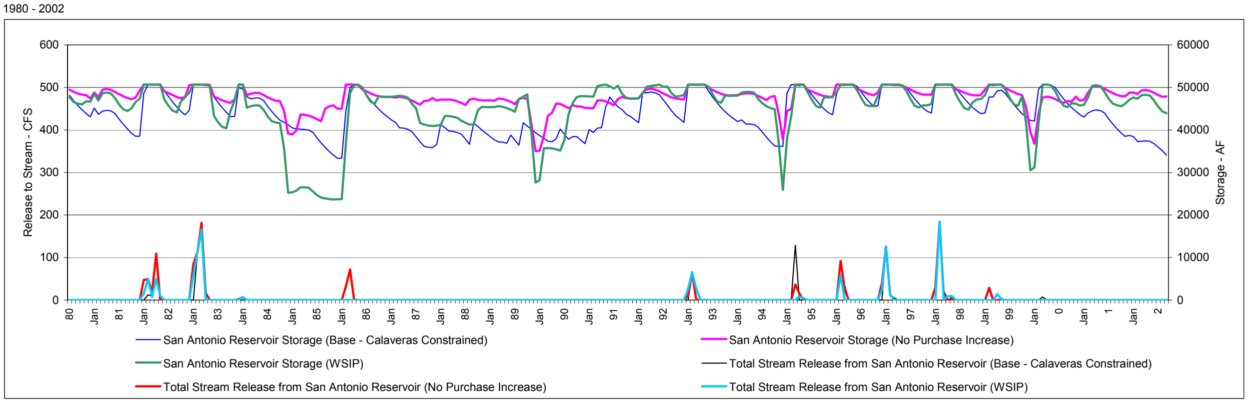
1940 - 1959



1960 - 1979

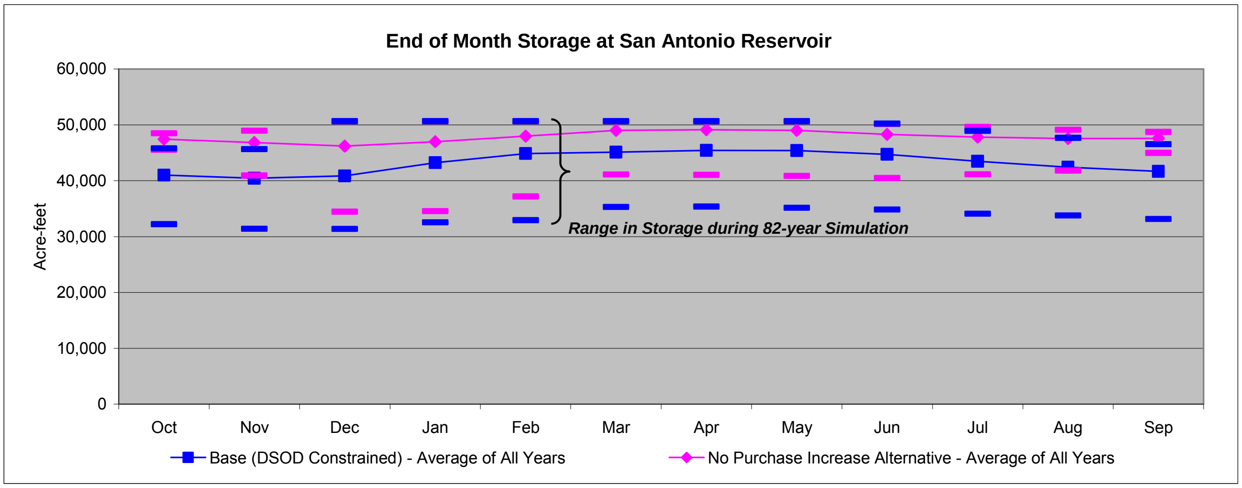


1980 - 2002



The reduction in diversion from Hetch Hetchy during these periods is accommodated in the system by the drawing of additional water from the Bay Area reservoirs. The proportionate share of this operation is evident in the tracing of San Antonio Reservoir storage for the alternative and WSIP settings. Figure 3.6-4 illustrates the average monthly storage in San Antonio Reservoir for the 82-year simulation, and the range in storage for each month for the alternative and base settings. Compared to the base setting, the alternative would draw less storage from San Antonio Reservoir, typically retaining a fuller reservoir.

Figure 3.6-4



Very little change in stream releases below San Antonio Reservoir is anticipated between the alternative and WSIP settings. Table 3.6-12 illustrates the modeled release to San Antonio Creek from San Antonio Reservoir for the two settings and the differences for the average release during a year type. With a fuller reservoir operation at times during the winter, as seen in Figure 3.6-4, a decrease in the ability to regulate reservoir inflow and avoid stream releases is expected. Given the sometimes rigid constraints within the modeling assumptions, the model will overestimate the frequency and magnitude of stream releases from San Antonio Reservoir under any of the investigated settings. The flexibility that occurs in actual operations would likely avoid most of the releases represented by the model. The modeled stream releases from San Antonio Reservoir and difference between releases for the alternative and base setting are shown in Table 3.6-13. The differences between the two settings reflect a general increase in modeled releases. This modeled circumstance reflects the different resulting storage operation between the two settings, as seen in Figure 3.6-3. In most circumstances, the alternative setting storage at San Antonio Reservoir would be higher than projected for the base setting during the same period. This circumstance could lead to an occasionally greater modeled release for the alternative setting, which is reflected in the results. As described above, the model will overestimate the frequency and magnitude of releases from San Antonio Reservoir, and the actual releases from San Antonio Reservoir in any setting and the difference between settings are expected to be minor.

Flow below the confluence of Alameda and San Antonio Creeks is influenced by releases from San Antonio Creek and flow arriving at the location from Alameda Creek, which includes upstream impairment by SFPUC operations and facilities. Table 3.6-14 illustrates the flow below the confluence for the alternative and WSIP settings, and the differences in flow between the two. The difference in flow between the alternative and WSIP settings at this location are the net sum of the differences identified for flow reaching the location from Alameda Creek and San Antonio Creek. The difference in flow from upstream in Alameda Creek has previously been identified as non-substantial. Along with the conclusion that flow differences in San Antonio Creek are non-substantial, modeled differences below the confluence are also considered non-substantial.

Table 3.6-15 illustrates the same information in comparing the alternative and base settings. Table 3.6-15 illustrates the larger differences in flow that would occur between the alternative and base settings. Those differences are particularly due to the effects of the restoration of Calaveras Reservoir operating capacity and the fuller San Antonio Reservoir in the alternative setting (if the fuller reservoir has any effect on steam releases).

3.7 Crystal Springs and San Andreas Reservoirs

There are differences in Crystal Springs Reservoir operations between the WSIP setting and the alternative and base settings. Figure 3.7-1 illustrates a chronological trace of the simulation of Crystal Springs Reservoir storage and stream releases from Crystal Springs Dam. Shown in Figure 3.7-1 are the results for the WSIP, alternative, and base settings. Fundamental to the difference in storage operations between the WSIP setting and the alternative and base settings is the restoration of reservoir operation capacity in the WSIP setting, which does not occur in the alternative or base settings.[8] The result is the operation of Crystal Springs Reservoir at a lower maximum storage in the alternative and base settings. A second difference in Crystal Springs Reservoir storage between the alternative and WSIP setting is caused by the interaction of the increased demand served by the system's resources (a net 265 mgd for the alternative and a net 290-mgd demand for the WSIP in many years), which tends to lessen the operation range of the reservoir in the alternative setting. Replenishment of Crystal Springs Reservoir storage (as well as other Bay Area reservoirs) would be accelerated with less system-wide demand to serve. The alternative setting would provide less carry-over storage at Crystal Springs Reservoir into periods of drought, and thereby cause additional draw from other resources to serve the same delivery. The magnitude of the draw of storage from Crystal Springs Reservoir is partially dependent on the discretionary assumptions of the model that proportion the use of storage among the Bay Area system reservoirs. In actual operations, some of the differences in result may not occur as system operators and prevailing hydraulic and hydrologic conditions may direct the operational effect of the different demand to an alternative apportionment of effect among the reservoirs. However, operation strategy prefers the retention of storage in the Peninsula Reservoirs, similar to the strategy used by the model. Figure 3.7-2 illustrates the average monthly storage in Crystal Springs Reservoir for the 82-year simulation, and the range in storage for each month for the alternative and WSIP settings.

[8] The Lower Crystal Springs Dam Improvements (LCSDI) project is included in the alternative, but was not modeled. With the LCSDI project included in the alternative the hydrologic effects at Crystal Springs Reservoir would be comparable to the WSIP setting.

Figure 3.7-1

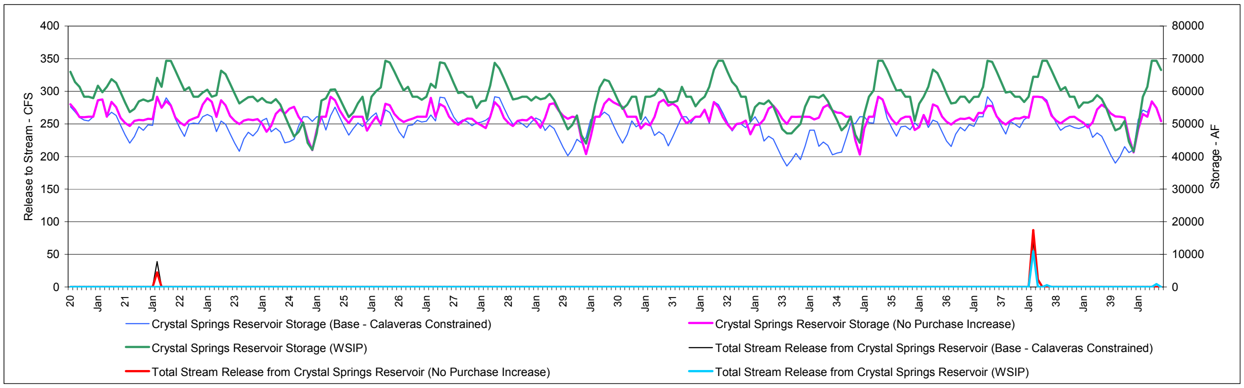
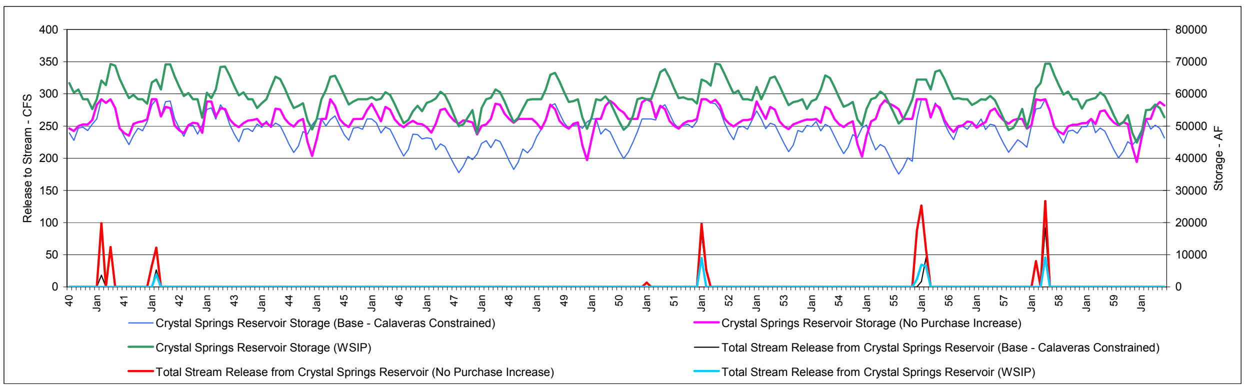
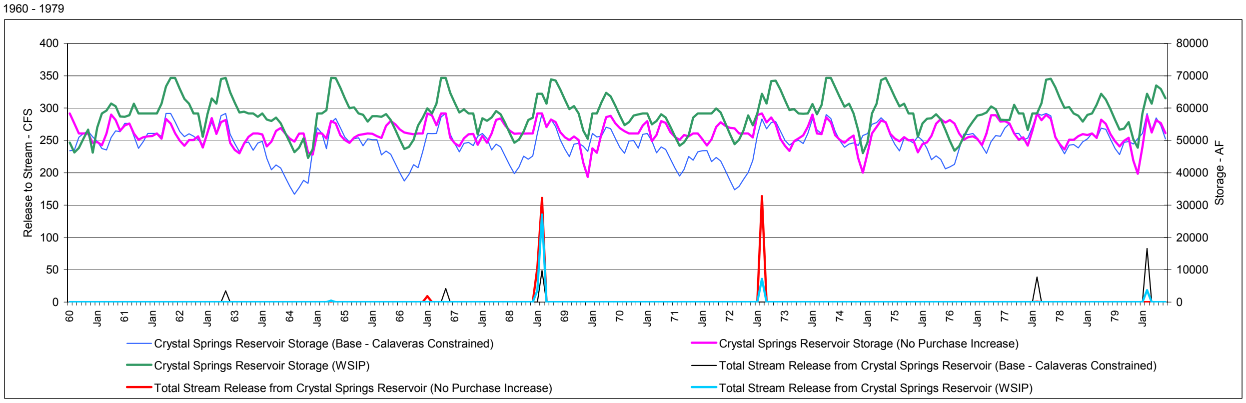
1920 - 1939



1940 - 1959



1960 - 1979



1980 - 2002

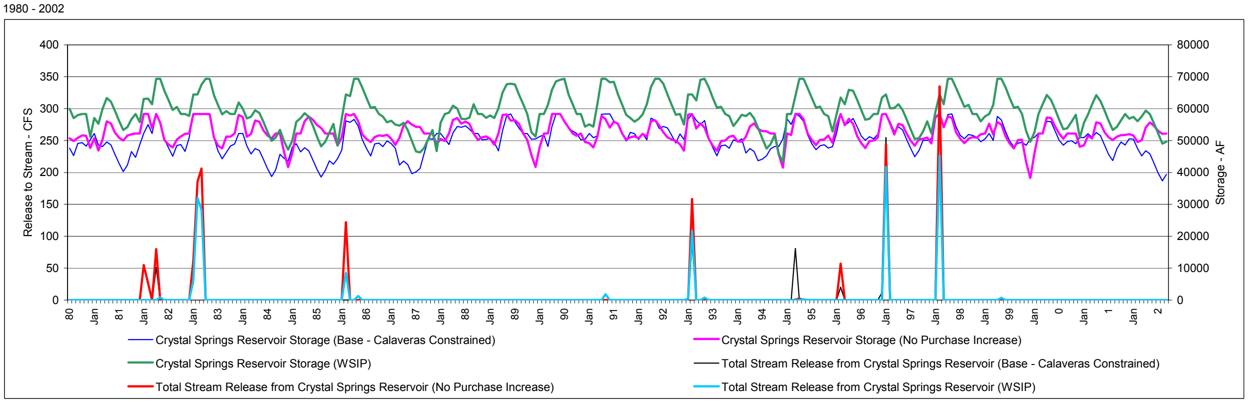


Figure 3.7-2

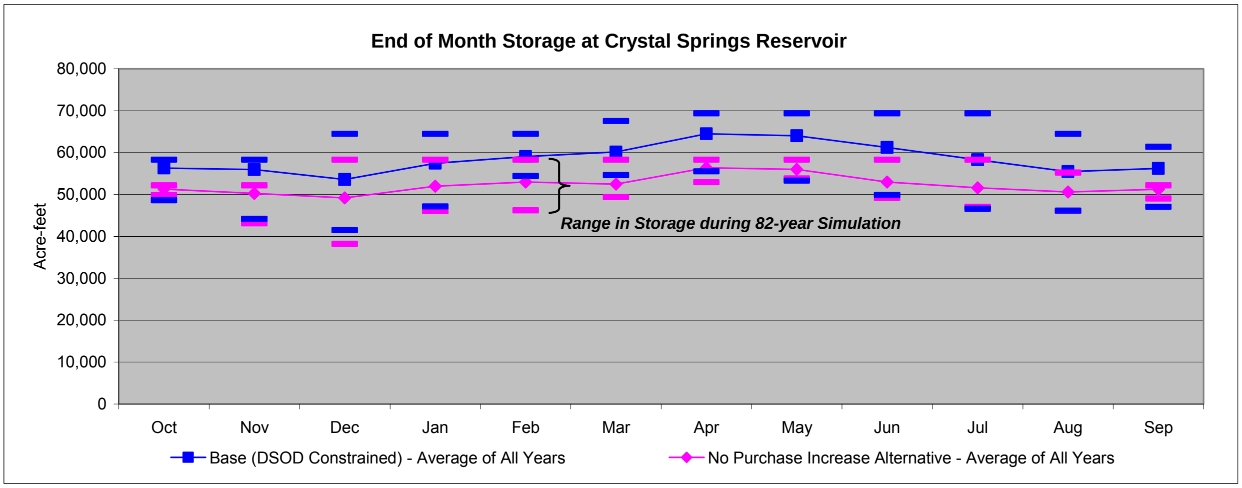

Figure 3.7-3 illustrates the average monthly storage in Crystal Springs Reservoir for the 82-year simulation, and the range in storage for each month for the alternative and base settings. The alternative setting would result in reservoir storage operating at a slightly higher average storage during some months, and the range of operating storage would typically be smaller in the alternative setting.

Figure 3.7-3

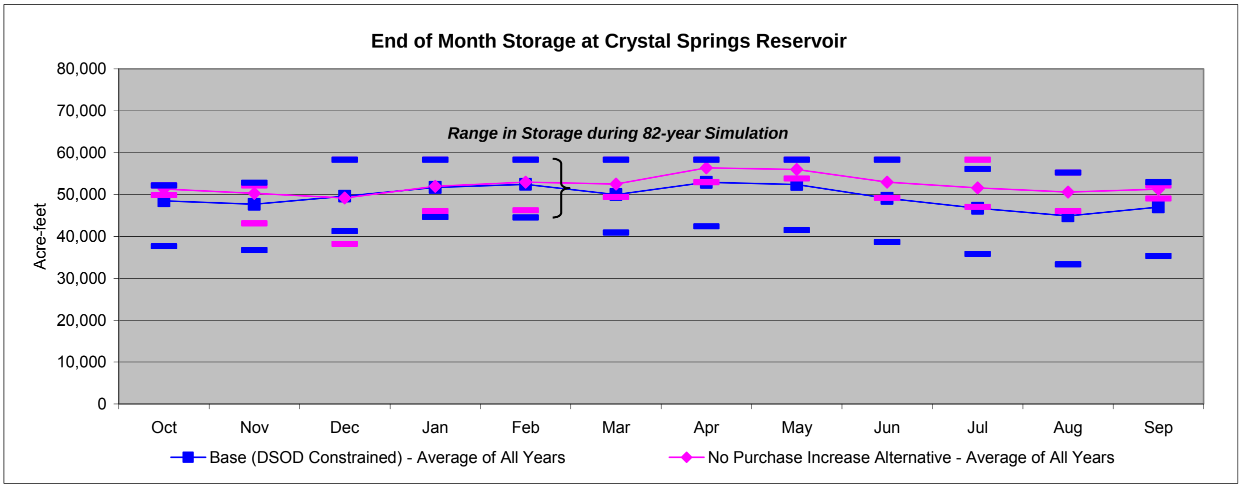

Table 3.7-1 illustrates the modeled alternative and WSIP stream releases from Crystal Springs Reservoir and the differences between the two settings. Modeling results indicate that an increase in the occasional release could occur. The potential difference is attributed to a narrower operating range of reservoir storage in the alternative setting. This narrower range in storage would lead to a greater potential for stream releases. In actual operations, it is anticipated that system operators would manage the reservoir system such that stream releases would be minimal under any setting, with the effect of essentially no difference would occur between the alternative and WSIP settings. Similarly, Table 3.7-2 illustrates the stream releases for the alternative and base settings, and the difference in modeled flows between the two settings. A lesser draw down in Crystal Springs Reservoir storage associated with the alternative setting would lead to a decreased potential to regulate reservoir inflow, which would lead to additional risk in needing to make stream releases. However, as described above, actual system operations would attempt to minimize releases under any setting; thus, the difference in releases between the alternative and base setting would be minimal, if any.

Reservoir storage at San Andreas Reservoir would follow a systematic filling and lowering each year; however, there would be slight differences in draw down between the alternative and WSIP settings, primarily due to the coincidence of the effects of different system-wide maintenance and differing water demands within each setting. Figure 3.7-4 illustrates a chronological trace of the simulation of San Andreas Reservoir storage and stream releases from San Andreas Dam. Shown in Figure 3.7-4 are the results for the WSIP, alternative, and base settings. There are no projected stream releases from San Andreas Reservoir in any setting. Compared to the base setting, Figure 3.7-4 illustrates the difference in storage operation every fifth year for the WSIP and alternative settings. These operations are the result of Hetch Hetchy conveyance maintenance, which is assumed to occur systematically in the alternative and WSIP settings. The maintenance constrains the amount of Hetch Hetchy water supplied to serve water demands in the Bay Area. As discussed previously, during these winter periods, the Bay Area reservoir system accommodates the reduction in imported supply by serving the Bay Area water deliveries with the local watersheds' runoff and storage. At San Andreas Reservoir, the serving of water demand affects the reservoir when additional required water production at Harry Tracy WTP associated with WSIP or the alternative exceeds the ability to maintain San Andreas Reservoir storage with pumping from Crystal Springs Reservoir. In the modeling, the conveyance capacity from Crystal Springs Reservoir is assumed to be same among all of the settings. The additional water demand of the WSIP and alternative require additional production from Harry Tracy WTP to be drawn from San Andreas Reservoir.

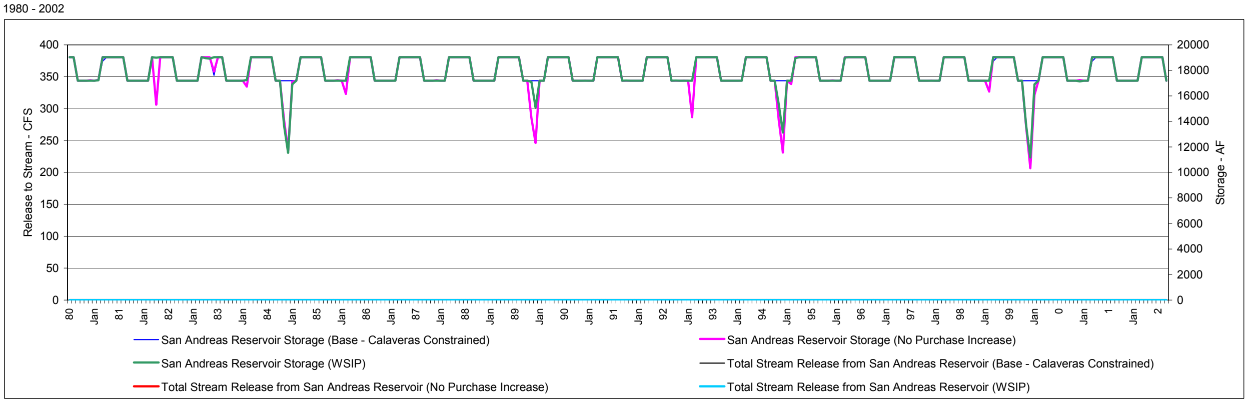

Figure 3.7-5 illustrates the average monthly storage in San Andreas Reservoir for the 82-year simulation, and the range in storage for each month for the alternative and base settings.

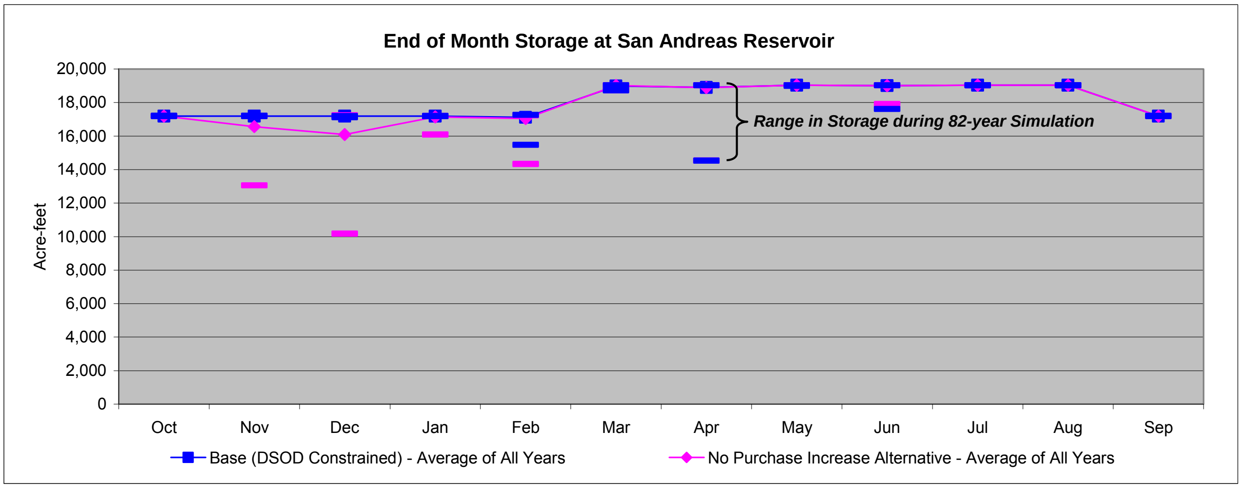
Figure 3.7-5



3.8 Pilarcitos Reservoir

Coastside CWD's water demand and its SFPUC delivery would slightly increase within the WSIP planning horizon of year 2030. Recognizing the current physical constraints to deliveries from the SFPUC to Coastside CWD and the ongoing planning activities in the watershed, the precise means of serving Coastside CWD's additional deliveries and the resultant potential changes to the operation of SFPUC facilities and their affected environs are uncertain.[9]

Assuming a range of potential means to serve the additional delivery from Coastside CWD, the following potential hydrologic effects to SFPUC facilities and their affected environs were identified:

- Due to limited yield from Pilarcitos Reservoir, additional diversions would be required from Crystal Springs Reservoir.
- If deliveries to Coastside CWD from Pilarcitos Reservoir increase during the winter season, these deliveries could potentially reduce storage in Pilarcitos Reservoir, thereby potentially reducing diversions to the San Mateo Creek watershed. Although the increased delivery would increase releases to Pilarcitos Creek from Pilarcitos Dam for a period of time, the increase would subsequently lead to a reduction in spills past Stone Dam.
- Additional wintertime deliveries could also potentially impair the ability to provide carry-over storage into the summer season from Pilarcitos Reservoir, and subsequently lead to an acceleration of the beginning of the season when releases to Pilarcitos Creek from Pilarcitos Reservoir consist only of the passage of reservoir inflow.
- An increase in summertime deliveries from Pilarcitos Creek could also accelerate the beginning of the season when releases to Pilarcitos Creek from Pilarcitos Reservoir consist only of the passage of reservoir inflow.

In the No Purchase Request Alternative, Coastside CWD's water delivery is anticipated to slightly increase to its maximum allotment, but would be less than in the WSIP setting. Hydrologic effects to the Pilarcitos Creek watershed would be less than in the WSIP setting.

---

[9] See "Analysis of SFPUC Pilarcitos/Coastside County Water District Operations", Daniel B. Steiner, March 8, 2007.

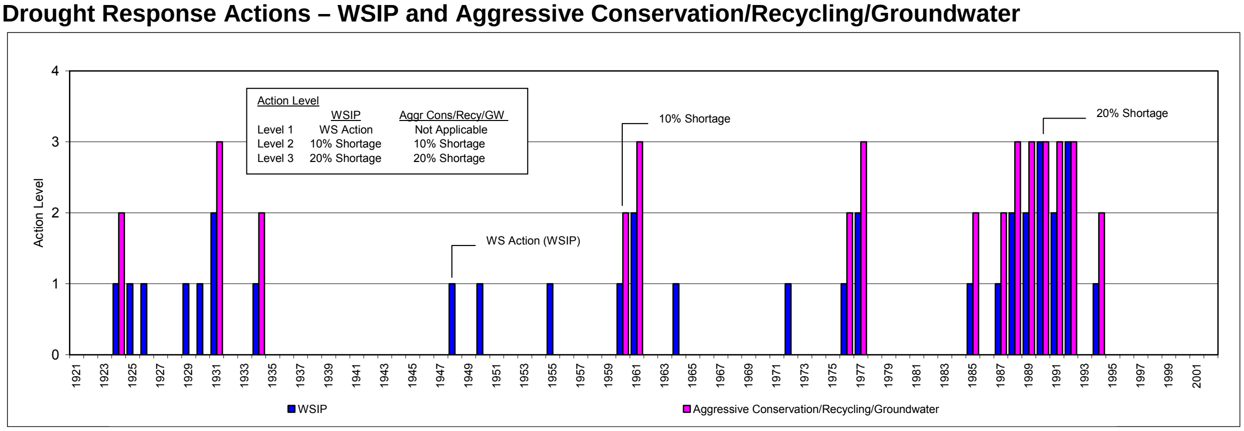
4. CEQA Alternative 3 – Aggressive Conservation/Recycling/Groundwater

CEQA Alternative 3 – Aggressive Conservation/Recycling/Groundwater Alternative would serve an increase in customer purchases from 265 mgd in 2005 to 300 mgd in 2030, met in large part through additional water conservation, water recycling, and groundwater programs beyond those already assumed in the 2030 demand projections. A total of 19 mgd of the demand is assumed to be met through regional recycled water, groundwater, and conservation projects within the regional service area, but outside of San Francisco. These projects are in addition to the 10 mgd of groundwater development, recycled water projects, and conservation in San Francisco (referred to herein as RRGWC) included in the WSIP and also incorporated into this alternative. The alternative would result in an average annual net demand on the regional system of 271 mgd compared to a net demand of 290 mgd in the WSIP setting, and compared to an average annual demand of 265 mgd for the base setting. The increased net water demand would be served through additional Tuolumne River diversions and increased use of local watershed supplies from restoration of Calaveras Reservoir. Compared to the WSIP setting, the alternative would not include supplemental supplies from implementation of the Westside Basin Groundwater Program, water transfers with the TID/MID, or water supply associated with restoration of Lower Crystal Springs Dam.[10] All other WSIP facility improvement projects would be implemented.

4.1 Water Deliveries and Drought Response Actions

Compared to the WSIP setting, the regional system's resources are required to serve a net 271-mgd demand (300 mgd purchase request less 10 mgd of RRGWC and 19 mgd from projects within the region but not in San Francisco) instead of a net 290-mgd demand. However, the alternative does not provide relatively comparable supplemental water supplies for the lesser demand, and requires a more frequent implementation of rationing and severity of rationing from the SFPUC system during drought periods. The shortages that SFPUC customers would experience in supply from the SFPUC system in the future would be in a setting where the region would have already developed some portion of the 19 mgd included in this alternative as a system resource. Development of these projects might affect the ability of SFPUC customers to cope with projected shortages in SFPUC supplies. Table 1-1 illustrates the comparison of the drought response actions for the proposed program and the alternative. Figure 4.1-1 illustrates the occurrence of drought response actions for the simulated 82-year historical period (1921-2002).

Figure 4.1-1
Drought Response Actions – WSIP and Aggressive Conservation/Recycling/Groundwater



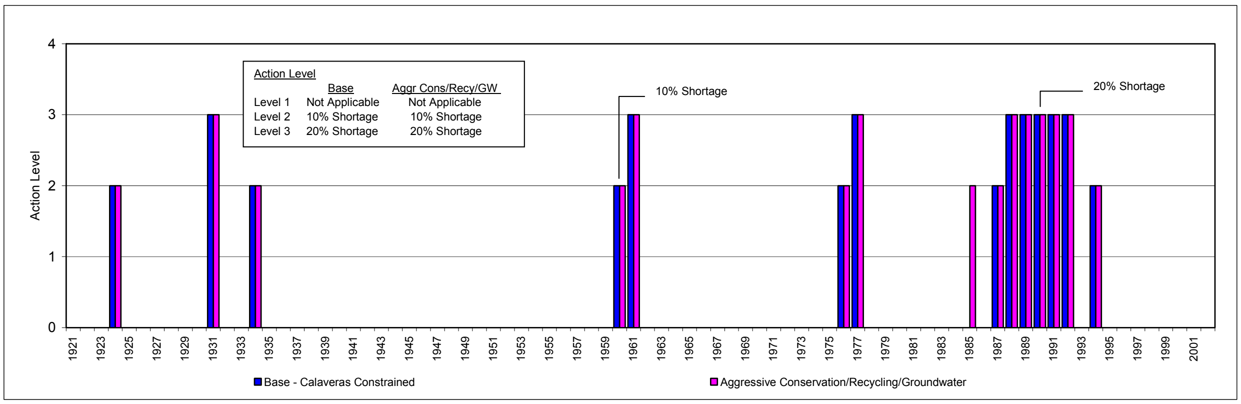
In Figure 4.1-1, years with bars showing a "1" or greater level of action indicate periods when a supplemental water supply action is initiated. In the WSIP setting, the water supply action is the use of the Westside Groundwater Basin Program to supplement SFPUC water deliveries. Also occurring in the WSIP setting is the water transfer supplemental supply from MID/TID. In the alternative setting, no supplemental water supply action is available, and only water delivery shortage (rationing) measures are available. Action levels greater than "1" indicate the imposition of delivery shortages to SFPUC

[10] The Lower Crystal Springs Dam Improvements (LCSDI) project is also included in this alternative; however, it was not included in the HH/LSM modeling.

customers. In both settings, the shortage measure is applied during level 2 (10 percent) and level 3 (20 percent), although they are applied to different levels of water demand. In the alternative, the system's net water demand is 271 mgd, and in the WSIP setting the net water demand is 290 mgd. SFPUC customers would experience more frequent periods of shortages, and the severity of shortages (percentage-wise) would increase.

The same form of information is shown in Figure 4.1-2 in comparing the alternative and "Base - Calaveras Constrained" (existing) settings. There is no level 1 action level in either the base or alternative setting. Without supplemental resources, both settings only have delivery shortage measures available to cope with drought. In the base setting, the shortage measure is imposed during level 2 (10 percent) and level 3 (20 percent). During this simulation period, rationing above 20 percent is not required in either setting; however, in the alternative setting, the frequency of water delivery shortages increases. The applied shortages (percentage-wise) occur to two different levels of net water demand.

Figure 4.1-2
Drought Response Actions – Base and Aggressive Conservation/Recycling/Groundwater



Not illustrated in Figure 4.1-2 but shown in Table 1-1 are the delivery shortages anticipated during the entire SFPUC Design Drought. During the Design Drought, the base setting does not have a viable operation without exceeding a 20-percent shortage level. The base setting exceeds the 20-percent shortage level (requires 25 percent rationing) during the last 18 months of the Design Drought. The alternative would viably provide deliveries without exceeding a 20-percent shortage level. However, the alternative would require 4 years of greater shortages (percentage-wise) than the WSIP setting during the Design Drought.

The difference in water deliveries between the proposed program and the alternative is shown chronologically for the 82-year simulation in Table 4.1-1. Less water would be delivered to the region by the SFPUC in all years, a result of serving a lesser net water demand (275 mgd instead of 290 mgd).

Comparing the alternative setting to the base setting, Table 4.1-2 illustrates the difference in water deliveries between the two settings. The increases in deliveries indicate the SFPUC system serving a larger net demand in the alternative setting (271 mgd) compared to the base setting (265 mgd). The one notable reduction in deliveries occurs during 1985 when the alternative setting requires rationing and the base setting does not.

Table 4.1-1

Difference in Total System-wide Delivery (MG)

Aggressive Conservation/Recycling/Groundwater minus WSIP

4.2 Diversions from Tuolumne River

The metric for illustrating the SFPUC diversion from the Tuolumne River Basin (Tuolumne) is the flow through the San Joaquin Pipeline (SJPL). Inherent to this alternative setting is a net water demand slightly greater than the base setting, which is less than the demand served by the proposed program. Table 4.2-1 illustrates the difference in diversions to the SJPL between the proposed program and the alternative settings. In both settings, the conveyance capacity of the SJPL is increased compared to the base setting. During the summer, the SJPL would essentially operate at the same maximum rate in both the alternative and WSIP settings to minimize draw down of Bay Area reservoir storage. A few exceptions occur during the summer of drought periods when the alternative is serving a lesser net demand than in the WSIP setting. Overall, compared to the WSIP setting, the alternative setting would divert less water from the Tuolumne, primarily due to the lesser net water demand place on the system.

Table 4.2-2 illustrates the difference in diversions to the SJPL between the alternative and base settings. Evident in the operation is the increase in summer diversions associated with an increase in the conveyance capacity of the SJPL. As described above, with the increase in SJPL conveyance capacity, summer diversions would increase to retain storage in the Bay Area reservoirs. Because the demand of the alternative is approximately the same as the base setting, the increase in summer diversions to the SJPL result in reduced diversions during the late summer and fall. The differences in December diversions are largely the result of maintenance occurring in the alternative setting (lessening available conveyance capacity), which does not occur in the base setting. The increased diversion during the winter and spring result from the need to replenish Bay Area reservoir storage after the maintenance, and then top off Bay Area reservoir storage prior to summer. Overall, there would be an increase in average annual diversions to the SJPL in the alternative setting, which is predominantly associated with the increase in net water demand.

The average monthly diversion through the SJPL by year type for the 82-year simulation for the proposed program and the alternative settings and the difference between the two settings is illustrated in Table 4.2-3. Table 4.2-4 illustrates the same information for the alternative and base settings.

Table 4.2-1

Difference in Total SJPL (Acre-feet) Aggressive Conservation/Recycling/Groundwater minus WSIP

4.3 Hetch Hetchy Reservoir and Releases

Compared to the WSIP setting, the alternative setting would draw less water from the Tuolumne due to the lesser net demand. This circumstance would lead to less draw from Hetch Hetchy Reservoir in all years. Figure 4.3-1 illustrates a chronological trace of the simulation of Hetch Hetchy Reservoir storage and stream releases. Shown in Figure 4.3-1 are the results for the WSIP, alternative ("Aggressive Conservation/Recycling/Groundwater"), and base ("Base – Calaveras Constrained") setting. Supplementing the Figure 4.3-1 representation of Hetch Hetchy Reservoir storage are Table 4.3-1 Hetch Hetchy Reservoir Storage (Aggressive Conservation/Recycling/Groundwater), Table 4.3-2 Hetch Hetchy Reservoir Storage (WSIP), and Table 4.3-3 Difference in Hetch Hetchy Reservoir Storage (Aggressive Conservation/Recycling/Groundwater minus WSIP). Table 4.3-4 is provided to illustrate the difference in Hetch Hetchy Reservoir storage between the base and alternative settings.

Table 4.3-3 illustrates that, by the end of summer, storage in Hetch Hetchy Reservoir associated with the alternative setting would be equal to or greater than the storage in the WSIP setting, albeit typically below 3,000 acre-feet. In about 20 percent of the years, storage would be greater by 3,000 acre-feet or more. The relatively minor increases in storage are attributable to years when summer diversions are the same in both settings (SJPL operating at maximum capacity) but less water is being diverted in the fall due to the lesser water demand. The larger increases in storage are associated with drought periods during which the differences in underlying demand and water delivery shortages between the WSIP and alternative settings are greater.

Through the fall and winter, storage in Hetch Hetchy Reservoir would be the same or higher. Hetch Hetchy Reservoir would fill by the end of May or June during approximately 89 percent of the years, which would negate any difference in storage from carrying into the next summer. Figure 4.3-2 illustrates the difference in reservoir storage averaged by year type for the comparison of the alternative to the WSIP setting. Also shown is the average difference in storage for the two settings during the 82-year simulation.

Table 4.3-4 illustrates the difference in Hetch Hetchy Reservoir storage between the alternative and base settings. Immediately after Hetch Hetchy Reservoir is filled (May or June, and then continuing through July), there would only be occasional differences in storage at the reservoir, typically a decrease of less than 10,000 acre-feet. This indicates that the same amount of water is being passed through the reservoir, regardless of the size of the conveyance capacity of the SJPL. Water not diverted to the SJPL would return to the Tuolumne River and flow to Don Pedro Reservoir. In the late summer and early fall, there would consistently be a slight difference (lower) in storage levels between the two settings as additional diversions to the SJPL would retain Bay Area reservoir storage. Some of this additional storage depletion would be ameliorated later in the fall and into winter as SJPL diversions are reduced due to lower Bay Area reservoir replenishment needs and less conveyance system maintenance. Storage becomes greater in November and December of the alternative setting due to the assumed system-wide maintenance that occurs in the alternative and does not occur in the base setting. Subsequent to December, the storage gain occurring in the alternative setting again becomes affected as replenishment of Bay Area reservoir storage resumes. In non-wetter years, there is a difference in storage between the alternative and base settings; the alternative setting results in a lower storage in the reservoir by the end of April. Figure 4.3-3 illustrates the difference in reservoir storage averaged by year type for the comparison of the alternative to the base setting. Also shown is the average difference in storage for the two settings during the 82-year simulation. Figure 4.3-4 illustrates the average monthly storage in Hetch Hetchy Reservoir for the 82-year simulation, and the range in storage for each month for the variant and base settings.

The difference in storage in Hetch Hetchy Reservoir attributed to the diversion effects of the alternative would manifest in differences in releases from O’Shaughnessy Dam to the stream. A different amount of available reservoir space in the winter and spring due to the alternative would lead to a different ability to regulate inflow, thus potentially changing the amount of water released to the stream in excess of minimum release requirements. Figure 4.3-1 illustrates the stream release from O’Shaughnessy Dam for the WSIP, alternative, and base settings. Table 4.3-5 illustrates the difference in stream releases between the alternative and WSIP settings. Compared to the WSIP setting, the alternative exhibits an incrementally greater stream release, predominantly during May or June, which reflects the months when releases to the stream above minimum release requirements are made in anticipation of the reservoir being filled. The exceptions to this circumstance during which incrementally larger reductions in releases to the stream occurs are considered anomalous within modeling, the results of only shifting releases from one month to the next. The increase in releases is the result of a less depleted reservoir, which is the result of lesser demands between the settings.

Table 4.3-6 illustrates the difference in stream release between the alternative and base settings. In this comparison, releases could be either greater or lesser than depicted for the base setting, and these differences would occur predominantly during May or June. Generally, Hetch Hetchy Reservoir storage would be slightly lower during non-wetter years, leading to a reduction in stream releases during non-wetter years if a release occurs. During wetter years, the releases are projected to increase. The differences, either increases or decreases are a result of the coincidence of the several parameters affecting the release of water from the reservoir, including system-wide water demands, conveyance capacity and maintenance assumptions, and the watershed’s hydrology.

Table 4.3-5 illustrates the difference in stream release between the alternative and WSIP settings, expressed in terms of a monthly volume (acre-feet) of flow. Table 4.3-7 illustrates the same information and the average monthly stream release for the alternative and WSIP setting, expressed in average monthly flow (cfs). Table 4.3-5 illustrates that the difference in monthly flow below O’Shaughnessy Dam could range up to an increase of approximately 51,000 acre-feet. Considering the manner in which releases are determined and made to the stream, quantifying the effect of these changes in terms of

average monthly flow (cfs) is not always meaningful.[11] When comparing the alternative to the WSIP setting, a change in the volume of release from O'Shaughnessy Dam to the stream would likely result in the initiation of the release being delayed or initiated earlier by a matter of days. Typical spring-time releases, when initiated, amount to a release up to 3,000 cfs (approximately 6,000 acre-feet over the span of a day). Assuming that a change in release volume equates to a delay or an earlier initiation of releasing 6,000 acre-feet per day, the difference in stream release between the alternative and WSIP would be up to an additional 8 days of release. Normally, the effect of this change in release would not affect the year's peak stream release rate during a year. Table 4.3-8 illustrates the average monthly stream release for the alternative and base setting, and differences, expressed in average monthly flow (cfs). Table 4.3-6 illustrates that the difference in monthly flow below the dam between the alternative and base settings could range from an increase of approximately 18,000 acre-feet to a decrease of approximately 29,000 acre-feet. Using the same metric as described above to estimate the delay or addition in the number days of release to the stream, the alternative could lead to an effect ranging from an increase of 3 days of release to a decrease of up to 5 days, compared to the base setting.

[11] See "Estimated Effect of WSIP on Daily Releases below Hetch Hetchy Reservoir", Memorandum by Daniel B. Steiner, December 31, 2006.

4.4 Lake Lloyd and Lake Eleanor

Compared to the operation of the WSIP, the operation of Lake Lloyd and Lake Eleanor are simulated to be only slightly different for the alternative. Figure 4.4-1 illustrates a chronological trace of the simulation of Lake Lloyd storage and stream releases. Shown in Figure 4.4-1 are the results for the WSIP, alternative, and base settings. The operation resulting from the alternative is essentially the same as for the WSIP setting, including during drought. The level of delivery between the alternative and base settings is close to the same (net demand of 271 mgd compared to 265-mgd demand) during the 1987-1992 drought, but there is a slightly greater draw from Hetch Hetchy Reservoir in the alternative setting compared to the base setting. The additional draw of water reduced the amount of water released from Hetch Hetchy Reservoir to Don Pedro Reservoir in the alternative setting, which, for satisfaction of MID/TID entitlements to inflow, was met with additional releases from Lake Lloyd, slightly more than in the base setting; thus, Lake Lloyd is slightly lower during this period in the alternative setting. Otherwise, the results for Lake Lloyd storage are essentially the same between the WSIP, base, and alternative settings.

Figure 4.4-2 illustrates the almost identical operation of Lake Eleanor for the alternative and WSIP settings. Also shown in Figure 4.4-2 is the operation for the base setting. Any difference that occurs in the Lake Eleanor operation would be caused by a small change in operation at Lake Lloyd that would affect the operation of the Cherry-Eleanor Tunnel between the two watersheds. Any difference that occurs in the simulations is more associated with modeling discretion that with any substantive difference in operation.

Supplementing the Figure 4.4-1 representation of Lake Lloyd stream releases is Table 4.4-1, illustrating releases for the alternative and WSIP settings, and the difference in releases between the two settings. Table 4.4-2 provides the same form of information for the alternative and base settings. With essentially no change in reservoir operations, stream releases would not be different.

4.5 Don Pedro Reservoir and La Grange Releases

A change in Don Pedro Reservoir operation is caused by changes in inflow to the reservoir. The changes in inflow to the reservoir are the result of net changes within the operation of the upstream SFPUC facilities described previously, and other changes in SFPUC operations associated with diversions to the Holm, Kirkwood, and Moccasin Powerhouses. Figure 4.5-1 illustrates a chronological trace of the simulation of Don Pedro Reservoir storage and Tuolumne River stream releases from La Grange Dam. Shown in Figure 4.5-1 are the results for the WSIP, alternative, and base settings.

Supplementing the Figure 4.5-1 representation of Don Pedro Reservoir storage are Table 4.5-1 Don Pedro Reservoir Storage (Aggressive Conservation/Recycling/Groundwater), Table 4.5-2 Don Pedro Reservoir Storage (WSIP), and Table 4.5-3 Difference in Don Pedro Reservoir Storage (Aggressive Conservation/Recycling/Groundwater minus WSIP). Table 4.5-4 is provided to illustrate the difference in Don Pedro Reservoir storage between the base and alternative settings.

Table 4.5-3 illustrates that, throughout many years, the storage in Don Pedro Reservoir associated with the alternative setting would differ from the storage in the WSIP setting, and this difference would almost always be more storage. Table 4.5-4 illustrates that the alternative setting results for Don Pedro Reservoir storage are close to the storage results depicted for the base setting, although typically lower than the base setting. Compared to the WSIP setting, the differences in storage indicate increases to the inflow of Don Pedro Reservoir that are due to lesser demands and SJPL diversions in the alternative setting. The increases in inflow typically occur during the winter through early summer. Compared to the base setting, the alternative would result in typically less inflow to Don Pedro Reservoir and the accumulation of less storage over multiple years.

Figure 4.5-1 and Table 4.5-4 illustrate that, during drought sequences, reduction in inflow to Don Pedro Reservoir can accumulate from year to year. Compared to the base setting, the alternative would result in lower Don Pedro Reservoir storage during drought periods. Figure 4.5-2 illustrates the difference in reservoir storage averaged by year type in comparing the alternative to the WSIP settings. Also shown is the average difference in storage for the two settings during the 82-year simulation. Figure 4.5-3 illustrates the same information in comparing the alternative and base settings.

Figure 4.5-2

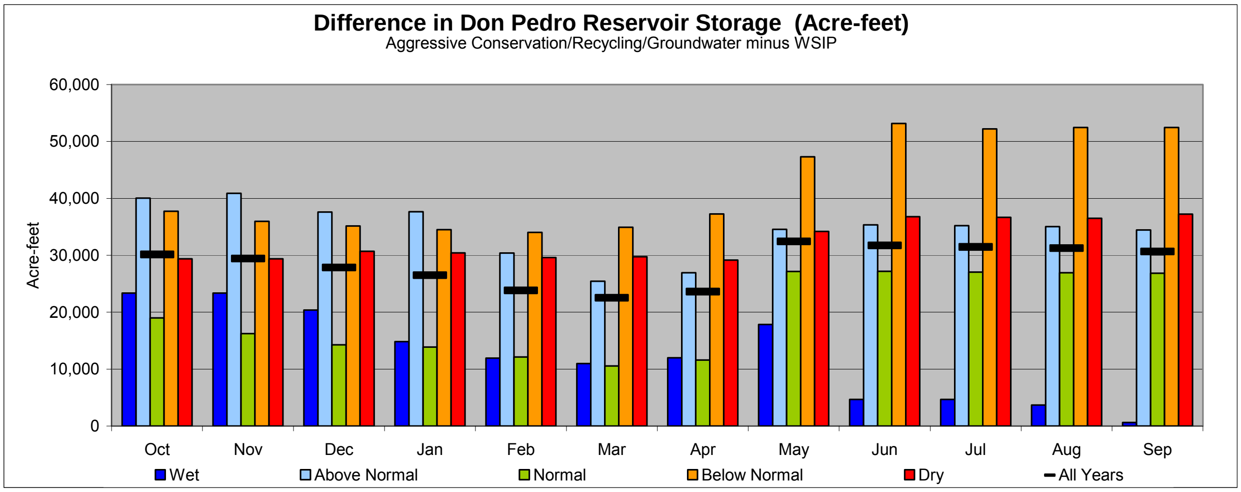

Figure 4.5-3

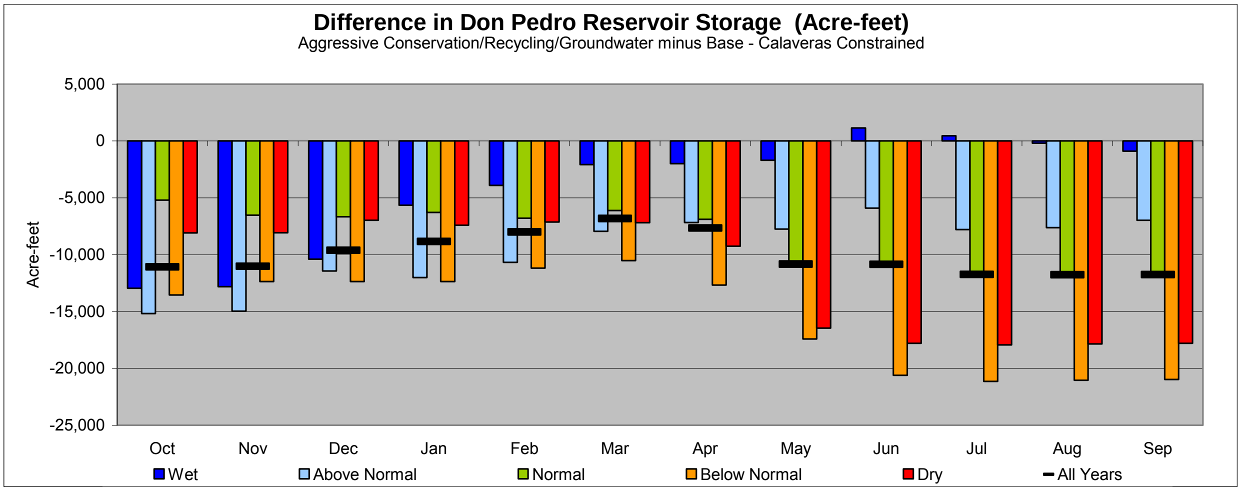

Figure 4.5-4 illustrates the average monthly storage in Don Pedro Reservoir for the 82-year simulation, and the range in storage for each month for the alternative and base settings.

The difference in storage in Don Pedro Reservoir attributed to the upstream effects of the alternative would manifest in differences in releases from La Grange Dam to the stream. A different amount of available reservoir space in the winter and spring due to the alternative would lead to a different ability to regulate inflow, thus potentially changing the amount of water released to the stream that is above minimum release requirements. During periods when inflow differs and Don Pedro Reservoir is at maximum storage capacity within the flood control storage limitation, a change in inflow directly manifests as a change in release from La Grange Dam (a change of either more or less flow). Figure 4.5-1 illustrates the stream release from La Grange Dam for the WSIP, alternative, and base settings.

Figure 4.5-4

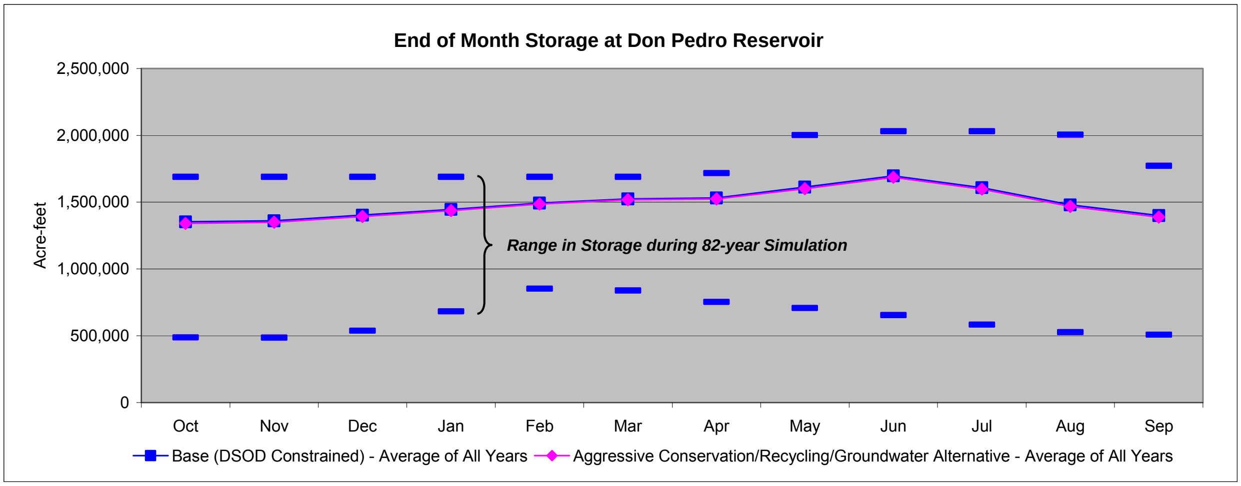

Table 4.5-5 illustrates the difference in stream releases between the alternative and WSIP settings. Compared to the WSIP setting, the alternative exhibits an incrementally larger stream release, predominantly during some months of the early-winter-through-June period, which reflects the months when releases to the stream above minimum release requirements are made due to flood control or in anticipation of the reservoir being filled. Table 4.5-6 illustrates the same information in comparing the alternative and WSIP settings, ranked in descending order of the San Joaquin River Index. Illustrated is the finding that differences in releases to the Tuolumne River from La Grange Dam would occur only when there are releases in excess of minimum FERC flow requirements. This circumstance typically occurs only in above normal and wet years, and predominantly during early winter through June. During other year types and during the summer and fall, releases would be maintained at minimum FERC flow requirements regardless of the setting. Compared to the WSIP setting, the large potential reduction in flow following an extended drought period is reduced with the alternative because the amount of water delivered by the SFPUC during these periods is less than that delivered in the WSIP setting, but is still more than that delivered in the base setting.

As described above concerning Don Pedro inflow and storage, compared to the base setting, the alternative setting would lead to an additional draw of storage due to SFPUC diversions that are greater than in the base setting. Although the reduction in storage would not greatly accumulate, greater replenishment of Don Pedro Reservoir storage is needed in about 38 percent of the years of the 82-year simulation. Occasionally, an increase in releases would occur, due to the shift in timing of SJPL diversions because of the increased conveyance capacity. The effect is an occasional additional release of water from Hetch Hetchy Reservoir in the winter, which then manifests as an additional release from Don Pedro Reservoir. Table 4.5-7 illustrates the difference in stream releases between the alternative and base settings, depicting the predominance of reductions to flow. Table 4.5-8 illustrates the same information ranked in descending order of the San Joaquin River Index.

Table 4.5-5 and Table 4.5-7 illustrate the difference in stream release between the alternative, WSIP, and base settings, expressed in terms of a monthly volume (acre-feet) of flow. Table 4.5-9 illustrates the same information and the average monthly stream release for the alternative and WSIP settings, expressed in average monthly flow (cfs). Table 4.5-10 illustrates the same information in comparing the alternative and base settings. In comparing the alternative to the WSIP setting, the difference in monthly flow below La Grange Dam could range from an increase of approximately 155,000 acre-feet to a decrease of approximately 7,000 acre-feet. Considering the manner in which releases are determined and made to the stream, quantifying the effect of these changes in terms of average monthly flow (cfs) is not always meaningful. Similar to the operation of releases below O'Shaughnessy Dam, a change in the volume of release from La Grange Dam to the stream would likely result in the initiation of the release being delayed or initiated earlier by a matter of days. Assuming that a change in release volume equates to a delay or acceleration of releasing 6,000 acre-feet per day, the difference in stream release from La Grange Dam between the alternative and WSIP would be an additional day of delay in releases

Table 4.5-5

Difference in Total La Grange Release to River (Acre-feet)

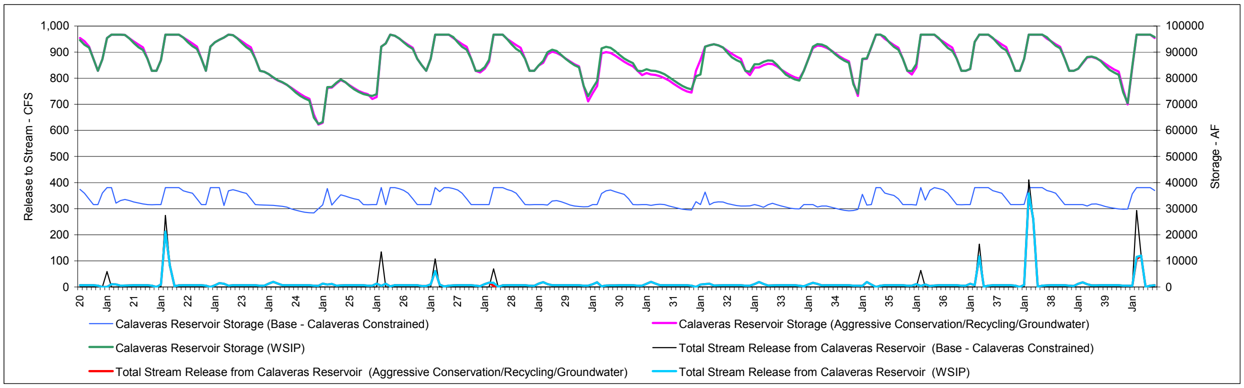
or up to almost an added month of release. Normally, the effect of a change in release would not affect the year's peak stream release rate during a year. However, infrequently, the alternative's effect on stream releases could manifest as an elimination of all flow during a year or as the only provision of flow that occurs in excess of minimum FERC flow requirements. Compared to the base setting, the alternative's effect to stream flow ranges from a reduction in releases (a potential delay in release of 6 days) to an increase in releases (a potential additional 4 days of release).

4.6 Calaveras and San Antonio Reservoirs, Alameda Creek and Downstream

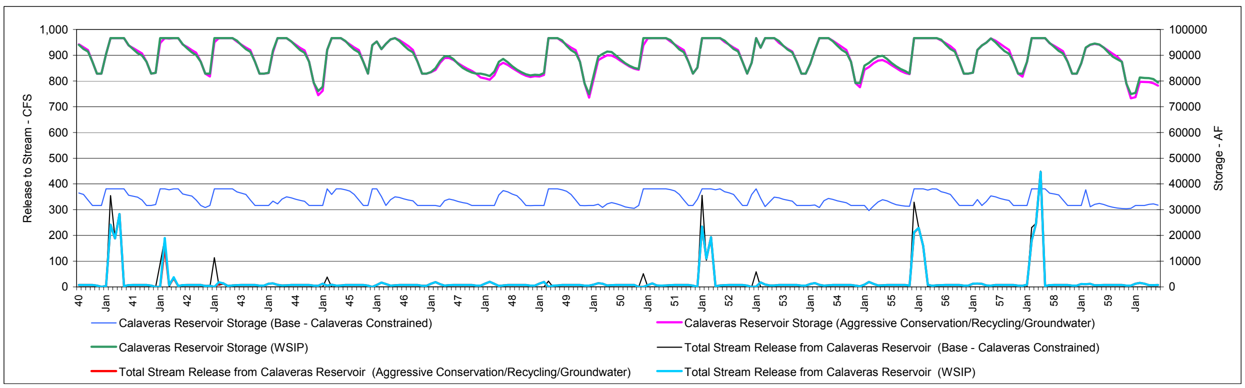
Compared to the WSIP setting, the operation of Calaveras Reservoir in the alternative setting is almost identical. Figure 4.6-1 illustrates a chronological trace of the simulation of Calaveras Reservoir storage and stream releases from Calaveras Dam. Shown in Figure 4.6-1 are the results for the WSIP, alternative, and base settings. Recognizing the different levels of system-wide deliveries served in each setting, the near identical operation of Calaveras Reservoir resulting from the two settings indicates that Calaveras Reservoir operations are mostly influenced by the principles that manage local watershed production. The differences in reservoir operation during the droughts of the 1960s and 1976-1977 are the result of modeling assumptions that balance reservoir storage among SFPUC reservoirs and the selection of the monthly SJPL conveyance rate. It is anticipated that the difference in Calaveras Reservoir operation in actual operations would be minimal, if any.

Figure 4.6-1
Calaveras Reservoir Storage and Stream Release

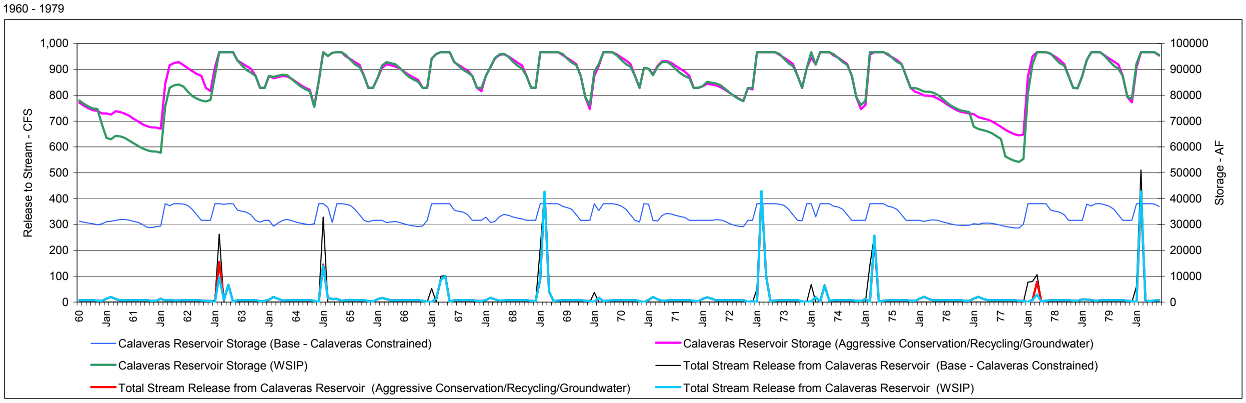
1920 - 1939



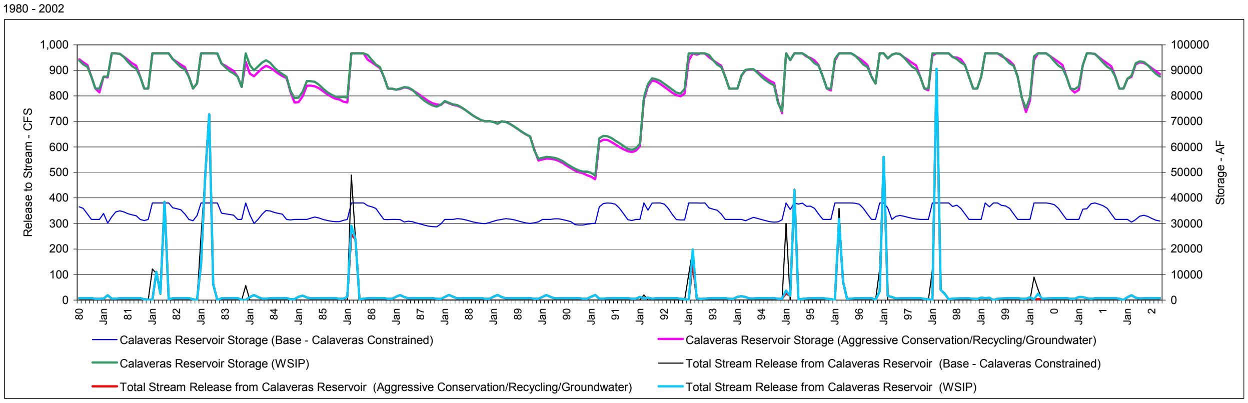
1940 - 1959



1960 - 1979

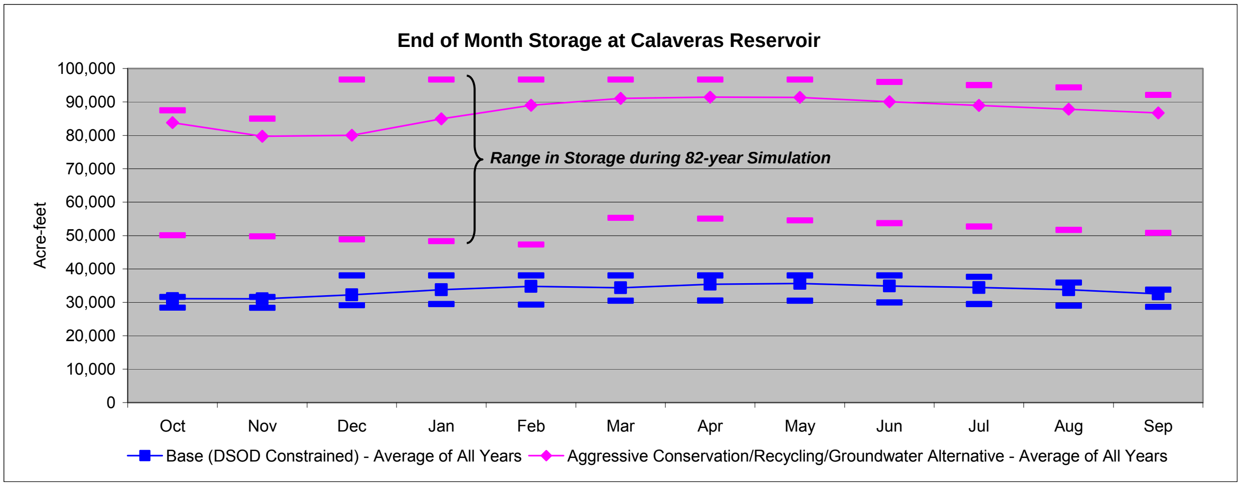


1980 - 2002



The difference in storage between the alternative and WSIP settings and the base setting is due to the restoration of the operational capacity of Calaveras Reservoir. Under both the alternative and WSIP settings, the full capacity of Calaveras Reservoir would be available, and a greater range in storage operation would occur. Figure 4.6-2 illustrates the average monthly storage in Calaveras Reservoir for the 82-year simulation, and the range in storage for each month for the alternative and base settings.

Figure 4.6-2



Compared to the WSIP setting, there would potentially be more or less release to Calaveras Creek below Calaveras Dam in the alternative setting. Both settings have fishery releases that are not included in the base setting. Calaveras Reservoir storage in the alternative setting is sometimes more and sometimes less than in the WSIP setting; however, in either direction, the difference is minor. Table 4.6-1 illustrates the difference in releases to Calaveras Creek between the alternative and WSIP settings (considered non-substantial). Supplementing the Figure 4.6-1 representation of Calaveras Dam stream releases and Table 4.6-1 is Table 4.6-2, illustrating releases for the alternative and WSIP settings, and the difference in releases between the two. Table 4.6-3 provides the same form of information for the alternative and base settings. The notable difference in releases between the alternative and base settings is the addition of the required flows to satisfy the 1997 MOU and the reduction of stream releases during wetter-year/wetter-season flows due to the restoration of Calaveras Reservoir operational capacity.

There would be very little if any difference in Alameda Creek diversions to Calaveras Reservoir in the alternative setting compared to the WSIP setting. With essentially the same storage conditions between the two, there would be no difference in diversions from the Alameda Creek watershed. With no difference in the diversion at Alameda Creek Diversion Dam, flow spilling past the diversion dam would be the same in the alternative setting. Table 4.6-4 illustrates the difference in flow below the Alameda Creek Diversion Dam between the alternative and WSIP settings (considered non-substantial). Table 4.6-5 illustrates the difference in flow below Alameda Creek Diversion Dam between the alternative and base settings. In this comparison, the reduction in flow below the diversion dam is due to the additional diversions to Calaveras Reservoir resulting from the restoration of reservoir operating capacity. Table 4.6-6 and Table 4.6-7 illustrate the flow past the Alameda Creek Diversion Dam, comparing the alternative, WSIP, and base settings by year type and the average of all years.

Table 4.6-1

Difference in Total Stream Release from Calaveras Reservoir (Acre-feet)

Aggressive Conservation/Recycling/Groundwater minus WSIP

Comparing the alternative and WSIP settings, differences in releases from Calaveras Dam to the stream, and differences to spills at Alameda Creek Diversion Dam, would result in differences in flow below the Alameda Creek and Calaveras Creek confluence. Table 4.6-8 illustrates the flow below the confluence for the alternative and WSIP settings. The modeled difference of these parameters has been described above as being non-substantial; thus, the combined effect of the differences at the confluence is considered non-substantial. Fishery releases for the 1997 MOU are assumed in both of the settings. Table 4.6-9 provides the same form of information for the alternative and base settings. The notable differences between the alternative and base settings (comparable to the difference between the WSIP and base settings) are the addition of required stream flows for the 1997 MOU and the reduction of wetter-year/wet season flows due to the restoration of Calaveras Reservoir storage.

A flow recapture facility in Alameda Creek below Calaveras Reservoir is incorporated in the alternative and WSIP settings. This facility is assumed to recapture flows explicitly released from Calaveras Dam for the 1997 MOU. The effect of the recapture is a reduction in the flow that occurs below the confluence of Alameda and Calaveras Creeks, but only to the extent that releases were explicitly made from Calaveras Reservoir for the 1997 MOU. Flows below this diversion have been estimated and noted as the flow above the Alameda and San Antonio confluence. Table 4.6-10 illustrates the flow at this location for the alternative and WSIP settings. The flow changes at this location are consistent with the changes noted for below the confluence of Alameda and Calaveras Creeks. These flow changes are considered non-substantial. Table 4.6-11 provides the same form of information for the alternative and base settings. The flows identified at this location indicate flow occurring below the confluence of Alameda and Calaveras Creeks (described above), with the addition of estimated stream accretions between the Alameda and Calaveras Creek confluence and the Alameda and San Antonio Creek confluence, minus the water assumed to be recaptured (diverted) by the SFPUC from the creek.

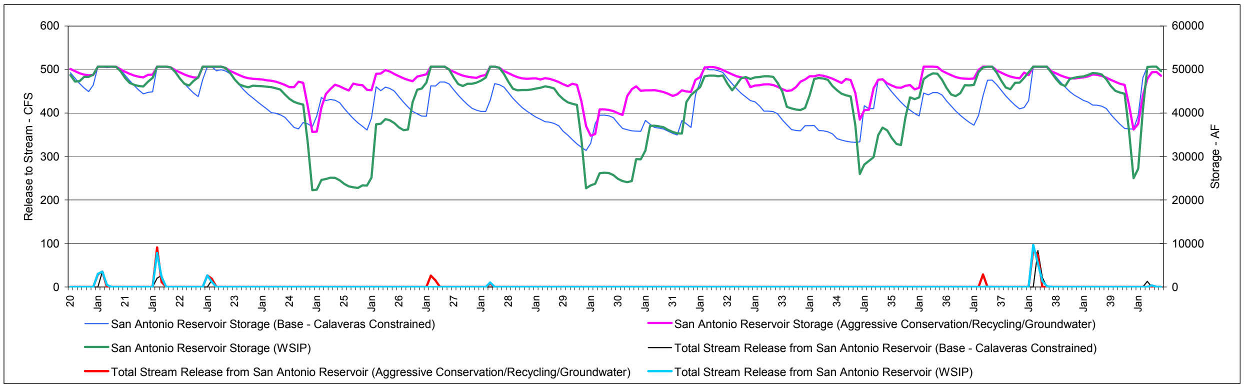
Compared to the WSIP setting, the alternative's San Antonio Reservoir operation would draw less from storage on annual basis, and particularly during cyclic maintenance. Figure 4.6-3 illustrates a chronological trace of the simulation of San Antonio Reservoir storage and stream releases from San Antonio Dam. Shown in Figure 4.6-3 are the results for the WSIP, alternative, and base settings. The difference in San Antonio Reservoir storage between the alternative and WSIP settings is mostly caused by the lesser demand of the alternative. Considering that Calaveras Reservoir storage is essentially the same between the settings, the difference in San Antonio Reservoir storage indicates the operational strategy to affect storage in San Antonio Reservoir more than storage in the other SFPUC Bay Area reservoirs. San Antonio Reservoir would retain more storage in the alternative setting compared to the WSIP setting.

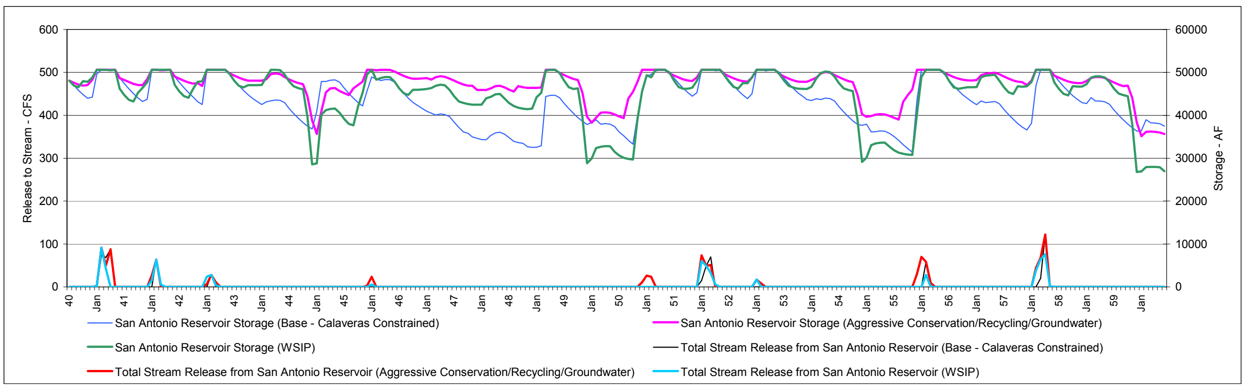
The difference in storage between the alternative and WSIP settings and the base setting is due to the restoration of the operational capacity of Calaveras Reservoir. In the base setting, the limited operating storage capacity at Calaveras Reservoir leads to a different operation at San Antonio Reservoir, one that retains relatively more stored water for system demands when the draw from Calaveras Reservoir is constrained due to limited storage. There is also a notable difference in storage operation between the alternative and WSIP settings and the base setting due to assumed maintenance. Assumed systematic maintenance of Hetch Hetchy conveyance facilities constrains diversions to the Bay Area from Hetch Hetchy every year, and particularly during every fifth year in the WSIP and alternative settings.

Figure 4.6-3
San Antonio Reservoir Storage and Stream Release

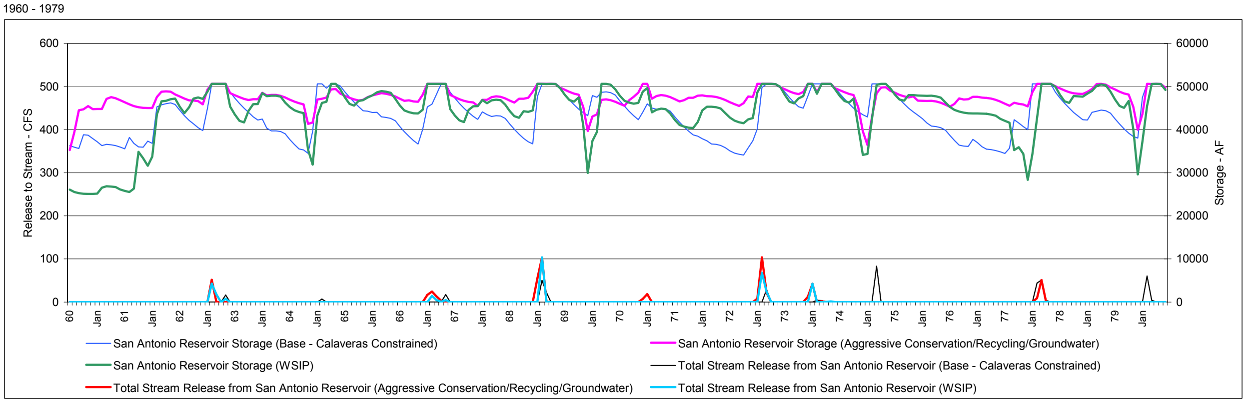
1920 - 1939



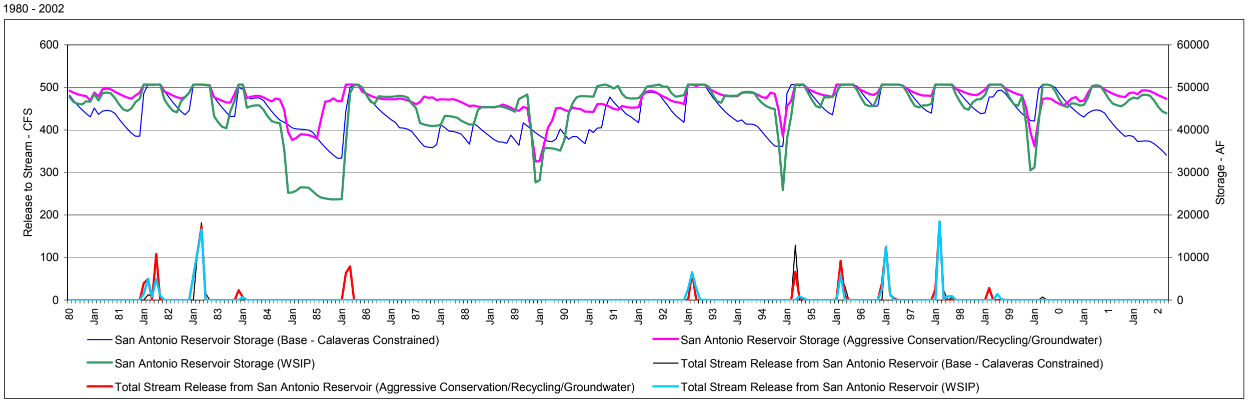
1940 - 1959



1960 - 1979

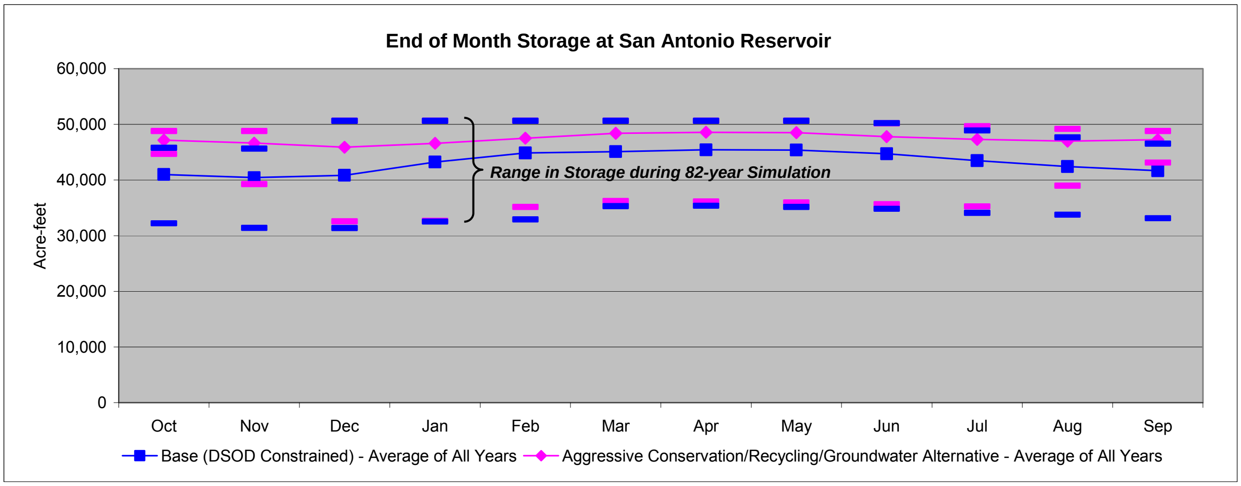


1980 - 2002



The reduction in diversion from Hetch Hetchy during these periods is accommodated in the system by the drawing of additional water from Bay Area reservoirs. The proportionate share of this operation is evident in the tracing of San Antonio Reservoir storage for the alternative and WSIP settings. Figure 4.6-4 illustrates the average monthly storage in San Antonio Reservoir for the 82-year simulation, and the range in storage for each month for the alternative and base settings. Compared to the base setting, the alternative would draw less storage from San Antonio Reservoir, typically retaining a fuller reservoir.

Figure 4.6-4



Very little change in stream releases below San Antonio Reservoir is anticipated between the alternative and WSIP settings. Table 4.6-12 illustrates the modeled release to San Antonio Creek from San Antonio Reservoir for the two settings and the differences for the average release during a year type. With a fuller reservoir operation at times during the winter, as seen in Figure 4.6-4, a decrease in the ability to regulate reservoir inflow and avoid stream releases would be expected. Given the sometimes rigid constraints within the modeling assumptions, the model will overestimate the frequency and magnitude of stream releases from San Antonio Reservoir under any of the investigated settings. The flexibility that occurs in actual operations would likely avoid most of the releases represented by the model. The modeled stream releases from San Antonio Reservoir and the difference between releases for the alternative and base setting are shown in Table 4.6-13. The differences between the two settings reflect a general increase in modeled releases. This modeled circumstance reflects the different resulting storage operation between the two settings as seen in Figure 4.6-3. In most circumstances the alternative setting storage at San Antonio Reservoir would be higher than projected for the base setting during the same period. This circumstance could lead to an occasionally greater modeled release for the alternative setting, which is reflected in the results. As described above, the model will overestimate the frequency and magnitude of releases from San Antonio Reservoir, and the actual releases from San Antonio Reservoir in any setting and the difference between settings are expected to be minor.

Flow below the confluence of Alameda and San Antonio Creeks is influenced by releases from San Antonio Creek and flow arriving at the location from Alameda Creek, which includes upstream impairment by SFPUC operations and facilities. Table 4.6-14 illustrates the flow below the confluence for the alternative and WSIP settings, and the differences in flow between the two. The difference in flow between the alternative and WSIP settings at this location are the net sum of the differences identified for flow reaching the location from Alameda Creek and San Antonio Creek. The difference in flow from upstream in Alameda Creek has previously been identified as non-substantial. Along with the conclusion that flow differences in San Antonio Creek are non-substantial, modeled differences below the confluence are also considered non-substantial.

Table 4.6-15 illustrates the same information for the comparison between the alternative and base settings. Table 4.6-15 illustrates the larger differences in flow that would occur between the alternative and base settings. Those differences are particularly due to the effects of the restoration of Calaveras Reservoir operating capacity and the fuller San Antonio Reservoir in the alternative setting (if the fuller reservoir has any effect on steam releases).

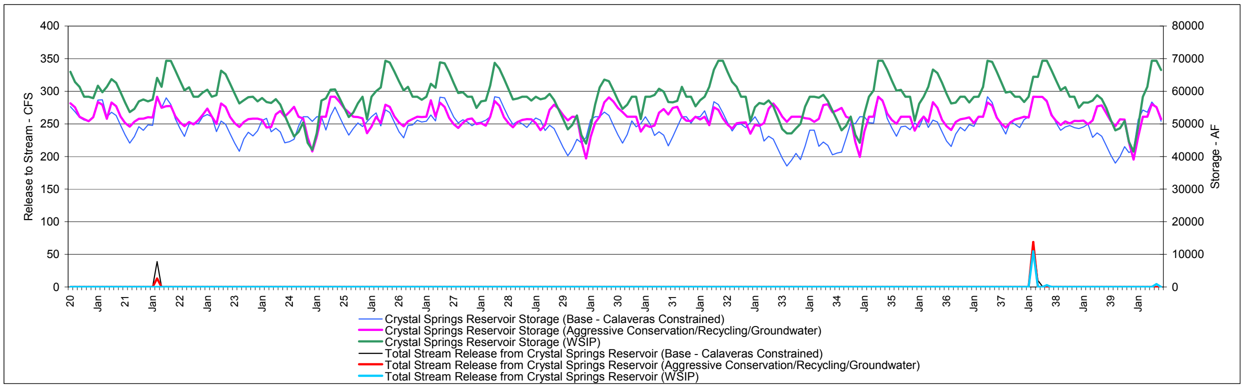
4.7 Crystal Springs and San Andreas Reservoirs

There are differences in Crystal Springs Reservoir operations between the WSIP setting and the alternative and base settings. Figure 4.7-1 illustrates a chronological trace of the simulation of Crystal Springs Reservoir storage and stream releases from Crystal Springs Dam. Shown in Figure 4.7-1 are the results for the WSIP, alternative, and base settings. Fundamental to the difference in storage operations between the WSIP setting and the alternative and base settings is the restoration of reservoir operation capacity in the WSIP setting, which does not occur in the alternative or base settings.[12] The result is the operation of Crystal Springs Reservoir at a lower maximum storage in the alternative and base settings. A second difference in Crystal Springs Reservoir storage between the alternative and WSIP setting is caused by the interaction of the increased demand served by the system's resources (a net 271-mgd for the alternative and a net 290-mgd demand for the WSIP in many years), which tends to lessen the operation range of the reservoir in the alternative setting. Replenishment of Crystal Springs Reservoir storage (as well as other Bay Area reservoirs) would be accelerated with less system-wide demand to serve. The alternative setting would provide less carry-over storage at Crystal Springs Reservoir into periods of drought, thereby causing additional draw from other resources to serve the same delivery. The magnitude of the draw of storage from Crystal Springs Reservoir depends partially on the discretionary assumptions of the model that proportion the use of storage among the Bay Area system reservoirs. In actual operations, some of the differences in result may not occur as system operators and prevailing hydraulic and hydrologic conditions may direct the operational effect of the different demand to an alternative apportionment of effect among the reservoirs. However, operation strategy prefers the retention of storage in the Peninsula Reservoirs, similar to the strategy used by the model. Figure 4.7-2 illustrates the average monthly storage in Crystal Springs Reservoir for the 82-year simulation, and the range in storage for each month for the alternative and WSIP settings.

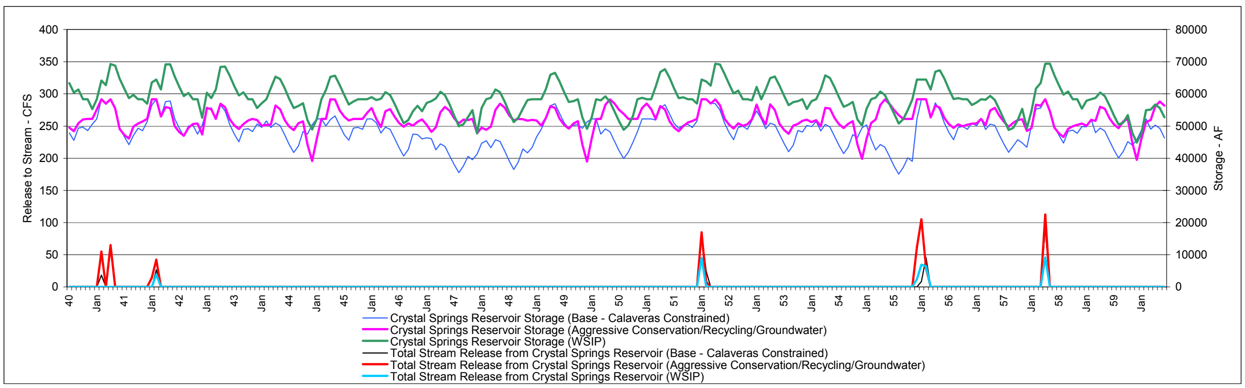
[12] The Lower Crystal Springs Dam Improvements (LCSDI) project is included in this alternative, but was not modeled. With the LCSDI project included in the alternative the hydrologic effects at Crystal Springs Reservoir would be comparable to the WSIP setting.

Figure 4.7-1
Crystal Springs Reservoir Storage and Release

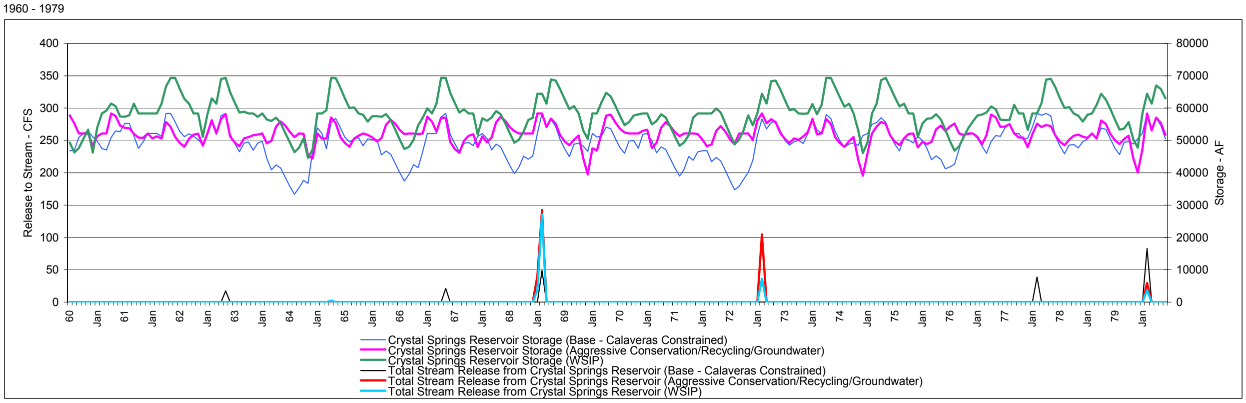
1920 - 1939



1940 - 1959



1960 - 1979



1980 - 2002

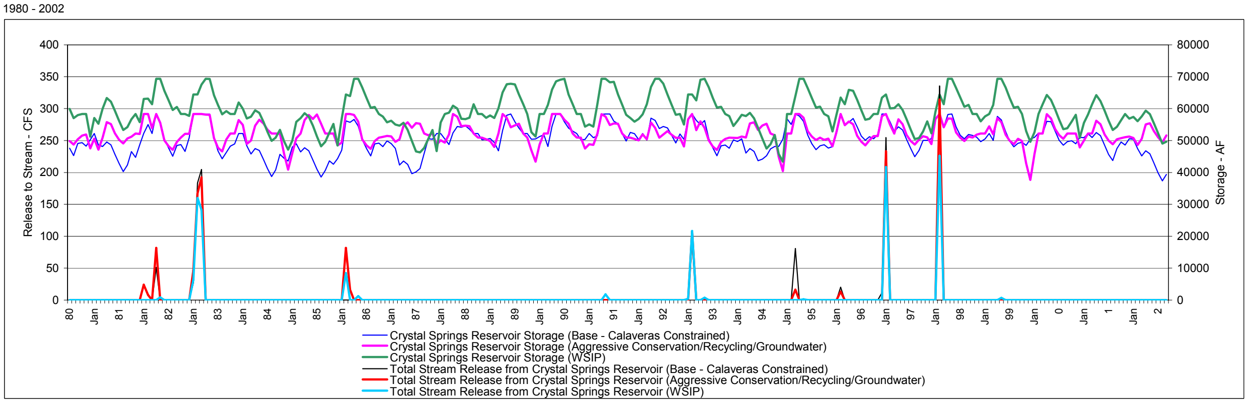


Figure 4.7-2

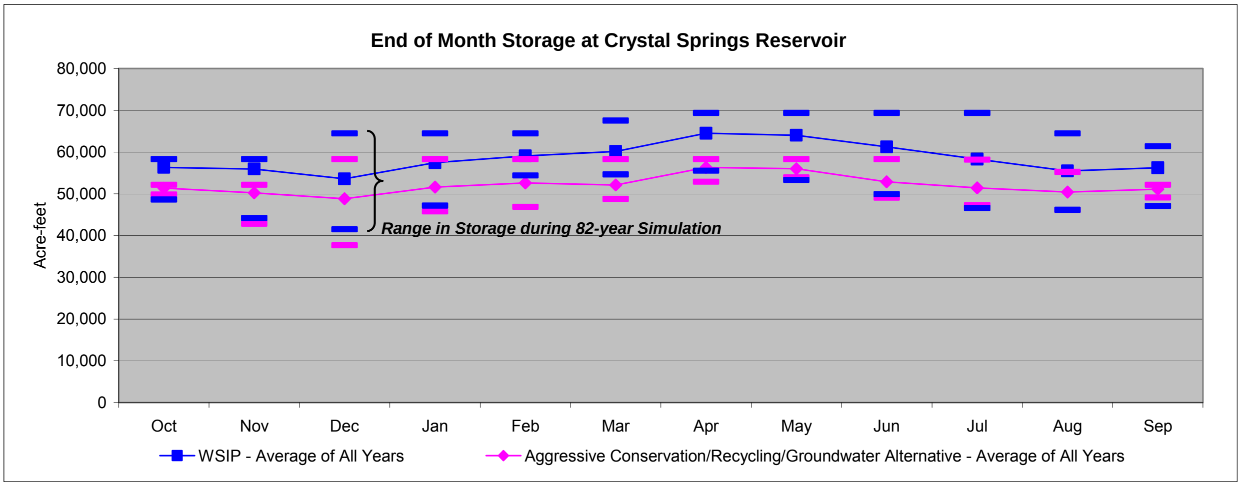

Figure 4.7-3 illustrates the average monthly storage in Crystal Springs Reservoir for the 82-year simulation, and the range in storage for each month for the alternative and base settings. The alternative setting would result in reservoir storage operating at a slightly higher average storage during some months, and the range of operating storage would typically be smaller in the alternative setting.

Figure 4.7-3

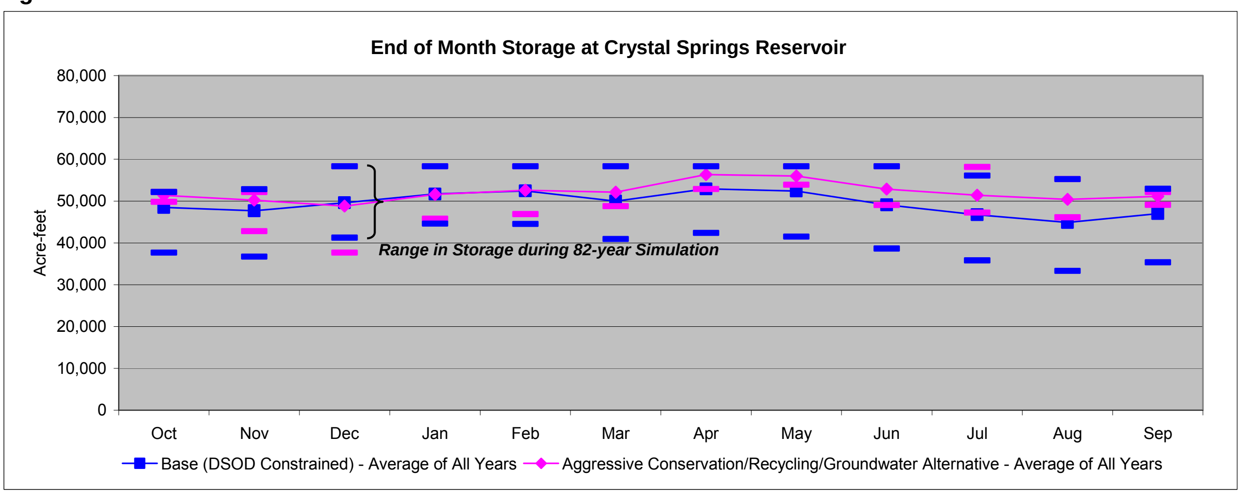

Table 4.7-1 illustrates the modeled alternative and WSIP stream releases from Crystal Springs Reservoir and the differences between the two settings. Modeling results indicate that an increase in the occasional release could occur. The potential difference is attributed to a narrower operating range of reservoir storage in the alternative setting. This narrower range in storage would lead to a greater potential for stream releases. In actual operations, it is anticipated that system operators would manage the reservoir system such that stream releases would be minimal under any setting, with the effect of essentially no difference between the alternative and WSIP settings. Similarly, Table 4.7-2 illustrates the stream releases for the alternative and base settings, and the difference in modeled flows between the two settings. A lesser draw down in Crystal Springs Reservoir storage associated with the alternative setting would lead to a decreased potential to regulate reservoir inflow, which would lead to additional risk in needing to make stream releases. However, as described above, actual system operations would attempt to minimize releases under any setting; thus, the difference in releases between the alternative and base setting would be minimal, if any.

Reservoir storage at San Andreas Reservoir would follow a systematic filling and lowering each year; however, there would be slight differences in draw down between the alternative and WSIP settings, primarily because of the coincidental effects of different system-wide maintenance and differing water demands within each setting. Figure 4.7-4 illustrates a chronological trace of the simulation of San Andreas Reservoir storage and stream releases from San Andreas Dam. Shown in Figure 4.7-4 are the results for the WSIP, alternative, and base settings. There are no projected stream releases from San Andreas Reservoir in any setting. Compared to the base setting, Figure 4.7-4 illustrates the difference in storage operation every fifth year for the WSIP and alternative settings. These operations are the result of Hetch Hetchy conveyance maintenance, which is assumed to occur systematically in the alternative and WSIP settings. The maintenance constrains the amount of Hetch Hetchy water supplied to serve water demands in the Bay Area. As discussed previously, during these winter periods, the Bay Area reservoir system accommodates the reduction in imported supply by serving the Bay Area water deliveries with the local watersheds' runoff and storage. At San Andreas Reservoir, the serving of water demand affects the reservoir when additional required water production at Harry Tracy WTP associated with WSIP or the alternative exceeds the ability to maintain San Andreas Reservoir storage with pumping from Crystal Springs Reservoir. In the modeling, the conveyance capacity from Crystal Springs Reservoir is assumed to be same among all of the settings. The additional water demand of the WSIP and alternative require additional production from Harry Tracy WTP to be drawn from San Andreas Reservoir.

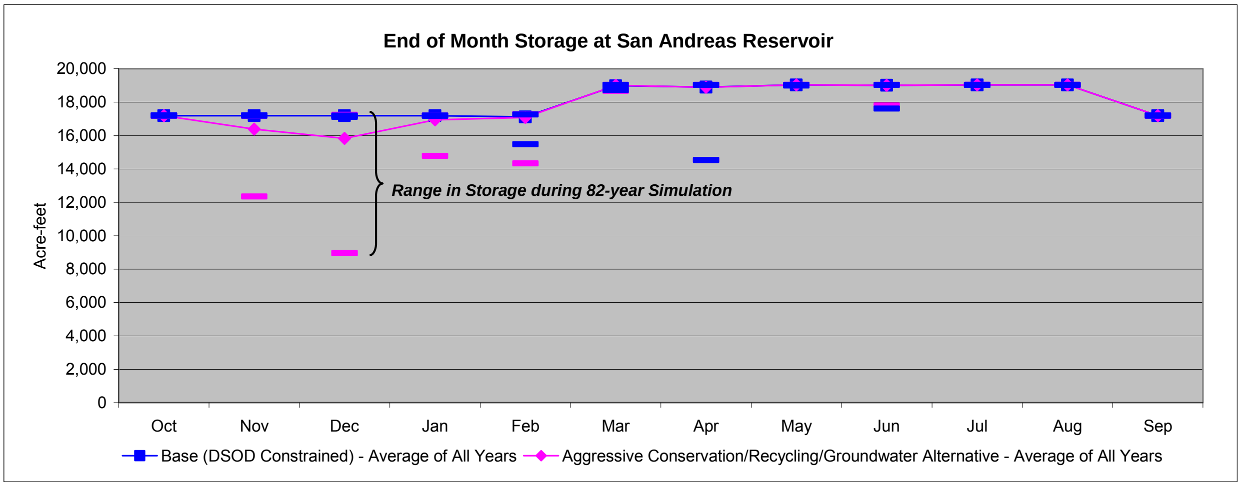
Figure 4.7-5



4.8 Pilarcitos Reservoir

Coastside CWD's water demand and its SFPUC purchase request are projected to increase within the WSIP planning horizon of year 2030. With the context of the 2030 purchase request of 300 mgd, Coastside CWD's portion has been estimated at about 3 mgd. This projected purchase request is approximately 1 mgd greater than its current purchase request. In the alternative, Coastside CWD's contribution to the 19 mgd of conservation, recycling, and groundwater is very small; therefore, Coastside CWD's purchase request in the alternative setting is assumed essentially equal to the WSIP setting. Recognizing the current physical constraints to deliveries from the SFPUC to Coastside CWD and the ongoing planning activities in the watershed, the precise means of serving Coastside CWD's additional purchase request and the resultant potential changes to the operation of SFPUC facilities and their affected environs are uncertain.[13]

Assuming a range of potential means to serve the additional purchase request from Coastside CWD, the following potential hydrologic effects to SFPUC facilities and their affected environs are identified:

- Due to limited yield from Pilarcitos Reservoir, additional diversions would be required from Crystal Springs Reservoir.
- If deliveries to Coastside CWD from Pilarcitos Reservoir increase during the winter season, these deliveries could potentially reduce storage in Pilarcitos Reservoir, thereby potentially reducing diversions to the San Mateo Creek watershed. Although the increased delivery would increase releases to Pilarcitos Creek from Pilarcitos Dam for a period of time, the increase would subsequently lead to a reduction in spills past Stone Dam.
- Additional wintertime deliveries could also potentially impair the ability to provide carry-over storage into the summer season from Pilarcitos Reservoir, and subsequently lead to an acceleration of the beginning of the season when releases to Pilarcitos Creek from Pilarcitos Reservoir consist only of the passage of reservoir inflow.
- An increase in summertime deliveries from Pilarcitos Creek could also accelerate the beginning of the season when releases to Pilarcitos Creek from Pilarcitos Reservoir consist only of the passage of reservoir inflow.

In the alternative setting, the hydrologic effects to the Pilarcitos Creek watershed would essentially be the same as those identified for the WSIP setting.

---

[13] See "Analysis of SFPUC Pilarcitos / Coastside County Water District Operations", Memorandum by Daniel B. Steiner, March 8, 2007.

4.9 Additional Considerations Regarding the Aggressive Conservation Alternative

The hydrologic effects of Alternative 3, Aggressive Conservation, are described above. The additional observations noted during the formulation and analysis of the alternative are discussed below.

As configured, the alternative serves a total SFPUC purchase request of 300 mgd, and 29 mgd of the purchase request is met with conservation, recycled water, and groundwater programs. The amount of purchase request served by the regional system is a net 271 mgd compared to the net 290 mgd served in the WSIP setting.

The alternative does not implement the Westside Basin Groundwater Program, water transfers from MID/TID, or the restoration of Crystal Springs Reservoir operational capacity, which foregoes 30 mgd of yield during the SFPUC design drought.[14] The foregone yield during the design drought is partially offset in effect to customer deliveries by the 19 mgd of additional conservation provided by the customers that reduces the net delivery demand from the regional system. The net remaining difference between the reduction in yield and lesser regional system demand is accommodated by the imposing of greater shortages (rationing) to deliveries during the design drought. Although the 20-percent maximum rationing objective was achieved in the alternative setting, 4 years of 10 percent greater rationing was required during the 8½-year design drought period (e.g., imposing 10 percent rationing when in the WSIP setting no rationing was required, or imposing 20 percent rationing when in the WSIP setting 10 percent rationing was required). The water delivery protocols that provided a viable operation through the design drought, although resulting in a lesser LOS than the objectives of the WSIP, manifest in additional rationing in other drought periods in the alternative setting.

Without the MID/TID water transfer, the amount of water served from the Tuolumne River during the design drought is about the same as between the alternative and base settings, and is constrained by the size and configuration of SFPUC facilities and the amount of water available to the SFPUC during the period after the rights and entitlements of MID/TID are satisfied. However, during non-drought years when the availability of water to the SFPUC from the Tuolumne River is practicably not constrained, diversions greater than the base setting would occur to serve a portion of the increase in purchase request. The purchase request increases by 35 mgd while the customers' conservation, recycled water, and groundwater programs only offset 29 mgd of regional system demand, thus leaving 6 mgd to be served by other SFPUC resources. Commensurate with the difference, Tuolumne River diversions increase by approximately 5 mgd annually during the 82-year simulation period.[15]

To prevent an increase in diversions from the Tuolumne River in the context of the alternative (with the assumed level of conservation, recycled water, and groundwater programs), the SFPUC would be required to further erode the LOS for the 300 mgd of purchase request, reduce the purchase request, or implement additional sources of supply that do not rely on the Tuolumne River.

LOS Reliability Option

As described above, the alternative as configured does not achieve the water supply reliability LOS of the WSIP, requiring greater levels of shortage during drought than the WSIP. Although the maximum severity of shortage for any year of shortage (20 percent) is achieved, a greater level of shortage is required in 4 years during the design drought. The protocols to provide a viable operation during the design drought result in shortages being applied during other drought periods of the 82-year simulation. During the entire simulation period, there would still be an additional average 5 mgd of diversion from the Tuolumne River annually, due to the 271-mgd demand of the typical net regional system, which is greater than the current 265-mgd demand.

[14] The Lower Crystal Springs Dam Improvements (LCSDI) project is included in the alternative, but was not modeled. With the LCSDI project included in the alternative the hydrologic effects at Crystal Springs Reservoir would be comparable to the WSIP setting. The restoration of operational capacity at Crystal Springs Reservoir results in an additional 1 mgd of system firm yield during the Design Drought.

[15] The difference between the 6-mgd increase in purchase request and the 5 mgd of additional Tuolumne River diversion is due to delivery shortages occurring during the 82-year simulation period, which reduces the average amount of water delivered during the simulation period.

If the metric for attempting to prevent increases in Tuolumne River diversions was based on the long-term average annual diversion from the basin, a comparable diversion could occur by further eroding the LOS water supply reliability objective. Assuming delivery shortage (rationing) of up to 25 percent in any year, and applying that shortage at the first hint of drought, a long-term average annual diversion from the basin could result that essentially equals the level of diversions currently occurring. As in the configured alternative, there would continue to be greater diversions from the Tuolumne River during non-drought years; however, during drought, there would be less diversion than occurs in the alternative setting. The delivery shortages during the Design Drought would manifest as 7½ years of 25-percent shortage during the 8½-year period. Approximately 18 percent of the years (15 years) during the 82-year simulation would be subject to the 25-percent shortage.

Alternatively, the SFPUC could attempt to maintain no more than the current diversion from the Tuolumne River basin by reducing the LOS for the level of purchase request. This option would be similar to the No Purchase Increase Alternative described previously in Section 3. There would be a nexus between the amount of additional conservation, recycled water, and groundwater developed and the accepted increase in purchase request. The LOS for level of purchase request, reliability, and firm yield would all be less than the WSIP objectives.

Additional Water Supply Option

If LOS objectives are to be met with the alternative (with its assumed level of conservation, recycled water, and groundwater), with no objective of additional diversion of water from the Tuolumne River, the SFPUC must develop additional water supply resources that do not rely on Tuolumne River water. The nature of the additional supply could be similar to that described in Section 5, Desalination in San Francisco. The development of sufficient supply from supplemental resource(s) would be required to provide additional drought and non-drought supply to meet WSIP LOS objectives while not increasing diversions from the Tuolumne River. As described later in Section 5, the development of supplemental resources separate from the Tuolumne River would not eliminate the potential for year-to-year diversions to change from the base setting. System-wide changes to the regional system, such as a planned maintenance program for the Hetch Hetchy conveyance system, would inherently change the pattern of diversions from the Tuolumne River, which would manifest in year-to-year and seasonal differences between current and future diversions.

5. CEQA Alternative 4 – Lower Tuolumne River Diversion

CEQA Alternative 4 – Lower Tuolumne River Diversion Alternative would, similar to the proposed WSIP, rely primarily on Tuolumne River water to serve the increased system-wide demand. However, instead of the entire SFPUC Tuolumne River diversion originating from Hetch Hetchy Reservoir, the alternative would divert most of the increase in demand at facilities located on the lower Tuolumne River upstream of the confluence with the San Joaquin River. The alternative would provide supplemental releases to the lower Tuolumne River in excess of those currently required below La Grange Dam for FERC requirements. Supplemental releases above those currently required would also be provided to the Tuolumne River below O'Shaughnessy Dam coincident with the lower Tuolumne River diversion. The purpose of this alternative is to accommodate the increase in system-wide demand with the diversion of Tuolumne River water, while at the same time increasing flow conditions in the middle Tuolumne River (Hetch Hetchy Reservoir to Don Pedro Reservoir) and in the lower Tuolumne River below La Grange Dam.

The alternative would implement almost all of the proposed facilities for the proposed WSIP. The exception to the WSIP configuration and proposed facilities would be the specific improvements to the SJPL. Improvements and repairs would be made to the SJPL to ensure that conveyance would continue at the existing 290-mgd capacity. A new SFPUC diversion facility located in the Tuolumne River near its confluence with the San Joaquin River would be sized to recover up to 55 mgd of releases provided by the SFPUC. From the diversion point, the recovered water would be pumped to a new water treatment plant near the Tesla Portal where it would be filtered and disinfected prior to blending with Hetch Hetchy water in the Coastal Tunnel. Numerous new permits and institutional arrangements would be necessary to facilitate the diversion of water by the SFPUC from the lower Tuolumne River, including an arrangement with MID/TID to release SFPUC water into the river.[16]

During non-drought years, the SFPUC would serve the increase of 35 mgd in purchase requests through a combination of conservation, water recycling, and groundwater supply programs, increased diversions from the Tuolumne River, and greater utilization of the Bay Area watershed supplies associated with the restoration of operational storage capacity, primarily at Calaveras Reservoir.[17] The SFPUC would implement conservation, water recycling, and groundwater supply programs in the SFPUC retail service area to achieve the equivalent of 10 mgd of supply every year in all years. These programs would be in addition to demand management and conservation measures already accounted for in the 2030 purchase request for the retail service area.

In most years, the SFPUC could serve the projected 2030 water purchases of 300 mgd with its existing sources of water supply; however, these sources alone have not allowed for full water deliveries during past droughts, and would continue to be insufficient during future droughts as purchase requests increase. In this alternative, the SFPUC would serve the 2030 need for increased system firm yield with a combination of conservation, water recycling, and groundwater programs in the SFPUC retail service area, water transfers from the Turlock Irrigation District (TID) and Modesto Irrigation District (MID), a groundwater conjunctive-use program incorporating the Westside Basin Groundwater Program, and restoration of reservoir operating capacity at Crystal Springs and Calaveras Reservoirs. As with the WSIP, system-wide rationing would be limited to no more than 20 percent in any year.

The following described results for this alternative are derived from studies performed by the SFPUC during the investigation of Water Supply Option 3. Subsequent to those studies, several refinements to assumptions for water demands, facility configuration, and operations have changed for the proposed future SFPUC regional system, which would have slightly altered the studies incorporated into Water Supply Option 3. These changes are non-substantive in terms of conclusions derived concerning the alternative; however, due to this circumstance, a comparison of the explicit modeling results for this alternative with results for the WSIP setting or base setting requires caution, and qualitative descriptions are provided.

---

[16] This setting is additionally described in *Water System Improvement Program (WSIP) Water Supply Option 3*, prepared by San Francisco Public Utilities Commission and Parsons, June 2006.

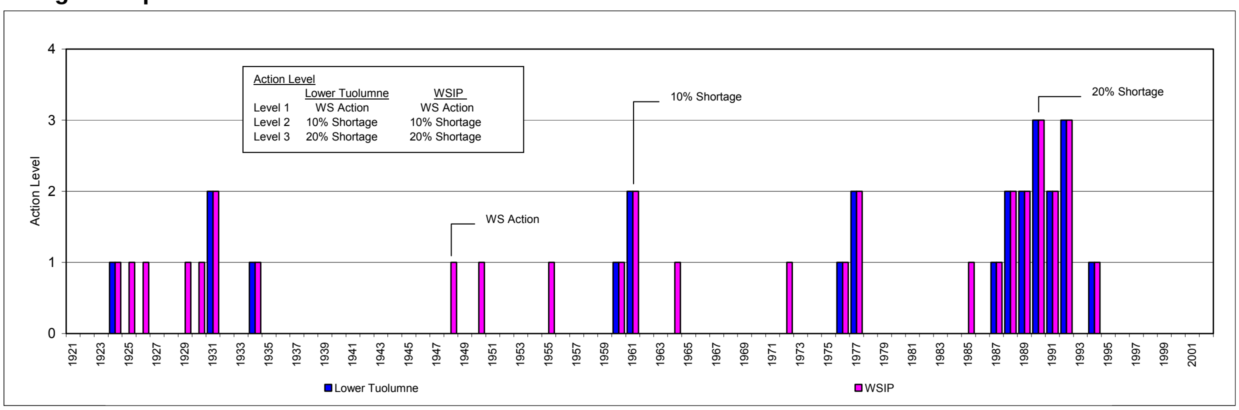
[17] The Lower Crystal Springs Dam Improvements project would be included in this alternative.

5.1 Water Deliveries and Drought Response Actions

In both the alternative and the WSIP settings, an average annual 300 mgd system-wide purchase request is served. Both settings include implementation of 10 mgd of conservation, water recycling, and groundwater supply programs in the SFPUC retail service area, with a net regional system demand of 290 mgd. Table 5.1-1 compares the drought response actions for the proposed program and the alternative settings. Figure 5.1-1 illustrates the drought response actions for the simulated 82-year historical period (1921-2002).

In Figure 5.1-1, years with bars showing a "1" or greater level of action indicate periods when a supplemental water supply action is initiated. In both the WSIP and alternative settings, the action is the use of the Westside Basin Groundwater Program to supplement SFPUC water deliveries. The water transfer from MID/TID is also occurring during these periods. Action levels greater than "1" indicate the imposition of delivery shortages (rationing) to SFPUC customers.

Figure 5.1-1
Drought Response Actions – Lower Tuolumne River Diversion and WSIP

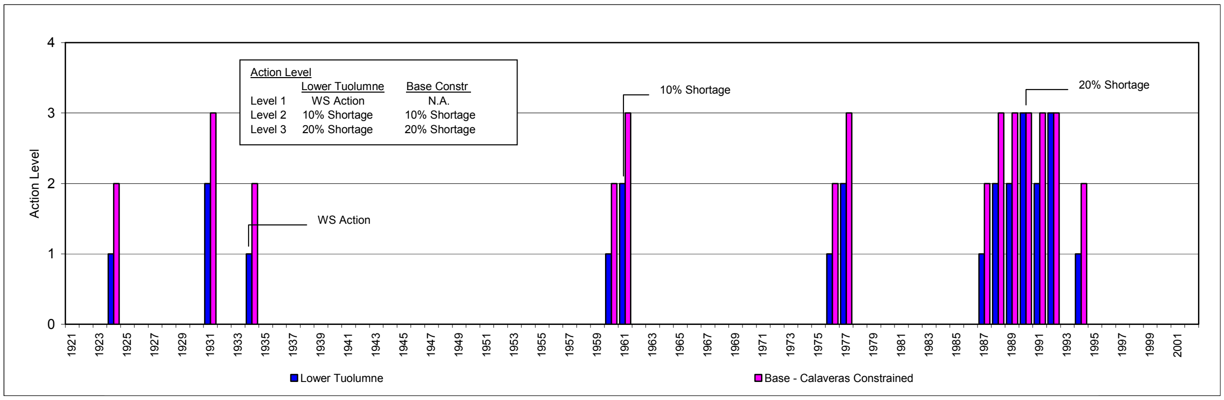


The need for water delivery shortages, in frequency and severity, would be the same for the alternative and WSIP settings, including during the design drought. Shortages would be no greater than 20 percent in any year. Although the WSIP setting indicates a greater frequency of use of the level 1 action (Westside Basin Groundwater Program), the indicated difference is partially a result of modeling discretion that was applied in the more recent WSIP studies and not consistently applied in the earlier Water Supply Option 3 studies. The modeling discretion concerned the explicit system storage level, at which the action is triggered. As described later concerning Bay Area reservoir storage, less depletion of local reservoir storage would be anticipated in the alternative setting because of the increased seasonal availability of conveyance from the Hetch Hetchy system. This would lead to a lesser need to trigger the supplemental groundwater program to retain local Bay Area reservoir storage. The increase in frequency of triggering the action associated with the WSIP is likely overstated.

The same form of information is shown in Figure 5.1-2 in comparing the alternative setting to the base setting. In modeling parlance, there is no level 1 action level in the base setting. Without supplemental resources, the existing system only has the delivery shortage measure available to cope with drought. This shortage measure is imposed during level 2 (10 percent) and level 3 (20 percent). These percentages of shortage are applied to both the alternative and base settings for these action levels. As evident in the illustration, the imposition of rationing occurs more frequent and to a greater extent in the base setting (level 2 and level 3 actions).

Figure 5.1-2 illustrates that, when comparing the base setting to the alternative setting, the supplemental resource (Westside Basin Groundwater Program) is triggered at times of drought, during periods when no supplemental resource is currently available to the system. The use of the supplemental resource during these times results in the elimination or reduction (or at least a non-increase in the severity) of delivery shortage.

Figure 5.1-2
Drought Response Actions – Base and Lower Tuolumne River Diversion



Not illustrated in Figure 5.1-1 or Figure 5.1-2 are the delivery shortages anticipated during the entire SFPUC Design Drought. Shortages during the Design Drought with the WSIP and alternative are maintained within the objective to limit the severity of shortage to no more than 20 percent. With the existing system (Calaveras and Crystal Springs Reservoirs constrained), the 20-percent limitation (cap) objective cannot be achieved during the last 18 months of the Design Drought, and a 25 percent shortage is applied.

5.2 Diversions from Tuolumne River

For the WSIP and base settings, the metric for illustrating the SFPUC diversion from the Tuolumne River Basin is the flow through the San Joaquin Pipeline (SJPL) originating at Moccasin Reservoir. In this alternative setting, additional water is diverted from the basin at the new diversion site, which is located in the lower Tuolumne River above its confluence with the San Joaquin River.

Table 5.2-1 illustrates the diversions and difference in diversions to the SJPL (from Moccasin Reservoir) for the proposed program and WSIP settings, averaged by month, by year type. Evident is the decrease in annual diversions associated with the alternative setting. Although the same system-wide level of deliveries occurs for the two settings, the specific locations of the SFPUC's Tuolumne River diversions differ. The difference in SJPL diversions between the WSIP setting and alternative setting is also illustrated in Figure 5.2-1, and the difference in average monthly diversion through the SJPL is shown, by year type, for the 82-year simulation period.

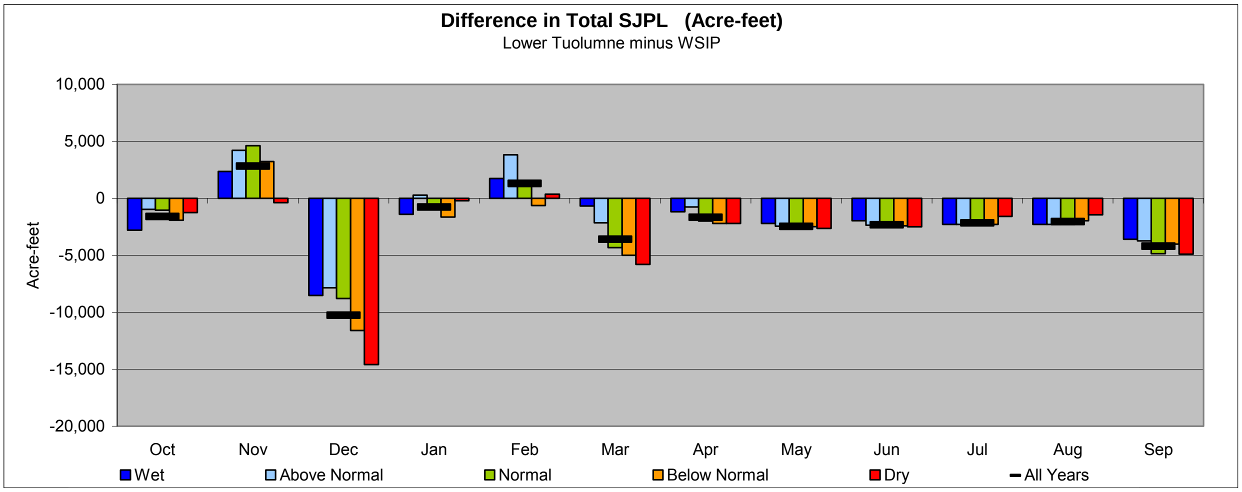
Figure 5.2-1



The lesser diversions from the Moccasin Reservoir source for the alternative setting during March through August is due to the assumed lesser conveyance capacity of the SJPL associated with the alternative setting. In the WSIP setting, conveyance is increased to 313 mgd, while in the alternative setting the capacity is not improved above the currently used 290-mgd capacity. The December reduction in conveyance is due to the annual maintenance associated with each setting. In the alternative setting, conveyance from the Moccasin Reservoir source is not available during December.

In the alternative setting, water would also be diverted by the SFPUC at a location in the lower Tuolumne River. The protocol for using the downstream diversion initiates with the local system calling for water from Hetch Hetchy. During March through August, the need is usually for all flow that can be provided because that period's system-wide delivery is greater than local watershed production. There is also an operational goal of the system to replenish and retain Bay Area reservoir storage, which calls for water from the Hetch Hetchy system. The 345-mgd capacity of the Coastal Tunnel physically limits the amount of water that could be conveyed from Hetch Hetchy, and determines the sizing of lower river diversion (345 mgd minus the 290-mgd capacity of the SJPL). During this season, the "first" 55 mgd is assigned to the lower Tuolumne River diversion. However, depending on the resultant SJPL residual, it may be slightly changed to provide an operation of the SJPL at one of its pre-set capacity rates. The SJPL is limited to operate at one of the set points, a minimum of 70 mgd (exceptions occur), zero during the maintenance period during December, or 210 mgd during November through March. During September through February, the lower Tuolumne River diversion fills in the call for Hetch Hetchy water that is greater than the available SJPL capacity (e.g., 290 mgd in October; 210 mgd in November, January, and February). During December, the SJPL capacity is zero, and the lower Tuolumne River diversion provides up to 55 mgd as needed. The lower Tuolumne River diversion is operated at assumed set points, 10, 20, 30, 40, 45, and 55 mgd.

Table 5.2-2 illustrates the modeled operation of the lower Tuolumne River diversion for the 82-year simulation period. The protocol generally produces a result that would develop releases and diversions during July and August; often but sporadic operation during March through June; more sporadic operation during November, January, and February; and a rare operation during October and September. Because of the SJPL outage during December, full operation of the diversion typically occurs. The "additional" flows occur below Hetch Hetchy Reservoir and La Grange. They do not reach beyond the Tuolumne River as they are recaptured at the lower Tuolumne River diversion. Table 5.2-3 illustrates the same diversion information in terms of monthly average volumes by year type.

The flow of the conveyance at the Coastal Tunnel fully describes the entire Tuolumne River diversion for the alternative. Figure 5.2-2 illustrates the average monthly diversion from the Tuolumne River Basin for the alternative and WSIP settings, and Table 5.2-4 illustrates the average monthly diversions for each setting and the differences between the two for each year type.

The average total diversion from the Tuolumne River Basin is essentially the same for the alternative and the WSIP settings, with some variation between the two settings by year type.

The differences between the alternative's diversions from the Tuolumne River Basin and the base setting diversions are similarly illustrated. Table 5.2-5 illustrates the diversions and difference in diversions to the SJPL (from Moccasin Reservoir) for the alternative and base settings, averaged by month, by year type. This information is also illustrated in Figure 5.2-3 in terms of monthly average diversions for the simulation period. The average annual diversions associated with the alternative setting are about the same as for the base setting. The difference in diversions during December results from different facility maintenance assumptions for the two settings. The alternative incorporates a maintenance program that constrains conveyance through the SJPL during December. Following this maintenance period, larger diversions occur to replenish Bay Area reservoirs and to partially serve the additional demand associated with the alternative.

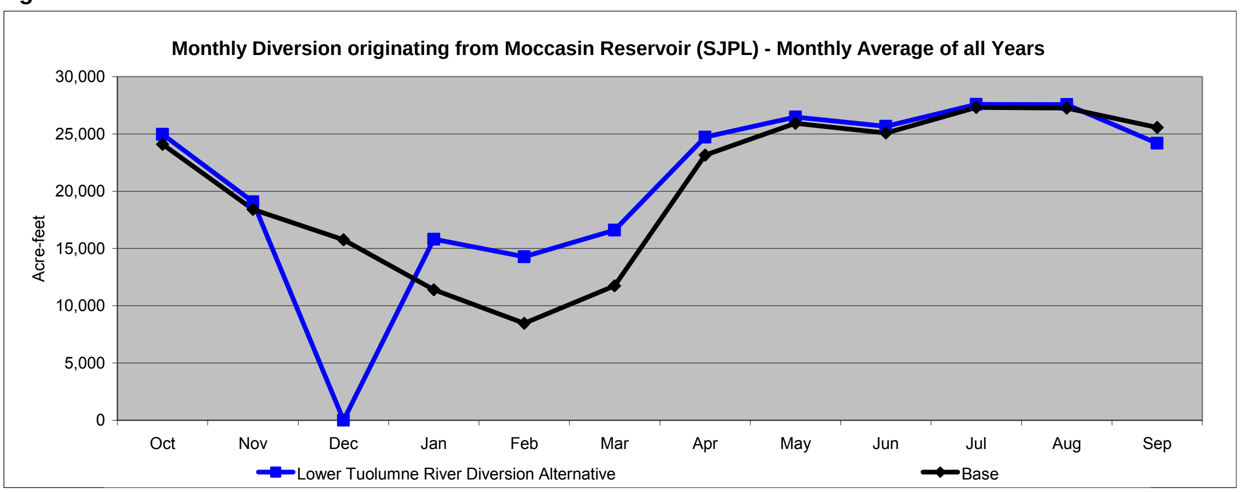
Figure 5.2-3



In the alternative setting, additional SFPUC diversions occur at a location on the lower Tuolumne River. The flow of the conveyance at the Coastal Tunnel fully describes the entire Tuolumne River Basin diversion for the alternative. Figure 5.2-4 illustrates the average monthly diversion from the Tuolumne River Basin for the alternative and base settings, and Table 5.2-6 illustrates the average monthly diversions for each setting and the differences between the two for each year type. As illustrated in the discussion above, regarding the differences in basin diversions between the alternative and WSIP settings, the alternative essentially diverts the same amount of water from the basin as does the WSIP, with both settings diverting more than the base setting. The alternative diverts essentially the additional demand for the increase in purchase request and delivery reliability from the lower Tuolumne River.

5.3 Hetch Hetchy Reservoir and Releases

Both the WSIP and alternative settings have the same underlying system-wide net demand for water (290 mgd), and would result in essentially the same draw of water from the Tuolumne River Basin. In the alternative setting, the need from the Bay Area system would be met from both diversion through the SJPL and the diversion in the lower Tuolumne River, and either diversion would still originate from water released from Hetch Hetchy Reservoir. Figure 5.3-1 illustrates a chronological trace of the simulation of Hetch Hetchy Reservoir storage and stream releases. Shown in Figure 5.3-1 are the results for the WSIP, base-Calaveras constrained ("Base – Calaveras Constrained") and alternative ("Lower Tuolumne") settings. Over the simulation period, the average annual release (Canyon Tunnel and stream release combined) from Hetch Hetchy Reservoir is about the same between the alternative and WSIP settings; however, the seasonal timing of the release is slightly different, predominantly due to the greater summer conveyance to the Bay Area system in the alternative setting and to the difference in conveyance maintenance. Table 5.3-1 illustrates the total releases from Hetch Hetchy Reservoir for the alternative and WSIP settings, and the difference between the two settings.

Storage in Hetch Hetchy Reservoir associated with the alternative setting could be either greater or less than anticipated for the WSIP setting, as seen in Figure 5.3-1. Figure 5.3-2 illustrates the average monthly storage for the alternative and WSIP settings.

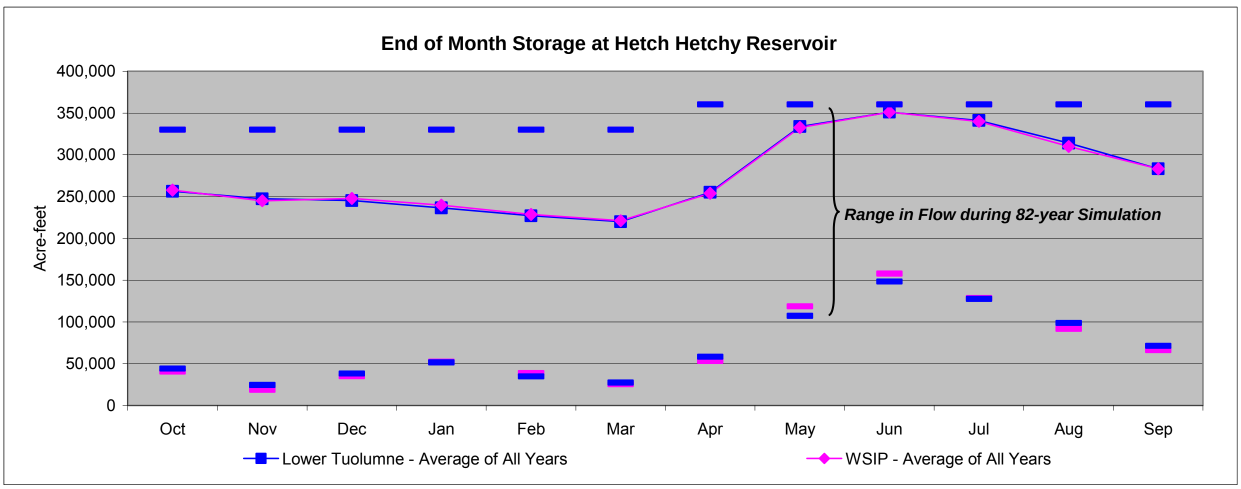
Figure 5.3-2



Hetch Hetchy Reservoir storage is drawn slightly more during summer in the alternative, as the combined release from Hetch Hetchy for the SJPL diversion (maximum 290 mgd) and the lower Tuolumne River diversion (maximum 55 mgd) are slightly greater than the combined releases for the SJPL diversion in the WSIP setting (maximum 313 mgd).

Similar to the WSIP setting comparison to the base setting, the comparison of the alternative setting's depiction of Hetch Hetchy Reservoir storage to the base setting storage would be a general reduction in storage for the alternative setting. The greater system-wide water demand of the alternative would draw additional water from Hetch Hetchy Reservoir. Figure 5.3-3 illustrates the average monthly storage for the alternative and base settings.

The difference in storage in Hetch Hetchy Reservoir attributed to the diversion effects of the alternative or WSIP settings compared to the base setting would manifest in differences in releases from O'Shaughnessy Dam to the stream. A different amount of available reservoir space in the winter and spring due to the WSIP would lead to a different ability to regulate inflow, thus potentially changing the amount of water released to the stream that is above minimum release requirements. In the case of the alternative, supplemental releases are explicitly made from Hetch Hetchy Reservoir to the stream to serve the diversion from the lower Tuolumne River. Figure 5.3-4 illustrates the difference in average monthly stream release from O'Shaughnessy Dam for the alternative and WSP settings by year type.

Figure 5.3-3

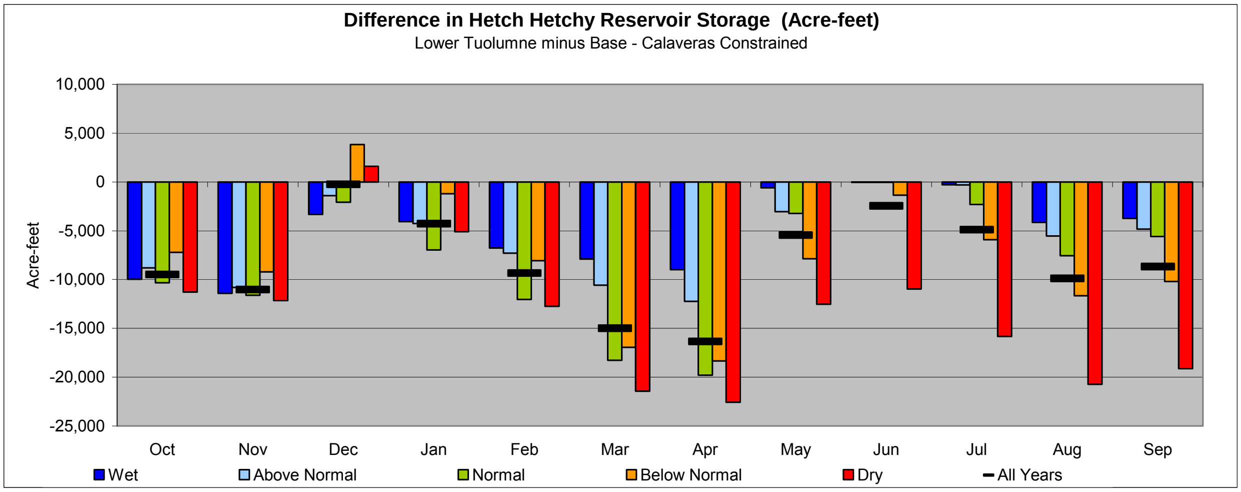


Figure 5.3-4

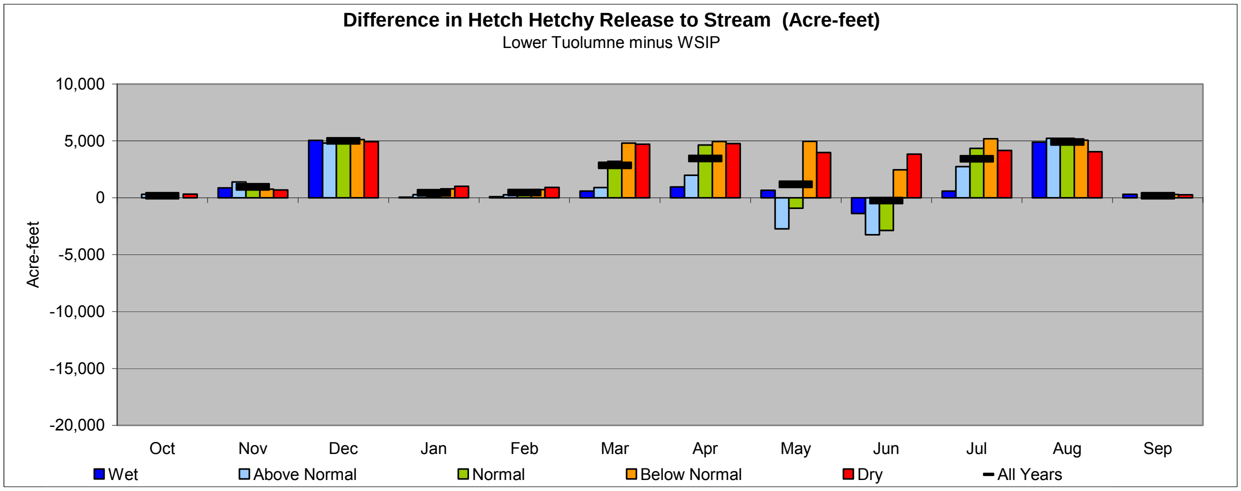

Figure 5.3-4 mirrors the results that were previously described regarding the lower Tuolumne River diversion. When the lower Tuolumne River diversion occurs, a corresponding release to the middle Tuolumne River from O'Shaughnessy Dam is made. A 5,000-acre-foot release is roughly equivalent to the 55-mgd diversion from the lower river.

Figure 5.3-5 compares stream releases from O'Shaughnessy Dam for the alternative and base settings. The change in release below O'Shaughnessy Dam in comparison to the base setting mostly mirrors the differences for the WSIP comparison. The exception occurs during the spring. The alternative draws additional water from Hetch Hetchy Reservoir to serve the greater system-wide demand, subsequently requiring greater replenishment of the reservoir, which typically results in a lesser stream release, predominantly during May or June, reflecting the months when releases to the stream above minimum release requirements are made in anticipation of filling the reservoir.

Supplementing Figure 5.3-4 (alternative comparison to WSIP) and Figure 5.3-5 (alternative comparison to base) are Table 5.3-2 and Table 5.3-3, which illustrate the difference in stream release from O'Shaughnessy Dam for the alternative compared to the WSIP and base settings, respectively.

Figure 5.3-5

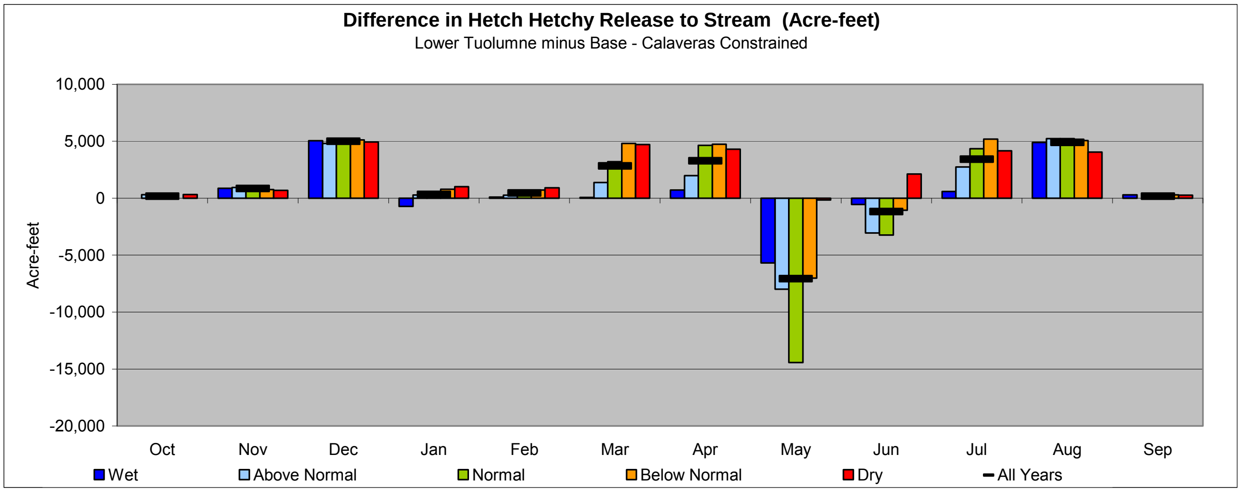

Table 5.3-2 and Table 5.3-3 illustrate the difference in stream release between the alternative setting and the WSIP and base settings, expressed in terms of a monthly volume (acre-feet) of flow. Although there are "enhanced" flows below O'Shaughnessy, the lower Tuolumne River diversion setting creates the same type of storage depletions at Hetch Hetchy Reservoir as the WSIP setting. These depletions affect the spills past O'Shaughnessy during replenishment, delaying the occurrence of releases to the stream in excess of minimum requirements. Figure 5.3-6 illustrates a sampling of the difference in stream releases below O'Shaughnessy Dam for the WSIP, alternative, and base settings. Illustrated are the additional flows during the year and the potential effect to releases during the reservoir's replenishment.

The difference in monthly flow below O'Shaughnessy Dam indicates a potential change in releases between the alternative and WSIP settings, ranging to a decrease of approximately 24,000 acre-feet. Considering the manner in which releases are determined and made to the stream, quantifying the effect of these changes in terms of average monthly flow (cfs) is not always meaningful.[18] Assuming that a change in release volume equates to a delay or earlier initiation of releasing 6,000 acre-feet per day, the difference in stream release from O'Shaughnessy Dam between the alternative and WSIP settings could be a delay in releases above minimum requirements by up to 4 days. Compared to the base setting, the delay could be up to 8 days. Normally, the effect of a delay in release would not affect the year's peak stream release rate during a year.

5.4 Lake Lloyd and Lake Eleanor

Compared to the operation in the WSIP setting, the operation of Lake Lloyd and Lake Eleanor are simulated to be essentially the same as in the alternative setting. Also, the operation resulting for the alternative and WSIP settings are essentially the same as in the base setting, because the Lake Lloyd and Lake Eleanor operation predominantly occur for the satisfaction of power generation needs and MID/TID entitlements to inflow. The lone exception in the simulation occurs during the prolonged drought of 1987-1992. During this drought period, there is a slightly different draw from Hetch Hetchy Reservoir in the different settings, which affects the amount of water released from Hetch Hetchy Reservoir to Don Pedro Reservoir; for satisfaction of MID/TID entitlements to inflow, this affects the amount of releases from Lake Lloyd. However, the effect is small and rarely occurs. A different storage level would result in Lake Lloyd manifesting as a change to releases to the stream above minimum requirements during a subsequent period of reservoir replenishment.

[18] See "Estimated Effect of WSIP on Daily Releases below Hetch Hetchy Reservoir", Memorandum by Daniel B. Steiner, December 31, 2006.

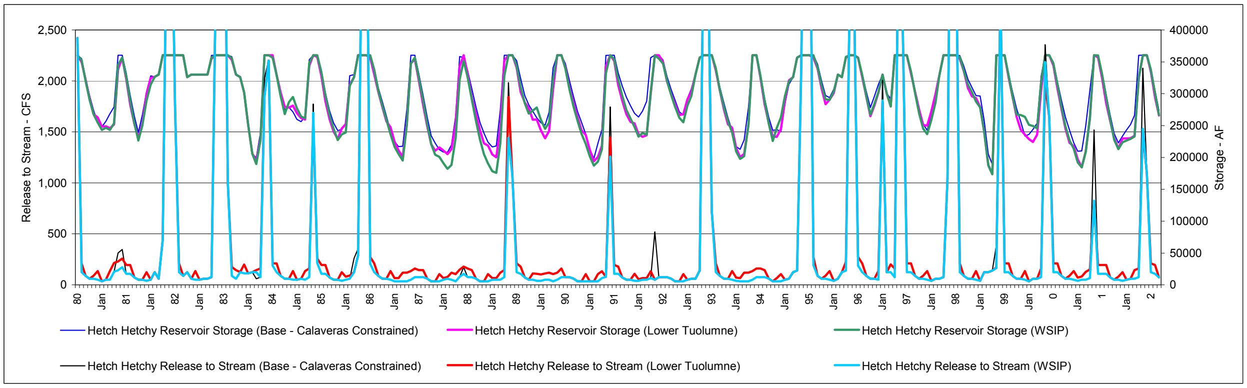
Figure 5.3-6
Hetch Hetchy Reservoir Storage and Stream Release (Sample with enlarged flow scale)



5.5 Flow below Tuolumne River and Cherry River Confluence

The flow that occurs below the confluence of the Tuolumne River and Cherry River is considered important to recreational activity (white water rafting) during May through September. To estimate the effect of Hetch Hetchy operations on the occurrence of flow at this location, HH/LSM monthly volumetric flow results were post-processed to reflect the daily and hourly shaping potential currently exercised by Hetch Hetchy operators to satisfy water and power objectives while accommodating the desires of recreational interests.[19] Compared to the WSIP setting, the alternative setting would typically result in greater flow at the location, particularly during July and August when the lower Tuolumne River diversion is occurring and coincidentally triggering a supplemental release to the middle Tuolumne River from O'Shaughnessy Dam. The supplemental release associated with a 55-mgd lower Tuolumne River diversion is approximately 85 cfs.

The same result essentially occurs in the comparison of the alternative setting to the base setting. However, in that comparison, the combined effect of the supplemental lower Tuolumne River diversion releases and the reduction to releases above minimum release requirements caused by system-wide demand increase replenishment typically leads to a reduction in flow at the location during May and June (the same underlying effect attributed to the WSIP setting). However, there would only be a rare occurrence when the shaped flow of the alternative would cross the threshold of being less than 1,000 cfs, as compared to greater than 1,000 cfs in the base setting. While in both the alternative and base settings there are occasional dry and critical years, there could be instances when the shaped flow would be less than 1,000 cfs; however, results indicate that it would be rare for the alternative setting to increase that frequency.

5.6 Don Pedro Reservoir and La Grange Releases

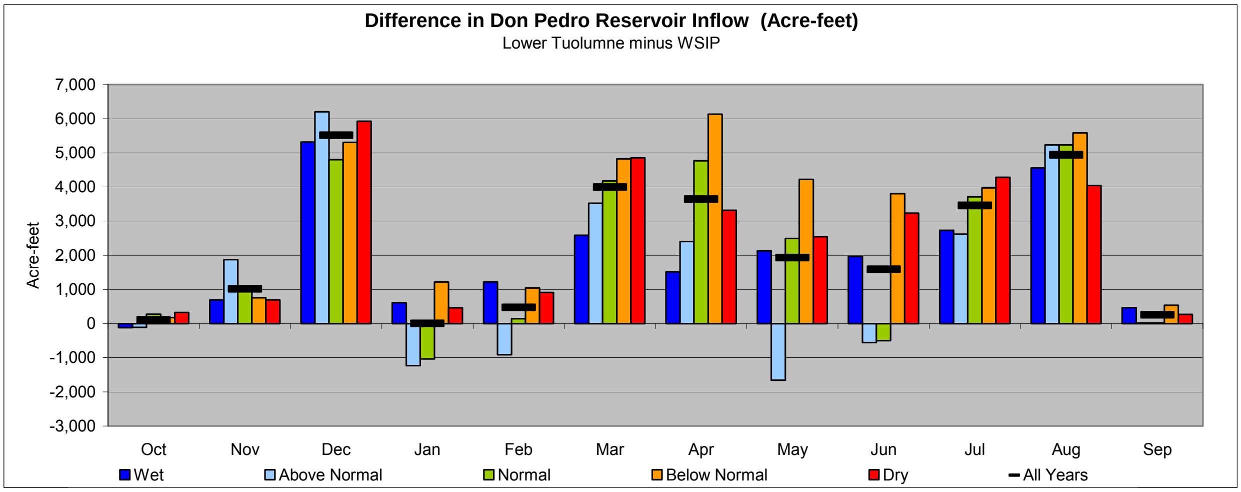
A change in Don Pedro Reservoir operation is caused by changes to inflow to and releases from the reservoir. The changes in inflow to the reservoir are the result of net changes within the operation of the upstream SFPUC facilities, described previously, and other changes in SFPUC operations associated with diversions to the Holm, Kirkwood, and Moccasin Powerhouses. In the alternative setting, the supplemental releases made from Hetch Hetchy Reservoir for the lower Tuolumne River diversion also affect inflow to Don Pedro Reservoir. The lower Tuolumne River diversion also affects releases from Don Pedro Reservoir.

Figure 5.6-1 illustrates the difference in inflow to Don Pedro Reservoir between the alternative and WSIP settings, averaged by month for each year type. The results are consistent with the intent of the alternative's operation, which shifts the effect of the increase in Tuolumne River diversion from upstream of Don Pedro Reservoir. Instead of reducing inflow to Don Pedro by diverting the additional flow to the SJPL from upstream, the otherwise diverted flow is released to the middle Tuolumne River and flows into Don Pedro Reservoir.

---

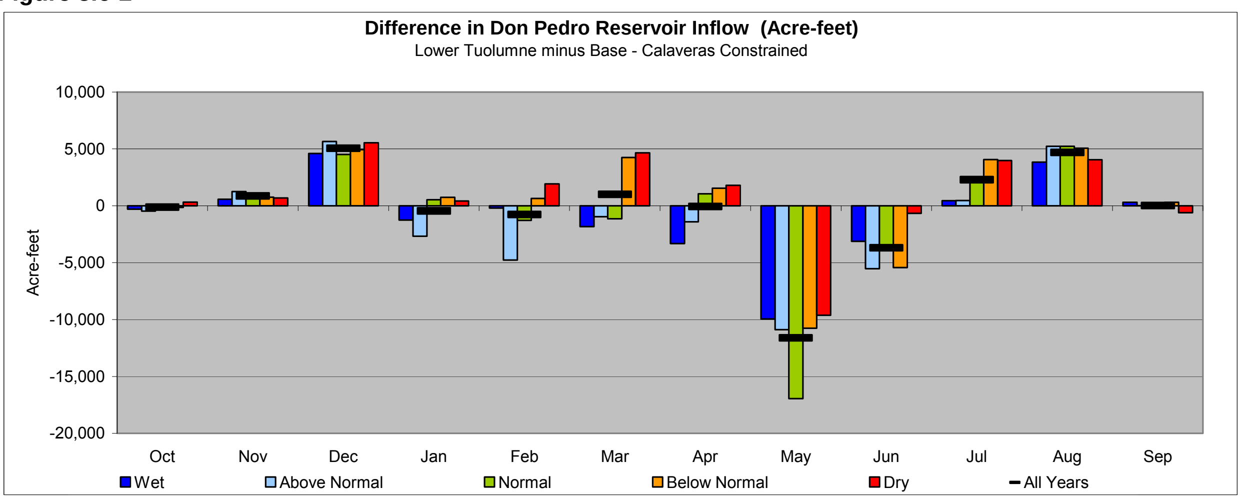
[19] See "HH/LSM Assumptions and Results – Proposed WSIP", Memorandum by Daniel B. Steiner, March 18, 2007.

Figure 5.6-1



The comparison of inflow to Don Pedro Reservoir between the alternative and base settings is illustrated in Figure 5.6-2. The illustration shows that all of the effects to inflow to Don Pedro Reservoir attributable to additional diversions from the Tuolumne River Basin are not eliminated with the lower Tuolumne River diversion. Shifts in the timing of inflow to Don Pedro Reservoir would occur due to changes in the seasonal operation of the entire SFPUC system, including a different maintenance program. Also, in this configuration of the alternative, there occurs an increase (albeit, a relatively small one) in upstream diversions to the Bay Area system.

Figure 5.6-2



Generally coincident with the changes to inflow to Don Pedro Reservoir would be changes to releases from La Grange Dam to the lower Tuolumne River. The alternative setting assumes that the SFPUC diversion at the lower Tuolumne River location would recapture releases from La Grange Dam that are explicitly made for the diversion. These releases would be in addition to releases made for compliance to the FERC release requirements. Described previously (in Table 5.2-3) are the modeled diversions at the lower Tuolumne River diversion location. Table 5.6-1 illustrates the same information, expressed as average monthly flow rates by year type, that would supplement La Grange Dam releases to serve the SFPUC diversions. The supplemental flows are also illustrated in Figure 5.6-3.

Table 5.6-1

Supplemental Release at La Grange Dam for SFPUC Recapture - CFS (Average within Year Type - Grouped by Unimpaired Runoff at LaGrange)	Oct	Nov	Dec	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep

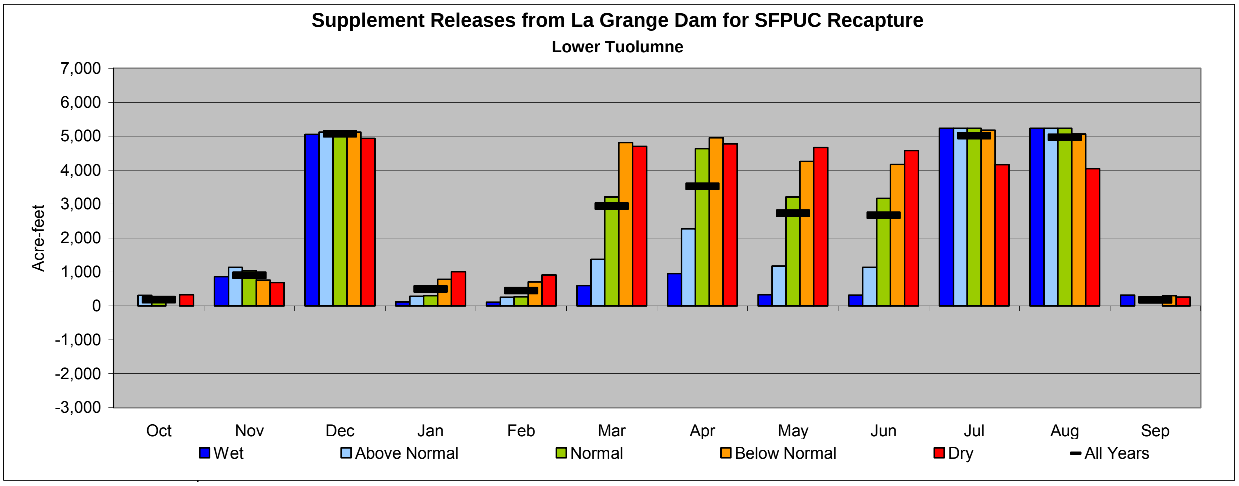
All Years	3	15	82	8	8	48	59	44	45	82	81	3

Figure 5.6-3



Compared to the WSIP setting, the inflow to Don Pedro Reservoir associated with the alternative setting is greater by about the amount of the diminishment of inflow that occurred between the WSIP setting and the base setting. Essentially, the same inflow to Don Pedro Reservoir occurs for either the alternative or the base setting. In the alternative setting, the inflow to Don Pedro Reservoir explicitly made by the SFPUC for the lower Tuolumne River diversion is assumed to pass through Don Pedro Reservoir as a supplemental release at La Grange Dam. Therefore, although the inflow to Don Pedro Reservoir associated with the alternative is essentially the same as for the base setting, an additional release from Don Pedro Reservoir (and La Grange Dam to the lower Tuolumne River) occurs, which depletes Don Pedro Reservoir storage by the amount of the supplemental release. This additional depletion of storage due to the supplemental release to the lower Tuolumne River is about the same as the depletion of storage associated with the WSIP. The depletion of inflow associated with the WSIP setting was caused by the diversion of additional water from upstream. The end result is that Don Pedro Reservoir storage is depleted by about the same amount in either the WSIP or alternative setting as compared to the base setting.

Although the alternative would increase the flow below La Grange Dam in many months, in many years, the resultant depletion of storage in Don Pedro Reservoir attributed to the alternative would subsequently manifest in reductions in releases from La Grange Dam to the stream in other months. The additional depletion of reservoir storage manifests as a reduction in subsequent releases below La Grange Dam in order to replenish reservoir storage. The differences in releases to the Tuolumne River from La Grange Dam would occur only when there would otherwise be releases in excess of minimum FERC flow requirements. With the net effect of changes in Don Pedro Reservoir inflow and releases resulting in a storage operation essentially the same as the WSIP setting, the alternative setting would result in the same magnitude of flow reductions during reservoir replenishment. Most notable would be the flow difference in a year, such as 1993, that follows the extensive drought of 1987-1992. Similar to the WSIP setting, the accumulated effect of the additional releases below La Grange Dam during this period could deplete the reservoir to an extent that the entire volume of flow that would have occurred in excess of FERC requirements in the base setting would have been eliminated during 1993, to replenish Don Pedro Reservoir. In other years, the depletion of storage associated with the alternative would delay the day that excess flow above FERC requirements would be released. Normally, the effect of the delay in release would not affect the year’s peak stream release rate during a year. However, infrequently, and as described for the period following the 1987-1992 drought, the alternative’s affect on stream releases could manifest as an elimination of all flows during a year that would otherwise occur in excess of minimum FERC flow requirements. Such a large and lengthy reduction in flow would not be common, and would result only because of the multi-year droughts.

5.7 Calaveras and San Antonio Reservoirs, Alameda Creek and Downstream

The analytical studies used to evaluate the alternative focused on depicting an alternative method of managing the SFPUC diversion of water from the Tuolumne River basin, i.e., the supplementing of flows in the middle and lower Tuolumne River and diverting of the increase in SFPUC demand from a location in the lower Tuolumne River. Those studies were used in support of developing Water Supply Option 3. Subsequent to those studies, refinements to the depiction of the Bay Area system and its operation have occurred that limit the direct use of HH/LSM results for illustrative purposes. The following qualitative descriptions of the comparison between the alternative, WSIP, and base settings have been developed from the review of HH/LSM results and engineering judgment. Overall, in the alternative setting, the Bay Area system would perform very much the same as in the WSIP setting.

Compared to the base setting, Calaveras Reservoir operations would substantively change in the alternative setting. With the restoration of Calaveras Reservoir operating capacity, the reservoir would be operated to a larger storage capacity. The operation of Calaveras Reservoir would be very similar to the operation described for the WSIP setting.

There would be two categorical changes in the regime of releases to Calaveras Creek below Calaveras Dam between the alternative and base settings. In the alternative setting, there would be the addition of the flows representing the flow objectives associated with the1997 MOU, and the reduction of stream releases during wetter-year/wetter-season flows due to the restoration of Calaveras Reservoir operational capacity.

Compared to the base setting, diversions from Alameda Creek to Calaveras Reservoir would increase in the alternative setting. With the current constraints on Calaveras Reservoir storage, diversions to Calaveras Creek are rejected. With the restoration of operational storage in the reservoir, the opportunity to divert water into the reservoir would increase.

Commensurate with changes in diversions from Alameda Creek to Calaveras Reservoir would be changes to the flow below the Alameda Creek Diversion Dam. Opposite in effect compared to diversions to Calaveras Reservoir, flow passing Alameda Creek Diversion Dam would decrease in the alternative setting. With operational capacity restored at Calaveras Reservoir, there would be more opportunity (and need) to divert Alameda Creek flows, thus reducing flow passing the dam.

Flow below the confluence of Alameda Creek and Calaveras Creek is affected by releases from Calaveras Dam to the stream, flow passing Alameda Creek Diversion Dam, and unregulated flow below Alameda Creek Diversion Dam and Calaveras Dam. As for the WSIP setting comparison, the notable differences between the alternative and the base settings are the addition of stream flows representing the 1997 MOU and the reduction of wetter-year/wet season flows due to the restoration of Calaveras Reservoir storage.

A flow recapture facility in Alameda Creek below Calaveras Reservoir is incorporated in the alternative setting. This facility is assumed to recapture flows explicitly released from Calaveras Dam in the representation of the 1997 MOU. The effect of the recapture is a reduction in the flow that occurs below the confluence of Alameda and Calaveras Creeks, but only to the extent that releases were explicitly made from Calaveras Reservoir. The flows at this location would be essentially the same as those described for the WSIP setting. The flows identified at this location indicate flow below the confluence of Alameda and Calaveras Creeks (described above), with the addition of estimated unregulated stream accretions between the Alameda-Calaveras Creek confluence and the Alameda-San Antonio Creek confluence, minus the water assumed to be recaptured (diverted) by the SFPUC from the creek.

The difference in San Antonio Reservoir storage between the alternative and base settings is the result of several factors, and is predominantly due to the restoration of the operational capacity of Calaveras

Reservoir, the use of SJPL flow for maintenance of Sunol Valley WTP production, and the maintenance of Hetch Hetchy conveyance. In the base setting, the limited operating storage capacity at Calaveras Reservoir leads to a different operation at San Antonio Reservoir, one that draws relatively more stored water for system demands when the draw from Calaveras Reservoir is constrained due to limited storage. The result is that the alternative setting would retain more storage in San Antonio Reservoir than in the base setting. There would very little change in stream releases below San Antonio Reservoir between the alternative, WSIP, and base settings, as the operational goal is to minimize releases to the stream. Flexibility within the balancing of storage among the Bay Area reservoirs would continue to facilitate this goal.

Flow below the confluence of Alameda and San Antonio Creeks is influenced by releases from San Antonio Reservoir and flow arriving at the location from Alameda Creek, which includes upstream impairment by SFPUC operations and facilities. The differences in flow at this location between the alternative and base settings are particularly due to the effects of the restoration of Calaveras Reservoir operating capacity in the alternative setting, and would be essentially the same as described for the differences between the WSIP and base settings.

5.8 Crystal Springs and San Andreas Reservoirs

Fundamental to the difference in storage operations at Crystal Springs Reservoir between the alternative setting and the base settings is the restoration of reservoir operation capacity in the alternative setting, which does not occur in the base setting. The result is the operation of Crystal Springs Reservoir at a higher maximum storage in the alternative setting. The operation of Crystal Springs Reservoir would be similar to the operation described for the WSIP setting.

Compared to the base setting, the alternative setting would generally result in a shifting of the maximum storage level and the range of reservoir operation to a greater volume (elevation), and the lower end of the monthly operating range would normally be greater in storage than in the base setting.

A difference in stream release below Crystal Springs Reservoir would be infrequent, and could be either an increase or decrease in the release. The potential difference is attributed to whether the alternative's operation would result in more or less available operational storage capacity at an instant compared to another setting. In actual operations, it is anticipated that system operators would manage the reservoir system such that stream releases would be minimal under any setting, with the effect of essentially no difference between the alternative, WSIP, and base settings.

Overall, Crystal Springs Reservoir, San Antonio Reservoir, and Calaveras Reservoir would tend to retain more storage during a year in the alternative setting as compared to the WSIP setting, and that result is even more dramatic when compared to the base setting. The alternative setting includes greater diversion capacity during the year from the Tuolumne River Basin, which is particularly used during the summer through the lower Tuolumne River diversion. The additional diversion capacity during the summer reduces the need to draw from Bay Area system storage, retaining greater storage in the Bay Area system during the summer and fall. The availability and use of the lower Tuolumne River diversion during December, when otherwise there would be no conveyance from Hetch Hetchy due to maintenance, also retains storage in the Bay Area system.

San Andreas Reservoir operations would generally be the same between the alternative, WSIP, and base settings. Reservoir storage would follow a systematic filling and lowering each year to manage runoff. However, different from the base and WSIP settings, the alternative setting would not typically result in an additional draw down of storage from San Andreas Reservoir during Hetch Hetchy conveyance maintenance periods. With the lower Tuolumne River diversion available during the period of conveyance maintenance, sufficient supplies and conveyance among the Bay Area system and the Tuolumne River system would negate the need to increase production at Harry Tracy WTP to compensate for the absence of Tuolumne River supply. The need to draw storage from San Andreas Reservoir to serve the demand at Harry Tracy WTP would be eliminated.

5.9 Pilarcitos Reservoir

Coastside CWD's water demand and its SFPUC purchase request are projected to increase within the WSIP planning horizon of year 2030. With the context of the 2030 purchase request of 300 mgd, Coastside CWD's portion has been estimated at about 3 mgd. This projected purchase request is approximately 1 mgd greater than its current purchase request. Recognizing the current physical constraints to deliveries from the SFPUC to Coastside CWD and the ongoing planning activities in the watershed, the precise means of serving Coastside CWD's additional purchase request and the resultant potential changes to the operation of SFPUC facilities and their affected environs are uncertain.[20]

Assuming a range of potential means to serve the additional purchase request from Coastside CWD, the following potential hydrologic effects to SFPUC facilities and their affected environs are identified:

- Due to limited yield from Pilarcitos Reservoir, additional diversions would be required from Crystal Springs Reservoir.
- If deliveries to Coastside CWD from Pilarcitos Reservoir increase during the winter season, these deliveries could potentially reduce storage in Pilarcitos Reservoir, thereby potentially reducing diversions to the San Mateo Creek watershed. Although the increased delivery would increase releases to Pilarcitos Creek from Pilarcitos Dam for a period of time, the increase would subsequently lead to a reduction in spills past Stone Dam.
- Additional wintertime deliveries could also potentially impair the ability to provide carry-over storage into the summer season from Pilarcitos Reservoir, and subsequently lead to an acceleration of the beginning of the season when releases to Pilarcitos Creek from Pilarcitos Reservoir consist only of the passage of reservoir inflow.
- An increase in summertime deliveries from Pilarcitos Creek could also accelerate the beginning of the season when releases to Pilarcitos Creek from Pilarcitos Reservoir consist only of the passage of reservoir inflow.

The alternative setting would result in the same potential effects in the Pilarcitos Creek watershed as in the WSIP setting.

[20] See "Analysis of SFPUC Pilarcitos / Coastside County Water District Operations", Memorandum by Daniel B. Steiner, March 8, 2007.

6. CEQA Alternative 5 – Oceanside Seawater Desalination Plant

CEQA Alternative 5 – Oceanside Seawater Desalination Plant Alternative (Desalination in San Francisco) would incorporate the production of 25 mgd of potable water from a desalination facility located near the Oceanside Water Pollution Control Plant in San Francisco. The 25 mgd of reverse osmosis production would be provided year-round in all years and served to the retail customers in the City and County of San Francisco.

The alternative would implement almost all of the proposed facilities for the proposed WSIP. The exception to the WSIP configuration and proposed facilities would be the specific improvements to the SJPL. Improvements and repairs would be made to the SJPL to ensure that conveyance would continue at the existing 290-mgd capacity. A SFPUC desalination plant and its appurtenant facilities would be constructed.[21]

During non-drought years, the SFPUC would serve the increase of 35 mgd in purchase requests through the supply derived from the desalination plant and a combination of conservation, water recycling, and groundwater supply programs, and greater utilization of the Bay Area watershed supplies associated with the restoration of operational storage capacity, primarily at Calaveras Reservoir.[22] The SFPUC would implement conservation, water recycling, and groundwater supply programs in the SFPUC retail service area to achieve the equivalent of 10 mgd of supply every year. These programs would be in addition to demand management and conservation measures already accounted for in the 2030 purchase request for the retail service area.

In most years, the SFPUC could serve the projected 2030 water purchases of 300 mgd with its existing sources of water supply; however, these sources alone have not allowed for full water deliveries during past droughts, and would continue to be insufficient during future droughts as purchase requests increase. In this alternative, the SFPUC would serve the 2030 need for increased system firm yield with a combination of conservation, water recycling, and groundwater programs in the SFPUC retail service area, water production from the desalination plant, a groundwater conjunctive-use program incorporating the Westside Basin Groundwater Program, and restoration of reservoir operating capacity at Crystal Springs and Calaveras Reservoirs. As with the WSIP, system-wide rationing would be limited to no more than 20 percent in any year. The water transfer program with MID/TID would not occur.

The following described results for this alternative are derived from studies performed by the SFPUC during the investigation of Water Supply Option 3. Subsequent to those studies, several refinements to assumptions for water demands, facility configuration, and operations have changed for the proposed future SFPUC regional system, which would have slightly altered the studies incorporated into Water Supply Option 3. Due to this circumstance, a comparison of the explicit modeling results for this alternative with results for the WSIP setting or base setting requires caution, and additional qualitative descriptions are provided.

6.1 Water Deliveries and Drought Response Actions

In both the alternative and WSIP settings, an average annual 300-mgd system-wide purchase request is served. With implementation of 10 mgd of conservation, water recycling, and groundwater supply programs in the SFPUC retail service area, the net regional system demand would be 290 mgd. Figure 6.1-1 illustrates the drought response actions for the simulated 82-year historical period (1921-2002).

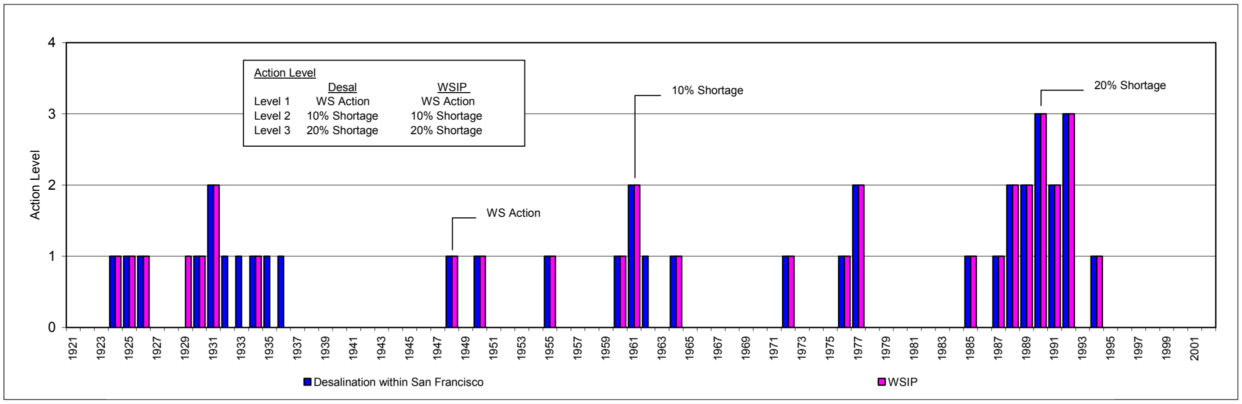
In Figure 6.1-1, years with bars showing a “1” or greater level of action indicate periods when a supplemental water supply action is initiated. In both the WSIP and alternative settings, the action is the use of the Westside Basin Groundwater Program to supplement SFPUC water deliveries. Action levels greater than “1” indicate the imposition of delivery shortages (rationing) to SFPUC customers.

---

[21] This setting is additionally described in *Water System Improvement Program (WSIP) Water Supply Option 3*, prepared by San Francisco Public Utilities Commission and Parsons, June 2006.

[22] The Lower Crystal Springs Dam Improvements project would be included in this alternative.

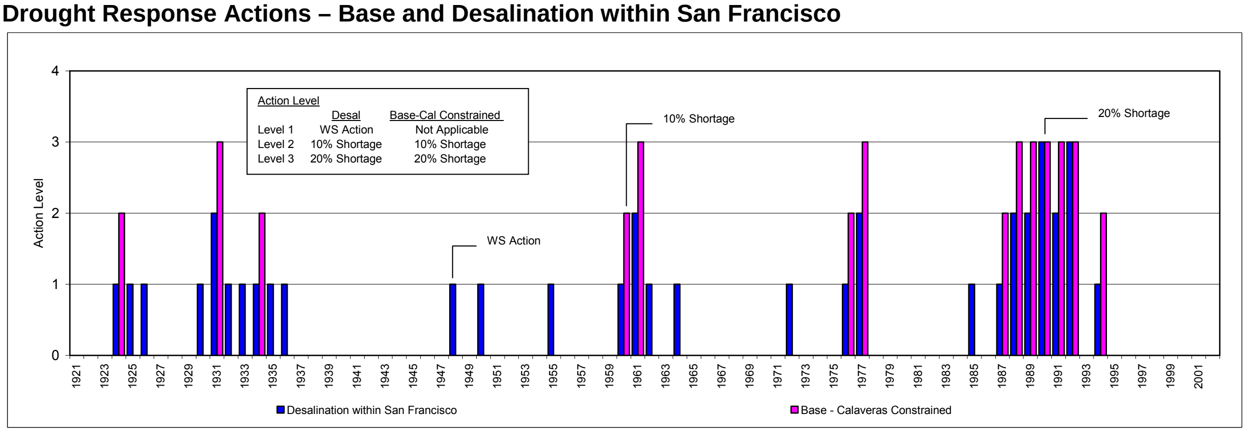
Figure 6.1-1
Drought Response Actions – Desalination within San Francisco and WSIP



The need for water delivery shortages, in frequency and severity, would be the same for the two settings, including during the design drought. Shortages would be no greater than 20 percent in any year. Although the WSIP and alternative settings indicate a different frequency of use of the level 1 action (Westside Basin Groundwater Program), the differences are partially a result of modeling assumptions that were applied in the more recent WSIP studies, which were not consistent with assumptions applied in the earlier Water Supply Option 3 studies. The modeling assumptions concern the explicit system storage level at which use of the action is triggered. As described later concerning Bay Area reservoir storage, less depletion of local reservoir storage would be anticipated in the alternative setting due to the availability of water supply production in the Bay Area system. This circumstance would lead to generally greater retention of Bay Area system storage due to the absence of conveyance constraints that limit the amount of Hetch Hetchy water that can be used seasonally to serve system-wide demand in the WSIP setting. The difference in frequency of triggering the action between the two settings is non-substantive.

The same form of information is shown in Figure 6.1-2 for the comparison of the alternative setting to the base setting. In modeling parlance, there is no level 1 action level in the base setting. Without supplemental resources, the existing system only has the delivery shortage measure available to cope with drought. This shortage measure is imposed during level 2 (10 percent) and level 3 (20 percent). These percentages of shortage are applied to both the alternative and the base settings for these action levels. As evident in the illustration, the imposition of rationing occurs more frequent and to a greater severity in the base setting (level 2 and level 3 actions). Figure 6.1-2 illustrates that, when comparing the base setting to the alternative setting, the supplemental resource (Westside Basin Groundwater Program) is triggered at times of drought, during periods when there currently is no supplemental resource available to the system. The utilization of the supplemental resource during these times results in the elimination or reduction, or at least a non-increase in the severity, of delivery shortage.

Figure 6.1-2
Drought Response Actions – Base and Desalination within San Francisco



Not illustrated in Figure 6.1-1 or Figure 6.1-2 are the delivery shortages anticipated during the entire SFPUC Design Drought. Shortages during the Design Drought with the WSIP and alternative are maintained within the objective to limit the severity of shortage to no more than 20 percent. With the existing system (Calaveras and Crystal Springs Reservoirs constrained), the 20-percent limitation (cap) objective cannot be achieved during the last 18 months of the Design Drought, and a 25 percent shortage is applied.

6.2 Diversions from Tuolumne River

For the alternative, WSIP, and base settings, the metric for illustrating the SFPUC diversion from the Tuolumne River Basin is the flow through the San Joaquin Pipeline (SJPL). Table 6.2-1 illustrates the diversions and difference in diversions to the SJPL for the proposed program and alternative settings, averaged by month, by year type. Evident is the decrease in annual diversions associated with the alternative setting. Although the same system-wide level of deliveries occurs for the two settings, the production of water supply by the desalination plant in San Francisco diminishes the use of the Tuolumne River water to serve the additional purchase request. The difference in SJPL diversions between the WSIP setting and the alternative setting is also illustrated in Figure 6.2-1. Illustrated is the difference in average monthly diversion through the SJPL by year type for the 82-year simulation period.

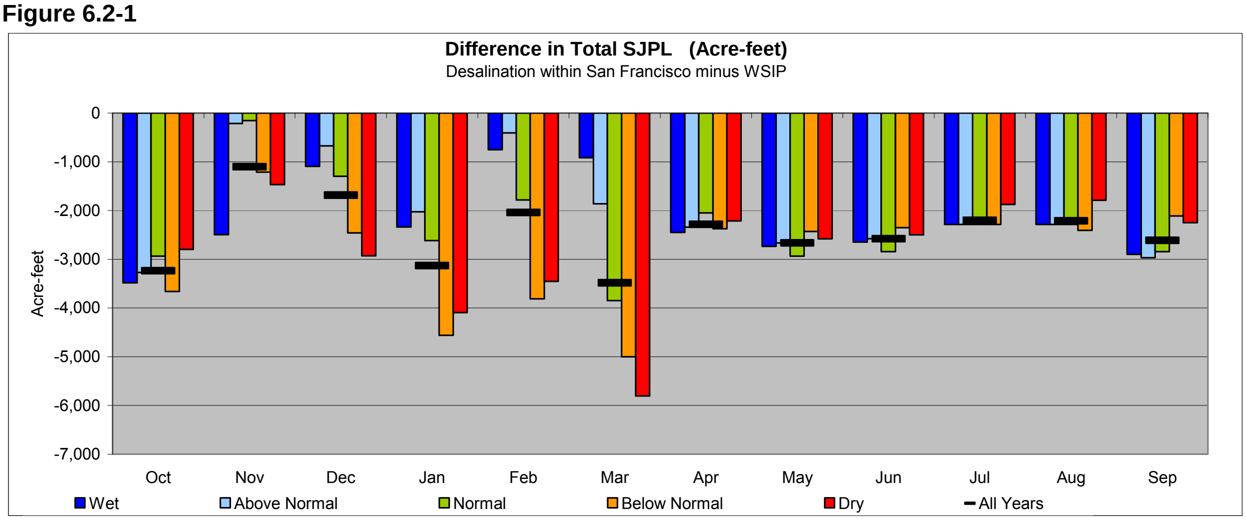
Figure 6.2-1



The lesser diversions for the alternative setting during March through August are due to the assumed lesser conveyance capacity of the SJPL associated with the alternative setting. In the WSIP setting, conveyance is increased to 313 mgd, while in the alternative setting the capacity is not improved above the currently used 290-mgd capacity. Differences during the fall, winter, and spring result from the lesser replenishment needed for Bay Area system storage from the Tuolumne River under the alternative setting. Also, less of the increase in demand is served from the Tuolumne River during this period.

The differences between the alternative's diversions from the Tuolumne River and the base setting diversions are similarly illustrated in Table 6.2-2 and in Figure 6.2-2. The average annual diversions associated with the alternative setting are about the same as those occurring for the base setting. However, there would be year-to-year differences and seasonal shifts in diversions. The seasonal shift in diversions between the two settings is due to different facility maintenance assumptions for the two settings. The alternative incorporates a maintenance program that constrains conveyance through the SJPL during November and December. Following this maintenance period, larger diversions occur to replenish Bay Area reservoirs. There would also be differences in management of storage due to the restoration of Calaveras Reservoir operational capacity and the occurrence of the desalination supply within the Bay Area system. All of these system-wide differences would result in changes in the use of the SJPL. While the overall average annual diversion through the SJPL in the alternative setting remained within 500 acre-feet of the base setting diversion, modeling results indicated that the difference in annual diversions could be as much as 35,000 acre-feet more or less than the base setting diversions in any particular year.

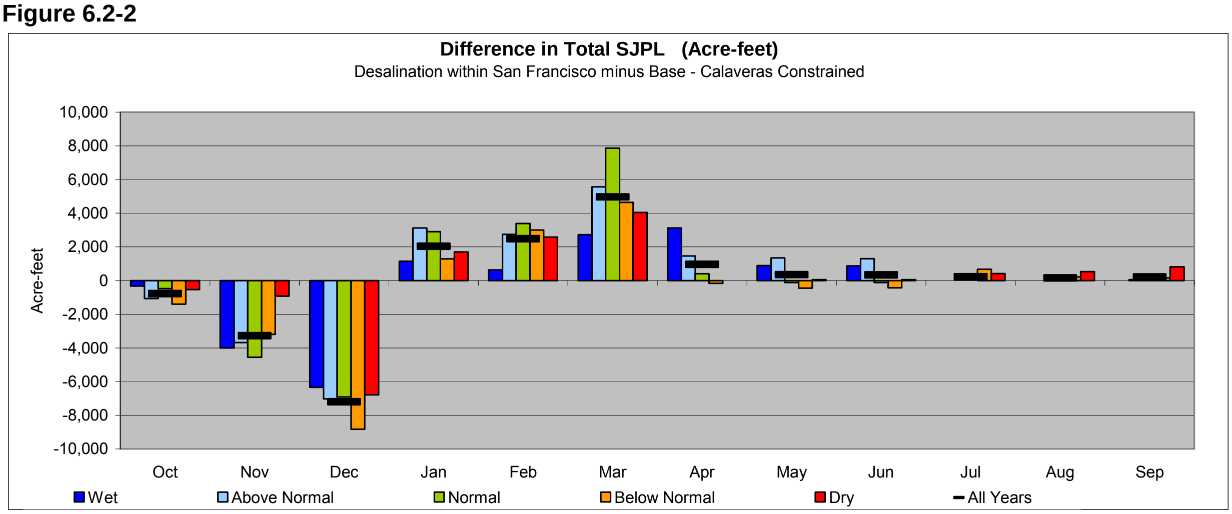
Figure 6.2-2



6.3 Hetch Hetchy Reservoir and Releases

Both the WSIP and alternative settings have the same underlying system-wide net demand for water (290 mgd); however, the alternative supplements the SFPUC water supply with production from the desalination plant instead of from the Tuolumne River. The increase in system-wide demand is essentially served with a Bay Area water resource, which results in about the same residual demand for the Hetch Hetchy system. Figure 6.3-1 illustrates a chronological trace of the simulation of Hetch Hetchy Reservoir storage and stream releases. Shown in Figure 6.3-1 are the results for the WSIP, base-Calaveras constrained ("Base – Calaveras Constrained"), and alternative ("Desalination within San Francisco") settings.

Storage in Hetch Hetchy Reservoir associated with the alternative setting would be either equal to (when full) or greater than anticipated for the WSIP setting, as seen in Figure 6.3-1. With a lesser demand (compared to the WSIP setting) served from the Tuolumne River in the alternative setting, more storage would be retained in Hetch Hetchy Reservoir. Figure 6.3-2 illustrates the average monthly storage and range of reservoir storage for the alternative and WSIP settings.

With about the same diversion from the Tuolumne River, Hetch Hetchy Reservoir storage in the alternative setting would be similar to the storage depicted for the base setting. Figure 6.3-3 illustrates the average monthly storage and range of storage for the alternative and base settings. Hetchy Hetchy Reservoir storage is typically greater by the end of December in the alternative setting due to the effect of constrained conveyance for maintenance during November and December. The increase in storage is often diminished by early spring as additional Bay Area reservoir replenishment subsequent to the maintenance draws additional water from the Hetch Hetchy system. By the end of April, during about 60 percent of the years, the reservoir would be slightly fuller.

A difference in storage in Hetch Hetchy Reservoir attributed to the diversion effects of the alternative or WSIP settings compared to the base setting would manifest in differences in releases from O'Shaughnessy Dam to the stream. A different amount of available reservoir space in the winter and spring due to the alternative would lead to a different ability to regulate inflow, thus potentially changing the amount of water released to the stream that is above minimum release requirements. Figure 6.3-1 chronologically illustrates the average monthly stream release from O'Shaughnessy Dam for the alternative, WISP, and base settings. The average monthly releases and difference in releases to the stream from O'Shaughnessy Dam for the alternative and WSIP settings are illustrated in Table 6.3-1 and Figure 6.3-4. The same form of information for the alternative setting and base setting is illustrated in Table 6.3-2 and Figure 6.3-5.

Compared to the WSIP setting, the alternative setting would typically result in an increase in stream releases during years and months when releases in excess of minimum requirements occur. As the reservoir would typically be fuller entering the reservoir filling season, there would be less ability to regulate inflow without releases in excess of minimum requirements.

Compared to the base setting, the alternative setting would result in alternating effects, ranging in effect from increases to decreases, and in some circumstances no change in releases. As described previously, essentially no change is anticipated in the long-term average diversion from the Hetch Hetchy system to serve the increased system-wide demand; however, year to year, there could be different amounts of diversions as compared to the base setting. These changes in diversions from year to year would lead to a change in storage from year to year in comparison to the base setting, and thus changes to releases at times. Over the 82-year simulation period, modeling results indicate that about a third of the time there would be no change to releases, about a third of the time there would be increases in releases, and about a third of the time there would be decreases in releases.

Table 6.3-1 and Table 6.3-4 illustrate the difference in stream release between the alternative setting and the WSIP and base settings, expressed in terms of a monthly volume (acre-feet) of flow. Considering the manner in which releases are determined and made to the stream, quantifying the effect of these

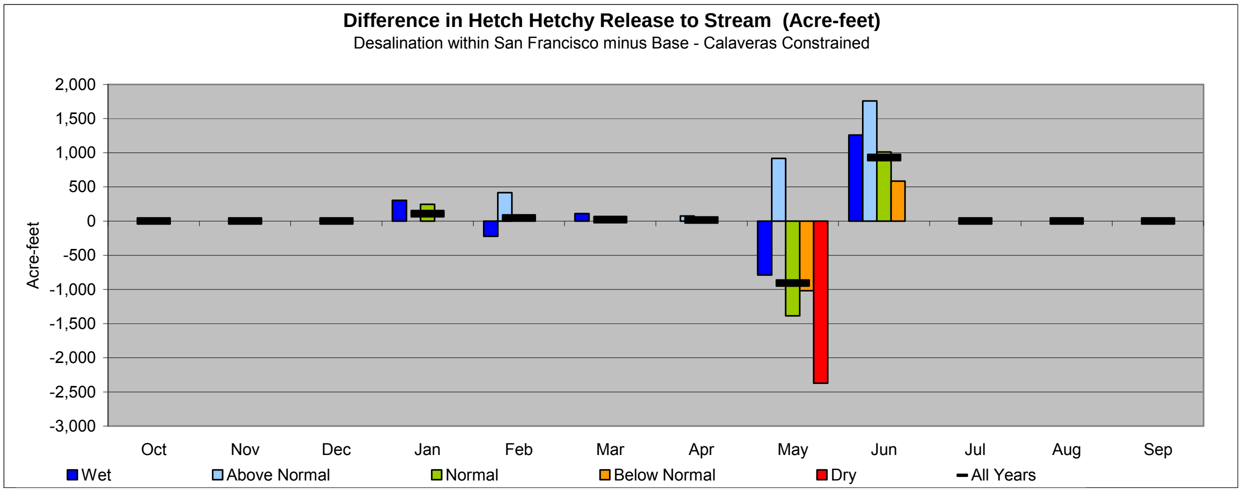
Figure 6.3-5



changes in terms of monthly flow (acre-feet or cfs) is not always meaningful.[23] Assuming that a change in release volume equates to a delay or earlier initiation of releasing 6,000 acre-feet per day, the difference in stream release from O'Shaughnessy Dam between the alternative and WSIP settings could be additional days of releases in excess of minimum requirements by up to 7 days. Compared to the base setting, a range of up to 4 days of additional releases to a delay of up to 5 days of releases could occur. Normally, the effect of a delay or earlier start in release would not affect the year's peak stream release rate during a year. Table 6.3-3 and Table 6.3-4 illustrate the modeled monthly volumetric changes in stream release between the alternative and WSIP settings and the alternative and base settings, respectively.

6.4 Lake Lloyd and Lake Eleanor

Compared to the operation in the WSIP setting, the operation of Lake Lloyd and Lake Eleanor in the alternative setting is simulated to be essentially the same. Also, the operation resulting for the alternative and WSIP settings are essentially the same as in the base setting. These outcomes are the result of Lake Lloyd and Lake Eleanor operations predominantly occurring for the satisfaction of power generation needs and MID/TID entitlements to inflow. The lone exception in the simulation occurs during the prolonged drought of 1987-1992. During this drought period, there is a slightly different draw from Hetch Hetchy Reservoir in the WSIP setting as compared to the alternative and base settings, affecting the amount of water released from Hetch Hetchy Reservoir to Don Pedro Reservoir, which, for satisfaction of MID/TID entitlements to inflow, affects the amount of releases from Lake Lloyd. The effect is small and would rarely occur. The effect of a different storage level occurring is Lake Lloyd would manifest as a change to releases to the stream above minimum requirements during a subsequent period of reservoir replenishment. There would be no difference in the operation of the reservoirs between the alternative and base settings.

6.5 Flow below Tuolumne River and Cherry River Confluence

With little difference between the performance of the alternative setting and the base setting, the flow below the Tuolumne River and Cherry River confluence is anticipated to be the same in both settings. While both the alternative and base settings, during some dry and critical years, there could be instances when the shaped flow would be less than 1,000 cfs; however, results indicate that the alternative setting would rarely change that frequency. There would be slightly more flow at this location in the alternative setting as compared to the WSIP setting.

6.6 Don Pedro Reservoir and La Grange Releases

A change in Don Pedro Reservoir operation is caused by changes to inflow to the reservoir. The changes in inflow to the reservoir are the result of net changes within the operation of the upstream SFPUC facilities, described previously, and other changes in SFPUC operations associated with diversions to the Holm, Kirkwood, and Moccasin Powerhouses. Figure 6.6-1 illustrates the difference in inflow to Don Pedro Reservoir between the alternative and WSIP settings, averaged by month for each year type. The results illustrate how serving the increase in system-wide demand with the water supply from the desalination plant located in the Bay Area system would reduce the amount of diversion from the Hetch Hetchy system compared to the WSIP setting, thus resulting in more inflow to Don Pedro Reservoir. The comparison of inflow to Don Pedro Reservoir between the alternative and base settings is illustrated in Figure 6.6-2. The illustration shows the small effect to inflow to Don Pedro Reservoir attributable to the alternative. Shifts in the timing of inflow to Don Pedro Reservoir would occur due to changes in the seasonal operation of the entire SFPUC system, including a different maintenance program. While the overall average annual inflow to Don Pedro Reservoir in the alternative setting remained within 500 acre-feet of the base setting diversion, modeling results indicated that the difference in annual inflow could be as much as 30,000 acre-feet more or less than the base setting diversions in any particular year.

[23] See "Estimated Effect of WSIP on Daily Releases below Hetch Hetchy Reservoir", Memorandum by Daniel B. Steiner, December 31, 2006.

Figure 6.6-1

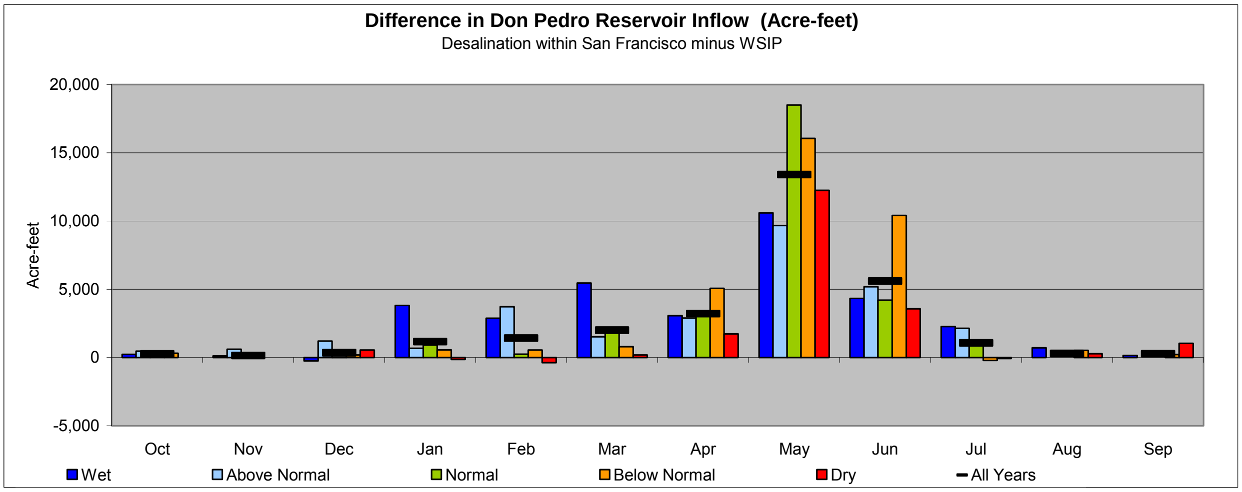

Figure 6.6-2

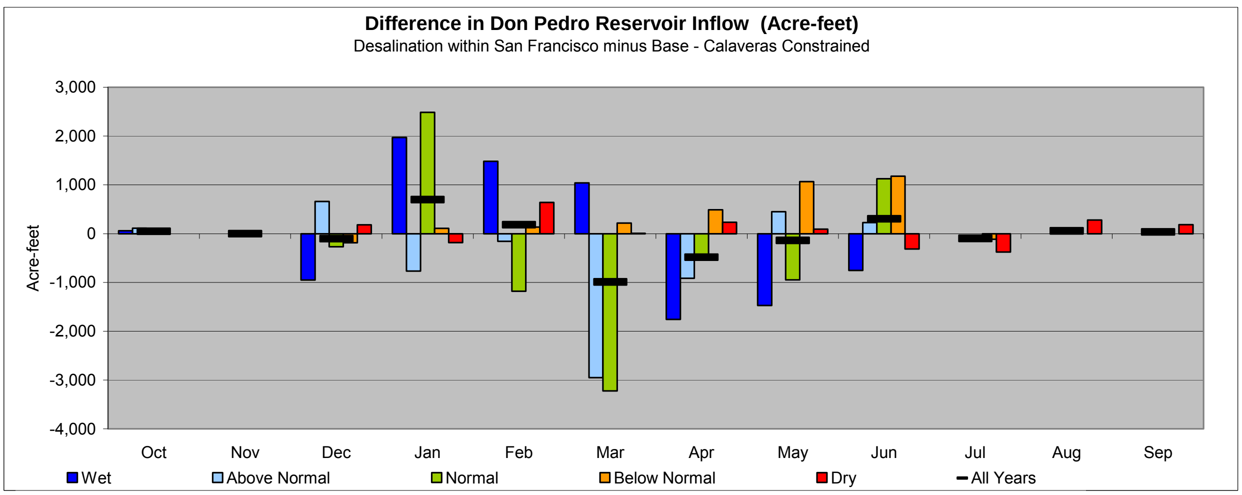

Essentially the same inflow to Don Pedro Reservoir occurs for the alternative and base settings. Figure 6.6-3 illustrates a chronological trace of the simulation of Don Pedro Reservoir storage and stream releases. Shown in Figure 6.6-3 are the results for the WSIP, base, and alternative settings. The alternative setting operation of Don Pedro Reservoir is essentially the same between the alternative and base settings. The lesser inflow to Don Pedro Reservoir associated with the WSIP setting would tend to deplete more storage from Don Pedro Reservoir than either the base or alternative settings, particularly during periods of sustained drought.

The additional depletion of reservoir storage in the WSIP setting manifests as a reduction in subsequent releases below La Grange Dam in order to replenish reservoir storage. The differences in release to the Tuolumne River from La Grange Dam would occur only when there would otherwise be releases in excess of minimum FERC flow requirements. In the alternative setting, the storage operation of Don Pedro Reservoir is essentially the same as the base setting, resulting in little difference in releases below La Grange Dam. As described previously, slight changes in inflow would occur between the alternative and base settings due to changes in the overall system-wide operation of the SFPUC system. The changes in inflow during periods when Don Pedro Reservoir would be passing inflow to maintain flood control space in the reservoir would manifest as a change in the amount of flow passed to the river. The overall average annual release to the Tuolumne River associated with the alternative is essentially the same as the water released in the base setting; however, there would be month-to-month and year-to-year differences.

6.7 Calaveras and San Antonio Reservoirs, Alameda Creek and Downstream

The analytical studies used to evaluate this alternative focused on depicting an alternative method of serving the increase in system-wide demand through means other than the Tuolumne River. Those studies were used in support of developing Water Supply Option 3. Subsequent to those studies, refinements to the depiction of the Bay Area system and its operation have occurred that limit the direct use of HH/LSM results for illustrative purposes. The following qualitative descriptions of the comparison between the alternative, WSIP, and base settings have been developed from the review of HH/LSM results and engineering judgment. Overall, in the alternative setting, the Bay Area system would perform very much the same as the system performs in the WSIP setting; however, the occurrence of the alternative's supplemental water supply within the Bay Area system would provide an improved ability to retain storage in the Bay Area reservoirs. This would occur due to the absence of the effect of conveyance constraints in the Hetch Hetchy system during summer and the conveyance maintenance period. The need for water from the Hetch Hetchy system that would at times occur when conveyance could not fully deliver would be satisfied from production at the desalination plant, leaving the Bay Area reservoirs less depleted within a year.

Compared to the base setting, Calaveras Reservoir operations would substantively change in the alternative setting. With the restoration of Calaveras Reservoir operating capacity, the reservoir would be operated to a larger storage capacity. The operation of Calaveras Reservoir would be very similar to the operation described for the WSIP setting.

There would be two categorical changes in the regime of releases to Calaveras Creek below Calaveras Dam between the alternative and base settings. In the alternative setting, there would be the addition of the flows representing the flow objectives associated with the1997 MOU, and the reduction of stream releases during wetter-year/wetter-season flows due to the restoration of Calaveras Reservoir operational capacity.

Compared to the base setting, diversions from Alameda Creek to Calaveras Reservoir would increase in the alternative setting. With the current constraints on Calaveras Reservoir storage, diversions to Calaveras Creek are rejected. With the restoration of operational storage in the reservoir, the opportunity to divert water into the reservoir would increase.

Commensurate with changes in diversions from Alameda Creek to Calaveras Reservoir would be changes to the flow below the Alameda Creek Diversion Dam. Opposite in effect compared to diversions to Calaveras Reservoir, flow passing Alameda Creek Diversion Dam would decrease in the alternative setting. With operational capacity restored at Calaveras Reservoir, there would be more opportunity (and need) to divert Alameda Creek flows, and thus reduce flow passing the dam.

Flow below the confluence of Alameda Creek and Calaveras Creek is affected by releases from Calaveras Dam to the stream, flow passing Alameda Creek Diversion Dam, and unregulated flow below Alameda Creek Diversion Dam and Calaveras Dam. As with the WSIP setting comparison, the notable differences between the alternative and base settings are the addition of stream flows representing the 1997 MOU and the reduction of wetter-year/wet season flows due to the restoration of Calaveras Reservoir storage.

A flow recapture facility in Alameda Creek below Calaveras Reservoir is incorporated in the alternative setting. This facility is assumed to recapture flows explicitly released from Calaveras Dam in the representation of the 1997 MOU. The effect of the recapture is a reduction in the flow that occurs below the confluence of Alameda and Calaveras Creeks, but only to the extent that releases were explicitly made from Calaveras Reservoir. The flows at this location would be essentially the same as those described for the WSIP setting. The flows identified at this location indicate flow occurring below the confluence of Alameda and Calaveras Creeks (described above), with the addition of estimated unregulated stream accretions between the Alameda-Calaveras Creek confluence and the Alameda-San Antonio Creek confluence, minus the water assumed to be recaptured (diverted) by the SFPUC from the creek.

The difference in San Antonio Reservoir storage between the alternative and base settings is the result of several factors, and is predominantly due to the restoration of the operational capacity of Calaveras Reservoir, the use of SJPL flow for maintenance of Sunol Valley WTP production, and the maintenance of Hetch Hetchy conveyance. In the base setting, the limited operating storage capacity at Calaveras Reservoir leads to a different operation at San Antonio Reservoir, one that draws relatively more stored water for system demands when the draw from Calaveras Reservoir is constrained due to limited storage. The result is that the alternative setting would retain more storage in San Antonio Reservoir than in the base setting. There would very little change in stream releases below San Antonio Reservoir between the alternative, WSIP, and base settings, as the operational goal is to minimize releases to the stream. Flexibility within the balancing of storage among the Bay Area reservoirs would continue to facilitate this goal.

Flow below the confluence of Alameda and San Antonio Creeks is influenced by releases from San Antonio Reservoir and flow arriving at the location from Alameda Creek, which includes upstream impairment by SFPUC operations and facilities. The differences in flow at this location between the alternative and base settings are particularly due to the effects of the restoration of Calaveras Reservoir operating capacity in the alternative setting, and would be essentially the same as described for the differences between the WSIP and base settings.

6.8 Crystal Springs and San Andreas Reservoirs

Fundamental to the difference in storage operations at Crystal Springs Reservoir between the alternative setting and the base settings is the restoration of reservoir operation capacity in the alternative setting, which does not occur in the base setting. The result is the operation of Crystal Springs Reservoir at a higher maximum storage in the alternative setting. The operation of Crystal Springs Reservoir would be similar to the operation described for the WSIP setting.

Compared to the base setting, the alternative setting would generally result in a shifting of the maximum storage level and the range of reservoir operation to a greater volume (elevation), with the lower end of the monthly operating range normally greater in storage than in the base setting.

A difference in stream release below Crystal Springs Reservoir would be infrequent, and could be either an increase or decrease in the release. The potential difference is attributed to whether the alternative’s operation would result in more or less available operational storage capacity at an instant compared to another setting. In actual operations, it is anticipated that system operators would manage the reservoir system whereby stream releases would be minimal under any setting, with the effect of essentially no difference between the alternative, WSIP, and base settings.

Overall, Crystal Springs Reservoir, San Antonio Reservoir, and Calaveras Reservoir would tend to retain more storage during a year in the alternative setting as compared to the WSIP setting, and that result is even more dramatic when compared to the base setting. The alternative setting includes water supply production from a desalination plant located within the Bay Area system. The additional supply during the summer reduces the need to draw from Bay Area system storage, retaining greater storage in the Bay Area system during the summer and fall. The availability and use of the supplemental supply during December, when otherwise there would be no conveyance from Hetch Hetchy due to maintenance, also retains storage in the Bay Area system.

San Andreas Reservoir operations would generally be the same between the alternative, WSIP, and base settings. Reservoir storage would follow a systematic filling and lowering each year to manage runoff. However, in contrast to the base and WSIP settings, the alternative setting would not typically result in an additional draw down of storage from San Andreas Reservoir during Hetch Hetchy conveyance maintenance periods. With the desalination supply available during the period of conveyance maintenance, sufficient supplies and conveyance among the Bay Area system would negate the need to increase production at Harry Tracy WTP to compensate for the absence of Tuolumne River supply. The need to draw storage from San Andreas Reservoir to serve the demand at Harry Tracy WTP would be eliminated.

6.9 Pilarcitos Reservoir

Coastside CWD's water demand and its SFPUC purchase request are projected to increase within the WSIP planning horizon of year 2030. With the context of the 2030 purchase request of 300 mgd, Coastside CWD's portion has been estimated at about 3 mgd. This projected purchase request is approximately 1 mgd greater than its current purchase request. Recognizing the current physical constraints to deliveries from the SFPUC to Coastside CWD and the ongoing planning activities in the watershed, the precise means of serving Coastside CWD's additional purchase request and the resultant potential changes to the operation of SFPUC facilities and their affected environs are uncertain.[24]

Assuming a range of potential means to serve the additional purchase request from Coastside CWD, the following potential hydrologic effects to SFPUC facilities and their affected environs have been identified:

- Due to limited yield from Pilarcitos Reservoir, additional diversions would be required from Crystal Springs Reservoir.
- If deliveries to Coastside CWD from Pilarcitos Reservoir increase during the winter season, these deliveries could potentially reduce storage in Pilarcitos Reservoir, thereby potentially reducing diversions to the San Mateo Creek watershed. Although the increased delivery would increase releases to Pilarcitos Creek from Pilarcitos Dam for a period of time, the increase would subsequently lead to a reduction in spills past Stone Dam.
- Additional wintertime deliveries could also potentially impair the ability to provide carry-over storage into the summer season from Pilarcitos Reservoir, and subsequently lead to an acceleration of the beginning of the season when releases to Pilarcitos Creek from Pilarcitos Reservoir consist only of the passage of reservoir inflow.
- An increase in summertime deliveries from Pilarcitos Creek could also accelerate the beginning of the season when releases to Pilarcitos Creek from Pilarcitos Reservoir consist only of the passage of reservoir inflow.

The alternative setting would result in the same potential effects to the Pilarcitos Creek watershed as in the WSIP setting.

[24] See "Analysis of SFPUC Pilarcitos / Coastside County Water District Operations", Memorandum by Daniel B. Steiner, March 8, 2007.

Memorandum

Subject: **HH/LSM Assumptions and Results – Proposed WSIP in Future Cumulative Setting**
From: **Daniel B. Steiner**
Date: **December 6, 2006**

1. Introduction

This memorandum summarizes the assumptions for and interprets the Hetch Hetchy Local Simulation Model (HH/LSM) results for the simulation of the Water System Improvement Program ("WSIP" or the "proposed program") in the "cumulative" setting. Because additional activities may occur separate from the WSIP, this analysis evaluates the future hydrologic effects that could occur as a result of such activities in combination with the WSIP. Two potential activities specific to the Tuolumne River Basin have been identified for the cumulative analysis: 1) the U.S. Fish & Wildlife Service (USFWS) "discretionary flows" below Hetch Hetchy; and 2) the Turlock Irrigation District (TID) river diversion project. The USFWS activity is explicitly modeled by HH/LSM, and is the topic of this paper; the TID project will be evaluated with post-processing of the HH/LSM results. The TID project would affect only the balance of river releases below La Grange Dam and Turlock Canal diversions, and would not affect the upstream operation of San Francisco facilities. A separate analysis of that cumulative action is being performed, the results of which are not included in this paper.

The San Francisco Public Utilities Commission (SFPUC) proposes to adopt and implement a WSIP to increase the reliability of the regional water system. The WSIP implements the service goals and system performance objectives established by the SFPUC for the Regional Water System in the areas of water quality, seismic reliability, delivery reliability, and water supply through the year 2030. The WSIP level of service objectives for water supply are to: 1) fully meet customer purchase requests in non-drought years through the planning year 2030, estimated at 300 million gallons per day (mgd) average annual delivery; and 2) provide drought-year delivery with a maximum system-wide delivery reduction (rationing) of 20 percent in any one year of a drought. These objectives correspond to a required system firm yield of 256 mgd in 2030.

The WSIP's effect on hydrology is described in a separate memorandum.[1] That memorandum discusses the components of the WSIP, the various modeling assumptions and performance and hydrologic results for the WSIP compared to the modeled existing setting (2005) with Calaveras Reservoir constrained by California Division of Safety of Dams (DSOD) restrictions, and the pre-2002 setting (with a Calaveras Reservoir operation prior to DSOD restrictions). The hydrology of the proposed program is primarily compared to the baseline condition of the Program Environmental Impact Report, i.e., the simulated current (2005) operation of the Regional Water System, assuming that the operation of Calaveras and Crystal Springs Reservoirs is constrained by DSOD restrictions. Primary hydrologic parameters such as projected water deliveries, reservoir storage, and stream flows are compared, and additional parameters that assist in identifying causes of hydrologic changes are also described as needed. The key hydrologic factors that lead to environmental impact assessment are also illustrated.

This analysis is based on both the projection of the WSIP operation in the year 2030 and the current operation of the Regional Water System.

2. USFWS Discretionary Flows

The USFWS has the discretion to require the release of additional water from Hetch Hetchy Reservoir. These releases amount to 15,000, 6,500, and 4,400 acre-feet during year types A, B, and C, respectively, as the year types are classified by the amount of precipitation and runoff at Hetch Hetchy Reservoir. Table 2-1 presents the criteria that determine the year type classification and the required basic releases

[1] See "HH/LSM Assumptions and Results – Proposed WSIP," Memorandum by Daniel B. Steiner, March 18, 2007.

to the Tuolumne River below O'Shaughnessy Dam. In addition to the basic release, during year types A and B, an additional release of 64 cubic feet per second (cfs) below Hetch Hetchy Reservoir can be required whenever Canyon Tunnel flow exceeds 920 cfs.

Table 2-1
Average Daily Required Fishery Release Schedule Below O'Shaughnessy Dam

	Year Type A		Year Type B		Year Type C
Month	Release (cfs)	Criteria[a, b]	Release (cfs)	Criteria[a, b]	Release (cfs)
January	50	8.80"	40	6.10"	35
February	60	14.00"	50	9.50"	35
March	60	18.60"	50	14.20"	35
April	75	23.00"	65	18.00"	35
May	100	26.60"	80	19.50"	50
June	125	28.45"	110	21.25"	75
July	125	575,000 acre-feet	110	390,000 acre-feet	75
August	125	640,000 acre-feet	110	400,000 acre-feet	75
September 1-14	100		80		75
September 15-30	80		65		50
October	60		50		35
November	60		50		35
December	50		40		35

[a] Precipitation indicator in inches is cumulative, measured at Hetch Hetchy Reservoir, starting October 1.
[b] Runoff indicator in acre-feet is the calculated inflow into Hetch Hetchy Reservoir commencing on the previous October 1.

Table 2-2 illustrates the assumed monthly basic release schedule and the discretionary release schedule used for the cumulative scenario. The analysis of the WSIP does not include the assumption of the discretionary release requirement. The implementation of the additional 64-cfs release as a condition of Canyon Tunnel diversions is applied dynamically within the HH/LSM.

Table 2-2
Modeled Monthly Minimum Release Below O'Shaughnessy Dam – Acre-feet

	Type A			Type B			Type C		
Month	F&W Release	Discre-tionary Release	Total Release	F&W Release	Discre-tionary Release	Total Release	F&W Release	Discre-tionary Release[a]	Total Release
October	3,689	0	3,689	3,074	0	3,074	2,152	0	2,152
November	3,570	0	3,570	2,975	0	2,975	2,083	0	2,083
December	3,074	0	3,074	2,460	0	2,460	2,152	0	2,152

February	3,362	0	3,362	2,802	0	2,802	1,961	0	1,961
March	3,689	0	3,689	3,074	0	3,074	2,152	0	2,152
April	4,463	0	4,463	3,868	0	3,868	2,083	0	2,083
May	6,149	0	6,149	4,919	0	4,919	3,074	0	3,074
June	7,438	0	7,438	6,545	0	6,545	4,463	0	4,463
July	7,686	6,000	13,686	6,764	2,600	9,364	4,612	1,800	6,412
August	7,686	6,000	13,686	6,764	2,500	9,264	4,612	1,800	6,412
September	5,316	3,000	8,316	4,284	1,400	5,684	3,669	800	4,469
Total	59,196	15,000	74,196	49,989	6,500	56,489	35,165	4,400	39,565

[a] If July first-of-month storage at Hetch Hetchy Reservoir is less than 210,000 acre-feet program will not make the discretionary release.

3. Results

3.1 Comparison to WSIP

For the area upstream of Don Pedro Reservoir operations, the cumulative setting replicates the WSIP setting, except for the discretionary releases. The additional discretionary releases below Hetch Hetchy Reservoir would at times occur at the expense of diversions to Canyon Tunnel, and at other times from storage of Hetch Hetchy Reservoir and the subsequent reduction of release to the river that would otherwise be above required minimum releases.

Table 3.1-1 illustrates the simulated releases below O'Shaughnessy Dam for the cumulative setting, depicted in average monthly flow (in cfs) in chronological sequence for the 1921-through-2002 modeling period. The values illustrate both periods of controlled releases for minimum release requirements and periods of excess release above minimum requirements (spills).

Table 3.1-2 illustrates the differences between releases anticipated with the WSIP and the cumulative settings. The values are illustrated in average monthly flow (in cfs), with positive values representing an increase in flow associated with the cumulative setting. The same data are shown in Table 3.1-3, arranged by descending order of wetness in the basin (La Grange unimpaired flow). Although the release requirement is based on a separate wetness index, the results show flow increases during the summer (July through September), with relatively larger increases during wetter years. During the wetter years, there sometimes appears to be no increase in flows during certain summer months (e.g., July). This is due to releases above minimum requirements (spills) in both settings, and the change in minimum release requirement has no effect on the release.

Table 3.1-2 illustrates that the additional summer releases would result in subsequent reductions in releases in some years, typically during May. This is consistent with the effect of additional demand from Hetch Hetchy Reservoir. Additional reservoir demand would lead to an additional draw on storage, which would require subsequent replenishment. The replenishment would occur through the additional capture of inflow, typically during May, when otherwise the inflow would spill to the river.

Table 3.1-4 illustrates the rank-ordered differences in monthly flow volumes (acre-feet). The reductions in springtime flow, due to replenishment, can accumulate to about 18,000 acre-feet (May 1989), but are typically less. As described for the effects of WSIP, this monthly reduction in flow would typically manifest as a delay of the day in which substantial dam releases are made to the stream.[2] In this extreme example, the delay could amount to about 6 days. Subsequent to this delay, releases would return to the level that would occur without the effect of the discretionary flows. Figure 3.1-1 illustrates the difference in flow between the WSIP and cumulative scenario by year type. The values represent the average flow change for all of the years within each year type classification. The graphic illustrates the increase in flow that would occur during summer due to the discretionary flows, and also the general decrease in flow that would occur during reservoir replenishment (decrease in spills) during spring.

Figure 3.1-1

Results also indicate that an average annual increase in releases of approximately 5,000 acre-feet would occur below Hetch Hetchy Reservoir. The implementation of the discretionary releases would not cause a change to the water deliveries of the SFPUC or diversions in the San Joaquin Pipeline (SJPL). However, the additional release from the dam to the stream would result in less diversion to the Canyon Tunnel that would otherwise be released back to the Tuolumne River below Kirkwood Powerhouse. The reduction in these releases would generally occur between December and July during years when spill is anticipated from Hetch Hetchy Reservoir.

Hetch Hetchy Reservoir storage would be affected by the discretionary flows. Subsequent to the reservoir being filled in late spring, any additional demand from the reservoir would cause additional drawdown. Figure 3.1-2 is a chronological illustration of storage during the 1921-through-2002 modeling period. Annually, the additional summertime release would cause additional depletion of storage. However, this storage depletion would be followed by replenishment, due to reductions in diversions to Canyon Tunnel and reductions in following-period spills to the river.

Figure 3.1-3 presents the same information, by illustrating the anticipated change in storage of Hetch Hetchy Reservoir with the cumulative setting compared to the WSIP setting. The data are presented by year type, represented as the average of the storage of all years within a year type. As shown, storage is cumulatively depleted, beginning in summer, with storage normally replenished by the end of spring.

No additional notable hydrologic effects are apparent within the Hetch Hetchy system in the comparison of the WSIP and cumulative settings. The Cherry-Eleanor system would experience a near identical operation, with a rare exception during extended drought when a difference in reservoir storage balancing between Hetch Hetchy Reservoir and Lake Lloyd may occur due to Don Pedro Water Bank Account operations. This difference would be essentially unnoticeable within the discretion of existing operations.

The net effect of release operations from Hetch Hetchy Reservoir (Canyon Tunnel and stream releases) manifests as a change in inflow to Don Pedro Reservoir. Figure 3.1-4 illustrates this anticipated change between the WSIP and cumulative settings. The data are presented by year type averages. In terms of average annual inflow to Don Pedro Reservoir, there is no change; however, the distribution of inflow changes. With the slight changes in inflow to Don Pedro Reservoir, a slight increase in the summer, a corresponding increase in storage would occur at the end of the water year (September) during years when Don Pedro Reservoir storage is below the fall-time flood control storage limit. In some years, the storage in Don Pedro Reservoir would be slightly lower in the spring when inflow is reduced by discretionary release operation. Figure 3.1-5 illustrates the simulated difference between the WSIP and cumulative settings, shown by the average storage of all years within a year type. These changes in storage are negligible, and in part only a result of modeling assumptions that make constant the Districts' (Modesto Irrigation District and TID) allocation of water to their customers. If storage were anticipated to be greater, conceptually, the Districts could allocate additional water for delivery, and storage would be unaffected.

Minor changes to releases to the Tuolumne River from La Grange Dam could occur from the single factor of the discretionary releases from Hetch Hetchy Reservoir. Table 3.1-5 illustrates the chronological differences in release between the WSIP and cumulative scenario. The values are presented in terms of monthly volume of flow (acre-feet). The potential changes occur sporadically, and would generally occur as an increase in spill (release above minimum requirements) in some months during the fall and early winter (as greater storage in Don Pedro Reservoir causes earlier and greater spills for flood control) and as a decrease in some winter and early spring releases (when the reduction in inflow to Don Pedro is coincident with spills at La Grange Dam). The average annual flow past La Grange Dam would remain the same. The same information, concerning the difference in flow between the settings, is illustrated in Figure 3.1-6 in terms of average monthly flows by year type.

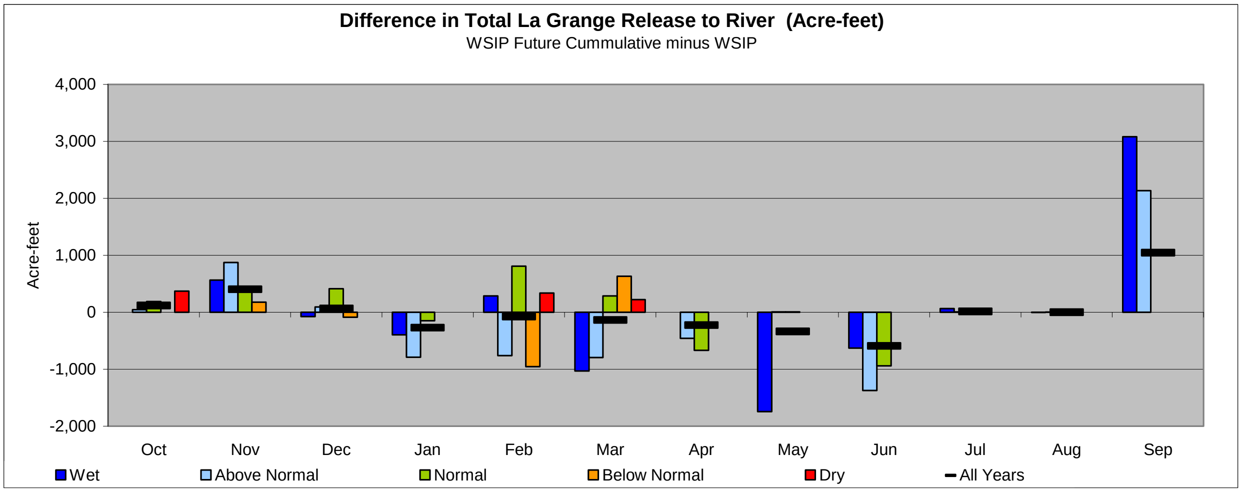
Figure 3.1-6



The changes in flow past La Grange Dam as a comparison between the WSIP and cumulative (with only the discretionary flow action) settings is relatively minor, and occur as a coincidence of change in inflow and flood control operations at Don Pedro Reservoir. The effect of larger or lesser releases at La Grange (shown by the volumes in Table 3.1-5) would manifest similarly to the effect described for WSIP changes. The change in volume would likely lead to a delay or earlier initiation of the day that releases are made in excess of minimum flow requirements. Most of changes illustrated would likely be managed with reservoir storage, and would lead to no change in river release.

The effect of the TID river diversion project on La Grange releases will be evaluated by layering on the absolute results for the La Grange releases to illustrate the combined cumulative effect of both the WSIP and the discretionary release actions.

With no change to the operation of the SJPL identified under the cumulative scenario, the local system operation would be identical to the WSIP. No changes in hydrologic effects would occur in the local system between the WSIP and cumulative settings.

3.2 Comparison to Base

The preceding discussion identifies the hydrologic parameters that, under the cumulative setting, differ from the WSIP setting. When comparing to the base setting, hydrologic effects associated with the cumulative setting would be consistent (identical) to those effects identified for the WSIP, except for the topic areas (parameters) described above. The following discussion presents those parameters compared to the base setting.

Table 3.1-1 illustrates the simulated releases below O'Shaughnessy Dam for the cumulative setting, depicted in average monthly flow (in cfs) in chronological sequence for the 1921-through-2002 modeling period. The values illustrate both periods of controlled releases for minimum release requirements and periods of releases above minimum requirements (spills).

Table 3.2-1 illustrates the differences between releases anticipated for the cumulative and base settings. The values are illustrated in average monthly flow (in cfs), with positive values representing an increase in flow associated with the cumulative setting. The same data are shown in Table 3.2-2, arranged by descending order of wetness in the basin (La Grange unimpaired flow). Although the release requirement is based on a separate wetness index, the results show flow increases during the summer (July through September), with relatively larger increases during wetter years. During the wetter years, there are instances in which no flow increases appear during certain summer months (e.g., July). This is due to releases above minimum requirements (spills) occurring in both settings, and the change in minimum release requirement has no effect on the release.

Table 3.2-1 shows that additional summer releases along with additional diversions due to the WSIP would result in subsequent reductions in releases in some years, typically during May. This is consistent with the effect of additional demand from Hetch Hetchy Reservoir. Additional reservoir demand would lead to a draw on storage, which then would require subsequent replenishment. The replenishment would occur primarily through the additional capture of inflow, typically during May, when otherwise the inflow would have spilled to the river.

Table 3.2-3 illustrates the rank-ordered differences in monthly flow volumes (acre-feet). The reductions in springtime flow, due to replenishment, can accumulate to about 58,000 acre-feet (May 2001), but typically would be less. This monthly reduction in flow would typically manifest as a delay of the day in which substantial dam releases are made to the stream.

Figure 3.2-1 illustrates the difference in flow between the cumulative base settings by year type. The values represent the average flow change for all of the years within each year type classification. The graphic illustrates the increase in flow that occurs during the summer due to the discretionary flows, as well as the general decrease in flow that would occur during reservoir replenishment (decrease in spills) in the spring due to the cumulative effect of the WSIP and discretionary flows.

Hetch Hetchy Reservoir storage would be affected by the WSIP and discretionary flows. Subsequent to the reservoir being filled in late spring, additional demand from the reservoir would cause additional drawdown in comparison to the base setting. Figure 3.2-2 illustrates a chronological depiction of Hetch Hetchy Reservoir storage during the 1921-through-2002 modeling period. Annually, the additional summertime release and increased diversions would cause depletion of storage in comparison to the base setting. Typically, however, this depletion of storage would be subsequently replenished by inflow and reductions in following-period spills to the river. The additional depletion can accumulate over a sequence of drought years when no spills occur from Hetch Hetchy Reservoir. Figure 3.2-3 presents the same information in summarizing the anticipated change in storage of Hetch Hetchy Reservoir between the cumulative and base settings. The data are presented by year type, represented as the average of the monthly storage of all years within a year type. As shown, storage is depleted beginning in summer, and is normally replenished by the end of spring.

The net effect of release operations from Hetch Hetchy Reservoir (Canyon Tunnel and stream releases) manifests as a change in inflow to Don Pedro Reservoir. Figure 3.2-4 illustrates the anticipated difference between the cumulative and base settings. The data are presented by year type averages.

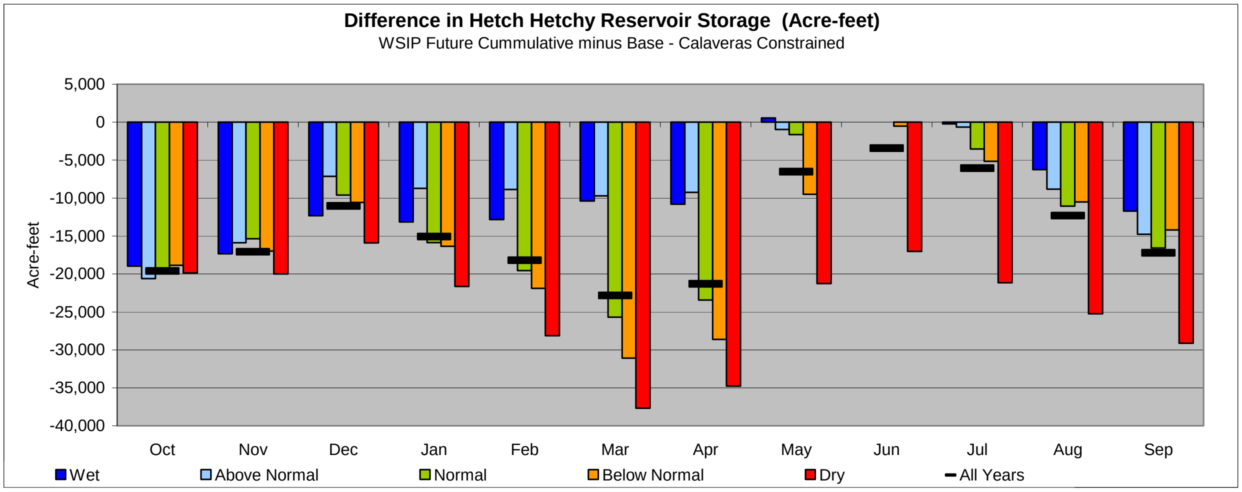

Figure 3.2-4

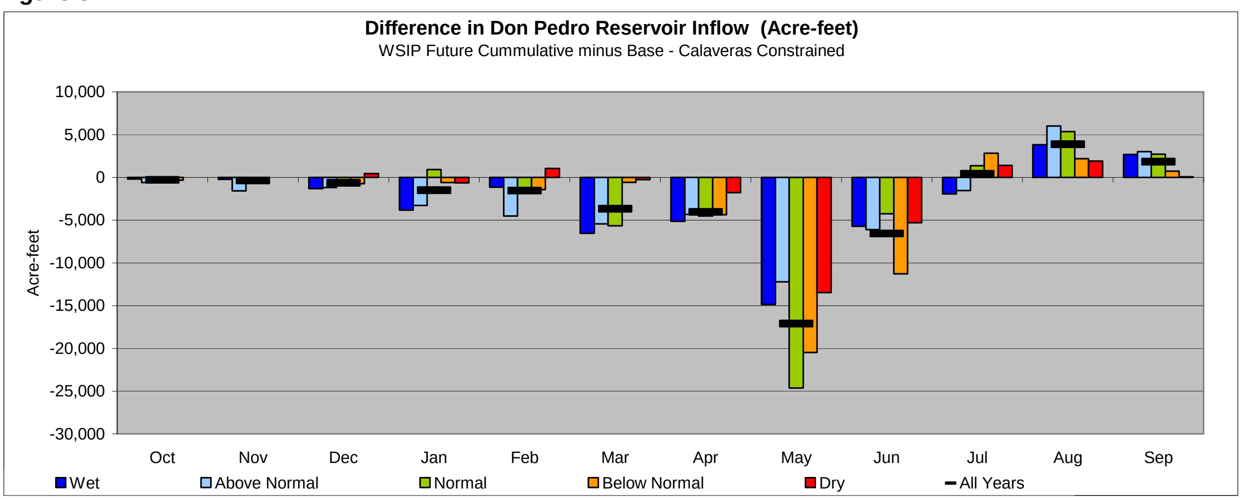

The average annual inflow to Don Pedro Reservoir would be reduced by about 30,000 acre-feet due to the WSIP, and this quantity would not change with the cumulative activity. Figure 3.2-5 shows simulated Don Pedro Reservoir storage chronologically for the modeling period. Figure 3.2-5 primarily compares the base and cumulative settings. The WSIP-alone setting is also illustrated in Figure 3.2-5, and is mostly included under the cumulative setting. As described above, there is very little change in storage operation between the WSIP and cumulative settings. The effects of the cumulative setting to Don Pedro Reservoir storage are essentially the same as those identified for the WSIP setting.

Changes in releases to the Tuolumne River from La Grange Dam would occur due to the WSIP and the single factor of the discretionary releases. These changes would be primarily caused by the WSIP, altered slightly (sometimes decreased, sometimes increased) by the effect of the discretionary flows at Hetch Hetchy Reservoir. Figure 3.2-6 illustrates the relative comparison of the base, cumulative, and WSIP-alone settings. Again, there is not much difference between the effects of the WSIP-alone setting and the cumulative setting when compared to the base setting. Table 3.2-4 shows the chronological differences in release between the base and cumulative settings, in terms of monthly volume of flow (acre-feet).

The effects of La Grange releases to the Tuolumne River between the cumulative and base settings are essentially the same as between the WSIP and base settings. The effect of lesser or greater releases at La Grange (shown by the volumes in Table 3.2-4) would manifest similarly to the effect described for WSIP changes. The change in volume would likely lead to a delay in, or earlier initiation of the day in which, releases are made above minimum flow requirements.

With no change to the operation of the SJPL identified under the cumulative setting, the local system would have an operation identical to the WSIP setting. In addition, when compared to the base setting, the hydrological effects would be the same as those identified for the WSIP setting.

List of Figures

1. Model Description

In addition to the Hetch Hetchy/Local Simulation Model (HH/LSM) analysis, a second model, VR_Temp, was used to assess the effects of the WSIP on water temperature in the Tuolumne River below La Grange Dam. As described in Chapter 5 of the PEIR, the WSIP would result in reduced flows at this location, which could elevate water temperatures and cause adverse effects on coldwater fisheries in the Tuolumne River. This modeling was not needed at other locations in the Tuolumne River system or in the Alameda Creek and Peninsula watershed systems because the predicted changes in flow would not occur at times when thermal conditions would be at issue.

VR_Temp was developed by Beth Neilson at Utah State University and Dr. Steve Chapra at Tufts University for application to the Virgin River in Utah. VR_Temp is a one-dimensional, surface heat balance and kinematic flow routing model developed based on the derivations found in Chapra (1997). The model is able to estimate maximum daily water temperatures and was constructed to allow different input time steps for meteorological data as well as point and distributed inflow sources. The model allows a single stream or river segment to be divided into computational cells or elements; stream networks are not modeled and tributaries are treated as a time-series input. VR_Temp was adapted for use on the Tuolumne River by Merritt-Smith Consultants.

Data requirements for the VR_Temp include time-series inputs for meteorological and hydrologic data, water temperature data for all inflows, and a description of the river channel geometry. The meteorological requirements are solar radiation, air temperature, relative humidity, and wind speed. Hydrologic data requirements include headwater flow (e.g., upstream inflow), tributary and distributed inflows, and diversions. Each inflow to the modeled river reach requires a corresponding water temperature. In addition, data regarding the geometry of the river is necessary, including lengths, elevations, and river-bottom widths.

2. Analysis Methodology

Application to the Lower Tuolumne River

The objective of simulating flow and temperature in the Tuolumne River was to compare water temperature at discrete points in the river under different management scenarios. A number of possible methods were considered, including empirical/statistical relationships, analytical approaches using a spreadsheet, a simple flow and temperature model, or a comprehensive basin-scale production model. The limitations of empirical models and spreadsheet models precluded their application. Further, for this fairly straightforward analysis, a large complex model was not desired (e.g., such models require considerable time to implement and populate with data). The VR_Temp model includes a flow model and the transport of heat, providing time series of daily temperatures—information readily used by biologists and similar scientists in assessing potential impacts of temperature change in aquatic systems.

The necessary data were gathered or estimated from available sources (Table 1) in order to implement the VR_Temp model on the Tuolumne River from La Grange Dam (river mile [RM] 52.5) to the confluence with the San Joaquin River (RM 0.0) (Figure 1). Dry Creek was the only major tributary modeled, entering the river at approximately RM 16.7.

Model Calibration

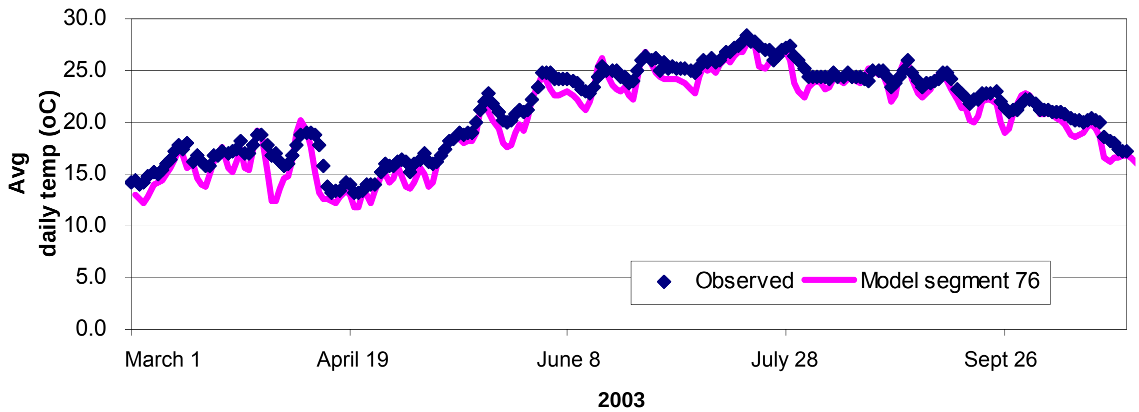
The model was calibrated for the period from March–October using data from 2003. This year was picked because, of the years for which data were available, 2003 provided the best variety in conditions (e.g., wet and dry periods). The model was run for eight months to focus on the period of the year when water temperatures were considered potentially important. Calibration results are shown in Figure 2, which shows that simulated temperatures are in good agreement with observations. Model performance was formally quantified using BIAS, MAE, and RMSE, as defined below, for maximum daily temperature, minimum daily temperature, and average daily temperature. Summary model performance statistics are presented in Table 2.

$$BIAS = \frac{1}{n}\sum_{i=1}^{n}\left(Temp_{modeled} - Temp_{measured}\right)$$

$$MAE = \frac{1}{n}\sum_{i=1}^{n}\left|Temp_{modeled} - Temp_{measured}\right|$$

$$RMSE = \left(\frac{1}{n}\sum\left[Temp_{modeled} - Temp_{measured}\right]^2\right)^{0.5}$$

Where n is the number of paired data points (observed and simulated).



NOTE: The modeled data are from the final calibration run.

Mean Daily Temperature	-0.99	1.08	1.71
Minimum Daily Temperature	-1.85	1.87	4.28

Model Application

Application of the flow and temperature model was based on comparative analysis. Specifically, a baseline conditions scenario (e.g., existing conditions, MEA3C[1]) was compared to a proposed scenario (e.g., the WSIP, MEA5HIN). Evaluation of simulated baseline results with simulated scenario results presumes that model uncertainty is approximately equal in both cases, and a direct comparison yields differences in "performance," which in this case is identified as a temperature difference. Figure 3 shows an example of such a comparison as a time series of water temperature at RM 45 in the Tuolumne River for mid-June, when the flow at La Grange Dam was 3,000 cfs for MEA3C and 250 cfs for MEA5HIN. A longitudinal profile of temperatures (daily average temperature from La Grange to the San Joaquin River) for the same period is shown in Figure 4.

[1] Temperature modeling was based on HH/LSM data output from model run MEA3C as the existing conditions, which is an earlier version of model run MEA3CHR, which was used as the existing conditions for the hydrologic analysis described in Appendix H1. The differences between the two versions are minor and would result in no substantive changes in the temperature modeling.

3. Temperature Modeling Results

Two reaches of the Tuolumne River were examined: below Hetch Hetchy Dam and the reach from La Grange Dam to the San Joaquin River. Although the VR_Temp model was only applied to the river below La Grange, approaches for both reaches are outlined herein.

Tuolumne River Below Hetch Hetchy Reservoir

Although several months of the year are identified as having notable flow reductions in this reach, the vast majority of flow reductions occur during the time of year when thermal conditions are not at issue (Table 3). To further explore potential impacts, individual months from the complete record were examined. The criteria for selecting potential months of concern included:

- May through October flow (period when thermal loading in the foothills and mid-Sierra may be of concern), and
- Reductions in flow on the order of 50 percent or more, and
- Final base flows under 200 cfs.

Based on these screening criteria, five dates were identified when thermal conditions may be of concern (Table 4).

TABLE 4
CURRENT AND PROPOSED MONTHLY AVERAGE FLOWS FOR CONDITIONS WHERE WATER TEMPERATURES MAY BE ADVERSELY AFFECTED: TUOLUMNE RIVER BELOW HETCH HETCHY
(cubic feet per second)

Date	MEA3C	MEA5HIN	Difference
May 1962	777	100	-677
May 1978	857	100	-757
May 1981	413	144	-169
May 1992	530	50	-470
May 1999	383	164	-219

Although water temperatures may be elevated in May, this month is the predominate snowmelt runoff month. Typically elevated temperatures would be short-lived (i.e., a "hot" spell), and snowmelt runoff from adjacent lands may ameliorate stream conditions. These five occurrences represent approximately one-half of 1 percent of the simulation period (five months out of 984 months). Other, less stringent screening criteria were examined (e.g., final base flows under 400 cfs versus 200 cfs), but, by and large, temperature conditions were limited to May. Overall, the impact is expected to be less than significant.

Tuolumne River Below La Grange Dam

La Grange Dam on the Tuolumne River is located at approximately RM 52.5. Releases from this point flow generally westward to the confluence with the San Joaquin River and subsequently to the Delta.

In downstream Tuolumne River reaches (and San Joaquin River reaches as well), meteorological conditions dominate thermal processes. Table 5 illustrates flow conditions for the existing and proposed conditions, as well as the percent change between the two regimes. For the vast majority of conditions, flow decreases occur during months when temperature conditions are not at issue (e.g., winter, summer); occur during high-flow conditions (i.e., when meteorological conditions would not affect temperature due to high flow); or are small deviations from the baseline. However, in a few instances (e.g., June in a normal year), flow reductions may affect the thermal regime of the Tuolumne River downstream of La Grange Dam. This impact could be further evaluated by inspecting existing daily temperature and flow data to determine if flow differences similar to the difference between existing and proposed conditions (shown for June in a normal year) results in a meaningful temperature impact. The reservoir generally attains isothermal conditions each winter, from year to year, and thermal carryover effects do not occur.

To further explore potential impacts, individual months from the complete record were examined. The criteria for selecting potential months of concern included:

- Months of April through October flow (period when thermal loading in the Central Valley may be of concern), and
- Reductions in flow on the order of 50 percent or more, and
- Final base flows under 400 cfs.

Four months were identified using these criteria, or approximately one-half of 1 percent of all months in the simulation period. Based on these screening criteria, three dates were identified when thermal conditions may be of concern (Table 6). Less strict criteria resulted in additional days being identified as potentially of concern. Although an occasional August or September date would be indicated during this sensitivity testing, the most prominent month was clearly June.

These flow reductions were assessed using the VR_Temp model. The model uses time series of flow and water temperature at La Grange Dam and associated time series of meteorological conditions to simulate

TABLE 6
CURRENT AND PROPOSED MONTHLY AVERAGE FLOWS FOR CONDITIONS WHERE WATER TEMPERATURES MAY BE ADVERSELY AFFECTED: TUOLUMNE RIVER BELOW LA GRANGE
(cubic feet per second)

Date	MEA3C	MEA5HIN	Difference

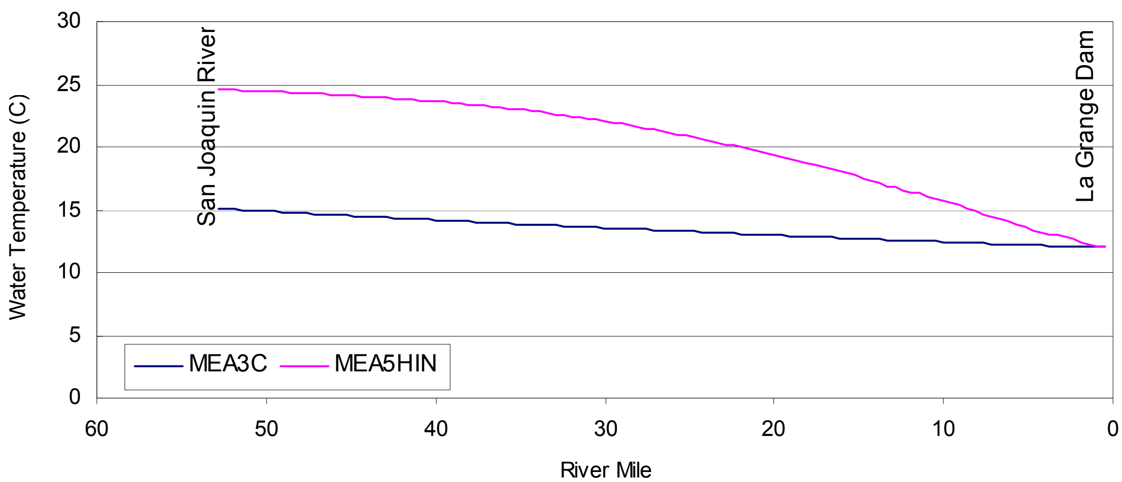
June 1993	2,996	250	-2,746
June 1999	523	250	-773

water temperature at 0.5-mile increments. Output is in the form of time series at each simulation point, or longitudinal profiles of temperatures along the river length; both types of output are included in the following analysis.

Simulation of June 1993 and June 1999 are shown to bracket the range of conditions that may occur—June 1993 being the extreme event, with over a 90 percent reduction in flow (Figures 5 through 8), and June 1999 representing a more modest event, with an approximate 50 percent reduction in flow (Figures 8 through 10).



SFPUC Water System Improvement Program ▪ 203287

Figure 5
Longitudinal Profile of Simulated Mean Daily Water Temperature from La Grange Dam to the San Joaquin River for MEA3C and MEA5HIN: June 15, 1927

For the large flow reduction in June 1993, water temperatures increase dramatically in the Tuolumne River below La Grange Dam. Releases from La Grange are largely below equilibrium temperature—the temperature at which water is in approximate equilibrium with meteorological conditions—because they originate from deep within Don Pedro Reservoir. Water temperatures rise steadily towards an equilibrium temperature of approximately 26 degrees Celsius (^{o}C) (Figure 5), but at a

Figure 8
Longitudinal Profile of Simulated Mean Daily Water Temperature from La Grange Dam to the San Joaquin River for MEA3C and MEA5HIN: June 15, 1999

much faster rate for the proposed conditions due to lower flows, which translate to longer transit times and shallower flow depths/volumes. The result is that daily mean temperatures are approximately 10 ^{o}C warmer under the proposed conditions by the time waters reach the San Joaquin River. Simulated time series for discrete locations along the river are presented in Figures 6 and 7. These data indicate the diurnal pattern of the river in response to the meteorological conditions, and clearly represent the changes in daily maximum and minimum temperatures under the two flow regimes. The larger flow, associated with current conditions, has a larger thermal mass and heats and cools much slower than the proposed flow. Thus, the proposed flow experiences not only a higher daily average temperature (Figure 5) than under the current condition, but also a larger diurnal range. The diurnal range at RM 40 is approximately 2 ^{o}C for current conditions and approximately 7 ^{o}C for proposed conditions, with maximum temperatures approaching 30 ^{o}C at the river’s mouth.

Conditions in June 1999 are not as disparate as in June 1993. Comparison of Figures 5 and 8 indicate that in 1999 the difference in daily average water temperatures at the San Joaquin River confluence are on the order of 2 ^{o}C as flows under both the current and future conditions rapidly approach equilibrium temperature. The diurnal range is similar at most locations between the two flow conditions, with the proposed lower-flow condition warmer overall than the current condition.

Overall, proposed operations may cause considerable deviation from the current condition in June, and an impact may occur.

11. Introduction to Comments and Responses

CHAPTER 11
Introduction to Comments and Responses

11.1 Purpose of the Final Environmental Impact Report

This is the first of three volumes of the Comments and Responses document, which was prepared to accompany the Draft Program Environmental Impact Report (Draft PEIR) on the San Francisco Public Utilities Commission's (SFPUC) Water System Improvement Program (WSIP or proposed program). The Draft PEIR was published by the San Francisco Planning Department on June 29, 2007 for public review and comment. The SFPUC has proposed the WSIP to increase the reliability of the SFPUC's regional water system with respect to water quality, seismic response, water delivery, and water supply and to meet water delivery needs to its customers through the year 2030. The WSIP would establish level of service goals and system performance objectives for the regional system, which provide the basis for a series of facility improvement projects, a proposed water supply option to serve increased water demands, and proposed operations during drought and nondrought periods.

The Draft PEIR described the proposed WSIP, identified the environmental consequences associated with implementation of the WSIP, specified mitigation measures to reduce significant and potentially significant impacts, and analyzed and compared the environmental effects of alternatives to the proposed program as required by the California Environmental Quality Act (CEQA). The Draft PEIR also included an analysis of three variants to the WSIP as requested by the SFPUC. The Comments and Responses document contains copies of comments received from the public and government agencies on the Draft PEIR and provides responses to those comments. The Draft PEIR (Volumes 1 to 5) together with the Comments and Responses document (Volumes 6 to 8) constitute the Final PEIR on the WSIP.

The Final PEIR is an informational document that the SFPUC must consider before approving the WSIP. The CEQA Guidelines (Section 15132) specify the following:

> The Final PEIR shall consist of:
>
> (a) The Draft PEIR or a revision of the draft
>
> (b) Comments and recommendations received on the Draft PEIR, either verbatim or in summary
>
> (c) A list of persons, organizations, and public agencies commenting on the Draft PEIR
>
> (d) The responses of the lead agency to significant environmental points raised in the review and consultation process
>
> (e) Any other information added by the lead agency

The Comments and Responses document was prepared pursuant to the CEQA Guidelines.

11.2 Environmental Review Process

On June 29, 2007, the San Francisco Planning Department published the Draft PEIR on the SFPUC's WSIP for public review and comment (State Clearinghouse No. 2005092019). The public review and comment period on the document was announced as lasting from June 29, 2007 through October 1, 2007, but was later extended to October 15, 2007. During the 108-day public review period, the San Francisco Planning Department received approximately 1,500 written comments sent through the mail or by hand-delivery, fax, or email as well as approximately 200 oral comments made at six public hearings.[1] A court reporter was present at each of the public hearings, transcribed the oral comments verbatim, and prepared written transcripts. Appendix J (Vol. 8) includes a summary of the Draft PEIR notification and public hearing process. Public hearings were held on the following dates and at the following locations:

- September 5, 2007 – Sonora Opera House, Sonora, CA
- September 6, 2007 – Thomas Downey High School, Modesto, CA
- September 18, 2007 – Fremont Main Library, Fremont, CA
- September 19, 2007 – Avenidas Senior Center, Palo Alto, CA
- September 20, 2007 – San Francisco City Hall, Planning Commission Chambers, San Francisco, CA
- October 11, 2007 – San Francisco City Hall, Planning Commission Chambers, San Francisco, CA[2]

On September 30, 2008, this Comments and Responses document was distributed for review to the San Francisco Planning Commission, the SFPUC, and all entities that submitted individual comment letters on the Draft PEIR.[3] On October 30, 2008, following the public review period for the Comments and Responses, the San Francisco Planning Commission certified the Final PEIR—consisting of the Draft PEIR and the Comments and Responses document—and determined it fulfills CEQA requirements. Upon Final PEIR certification, the SFPUC was then able to take action on the WSIP. However, prior to making a decision on the WSIP, the SFPUC reviewed and considered the certified Final PEIR and the associated Mitigation Monitoring and Reporting Program (MMRP). Consistent with CEQA Guidelines (Section 15097), the MMRP is a program for monitoring and reporting of the measures required to mitigate or avoid significant environmental effects in order to ensure that the mitigation measures and revisions identified in the Final PEIR are implemented. By adopting the CEQA findings and the MMRP, the SFPUC was then able to approve and adopt the WSIP or any portion/modification of the WSIP analyzed

1 A public hearing was also held before the San Francisco Landmarks Preservation Advisory Board on September 19, 2007. No members of the public attended the meeting, and thus a written transcript was not prepared. The comments of the Landmarks Board presented at that meeting were later submitted to the Planning Department in writing within the review period (see the L_SFLandmarks comment letter).

2 Because the comment period was extended, a second public hearing was held in San Francisco.

3 Commenters who submitted form letters were notified by mail or email regarding the availability of the Comments and Responses document and the locations where the document is available for viewing; these commenters were not sent a copy of the Comments and Responses document unless requested.

in the PEIR. As indicated in the CEQA findings (attached to the front cover of Volume 1), the SFPUC adopted the Phased WSIP Variant — a variation of the original WSIP described in Chapter 3 of the PEIR on October 30, 2008, subsequent to the certification action by the San Francisco Planning Commission.

[Additional discussion of the Phased WSIP Variant that was adopted by the SFPUC is provided in Section 13.4, Phased WSIP Variant (Vol. 7, Chapter 13).]

11.3 Report Organization

Due to the quantity of comments received on the Draft PEIR, the Comments and Responses document is separated into three volumes. Volume 6 consists of this introductory chapter and Chapter 12, which contains the comments received during the comment period. Chapter 11 includes a list of all commenters, and Chapter 12 includes copies of mailed letters and faxes, printouts of emails, and transcripts of oral comments received at the public hearings. All comments are coded and numbered to correspond to the responses provided in Volume 7. Volume 8 consists of all of the appendices.

In some cases, comment letters included extensive attachments. All attachments are acknowledged and have been considered during preparation of the responses. If the attachments contain direct comments on the adequacy or accuracy of the Draft PEIR, they are included along with the comment letters in Chapter 12 and are treated the same as individual comments. However, in other instances the attachments provide generic information supporting some aspect of an agency or organization's mission (e.g., description of a city's conservation program and activities) and are not directly related to the adequacy or accuracy of the Draft PEIR; those materials are not reproduced in this document but are available for review at the San Francisco Planning Department.[4] The attachments received with a particular letter are indicated at the end of each comment letter in Chapter 12, and Appendix K (Vol. 8) is a summary of all attachments received as part of comments on the Draft PEIR and indicates where copies of the attachments are available.

Volume 7 of the PEIR contains the responses to comments. Chapter 13 describes the organization of responses to the comments received on the Draft PEIR and also describes changes in the WSIP proposed by the SFPUC since publication of the Draft PEIR. Chapter 14 contains master responses, which provide a comprehensive discussion of issues that received numerous comments. Chapter 15 contains the individual responses directed to each specific comment, though in some cases, the reader is referred to a master response in Chapter 14 or to another individual response. Chapter 16 contains a consolidated set of all staff-initiated changes made to the Draft PEIR that resulted from: (1) changes made in response to the comments received on the Draft PEIR; (2) changes that reflect the WSIP revisions; or (3) changes to correct errors or to clarify information presented in the Draft PEIR. Volume 8 contains supporting documentation for information presented in the Comments and Responses document.

11.4 Organization of Comments and List of Commenters

In order to facilitate the preparation of responses, each comment set (i.e., a letter, email, or public hearing transcript) received on the Draft PEIR was coded, then broken down into individual comments and bracketed by topic or issue area; individual comments were then numbered. The individual comments are referenced alphanumerically by comment set code and comment number and are shown in the margins. The coding for the comment sets consists of a prefix indicating the category of commenter (see **Table 11.1**) followed by the initials or acronym of an agency/

4 The San Francisco Planning Department is located at 1650 Mission Street, Suite 400, San Francisco, California, 94103.

TABLE 11.1
COMMENTER CATEGORIES AND ABBREVIATIONS

Category of Commenter	Coding Abbreviation
Federal Agency	F
State Agency	S
Local and Regional Agency	L
Group	SI
Citizen	C

organization or the first five letters of a person's last name. Within each comment set, the individual topics or issue areas are bracketed and numbered sequentially. For example, the first comment in the first set of comments from the Bay Area Water Supply and Conservation Agency (a local agency) is L_BAWSCA1-01. Comments submitted via email, via U.S. Postal Service, or during a public hearing are all coded and numbered in the same way; if a single agency, interest group, or individual submitted comments more than once, a number is added at the end of the comment letter code to indicate multiple submittals by the same commenter (e.g., L_BAWSCA2 represents a second comment set, received either in a separate letter or as part of the oral comments presented at a public hearing).

Multiple copies of two form letters were received as comments on the Draft PEIR. The text in the Form Letter 1 submittals is the same or varies only slightly and the Form Letter 2 submittals were identical; therefore, to avoid excessive duplication of responses, each form letter is treated as a single comment letter. A sample of each form letter is presented in Section 12.7 of this document. A list of the people who signed and/or submitted a form letter is shown below in Table 11.7. All Form Letter 1 submittals are included in Appendix L (Vol. 8).

In some cases, signatures on comment letters were illegible. Illegible signatures on individual citizen comment letters are identified in **Table 11.6** as Unreadable 1 through 5, and illegible signatures on form letters are identified in **Table 11.7** as Unidentified Names 1 through 69.

Tables 11.2 through **11.7** list all persons and organizations that submitted comments on the Draft PEIR during the comment period (June 29, 2007 through October 15, 2007), as well as those comments received through December 31, 2007. Volume 7 of this Comments and Responses document provides written responses to these comments. Appendix M (Vol. 8) contains comment letters received after December 31, 2007; these comments are not responded to individually, but Appendix M includes cross reference for each of these letters to either a master response or another response that includes a discussion of related issues. **Table 11.8** lists all citizens who telephoned the SFPUC General Manager's office during the comment period to voice their concern about the proposed program. The San Francisco Planning Department acknowledges receipt of these comments, and individual written responses to these telephone messages are not included in the Comments and Responses document since they do not address the adequacy or accuracy of the environmental analysis or identify any other significant environmental issue requiring a response.

Re: SFPUC Water System Improvement Program Draft Program Environmental Impact Report (PEIR)

Dear Mr. Maltzer:

Thank you for forwarding a copy of the Notice of Preparation and a copy of the PEIR. Please consider these comments and include them in the official record for the project.

We appreciate the thorough description and disclosure of the Scenic Easement and Scenic and Recreation Easement administered by the Golden Gate National Recreation Area for Peninsula watershed lands. The reference to Canada Road as the demarcation should be deleted. 01 We can provide you with a more accurate map to reference. Due to this interest and because of an agreement between the SFPUC and the GGNRA titled *Joint Communications Procedures Between the San Francisco Public Utilities Commission and the Golden Gate National Recreation Area for Routine Work and Special Projects within the San Francisco Peninsula Watershed*, we request to be considered a stakeholder agency during planning for the subsequent project-specific CEQA environmental documents. 02 We would like to participate in project development, receive advance notification of meetings, and assist in creating mitigations for potential impacts. Specifically, we are interested in collaborating with the SFPUC on the projects in the Peninsula Region: Crystal Springs/San Andreas Transmission Upgrade (PN-2), Harry Tracy WTP (PN-3), Lower Crystal Springs Dam Improvements (PN-4), and the Pulgas Balancing Reservoir Rehabilitation (PN-5).

We are specifically concerned about the potentially significant but mitigatable impacts to existing land uses, visitor access and experience, visual character, impacts on wetlands and aquatic resources, historic resources, traffic safety hazards as well as the unavoidable significant impacts to sensitive biological and historic resources. Hopefully by working together, we can ensure watershed resources are protected to the greatest extent feasible and that our interests in the easements are protected. 03

Thank you for the opportunity to comment and your coordination with the GGNRA on these important capital improvements projects. Please call Karen Cantwell on my staff at (415) 561-4842 with questions or for further coordination.

Sincerely,

Brian O'Neill

IN REPLY REFER TO:
A3815 (YOSE-SUPT)

Mr. Paul Maltzer, Environmental Review Officer, WSIP PEIR
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, California 94103

Dear Mr. Maltzer:

Yosemite National Park appreciates the opportunity to provide comments on the Draft Program Environmental Impact Report of the Water System Improvement Program proposed by the San Francisco Public Utilities Commission (SFPUC). The partnership that has been forged between our respective agencies in protecting the upper Tuolumne River watershed is mutually beneficial, as outlined in our 5-year cooperative "Hetch Hetchy Watershed Protection Agreement," executed in 2005.

Yosemite National Park would like to see the SFPUC both model and intensively monitor the impacts of this potential water release regime along the Tuolumne River to determine if the water delivery amounts, duration and seasonal timing will have any adverse impacts on the riverine ecosystem. The SFPUC should continue detailed studies that would address scenarios to include multiple drought years, persistent sub-average precipitation and other climate change impacts. We do not feel that current baseline data and modeling analysis can provide enough information for a comprehensive assessment of potential impacts. 01

We are also concerned about the impacts to cultural resources in the Hetch Hetchy area of Yosemite National Park. The SFPUC needs to define a plan to address the protection of archeological resources. For example, we do not see a comprehensive approach to protecting possibly exposed sites within the park boundaries from "pot hunters." We request a process that clarifies the roles of the SFPUC and the NPS for protecting archeological resources, and provides for notification if, during a draw down, there is any potential risk to archeological resources. 02

We look forward to working with you and your staff on this plan and other endeavors. If you have any questions, contact me at (209) 372-0238.

Sincerely,

/S/ Michael J. Tollefson, Superintendent

Subject: Draft Program Environmental Impact Report for the San Francisco Public Utilities Commission's Water System Improvement Program

Dear Mr. Maltzer:

The Bureau of Reclamation respectfully submits this comment letter on the subject Draft Program Environmental Impact Report (DPEIR) for the Water System Improvement Program (WSIP). Reclamation asks that you accept these very important comments into the record for the DPEIR.

Reclamation has significant reservations with the discussion of impacts to the San Joaquin River and Delta in Section 5.3. of the DPEIR. This section assumes that reductions in San Joaquin River flow and Delta inflow caused by the WSIP would be mitigated by a corresponding change in the Central Valley Project (CVP) and State Water Project (SWP) operations, but fails to discuss the impacts caused by the WSIP to fisheries, water quality, and water users who receive water from the CVP and SWP. The lack of analysis of the WSIP's significant impacts causes the DPEIR to fail to meet the California Environmental Quality Act (CEQA) requirement that all reasonably foreseeable environmental impacts be discussed in an EIR. 01

Section 5.3.1-5 discusses impacts to the San Joaquin River caused by the WSIP:

> "The SWRCB has established flow objectives for the San Joaquin River at Vernalis, just upstream of the Sacramento–San Joaquin Delta. Almost all of the time, the reductions in San Joaquin River flow attributable to the WSIP would not be sufficient to cause flow in the river at Vernalis to fall below the objective. Very infrequently, following protracted droughts, reductions in San Joaquin River flow attributable to the WSIP would be sufficient to cause flow in the river at Vernalis to fall below the objective. *Under these circumstances, (Reclamation), the agency responsible for compliance with objectives for the San Joaquin River, would be expected to increase releases from New Melones* 02

> *Reservoir on the Stanislaus River to meet the flow objectives at Vernalis.* Thus, the WSIP would not alter flow in the San Joaquin River below its confluence with the Tuolumne River such that it would be substantially outside the range experienced under existing conditions nor result in a violation of flow objectives." DPEIR, at 5.3.1-38 (emphasis added). 02 cont.

Thus, the DPEIR seeks to assign responsibility for mitigation of impacts to the San Joaquin River to Reclamation, without discussing the impacts to CVP operations caused by such an assignment. The same is true for the WSIP's impacts to the Delta:

> "The reductions in flow in the Tuolumne River below La Grange Dam attributable to the WSIP would also reduce inflow to the Sacramento–San Joaquin Delta. The SWRCB has established objectives for Delta outflow as measured at Chipps Island, just upstream of Suisun Bay. Almost all of the time, the reductions in Delta inflow attributable to the WSIP would not be sufficient to cause Delta outflow to fall below the objective. Very infrequently, following protracted droughts, reductions in Delta inflow attributable to the WSIP would be sufficient to cause Delta outflow to fall below the objective. *Under these circumstances, the USBR and DWR, the respective operators of the Central Valley Project and State Water Project, would be expected to decrease their diversions so that the Delta outflow objectives were met.* Thus, the WSIP would not alter flow in the Sacramento–San Joaquin Delta such that it would be substantially outside the range experienced under the existing condition." DPEIR, at 5.3.1-38, 39 (emphasis added). 03

Again, no analysis is provided on the impacts caused by the decrease in diversions by the CVP and SWP required to mitigate for the WSIP's impacts.

The City and County of San Francisco (CCSF) has established informal significance standards for impacts related to water supplies:

> "The CCSF has not formally adopted significance standards for impacts related to water supplies, but generally considers that implementation of the proposed program would have a significant water supply impact if it were to:
>
> • Result in substantial adverse changes in operations or substantial decreases in water deliveries for water users, as measured by significant changes in reservoir storage, timing or rate of river flows, or water quality 04
> • Violate any water quality standards or otherwise substantially degrade water quality." DPEIR, at 5.3.4-4.

The DPEIR does not apply these standards to WSIP-related impacts to the San Joaquin River and Delta. Instead, it merely concludes that these impacts will be mitigated by changes in operations by the CVP or SWP (or both):

> "Changes in flow in the Tuolumne River below La Grange Dam attributable to the WSIP would affect flows in the San Joaquin River from its confluence with the Tuolumne River to the Delta. The Delta standards include flow and quality objectives for the San Joaquin

River at Vernalis, just upstream of the point where the San Joaquin River flows into the Delta. *Very infrequently, following protracted droughts, reductions in San Joaquin River flow attributable to the WSIP could make it necessary for (Reclamation), the agency responsible for compliance with water quality and flow objectives for the San Joaquin River, to increase releases from New Melones Reservoir to meet the objectives at Vernalis.*" DPEIR, at 5.3.4-5 (emphasis added).

"The WSIP would typically reduce Delta inflow in wet and above-normal years when the Delta is in excess conditions and Delta outflow is so great that the export limits do not limit pumping by the State Water Project and Central Valley Project. Under these conditions, the WSIP would reduce Delta inflow and outflow by the same amount, but would have no effect on the (SWP's) and (CVP's) ability to pump water from the Delta. There could be rare occasions when the WSIP would reduce Delta inflow during excess *conditions but when the export limits do affect pumping by the (SWP) and (CVP). Under these conditions, the WSIP would reduce Delta outflow and could potentially reduce pumping by the (SWP) and (CVP) by 35 percent of the WSIP-induced reduction in Delta inflow. However, the (SWP) and (CVP) may choose to comply with the export limits by releasing more water from upstream reservoirs rather than by limiting pumping.*" DPEIR, at 5.3.4-10,11 (emphasis added). 04 cont.

As with the discussion of impacts to CVP and SWP operations in section 5.3.1, section 5.3.4 does not analyze the impacts to the CVP and SWP caused by the WSIP – instead, it assumes that the CVP and SWP will automatically take the actions necessary to mitigate for the effects caused by the WSIP, and merely concludes with the following:

"Given the very small magnitude and low frequency of potential effects on Delta flows, the impact of the WSIP on water availability and quality at water agencies' and other diverters' diversion points in the Delta would be *less than significant*, and no mitigation measures would be required." DPEIR, at 5.3.4-11 (emphasis in original). 05

The CCSF considers water supply programs to have significant impacts if they adversely affect deliveries to water users or water quality. Protracted droughts by definition create circumstances where deliveries to water users and water quality are adversely affected. However, the DPEIR fails to apply this standard to WSIP operations during drought conditions – instead, it avoids a finding of significance by shifting the mitigation burden to the CVP and SWP.

The DPEIR does not discuss the potentially significant impacts caused by reoperating the CVP and SWP to mitigate for the impacts caused by the WSIP. CVP operations on the San Joaquin and Stanislaus Rivers are subject to many regulatory requirements and agreements between parties on the San Joaquin River system (including the San Joaquin River Agreement). Any additional demands on this system (such as the WSIP demands described in the DPEIR) make it more difficult to meet flow and water quality objectives, and may cause agreements to be no longer valid. The CVP and SWP are subject to significant operational constraints on their Delta operations (and further constraints are anticipated to protect Delta smelt) - during times of protracted drought, mitigation for the impacts of the WSIP will cause significant impacts to CVP 06

and SWP operations. The failure of the DPEIR to analyze these impacts thus violates CEQA's mandate to discuss all reasonably foreseeable impacts. 06 cont.

Reclamation appreciates your consideration of these comments, and asks that the deficiencies in the DPEIR identified above be corrected before the final version of this document is published and a decision made on the WSIP. Please contact Mr. Ray Sahlberg, Regional Water Rights Officer, at (916) 978-5249 if you have any questions.

Sincerely,

Richard J. Woodley
Regional Resources Manager

Paul Maltzer
Environmental Review officer
San Francisco Planning Department
WSIP PEIR
1650 Mission Street, Suite 400
San Francisco, CA 94103

Dear Mr. Maltzer:

The Stanislaus National Forest is submitting comments on the Hetch Hetchy Water System Improvement Project.

Our comments center on actions which affect the Stanislaus National Forest's resources, which in the Environmental Impact Report (EIR) most closely relates to the discussion on the stretch from Hetch Hetchy to Don Pedro Reservoir. Our concerns include, but are not limited to:

12.1-4

1) Changes in water flows and the specifics on how water diversions will be increased. 01

2) Effects of the change in water flows on biological and aquatic resources. 02

3) Recreational impacts to National Forest visitors, particularly those people who recreate on Cherry Lake (Lake Lloyd Reservoir), Cherry Creek and the Tuolumne River, including those who fish and those who enjoy river rafting. Effects are projected on recreation due to a decrease in minimum rafting flows. 03

4) Resource environmental studies, such as the river system ecology, have not been completed making it difficult to comment on any of the proposed alternatives. 04

There has been inadequate communication and coordination by the City and County of San Francisco, San Francisco Public Utilities Commission, with the Forest Service to identify and propose mitigation on the effects of the proposal on Stanislaus National Forest resources. The Raker Act provides regulatory authority to the Department of Agriculture for the protection of public lands affected by the project. We have not had the opportunity to provide potential mitigation nor have we had the opportunity to discuss potential effects of the project on the Forest's resources. 05 Thus, we request additional time be made available for us to provide comments and mitigation following a discussion with the City and County regarding the proposal. We also request a copy of the Comments and Responses document. 06

F_USDAFS

At this point, due to the conceptual nature of the impacts and mitigation that are described in the EIR, we favor an alternative which does not divert additional water which would affect the Stanislaus National Forest. 07

We are submitting these written comments to the address above as well as submitting them electronically to wsip.peir.comments@gmail.com.

Sincerely,

TOM QUINN
Forest Supervisor

SUBJECT: Comments regarding the Draft Program Environmental Impact Report (PEIR) for the San Francisco Public Utilities Commission's Water System Improvement Program

Dear Mr. Maltzer:

The Don Edwards San Francisco Bay National Wildlife Refuge (Refuge) appreciates the
opportunity to comment on the San Francisco Public Utilities Commission's Water System
Improvement Program. We are the property owner adjacent to the Commission's pipeline in the
Newark area including the access routes to a portion of the pipeline. We are extremely concerned
about the potential wildlife and habitat impacts associated with the project to replace BDPL Nos. 01
1 and 2 that run through the Refuge (see attached map). We would like to relay the following
specific comments on the PEIR:

- *Noise, vibration and human disturbance to wildlife during construction and operation.* The
pipeline is located in wetland habitat that supports the endangered California clapper rail and
salt marsh harvest mouse, as well as numerous migratory bird species. These species rely on
this environment for breeding, nesting, foraging and roosting. We are concerned that 02
construction and operation activities may displace these species temporarily and/or
permanently from this area. We request that construction activities not occur during sensitive
breeding and nesting periods for these species.

- *Habitat disturbance.* We are concerned about the project's anticipated access needs to the
pipeline during the construction and operation phase. It is unclear if wetlands on the Refuge
and Refuge-managed property will be adversely impacted. In order to meet our
congressionally mandated requirements, we would need to be very restrictive in allowing
work to be conducted on or near the Refuge. Since the pipeline is surrounded on both sides 03
by wildlife habitat including species listed as threatened and endangered, we are also
concerned with the potential for take of wildlife during construction and maintenance
activities.

- *Underground pipeline.* We support decommissioning portions of BDPL Nos. 1 and 2
between the Newark Valve Lot and the Ravenswood Valve Lot, and constructing the Bay
Division Pipeline 5 underground. We recommend that SFPUC remove the aboveground
infrastructure in order to restore this area to wetland habitat. Leaving the pipeline in place
will either require ongoing maintenance which causes regular impacts to wildlife and 04
endangered species or, if maintenance is not conducted, the pipeline would collapse into the
marsh directly impacting this delicate resource. The short-term impacts associated with its
removal would be better then the long-term impacts of leaving it. All impacts would have to
be mitigated.

- *Dumbarton Rail.* We understand that the Dumbarton Rail Project is also going on in the
area. We recommend that you coordinate activities with San Mateo County Transit District 05
to minimize habitat impacts for both projects.

- *Dredge material.* We understand that dredge material will be produced from placing the
pipeline underground. We are interested in acquiring clean dredge material for use in 06
wetland restoration associated with the South Bay Salt Pond restoration project.

Thank you for including our comments during your comment period. Because of the potential
impact to listed species, we recommend you also coordinate with the Service's Division of 07
Endangered Species at the Sacramento Fish and Wildlife Office. They can be contacted at 916-414-6600. If you have questions regarding the Refuge, please contact Clyde Morris, Manager Don Edwards San Francisco Bay NWR, at 510-792-0222, x25.

Sincerely,

G. Mendel Stewart

SFPUC Water System
Improvement Project

Diana Sokolove
City and County of San Francisco
Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103

Dear Ms. Sokolove:

The California Department of Transportation (Department) appreciates the opportunity to have reviewed the Draft Environmental Impact Report for the proposed project to modify and improve the SFPUC Water System through the counties of San Joaquin, Stanislaus, and Tuolumne. The Department has the following comments:

- Please contact the Department for any planned construction of pipeline crossing the State facilities.
- An Encroachment Permit will be required for work (if any) done within the Department's right of way. This work is subject to the California Environmental Quality Act. Therefore, environmental studies may be required as part of the encroachment permit application including biological, cultural resources, and exposure to hazardous materials. A qualified professional must conduct any such studies undertaken to satisfy the Department's environmental review responsibilities. Ground disturbing activities to the site prior to completion and/or approval of required environmental documents may affect the Department's ability to issue a permit for the project. Furthermore, if engineering plans or drawings will be part of your permit application, they should be prepared in standard units. 01

If you have any questions, please contact Annette Clark at (209) 948-3909 (e-mail: annette_clark@dot.ca.gov) or me at (209) 941-1921.

Sincerely,

Annette Clark

San Francisco Planning Department
Attention: Paul Maltzer, Environmental Review Officer, WSIP PEIR
1650 Mission Street, Suite 400
San Francisco, CA 94103

Dear Mr. Maltzer:

Thank you for the opportunity to review the Draft Program Environmental Impact Report (PEIR) for the San Francisco Public Utilities Commission's Water System Improvement Program (WSIP).

The State Coastal Conservancy acts with others to preserve, protect and restore the resources of the California Coast. The San Francisco Bay Area Conservancy Program was created by the State Legislature in 1997 as a special program within the State Coastal Conservancy to help public agencies and private nonprofit organizations preserve open space, protect and restore fish and wildlife habitat, promote the use of habitat restoration projects for environmental education, provide public access to open space areas, and restore urban waterfronts in the nine Bay Area counties.

The Conservancy's comments on the PEIR for the WSIP are connected to the South Bay Salt Pond Restoration Project (SBSP Project). The Conservancy is facilitating the restoration, public access, and flood management planning for the SBSP Project, in coordination with the landowners, U.S. Fish and Wildlife Service and California Department of Fish and Game, and the local flood control agencies, Santa Clara Valley Water District and Alameda County Flood Control and Water Conservation District, as well as many other partners and stakeholders. We are currently in the process of producing the Final EIR/EIS for the SBSP Project. The Draft EIR/EIS, as well as the public comments, can be viewed at www.southbayrestoration.org. 01

The Conservancy supports the construction of a new Bay Division Pipeline 5, due to the fact that it would be underground from the Newark Valve Lot to the Ravenswood Valve Lot. The five mile "Bay Tunnel" segment of the pipeline would pass under marshlands, mudflats, and open Bay water. While there will be construction and maintenance impacts that need to be planned during species windows and mitigated, the tunnel is preferable to the existing aboveground Bay Division Pipelines Nos. 1 and 2, which pass over 02

1330 Broadway, 13th Floor

510·286·1015 *Fax:* 510·286·0470

marshlands, reducing the amount of wildlife habitat and blocking the movement of wildlife, including endangered species.

The PEIR states in Table S.2 on Page S-14 that the portions of BDPL Nos. 1 and 2 between the Newark Valve Lot and the Ravenswood Valve Lot will be decommissioned, but that decommissioning is not part of this project. As part of the construction of the "Bay Tunnel", this five-mile segment of BDPL Nos. 1 and 2 needs to be decommissioned and physically removed. Without the physical removal of the pipelines, constructing the "Bay Tunnel" loses its potential benefits to fish and wildlife habitat and simply results in the addition of construction impacts to the existing impacts from BDPL Nos. 1 and 2. If the plan is to decommission this portion of the pipeline, it should be included in the Programmatic EIR and physical removal of the pipeline should be planned. The short term impacts of the removal outweigh the long-term impacts of maintenance and potential deterioration of the pipelines. The SFPUC should also consider that physical removal of BDPL Nos. 1 and 2 through the Bay and marshlands may partially mitigate for activities in the Bay and marshlands contemplated as part of the WSIP. 02 cont.

The SBSP Project could benefit from any clean dredge material produced as a result of construction of the "Bay Tunnel". Many of the former salt ponds are subsided and the placement of dredge material on the pond bottoms would raise the elevation to a level more suitable for tidal marsh restoration. The Conservancy requests that the SFPUC coordinates with the SBSP Project, particularly with the Don Edwards San Francisco Bay National Wildlife Refuge, as the "Bay Tunnel" project proceeds, to determine the potential use of dredge material for salt pond restoration. 03

The construction of the "Bay Tunnel" and physical removal of the BDPL Nos. 1 and 2 could also assist with completion of a gap in the San Francisco Bay Trail. The Bay Trail is a planned recreational corridor that, when complete, will encircle San Francisco Bay and San Pablo Bay with a continuous 500-mile network of bicycling and hiking trails. It will connect the shoreline of all nine Bay Area counties, link 47 cities, and cross the major toll bridges in the region. To date, approximately 290 miles of the alignment—over half the Bay Trail's ultimate length—have been completed.

A major gap in the Bay Trail exists between Highway 84 and the Ravenswood Open Space Preserve. The City of Menlo Park, in an effort to develop alternatives for completing this gap, conducted a Bay Trail Feasibility Study (the final Feasibility Study report was completed January 5, 2005). The completion of this gap is of interest to the Conservancy for two reasons. One is that the Conservancy's enabling legislation includes completion of regional trails, such as the Bay Trail, as an objective. The Conservancy provides block grants to the Bay Trail project at ABAG to help achieve this goal. The second reason is the connection between this trail gap and the trails that will be built as part of the SBSP Project. All of the alternatives for the SBSP Project include completion of the Bay Trail through the project area, including the Ravenswood Pond Complex (attached are the 2 action alternatives for the Ravenswood ponds). The trail connection between Pond SF2 in the Ravenswood Pond Complex and the Ravenswood Open Space Preserve to the south is difficult primarily due to the presence of the 04

S_CC

Dumbarton Rail right of way. Another factor, however, is the presence of the BDPL Nos. 1 and 2. The Conservancy asks that as the "Bay Tunnel" project proceeds, the SFPUC coordinates and works cooperatively with the Conservancy and ABAG's Bay Trail project regarding completion of this Bay Trail gap through SFPUC lands. 04 cont.

Thanks for this opportunity to comment on the PEIR for the San Francisco Public Utilities Commission's Water System Improvement Program. Any questions can be directed to Amy Hutzel, San Francisco Bay Area Program Manager at (510) 286-4180 or ahutzel@scc.ca.gov.

Sincerely,

Sam Schuchat
Executive Officer

Dear Mr. Maltzer:

Subject: Case No. 2005.0159E, SCH No. 2005092926, Draft Program Environmental Impact Report for the San Francisco Public Utilities Commission's Water System Improvement Program

Moccasin Creek State Fish Hatchery Flow Protection:

For more than fifty years, the Department of Fish and Game has operated its Moccasin Creek Trout Hatchery facility, located downstream of Priest Reservoir, using a water supply supplied pursuant to an agreement between the Department and Hetch Hetchy Water and Power. We have been informed by local operations staff that in future years, maintenance of the HHWP facilities could require temporary interruption of water flows to the hatchery for some substantial periods, and that this could occur annually or nearly annually. If flow interruptions occur, it will have a devastating effect on fish hatchery operations and will adversely affect the Department's ability to meet statewide trout production goals. These goals are now legislatively mandated, within Fish and Game Code Section 12007. 01

Given the scope of major infrastructural changes planned and articulated through the subject Programmatic EIR/EIS, we believe it is reasonable to request that alternatives, such as bypass pipelines or other features, be considered that could effectively remediate the impacts of the planned maintenance on our facility operations. 02

Sincerely,

W. E. Loudermilk

Mr. Paul Maltzer
Environmental Review Officer
San Francisco Planning Department: WSIP PEIR.
1650 Mission Street, Suite 400
San Francisco, CA 94103

Dear Mr. Maltzer:

Subject: Case No. 2005.0159E, SCH No. 2005092926, Draft Program Environmental Impact Report for the San Francisco Public Utilities Commission's Water System Improvement Program

The California Department of Fish and Game (DFG) has reviewed the draft Program Environmental Impact Report (PEIR) for the Water System Improvement Program (WSIP) being proposed by the San Francisco Public Utilities Commission (SFPUC). The SFPUC proposes to adopt and implement the WSIP to increase the reliability of the regional water system, which provides drinking water to 2.4 million people in San Francisco, San Mateo, Santa Clara, Alameda, and Tuolumne counties. WSIP implementation would involve using additional water supplies to serve customer needs through 2030 as well as constructing repairs and improvements to many facilities within the existing system located in Tuolumne, Stanislaus, San Joaquin, Alameda, Santa Clara, San Mateo, and San Francisco counties.

DFG, a Trustee Agency under the California Environmental Quality Act (CEQA), is responsible for the conservation, protection, and management of the State's biological resources. The purpose of DFG's comments is to provide guidance to the SFPUC to ensure that, if the WSIP is implemented, biological resources are protected. Like the PEIR, DFG has organized comments beginning with the WSIP and proceeding with comments by each respective watershed (i.e.,Tuolumne River, Alameda Creek and San Francisco Peninsula).

<u>WSIP</u>

Please be advised that for any activity that will divert or obstruct the natural flow, or change the bed, channel, or bank (which may include associated riparian resources) of a river or stream, or use material from a streambed, DFG may require a Streambed Alteration Agreement (SAA), pursuant to Section 1600 et seq. of the Fish and Game Code, with the applicant. The PEIR identifies several existing points of water diversion and could be subject to Section 1600 01 et seq. of the Fish and Game Code. These include: Alameda Creek Diversion Dam, Stone Dam, and Early Intake Diversion Dam. However, given the complex nature of the SFPUC's water transport, other PODs may also exist and be subject to Section 1600 et seq. of the Fish and Game Code.

Issuance of SAAs is subject to CEQA. DFG, as a responsible agency under CEQA, will consider the CEQA document for the project. The CEQA document should fully identify the potential impacts to the stream or riparian resources and provide adequate avoidance, mitigation, monitoring and reporting commitments for completion of the agreement. To obtain information about the SAA notification process, please access our website at www.dfg.ca.gov/1600; or to request a notification package, contact the Streambed Alteration Program at (707) 944-5520. 01 cont.

TUOLUMNE RIVER

The Tuolumne River flows from the crest of the Sierra Nevada westward to its confluence with the San Joaquin River. The San Joaquin River flows north to the Sacramento–San Joaquin Delta, which then from the Delta discharges to the San Francisco Bay Estuary and the Pacific Ocean. Surface water bodies in the Tuolumne River system that could be affected by the proposed program include the Tuolumne River, Cherry Creek, Eleanor Creek, and a quarter-mile reach of Moccasin Creek. Several reservoirs could be affected by the WSIP, including Hetch Hetchy Reservoir, Lake Lloyd, Lake Eleanor, and Don Pedro Reservoir. Because the Tuolumne River drains to the San Joaquin River and the Sacramento–San Joaquin Delta, these water bodies could also be affected by the WSIP. The proposed program could affect flow in the streams and water levels and water quality in the reservoirs.

Upper Tuolumne River Watershed (Below O'Shaughnessy Dam but including Cherry Valley Dam and Lake Eleanor)

The PEIR states that the implementation of the WSIP would have a less than significant impact on stream flow from O'Shaughnessy, and that releases are subject to an instream flow agreement set in 1987 between the U.S. Department of Interior and the SFPUC. In addition, the PEIR also states that the WSIP has the potential to have a significant negative impact on terrestrial biological resources along the Tuolumne River below O'Shaughnessy Dam. This analysis implies that the 1987 instream flow agreement could be inadequate to maintain riparian habitat for wildlife along the Tuolumne River below O'Shaughnessy Dam. We recommend the 1987 instream flow agreement be re-evaluated and appropriately revised to consider the geomorphic processes that maintain alluvial features and riparian habitat. 02

In addition, it should consider the life histories of resident native fish and special status species such as: State-listed endangered 03

Willow flycatcher (*Empidonax traillii*); State species of special concern foothill yellow-legged frog (FYLF) (*Rana boyii*) and western pond turtle (*Clemmys marmorata*); and Federal Threatened California red-legged frog (CRLF) (*Rana draytonii*). A re-evaluation of the 1987 flow agreement may provide insight leading to an appropriate flow regime that could accommodate the needs of the SFPUC and the needs of biological resources below O'Shaughnessy Dam. 03 cont.

We applaud and encourage the SFPUC to continue their ongoing efforts to better characterize the relationships between regulated flow, physical habitat, and the biological communities in the upper Tuolumne River watershed (McBain and Trush 2006, McBain and Trush 2007). The intensive effort the SFPUC has invested into characterizing these relationships presents a firm scientific foundation to re-evaluate and possibly revise the1987 instream flow agreement. We recommend that a re-evaluation and possible revision of the 1987 flow agreement be incorporated into mitigation measure 5.3.7-2. Section 11 of the Raker Act requires the City and County of

San Francisco (CCSF) to comply with applicable state law, including but not limited to, DFG codes 5937 and 1600 et seq. and the CESA; we request that the SFPUC collaborate with us to implement mitigation measure 5.3.7-2. We look forward to working with the SFPUC, the public, and the other agencies in the upper Tuolumne River watershed.

Mitigation Measure 5.3.7-2

The PEIR proposes mitigation measure 5.3.7-2 to offset WSIP impacts on terrestrial biological resources due to potential effects on riparian habitat and special status species. Measure 5.3.7-2 would manage releases from Hetch Hetchy Reservoir to recharge riverside meadows, including the Poopenaut Valley. The PEIR states that well-managed, timely releases under 5.3.7-2, in addition to groundwater and plant population monitoring, would likely maintain meadow conditions in the Poopenaut Valley. 04

We recommend that monitoring of meadow systems along the Tuolumne River not be limited to groundwater and plant population surveys, but be expanded to include the monitoring of aquatic habitat or ecosystems. Botanical surveys are a useful tool in monitoring how meadow systems react to certain management activities (Wexielman et al. 2003; Ratliff 1985). However, it is unclear how sensitive botanical surveys are in detecting changes to aquatic habitat or ecosystems that can potentially occur with implementation of 5.3.7-2. For example, changes in stream hydrology resulting in stream bank failure or channel incision could have adverse impacts to the aquatic and riparian habitat and ecosystem (Micheli and Kirchner 2002), which may only be reflected over time in species composition/diversity that are described in botanical surveys. A community ecology approach to monitoring meadow systems may be a more effective approach in detecting changes in community structure, especially in a complex and relatively pristine system such as Poopenaut Valley. Furthermore, additional monitoring is required in order to generate sufficient data demonstrating that operations at O'Shaughnessy Dam comply with Fish and Game code 5937. Fish and Game code 5937 states that "[t]he owner of any dam shall allow sufficient water at all times to pass through a fishway, or in the absence of a fishway, allow sufficient water to pass over, around or through the dam, to keep in good condition any fish that may be planted or exist below the dam." We recommend that 5.3.7-2 include fishery surveys in order to analyze the impacts of pulse releases on the fishery. We recognize that implementing a comprehensive protocol may be costly and difficult, which is why we recommend that the SFPUC work with us in addition to the U. S. Fish and Wildlife Service (USFWS), National Park Service, and the U. S. Forest Service when implementing a monitoring protocol for mitigation measure 5.3.7-2. 04 cont.

Lower Tuolumne River (Below New Don Pedro)

The PEIR states that the implementation of WSIP would have no impact on the current minimum instream flow requirement set by the Federal Energy Regulatory Commission (FERC) in the 1996 Fishery Settlement Agreement. DFG is concerned that the current FERC required flow regime (i.e. PEIR's CEQA baseline conditions) may not be sufficient to prevent salmon populations in the Tuolumne River from declining. In fact, we have evidence demonstrating that adult Tuolumne River fall-run Chinook salmon *(Oncorhynchus tshawytscha)* produced at a given spring flow has declined by about 50% (mean of 6,805 recruits) since the FERC Settlement Agreement (FSA) was implemented in 1996. The decline is statistically significant based on an F-test comparison of two flow recruitment regression models: one based on the period from 1980 to 1990 and the other based on the period from 1998 to 2003. We believe that, as proposed, WSIP would make these conditions worse for Tuolumne River salmonids, thus exacerbate the current decline of this population. 05

To address this concern, DFG wrote a letter dated August 1, 2007 to Secretary Kathleen Bose of the FERC and requested the FERC to direct the Modesto Irrigation District (MID) and Turlock Irrigation District (TID) to provide higher magnitude and greater duration instream flows during the spring period of each year in order to assure acceptable salmon smolt survival and assure that the now-critically-impaired salmon populations will remain intact until a new license is considered for Project 2299 in 2014. In this letter, DFG presents evidence, which is summarized below, that demonstrates strong correlations between this observed population decline and the conditions of reduced spring flow and elevated spring water temperature, as directly caused by the operations of project 2299.

The CEQA environmental baseline conditions in the lower Tuolumne River are essentially driven by the operations of project 2299 which, for reasons we identify below, are creating conditions that are not suitable for the anadromous fisheries in the Tuolumne River. Although we recognize that the CCSF are not the licensees for project 2299, it is irrefutable that the actions of the SFPUC on the Tuolumne River at Early Intake, Cherry Valley Dam, and Hetch Hetchy and Lake Eleanor reservoirs influence the timing, duration, and magnitude of water releases from the New Don Pedro Dam. Increased diversion of waters from a river system which currently lacks sufficient flow to support sustainable anadramous fisheries including Federally Threatened Central Valley steelhead (*Oncorhynchus mykiss iridieus*) should be considered a significant cumulative impact. Although the proposed increase in diversion in itself may (arguably) not be deemed significant, when viewed in conjunction with project 2299, existing SFPUC diversions, and other diversions from the Tuolumne River, the effects are cumulatively considerable [see CCR Title 14, section15065(a)(3)]. In this context, *we believe the proposed project has the potential to cause anadromous fish populations to drop below self-sustaining levels and further reduce the number and restrict range of Federally Threatened Central Valley steelhead* – thereby requiring a finding of significant effect (CCR Title 14, section 15065 (a)(1)). Therefore, we respectfully request the SFPUC use alternative water sources other than Tuolumne River system to meet purchase requests in 2030 and drought year demands, at least until Project 2299 can properly address the inadequacies in the current flow regime for the purpose of creating, enhancing and supporting a sustainable anadromous fishery in the lower Tuolumne River. 05 cont.

Documented Tuolumne River Salmon Population Decline

Strong evidence exists that the Tuolumne River fall-run Chinook salmon population has declined severely. Historically, this fall run was documented (USFWS 1940) to annually exceed 72,000 escaping (i.e., spawning) adults. This number became reduced severely, coincidentally with, and in part caused by, water diversions and dams which were developed and operated on the Tuolumne River. Immediately prior to the operation of the New Don Pedro Project, fall-run Chinook salmon numbers annually reached 20,000 to 25,000 escaping adults, but unfortunately, the instream flow and other fishery protection measures included in the original Project 2299 license were inadequate to stem the continuing decline of salmon. By the time of the 1996 Fisheries Settlement Agreement, salmon numbers had progressively declined to less than 1,000 adults annually. This decline, both overall and when dissected into various life-stage survival components, very strongly correlates with Tuolumne River flow inadequacy during critical salmon life-stages.

In 1997, a record high water year produced substantial project spill, essentially rendering moot the fishery effects of Project 2299 water operations, as well as the effects of some of the out-of-tributary influences on juvenile salmon survival during that year. Absent those controlling influences, the salmon experienced much greater juvenile survival and downstream migration success. Accordingly, in 2000, when most of these fish returned to the Tuolumne River as adults, we documented runs well in excess of 18,000 individuals. Unfortunately, that benefit was short-lived. Since 2000, and after normal Project 2299 operations resumed, the Tuolumne River salmon escapements have again sharply declined. As of 2006, the Tuolumne River escapement population had dwindled to about 600 returning adults. This represents an order-of-magnitude salmon population reduction, during the time when the Fishery Settlement Agreement Flows and other "protective conditions" under that agreement were in full effect.

<u>Effects of Out-of-tributary Salmon Population Controllers</u>

Within the San Joaquin River watershed, there are four major tributaries; three of which support fall-run salmon populations. These populations are controlled: i) by an array of limiting factors within the specific tributaries, ii) by limiting effects of water operations, water quality, temperature and other parameters within the downstream San Joaquin River and delta, and iii) by oceanic mortality, including sport and commercial angling. Separating the quantitative effects of these various population controllers presents a challenge, given the limitation of being only able to observe and measure salmon success at the earliest (i.e., fry-smolt) and latest (i.e., escapement) stages.

Some biologists believe ocean harvest and Delta water diversions and exports are the sources of substantial adult population limiting mortality across the San Joaquin river watershed. Both ocean harvest and Tuolumne salmon escapement are compared (years 2000 through 2006) in Figure 11 (attached Appendix). Delta exports and Tuolumne River adult brood year production trends were compared (years 1998 through 2004) in Figure 12 (attached Appendix). Based upon these figures, we believe neither ocean harvest, as described by the multi-agency Central Valley Harvest Index, nor South Delta export trends correlate significantly with Tuolumne River escapement or brood production year trends. This suggests (i.e. infers) that neither ocean harvest nor Delta exports, even though they are sources or mortality, are strong controllers of the Tuolumne River salmon population.

05 cont.

The deployment of hatchery operations on only one of the San Joaquin River tributaries provides a useful comparative tool to separate the importance of in-tributary effects upon salmon survival and population levels. Within the San Joaquin River watershed, a salmon hatchery operation exists only on the Merced River. Most of the production of that hatchery is released into the Merced River directly, with lesser numbers of juveniles being released below the confluence of Merced and San Joaquin rivers. These latter releases are a part of basin-wide salmon downstream (juvenile) migrant survival studies.[1]

[1] These studies are required pursuant to the Vernalis Adaptive Management Program in which water operators on the several major tributaries coordinate downstream flows for the purpose of reversing declines in San Joaquin River salmon populations.

The process of hatching and rearing the juvenile salmon in a controlled, out-of-river hatchery environment essentially circumvents any dependency of these eggs or juveniles upon water and other habitat conditions within the natural channel of the Merced River tributary. So, to the extent that the most important salmon population controllers are located within the tributary habitat, the hatchery reared eggs and juvenile salmon should not be exposed to those controllers and as such their survival should be unaffected. As such, returning adult numbers should not vary as a feature of differential in-tributary conditions. Conversely, to the extent that the principal population controllers exist in areas downstream from the Merced River and other major tributary habitats (e.g., in the main-stem San Joaquin River, Delta, or Pacific Ocean), as is asserted on the Tuolumne River by the Licensees, then we would logically expect the post-hatchery-released Merced River salmon to experience those same limiting factors and thus be affected similarly to the salmon leaving the Tuolumne and Stanislaus rivers. Consequently, we would expect the Merced River returning adult population to be similarly reduced in magnitude.

This comparison between neighboring rivers provides a useful indication of where and when, within the salmon life history, the key limiting factors are occurring. In fact, since the Merced River Hatchery has been in operation and juvenile survival has been regularly artificially supported, the Merced River salmon population has been maintained at much more numerous and stable levels than the populations within the Tuolumne and Stanislaus rivers, which have experienced similar water-year sequences, but in which salmon juveniles have been exposed to in-tributary limiting factors. The evidence thus strongly suggests that these salmon populations are substantially affected and controlled by in-tributary limiting factors, rather than oceanic or other downstream controlling features.

05 cont.

<u>Tuolumne River Salmon Population Controllers: Flow Magnitude, Timing and Duration</u>

Figures 2 and 3 (attached Appendix) show trends in fall and spring flow within the Tuolumne River. Tuolumne River fall (i.e., spawning) flows, from 1997 through 2003 are essentially uniform in release timing and magnitude, and do not significantly correlate with observed brood-year reductions. Spring rearing and downstream conveyance flow releases (April and May) for years 1998 through 2004 do strongly correlate survival across a variety of different water/brood-years. Figure 4 (attached Appendix) shows the annual Tuolumne River flow at La Grange, versus salmon escapement occurring 2.5 years later (past evidence reflects that salmon escapement is typically dominated by three-year-old returning adults). We reiterate that this reflects a very consistent relationship between spring flow reduction and escapement reduction in the Tuolumne River between escapement years 2000 and 2006.

To investigate the relationship between spring flow (magnitude, frequency/ duration) and salmon escapement 2.5 years later, spring flows for the period 2000- 2006, were categorized by both flow and frequency/duration of occurrence. We used 1500 cfs increments, encompassing the range from 1500 cfs or less to 7500 cfs, for the April and May period of each year (see attached Table 1). We note a very clear trend in spring flow magnitude and duration, which strongly correlates with Tuolumne River adult salmon production. This relationship prevails regardless of whether annual escapement or brood-year cohort production metrics are used. Figure 5 (enclosed Appendix) shows the statistical correlation between La Grange spring flow level and Tuolumne River adult salmon brood year production (e.g. linear r-square = 0.97, non-linear r-square = 0.82).

Relationship of Salmon Production to Water Temperature:

In addition to assessing Tuolumne River spring flow as a factor in Tuolumne River salmon production declines, spring Tuolumne River (Modesto measurement station) water temperature was evaluated as a factor affecting Tuolumne River salmon brood year production. Figure 6 (see attached Appendix) shows the statistical relationship between spring daily flow and water temperature at Modesto from 1998 through 2006 (We point out the linear r-square = 0.99). This represents strong (i.e., statistically valid) evidence that water temperatures at the Modesto measurement station are driven primarily by Tuolumne River instream flow releases from Project 2299. 05 cont.

To determine if variation in spring water temperature frequency occurred during production years 1998 through 2004 (years consistent with 2000 through 2006 escapements), spring water temperatures were categorized in 1°C increments from 15 to 20°C (59 to 68°F) (Table 2 see enclosed). Substantial variation across this critical salmon thermal range occurred among spring Tuolumne River temperatures during this period. Years with colder spring water temperatures clearly produced higher adult escapement 2.5 years later than was observed under warmer springtime conditions. We note that when spring water temperatures in the Tuolumne River at Modesto were below 15°C (the U.S. Environmental Protection Agency (EPA) Region 10 Water Temperature Threshold Standard for Tributary Out-migrating Juvenile Chinook Salmon smolts), Tuolumne River adult salmon brood year production was at its highest.

Figure 7 (attached) shows the statistical relationship between spring Tuolumne River water temperature at Modesto and both annual escapement (e.g. non-linear r-square = 0.75) and brood year production trends (e.g. non-linear r-square = 0.65). These correlations infer that water temperature is an important variable influencing adult salmon production trends in the Tuolumne River. We note that due to the demonstrated influence of instream flow releases upon water temperatures, the thermal regime within the Tuolumne River, downstream of New Don Pedro Dam results directly from Licensees' Project 2299 operations.

12.2-8

Lower Tuolumne Fishery Impact Conclusion

In conclusion, we have observed a very dramatic decline in Tuolumne River salmon adult escapement between 2000 and 2006 while the Fishery Settlement Agreement flow regimes and other protective features have been in place. We have observed a strong relationship between this observed population decline and the conditions of reduced spring flow and elevated spring water temperature, as directly caused by the operations of project 2299. As mentioned earlier, we recognize that the City and County of San Francisco are not the licensees for project 2299; however, it is irrefutable that the actions of the SFPUC on the Tuolumne River at Early Intake, Cherry Valley Dam, and Hetch Hetchy, and Lake Eleanor reservoirs influence the water releases from the New Don Pedro Dam. 05 cont. Increased diversion of waters from a river system which currently lacks sufficient flow to support sustainable anadromous fisheries (including Federally Threatened steelhead) should be considered a significant cumulative impact. Although the proposed increase in diversion in itself may (arguably) not be deemed significant, when viewed in conjunction with project 2299, existing SFPUC diversions, and other diversions from the Tuolumne River, the effects are cumulatively considerable [see CCR Title 14, section15065(a)(3)]. In this context we believe the *WSIP has the potential to cause anadramous fish populations to drop below self-sustaining levels and further reduce the number and restrict range Federal Threatened Central Valley steelhead* – thereby requiring a finding of significant effect [CCR Title 14, section 15065 (a)(1)]. Given the dramatic decline in Tuolumne River salmon adult escapement between 2000 and 2006; we believe that if implemented as proposed, the WSIP would only exacerbate the current decline of anadromous fisheries in the Tuolumne River. Consequently, we respectfully request that the SFPUC use alternative water sources other than the Tuolumne river system or implement water conservation measures to meet drought year demands and 2030 purchase requests, at least until Project 2299 can properly address the inadequacies in the current flow regime for the purpose of creating, enhancing and supporting a sustainable anadromous fishery in the lower Tuolumne River. 06

Proposed Mitigation to Offset WSIP Impacts to Fisheries Below La Grange Dam

The PEIR justifiably acknowledges that the WSIP would have a significant impact on fisheries in the Tuolumne River below La Grange dam. The PEIR proposes two mitigation measures to offset the WSIP impacts on fisheries (5.4-3a and 5.4-3b). These mitigation measures are presented from, and based on, a firm scientific foundation (McBain and Trush 2000). However, in light of recent science (Mesick et al. 2007), we believe these mitigations are potentially inadequate to reduce WSIP's impacts on fisheries in the lower Tuolumne River to *less than significant*. 07

Mitigation Measure 5.4-3a

The PEIR states that implementation of this mitigation measure will require the SFPUC to pursue a water transfer arrangement with MID/TID and/or water agencies such that demand on Don Pedro Reservoir as a result of conservation, improved delivery efficiency, inter-agency water transfer or use of an alternative supply such as groundwater. Although we support the continued development of the mitigation measure, the high degree of uncertainty causes us concern that this mitigation may not be sufficient to offset WSIP's impacts on fisheries in the Tuolumne River. If this mitigation measure is implemented, the terms and conditions of the transfer agreement should be disclosed to the public to determine the adequacy of the mitigation and the impacts to resources. We also believe that this mitigation measure could potentially be transferring WSIP impacts to another watershed, which would likely require the SFPUC to mitigate its own mitigation. For these reasons, we believe that this mitigation measure has potential to be inadequate to offset WSIP impacts to fisheries to *less than significant* threshold. 07 cont.

Alternatively, we will actively support and provide technical assistance to the SFPUC and CCSF in further developing this mitigation measure in order to increase use of water recycling/conservation strategies, and conjunctive groundwater. We request that as part of this mitigation measure, the SFPUC implement and mandate enforceable water recycling/conservation strategies or upgrades for its wholesale customers and their constituents that elect not to use feasible water recycling/conservation strategies or upgrades. We highly recommend that the SFPUC become more assertive with its wholesale customers for the purpose of conserving water and to ensure that growth is feasible with respect to the water supply that is currently available. We look forward to working with the CCSF, SFPUC and other resource agencies to provide comments during the environmental review of this mitigation measure.

Mitigation Measure 5.4-3b

The PEIR proposes to offset impacts to fisheries by implementing gravel augmentation projects and/or removal of gravel quarry pits. The objective of these projects would be to introduce enhance spawning gravel and fill in instream gravel pits occupied by fish predators. Mesick et al. 2007 developed a Tuolumne River Management Conceptual Model (Model) that includes a limiting factor analysis of the Tuolumne River populations, unanswered management questions and related testable hypotheses, and recommended studies and experimental instream flow schedules needed to test the hypotheses. Part of their limiting factor analysis included a preliminary analysis of previous habitat restoration projects that are similar to the projects proposed in this mitigation measure. This preliminary analysis produced hypotheses and experiments that test the hypotheses. In light of analysis presented by Mesick et al. 2007, which is partially summarized below, we question the ability of 5.4-3b to mitigate WSIP's 08

impacts on fisheries to *"less than significant."* We have reason to believe that the projects under 5.4-3b are potentially inadequate to reduce WSIP's impacts to *"less than significant."* We concur with and support the hypotheses and purposed experiments presented by Mesick et al. 2007. If WSIP is implemented as proposed, we request the SFPUC and CCSF to consider the hypotheses set forth by Mesick et al. 2007 when planning mitigation measures in the lower Tuolumne River.

Spawning Habitat Restoration (from Mesick et al. 2007)

Preliminary analyses suggests that although the degraded condition of the spawning habitat in the Tuolumne River limits the production of fry, more fry are currently being produced than can be supported by the rearing habitat. If true, then gravel augmentation and restoring sediment transport will not substantially increase adult recruitment.

The preliminary analysis is based on rotary screw trap captures in the Tuolumne River. At least 7,300,000 and 3,500,000 juveniles were produced in the Tuolumne River in 1999 and 2000, respectively. The estimates are based on rotary screw trap catches at the 7/11 site (RM 38.6), which is downstream of the majority of the spawning habitat in the Tuolumne River (Turlock Irrigation District and Modesto Irrigation District 2005); only a portion of the migratory period was sampled during both years and so the true estimates are probably higher. It is likely that these numbers far exceeded the capacity of the rearing habitat, because only 0.4% of these fish in 1999 and 1.4% of these fish in 2000 survived to a smolt-size at the downstream Tuolumne River trap at Grayson (RM 5.2). 08 cont.

Smolt production also appears to be controlled by the quality of the rearing habitat and not the production of fry in the Stanislaus River. After implementing a spawning habitat restoration project in the Stanislaus River that added spawning-sized gravel to 18 sites between Goodwin Dam and Oakdale in summer 1999 (Carl Mesick Consultants 2002), juvenile production, which was measured with a rotary screw trap at Oakdale (RM 40), increased by 32% in spring 2000 compared to spring 1999 (Figure 15 see attached). However, there was no increase in the number of smolt-sized fish that migrated from the river in spring 2000 compared to spring 1999 (Figure 15) as measured with rotary screw traps at Caswell Park (RM 5 see attached) even though the mean flow from March 1 to June 15 at Goodwin Dam was nearly identical (1,497 cfs) in 1999 and 2000.

Fish Predators (from Mesick et al. 2007)

It is likely that high winter and spring flows reduce predation by largemouth bass (*Micropterus salmoides*), smallmouth bass (*M. dolomieu*), Sacramento pikeminnow (*Ptychocheilus grandis*), and striped bass (*Morone saxatilis*) on juvenile salmon in the Tuolumne River and that predation rates are abnormally high where predator habitat was enhanced by in-river gravel extractions. Although the initial studies indicated that predation by largemouth and smallmouth bass in the large captured mine pits is a major source of mortality in the Tuolumne River (Turlock Irrigation District and Modesto Irrigation District 1992b), there is uncertainty about the importance of predation relative to other rearing habitat limitations and there is uncertainty about the importance of other predator species, such as Sacramento pikeminnow and striped bass.

The initial studies conducted by EA indicated that very few bass contained juvenile salmon in their stomachs except during May 1990 when 93,653 hatchery reared salmon smolts were released at Old La Grange Bridge for survival studies (Table 5 see enclosed). Furthermore, predation by black bass should have been unusually high during the drought conditions of 1989 and 1990 when EA conducted their studies, and so typical predation rates by black bass should be much lower than those shown in Table 5. There is no evidence that restoring the large pond at Special Run Pool 9 and isolating the pond at Special Run Pool 10 reduced predation rates or improved the survival of juvenile salmon in the Tuolumne River (Turlock Irrigation District and Modesto Irrigation District 2005).

We also suspect that the electrofishing methods used by EA (Turlock Irrigation District and Modesto Irrigation District 1992b) were selective for largemouth and smallmouth bass, which utilize cover compared to striped bass and Sacramento pikeminnow, which tend to utilize open water. Radio tracking studies conducted by S.P. Cramer & Associates in 1998 and 1999 in the Stanislaus River (Demko and others 1998, SPCA unpublished data) suggest that the survival of large naturally produced and hatchery juveniles, 105 to 150 mm fork length, with gastrically implanted transmitters and 12-inch external whip antennas, was less than 10% during May and June (Demko and others 1998). Three striped bass collected had radio tagged juvenile Chinook salmon in their stomachs and striped bass were observed near the locations where many of the tagged juveniles ceased their migration. However, there is uncertainty as to whether the tagging procedure affected the fish's vulnerability to predators. Gastric implantation is stressful to juvenile salmonids and the whip antenna impairs their swimming ability (Vogel, personal communication, see "Notes"). During the 1998 SPCA studies, only 73% of the fish survived the tagging procedure and no observations were made to verify that tagging did not affect the fish's behavior (Demko and others 1998). Another potential predator of juvenile salmon in the Tuolumne River is the adult Sacramento pikeminnow, which forms large schools in 3 to 8 foot deep ditch-like channels called Special Run-Pools. Sport anglers report that large adults frequently have numerous salmon fry in their stomachs particularly during January and February. 08 cont.

Proposed Lower Tuolumne Fishery Mitigation Conclusion

We support the development of mitigation measure 5.4-3a in order to increase use of water recycling/conservation strategies and conjunctive groundwater. We 09

also recommend that the SFPUC become more involved with wholesale customers to address responsible growth with respect to the current water supply capabilities. We request that, as part of this mitigation measure, the SFPUC implement and mandate enforceable water recycling/conservation strategies or upgrades for its wholesale customers and their constituents that elect not to use feasible water recycling/conservation strategies or upgrades. 09 cont.

Although the SFPUC and CCSF have built mitigation measure 5.4-3b from a firm scientific foundation, recent evidence and preliminary analysis suggests that the projects described in 5.4-3b may not be an effective mitigation measure in the current flow regime, let alone in the reduced flow regime being proposed by the WSIP. We request that the SFPUC and CCSF consider the hypotheses and proposed experiments describe by Mesick et al. 2007, when developing mitigation measures for fishery enhancements on the lower Tuolumne River. We also recommend that the SFPUC and CCSF coordinate with the National Marine Fisheries Service (NMFS), USFWS, and DFG to develop adequate mitigation measures for the lower Tuolumne River fishery. 10

ALAMEDA CREEK

The SFPUC manages the Alameda Creek watershed portion of the regional system with the primary objective of conserving local watershed runoff for delivery to customers. Therefore, the Alameda reservoirs are managed to capture winter and early spring runoff in order to maximize storage and water delivery to customers during the winter months, while Hetch Hetchy runoff is stored for summer and fall delivery. This interconnectivity of the Alameda and Hetch Hetchy systems provides for substantial flexibility in operations.

The proposed WSIP system operations would affect the two SFPUC reservoirs in this watershed—Calaveras and San Antonio Reservoirs—as well as some reaches of Alameda Creek and its tributaries. Within the CCSF owned watershed, Calaveras Creek and Arroyo Hondo drain directly to Calaveras Reservoir, and Alameda Creek flow is diverted into Calaveras Reservoir via the Alameda Creek Diversion Tunnel through operation of the Alameda Creek Diversion Dam. Farther downstream, San Antonio Creek drainage flows to San Antonio Reservoir, which is also used to store water from the Hetch Hetchy system and, periodically, water from Calaveras Reservoir. Downstream of its confluence with San Antonio Creek, Alameda Creek continues flowing through the Sunol Valley and then through Niles Canyon, eventually draining to San Francisco Bay.

Calaveras Reservoir and Calaveras Creek below the reservoir

Calaveras Reservoir is currently operated to conserve local watershed runoff for integration into the SFPUC regional water supply; however, due to Division of Safety of Dams (DSOD) restrictions, the water level in Calaveras Reservoir has 11 been considerably lower since the end of 2001 than in previous years. Reservoir storage is constrained to approximately 37,800 acre-feet, about 40% capacity. Under the WSIP, Calaveras would be restored to its full design capacity (approximately 96,800 acre-feet), which would allow the SFPUC to maximize the use of local watershed supplies. Furthermore, fishery releases from the reservoir (measured below the confluence of Alameda and Calaveras creeks) and flow recapture would be implemented under the WSIP in accordance with a 1997 Memorandum of Understanding (MOU) with DFG, regarding releases of water from Calaveras Reservoir and maintenance of minimum storage levels from July through October to enhance fishery habitat, improve the coldwater fishery resources downstream of Calaveras Dam, and enhance warm-water native fisheries in the lower reach of the creek.

The SFPUC, under the aforementioned 1997 MOU with DFG, agreed to specific flow releases to provide habitat for resident rainbow trout and other native fish species downstream of Calaveras Reservoir based on the knowledge of fish migration barriers being present in the lower downstream reaches of Alameda Creek. At this time, there is continuing work to remove or remediate the downstream fish barriers (e.g. BART weir, USGS gauge, etc.). As these barriers are removed or retrofitted for adequate fish passage, the SFPUC will need to assess adequate flows for anadromous steelhead trout, the native resident fish community, FYLF, and CRLF and will need to renegotiate with DFG such that adequate flows from Calaveras Reservoir, San Antonio Reservoir and the Alameda Creek diversion dam are released or bypassed to provide suitable resource protection and comply with Fish and Game Code 5937. 11 cont.

Before the SFPUC releases water from Calaveras Reservoir to comply with the DFG 1997 MOU, DFG recommends that the SFPUC propose and submit to DFG and USFWS an invasive specie eradication plan to eliminate or suppress populations of bullfrog and non-native centrarchids from the Calaveras reservoir watershed. We are aware that Calaveras Reservoir has a healthy population of bullfrog (*Rana catesbeiana*). We are concerned this population will jeopardize the success of the SFPUC mitigation projects surrounding Calaveras Reservoir for California tiger salamander (*Ambystoma californiense*) and CRLF. We are also concerned that flow releases from Calaveras Reservoir, without having screens at the intake towers, could be a mechanism for expanding the range of bullfrogs and non-native centrarchids. Expanding the range of these species in the Alameda Creek watershed would likely have a significant negative impact on special status species such as FYLF, juvenile rainbow/steelhead trout, California tiger salamander and CRLF. Part of this plan should include the following measures:

1) A specific plan to screen as per DFG screening criteria at the new intake tower/adit(s) at Calaveras Reservoir.
2) Implementation of a comprehensive multi-year eradication program aimed at different life stages of invasive species (e.g. bullfrogs, and

12.2-11

non-native centrarchids) in Calaveras reservoir, San Antonio reservoir and the stock ponds in both watersheds.

3) Adaptive management measures that can be swiftly implemented if invasive species migrate or escape from the reservoir during uncontrolled releases.

Part of the environmental review for the Calaveras Dam Replacement project should be an assessment of operations of the water elevation during critical periods of migration for the landlocked steelhead/rainbow trout. The SFPUC should ensure that Calaveras Reservoir is operated such that fish passage is maintained between the reservoir and Arroyo Hondo by keeping reservoir water elevations as high as possible during the period when adult trout migrate upstream from the reservoir through the end of the downstream (adult and juvenile trout) migration season. 11 cont.

Alameda Creek between the Diversion Dam and Calaveras Creek Confluence

The Alameda Creek diversion dam and tunnel divert water from the upper Alameda Creek watershed to Calaveras reservoir. Inflow at the diversion dam is diverted into the tunnel up to the maximum capacity of the tunnel, about 650 cfs. Inflow to the diversion dam that exceeds the tunnel capacity flows past the diversion dam and continues downstream in Alameda Creek. Diversions from Alameda Creek to Calaveras Reservoir have been substantially reduced because of the DSOD restrictions on Calaveras Reservoir. The SFPUC is unable to capture most local watershed runoff from upper Alameda Creek, and post 2002 flows in Alameda Creek below the diversion dam have been substantially greater than they were prior to 2002. The rediversion of flows from Alameda creek at the diversion dam affects two reaches of the creek: the reach between the diversion dam and the confluence with Calaveras Creek and the reach below the confluence with Calaveras Creek (see impact 5.4.1-2).

Mitigation Measure 5.4.1-2 and 5.4.5-3(a)(b)

To offset impact 5.4.1-2, the PEIR proposes to implement mitigation measure 5.4.5-3a Minimum Flows for resident trout on Alameda Creek and 5.4.1-2 Diversion Tunnel. Measure 5.4.5-3a, requires the SFPUC to develop and carry out as part of the implementation of the Calaveras Dam Replacement project, an operation plan to implement minimum stream flows when precipitation generates runoff into the creek below the Alameda Creek Diversion Dam (ACDD) to the Calaveras Creek confluence from December 1 through April 30 to support resident trout spawning and egg incubation. The operation plan will identify the specific minimum flow requirements to support resident trout spawning and egg incubation, a detailed monitoring plan to survey and document trout spawning and egg incubation, and any diversion facility modifications that are needed to implement the minimum stream flows. The PEIR continues by stating that a 12 monitoring plan will be provided to appropriate resource agencies for review and comment and will subsequently be implemented by the SFPUC staff. At the completion of the monitoring period (5-10 years) the SFPUC shall produce a draft comprehensive report describing the methods, data collected, and results used to assess the performance of the minimum stream flow in provided suitable habitat for resident trout spawning and egg incubation. The PEIR states, that if monitoring indicates that this measure does not sustain the resident trout fishery in this reach, then the SFPUC shall either modify the minimum stream flow to enhance downstream habitat conditions to fully meet the mitigation requirement or also implement mitigation measure 5.4.3-3b Diversion Restrictions or Fish Screens (further described below). 12 cont.

Measure 5.4.1-2 states that the SPFUC will establish and implement written operational criteria for the Alameda Creek Diversion Dam that directs that the diversion dam and tunnel shall be operated to pass flows down Alameda Creek when diversion of those flows is not required to maintain desired levels in Calaveras Reservoir in order to provide the maximum possible days of winter and spring flows in Alameda Creek below the diversion dam. The PEIR states that this mitigation measure reinforces the way the SPFUC generally operates the diversion tunnel now: that diversion gates are closed in the spring once desired Calaveras reservoir storage have been reached.

Mitigation Measure 5.4.3-3a

We support the continued developed of this mitigation measure; however, we are concerned about the lack of scope involved in the objectives and monitoring protocol described in this mitigation measure. There are viable populations of Federal Threatened CRLF and State Species of Special Concern FYLF in Alameda Creek at Camp Ohlone (Bobzien and Didonato 2007). When sufficient flows are bypassed from the ACDD, Alameda Creek from the ACDD to Little Yosemite provides about 2.5 to 3 miles of suitable habitat for both species. We believe that an objective of this mitigation measure should include providing sufficient bypass flows to support viable populations of CRLF and FYLF. Consequently, the monitoring protocol described in this mitigation measure should include monitoring how these amphibian populations respond to the bypass flows. If this mitigation measure is implemented successfully, we would expect the population dynamics of these populations to be similar to those at Camp Ohlone. Therefore, we recommend that success of this objective be partially determined by using the Camp Ohlone amphibian population as a model. 13

This mitigation measure calls for evaluating success after five to ten years of monitoring. We recommend that the SFPUC coordinate with us frequently throughout the monitoring program to evaluate the results. As the monitoring results are evaluated, testable-hypotheses and adaptive management measures

testing these hypotheses should be formulated and incorporated into mitigation measure 5.4.5-3b.

Currently, there are migration barriers for Federal Threatened Central Coast Steelhead present in the lower downstream reaches of Alameda Creek. As these barriers are removed or retrofitted for adequate fish passage, the SFPUC will need to reassess this mitigation measure to provide adequate flows for anadromous steelhead trout, the native resident fish community, FYLF, and CRLF and will need to renegotiate with DFG such that adequate flows from the ACDD are bypassed to provide suitable resource protection and comply with Fish and Game Code 5937. 13 cont.

We look forward to working with the SFPUC and CCSF in developing and monitoring the success of this mitigation measure.

Mitigation Measure 5.4.3-3b

The PEIR states that if, after 10 years of monitoring, results for Measure 5.4.5-3a indicate that the measure does not sustain the resident trout population in Alameda Creek below the ACDD, the SFPUC shall also implement additional measures as follows: either implement restrictions on diversions to Calaveras Reservoir to protect the downstream resident rainbow trout fishery during the critical spawning period (December 1 to April 30) or install and operate a fish passage barrier to "screen" the diversion facility.

We support the development of this mitigation measure for the purposes of having a contingency plan for mitigation measure 5.4.3-3a. We recommend that if, after 5-10 years of monitoring, results for 5.4.5-3 indicate the measure does not sustain resident rainbow trout, CRLF, and FYLF populations, that the following be also evaluated and, if feasible, incorporated into this mitigation measure. 14

1.) The ACDD be decommissioned and removed.
2.) The ACDD be retrofitted to accommodate fish passage to comply with DFG code 5901.
3.) Other adaptive management measures that might arise during the analysis of monitoring results.

Furthermore, we believe ten years is too long to consider screening the tunnels at the ACDD. The diversion tunnels at the ACDD should be screened concurrently with the Calaveras Dam Replacement project in order to comply with DFG codes 5980 et seq.

Mitigation Measure 5.4.1-2

We believe this mitigation measure should be re-evaluated and be developed in coordination with mitigation measure 5.4.5-3a. Implementation of this mitigation measure means the SFPUC diverts all of the early winter storms (up to 650 cfs) only to leave portions of storms after Dec. 1 to bypass the ACDD. Given the boulder-bedrock character of Alameda Creek, if early winter flows are diverted to Calaveras Reservoir, late season flows could go subterranean only to recharge groundwater. Consequently, only bypassing late season flows may be insufficient to maintain flowing water in Alameda Creek. We recommend that appropriate hydrologic studies be conducted in Alameda Creek from the diversion dam to Little Yosemite in order to determine the amount of flow required during various water years to bypass sufficient instream water to support the different life stages of resident native fish, FYLF and CRLF. 15

San Francisco Peninsula

San Mateo Creek Watershed

The SFPUC operates four water supply reservoirs on the San Francisco Peninsula: Pilarcitos, Upper and Lower Crystal Springs, and San Andreas reservoirs. The four reservoirs and two streams (San Mateo Creek and Pilarcitos Creek) on the Peninsula could be affected by the WSIP. San Mateo Creek, and its tributary San Andreas Creek, flow southward in the rift valley formed by the San Andreas fault and then turn east, flowing to San Francisco Bay. Pilarcitos Creek also flows southward, but it turns to the west and flows to the Pacific Ocean. The SFPUC's water supply facilities on the San Francisco Peninsula lie within two watersheds, the San Mateo Creek and Pilarcitos Creek watersheds, which are referred to collectively as the Peninsula watershed.

San Mateo creek Below Crystal Springs Reservoirs

The SFPUC operates the upper and lower Crystal Springs Reservoirs (Reservoirs) to store water from local watersheds and water imported from the Tuolumne River, and Pilarcitos and San Mateo creeks. Since 1983, the SFPUC has been forced by the Division of Safety of Dams to change the management of the Reservoirs by reducing the historic storage capacity of the Reservoirs from 68,300 acre-feet to 58,000 acre-feet. Under the WSIP, the SFPUC proposes to change the management of the Reservoirs by operating the Reservoirs at full storage capacity. The SFPUC manages these Reservoirs to collect as much runoff as possible from the upper San Mateo Creek watershed. Most of the time, the SFPUC captures all of the runoff from the upper watershed and no water is released to San Mateo Creek below Lower Crystal Springs Dam (LCSD). Under the WSIP, the SFPUC proposes to operate the Reservoirs as they are currently operated. Releases to San Mateo Creek are proposed to occur infrequently, as they do under existing condition, and are proposed to be of a similar magnitude. 16

The Reservoirs should be managed to store water and to support fish and wildlife in the Reservoirs and in lower San Mateo Creek. DFG requests that the SFPUC provide flow releases to the stream channel below LCSD to encourage riparian habitat complexity, invertebrate productivity, adequate dissolved oxygen, low water temperatures, improved water quality, provide habitat complexity for federal threatened CRLF and Federal and State Endangered San Francisco garter snake (*Thamnophis sirtalis tetrataenia*), rearing habitat for juvenile steelhead and spawning habitat for adult steelhead. DFG requests that the SFPUC propose and submit to DFG for approval, flows regimes for various water years from LCSD immediately following the completion of the LCSD improvement project. During the interim, DFG recommends that the SFPUC implement a monitoring program in the San Mateo Creek watershed that would generate sufficient data to determine an adequate flow regime from LCSD to comply with Fish and Game code 5937, which states that "the owner of any dam shall allow sufficient water at all times to pass through fishways, or in the absence of a fishway, allow sufficient water to pass over, around or through the dam, to keep in good condition any fish that may be planted or exist below the dam..." This monitoring program should include the following:

1.) Stream gauges to assess flows and water temperatures in upper and lower San Mateo Creek. Stream gauges should also be placed in the tributaries to the reservoirs. 16 cont.

2.) A habitat-based stream assessment for upper/lower San Mateo Creek and Laguna Creek done at a seasonally appropriate time period that incorporates habitat and life history criteria of resident rainbow trout, steelhead, CRLF and San Francisco garter snake.

3.) A fish passage study of potential barriers on lower San Mateo Creek.

4.) A hydrologic study to determine the amount of water that is needed to support steelhead through critical reaches under various water year conditions within the reaches affected by WSIP (i.e. upper San Mateo Creek and Laguna Creek) and reaches of lower San Mateo Creek below LCSD.

5.) A hydrologic study to assess the instream channel capacity in various reaches throughout lower San Mateo creek.

6.) The SFPUC should collect baseline data on lower San Mateo Creek and determine appropriate success criteria to reach when the flow regime has been implemented. Such baseline data should include:

   a. Diversity and abundance of fish in lower San Mateo Creek.

   b. Diversity and abundance of aquatic insects.

c. Instream habitat assessment for Central coast ESU steelhead and riparian habitat assessment focused at the life history of CRLF and San Francisco garter snake.

d. Water quality monitoring of the following parameters:

i. Water temperature

ii. Dissolved oxygen

iii. Water chemistry (e.g. turbidity, pH, containments etc)

The SFPUC should assess adequate flows for steelhead and should submit flow regime proposals to DFG such that adequate flows are released. Although there have not been formal studies and agreements that have set a minimum instream flow requirements for LCSD and Stone Dam, it does not exempt the SFPUC from complying with Fish and Game code 5937, 1600 et seq. or the Endangered Species Act. DFG recognizes and encourages the ongoing effort the SFPUC has invested in attempting to restore steelhead populations in Alameda Creek; however, the SFPUC shouldn't limit this effort to the Alameda Creek watershed and should extend a similar restoration effort to San Mateo Creek watershed and other watersheds that the SFPUC owns and manages (e.g. Pilarcitos and San Antonio). 16 cont.

Crystal Springs Reservoirs

The Notice of Preparation for the LCSD improvement project proposes the future minimum pool elevation to be 277.4 feet. We are uncertain if the reservoirs will have a hydrological disconnect that can be defined by an active channel between the reservoir and the tributaries that Steelhead/rainbow trout use for spawning. The WSIP could severely impact the population of *Oncorhynchus mykiss* spp. in the reservoirs especially if there are no hydrological connections or defined channels when *Oncorhynchus mykiss* spp. are migrating to/from the tributaries.

The lack of active channels and hydrological connections could impede migration and therefore have a significant negative impact on out-migrating smolts and spawning adult *Oncorhynchus mykiss* spp. Consequently, as part of the environmental review of WSIP and the LCSD improvement project DFG recommends the SFPUC conduct surveys to: 17

1.) Identify when *Oncorhynchus mykiss* spp make spawning runs in upper San Mateo Creek and Laguna Creek.

2.) Identify when smolts and adult *Oncorhynchus mykiss* spp are out-migrating from the tributaries to the reservoir.

3.) Determine if there are hydrological connections and defined active channels that fish can migrate through between the reservoir and the tributaries during periods of the year critical for migration of steelhead/rainbow trout.

4.) Propose a mitigation strategy if it is determined that hydrological disconnects and lake of active channels constitutes a fish passage barrier. 17 cont.

Pilarcitos Watershed

Pilarcitos Creek rises on the eastern flanks of Montara Mountain in the Coast Ranges. The creek flows southward through the mountains before turning westward and discharging to the Pacific Ocean at Half Moon Bay. Rainfall in the Pilarcitos Creek watershed is variable, ranging from 26 inches annually at the coast to 42 inches near Pilarcitos Reservoir. The approximately 27-square-mile Pilarcitos Creek watershed consists primarily of relatively rugged uplands, characterized by shrubs and grasslands. The CCSF owns substantial portions of the upper watershed, and the Peninsula Open Space Trust protects large areas of the lower watershed above Arroyo Leon. Developed lands within the watershed are primarily agricultural and are located along the lower reaches of the stream corridors. Residential land uses are also present in the watershed, generally along roadways. Other land uses include a cemetery on Highway 92 at Skyline Boulevard, a sanitary landfill in upper Corrida Los Trancos Canyon, and a quarry in Nuff Creek Canyon.

Pilarcitos Creek

The PEIR states that WSIP would have significant impacts on surface water quality (5.5.3-2), fisheries (impacts 5.5.5-4, 5.5.5-5), sensitive habitats and key special-status species (impacts 5.5.6-4, 5.5.6-5) in Pilarcitos Reservoir and along Pilarcitos Creek below the reservoir. To mitigate these impacts the SFPUC proposes mitigation measure 5.5.3-2 Revised Operations Plan for Pilarcitos Watershed Facilities. The PEIR states that implementation of 5.5.3-2 will require the SFPUC to develop an operations plan for Pilarcitos Reservoir, Stone Dam, and associated diversions that would manage storage in Pilarcitos Reservoir and releases to Pilarcitos Creek so that flows in Pilarcitos Creek between Pilarcitos Reservoir and Stone Dam would be similar to those that occur under the existing condition. As a result of the operation plan, storage in Pilarcitos reservoir would be similar under WSIP as they are in existing conditions. 18

DFG supports the SFPUC in revising operations in the Pilarcitos watershed. We support this operational revision provided that the SFPUC utilize the wealth of science that has been done to characterize steelhead use and habitat in the Pilarcitos watershed (*"An analysis of Sediment Mobilization in Pilarcitos Creek," "Evaluation of Flow-Habitat Relationships Downstream of Stone Dam," "Pilarcitos Aquatic Habitat and Fish Population Surveys" and "Pilarcitos Operations"*). These studies could provide a firm foundation for operational revisions to consider the welfare of Federally Threatened Central Coast steelhead, San Francisco garter snake and CRLF in the watershed, above and below Stone Dam. We agree with the CCSF in that the best opportunity for steelhead restoration in the Pilarcitos Creek arises from the SFPUC's proposed multi-billion dollar capital improvement program (CCSF 2002). We believe that the development of this mitigation measure should include the recommendations for steelhead restoration that have been previously presented by the National Marine Fisheries Service (NMFS, 2006, NMFS 2004, NMFS 2002, NMFS 2003). The NMFS recommendations that we believe should be evaluated and included in mitigation measure 5.5.3-2 are the following:

1.) Complete removal of Old Stone Dam.

2.) Partial removal of Old Stone Dam

3.) Retrofitting Old Stone Dam to accommodate fish-passage.

4.) Flushing flows from Pilarcitos Lake to transport aggraded sediment in the channel.

5.) Instream flow assessment for the purposes of implementing a bypass flows regime from Pilarcitos Lake and Stone Dam that would accommodate steelhead migration, spawning, and rearing in lower Pilarcitos Creek.

18 cont.

We appreciate your consideration of our comments. DFG personnel are available for consultation regarding resources and strategies to minimize impacts. If you have questions please contact Dan Wilson, Environmental Scientist, at (707) 944-5534 or Greg Martinelli, Water Conservation Supervisor, at (707) 944-5570.

Sincerely,

Charles Armor

12.2-18

Table 1. Tuolumne River Spring Flow Comparison (1997 thru 2003)

Tuolumne River April & May La Grange Flow Frequency Comparison							
	Year						
Flow Range (cfs) Categories	1998	1999	2000	2001	2002	2003	2004
1500		20	42	61	61	61	61
3000	9	32	13				0
4500	22	9	6				0
6000	22						0
7500	8						0
Total (# of Days)	61	61	61	61	61	61	61
Average	4492	1863	1353	633	540	579	706
Median	**4490**	**1950**	**1120**	**618**	**553**	**551**	**636**
Escapement (+2.5 Yrs)	17873	8782	7173	2163	1984	500	500
Recruitment (Brood Year)	***43119***	***10504***	***7083***	***5644***	***2335***	***2102***	***877***

Note: Salmon production in the Tuolumne River begins to rise sharply consistent with spring period flows approaching 2000 cfs and takes off consistent with flows approaching 4500 cfs.

19

Table 2. Tuolumne River Spring Flow and Water Temperature

Tuolumne at Modesto April & May Water Temperature Comparison							
	Years						
Categories	1998	1999	2000	2001	2002	2003	2004
<=15	61	47	33	11	11	12	17
16		0	8	10	6	11	5
17		1	5	5	4	11	3
18		1	1	11	10	4	14
19		2	2	12	5	10	10
20		1	2	0	10	3	1
Total # Days	61	52	51	49	46	51	50
Average	**12.1**	**14.2**	**15.7**	**17.9**	**18.0**	**17.1**	**17.3**
Median	12.2	12.9	14.9	17.2	17.9	16.7	17.5
Mean Flow (cfs)	4567	1894	1375	644	549	589	717
Escapement (+2.5 Yrs)	17873	8782	7173	2163	1984	500	500
Recruitment (Broodyear)	**43119**	**10504**	**7083**	**5644**	**2335**	**2102**	**877**

Note: Salmon production in the Tuolumne River begins to rise sharply consistent with smolt out-migration (e.g. spring period) water temperatures drop to 15°C (59°F)and really take off when water temperatures are at 12°C (54°F). Consistent with Table 1, and Graph ??, spring water temperatures in the Tuolumne River are primarily controlled by spring flow level. A Tuolumne River spring flow of 2000 cfs would produce water temperature of about 14°C (57°F) while a flow of 4500 would produce a corresponding water temperature of about 12°C (54°F).

Table 3. Stanislaus River Spring Flow Comparison (1998 thru 2004)

Stanislaus River April & May Ripon Flow Frequency Comparison

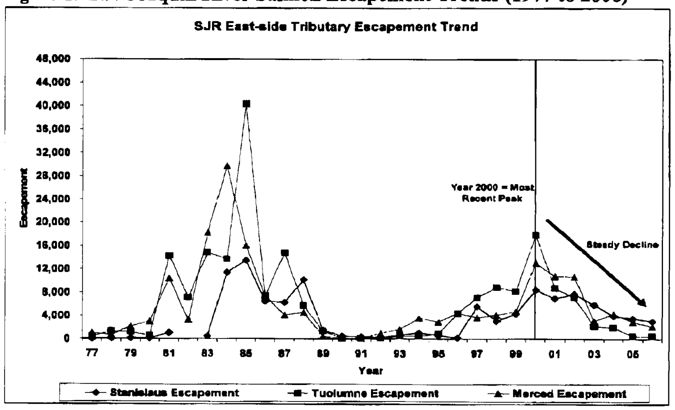
Note: Salmon production in the Merced River begins to rise sharply consistent with spring period flows approaching 1100 cfs and takes off consistent with flows approaching 2600 cfs.

12.2-19

Table 2. EA Engineering, Science, and Technology predation studies in the lower Tuolumne River in 1989 and 1990.

Sampling Dates	La Grange Flows (cfs)	% Largemouth Bass with juvenile salmon in their stomachs	% Smallmouth Bass with juvenile salmon in their stomachs	Origin of Juvenile Salmon
4/19 to 5/17, 1989	40 – 121	3.6% (2/56)	8.6% (5/58)	Naturally Produced
1/29 to 3/27, 1990	142 – 174	2.1% (2/97)	3.1% (1/32)	Naturally Produced
4/25 to 4/28, 1990	187 – 207	2.6% (2/76)	6.3% (1/16)	Naturally Produced
5/2 to 5/4, 1990	299 -572	26% (40/152)	33.3% (6/18)	CWT Hatchery

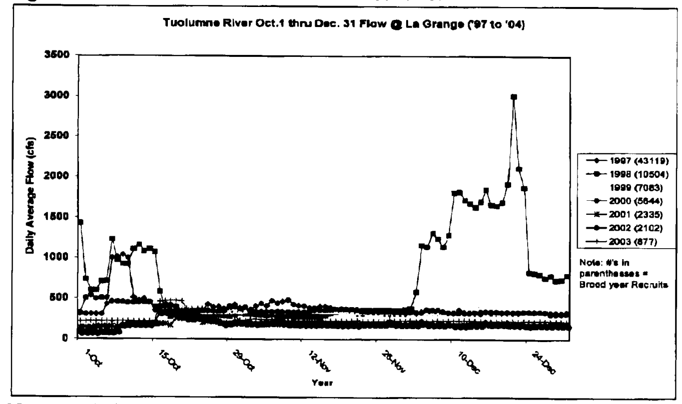
Figure 1. San Joaquin River Salmon Escapement Trends (1977 to 2006)



The year 2000 was the last peak salmon production period for each SJR east-side tributary. Since 2000, each east-side tributary's escapement has steadily declined with the Tuolumne River escapement "bottoming out" at levels lower than both the Stanislaus and Merced Rivers.

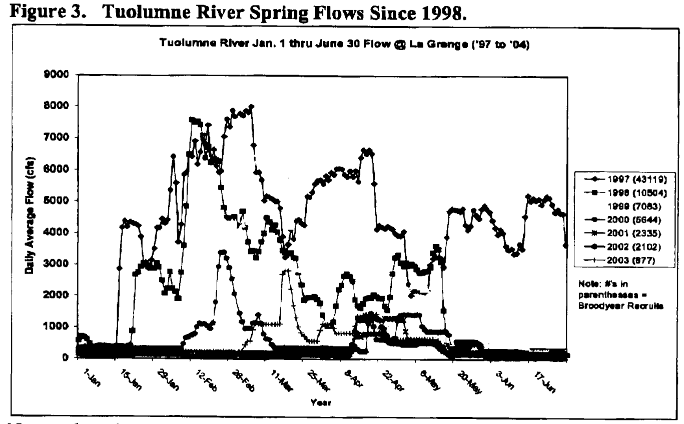
19 cont.

Figure 2. Tuolumne River Fall Flows Since 1998.



Note: With the exception of 1998, there is overlap (e.g. consistency) in the fall spawning flow patterns that does not correspond well with variation in future year escapement suggesting that fall flow has less influence upon adult production than other potential production related variables.

Figure 3. Tuolumne River Spring Flows Since 1998.

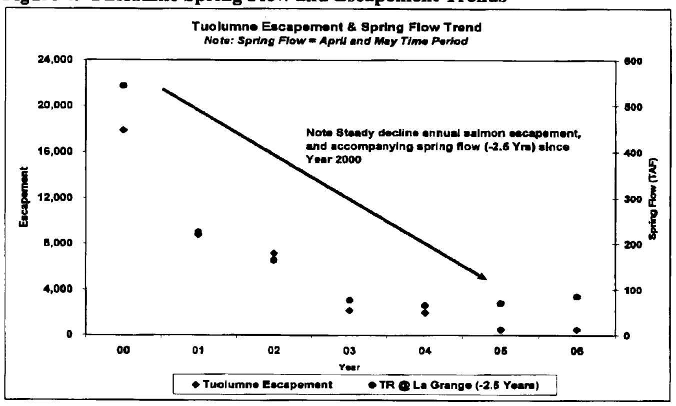


Note: There is a sharp contrast, and consistent pattern, in both winter and spring flow between for the years comprising the 2000 to 2006 escapements (here depicted as 1997 thru 2003 brood production years). Wherein both winter, and spring, flow magnitude and duration have diminished with each successive year. At spring flow levels of about

19 cont.

1500 cfs, salmon production begins to sharply fall. The importance of winter flow can be seen comparing years 1998 (red line), 1999 (yellow line), and 2000 (green line). In years where short duration winter pulse combined with a low spring pulse (year 2000) occur fewer salmon are produced than years with moderate winter and spring pulse flows (year 1999) and, far fewer salmon that years with when higher magnitude and longer duration winter pulse flow combined with elevated spring flow (year 1998) occurs. 19 cont.

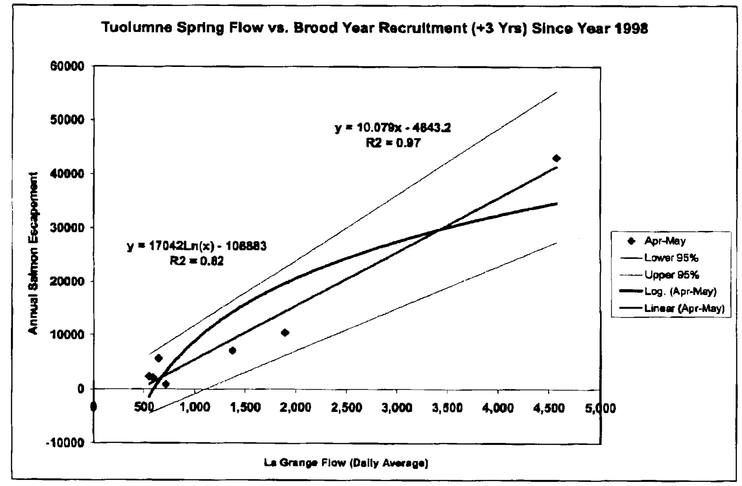
Figure 4. Tuolumne Spring Flow and Escapement Trends



Note similarity between annual escapement and spring period flow allocation volume

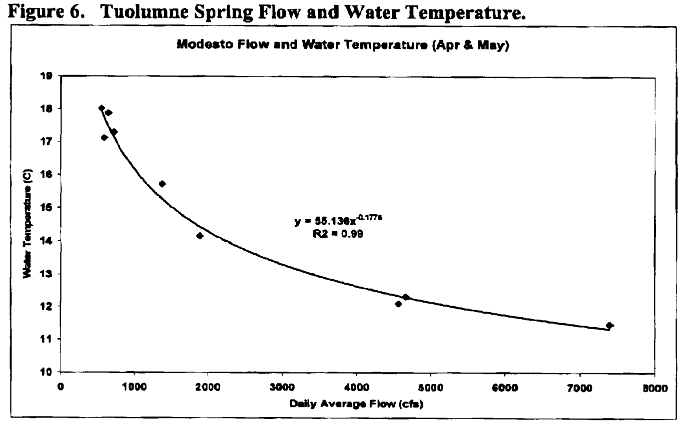
Figure 5. Tuolumne Spring Flow and Brood Year Recruitment Production

12.2-20



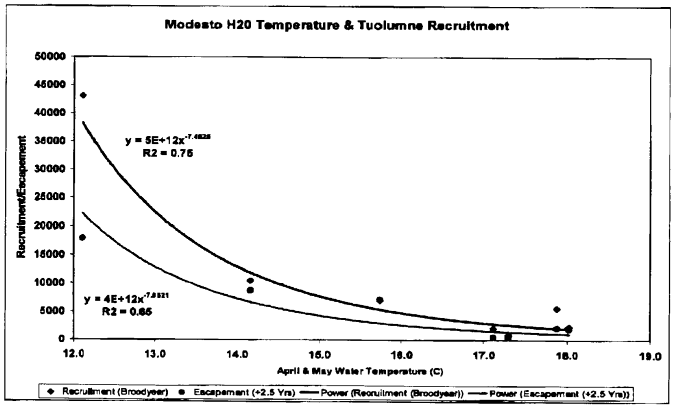
Note how the non-linear log normal relationship drops in r-square (e.g. line fitness) value and fails have proximity to empirical escapement data values >750. The use of brood year recruitment values improves the linear fitness (e.g. r-square value) suggesting that the relationship between brood year recruitment production is, under these value ranges, linear in nature. 19 cont.

Figure 6. Tuolumne Spring Flow and Water Temperature.



Note: The relationship between Tuolumne River (at Modesto) flow and water temperature is for the years 1998 thru 2006. A broad range of flows is included in this Figure. Water temperature data for the years 1998 thru 2000 was calculated using Hughson (River Mile 23.6) water temperature data, and its very strong linear relationship with Modesto (River Mile 16) water temperature (R2=0.98). Water temperature drops sharply with a corresponding increase in Tuolumne River flow.

Figure 7. Tuolume River Spring Water Temperature and Adult Salmon Production

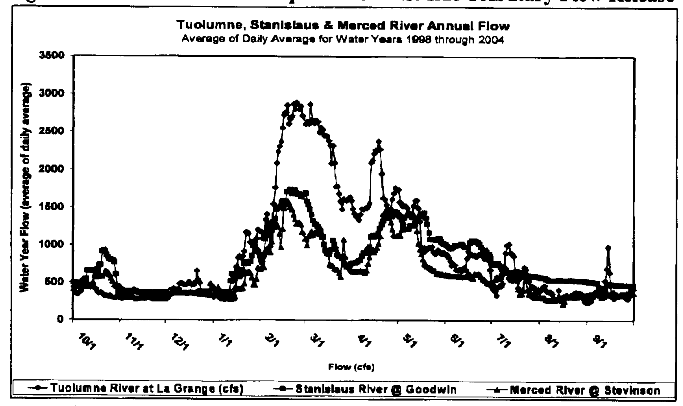


Note: There is a sharp increase in production, whether measured by annual escapement or by brood year production, consistent with Tuolumne River (at Modesto) water temperature decline during the spring period (e.g. April and May) annual escapement years 2000 thru 2006 and for brood production years 1997 thru 2003. Said differently, water temperatures exceeding 15°C (59°F) in the Tuolumne River at Modesto concurrently, and consistently, occur with sharply diminished adult salmon production in the Tuolumne River since escapement year 2000.

19 cont.

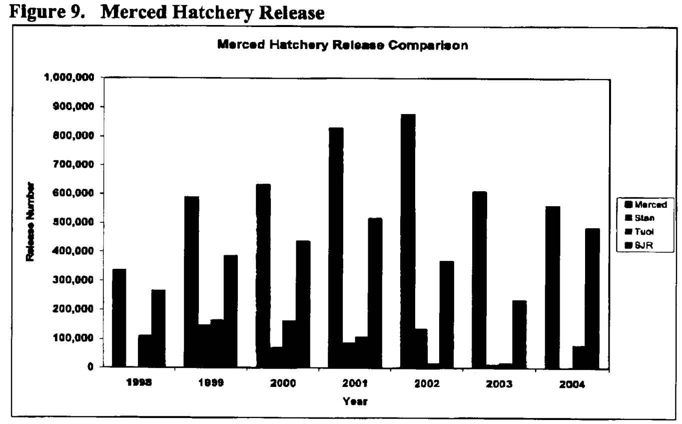
12.2-21

Figure 8. Coordinated San Joaquin River East-side Tributary Flow Release



Note: Flows for the three San Joaquin River east-side tributaries have been consistently managed, during the fall, winter and spring, since the late 1990's. The Tuolumne is by far the largest basin with a watershed area of 1540 square miles, as compared to the Stanislaus at 1075 square miles and the Merced at 1273 square miles[2].

Figure 9. Merced Hatchery Release



Note: The Merced River has received the vast majority of hatchery produced salmon smolts since 1998. Returns of Merced Hatchery smolts are consistent with release

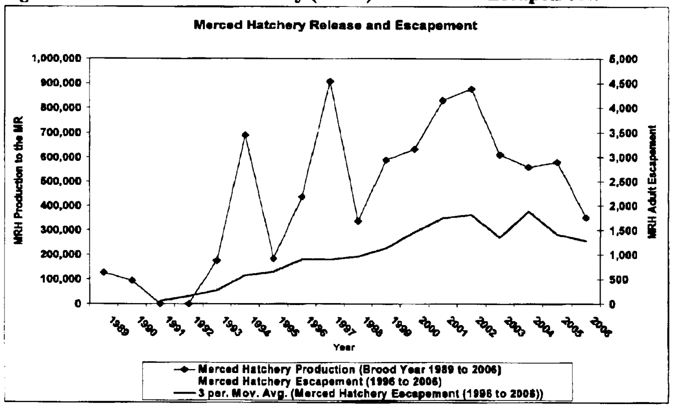
19 cont.

[2] From http://www.delta.dfg.ca.gov/afrp/ws_stats

12.2-22

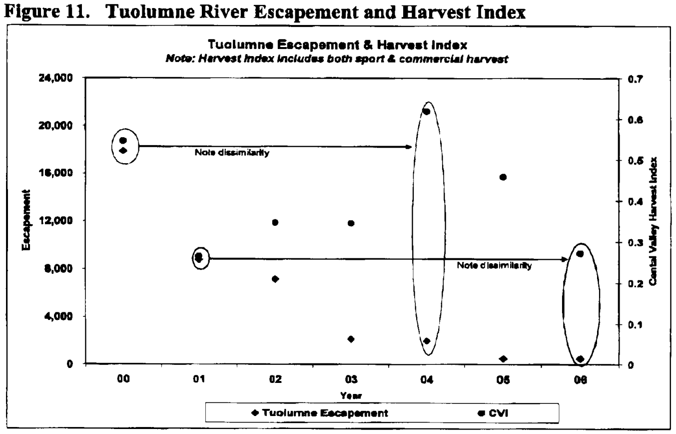
location (e.g. a smolt released into the Merced is likely to return as an adult to the Merced etc.). San Joaquin River released smolts tend to return as adults to the Merced River (from data obtained from coded-wire-tag recoveries).

Figure 10. Merced River Hatchery (MRH) Release and Escapement.



Note: The Merced River Hatchery (MRH) escapement trend is a moving three year average to account for variation in adult return age. As MRH releases into the Merced River increased MRH escapement trend also increased.

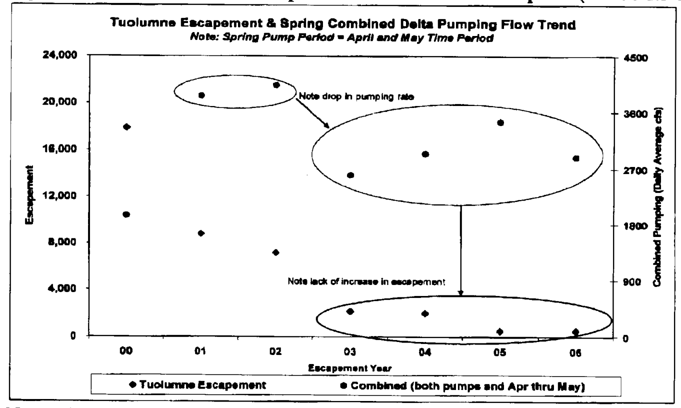
Figure 11. Tuolumne River Escapement and Harvest Index



19 cont.

Note dissimilarity between CVI values and escapement estimates. This suggests that something other than ocean harvest is influencing salmon escapement in the Tuolumne River.

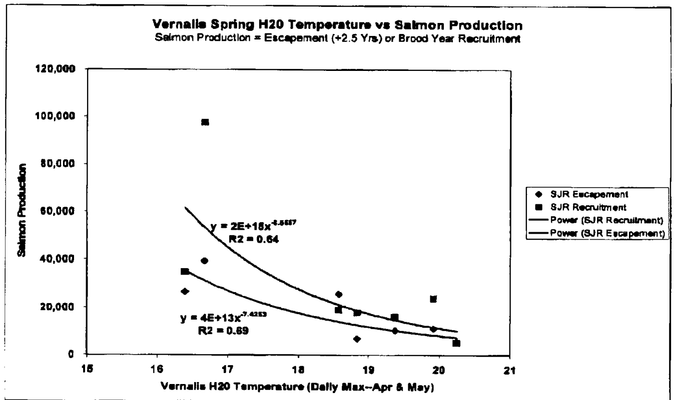
Figure 12. Tuolume River Escapement and South Delta Exports (minus 2.5 Years).



Notes: i) Pumping year is 2.5 years earlier than Escapement year (e.g. Escapement Year 2000 corresponds to Delta Pump Year 1998); ii) even though there appears to be a connection between Escapement Years 2000-2002 and Combined Pumping rates for 1998-2001, when pumping rates lowered for the 2003-2006 Escapement Years salmon escapement did not show a corresponding increase. This lack of consistent relationship suggests that something else besides Delta Spring Time Pumping is controlling Tuolumne River salmon escapement abundance.

Figure 13. Vernalis Spring Water Temperature and Tuolumne Salmon Production

19 cont.

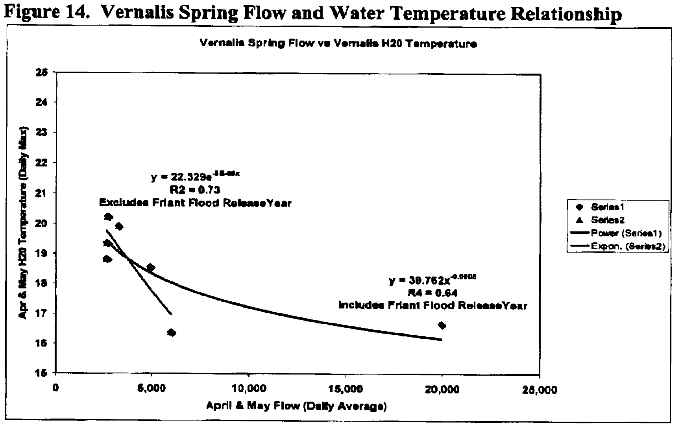


Note: The correlation between spring Vernalis water temperature and Tuolumne River salmon production (both annual escapement and brood year production). Tuolumne River salmon production sharply rises consistent with Vernalis flow water temperatures <18°C (64°F).

19
cont.

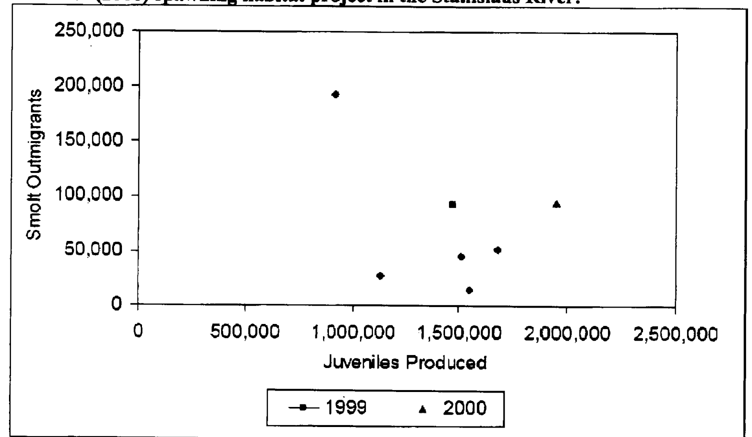
12.2-23

Figure 14. Vernalis Spring Flow and Water Temperature Relationship



Note: The apparent data outlier is associated with Friant flood control releases. Excluding this data point causes the correlation between spring Vernalis flow and spring Vernalis water temperature to sharply increase.

Figure 15. Juvenile Production and Smolt Outmigrants relationship before (1999) and after (2000) spawning habitat project in the Stanislaus River.



Note: The estimated abundance of all sizes of juveniles that passed the Oakdale screw trap (RM 40) plotted with the estimated abundance of smolt out-migrants (> 70 mm Fork Length) at the Caswell State Park screw traps (RM 5) in the Stanislaus River from 1998 to 2004. The Knights Ferry Gravel Replenishment Project (KFGRP) constructed 18 spawning beds in the Stanislaus River in summer 1999. A comparison of the 1999 and 2000 estimates provides the best evaluation of the effects of gravel augmentation on juvenile and smolt production, because they occurred immediately before and after the KFGRP and they were both affected by similar spring flows between February 1 and June 15 (7,394 cfs and 6,940 cfs, respectively) and similar numbers of spawners (2,600 and 3,200 Age 3 equivalent fish, respectively). (From Mesick et al. 2007)

SALLY J. LIEBER
ASSEMBLYWOMAN, TWENTY-SECOND DISTRICT
SPEAKER PRO TEMPORE

CHAIR, SELECT COMMITTEE ON MOBILE HOMES
COMMITTEE ON INSURANCE
COMMITTEE ON JUDICIARY
COMMITTEE ON LOCAL GOVERNMENT
COMMITTEE ON HEALTH

September 28, 2007

Bill Wycko, Environmental Review Officer
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103

Dear Mr. Wycko,

We are arriving at a critical juncture in the development and implementation of the SFPUC's Water System Improvement Program. We appreciate the efforts the San Francisco Planning Department in preparing the draft PEIR. Many local agencies, elected officials and consumers have been waiting eagerly for the release of the draft.

Many of our constituents are served by some of the 27 cities, water districts and water companies represented by the Bay Area Water Supply and Conservation Agency. We share the view of the importance and urgency to rebuild the regional water system's infrastructure in order to protect the health and well-being of over 2 million residents and 31,000 businesses. We believe this primary goal must be reiterated and focused upon throughout this process. 01

The draft PEIR has provoked concerns about additional diversion of water from the Tuolumne River. We urge you to undertake more comprehensive studies of the alternatives that minimize new diversions. The "Environmentally Superior Alternative" presented in the draft certainly seems to be a direction that the Planning Department should more fully explore in the final PEIR. 02

Implementation of more water conservation, efficiency, and recycling is the best way to lessen impacts on the Tuolumne River while promoting a sustainable water plan for the Bay Area. We know BAWSCA, its member agencies and our Bay Area consumers have done an exceptional job in reducing residential use so that we have among the lowest per capita utilization in the state. 03

S_CSA

10/01/2007 13:57 FAX 6502102000 ASSEMBLY DISTRICT OFF 22 003/003

We are aware that BAWSCA is committed to even greater conservation measures. The possibilities of urban and agricultural agencies working together to reduce net diversions in the future seem hopeful and worthy of energetic collaborative efforts. Investing in agricultural conservation, as proposed by BAWSCA and supported by Environmental Defense, appears to be cost-effective in providing water, increased agricultural conservation and could benefit the lower Tuolumne. 04

The balance of urban, suburban and agricultural water needs along with the need for environmental protection of such treasures as the Tuolumne River will be a difficult, but solvable, issue over time. The one thing that is clear and immediate is the need to avoid potential catastrophe of the collapse of our water delivery system from a major earthquake. The repair of the infrastructure must remain front and center throughout this process. 05

Therefore, we urge the Planning Department seriously consider BAWSCA's idea to improve the "Environmentally Superior Alternative" and finalize the PEIR promptly after receiving and considering all comments it receives, and that the Planning Commission certify the PEIR so that San Francisco can move ahead with rebuilding the Hetch Hetchy water system to protect the health, safety and economic well being of our region. 06

Thank you for your efforts.

Sincerely,

SALLY J. LIEBER

San Francisco Public Utilities Commission's (SFPUC) Water System Improvement Program
State Clearinghouse (SCH) Number: 2005092026

The project corresponding to the subject SCH identification number has come to our attention. The limited project description suggests your project may be an encroachment on the State Adopted Plan of Flood Control. You may refer to the California Code of Regulations, Title 23 and Designated Floodway maps at http://recbd.ca.gov/. Please be advised that your county office also has copies of the Board's designated floodways for your review. If indeed your project encroaches on an adopted food control plan, you will need to obtain an encroachment permit from the Reclamation Board prior to initiating any activities. The attached Fact Sheet explains the permitting process. Please note that the permitting process may take as much as 45 to 60 days to process. Also note that a condition of the permit requires the securing all of the appropriate additional permits before initiating work. This information is provided so that you may plan accordingly. 01

If after careful evaluation, it is your assessment that your project is not within the authority of the Reclamation Board, you may disregard this notice. For further information, please contact me at (916) 574-1249.

Sincerely,

Christopher Huitt
Staff Environmental Scientist
Floodway Protection Section

Encroachment Permits Fact Sheet

Basis for Authority
State law (Water Code Sections 8534, 8608, 8609, and 8710 – 8723) tasks the Reclamation Board with enforcing appropriate standards for the construction, maintenance, and protection of adopted flood control plans. Regulations implementing these directives are found in California Code of Regulations (CCR) Title 23, Division 1.

Area of Reclamation Board Jurisdiction
The adopted plan of flood control under the jurisdiction and authority of the Reclamation Board includes the Sacramento and San Joaquin Rivers and their tributaries and distributaries and the designated floodways.

Streams regulated by the Reclamation Board can be found in Title 23 Section 112. Information on designated floodways can be found on the Reclamation Board's website at http://recbd.ca.gov/designated_floodway/ and CCR Title 23 Sections 101 - 107.

Regulatory Process
The Reclamation Board ensures the integrity of the flood control system through a permit process (Water Code Section 8710). A permit must be obtained prior to initiating any activity, including excavation and construction, removal or planting of landscaping within floodways, levees, and 10 feet landward of the landside levee toes. Additionally, activities located outside of the adopted plan of flood control but which may foreseeable interfere with the functioning or operation of the plan of flood control is also subject to a permit of the Reclamation Board.

Details regarding the permitting process and the regulations can be found on the Reclamation Board's website at http://recbd.ca.gov/ under "Frequently Asked Questions" and "Regulations," respectively. The application form and the accompanying environmental questionnaire can be found on the Reclamation Board's website at http://recbd.ca.gov/forms.cfm.

Application Review Process
Applications when deemed complete will undergo technical and environmental review by Reclamation Board and/or Department of Water Resources staff.

Technical Review
A technical review is conducted of the application to ensure consistency with the regulatory standards designed to ensure the function and structural integrity of the adopted plan of flood control for the protection of public welfare and safety. Standards and permitted uses of designated floodways are found in CCR Title 23 Sections 107 and Article 8 (Sections 111 to 137). The permit contains 12 standard conditions and additional special conditions may be placed on the permit as the situation warrants. Special conditions, for example, may include mitigation for the hydraulic impacts of the project by reducing or eliminating the additional flood risk to third parties that may caused by the project.

Additional information may be requested in support of the technical review of

S_DWR

your application pursuant to CCR Title 23 Section 8(b)(4). This information may include but not limited to geotechnical exploration, soil testing, hydraulic or sediment transport studies, and other analyses may be required at any time prior to a determination on the application.

Environmental Review
A determination on an encroachment application is a discretionary action by the Reclamation Board and its staff and subject to the provisions of the California Environmental Quality Act (CEQA) (Public Resources Code 21000 et seq.). Additional environmental considerations are placed on the issuance of the encroachment permit by Water Code Section 8608 and the corresponding implementing regulations (California Code of Regulations – CCR Title 23 Sections 10 and 16).

In most cases, the Reclamation Board will be assuming the role of a "responsible agency" within the meaning of CEQA. In these situations, the application must include a certified CEQA document by the "lead agency" [CCR Title 23 Section 8(b)(2)]. We emphasize that such a document must include within its project description and environmental assessment of the activities for which are being considered under the permit.

Encroachment applications will also undergo a review by an interagency Environmental Review Committee (ERC) pursuant to CCR Title 23 Section 10. Review of your application will be facilitated by providing as much additional environmental information as pertinent and available to the applicant at the time of submission of the encroachment application.

These additional documentations may include the following documentation:

- California Department of Fish and Game Streambed Alteration Notification (http://www.dfg.ca.gov/1600/),
- Clean Water Act Section 404 applications, and Rivers and Harbors Section 10 application (US Army Corp of Engineers),
- Clean Water Act Section 401 Water Quality Certification, and
- corresponding determinations by the respective regulatory agencies to the aforementioned applications, including Biological Opinions, if available at the time of submission of your application.

The submission of this information, if pertinent to your application, will expedite review and prevent overlapping requirements. This information should be made available as a supplement to your application as it becomes available. Transmittal information should reference the application number provided by the Reclamation Board.

In some limited situations, such as for minor projects, there may be no other agency with approval authority over the project, other than the encroachment permit by Reclamation Board. In these limited instances, the Reclamation Board may choose to serve as the "lead agency" within the meaning of CEQA and in most cases the projects are of such a nature that a categorical or statutory exemption will apply. The Reclamation Board cannot invest staff resources to prepare complex environmental documentation.

Additional information may be requested in support of the environmental review of your application pursuant to CCR Title 23 Section 8(b)(4). This information may include biological surveys or other environmental surveys and may be required at anytime prior to a determination on the application.

Comments on Draft Program Environmental Impact Report for the San Francisco Public Utilities Commission's Water System Improvement Program, SCH No. 2005092026

Dear Mr. Maltzer:

We have reviewed the Draft Program Environmental Impact Report (PEIR) for the San Francisco Public Utility Commission's (SFPUC) Water System Improvement Program (WSIP). The goals and objectives of WSIP include the following:

- **Water Quality:** (A) Design improvements to meet current and foreseeable future federal and state water quality requirements; (B) Provide clean, unfiltered water originating from Hetch Hetchy Reservoir and filter all other surface water sources; and (C) Continue to implement watershed protection measures.
- **Seismic Reliability:** (A) Design improvements to meet current seismic standards; (B) Deliver basic service to the East/South Bay, Peninsula, and San Francisco within 24 hours after a major earthquake (229 million gallons per day [mgd] and deliver to at least 70 percent of the turnouts). (C) Restore facilities to meet average-day demand of 300 mgd within 30 days after a major earthquake.
- **Delivery Reliability:** (A) Provide operational flexibility to allow planned maintenance shutdowns of individual facilities without interruption of service; (B) Provide operational flexibility to minimize risk of service interruption due to unplanned facility upsets or outages; (C) Provide operational flexibility and system capacity to replenish local reservoirs as needed; (D) Meet estimated average annual demand of 300 mgd for 2030 under the conditions of one planned shutdown of a major facility for maintenance concurrent with one unplanned facility outage.
- **Water Supply:** (A) Meet average annual water purchase requests from retail and wholesale customers during nondrought years through 2030 (estimated average annual demand of 300 mgd for 2030); (B) Meet dry-year delivery needs through 2030 while limiting rationing to a maximum 20 percent system-wide reduction in water service during extended droughts; (C) Diversify water supply options during nondrought years and drought periods; (D) Improve use of new water sources and drought management, including use of groundwater, recycled water, conservation, and transfers.

- **Sustainability:** (A) Manage natural resources and physical systems to protect watershed ecosystems; (B) Meet, at a minimum, all current and anticipated legal requirements for protection of fish and other wildlife habitat; and (C) Manage natural resources and physical systems to protect public health and safety.
- **Cost-effectiveness:** (A) Ensure cost-effective use of funds; (B) Maintain gravity fed system; and (C) Implement regular inspection and maintenance program for all facilities.

Based on the information provided in the Draft PEIR, Central Valley Regional Water Quality Control Board (Water Board) staff offer the following comments to advise the SFPUC of our concerns.

Comment 1
Section 4.5: Hydrology and Water Quality, Regulatory Framework, Water Quality Regulations, Page 4.5-9.

The discussion of Water Quality Regulations in Section 4.5 should be expanded to clarify that the Water Board also issues WDRs to regulate discharges of waste into waters of the State that are outside federal jurisdiction as defined under the Clean Water Act (CWA), including isolated waters under the Supreme Court's SWANCC and Rapanos decisions. 01

Please also note that the Water Quality Control Plan for the Sacramento and San Joaquin River Basins (Basin Plan) was last revised in February 2007. A copy of the revised Basin Plan can be obtained at http://www.waterboards.ca.gov/centralvalley/water_issues/basin_plans/index.html .

Comment 2
Section 4.5: Hydrology and Water Quality, Regulatory Framework, Beneficial Uses, Pages 4.5-9 and 4.5-10.

The discussion of beneficial uses indicates that beneficial uses of surface waters serve as the basis for establishing water quality objectives and discharge prohibitions to attain beneficial use goals. This discussion should be expanded to indicate that beneficial uses are designated in Water Quality Control Plans (Basin Plans) for surface waters and ground water basins. These beneficial uses serve as the basis for establishing water quality objectives and discharge prohibitions to attain the goal of achieving the highest water quality consistent with maximum benefit to the people of the state. Table 4.5-1 lists the designated beneficial uses for water bodies that may be affected by the WSIP. Please expand this table to include the beneficial uses for the Tuolumne River and groundwater basins that may be affected by the WSIP. As listed in Table II-1 of the Basin Plan, the beneficial uses of the Tuolumne River include the following: 02

- **Source to (New) Don Pedro Reservoir include Municipal (i.e. see Figure II-1 in the Basin Plan)**: Municipal and Domestic Supply (MUN); Agricultural Supply (AGR); Hydropower Generation (POW); Water Contact Recreation (REC-1); Non-water Contact Recreation (REC-2); Warm Freshwater Habitat (WARM); Cold Freshwater Habitat (COLD); and Wildlife Habitat (WILD).

- **New Don Pedro Reservoir:** MUN (Potential); POW; REC-1; REC-2; WARM; COLD; and WILD.
- **New Don Pedro Dam to San Joaquin River:** MUN (Potential); AGR; REC-1; REC-2; WARM; COLD; Migration of Aquatic Organisms (MIGR); Spawning, Reproduction, and/or Early Development (SPWN); and WILD. 02 cont.

Unless otherwise designated by the Regional Water Board, all ground waters in the Region are considered as suitable or potentially suitable, at a minimum, for MUN, AGR, industrial service supply (IND), and industrial process supply (PRO). Criteria for making exceptions to beneficial uses of ground waters are provided on Page II-3.00 of the Basin Plan.

Comment 3
Section 4.5: Hydrology and Water Quality, Regulatory Framework, Construction in Waters of the State and of the United States, Page 4.5-12; and Section 4.6, Biological Resources, Regulation of Activities in Wetlands, Page 4.6-32.

The discussions of Construction in Waters of the State and United States in Section 4.5 and Regulation of Activities in Wetlands in Section 4.6 should be expanded to clarify that the Water Board has regulatory authority over construction in waters of the United States and waters of the State, including activities in wetlands, under both the CWA and the State of California's Porter-Cologne Water Quality Control Act (California Water Code, Division 7). Under the CWA, the Water Board has regulatory authority over actions in waters of the United States, through the issuance of water quality certifications (certifications) under Section 401 of the CWA, which are issued in conjunction with permits issued by the Army Corps of Engineers (ACOE) under Section 404 of the CWA. When the Water Board issues Section 401 certifications, the project is also regulated under State Water Resources Control Board Order No. 2003-0017-DWQ, "General Waste Discharge Requirements for Dredge and Fill Discharges That Have Received State Water Quality Certification" which requires compliance with all conditions of this Water Quality Certification. Activities in areas that are outside of the jurisdiction of the ACOE (e.g., isolated wetlands, vernal pools, or stream banks above the ordinary high water mark) are regulated by the Water Board, under the authority of the Porter-Cologne Act. Activities that lie outside of ACOE jurisdiction may require the issuance of either individual or general WDRs. 03

Comment 4
Section 4.5: Hydrology and Water Quality, Impact 4.5-1: Degradation of water bodies as a result of erosion and sedimentation or a hazardous materials release during construction, Pages 4.5-21 through 4.5-28; and Section 6.2: SFPUC Construction Measures, Measure #3: Onsite air and water quality measures during construction, Page 6-4.

The text indicates the WSIP will result in less than significant impacts to water bodies as a result of erosion and sedimentation or a hazardous materials release during construction. The rationale for this conclusion is that all projects will be required to implement best management practices (BMP) specified in SFPUC Construction Measure #3 (onsite air and water quality measures during construction). In addition, projects outside of San Francisco that disturb more than 1 acre will have to comply with either the NPDES Permit for Small Linear Projects or the NPDES General Permit for Construction, which require the BMPs to be implemented in 04 accordance with stormwater pollution prevention plans (SWPPP). In San Francisco, projects would be subject to Article 4.1 of the San Francisco Public Works which requires, at a minimum, the development of an erosion and sediment control plan to reduce the impact of runoff from construction sites.

SFPUC Construction Measure #3 includes many effective BMPs, such as preservation of existing vegetation and stabilization of site ingress/egress locations, to minimize erosion. However, scheduling is not included in SFPUC Construction Measure #3 and should be used as a BMP for all WSIP projects. Scheduling should be used to phase construction to limit areas and periods of disturbance to the maximum extent practicable and to minimize the area of disturbed soil during the wet season. Scheduling should also be used to coordinate construction activities with implementation of appropriate erosion and sediment control BMPs. 04 cont.

Comment 5
Section 4.6: Biological Resources. Impacts, Significance Criteria, Page 4.6-37.

The third bullet under the significance criteria for biological impacts should be expanded to include wetlands protected under the State of California's Porter-Cologne Water Quality Control Act. 05

Comment 6
Section 4.6: Biological Resources, Impact 4.6-1: Impacts on wetlands and aquatic resources, Page 4.6-43; and Section 6.3: Mitigation Measures to Minimize Facilities Impacts, Mitigation Measure 4.6-1a: Wetlands Assessment, and Mitigation Measure 4.6-1b: Compensation for Wetlands and Other Biological Resources, Pages 6-11 and 6-12.

The discussion of impacts on wetlands and aquatic resources in Section 4.6 discloses that impacts on wetlands are assumed to occur for all WSIP projects that involve surface disturbance. We also acknowledge and appreciate mitigation measures presented in Section 6.3. To mitigate potential impacts to wetlands and aquatic features, a qualified wetland scientist will assess and delineate wetlands potentially occurring at project sites (Mitigation Measure 4.6-1a), and site-specific mitigation measures will be identified as part of the project specific CEQA reviews (Mitigation Measure 4.6-1b). Mitigation Measure 4.6-1b states that when a WSIP project will affect jurisdictional wetlands, the SFPUC will implement avoidance measures, restoration procedures, and compensatory creation or enhancement. 06

We acknowledge and appreciate these mitigation measures, and wish to emphasize that under the Porter-Cologne Act, the Water Board has jurisdiction over wetlands of any type, including areas that are outside of ACOE jurisdiction under the CWA. In addition, Mitigation Measure 4.6-1b should be expanded to include measures to minimize impacts to wetlands. For all impacts to wetlands, the SFPUC will be required to demonstrate to the Water Board that they have avoided and minimized impacts to the maximum extent practicable before considering compensation measures.

Comment 7
Section 4.6: Biological Resources, Impact 4.6-1: Impacts on wetlands and aquatic resources, Page 4.6-43. 07

The PEIR should note that the discussion of potential changes to jurisdictional determinations pending outcomes of recent federal court cases only pertains to federal jurisdiction under the CWA. State jurisdiction under the Porter-Cologne Act will not be affected by the pending outcomes of recent federal court cases and has not been affected by earlier decisions, such as the Tulloch, SWANCC, and Rapanos decisions. To regulate impacts to waters of the State that are outside federal jurisdiction, the Water Board may issue either individual or general WDRs. 07 cont.

Comment 8
Section 5.2: Plans and Policies, Federal Statutes and Agreements, Clean Water Act, Page 5.2-6.

The discussion of the CWA includes requirements under Section 404 of the Act; however, requirements under Section 401 of CWA were not provided in this discussion. Under Section 401 of CWA, every applicant for a federal permit or license for any activity which may result in a discharge to a water body must obtain State Water Quality Certification (Certification) that the proposed activity will comply with state water quality standards. Most Certifications are issued in connection with CWA Section 404 permits for dredge and fill discharges. Please revise the discussion of the CWA in Section 5.2 to include requirements under Section 401 of the Act. 08

Comment 9
Section 5.3: Tuolumne River System and Downstream Water Bodies, Impact 5.3.7-2: Impacts on Alluvial Features that Support Meadow and Riparian Habitat along the Tuolumne River from O'Shaughnessey Dam to Don Pedro Reservoir, Pages 5.3.7-15 through 5.3.7-22; and Section 6.4: Mitigation Measures to Minimize Water Supply and System Operations Impacts, Mitigation Measure 5.3.7-2, Controlled Releases to Recharge Groundwater in Streamside Meadows and Other Alluvial Deposits, Pages 6-49 through 6-50.

On page 5.3.7-15 of Section 5.3, the text indicates that the two primary factors influencing riparian ecological resources are hydrology and geomorphology because of the following:

- Flood flows create open sites for colonization by new individuals and are important in determining the period of saturation in the root zone.
- High flows determine the extent and type of habitats in meadow and riparian systems by recharging groundwater. 09
- Minimum flows maintain groundwater levels and affect the extent and diversity of riparian, meadow, and aquatic habitats.

Impact 5.3.7-2 indicates that there are potentially significant impacts on wet meadow and riparian habitats along the Tuolumne River between O'Shaughnessey Dam to Don Pedro Reservoir. These impacts occur because of changes in geomorphologic processes and reductions in groundwater recharge primarily in the Poopenaut Valley. Under Mitigation Measure 5.3.7-2, the SFPUC proposes to manage reservoir releases in a pattern that provides flows of a magnitude to inundate the meadows and streamside alluvial deposits for as long as possible (i.e. pulse flows). The SFPUC also proposes to collect baseline data and follow up monitoring to evaluate whether the proposed pulse flows are meeting the objective of maintaining and improving wet meadow habitat. Some of the baseline data needed may be available from the study effort in Poopenaut Valley performed collaboratively by the National

Park Service, U.S. Forest Service and SFPUC to evaluate sediment transport and deposition relationships. Water Board staff appreciate the SFPUC's effort to mitigate effects on meadow and riparian habitats. As waters of the State, meadows and riparian habitat provide beneficial uses, such as endangered species habitat, that need to be protected. As a result, Water Board Staff recommend using the baseline studies to evaluate the effectiveness of pulse flows and verify that minimum flows are sufficient to ensure the continued health of riparian and meadow systems in the upper Tuolumne River watershed. 09 cont.

Comment 10
Section 5.7: Cumulative Projects and Impacts Related to WSIP Water Supply and System operations, Subsection 5.7.6 Climate Change and Global Warming, Pages 5.7-92 through 5.7-97.

The discussion on climate change in Section 5.7 evaluates effects from reductions in annual snowpack, increased precipitation in the form of rain, and shifts in seasonal precipitation. We acknowledge and appreciate the difficulty in assessing impacts related to climate change because of the uncertainty associated with the models. However, the discussion on climate change should be expanded to include a discussion of potential effects resulting from changes in the frequency and duration of extreme climatic events, such as droughts and flood events. 10

The projections by the Intergovernmental Panel on Climate Change (IPCC) summarized indicate that more intense precipitation and drought events are likely to occur in the 21st century. These predictions are summarized in Table 9.6 of Climate Change 2001: The Scientific Basis (http://www.grida.no/climate/ipcc_tar/wg1/pdf/TAR-09.PDF). On Page 891 in Climate Change 2007: The Physical Science Basis, the IPCC's review of regional climate models also found increases in extreme temperature events in California, prolonged hot spells and increased diurnal temperature range (http://ipcc-wg1.ucar.edu/wg1/Report/AR4WG1_Print_Ch11.pdf). Although there is no clear scientific consensus on the quantification of these extreme events, a qualitative assessment acknowledging the uncertainties in climate models should be performed to evaluate whether changes in operations will exacerbate adverse effects associated with extreme climatic events.

Conclusion
Please contact Xavier Fernandez at 510-622-5685 xafernandez@waterboards.ca.gov at the San Francisco Bay Regional Board office or me at (916) 474-4742 if you have any questions.

Subject: Comments on Draft Program Environmental Impact Report for the San Francisco Public Utilities Commission's Water System Improvement Program
SCH No. 2005092026

Dear Mr. Maltzer:

We have reviewed the Draft Program Environmental Impact Report (PEIR) for the San Francisco Public Utility Commission's (SFPUC's) Water System Improvement Program (WSIP). The goals and objectives of WSIP include the following:

1. **Water Quality:** (A) Design improvements to meet current and foreseeable future federal and state water quality requirements; (B) Provide clean, unfiltered water originating from Hetch Hetchy Reservoir and filter all other surface water sources; and (C) Continue to implement watershed protection measures.
2. **Seismic Reliability:** (A) Design improvements to meet current seismic standards; (B) Deliver basic service to the East/South Bay, Peninsula, and San Francisco within 24 hours after a major earthquake (229 million gallons per day [mgd] and deliver to at least 70 percent of the turnouts). (C) Restore facilities to meet average-day demand of 300 mgd within 30 days after a major earthquake.
3. **Delivery Reliability:** (A) Provide operational flexibility to allow planned maintenance shutdowns of individual facilities without interruption of service; (B) Provide operational flexibility to minimize risk of service interruption due to unplanned facility upsets or outages; (C) Provide operational flexibility and system capacity to replenish local reservoirs as needed; (D) Meet estimated average annual demand of 300 mgd for 2030 under the conditions of one planned shutdown of a major facility for maintenance concurrent with one unplanned facility outage.

4. **Water Supply:** (A) Meet average annual water purchase requests from retail and wholesale customers during nondrought years through 2030 (estimated average annual demand of 300 mgd for 2030); (B) Meet dry-year delivery needs through 2030 while limiting rationing to a maximum 20 percent system-wide reduction in water service during extended droughts; (C) Diversify water supply options during nondrought years and drought periods; (D) Improve use of new water sources and drought management, including use of groundwater, recycled water, conservation, and transfers.
5. **Sustainability:** (A) Manage natural resources and physical systems to protect watershed ecosystems; (B) Meet, at a minimum, all current and anticipated legal requirements for protection of fish and other wildlife habitat; and (C) Manage natural resources and physical systems to protect public health and safety.
6. **Cost-effectiveness:** (A) Ensure cost-effective use of funds; (B) Maintain gravity fed system; and (C) Implement regular inspection and maintenance program for all facilities.

Based on the information provided in the Draft PEIR, San Francisco Bay Regional Water Quality Control Board (Water Board) staff offers the following comments to advise the SFPUC of our concerns.

Comment 1
Section 4.5: Hydrology and Water Quality, Regulatory Framework, Water Quality Regulations, Page 4.5-9.

The discussion of Water Quality Regulations in Section 4.5 should be expanded to clarify that the Water Board also issues Waste Discharge Requirements (WDR) to regulate discharges of waste into waters of the State that are outside federal jurisdiction as defined under the Clean Water Act (CWA), including isolated waters under the Supreme Court's SWANCC and Rapanos decisions. 01

Please also note that revisions to the San Francisco Bay Basin Water Quality Control Plan (SF Basin Plan) were recently approved by the Office of Administrative Law. The effective date of the revised plan is December 22, 2006. A copy of the revised SF Basin Plan can be obtained at http://www.waterboards.ca.gov/sanfranciscobay/basinplan.htm.

Comment 2
Section 4.5: Hydrology and Water Quality, Regulatory Framework, Beneficial Uses, Pages 4.5-9 and 4.5-10. 02

The discussion of beneficial uses indicates that beneficial uses of surface waters serve as the basis for establishing water quality objectives (WQOs) and discharge prohibitions to attain beneficial use goals. This discussion should be expanded to indicate that

12.2-31

beneficial uses are designated in Water Quality Control Plans (Basin Plans) for surface waters, groundwater basins, and in the case of the San Francisco Bay Basin, wetlands. The beneficial uses designated in the Basin Plans serve as the basis for establishing WQOs and discharge prohibitions to attain the goal of achieving the highest water quality consistent with maximum benefit to the people of the state. Table 4.5-1 lists the designated beneficial uses for water bodies that may be affected by the WSIP. Please expand this table to include the beneficial uses for groundwater basins that may be affected by the WSIP as listed in Table 2-2 of the SF Basin Plan. Table 2-2 can be obtained at http://www.waterboards.ca.gov/sanfranciscobay/basinplan/web/tab/tab_2-02.pdf. Please include a footnote stating that beneficial uses for specific wetland sites affected by the WSIP will be determined as needed based on the process described in Chapter 4 of the SF Basin Plan. 02 cont.

Comment 3
Section 4.5: Hydrology and Water Quality, Regulatory Framework, Construction in Waters of the State and of the United States, Page 4.5-12; and Section 4.6, Biological Resources, Regulation of Activities in Wetlands, Page 4.6-32.

The discussions of Construction in Waters of the State and United States in Section 4.5 and Regulation of Activities in Wetlands in Section 4.6 should be expanded to clarify that the Water Board has regulatory authority over construction in waters of the United States and waters of the State, including activities in wetlands, under both the CWA and the State of California's Porter-Cologne Water Quality Control Act (California Water Code, Division 7). Under the CWA, the Water Board has regulatory authority over actions in waters of the United States, through the issuance of water quality certifications (certifications) under Section 401 of the CWA, which are issued in conjunction with permits issued by the Army Corps of Engineers (ACOE) under Section 404 of the CWA. When the Water Board issues Section 401 certifications, the project is also regulated under State Water Resources Control Board Order No. 2003-0017-DWQ, "General Waste Discharge Requirements for Dredge and Fill Discharges That Have Received State Water Quality Certification" which requires compliance with all conditions of this Water Quality Certification. Activities in areas that are outside of the jurisdiction of the ACOE (e.g., isolated wetlands, vernal pools, or stream banks above the ordinary high water mark) are regulated by the Water Board, under the authority of the Porter-Cologne Act. Activities that lie outside of ACOE jurisdiction may require the issuance of either individual or general Waste Discharge Requirements (WDRs). 03

Comment 4
Section 4.5: Hydrology and Water Quality, Regulatory Framework, NPDES Waste Discharge Regulations, Municipal Stormwater Permits, Pages 4.5-12 and 4.5-13. 04

This Section describes requirements and provisions in municipal stormwater permits for Alameda, Santa Clara, and San Mateo Counties. Included in this description is the following statement: "Projects completed in a public right-of-way, such as pipeline projects proposed as part of the WSIP, are exempt from the C.3 requirements when both sides of the right-of-way are developed." This statement is incorrect. The exemption for projects in a public right-of-way is only for reconstruction projects within a public street or road right-of-way, where both sides of the right-of-way are developed.

Please also note that the Water Board is in the process of developing a Municipal Regional Urban Runoff Phase I NPDES Stormwater Permit (MRP) that will replace the municipal stormwater permits for these counties. The purpose of the MRP is to improve regional consistency in permit requirements and to require more specific actions than previous stormwater permits. The administrative draft was issued on May 1, 2007, and can be obtained from the Water Board's website at http://www.waterboards.ca.gov/sanfranciscobay/mrp.htm. A revised draft is expected shortly and will be available at the same address. 04 cont.

Comment 5
Section 4.5: Hydrology and Water Quality, Impact 4.5-1: Degradation of water bodies as a result of erosion and sedimentation or a hazardous materials release during construction, Pages 4.5-21 through 4.5-28; and Section 6.2: SFPUC Construction Measures, Measure #3: Onsite air and water quality measures during construction, Page 6-4.

The text indicates the WSIP will result in less than significant impacts to water bodies as a result of erosion and sedimentation or a hazardous materials release during construction. The rationale for this conclusion is that all projects will be required to implement best management practices (BMPs) specified in SFPUC Construction Measure #3 (onsite air and water quality measures during construction). In addition, projects outside of San Francisco's combined sewer system that disturb more than 1 acre will have to comply with either the NPDES Permit for Small Linear Projects or the NPDES General Permit for Construction, which require the BMPs to be implemented in accordance with permit requirements and stormwater pollution prevention plans (SWPPP). The text further states, that projects within the area served by the combined sewer in San Francisco would also be subject to Article 4.1 of the San Francisco Public Works Code which requires, at a minimum, the development of an erosion and sediment control plan to reduce the impact of runoff from construction sites that are 0.5 acres or more in size. Projects within the area served by a separate sewer system in San Francisco would be subject to the Statewide General Permit for Stormwater Discharges from Small Separate Storm Sewer Systems. 05

SFPUC Construction Measure #3 includes many effective BMPs, such as preservation of existing vegetation and stabilization of site ingress/egress locations, to minimize erosion. However, scheduling is not included in SFPUC Construction Measure #3 and should be used as a BMP for all WSIP projects. Scheduling should be used to phase

construction to limit areas and periods of disturbance to the maximum extent practicable and to minimize the area of disturbed soil during the wet season. Scheduling should also be used to coordinate construction activities with implementation of appropriate erosion and sediment control BMPs. In addition, the SFPUC should allow 60 days for the Water Board to review and accept SWPPPs prior to commencement of construction activities. 05 cont.

Comment 6
Section 4.5: Hydrology and Water Quality, Impact 4.5-2: Depletion of groundwater resources, Sunol Valley Region, Pages 4.5-29 and 4.5-30; Section 4.6: Biological Resources, Impact 4.6-3: Impacts on key special status species –direct mortality and/or habitat effects; and Section 6.3: Mitigation Measures to Minimize Facilities Impacts, Mitigation Measure 4.5-2: Site Specific Groundwater Analysis and Identified Measures and Mitigation Measure 4.6-1a: Wetlands Assessment, Page 6-9.

The discussion in Section 4.5 indicates potentially significant impacts to groundwater resources in the vicinity of the New Irvington Tunnel project because construction of the existing Irvington Tunnel in the 1930's resulted in depletion of groundwater resources in the area (Impact 4.5-2). In addition, the text in Section 4.6 indicates that dewatering during the New Irvington Tunnel Project could alter surface water features thereby potentially impacting key special status species, such as the California red-legged frog and California tiger salamander.

We acknowledge and appreciate mitigation measures presented in Section 6.3. The measures to mitigate detrimental effects related to depletion of groundwater (Mitigation Measure 4.5-2) include taking an inventory of springs and wells in the area of the planned tunnel and conducting a project-specific analysis as part of the California Environmental Quality Act (CEQA) review process for the Irvington Tunnel Project. If a significant impact is identified in the project-specific CEQA review, measures such as altering groundwater withdrawal rates and/or providing alternate water supply for affected users will be implemented to mitigate impacts to groundwater resources and beneficial uses. To mitigate potential impacts to wetlands and aquatic features, a qualified wetland scientist will assess and delineate wetlands potentially occurring at project sites (Mitigation Measure 4.6-1a), and site-specific mitigation measures will be identified as part of the project-specific CEQA reviews (Mitigation Measure 4.6-1b). 06

In addition to Mitigation Measure 4.5-2, the PEIR mitigation measures should include evaluating indirect effects on aquatic and riparian habitat associated with lowering of groundwater levels. This should be accomplished by expanding Mitigation Measure 4.6-1a to include sensitive habitat in and around springs and creeks in the area around the New Irvington Tunnel Project. If potentially significant impacts to aquatic and/or riparian habitat are identified, then Mitigation Measure 4.6-1b should be used to (1) avoid the impact, (2) minimize unavoidable impacts, and (3) compensate for unavoidable impacts. The Water Board will review the use this three-step process when reviewing project impacts. We will also require appropriate mitigation for unavoidable impacts as part of project review. Please revise the PEIR to include a citation of the three-step review process described above and in Comment 11. 06 cont.

Comment 7
Section 4.5: Hydrology and Water Quality, Impact 4.5-3: Construction dewatering discharges to surface waters and construction related discharges of treated water, Pages 4.5-31 through 4.5-33.

The PEIR discloses that dewatering of groundwater will be required for projects requiring excavation below the groundwater table. The dewatered groundwater may contain sediments and contaminants that could degrade water quality. The text further explains that discharges of groundwater to surface water may be possible under the General Construction Permit. The PEIR should note that discharges of dewatered groundwater are possible under the General Construction Permit provided that it can be demonstrated that the water is uncontaminated. The PEIR further states that in the San Joaquin Region, the dewatering discharges may be performed in accordance with the General Order for Dewatering and Other Low Threat Discharges to Surface Waters, and for any discharge to land, it may be possible to perform the discharge in accordance with the State General Waste Discharge Requirements for Discharges to Land with a Low Threat to Surface Waters. The PEIR also acknowledges that an individual National Pollutant Discharge Elimination System (NPDES) permit, or a waiver, may be required. 07

The discussion of potential permits under which dewatered groundwater may be discharged should be expanded to include General Permits in the San Francisco Regions. These include the following General NPDES Permits:

- General NPDES Permit for VOC Cleanups (Order No. R2-2004-0055);
- General NPDES Permit for Fuel Cleanups (Order No. R2-2006-0075);
- General NPDES Permit for Groundwater Dewatering (Order No. R2-2006-0075).

Please note that before discharging under any general permit, the SFPUC must submit a completed Notice of Intent (NOI) that includes a dewatering plan with appropriate treatment and monitoring specifications. The SFPUC should also allow at least 60 days for Water Board review and acceptance of NOIs and dewatering plans.

Comment 8
Section 4.5: Hydrology and Water Quality, Impact 4.5-5: Degradation of water quality and increased flows due to discharges to surface water during operation, Crossover Facilities and Pipelines, Pages 4.5-41 through 4.5-49.

The text indicates that discharges of chlorinated and chloraminated water from crossover facilities and pipelines will occur in the Sunol Valley, Bay Division, Peninsula, and San Francisco Regions of the WSIP. The PEIR states that "These discharges would be dechlorinated or dechloraminated and would occur at a rate that would not cause erosion or downstream flooding." However, historical discharges from pipelines and crossover facilities have impacted water quality and beneficial uses despite BMPs to prevent adverse effects from these discharges. As a result, we recommend that the SFPUC evaluate the potential to plumb blow off valves, crossover facilities, and other potable water discharge locations to treatment plants and sanitary sewers, where feasible. 08

Comment 9
Section 4.5: Hydrology and Water Quality, Impact 4.5-6: Degradation of water quality as a result of alteration of drainage patterns or an increase in impervious surfaces, Pages 4.5-49 through 4.5-54.

The text indicates that projects in the Sunol Valley, Bay Division, Peninsula, and San Francisco Regions of the WSIP will result in increases or replacement of impervious surfaces. The text goes further to state that stormwater treatment is required for projects creating or replacing 10,000 square feet or more of impervious surface, but that this threshold only applies to specific projects and not to a cumulative set of projects such as the WSIP. However, this is only correct if the locations of a cumulative set of projects under a single program are noncontiguous, and/or are not part of a single common plan of development. As a result, the text should be revised to reflect that contiguous projects under WSIP will be required to meet this threshold. For instance, both the Additional 40-mgd Treated Water Supply (SV-3) and SVWTP-Treated Water Reservoirs (SV-5) projects will create new impervious surfaces and will occur at the Sunol Valley Water Treatment Plant. As a result, the 10,000 square foot threshold would apply to the cumulative area of new impervious surfaces created by these projects. Further, to the extent that projects are part of a single common plan of development that cumulatively exceeds 10,000 square feet of new or replaced impervious surface, the smaller amount of impervious surface from each sub-project would be require appropriately sized stormwater treatment BMPs. Appropriately sized treatment must be based on the following hydraulic design criteria: 09

Volume Hydraulic Design Basis: Treatment BMPs whose primary mode of action depends on volume capacity, such as detention/retention units or infiltration structures, shall be designed to treat stormwater runoff equal to:

1. the maximized stormwater quality capture volume for the area, based on historical rainfall records, determined using the formula and volume capture coefficients set forth in Urban Runoff Quality Management, WEF Manual of Practice No. 23/ ASCE Manual of Practice No. 87, (1998), pages 175-178 (e.g., approximately the 85th percentile 24-hour storm runoff event); or,
2. the volume of annual runoff required to achieve 80 percent or more capture, determined in accordance with the methodology set forth in Appendix D of the California Stormwater Best Management Practices Handbook, (1993), using local rainfall data.

Flow Hydraulic Design Basis: Treatment BMPs whose primary mode of action depends on flow capacity, such as swales, sand filters, or wetlands, shall be sized to treat:

1. 10% of the 50-year peak flow rate;
2. or the flow of runoff produced by a rain event equal to at least two times the 85th percentile hourly rainfall intensity for the applicable area, based on historical records of hourly rainfall depths; or, 09 cont.
3. the flow of runoff resulting from a rain event equal to at least 0.2 inches per hour intensity.

The text in Section 4.5 also states that projects disturbing more than 1 acre of land would be required to include post-construction erosion and sediment control BMPs in the SWPPP prepared for the project. Please also note that under the municipal stormwater permits, the post-construction erosion and sediment control BMPs for projects creating or replacing more than 1 acre of impervious surface must also comply with requirements in the Hydrograph Modification Management Plans for Alameda, Santa Clara, and San Mateo Counties.

We appreciate and acknowledge the watershed management actions pertaining to onsite stormwater collection and drainage systems. We are especially concerned that these actions continue in perpetuity (i.e. for the life of the system/facility) and are implemented at all SFPUC facilities, including, but not limited to, maintenance and access roads, corporation yards, and parking lots.

Comment 10
Section 4.6: Biological Resources. Impacts, Significance Criteria, Page 4.6-37.

The third bullet under the significance criteria for biological impacts should be expanded to include wetlands protected under the State of California's Porter-Cologne Water Quality Control Act. 10

Comment 11
Section 4.6: Biological Resources, Impact 4.6-1: Impacts on wetlands and aquatic resources, Page 4.6-43; and Section 6.3: Mitigation Measures to Minimize Facilities Impacts, Mitigation Measure 4.6-1a: Wetlands Assessment, and Mitigation Measure 4.6-1b: Compensation for Wetlands and Other Biological Resources, Pages 6-11 and 6-12.

The discussion of impacts to wetlands and aquatic resources in Section 4.6 discloses that impacts to wetlands are assumed to occur for all WSIP projects that involve surface disturbance. The PEIR should note that under the Porter-Cologne Act, waters of the State are defined as "any water, surface or underground, including saline waters, within the boundaries of the State." Based on this definition, the SF Basin Plan states that "Wetlands water quality control is therefore clearly within the jurisdiction of the State and Regional Boards." As a result, the Water Board has jurisdiction over wetlands of any type, including isolated wetlands under the Supreme Court's SWANCC and Rapanos decisions.

The PEIR proposes two measures to mitigate potential impacts to wetlands and aquatic features. First, a qualified wetland scientist will assess and delineate wetlands potentially occurring at project sites (Mitigation Measure 4.6-1a). Second, site-specific mitigation measures will be identified as part of the project-specific CEQA reviews (Mitigation Measure 4.6-1b). Mitigation Measure 4.6-1b states that when a WSIP project will affect jurisdictional wetlands, the SFPUC will implement avoidance 11
measures, restoration procedures, and compensatory creation or enhancement.

We wish to emphasize that all wetlands are within the Water Board's jurisdiction. To protect wetlands, the Water Board adopted U.S. EPA's Section 404(b)(1), "Guidelines for Specification of Disposal Sites for Dredge or Fill Material," dated December 24, 1980, in the SF Basin Plan for determining the circumstance under which filling of wetlands, streams or other waters of the State may be permitted. Section 404(b)(1) Guidelines prohibit all discharges of fill material into regulated waters of the United States, unless a discharge, as proposed, constitutes the least environmentally damaging practicable alternative that will achieve the basic project purpose.

The Guidelines sequence the order in which proposals should be approached: (1) Avoid - avoid impacts to waters; (2) Minimize - modify project to minimize impacts to waters; and, (3) Mitigate – once impacts have been fully minimized, compensate for unavoidable impacts to waters. When it is not possible to avoid impacts to water bodies, disturbance should be minimized. Mitigation for lost water body acreage and functions through restoration or creation should only be considered after disturbance has been minimized. Where impacts cannot be avoided, the creation of adequate mitigation habitat to compensate for the loss of water body acreage, functions and values must be provided.

As a result, the SFPUC will be required to obtain appropriate approvals from the Water Board for wetland fill. Applications for these approvals must demonstrate to the Water Board that impacts to wetlands have been avoided and minimized to the maximum extent practicable before considering compensation measures. Mitigation Measure 4.6-1b should be expanded to reflect this by stating that measures will be implemented to minimize unavoidable impacts to wetlands before implementing restoration, enhancement, or creation activities. 11 cont.

Cumulative and indirect impacts to wetlands must also be prevented. Indirect impacts include: deposition of sediments; erosion of substratum; additional water (flooding); reduced water supply or flows; creating a condition of pollution; shading; and, watershed degradation.

Comment 12
Section 4.6: Biological Resources, Impact 4.6-1: Impacts on wetlands and aquatic resources, Page 4.6-43.

The PEIR should note that the discussion of potential changes to jurisdictional determinations pending outcomes of recent federal court cases only pertains to federal jurisdiction under the CWA. State jurisdiction under the Porter-Cologne Act will not be affected by the pending outcomes of recent federal court cases and has not been affected by earlier decisions, such as the Tulloch, SWANCC, and Rapanos decisions. To regulate impacts to waters of the State that are outside federal jurisdiction, the Water Board may issue either individual or general WDRs. 12

Comment 13
Section 5.2: Plans and Policies, Federal Statutes and Agreements, Clean Water Act, Page 5.2-6.

The discussion of the CWA includes requirements under Section 404 of the Act; however, requirements under Section 401 of CWA were not provided in this discussion. Under Section 401 of CWA, every applicant for a federal permit or license for any activity which may result in a discharge to a water body must obtain State Water Quality Certification (Certification) that the proposed activity will comply with state water quality standards. Most Certifications are issued in connection with CWA Section 404 permits for dredge and fill discharges. Please revise the discussion of the CWA in Section 5.2 to include requirements under Section 401 of the CWA. 13

Comment 14
Section 5.4: Alameda Creek Watershed Streams and Reservoirs, Subsection 5.4.2: Geomorphology, Impact 5.4.2-1: Effects on channel formation and sediment transport along Calaveras Creek, and Impact 5.4.2-2: Effects on channel formation and sediment transport along Alameda Creek downstream of diversion dam, Pages 5.4.2-1 through 5.4.2-4.

The description of geomorphology and sediment transport characteristics beginning on Page 5.4.2-1 should include a discussion of Luna Leopold's effective work concept, particularly as modified by GeoSyntech's recent work on creeks dominated by fine grained sediment (GeoSyntech 2002). This concept suggests that relatively frequent moderate flows cumulatively transport a large proportion of total sediment in streams and control channel stability, or instability. Even low flows (less than 60 percent of bankfull) were found to mobilize fine grained bed material although bulk gravels were undisturbed (Carling 1987 as cited in GeoSyntech 2002). Furthermore, sediment load, particle size range, input timing and mechanisms, and longitudinal distribution were all determined to be important in the development of geomorphic surfaces and instream deposits, both of which serve as the foundation for riparian and aquatic habitat. As a result, a change in either the discharge or sediment load may initiate adjustments to channel morphology that impact the beneficial uses of the stream.

The text on page 5.4.2-2 states that the SFPUC will discharge about 900 cubic yards per year of sediment accumulated behind the Alameda Creek Diversion Dam. In addition, there are significant and unmitigatable effects on stream flow along Alameda Creek between the diversion dam and the Calaveras Creek confluence (Impact 5.4.1-2). Specifically, flows above 650 cubic feet per second (cfs) will be significantly reduced, and flows below 650 cfs will be virtually eliminated. As a result, flows occurring during major storms will resemble flows currently occurring during small storms and flows during small storms will be virtually nonexistent. The overall effect will be to reduce the frequency of low and moderate flows (i.e. flows currently associated with small storms will only occur during major storms) while eliminating high flows (i.e. flows currently associated with major storms will not occur). Changes in both the timing of sediment input and water flows have the potential to impact channel shape and sediment transport along Alameda Creek downstream of the diversion dam (Impact 5.4.2-2). 14

The text on pages 5.4.1-19 through 5.4.1-25 indicates that there will be changes in the timing and magnitude of flows as a result of the WSIP. Reduced winter flows would occur in years with above average rainfall. New instream fishery releases would increase flows in summer months. We support fisheries releases; however, it is important that these releases as well as other operational changes be performed in a manner that does not result in detrimental impacts to stream geomorphology.

The evaluation of effects on channel formation and sediment transport along Calaveras Creek and along Alameda Creek downstream of the diversion dam (Impacts 5.4.2-1 and 5.4.2-2) should be revised to include an assessment of the expected effects on stream geomorphology resulting from changes in frequency, magnitude and duration of low, moderate and high flows, and the timing of sediment inputs. To account for the cumulative effect of small and moderate flows, continuous modeling over a period of record rather than focusing on a particular return period flow (e.g. 3.5-year flow) should be used for this assessment. Please incorporate continuous modeling into the impact assessment in the PEIR, or include it as a mitigation requirement in the PEIR. 14 cont.

Comment 15

Section 5.4: Alameda Creek Watershed Streams and Reservoirs, Subsection 5.4.3: Surface Water Quality, Impact 5.4.3-3: Effects on water quality along Calaveras, San Antonio, and Alameda Creeks, Alameda Creek-Reach 1, Page 5.4.3-11.

The text on page 5.4.2-2 states that the SFPUC will discharge about 900 cubic yards per year of sediment accumulated behind the Alameda Creek Diversion Dam. Releasing this sediment though sluice gates has the potential to impact the water quality downstream of this discharge. However, the PEIR does not include an evaluation of potential water quality impacts associated with the sluicing of sediment from behind the diversion dam. It also does not indicate whether the sediment is expected to be released in a single event or multiple events. As a result, the PEIR should be revised to include an assessment of potential impacts on beneficial uses and/or water quality as a result of releasing sediment. This assessment should, at a minimum, include; (1) the expected frequency, magnitude, and timing of sediment releases; (2) any associated changes in total dissolved solids (TDS) and/or turbidity; (3) the expected fate and transport of the sediment; and (4) any associated changes in benthic macroinvertebrate or fish spawning habitat. Sediment discharges that have the potential to exceed WQOs in the SF Basin Plan should be considered significant impacts. The following WQOs should be considered in the assessment: 15

- **TDS in the Alameda Creek Watershed above Niles:**
  - 250 milligrams per liter (mg/l) (90 day-arithmetic mean)
  - 360 mg/l (90 day-90th percentile)
  - 500 mg/l (daily maximum)

S_RWQCBSF

- **Sediment:** The suspended sediment load and suspended sediment discharge rate of surface waters shall not be altered in such a manner as to cause nuisance or adversely affect beneficial uses. The suspended sediment load and suspended sediment discharge rate of surface waters shall not be altered in such a manner as to cause nuisance or adversely affect beneficial uses.

  Controllable water quality factors shall not cause a detrimental increase in the concentrations of toxic pollutants in sediments or aquatic life.

- **Settable Material:** Waters shall not contain substances in concentrations that result in the deposition of material that cause nuisance or adversely affect beneficial uses.

- **Suspended Material:** Waters shall not contain suspended material in concentrations that cause nuisance or adversely affect beneficial uses. 15 cont.

- **Turbidity**: Waters shall be free of changes in turbidity that cause nuisance or adversely affect beneficial uses. Increases from normal background light penetration or turbidity relatable to waste discharge shall not be greater than 10 percent in areas where natural turbidity is greater than 50 NTU.

Adverse effects on beneficial uses would include, but are not limited to, clogging of spawning beds with fine grained sediment, and covering of benthic macroinvertebrate habitat with excessive sediment.

If the evaluation identifies significant impacts to beneficial uses and/or water quality, mitigation for these impacts must be developed and proposed. Mitigation may include operational changes that modify the frequency in which sediment is sluiced from behind the dam or modify the frequency and duration of water diversions, or changes in sediment management that could preclude the current sediment discharge method.

Comment 16

Section 5.7: Cumulative Projects and Impacts Related to WSIP Water Supply and System operations, Subsection 5.7.6 Climate Change and Global Warming, Pages 5.7-92 through 5.7-97.

The discussion on climate change in Section 5.7 evaluates effects from reductions in annual snowpack, increased precipitation in the form of rain, and shifts in seasonal precipitation. We acknowledge and appreciate the difficulty in assessing impacts related to climate change because of the uncertainty associated with the models. However, the discussion on climate change should be expanded to include a discussion of potential effects resulting from changes in the frequency and duration of extreme climatic events, such as droughts and flood events. 16

California Environmental Protection Agency
Recycled Paper

The projections by the Intergovernmental Panel on Climate Change (IPCC) summarized indicate that more intense precipitation and drought events are likely to occur in the 21st century. These predictions are summarized in Table 9.6 of Climate Change 2001: The Scientific Basis (http://www.grida.no/climate/ipcc_tar/wg1/pdf/TAR-09.PDF). On Page 891 in Climate Change 2007: The Physical Science Basis, the IPCC's review of regional climate models also found increases in extreme temperature events in California, prolonged hot spells and increased diurnal temperature range (http://ipcc-wg1.ucar.edu/wg1/Report/AR4WG1_Print_Ch11.pdf). Although there is no clear scientific consensus on the quantification of these extreme events, a qualitative assessment acknowledging the uncertainties in climate models should be performed to evaluate whether changes in operations will exacerbate adverse effects associated with extreme climatic events. 16 cont.

Environmental Review Officer, WSIP PEIR
1650 Mission Street, Suite 400
San Francisco, CA 94103

Re: San Francisco Water System Improvement Program (WSIP) – County of Alameda General Comments on the Program and Program Environmental Impact Report (PEIR)

Dear Environmental Review Officer:

Alameda County Community Development Agency (CDA) staff have reviewed the available information for the proposed WSIP. The WSIP, if approved, would result in significant and necessary changes to the water treatment and delivery system that provides San Francisco and numerous Bay Area communities with a dependable source of high-quality water for all applications. The program would include upgrades to pipelines, aqueducts and water treatment facilities at many locations along the route from the Hetch Hetchy Reservoir to the service area, which includes local customers in four different counties.

Upon review by the County, the PEIR appears to be accurate in its description of possible environmental impacts. Impacts to land use, visual quality, biology, traffic and transportation, air quality and noise are identified, and where possible, mitigation measures are identified to reduce the levels of significance for the impacts. Where impacts cannot be mitigated, the PEIR identifies these as unavoidable impacts, for which Findings of Overriding Consideration would need to be adopted. Alameda County staff concurs with these analyses. 01

A significant portion of the program pertains to the water delivery route that crosses lands in unincorporated Alameda County, along the Hetch Hetchy Aqueduct. The program includes a number of improvements to portions of the system in eastern Alameda County from the eastern County boundary, across the Livermore Valley, across and through the coast ranges, through the Sunol Valley and on to the boundary with the City of Fremont. The program would largely affect facilities and lands currently owned and operated by the City of San Francisco for the purposes of water delivery and treatment; however, in some cases, lands not currently owned by San Francisco would need to be utilized in order to effect the improvements specified in the WSIP. 02

The lands owned by the City of San Francisco, in most cases, are designated for land use by the County of Alameda General Plan (the *East County Area Plan*, [ECAP], as amended, May, 2002) for Water Management (WM), while the private lands along the route are designated for either Large Parcel Agricultural (LPA) or Resource Management (RM). While these land use designations generally permit the presence and construction of necessary infrastructure, the ECAP also has a number of other issue-specific policies related to land use, biology, visual resources, growth-inducement, and other critical issues. Wherever the program would result in construction or modified operational activities on any of these lands, the SFPUC must apply to the County of Alameda for a Finding of General Plan Conformance under the State of California Government Code, Section 65402.

12.3-1

In addition, for any specific projects under the WSIP that would result in construction or operation on privately-owned lands within the unincorporated area of Alameda County, the SFPUC and/or landowner would need to apply to the County for either a Conditional Use Permit (CUP, for permanent program features or major activities that would last longer than six [6] months, or an Administrative CUP (for temporary or minor activities that would last less than six [6] months) (Reference Alameda County General Ordinance Code, Title 17, Zoning, Section 17.06.040, Conditional uses - Board of zoning adjustments, Paragraph J.). 02 cont.

Each of these matters would need to be addressed on a project-by-project basis.

The program also includes descriptions of projects that would be implemented in the Sunol Valley, on or near lands that may currently be under Alameda County Surface Mining Permits (SMPs), and possibly also on lands for which the State of California has determined include Regionally Significant Construction Aggregate Resources (RSCAR). The Hetch Hetchy Aqueduct route itself, as it currently exists, has been excluded from this designation; however, it is bounded on both sides by lands bearing the State RSCAR designation as it crosses the Sunol Valley floor.

If any project of the WSIP would include significant alterations to the pattern of mining currently being conducted under existing County SMPs, revisions to those SMPs and associated reclamation plans may be necessary under the County Surface Mining Ordinance (SMO), with possible review by the State Department of Conservation, Division of Mined Land Reclamation. These matters would also need to be addressed on a project-by-project basis. 03

Similarly, if any project constructed or use implemented pursuant to the WSIP would threaten the potential to extract any minerals in an area designated as a RSCAR, then under State Public Resources Code, Division 2, Chapter 9 (Surface Mining and Reclamation Act, SMARA), Sections 2762 and/or 2763, the lead agency would be required to initiate a duly noticed public process, wherein a statement is prepared specifying reasons why the new use would be permitted, that statement also being submitted to the State Geologist for review and comment. These matters would also need to be addressed on a project-by-project basis.

This concludes our comments on the WSIP. If you have any questions, please do not hesitate to contact me at (510) 670-6527 or at bruce.jensen@acgov.org.

Sincerely,

Bruce Jensen

Dear Mr. Maltzer:

Subject: Comments on Draft Program Environmental Impact Report (Draft PEIR) for the San Francisco Public Utilities Commission's Water System Improvement Program (WSIP) Case # 2005.0159E SCH#200509026

The Alameda County Flood Control and Water Conservation District (District) has reviewed the City's Environmental Impact Report entitled: *Draft Program Environmental Impact Report (dPEIR) For the San Francisco Public Utilities Commission's proposed Water System Improvement Program (WSIP).*

Below are the District's comments on the dPEIR. The comments are in two categories: General and Specific. The general comments are followed by specific statements from the dPEIR. Each specific statement is followed by District comments *italicized.*

General District Comments

1. *Throughout the dPEIR, please provide temperature measurements in both degrees, Celsius (ºC) as well as in degrees Fahrenheit (ºF), or include in your conversion factors.* 01

2. *On July 31, 2007, the Alameda County Flood Control and Water Conservation District and the Alameda County Water District entered into an Agreement to design a fish passage facility over the BART weir and middle inflatable dam in the Alameda Creek Flood Control Channel. This is a logical step in the 10-year effort (in which the SFPUC has participated) to improve steelhead passage and habitat throughout the Alameda Creek watershed. The* 02

NOP for the improvement of the BART weir and middle inflatable dam for fish passage will be circulated by December 2007. 02 cont.

3. *Prior to circulating the NOP for this dPEIR, the District, in accordance with Sections 21104 and 21153(a), provided a list of programmed projects which included the improvements to the BART weir for fish to your environmental consultants in December 2006. None of the projects on the list were considered in preparing this dPEIR. There are significant implications of your project on lower Alameda Creek. For example:* 03

- *Additional diversion of flows from Alameda Creek by up to 50% will further hinder the ability of steelhead to navigate through the lower reaches of the creek. Lower flows in the channel would result in higher water temperature and increased mortality. These direct impacts ("take" under Section 9 of the Endangered Species Act (ESA)) require thorough discussion to quantify the level of the obvious impacts and appropriately mitigated. Additional diversions will effectively eliminate anadromous species reestablishment anywhere in the watershed. This diversion of flows is inconsistent with the SFPUC's fish habitat improvement rationale for removal of the Sunol and Niles dams.* 04

- *The assertion in the NOP for this dPEIR was that "big picture" concept would be addressed. To this end, the effects of the project in light of climate change, including global warming, on the threatened species was inadequately addressed.* 05

- *Since 1997, multiple stakeholders, including the SFPUC, have spent countless resources to determine how best to enhance steelhead runs and improve steelhead habitat throughout the Alameda Creek watershed. To stress in the dPEIR that there is no steelhead habitat above the BART weir is erroneous and contrary to SFPUC's participation in the Alameda Creek Fisheries Workgroup effort to restore steelhead in this watershed.*

- *Upstream habitat has been compromised by diversion of flows into reservoirs. This is one of the principal reasons that the Central California Coast ESU became listed as threatened by USFWS in 1997. The BART weir is only a barrier to upstream migration precisely because there are insufficient flows through that corridor! Besides, the species is known for its persistency to navigate over structures higher than the BART weir, and there have been periodic sightings of the species upstream of the BART weir. The flows necessary during critical period to get to the spawning grounds are missing!* 06

- *The dPEIR uses of hypothetical scenarios to support no impacts to steelhead are flawed and misleading and renders the dPEIR inadequate. Please revise the dPEIR to address the potential "take" of Onchorynchus mykiss under Section 9 of the ESA and provide appropriate mitigation for these impacts.*

4. *The proposed increased diversions of flows from Alameda Creek will further subject steelhead to greater stress and possibly lead to the extinction of the species in this watershed! The District recommends that SFPUC scale back flow diversions to levels below*

the current rate of diversion to support and improve the habitat of the threatened steelhead species. SFPUC should emphasize conservation measures which are on par with 21st century technologies and comply with current environmental laws and regulations.

5. *SFPUC diverts 86% of surface runoff from Upper Alameda Creek watershed above Sunol Valley (specifically San Antonio and Arroyo Hondo tributaries), yet impacts to steelhead are not addressed in the dPEIR. A reason the species was listed by USFWS includes habitat destruction due to a lack of sufficient flows. In 2006, SFPUC removed two (2) barriers to improve the habitat. Construction of a fish passage structure over the BART weir and the middle inflatable dam are scheduled for 2010. The dPEIR failed to discuss effects of the proposed additional diversion of flows on these known projects in accordance with CEQA Sections 15065 (a) and (b) and 15130, and Sections 9 and 10 of the ESA. Furthermore, how would this increased flow diversion rate affect emergency response downstream?*

6. *It appears that much of the discussion in the dPEIR is focused on the BART weir. The fact is steelhead habitat currently exists within the project limits and is independent of the BART weir. This obvious omission renders the dPEIR incomplete requiring major rewrite and re-circulation in accordance with Public Resources Code, Section 21064.5; 21080 subd(c)(2); and CEQA guidelines 15070 subd.(b)(1).* 06 cont.

7. *Location of the SV-2 Alameda Creek Fishery Enhancement Project should be identified on a map. If there are no steelhead (I presume this is the species in question), why enhancement? To be consistent with the "big picture" as stated in the NOP, an explanation is warranted and any impact identified should be mitigated and the dPEIR re-circulated for public comments.*

8. *The flows suggested to be released from Calaveras Reservoir under the Alameda Creek Fisheries Enhancement Project (SV-2) should be available for steelhead below the proposed recapture facility; otherwise, it would impair steelhead upstream migration further downstream.*

9. *The justification for increased water diversions from Alameda Creek is seriously flawed because there is no rationale for using an older 2000 ABAG data for the demand analysis when more recent 2005 ABAG data that demonstrates less water use needs exists.* 07 *Additionally, why was water use efficiency not adequately reviewed and analyzed? Why was no use analysis performed? Emphasis on aggressive recycling and conservation would negate the need for additional water diversion from Alameda Creek. Please revisit your analysis using the most current data and appropriately address the impacts and re-circulate the revised dPEIR for public comments.* 08

10. *The fact that the SFPUC has failed to address steelhead in the Calaveras Dam replacement project in this dPEIR to provide a context for the "big picture" is a serious inadequacy of the dPEIR. The SFPUC has been an active member of the Alameda Creek Fisheries Workgroup* 09

since its inception. There is, therefore, no rational basis for not acknowledging or not knowing that anadromous steelhead exists above the BART weir on SFPUC lands! 09 cont.

11. *Existing SFPUC water pipelines that cross District Channel and creek inverts create hydraulic constriction and flooding potential upstream of the crossings. There is potential liability associated with said crossings. The District requests that none of the proposed pipelines crosses the District's facilities at any elevation above the invert bottom. Furthermore, any such crossings must provide a minimum of 3 ft clearance from the inverts bottom.* 10

12. *The proposed reservoir releases into Flood Control facilities would result in significant impact on the downstream segments of Alameda Creek. It is critical that Flood Control District be notified and agreed with the proposed SFPUC release protocols for both Calaveras and San Antonio dams.* 11

13. *Based on the general comments above, please change the following Initial Study checklist items:* 12

 Transportation and Circulation
 (a) Change from Less than Significant to Potentially Significant.

 Biological Resources
 (a, b, c, d) Change from Less than Significant to Potentially Significant.

 Hydrology and Water Quality
 b) and c) Change from Less than Significant to Potentially Significant.

Specific District Comments

The following Specific Comments are based principally on dPEIR discussions on sections of the WSIP in within Alameda County. The relevant section is identified (where possible) and the text is identified and followed by the District's comment in *italics*.

Statement

On page one of NOP, it states, "The PEIR will address the "big picture" issues (including the program's growth inducement potential and the associated secondary effects of growth, cumulative effects, system tradeoffs, and program alternatives) and will identify programmatic mitigation measures." 13

District Comment

An important missing aspect of the "big picture" in the dPEIR is the discussion of the federally listed species Oncorhynchus mykiss. Even if SFPUC is planning to undertake individual project level CEQA review sometime in the future (subsequent EIR), the "big *picture" now requires discussion of all the known impacts of the WSIP. How can a thorough evaluation of the project impact in a subsequent EIR be accomplished if it is not acknowledged in the programmed EIR, especially an obvious impact such as flow diversion on the threatened steelhead?*

SFPUC has been a major player in the effort to restore steelhead to the watershed. In fact, in 2006, Sunol and Niles dams were removed to enhance fish habitat as SFPUC General Manager, Susan Leal, proclaimed in a press release dated September 19, 2006:

> *"The removal of these dams demonstrates our commitment to restoring steelhead on the Alameda Creek even as we work to rebuild the seismically vulnerable Calaveras Dam…."*
>
> *And SFPUC's Natural Resources Division Manager, Tim Ramirez, also stated:*
>
> *"This is an exciting time for those of us who care about Alameda Creek and steelhead restoration… we are working collaboratively with environmental groups, state and federal agencies and other water agencies to work towards the common goal of restoration of fish populations in Alameda Creek."*

What has happened to these pronouncements? How can the dPEIR then dismiss the effects of the WSIP on the restoration of steelhead in the Alameda Creek Watershed? 13 cont.

12.3-4

Statement

On page 20, 3.1, Program EIR Level of Analysis, it states: "According to the CEQA Guidelines, Section 15168, a program EIR is one type of environmental review document that may be used to evaluate a plan or program that has multiple components (projects and actions) or to address a series of actions that are related."

District Comment

This statement in the NOP set the tone for the preparation of the dPEIR. However, the dPEIR failed to adequately address the effects of the WSIP in accordance to the following bullets from the NOP:

- *"• Provide for a more exhaustive consideration of effects and alternatives than would be practical in an EIR on an individual action"*
- *"• Ensure consideration of cumulative impacts that might not be evident in a case-by-case or project-by-project analysis"*

The dPEIR is not exhaustive and fails to acknowledge and consider the effects of the project on steelhead, a federally listed species. In 2006, SFPUC removed two dams within the watershed. The reason provided for the removal was to improve steelhead habitat. What has happened within a year to dismiss the species outright from the watershed? How does the SFPUC, a 10-year partner on steelhead restoration effort in

the Alameda Creek Watershed, reconcile the dismissive language in the dPEIR with the pronouncements by the General Manager and Natural Resources Manager of SFPUC? The dPEIR is inadequate and needs major work per Section 15168(c)(5) of CEQA.

Statement

On page S-67, the dPEIR states, "Reduced winter and spring flows in Alameda Creek above the BART weir would limit migration and spawning if steelhead were to gain access upstream."

District Comment

This statement is hypothetical and misleading. Reduced flows during winter and spring may be due to drought conditions or excessive diversion of water from the creek. By limiting the statement to a specific hypothetical scenario, the statement is at best confusing, misleading, and minimizes the significance of the upper watershed for full steelhead recovery. Indeed it ignores one of the reasons (habitat loss) the Central California Coast Steelhead ESU was listed "threatened" under Sections 9 and 10 of the Endangered Species Act. Please revise the statement to read: <u>Normal or enhanced winter and spring flows in Alameda Creek above the BART weir (highly regulated by SFPUC and DWR) would increase migration and spawning opportunities for steelhead</u>. By revising the statement, the impacts associated with the current and proposed increased diversion rates becomes clear. 13 cont.

Statement

On page 5.4.1-4, the dPEIR states, "In 2006, the SFPUC completed removal of the Sunol and Niles Dams as part of an effort to restore creek flows and fish habitat along this reach of Alameda Creek…"

District Comment

The District supports the effort to "restore creek flows and native habitat for threatened steelhead." Sunol and Niles dams removal for restoring steelhead habitat was a major step in the long effort to restore a viable steelhead fishery in the watershed. Statements elsewhere in the dPEIR contradict this stated purpose and would cause significant singular and cumulative impacts to the species and defeat the 10-year effort by the Alameda Creek Fisheries Workgroup to restore habitat, improve access, and remove barriers throughout the watershed. The Fisheries Workgroup effort is supported by SFPUC. The impacts of the WSIP requiring mitigation have not been adequately addressed and mitigated per Section 21001 of the Public Resources Code and, therefore, the dPEIR requires major revision and re-circulation for public comments.

Statement

The dPEIR states that there is "no current steelhead migration above the BART weir…"

District Comment

The dPEIR statement is inaccurate because steelhead migration over the BART weir has occurred every year, at least since 2001, when recordkeeping began. A steelhead implanted with a tracking device has also been remotely recorded above the BART weir moving towards the upper watershed.

The BART weir is a temporal, not total, barrier to steelhead, i.e., it is passable to steelhead under certain flows. At higher flows, steelhead migrates pass the BART weir. Furthermore, steelhead has been transported yearly above the BART weir under the auspices of the Fisheries Workgroup with authorization from California Department of Fish and Game (CADFG) and National Marine Fisheries Services (NMFS). With the removal of both Niles and Sunol Dams in 2006, and upon completion of the scheduled improvement to the BART weir by 2010 (or sooner), prior to WSIP construction start date in 2011, steelhead will be able to migrate up into Alameda Creek watershed to spawn. SFPUC is fully aware of these improvements. What provision is SFPUC making in the WSIP to provide adequate flows to support these efforts consistent with Section 15125 of CEQA?

Steelhead habitat exists throughout the watershed. The WSIP impacts on this fragile habitat are a "take" under the ESA requiring analysis of the impacts and providing mitigation accordingly.

12.3-5

13 cont.

Statement

On page 4.6-2 of the dPEIR, in reference to rainbow trout being a key special-status species within the Alameda Creek watershed, and footnote number 5, "…rainbow trout and steelhead are the same species of trout…"

District Comment

The District wishes to re-emphasize the statement made under footnote number 5 and suggests rainbow trout and steelhead be used interchangeably as special status species. Additionally, this footnote contradicts the assertion made throughout the dPEIR that no steelhead exists within the project limits. Since steelhead (or if you prefer rainbow trout) is acknowledged to be in the watershed, the dPEIR is inadequate. Please revise the dPEIR to discuss the impacts and re-circulate the dPEIR for public comments.

Statement

On page 4.6-19 to 20, the dPEIR states, "…other barriers, including the BART weir …continues to block anadromous fish passage…"

District Comment

The BART weir is only a temporal and not a total barrier to steelhead, i.e., it is currently passable to steelhead under certain flows. Under higher discharges and minimal or no diversion of flows, steelhead migrates pass the BART weir. Secondly, the dPEIR statement is inaccurate because steelhead has been recorded since 2001 upstream of the BART weir (even if it is due to assistance). This is an error based on faulty analysis that has led to an erroneous "no impact conclusion."

The question dPEIR failed to answer adequately is: what is the impact of the proposed additional diversion of flows from the Alameda Creek into reservoirs has on steelhead life cycle? The project environmental setting description needs to be revised to capture the presence of habitat for the steelhead within the WSIP project limits and the full effects of the proposed project on anadromous species and its habitat identified analyzed and mitigation provided.

Statement

On page 5.4.1-4, the PDEIR states, "…a flow control structure …provides grade control and is a barrier to fish passage along this reach."

District Comment

The BART weir is not a grade control structure but rather a structure designed to protect the footings of the BART and UPRR bridge crossings and to describe it as such is misleading.

13 cont.

The BART weir is considered an upstream migration barrier under certain flows and not a downstream migration barrier, it and the middle inflatable dam are scheduled for improvement by 2010, well ahead of the WSIP construction schedule. Furthermore, SFPUC has been involved in the effort to facilitate fish passage over the weir for the last 10 years. To use the presence of the BART weir to justify a "no steelhead habitat" to avoid discussion of the potential impact of not removing the diversion dam, and denial of adequate flows to support steelhead migration in the dPEIR is misleading and disingenuous.

The real major "barriers" to steelhead migration in the watershed are the diversion of water into reservoirs and storage facilities which leave the species with no means of moving into upstream habitats. Fish needs water to swim!

The District requests that the document be revised to fully describe the project impacts as proposed in the context of the "big picture" as described in the project NOP and appropriate mitigation provided.

Statement

On page 5.4.5-2, the dPEIR states, "The Sunol and Niles Dams were partially removed in September 2006, eliminating them as obstacles to fish passage."

District Comment

The District supported the SFPUC on removing Sunol and Niles dams for steelhead habitat enhancement. The dPEIR failure to analyze the impact of its WSIP on steelhead in the context of the "big picture" is in stark contrast to the earlier pronouncements. 13 cont.

Statement

On page 5.4.5-3 of the dPEIR, in reference to lower Alameda Creek, "…the reach provides habitat for warm water fish such as largemouth bass."

District Comment

What was the basis for the statement that the lower reach of Alameda Creek provides habitat for warm-water fish? The statement leaves the reader with an erroneous impression that the lower reach solely provides warm-water fish habitat. The dPEIR fails to mention that lower Alameda Creek reach, including the estuarine zone, is an ideal transition zone suited for smolt development and acclimatization. There are ongoing studies in this reach to identify steelhead habitat enhancement opportunities. 14

Furthermore, the "big picture" which the dPEIR failed to address is the multi-agency, multidiscipline, multiyear ongoing South Bay Salt Pond Restoration along the Alameda Creek Estuary. The "lower reach" is thirsting from lack of flows principally due to existing diversion to reservoirs in the upper watershed. The failure to discuss the impact of water diversion on this reach of Alameda Creek is a significant omission rendering the dPEIR inadequate. The District requests that the dPEIR be revised and identified impacts mitigated.

Statement

On page 5.4.5-4, the dPEIR states, "rainbow trout and steelhead are the same species of trout (*O. mykiss*)."

District Comment

How can the dPEIR assert the absence of steelhead in the watershed while acknowledging that the rainbow trout and steelhead are the same species? If they are the same species, then the WSIP will have significant impact on the habitat warranting full discussion and mitigation. The dPEIR is inadequate. 15

Statement

On page 5.4.5-6, the statement, "In recent years, individual steelhead were captured near the BART weir by *citizen group…*"

District Comment

In addition to the statement, offspring of gravid-anadromous salmonids, which moved above the BART weir (either naturally or with assistance), invariable migrate back over the BART weir into the ocean only to return year in, year out into Alameda Creek. How else do you explain the annual occurrences of steelhead and intermittent occurrences of Chinook salmon in Alameda Creek? Does this not lend credence to the fact that steelhead habitat exists?

12.3-6

Statement

On page 5.4.5-6, the dPEIR states, "the presence of migratory barriers, notably the BART weir, prevents upstream movement of migratory steelhead."

District Comment

Once again the statement is misleading. It is uncertain that steelhead cannot migrate upstream beyond the BART weir under higher flows. It is apparent that lower flows limit steelhead navigation over the BART weir. This structure pales in comparison to natural barriers that steelhead are known to navigate with ease. The dPEIR is incomplete because it focuses erroneously on the BART weir rather than on effects of the project on steelhead habitat within the project limits. This has resulted in failure to discuss the consequences of flows diversion on steelhead upstream migration into these habitats. 15 cont.

The existing conditions are best described as follows: [The presence of barriers, notably the BART weir, prevents upstream movement of migratory steelhead under low flows conditions]. The dPEIR should be revised to address the steelhead habitat within the project limits caused by water diversions. The "big picture" is flows and how it affects the species habitat and journey into the upper watershed habitat. These are both individually and cumulatively significant impacts requiring mitigation.

Statement

On page 5.4.5-7 to 9, the dPEIR states, "other migration barriers along the creek have been or are in the process of being removed…"

District Comment

The dPEIR rightly addresses the removal of dams by the EBRPD, and ACWD plans to provide fish passage at their upper inflatable dam. It, however, failed to mention the ACWD and the District's scheduled fish passage project over the BART weir and middle inflatable dam. The joint effort by the two entities is necessary to ensure that the entire corridor barriers are improved at the same time (information provided to SFPUC December 2006 per Sections 21101 and 21153(a)). The NOP for this joint effort will be out in December 2007. Please revise your dPEIR to address these omissions, erroneous conclusions, and provide mitigation to address the obvious impacts that water diversion and lack of flows to support the federally listed species in accordance with Sections 9 and 10 of the Endangered Species Act.

Statement

On page 5.4.5-9, in reference to the fish passage structure over the BART weir and the middle inflatable dam, the dPEIR states, "there is currently no schedule or budget for this project, and environmental review has yet to begin."

District Comment

This statement is incorrect. As acknowledged in the dPEIR, the District has sponsored several studies looking at various design options to provide steelhead passage over the BART weir. The results of these studies led the District to conclude that any structure which provides fish passage over the BART weir must also accommodate the ACWD Middle Inflatable Dam. It is for this reason that the District and ACWD entered into Memorandum of Agreement (MOA) to construct a fish passage facility over both barriers concurrently. The NOP for this project will be out in December 2007.

Statement

On page 5.4.5-9 of the dPEIR, in reference to the USGS Niles gauging station weir/concrete apron being a potential barrier.

District Comment

On February 28, 2007, a male steelhead was collected below the BART weir, surgically implanted with a radio-transmitter, and transported upstream to the scour pool below the USGS Niles gage located on SFPUC property. The steelhead was remotely monitored both up and downstream of the Niles gage structure. The structure did not appear to hinder movement and is not a barrier to upstream migration. Rather, the most significant barrier to the species use of the watershed habitats is lack of flows to which this document has woefully failed to address contrary to the "big picture" approached asserted in the NOP and inconsistent with Section 15168(5) of CEQA. 15 cont.

Habitat presence in the watershed is independent of the BART weir. Important conditions for the continual survival of the species are water and flows an important abiotic component of a functioning habitat. One gets the impression that the dPEIR for WSIP was written to avoid any discussion of the flows diversion impacts on sustainable viable fish population and habitat in the watershed.

The USGS Niles gage weir has recently been identified as falling apart and may not last another wet season. SFPUC has requested a multi-agency coordination meeting to address the future of this structure. The District supports this effort and is providing funding to coordinate the meeting. If SFPUC decides to remove or improve this barrier on their property to fish passage, the District will support that effort as long as the gage station functions are preserved.

Statement

On page 5.4.5-11, the dPEIR states, "there is no current steelhead migration above the BART weir…it is speculative to assess the specific impacts that system operations…might have on the potential future restoration of steelhead…"

District Comment

This statement is inconsistent with definition of special status on page xxx of Volume 1 of 5 of the dPEIR. Since 2001 steelhead have been sighted and moved over the BART weir to locations in Niles Canyon yearly under the auspices of the Alameda Creek Fisheries Workgroup. The recent removal of both Niles and Sunol dams in 2006 and the scheduled BART weir fish ladder by 2010, will assure steelhead migration upstream Alameda Creek and its tributaries in the watershed. Based on the past, current, and future projects described in the dPEIR, the WSIP will result in cumulative impact on the habitat (CEQA Sections 21061, 21002.1, and 15003(b)). The document requires major revision to address these impacts.

SFPUC has been a partner in the 10-year effort to improve steelhead habitat in the Alameda Creek Watershed and is aware of the projects downstream. Because the species is listed under ESA, Section 9 of the ESA requires projects that may affect listed species to provide mitigation. No mitigation for the species has been identified in the dPEIR even though the WSIP clearly will result in substantial impact on steelhead. Why? 15 cont.

Finally, what is speculative about the 10-year effort to restore fish habitat in the Alameda Creek Watershed? What is speculative about SFPUC staff advocating for stream flows analysis for the creek through the Fishery Workgroup? What is speculative about Section 10 of the ESA? What is speculative about the current rate of flow diversion from the Alameda Creek Watershed into reservoirs? This dPEIR is woefully inadequate. It requires major revision to address the impacts that it failed to acknowledge. Please revise your document to address these potentially significant impacts and re-circulate for public comments.

Statement

In reference to Table 5.4.5-2, Summary of Impacts – Fisheries in Alameda Creek Watershed, Stream, and Reservoirs.

District Response

The dPEIR failed to adequately address significant impacts on steelhead in Alameda Creek from the middle inflatable dam to its outfall with San Francisco Bay reach. This is 9.5 miles of unaccounted for creek segment that will be impacted with diversions of flows requiring mitigation.

Statement

On page C-2, regarding the statement, "…Calaveras Reservoir would operate to release up to 6,300 afy (5.5 mgd) of water to Alameda Creek in support of fisheries."

District Comment

Releases from Calaveras Reservoir should be operated for fisheries enhancement. The most important fisheries resources to support in this watershed are the threatened steelhead. Flow releases from Calaveras Reservoir must be sufficient to support all life stages of steelhead throughout the stream segments from the base of Calaveras Dam to the mouth of Alameda Creek at San Francisco Bay. The document failed to adequately address this impact in any detail in stark contrast to the increased diversions described in the dPEIR. This increased diversion is a significant "take" requiring mitigation and need not be deferred until a subsequent EIR phase. Please revise your document to identify this impact and provide appropriate mitigation.

Statement

On page C-21, in reference to SV-1 (Alameda Creek Fishery Enhancement) preliminary construction schedule occurring in 2011 and SV-2 (Calaveras Dam Replacement) preliminary construction schedule occurring during 2009 to 2011.

District Comment

The District and the Alameda County Water District entered into an MOA to construct a fish passage facility over the BART weir and middle inflatable dam within the Alameda Creek Flood Control Channel by 2010. The NOP for this project is due in December 2007. The BART Weir construction timeline is well ahead of the 2011/2012 completion schedule of the SV-1 and SV-2 projects. 15 cont.

The SFPUC staff has openly commented that they would rather construct the WSIP (SV-1 and SV-2) prior to entertaining the construction of the fish ladder over the BART weir and middle inflatable dam. Could this be the reason for not addressing the WSIP project impacts on the Steelhead in the dPEIR, subsequent EIR notwithstanding?

Statement

In reference to Table III.E-3: Special Status Animals Species Potentially Occurring in the Alameda Watershed dPEIR in Appendix D Biological Resources: Special Status Species in Alameda and Peninsula Watersheds.

District Comment

The lack of reference to any fish, including steelhead, as a special-status species within the Alameda Creek watershed appears to be misleading. The Central California Coast Steelhead (Oncorhynchus mykiss) ESU was listed in 1997 as threatened and identified as such in the CNDDB. Every year since 2001, steelhead have been observed in the Alameda Creek watershed. Occurrence of the species in the watershed affirms the potential "take" associated with the WSIP dPEIR requiring mitigation.

Thank you for the opportunity to comment on this dPEIR. Given the substantial errors documented in this dPEIR, a revised document would need to be re-circulated in accordance with Section 150703.5 of CEQA. We would appreciate a response to our comments. If you have any questions, please contact Mr. Emmanuel da Costa at 510.670.6479, mannyd@acpwa.org. 16

Very truly yours,

Kwablah Attiogbe

Mr. Paul Maltzer, Environmental Review Officer
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103-2414

Dear Mr. Maltzer:

Subject: SFPUC Water Supply Improvement Program: Draft Program Environmental Impact Report

The Alameda County Water District (ACWD) appreciates this opportunity to comment on the Draft Program Environmental Impact Report for the SFPUC's Water Supply Improvement Program (WSIP). ACWD's specific comments on the WSIP Draft Program EIR (DPEIR) are provided in the attached table. The following narrative addresses ACWD's reliance on San Francisco Regional Water supplies, ACWD's support for improving the Regional Water System, and the need for the DPEIR to adequately address local impacts in the Alameda Creek Watershed.

ACWD Background and Future Purchase Estimates

ACWD supplies water to a population of over 320,000 in the cities of Fremont, Newark and Union City and relies on purchases from the San Francisco Regional Water system for approximately 20% of its supplies. ACWD's other supplies include imported water from the State Water Project (40%) and local sources (40%). ACWD's local supplies include groundwater from the underlying Niles Cone Groundwater Basin and runoff from the Alameda Creek Watershed. This local runoff, along with State Water Project (SWP) water, is percolated into the Niles Cone Groundwater Basin through recharge in Alameda Creek itself and through recharge ponds within and adjacent to the Quarry Lakes Regional Recreational Area. The water is subsequently recovered through groundwater production wells and provided as a potable supply to ACWD's customers.

In 1995 ACWD completed its Integrated Resources Planning Study which provides the foundation for ACWD's long-term water supply strategy. This multi-faceted strategy includes:

- Water conservation;
- Local conjunctive use;
- Off-site groundwater banking;
- Desalination of brackish groundwater; and
- Recycled water.

Over the past twelve years ACWD has implemented many components of this strategy including: a comprehensive water conservation program; improvements to the local groundwater recharge program; securing 150,000 acre-feet of off-site groundwater storage in Kern County; and implementation of Northern California's first brackish groundwater desalination facility. ACWD is currently in the process of expanding the capacity of this desalination facility and also has begun planning for a recycled water supply. Implementation of this comprehensive water management program means that ACWD will be able to meet its projected 2030 demands with <u>no increase</u> in its purchases from the SFPUC above ACWD's historical purchases, or ACWD's existing contractual entitlement (13.76 mgd). 01

Support for Implementation of the WSIP

As one of the SFPUC's larger wholesale customers, ACWD has a profound interest in seeing the SFPUC successfully execute its multi-billion dollar WSIP. We share with the residents of San Francisco the same desire for a high quality water supply and a reliable storage and conveyance system that will serve the present and future needs of the San Francisco Bay Area at a reasonable cost. 02

ACWD also supports the Bay Area Water Supply and Conservation Agency's (BAWSCA's) proposal that the final PEIR further describe and analyze the DPEIR's Modified WSIP Alternative (the environmentally superior alternative) and that the final PEIR explore the feasibility of the Bay Area water customers financially supporting water conservation with agricultural interests on the lower Tuolumne River that will result in no net decrease in flows on the lower Tuolumne. BAWSCA's proposal is to conserve even more agricultural water resulting in a net increase in lower Tuolumne River flows. This additional water could then be available to support greater flows in the lower Tuolumne River, deployed at times and in volumes most beneficial for salmon and other important species in the lower Tuolumne River. Under BAWSCA's proposal, the implementation of the WSIP can improve, rather than degrade, flow conditions in the lower Tuolumne River. 03

Need to Address Alameda Creek Watershed Impacts

Similar to addressing the Tuolumne River impacts, the DPEIR should also include a program to fully mitigate for flow impacts in the Alameda Creek Watershed. At almost 700 square miles, the Alameda Creek Watershed is the largest local watershed tributary to San Francisco Bay. This watershed is an important local resource in the Bay Area with much of the upper watershed remaining in pristine, natural condition. Alameda Creek provides many beneficial uses including 04

Mr. Paul Maltzer
Page 3 of 3
September 26, 2007

fisheries and riparian habitat for a wide variety of species, as well as serving as a vital source of water supply to the communities in ACWD (Fremont, Newark and Union City).

For that reason, ACWD's comments on the DPEIR, provided in the attached table, focus on ensuring that potential downstream impacts in the Alameda Creek Watershed, including the fishery resources and water supply to the Niles Cone Groundwater Basin, are adequately evaluated, and that full mitigation is provided for any adverse impacts. As these comments illustrate, the DPEIR is inadequate because of its failure to address: (1) downstream impacts to ACWD's water supplies from Alameda Creek and the Niles Cone Groundwater Basin, and (2) potential impacts to steelhead trout, a federally-protected species. Both of these impacts need to be addressed prior to finalization of the DPEIR. 04 cont.

We look forward to your consideration of this comment letter and continuing to work with the SFPUC throughout the implementation of the WSIP. If you have questions, please contact Doug Chun, Water Quality Manager at (510) 668-6510, or Eric Cartwright, Water Resources Planning Manager at (510) 668-4206.

Sincerely,

Paul Piraino
General Manager

Attachment: ACWD Comments on San Francisco Water Supply Improvement Program Draft PEIR

Comment No.	WSIP DPEIR Item of Concern	Summary of DPEIR Coverage of Item	ACWD Concerns regarding adequacy of DPEIR	ACWD Proposed Resolution
1	Section 3.8 Proposed Facility Improvement Projects, Table 3.10 Page 3-50	The DPEIR provides a description of the Alameda Creek Fishery Project in which is stated that the project would recapture the water released as part of the Calaveras Dam project.	The DPEIR does not indicate that the quantity of water to be "recaptured" would be limited to the quantity being released upstream. If more water is diverted at this recapture facility than is being released upstream, then there would be downstream flow impacts, including potential fishery impacts and water supply losses at ACWD's groundwater recharge facilities.	The DPEIR should clarify that the recapture facility would not capture any additional quantity of water than that which is being released upstream. If this is not the case, then the DPEIR should quantify the additional amount of water (beyond the upstream releases) and provide for measures to mitigate for downstream impacts.
2	Section 4.5, Hydrology and Water Quality; Bay Division Region, Page No. 4.5-6 to 4.5-7	This section provides information for the major water bodies and watersheds with beneficial use that could be affected by the Bay Division Region projects.	The DPEIR fails to address the Niles Cone Groundwater Basin which coincides with WSIP Facility Construction Projects BD-1, BD-2, and BD-3. The Niles Cone Groundwater Basin underlies the ACWD service area and provides approximately 40% of the water supply to a population of over 320,000 in Fremont, Newark and Union City	The DPEIR should include hydrology and water quality information, including an impact analysis and mitigation measures, for the Niles Cone Groundwater Basin wherever it coincides with WSIP Facility Construction Projects.
3	Hydrology and Water Quality: Section 4.5-2, Impact 4.5-1: Construction Impacts, Pages 4.5-21 to 28	The DPEIR describes possible water quality impacts during construction due to erosion, sedimentation and hazardous materials release.	The DPEIR should acknowledge that possible discharges to creeks and waterways in the Alameda Creek watershed could have impacts on downstream water intakes (i.e. at ACWD diversion facilities in the Flood Control Channel). ACWD would need immediate notification of any spills or discharges that could impact water quality.	The DPEIR should include an analysis of possible impacts on downstream water intakes at ACWD's facilities in the Flood Control Channel, and include in the mitigation measures development of a notification plan between SFPUC and ACWD in the event of a spill or release to any waterways in the Alameda Creek system.

05

Comment No.	WSIP DPEIR Item of Concern	Summary of DPEIR Coverage of Item	ACWD Concerns regarding adequacy of DPEIR	ACWD Proposed Resolution	
4	Hydrology and Water Quality: Section 4.5-2, Impact 4.5-3, Pages 4.5-31 to 37	The DPEIR describes possible water quality impacts from dewatering and construction-related discharges in the Alameda Creek watershed.	The DPEIR does not mention that discharges could impact downstream water users in the Alameda Creek watershed if control measures fail. ACWD would need notification of any discharges to the Alameda Creek system that may contain contaminants due to failure of the proposed control measures.	The DPEIR should include a discussion of possible control measure failures and downstream impacts on ACWD's diversion and groundwater recharge facilities. Include in the mitigation measures development of a notification plan between SFPUC and ACWD in the event of contaminants being released to any waterways in the Alameda Creek system.	05 cont.
5	Hydrology and Water Quality: Section 4.5-2 Impact 4.5-4 Pages 4.5-37 to 41	The DPEIR describes possible flooding and water quality impacts associated with impeding or redirecting flood flows. In the Sunol Valley region, flooding impacts are considered potentially significant.	The DPEIR does not mention that flooding and possible sediment and contaminant releases could affect downstream water users. ACWD would need notification of flood events with known contaminant releases related to construction, or flood events related to construction that could have an impact on ACWD's inflatable dam and groundwater recharge operations.	The DPEIR should include a discussion of possible impacts on ACWD's diversion and groundwater recharge facilities. Include in mitigation measures development of a notification plan between SFPUC & ACWD.	06
6	Hydrology and Water Quality: Section 4.5-2, Impact 4.5-5 Pages 4.5-41 to 49	The DPEIR describes impacts due to degradation of water quality and increased flows due to discharges to surface water during operations	The DPEIR does not mention that changes in flow conditions in Alameda Creek could affect ACWD's rubber dam and diversion operations in the Alameda Creek Flood Control Channel.	The DPEIR should include a discussion of possible impacts of discharges on Alameda Creek flow conditions and ACWD's downstream inflatable dam and diversion operations. Include in the mitigation measures development of a notification plan between SFPUC and ACWD for such events.	07

L_ACWD

Comment No.	WSIP DPEIR Item of Concern	Summary of DPEIR Coverage of Item	ACWD Concerns regarding adequacy of DPEIR	ACWD Proposed Resolution	
7	Section 4.11 "Pipelines" (subsection) This subsection discusses the setting and impacts of the pipeline projects. Page 4.11-10, 11, 12	The DPEIR states that pipeline construction activities could result in disruption and/or damage to existing utilities if they are not properly identified prior to construction. The section text indicates that pipelines would be identified during design, and detailed engineering and construction plans would be prepared as a condition of approval "…for either a utility excavation permit or an encroachment permit."	The ACWD water distribution system pipelines cross the existing BDPL Nos. 1 and 2 at many locations along the SFPUC right-of-way between Irvington Portal and the Newark Valve Lot. Construction of the proposed welded steel pipeline within this right-of-way is expected to impact many, if not all, of these pipeline crossings. ACWD wants to ensure potential utility conflicts are identified and resolved well in advance of the project construction phase.	In order to avoid any problems that may adversely impact ACWD's pipelines and/or ACWD's ability to provide water service to our customers, the SFPUC should coordinate with ACWD during the project planning and design phases to minimize the impacts associated with conflicting water facilities.	08
8	Section 4.11, various pages including: 4.11-14, "Bay Division Region" 4.11-22 & 23, "Siting Impacts"	The DPEIR states that the WSIP projects may result in the need for relocation of utilities and such relocations would have the potentially significant impacts. However, these impacts would be mitigated to a less than significant impact by implementation of "SFPUC Construction Measure #1, neighborhood noticing and identification of public utility lines prior to commencing construction".	Neighborhood noticing and identification of utilities *will not* reduce the potential for construction impacts to a less than significant level.	ACWD requests that SFPUC coordinate with ACWD and obtain ACWD review and concurrence with the project design and planned protective measures, prior to releasing the plans for construction (this would entail a modification to Mitigation Measure 4.11-1h, see below).	
9	Attachment 4-A, "Public Services and Utilities" (subsection), page 41 Mitigation Measure 4.11-1g (erroneously listed as -2g)	The mitigation measure indicates that SFPUC or its contractor will reconnect any utility lines disconnected in the course of construction.	Without an on-site ACWD inspector, disconnection and/or reconnection of ACWD pipelines may result in damages to ACWD facilities and/or water service disruptions to ACWD's customers.	The proposed mitigation measure should also include prior notification and coordination with ACWD such that either ACWD can perform necessary work in advance of SFPUC construction, or ACWD can provide an inspector for any construction work that involves ACWD facilities, whichever ACWD determines to be most appropriate. Disinfection,	

Comment No.	WSIP DPEIR Item of Concern	Summary of DPEIR Coverage of Item	ACWD Concerns regarding adequacy of DPEIR	ACWD Proposed Resolution	
				flushing and bacteriological testing of reconnected lines should be done in accordance with AWWA Standard C651.05 for main disinfection.	08 cont.
10	Attachment 4-A, "Public Services and Utilities" (subsection), page 41 Mitigation Measure 4.11-1h	The mitigation measure indicates SFPUC or its contractors will coordinate final construction plans and specifications with affected utilities.	Coordination needs to take place long before plans are finalized in order to allow for preparations (such as utility relocations) to be completed in an orderly way. Also, SFPUC should commit that the plans and specification shall be *approved* by ACWD in advance of being finalized.	The mitigation measure should state that SFPUC will coordinate plans and specifications with affected utilities throughout the design process. Plans and specifications relating to ACWD facilities shall be approved by ACWD before being released for construction.	
11	Section 5.4.1.1 – Alameda Creek Watershed Streams and Reservoirs, Stream Flow and Reservoir Water Levels, Setting Page 5.4.1-1 to 5.4.1-4	The DPEIR description of the Alameda Creek Watershed Boundary covers the entire upper watershed, but downstream, extends only to Niles Canyon (as shown on Figure 5.4.1-1).	This description of the watershed boundary is not complete. From Niles Canyon, Alameda Creek extends downstream approximately 12 miles to San Francisco Bay. Correspondingly, the watershed also extends to San Francisco Bay, and includes portions of the Cities of Fremont, Newark and Union City. This downstream section of the creek (channelized in the 1970's by the US Army Corps of Engineers and called Alameda Creek Flood Control Channel) provides multiple beneficial uses including groundwater percolation and water supply, flood control, recreation, fish habitat and migratory corridor, and riparian habitat. The Niles Cone Groundwater Basin underlies the Flood Control Channel and has historically been recharged from flows in Alameda Creek. This groundwater basin, managed by ACWD, provides approximately 40% of the water supply to a population of over 320,000 in Fremont, Newark and Union City. The Flood Control Channel also provides fish habitat and a riparian corridor. By not including this downstream segment in	The DPEIR should be revised to include the downstream section of the watershed to San Francisco Bay. Analyses of potential impacts to stream flows, flood control, fisheries and riparian habitat in the Flood Control Channel and groundwater percolation and water supply in the underlying Niles Cone Groundwater Basin should be included in the DPEIR. The DPEIR should include mitigation measures, if necessary, for any significant impacts in this downstream section of the watershed.	09

L_ACWD

Comment No.	WSIP DPEIR Item of Concern	Summary of DPEIR Coverage of Item	ACWD Concerns regarding adequacy of DPEIR	ACWD Proposed Resolution	
			the DPEIR analyses, the DPEIR does not provide an adequate analysis of potential downstream impacts to water supply, flood control and fisheries in this section of the creek and watershed.		09 cont.
12	Section 5.4.1.2 – Alameda Creek Watershed Streams and Reservoirs, Impacts, Approach to Analysis Page 5.4.1-17 to 5.4.1-18	The Baseline Conditions used in the analyses of impacts downstream of Calaveras Reservoir is based on existing operating conditions of Calaveras Reservoir. This includes the 2001 Division of Safety of Dams (DSOD) requirements that Calaveras Reservoir be operated at approximately 40% of its maximum capacity (due to DSOD's concern about the seismic stability of the dam). This Baseline Condition also includes the associated operation of the Alameda Creek Diversion Dam (ACDD), which diverts water to fill Calaveras Reservoir. Under existing conditions with DSOD restrictions, the Alameda Creek Diversion Dam has passed significantly more Alameda Creek flows downstream then under pre-2001 operations (prior to the DSOD restriction).	The DPEIR indicates that the Calaveras Dam project will not be fully implemented until 2012, thereby resulting in over ten years of operations under the current DSOD restrictions. Because of this extended timeframe, it is appropriate to utilize the operations of Calaveras and ACDD under the DSOD restrictions as the Baseline Conditions. In order to determine downstream impacts on flows, the DPEIR should rely solely on these Baseline Conditions to compare against the projected flows under the proposed Program.	ACWD supports the use of the Baseline Conditions under the existing DSOD requirements for Calaveras Reservoir and the associated diversions at Alameda Creek Diversion Dam.	10

L_ACWD

L_ACWD

Comment No.	WSIP DPEIR Item of Concern	Summary of DPEIR Coverage of Item	ACWD Concerns regarding adequacy of DPEIR	ACWD Proposed Resolution
13	Section 5.4.1.2 – Alameda Creek Watershed Streams and Reservoirs, Impacts, Approach to Analysis Page 5.4.1-18	As documented in the DPEIR (Appendix H), projected changes to streamflows and reservoir levels attributed to implementation of the WSIP are evaluated through the use of the Hetch-Hetchy/Local Simulation Model (HH/LSM). All modeling of impacts to Alameda Creek flows was conducted on a monthly time step. These results are presented as average monthly flows. In the discussion of model limitations, the PEIR notes that "the model results were not solely relied upon when evaluating flows in creeks immediately downstream of SFPUC reservoirs that normally have minimal flow or are affected by SFPUC operations for time periods less than a month in duration." Operator experience and knowledge are cited as additional considerations for the evaluation.	The monthly model time step is not sufficient to capture day-to-day flow impacts that may be significant. In addition, the PEIR does not provide enough detail about the day-to-day evaluations that were based on "operator experience and knowledge." Winter and spring flows in Alameda Creek and its tributaries are highly variable, and are primarily a function of the daily rainfall conditions. It is common for daily flows within a month to vary widely, with peak flows occurring during and directly after a rainfall event. Flows quickly recede after these periods of rainfall. Because of these wide variations in daily flows, the use of a monthly time step to evaluate downstream flow impacts is not adequate. For instance, implementation of the WSIP program may significantly reduce stream flows for a portion of a month (with significant impacts to fisheries and downstream water supplies) while keeping water in the creek for the remainder of the month. However, with the use of average monthly flows in the HH/LSM, the impacts of significantly reducing flows during a portion of the month would be obscured, or entirely overlooked in the DPEIR impact analysis.	The DPEIR should analyze downstream flow impacts utilizing a daily time-step for the Alameda Creek watershed. Given the highly variable flow conditions in the watershed, a daily time step is necessary to analyze and properly assess impacts to both fisheries and water supply. As an example, ACWD utilizes a spreadsheet based operational model, utilizing a daily time step, with over 70 years of daily hydrology on Alameda Creek. This ACWD model is used for the planning and operation of ACWD water supply facilities in the Alameda Creek Flood Control Channel. In order to facilitate the implementation of a similar daily hydrologic model of the SFPUC's Alameda Creek watershed operations, ACWD can provide the SFPUC with daily input data, including hydrologic data from the watershed.

11

L_ACWD

Comment No.	WSIP DPEIR Item of Concern	Summary of DPEIR Coverage of Item	ACWD Concerns regarding adequacy of DPEIR	ACWD Proposed Resolution
14	Section 5.4.1.2 – Alameda Creek Watershed Streams and Reservoirs, Impacts, Impact 5.4.1-4: Effects of flow along Alameda Creek below the confluence of San Antonio Creek Page 5.4.1-39 to 5.4.1-40	The DPEIR analyzes impacts to downstream flows on Alameda Creek below the confluence with San Antonio Creek. This represents the furthest downstream flow impact analysis that is provided in the DPEIR. The results from the impact analyses indicates that winter/spring flows would be reduced by an average of approximately 50% during normal years, and approximately 30% during above normal and wet years. The DPEIR states that these impacts would be dampened by inflows from downstream tributaries and characterizes this impact as "less than significant".	The DPEIR does not adequately address potential downstream impacts to flows. Specific deficiencies include: 1. The DPEIR does not include an evaluation of flow impacts downstream in Niles Canyon or in the Flood Control Channel. An impact assessment in both of these reaches is required to determine potential impacts to fisheries, riparian habitat and water supply (see comment no. 11 above, regarding need to address full extent of Alameda Creek Watershed in impact analysis). 2. The impact assessment is based on a hydrologic model utilizing a monthly time step. As discussed in comment no. 13 above, the impact analyses for flows in the Alameda Creek watershed should utilize a daily time step. This is necessary to account for the highly variable flow conditions that occur within any given month during winter and spring conditions. 3. The DPEIR's assertion that flow impacts would be "dampened" by inflows from other tributaries is not supported by any technical analyses or documentation.	In order to adequately address potential downstream impacts to flows in Alameda Creek, the DPEIR should be revised: 1. The impact assessment should include downstream Alameda Creek flow impacts both in Niles Canyon and in the Flood Control Channel. The impact assessment should address potential flow related impacts to fisheries as well as water supply impacts to ACWD groundwater recharge operations. 2. The flow impact analyses should be performed with a daily hydrologic model in order that potential impacts under the wide variations in daily flows can be accurately evaluated. 3. The DPEIR should provide technical evaluation of the mitigating impacts of "flow dampening" from downstream tributaries. This analysis should also be performed with a hydrologic model with a daily time step. 4. The impact conclusions should be re-evaluated based on the revised technical analysis, as described above. The level of significance of the downstream flow impacts in Niles Canyon and

12

L_ACWD

Comment No.	WSIP DPEIR Item of Concern	Summary of DPEIR Coverage of Item	ACWD Concerns regarding adequacy of DPEIR	ACWD Proposed Resolution	
				the Flood Control Channel should be made in consultation with ACWD to determine potential water supply impacts, and with qualified biologists to determine impacts to fisheries, aquatic and riparian habitat. 5. The DPEIR should also include mitigation measures to develop a joint communications/notification plan between SFPUC and ACWD to minimize the impacts of day-to-day and hour-to-hour changes in streamflows that could affect ACWD's downstream operations and facilities.	12 cont.
15	Section 5.4.2.2 – Geomorphology, Impacts: Page 5.4.2-2 to 5.4.2-4	The PEIR notes that under WSIP, uncontrolled reservoir releases could result in increased erosion, sediment transport and deposition downstream of Calaveras Dam compared to current conditions, but that it would be similar to long-term conditions that formed the channel and would be less than significant.	Given that Baseline Conditions should be used as the basis to determine impacts, it is inappropriate to base the level of significance on a comparison with conditions other than Baseline Conditions (i.e. before Calaveras DSOD restrictions). Also, the DPEIR does not consider any impacts on geomorphology and sediment transport in Alameda Creek downstream of Calaveras Creek and through Niles Canyon and the Flood Control Channel. In addition, the DPEIR does not address the possible impact of additional debris loading downstream due to changes in flows; this can be a significant issue for ACWD's downstream facilities. For instance, logs and other floating debris can damage or puncture ACWD inflatable dams in the Alameda Creek Flood Control Channel.	1. The DPEIR should evaluate the significance determination based solely on the Baseline Conditions, (as described in the DPEIR on pages Page 5.4.1-17 to 5.4.1-18). 2. The DPEIR should include an evaluation of downstream impacts on geomorphology and sediment transport in Niles Canyon and the Alameda Creek Flood Control Channel. 3. The DPEIR should also include an evaluation of downstream debris loading as a possible downstream impact at ACWD's groundwater recharge facilities in the Alameda Creek Flood Control Channel.	13

A-8

L_ACWD

Comment No.	WSIP DPEIR Item of Concern	Summary of DPEIR Coverage of Item	ACWD Concerns regarding adequacy of DPEIR	ACWD Proposed Resolution	
16	Section 5.4.3.1 Setting/Surface Water Quality, (including Tables 5.4.3-3 and 5.4.3-4) Pages 5.4.3-4 to 5.4.3-6	The DPEIR cites ACWD temperature data from Alameda Creek at the mouth of Niles Canyon with a reference to "ACWD, 2007," but the reference at the end of the section is to ACWD's website, which does not contain this data.	ACWD has several concerns regarding this item: 1) Reference is incorrect; 2) ACWD temperature and TDS data may not be subject to the rigorous QA/QC procedures that would be required for data used in scientific studies, and therefore should not be used for purposes other than an indication of general conditions (unless otherwise specified by ACWD); 3) Text on 5.4.3-4 notes that the data is from the monitoring station at the mouth of Niles Canyon near Mission Blvd., but Tables 5.4.3-3 & 4 cite the location as "near Sunol." These appear to be two different locations.	The DPEIR should be modified to: 1) Provide appropriate reference; 2) Include disclaimer that data QA/QC is not to the level of scientific studies; 3) Clarify monitoring location.	14
17	Section 5.4.3.1 Setting/Surface Water Quality Page 5.4.3-5	The DPEIR states "... most of the summer and fall flows in Alameda Creek below its confluence with Arroyo de la Laguna originate from the South Bay Aqueduct. This South Bay Aqueduct water may be warmer and is higher in total dissolved solids (TDS) than the flows in Alameda Creek originating from the Sunol Valley watershed."	The statement that most summer & fall flows below the confluence of Arroyo de la Laguna are due to releases of South Bay Aqueduct (SBA) water into Alameda Creek is incorrect. The amount of SBA contributions to Alameda Creek flow can vary greatly from year to year depending on the year type, and from day to day depending on operations. Flows in Alameda Creek during these times are also highly dependant on other discharges within the watershed, and often a significant portion of the flow passing through Niles Canyon originates in Arroyo de la Laguna. Additionally, no data is provided to substantiate the claim that SBA water is warmer and higher in TDS. Air and water temperature studies conducted by Hanson Environmental (October 2002) concluded that, based on the available data, "no apparent pattern or trend was detected in (Alameda Creek) water temperature that could be directly attributable to releases from the South Bay Aqueduct into Alameda Creek".	Remove generalized statement about SBA water or expand discussion about the variations in SBA contributions to flow conditions and the other variables (Arroyo de la Laguna flow, quarry discharges, etc.) that can contribute flow during summer and fall. Unless the SFPUC can cite specific data or studies, remove incorrect statements that claim that SBA water released into Alameda Creek is warmer than local watershed inputs.	15

L_ACWD

Comment No.	WSIP DPEIR Item of Concern	Summary of DPEIR Coverage of Item	ACWD Concerns regarding adequacy of DPEIR	ACWD Proposed Resolution	
18	Section 5.4.3.2 Surface Water Quality – Impacts	The DPEIR determines that water quality impacts are less than significant based on an analysis of a small number of water quality parameters, including temperature, dissolved oxygen and nutrients.	This section does not address the possibility of turbidity impacts due to changing operational and flow conditions under the WSIP. Increased turbidity at lower flows could affect ACWD groundwater recharge operations. Specifically, high turbidity in flows captured by ACWD's downstream facilities may significantly reduce the percolation capacity at ACWD's recharge ponds. In addition, ACWD may lose significant water supplies if, because of high turbidity, ACWD cannot divert and percolate this water and must instead bypass it.	This section should include an analysis of the impacts of WSIP operations and flows on downstream turbidity in the Flood Control Channel and potential impacts to ACWD's groundwater recharge operations. Any water supply or operational impacts to ACWD should be fully mitigated.	16
19	Section 5.4.4, Groundwater Page 5.4.4.1 and Impact 5.4.4-1 Page 5.4.4-6	The PEIR states that, "Because the proposed program would not affect upstream areas in the Livermore Valley or lower areas in the Niles Cone (which is below the SFPUC's infiltration galleries), this section focuses on describing the groundwater conditions and potential WSIP impacts in the Sunol Valley". Under a later discussion of groundwater impacts (Impact 5.4.4-1) the DPEIR states that "impacts on groundwater in the Niles Cone would be dampened by inflow from non-SFPUC watershed streams and aquifers, removal of the Sunol and Niles Dams, and ongoing withdrawals at the infiltration galleries above the water temple; as a result, impacts are expected to be minimal."	The DPEIR incorrectly states that the proposed program would not impact the Niles Cone Groundwater Basin. As described above, the Niles Cone Groundwater Basin underlies the Alameda Creek Flood Control Channel (which historically has provided the majority of the recharge for the basin) and provides approximately 40% of the water supply to the communities of Fremont, Newark and Union City. The DPEIR has already acknowledged that winter and spring flows in Alameda Creek (below the confluence with San Antonio Creek) will be reduced by over 50% in normal years. Given ACWD's reliance on these winter and spring flows to replenish the Niles Cone Groundwater Basin (and to protect the Basin from seawater intrusion from San Francisco Bay), the Niles Cone would, in fact, be affected by the proposed WSIP. Under Impact 5.4.4-1, the DPEIR is incorrect	The DPEIR should include an analysis of potential impacts to the Niles Cone Groundwater Basin and ACWD's water supplies from the Niles Cone Groundwater Basin. This impact analysis should consider potential impacts due to changes in timing, quantity, and quality of flows in the Alameda Creek Flood Control Channel. The impact analyses should use the Baseline Conditions as described in Section 5.4.1.2 (post DSOD requirements for Calaveras operations) and should consider ACWD's facilities and operations utilized for groundwater recharge in the Flood Control Channel and adjacent percolation ponds. The DPEIR should also include mitigation for any resulting impacts to water supply or water quality in the Niles Cone	17

L_ACWD

Comment No.	WSIP DPEIR Item of Concern	Summary of DPEIR Coverage of Item	ACWD Concerns regarding adequacy of DPEIR	ACWD Proposed Resolution	
			in stating that impacts to Niles Cone would be dampened by inflow from other streams, removal of Sunol and Niles Dam, and ongoing withdrawals at the infiltration gallery. First, the removal of Sunol and Niles Dams is not part of the WSIP, and in fact occurred several years prior to the release of this Draft PEIR. Second, the infiltration galleries referred to result in a net loss of supplies to Niles Cone, and thus would provide no "dampening" effects. Third, inflows from non-SFPUC tributaries would not change as a result of the WSIP program, and therefore would not offset the loss of water supplies to the Niles Cone Groundwater Basin.	Groundwater Basin.	17 cont.
20	Section 5.4.5.1 - Alameda Creek Fisheries: Potential Steelhead Restoration Page 5.4.5-11	The DPEIR does not include any analysis of the WSIP's potential impacts to steelhead in the Alameda Creek Watershed. The DPEIR's rationale for this approach is that, under existing conditions, steelhead cannot access the upper watershed (i.e. upstream of the BART weir), and therefore, the WSIP implementation would not impact steelhead upstream of the BART weir. The DPEIR also states that since a number of steps are required before steelhead can access the upper watershed, it would be "speculative" to assess the specific impacts that the WSIP operations may have on a future restored steelhead fishery.	The DPEIR's failure to evaluate steelhead impacts is based on an incorrect and incomplete assessment of the current status of steelhead fishery in Alameda Creek and the ongoing steelhead fishery restoration efforts. The DPEIR does not consider the following facts in its approach to evaluating impacts to a steelhead fishery: (1) Under existing conditions, there are annual sightings of steelhead in the Alameda Creek system. Multiple sightings of steelhead in the Alameda Creek Flood Control Channel have been documented every year since 1998 by Alameda Fishery Workgroup members. These steelhead are attracted to the Alameda Creek watershed by the winter and spring flows. As noted above, implementation of the WSIP would substantially reduce winter and spring Alameda Creek flows (by up to 50% in normal years according to the WSIP's impacts analysis for Alameda Creek flows below the	The DPEIR should correctly describe: (1) the current status of steelhead in the lower watershed (i.e. under existing conditions steelhead are sighted annually in the flood control channel below the BART weir) and (2) the on-going efforts to provide access to the upper watershed, including the recent ACWD/ACFC&WCD Agreement that provides for preliminary design of a fish passage facility with a goal of constructing this facility by the year 2010. Given this corrected information, the DPEIR should address potential impacts of the WSIP on both the existing steelhead downstream in the Flood Control Channel, and a future restored steelhead population in the	18

Comment No.	WSIP DPEIR Item of Concern	Summary of DPEIR Coverage of Item	ACWD Concerns regarding adequacy of DPEIR	ACWD Proposed Resolution	
			confluence below San Antonio Creek). Flow reductions of this magnitude may adversely impact steelhead that currently access Alameda Creek below the BART weir. (2) There is an active program to restore steelhead to the upper watershed through the Alameda Creek Fisheries Restoration Workgroup. A MOU signed by the Workgroup stakeholders, including the SFPUC, documents the process that the Workgroup members are taking to restore steelhead. This MOU also provides a commitment to conduct the studies necessary to determine flow requirements for a restored steelhead fishery. The first phase of these studies is near completion. (3) There is an active and on-going program to address fish passage in the Alameda Creek Flood Control Channel. For example, ACWD and Alameda County Flood Control and Water Conservation District (ACFC&WCD) have prepared conceptual designs for fish passage at the BART weir and ACWD's inflatable dams. More recently ACWD and ACFC&WCD governing boards approved an Agreement to provide for preliminary design of a fish ladder to provide passage at the BART weir and middle inflatable dam. Under this Agreement, the timeline for constructing the fish ladder is by the year 2010 (two years before the completion of the Calaveras Dam project). ACWD's Capital Improvement Program, adopted by the ACWD Board in 2007, also provides for funding for ACWD's share of this project costs in the years 2007 through 2010.	upper watershed. The DPEIR should include mitigation measures to avoid adverse impacts to flows needed for the existing steelhead returning to the Alameda Creek Flood Control Channel and the planned future restored steelhead fishery. This analysis should consider impacts along the full length of Alameda Creek, from SFPUC facilities in the upper watershed downstream to San Francisco Bay.	18 cont.

Comment No.	WSIP DPEIR Item of Concern	Summary of DPEIR Coverage of Item	ACWD Concerns regarding adequacy of DPEIR	ACWD Proposed Resolution	
21	Section 5.4.5.2 - Alameda Creek Fisheries: Impacts – Impact 5.4.5-6 Effects on fisheries along Alameda Creek downstream of San Antonio Creek Page 5.4.5-21 to 5.4.5-22	The DPEIR impact analysis focuses primarily on fishery impacts related to San Antonio Creek and reservoir operations. DPEIR conclusion is that impacts would be "less than significant". The DPEIR provides no discussion of downstream fishery impacts in Sunol Valley, Niles Canyon or the Flood Control Channel.	The DPEIR discussion of impacts to fishery resources along Alameda Creek below the confluence with San Antonio Creek is incomplete. Under existing conditions there is significant fishery habitat in Alameda Creek downstream of the confluence with San Antonio Reservoir. The fishery resources have been documented by the Department of Fish and Game, the Alameda Creek Fishery Workgroup, and others. The DPEIR's flow analyses also indicates that winter/spring flows below in Alameda Creek below the confluence would be reduced by approximately 50% during normal years. Given these substantial flow reductions, and the extent of the existing downstream fishery resources in Sunol Valley, Niles Canyon and the Flood Control Channel, the DPEIR evaluation of fishery-related impacts is incomplete without an evaluation of potential impacts in these downstream reaches.	The DPEIR should include an evaluation of potential impacts to Alameda Creek fishery resources downstream of the San Antonio confluence. This impact evaluation should address potential impacts to fisheries downstream to San Francisco Bay and include Sunol Valley, Niles Canyon, and the Alameda Creek Flood Control Channel.	19
22	Section 5.7 Cumulative Projects and Impacts Related to WSIP Water Supply and System Operations Page No. 5.7-55	Figure 5.7-3 Future Projects in the Alameda Creek Watershed Considered in the Cumulative Analysis.	The figure shows facilities in wrong locations.	The DPEIR should be revised to correct the following facility locations: 1.) ACWD Wells (actual location is south of Alameda Creek) 2.) The BART Weir 3.) ACWD Upper Inflatable Dam, AC-6 "Upper Inflatable Dam Fish Passage Project", and AC-2b "Alameda Creek Pipeline No. 1 Fish Screen." These projects are all in the same vicinity just downstream of the Mission Blvd. bridge.	20

L_ACWD

Comment No.	WSIP DPEIR Item of Concern	Summary of DPEIR Coverage of Item	ACWD Concerns regarding adequacy of DPEIR	ACWD Proposed Resolution	
23	Surface Water Hydrology and Water Quality: Section 6.3.4, Pages 6-9 to 10	The DPEIR outlines mitigation measures for water quality and hydrology.	The DPEIR does not provide mitigation measures that include notification of ACWD in the event of any flow changes or water quality contamination events that could affect ACWD's downstream rubber dam and diversion facility operations. (See comments on impacts 4.5-1, 4.5-3, 4.5-4, 4.5-5.) A coordinated notification plan is vital to protection of ACWD's water resources.	The DPEIR should include an additional mitigation measure that includes a commitment to develop a coordinated notification plan between SFPUC and ACWD for events that could unexpectedly alter flows or release contaminants that could affect ACWD's downstream operations.	21
24	Section 6.4.3 – Alameda Creek Watershed Streams and Reservoirs: Mitigation Measure 5.4.1-2: Diversion Tunnel Operation Page 6-51 to 6-52	This mitigation item directs the SFPUC to "establish and implement written operational criteria" for Alameda Creek Diversion Dam (ACDD) operations. As described in the DPEIR, the operating criteria would give priority to diverting water to Calaveras, and once Calaveras storage targets are met, the water would be passed downstream.	The proposed "mitigation" measure does not provide any real mitigation for downstream flow impacts since the operational criteria will simply document the operation of the facility.	This mitigation measure should be revised to provide actual mitigation of the impacts due to reduced flows downstream of the ACDD.	
25	Section 6.4.3, Streamflow & Reservoir Water Levels - System Measures Pages 6-51 to 52	The DPEIR does not include any mitigation for altered streamflows and the possible effects on ACWD's downstream operations.	Alterations of streamflows caused by the WSIP (on a day-to-day and hour-to-hour basis) could have significant impacts on real-time operations at ACWD's downstream rubber dams and diversion facilities.	The DPEIR should include an additional mitigation measure that includes development of a joint communications/notification plan between SFPUC and ACWD to minimize the impacts of day-to-day and hour-to-hour changes in streamflows that could affect ACWD's downstream operations and facilities.	22

L_ACWD

Comment No.	WSIP DPEIR Item of Concern	Summary of DPEIR Coverage of Item	ACWD Concerns regarding adequacy of DPEIR	ACWD Proposed Resolution	
26	Section 6.4.3 – Alameda Creek Watershed Streams and Reservoirs: Mitigation Measure 5.4.5-3a: Minimum Flows for Resident Trout on Alameda Creek Page 6-52 to 6-54	Under this mitigation measure, the SFPUC would provide a minimum flow downstream of the ACDD from Dec 1 to April 30 to support resident trout spawning and egg incubation. The quantity of flow is not specified – rather the DPEIR states that the SFPUC will complete the studies needed to "determine the appropriate minimum stream flow for this reach of the creek". The DPEIR notes that a minimum flow of 10 cfs "has been suggested".	The proposed flow releases under this mitigation measure are contingent on future studies by the SFPUC. Therefore this measure will not provide for any real mitigation if the SFPUC chooses to release minimal amounts based on its own staff recommendations. The SFPUC has already conducted numerous fishery and hydrologic studies of this section of the creek. Indefinite deferral of a determination of the amount of flow is impermissible under CEQA.	Based on the existing studies and consultation with Department of Fish and Game biologists, the DPEIR should commit to a minimum level of flow releases for fisheries, rather than rely on future studies by SFPUC staff.	23
27	Section 7.3.4 Growth in Water Demand Compared with Growth in Population and Employment Page 7-32 to 7-36	The DPEIR provides a comparison of projected growth in water demands versus projected growth in employment and population. This section includes a table (Table 7.10) that provides a comparison for specific agencies that lists the customer's demands as "Percentage of Total 2030 Demand". A discussion is also provided for each wholesale customer, including ACWD (page 7-35). Under the ACWD discussion it is stated that ACWD's 2030 water purchase estimate is approximately 15% higher than its 2001 water purchase. This section also states that the employment projection used in the SFPUC's demand study is about 25% higher than the employment projections incorporated in the general plans of the cities in ACWD service area (Fremont, Newark, and Union City).	ACWD has the following concerns regarding this section of the DPEIR: 1. Table 7.10 expresses the wholesale customers' projected demands as a function of the total demand in the area served by the San Francisco Regional Water System. However, the table does not indicate that, in ACWD's case, only approximately 25% of ACWD's projected demand will be met by purchases from the San Francisco system. As currently configured, this table provides a misleading characterization that ACWD has the highest projected demand of water from the San Francisco System. 2. The DPEIR does not recognize that ACWD's estimated 2030 purchase of water from the SFPUC (13.76 mgd) is within its existing contractual maximum, and is no greater than ACWD's historical purchases. For instance in fiscal year 2006/07, ACWD purchased its full contractual quantity from	The DPEIR should be revised as follows: 1. Table 7.10 should be revised to note that ACWD's estimated 2030 water purchases from the SFPUC are only 25% of ACWD's 2030 demand. 2. The DPEIR should correctly state that ACWD's 2030 purchase estimate is: (a) no more than ACWD's existing contractual entitlement (13.76 mgd), and (b) no more than ACWD has historically purchased from the SFPUC. 3. Rather than compare the 2030 ABAG employment projections against the 2020 general plan employment projections, the DPEIR should be revised to	24

L_ACWD

Comment No.	WSIP DPEIR Item of Concern	Summary of DPEIR Coverage of Item	ACWD Concerns regarding adequacy of DPEIR	ACWD Proposed Resolution
			the SFPUC, and is not requesting an amount greater than this historical usage for its 2030 purchase estimate. 3. The comparison between the employment projections provided by ABAG and the cites's general plans is misleading. The planning horizon for the cities' general plans is the year 2020, whereas the ABAG projections are for the year 2030. If the ABAG projections for the year 2020 are utilized, the difference between the two approaches (ABAG versus general plans) is much less (approximately 10%).	compare the 2020 ABAG employment projections versus the 2020 general plan projections.
28	General Comment		Since ACWD relies on the BDPLs as sources for blending and water distribution, any potential disruption of these sources may impact ACWD's ability to meet customer demands and fire flow requirements.	SFPUC should work with ACWD to review potential operational impacts of any project options which may involve disruption of the BDPL Nos. 1 and 2.

October 1, 2007

Paul Maltzer, Environmental Review Officer
San Francisco Planning Department
WSIP PEIR
1650 Mission Street, Suite 400
San Francisco, CA 94103

Re: Program Environmental Impact Report; Water System Improvement Program

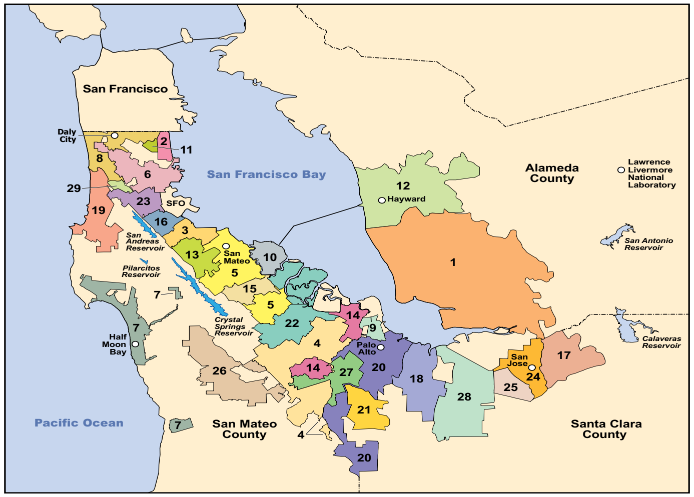
Dear Mr. Maltzer:

The Bay Area Water Supply and Conservation Agency (BAWSCA) appreciates the opportunity to offer comments on the comprehensive draft Program Environmental Impact Report (PEIR) which the Planning Department has prepared for the Water System Improvement Program (WSIP) being developed by the San Francisco Public Utilities Commission (SFPUC).

1. BAWSCA'S INTEREST IN THE WSIP

BAWSCA is an independent special district whose board of directors represents the 27 long-term contract customers of San Francisco in Alameda, San Mateo and Santa Clara counties. These neighboring communities include 16 cities, 9 water districts, an investor-owned public utility and Stanford University. The individual customers are listed, and their service areas are depicted, on Figure 1.

Figure 1. Map of BAWSCA Service Area



1 Alameda County Water District
2 City if Brisbane
3 City of Burlingame
4 CWS - Bear Gulch
5 CWS - Mid-Peninsula
6 CWS - South San Francisco
7 Coastside County District
8 City of Daly City
9 City of East Palo Alto
10 Estero Municipal Improvement District
11 Guadalupe Valley MID
12 City of Hayward
13 Town of Hillsborough
14 City of Menlo Park
15 Mid-Peninsula Water District
16 City of Millbrae
17 City of Milpitas
18 City of Mountain View
19 North Coast County Water District
20 City of Palo Alto
21 Purissima Hills Water District
22 City of Redwood City
23 City of San Bruno
24 City of San Jose (North)
25 City of Santa Clara
26 Skyline County Water District
27 Stanford University
28 City of Sunnyvale
29 Westborough Water District

Many of these customers rely on San Francisco for 100% of the water they distribute. All but one obtain more than 50% of their supply from the San Francisco regional system. Collectively, they purchase over two-thirds of the water which the SFPUC distributes, and pay over two-thirds of the cost of the regional water system. (In fiscal year 2006-07, customers represented by BAWSCA paid SFPUC over $100 million.) The water purchased from San Francisco is redistributed to over 1.7 million residents in the neighboring communities that rely on the San Francisco regional system. Their interest, individually and collectively, in a reliable water system, and therefore in the Water System Improvement Program evaluated in the draft PEIR, is plain to see.

2. ORGANIZATION OF BAWSCA'S COMMENTS

This letter addresses the major themes of the PEIR, with particular emphasis on the basic purpose of, and urgency for, the WSIP, and on the alternatives to it described in the draft PEIR. Attachment 1 to this letter contains our more specific, section-by-section review of the draft PEIR. We are also submitting separately bound volumes that provide additional information on, and illustrations of, wholesale customers' water conservation and efficiency measures, recycled water projects, and the "Smart Growth" that is encouraged by land use policies of San Francisco's neighboring communities. Finally, many of the individual wholesale customers which are members of BAWSCA will be submitting comments separately, addressing the elements of the draft PEIR that affect them directly and providing their individual perspectives on the PEIR and the program itself. 01

3. SUMMARY OF BAWSCA COMMENTS

- The draft PEIR is a conscientious, and largely successful, effort to satisfy the requirements of the California Environmental Quality Act (CEQA) for program EIRs.
- However, the description of the program in the draft PEIR does not convey to the reader the fundamental purpose of, and driving motivation for, the WSIP: to protect the 2.5 million people who live in the area served by the San Francisco regional water system from the catastrophic consequences of the system's failure during an earthquake. Nor does it convey the urgency with which those residents, their elected officials, and the State Legislature expect the WSIP to be prosecuted to completion.

October 1, 2007
Page 4

- Several of the alternatives to the WSIP presented in the draft PEIR are considerably worse from the environmental, public safety, public health, resource allocation and urban planning perspectives than the WSIP.
- The variant which would limit maximum systemwide rationing to 10% of normal use avoids significant environmental and economic harm in the Bay Area and can be achieved with no additional impact on flows in the lower Tuolumne River or to the agricultural economy in the San Joaquin Valley lands bordering the River. The economic impacts of the proposed program, which tolerates systemwide rationing up to 20% of normal use, are severe and are not adequately described in the draft PEIR.
- By contrast, the "Environmentally Superior Alternative" does indeed appear to be superior to the basic WSIP. It is described in only the most abbreviated, outline form in the draft PEIR. If we understand it correctly, its cornerstone is water agencies in the Bay Area providing economic incentives to encourage the Turlock Irrigation District and/or the Modesto Irrigation District, which currently divert large amounts of water from the Tuolumne River, to implement additional water conservation and reuse practices, thereby conserving at least the same amount of water as that to be diverted by the SFPUC over and above the City's existing contractual commitments to its wholesale customers. BAWSCA endorses this alternative, although we believe its environmental values can be further enhanced, as we describe below in Section 7.

01 cont.

4. THE FUNDAMENTAL PURPOSE OF THE WSIP -- PROTECTION AGAINST DISASTER

The need for the WSIP is rooted in the hard science of plate tectonics. The San Francisco Bay Region lies on the boundary zone between two of the tectonic plants (the Pacific Plate and the North American Plate) that make up the Earth's outer shell. The relentless motion of these plates as they grind past each other builds up strains that will eventually be released on the region's many faults. A stark reality which those who live or work in the Bay Area must face is that geological forces of immense power will inevitably, violently and without warning be released in the earth beneath their homes, schools, hospitals, offices, factories, public utilities, and transportation systems. The map included below as Figure 2, entitled "Earthquake Shaking

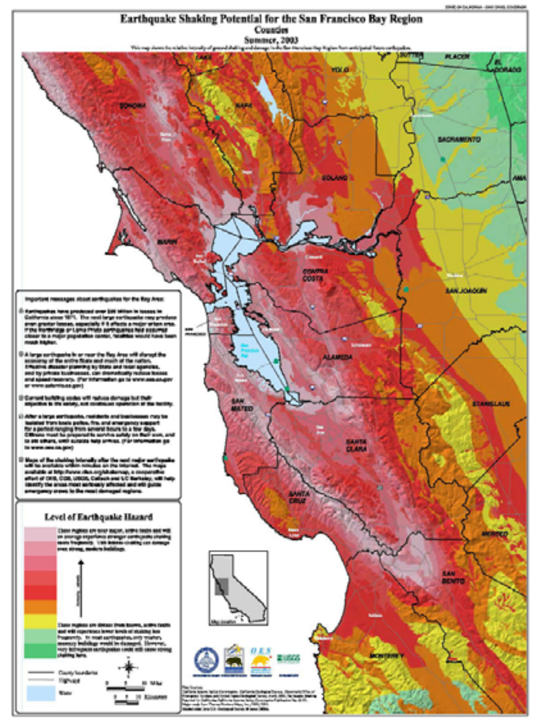
02

October 1, 2007
Page 5

Potential for the San Francisco Bay Region Counties" graphically illustrates the potential of high intensity seismic activity concentrated in the four counties served by the San Francisco regional water system.

02 cont.

Figure 2.



October 1, 2007
Page 6

Many of the regional water system facilities are located on, or very near, one or more active faults. The map reproduced as Figure 3 shows the location of the "backbone" storage, transmission, and treatment facilities in relation to the faults. The Calaveras Fault is directly below Calaveras Reservoir in Alameda County and crosses the pipelines that carry Hetch Hetchy water into the Bay Area. The San Andreas Fault is directly below both San Andreas and Crystal Springs Reservoirs in San Mateo County. The Hayward Fault intersects all four of the pipelines that deliver water from the East Bay to San Francisco, the Peninsula, and South Bay communities. 02 cont.

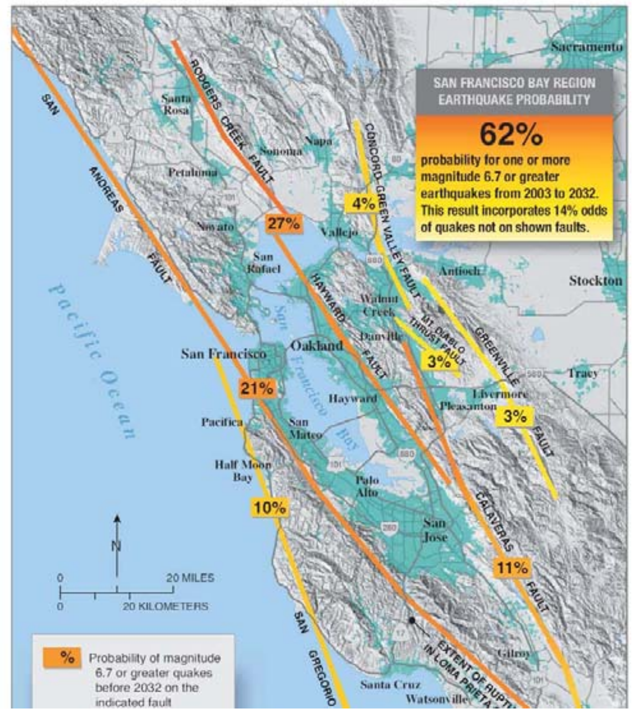
Page 7

<u>The odds of a major earthquake striking the Bay Area in the near future are high.</u> On the basis of research conducted since the 1989 Loma Prieta earthquake, U.S. Geological Survey (USGS) and other scientists have concluded that there is a better than 60% chance of at least one magnitude 6.7 or greater earthquake, capable of causing widespread damage, occurring before 2032. (See Figure 4.) 02 cont.

Figure 4. San Francisco Bay Region Earthquake Probability



Source: USGS at http://earthquake.usgs.gov/regional/nca/wg02/media.php

12.3-24

The San Francisco earthquake of 1906 toppled buildings and shattered water systems from Santa Clara to Santa Rosa. Without water, San Francisco was unable to fight the fires that eventually consumed the City. The 1989 Loma Prieta earthquake caused billions of dollars of damage in San Francisco, Oakland, Santa Cruz and other communities. More recently, the consequences of the 1991 Oakland Hills firestorm would have been unimaginable had the municipal water system been inoperable. The following photographs (Figures 5 through 7) demonstrate the urgent need for the WSIP.

1345071.8

San Francisco Water System is old and poorly maintained. Most of the backbone facilities of the regional water system are over 40 years old; many date from the 19th Century, as can be seen from Table 1 below, which identifies key components of the regional system that the SFPUC considers at high risk of failure.

TABLE 1
SFPUC Regional Facilities at High Risk of Earthquake Damage

Facility	Location (County)	Constructed
Calaveras Dam	Alameda	1925
San Antonio Pump St.	Alameda	1968
Sunol Valley Treatment Plant	Alameda	1966
Alameda Siphons (3)	Alameda	1934,1953,1967
Irvington Tunnel	Alameda	1930

Coast Range Tunnel	Alameda/San Joaquin	1934

Source: San Francisco Public Utilities Commission

These structures were not designed to modern seismic engineering standards, and they have suffered decades of neglect. In June 1994, the San Francisco Board of Supervisors received a "Management Audit" of the San Francisco Water Department from the Board's Budget Analyst.

The audit reported:

> The Water Supply and Treatment Division [of the San Francisco Water Department] performs practically no preventive maintenance on the water supply facilities other than to its water treatment plants and certain valves in the Sunol area. As a result of this poor maintenance program, the Department's water supply and treatment facilities are deteriorating more rapidly than they would if they had been maintained well. The water supply system has aged and, without proper maintenance, the potential for outages has increased. Pipeline corrosion, inoperable valves, and aged support structures contribute to reduced reliability.

03

12.3-25

Eight years later, a Public Utilities Infrastructure Task Force appointed by then-Mayor Willie Brown confirmed the assessment of a system in disrepair:

> The Task Force and the PUC agree that the City's 100 year old public utility infrastructure is suffering from decades of deferred maintenance and less than benign neglect . . . .

As shown in Figure 8 below, the current state of disrepair of the regional water system infrastructure can no longer be tolerated.

03 cont.

The system is likely to fail in a major earthquake. Given the facilities' age, physical condition and proximity to active faults, it is not surprising that the engineering consensus is that many of these critical facilities would fail in a serious earthquake.

Calaveras Reservoir is normally the SFPUC's largest reservoir in the Bay Area. But, as shown in Figure 9, it has been drained to 30-40% of its capacity by order of the California Division of Safety of Dams, due to that agency's concern that it would not survive a large earthquake.

Figure 9. Calaveras Reservoir at Reduced Capacity

Source: San Francisco Public Utilities Commission

12.3-26

The following excerpts from engineering reports submitted to the SFPUC are illustrative. The reports consider three facilities that connect the Bay Area to the Hetch Hetchy water system and to Calaveras Reservoir. 03 cont.

> **Bay Division Pipelines:** Given a large earthquake on the Hayward Fault in Fremont, it is very likely that both the Bay Division Pipelines No. 3 and 4 will break open. Leak rates will approach 300,000 gallons per minute. Total loss of water will be about 178 million gallons before breaks can be valved off. *Source: "Analysis of Bay Division Pipelines 3 & 4 at the Hayward Fault," prepared for the City of San Francisco Utilities Engineering Bureau, G&E Engineering Systems Inc., Report 22.02.06, Revision 0, August 24, 1999.*

> **Alameda Siphons:** The Alameda siphons are three buried pipelines, each 3,000 feet long, which cross the Calaveras fault. The pipelines, the oldest of which was constructed in 1934, are suffering from joint separation damage due to fault creep. Recent studies indicate that horizontal and vertical movements of up to 3 feet and 1.5 feet, respectively, can be expected during a maximum credible earthquake on the main trace of the Calaveras fault. None of these siphons were designed to withstand the movements associated with such a major seismic event. *Source: "Irvington Tunnel # 2 and Siphons Modifications," Executive Summary, Woodward-Clyde Consultants, prepared for the City of San Francisco Utilities Engineering Bureau, November, 1991.*

> **Irvington Tunnel:** All Hetch Hetchy water plus that supplied by reservoirs located in the East Bay flows through this 3.5 mile long tunnel. It is a critical

> lifeline facility to the 2.7 million people served by the system. Constructed in 1930, the tunnel has not been inspected or maintained since 1966 because it cannot be taken out of service due to high water demands and the lack of redundant facilities. Recent seismic studies have found the tunnel is subject to 6-inch movements on local minor faults that would result from major earthquake events on the nearby Hayward and Calaveras faults. The tunnel was not designed to accommodate even these small movements. Either fault is likely to generate, within the next 30 years, a maximum credible earthquake. *Source: "Irvington Tunnel # 2," Preliminary Engineering Study, Phase 4, Woodward-Clyde Consultants, prepared for the City of San Francisco Utilities Engineering Bureau, November 27, 1991.*

The maps reproduced as Figures 10 through 13 show the facilities that SFPUC expects to fail as a result of earthquakes.

03 cont.

Losing access to water for 30 days or more will create severe public health and safety dangers for millions of people. In 2001, the Bay Area Water Users Association (predecessor to BAWSCA) commissioned G&E Engineering Systems to describe the consequences to Bay Area communities from earthquake damage to SFPUC's water system. The report, a copy of which is included as Attachment 2, was prepared by John Eidinger, a civil engineer greatly respected for his expertise in water system performance during and after earthquakes.

After confirming the SFPUC's own estimates of outages on the SFPUC water system from 20 to 60 days, Dr. Eidinger pointed out some of the very practical consequences: 04

- Water will be unavailable for basic sanitation: bathing and flushing toilets will not be possible.
- Water will be unavailable for drinking or preparing food.
- Hospitals, skilled nursing facilities and other institutions such as universities, will have to close and relocate patients and students elsewhere.

- After a few days, firefighters will be without water necessary to fight fires, the incidence of which increases after earthquakes.

04 cont.

Extended Loss of Water Will Have Disastrous Economic Consequences. In October 2002, the Bay Area Economic Forum issued a report entitled "Hetch Hetchy Water and the Bay Area Economy."[1] The report based its conclusions on previous engineering analyses prepared for the SFPUC of the water system facilities likely to fail in a major earthquake on each of four active faults and on the time required to restore service.

The report is sobering:

> A major reduction of water supplies will have serious effects on many of those most vulnerable -- the homebound elderly, children, hospital and nursing home patients, families displaced from their homes by earthquakes and fire. In attempting to minimize those impacts, local water agencies must make difficult choices within their service territories in assigning priority for water delivery. It is only after emergency, public health and drinking water needs are met that water might be made available for commercial and industrial uses. At the end of the rationing queue, and with few cost-effective alternatives, many businesses will be at serious risk.
>
> Interviews with Bay Area commercial and industrial water users suggest the serious operational and economic impacts that would result from a Hetch Hetchy system failure. The most immediate and damaging impacts from a service interruption are in two areas:
>
> *Health and Safety.* Businesses across the board say they would feel compelled to close buildings that could not provide running water in sinks, toilets and drains, and adequate water or pressure for fire sprinkling systems. Bottled water and portable toilets would be a limited and temporary solution at best.
>
> *Plant operations.* Most large commercial and industrial complexes have rooftop cooling towers that run water through fan powered chillers. The water is then routed to building subsystems for drinking and sanitation, for filtration and use in industrial processes, and into closed fire protection and cooling system loops. Even a closed loop system loses water through evaporation and needs replenishing, or chillers will overheat and automatically close down. That in turn shuts off air conditioning, temperature-controlled laboratory environments, computer server clusters

05

12.3-28

[1] The Bay Area Economic Forum is a partnership between the Association of Bay Area Governments and the Bay Area Council. The economic analyses in the Report were carried out by Dr. David Sunding and other economists from the University of California at Berkeley.

> and water cooled equipment such as electrical generators and vacuum pumps.
>
> Based on these considerations alone, most businesses experiencing a loss or severe reduction in water supply beyond 2-3 days would probably suspend operations or close down altogether.
>
> *(Hetch Hetchy Water and Bay Area Economy, p. 14)*

The Bay Area Economic Forum report estimated that potential economic losses from a water supply interruption to the portions of the Bay Area served by the San Francisco regional water system would total <u>at least</u> $28.7 billion for a major earthquake on the San Andreas Fault and $17.2 billion for a similar event on the Hayward Fault. The components of the loss are quantified as shown Table 2:

TABLE 2
Economic Loss From Water Supply Interruption

	San Andreas Fault	Hayward Fault
Business Losses		
Manufacturing	$4.35 billion	$3.45 billion
Wholesale/retail	7.70 billion	5.60 billion
Professional/scientific Technical	1.60 billion	.63 billion
Accommodations/Food Services	.54 billion	.20 billion
Total Business Losses	**$14.2 billion**	**$9.9 billion**
Residential Losses	**$3.8 billion**	**$1.5 billion**
Fire Damage (water related)	**$10.7 billion**	**$5.8 billion**
TOTAL ESTIMATED LOSSES	**$28.7 billion**	**$17.2 billion**

Source: Bay Area Economic Forum Report "Hetch Hetchy Water and the Bay Area Economy," p. 29.

In addition to these quantifiable near-term damages, the report observed that "the Bay Area economy would suffer irreversible long-term damage due to the failure of many businesses to reopen because of losses incurred during disruption, the permanent relocation of other businesses outside the region due to water security concerns, and the reluctance of new businesses to locate here for similar reasons. These permanent economic losses are difficult to estimate without more study, but would almost certainly be on a large scale."

05 cont.

The State Legislature Acts

In 2002, the California legislature enacted AB 1823, the Wholesale Regional Water System Security and Reliability Act (Water Code Section 73500 *et seq.*). In passing this landmark legislation, the Legislature made specific and important findings about the risks the WSIP is designed to minimize.

> The reliability of [the San Francisco regional] water infrastructure system is of vital importance to the health, welfare, safety, and economy of the region that it supplies.
>
> In turn, this region is of vital importance to the entire State of California, because of the resident industries, universities, and commercial enterprises that employ millions of Californians and generate billions of dollars in exports and tax revenues to the state.
>
> The regional water system is old, and designed to outdated seismic safety standards. The system either crosses, is located on, or is adjacent to, three major active earthquake faults, including the Calaveras fault, the San Andreas fault and the Hayward fault. Engineering investigations have disclosed that the system is at risk of catastrophic failure in a major earthquake. Many areas in all four counties served by the system face interruptions in their supplies of potable water for up to 30 days, and some areas could be without water for as long as 60 days. 06
>
> Interruptions in water supply of this magnitude and duration to a densely populated metropolitan region would be disastrous for public health and safety and for the regional and state economy. In addition, uncontrolled releases of water from pipelines, tunnels, and reservoirs could create severe flood damage and environmental harm to fish and wildlife habitat in the communities in which water facilities are located.
>
> Californians in neighboring counties, including those Californians outside the immediate service area of the regional system, will benefit from the implementation of the act adding this section. Access to a reliable supply of water is an important component of the infrastructure necessary to a prosperous metropolitan economy.
>
> The state has concerns for the health, safety, and the economic strength of the region that warrant requiring San Francisco to take prudent steps to upgrade the regional water system in a timely manner.
>
> *(Stats. 2002, Chapter 831, Section 1(c) through (h))*

San Francisco's Response

While San Francisco opposed AB 1823, once it became law San Francisco political leadership, and its voters, took action. Measures passed by the voters in November 2002 embodied San Franciscans' recognition of the dangers posed by the fragile condition of the regional water system and their intention that the system be rehabilitated without delay.

Measure A authorized the SFPUC to issue $1.6 billion in revenue bonds to restore the system, by far the largest bond issue in the City's history. The principal argument in favor of the measure, signed by a majority of the Board of Supervisors, warned:

> If a serious quake were to occur today, there is a high probability that water delivery to San Francisco could be interrupted for more than two months. This would threaten our ability to fight fires after an earthquake and lead to an economic disaster as we attempted to recover without a stable water supply.
>
> (Arguments in favor, including that submitted by former San Francisco Mayor and current United States Senator Diane Feinstein, are attached as Attachment 3.) 07

Measure E amended the City's Charter to give the SFPUC direction to fix the system and new authorities to enable it to do so quickly and efficiently. The measure added Section 8B.120 to the Charter; the new section reads, in part:

> Hetch Hetchy Water and Power System is an irreplaceable asset of the people of the City and County of San Francisco. The system is fundamental to the economic vitality of San Francisco and the Bay Area. The voters of the City and County of San Francisco are committed to preserving and protecting the system as well as safeguarding the extraordinary quality of the water from Yosemite and local watersheds. The voters find that the protection, maintenance and repair of the system are among their highest priorities.
>
> San Francisco faces an unprecedented challenge: to restore its aging water system to ensure a reliable Bay Area water supply through the next century. Repairs must be accomplished as quickly as possible to avoid system outages, which could be caused by natural disasters such as earthquake.

Conclusion

It is now over five years since Governor Gray Davis signed AB 1823 into law. Much planning and analysis (including this draft PEIR) has been completed since then. But very little actual construction has been accomplished. The City and its neighboring communities remain at risk of being cut off from water after a major earthquake. 07 cont.

5. MOST OF THE ALTERNATIVES CONSIDERED IN THE DRAFT PEIR ARE WORSE THAN THE WSIP 08

A. No Program Alternative. The No Program Alternative is unacceptable as a matter of social policy. It offers no environmental benefits when compared to the WSIP as proposed, and it risks an environmental, as well as human, disaster. Finally, it is of doubtful legality. 09

Abandoning the program will extend indefinitely the period of time that 2.5 million people remain exposed to the risks that the WSIP is designed to avoid. The draft PEIR identifies several of the consequences of the No Program Alternative under the heading of Feasibility. 10

> The No Program Alternative would place the regional system at significant risk to seismic hazards, increased facility failures, and increased supply shortages on a day-to-day basis, as well as result in prolonged service disruptions to many customers in the event of an earthquake or other emergency due to inadequate facility redundancy and operational flexibility. In addition, this alternative could add substantial long-term costs due to the increased likelihood of facility failures and increased need for emergency repairs and replacement in the event of an earthquake or other emergency." We agree. We also agree that it "would raise some fundamental institutional issues regarding the ability of the SFPUC to fulfill its basic mission to provide reliable, high quality and affordable water to its customers.
>
> *(draft PEIR p. 9-27)*[2]

[2] While only feasible alternatives to a project need to be evaluated in an EIR (14 Cal. Code Regs. §15126.6(a)), consideration of the No Project Alternative, even if infeasible, is mandatory (14 Cal. Code Regs. §15126.6(e)(1)).

L_BAWSCA1

From the perspective of environmental harm, if an earthquake were to disrupt the supply of water to the Bay Area and the fires that typically accompany earthquakes in cities were to burn through large areas, a significant amount of carbon would be released to the atmosphere and polluted runoff would contaminate local streams and San Francisco Bay. The uncontrolled release of water from damaged pipelines could result in erosion and other environmental harm. In terms of human impact, water cascading from a shattered dam could result in far more serious consequences for those unfortunate enough to live or work in the path of the flood waters. 11

Moreover, a conscious adoption by San Francisco of the No Program Alternative would violate its contract obligation to wholesale customers to use its best efforts to keep the system in "good working order and repair" and would trigger reviews by the California Department of Public Health and the California Seismic Safety Commission, under AB 1823. 12

B. The "No Purchase Request Increase" Alternative. The stated purpose of this Alternative is to "avoid or minimize the potential growth-inducing effects and secondary effects of growth associated with providing more water to the regional customers." (draft PEIR p. 9-41) But the draft PEIR acknowledges that limiting the amount of water San Francisco sells to its neighboring communities to 184 mgd (instead of the 209 mgd anticipated by the WSIP) is unlikely to have the desired effect. ("Thus, the growth-inducement potential under this alternative could be similar to that of the proposed program…. [T]he growth would occur anyway[.]" (draft PEIR p. 9-47) Furthermore, the draft PEIR also states that "withholding additional supply from the regional system to the wholesale customers would not necessarily 13

reduce the growth in the communities within the service area." (draft PEIR p. S-77) The draft PEIR observes on page 9-40 that, in the event that the SFPUC were to limit future water sales, the neighboring communities that purchase water from San Francisco would most likely pursue supplemental supply sources to accommodate the growth that is already planned for their communities. The draft PEIR also recognizes that tapping these alternative sources would itself have negative environmental impacts, but does not rigorously analyze those impacts. 14

Assuming that this Alternative could achieve its objective (limiting growth in the neighboring communities), the environmental impacts associated with growth would not be avoided. If growth were not to occur in the neighboring communities, it would be displaced to the periphery of the Bay Area, and eastward into the Central Valley. We agree with the draft PEIR's conclusion that the environmental impacts associated with such displaced growth, largely low-density and dispersed, would likely be far greater than those associated with the high-density, infill development which the WSIP seeks to accommodate in the existing SFPUC service area. 15

(1) Growth Within the Existing Service Area Minimizes the Environmental Impacts of Development. "Smart Growth" is a philosophy of land-use planning that is designed to avoid urban sprawl by advocating compact, transit-oriented development, with a range of housing choices. Why is Smart Growth smart? In addition to significant social and economic benefits of providing housing near where people work, Smart Growth offers considerable environmental benefits. Increased use of public transportation results in less traffic congestion, with a decrease in environmentally damaging emissions. Compact, dense housing results in lower per capita use of water and energy, with attendant environmental benefits. (See U.S. Environmental Protection Agency: *What Are The Environmental Benefits of Smart Growth*) A 2000 study found that compact development in New Jersey would produce 40 percent less water pollution than more dispersed development patterns. (Rutgers University, Center for Urban Policy and Research. *The Costs and Benefits of Alternative Growth Patterns: The Impact Assessment of the New Jersey State Plan* 2000, available at http://www.nj.gov/dca/osg/plan/impact.shtml.) 16

A concise, comprehensive statement of the purpose and benefits of Smart Growth appears in a recent issue of The Yodeller, published by the San Francisco Bay Chapter of the Sierra Club. Its author, Katie Crecelius, a founding member of the Marin Environmental Housing Collaborative, makes the following points: 17

- The Bay Area economy needs thoughtful, controlled, "smart" development. Stopping real-estate development would stifle

our economy, upon which we depend for jobs and for tax income to pay for parks, police, schools, roads, etc.

- The lack of housing affordable to workers creates significant difficulties for Bay Area employers in recruiting and retaining employees.
- To support thoughtful development while protecting Bay Area open-space buffers and greenbelts, elected officials need to allow higher densities in infill areas.
- To begin to reduce greenhouse-gas emissions, we need increased opportunities for public transportation. Public transportation ridership depends upon population and job concentration near transit stops. 17 cont.
- To reduce vehicle miles traveled, the Bay Area needs housing located near job centers. This housing needs to be affordable for households of all income ranges.
- Land within walking distance of public transportation is precious. Such a scarce resource should be fully utilized.

(*The Yodeller, September-October, 2007, p.4)*

Planned growth in San Francisco's neighboring communities is consistent with these goals and realities. Most of San Francisco's neighboring communities are already built up and largely urbanized, located close to transit corridors and transportation hubs. Most of the large development projects recently built or currently planned within the SFPUC service area will utilize compact building design in already existing communities near a variety of transportation choices. Such development creates a range of housing opportunities and choices while preserving open space, natural beauty, and critical environmental habitats. 18

Four examples indicated below as Figure 14 demonstrate the Smart Growth trend in San Francisco's neighboring communities. Other examples are collected in Volumes 2 through 6.

12.3-32

Figure 14. Examples of Smart Growth

18 cont.

Bay Meadows Project in San Mateo, is a mixed-used development located on a former practice horseracing track adjacent to the actual horseracing track. It is a thriving residential, office and retail community that includes 734 housing units for multifamily and single family residents, 98,000 square feet for retail purposes as well as 750,000 square feet of office space. It is also approximately a half a mile away from the Hillsdale Commuter Rail Station, providing a convenient commute to San Jose and San Francisco. The Sierra Club currently features Bay Meadows in "Building Better, A Guide to America's Best New Development Project" and has also endorsed an expansion of the Bay Meadows Project to create Bay Meadows II.

Whisman Station in Mountain View, is located on the former 40-acre GTE complex site. This project features 500 units, all within easy walking distance from a new lightrail station.

The Crossing in San Bruno, is a 20-acre mixed use master planned development located on a former U.S. Navy facility. The Crossing is located near shopping and is less than one half mile from the new San Bruno BART Station. The Crossing has received national attention for both its transit-oriented development characteristics and its potential to redefine the City of San Bruno. The Crossing will include 1,063 multifamily and senior housing residences, 300 to 500 hotel rooms, a recreation center and commercial uses.

Rivermark in Santa Clara consists of 1800 units of medium and high density housing. Its compact design requires significantly less irrigation than more traditional single family developments. Rivermark makes extensive use of recycled water. In April 2004, Rivermark won 17 awards from the Home Builders Association of Northern California including the Community of the Year Award for High Density Homes in Northern California.

(2) The PEIR Should Include a More Thorough Analysis of the Consequences of Displaced Growth. The California Department of Finance forecasts that, by 2030, more than 45 million people will live in California, an increase of 37% over the State's population in 2000. (Cal. Dept. of Finance Projections available at http://www.dof.ca.gov) These people will live somewhere. If growth does not occur in the SFPUC service area, it is likely to occur instead on the eastern and southern fringes of the Bay Area, as well as in the communities on the western borders of the San Joaquin Valley. These fast growing communities are already under extreme development pressure. A recent California Supreme Court case indicates that the environmental consequences of displaced growth should be considered in the preparation of an EIR. (*Muzzy Ranch, Co. v. Solano County Airport Land Use Commission* (2007) 41 Cal. 4th 372.) However, the draft PEIR does not compare the impacts of such displaced growth to the impacts of the growth the WSIP will accommodate in San Francisco and its immediately adjacent neighboring communities. At a minimum, such a comparison should address the following four potential impacts. 19

(a) Air Pollution. One consequence of the expansion outward from the urban core of the Bay Area is the need to drive. Although most Californians (even city dwellers) love their cars, residents of more compactly developed areas drive less than those who live in low-density, suburban/exurban areas where driving is a necessity. (Sierra Club, *Sprawl Report 2001*; see also Sierra Club *Fact Sheet. Population Growth and Suburban Sprawl: A Complex Relationship*) The Metropolitan Transportation Commission estimates that the weekday vehicle miles traveled (VMT) per person in Solano County will increase by 71% between 2007 and 2030. (MTC *Projections 2007* and *Projections 2030*) By contrast, the MTC projects VMT in San Mateo County to increase over the same time period at less than a third of that rate. Increased air pollution is the one of the most obvious effects of increased automobile traffic. Pollution caused by motor vehicles has demonstrable environmental and health impacts, as well as contributing to the inexorable warming of our planet's atmosphere. 20

(b) Water Pollution. Increased driving can also affect water quality. Exhaust particles from tailpipes are deposited on roadways, leaving a toxic residue that is washed into waterways by rainfall. Such storm water runoff is a major contributor to water 21 quality problems. (EPA, *Our Built and Natural Environment* (2001) at p. 15; see also NRDC *Paving Our Way to Water Shortages*) More cars require more roads, impervious to runoff. Not only does increasing the area of impervious surfaces lead to higher runoff volumes, but it can cause larger and more frequent incidents of local flooding, longer periods of below-normal stream levels, reduced groundwater recharge, and other negative effects such as increased sedimentation, increased water acidity, and higher water temperatures. (EPA, *Our Built and Natural Environment* at p.19) 21 cont.

(c) Water Demand and Infrastructure. Displaced growth outside of the service area will not only impact water quality, but will also put increased stress on water supplies. People living in the hotter inland counties have substantially higher per-capita water use than those living in more urbanized coastal areas. Unlike the Smart Growth within the SFPUC service area, characterized by dense, compact housing, inland areas generally have single family homes on large lots. These larger lots have higher water use--especially outdoor water use. In fact, outdoor water demand for typical residential lots in an inland area is between two and three times higher than in the more compactly developed areas that make up most of the SFPUC service area. (Public Policy Institute, *Lawns and Water Demand in California*, (2006))

According to the Sierra Club, households in low density subdivisions (one-acre lots) use more than twice as much water per household as households in more densely developed areas (1/3 acre lots). (www.sierraclub.org/sprawl/density/water.asp) Water consumption is again reduced by half when there are ten households per acre. Much of San Mateo County's population lives in areas where there are between 10 and 25 people per acre. This population density is expected to increase by 2030, as most areas will add 1-5 people per acre, and some areas of the county will add as many as 25 people per acre. (MTC *Projections 2005* as expressed in *Focusing Our Vision: Network of Neighborhoods*, available at http://gis.abag.ca.gov/website/fov/viewer.htm.) By comparison, average density in San Joaquin County is only eight persons per acre. 22

Adding population to already built-up areas requires little in the way of increased infrastructure. By contrast, displaced growth in the outer fringes of the Bay Area will require new roads, treatment plants, storage tanks, and water distribution and sewer collection mains, all of which carry their own environmental impacts. 22 cont.

(d) Loss of Agricultural Land and Endangered Species Habitats. Outside San Francisco itself, and the densely populated Bay Plain, the Bay Area still supports orchards, ranches, and farms. Indeed, these agricultural lands are essential components of the increasingly popular Farmers' Markets which provide local produce to urban residents. According to the Greenbelt Alliance, these are the lands most directly threatened by development, while San Francisco and the neighboring communities to which it supplies water contain very few such areas.

The Greenbelt Alliance's 2006 report "At Risk: The Bay Area Greenbelt" stresses that the neighboring communities that are San Francisco's wholesale customers are NOT the communities at risk of conversion to sprawl. (See excerpts from Report included as Attachment 4.) In a county-by-county analysis, the report highlights the following about the BAWSCA area: 23

- San Mateo County is singled out as "a leader in protecting land over the last five years." The report notes that since 2000, "four new BART stations in the County and the connection of BART to Caltrain at Millbrae have created valuable new opportunities for regional integration and smart growth in San Mateo County."
- Since 2000, the City of San Jose has protected more than 20,000 acres of land. The City envisions the gradual redevelopment of the industrial North First Street area (served only by SFPUC water) as a high density residential area.
- In Alameda County, the report acknowledges Fremont's hillside protection ordinance and describes the County as having "made significant progress in securing its greenbelt." The "hot spots" at risk of conversion to sprawl are outside the SFPUC service area, mainly in the east county cities of Livermore, Pleasanton, and Dublin.

23 cont.

While sprawl is a concern in the eastern portion of Alameda County, the Central Valley is at even greater risk of losing its agricultural base to overdevelopment. The Central Valley's best farmland is being developed quickly and with alarming inefficiency, often by converting actively farmed land into "ranchettes." (American Farmland Trust, *The Future is Now: Central Valley Farmland at the Tipping Point*) These properties can be as large as 20 acres and are not farmed at all. Not only do such ranchettes house very few people on a large amount of land, they also pose challenges to agriculture from land use conflicts, making it increasingly expensive for those who wish to continue to farm the land. Finally, they contribute to land price inflation, which provides incentives for farmers to sell even more land for development.

Displaced growth will also destroy land that is the habitat of important species. In fact, habitat destruction is the main factor threatening 80 percent or more of the species listed under the Endangered Species Act. (EPA, *Our Built and Natural Environments* at p. 13) For example, in 2001, the U.S. Fish and Wildlife Service designated more than four million acres of land near Livermore, on the eastern fringe of the Bay Area, as essential for the recovery of the threatened California red-legged frog, which breeds in the weedy creeks hidden in the hollows of this landscape. Today, only 11 percent of that original landscape remains as a viable habitat for this threatened species. (See Attachment 4.)

The Natural Resource Defense Council lists ten ways to improve the Bay Area's environment. The top four are: <u>conserve energy</u>, <u>conserve water</u>, <u>drive less</u>, and <u>move to a compact neighborhood</u>. (*The Green Gate: NRDC's Environmental Guide to the San Francisco Bay Area*) The WSIP accommodates growth while permitting all four of these goals to be achieved. Displaced growth that is likely to occur under the "no more water" alternative likely will achieve none of them.

24

(3) Most of the Planned Growth to be Accommodated by the WSIP Has Already Been Analyzed in CEQA-Approved Documents. The draft PEIR compares the growth projections used as the basis for each of the wholesale customers' 2030 water demand estimates, and the growth projections presented in general plans of jurisdictions in the SFPUC service area that have already undergone CEQA analysis. The draft PEIR concludes that these

24 cont.

two growth projections are generally comparable. We agree. Attachment 1 contains a more detailed discussion of the adequacy of the draft PEIR's analysis of growth-induced impacts.

25

(4) A Decision by San Francisco to Restrict Water Deliveries to Neighboring Bay Area Communities Jeopardizes San Francisco's Water Rights. A fundamental principle of California water law is that appropriative water rights, including those obtained prior to 1914, may be lost through non-use. *Smith v. Hawkins* (1895) 110 Cal. 122. A pronouncement by San Francisco that it will forego any future increase in diversions from the Tuolumne River, beyond those necessary to satisfy existing contractual commitments, risks the permanent loss of those valuable rights, with consequences that need to be described in the final PEIR.

In addition, such a decision, motivated by a desire to exercise control over development outside San Francisco's jurisdictional boundaries, would be inconsistent with (1) the premises underlying the Raker Act, (2) BAWSCA agencies' status as co-grantees of the Raker Act, (3) San Francisco's responsibility under California law as fiduciary of assets acquired from the federal government, and (4) the existing policy of the SFPUC Resolution No. 93-0084.

26

<u>**Conclusion**</u>

The "No Purchase Request Increase" Alternative is not likely to achieve its stated goal of limiting growth in San Francisco's neighboring communities. Moreover, this goal runs counter to sound public policy. This Alternative will discourage Smart Growth in the urbanized core of the Bay Area, and will encourage instead sprawl at the periphery and in the Central Valley, with environmental impacts far more significant those of the WSIP. Finally, its feasibility is questionable given the hazardous legal and political uncertainties that surround this misguided alternative.[3]

---

[3] Under CEQA, a program's legality must be considered in determining feasibility. (See Guidelines section 15364 ("Feasible" means "capable of being accomplished . . . taking into account economic, environmental, legal, social, and technological factors.")

C. The Aggressive Conservation/Water Recycling/Local Groundwater Alternative. The wholesale customers already have a diverse supply portfolio, including water recycling and local groundwater, as well as desalination. These alternative sources meet one third of the customers' supply needs. Given the wholesale customers' current low water use and the conservation and local supply projects that they already have in place or have built into their projections of demand, we agree with the draft PEIR's conclusion that it is not feasible to reduce demand for water from the regional system by an additional 19 mgd. 27

(1) The Draft PEIR Rightly Concludes that the Assumption of an Additional 19 Mgd of Water Conservation and Recycling is Infeasible.

(a) Residential per capita water use in the Bay Area is lower than in any other region of California. BAWSCA member agencies and their customers are dedicated to conserving and recycling water. While residential per capita use in the San Francisco Bay Area is the lowest of any of the ten hydrologic regions in the State, the 1.7 million residential customers of BAWSCA members use less than the average for the Bay Area as a whole. (See Table 3.) 28

* *The San Francisco Bay Region includes all or portions of nine Bay Area counties*

12.3-35

Even though the wholesale customers' per capita use is less than that in all other regions of the State, residential per capita water demand is still projected to decrease 3%, from 88 gallons per capita per day (gpcpd) in 2005 to 86 gpcpd in 2030. (*Projected Water Usage for BAWSCA Agencies*, Brown and Caldwell (2006)) Gross per capita water demand (which includes water use by industrial, commercial, institutional, and municipal customers) in the wholesale service area is also projected to decrease, from 165 gpcpd in FY 2005 to 160 gpcpd in 2030. (*BAWSCA Annual Survey*, FY 2005/2006, *Projected Water Usage for BAWSCA Agencies*, Brown and Caldwell)

(b) Wholesale customers have outpaced southern California companies in water conservation.. Some have argued that the Bay Area should be able to achieve savings similar to those achieved by the Metropolitan Water District in Southern California: a 16% reduction in water use from 1990 to 2003 despite a 14% increase in population. (*From Tuolumne to Tap: Pursuing a Sustainable Water Solution in the Bay Area,* Tuolumne River Trust (July 2007) p. 22) In fact, the customers served by the BAWSCA agencies have reduced their use significantly over a similar period. Despite an 18% increase in population between 1986 and 2003, overall water demand remained flat and residential per capita demand decreased by 11%. Today's residential per capita water use is 15% less than it was in 1986, before the last drought, and 23% less than before the drought of 1976-1977. (*BAWSCA Annual Survey*, FY 2005/2006) 28 cont.

Moreover, despite its recent downward trend, per capita use in Southern California is still higher than that of the wholesale customers, and will remain higher in 2030. (*Regional Urban Water Management Plan* (MWDSOC, November 2005); *Projected Water Usage for BAWSCA Agencies*) Consider the following comparisons:

- In 1986, the gross per capita water use in Metropolitan Water District's service area was 200 gpcpd, 10% higher than for the wholesale customer area in that year (182 gpcpd).
- Metropolitan Water District's gross per capita water use in 2030 is projected to be 191 gpcpd, 19% higher than the corresponding projected demand of 160 gpcpd in the

wholesale customers' service area in 2030. (*Projected Water Usage for BAWASCA Agencies*)

Looking to the future, the wholesale customers are projecting a 19% increase in population and 31% increase in employment. (*SFPUC 2030 Purchase Estimates Technical Memorandum*, URS (2004)) Despite this increase in population and jobs, wholesale customer water demand (including sources other than the regional system water) is predicted to increase by only 19%. (*SFPUC 2030 Purchase Estimates Technical Memorandum*) 28 cont.

(2) The Neighboring Communities Have Committed to Increased Water Use Efficiency as Part of Their Plans for 2030. The wholesale customers, collectively, anticipate 13 mgd savings from implementation of conservation programs in their service areas as well as 25 mgd of conservation savings due to continuous implementation of the existing plumbing codes. These conservation savings have already been built into the forecast of demand used in the PEIR. In developing their 2030 purchase estimates, the wholesale customers examined the nine quantifiable California Urban Water Conservation Council Best Management Practices for Urban Water Conservation plus an additional 23 water conservation measures. (*SFPUC Wholesale Customer Water Conservation Potential*)

In addition to conservation "best management practices" implemented by individual wholesale customers, BAWSCA has implemented regional water conservation programs since 1998 and has expanded these programs to include: 29

- Water Efficient Residential Washing Machine Rebate Program
- School Water Education Program
- Large Landscape Audit Program
- Low Water Use Landscape Education Classes (for landscape designers and gardeners)
- Water Efficient Landscape Educational CD-ROM
- High-Efficiency Toilet Rebate Program

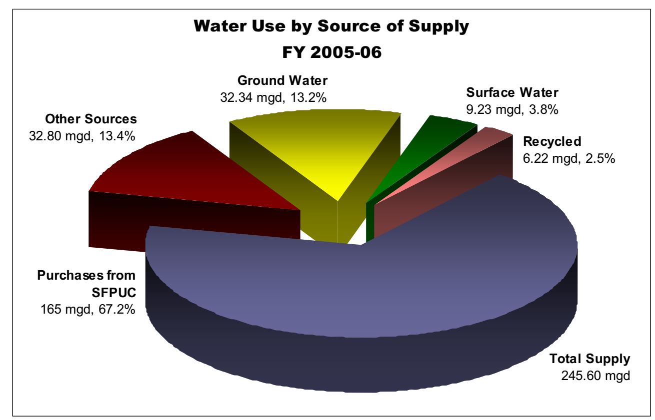
In addition, in fiscal year 2007-2008, BAWSCA will be adding a commercial washing machine rebate program. BAWSCA has joined with the SFPUC in the "Water Saving Hero" public

education campaign, with billboards, posters, newspaper display ads, and radio spots featuring ordinary people adopting simple water conservation practices in everyday life. The Fiscal Year 2006-2007 report on BAWSCA's conservation programs, along with a Water Efficient Landscape educational CD, is included as Attachment 5. 29 cont.

(3) Collectively, the Agencies that Purchase Water From the SFPUC Have a Diversified Portfolio of Water Supplies to Meet the Demands of Their Customers. In addition to purchases from the regional water system, BAWSCA agencies have already developed local water supplies (including surface water, desalinated water, groundwater, and recycled water), as well as contracts with the State Water Project and Santa Clara Valley Water District.

Figure 15 below shows the distribution of supply sources utilized by the BAWSCA agencies in FY 2005/2006. (*BAWSCA Annual Survey*, FY 2005/2006) 30

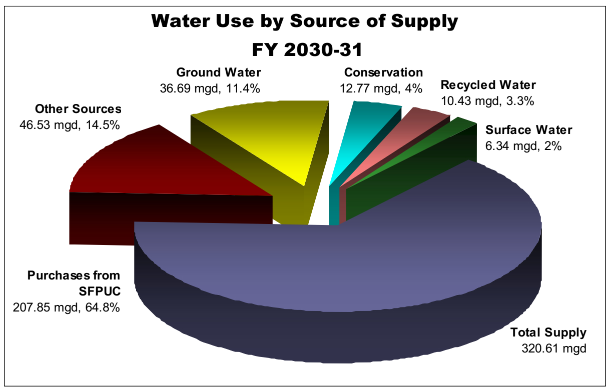
Figure 15.



Currently, 81 mgd (about 33% of the total wholesale customer water demand) is provided by sources other than the San Francisco regional water system. 30 cont.

By 2030, the contribution from sources other than the San Francisco regional system is projected to increase by 40%, to 113 mgd. (*BAWSCA Annual Survey*, FY 2005/2006) Desalination will increase from 5 mgd to 10 mgd and recycled water from 6 mgd to 10 mgd. The largest contribution to increased water supply from a non-regional system source will come from water conservation: 38 mgd, which includes the 13 mgd in new conservation programs shown in Figure 16, and the 25 mgd attributable to installation of water-efficient, code-compliant plumbing fixtures which is embedded in the wholesale customers' demand projections themselves and therefore not evident in Figure 16.

Figure 16.



31

By contrast, San Francisco is nearly 100% reliant on the regional system for meeting demands of its in-City and other retail customers such as the San Francisco Airport. San Francisco has had plans for decades to increase its groundwater and recycled water supplies, but San Francisco's only recycled water plant, the McQueen Treatment Plant in Golden Gate Park, was shut down in 1981. Since that time, San Francisco has developed less than 1 mgd of tertiary-treated 32

recycled water which is used for wash-down operations within the water treatment plant itself. (*San Francisco Urban Water Management Plan* (2005)) The additional 10 mgd of conservation, recycling and groundwater in the San Francisco retail area that the WSIP projects to be achieved by 2030 will finally bring San Francisco more in line with the water supply operations of its wholesale customers. 32 cont.

(4) There are Significant Negative Impacts Associated with this Alternative Including Impacts on Public Health, Demand Hardening and Environmental Impacts Identified in the Draft PEIR. The goal of the Aggressive Conservation Alternative is to address the impacts to the Tuolumne River, Alameda Creek, and the Peninsula watershed that are associated with the preferred Program. In fact, the Modified WSIP alternative does a significantly better job at reducing the overall identified impacts. Moreover, the Aggressive Conservation Alternative creates three additional potentially significant water supply and system operations impacts when compared to the Modified WSIP. Specifically, the Aggressive Conservation Alternative would have the following impacts beyond the Modified WSIP: 33

- Impacts on the rainbow trout fishery resources between Alameda Creek and Calaveras Reservoir; 34
- Impacts on the recreational experience of hikers on the Alameda Creek in the Sunol Regional Wilderness resulting from reduced in stream flows during winter and early spring months; and 35
- Impacts on visual effects along the Alameda Creek in the Sunol Regional Wilderness area resulting from WSIP-induced reduction in stream flows. 36

(a) <u>Demand Hardening makes droughts harder to bear, such that increased rationing may have significant economic and lifestyle impacts</u>. One by-product of the Aggressive Conservation Alternative is the hardening of demand in the service area. Water conservation activities "harden" demand since they incorporate continuous water savings into baseline demands. Therefore, the next increment of water use reduction becomes significantly more difficult to achieve. When demand is hardened, a water supplier faces greater challenges 37 in achieving rationing targets without significant impacts on residential, business and industrial customers.[4]

A recently released study "Measures to Reduce the Economic Impacts of a Drought-Induced Water Shortage in the SF Bay Area" (Public Financial Management/Bay Area Economic Forum (PFM/BAEF) (May 2007)) examined the economic impacts of water rationing on the commercial and industrial sectors in the SFPUC's service area. One key finding of this analysis addressed the impact of demand hardening and acknowledged that "Residential demand becomes more difficult to reduce as additional conservation measures are implemented; demand hardening is real." (PFM/BAEF Report)

The draft PEIR also recognizes the consequences of demand hardening:

> As a result of the water use efficiency or demand "hardening" that would be further institutionalized through this alternative, customers would have limited options for accommodating a period requiring 20 percent or more rationing in terms of what water uses they could cutback. Customers would have already increased their water use efficiency and eliminated less efficient uses such as many types of conventional outdoor use (e.g., landscape irrigation, car washing). In these cases, the water use cutbacks required to achieve 20 percent or more rationing would involve reductions in more essential water uses, such as indoor uses for cleaning and bathing, which could cause greater hardship on customers.
> *(draft PEIR, p. 9-54.)*

> Although the information on effects of water shortages during drought is limited, studies completed to date indicate that rationing cutbacks of 15 to 20 percent can have substantial economic impact on commercial, industrial and residential sectors as well as lifestyle effects on residents. [R]equiring rationing of up to 20 percent during a drought of customers who have already implemented aggressive conservation and water recycling would result in more severe economic and lifestyle effects.
> *(draft PEIR, p. 9-31)*

37 cont.

[4] Consider the example of toilet upgrades. In the past, a common toilet may have used seven gallons per flush ("gpf"). Today, the current standard toilet uses 1.6 gpf. The latest High Efficiency Toilets ("HET") improve performance by at least an additional 20%, to 1.28 gpf or less. Whereas in the 1980s a residential customer could save seven gallons by the simple act of flushing the toilet only once every other use, similar conservation-driven behavior now will save less than two gallons. The State of California has recognized the existence of demand hardening and the negative impact it has on the ability of retail water users to duplicate their response to previous droughts (DWR, 2005).

As a water agency and its customers significantly increase water use efficiency and harden the water demand, the planned level of drought rationing and its impacts on the customers and community must be given serious consideration. Just because customers have been able to reduce water use historically during a drought by some percentage does not mean that the same customers can achieve similar water reductions in the future with similar efforts. See discussion in Section 6 below for more detail about the impacts of rationing.[5] 37 cont.

(b) Aggressive conservation could negatively impact greenscapes. While residences in most of the neighboring communities have higher outdoor water use than those in the completely urbanized San Francisco, the water used to maintain these green spaces is by no means wasted. The California Legislature has recognized the social and environmental values of greenscapes in metropolitan areas. "Landscapes are essential to the quality of life in California by providing areas for active and passive recreation and as an enhancement to the environment by cleaning air and water, preventing erosion, offering fire protection, and replacing ecosystems lost to development." (California Water Code Section 65593)

Trees and shrubs not only sequester carbon, thereby reducing emissions of greenhouse gasses, but provide shade that can lower energy costs. According to the Sierra Club, mature trees and tall shrubs around homes can lower air-conditioning costs by up to 40 percent. (*Sierra Magazine*, July/August 2007 at p. 50) Indeed grass sequesters CO_2 and stories it underground in roots and soil. (M. Pollan, The Omnivore's Dilemma, p. 197-98) 38

San Francisco itself appreciates the benefits of the urban forest. The San Francisco Department of the Environment's 2007-2009 Strategic Plan notes that "trees provide environmental and economic benefits through improving air and water quality, increasing property values, lowering building energy use, and providing an experience of nature." (Department of the Environment, City and County of San Francisco: *Strategic Plan 2007-2009*, December 4, 2006 at p.

[5] Demand hardening is, in itself, not a reason to limit water-conserving activities. However, conservation must be accommodated by providing greater reliability during drought, through measures such as increased surface or groundwater storage or water transfers. The environmental impacts of increased storage sufficient to bolster the drought reliability of the system have not been considered in the draft PEIR, although the option of additional dry year water transfers from agricultural areas has. 37 cont.

12; see also *City and County of San Francisco Urban Forest Plan* (2006)) In addition, "trees improve public health and well being by reducing UV radiation exposure, providing restorative healing for people with illness, and creating safe public spaces." (Department of the Environment, City and County of San Francisco: *Strategic Plan 2007-2009* at p. 12) In order to maintain its urban forest, the San Francisco's Department of Public Works has a total of ten water trucks that water the City's trees on a weekly basis. 38 cont.

(c) <u>Increased water use during summer/fall is not just for landscaping</u>. Contrary to recent suggestions, the increase in water use in the wholesale customers' service area during the warm summer and fall months is not due solely to outdoor irrigation. Rather, the increased water use in warmer weather is substantially caused by the use of water for cooling critical public health, educational, commercial, and industrial facilities.

San Francisco's climate differs from that of the majority of its neighboring communities. In the summer, fog typically blankets the western half of San Francisco -- cooling the entire city -- while most other parts of the Bay Area enjoy a moderate Mediterranean climate with sunny warm days. While these weather differences impact water use for outside irrigation, other important uses of water are also affected by warmer weather, uses that have nothing to do with lawn watering. 39

- Water is used for cooling purposes in many industrial processes (such as chip fabrication), other manufacturing facilities, and computer server "farms" essential to operation of the internet.

- Hospitals, schools, libraries, and other commercial/industrial buildings contain people and equipment that generate heat and must be cooled. Cooling towers that recycle water are one cost-effective method of heat exchange and use less electrical power, and have fewer environmental impacts than some alternatives.

Cooling towers are used in many buildings inside San Francisco. However, since San Francisco's weather pattern is cool in summer and relatively uniform throughout the year, its building cooling demands are also relatively consistent throughout the year. Water used for

cooling inside San Francisco cannot therefore readily be segregated as a seasonal use through the inspection of water records. Conversely, in the warmer portions of the Bay Area, where summer temperatures typically hover in the high 70s to 90s, use of water for cooling purposes shows up as a seasonal increase in water use during the summer and fall periods. 39 cont.

It therefore is wrong to assume that the increased seasonal use in the BAWSCA service area is driven solely by outdoor landscaping.

6. THE "VARIANT" WHICH LIMITS WATER RATIONING DURING DROUGHTS TO 10% OF NORMAL SYSTEMWIDE USE IS ENVIRONMENTALLY AND ECONOMICALLY SUPERIOR 40

The WSIP preferred program incorporates a goal of limiting rationing during droughts to a maximum of 20% <u>systemwide</u>. We believe that presenting this goal as a single systemwide percentage without describing how the reductions will be allocated between San Francisco's retail users and the wholesale customers is misleading. For example, if San Francisco were to administer the rationing program so that reductions within San Francisco were limited to 10%, achieving a 20% <u>systemwide</u> reduction would require an average cutback in use by wholesale customers collectively of nearly 25%. 41

The environmental and economic consequences of a 25% <u>year round</u> reduction in water use in the wholesale service area would be severe and are not addressed in the draft PEIR. For example, the draft PEIR does not address the impact on commercial and industrial entities, for which water is either a significant component of the end product or essential to manufacturing processes, or both. While the draft PEIR does not address such impacts, there is good research on this issue. A copy of the report, "An Economic Evaluation of the Water Supply Reliability Goal in the SFPUC Water System Improvement Plan," prepared by William Wade, Ph.D., a resource economist, is included as Attachment 6. 42

The report's principal findings are troubling, though not surprising. Two points stand out:

- A small number of industrial sectors, for which water is a critical component of the production process, represent a very large share (over 80%) of total manufacturing output in the region. Chief among these industries are computer/electronic products and food and beverage products ($207 billion in 2001). The emerging biotech industry is also water-dependent.

- These industries are particularly sensitive to curtailments in water supply. The impact of a 20% water supply deficiency on shipments from these industries located in the wholesale customer service area is estimated at nearly $7.7 billion annually, whereas a 10% cutback results in "only" a $2.5 billion cost. The difference ($5.2 billion) far exceeds the $181 million cost estimated by the SFPUC staff of improving the SFPUC system's reliability from 80% to 90%, as shown on the SFPUC's Water Supply Matrix: Water Supply Options 2030 included as Exhibit A to the Wade Report.[6]

The impact of this potentially extreme rationing is severe when considered in light of the City's experience in the last drought. The Governor's Advisory Drought Planning Panel in its December 2000 Critical Water Shortage Contingency Plan reported:

> Among large urban agencies' water development projects, the City and County of San Francisco experienced the greatest reduction in storage, having only about 22 percent of its total system storage capacity left by 1991.

The implications of that depletion in storage was made evident in the SFPUC's response to a survey distributed in 1990 by the California Department of Water Resources:

> Q: What are your alternatives if 1991 is as dry or drier than 1990 and if 1991 is as dry as 1977?
>
> A: If 1991 is as dry or drier than 1990 or 1977, a rationing program to cut normal use by <u>50 percent</u> will be necessary to avoid running out of water if 1992 is also dry.

The SFPUC itself summed it up clearly in its June 1993 Report to the Federal Energy Regulatory Commission:

> "Nowhere else in the state was rationing imposed on a major urban area to such a degree for so long a period."

42 cont.

12.3-40

---

[6] As discussed previously, based on the experience of the last drought, a 20% reduction on a systemwide basis would require reductions greater than 20% in San Francisco's neighboring communities. The economic impacts would therefore be more severe than those projected in the Wade report, which assumes that a 20% reduction in industrial/commercial customers' water supply would be the worst case.

In addition, the SFPUC's then-General Manager, Anson Moran, in a 1994 affidavit submitted to the Federal Energy Regulatory Commission, eloquently described the consequences of shortage:

> The consequences of potential shortages include economic, socio-economic, environmental, and personal (human) impacts.
>
> What makes San Francisco's situation unusual is the consequence of being wrong in our forecast. Because of our entitlement structure, and limited conveyance and treatment capacity, an additional, unforecasted year of drought could literally result in empty reservoirs, no entitlements, and little or no alternate source of water. We could have no water to serve our 2.3 million customers.
>
> In the spring of 1991 these consequences achieve a sobering clarity. I became acutely aware of the physical constraints of the City's water conveyance, treatment and delivery facilities; the availability of, and limitations to movement of supplemental emergency water supplies into the City's system; and the uncertainty as to when the drought would finally end. Due to the extremely limited conveyance and treatment capacity system to bring other emergency sources of water to the City, the City must rely on storage in the Tuolumne River basin to ride out droughts. The City just does not have other sources to call on during drought, such as turning on pumps. In addition, I had first-hand information as to the direct and indirect adverse impacts that were occurring to the City's customers as the result of water shortages.
>
> Situated within the drought, I weighed all the above factors and supported the operation rule that is currently used by the City in practice, and incorporated in the planning studies submitted to FERC. That plan was tested as it was developed and is the direct product of real, on-the-line decision making. When considering all the factors associated with the City's entitlements to water, its physical system, and the dire consequences of just being wrong in the forecasting of the length of drought that may hit the City, I can not agree with any comment that the City's operation rule is overly conservative.
>
> Mr. Moran's complete affidavit is included as Attachment 7.

42 cont.

Furthermore, the WSIP must also be analyzed in light of the City's own policy, found in the City Charter, to assign a higher priority to water delivery than to power generation. Limits on generation of electric power to avoid impacts on water availability should be incorporated into all variants and alternatives in order to both reduce the need to impose rationing, as well as

43

stress on other water supply sources required to offset avoidable shortages in SFPUC water deliveries during droughts. 43 cont.

The WSIP anticipates that water to offset San Francisco's diminished entitlements to Tuolumne River which occur during dry years will be secured through agreements with Turlock Irrigation District (TID) and/or Modesto Irrigation District (MID), to utilize "credits" to San Francisco's water bank account" in New Don Pedro Reservoir. A dry-year transfer with TID/MID, providing access to additional Tuolumne River water for the Bay Area during 44 drought, need not (and should not) come at the expense of either diminished flows in the lower Tuolumne River nor agricultural production. Rather, it could be supplied through conjunctive use of the substantial groundwater reserves available. Central Valley growers, including those in TID/MID, regularly rely on short-term increases in groundwater pumping during dry years -- precisely what conjunctive management of groundwater is intended to do.

The draft PEIR states that the 10% "variant" would "result in slightly increased average annual Tuolumne River diversions over the 82-year hydrologic record compared to the proposed program, but due to rounding, the levels of diversion appear to be the same." (draft PEIR, 45 Table 8, fn. a) The final PEIR should describe more precisely the volumetric difference in a dry year to meet the 10% goal, although we expect that this amount will be relatively modest, particularly when compared to MID and TID diversions.

7. BAWSCA SUPPORTS THE ENVIRONMENTALLY SUPERIOR ALTERNATIVE AND RECOMMENDS THAT THE FINAL PEIR EVALUATE IT IN MORE DETAIL

The draft PEIR describes a Modified WSIP Alternative, which it identifies as the Environmentally Superior Alternative. This alternative differs from the WSIP as proposed, by incorporating three interrelated components:

<u>One</u>: Modifications to the planned operations of three local reservoirs intended to lessen 46 the impact of the WSIP on local streams (Alameda Creek and Pilarcitos Creek) and on riparian habitat (the oak woodlands near Crystal Springs Reservoir).

<u>Two</u>: Additional water conservation, local groundwater and recycling projects to be carried out by the wholesale customers, intended to compensate for the reductions in system

supply caused by the three operational modifications described above and, potentially, to reduce demand for additional diversions from the Tuolumne River.

<u>Three</u>: A "transfer" of "conserved water" from Turlock Irrigation District (TID), Modesto Irrigation District (MID), or some other agency which would reduce demand within their service areas for water from New Don Pedro Reservoir, thereby avoiding the reduction in flows in the Tuolumne River below New Don Pedro that would otherwise occur as San Francisco's diversions to the Bay Area gradually increase as envisioned by the WSIP.

The draft PEIR explains why this is considered to be the environmentally superior alternative:

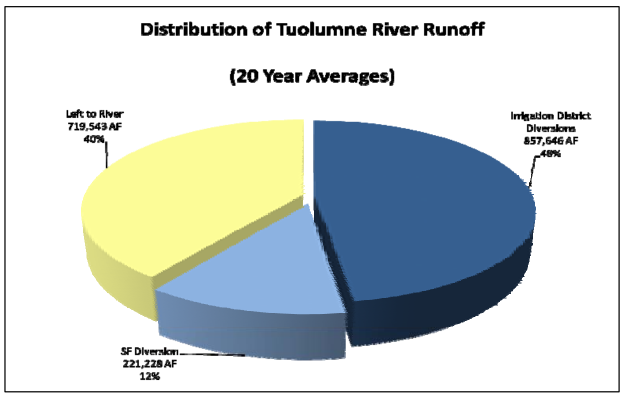
> The Modified WSIP Alternative is considered to be the environmentally superior alternative. It would reduce key impacts of the proposed WSIP on natural resources along the lower Tuolumne River, along Alameda Creek below the diversion dam, at Pilarcitos Creek, and in Crystal Springs Reservoir, but it would continue to meet the WSIP's primary goals and objectives. Like the WSIP, this alternative would maximize the use of existing facilities and the largely gravity-driven system without also requiring the construction of additional major facilities called for under many other alternatives, or substantially increasing the energy demand of 46 cont. the system or need for pumping. While some of the other alternatives would avoid or lessen certain WSIP impacts, they would also result in substantial additional impacts that the WSIP would not generate, because these alternatives would require substantial additional major facilities and affect other environmental resources in different geographic locations in addition to those affected by the WSIP. . . .
>
> The Modified WSIP Alternative includes implementation of more conservation, water recycling and local groundwater projects within the regional service area than under the WSIP, which would require construction of some additional facilities in some areas not affected by the WSIP. However, while construction of these facilities would cause temporary construction disruption and related environmental impacts, long-term implementation of these regional conservation, water recycling, and local groundwater projects would offset impacts of the operational modifications proposed under the Modified WSIP Alternative on the Tuolumne River. Depending on the extent of these projects implemented by wholesale customers in collaboration with the SFPUC, they could also help reduce the amount of additional diversion required from the Tuolumne River to serve the 2030 customer purchase requests.
>
> *(draft PEIR, p. 9-96)*

BAWSCA supports the Environmentally Superior Alternative and recommends that the Final PEIR provide a more detailed description of how its centerpiece (the reduction in demand for water from New Don Pedro) is to be achieved.[7] 46 cont.

Agricultural Conservation

As Figure 17 indicates, San Francisco and the wholesale customers are not the most significant users of Tuolumne River water. In fact, almost half of the Tuolumne River runoff is used for agricultural production. San Francisco's diversion currently represents about 12% of that flow and would increase only to 13% by 2030, assuming the increase in demand projected in the WSIP. 47

Figure 17.



Source: Turlock Irrigation District

Central to the Modified WSIP is the "transfer" of water conserved by TID and MID such that demand from New Don Pedro Reservoir would be reduced, avoiding the reduction in flows in

7 A more in-depth analysis would also be responsive to San Francisco Board of Supervisors' Resolution 321-08. 46 cont.

12.3-42

the Tuolumne River below La Grange that would otherwise occur under the WSIP, and where the WSIP's significant environmental impacts would occur.[8]

The large majority of the water currently diverted by TID and MID is, as their names suggest, used for agricultural irrigation. The draft PEIR does not describe how approximately 15,000-20,000 acre feet per year (AF/Y) of the approximately 800,000 AF/Y applied to irrigated agriculture in the two districts could be conserved. Some possibilities are mentioned indirectly in the portion of the draft PEIR that addresses possible environmental impacts of mitigation measures themselves:

- Water use efficiency and conservation for agricultural, residential and commercial users
- Land use changes, either agricultural to urban, or more water intensive (e.g., pasture) to less intensive (e.g., orchard)
- Conjunctive use of groundwater
- Recycled water
- Tiered water pricing
- Land fallowing of agricultural lands.

(draft PEIR, p. 6-63) 47 cont.

Agriculture in the Central Valley is part of our shared history and culture and contributes significantly to California's economy. For this reason, BAWSCA does not support the notion of permanently fallowing agricultural lands as an on-going source of water for the Bay Area. Similarly, decisions about which crops to cultivate are best made by individual growers familiar with local conditions and market forces.

8 Two of the subsidiary aspects of the Environmentally Superior Alternative uniquely affect individual BAWSCA member agencies and warrant specific caveats. First, BAWSCA support for meeting Coastside County Water District's increased demand by pumping from Crystal Springs rather than by gravity flow from Pilarcitos Lake is conditioned on the economic impact of that approach (increased power costs) being borne by all users of the regional water system, including San Francisco, rather than solely by Coastside County Water District. Second, BAWSCA support for increased stream flow in a particular reach of Alameda Creek despite its possible impact on system yield is not meant to suggest that BAWSCA disagrees with Alameda County Water District comments that more water should be released and allowed to flow through lower Alameda Creek to the Bay, in order to support restoration of steelhead to the upper reaches of the Creek.

Nor do we believe that greater urbanization of the Central Valley is likely to result in less water use, on a per acre basis, than agriculture.[9] Finally, the pricing of water is an internal matter statutorily delegated to the elected governing boards of the irrigation districts, whose informed judgment should be respected, particularly by urbanized communities 100 miles away.

Rather, we propose a bold and visionary approach, suggested only obliquely by the Environmentally Superior Alternative, in which Bay Area water agencies would provide economic incentives to encourage TID and/or MID, the Cities of Modesto and Turlock, or individual growers, canners and orchardists to voluntarily implement water conservation measures at no cost to them, that would save both money and water, with resulting benefits to all stakeholders. There appear to be several opportunities available in both districts to conserve water. 47 cont.

The point of this comment is not to identify the most promising of these opportunities. The irrigation districts are much more capable of doing that. Rather, the point of the comment is merely to corroborate the feasibility of the concept at the center of the Environmentally Superior Alternative and demonstrate the benefits that it can provide to agriculture, the urban Bay Area, and to the lower Tuolumne River.

Arrangements of this precise kind are now in place in California, on a much greater scale. For example, the Imperial Irrigation District has contracted to transfer over 300,000 acre feet a year to San Diego and other coastal cities served by the Metropolitan Water District of Southern California. The IID's "Efficiency Conservation Definite Plan" adopted in May 2007 contains very detailed analyses of the costs/benefits and water savings achievable by a range of irrigation efficiency measures. It provides a possible road map for the Bay Area and TID and/or MID to follow.[10]

---

[9] In the TID/MID area, an acre of homes uses about the same amount of water as an acre of irrigated crops.

[10] The Environmentally Superior Alternative has the additional benefit of not jeopardizing San Francisco's water rights. And the water rights of MID and MID can also be fully protected by virtue of Water Code provisions designed to encourage water conservation and the use of recycled water and groundwater in lieu of surface water, e.g., Water Code Sections 1010-1011. We understand that TID 48

From a purely financial perspective, Bay Area water agencies should be willing to provide monetary contributions sufficient to support implementation of the most cost-effective mix of these alternatives. Many might be prepared to subsidize water conservation in the TID/MID area at levels that go beyond those necessary to simply offset the diversions by San Francisco to meet gradually increasing urban demands in the Bay Area. In fact, BAWSCA's board of directors has recommended that the final PEIR should explore the feasibility of Bay Area water customers financially supporting water efficiencies in TID/MID that will result in <u>more</u> water remaining in New Don Pedro than is currently the case, even <u>after</u> taking increased diversions by San Francisco into account. This additional water could then be available to support <u>greater</u> flows in the lower Tuolumne River, deployed at times and in volumes most beneficial for salmon and other important species in the lower Tuolumne River. 49

In sum, BAWSCA believes there are opportunities for partnerships with agricultural interests such that more water can flow through the lower Tuolumne while still providing the water necessary to accommodate environmentally sound, infill growth planned in San Francisco and its neighboring communities. 50

<u>Additional Conservation and Recycling in the BAWSCA Service Area.</u>
BAWSCA also supports the component of the Environmentally Superior Alternative that calls for additional water conservation, recycling and local groundwater development to be achieved in the BAWSCA service area. But, just as we believe the agricultural conservation component of this alternative can be improved, so that the WSIP results in more water being made available in the lower Tuolumne River than would be the case under any of the other alternatives, we also believe that this component can be improved. Specifically, rather than involve SFPUC in this aspect, we recommend that BAWSCA and its member agencies be given the responsibility for achieving these results. 51

In enacting the Bay Area Water Supply and Conservation Act in 2002, the Legislature took note of the anomalous situation which the wholesale customers of SFPUC occupy in relation to San Francisco. They are dependent for a vital and limited resource on a monopoly supplier not 52

---

has utilized these statutory filing mechanisms to document savings achieved through installation of drip irrigation systems that have already replaced flood irrigation in areas of that district. 48 cont.

regulated by the California Public Utilities Commission and in which they have no political representation. (Water Code Section 81301(a))

The Legislature also found that:

> The San Francisco regional system is . . . susceptible to severe water shortages during periods of below average precipitation because of insufficient storage and the absence of contractual arrangements for alternative dry year supplies.
>
> The lack of a local, intergovernmental, cooperative governance structure for the San Francisco regional system prevents a systematic, rational, cost-effective program of water supply, water conservation, and recycling from being developed, funded, and implemented.
>
> *(Water Code Section 81301(b), (c))*

BAWSCA has express statutory authority to:

- "Plan, finance, acquire, construct, maintain and operate facilities for the collection, transmission, treatment, reclamation, reuse and conservation of water." (Water Code Section 81420);
- "Conduct studies of the water supplies available to its members and their current and future demand for water," as well as "develop plans for projects and programs that can assist its members to meet those future water needs." (Water Code Section 81445);
- Carry out any "project" or "work" which are broadly defined to include water conservation measures and programs, facilities for the conjunctive use of surface water and groundwater and facilities for the transmission of recycled water." (Water Code Sections 81306, 81308, and 81420)

52 cont.

Since its formation in 2003, BAWSCA has developed, and implemented, at its own expense, effective water conservation programs that augment those administered by is member agencies. The range of these programs has steadily expanded, as the current Water Conservation Report (Attachment 5) demonstrates. We submit that the development of an additional 5 to 10 mgd of

53

water savings through conservation, local groundwater or recycled water within communities that are members of BAWSCA (over and above those agencies' current commitments) will be far more feasible if the initiative and coordination is taken by BAWSCA -- an independent government agency established specifically for that purpose, which is representative of and responsive to the communities in which those projects and programs are to be built or implemented.

In order to generate funds for these programs, SFPUC should include in wholesale rates a "water conservation" charge. The amount of this charge should be determined by BAWSCA's board of directors, the revenue should be collected by SFPUC and forwarded to BAWSCA regularly, and the utilization of the funds should be decided by BAWSCA's board of directors. The SFPUC should limit its conservation, groundwater, and recycling activities to programs and projects within the limits of the City and County of San Francisco or on outside properties owned by the City, such as the Sharp Park Golf Course in Pacifica.

53 cont.

Thank you for considering this letter, the detailed comments which appear at Attachment 1, and the materials in the accompanying Volumes.

Sincerely,

Arthur R. Jensen
General Manager

Detailed Section-by-Section Comments on the Program Environmental Impact Report for the Water System Improvement Program

Below are the comments from the Bay Area Water Supply and Conservation Agency that are more narrowly focused and presented as a section-by-section review of the draft PEIR.

Summary Section

p. S-2 to p. S-23: The summary section does not highlight historical examples of problems encountered with operation of the existing regional water system which need immediate attention and which are the premise of the need for the WSIP. Below are some examples of failures on the regional water system over the last twenty years:

- San Joaquin Pipeline No. 3 (SJPL 3) failed in the San Joaquin Valley at the same time that the Sunol Valley Water Treatment Plant was shutdown for maintenance. This situation caused an immediate loss of water supplied from two sources including the Hetch Hetchy and Calaveras Reservoir supplies.
- San Andreas Pipeline No. 3 ruptured, flooding school property on the Peninsula.
- A loss of supply from Hetch Hetchy was caused by failures on the SJPL system near Mountain Tunnel.
- During heavy rains the Hetch Hetchy supply was lost for a period of six weeks at the same time power outages occurred at the Harry Tracy Water Treatment Plant.
- During heavy rains, San Mateo Creek was flooded in an attempt to lower Crystal Springs Reservoir elevation which rose to within inches of spilling over the 4 foot high stop logs. DSOD demanded that the reservoir be lowered to avoid the stop logs from floating out of their holding rack which can cause disastrous flooding. Lack of reservoir storage capacity can also cause uncontrolled spills. During one such event the Mills Hospital first floor in San Mateo was flooded. 54
- A valve-exercising program that is part of necessary maintenance of the transmission system has been nonexistent due to fear that valve might be able to be reopened, leaving major pipelines closed and causing regional water losses.
- A planned dewatering of the Stanford Tunnel to inspect the integrity of the tunnel was halted to avoid risks involved in having an extended shutdown.
- A landslide occurred on the peninsula near the existing Crystal Springs Bypass Tunnel. This tunnel was shut down as a precaution so that if further land movement caused the tunnel to break it would not result in flooding. If the line failed it could produce an estimated 900 mgd rush of water into San Mateo Creek causing public health, safety and

environmental harm. The Harry Tracy Water Treatment Plant is the only source of water to the north of the tunnel, serving the northern peninsula and San Francisco. SFPUC staff stayed on site around the clock to put the tunnel back in service in case treatment plant operations were disrupted. 54 cont.

- Multiple emergency shutdowns of the water treatment facilities have been made due to aging and unreliable equipment.
- The San Antonio Pipeline failed causing immediate shutdowns and flooding.

p. S-2, Program Description, 2nd paragraph: This paragraph should clarify that the City and County of San Francisco is the single largest customer of the regional water system, using 1/3 of the total water developed, and being nearly 100% dependent on the regional water system. 55

p. S-2, Program Description, 2nd paragraph: The draft PEIR states "Some of the wholesale customers have sources of water in addition to what they receive from the SFPUC regional system, while others rely completely on the SFPUC for supply." In fact, 13 of the BAWSCA agencies have diverse water supply portfolios that include recycled water, desalinated water, local groundwater, and local or imported surface water. Figure A below provides detail on the current diversified water supply portfolios of the combined BAWSCA agencies. BAWSCA agencies have committed to increasing the diversity of their water supply portfolio in the future with increased use of recycled water, conjunctive use of groundwater supplies, and implementation of water conservation as shown in Figure B below. 56

Figure A

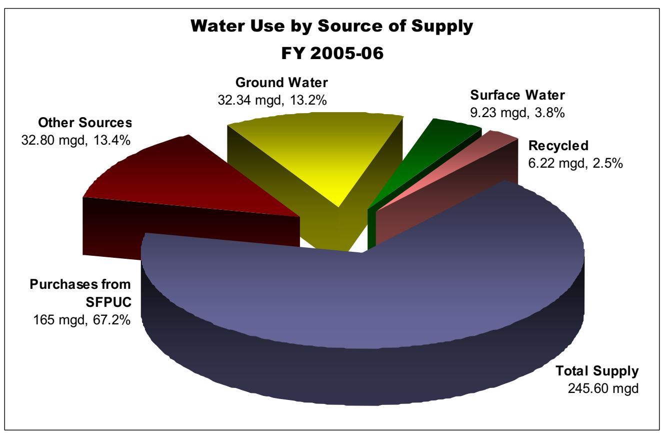

Figure B

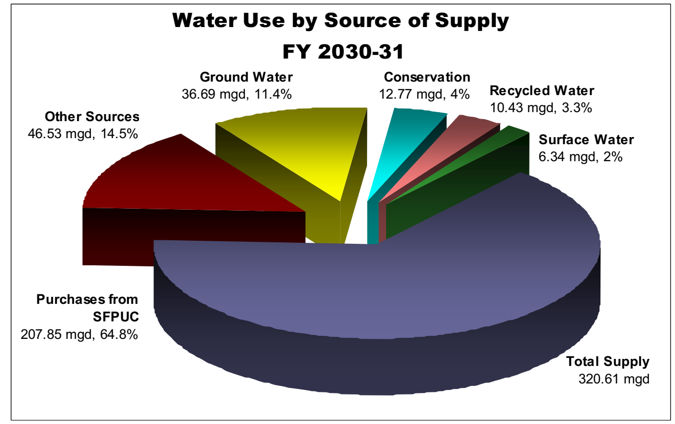


56 cont.

p. S-5, Figure S.3 and p. 5.1-6, Figure 5.1-2: This figure shows historical and projected water <u>deliveries</u>, not water demands. Some of the projected water demand will be met by sources other than purchases from the SFPUC regional water system. The data label for the projected period (right-hand side of graph) should be changed to read "Annual Average Forecasted Deliveries" (not ".....Forecasted Demand"). 57

p. S-23, Figure S.7: The Master Schedule shown should be updated to reflect most current WSIP Quarterly Report. Also, please clarify whether this timeline shows the project close-out dates adopted by the Commission or revised project close-out dates that have not yet been formally adopted by the Commission. 58

p. S-26, Facility Construction Effects, 4th bullet: The report identifies certain facilities as having historical significance. Information about whether these identified sites are classified in local or state registries as historical sites should be provided. 59

p. S-65, 1st bullet (Proposed Program): Regarding the concern raised by some commentors about the impact of this program objective, fundamental principals dictate that water quality from the best source is the most reliable means of eliminating uncertainties associated with contamination and public health risk. Water quality regulations are becoming more stringent 60 with many more trace organics being detected, raising public health concerns. Options for source water downstream of the current intake are influenced by runoff and contamination from many other sources due to human activity. The uncertainty about endocrine disruptors and other contaminants may result in increased health risk and higher levels of treatment. A treatment scheme capable of producing a similar water quality would include reverse osmosis and activated carbon among other processes which require more energy and disposal problems that have negative impacts on the environment. Public concern over drinking water is a leading issue resulting in diminished public confidence and higher use of bottled water which carries its own set of issues related to trace organic contamination and disposal of packaging and containers. 60 cont.

Chapter 2 – Existing Regional Water System

p. 2-8, Sunol Valley Faculties: Please add a description of the San Antonio Pumping Facility to this section and explain its importance to reliable operation of the overall system. 61

p. 2-12, Bay Division Facilities: Further clarity would be helpful regarding the SCVWD intertie and its function. The statement is made that SCVWD is currently returning supplies to the SFPUC at an average rate of 5 mgd through the intertie. This is confusing since it does not state whether this is short-term or long-term. In fact, this action is in accordance with the agreement with SCVWD and the action is short-term. Please clarify since statement implies the intertie supplies a long-term supplemental supply of 5 mgd. 62

p. 2-27, System Maintenance: It is important that this section be modified to highlight problems with the existing system operation which require resolution by the WSIP. Specifically, this section should: 63

- Highlight that the WSIP improvements are necessary to overcome aging infrastructure and operational problems impacting the health and safety of the 2.5 million customers of the system.
- Clarify those operational areas and issues which act as drivers for the WSIP. There is no information on what is expected to occur during a major seismic event or other facility failures which occur too frequently. Include examples of how operations and maintenance are being impacted.
- Provide information on the difficulty operations staff currently face whenever it is necessary to shutdown portions of the existing system for maintenance purposes. The most extreme examples include no ability to take Irvington and Pulgas Tunnels out of service. The report should clarify why the Irvington Tunnel inspection frequency is different than the desired 10-year cycle for tunnel inspections.

12.3-47

p. 2-28, System Maintenance: Some additional examples of recent outages that support the need for the WSIP are: 63 cont.

- San Joaquin Pipeline No. 3 (SJPL 3) failed in the San Joaquin Valley at the same time that the Sunol Valley Water Treatment Plant was shutdown for maintenance. This situation caused an immediate loss of water supplied from two sources including the Hetch Hetchy and Calaveras Reservoir supplies.
- San Andreas Pipeline No. 3 ruptured causing flooding of school property on the Peninsula.
- A loss of supply from Hetch Hetchy was caused by failures on the San Joaquin Pipeline system near Mountain Tunnel.
- During heavy rains the Hetch Hetchy supply was lost for a period of six weeks at the same time power outages occurred at the Harry Tracy Water Treatment Plant.
- During heavy rains, San Mateo Creek was flooded in an attempt to lower Crystal Springs Reservoir elevation which rose to within inches of spilling over the 4 foot high stop logs. DSOD demanded that the reservoir be lowered to avoid the stop logs from floating out of their holding rack which can cause disastrous flooding. Lack of reservoir storage capacity can also cause uncontrolled spills. During one such event the Mills Hospital first floor in San Mateo was flooded.
- A valve-exercising program that is part of necessary maintenance of the transmission system has been nonexistent due to fear that valve might be able to be reopened, leaving major pipelines closed and causing regional water losses.
- A planned dewatering of the Stanford Tunnel to inspect the integrity of the tunnel was halted to avoid risks involved in having an extended shutdown.
- The text cites one example related to the landslide that occurred on the peninsula near the existing Crystal Springs Bypass Tunnel. The text should cite the consequences if the endangered portion of the system had been damaged: It was estimated that if the line failed it could produce a 900 mgd rush of water into San Mateo Creek causing public health and safety and environmental concerns. The Harry Tracy Water Treatment Plant is the only other source of water to the north of the Crystal Springs Bypass Tunnel, serving the northern peninsula and San Francisco. SFPUC staff were stationed at the site on a 24 hour-7 day basis to put the tunnel back in service in case the treatment plant operations were disrupted.
- Multiple emergency shutdowns of the water treatment facilities have been made due to aging and unreliable equipment.
- The San Antonio Pipeline failed causing immediate shutdowns and flooding of rights of way.

Chapter 3 – Program Description

p. 3-9, Table 3.2: The WSIP goal for seismic reliability is different than what was presented in the NOP for this PEIR. The demand level for basic service 24 hours after a major seismic event has been increased from 215 mgd to 229 mgd. The text discusses detailed analyses conducted since the level of service goals were formulated by the Commission. Clarifying language is needed to explain how these subsequent studies support refining this goal. 64

p. 3-14, 3rd paragraph, Water Supply Studies: The statement is made "As described below, the Commission selected the 20 percent maximum system wide reduction in water service during drought periods for further study." The draft PEIR does not provide sufficient justification for the stated 20% rationing goal. Such a critical decision should be an informed, well-documented decision. The justification for the decision to have a 20% rationing goal should be included in the PEIR. The document should provide more analysis of the possible extent of rationing throughout the service area, up to 40% in some communities. It should also address the environmental and public health impacts of extreme rationing. These include loss of greenspace and landscaping and loss of water for sanitation, cooling and domestic use. In addition, a comparison to the rationing goals of other major water utilities having comparable levels of water use and demand hardening should be presented. 65

p. 3-14, 4th paragraph, Water Supply Studies: The last sentence of this paragraph should be changed to provide greater clarity. Specifically, the sentence should clarify that the "12 to 40 percent" reductions apply to the wholesale customers NOT the individual retail water customers within each jurisdiction, who will also experience different levels of reduction. 66

p. 3-18, Table 3.3: It is important to note that the BAWSCA agencies have **already committed** to the identified levels of water conservation (13-15 mgd) and recycling (9-10 mgd) in 2030 shown on this table in comparison to the conservation (0-4 mgd) and recycling (0-4 mgd) values identified for the SFPUC. To date, the SFPUC has not committed to any level of increased water conservation or recycling in 2030, and have treated water conservation and recycling in San Francisco as a component of the WSIP. 67

p. 3-19, Table 3.4: City of Menlo Park is 100% reliant on water from the SFPUC. Footnotes "a" and "c" should not be used for this city. 68

p. 3-22, Purchase Estimates: The draft PEIR does not fully describe how the wholesale customers have included conservation potential into their demands. Each wholesale customer conducted a cost-effectiveness analysis to select conservation measures to which it would commit above and beyond implementation of the plumbing codes and the measures recommended by the California Urban Water Conservation Council. In addition, the draft PEIR should describe in detail the wholesale customers' diversified water supply portfolio. 69

L_BAWSCA1
Attachment 1

p. 3-22, Recycled Water Potential, second sentence: The numbers in this sentence need to be corrected. The corrected sentence should read "The studies indicated that there is a range of about 20.1-25.0 mgd recycled water potential in addition to the existing and planned recycled water supply within the BAWSCA area." (RMC, 2004). 69 cont.

p. 3-25, bullet "E. Regional Recycled Water Projects," WSIP Project Refinement and Other WSIP Components: This bullet refers to the SFPUC consideration of the development of recycled water projects in areas outside of their jurisdiction in coordination with other agencies. While the SFPUC and other willing jurisdictions can partner to implement mutually agreeable projects, it is important to note that SFPUC participation is not necessary and in fact, may not be desired. The Bay Area Water Supply and Conservation Agency (BAWSCA) was created by the wholesale customers of the San Francisco regional water system with an expressed power to develop, implement, and fund regional water resources programs, including recycled water projects, as may be deemed appropriate by the Board of Directors. In addition, San Francisco may not necessarily be the lead agency in any such joint project. As a public agency, BAWSCA can be the lead agency in any project that it chooses to develop. Please clarify text accordingly. 70

p. 3-27, Water Quality Level of Service: Other water quality regulations of significance to the SFPUC that should be referenced are the Stage 2 disinfection by-products rule, Candidate Contaminant List, California Action Levels, and California Public Health Goals. 71

p. 3-27, Section 3.5.2 & 3.5.3: System performance under major seismic and reliability event scenarios with a completed WSIP show deliveries surpassing the some level of service objectives. For example, the last paragraph on p. 30 states "With implementation of the WSIP projects, this delivery capability would increase to 313 mgd, surpassing the level of service objective." Clarifying language is needed to explain which level of service objective is the limiting criterion for sizing a particular project and how, in some scenarios, meeting some objectives allows other level of service objectives to be exceeded. In general, if a facility is sized to meet one of several objectives, the facility may be able to operate beyond other minimum levels of performance. 72

p. 3-31, Table 3.7: The phrase "Delivery During a Hetch Hetchy Water Quality Event" should be clearly defined with a footnote to this table and language in the text. If there is a "water quality event," it is unclear whether <u>any</u> water can be served. 73

p. 3-32, Other Goals and Objectives, 1st paragraph: The statement is made "The SFPUC has included these program goals as fundamental elements of the WSIP, although the WSIP does not establish quantitative levels of service for the sustainability and cost-effectiveness goals." Do guiding principles exist regarding these goals in the absence of quantifiable levels of service? 74

p. 3-39, Proposed System Operations Strategy: BAWSCA is pleased that the future regional system operations assumed in this PEIR includes "Assigning a higher priority to water delivery over hydropower generation." The continuation of this priority, called "Water First Policy," is consistent with the legislature's intent upon passing AB1823. 75

p. 3-39, Proposed System Operations Strategy: The text should add other operating objectives that are used by the SFPUC in operating the regional water system: minimizing reservoir spillage; meeting local reservoir replenishment requirements; and providing effective emergency response and recovery. 76

p. 3-39, Proposed System Operations Strategy: When citing the operating objective of maximizing local reservoir storage, there is no mention that this strategy can result in reservoir spills and, in extreme cases, downstream flooding. The WSIP should address downstream flood control improvements to support this operating strategy. 77

p. 3-43, 1st paragraph, Water Supply and Storage Operations Strategy: Section 6 of the current Interim Water Shortage Allocation Plan sets forth an Annual Schedule which is to be followed by the SFPUC and its wholesale customers during periods of water shortage. Under this schedule, the SFPUC is to provide to its wholesale customers an estimate of the available water supply and, by March 31st of any drought year, a formal declaration of the existence of a water shortage emergency. 78

p. 3-43, Instream Flow Releases: The draft PEIR assumes that the SFPUC's current agreement with TID and MID, to pay them to provide all the additional water, if any, required for fishery releases when FERC imposes new requirements in 2016, will continue. Please provide specific strategies or approaches which may be used to provide additional water for fishery releases if needed. 79

p. 3-46, 1st full paragraph, Water Delivery Operations Strategy: The statement is made "At present, depending on hydrologic conditions and the transmission capacity of pipelines, the replenishment of local reservoirs can take more than one year to complete." Will the WSIP increase replenishment rates and decrease replenishment time? If so, by how much in terms of mgd or months? 80

p. 3-46, 1st full paragraph, Water Delivery Operations Strategy: The statement is made "The addition of redundant facilities and hydraulic capacity upgrades would also increase the system's transmission capability so that local reservoirs in the Alameda and Peninsula watersheds can continue to be replenished during maintenance periods to maintain higher average annual storage levels, thus ensuring that water would be available for use during emergencies or droughts, while also continuing to meet ongoing customer demands." BAWSCA concurs that this is an important operational necessity. The ability to replenish the local reservoirs is a critical component of providing water supply reliability. 81

L_BAWSCA1
Attachment 1

p. 3-48, 1st paragraph, Maintenance and Asset Management Strategy: The statement is made "The SFPUC has limited ability to shut down some of the tunnels and pipelines while still meeting customer demand. The transmission system needs additional tunnels and/or pipelines to provide redundant capabilities to enable shutdown, inspection, and maintenance of some major components of the existing system." The PEIR should strongly state the fact that currently some tunnels and pipelines cannot be taken out of service for inspection, routine maintenance or emergency repairs without major reductions in water delivery. 82

p. 3-49, Table 3.10, Project SJ-3: The project description for the San Joaquin Pipeline System states "Note: While the current preferred alternative would construct 16 miles of pipelines, as much as 22 miles of pipelines could be constructed depending on the results of a conditions assessment of the existing pipelines." BAWSCA supports this statement and has expressed support for the continued retention of this modification as part of its comments on the NOP for this specific project: 83

> The project scope indicates that an 86 inch pipeline connected to the west of the San Joaquin River from the cross over to Tesla portal be constructed. The CER [Conceptual Engineering Report] for this project indicates that, depending on the condition assessment of the existing San Joaquin River crossings, a fourth crossing denoted as Alternative 5 may be considered. This potential should be included in the NOP for review until the final determination is made.

p. 3-51, Table 3.10, Project SV-4: The project description makes the statement "The new tunnel would be a redundant water transmission facility to the existing Irvington Tunnel." While this is a true statement, it fails to address why this redundancy is important. The statement made earlier in the PEIR on p. 3-48, 1st paragraph should be referenced as part of this description ("The transmission system needs additional tunnels and/or pipelines to provide redundant capabilities to enable shutdown, inspection, and maintenance of some major components of the existing system.") so that the purpose for this tunnel is clearly understood. 84

p. 3-63, Table 3.12: Table 3.12 indicates significant overall need for staffing increases, however does not refer to a staffing plan that demonstrates whether or how the work can be accomplished. . The staffing needs for shutdown support during construction should be analyzed and addressed in such a plan and the final PEIR should more fully analyze and disclose the staffing challenges. 85

p. 3-82, Proposed Construction Schedule: The statement is made "there would be an intense period of construction from 2009 to 2010, when 18 of the 22 projects would be constructed concurrently." Is this correct? Will all the projects be constructed concurrently in one year or rather will they be "in construction" during this period? Change wording as appropriate. 86

p. 3-86, Required Actions and Approvals: Affected wholesale customers must review, approve and possibly fund any additional conservation, recycling and groundwater projects that are proposed in their service areas as part of an alternative. 87

Chapter 4 – WSIP Facility Projects – Setting and Impacts

p. 4.16-13, Geology, Soils, and Seismicity, Impact 4.16-2: It is stated "implementation of the WSIP would collectively result in *beneficial* effects related to the seismic safety of the regional water system." The "beneficial effects related to the seismic safety of the regional water system" after implementation of the WSIP should be illustrated with graphic and tabular data from previous seismic vulnerability studies. 88

Chapter 5 – WSIP Water Supply and System Operations – Setting and Impacts

p. 5.1-4, Section 5.1.3, Proposed Water Supply Option and System Operations: The text describes the proposed water supply option for non-drought year and drought year water supplies. One identified component of the drought year water supply is rationing. The following sections of the chapter discuss the impacts of the various water supply components, but give very little detail about the direct and indirect impacts of the rationing component beyond what is identified with associated drought year groundwater pumping. Additional information about rationing impacts should be presented in this section. 89

p. 5.1-5, 1st full paragraph, Proposed Water Supply Option and System Operations: The statement is made "Although no major changes are proposed under the WSIP with respect to regional system operations, there would be some operational refinements (described in Chapter 3, Section 3.7)." These refinements to operations should be clarified to include modification of reservoir seasonal storage levels and more flexibility for system maintenance. 90

p. 5.1-17, Proposed Water Supply Option and System Operations: The report states that spills or releases from local reservoirs will occur and states that they will last only a few days. The report does not acknowledge that a full reservoir cannot control a maximum credible event or storm which will then cause the reservoir to spill uncontrolled. Downstream impacts due to flooding should be addressed. 91

Chapter 6 – Mitigation Measures

p. 6-189, References: The tables in Section 6.6 refer to a number of published regulations and policies. Full citation (derived from reference lists embedded in Chapters 4 and 5) would enhance the utility of Tables 6.3 through 6.7. 92

Chapter 7 – Growth-Inducement Potential and Indirect Effects of Growth

Part 1 of BAWSCA's comments stressed that the large majority of the planned growth to be accommodated by the WSIP has already been analyzed in CEQA-approved documents. There are two areas in which analysis of the impacts of growth can be expanded. However, the potentially un-analyzed impacts of growth are either the same as those already analyzed, or so small as to be insignificant.

The first category of potentially un-analyzed growth impacts are those that have been analyzed in CEQA documents, mostly general plans from jurisdictions served by the regional water system, although not for the same length of time as called for in the WSIP. The reason for this potential discrepancy is that none of the general plans' horizons extend to 2030. The draft PEIR concludes that the growth accommodated by the WSIP in years beyond those analyzed in general plans (mostly the years 2020-30) would have impacts that are substantially similar to, though incrementally greater than, the impacts identified in local general plan CEQA documents (p.7-60; see also Table E.5.1.) We agree with this assessment. 93

The second category of potentially un-analyzed growth impacts are those that might occur in territories not covered in prior CEQA documents at all. However, this growth represents an insignificant portion of the total planned regional growth. Appendix E.5 of the draft PEIR lists those planning documents that have already received CEQA analysis. Table 7.4 shows the projected changes in population and employment for all the jurisdictions within the service area. A comparison of these two documents reveals that less than 8% of the total population growth in the wholesale service area, and less than 5% of the employment growth, has not undergone CEQA review for the effects of the WSIP's planned growth. Put another way, the impacts of over 90% of the growth that will be accommodated by the WSIP have already been addressed in previous CEQA analyses.

Chapter 8 – WSIP Variants and Impact Analysis

Chapter 8 describes and analyzes the potential environmental effects of three identified WSIP variants: All Tuolumne (Variant 1); Regional Desalination for Drought (Variant 2); and 10% Rationing (Variant 3).

The use of variants in a proposed program is not common in CEQA documents. The overview clearly distinguishes the discussion in this chapter from the CEQA alternatives presented in Chapter 9. The text needs to further explain the utility of the analysis in the context of CEQA. One of the variants (Variant 2 – Regional Desalination for Drought) is carried forward into the formal CEQA alternatives analysis. 94

A comparison of the results of the impact analyses for each of these variants provides a useful sensitivity analysis for the project components in the proposed WSIP as well as some of the early policy decision making. For example:

> With the exception of the Bay Area Regional Desalination Project (BARDP) component of Variant 2, all three variants would have the same significant unavoidable or potentially significant unavoidable impacts as the proposed program….The greatest differences among the proposed program and the variants are associated with facilities-related impacts of the BARDP (p. 8-77, WSIP Variants and Impact Analysis)

> ...although the water supply and system operations impacts of the variants differ somewhat from those of the proposed program, the magnitude of the differences is small and not sufficient to change either the significance determinations or the mitigation measures identified for the WSIP. (p. 8-77, WSIP Variants and Impact Analysis) 95

> ...with the exception of the BARDP component of Variant 2, the variants would have the same areas of controversy, the same unavoidable effects, and the same irreversible environmental changes as the proposed program. (p. 8-83, WSIP Variants and Impact Analysis)

By slightly changing the proposed water source or level of rationing for each of the variants, the resulting impacts analysis provides an understanding of the sensitivity of impacts associated with the proposed program. Two important conclusions can be made based on the results of this sensitivity analysis:

1. The environmental impacts of a Bay Area Regional Desalination Project are far greater than the impacts of providing additional water supply reliability through increased diversions from the Tuolumne River.
2. Greater reliability can be provided with a 10% rationing limit without causing any increased impacts to the environment.

Chapter 9 - CEQA Alternatives

p. 9-4, Table 9-2: There should be an attempt to quantify the existing level of service beyond "not defined" in order to better correlate with the conclusions presented in Table 9-6 "Summary of Ability of Alternatives to Meet Program Objectives." Quantitative data on existing system performance for this purpose could be extracted from Chapter 3, Tables 3.6 and 3.7. 96

p. 9-16, Table 9-6: While this table identifies whether the individual alternatives meet the program objectives, including "Ensure cost-effective use of funds," nowhere in this chapter are the actual total costs of individual alternatives presented. CEQA does not require an economic analysis, however a presentation of the economics of the proposed program and identified alternatives is crucial as part of the final decision making process. Given the wide range of costs associated with the supply components of the various alternatives, full disclosure of the known costs of the alternatives being considered is important as part of the public debate concerning the decision being made. 97

p. 9-16, Table 9-6, Water Quality Objectives: One water quality objective is "Design improvements to meet current and foreseeable future federal and state water quality requirements." In evaluating whether an alternative meets this objective, consideration must be given to the fundamental principles that dictate that water quality from the best source is the most reliable means of eliminating uncertainties associated with contamination and public health risk. Water quality regulations are becoming more stringent with many more trace organics being detected, raising public health concerns. Options for source water downstream of the current intake are influenced by runoff and contamination from many other sources due to human activity. The uncertainty about risks from endocrine disruptors and other contaminants may result in increased health risk and higher levels of treatment. A treatment scheme capable of producing a similar water quality would include reverse osmosis and activated carbon among other processes which require more energy and disposal problems that have negative impacts on the environment. Public concern over drinking water is a leading issue resulting in diminished public confidence and higher use of bottled water which carries its own set of issues related to trace organic contamination and disposal of packaging and containers. 98

p. 9-17, Table 9-7: Another column should be added to this table showing the results of the water supply and system operations impact analysis results for the Proposed Program to more easily see the comparison to the alternatives. In reviewing this table, some summary comparisons can be made: 99

- Comparing to the Proposed Program, the Modified WSIP reduces 17 water supply and system operations impacts from "Potentially Significant, Mitigatable" to "Less than Significant"

- Comparing to the No Purchase Request Alternative, the Modified WSIP reduces 7 water supply and system operations impacts from "Potentially Significant, Mitigatable" to "Less than Significant"

- The No Action Alternative has the same identified "Potentially Significant, Mitigatable" water supply and system operations impacts as the Proposed Program

99 cont.

p. 9-26, last paragraph, No Program Alternative, Sec. 9.2.2: If the wholesale customers were to seek alternative supplies, they would have to use some, if not most of the Bay Area portion of the of the existing San Francisco regional waster system infrastructure. The draft PEIR does not fully disclose the constraints on this system. Understanding of these constraints is essential to know if the environmental impacts of the potential use of alternative supplies by the wholesale customers has been thoroughly analyzed and disclosed. For example, if the existing San Francisco regional system infrastructure is not available for these purposes, then the environmental impacts from the construction of a new supplemental water distribution system necessary to deliver alternative supplies could be greater than the impacts of the WSIP and should be disclosed as part of the final PEIR. 100

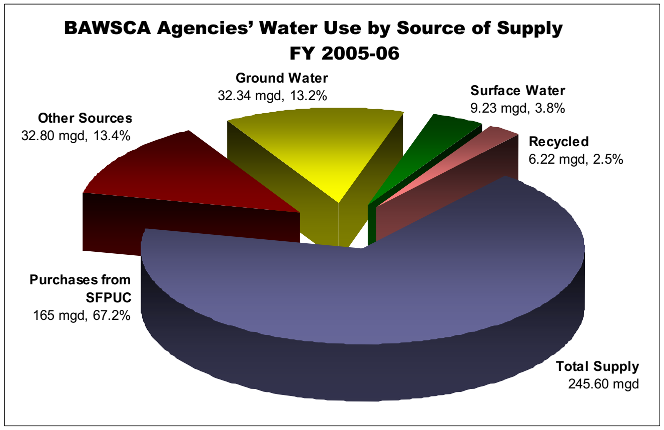
p. 9-26, last paragraph, No Program Alternative, Sec. 9.2.2: Regarding the statement that agricultural water use is decreasing because agricultural water users are selling water rights or contracts to urban agencies, another model to explain this result has also appeared. Specifically, some urban customers are investing in conservation in the agricultural regions and contracting to buy the conserved water, without land fallowing or selling of water rights. 101

p. 9-28, first paragraph, No Program Alternative, Sec. 9.2.2: The draft PEIR states that the wholesale customers have factored in additional conservation and recycling into their 2030 demands. In fact, by 2030, the wholesale customers expect to have an additional 9 mgd of recycled and desalinated water as well as 13 mgd from active conservation. (BAWSCA Annual Survey, FY 2005-06.) 102

p. 9-48 and 9-49, Aggressive Conservation/Water Recycling and Local Groundwater Alternative: The evaluation and analysis of the Aggressive Conservation/Water Recycling and Local Groundwater Alternative in the PEIR must consider the existing water demands and supply sources as well as projections for future water demand and water supply diversity.

First, the diversification of water supplies today is very different when comparing the City and County of San Francisco with the BAWSCA agencies. Thirteen of the BAWSCA agencies have diverse water supply portfolios that include recycled water, desalinated water, local groundwater, and local surface water. Figure C below provides detail on the current diversification of existing water supply portfolios. By comparison, Figure D shows the sources of supply for the San Francisco Retail System in the year 2000. 103

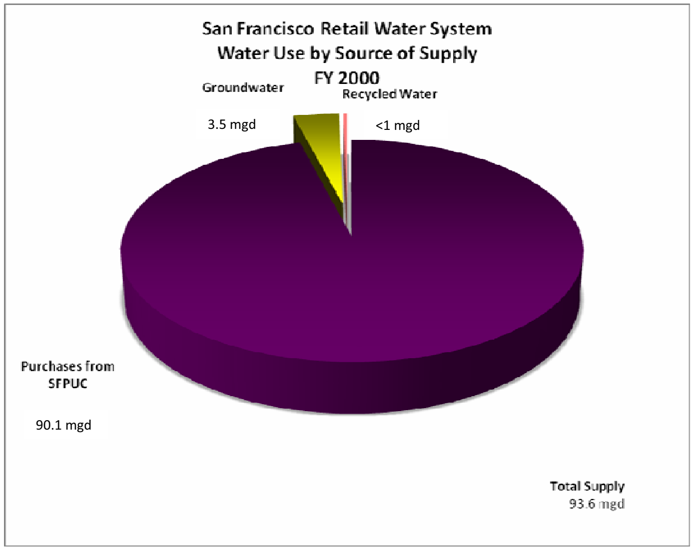
Figure C



103 cont.

[Remainder of page intentionally left blank.]

Figure D



103
cont.

BAWSCA agencies have committed to increasing the diversity of their water supply portfolio in the future with increased use of recycled water, conjunctive use operation of groundwater supplies, and implementation of water conservation in 2030 as shown in Figure E below. Again, for comparison purposes, Figure F shows the planned sources of supply for the San Francisco Retail System in 2030 including an assumption that the conservation and water recycling component of the WSIP is implemented.

Other Comments Relating to Section 3.4.4, Water Demand Studies, and Supporting Studies for PEIR

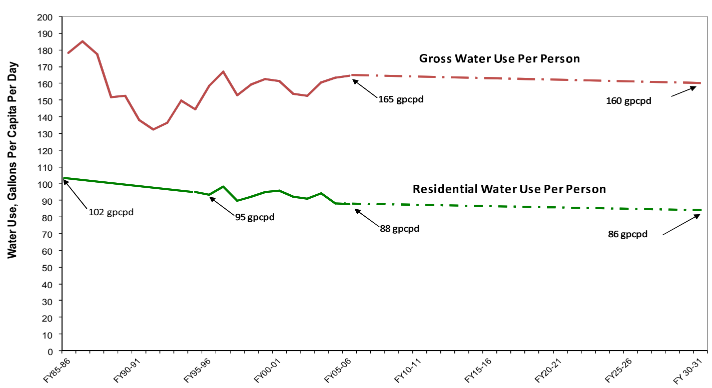
Since the release of the draft WSIP PEIR, several organizations have made critical statements questioning BAWSCA member agencies' water use characteristics and demand projections, which are included in the PEIR's supporting documents.

BAWSCA would like to offer the following comments and information on Section 3.4.4 "Water Demand Studies" of the PEIR and in response to the statements that have been made. Below is a summary of those comments made and BAWSCA's responses for purposes of clarifying similar issues in the PEIR.

- Critical Statement: The wholesale customers anticipate that the single-family residential per-capita outdoor water use will increase from 39 gpcpd in 2001 to 40 gpcpd in 2030; Per capita water use is projected to increase for the wholesale customers, further indicating that they lack effective conservation programs.

  BAWSCA Response: As documented in the technical memorandum "*Projected Water Usage for BAWSCA Agencies*" (Brown and Caldwell, Nov. 2006), while the single-family residential per-capita outdoor water use for the BAWSCA member agencies will increase from 39 gpcpd in 2001 to 40 gpcpd in 2030, total single family residential per-capita use will <u>*decrease*</u> from 96 gpcpd to 86 gpcpd over the same period (although current 2005-06 per capita use is actually 88 gpcpd) and gross per capita use will <u>*decrease*</u> from 165 gpcpd currently to 160 gpcpd in 2030. Figure G below presents historical and projected gross and residential per capita use in the BAWSCA area.

Figure G 104



<u>Data Sources</u>
Historical Data: BAWSCA Annual Surveys
Projected Data: Projected Water Usage for BAWSCA Agencies Technical Memo, Brown and Calldwell, Nov. 2006

- Critical Statement: The SFPUC's "Proposed Program" ignores conservation, efficiency, and recycling measures that their own studies found could eliminate the need to divert more water from the Tuolumne by at least 74%.

  BAWSCA Response: This statement is incorrect. In fact, the WSIP includes implementation of over 23 mgd of conservation and recycling in the BAWSCA service area by 2030 as well as an additional 10 mgd of conservation and recycling in San Francisco by 2030. 105

- Critical Statement: The SFPUC should conduct a study to determine the maximum technical potential for conservation and efficiency savings within the SFPUC service territory.

  BAWSCA Response: Such a study was completed in March 2006, the "*SFPUC Investigation of Regional Water Supply Option No. 4 (RWSO4)*" (URS, March 2006). This study presented the results of a comprehensive analysis of water conservation, water recycling, and naturally renewable groundwater projects that could be implemented to meet future water demands without additional diversion from the Tuolumne River. While this report does identify areas of potential additional opportunities that could be implemented to reduce the need for additional Tuolumne River diversion, the study concludes: 106

  > The total "high range" yield for the three categories of RWSO4 projects is approximately 28.5 mgd. The "high range" yield is the <u>**maximum**</u> possible from the combination of water conservation, recycling, and renewable groundwater projects. Because some of these projects are only considered potentially eligible and because the feasibility of many of the projects is unknown, this Technical Memorandum concludes <u>**that RWSO4 will not meet**</u> the 35 mgd increase in normal year SFPUC system demand by the year 2030. (emphasis added)

- Critical Statement: "the non-residential sector is responsible for over 80% of the projected 2030 demand increase."

  BAWSCA Response: This statement is incorrect. 53.4% of the projected total increase in demand is associated with non-residential water use. The difference in the non-residential sector between 2001 actual (91 mgd) and 2030 projected (120.5 mgd) is 29.5 mgd, which represents 53.4% of the total increase in demand. 107

- Critical Statement: "over 40 percent of the increase in non-residential demand is due to outdoor use."

  BAWSCA Response: This statement is incorrect. As documented in the technical 108
  memorandum "*Projected Water Usage for BAWSCA Agencies*" (Brown and Caldwell, Nov. 2006), the difference in the non-residential sector between 2001 (actual) and 2030 (projected) is 29.5 mgd. Of this amount, the increase in *outdoor use* is 9.4 mgd, or 32%.

- Critical Statement: The PEIR and associated demand studies failed to account for the impact rising price of water has on consumption.

  BAWSCA Response:

  First, all of the BAWSCA agencies meet the CUWCC Best Management Practice #11 for Pricing.

  Second, the demand studies that form the basis for the PEIR did incorporate the future cost of water (estimated at $1,070/acre-foot) when analyzing the cost-effectiveness of each individual conservation and water recycling measure. This allowed the individual BAWSCA member agencies to identify the cost-effective water supply alternatives available to them based on the future cost of water.

  Third, the demand studies that form the basis for the PEIR are based on an end-use 109
  model. This type of model differs from straight per capita or land use-based forecasting approaches in that it uses growth in number of accounts and a complete breakdown of water uses by account type (end uses) to forecast water demands. Using an end-use model allows more consideration of the effects of targeted conservation measures than is possible with a per capita or land use demand model. One characteristic of utilizing an end-use model is that very specific conservation measures are identified and evaluated for all end uses of water that can be identified. The result is that water use and available conservation activities are broken down very specifically. These individual conservation measures are then applied to end uses and the resulting water demand after conservation activities is determined. Because of this, applying a general elasticity value to this resulting demand, in an attempt to "mimic" the effect of pricing increases, would in fact then double-count much of the already identified and planned savings. Put another way, the specific conservation measures evaluated as part of an end use model provide clarity and specificity as to how a customer would achieve conservation savings in response to pricing structures designed to encourage water conservation.

- Critical Statement: "A study conducted by the Irvine Ranch Water District in California, for example, showed that evapotranspiration controllers reduced outdoor water use for large residential users by 24 percent."

  BAWSCA Response: BAWSCA is currently awaiting results from a multi-year study being conducted on weather-based irrigation controllers and their effectiveness. This
  study is a grant-funded effort in the San Francisco Bay Area headed by EBMUD and 110
  includes EBMUD, SCWA, CCWD, ACWD, SCVWD, and the City of Davis. Results of the study will not be out for another year or so. It is important to review the results of this study prior to implementing any irrigation controller rebate program, as the study should demonstrate actual water savings potential in *climatologic and hydrologic areas similar to the BAWSCA agencies,* as opposed to studies from Southern California or elsewhere in the country.

- Critical Statement: "Recent conservation assessments indicate that there are a substantial number of cost effective technologies that can drastically reduce residential water demand – both indoor and outdoor – to levels far below those projected for the wholesale and retail customers. For example, a 1997 study by the American Water Works Association (AWWA) found that conservation could reduce indoor water use from 65 gpcpd to 45 gpcpd for single-family homes, a savings of over 30 percent."

  BAWSCA Response: According to the report *Water and Energy Savings From High Efficiency Fixtures and Appliances in Single Family Homes* (EPA, 2005):

  > The mean daily household indoor use for the three groups during the
  > baseline was 175 gpcpd, which dropped 39 percent to 107 gpcpd after the 111
  > installation of the new high-efficiency fixtures and appliances.

  For the houses studied in the service area of East Bay Municipal Utilities District in the San Francisco Bay Area, the pre-retrofit total residential water use was 187.6 gpcpd and the post-retrofit use was 123.9 gpcpd, a difference of 63.7 gpcpd or 33.95%. These findings support the fact that household retrofits with efficient plumbing fixtures can significantly reduce residential water use. However, the study shows that residential water use in other parts of the San Francisco Bay Area is significantly higher currently than that for BAWSCA, including that for BAWSCA's projected 2030 use. As stated earlier in these comments, total single family residential per capita water use will decrease from the current level of 88 gpcpd to 86 gpcpd in 2030.

Impact of Earthquakes on BAWUA Customers

Summary Report

Prepared for:
Bay Area Water Users Association

Prepared by:

G&E Engineering Systems Inc.
6315 Swainland Rd
Oakland, CA 94605
(510) 595-9453 (510) 595-9454 (fax)

Principal Investigator:
John Eidinger

G&E Report 54.01.01, Revision 0X
November 23, 2001
(includes minor revisions by BAWUA)

Introduction

This report describes what might happen to deliveries of water to BAWUA customers resulting from earthquake-induced damage to the SFPUC water system after two significant and likely earthquakes: a magnitude 7.9 earthquake on the San Andreas fault or a magnitude 7.1 earthquake on the Hayward fault. Unless otherwise noted below, estimated restoration times refer to SFPUC regional system. Damage to local distribution systems may further impede water from reaching the actual end-user. Water deliveries may be non-potable during the time water is restored to customers.

San Andreas M 7.9 Earthquake

This earthquake will be very damaging to the main pipelines, tunnels, water treatment plants and pump stations in the Peninsula portions of the SFPUC system. No new water supply from the SFPUC system will be available until repairs are made to the most critical pipeline and tunnel infrastructure; this will take between 20 and 30 days, depending on location within the SFPUC system. Projected impacts to BAWUA customers are as follows:

- 349,000 people (Brisbane, Burlingame, Colma, Foster City, Hillsborough, Millbrae, Pacifica, San Mateo, South San Francisco, parts of Belmont and Daly City): Water supply is lost to almost all customers in about 24 hours. No water via the piped system for about 30 days. After 30 days, about 35% of customers will have water restored, ramping up to 100% of customers in about 58 days.

- 140,000 people (San Bruno, most of Daly City): Water supply is lost to almost all customers in about 24 hours. There is no water to most of the piped system for several days. Then, water supply is restored to most people at severe rationing levels within 30 days. After 30 days water is supplied to most people at near normal levels. 112

- 277,000 people (East Palo Alto, Los Altos Hills, Menlo Park, Palo Alto, Redwood City, Woodside, parts of Belmont and North San Jose): Water supply is lost to almost all customers in about 24 hours. There is no water via the piped system for about 20 days. After 20 days, about 35% of customers will have water restored, ramping up to 100% of customers in about 34 days.

- 334,000 people (Mountain View. Santa Clara, Stanford University and Sunnyvale): Water supply is lost to almost all customers in about 24 hours. No water to most of the piped system for a few days. After 14 days, about two-thirds of customers will have water restored, ramping up to 100% of customers at near normal levels in about 34 days.

- 511,000 people (Hayward, Fremont, Newark and Union City). Damage to local distribution pipelines, especially those near the bay, will cause between 3% and 20% of customers to lose all water supply for up to a few days after the earthquake

- 800,000 people (San Francisco). Damage to local distribution pipelines, especially those serving the lower elevation north waterfront, downtown and South of Market areas, will lead to loss of all water supply to those areas within 8 to 24 hours after the earthquake. Water supply to the western and higher elevation parts of the City will be

L_BAWSCA1

lost to localized areas within a few hours after the earthquake. Damage to all the major transmission pipelines serving San Francisco will prevent re-supply of the City, causing most of the City to lose nearly all water supply within about 72 hours. Limited portions of the City served by unbroken parts of the salt-water auxiliary water supply system may have access to salt water for fire fighting purposes. For up to 30 days, a portion of the City could get non-potable water if it is decided to pump Lake Merced water into the potable water system; most of the remainder of the City will have no water. Some of the transmission pipelines are restored to service 30 days after the earthquake, and about three-quarters of the City will then have water. Essentially all customers get water restored within 45 days.

Hayward M 7.1 Earthquake

This earthquake will be very damaging to the main pipelines, tunnels, water treatment plants and pump stations in the East Bay portions of the SFPUC system. No new water supply from the SFPUC system will be available to the East Bay and parts of the South Peninsula areas until repairs are made to critical pipeline and tunnel infrastructure; this will take between 20 and 30 days, depending on location within the SFPUC system. Given the expected damage patterns, BAWUA customers should expect the following:

- 200,000 people (East Palo Alto, Hayward, Woodside, parts of Menlo Park, North San Jose, Palo Alto and Redwood City). Water supply is lost to almost all customers in about 24 hours. There is no water via the piped system for about 20 days. After 20 days, about 35% of customers will have water restored, ramping up to 100% of customers in about 35 days. For up to 60 days after the earthquake, water supply will be intermittent (sufficient at night time, on-and-off in the day time). 112 cont.

- 725,000 people (Fremont, Milpitas, Newark, Santa Clara, Sunnyvale, Union City and parts of Stanford University). Water supply is lost to almost all customers in about 24 hours. There is no water to most of the piped system for a few days. Water supply to about one-half of customers is restored within 15 days. Then, water supply to about two-thirds of customers is restored within 20 days, which is when the SFPUC system is sufficiently repaired to start making limited deliveries again. For up to 60 days after the earthquake, water supply will be intermittent.

- 800,000 people (San Francisco). Damage to local distribution pipelines, especially those near the bay, will cause between 5% and 20% of customers to lose all water supply within 24 hours after the earthquake, with most of these customers reconnected to the system within ten days after the earthquake. For up to 60 days after the earthquake, there may be insufficient water available to supply all of San Francisco, if the decision is made to divert limited water supplies to meet the requirements of Peninsula and South Bay suburban customers. If the decision is made to divert water, then San Francisco customers will have to greatly reduce demand, or else there will be localized intermittent water outages.

- 710,000 people (northern Peninsula and areas not listed above). Damage to local distribution pipelines, especially those near the bay, will cause between 2% and 15% of customers to lose all water supply for up to a few days after the earthquake. For up to 60 days after the earthquake, water supply will be intermittent (sufficient at night time, on-and-off in the day time).

Impacts to Affected BAWUA Customers

For the first one to three days after either a San Andreas M7.9 or Hayward M7.1 earthquake, a large portion of affected people will likely stay home, to take care of immediate family matters and damage to local residences. If residential structures suffer little to moderate damage, most people will continue to live at home, while some will relocate to stay with friends or family outside the affected zone. If residential structures suffer considerable damage, people will have to relocate to various types of emergency shelters like school gymnasiums.

During the first few days, most people in the areas with water outages will obtain drinking and cooking water from bottled water suppliers. Within a day or two, water supply for sanitation and washing purposes will become a high priority for people. People without water at their residences beyond one or two days will either relocate to emergency shelters / hotels, move in with family outside of the affected area, or suffer the inconvenience of obtaining bottled water and/or water from emergency distribution locations for all of their needs.

Faced with water outages that could last up to 20 to 60 days, there will be substantial impacts to local communities. Most emergency care facilities (hospitals) will likely have to relocate their patients to other hospitals if their facility loses piped water supply for more than a day or so. People will tend to become "disillusioned" with their water agencies if piped water is not restored within about 4 to 10 days. Economic activity in the areas without piped water supply will drop by about 50-70%; most affected businesses will furlough their employees for the interim; "marginal" companies may not ever recover.

A large earthquake will ignite fires in many locations. Many of these fires will ignite due to leaking natural gas pipes; short circuits in electrical systems; unattended cooking and tipped-over heating appliances when PG&E electric power is restored; spillage of flammable materials, etc. Fire fighters will be able to make good use of local water supplies in tanks until the water within the tanks runs out, likely within 6 to 18 hours after the earthquake. Fire fighting efforts at fire locations that are located too far away from a water supply (either because of broken water pipes, or the system has become depressurized), will be largely ineffective; the buildings (and a few around them) will be left to burn down. If it is very windy at the time of the earthquake (about 2% to 5% chance), fires that cannot be rapidly controlled before the local water supply is exhausted will likely spread; in densely constructed areas, one or two uncontrolled ignitions could lead to conflagrations involving 10s to 100s to 1000s of structures.

Basis of this Report

This report was prepared using the findings described in the "Phase II – Regional System Overview" report of the SFPUC Facilities Reliability Program (January 2000), coupled with trends that have occurred to local water distribution systems in recent earthquakes around the world. Further engineering evaluations of individual components of each water system can refine the results presented herein. The water outages described in this report are no more severe than what has actually been experienced to modern metropolitan urban areas that have recently experienced large earthquakes. For example, the city of Kobe, Japan (population 1,500,000 people), was impacted by a magnitude 7 earthquake in 1995; the resulting damage to the water

112 cont.

system resulted in water outages lasting up to 90 days. For BAWUA customers, the dominant reason for lengthy water outages is damage to pipelines that cross soil liquefaction areas (the San Francisco Bay Area has many such pipelines and many such soil areas); and that major pipelines cross faults (the SFPUC system has all 4 of its major pipelines cross the Hayward fault). Another important cause of damage is the intense level of ground shaking that will occur near the faults, which will greatly overload the vintage water facilities built near them, like reservoir outlet towers and tunnels – most of these facilities were not designed for anything much more than about one-quarter the level of ground shaking that they will likely be subjected to in future earthquakes.

For the interested reader, detailed reports on the performance of water systems in recent earthquakes are available from the American Society of Civil Engineers (www.asce.org), Technical Council on Lifeline Earthquake Engineering: Kobe, Japan, 1995 (monograph 15); Izmit, Turkey 1999 (monograph 17); Chi-Chi Taiwan, 1999 (monograph 18); Bhuj, India, 2001 (monograph 19). In all of these earthquakes, damage to water systems led to water outages lasting between weeks to several months for urban areas of 100,000s to 1,000,000s of population.

L_BAWSCA1

A Water Bonds

Digest

by Ballot Simplification Committee

THE WAY IT IS NOW: San Francisco's water system supplies drinking water to about 2.4 million people in San Francisco and the Bay Area. This water is stored at Hetch Hetchy Reservoir and in other reservoirs in the Sierra and in Alameda and San Mateo counties. Some of the water is piped more than 150 miles to reach the Bay Area. Many of the water system's pipelines, tunnels and other facilities are in need of repair or replacement. Some of these are located on or near fault lines, and are vulnerable to damage in an earthquake.

THE PROPOSAL: Proposition A is a revenue bond that would authorize the City to borrow $1,628,000,000 to pay for improvements to its water system. The money would be used to:

- Upgrade and strengthen the system's pipelines, tunnels and other facilities against earthquakes;
- Upgrade the system used to store water and pipe it to the Bay Area;
- Upgrade the water distribution system in San Francisco;
- Meet future water quality standards; and
- Increase water system capacity.

Rates charged to water system customers in San Francisco would be increased over time to repay these bonds. San Francisco landlords could pass on to tenants in rent-controlled units half the increase in water rates resulting from the bond. Suburban water system users would finance and pay for their share of improvements to the water system.

If in the future the San Francisco Board of Supervisors determines that it is cheaper to pay for water system improvements by joining with suburbs to create a Regional Water Financing Authority, then a surcharge will be imposed on San Franciscans to cover the additional costs including to pay for the operating expenses of the Authority.

A "YES" VOTE MEANS: If you vote "Yes," you want the City to borrow $1,628,000,000 to make water system improvements, to be paid for with increased water rates.

A "NO" VOTE MEANS: If you vote "No," you do not want the City to borrow $1,628,000,000 for these purposes.

Controller's Statement on "A"

City Controller Edward Harrington has issued the following statement on the fiscal impact of Proposition A:

In my opinion, should the proposed bond issue of $1,628,000,000 be authorized and bonds issued at current interest rates, based on a single bond sale and level redemption schedules, the cost would be approximately $85,000,000 annually for thirty (30) years for a total approximate cost including debt service of $2,551,000,000.

This bond amount represents increases ranging between 5% and 12% annually between 2003 and 2015 in water rates for San Francisco consumers, the source of repayment for these bonds. For the average single family residential service in San Francisco this cost is equivalent to an increase of approximately $26.42 per month above the current rate of $14.43 per month, for a total of $40.85 per month by 2015.

The City typically does not issue all authorized bonds at one time; if these bonds are issued over several years, the actual debt service may be somewhat less than the maximum amount shown herein.

Before the bonds are issued, the City will need to amend the Residential Rent Stabilization and Arbitration Ordinance. This amendment is to provide landlords the ability to pass through 50% of the costs resulting from increased water rates to residential tenants. Under current financing assumptions, the average tenant in a four unit building would pay approximately $10.56 per month by 2015.

How Supervisors Voted on "A"

On July 22, 2002 the Board of Supervisors voted 8 to 3 to place Proposition A on the ballot.

The Supervisors voted as follows:
Yes: Supervisors Ammiano, Daly, Gonzalez, Leno, Maxwell, McGoldrick, Newsom, and Peskin.
No: Supervisors Hall, Sandoval, and Yee.

THIS MEASURE REQUIRES **50%+1** AFFIRMATIVE VOTES TO PASS.

ARGUMENTS FOR AND AGAINST THIS MEASURE IMMEDIATELY FOLLOW THIS PAGE. THE FULL TEXT BEGINS ON PAGE **P-19**.
SOME OF THE WORDS USED IN THE BALLOT DIGEST ARE EXPLAINED ON PAGE **P-3**.

A Water Bonds

PROPONENT'S ARGUMENT IN FAVOR OF PROPOSITION A

Should a major earthquake strike San Francisco's Hetch Hetchy water system must be ready.

If a serious quake were to occur today, there is a high probability that water delivery to San Francisco could be interrupted for more than two months. This would threaten our ability to fight fires after an earthquake and lead to an economic disaster as we attempted to recover without a stable water supply.

When San Franciscans came together in common purpose to build Hetch Hetchy nearly 100 years ago, we showed we were a city that knew how to do things right. Now, it is time for our generation to show that we know how to safeguard this civic treasure.

After years of study and rigorous review, the city is going forward with Proposition A to seismically-strengthen and repair the deteriorated system.

Hetch Hetchy brings more than vital water; it provides tremendous financial benefits to the people of San Francisco. Because of our ownership of the system, San Francisco will pay for just 30 percent of the cost of regional repairs. Our suburban customers will pay the rest - $2 billion. And our water rates will be competitive with neighboring counties in the Bay Area. Hetch Hetchy also provides San Francisco free water and power for critical city needs such as the Municipal Railway, Public Schools, San Francisco General Hospital and other city facilities.

12.3-60

Now is the time to safeguard this civic treasure. The system crosses three major earthquake faults and is vulnerable.

A city cannot live without water. That's why Board President Tom Ammiano and Supervisors Peskin, Maxwell, Daly, Leno and McGoldrick have joined with the Chamber of Commerce, environmental activists and leaders from throughout San Francisco to support Proposition A.

Please Vote YES on Proposition A.

Supervisors Tom Ammiano, Aaron Peskin, Sophie Maxwell, Chris Daly, Mark Leno and Jake McGoldrick

San Francisco Chamber of Commerce

REBUTTAL TO PROPONENT'S ARGUMENT IN FAVOR OF PROPOSITION A

Proposition A triples water rates, raises rents and gives away control of our water system to the suburbs.

Don't fall for the scare campaign. Though our water delivery system must be made seismically safe, there is an alternative plan that would cost 75% less - and keeps San Francisco voters, not suburban politicians, in control of our water system.

The political establishment supports this measure because it helps to create a new bureaucracy called The Regional Water Finance Authority. This Authority will control spending and set your water rates. You the ratepayer or renter will pay the costs of this new bureaucracy.

Current law requires a vote of the public to increase water rates. This important decision must remain in the hands of voters and certainly not the hands of politicians.

Please read the ballot question and you will see that the devil is in the details. See through the fear campaign and keep what Congress gave San Francisco more than 80 years ago.

Please join us in saying **NO to THE WATER GRAB.** Vote No on Prop A!

PAID ARGUMENTS IN FAVOR OF PROPOSITION A

SENIORS SUPPORT THE REPAIR AND RENEWAL OF OUR WATER SYSTEM! PAY NOW OR PAY MUCH MORE LATER. **VOTE YES ON PROP A.**

Margaret Griffin, Vice-President, SENIOR ACTION NETWORK
Denise D'Anne, Treasurer, SENIOR ACTION NETWORK

The true source of funds used for the printing fee of this argument is SENIOR ACTION NETWORK.

Hetch Hetchy is the largest source of high quality drinking water in California. It delivers water to all San Franciscans and several peninsula communities -- about 3 million people are served.

The Hetch Hetchy water system needs overhauling: new pipes that are seismically upgraded to meet modern safety standards; reinforcement of city reservoirs, such as in the Sunset, that provide water to 60% of San Francisco and serve as emergency supply; and modernized pump stations that move water throughout the city.

It would be foolhardy not to repair this system. Throughout California, there are communities searching for high quality drinking water. We have it and we must keep it.

I urge you to vote "Yes" on Proposition A.

Dianne Feinstein, U.S. Senator, former Mayor, former Supervisor

The true source of funds used for the printing fee of this argument is Save Hetch Hetchy Committee - Yes on A: A Business & Labor Coalition to Safeguard Our Water Supply.

The three largest contributors to the true source recipient committee are: 1. California Alliance for Jobs 2. Engineering and Utility Contractors Association 3. San Francisco Chamber of Commerce 21st Century Committee.

State Senator Jackie Speier says "it is not a question of ***if*** a major earthquake will strike the Bay Area. It is a question of ***when.***" I agree.

Hetch Hetchy's aging pipes cross three active earthquake faults: the Calaveras, the Hayward, and the San Andreas. A 7.0 earthquake could cut water to 2.4 million residents of the Bay Area for up to 60 days. Emergency crews would be unable to fight fires, and hospitals would be unable to function properly. This is a risk that we cannot afford to take.

Senator Speier and I speak with passion borne of a love of this great city when we implore you to help Save Hetch Hetchy for our generation and for generations to come.

History will judge us by our vote on November 5.

Please, vote yes on A.

Jane Morrison, Chair, San Francisco Democratic Party

The three largest contributors to the true source recipient committee are: 1. California Alliance for Jobs 2. Engineering and Utility Contractors Association 3. San Francisco Chamber of Commerce 21st Century Committee.

Join the San Francisco Democratic Party in Voting YES on A.

Proposition A is a vital public safety priority for all San Franciscans. We must protect our water supply and preserve the Hetch Hetchy system.

A major earthquake will strike sooner, or later.

We must be ready.

Don't Delay. Vote YES ON A!

San Francisco Democratic Party

The true source of funds used for the printing fee of this argument is Save Hetch Hetchy Committee - Yes on A: A Business & Labor Coalition to Safeguard Our Water Supply.

The three largest contributors to the true source recipient committee are: 1. California Alliance for Jobs 2. Engineering and Utility Contractors Association 3. San Francisco Chamber of Commerce 21st Century Committee.

The San Francisco Chamber of Commerce Urges YES on A.

As representatives of the business community, we know that our economy will wither if we cannot protect our water supply. A major earthquake will knock out water to our city for months. That will create an immediate danger as we fight fires in the aftermath of an earthquake, and a long-term disaster as we try to rebuild our economy without water.

We have waited too long already. Now is the time for the entire city to unite behind Proposition A.

A. Lee Blitch, President and CEO, San Francisco Chamber of Commerce

The three largest contributors to the true source recipient committee are: 1. California Alliance for Jobs 2. Engineering and Utility Contractors Association 3. San Francisco Chamber of Commerce 21st Century Committee.

12.3-61

The Hetch Hetchy system was an engineering marvel when it was constructed nearly 90 years ago. However, now it does not meet modern earthquake safety requirements. Many of the water system's pipelines and structures are at the end of their useful life and require replacement or rehabilitation before they fail.

Water from the dam in the Sierra Nevada flows across three major earthquake faults as it travels in pipelines over 167 miles to the City of San Francisco and the Bay Area. The risk of a significant earthquake is high. Furthermore, there are system components without redundancy. Standards and technology have improved dramatically since construction in 1914, and should be implemented to help protect this vital system and assure all City users of a constant water supply.

We mush rehabilitate and/or replace pipelines and structures as well as incorporate modern seismic safety standards to protect our water supply system.

Please join the American Society of Civil Engineers, San Francisco Section, in support of Proposition A.

Jennifer Webber

Vote Yes on Prop A.

The Hetch Hetchy water system is the pride of our city, but all agree that it is in need of repair.

We San Franciscans must demonstrate that we won't neglect one of our most precious possessions by protecting Hetch Hetchy from earthquakes and collapse. Proposition A will help preserve this vital system and keep it in the hands of San Francisco while maintaining our partnership with our suburban customers. The economic benefits that San Francisco enjoys will continue.

Proposition A should be a priority for everyone.

Please Vote Yes on Prop A.

Jim Lazarus, Former Deputy Mayor

The true source of funds used for the printing fee of this argument is Save Hetch Hetchy Committee - Yes on A: A Business & Labor Coalition to Safeguard Our Water Supply.

The three largest contributors to the true source recipient committee are: 1. California Alliance for Jobs 2. Engineering and Utility Contractors Association 3. San Francisco Chamber of Commerce 21st Century Committee.

Vote Yes on Prop A!

We work in San Francisco to keep your lights on, but we know it's just as important to have water come from the tap.

Please join us in supporting Proposition A it's about protecting a vital resource, it's about clean water, and it's about jobs.

Yes on A.

IBEW Local 1245

The true source of funds used for the printing fee of this argument is IBEW Local 1245.

Proposition A will allow San Francisco to produce recycled water for the first time. This can help recharge the Westside Basin Aquifer and reduce our dependence on the Hetch Hetchy reservoir.

Vote Yes on A!

San Francisco Tomorrow

The true source of funds used for the printing fee of this argument is San Francisco Tomorrow.

PAID ARGUMENTS IN FAVOR OF PROPOSITION A

The Hetch Hetchy water system is San Francisco's life line. SPUR believes that Proposition A is a well researched, well-prepared investment in the long term future of our water system.

Improvements to the system will be paid for over time. Customers who live outside the city will pay their share up front. The plan puts the most important work first, in the interests of shoring up the system's ability to withstand earthquakes.

Because this is a revenue bond, it will be paid for out of customers' fees; it will not raise taxes.

Together with Proposition E, a companion measure that gives the Public Utilities Commission the tools it needs to get the job done on time and on budget, we can protect our water supply for the next century.

SPUR recommends a yes vote on Prop A.

For the full ballot analysis, see www.spur.org

SPUR

The true source of funds used for the printing fee of this argument is SPUR Urban Issues Committee.

The three largest contributors to the true source recipient committee are: 1. John Weeden 2. Frankie Lee 3. Vince Hoenigman.

Join me in voting Yes on Prop A.

The Hetch Hetchy water system is part of what makes San Francisco a unique place to live, but the system is aging and in need of repair.

Proposition A would direct our money to where it is needed to fix the rusting and decaying pipelines. These repairs will keep our water clean and make sure an earthquake will not leave us without water.

Now is the time to cast a vote that will keep San Francisco a one-of-a-kind city.

Please, vote yes on A.

Congresswoman Nancy Pelosi

The true source of funds used for the printing fee of this argument is Save Hetch Hetchy Committee - Yes on A: A Business & Labor Coalition to Safeguard Our Water Supply.

San Franciscans Unite to Preserve Hetch Hetchy - Vote YES on A.

San Francisco has always been a city of great vision. Proposition A is our chance to renew that vision by preserving our water system.

Nearly 80 years ago, our city united to create the world-class Hetch Hetchy water system. Now, we must unite again to invest in system repairs and to ensure San Francisco's continued ownership of this vital utility.

Please join us in voting YES on A.

Senator John Burton
Assemblyman Kevin Shelley

The true source of funds used for the printing fee of this argument is Save Hetch Hetchy Committee - Yes on A: A Business & Labor Coalition to Safeguard Our Water Supply.

The three largest contributors to the true source recipient committee are: 1. California Alliance for Jobs 2. Engineering and Utility Contractors Association 3. San Francisco Chamber of Commerce 21st Century Committee.

Proposition A will ensure that we take the necessary steps to fix our water system. The repair of Hetch Hetchy will guarantee us clean water for years to come.

The rebuild will also create jobs and give people skills to continue in the industry after the Hetch Hetchy project is completed.

We must support Proposition A. The clean water and jobs are a win-win for all San Franciscans.

Please vote Yes on A.

Supervisor Sophie Maxwell

Help Keep San Francisco Safe - Vote Yes on A.

San Francisco didn't just fall down in 1906 - it burned down. One of the major reasons was lack of water in the aftermath of the earthquake.

Our Hetch Hetchy system is now more than 80 years old. Experts say it will not withstand a major quake. That is why we must unite and Vote Yes on A.

Sheriff Michael Hennessey

The three largest contributors to the true source recipient committee are: 1. California Alliance for Jobs 2. Engineering and Utility Contractors Association 3. San Francisco Chamber of Commerce 21st Century Committee.

Water Bonds A

PAID ARGUMENTS IN FAVOR OF PROPOSITION A

Proposition A is needed to protect one of the City's most valuable assets: Hetch Hetchy and our City's water supply. Failure to protect our water supply would place this City at great economic risk. Prop A will also make ecological improvements to our water system that is long overdue.

I ask all San Franciscans to join me in supporting Proposition A.

City Treasurer Susan Leal

The true source of funds used for the printing fee of this argument is Susan Leal.

Join District 11 Democrats and Vote Yes on Prop A.

Water is a precious resource that must be safeguarded, and fixing our our unique Hetch Hetchy water system will help do that.

Proposition A will allow San Francisco's entry into the use of recycled water - a much needed conservation measure.

Proposition A is a fair proposal.

Vote Yes on A.

District 11 Democrats

Alameda County

County progress, Tri-Valley pressure

General Assessment

Alameda County has made significant progress in securing its greenbelt, but challenges remain. The 2000 elections in particular were a landmark in the county's land-use history, with voters passing crucial greenbelt protection measures. Going forward, more responsible city policies will be needed, as well as continued vigilance against developer-backed attempts to roll back growth limits.

Hot Spots

The east county cities of Livermore, Pleasanton, and Dublin remain the focus of land-use controversies in Alameda County. Virtually all of the county's 15,000 acres that remain at high risk are around these cities. The flat ranchlands north of Livermore remain a prime target of developers, despite an urban growth boundary protecting the area. Developer Pardee Homes placed an initiative on the 2005 ballot to allow 2,450 houses on 1,500 acres of the land, but failed thanks to the concerted efforts of local activists. Despite the progress made in recent years, the growth pressures in these Tri-Valley cities could still increase Alameda County's total urbanized area by more than 10% in just the next 10 years.

Bright Spots

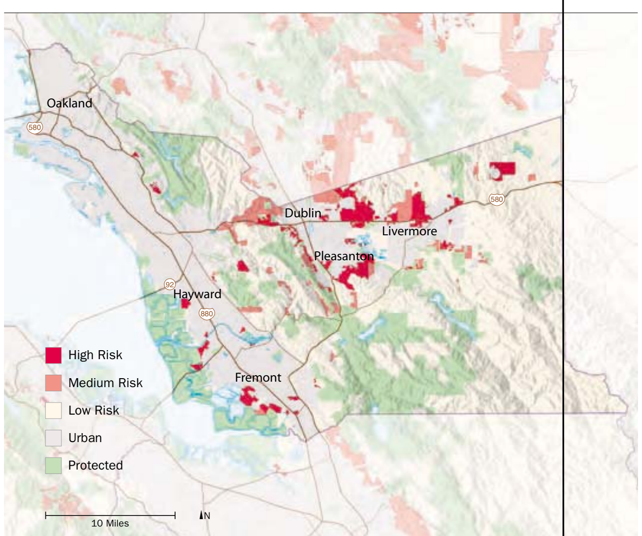
The passage of Measure D by county voters in 2000 laid down a key cornerstone for long-term greenbelt protection in Alameda County. The measure established a county urban growth boundary, prohibited subdivision of ranchlands in the east county, and encouraged investment in existing urbanized areas, extending regulatory protection to as much as 150,000 acres of farm, ranch and habitat lands. In the same election, Dublin voters passed Measure M to protect 4,000 acres of hill country, and county voters overwhelmingly passed the transit-friendly transportation sales tax Measure B.

Progress continued in 2002, when Fremont also passed a hillside protection ordinance, and the Livermore City Council established the North Livermore Urban Growth Boundary, connecting to the existing South Livermore Urban Growth Boundary to complete the boundary around the city. In 2004, voters in the western parts of Alameda and Contra Costa County bolstered financial support for the western, more heavily used parts of the East Bay Regional Park District, by passing Measure CC in the 2004 elections.

	ACRES
High Risk	15,000
Medium Risk	11,100
Low Risk	203,000
Urban	144,000
Protected	104,700
Total	477,800

The County Board of Supervisors also has maintained its important policy of requiring large minimum lot sizes for rural parcels, helping to preserve the viability of remaining agricultural lands.

113



L_BAWSCA1

San Mateo County

From greenbelt protection to smart infill

General Assessment

San Mateo County solidified its status as a leader in protecting greenbelt land over the last 5 years. With large public land holdings and active land protection activities by the Mid-Peninsula Regional Open Space District and the Peninsula Open Space Trust, San Mateo's total acreage of land at risk is relatively small, totaling 10,200 acres.

Hot Spots

As with Marin County, San Mateo's primary challenge lies in making its already urbanized areas more affordable and livable, so that it can continue to accommodate its share of future Bay Area growth and improve social equity. In general, a changing economic and political climate has contributed to a lessening of growth pressures around the coastal cities of Half Moon Bay and Pacifica, although much of the land around those cities remains at medium risk of development.

Bright Spots

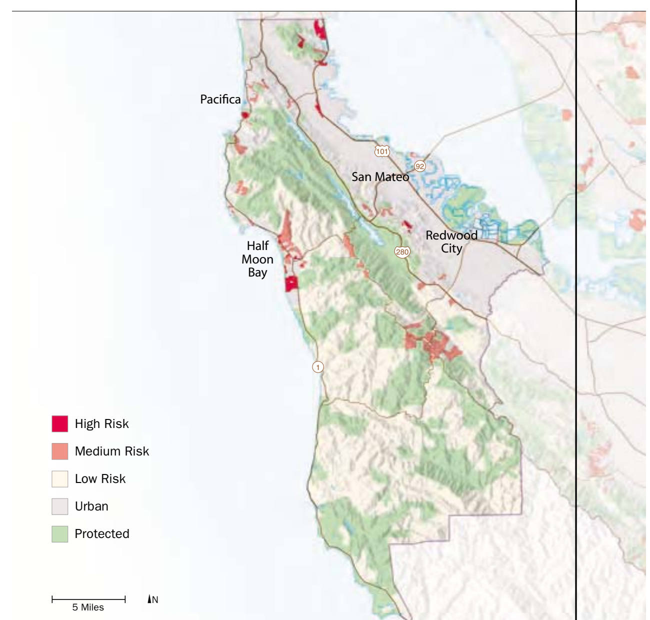
The Mid-Peninsula Regional Open Space District won authorization to expand its jurisdiction all the way to the Pacific Coast in 2004, 6 years after voters recommended the change. This move complements the Peninsula Open Space Trust's "Saving the Endangered Coast" campaign, launched in 2001, which has protected more than 14,000 acres in western San Mateo County. A major effort to restore some of the Bay's lost wetlands by acquiring and restoring salt ponds has also protected baylands on the edge of Menlo Park.

In 2000, Mori Point, a coastal promontory above Pacifica that had been the focus of many development proposals, was permanently protected as part of the Golden Gate National Recreation Area.

Since 2000, four new BART stations in the county and the connection of BART to CalTrain at Millbrae have created valuable new opportunities for regional integration and smart growth in San Mateo County. In 2004, Measure A, a transit-friendly transportation sales tax, won voter approval, further enhancing San Mateo County's infill potential. In 2005, the City of San Mateo approved a good example of transit-oriented development, Bay Meadows Phase II, which would replace the aging Bay Meadows racetrack with a new neighborhood next to a CalTrain station. The "Grand Boulevard" effort to revitalize El Camino Real will also help accommodate new growth and better use urbanized land in both San Mateo and Santa Clara County.

	ACRES
High Risk	2,000
Medium Risk	8,200
Low Risk	100,400
Urban	71,100
Protected	107,800
Total	289,500

113 cont.



L_BAWSCA1

Santa Clara County

A sprawling past and changing future

12.3.65

General Assessment

Today, Santa Clara County faces crucial decisions about its future. The proposal to develop housing for up to 80,000 people in Coyote Valley in southeast San Jose, and ongoing sprawl pressure in Morgan Hill and Gilroy, mean that planning actions made in south Santa Clara in the next few years will shape the county for decades to come.

Hot Spots

Ever since the City of San Jose began its latest round of planning for the development of Coyote Valley in 1999, it has been one of the largest development hot spots in the Bay Area. The City's goal is the creation of 25,000 homes and 50,000 jobs on 6,800 acres of land—essentially the creation of an entire new town. Unfortunately, the City's plans for the valley thus far have not lived up to its stated smart growth goals.

The far southern end of the county also remains a key hot spot, as Morgan Hill and Gilroy grapple with sprawl pressures both from Silicon Valley and the south. Morgan Hill began studying an expansion of its urban growth boundary in 2003; 1,250 acres of farmland outside the boundary are now at risk. Likewise, the Gilroy City Council voted in 2002 to allow development on 660 previously protected acres of the Santa Clara County Agricultural Preserve. In 2005, Gilroy passed up an opportunity to join the county's open space district. South of Gilroy, Sargent Ranch, 6,500 acres of farmland and wildlife habitat, remains under threat in spite of the defeat in 2001 of a major development proposal.

Bright Spots

With these threats, there have also been some important improvements in the county. In 2000, San Jose residents voted to strengthen the City Council's urban growth boundary, protecting more than 20,000 acres. In 2001, the City Council passed 15 general plan amendments encouraging infill and affordable housing, and the City now has large-scale plans to redevelop the industrial North First Street area and add thousands of new homes to the downtown. In 2002, county property owners voted to provide $80 million over 10 years to fund the Santa Clara County Open Space Authority.

	ACRES
High Risk	21,300
Medium Risk	54,000
Low Risk	377,600
Urban	185,100
Protected	201,800
Total	839,800

In 2006, Santa Clara County voters will decide on an initiative to prevent sprawl development and parcelization on rural county land.

BAWSCA
Bay Area Water Supply & Conservation Agency

WATER CONSERVATION PROGRAMS ANNUAL REPORT FY2006/07

Prepared by:

Nicole Sandkulla, Sr. Water Resources Engineer

Benjamin Pink, Water Resources Planner

September 2007

L_BAWSCA1

Introduction

The Bay Area Water Supply and Conservation Agency (BAWSCA) represents the interests of 25 cities and water districts and two private utilities, that purchase water from the San Francisco regional water system. A map showing the agencies is presented in Figure 1. The entities provide water to 1.7 million people, businesses and community organizations in Alameda, Santa Clara and San Mateo counties.

BAWSCA has been implementing efficient water conservation programs for its member agencies for over five years. Although the main responsibility for conservation lies within the individual member agencies, BAWSCA offers regional programs that serve to augment the programs offered by the agencies.

BAWSCA member agencies implement water conservation for several significant reasons including:

- Water conservation extends the limited supply of water available for both current and future water needs;
- Water conservation is good public policy; 114
- Water conservation increases the drought reliability of the existing water system; and
- Water conservation saves money for both the agency and the customer.

In FY 2006/2007, 20 member agencies participated in one or more of the four conservation programs offered by BAWSCA with a total budget of over $632,000.

Organization of this Report

This report is broken down into these specific sections:

- BAWSCA Area Water Supply and Demand Characteristics
- BAWSCA Water Conservation Programs Overview
- BAWSCA Conservation Programs in Detail

12.3-67

BAWSCA Area Water Supply Characteristics

Current Diverse Water Supply Portfolio

The water supply for the BAWSCA agencies comes from a variety of sources as seen in Figure 2. The majority of the water used by the BAWSCA agencies is purchased from the San Francisco Public Utilities Commission (SFPUC) coming from the Tuolumne River.

In addition to purchases from the regional water system, BAWSCA agencies have developed local water supplies (including surface water, desalinated water, groundwater, and recycled water), as well as contracts with the State Water Project and Santa Clara Valley Water District, to meet the water needs of their customers.

Figure 2 shows the breakdown of supply sources utilized by the BAWSCA agencies in FY 2005/2006. Currently, about 33% of the total BAWSCA agencies' water demands are met by sources other than the San Francisco Regional Water System. By 2030, this proportion will increase to 35%.

Increasing Diversity in 2030 Water Supply Portfolio

BAWSCA agencies have also committed to increasing the diversity of their water supply portfolio in the future with increased use of recycled water, conjunctive use operation of groundwater supplies, and implementation of water conservation. Figure 3 provides the breakdown of water use by supply source in 2030 as projected by the BAWSCA agencies. Factoring in the level of conservation that the agencies have committed to, total water demand in 2030 is projected to be 308 MGD.

Per Capita Water Demand Continues to Decrease

The per capita water demand for residential uses will continue to decrease. Residential per capita water demand of the wholesale customers is projected to decrease 3%, from 89 gpcpd in 2005 to 86 gpcpd in 2030. Today's residential per capita water use is 15% less than before the drought that began in 1986 and 23% less than before the drought of 1976-1977. Residential per capita water use of wholesale customers is less than in other parts of California, and is less than the average for the San Francisco Bay Region as a whole. Projected gross per capita water demand, including water used by businesses and industry, for the BAWSCA agencies is expected to stay about the same in 2030. Gross per capita water demand was 162 gallons per capita per day (gpcpd) in 2001 compared to projected use of 160 gpcpd in 2030. This actually represents a decrease of 2 gpcpd or 1%.

The per capita water demand for residential uses will continue to decrease. Residential per capita water demand of the wholesale customers is projected to decrease 3%, from 89 gpcpd in 2005 to 86 gpcpd in 2030. Today's residential per capita water use is 15% less than before the drought that began in 1986 and 23% less than before the drought of 1976-1977. Residential per capita water use of wholesale customers is less than in other parts of California, and is less than the average for the San Francisco Bay Region as a whole.

L_BAWSCA1

BAWSCA Water Conservation Programs Overview

BAWSCA has been implementing efficient water conservation programs for its member agencies for over five years. Although the main responsibility for conservation lies within the individual member agencies, BAWSCA offers regional programs that serve to augment the programs offered by the agencies.

BAWSCA member agencies implement water conservation for several significant reasons including:

- Water conservation extends the limited supply of water available for both current and future water needs;
- Water conservation is good public policy;
- Water conservation increases the drought reliability of the existing water system; and
- Water conservation saves money for both the agency and the customer.

In creating its water conservation program, BAWSCA has followed several key principles:

1. The programs are developed for the BAWSCA agencies and by the BAWSCA agencies. It is very important that BAWSCA's conservation programs are designed to meet the specific needs and requirements of the BAWSCA agencies.
2. The programs must offer increased water savings at a lower cost to the agency and the customer.
3. Most programs are paid for by participating BAWSCA agencies; those that participate pay the full cost of the program.

114 cont.

In FY 2006/07, BAWSCA offered the following regional water conservation programs to its member agencies:

- Residential Washing Machine Rebate Program
- School Education Program (Water-Wise School Education Kits)
- Large Landscape Audit Program
- Landscape Education Classes
- Landscape Educational CD-Rom

Each of these programs is better administered at a regional level through BAWSCA rather than at the local agency level. BAWSCA provides these programs in a cost-effective and efficient manner. BAWSCA is also active in investigating and securing grant awards for regional conservation programs that fit the needs of its member agencies.

Twenty member agencies now participate in one or more of the conservation programs offered by BAWSCA. BAWSCA agencies have expressed a continued desire to participate in the ongoing and new conservation programs that BAWSCA will be offering in FY2007/08. The new BAWSCA

12.3-69

Commercial Clothes Washer Rebate Program for FY2007/08 already has nine agencies signed up to participate for a total of $77,600 which is equivalent to 353 commercial clothes washer rebates at $220 each.

Figure 4 shows the level of participation in BAWSCA water conservation programs since FY 2001/02. Detailed information on each program appears in the following sections. As the data in Figure 4 shows, overall participation levels in each of the BAWSCA programs has been on the rise since FY2001/02.

Figure 5 shows the level of participation in BAWSCA water conservation programs in terms of total dollars spent by all agencies per program since FY2001/02. The figure shows that in terms of the total dollars spent per program, the Residential Washing Machine Rebate Program is the highest.

114
cont.

BAWSCA Conservation Programs in Detail

I. <u>Residential Washing Machine Rebate Program Continues Success</u>

The Residential Washing Machine Rebate Program (WMRP) began on October 1, 2001. In 2002, the regional program expanded with eight other Bay Area water agencies joining to offer a single Bay Area Water Utility Clothes Washer Rebate Program covering a region of 2.7 million residential customers. In addition to BAWSCA, other participants in this regional program include Contra Costa Water District, Zone 7 Water Agency, East Bay Municipal Utility District, Alameda County Water District, Santa Clara Valley Water District, Marin Municipal Utility District, Sonoma County Water Agency, City of Davis, and beginning July 1, 2006, the SFPUC.

For the last several years, the participating Bay Area water agencies have been successful in applying for and receiving grant funding from the State including Proposition 13 and Proposition 50 funds. The total grant amount awarded to the Bay Area under Proposition 13 was $2.1 million and BAWSCA's share of this amount was $236,250. This grant award was utilized by the BAWSCA agencies for the WMRP starting in July 2004. The total grant amount awarded to the Bay Area under Proposition 50 was $1,534,350 and BAWSCA's share of this amount was $187,500. This grant award was utilized by the BAWSCA agencies starting in July 2006.

In May 2007, this program was awarded a $2,981,350 Proposition 50 Grant and BAWSCA's share is $300,000. This grant award is planned to be utilized beginning January 2008 Through BAWSCA's successful efforts to secure these grants, all BAWSCA member agencies have had access to grant funds to increase customer participation and achieve overall cost-effectiveness of the program while funds were available.

BAWSCA member agency participation in this program has been strong since it began. There are 16 agencies that participated in the FY2006/07 program. Details for level of program implementation and BAWSCA agency participation are shown in Table 1.

To date, a total of 14,640 rebates have been paid to customers for an estimated savings of 229.8 AF/Yr.; or enough water to serve over 900 households per year.

114 cont.

Table 1: Residential Washing Machine Rebate Program Summary FY2001/02 to 2006/07

Residential WMRP	FY 2001/02	FY 2002/03	FY 2003/04	FY 2004/05	FY 2005/06	FY 2006/07
Number of Participating BAWSCA Agencies	11	15	10	16	16	16
Total Rebates	1,244	3,091	1,805	2,914	2,332	3,254
Est. Savings (AF/Yr.)	19.5	48.4	28	46	37	50.9
Total $ Paid to Customer	$125,325	$336,200	$178,400	$379,375	$404,113	$449,100

II. School Education Program Grows Based on First Year Success

The Water-wise School Education Kit Program involves the distribution of a kit to 5th grade students. The kit enables the students to install water saving devices and perform a water audit in their home. The concept with the kit is that it provides a water conservation curriculum that can be easily implemented by teachers, easily understood and taken back into the home by the students, and includes methods to quantify the water savings as a result of taking the actions in the curriculum. The kits are consistent with BAWSCA's approach to offering public education and outreach regarding water conservation.

BAWSCA has contracted with Water-wise Consulting Company for implementation of this program. Water-wise offers a turn-key program in which they work directly with the school and teachers in the individual service area to provide the kits, which are produced by Water-wise, into the classrooms.

The kits are typically taken home by the students, who may share the learning experience with family members. The energy and water efficient devices contained in the kits are installed in the home and the family is able to calculate the water savings resulting from each device. Essentially, the kit allows the student to perform in-home water audit.

After the student performs the audit and installs the water and energy saving devices, affidavits signed by the parents are returned to the school, collected by the teacher, and forwarded to Water-wise for program documentation of implementation and resulting savings.

The following projected cumulative 10 year savings are expected per participating student sponsored:

- 2,098 Kwh of electricity
- 441 therms of gas
- 174,515 gallons of water
- 174,515 gallons of wastewater

The Water-wise School Education Kit Program assists participating agencies in implementing several Best Management Practices for Urban Water Conservation:

- BMP 1: Residential Surveys
- BMP 2: Residential Audits
- BMP 8: School Education

FY2005/06 was the first year that BAWSCA agencies participated in this program. The program was continued again successfully in FY2006/07. This program has proven to be a cost-effective means of achieving water conservation savings in the home and educating students on the value of water. Table 2 provides the detailed information for this program's implementation. To date, 4,425 students have participated in this program with an estimated total lifetime water savings of 1,422 AF.

114 cont.

Table 2: School Education Program Summary FY2005/06 and FY2006/07

BAWSCA School Education Program (Water-wise School Education Kits)	FY 2005/06	FY 2006/07
# Participating BAWSCA Members	6	11
Number of Participants (# of kits disbursed)	1,554	2,871
Est. Annual Water Savings/Kit (gallons)	17,451	17,451
Est. Total Lifetime Savings for Kits Installed (based on 60% installation rate) (acre-feet)	499.3	922.4
Total Spent By All Agencies	$51,671	$93,023
Cost of Lifetime Water Savings ($/AF)	$103	$101

12.3-71

III. Landscape Audit Program Continues to Improve and Expand

The Landscape Audit Program was first offered to BAWSCA member agencies in FY 2002/03. This BAWSCA program offers access to a turn-key program that enables the participating BAWSCA agency to meet the requirements of the California Urban Water Conservation Council's Best Management Practice (BMP) #5 in a cost-effective manner.

The program offers services for the development and monthly distribution of landscape water budgets for selected accounts and actual large landscape surveys to assess landscape watering needs. A key component of the program is ongoing monitoring/tracking of actual water use and estimated water savings for the sites surveyed.

The large landscape audit program has been improving since its inception as a BAWSCA program. For FY2007/2008, modifications to the scope of services were made to accommodate large residential properties into the program in addition to commercial sites. This will allow participation in the program by BAWSCA agencies that have large residential sites with large areas of outdoor landscaping.

Details of program implementation and agency participation are shown in Table 3. Results from the FY2006/2007 program show a savings of 25% reduced water use relative to 2002. Taking into account the effect of significant rainfall experienced in March and April 2006, the actual savings achieved as a result of the program are about 10%-15% of overall water use. The estimated cost of water saved is about $50 to $75 per acre-foot. 114 cont.

Table 3: Landscape Audit Program Summary FY2002/03 to 2006/07

Landscape Audit Program	FY 2002/03	FY 2003/04	FY 2004/05	FY 2005/06	FY 2006/07
# Participating BAWSCA Members	4	5	4	5	6
Est. Savings for that Year (acre-feet)*		299	212	520	543
Total spent by all agencies	$65,132	$23,802	$29,663	$24,720	$23,362
Cost Per Acre/Foot Saved		$59	$90	$37	$43

*savings are calculated on a calendar year basis

IV. High Efficiency Toilet/Urinal Direct Install Program

The Direct-Install High-Efficiency Toilet Replacement Program was eagerly anticipated as an important water conservation program for FY2006/07. Targeted at the commercial and multi-family residential sectors, this program should have been a turn-key, relatively easy to implement program that could provide real results in terms of water savings. Unfortunately, the FY2006/07 program had several implementation issues that resulted in the program not being successful. At the end of the fiscal year, BAWSCA chose not to exercise the option to extend the contract with SJ Water and instead let the contract expire.

The BAWSCA agencies have expressed a continued desire for this program in FY2007/08. As such, BAWSCA staff has been working to repackage this program with an alternative contractor. BAWSCA staff will bring this item before the Board of Directors in the coming months for potential action.

V. Regional Landscape Education Classes Well Attended

This year BAWSCA collaborated with the City of Millbrae and Redwood City to offer landscape classes throughout the springtime from the beginning of February through the end of April. These classes were designed to introduce homeowners to the concepts of sustainable landscape design, focusing on creating a beautiful water-efficient garden. A total of 12 classes were held around the service area of the BAWSCA member agencies. Figure 6 presents a copy of the front side of the flyer for the classes. 114 cont.

BAWSCA specifically sponsored a total of four landscape education classes over the course of the month of April that were held in Palo Alto, Burlingame, Half Moon Bay, and Hayward. The BAWSCA sponsored classes were entitled: *Landscaping with Native Plants* (instructors Chris Todd and Patricia Evans), *Sustainable Landscape Design* (instructor Alrie Middlebrook), *Smart Gardening* (instructor Steve Gill), *and Water-wise Landscape Design* (instructor Candice Stein). The classes had an attendance of as high as 50 people. Total attendance for the four BAWSCA classes was approximately 110 people. Each person attending the classes was offered a free landscape educational CD-Rom produced by BAWSCA entitled *Water-Wise Gardening in the Bay Area.*

Figure 6: Flyer for the 2007 Water Efficient Landscaping Class Series

114 cont.

VI. Region-wide Native Garden Tours

This year BAWSCA sponsored two native garden tours that took place in the months of April and May. Each tour was designed to showcase homes around the Bay Area that have beautiful water conserving gardens comprised primarily of California native plants.

The first tour was the *Going Native Garden Tour,* which took place in San Mateo and Santa Clara Counties on Sunday April 29th. This tour showcased 45 gardens that were visited a total of 6,688 times. The locations of the gardens in this tour ranged from as far north as the Cities of Belmont and Redwood City and south to Saratoga in Santa Clara County.

12.3-72

The other tour, *Bringing Back the Natives Garden Tour,* took place in Alameda and Contra Costa Counties on Saturday April 28 and May 5. This tour featured 63 total gardens that were visited by a total of 13,330 people over the two Saturdays. Gardens in this tour ranged in location from Berkeley and Walnut Creek to Fremont, Alameda, and Hayward. Figures 7 and 8 show the flyers for the two native garden tours.

114 cont.

Figure 7: Flyer for the 2007 Going Native Garden Tour

12.3-73

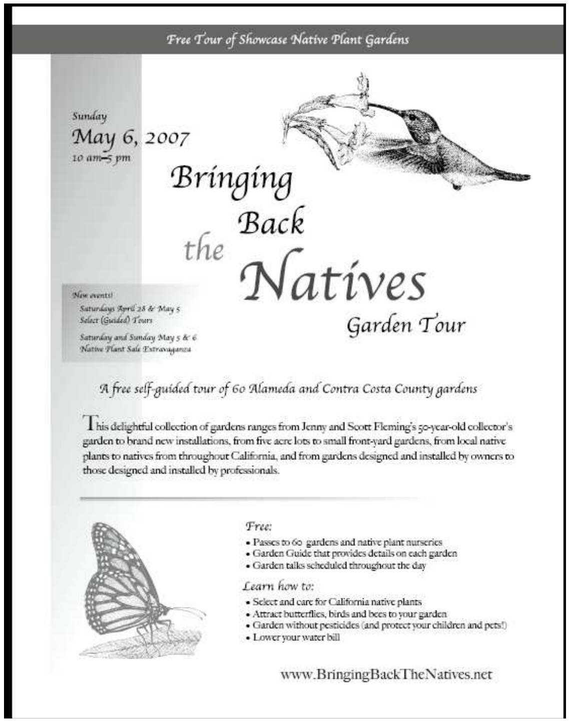

Figure 8: Flyer for the 2007 Bringing Back the Natives Garden Tour

114 cont.

VII. Innovative Landscape Educational CD-Rom is Released

This year BAWSCA completed the landscape educational CD-Rom entitled *Water-Wise Gardening in the Bay Area*. This new CD-Rom is full of information on how to garden beautifully while saving water. It displays outstanding water efficient garden photographs, with links to the plants that compose them. The photography is primarily composed of sites in the Bay Area, specifically those locations in the service areas of BAWSCA member agencies in Alameda, San Mateo, and Santa Clara Counties. The software offers a searchable plant database and a garden resource encyclopedia containing a multitude of water-wise, how-to gardening information. Also included are watering recommendations that are specifically tailored to the user's location within the Bay Area. The user can create their own plant shopping list as they navigate through the photography, which they then can print and take to

L_BAWSCA1

their local water-wise nursery. The watering tips are customized for the user based on their location in the Bay Area; for example coastal residents will see watering schedules that reflect coastal fog rather than hotter inland conditions.

The CD-Rom was made available to the BAWSCA member agencies. **A total of 6,825 CDs were ordered by of 20 of the BAWSCA agencies.** Based on the size of this order, a reduced price was secured from the contractor which benefitted all agencies participating. BAWSCA will also be making the CDs available to interested citizens free of charge.

The CD-Rom came enclosed in a four-panel mailer that is shown in Figure 9 below.

Figure 9: Mailer Panel from the Water-Wise Gardening CD-Rom

114 cont.

VIII. Additional Activities

BAWSCA Website Update

In addition to the water conservation programs listed above, one significant activity undertaken in FY2006/07 was the updating of the conservation areas on the BAWSCA website. The website content was updated to reflect all current conservation programs. The updated site now displays content in four categories related to water conservation: Residential Indoor, Residential Outdoor, Commercial Programs, and School Programs. There is now also a page of water conservation related links that direct users to other important conservation websites. The updated site can be viewed at http://www.bawsca.org/conserve.html.

Drought Outreach Campaign: Water Saving Hero

In May 2007, San Francisco Public Utilities Commission (SFPUC) and BAWSCA announced a request for a ten percent voluntary water use reduction due to the continuing dry conditions. In July 2007 the SFPUC and BAWSCA partnered to launch a regional public education campaign focusing on our dry year message. The initial campaign success prompted other water agencies including the Santa Clara Valley Water District, Contra Costa Water District and Zone 7 Water Agency to join. The result was the launch of an unprecedented campaign aimed at reminding residents and businesses to curb water use in the summer and fall period.

The campaign's theme is [be a] "Water Saving Hero" and features ordinary people adopting simple water conservation practices in their everyday lives, such as washing full loads of laundry and watering gardens during the cool morning hours. The ads are currently featured on billboards, transit stations, buses, trains, newspapers and the radio throughout the region. The effort also features a new website www.WaterSavingHero.com, where any Bay Area residents can link directly to their local water agency's conservation programs and cash rebate information.

The campaign ads and billboards will run through the fall of 2007. Figures 10 and 11 below are examples of billboard and print advertising as part of this campaign.

Figure 10: Ray Samuels Water Saving Hero Campaign Ad

114 cont.

12.3-74

Figure 11: Frank Chen Water Saving Hero Campaign Ad

BAWSCA Water Conservation Programs for FY2007/08

For FY2007/08, BAWSCA will offer the following programs:

1. Residential Washing Machine Rebate Program
2. School Education Program (Water-wise School Education Kits)
3. Landscape Audit Program
4. High Efficiency Toilet/Urinal Direct Install Program
5. Landscape Education Classes
6. Native Garden Tours
7. Landscape Educational CD-Rom
8. Commercial Clothes Washing Machine Rebate Program (NEW)

114 cont.

Response to BAWSCA's program offerings for FY2007/08 has been very good to date. The Landscape Audit Program has six agencies signed up to participate; this includes several new agencies participating this year. The School Education Program has nine agencies signed up. The Residential Washing Machine Rebate program has 16 agencies signed up.

In addition, a new program will be added for FY2007/08: the Commercial Clothes Washing Machine Rebate Program. This unique program is a partnership between the energy utility, PG&E, and the water agencies. The program involves offering a combined water and energy rebate to commercial customers who retrofit their facilities with new high efficiency commercial washing machines. This program is a benefit to BAWSCA in that it is a partially grant funded program; all program administration costs, rebate processing service costs, and marketing costs will be paid by the grant. The only cost to the participating BAWSCA member agencies is the cost of the water rebate itself. As a new program, the Commercial Washing Machine Rebate Program already looks to be very successful with a total of 13 agencies already signed up. 114 cont.

Prospective Program

In addition, BAWSCA has expressed interest in joining with the SFPUC to launch the Cooling Tower Feasibility Study. This would be a study of the potential water savings available in the BAWSCA/SFPUC service area through the implementation of a cooling tower conductivity controller retrofit program. A grant application for partial funding of this study was submitted to the State Department of Water Resources but was not successful. BAWSCA intends to pursue the study with SFPUC without the grant funding.

AN ECONOMIC EVALUATION OF THE WATER SUPPLY RELIABILITY GOAL IN THE SFPUC WATER SYSTEM IMPROVEMENT PLAN

William W. Wade

1. Introduction and Executive Summary

In February 2005, the San Francisco Public Utilities Commission (SFPUC) authorized its General Manager to forward to the San Francisco Planning Commission a draft report summarizing the principal goals of its Water System Improvement Plan. The final version of the document, "Water System Improvement Plan: Prepared for the Programmatic Environmental Impact Report," (WSIP) was sent to the Planning Commission and publicly released on February 28, 2005.

The Bay Area Water Supply & Conservation Agency (BAWSCA) is a regional government agency established in 2003. It comprises the 28 cities, water districts and other water suppliers in San Mateo, Santa Clara and Alameda counties that purchase some or all of their water from the SFPUC. 115 cont.

BAWSCA commissioned Energy and Water Economics to review the portion of the WSIP that addresses water supply reliability during drought, specifically, the goal of providing no more than 80 percent of normal demand during a "design drought."

The principal findings of this report are:

(a) The process by which the SFPUC selected the goal of 80 percent reliability was superficial and far below the analytic standard employed by comparable urban water agencies in California and the United States.

(b) SFPUC's analytic process failed to consider the costs to Bay Area communities of the water shortages that would be imposed through mandatory rationing to accommodate a 20 percent system-wide supply shortfall.

(c) Even a preliminary review of published economic literature shows that the loss of production from water-intensive Bay Area industries resulting from a 20 percent cutback in their water supply would far exceed the estimated cost of improving the SFPUC system's reliability from 80 percent to 90 percent.

Based on these findings, this report recommends that the SFPUC revisit the WSIP's reliability goal. In doing so, it should employ economic principles commonly used in water supply planning to identify the most efficient level of water reliability. In the short run, this reconsideration should focus on the relative cost-benefit ratios of the provisionally selected 80 percent goal in comparison with a goal of a 90 percent reliable supply.

2. The SFPUC Adopted its Drought Reliability Goal Without Considering the Costs of Water Shortages to its Customers

Reliable delivery of basic utility services (electricity, natural gas, communications, water and sewer) is an expected part of contemporary urban life -- at least in developed industrial societies such as California. 115 cont.

There are a variety of definitions of reliability. The CalFed Bay Delta program formalized water reliability as:

> ". . . the probability that a system does not fail, or conversely, it is the probability of a system failure subtracted from one."

More simply put, reliability is the measure of a utility's ability to deliver uninterrupted service. It is apparent that the larger the investment in long-term reliability, the less frequent and less severe will be the shortages experienced.

The objectives of water supply reliability planning are (1) to determine the most effective way of achieving an additional increment of reliability at the least cost, and (2) to ascertain whether the benefits, in terms of avoided shortage costs and losses, justify the costs of adding that increment. This is commonly referred to in the utility planning literature as Least Cost Planning (LCP). LCP has been embraced widely in California.

The approach uses information about the costs and losses associated with shortages of varying severity and duration as well as the costs of long-term and contingency water management options. In order to make an informed judgment about the appropriate level of supply reliability, the decision-maker needs to know not merely the cost of providing an increment of additional supply, but the costs to society of NOT providing that supply increment -- the economic impacts and other costs of shortage.

The SFPUC adopted its 80 percent reliability goal with very limited information about the costs of achieving three levels of reliability:

Option A	Option B	Option C
100 percent	90 percent	80 percent

and no information about the costs of providing less than 100 percent reliability.

The goals of these alternatives appear on a one-page chart entitled "Water Supply Matrix" that was presented to the SFPUC but is not included in the WSIP. It is attached as Exhibit A. The facilities or other measures associated with the incremental costs of 90 percent or 100 percent reliability are not identified clearly, but apparently reflect the cost of increasing the height of Calaveras Dam in Alameda County and/or various mixes of options including desalination, recycling, groundwater, transfers and conservation. 115 cont.

12.3-78

The cost of each level, in millions of dollars, was estimated as follows:

Option A	Option B	Option C
100 percent	90 percent	80 percent
$1,222	$603	$422

Thus, the difference between achieving an 80 percent level of reliability and a 90 percent level was estimated at $181 million, over 25 years.

SFPUC did not attempt to quantify the economic costs and losses of a 20 percent shortage, nor the costs of the less demanding levels of rationing that would be required to cope with less severe, but more frequent, droughts. Neither does the

L_BAWSCA1

SFPUC anticipate how shortages would be distributed geographically. In the 1987-1992 drought, the SFPUC imposed different levels of rationing on its in-City retail customers and its wholesale customer agencies in the neighboring counties.[1]

The WSIP is fatally flawed, from the perspective of economic analysis, by its failure to include the effect of shortage costs in its evaluation process. Determining an efficient level of reliability requires consideration of two curves -- one representing the incremental costs of reliability improvements and the other representing the costs of incrementally more severe water shortages. The intersection of these two curves – the point where incremental costs are equal – is the least cost mix of resources, the efficient level of reliability management.

This can be illustrated by a simple figure, drawn from a recent California Department of Water Resources publication.[2]

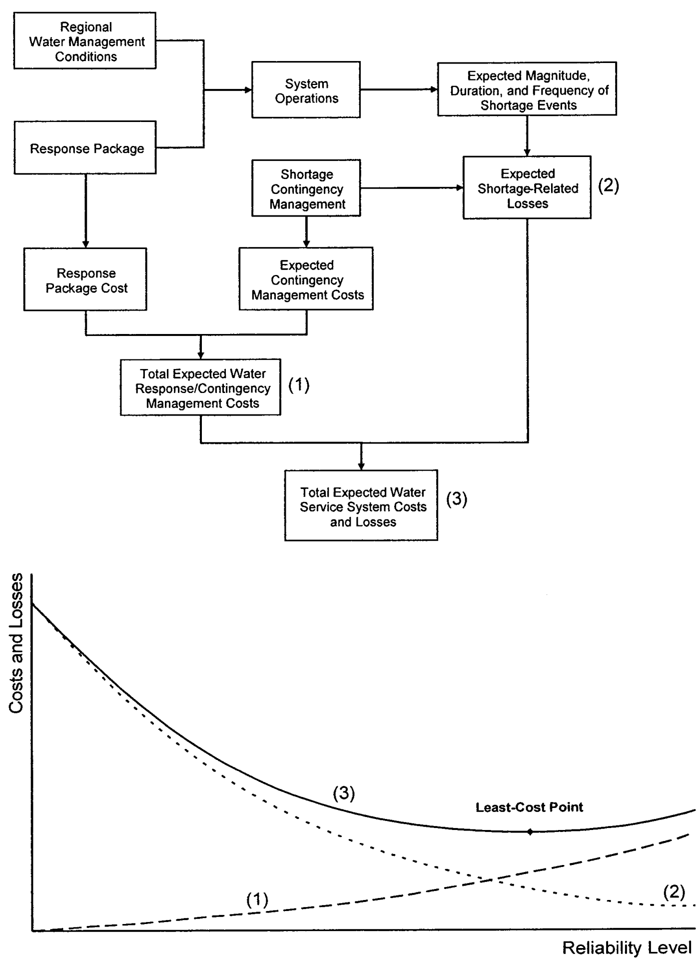
Figure 1 contains three cost curves. Curve 1 is the cost of increasing reliability, which includes both the cost of supply augmentation and the agency's costs of managing the drought. Curve 2 is the societal cost of enduring water shortages. Both the total expected water management and contingency management costs (Curve 1) and the expected shortage-related losses (Curve 2) are a function of the level of demand reduction or supply enhancement response options implemented. Both curves are affected by the availability, cost, and effectiveness of contingency management (e.g., transfers, rationing programs, etc.). While the total cost of the management and response options increases as reliability increases, the expected shortage-related losses decrease as a consequence of the increased reliability. The total expected water service system cost (Curve 3) is the sum of these costs and losses. The lowest point 115 cont.

[1] In general, inside City use was to be reduced by approximately 14 percent, while wholesale communities faced an aggregate 27 percent reduction, under the 10/60 formula employed by SFPUC to achieve a system wide 22 percent goal.

[2] CDWR, LCPSIM Background, 2002.

12.3-79

Figure 1. Least Cost Planning Conceptual Diagram



115 cont.

on this curve represents the level of reliability provided by the most economically efficient mix of resource costs and remaining shortage costs.[3]

The SFPUC did not attempt to determine the costs of shortage. Without both reliability enhancement costs and shortage costs imposed on society, SFPUC is unable to make even the most rough-cut approximation of the balance between the costs of improved reliability and its benefits. Without this information, no economic basis exists to find the least cost point among the three options.

3. <u>The Economic Costs to the Bay Area of Water Shortages Can be Determined</u>

The State Water Resources Control Board began its hearings on water quality standards for the Bay Delta in 1987. The extended California drought began at approximately the same time. Together, these two events became the impetus for a substantial effort by economists to quantify the costs of urban water shortages and, reciprocally, the value of reliable water supplies. The California Urban Water Agencies (CUWA), a consortium of major California urban water suppliers including the SFPUC, played an important role in this process.

115 cont.

Examples of the economic literature that emerged at the time of the Bay Delta hearings and the last drought are included in the references to this Report. Two studies in which the author of this report participated addressed the economic effects of water shortage on the two major customer segments of urban water suppliers: residential and industrial.

In a study commissioned by the Metropolitan Water District of Southern California, the author estimated the economic value of landscape losses based on a scientific horticultural survey of drought effects on Santa Barbara vegetation.[4] Research sponsored by CUWA into industrial water use revealed that shortages of

[3] The minimum point of the two cost curves is equivalent to the intersection of the incremental cost curves.

[4] William Wade, Mary Renwick, et al., "The Cost of Water Shortages: Case Study of Santa Barbara," Metropolitan Water District of Southern California, 1991.

between 15 to 30 percent produced extremely large economic losses due to decreased production in water-intensive industries.[5]

The water shortage cost literature generated by the last drought evolved into more formalized water reliability valuation studies and eventually led to the modeling process called Least Cost Planning, described by the above Figure 1. Least Cost Planning methodologies today underlie Integrated Resource Planning.

More immediately relevant, SFPUC relied on the work done by the author to estimate the regional economic costs to the Bay Area from water shortages. In a report submitted in 1993 to the Federal Energy Regulatory Commission (FERC),[6] the SFPUC utilized the output elasticities of water identified in CUWA's 1991 report to correlate an industrial firm's change in production to a reduction in water supply.[7]

The SFPUC report to FERC estimated the direct economic impact, as measured by the reduced value of shipments, of a 15 percent cutback in supply to the largest water using industrial sectors in the SFPUC service area at $305 million per year. 115 cont.

When the secondary impacts[8] of the reduced industrial output are taken into account, SFPUC estimated the total loss would increase to $397 million per year.

Some of the key findings in SFPUC's 1993 report include:

"• The economic impact resulting from a water supply cutback will be concentrated in two industries: electronic components and accessories, and computer and office equipment. Other industries could experience larger production cutbacks, but their economic impact will be small by comparison, except for the beverage industry.

[5] William Wade, Julie Hewitt, et al., "Cost of Industrial Water Shortages," Spectrum Economics Report to CUWA, November 1991.

[6] Hetch Hetchy Water and Power Department, Response to Data Request Concerning FERC Opinion 420: New Don Pedro Project, June 8, 1993.

[7] The output elasticity of water estimates the percentage change in production due to the percentage change in water input.

[8] Secondary impacts reflect reduced economic activity in other sectors of the economy due to reduced spending by firms and employees of the industry directly affected.

L_BAWSCA1

- A 15 percent cutback in water supply could reduce direct shipments from the electronic component industry by $68,000,000, and $163,000,000 from the computer equipment industry. The secondary impact could increase the loss from these two industries to $294,000,000.
- A 15 percent cutback in water supply could result in more than 2,000 jobs lost in the two industries and their ancillary service areas.
- At a 15 percent cutback in water supply, the beverage industry would experience the largest production cutback of 10.4 percent and lost sales of approximately $72,400,000."

The direct economic cost of a 15 percent reduction in deliveries to key water-dependent industries ($305 million in 1990 dollars) is itself larger than the cost ($181 million, apparently in 2005 dollars) of enhancing the SFPUC's reliability level from 80 percent to 90 percent. The direct loss figure does not take into account indirect losses in other industrial sectors. Nor does it include the costs to government in terms of reduced sales tax and income tax revenues.

Nearly 15 years have passed since the data on which the SFPUC's 1993 report was based were collected. Is there any reason to think that a comparable reduction in water deliveries in, for example, 2010 would have less serious economic impacts? 115 cont.

Based on more recent published economic analyses of water supply and on the author's preliminary review of water use and census data, the answer is "NO." In fact, recent production values for a similar subset of water-dependent industries shows that the costs of water shortage will be greater than during the last drought.

4. The Cost of a Renewed Water Shortage, Measured Solely in Terms of Reduced Industrial Output, Will Greatly Exceed the Cost of Improving System Reliability to 90 Percent

In the Bay Area, a higher percentage of water is used for industrial, commercial and governmental operations (38%) than is the case in California generally (32%).[9] This allocation is a bit more pronounced in the SFPUC wholesale service area, where, in 2001 for example, 39% of the water distributed was devoted to these non-residential

[9] CDWR, Urban Water Use in California, Bulletin 166-4 (August 1994).

uses. In those wholesale communities where significant industrial activity is concentrated, the percentage of water devoted to industrial/commercial/institutional use is even higher, as can be seen in Table 1.

Table 1: High Non-Residential Water Use Areas

	Residential	Non-Residential	Purchases from SFPUC (MGD)
Guadalupe Valley M.I.D.	13%	87%	0.3
San Jose (North)	19%	81%	4.9
Menlo Park	40%	60%	3.8
Santa Clara (North)	44%	56%	4.0
South San Francisco (CWS)	44%	56%	8.3
Milpitas	45%	55%	11.2
Brisbane	50%	50%	0.4
Mountain View	51%	49%	11.0
Palo Alto	58%	42%	13.3
Sunnyvale	60%	40%	9.7
Source: SFPUC Water Demand Forecast, Appendix C, 2004			

The companies that account for the majority of industrial sector water use are those in the computer equipment and electronic component manufacturing categories.[10] These water-dependent industries that are the backbone of the Bay Area economy. The significance of their contribution to the regional economy has grown dramatically since the CUWA survey was completed in 1991, as can be seen from a comparison of Table 2 and Table 3.

115 cont.

[10] Hetch Hetchy Water and Power Department Report, pp. 106-07.

12.3-81

L_BAWSCA1

Table 2: Value of Manufacturing Shipments - 1990
(in millions of dollars)

	Alameda	San Mateo	Santa Clara	Total
Total Manufacturing	$15,300	$4,400	$36,600	$56,300
Water Critical Industries	$9,700	$1,600	$273,00	$38,600
Percentage of County	63%	36%	75%	69%
Source: CUWA, Cost of Industrial Shortages, Appendix C, 1991				
Note: Census of Manufacturers 1987 forecast to 1990 by the Center for Continuing Study of the California Economy.				

The share of total manufacturing output represented by water critical industries in the three counties for 1990 was 69 percent. This rose to 83 percent in 2001.

Table 3: Estimated Value of Manufacturing Shipments - 2001
(in millions of dollars)

	Alameda	San Mateo	Santa Clara	Total
Total Manufacturing	**$38,346**	**$13,116**	**$155,875**	**$207,336**
Fabricated metal products	$1,972	$562	$2,352	$4,886
Computer and electronic products	$16,297	$6,214	$125,346	$147,857
Electrical equipment and appliances	$908	$175	$2,191	$3,274
Food products	$2,498	$806	$1,397	$4,701
Beverage products	$2,154	$362	$712	$3,228
Paper manufacturing	$749	$171	$616	$1,535
Chemical manufacturing	$2,000	$2,328	$3,262	$7,590
Water Critical Industries Subtotal	**$26,578**	**$10,617**	**$135,876**	**$173,072**
Percent of County	**69%**	**81%**	**87%**	**83%**

Note: Estimated value of shipments based on ratio of wages and salaries to shipments from 1997 Census of Manufacturing and wages and salaries provided for 2001. Placeholder values until publication of 2002 Census of Manufacturing.

115 cont.

Table 3 shows that the total value of manufacturing shipments nearly quadrupled between 1990 and 2001, (from $56.3 Billion to $207.3 Billion) while the value of shipments from water critical manufacturing industries more than quadrupled (from $38.6 Billion to $173.1 Billion).

In some industries, water is an essential element of the production process, not ancillary to plant production for employee use. For example, about 75 percent of water use in the food products industry is employed directly in the process. Water essentially is the product for many beverage processors. Microchips are manufactured in a wet environment with much necessary rinsing. Biotechnology, an emerging industry in the Bay Area, requires water. Genentech, for example, is the largest industrial user of water in South San Francisco. Over 75% of the water used in its South San Francisco plant is employed directly in the manufacturing process, while R&D uses account for most of the remainder. Genentech's explanation of the importance of water is short and to the point:

"What are our raw materials?
- Genetically modified cells
- Water"[11]

What would be the effects of a new round of water rationing imposed on these industries? The 1991 CUWA study estimated the impact of 15% and 30% water supply reductions on the water critical industries in six Northern California counties. Using the same methodology employed in the CUWA study, it is possible to estimate the effect of 10%, 15% and 20% cutbacks on the water critical industries of Alameda, San Mateo and Santa Clara counties, benchmarked to 2001 revenues. The results are shown on Table 4.

Table 4 shows that the estimated value of current production losses in these water critical industries ranges from $2.5 billion to $7.7 billion per year. The estimates are based on the countywide values in Table 3, adjusted to reflect the portion of each county's industrial customers served by the SFPUC, as presented in the Bay Area

115 cont.

12.3-82

[11] Genentech – A Biotech Case Study: Water Sustainability in Silicon Valley (May 2004).

L_BAWSCA1

Economic Forum 2002 report "Hetch Hetchy and the Bay Area Economy." The figures are San Mateo 100%, Alameda 50% and Santa Clara 80%.

Table 4: Effect of Water Shortage on BAWSCA Water Critical Industries

	Output Elasticities of Shortage		Lost Value of Shipments – 2001 (in millions of dollars) Imposed Supply Shortage		
	15%	30%	10%	15%	20%
Fabricated metal products	0.15	0.41	$51	$211	$281
Computer and electronic products	0.18	0.27	$2,064	$4,643	$6,191
Electrical equipment and appliances	0.18	0.27	$43	$96	$129
Food products	0.27	0.35	$86	$167	$222
Beverage products	0.69	1.14	$139	$343	$458
Paper manufacturing	0.40	0.70	$42	$109	$145
Chemical manufacturing	0.12	0.20	$71	$178	$238
Subtotal: Water Critical Industries	na	na	**$2,495**	**$5,747**	**$7,663**

Note: BAWSCA industry is assumed to be 100% of San Mateo; 80% of Santa Clara; 50% of Alameda; following the assumption in Sunding et al., p. 23.

115 cont.

These estimates are conservative in that they use the production relationships developed 15 years ago in the CUWA study. In the intervening years, water use efficiency in these industries has improved as companies have invested in water conservation. The industrial water use survey reported in the CUWA study found ongoing conservation projects aimed at reuse and recirculation of water costing many thousands of dollars for each acre-foot saved.[12] The SFPUC 1993 study for FERC reported that "managers interviewed felt they had squeezed most of the potential water savings out of cooling, personal and landscape uses."[13] These improvements in efficiency have "hardened" demand. As a result, a reduction in water supply today will produce a greater loss in production than the corresponding reduction would have done 15 years ago.

[12] See Section 6 of Cost of Industrial Water Shortages.

[13] Hetch Hetchy Water and Power Department Report, p. 115.

Moreover, the estimated losses in Table 4 do not include the secondary economic impacts -- the "ripple" effects that the loss of output and wages in these water critical industries would have on other sectors of the economy. Nor do they account for the loss in sales and income tax revenue to local governments.

Additionally, water shortages will impose costs on the commercial sector of the economy. Two of the most important components of this sector in the Bay Area are hotels/motels and restaurants. Those two categories are among the largest users of water in the region – accounting for over 40% of all commercial water use.[14] Most of the water use in the hospitality/tourism sector is "indoor" use: very little is devoted to landscape irrigation. Costs to the commercial sector are not included in the $2.5 - $7.7 billion cost estimate, nor are the effects of rationing on hospitals, schools and other institutional users.

5. <u>The SFPUC Also Failed to Take the Costs of Shortages to Residential Customers into Account</u>

115 cont.

Costs that water shortages impose on residential customers should not be overlooked. The value of water supplies for residential uses can be estimated by residential customers' "willingness to pay." Economists measure a person's willingness to pay for a good with reference to the demand curve. The aggregate demand curve allows estimates of how much people are willing to pay for each additional unit of the good or service. Consumers pay a charge for water that can be seen as a lower bound estimate of their willingness to pay. We know that consumers are willing to pay at least that much because they *do* pay that much. They may be willing to pay considerably more than this—particularly if the alternative were water shortages. The difference between what they are *willing to pay* and what they are charged is the *consumer surplus*, also known as the net benefit.

The California Department of Water Resources has developed a data base of consumer surplus values, which represent an amount each household would be willing to pay <u>in addition to its existing water bill</u> to avoid a shortage of a given size. (See

[14] Hetch Hetchy Water and Power Department Report, p. 104.

Appendix Table 1.) A preliminary calculation using CDWR values, updated to 2005 dollars, the Association of Bay Area Governments just-completed census of households, and residential water use data compiled by SFPUC and BAWSCA suggests that residential customers in the SFPUC wholesale service area attach high values to greater reliability. Table 5 shows the magnitude of annual residential values at stake but omitted in the WSIP planning process. The number of projected households from ABAG's 2005 projections is multiplied by the percentage of Single Family and Multi-Family Households and then by the respective willingness to pay values from Appendix Table 1. The results are shown at the bottom of Table 5.[15]

These numbers show that, given today's population, the value to residents in the SFPUC wholesale service area territory of avoiding a 20 percent shortage is approximately $97 million per year. Any supply portfolio that could improve that reliability with an annualized cost of less than that amount would be of benefit to the residential customers in the region. The values on Table 5 may be low.[16] As shown in the table, the benefit from improving reliability increases over time, as the population grows.

115 cont.

[15] Costs on Table 5 assume that a single-family housing unit uses, on average, 0.3 AF of water per year while a multi-family housing unit uses, on average, 0.2 AF per year. They also assume that 95% of residential water use in San Mateo County is supplied by the SFPUC, with the corresponding percentages being 31% and 23% in Alameda and Santa Clara counties, respectively.

[16] Rationing systems adopted during a drought could shift a larger burden of a system-wide shortfall to the residential sector. Hence, a system-wide 20% shortfall might impose the cost of a 25% shortage on residential customers. Moreover, CDWR adjusts upward the values for both demand hardening and for multiyear events.

12.3-84

Table 5: Residential Reliability Values for BAWSCA Households							
Households	**2000**	**2005**	**2010**	**2015**	**2020**	**2025**	**2030**

6. Conclusion: The SFPUC Should Reconsider the Water Reliability Goal in the WSIP, Taking Economics into Account

The industrial and residential shortage cost estimates provided in this report are preliminary and approximate. They are starting points used simply to illustrate that SFPUC has omitted them from the WSIP, that they are large, and that they far exceed the SFPUC's estimates of incremental costs to improve system reliability to 90%, or, for that matter, 100%. They could be used, along with estimates of the cost of reliability options, to develop lifecycle benefits to compare with lifecycle costs of proposed options, in order to assess whether the improvement in reliability is beneficial from the point of view of avoided social and economic costs. The analytic process is more complicated than simply comparing values in Tables 4 and 5 to engineering and construction costs. To fully develop the analysis, the SFPUC would have to develop the costs of an array of reliability management alternatives, together with the expected shortage in each year of the project life of those supply alternatives. The California Department of Water Resources and the Metropolitan Water District of Southern

California have been employing analytic methods of this kind for nearly 20 years. References cited in this paper will lead the interested reader to the appropriate tools and approaches.

Project No. 2299

AFFIDAVIT OF ANSON B. MORAN

I, Anson B. Moran, do hereby declare as follows:

1. I am General Manager of the Public Utilities Commission for the City and County of San Francisco, and have been so employed since December, 1993. Prior to my appointment to this position, I was General Manager of the Hetch Hetchy Water and Power Department since 1988. Prior to that position, I was Assistant General Manager, Finance for the San Francisco Public Utilities Commission. I Joined the Public Utilities Commission in 1980.

2. I serve on the Boards of the California Water Education Foundation and California Municipal Utilities Association, and am currently Chairman of the California Urban Water Agencies. I have a Bachelor of Science in Electrical Engineering from Worcester Polytechnic Institute and a Master of Arts in Urban Studies from Occidental College.

3. I am responsible for the actions of the Hetch Hetchy Water and Power Department and San Francisco Water Department which supply water to a population of approximately 2.3 million people within the counties of Tuolumne, Alameda, Santa Clara, San Mateo, and San Francisco.

4. In this affidavit, I address the subject of the planning and operation the City's water facilities during drought.

116

L_BAWSCA1

Specifically, I address the basis of the procedures the City used to determine the rationing that was implemented during the recent drought, and which are incorporated in the City's water supply planning studies.

5. The City's "operation rule" was developed during the course of the recent 1987-1992 drought. Never before had such a sustained drought been experienced by the City. The onset of the drought really began in 1986, the point in time when the City's reservoirs were last filled, and continued until June, 1993 when the City's reservoirs finally refilled to full capacity. This drought spanned approximately 7 years.

6. Water deliveries to City customers at the time the drought began amounted to approximately 293 million gallons per day (MGD) (328,000 acre-feet per year). During the 1987-1992 period the City received from Tuolumne River runoff an average of only 151,500 acre-feet per year, and from local Bay area water sources approximately 20,700 acre-feet per year. The deficit between water supplies and water demands during the drought became readily apparent as the drought progressed, requiring an extreme dependence on Tuolumne River reservoir storage to partially close the gap.

7. The City proceeded with operations at the onset of the drought in accordance with procedures based on the experience of many years of historical operation, including the knowledge of previous drought events such as had occurred in 1976-1977. The operation of the City's facilities in accordance with rules based only on historical data proved to be a mistake.

116
cont.

8. The City learned the painful lesson as to the adverse impacts that are caused by not planning for a drought worse than any experienced to date. This lesson was driven home when the hydrology of the Tuolumne River and the City's operations through 1990 and early 1991 had created a situation where a 45 percent rationing program among City customers was initiated - a level of rationing that was found to be intolerable and not achievable.

9. The City and its customers implemented numerous drought-related and long-term water conservation programs to lessen water demand, with water demand ultimately being reduced by approximately 30 percent as compared to pre-drought deliveries. The City also purchased water from other entities to narrow the gap between supplies and demands. These actions along with a fortuitous storm during the spring of 1991 allowed the City to regain control of its system and efforts moved forward to better plan for the reliability of the City's water deliveries.

10. Significant questions regarding how the City would operate its water system had to be addressed. Several of these questions were as follows:

- How much water should the City maintain in storage in one year to assure water deliveries during the next year?
- To what level and for what duration can the City expect its customers to reduce water use?
- How long a period should the City expect the drought to continue?
- During the drought period, what water supplies (e.g., inflow to City reservoirs) should be expected to occur?

116 cont.

12.3-89

L_BAWSCA1

The answers to these fundamental questions are intertwined, and result in the operation rule that the City now uses to guide City water delivery operations.

11. However, underlying the answers to these questions is an appreciation of the risk that is inherent in operating to any rule. In the case of the City's water deliveries, risk is the product of the probability (frequency) of water shortages and the consequences of those shortages.

12. The frequency of potential shortages is forecasted with modeling tools that integrate assumptions for each of the above questions.

13. The consequences of shortages include economic, socio-economic, environmental, and personal (human) impacts.

14. What makes San Francisco's situation unusual is the consequence of being wrong in our forecast. Because of our entitlement structure, and limited conveyance and treatment capacity, an additional, unforecasted year of drought could literally result in empty reservoirs, no entitlements, and little or no alternate source of water. We could have no water to serve our 2.3 million customers.

15. In the spring of 1991 these consequences achieve a sobering clarity. I became acutely aware of the physical constraints of the City's water conveyance, treatment and delivery facilities; the availability of, and limitations to movement of supplemental emergency water supplies into the City's system; and the uncertainty as to when the drought would finally end. Due to the extremely limited conveyance and treatment capacity system to

116 cont.

bring other emergency sources of water to the City, the City must rely on storage in the Tuolumne River basin to ride out droughts. The City just does not have other sources to call on during drought, such as turning on pumps. In addition, I had first-hand information as to the direct and indirect adverse impacts that were occurring to the City's customers as the result of water shortages.

16. Situated within the drought, I weighed all the above factors and supported the operation rule that is currently used by the City in practice, and incorporated in the planning studies submitted to FERC. That plan was tested as it was developed and is the direct product of real, on-the-line decision making. When considering all the factors associated with the City's entitlements to water, its physical system, and the dire consequences of just being wrong in the forecasting of the length of drought that may hit the City, I can not agree with any comment that the City's operation rule is overly conservative.

116 cont.

12.3-90

I declare under penalty of perjury that the foregoing is true and correct.

Statement from Arthur Jensen, General Manager
Bay Area Water Supply and Conservation Agency about
San Francisco's Draft Program Environmental Impact Report
for its Water System Improvement Program

RECEIVED AT CPC HEARING 9-20-07
2005.0159E WATER SYSTEM IMPROVEMENT PROGRAM (SOKOLOVE)

September 20, 2007

BAWSCA is an independent special district whose board of directors represents the 27 long-term contract customers of San Francisco in Alameda, San Mateo and Santa Clara counties. BAWSCA members purchase over two-thirds of the water which the SFPUC distributes, and pay over two-thirds of the cost of the regional water system. BAWSCA has been working diligently to evaluate the PEIR and will shortly be submitting extensive written comments. Today, we highlight three key issues.

First, the PEIR should more clearly emphasize the critical importance of completing the WSIP to protect the public health and safety of 2.5 million people that live in the Bay Area. We must not lose sight of why the WSIP is necessary and of the urgency with which it must be prosecuted. 01

- Many of the regional water system's tunnels, reservoirs and pipelines are located on--or cross--one or more active faults.
- There is greater than a 60% chance of a major earthquake before 2032. It is not a question of if such an earthquake will happen. But when. 02
- Following a major earthquake, the flow of water to communities could be disrupted for 30 to 60 days. The WSIP is necessary to protect the millions of people who live in this area from the catastrophic consequences of the water system's failure.

Second, BAWSCA member agencies and their customers are dedicated to conserving and recycling water. Residential customers of BAWSCA members use less water on a per capita basis than residents in all other regions of the State. Indeed, residential water use by the 1.7 million people in San Francisco's neighboring communities is lower than the average for the Bay Area as a whole. Today's residents use 23 percent less water than they did before the 1976 drought. As population grows, BAWSCA, its member agencies and their customers will implement additional conservation measures and water recycling so that residential per capita water use is actually expected to decline despite the forecasted population growth. 03

Third, contrary to some recent public statements, San Francisco and BAWSCA are not the most significant users of Tuolumne River water. Almost half of the Tuolumne River runoff is used for agricultural production. While BAWSCA actively pursues additional conservation efforts in its own service area, it also makes sense to encourage further conservation from agricultural users of Tuolumne River water. 04

The Modified WSIP, identified in the PEIR as the Environmentally Superior Alternative, suggests a partnership with agricultural interests to conserve Tuolumne River water, while keeping agricultural stakeholders whole, so that water delivered to the Bay Area would be offset by agricultural water conservation. BAWSCA supports such a partnership. It hopes, in its written comments, to support and enlarge upon the ideas presented in the PEIR and will suggest ways to achieve a net savings on the River while still providing the water necessary to accommodate environmentally sound, infill growth planned in San Francisco and its neighboring communities.

Delivered by Steven Miller on behalf of Arthur Jensen at the public hearing held in San Francisco on September 20, 2007

Making San Francisco Bay Better

September 6, 2007

RECEIVED
SEP 07 2007
CITY & COUNTY OF S.F.
PLANNING DEPARTMENT
MEA

Diana Sokolove
City and County of San Francisco
Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103-2479

Subject: BCDC Inquiry File No. MC.MC.0704.1 San Francisco Public Utility Commission's Water System Improvement Program Draft Program Environmental Impact Report. (State Clearinghouse #2005092026.)

Dear Ms. Sokolove:

Thank you for the opportunity to comment on the Water System Improvement Program Draft Program Environmental Impact Report (DEIR) for the San Francisco Public Utility Commission. The DEIR is dated June 2007, and was received in our office on July 2, 2007. The Commission has not reviewed the DEIR, so the following comments are based on the *San Francisco Bay Plan* (Bay Plan) and the McAteer-Petris Act and staff review of the DEIR.

Project Description. As described in Tables 3.10 (page 3-52) and C.1 (page C-4) of the DEIR, the Bay Division Pipeline Tunnel (BD-1) project includes a "(n)ew "Bay Tunnel" segment of BDPL No. 5 ... extending five miles from Newark Valve Lot to Ravenswood Valve Lot, crossing under San Francisco Bay and adjacent marshlands; BDPL Nos. 1 and 2 would tie into the tunnel at both ends and would be decommissioned between Newark and Ravenswood Valve Lots." (The DEIR states that decommissioning of the existing tunnel is not part of the proposed project.) The map in Figure 3.5a shows approximately where the new tunnel segment will cross the Bay.

The descriptions in Chapter 3 and Appendix C also indicate that the BD-1 project will include new facilities at eight valve lot (or house) locations along the pipeline, and that project construction will require staging space at the drive and receiving shaft locations at either end of 01
the Bay Tunnel segment. However, the locations of the valve lots and the construction activities associated with the BD-1 project are unclear from these project descriptions. Additionally, the map figures included in the DEIR do not show these locations. As a result, we cannot determine if these project components fall within BCDC jurisdiction. The language in Table C.1 (page C-4) and in 4.3 Land Use and Visual Quality section (last paragraph under Bay Division Region, *Land Use*, page 4.3-5) suggests that the locations of the project components are known more accurately than they are presented in the DEIR. If this is the case, the project description should have a more accurate description of these locations.

The new tunnel segment of the BD-1 project falls within BCDC jurisdiction. For the purpose of this comment letter, we have assumed that the valve lot and construction staging project components are within the Commission's jurisdiction.

Plans and Policies. Under *Other Land Use Plans and Policies* (page 4.2-8), the DEIR describes the Commission as having "authority to issue or deny permit applications for placing 02
fill, extracting materials, or changing the use of any land, water, or structure within the area of its jurisdiction and to enforce policies aimed at protecting the bay and its shoreline." The EIR

should also specifically state BCDC's jurisdiction as all areas of San Francisco Bay up to mean high tide, and in areas of marsh up to 5 feet above mean sea level, a shoreline band lying 100 feet inland from the Bay, as well as salt ponds, managed wetlands and certain waterways.

The DEIR recognizes that the Bay Division Pipeline Tunnel (BD-1) project includes approximately five miles of tunnel under the Don Edwards San Francisco Bay Wildlife Refuge, Newark Slough, and San Francisco Bay, and that this "project could be subject to certain provisions contained in the SF Bay Plan." The EIR should explicitly state that the BD-1 project 02 cont.
will be subject to Bay Plan policies concerning placement of fill in the Bay and dredging, and that certain other Bay Plan policies may also apply, depending on the final project plans. To be consistent with the level of description for other relevant policies and plans in the DEIR, the applicable Bay Plan policies on Safety of Fill and Dredging should be referenced in this section as well. Additionally, the EIR should reference the Bay Plan policies on Public Access that may apply in BCDC permits issued for BD-1 projects.

The discussion of *Consistency of WSIP Projects with Other Applicable Land Use Plans and Policies* (p. 4.2-16) should address program consistency with the additional Bay Plan policies that have not been identified in the San Francisco Bay Plan description under *Other Land Use Plans and Policies*.

Biological Resources. BCDC's Bay Plan findings and policies on Fish, Other Aquatic Organisms and Wildlife; Tidal Marshes and Tidal Flats; and Salt Ponds address protection of these resources. The discussion of the *Regulatory and Conservation Planning Framework* (beginning page 4.6-23) in the Biological Resources section of the DEIR should reference these 03
applicable Bay Plan policies and state that, in reviewing permit applications for projects within its jurisdiction, BCDC relies on these Bay Plan policies to ensure protection of habitats and biological resources.

Fresh Water Inflow. Bay Plan findings and policies on Fresh Water Inflow into the Bay state, in part, that fresh water flows of the Sacramento and San Joaquin Rivers create a "delicate relationship between fresh and salt water" that "helps determine the ability of the Bay to support a variety of aquatic life and wildlife." Further, the Bay Plan finds that "fresh water flows from the Sacramento and San Joaquin Rivers into the Delta and the Bay have been reduced in the past by diversions of federal, state, and local governments for agricultural, industrial, and domestic uses. Additional diversions are being sought, and further substantial diversions could change the salt content of Bay water and thereby adversely affect the ability of the Bay to support a great variety of aquatic life." BCDC's Fresh Water Inflow policies require 04
that "diversions of fresh water should not reduce inflow into the Bay to the point of damaging the oxygen content of the Bay, the flushing of the Bay, or the ability of the Bay to support existing wildlife."

The EIR should address whether diversions of freshwater from the Tuolumne River proposed in the preferred alternative will negatively impact the Bay as described in the Bay Plan findings and policies. BCDC's Fresh Water Inflow policies should also be described in Section 5.2.3 Relevant Plan, Policies and Planning Actions as well as Section 5.3.6 under *Regulatory Setting*.

Sea Level Rise and Safety of Fills. Bay Plan findings and policies anticipate the need for planning associated with safety of fills and sea level rise. The Safety of Fills findings recognize that "Bay water levels are likely to increase in the future because of a relative rise in sea level... Relative rise in sea level is the sum of: (1) a rise in global sea level and (2) land elevation change 05
(lifting and subsidence) around the Bay." Policy 5 states, in part, "...structures on fill or near the shoreline should be above the highest estimated tide level for the expected life of the project water level during the expected life of the project or be sufficiently protected by levees..." Additionally, Policy 6 states, "local governments and special districts with responsibilities for

L_BCDC

flood protection should assure that their requirements and criteria reflect future relative sea level rise and should assure that new structures and uses attracting people are not approved in flood prone areas or in areas that will become flood prone in the future, and that structures and uses that are approvable will be built at stable elevations to assure long-term protection from flood hazards." 05 cont.

Projects in BCDC jurisdiction that involve bay fill must be consistent with the Bay Plan policies on safety of fill and sea level rise. The EIR should include these Bay Plan policies in the Regulatory Framework discussion in Chapter 4.5 on Hydrology and Water Quality (beginning on page 4.5-9), and consider sea level rise-related flooding impacts under Impact 4.5-4, Bay Division Region.

If you have any questions regarding this letter, please contact Joe LaClair by phone at 415 352-3656 or email joel@bcdc.ca.gov.

Sincerely,

SARA POLGAR
Planner

San Francisco, CA 94103

Subject: Draft PEIR, SFPUC Water System Improvement Program

Dear Mr. Maltzer:

Thank you for the opportunity to review the SFPUC Water System Improvement Program Draft PEIR. The City of Brisbane and Guadalupe Valley Municipal Improvement District have reviewed the document and offer the following comments:

General Comments:

- The City of Brisbane and Guadalupe Valley Municipal Improvement District (GVMID) rely entirely on the SFPUC for potable water supply; therefore, we find it imperative that SFPUC meet the seismic and reliability goals of the WSIP in a timely manner. 01
- The City of Brisbane and GVMID support the Modified WSIP Alternative as the preferred alternative. 02

Specific Comments:

- The Draft PEIR lists Brisbane in TABLE 3.11 as an affected jurisdiction to Project No. SF-2. The City of Brisbane and GVMID are not mentioned as a participating member of a conjunctive-use program under the Regional Groundwater Projects (SF-2) in Chapter 5 of the Draft PEIR; the City of Brisbane should be removed from TABLE 3.11 as an affected jurisdiction to Project No. SF-2. It should be noted that the City of Brisbane and GVMID are located outside the limits of the South Westside Groundwater Basin and no viable source of a dependable groundwater supply has been documented to the knowledge of city staff. 03

- The Draft PEIR TABLE 7.3 and TABLE E.2.1 correctly show a large projected increase in water demand for the City of Brisbane and GVMID between 2001 and 2030 (111 percent and 153 percent, respectively). This is primarily due to a 416.6 percent and 27.6 percent projected increase in employment for the City of Brisbane and GVMID, respectively (noted on Table E.3.5) and a 45.1 percent and 249.3 percent projected increase in residential population for the City of Brisbane and GVMID, respectively (noted on Table E.3.6). The large projected percentage increase in employment and residential population is due principally to the fact that the City of Brisbane and GVMID have significant acreage of zoned but not yet developed areas (i.e., the 655-acre brownfield Baylands site and the 76-acre Sierra Point closed landfill site represent one-third of the City's land base that is above sea level and not covered by the San Francisco Bay) which create statistically obvious impacts when anticipated water demand from these sites is applied to the small existing (2001 data) residential population bases (3,174 and 446 for the City of Brisbane and GVMID, respectively) and small existing (2001 data) employment population bases (3,789 and 4,442 for the City of Brisbane and GVMID, respectively). 04

  - The two attached documents listed below illustrate the City's work to manage its growth and continue its water conservation efforts during future development:

Attachment A	Brisbane and Smart Growth
Attachment B	Brisbane and GVMID Water Conservation Practices

- The Draft PEIR TABLE E.3.38 again notes the increase in future water demands for the City of Brisbane and GVMID between 2005 and 2030. On Page E.3-45 of the Draft PEIR it is noted that Brisbane and GVMID have increased water demands with either large projected increases in employment or population, but not both. This is correct and it has been explained above that the large percentage increases to either the employment or residential population is enough to cause statistically obvious impacts to the future daily water demand.

- The Draft PEIR PAGE E.2-5 notes that the total daily water demand for GVMID in Fiscal Year (FY) 2002/2003 of 0.36 mgd is slightly higher than the 2001 base 05

year daily water demand of 0.32 mgd. It is correct that GVMID experienced a slight increase in daily water demand for FY 2002/2003; however, it should be noted that total daily water demand for GVMID in subsequent years show a downward trend in daily water demand (0.33 mgd in FY 2003/2004, 0.31mgd in FY 2004/2005 and 0.27 mgd in FY 2005/2006). Similarly, the City of Brisbane has shown a decrease in daily water demands from the 2001 base year daily water demand of 0.44 mgd to 0.39 mgd in FY 2005/2006. 05 cont.

- The Draft PEIR TABLE E.2.5 includes a list of SFPUC wholesale agencies that have current or planned recycled water projects under study. The City of Brisbane and GVMID have been actively involved in a South San Francisco-San Bruno Recycled Water Feasibility Study since this information on recycled water potential was tabulated as part of the December 2004 Wholesale Customer Recycled Water Potential Technical Memorandum. 06

Thank you for the opportunity to comment on this project. We look forward to reviewing the FEIR when available. Should you have additional questions, please call me at 415-508-2130.

Very truly yours,

Randy L. Breault, P.E.

Subject: Comments from the City of Burlingame on the Draft Program Environmental Impact Report for the SFPUC's Water System Improvement Program

Dear Mr. Maltzer:

The City of Burlingame ("Burlingame") is submitting this letter in response to the Draft Program Environmental Impact Report ("PEIR") for the San Francisco Public Utilities Commission's ("SFPUC's") Water System Improvement Program ("WSIP"), dated June 2007.

Burlingame has reviewed the SFPUC report and a brief summary of concerns and comments is included below. These concerns relate to (1) projections of Burlingame's requests for SFPUC water in 2030, and (2) demand hardening and the effects of 20% supply cutbacks during dry years.

Projection of Burlingame's 2030 Purchase Requests

As expressed to the SFPUC in Burlingame's letter to Paula Kehoe dated 8 April 2005 (Burlingame, 2005), the projected quantity of water that Burlingame will purchase from SFPUC in 2030 ("2030 purchase projection") that is included in the WSIP PEIR differs from the more conservative 2030 purchase projections developed by Burlingame for planning purposes. This conservative projection was developed as part of Burlingame's 2004 Water System Master Plan ("WSMP") and was updated in the 2005 Urban Water Management Plan ("UWMP") based on new population projections published by the Association of Bay Area Governments. Burlingame considers the WSIP 2030 purchase projection of 4.68 million gallons per day ("MGD"), a target non-conservative goal for which we will strive to meet, but recognizes that this goal makes assumptions regarding four key factors, listed below:

- Population and employment growth, 01
- The percentage of old fixtures in Burlingame and the water use per fixture,
- The percentage of old fixtures that will naturally be replaced in Burlingame and associated water savings per year,
- Water savings achieved due to implementation of water conservation measures.

Though Burlingame will attempt to meet the 2030 purchase projection goals included in the WSIP, for planning purposes, we will continue to rely on the more conservative water purchase projections contained in the UWMP to size water system infrastructure improvements. This projection estimates an average daily purchase request of approximately 5.03 MGD in 2030.

Support of WSIP Variant 3 – Maximum of 10% Dry Year Supply Reductions

In an efforts to ensure a sufficiently reliable water supply to meet the future demands of its customers, Burlingame is concerned with the dry year supply reductions proposed in the PEIR for the WSIP and two of the three WSIP Variants (Variant 1: All Tuolumne, and Variant 2: Regional Desalination for Drought). As water conservation measures are implemented within Burlingame's service area and throughout the SFPUC's entire wholesale customer area, there is increasingly less flexibility during dry years to save additional water to meet cutbacks in supply. Given this projected hardening of demand, Burlingame is concerned that the 20% supply reduction proposed for the WSIP during dry years (for 3.5 years out of an 8 year design drought) will place significant strain on Burlingame's customers.

In particular, Burlingame is concerned with the potential for economic loss resulting from water supply 02
reductions during a drought. According to SFPUC's recent study *Measures to Reduce the Economic Impacts of a Drought-Induced Water Shortage in the SF Bay Area* (SFPUC, 2007), annual losses of between $15 million and $32 million are expected throughout the region under a 10% water supply reduction. Economic losses between $51 million and $98 million are expected to occur under a 20% water supply reduction. Burlingame's share of this projected loss is estimated to range from approximately $500,000 under a 10% supply reduction to as much as $1.7 million under a 20% supply reduction. Thus to minimize the burden of economic loss during dry years, Burlingame considers WSIP Variant 3: 10% Rationing as a preferred option to the WSIP, Variant 1, and Variant 2, which would require supply cutbacks of up to 20%. Furthermore, as the WSIP Variant 2 option projects even more years with 20% supply cutbacks (5.5 out of an 8 year drought), Burlingame considers this option the least desirable of the four options presented in the PEIR.

Please contact Matt Zucca at (650) 292-9100 or myself at (650) 558-7230 if you have any questions.

Very truly yours,

THE CITY OF BURLINGAME

Re: California Water Service Company's Comments on the SFPUC WSIP PEIR

Dear Mr. Maltzer,

The following comments on the Program Environmental Impact Report (PEIR) for the SFPUC's Water System Improvement Program (WSIP) are provided by California Water Service Company Water (Cal Water).

Cal Water supports the SFPUC's proposed Water System Improvement Program, which is intended to improve the water supply reliability of the regional water system that serves 2.4 million residents, including 235,250 Cal Water customers that reside in San Mateo County on the San Francisco Peninsula. Cal Water supports SFPUC approach to establishing this supply reliability by addressing the needed repairs to the aging infrastructure, retrofits of the water system where it is exposed to seismic and other safety hazards, assure continued compliance with water quality standards through system upgrades, adding redundancy to critical facilities and the enhancement of supplies to meet customer demands during both drought and non-drought years. Cal Water appreciates that the goals and objectives of the WSIP not only call for providing the supply reliability through the means stated above, but also call for the sustainability of these efforts through protections of the natural resources and public health and safety, while striving to achieve these in a cost effective manner. 01

Cal Water has reviewed the entire PEIR document, but has made a critical examination of the following sections:

Section 5.6 Westside Groundwater Basin Resources
Chapter 7: Growth Inducement Potential and Indirect Effects of Growth.
Appendix E: Growth Inducement and Supporting Information

Westside Groundwater Basin Resources

Cal Water has long been a supporter of conjunctive use programs. We have been an active partner with the SFPUC, Daly City and San Bruno regarding the development of a conjunctive use program in the Westside Basin. Section 5.6 of the PEIR presents an accurate and complete assessment of the setting for this program and the impacts that it may have. The banking of surplus supplies through in-lieu replenishment methods during periods of abundant precipitation, 02

DISTRICT OFFICES: ANTELOPE VALLEY • BAKERSFIELD • BAYSHORE • BEAR GULCH • CHICO • DIXON • EAST LOS ANGELES • KERN RIVER VALLEY • KING CITY • LIVERMORE • LOS ALTOS • MARYSVILLE • OROVILLE • RANCHO DOMINGUEZ • REDWOOD VALLEY • SALINAS • SELMA • STOCKTON • VISALIA • WESTLAKE • WILLOWS

CALIFORNIA WATER SERVICE COMPANY

followed by the extraction of these banked supplies during drought and emergencies is a sound, beneficial process to protect and perpetuate the groundwater resources. It has been successfully employed in other areas of the state to provide drought protection, and Cal Water anticipates the eventual implementation of this conjunctive use program. 02 cont.

Growth Projections

The projected growth as presented in the PEIR is based on modeling done in 2003 and has been found to be inline with current projections. Growth in Cal Water's Districts will be mainly redevelopment in established neighborhoods since land is not available for new housing developments. This modus operandi for the three Districts has been and will be the increased densification with replacement of single family homes with multi unit homes and buildings. Given this growth limiting nature, it is important to note that the District's per capita demand has remained constant. 03

Local Supply Enhancement Projects

Cal Water avidly supports the approval of all projects that will improve the reliability and maximize the availability of locally produced water. One such project is the replacement of the Calaveras Dam. This vital project will restore this local supply reservoir to its original 96,800 acre-foot capacity and enable future enlargement as demand conditions dictate. Maximizing locally produced water improves supply reliability for all SFPUC customers, since water captured and held locally can reduce the impact of conveyance outages during maintenance and emergencies. 04

Conservation and Recycling

As discussed in the PEIR in section 3.8 regarding Project SF-3 which includes recycled water supply projects at various locations on the west side of San Francisco. Cal Water supports this project and other recycled water projects and would like to have these sources made available for purchase outside the jurisdictional boundaries of the respective producer. Purchase of recycled water would benefit Cal Water's SSF District by offsetting water currently being used for landscaping, particularly by the cemeteries in the City of Colma. Cal Water appreciates the role that the SFPUC has previously taken to be an active partner in recycled water investigations. Cal Water strongly urges the SFPUC, the Bay Area Water Supply and Conservation Agency (BAWSCA) and other applicable local water agencies and organization to consider ways of expanding the role of recycled water as a means of developing enhanced supply reliability throughout the San Francisco Bay area. 05

L_CalWater

CALIFORNIA WATER SERVICE COMPANY

Cal Water is continuing its effort in reducing demand by identifying potential users for recycled water by developing Water Supply and Facilities Master Plans for the three districts that purchase SFPUC water. In addition to these plans, Cal Water details its conservation efforts in each of its district's Urban Water Management Plans and participates in public outreach programs as detailed in the following attachments. 05 cont.

Thank you for your time.

Sincerely,

Thomas A. Salzano
Water Resources Planning Supervisor

Subject: Contra Costa Water District comments on the San Francisco Public Utilities District Draft Program Environmental Impact Report for the Water System Improvement Program

Dear Mr. Maltzer:

Contra Costa Water District (CCWD) appreciates this opportunity to comment on the Draft Program Environmental Impact Report (DPEIR) for the San Francisco Public Utilities Commission's (SFPUC's) proposed Water Supply Improvement Program (Program). CCWD commends the SFPUC on its strong efforts to improve water supply reliability through capital projects that reduce the likelihood of facilities failures from seismic events or other causes.

The Program includes increases in diversions of up to 25 MGD from the Tuolumne River upstream of the Sacramento-San Joaquin Delta (Delta). CCWD supplies drinking water diverted from the Delta to approximately 550,000 people in northern, central and eastern Contra Costa County, so new diversions from the Tuolumne River system have the potential to reduce both the quantity and quality of CCWD's water supply through changes to San Joaquin River inflow to the Delta. CCWD requests that the SFPUC review the DPEIR analysis of impacts to in-Delta water users with this in mind, and augment or revise them as appropriate.

In particular, CCWD has the following concerns:

- **Delta water quality.** The DPEIR provides information on potential changes to Tuolumne and San Joaquin River flows, but the analysis does not include the resultant changes to Delta water quality. These changes could be determined by, for example, running the Delta Simulation Model (DSM2). DSM2 modeling would also permit analysis of changes to Central Valley Project and State Water Project operations that would be required to meet Delta flow and salinity standards. Access to the DSM2 water quality results would allow CCWD to analyze our operations with and without the Project, and to evaluate the Project impacts. 01

L_CCWD

Mr. Paul Maltzer
San Francisco Planning Department
October 1, 2007
Page 2

- **Significance criteria for in-Delta water users**. Section 5.3.4.2 lists the following significance criteria for surface water supplies:

  > The proposed program would have a significant water supply impact if it were to:
  > - Result in substantial adverse changes in operations or substantial decreases in water deliveries for water users, as measured by significant changes in reservoir storage, timing or rate of river flows, or water quality
  > - Violate any water quality standards or otherwise substantially degrade water quality

  However, the PDEIR analysis of effects on Delta water users focuses only on the first part of the second bullet point, potential violations of Delta water quality standards, and does not include potential impacts to CCWD. CCWD operates to a delivered water quality goal set by our Board of Directors of no more than 65 milligrams per liter chloride concentration. This means that CCWD's operations are determined by source water quality, and that increases in Delta salinity caused by the Project could potentially affect CCWD's ability to meet the delivered water quality goal and could further affect CCWD's water supply reliability. Impacts could occur due to source water salinity increases, even if no standards are violated. The PDEIR should include analysis of potential impacts to CCWD and of the potential for significant impacts to occur in the absence of standards violations. 02

If you have any questions regarding CCWD's comments or would like additional information to supplement your analyses, please call me at (925) 688-8083, or call Marianne Guerin at (925) 688-8344.

Sincerely,

Leah Orloff
Senior Water Resources Specialist

cbrennan@coastsidewater.org

Paul Maltzer
Environmental Review Officer, WSIP, PEIR
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103
wsip.peir.comments@gmail.com

Dear Mr. Paul Maltzer:

Coastside County Water District appreciates the opportunity to comment on the San Francisco Public Utilities Commission's (SFPUC) Water System Improvement Program (WSIP) PEIR-Draft. Coastside County Water District supports the overall goals of the WSIP:

- Maintain high quality water 01
- Reduce vulnerability to earthquakes
- Increase delivery reliability and improve the ability to maintain the system
- Meet customer water supply purchase requests in non-drought and drought periods
- Enhance sustainability in all system activities
- Achieve a cost effective, fully operational system

Because these goals are important to Coastside County Water District, the District found it necessary to clarify certain information and descriptions pertaining to our service area and operations. Our primary concerns are in regards to the discussions on the Pilarcitos facilities and Upper Crystal Springs Reservoir facilities. Coastside County Water District is the only wholesale customer that has intake facilities in Upper Crystal Springs Reservoir and in the Pilarcitos Watershed, so any physical or operational modifications would directly impact our operations.

766 MAIN STREET, HALF MOON BAY, CALIFORNIA 94019 650-726-4405

The Bay Area Water Supply and Conservation Agency (BAWSCA) is submitting separate comments on the SFPUC's WSIP PEIR-Draft. Coastside County Water District is a member of BAWSCA and supports BAWSCA's efforts to represent the wholesale customers through its comments on the WSIP PEIR-Draft.

Attached are Coastside County Water District's comments on the WSIP PEIR-Draft. Please feel free to contact me at 650-726-4405 x11 to inquire about any of the comments.

Sincerely,

Joe Guistino
Interim General Manager

San Mateo, CA 94402

Chapter	Section	Page(s)	Comments	
			Summary	
Summary	S.2	S-4	The service area for Coastside County Water District (Coastside CWD) shows two non-contiguous areas. The southern non-contiguous area will not be developed, according to the County of San Mateo and the eastern non-contiguous area is property used for Coastside CWD's facilities only.	02
Summary	S.2	S-7	WSIP Goals and Objectives: Coastside CWD supports the system performance objectives listed in on Table S.1.	03
Summary	S.3	S-56	The summary of water supply impacts and mitigation measures mentions that a revised operations plan for Pilarcitos Watershed facilities will be developed and implemented. Since Coastside CWD is a wholesale customer of the Pilarcitos Watershed facilities, Coastside CWD should be included in the development and implementation of an operations plan for these facilities.	04
Summary	S.3	S-57	The summary of water supply impacts and mitigation measures mentions that there will be impacts on Upper Crystal Springs Reservoir. Since Coastside CWD is a wholesale customer and has intake facilities in Upper Crystal Springs Reservoir, Coastside CWD should be included in the development of an adaptive management plan to minimize adverse effects. The periodic drawdown of reservoir water levels for maintenance may affect the intake facilities owned and operated by Coastside CWD.	05
Summary	S.3	S-62	Although the PEIR Draft concluded that the WSIP could support more growth in Half Moon Bay than is forecasted in the adopted general plan, growth is strictly controlled by the City of Half Moon Bay and the County of San Mateo (San Mateo County Local Coastal Program (LCP).	06

L_CoastsideCWD

Chapter	Section	Page(s)	Comments	
			Existing Regional Water System	
2	2.3.4	2-24	The following sentence does not correctly characterize how Coastside CWD uses Pilarcitos Reservoir/Stone Dam facilities – "*In the Summer months, when Coastside CWD's water demand is at its seasonal maximum, its water supply from Pilarcitos Creek is supplemented by water pumped from Crystal Springs Reservoir.* ". Coastside CWD's does not supplement Pilarcitos Creek water supply with Crystal Springs Reservoir supply. Due to limitations of the infrastructure and system design, Coastside CWD can use Pilarcitos Creek or Crystal Springs Reservoir – Coastside CWD can't use both sources simultaneously. When demand is more than Pilarcitos Creek can meet, Coastside CWD switches to Crystal Springs to meet the demand.	07
			Program Description	
3	3.7.1	3-43	This section acknowledges that there are concerns regarding stream flows in Pilarcitos Creek below Stone Dam and acknowledges that there are experimental releases and studies to address these concerns. As the only wholesale customer that uses Pilarcitos Creek facilities as a water supply, Coastside CWD has a vested interest in any operational and physical changes made to the Pilarcitos Creek Reservoir, Pilarcitos Creek, and Stone Dam. Coastside CWD should be included in any process that SFPUC initiates to accommodate changes in the Pilarcitos Creek watershed.	08
3	3.7.3	3-46	Coastside CWD supports the fact that the proposed system upgrades would optimize water storage in the Peninsula watersheds, so that they can continue to be replenished during periods of maintenance and ensure that water would be available for use during emergencies or droughts.	09

L_CoastsideCWD

Chapter	Section	Page(s)	Comments	
			WSIP Water Supply and System Operations – Setting and Impacts	
5	5.2.3	5.2-21	Coastside CWD is a participant in the workgroup for the Pilarcitos Creek Integrated Watershed Management Plan. This process has identified issues that may have a bearing on the operation and management of Pilarcitos Reservoir and Stone Dam.	10
5	5.5.1	5.5.1-9	As mentioned earlier Chapter 3, The National Marine Fisheries Service (NMFS) has raised concerns regarding flows in Pilarcitos Creek. The statement describing that the only water releases from Pilarcitos Reservoir, after it has filled, is the amount requested from Coastside CWD - may not be accurate. There are also releases to Lower Crystal Springs Dam that occur with the releases for Coastside CWD. The SFPUC is releasing water on an experimental basis currently and the Pilarcitos Creek Integrated Watershed Management Plan process may identify the need to continue releases or to manage releases differently.	11
5	5.5.1	5.5.1-11	Coastside County Water District tries to maximize the Pilarcitos Creek (reservoir) source because it is gravity fed compared to Crystal Springs, which needs to be pumped. Due to infrastructure constraints, once the demand is higher than what Pilarcitos can supply, Coastside CWD must switch to Crystal Springs to meet demand. As mentioned before, Coastside CWD can't operate Pilarcitos Creek and Crystal Springs simultaneously.	12
5	5.5.1	5.5.1-13	To meet Coastside CWD's future demand, the PEIR suggests that future demand will be met from the increased use of both Crystal Springs and Pilarcitos Creek. The PEIR also mentions that this might require the construction of new facilities. In order for Coastside CWD to increase its use of Pilarcitos Creek, new facilities would be required. At a minimum, a larger pipe would be required to convey the water from Pilarcitos Creek. Currently, Coastside CWD maximizes the use of Pilarcitos Creek to the greatest extent possible. Any new facilities would be scrutinized for potential impacts and would need to comply with the coastal	13

Chapter	Section	Page(s)	Comments	
			development permit and local coastal plans and the environmental review process. Based on past experience on the Coastside, the process to upgrade or install new facilities will be time intensive and costly. If the water supply improvement process results in operational changes that result in more reliance on Pilarcitos, the new facilities required should be characterized and identified as soon as possible.	13 cont.
5	5.5.1	5.5.1-20	As mentioned before, Coastside CWD already maximizes use of Pilarcitos Creek, so descriptions of taking additional water from Pilarcitos facilities would not be possible without new facilities and/or upgraded facilities. In addition, there is the Pilarcitos Integrated Watershed Management Plan process taking place and findings from this process may also influence the management of Pilarcitos Reservoir and Stone Dam.	14
5	5.5.3	5.5.3-5	Since Coastside CWD takes raw water from Crystal Springs, any increases in nitrogen and phosphorous and any increased potential for algae growth would have a direct effect on the water treatment processes. Coastside CWD would like to be informed of any changes in raw water quality in a timely manner, so that the proper adjustments to treatment can be taken to ensure high quality drinking water is delivered to Coastside CWD customers.	15
5	5.5.3	5.5.3-6	The report concludes that the adverse impacts of the WSIP on water quality in Crystal Springs Reservoir would be less than significant (LS) and no mitigation is required. An increase in algae would impact Coastside CWD's water treatment. Is there any more data or information regarding the possible increase in algae growth in Upper Crystal Springs? Can you please provide more details as to why the minor water quality changes are classified as LS in Upper Crystal Springs Reservoir?	
5	5.5.5	5.5.5-3	It is mentioned that the National Marine Fisheries Service (NMFS) is interested in developing fish passages on Pilarcitos Creek. The alternatives mentioned are	16

Chapter	Section	Page(s)	Comments	
			complete or partial removal of Stone Dam and construction of a fish ladder at Stone Dam. The partial and complete removal of Stone Dam could impact Coastside CWD's diversion at Stone Dam unless new facilities are provided for the diversion. Coastside CWD would like to be included in the process for any modification of Stone Dam.	16 cont.
5	5.5.7	5.5.7-3	Pilarcitos Creek is described in the WSIP PEIR Draft as running through Golden Gate National Recreation Area. A map of the Golden Gate Biosphere Reserve shows that Pilarcitos Reservoir and upper Pilarcitos Creek are in the San Francisco Peninsula Watershed and is designated as "other public lands". We could find no reference of the Pilarcitos Watershed as being part of the Golden Gate National Recreation Area. There is no recreation activity in the Pilarcitos watershed that is known to Coastside CWD.	17
			Mitigation for Chapter 5 Impacts	
5	5-A	5-A-10	Coastside CWD has a vested interest in the proposed "*Revised Operations Plan for Pilarcitos Watershed Facilities*" and requests that we be involved directly with developing this proposed operations plan.	18
			Mitigation Measures	
6	6.4.4	6-56	Coastside CWD has a vested interest in the proposed "*Revised Operations Plan for Pilarcitos Watershed Facilities*" and requests that we be involved directly with developing this proposed operations plan.	
			Growth Inducement Potential and Indirect Effects of Growth	
7	7.3.5	7-40 7-41	Growth is managed by multiple agencies and plans in the Coastside CWD service area. There are growth management provisions in the San Mateo County Local Coastal Program (LCP) and the City of Half Moon Bay has land use provisions in	19

L_CoastsideCWD

Chapter	Section	Page(s)	Comments	
			the Half Moon Bay Local Coastal Program (LCP) and Land Use Plan. The coastal development permit for the crystal springs project limits the number of connections in the Coastside CWD service area. Connections are categorized as priority and non-priority, so Coastside CWD is restricted not only in number of connections but type of connection. In addition to the limitation on connections, the coastal development permit limits the amount of water that Coastside CWD can take from Crystal Springs Reservoir. The PEIR Draft discusses the differing population projections for the Coastside CWD service area. There are difficulties in projecting population growth in a service area, especially when the service area includes only partial areas of city and county jurisdictions. It also requires assumptions about occupancy of the new and existing residential dwellings in the service area. Since different organizations may have different assumptions, it is likely that the projections will differ from organization to organization. Coastside CWD makes every attempt to maximize the use of local sources, but there are institutional, environmental and political barriers to maintaining and developing these water supply sources. Planning for future water demand requires Coastside CWD to plan for increased reliance on the SFPUC.	19 cont.
7	7.4.1	7-60	Although the PEIR Draft concluded that the WSIP could support more growth in Half Moon Bay than is forecasted in the adopted general plan, growth is strictly controlled by the City of Half Moon Bay and the County of San Mateo (San Mateo County Local Coastal Program (LCP)). There are a limited number of connections that are allowed in the service area.	20

Chapter	Section	Page(s)	Comments	
			WSIP Variants and Impact Analysis	
8	8.5	8-60	The PEIR Draft - Table 8.7 – explains that the increased demand for Coastside CWD will be met by Coastside CWD taking more water from the Pilarcitos Creek (Stone Dam) under all the variants, resulting in less flow down stream of Stone Dam on Pilarcitos Creek. As mentioned in other comments, Coastside CWD currently maximizes it use of Pilarcitos Creek at Stone Dam. Unless the conveyance pipe and other facilities are improved, Coastside CWD will not be able to significantly increase use of Pilarcitos Creek (Stone Dam and Pilarcitos Reservoir).	21
8	8.5.1	8-71 8-72	Since Coastside CWD has intake facilities located in Upper Crystal Springs Reservoir, Coastside CWD is sensitive to the potential for lower reservoir operating levels mentioned as an impact for variant 1. Due to current operational and infrastructure limitations, the assumption that Coastside CWD would be able to increase its diversions from Pilarcitos Creek may not be possible.	22
			CEQA Alternatives	
9	9.2.1	9-13	Table 9-5 describes the estimated drought year shortages expected under each alternative. Coastside CWD has serious concerns about the alternatives that show there will be shortages of over 20%. Shortages requiring reductions of over 20% would impact health and safety in our service area. The regulatory and voluntary efforts to reduce overall water demand and promote the most water efficient technologies and behaviors results in a lower water demand under normal conditions. This "demand hardening" will affect the ability of most residential, institutional, and commercial consumers to meet mandatory curtailment requirements over 20%.	23

L_CoastsideCWD

Chapter	Section	Page(s)	Comments	
9	9.2.1	9-14	Table 9-6 is summary of alternatives and their ability to meet the program objectives. Coastside CWD has concerns about the alternatives that fail, partially fail or there is uncertainty in meeting the seismic reliability objectives.	24
9	9.2.2	9-39	The description of Coastside CWD meeting its increased demand with Pilarcitos Creek and the potential adverse effects on Pilarcitos Reservoir needs clarification. As a supply source, Coastside CWD has maximized its use of Pilarcitos with the current infrastructure. Assuming that the infrastructure is not improved and demand increased in the service area, Coastside CWD would switch over to Crystal Springs Reservoir earlier. The result being that there might be more water in Pilarcitos Reservoir because Coastside CWD would not be able to use it as a source due to the limited gallons per minute available through the current infrastructure.	25
9	9.2.3	9-46	The description of Coastside CWD meeting its increased demand with Pilarcitos Creek and the potential adverse effects on Pilarcitos Reservoir needs clarification. As a supply source, Coastside CWD has maximized its use of Pilarcitos with the current infrastructure. Assuming that the infrastructure is not improved and demand increased in the service area, Coastside CWD would switch over to Crystal Springs Reservoir earlier. The result being that there might be more water in Pilarcitos Reservoir because Coastside CWD would not be able to use it as a source due to the limited gallons per minute available through the current infrastructure.	
9	9.2.4	9-57 9-58	The description of Coastside CWD meeting its increased demand with Pilarcitos Creek and the potential adverse effects on Pilarcitos Reservoir needs clarification. As a supply source, Coastside CWD has maximized its use of Pilarcitos with the current infrastructure. Assuming that the infrastructure is not improved and demand increased in the service area, Coastside CWD would switch over to Crystal Springs Reservoir earlier. The result being that there might be more water

Chapter	Section	Page(s)	Comments	
			in Pilarcitos Reservoir because Coastside CWD would not be able to use it as a source due to the limited gallons per minute available through the current infrastructure.	
9	9.2.5	9-66	The description of Coastside CWD meeting its increased demand with Pilarcitos Creek and the potential adverse effects on Pilarcitos Reservoir needs clarification. As a supply source, Coastside CWD has maximized its use of Pilarcitos with the current infrastructure. Assuming that the infrastructure is not improved and demand increased in the service area, Coastside CWD would switch over to Crystal Springs Reservoir earlier. The result being that there might be more water in Pilarcitos Reservoir because Coastside CWD would not be able to use it as a source due to the limited gallons per minute available through the current infrastructure.	25 cont.
9	9.2.6	9-73	The description of Coastside CWD meeting its increased demand with Pilarcitos Creek and the potential adverse effects on Pilarcitos Reservoir needs clarification. As a supply source, Coastside CWD has maximized its use of Pilarcitos with the current infrastructure. Assuming that the infrastructure is not improved and demand increased in the service area, Coastside CWD would switch over to Crystal Springs Reservoir earlier. The result being that there might be more water in Pilarcitos Reservoir because Coastside CWD would not be able to use it as a source due to the limited gallons per minute available through the current infrastructure.	
9	9.2.8	9-79	The modified WSIP alternative, which is the environmentally preferred alternative, would meet Coastside CWD's increased demand from Crystal Springs Reservoir as opposed to meeting the increased demand with Pilarcitos Creek, as described in the program alternative. The increased pumping costs would have an impact on Coastside CWD. Coastside CWD encourages the SFPUC to consider making improvements to both the Pilarcitos facilities and Coastside CWD's Crystal Springs	26

Chapter	Section	Page(s)	Comments	
			facilities, so that there is more flexibility and reliability. Improvements to both the Pilarcitos facilities and the Crystal Spring facilities are consistent with the goals and objectives of the WSIP. Improvements on the Pilarcitos facilities could offer more flexibility in the operation of Pilarcitos Reservoir and Stone Dam. This flexibility could benefit the aquatic habitat and meet the increasing demand for Coastside CWD in a cost effective manner.	26 cont.
9	9.3.1	9-90	The statement that "*The SFPUC currently services Coastside CWD primarily from the Pilarcitos Reservoir*" may not be accurate. Pilarcitos is Coastside CWD's preferred choice over Crystal Springs, but on average we meet approximately 25% of our demand from Pilarcitos and approximately 50% of our demand from Crystal Springs. And since Coastside CWD already maximizes the use of Pilarcitos the "*No Purchase Request Increase Alternative*" would not lessen the impacts on Pilarcitos Reservoir and Creek.	27

Subject: Water System Improvement Program – PEIR

Dear Mr. Maltzer:

The City of Daly City appreciates the opportunity to provide comments on the draft Program Environmental Impact Report (PEIR) prepared for the Water System Improvement Program (WSIP) being developed by the San Francisco Public Utilities Commission (SFPUC). Our correspondence intends to provide a summary background of Daly City, concerns on some of the major themes within the WSIP PEIR draft, and focused comments on proposals pertinent to our community. Daly City's intent in providing these comments is to help correct any errors or omissions, provide clarifications, and expand upon existing descriptions aimed at strengthening the document itself. It should be stated upfront that Daly City believes the PEIR represents a thorough and comprehensive effort that satisfies the requirements of the California Environmental Quality Act, and our agency's commentary is aimed at constructively moving the document toward certification and ultimate approval in order to advance the necessary work scope set forth under the WSIP. 01

A summary background of Daly City helps identify its interest in moving the WSIP forward. Daly City, incorporated in 1911, is located in the northern part of San Mateo County, adjacent to the southern boundary of the City and County of San Francisco. Daly City is one of twenty-seven agencies of the Bay Area Water Supply and Conservation Agency (BAWSCA) and is the last wholesale agency on the line served by the Hetch Hetchy and local reservoir system. Interstate Highway 280 (I-280), running north and south, divides Daly City into two geographically distinct areas with different development characteristics. Older neighborhoods, comprised of medium-density, single-family housing, are located on the eastern side of I-280. West of I-280, development is newer, primarily built after 1949, and shares a number of similarities with homes on the westside of San Francisco as pertains to lot size and climate. In this area, lower-density, single-family houses are concentrated around shopping centers often dedicated to serving regional rather than local population. Limited manufacturing enterprises in the City are located near the Cow Palace in the Bayshore neighborhood located on the eastside of I-280. 02

Daly City is a center for retail trades, primarily home furnishings and appliances, apparel, general merchandise and restaurants. Major shopping centers include Serramonte Shopping Center, Westlake Shopping Center, Pacific Plaza and the Mission Street (El Camino Real) retail corridors. Daly City is the most populous city in San Mateo County, exceeding 100,000 residents in 1997. Its current 2007 population is 106,160. Between 2005-2030, Daly City's population is estimated to increase to 115,651 persons, while the number of households is expected to increase by a modest 4 to 5 percent to 38,100. According to Daly City's General Plan, 53 percent of the community is currently residential, 16 percent open space, 12.5 percent is public facilities, 10.3 percent commercial, 7 percent vacant, and 1.2 percent other uses. Office and retail sites are located in the Sullivan Avenue/Civic Center, Junipero Serra Boulevard, Serramonte Plaza, Bayshore and Gateway Plaza areas and total approximately 120 acres. An example of recent development activity that follows the basic principles of Smart Growth is the Pacific Plaza Development with its anchor tenants Autodesk and Genysis, along with accompanying retail establishments adjacent to the Daly City BART Station, a major transit hub. Daly City is nationally recognized for promoting the safety of its existing housing supply through its award-winning Project Homesafe and progressive second-unit housing ordinance. This ordinance provides for the legalization of new and existing owner-occupied houses with in-law secondary units. Over 1,800 Project Homesafe permits have been issued. Daly City is also actively engaged with the Peninsula Habitat for Humanity to secure additional housing within in-fill lots.

02 cont.

Daly City has eleven metered pipeline connections to the SFPUC regional system that normally contribute 55 to 57 percent of the City's supply. The remaining 43 to 45 percent is derived from six municipal production wells within the Westside Basin that can produce upwards of 4.25 mgd with an historic pumping average of 3.75 mgd. Five of Daly City's municipal wells were noted as being highly protected from potential pathways of contamination and a sixth well as being moderately protected as part of its Drinking Water Source Assessment. Results from the triennial Lead and Copper Testing, completed in August 2007, were again under notification levels. Daly City's 90th percentile results for lead were <0.005 mg/l (0.015 mg/l notification level), and for copper were 0.0049 mg/l (1.5 mg/l notification level).

03

Daly City's water rates, effective July 1, 2007, continue to incorporate a basic bimonthly charge based on meter size coupled with an inclining block rate structure for usage over six units of water as a means to encourage continued conservation. Daly City residents have responded to drought conditions and have demonstrated continued conservation as evidenced by having among the lowest residential per capita usage (53.7 gpcpd) and lowest gross per capita consumption (65.2 gpcpd) among other BAWSCA agencies and is consistent with the lower regional Bay Area overall water usage when compared against other statewide regions throughout California. Daly City continues to actively participate in regional, cost-effective water conservation programs. An example is its residential washing machine rebate program in which 1,634 rebates have been processed since 2004 with an average bimonthly savings of two

04

L_DalyCty

units (1,496 gallons) among rebate participants. This program alone has saved 14,666,784 gallons.

04 cont.

The City Council of Daly City has directed staff to preserve the groundwater aquifer for municipal purposes and has embarked on two important water supply programs with the SFPUC: conjunctive use and recycled water. Daly City entered into an in-lieu pilot conjunctive use program with the SFPUC with the goal of enhancing regional water resource management. In October 2002, as a result of available surplus SFPUC system water, Daly City agreed to utilize more surface water with a corresponding decrease in its groundwater pumpage. This action provided the opportunity to observe the response of the Basin from in-lieu recharge that took place as a result of the reduction in pumping. The in-lieu pilot conjunctive use program terminated in early-May 2007, and initial results show that approximately 12,000 acre-feet of additional water has been stored locally in the aquifer.

05

In August 2004, Daly City's Tertiary Recycled Water Facility (through its subsidiary, the North San Mateo County Sanitation District) began delivering full Title 22 compliant public contact irrigation water to the Olympic Club. Soon after, water deliveries included the Lake Merced Golf Club and Daly City's Westlake Park. During the 2005 irrigation season, deliveries included the San Francisco Golf Club. The SFPUC contributed $1 million toward the $7.34 million project, and discussions are underway to examine the feasibility of service to San Francisco's Harding Park Golf Course. Since its initiation, some 537 million gallons have been delivered, lessening the demand on local groundwater for irrigation use.

06

Daly City's review notes three major themes in which general comments are provided. These include a request for a more robust discussion of seismic risk, analysis of water conservation, and advocacy in support of a 10% rationing as a program level of service.

07

Daly City's review of the PEIR indicates that the urgent purpose of the WSIP can be strengthened by a more robust description of the very real seismic safety risks to Bay Area residents and the resulting extensive economic consequence to the local economy. While the SFPUC's specific level of service goal of delivering a basic level of service within 24 hours after a major earthquake is laudable, existing water system outage estimates, which range from twenty to sixty days following a catastrophic earthquake, are frightening beyond comprehension. The devastation of the Gulf Coast from Hurricane Katrina gave ample warning of the potential impact to a community. But unlike a hurricane that can be seen and forecast in advance, no such advance warning comes from an earthquake. There is ample evidence from the United States Geological Survey regarding the 60% probability of a significant, magnitude 6.7 or greater, seismic event on the San Andreas, Hayward and Calaveras Faults in the very near future – from 2003 to 2032 – that gives one pause. It does not appear that the draft PEIR prominently describes the very real risk facing users of the SFPUC regional and local water system. An expanded discussion should be provided in the final PEIR to give needed urgency to the purpose in which the WSIP is intending to address and protect the 2.4 million residents dependent upon the regional water system.

08

Water conservation is recognized as a major component associated with the WSIP. Daly City and its residents recognize the importance of locally efficient and effective water conservation measures. However, a cornerstone proviso in any conservation measure must include cost effectiveness. Daly City has participated in the modeling and economic analysis of 32 conservation measures using the Demand Management Least-Cost Planning Decision Support (DSS) model. The results for Daly City showed savings of 0.44 million gallons per day (mgd) under Program B by the year 2030. Based on the conclusions from the DSS modeling, Daly City made a determination that the water savings associated with Program B made the most sense in regard to what could be realistically achieved given the baseline consumption characteristics of the Daly City service area and planned development. Any minor incremental water savings associated with Program C was considered not feasible in large part due to diminishing returns that the model demonstrated. Daly City's local Program B results are by no means insignificant insofar as they demonstrate continued benefits and water savings accounting for a zero net gain over time by the year 2030 despite increases in local population and continued economic development. Water conservation efforts throughout Daly City are included in this review as Exhibit #1.

However, it must also be noted that program savings as currently set forth under Program B are not intended to be rigid in application but rather a tool to demonstrate range of savings of selected measures implemented together. Daly City's goal is 0.44 mgd and how the community reaches that goal must be quantified as being the most cost-effective and implementable in order to achieve sustainable success. Furthermore, while it would be speculative at best to exceed the 0.44 mgd goal, that does not suggest in any way that Daly City would not take into account future cost-effective measures that would improve upon its targeted Program B commitment. 09

The existing program level of service providing for a maximum 20% system wide reduction in water service during extended droughts ought to be re-examined as the WSIP moves forward. During its public scoping meetings, SFPUC staff submitted its evaluation that a maximum 10% systemwide rationing in water service could be achieved through additional investment of $181 million into the WSIP. Daly City contends such an increased investment is not only cost-effective, but prudent policy development in light of the existing $4.3 billion WSIP program scope. At issue for Daly City is the reasonableness of achieving an additional 20% drought cutback in light of its current usage profile demonstrating local residents are practicing water conservation behaviors. Of the approximate 22,576 active water accounts, 82% are single-family dwellings, 12% multi-family units, 3% commercial/industrial and 3% landscape and other. The average residential per capita consumption, accounting for 94% of Daly City's accounts, is 53.7 gpcpd; and Daly City's gross per capita consumption of 65.2 gpcpd. Moreover, 12% of Daly City water users consume 6 ccf or less during a bimonthly billing cycle, 54% consume between 7 to 18 ccf bimonthly, and another 24% consume between 19 to 30 units bimonthly. While increased conservation during a drought is reasonably expected, especially among higher users, almost two-thirds of Daly City residential household customers use 18 ccf or less during a 60-day billing cycle. Daly City's question is to what extent did demand hardening play in originally 10

determining the 20% maximum? As the PEIR correctly notes, demand hardening from permanent water use reductions will make it more difficult for an agency to duplicate previous water use reduction goals during a future drought. From the existing local usage noted, Daly City believes WSIP Variant 3-10% Rationing is a more realistic and prudent policy to follow. 10 cont.

The following section notes specific and focused comments associated with the draft WSIP PEIR. Its intent is to expand, clarify or correct information as needed, but in no way should be construed as indicating anything but Daly City's contention that the PEIR should move expeditiously toward certification. For ease in review, page number and section, and/or footnote reference will be used.

<u>*Page S-5, Figure S.3*</u>
It is noted Annual Average Forecasted Demands cross into the 300 mgd range around 2025, demonstrating such demand is not instantaneous but occurs incrementally eighteen years from now. 11

<u>*Page S-6*</u>
Daly City concurs with proposed water supply approach to meet increased 35 mgd purchase requests. 12

<u>*Page S-8*</u>
WSIP level of service goal maximizing 20% systemwide rationing in any one year of drought needs to be re-reviewed in favor of Water Supply Variant 3-10% Rationing as noted by Daly City's earlier comments. 13

<u>*Page S-8*</u>
Daly City expects to continue working with SFPUC toward implementing a groundwater conjunctive use project. 14

<u>*Page S-18, Table S.2*</u>
Project Description for SF-3, Recycled Water Projects, may want to include potential to develop local recycled projects with other outside agencies to avoid potential scoping conflicts in the future. 15

<u>*Page S-34, Table S.4, Mitigation Measure 4.5-5*</u>
Stormwater Treatment data developed under joint Daly City/SFPUC Lake Merced Pilot Stormwater Enhancement Project might help serve as a baseline. Also, groundwater sampling around Lake Merced and Daly City as part of conjunctive use analysis might also be of assistance. 16

<u>Page S-59, Table S.8, Mitigation Measures Westside Groundwater Basin</u>

<u>Impact 5.6-1</u> Daly City concurs with the Less Than Significant Determination on the South Westside Groundwater Basin.

<u>Impact 5.6-2</u> Daly City concurs with N/A Determination for South Westside Groundwater 17
Basin.

<u>Impact 5.6-3</u> Daly City concurs with Less Than Significant Determination on the South Westside Basin, but must caution that existing understanding of a pathway for potential seawater impact that may affect the Basin is north of Lake Merced through the Sunset District of San Francisco.

<u>Page S-62</u>
The modest "growth" within Daly City will primarily be in-fill lots aimed at mixed-use
developments to diversify current mix of residential with commercial. Smart Growth project 18
examples in Daly City are included in this review as an Exhibit #2.

<u>Page S-64, Areas of Controversy, Demand Estimates/Customer Purchase Requests</u>
Noting issues brought up during PEIR scoping process is very helpful. The demand purchase
request methods being criticized fail to note the projections were uniformly applied using the
best available information when determining Daly City's demand numbers. This examination
occurred from March 2003 to February 2005. The real issue, if any, should not focus on newer 19
available information but whether the methodology used was conducted in a consistent manner.

The numbers provided during this examination used ABAG Projections 2002 figures in an endeavor to provide legally-required rigor and consistency.

<u>Page S-72</u>
Daly City concurs with Variant 3-10% Rationing as a preferred alternative as noted in its previous comments.

<u>Page S-73</u>
Daly City understands a No Program Alternative is required under the law but does not consider 20
it a viable option in light of seismic risk now facing the system. Daly City also rejects the No
Purchase Request Increase Alternative as a viable program consideration because of its narrow
focus and questionable, at best, environmental benefit. Daly City, as well as other urbanized Bay
Area jurisdictions, is incorporating Smart Growth concepts into its land use decisions aimed, in
part, at improved water use efficiency.

<u>Page S-74</u>
With respect to the Aggressive Conservation/Water Recycling and Local Groundwater
Alternative, Daly City is troubled by the notion that any future system demands would only be
met through additional conservation efforts, recycling or groundwater projects. The PEIR
correctly notes the unfeasibility of such an approach and the environmental impacts of such a 21
strategy, including an increase in drought rationing to 25%. Daly City is committed to cost-
effective and sustainable water conservation as previously noted under its Program B
commitment, is actively engaged in expanding its recycled water deliveries to new customers to
maximize its 2.77 mgd rated capacity, and is reviewing operational and contractual approaches to
formalize a permanent conjunctive use program within the Westside Basin.

<u>Page S-78, 2nd full paragraph</u>
Daly City supports the Bay Area Water Supply and Conservation Agency's (BAWSCA's)
proposal that the final PEIR further describe and analyze the draft PEIR's Modified WSIP
Alternative (the environmentally superior alternative) and that the final PEIR explore the
feasibility of the Bay Area water customers financially supporting water conservation with
agricultural interests on the lower Tuolumne River that will result in no net decrease in flows on 22
the lower Tuolumne. BAWSCA's proposal is to conserve even more agricultural water resulting
in a net increase in lower Tuolumne River flows. This additional water could then be available
to support greater flows in the lower Tuolumne River, deployed at times and in volumes most
beneficial for salmon and other important species in the lower Tuolumne River. Under
BAWSCA's proposal, the implementation of the WSIP can improve, rather than degrade, flow
conditions in the lower Tuolumne River.

<u>Page 3-17, Demand Projection Methodology</u>
The real issue to be examined is the application of methodology used at the time when forecast of
future demand numbers was requested and put together in answer to the question posed. The 23
existence of new information or application of other criteria must be weighed against consistency
in how the numbers were developed.

<u>Page 3-18, Table 3.3, Summary of Water Supply Assumptions and 2030 Demand Projections</u>
Daly City appreciates the correct notation contained under Footnote (f) of summarizing the
manner how Daly City staff used a range of potential groundwater use to calculate its future
demand. In doing so, it was determined it would be prudent to provide both an anticipated high
range of future demand purchases and not simply rely upon "status quo" operation. Daly City's 24
point was to provide a future demand calculation that included at least two wells remaining in
operation constituting lowest production yield, as well as historic pumpage constituting
sustainable production yield as a means to more properly address the significant policy question
that it was being asked to answer. This internal decision to provide a range of purchase demands
was not taken lightly.

However, Daly City is concerned with the column "2030 Projected Demand (with Plumbing Code Savings)" of 9.1 mgd. While the number is correct, it could be misleading. Daly City has committed to Program B savings of 0.44 mgd by 2030 for a Projected Demand of 8.67 mgd. From Daly City's perspective, this notes an anticipated no net increase of water demand in Daly City by the year 2030. 24 cont.

Page 3-19, Table 3-4
For the City of Daly City, the change in Water Purchases from SFPUC is consistent with the range of projected purchases showing an anticipated high and low amount as explained previously. The higher amount shown is consistent with a scenario of at least two wells remaining in operation affecting the mix of water supply. This mix must also be balanced with conservation goals under Program B measures. 25

Page 3-22, Purchase Estimates, second sentence
Daly City believes the sentence can be improved by acknowledging an estimated range of purchases "took into account local scenarios as a means to better provide demand estimates". As noted earlier, in calculating its future demand out to the year 2030, Daly City felt it prudent to include a scenario of two production wells remaining in operation constituting lowest production yield pumpage, along with historical pumpage constituting sustainable yield. 26

Page 3-25, Paragraph E
The paragraph should be expanded to include ability for SFPUC to also work with other local agencies to provide recycled water to San Francisco so the reader is more fully aware of efforts to include recycled water into the mix of supply options. 27

Page 3-34, Section 3.6.1, Proposed Non-drought Water Supply – Footnote 20
The footnote's second to last paragraph states, "Program C represents an upper bound of conservation that is considered achievable and fundable." Daly City considers this statement problematic as it infers any and all conservation measures are implementable. Such an overarching statement neglects the fact that under the DSS Model used to calculate and forecast future demands to 2030, some Program C measures were not deemed cost-effective and/or achievable by some agencies because of unique local characteristics that include demographics, climate and land use and, therefore, run counter to the implication of the footnote. 28

Page 3-39, top of page, first sentence
It should be clarified that under the proposed groundwater conjunctive use program that "an additional" 8,100 acre-feet of water per year is anticipated. The use of the term "additional" is an important consideration that distinguishes conjunctive use from normal historical groundwater pumping. 29

Page 3-39, Footnote 23
The description should be clarified to note the conjunctive use program has been designed to provide an additional extraction capacity of approximately 8,100 acre-feet in a dry year. 30

Page 3-42, first full paragraph, last sentence
This should be clarified so it's understood that conjunctive use participants increasing groundwater pumping and thereby reducing the amount of purchase requests does not create a temporary reduction in system demand but instead provides that available capacity for other users who do not possess alternate supplies. 31

Page 3-55, Table 3.10
Within the description of Project SF-2, Groundwater Projects, Daly City expects that any use of groundwater within San Francisco would remain consistent with Daly City's efforts to preserve the groundwater basin for municipal purposes – in other words, the highest and best use. 32

Page 3-60, Table 3.11
As it pertains to affected jurisdictions, Daly City should be marked off on Project SF-3 as an "X" or, at the very least, an "A", as it is involved with the SFPUC in its examination of providing recycled tertiary water to Harding Park Golf Course. 33

Page 5.6-1, Section 5.6.1.1, Westside Groundwater Basin
It is Daly City's understanding that of the 45 square mile area of the Westside Ground Basin, 14 square miles are in San Francisco and the remaining 31 are in San Mateo County. 34

Page 5.6-5, Section 5.6.1.2, Monitoring Network and Program
Reference is made to the In-Lieu Recharge Study, the actual language from the agreements initiated reads "Aquifer Recharge Study". 35

Page 5.6-8, Irrigation Pumping
The recycled water was made available from the North San Mateo County Sanitation District, a subsidiary of the City of Daly City. As a point of reference, total 2005 deliveries of recycled water to the golf clubs was 155.24 million gallons. 36

Page 5.6-8, Footnote 8
Daly City records show a range of 278-305 afy as opposed to the 120-150 afy quoted in the footnote. 37

Page 5.6-13, Section 5.6.1.5, Lake Merced
The last sentence of the first paragraph reads, "However, Lake Merced has not been used as a potable water supply since the 1930's." Since there are a number of misperceptions among the public regarding Lake Merced as a water supply, it might be helpful to include the actual Basin Plan beneficial uses for Lake Merced. Such information would to provide an enhanced understanding of efforts to better shepherd intent of WSIP projects. 38

Page 5.6-13, Section 5.6.1.5, Lake Merced
The third paragraph focuses on the decline of lake levels. The paragraph also provides an opportunity to provide a description associated with the rapid rise of the lake beginning in the early 1930's and quickly peaking in the 1940's, and how the lake was originally operated as a systemwide balancing reservoir as part of the regional distribution system. This description would go a long way in order to keep fluctuating lake levels in perspective. See also *Figure 5.6.7, Page 5.6-14.* 38 cont.

Page 5.6-15, First full paragraph
The paragraph describes that Lake Merced is connected to the shallow aquifer. However, for years a public perception was allowed to persist that Lake Merced was a surface expression of the groundwater basin that directly linked groundwater pumpage with decline in water levels. A more accurate description of this inter-relationship exists and should be incorporated within the PEIR in order to both bolster that lake levels are indirectly connected to the deep pumping aquifer, and that lake levels and groundwater pumpage can be separately and distinctly managed.

Page 5.6-16 to 17, Section 5.6.1.7, Seawater Intrusion
The description associated with Daly City's groundwater pumpage and lowering to over 120 feet below msl reads as though levels continue to be lowered instead of having reached a stabilized level. The misperception that may be created requires correction. Additionally, the description does not go far enough because LSCE's examination of the Basin indicated that because of the physical barrier west of the Daly City pumping area, seawater intrusion was more likely much farther to the north in San Francisco's Sunset District, where the physical barrier thinned out. 39

Page 5.6-17, Section 5.6.1.9, In-Lieu Recharge Study
From the executed agreement, the title was "Aquifer Recharge Study", a minor point. However, results from Daly City from October 2002 to May 2007, in which some 12,000 acre-feet of groundwater was stored within the basin, can be used to better describe the concept. Daly City's interest in participating in a conjunctive use program is consistent with the City Council's direction to preserve the groundwater aquifer for municipal purposes – deemed as the highest best use of the resource. 40

Page 5.6-21, Well Permitting Requirement
With respect to Daly City's Chapter 13.20 of the Municipal Code, while it is true existing provisions do not include overdraft conditions, Section 13.20.070 allows for denial of permit when judged not to be in the public interest. The definition should be included within the text description to better define Daly City's legal authority. 41

Page 5.6-25, South Westside Groundwater Basin, 2nd paragraph, last sentence
This should be amended to read, "During drought conditions, the SFPUC would be able to reduce the quantity of SFPUC system water delivered to participating pumpers and the stored 42

L_DalyCty

groundwater, or banked water, would be available for local use to supplement supplies from the regional water system." The amended sentence is intended to clarify anticipated operation.

Page 5.6-26, top of page
In describing withdrawals, it would be helpful to clarify conjunctive use groundwater pumping would be restricted to the amount of water banked. This clarification would help distinguish conjunctive use pumping from historical pumping within the Basin.

Page 5.6-26, Footnote 15, second sentence
Clarified to read, "The program is being designed to provide an extraction capacity of approximately 8,100 acre-feet of additional water during a drought year (an equivalent of about 7 mgd). The purpose of the clarification is to better describe intent of conjunctive use program. 42 cont.

Page 5.6-29, South Westside Groundwater Basin
First sentence clarified that participating pumpers would be able to extract conjunctive use groundwater up to the amount of water stored. Purpose is to provide better description of intended program.

Program 5.7-86, Irrigation Pumping
Recycled water was made available from the North San Mateo County Sanitation District, a subsidiary of the City of Daly City, as a substitute irrigation supply. 43

Page 5.7-87, Municipal Pumping
First bullet point needs correction to clarify summary. The 4,212 afy is equivalent to 3.76 mgd existing pumping as a baseline amount consistent with Daly City's historical 3.75 mgd pumping average established for the Aquifer Recharge Study conducted from October 2002 to May 2007. Reference also *Table 4.4, pages 4-5.* 44

Page 5.7-91, top of page, 2nd bullet point
Under the proposed conjunctive use program, the participating pumpers… Edit to clarify the description. 45

Page 7-15, Table 7.2
Daly City concurs with the numbers presented and the accompanying Footnote (e) describing range of purchases based on groundwater usage. Please see detailed discussion within text of this review. 46

Page 7-15, Table 7.2, footnote (e)
The footnote correctly notes manner in which a range of system demand was calculated linked to local groundwater production scenarios when estimating future purchases. See also earlier commentary on why range of purchase demands was selected.

Mr. Paul Maltzer
San Francisco Planning Department

October 1, 2007
Page 12

Page 7-18, Table 7.3
Daly City concurs with numbers presented but must caution against potential misconceptions
regarding the upwards of 44% change of purchase. Some may erroneously construe and
incorrectly misrepresent that number, which would be unfortunate. The number represents a
range consistent with local scenarios presented as it pertains to groundwater pumpage. The 47
number represents a potential change in the mix of local water supply that one should reasonably
expect as part of a detailed examination of local demands. The mix of supply must also take into
account anticipated conservation and balance that consideration as part of the public policy
debate.

Page 7-33, Table 7.10
Daly City concurs with numbers presented but notes the Water Demand percentage, which is 48
correct, does not include conservation of 0.44 mgd under Program B. This comment is provided
so the information presented is not misconstrued.

Page 7-41, City of Daly City Description
While the description itself is correct, the absence of a discussion regarding anticipated savings
associated with Program B water conservation may lead some to misconstrue the information.
The paragraph discusses mix of supply as a function of the historical balance within Daly City
between groundwater pumpage and surface water purchases. That mix of supply options must be
balanced against anticipated system demands from 2005 to 2030 in which conservation under 49
Program B by the year 2030 shows no net increase in overall demand but some peaking of
demand, as high as 9.27 mgd by 2020 before achieving an end result of 8.67 mgd by 2030 as
conservation measures kick in. As it pertains to a discussion of growth inducement, this kind of
recognition associated with water conservation needs to be further incorporated into this section
of the PEIR.

Page 8.33, Section 8.4.1, Description Variant 3-10% Rationing
As noted earlier in this review, Daly City believes 10% maximum systemwide rationing is
economically and environmentally preferable over the existing 20% maximum established as a 50
level of service goal. Daly City is concerned about demand hardening within its community
based on existing low residential per capita per day usage, constituting 94% of existing customer
base.

Page E.1-2, Table E.1.1
Daly City concurs with the data provided for our agency.

Page E.2-2, Table E2.1
Daly City concurs with the data provided for our agency as it is consistent with range of purchase 51
estimates provided. However, Daly City must note its concern over the mischaracterization of
the 44% change in purchases by 2030 as being tantamount to an overly inflated estimate in
support of continued wasteful suburban practices, as some would attest. The 44% change in
purchase estimate is the direct result of Daly City's scenario regarding groundwater pumping in

Mr. Paul Maltzer
San Francisco Planning Department

October 1, 2007
Page 13

which a sustainable yield amount and a lowest anticipated yield amount were provided. The 44%
value should be measured against the mix of supply, groundwater or surface water, and balanced 51
against local water conservation under Program B which demonstrates an anticipated no net cont.
increase in the total amount of water demand in Daly City.

Page E2-7, second to last paragraph
Attached, for the record as Exhibit #3, is Daly City's April 26, 2004 correspondence to
BAWSCA in support of the new/renovated commercial use created for Daly City. Daly City's
concern with an element of the DSS was its reliance on current General Plan and/or Housing
Element absent other locally prepared, publicly vetted, and adopted planning documents. The 52
inability to include these other local planning efforts was deemed as potentially penalizing Daly
City. Daly City's review of 51 projects associated with these locally-adopted specific plans
utilized standard calculations in gallons per day per capita, or in gallons per square foot, in
arriving at the 0.57 mgd increase through 2010. The point of this comment is to note local
efforts to comply with a defensible, consistent and transparent process in determining the
increased demand amount.

Page E2-14, Table E.2.4
Daly City concurs with the numbers shown for our agency on projected conservation savings.

Page E2-17, Table E.2.5, Recycled Water Potential

Daly City needs to clarify and correct some of the numbers shown.

Current (2004) recycled water projects should be corrected from 0.001 to 0.01, consistent with
planned expanded deliveries to Marchbank Park and Junipero Serra Boulevard landscaped
medians. Also, the reader needs to understand the numbers are driven to show offset to the
regional water system so that the deliveries from the North San Mateo County Sanitation District 53
to the Olympic Club, Lake Merced Golf Club and San Francisco Golf Club since 2004 could not
be included.

Daly City would like to correct the column for Projects under Study from zero to 0.53 mgd to
better represent actual and ongoing discussions to expand recycled water within the community
that intends to offset system supply.

Page E2-18, Table E.2.6, Summary of 2030 Demand Projections
Footnote (e) correctly summarizes the range of estimates provided by Daly City as it pertains to
groundwater usage. The numbers must also be balanced against anticipated water conservation
savings.

Mr. Paul Maltzer
San Francisco Planning Department

October 1, 2007
Page 14

Page E3-6, Table E3.4, Employment and Population Estimates
Daly City notes that both the starting point and endpoint values for employment and population are correct. There are very slight differences in numbers in our records as opposed to those shown for 2005 and 2025, but the numbers are not deemed significant.

Page E3-7, Table E3.5, Employment
As noted above, starting point numbers and endpoint numbers are same as Daly City records but there is a slight variance in numbers presented between the period of 2005-2025 and 2005-2030, but the variance is not deemed significant. 54

Page E3-8, Table E3.6, Population
As noted above, starting point numbers and endpoint numbers are same as Daly City records but there is a slight variance in numbers presented between the period of 2005-2025 and 2005-2030, but the variance is not deemed significant.

Page E3-43, Table 3.37
Daly City concurs with the numbers presented but must caution the number shown for 2030 does not include Program B water conservation potential of 0.44 mgd. 55

Thank you, Mr. Maltzer, for your attention and assistance in incorporating Daly City's comments into the final PEIR document for the WSIP. Daly City recognizes the challenges in crafting a draft PEIR and acknowledges the thoroughness and conscientious effort clearly exhibited. As noted earlier, Daly City contends the draft PEIR and anticipated responses satisfies the legal requirements set forth under CEQA. Daly City's comments are aimed at constructively moving the PEIR forward toward certification and approval. Any comments or questions associated with this submittal can be directed to Patrick Sweetland, Director of Water and Wastewater Resources, by telephone at (650) 991-8201 or email at psweetland@dalycity.org.

Sincerely,

Patricia E. Martel
City Manager

Subject: Comments - Draft PEIR for SFPUC Water System Improvement Program

Dear Mr. Maltzer:

Dublin San Ramon Services District (DSRSD) appreciates the opportunity to review and comment on the subject Draft Program Environmental Impact Report (PEIR) for SFPUC Water System Improvement Program.

While each water system in the State is unique, all water agencies share one common planning requirement: providing a base water supply during a water supply shortage whether caused by drought, regulatory requirements or system failure. Section "S.1 Introduction and Purpose of the PEIR" provides the statement "...to increase the reliability of the regional water system that serves 2.4 million people in San Francisco and the San Francisco Bay Area." Table 3.2 lists the following specific goals and objectives: "Provide operational flexibility to minimize the risk of service interruptions due to unplanned facility upsets or outages"; "Diversify water supply options during ... drought periods"; and "improve use of ...groundwater, recycled water,...and transfers".

Section 3.4.6.E identifies potential projects covered by the PEIR as "...recycled water projects that would be located outside San Francisco in coordination with other jurisdictions." DSRSD is one of a number of jurisdictions that may be able to provide recycled water to San Francisco. Such projects could increase San Francisco's system reliability during a water supply shortage and could be a factor in regional water management solutions that would benefit several water suppliers. 01

Water supply in California can be highly variable by watershed as a result of either drought or seismic activities. Having interconnections with the watersheds or groundwater basins of other jurisdictions may also assist San Francisco in increasing water supply reliability. DSRSD

L_DSRSD

Mr. Paul Maltzer
Page 2
September 28, 2007

(working closely with our wholesaler, Zone 7 Water Agency) is one of several jurisdictions that could assist San Francisco by providing an opportunity for increased reliability through interconnection, water exchanges, and similar water management techniques that would have multiple beneficiaries. There is also some potential for such projects to provide water for fisheries enhancement and other environmental values.

DSRSD recommends that the following project refinement be added to the PEIR on page 3-25. 01 cont.

> "**3.4.6.G: Regional Interconnecting Projects.** The SFPUC expects to consider and develop some interconnection projects to surface and/or groundwater supplies, and perhaps to recycled water supplies, of other jurisdictions located outside of San Francisco that will increase system reliability and provide regional water management benefits during times of water supply shortages. As these projects are developed and designed, they will be reviewed to determine the appropriate level of environmental review."

If you have any questions, please feel free to call Dave Requa, District Engineer at 925.875.2244.

Sincerely,

Bert L. Michalczyk
General Manager

Re: Draft Program Environmental Impact Report for the San Francisco Public Utility Commission's Water System Improvement Program

Dear Mr. Maltzer:

East Bay Municipal Utility District (EBMUD) appreciates the opportunity to comment on the Draft Program Environmental Impact Report (EIR) for the San Francisco Public Utility Commission's Water System Improvement Program. Even though the property is located outside of EBMUD's Ultimate Service Boundary and Service Area, EBMUD requests to be kept on the project mailing list, to receive the Final EIR and Mitigation Monitoring and Reporting Plan, and to reserve the option to comment at the certification hearing. 01

If you have any questions concerning this response, please contact David J. Rehnstrom, Senior Civil Engineer, Water Service Planning at (510) 287-1365.

Sincerely,

William R. Kirkpatrick
Manager of Water Distribution Planning

RE: EAST BAY REGIONAL PARK DISTRICT (EBRPD) COMMENTS ON SFPUC WATER SYSTEM IMPROVEMENT PROGRAM (WSIP) DRAFT PEIR

Dear Mr. Maltzer:

12.3-118

Thank you for providing East Bay Regional Park District ("District") with a copy of the Draft Program Environmental Impact Report (DPEIR) for San Francisco Public Utilities Commission's (SFPUC) WSIP Project. The District owns or manages several parks that abut San Francisco Water District (SFWD) watershed lands and leases 3,812 acres of land from SFPUC as part of the Sunol and Ohlone Regional Wilderness parks. Scoping comments were previously submitted to SFPUC by the District for the following projects that are directly or indirectly related to the WSIP Project:

- October 12, 2005 – Scoping comments for SFPUC Water System Improvement Program.
- November 9, 2005 – Scoping comments for SFPUC Calaveras Dam Replacement.
- August 16, 2007 - Scoping comments for SFPUC Habitat Reserve Program.
- September 4, 2007 – Scoping comments for Sunol valley Water Treatment Plant.

The District's Master Plan establishes its commitment to preserve natural and cultural resources, open space, parks and trails for enjoyment and recreation for generations to come. Changes to management practices or construction of new facilities within the watershed could affect the resources the District manages in and around SFWD's

watershed lands. Based on the project description, analysis and maps provided in the DPEIR ("PEIR"), WSIP projects associated with the Sunol Valley Region and projects contributing to biological and water quality impacts to Alameda Creek are of particular concern to the District for managing resources in the following regional parks:

1.	Sunol Regional Wilderness	6,858 acres
2.	Ohlone Regional Wilderness (including camp Ohlone)	9,736 acres
3.	Mission Peak Regional Preserve	2,998 acres
4.	Vargas Plateau Regional Preserve	1,030 acres
5.	Quarry Lakes Regional Recreation Area	538 acres
6.	Coyote Hills Regional Park	978 acres
		(Total: 22,138)

The District has extensive experience in managing and enhancing natural and cultural resources and open space on more than 97,000 acres of land and 1,100 miles of trails in Alameda and Contra Costa County. We recognize the SFPUC's commitment to provide a reliable water supply to its customers and the challenges it faces in constructing and operating the infrastructure needed to meet this demand in a fashion that minimizes impacts on the environment. In continuing with its cooperative relationship with SFPUC in managing open space and watershed lands, we provide the following comments for consideration under the California Environmental Quality Act for the Water Supply Improvement Program:

I. Recreation:

The PEIR establishes significance standards related to recreation and considers that implementation of the proposed program would have a recreational impact if it were to cause environmental impacts (such as air quality or noise effects) that would indirectly result in deterioration in the quality of the recreational experience (PEIR, P. 4.12-17). In determining whether project impacts may deteriorate the quality of the recreational experience it is necessary to understand the types of activities that are associated with the "recreational experience". Our Master Plan describes recreational activities that its park users experience while enjoying the lands it manages - these activities include nature appreciation, hiking, biking, equestrian use, camping, picnicking, photography, painting, and birding. Any disruption or deterioration of park users experience while engaging in these activities is of concern to the District and may result in a significant environmental impact under CEQA. 01

The PEIR does not recognize that there are several impact categories, such as traffic, air quality, visual/aesthetics, biological resources and noise that could disrupt or deteriorate the experience of park users as a result of the project. Other than a brief discussion of construction impacts in Volume 2 (PEIR, p. 4.12-18) and combined recreational and visual/recreational impacts in Volume 3 (PEIR, PP. 5.4.7-1 and 5.4.7-5), in determining the potential effects on recreational resources, the PEIR relies on the conclusions of impact findings from sections of the report that do not specifically evaluate the project's impacts on recreational resources. The PEIR's analysis of recreational impacts could be improved to help the public better understand and evaluate potential indirect environmental impacts 02 the project may have on recreational resources. The District offers the following comments regarding the projects potential impacts on recreational resources: 02 cont.

1. Traffic -

   a. Temporary closure of Calaveras Road between Geary Road and Felter Road to through traffic during construction of the Calaveras Dam project could impact recreational resources as follows:

      i. Park visitors currently enjoy a scenic drive when they come to visit Sunol Regional Wilderness with little or no congestion or delay. The proposed road closure would block access to the park from Santa Clara County and eliminate this secondary access route to the park. This alternate route is also a desirable route for nature viewing. 03

      ii. Closure of this secondary access route coupled with an increase in traffic volumes with up to 50 -190 worker vehicle trips (PEIR, P. 4.8-18) and up to 180 a.m. and p.m. peak hour truck trips would present a formidable obstacle to park users attempting to access the park. This considerable increase in traffic volume could discourage park users from visiting Sunol and Ohlone Regional Parks because of congestion, delay and associated road hazards. The impact of the road closure and increased vehicle trips on park users should be evaluated in the PEIR at a programmatic level for collective and cumulative impacts and at the project level in subsequent CEQA analysis.

      iii. The PEIR may not provide enough programmatic information to establish performance standards from which future project specific CEQA analysis can draw from. A range of mitigation measures should be identified at the program level to minimize these impacts to park visitors. Some of these measures should include:

         1. Consulting with EBRPD to evaluate the vehicle/visitor demand to Sunol Regional Wilderness and incorporate these findings into the traffic control plan for each project utilizing Calaveras Road for construction. The traffic control plan should recognize peak demand hours for park use and minimize its traffic volumes to not overlap with these hours. This may require that construction traffic be significantly restricted or prohibited during holidays and weekends. 04

         2. Prohibit or restrict construction traffic for the Calaveras Dam Replacement project (SV-2) from using Calaveras Road from the north.

         3. Requirement that SFPUC be the sole agency responsible for notifying the public of the proposed closure of Calaveras Road.

SFPUC should provide proper signage at appropriate locations, informational pamphlets and displays for park users at informational kiosks and other outreach efforts (newspaper, radio and television press releases).

         4. SFPUC should provide us with an opportunity to review and comment on the traffic control plan for each project impacting this area and coordinate public outreach and information/ notification of road closures with us well in advance of closures. Public notification efforts should also identify the specific locations, durations and alternatives means of access to public trails. 04 cont.

      iv. Most of the construction related traffic impacts related to this road closure are concluded to have a less than significant impact with mitigation because of the temporary nature of the impact. It is unclear from the PEIR if the closure will be for two to three (PEIR, P. 4.8-12; P. 4.3-15) years or two years (PEIR, P. 4.8-22). In order to ensure certainty as to the temporary nature of this closure, a performance based mitigation measure should be adopted for when the road must re-open. Without such standard, insufficient information is provided on the temporary nature of these impacts. 05

      v. It is unclear which trails will be restricted due to the closure of Calaveras Road (PEIR, P. 4.8-22) – more information should be provided in the PEIR for trail users to better evaluate and understand how the project will restrict trail use and how this impact will be mitigated to a less than significant level. 06

   b. The increase in traffic volumes from construction activities, especially truck trips on County roads and local streets, could rapidly accelerate the deterioration of roadway surfaces along haul routes. The PEIR should address how these roadway surfaces will be maintained in good condition during and after the project is completed. 07

   c. Mitigation Measure 4.16-6c does not provide a level of certainty that traffic impacts could be mitigated with the implementation of a traffic control plan because it provides too much flexibility for whether or not identified standards for the plan are required or optional (PEIR, P. 6-33). The measure says that these standards “could” include. The words “shall include but not be limited to” would result in a more predictable outcome of successfully implementing this mitigation measure. 08

2. Air Quality – Levels of fugitive dust and criteria pollutants will drastically exceed BAAQMD significance thresholds (PEIR, P. 4.9-24) as a result of the project. The District recognizes that for the purpose of the PEIR sensitive receptors are generally associated with certain land uses (schools, day-care centers, hospitals & convalescent homes). However, because of the close proximity of the construction 09

and associated vehicle traffic to Sunol and Ohlone parks, sensitive receptor consideration should be given to park visitors such as children, the elderly and active persons engaged in strenuous exercise that use the parks. Poor air quality and associated health risks may diminish the recreational experience of park users. The PEIR should analyze this potential impact at a programmatic level and provide mitigation for this potential impact in order for park users (especially young families, the elderly and joggers/cyclists) to better understand and evaluate the air quality impacts of the WSIP. 09 cont.

3. Visual/Aesthetics - Park visitors are attracted to the natural beauty and views they enjoy and experience in the parks and surrounding areas. Any actions that may diminish this experience may have a significant impact on recreational resources. The PEIR recognizes that distant views of SFPUC facilities may be available from public trails in the Sunol Regional Wilderness (PEIR, 4.3-2). However, it does not recognize these views as visual resources in its impact analysis (PEIR, P 4.3-8). Given the broad range of projects that could alter views from the Sunol and Ohlone parks, the PEIR and subsequent project level CEQA review should recognize views from these parks as visual resources and minimize project impacts to these resources. 10

Using the Alameda Watershed Management Plan (WMP) design guidelines may not sufficiently mitigate for visual/aesthetic impacts resulting from the WSIP because the WMP serves as guideline document without any clear substantive requirements for preserving visual resources – the goals and policies section of the WMP do not provide any guidance on how to apply its subjective design guidelines in a fashion that would result in the protection or preservation of visual/aesthetic resources. Where known visual impacts will occur but the exact location and design has not yet been established, such as with the Calaveras Dam Replacement project (including the borrow site & haul road), the PEIR should establish citing criteria or designate generally acceptable locations for siting/placement of these projects. 11

Policy WA-9 of the WMP requires that if new facilities require additional new locations that view shed studies be conducted to minimize, eliminate or conceal the violation of scenic values. The PEIR evaluates the applicability of this policy on page 5.4.7-4 and concludes that since no new facilities are required for the project that view shed studies are not required. This conclusion may be true for most of the WSIP, however, for the Calaveras Dam replacement project, construction impacts will result in the permanent loss of riparian natural communities in the vicinity of the new dam and associated roads, staging areas and borrow site (PEIR, P. 4.6-55). Although not technically a new facility location, the impact area necessary for the construction of this project is well beyond the original facility location and should require a view shed study as called for by WMA, Policy WA-9. EBRPD should be consulted to assist in determining the locations from which this view shed analysis should be conducted for views from District managed lands. 12

4. Biological Resources – In its effort to maintain the recreational experience of its park users, we are actively involved in management activities aimed to preserve existing plant life and fish and wildlife habitat in the parks we manage and 13

L_EBRPD

surrounding watersheds. Reduced flows in Alameda Creek as a result of the project (PEIR, P. 5.4.7-5) is of particular concern to us because we operate and manage several parks that feature Alameda Creek as a focal recreational feature (Sunol, Coyote Hills, Quarry Lakes and Vargas Plateau). Maintaining flows in Alameda Creek to maximize benefits to amphibians and anadromous fish species in Alameda Creek is a priority for the District. 13 cont. The adopted Land Use Plan for Sunol and Ohlone Wilderness Regional Preserves calls for the District to coordinate the timing of water releases for the Calaveras Dam with the SFPUC to maximize the benefits to these species. 14 In addition to considering the recommendations of the Alameda Creek Fisheries Restoration Workgroup, as part of mitigation measure 5.4.5-3a, the SFPUC should consider giving us an opportunity to review and comment on the operation plan for establishing minimum flows for resident trout in Alameda Creek. This cooperative effort will ensure that the resource management efforts of the District and SFPUC are coordinated in a fashion that best preserves and enhances these resources. 15

The PEIR concludes that the project would result in permanent loss of sensitive riparian natural communities (PEIR, P. 4.6-55) and that implementation of mitigation measures for these impacts would compensate for these impacts. The SFPUC's Habitat Reserve Program was identified as an option for implementing offsite habitat compensation (PEIR, P. 4.6-56). We would like to reiterate our concern over the use of lands already conserved and managed for watershed protection for use as habitat mitigation lands for new capital projects (also see the August 16, 2007 EBRPD Notice of Preparation comment letter for the Habitat Reserve Program). Preservation can be a feasible means for reducing the impact of lost habitat; however, using already protected watershed lands that are already effectively managed for habitat protection (as a result of watershed and water quality management objectives) would result in a net loss of the resource. Therefore, any proposed use of existing SFPUC watershed preserve land for mitigation for project impacts may be considered inadequate under CEQA unless the mitigation were to rehabilitate or enhance disturbed or marginal habitat areas within the watershed. 16

The effectiveness of conservation easements over private lands may be insufficient for ensuring long-term management and enhancement of habitat due to the difficulty associated with enforcing land use restrictions on present and future property owners. In addition, public access is generally not allowed on such lands, even when acquired with public funds. Fee purchase of mitigation lands will ensure that there are no problems enforcing land use restrictions and assuring that long-term management can occur. 17

5. Noise - An increase in 5dB CNEL over existing noise levels is generally considered a significant noise impact. The PEIR should evaluate noise impacts to park users in this context. Construction activities and increased traffic volumes should be evaluated for noise impacts to park users where haul roads or construction activities will be audible from parks. 18

II. General Comments:

1. The PEIR should recognize that regional parks have land use plans that guide the management of our parks. 19

2. The PEIR should address if some of the WSIP projects would need an encroachment permit from EBRPD where access is needed to District owned properties and trails (lands that are not leased by EBRPD from SFPUC) - it is unclear from the maps provided if any WSIP project will encroach onto District property (also see comment II.3 below). 20

3. The PEIR states that the Irvington Tunnel (SV-4) would tunnel below a portion of Mission Peak Regional Park (PEIR, P. 4.12-23), however, the maps provided indicate that this project is nearly a mile north of Mission Peak Regional Park. This statement should be clarified in the PEIR and sufficient mapping detail should be provided to show where the tunnel will cross under Mission Peak Regional Park. Providing this information will help the District evaluate the potential impacts of this crossing and determine the ownership of this portion of the park and types of approvals that may be needed. 21

4. Mitigation measure 4.5-4b is intended to prevent potential flooding impacts associated with the Alameda Creek Fishery Enhancement (SV-1). It is unclear from the project description what the project will actually involve or where it could be located. As a result, there is insufficient project detail in the PEIR to demonstrate that project impacts associated with SV-1 can be mitigated with the proposed mitigation measures. Construction of a diversion dam or concrete weir could alter the drainage of surface flows in Alameda Creek, causing flooding or siltation (PEIR, P. 4.5-39) – this impact cannot be evaluated without basic essential information such as the location of the proposed project. This deficiency may be augmented by including in the project description or as an additional mitigation measure siting criteria or generally acceptable sites that could accommodate the project without causing flooding or siltation. 22

5. Our public safety division provides fire and law enforcement/police services district wide - the Public Services and Utilities chapter of the PEIR should recognize this and include EBRPD Fire Department in the list of agencies SFPUC will coordinate with for fire suppression planning and response for construction activities, including the review and approval of traffic control plans (Mitigation Measure 4.8-1). 23

6. Based on the information provided in the PEIR, it appears that the borrow and spoils area will be located at the south end of the Calaveras Reservoir on north and east facing slopes. The PEIR should use this information to more accurately disclose the Calaveras Dam project's programmatic impacts to biological and visual/aesthetic resources. This conclusion is based on information provided in the PEIR where the location of the borrow area is identified as being at the south end of the Calaveras Reservoir (PEIR, P. 4.10-19) and north and east facing slopes in the immediate vicinity of the dam (PEIR, P4.3-38). 24

III. Clarifications/Corrections:

1. Reference to the WSIP Habitat Reserve Program (HRP) appears to be incorrect on page 6-55. Section 3.11 (Proposed Construction Schedule) is referenced for the WSIP – the correct reference is Section 3.12.3 (Page 3-84). 25

2. Page 5.4.7-1, "Alameda Creek Recreation and Visual Quality" – the PEIR does not disclose that Alameda Creek is adjacent to Vargas Plateau Regional Preserve, Quarry Lakes Regional Recreation Area and Coyote Hills Regional Park. These parks should be considered in the impact analysis. 26

We look forward to continuing our long established cooperative working relationship with the SFPUC in managing open space and watershed lands in the East Bay. We requests a copy of the FEIR when it becomes available (one hard copy and CD are preferred). Thank you for the opportunity to comment on the Water System Improvement Program Draft PEIR and the SFPUC's consideration of our comments. If you have any questions or comments, please contact me at (510) 544-2627.

Sincerely,

Chris Barton

Subject: DRAFT PROGRAM ENVIRONMENTAL IMPACT REPORT FOR THE SAN FRANCISCO PUBLIC UTILITY COMMISIONS (SFPUC) WATER SYSTEM IMPROVEMENT PROGRAM - (PLANNING DEPT. FILE NO. 2005.0159E)

Dear Mr. Maltzer:

The Estero Municipal Improvement District (EMID), representing 35,330 residential customers and 25,356[1] employees and business users' thank you for the opportunity to comment on the Draft Program Environmental Impact Report for the San Francisco Public Utility Commissions Water System Improvement Program - (Planning Dept. File No. 2005.0159E).

One goal of EMID's stated Policy Calendar is to "Pursue Reliable and Uninterruptible Alternative Sources of Water Supply" and the proposed Water System Improvement Program (WSIP) will help achieve this goal.

We have over 35,000 residential customers and 25,000 employees and business users that rely 100 percent on the SFPUC water supply. With the probability of a major seismic event occurring within the next 30 years, we encourage the retrofit work to begin immediately as a defined Capital Improvement Project system rehabilitation program. 01

The following are our specific review comments on referenced Tables and text:

<u>TABLE 3.3 Summary of Water Supply Assumptions & 2030 Demand Projections</u> (page 3-18) 02

On March 1, 2004, the EMID Board of Directors gave concurrence to the SFPUC Capital Improvement Program Wholesale Customers Demand Projections.

[1] Table E3.4 (page E.3-6 of DEIR for year 2005)

Mr. Paul Maltzer, Environmental Review Officer
San Francisco Planning Department
Page 2
October 1, 2007

The concurrence form was submitted to the SFPUC in February of 2004 and the 2030 demand projection was approved for 6.8 MGD not a range of 6.20 – 6.80 MGD, this should be noted on all of the subsequent Tables that reference the range of Demand Projections. (Table 3.4; Table 7.2; Table 7.3; Table E.1.1; Table E.2.1 and Table E.2.6). 02 cont.

Text Comments:

<u>Estero MID</u> (page 7-43)

It is correctly noted that EMID and the City of Foster City city limit /boundary lines do not coincide.

This point is referenced to reinforce the text reference on page 7-43 as follows:

> "The difference between the demand study and general plan projections is "probably" due both to the general plan's horizon of 2010 and the fact EMID serves more than Foster City". 03

Based on the above, all of the Tables and text references of the population of the City of Foster City should not be used to calculate the projected water demand. All water demands and projected flows include Foster City and the portion of the City of San Mateo that is east of the Marina Lagoon. This area within the City of San Mateo includes residential, hotels, commercial/retail and office use.

<u>General Comments:</u>

EMID staff supports the Modified WSIP and concurs that it meets the WSIP goals with less environmental impacts. In addition, the adoption of the 10% rationing goal rather than the 20% goal is a much more desirable approach since our residents and business community relies on the SFPUC for its entire water supply. 04

EMID recognizes the challenges of even a 30 to 90 day water outage scenario and the threat to the public health, safety and economic impact. EMID has been working with the San Mateo County Office of Emergency Services to develop an Emergency Sanitation Annex Plan to address an extended water outage event. The importance of the complete rehabilitation of the Hetch Hetchy system cannot be ignored. Staff will continue to monitor and develop the Emergency Sanitation Annex Plan as it relates to a long-term water outage and the community sanitation needs. 05

City of Fremont Comments - Draft PEIR Water System Improvement Program

1 message

Rene Dalton <rdalton@ci.fremont.ca.us> **Tue, Oct 9, 2007 at 10:24 AM**
To: wsip.peir.comments@gmail.com

Dear San Francisco Planning Department,

Thank you for the opportunity to comment on the Draft PEIR Water System Improvement Program. The City apologizes for the late submittal of these comments and hope that this submittal could still be considered. The City comments regarding the Draft PEIR Water System Improvement Program Project are as follows:

1. Page 4.8-13, Bay Division Region, first paragraph of the document calls for the use of cut-and-cover method for construction across major arterial streets in Fremont such as Mission Boulevard, Paseo Padre Parkway and Fremont Boulevard. City of Fremont recommends that the project consider as a first alternative jack-and- bore method at all arterial streets in Fremont and cut and cover method for residential streets. 01

2. Traffic Control Measures in addition to SFPUC Construction Measure #5 should include City Standard requirements such as CA MUTCD and 2006 Caltrans Standard Plans. 02

3. Application for encroachment permit and traffic control plan review shall be submitted two (2) months in advance to the City of Fremont. Enclosed for applicants information and use are the City of Fremont Encroachment Application and Fremont staff contact information or see the following link: 03

http://www.fremont.gov/Permits/EngineeringPermits/default.htm

4. Closure of bicycle trails and maintenance access road if there is no way to re-route the traffic at north of Paseo Padre Parkway should be coordinated with City staff, Afshin Abtahi, 510 494-4724. 04

5. Site specific plans must be submitted for all work within City limits impacting the City's transportation network. 05

Thank you for the opportunity to comment on the Draft PEIR Water System Improvement Program. If you have any questions or need additional information please contact me directly.

Sincerely,

Rene Dalton

WSIP PEIR
1650 Mission Street, Suite 400
San Francisco, CA 94103

Subject: Comments on the Water System Improvement Program Draft Program Environmental Impact Report – San Francisco Planning Department File No. 2005.0195E – State Clearinghouse No. 2005092026

Dear Mr. Maltzer:

This letter is to provide comments on the above referenced Program Environmental Impact Report (PEIR) for the San Francisco Public Utilities Commission (SFPUC) Water System Improvement Program (WSIP). The PEIR was prepared in accordance with the California Environmental Quality Act and is now undergoing the requisite public review and comment process prior to certification. As one of the largest wholesale customers of the regional water system, Hayward has a keen interest in the certification of the PEIR and in the expeditious implementation of the system improvements, and thus offers the following comments in the spirit of cooperation and support.

The regional water system provides 100% of Hayward's water system supply to its 146,000 residents, two hospitals, over 30 educational facilities, including a state university and a community college, government centers, and numerous commercial and industrial entities. A reliable supply of water is fundamental to the health, safety, and economic well-being of our community. Hayward has taken many steps to improve its distribution and storage facilities, investing significant resources into seismic upgrades and reinforced pipelines. Now we are urging SFPUC to take the lead to increase the delivery reliability of the regional system and to take the next major step in this process by certifying the PEIR at the earliest possible date.

<u>General Comments</u>

We would first like to offer comments about the overall PEIR document. We recognize that the CEQA PEIR process functions to provide information about potentially significant environmental affects of the WSIP and possible means of reducing or

L_Hayward

eliminating those impacts. The process is not intended to evaluate the merits of the program per se. However, the Draft PEIR can and should convey the urgent need to address the system reliability issues given the severe health, safety and environmental harm that could result from uncontrolled releases of water from reservoirs and large pipes. The potential impacts are acknowledged in the 2002 Assembly Bill 1823, the Wholesale Regional Water System Security and Reliability Act, which obligates the SFPUC to implement certain improvement projects. More recently, the severe adverse consequences and devastating environmental impacts of delayed maintenance and upgrades have been seen in catastrophic events such as Hurricane Katrina and the collapse in Minneapolis of the I-40 bridge over the Mississippi River.

In Hayward's opinion, construction of the improvements needed to improve the reliability of the water system is the most critical aspect of the WSIP. The PEIR correctly points out that much of the SFPUC regional water system was constructed in the early 1900s, and is at risk for system failure. The regional system crosses a number of earthquake faults, and yet many of the facilities do not meet current seismic standards. The regional system has already been required to significantly reduce storage in the Calaveras Reservoir due to seismic safety hazards. Additional redundancy in some critical facilities is needed to increase the reliability of water delivery, particularly in the event of an earthquake. And, while the system currently meets or exceeds existing water quality standards, upgrades are needed to maintain compliance with current and anticipated standards. The projects to address these urgent problems need to be placed on the critical path. 01

The WSIP also includes projects to provide additional water supplies to meet estimated future demand. Although Hayward's projected water consumption is expected to increase, for reasons that will be further explained, we consider the development of additional water supplies to meet demand in 2030 to be less urgent at this time. We acknowledge that there are issues to be resolved among various stakeholders regarding future demand, but given that the future demand is based on 2004 projections and long-term forecasts, and that the full demand is not expected to be realized for some 23 years, there is sufficient time to work through mutually agreeable solutions and develop appropriate agreements. We urge the SFPUC not to delay the certification of the PEIR and implementation of critical reliability projects due to issues related to future demand. 02

<u>Hayward-Specific Comments</u>

The PEIR correctly states that Hayward's projected demand in 2030 is substantial and higher than the projected growth in population and employment alone. It is important to note that Hayward's demand projections were prepared in accordance with the methodology used to estimate future demand from all wholesale customers. Hayward, like many other agencies, requested some modifications to the model to account for specific local conditions. The data that formed the basis for our requests was carefully scrutinized by SFPUC and the modeler in order to maintain the integrity of the process. The reason that the water demand estimates differ from population and employment projections are discussed in the PEIR, and it is not our intention to restate what has 03 already been described. But we do feel it is important to add Hayward's perspective to the discussion. To that end, the following paragraphs explore some of the main features of Hayward development, both residential and industrial, in order to more fully explain Hayward's unique situation, relative to many other regional water system wholesale customers.

Residential Water Demand

Hayward is the largest public wholesale customer of the regional water system. Our residents, however, have per capita water use that is among the lowest of all SFPUC's wholesale customers. Had this not been the case, the volume and percentage increases in estimated future water usage would have been lower, as the base usage would be higher. And, in spite of the projected increases in 2030, Hayward's projected per capita use in 2030 is still expected to be within the mid-range of other regional water customers. This is an important point, because Hayward is essentially expecting to "catch up" with other communities in terms of neighborhood amenities and their attendant water demands.

The lower-than-average use is due in part to the high density housing that has been built in the past, with little attention to landscaping, and because likewise many of the single-family homes have limited or no landscaping. While this scarcity of landscaping is advantageous from a water use standpoint, it is not a desirable feature for our community, and the City is actively working to change the situation. While the City is fully committed to best water conservation practices, any enhancements to the existing landscaping on these sites will inevitably result in a water use increase. 03 cont.

A recent housing needs assessment prepared by the Association of Bay Area Governments (ABAG) indicates the need for Hayward to plan for the building of nearly 3,400 housing units during the next seven years in order to keep pace with population growth. Hayward will continue to experience in-fill development, redevelopment of underutilized sites, and development of remaining large parcels within its adopted urban limit line, while some cities on the Peninsula are essentially "built out." An example of potential development that was not even in view when the demand study was prepared is the Route 238 Bypass Corridor Land Use Study to develop a plan to utilize parcels no longer needed for the Route 238 Bypass project. The study area totals over 350 acres, and the planning study for these parcels is just getting underway. Among the major study objectives is the City's desire to accommodate sufficient housing, including affordable housing, and other uses to support population increases and workforce needs for the full spectrum of the population and to reduce traffic congestion and improve air quality.

For some of the new development through the City, larger-than-average lot sizes are anticipated because of the intended design of the housing. However, even these "larger" lots are considerably smaller than in some other Bay Area communities. Also, new homes on average sized lots will have more extensive landscaping than is currently found on many existing lots. A review of actual current water usage for similar homes constructed in the past few years indicate that current water usage is between 400 to 600 gpd, compared with our average of about 300 gpd for existing homes.

However, Hayward is also committed to the principles of Smart Growth, and where appropriate, is developing neighborhoods that are compact, walkable, and transit oriented. Landscaping is intended to enhance the livability of the community. The first attachment to this letter includes descriptions of recently constructed and proposed developments in Hayward to provide a sense of the type of Smart Growth development that is encouraged. These housing developments are redevelopment projects, located on formerly underutilized sites. All of the projects are within walking distance of a Bay Area Rapid Transit (BART) station and close to retail and commercial facilities.

At the same time, existing homes are being purchased and rehabilitated, including installation of landscaping, due to the relative affordability of Hayward properties compared with those on the Peninsula or in the South Bay. And, while homes are comparatively affordable in Hayward, they are still expensive in terms of dollars, so many existing homeowners are choosing to upgrade their Hayward property to protect their investment and as a matter of pride. Some property owners who are interested in selling their properties are installing landscaping to make their homes more marketable. Residential improvements are encouraged by the City through the Housing Rehabilitation and Neighbor Initiatives Programs, which provide grants and loans for eligible projects. Hayward's General Plan expressly encourages the rehabilitation and upkeep of residential properties to generally improve property values and quality of life for residents. 03 cont.

As properties improve, water usage can be expected to rise, particularly due to increased outdoor use. Thus, the model appropriately assumes that a certain number of renovated properties would increase water usage to an average of 400 gallons per day (gpd). This is the usage that we are seeing in newly constructed homes in Hayward with typical contemporary landscaping, and still very reasonable compared with similar uses elsewhere.

It is important to emphasize that the increased residential usage does not result from "lush landscaping" with water-intensive plantings, rather it is based on installation of typically low water use plants and shrubs. In fact, the City adopted a Water Efficient Landscaping Ordinance nearly fifteen years ago to regulate the type of plant materials and irrigation systems that are used in new development and has a Landscape Architect on staff to ensure conformance with the Ordinance. This Ordinance will be updated in accordance with the provisions of Assembly Bill 1881, and Hayward is also developing a Bay Friendly Landscaping Ordinance. The City provides classes and other resources to educate and encourage water efficient landscaping. Nonetheless, the City is committed to improving the overall appearance of the City, similar to the appearance of many Peninsula and South Bay communities, and we realistically expect that the water usage for new housing will exceed that of our current residential averages as a result.

Industrial Water Demand

Regarding this customer sector, Hayward's industrial development patterns differ from those in Peninsula cities. Although Hayward's business population grew in the 1990s, we did not have nearly the same level of economic development experienced in other communities. While a number of business parks and industrial sites were built, a significant portion of this industrial space was and continues to be underutilized for warehousing and other similar uses. There was much less high tech manufacturing and other water-intensive uses in Hayward that characterized industrial development in other communities. A key General Plan strategy is to reverse this practice and to focus business attraction and retention efforts on "…employment generators, high performance, fast growing firms and community-service retail, as well as high technology and other industries that will enhance the local economy." Hayward is currently implementing this strategy.

In recent years, the high cost of space and housing has prompted a number of manufacturing and food processing businesses, typically large water users, to leave the more expensive Peninsula and South Bay areas. Many have chosen to relocate to the Central Valley and other lower cost regions within the State, or to leave California altogether. However, some have opted to move their operations to more affordable cities within the Bay Area, such as Hayward, with access to needed workforce and public transportation. This transition has created a water allocation opportunity in many Peninsula and South Bay cities, as the uses are typically replaced by much less water use intensive research and development and office complexes. However, this redistribution of industrial use has and is expected to continue to shift some water demand to Hayward, not in the form of one or two high water use businesses, but in the situating of a variety of moderate and steady manufacturing entities. 03 cont.

Hayward's growing industrial base reflects much diversity in terms of types of industries. As noted in the previous paragraph, there are no "mega" water-using businesses in Hayward, the closure of which would cause a significant decline in overall water usage. Rather, there are an increasing number of food and beverage processors, biotechnology firms, and high tech companies that, in aggregate, contribute significantly to Hayward's industrial water demand. This is an important distinction between Hayward and some other Bay Area communities where a few very large businesses consume a significant portion of water, and their closure or reduced production can cause a significant reduction in water use.

Conclusion

Hayward has been and will remain committed to responsible and cost effective water conservation. The second attachment lists a number of programs that have been implemented in the past or are currently underway.

Recognizing that the desire for improved landscaping and other home features, and the City's desire to attract businesses, must be balanced with careful management of resources, the City is currently working closely with other SFPUC wholesale municipal customers, through BAWSCA, to develop cost effective regional water conservation programs and will continue to implement City-specific programs as well. The second

attachment describes a number of programs that have been implemented in the past or are currently underway.

We need to be mindful of the fact that the projections were developed in 2004 for estimated water use in 2030, over 25 years in the future. A 25-year planning horizon suggests that some of the underlying assumptions will change over the years. The estimates were prepared using the best data available and our current knowledge about local conditions and development patterns. However, regardless of the residential and business development that occurs in our community, Hayward's long-standing commitment to water conservation and responsible water use will remain unchanged. 03 cont.

We appreciate the opportunity to provide these comments.

Sincerely,

Robert A. Bauman
Director of Public Works

Water Conservation Program Descriptions

CITY OF
HAYWARD
HEART OF THE BAY

12.3-127

CITY OF HAYWARD
SMART GROWTH DEVELOPMENT

The City of Hayward is committed to the Smart Growth principles of developing neighborhoods that are compact, walkable, mixed use and transit oriented. A number of recently constructed developments and approved conceptual plans illustrate this commitment.

Atherton Place Townhomes

Built in 1997, this 83-unit townhome project is bounded by C Street, D Street and Atherton Street. It is adjacent to the Hayward BART station and downtown Hayward.

City Walk Townhomes

Completed in 2003, this 77-unit housing development is located at the corner of C Street and Watkins Street, just across from the BART Station. This project represents the City's continuing efforts to repopulating the downtown core with a customer base through the construction of higher density housing.

Renaissance Walk

Renaissance Walk is a city block bounded by C Street, D Street, Atherton Street, and Watkins Street. A total of 46 condominium units were constructed in 2005, in a series of four-plex, tri-plex, and duplex buildings that appear as larger homes in traditional California styles. The homes are within walking distance of BART.

L_Hayward

Studio Walk

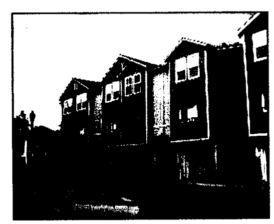
This development of 70 loft units, completed in 2005, brings a new housing product to Hayward. The project density is 35 units per net acre, with three story (40 foot) high buildings composed of 1,454 square foot, two story units at grade and 1,667 square foot flats above. The project maintains a street presence with entry doors providing direct access to Atherton Street. It is within walking distance of BART.

Amador Village Condominiums

This 155-unit rental condominium development in the Burbank/Cannery area was completed in 2000. It is located on Amador Village off of D Street and is within walking distance of the Hayward BART Station and the Hayward downtown.

Pinnacle City Centre

This 192-unit rental condominium development located in the Burbank/Cannery area at the corner of C and Grand Streets was completed in 1999. It is located approximately two blocks from the Hayward BART station and within walking distance of downtown.

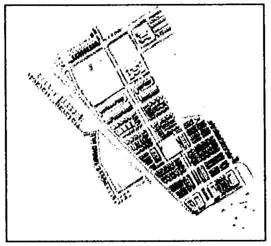


Grand Terrace

These 235 townhomes were approved by the City Council in July of 2000 and continue the contemporary adaptation of the row house concept developed at Atherton Place. Perimeter units are oriented to face the street and have individual raised porches. At a net density of about 35 units per acre, these two- and three-bedroom units are within walking distance of the downtown BART station.

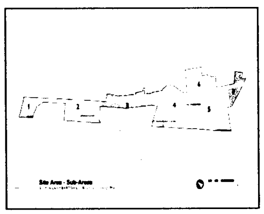
12.3-128

Cannery Area Plan Implementation



The Cannery Area, located just west of downtown Hayward is an older industrial area now surrounded by the Burbank neighborhood. In 2001 the City adopted the Cannery Area Design Plan. The Plan's primary focus is the redevelopment of the central 55+ acres which will include the development of approximately 750-850 housing units, a new, elementary school, and an expanded Cannery Park. Key elements of the Plan include access to the nearby Bay Area Rapid Transit (BART) and AMTRAK/Capitol Corridor lines and neighborhood retail uses to serve the residents of the community. The Local Government Commission's Center for Livable Communities recognized the Cannery Plan with an Ahwanee Award in 2001, noting that the Plan "demonstrates many of the Ahwanee Principles in a single project. The Plan will provide a seamless connection to the surrounding neighborhoods."

South Hayward BART/Mission Boulevard Plan



The land use plan for the Mission Boulevard Corridor between Harder Road and Industrial Boulevard and including the South Hayward BART station was completed in June 2006. Among the goals of the Plan is to "provide for intensified land uses to encourage the development of a transit-friendly, smart growth area near an existing BART station." The planning area encompasses about 240 acres. The number of new housing units is expected to range from 1,600 to 3,200, depending on development proposals.

L_Hayward

CITY OF
HAYWARD
HEART OF THE BAY

CITY OF HAYWARD
WATER CONSERVATION PROGRAM

The City of Hayward has a long-standing and active commitment to water conservation. As an original signatory to the California Urban Water Conservation Council Memorandum of Understanding (MOU), the City has implemented a number of cost effective demand management measures and consumer education programs to reduce water usage among our residential, commercial and industrial customers. In addition to our external customers, the City has also put into place water conservation practices and resources to reduce usage at City properties, most notably in landscape irrigation and system leak detection. The Water Conservation Program's success is demonstrated by the relatively low per capita consumption.

The following is a brief summary of the programs and practices that the City is currently implementing, or has offered in the past, to reduce water use.

<u>Appliance and Fixture Replacements</u>

- Household Fixture Replacements. Water conservation kits, consisting of water efficient showerhead, faucet aerators, toilet displacement bags, and leak detection tablets were made available at no cost to customers. About 5,000 kits were distributed in 1999 and 2000. More recently, water conserving devices have been distributed to families as part of the Water Wise school education program (see below). Similar to the original water conservation kit in content, the Water Wise kit provides high quality fixtures and water use audits and activities.

- Residential Toilet Replacement Rebates. The City offered rebates for the replacement of an existing toilet with a 1.6 gpf model between 2000 and 2003. As a result, close to 900 toilets, using up to 7 gallons per flush, were replaced with water efficient units.

- Commercial and Multifamily High Efficiency Toilet Replacements. The City participates in a regional program to replace existing toilets and urinals with high efficiency models in business and multifamily settings. This is a direct install program. The program experienced some start-up delays during its first year and is expected to be active in 2007-08.

- Residential Washing Machine Rebates. This regional program provides rebates for the purchase of an Energy Star rated clothes washing machine. The City has participated since its inception in 2001 and has issued 1,300 rebates to date.

- Commercial Washing Machine Rebates. Through the CUWCC Smart Rebates Program, the City is offering rebates for the purchase of a commercial washing machine, typically found in coin operated laundries and multi-family laundry facilities. The City has been allocated a total of 25 rebates based on available CUWCC funding and program participation.

- Cooling Tower Controller Rebates. Again through the CUWCC Smart Rebates Program, a financial incentive is offered for the installation of a cooling tower control to increase the number of cycles prior to discharging water used for cooling purposes. This program is getting underway at this time.

- Pre-Rinse Spray Valves. About 150 food related businesses, more than one-half of all such businesses in Hayward, have been equipped with a pre-rinse spray valve to reduce the water used for cleaning dishes and cooking utensils. The valves, which were installed between 2003 and 2007, were provided at no cost to the businesses

Price Signals

- Water Usage Rates. The City introduced an inclining block water rate structure in 1993 to encourage water customers to reduce their use. The rate schedule originally had two tiers; in 2003, it was expanded to three tiers. The first tier (1 to 10 units) rate is the base rate. The cost of second tier usage (11 to 30 units) is about 18% above the first tier, while highest block (over 30 units) has a substantially higher cost, at about 23% over the second tier. About 25% of the City's water is sold at the two lower rates.

  The current annual average residential water use in Hayward is 20 hundred cubic feet (ccf) per billing period, which results in a water use charge of $46.80. Customers whose usage reaches the ceiling amount within the second rate tier see a water use charge of $72.10 or 54% above the annual average. If an additional 10 units of water is used in a billing period, the water usage charge would climb to $103.30, more than twice as high as the average billing. While the issue of price signals and price elasticity is still being explored in the water conservation community, Hayward's water rate structure and water use rates deliver incentives to minimize water use.

- Service Charge. Hayward has one of the lowest service (or fixed) charges among Bay Area water agencies. This is significant because it means that customer billings are primarily driven and affected by water use. The basic charge for a 5/8" meter was, for many years, held at $3.50 per month. A modest increase to $4.50 was approved effective October 2007. In FY 2006-07, the revenue for water service totaled $22 million. Of that total, only about 10% was derived from service charges, with the remainder coming from water usage charges. The City remains committed to a rate structure in which the fixed charges remain low and most of the operating revenue is obtained through use-based fees.

12.3-129

- Wastewater Charges. The City of Hayward is one of the few agencies which offer a residential wastewater rate structure that is based on wastewater discharge and provides an incentive to minimize water use. Customers that use ten or fewer units of water in a billing period are automatically billed the lowest (Lifeline) sewer rate, which is about 30% of the top rate. Customers that use between 11 and 15 units pay the middle (Economy) rate, which is about 60% of the top rate. The top sewer rate is applied when water usage exceeds 15 units. This is a practical method for implementing wastewater rates that are aligned with water usage, since wastewater metering is still impractical. Customers do not need to apply for the lower wastewater rate tiers; they are applied automatically based on meter readings.

Consumer Education

- Water Efficient Landscape Classes. The City sponsors a class each year, taught by a noted expert in water efficient landscaping, for residential customers. This past year, close to 90 people expressed interest in the class, exceeding the City's best estimate based on participation in previous years and in other jurisdictions. Accordingly, in the future we will increase the number of sessions to accommodate more participants.

- Water Efficient Landscaping Information. Hayward offers residential free brochures and a GardenSoft CD to encourage water conserving landscaping. The CD is a particularly effective tool for helping customers design and install a landscaping plan that does not sacrifice beauty for water efficiency. The information and CDs are available through the City's website, Revenue office, at special events, and by request.

- School Education. The City offers the WaterWise curriculum (developed by Resource Action) to fifth grade classrooms. This program includes teaching aids, activity books, and CDs. Students also receive high quality showerheads and faucet aerators for installation in their homes. The response to the program has been excellent. In two years, the program has been provided to 35 classrooms, reaching nearly 1,000 students.

- Water Efficient Landscape Ordinance. The City Council adopted a Water Efficient Landscape Ordinance in 1993 to ensure that landscaping in new development met certain standards for water efficiency. The City has on staff a landscape architect who reviews landscaping plans for conformance with the ordinance and ensures that the final installation meets the City's standards. (Note: The City will update the Ordinance, in accordance with Assembly Bill 1881, when the model is available from the Department of Water Resources.)

- Special Events. The City participates in a variety of special events, including local fairs, festivals, and business activities, to provide information and devices to encourage water conservation.

- Billing Inserts. Customers receive information with their bills providing ideas for conserving water, both indoors and outdoors. The inserts are typically purchased from the AWWA and thoroughly researched and credible.

- Consumption Tracking. Water bills enable consumers to track their water use from year to year by providing information about water use for the same period in the previous year.

- Website Information. The City's website includes information about the City's current water conservation programs and general water conservation ideas, including a link to H2Ouse.org, the CUWCC's innovative conservation website.

City-Specific Water Conservation Activities

- Landscape Irrigation Staffing. The City funds two dedicated positions within the Water Operating Fund to manage irrigation systems on all public streets, public right-of-ways, and City-owned properties. These staff members monitor and maintain the systems to ensure that watering times are appropriate for the weather conditions and the sprinkler heads are correctly adjusted to minimize waste.

- Evapotranspiration (ET) Controller Installations. To date, the City has installed about 10 ET controllers to manage watering needs, particularly in new developments. Ultimately the City plans to install 75 such controllers. Currently, water savings of about 25 percent at each site are being achieved. Once the system is fully upgraded and centrally controlled, water savings are expected to be in the range of 40%.

- Leak Detection Survey and Repair. In order to address the issue of unaccounted-for-water, the City retained a contractor in 2006-07, to identify leaks through a comprehensive leak detection survey. This work had been previously done in 1995. The survey indicated that the distribution system is quite sound, with just a very few small leaks located. Hence, the City is planning to concentrate next on meter testing and replacement to reduce the difference between wholesale water purchased and retail distribution.

In addition to continuing its existing programs, Hayward is currently evaluating and considering other efforts to increase water use efficiency, including continued participation in regional rebate and education programs. Hayward will be implementing all actions required by Assembly Bill 1880, including updating the Water Efficient Landscape Ordinance and requiring separate irrigation meters under certain conditions.

Mr. Paul Maltzer
Environmental Review Officer, WSIP, PEIR
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103

RE: Comments for the Draft Program Environmental Impact Report (DPEIR)
Water System Improvement Program (WSIP)

Dear Mr. Maltzer:

The Town of Hillsborough supports the overall goals and objectives of the San Francisco Public Utilities Commission Water System Improvements Program to enhance the reliability, seismic performance, water quality, as well as cost effectiveness of the water delivered for the regional water system, as outlined in the Draft Program Environmental Impact Report. The Town finds the DPEIR to be a comprehensive document analyzing the environmental impacts of the projects and alternatives as required by law. The Town has the following comments: 01

- The DPEIR should further analyze and discuss the seismic performance and potential failure of the existing system and the critical importance of completing the WSIP to protect the public health and safety of the people who live in the Bay Area. The regional system is the main source of water for the Town and the region. The DPEIR does not discuss the need and urgency to repair the regional system to avoid failure in a significant seismic event. There is a 60 percent probability of a major earthquake occurrence in the Bay Area from now to 2030 that could disrupt the regional water system for 30 to 60 days. We recommend that the DPEIR establish the economic impact of not completing the projects (excluding injuries and loss of life) compared to the cost of system reconstruction, in a seismic event. The DPEIR should discuss the catastrophic impact on public health and safety in a significant seismic event and the need for expeditious and urgent repair of the regional system consistent with AB 1823. Furthermore, we request that SFPUC proceed with completion of improvements to the regional water system as soon as possible and avoid any delays arising out of re-evaluation of the projects. 02

San Francisco Planning Department
Mr. Paul Maltzer
September 27, 2007
Page 2

03

- The DPEIR evaluates several alternatives to the project as required by CEQA. The Town of Hillsborough supports the modified WSIP as the preferred alternative. This alternative would reduce key impacts on natural resources along the lower Tuolumne River, Alameda Creek below the diversion dam at Pilarcitos Reservoir and Creek as well as Crystal Springs Reservoir and will continue to meet the WSIP primary goals and objectives. This alternative will also maximize the use of the existing system and facilities without requiring construction of additional facilities or substantially increasing

04

the energy demand to meet the needs of the customers. The Town of Hillsborough also supports the Bay Area Water Supply and Conservation Agency's (BAWSCA's) proposal that the final DPEIR further describe and analyze the DPEIR's Modified WSIP Alternative (the environmentally superior alternative) and that the final DPEIR explore the feasibility of the Bay Area water customers financially supporting water conservation with agricultural interests on the lower Tuolumne River that will result in no net decrease in flows on the lower Tuolumne. BAWSCA's proposal is to conserve even more agricultural water resulting in a net increase in lower Tuolumne River flows. This additional water could then be available to support greater flows in the lower Tuolumne River, deployed at times and in volumes most beneficial for salmon and other important species in the lower Tuolumne River. Under BAWSCA's proposal, the implementation of the WSIP can improve, rather than degrade, flow conditions in the lower Tuolumne River.

05

We also recommend that DPEIR discuss the possibility that the new contract with the wholesale purchasers while establishing fixed entitlements, that SFPUC consider transferability among purchasers in the new contract. The Town also supports Bay Area Water Supply and Conservation Agency to take the lead on conservation regionally funded through water rates.

06

- The DPEIR discusses the water supply needs of the region by year 2030. DPEIR references the Water Supply Master Plan (SFPUC 2000) as a guidance document for the SFPUC service area, and SFPUC Water Supply Options Report (2007), the most current evaluation of water supply for the region. The Town acknowledges the need to evaluate the future water supply needs, however, we are concerned that the priority should remain on fixing the regional system's performance and reliability.

  The need to plan for 2030 water supply should not delay meeting the level of service goals to ensure the current regional system will continue meeting the existing needs. We further recommend the level of service goals for the existing system be attained sooner, even if it results in delays in meeting 2030 water supply goals. The Town strongly urges SFPUC to proceed with the program expeditiously to ensure reliable

07

delivery of water to the SFPUC customers. The water supply analysis for 2030 also assumes a 20% rationing to allocations during drought periods. We request that a 10%

San Francisco Planning Department
Mr. Paul Maltzer
September 27, 2007
Page 3

07 cont.

rationing variant be considered since it will increase the reliability of the system in drought years and will significantly reduce the economic impact on the region.

08

- The WSIP as proposed will result in construction and upgrade of facilities within the Town of Hillsborough boundaries. We request SFPUC to address the following issues upon better definition of each project within the Town:

  - Public Outreach
  - Air Quality
  - Traffic
  - Noise
  - Impact on Schools
  - Construction dewatering and impact on local facilities
  - Erosion Control and Geology

09

- The Town of Hillsborough has taken significant measures to comply with the SFPUC's recent request for a 10% BAWSCA and member agencies voluntary reduction in water usage and actively support implementation of additional water conservation program measures and water recycling to make effective use of limited water supplies. Following are some examples of our efforts:

  Smart Irrigation Month: The Town participated in the Irrigation Association's campaign to reduce outdoor water usage. Weekly articles on outdoor water conservation appeared in the "What's New" section of the Town's website. Town residents also received a "Smart Irrigation Month" brochure with their utility bill in July. An article also appeared in the Town's quarterly newsletter.

  Water Wise Gardening CD: The Town purchased five hundred CDs for dissemination to interested Town residents. The Town advertised the CDs in its quarterly Newsletter, on its website and in Town Hall itself.

  Water Wise Education Kit: The Town purchased one-hundred and eighty Water Wise Education Kits for FY 2007/08, enough for every 5th grade student attending the Hillsborough City School District.

  Be A Water Saving Hero: The Town participates in the regional awareness campaign by posting campaign information on the Town website, inserting brochures in residents' utility bills and making the brochures available to Town residents at Town Hall.

  Rebate Programs Washing Machines: The Town continues to participate in the BAWSCA sponsored washing machine rebate program.

San Francisco Planning Department
Mr. Paul Maltzer
September 27, 2007
Page 4

Landscape Audit Program: The Town has applied for, was accepted to participate in and has dedicated funding for, the BAWSCA Landscape Audit Program. Funding has been dedicated by the Town Council for each of the next three fiscal years.

Water Main Flushing: After some study and consideration, the Town has combined its water main flushing and fire flow testing activities. This has resulted in a significant reduction in water being discharged into storm drains by Town staff during routine maintenance and testing of its water infrastructure.

Town Hall Irrigation System: The Town is refurbishing the Town Hall landscape irrigation system to ensure water conservation.

Water Conservation Garden: The Town is refurbishing its Water Conservation Garden so it will continue to serve as a model example for Town residents interested in drought tolerant landscaping.

Green Building Guidelines: The Town is in the process of considering Green Building guidelines for future Town facilities and for certain residential construction projects. Water conservation is a significant component of these guidelines.

Grey Water Systems: The Town is researching "closed" grey water systems with potential residential application. This system uses grey water captured from the bathroom sink for toilet flushing. The Town will purchase and test at least one of these systems in its own facilities. 09 cont.

Smart Irrigation Controllers: The Town continues to research Smart Irrigation Controllers and model rebate programs. The Town purchased and tested a Smart Controller at its Vista Park facility. The Town hopes to incorporate a Smart Controller rebate program into its Landscape Audit Program in the coming fiscal year.

Water Flushing Conservation Methods: The Town continues to research conservation solutions for the Town's water main flushing activities. The Town is also researching the placement of mobile water tanks to hold flushed water for use by Town staff and building contractors.

Low Flow Devices: The Town continues to research innovative low flow devices that may be of interest to our residents. The results of our research will be made available on the Town's website.

Town Website Water Conservation Page: The Town is in the process of improving its Public Works web pages, which will include a dedicated "water conservation" page. Residents will find in depth water conservation tips and guidelines on this page, as well as links to other water conservation websites.

September 21, 2007

San Francisco Planning Department
Att: Paul Maltzer, Environmental Review Officer, WSIP-PEIR
1650 Mission Street, Suite 400
San Francisco, CA 94103

Subject: San Francisco Water Supply Improvement Program (WSIP)
Comments on Programmatic Environmental Impact Report (PEIR)

Dear Mr. Maltzer:

The Los Altos Hills County Fire District draws water from Purissima Hills Water District and the California Water Service systems, both of which are affected by the WSIP. The PEIR addresses regional water supply issues that are critical to reliable water supply for fire fighting in Los Altos Hills. Without a reliable water supply, there are billions of dollars of property at risk of fire including Foothill Jr. College with 18,000 enrolled students, a public elementary school, a large private school, over 3,000 high value residential buildings and thousands of acres of hilly woodland and grassland.

The recent Stanford Hills fire and the Stevens Creek wildfires on our borders posed grave threats to our community, and could have created fire disasters. The Town includes extensive acreage of undeveloped hillside land and borders regional parkland and preserves that provide wildlife habitat for many species, all of which are at risk of loss by wildfire. 01

Recent court orders to "stop pumping" from Delta water sources to preserve fish spawns have severely reduced the reliability of the Delta supply and could affect water availability to California Water Service. This plus the lack of usable groundwater in our area, accentuate the need to improve the reliability of the SFPUC's Hetch–Hetchy and Calaveras supplies, as the only viable supply available for fire fighting. While the Purissima Hills Water District has adequate local storage capacity, it is totally dependent on SFPUC's supply to fill its tanks.

Growth within the City of San Francisco and the communities served by the SFPUC's regional water supply system is expected to require an increase in the amount of water drawn from an already over-utilized Tuolumne River supply. The District has unresolved reservations about increases in the drawdown of water from this resource. The District encourages the SFPC and the SFBoS to consider conservation measures and additional restrictions on water use in order to protect the valuable natural resource. 02

Our District already has firmly established water conservation measures in place including water-saving foaming apparatus on all of our trucks, and protocols to minimize water use when testing

L_LAHCFD

hydrants. All pressure and flow testing of hydrants by our staff is coordinated with the water company personnel so that main flushing and bacterial testing is done simultaneously, saving water. 02 cont.

Los Altos Hills County Fire District therefore urges the San Francisco Planning Commission, and the San Francisco Board of Supervisors to approve and certify the PEIR without further modifications or variation. We urge rapid completion of the environmental review process and implementation of WSIP improvements to reduce the extreme risk of disastrous wildfire and economic catastrophe resulting from lack of a reliable water supply. 03

Very truly yours,

Dorothy Price

CITY & COUNTY OF S.F.
PLANNING DEPARTMENT
MEA

San Francisco Planning Department
Att: Paul Maltzer, Environmental Review Officer, WSIP-PEIR
1650 Mission Street, Suite 400
San Francisco, CA 94103

Subject: San Francisco Water Supply Improvement Program (WSIP)
Comments on Programmatic Environmental Impact Report (PEIR)

Dear Mr. Maltzer

The PEIR addresses regional water supply issues that are critical to reliable water supply and fire safety in Los Altos Hills. Los Altos Hills is served by Purissima Hills Water District and by California Water Service systems, both of which are affected by the WSIP. The lack of a reliable water supply places billions of dollars of property at risk of fire including Foothill Jr. College with 18,000 enrolled students, a public elementary school, a large private school, and over 3,000 high value residential buildings.

The recent Stanford Hills fire and the Stevens Creek wildfires posed grave threats to our
community. The Town includes large acreage of undeveloped hillside land and borders regional 01
parkland and preserves that provide wildlife habitat for many species, all of which are at risk of
loss by wildfire.

Recent court rulings and "stop pumping" orders on Delta water sources to preserve fish spawns have severely reduced the reliability of the Delta supply. We therefore cannot rely on the Santa Clara Valley Water District, and there is no usable groundwater resource in our area. This accentuates the need to improve the reliability of the SFPUC's Hetch–Hetchy and Calaveras supplies, as the only viable supply available to us.

Planned growth within the City of San Francisco and the communities served by the SFPUC's
regional water supply system is expected to require an average of 300 mgd by the year 2030.
This can be met utilizing the Tuolumne River supply within the limits of the SFPUC's legally 02
entitled water rights, water transfers and conservation through 2030 according to the proposed
WSIP.

"Smart Growth" has been a key principle in Los Altos Hills since its incorporation in 1956, with
a minimum residential lot size of 1 acre. The resulting low density development has reduced
water demands per acre by 20 to 100+ percent over water consumption in neighboring cities 03
where six to ten dwellings or more per acre is the norm. While per capita water usage appears
higher, the net effect is that planned growth in Los Altos Hills has reduced total demand for the
area.

Fax 650/941-3160

L_LosAltosH

Conservation measures are already firmly established in irrigation practices, in plumbing codes, in landscaping design, plan review and water system operations. Further water savings may be marginal when compared to the reductions already achieved. For example, the two schools with large athletic fields in our Town have already converted to artificial turf to save water. Nevertheless conservation continues to be a high priority and recent initiatives are listed below.

- Resolution 122-06 was enacted in December 2006 coordinating efforts with Purissima
  Hills Water District to reduce water usage on new landscape projects; promote water
  conservation through public education and consider incentives for property owners to 04
  conserve water.
- The Conservation Element of the Town's General Plan was revised in April 2007 to improve protection and conservation of the Town's water resources including five policies, nine programs, and adoption of best management practices.
- A new Water Conservation Subcommittee was formed to develop and implement the Council adopted resolution, policies and programs.

Los Altos Hills therefore urges the San Francisco Planning Commission, and the San Francisco
Board of Supervisors to approve and certify the PEIR without further modifications or variation.
We urge rapid completion of the environmental review process and implementation of WSIP 05
improvements to reduce the extreme risk of catastrophe resulting from a seismically deficient
and unreliable water supply system.

CITY OF MENLO PARK

701 LAUREL STREET, MENLO PARK, CA 94025-3483
www.menlopark.org

October 1, 2007

San Francisco Planning Department
Attention: Paul Maltzer, Environmental Review Officer, WSIP PEIR
1650 Mission Street, Suite 400
San Francisco, CA 94103

Subject: Comments on the Draft Program Environmental Impact Report (PEIR) for the San Francisco Public Utilities Commission (SFPUC) Water System Improvement Program (WSIP)

Dear Mr. Maltzer:

Thank you for the opportunity to comment on the WSIP PEIR. The City of Menlo Park appreciates your willingness to consider these comments.

As a long-time wholesale customer of the SFPUC, the Menlo Park Municipal Water District serves approximately 10,000 residents and numerous other businesses and institutions, including local schools and a Department of Veterans Affairs hospital. The Menlo Park Municipal Water District currently relies on the SFPUC for 100 percent of its water supply. A sustained water system outage would have devastating impacts to our community members, institutions, and local economy. Given the current vulnerability of the regional water system to damage from seismic events, it is imperative to proceed expeditiously with the projects outlined in the WSIP. 01

Menlo Park's comments will focus in particular on some of the construction impacts associated with the WSIP. Project BD1, the Bay Division Reliability Upgrade, includes a new 120-inch diameter, five-mile long tunnel under San Francisco Bay that will be constructed from a staging area in Menlo Park. Project BD1 also includes a new 72-inch diameter pipeline that will travel through Menlo Park for approximately 2.6 miles. Menlo Park would like to work cooperatively with the SFPUC to plan for reasonable construction mitigation measures that will minimize the construction impacts to local residents and businesses. We understand that as a program-level EIR, some of the details regarding Project BD1 are simply not available at this time and a project-level EIR is being planned. 02

L_Menlo1

Please consider the following specific comments:

1) **More work is needed to identify noise impacts and mitigations.** Section 6.3.9 describes Mitigation Measure 4.10-1a and states, "SFPUC Construction Measure #6 for noise requires compliance with local noise ordinances to the extent feasible." A copy of Menlo Park's noise ordinance is attached for reference. Menlo Park requests that the PEIR or project-level EIR for Project BD1 conduct more thorough studies of potential construction noise and ways to mitigate for it. The "to the extent feasible" language in this mitigation measure leaves the community with no way to evaluate how significant noise impacts may be, and therefore no meaningful way to comment on the impacts of construction noise levels as part of the EIR process. We urge the SFPUC to examine Menlo Park's noise ordinance, identify mitigation measures capable of meeting the noise levels in the ordinance, and adopt these measures as part of Project BD1. 03

2) **Settlement monitoring is needed where the proposed Bay Tunnel crosses under existing levees in Menlo Park.** Impact 4.5-4 provides for Mitigation Measure 4.5-4b, Site Specific Flooding Analysis and Identified Measures. The City of Menlo Park requests that a site-specific analysis be performed for the Bay Tunnel portion of Project BD1. This tunnel will pass under existing levees along the shore of San Francisco Bay. The tunneling operation and ground disturbance in the vicinity of the levee have significant potential to induce settlement, which would subject the area to greater risk of tidal flooding. Much of the alignment of Project BD1 through Menlo Park is in an area designated by the Federal Emergency Management Agency as a flood hazard zone. A settlement monitoring and mitigation plan should be developed as part of the project-level EIR for Project BD1. 04

3) **Construction working hours need to be better defined and more reasonable truck hauling requirements should be developed.** Impact 4.10-2, Temporary Noise Disturbance Along Construction Haul Routes, does not currently include sufficient mitigation measures. Construction of the Bay Division #5 pipeline as part of Project BD1 calls for the construction of a 72-inch diameter pipeline adjacent to residences in Menlo Park. Residences will be only 20 to 30 feet from the planned pipeline trench. The mitigation measures under this impact appear to allow up to 80 truck trips per hour except during nighttime hours, defined as 10 p.m. to 7 a.m. Menlo Park believes this is an unreasonable level of impact in residential neighborhoods. Construction hours should be customized in consultation with local jurisdictions to reflect the character of the adjacent area. Trenching and truck hauling from 7 a.m. to 10 p.m. is unreasonable in residential neighborhoods! 05

4) **More work is needed to identify and mitigate for temporary traffic impacts.** Mitigation Measures 4.8-1a and 4.8-1b are designed to address a variety of temporary traffic impacts. These measures require site-specific traffic control plans, which are certainly necessary to address traffic safety. As a mitigation measure however, they are not sufficient to mitigate impacts to a less than significant level. Even with these mitigation measure in place detours, temporary street closures, loss of parking, and limited access to businesses and residences will be experienced, which should be considered a significant environmental impact. More work is needed to address site specific traffic impacts. Without disclosing which streets will be closed for what duration, the PEIR is currently insufficient to conclude that temporary traffic impacts have been properly mitigated to less than significant levels. The City of Menlo Park requests that the project-specific EIR for Project BD1 evaluate and consider additional mitigation measures for temporary traffic impacts. These measures should be developed well before projects are put out to bid. With smaller projects it is common to simply leave traffic control up to the contractor. Given the scale of Project BD1, this approach would inevitably lead to conflict, delays, and claims for extra work from the contractor. Menlo Park would like to work cooperatively with the SFPUC to better identify construction traffic routing and appropriate mitigation measures as part of project design. 06

5) **Establish a vibration monitoring program for Project BD1.** Mitigation Measure 4.10-3a includes specific values for allowable vibration. More information is needed to better understand how these values were established. The tunneling and large-scale trenching required under Project BD1 could generate substantial vibration in nearby residences and businesses. Simply stating a limit in the specifications as required by the mitigation measure is insufficient. A monitoring program should be developed and implemented to ensure that the contractor complies with the stated limits. 07

6) **Menlo Park currently receives 100 percent of its water supply from the SFPUC.** Table 3.1, which lists BAWSCA members, includes an asterisk for Menlo Park indicating multiple sources of supply. The City of Menlo Park has multiple water companies operating within its political boundaries. However, the Menlo Park Municipal Water District is the specific entity that is a BAWSCA member, and it currently receives 100 percent of its water supply from the SFPUC. Please correct Table 3.1 by removing the asterisk from Menlo Park. 08

L_Menlo1

Thank you for considering the City's comments. Please call me at 650-330-6781 if you have questions.

Sincerely,

Kent Steffens
Director of Public Works

Title 8 PEACE, SAFETY AND MORALS*

Chapter 8.06 NOISE

12.3-137

8.06.010 Declaration of policy.

It is declared to be the policy of the city to protect the peace, health and safety of its citizens from unreasonable noises from all sources including, but not limited to, those specified in this chapter. (Ord. 892 § 2 (part), 1999).

8.06.020 Definitions.

The definitions set forth in this section shall govern its construction.

(1) **"A-Weighting"** means a filter network designed to transform a frequency spectrum to that which is heard by the human ear.

(2) **"Construction activities"** means the grading, demolition, alteration, repair or remodeling of existing structures and construction of new structures including the use of power equipment in connection with activities. "Construction activities" does not include radios or other forms of amplified music on a construction site.

(3) **"Daytime"** means the period from seven (7) a.m. to ten (10) p.m. daily.

(4) **"Decibel (dB)"** means a unit for measuring the amplitude of sound, equal to twenty (20) times the logarithm to the base ten (10) of the ratio of the pressure of the sound measured to the reference pressure, which is twenty (20) micropascals.

(5) **"Delivery"** means the delivery or pickup or the arrival for delivery or pickup of goods, wares and merchandise by the use of a motorized vehicle, other than an automobile or train.

(6) **"Equivalent-energy level (Leq)"** means the level of a steady-state noise that has the same sound energy as a given time-varying noise.

(7) **"Holidays"** means the follow days: New Year's Day, Martin Luther King Day, President's Day, Memorial Day, Independence Day, Labor Day, Veterans Day, Thanksgiving, and Christmas

Day.

(8) **"Impulsive sound"** means sound of short duration, usually less than one (1) second, with an abrupt onset and rapid decay. Examples of impulsive sounds include explosions, drop impacts and firearm discharge.

(9) **"Motor vehicles"** means any and all self-propelled vehicles as defined in the Vehicle Code of the state, including all on-highway types of vehicles subject to registration under said code and all off-highway type of motor vehicle subject to identification under said code.

(10) **"Multifamily dwelling"** means any housing unit where two (2) or more dwellings are separated by a common wall, floor or ceiling, including but not limited to apartments, condominiums and townhouses.

(11) **"Nighttime"** means the period from ten (10) p.m. to seven (7) a.m. daily.

(12) **"Noise disturbance"** means any source of sound which exceeds the noise limitations permitted in Section 8.06.030. For purposes of this section sources of sound shall include but not be limited to the following: amplified music, loudspeakers, radios, televisions, stereos, musical instruments, powered toys or models, swimming pools or spas, industrial machinery, manufacturing equipment, pile drivers, air compressors, paint sprayers, motors, pumps, blowers, air conditioners, cooling towers, ventilating fans, fork lifts, loaders, tractors, animals, concerts, mechanical equipment, human voices, electrical appliances, vacuum cleaners, powered equipment, chain saws, beepers, motor vehicles and attached equipment not operated on a street or highway, etc.

(13) **"Noise level"** means the amplitude of sound pressure referenced to twenty (20) micropascals, measured in decibels, using the A-weighting network (for the purposes of this chapter).

(14) **"Noise level measurement"** means the procedure of measuring sound consisting of the usage of a precision sound level meter (SLM), as defined in the section, set to "fast" response. If the sound level meter is analog with a VU meter, then the response shall be "slow" unless the noise issue is impulsive. The meter must be calibrated before any measurements and the microphone shall be a minimum of three and one-half (3 1/2) feet from any wall, floor or other large sound reflecting surface. The meter shall be protected from wind or other extraneous noise by the use of screens, shields or other appropriate devices.

(15) **"Precision sound level meter"** means a sound pressure level measuring instrument which conforms to the American National Standards Institute (ANSI) specification S1.4 for Type 1 or Type 2 measuring instruments.

(16) **"Powered equipment"** means a motorized device powered by electricity or fuel used for construction, demolition and property or landscape maintenance or repairs. Powered equipment includes but is not limited to: lawn mowers, hedgers, parking lot sweepers, saws, sanders, motors, pumps, generators, blowers, wood chippers, vacuums, drills and nail guns (but specifically excluding internal fuel combustion engine leaf blowers).

(17) **"Residential property"** means any property legally used for a single family or multifamily dwelling as defined in Section 16.04.240.

(18) **"Sound-amplifying equipment"** means any machine or equipment or device for the amplification of the human voice, music or any other sound. Sound-amplifying equipment shall not be construed as including automobile radios (which are covered by the California Vehicle Code), warning devices on authorized emergency vehicles or horns or other warning devices on other vehicles used for traffic safety purposes.

(19) **"Work personally done by resident or property owner"** means work undertaken by the property owner/resident. Resident/property owner may be assisted by a family member, friend or other persons. (Ord. 895 § 5, 1999; Ord. 892 § 2 (part), 1999).

8.06.030 Noise limitations.

(a) Except as otherwise permitted in this chapter, any source of sound in excess of the sound level limits set forth in Section 8.06.030 shall constitute a noise disturbance. For purposes of determining sound levels from any source of sound, sound level measurements shall be made at a point on the receiving property nearest where the sound source at issue generates the highest sound level. Sound level measurements shall be made with a precision sound level meter (Type 1 or 2) set to A-weighting, and "fast" response for fluctuating sound. Slow or fast response may be used for continual sources. For repetitive, impulsive sound, the one (1) second rms maximum level (Lmax) shall be used. For continuous sound, use the average level or Leq. In multifamily residential structures, the microphone shall be placed no closer than three and one-half (31/2) feet from the wall through which the source of sound at issue is transmitting. The microphone shall also be placed five (5) feet above the floor regardless of whether the source of sound at issue transmits through the floor, ceiling or wall.

(1) For all sources of sound measured from any residential property:

(A) "Nighttime" hours--fifty (50) dBA,

(B) "Daytime" hours--sixty (60) dBA;

(2) For all sources of sound within a multifamily residential structure transmitting through a common interior partition (wall, floor or ceiling) from one (1) dwelling unit to another:

(A) "Nighttime" hours--thirty-five (35) dBA,

(B) "Daytime" hours--forty-five (45) dBA;

(3) Corrections for character of sound: In the event the alleged offensive noise contains a steady, audible tone, such as a whine, screech, beating, pulsating, throbbing or hum the standards set forth in Section 8.06.030(a)(1) and (2) shall be reduced by five (5) dB.

(b) Any and all excessively annoying, loud or unusual noises or vibrations such as offend the peace and quiet of persons of ordinary sensibilities and which interfere with the comfortable enjoyment of life or property and affect at the same time an entire neighborhood or any considerable number of persons shall be considered a noise disturbance.

(c) It shall be unlawful to create, permit, allow or maintain a noise disturbance in Menlo Park. (Ord. 892 § 2 (part), 1999).

12.3-138

8.06.040 Exceptions.

The following are exceptions to the noise limitations set forth in Section 8.06.030. These activities may occur at other times provided they meet the noise levels set forth in Section 8.06.030.

(a) **Construction Activities.**

(1) Construction activities between the hours of eight (8) a.m. and six (6) p.m. Monday through Friday,

(2) Residents/property owners personally undertaking construction activities to maintain or improve their property on Saturdays, Sundays or holidays between the hours of nine (9) a.m. and five (5) p.m.,

(3) A sign, containing the permitted hours of construction activities exceeding the noise limits set forth in Section 8.06.030, shall be posted at all entrances to a construction site upon the commencement of construction, for the purpose of informing contractors and subcontractors and all other persons at the construction site of the basic requirements of this chapter. The sign shall be at least five (5) feet above ground level and shall consist of a white background with black letters,

(4) Notwithstanding any other provision set forth above, all powered equipment shall comply with the limits set forth in Section 8.06.040(b);

(b) **Powered Equipment.**

(1) Powered equipment used on a temporary, occasional or infrequent basis operated between the hours of eight (8) a.m. and six (6) p.m. Monday through Friday. No piece of equipment shall generate noise in excess of eighty-five (85) dBA at fifty (50) feet,

(2) Residents/property owners personally using powered equipment to maintain their property and/or residence on Saturdays, Sundays or holidays between the hours of nine (9) a.m. and five (5) p.m. No piece of equipment shall generate noise in excess of eighty-five (85) dBA at fifty (50) feet.

(c) **Internal Fuel Combustion Engine.** Gasoline powered leaf blowers operated in accordance

with and during hours as permitted by Chapter 8.07 (Leaf Blowers);

(d) **Deliveries.**

(1) Deliveries to food retailers and restaurants,

(2) Deliveries to other commercial and industrial businesses between the hours of seven (7) a.m. and six (6) p.m. Monday through Friday and nine (9) a.m. to five (5) p.m. Saturdays, Sundays and holidays;

(e) **Occasional Social Gatherings.** Occasional social gatherings between eleven (11) a.m. and eleven-thirty (11:30) p.m.; provided, the noise level for the occasional social gathering measured from any adjacent residential property does not exceed sixty-five (65) dBA;

(f) **Street Sweeping/Parking Lot Sweeping.** Street sweeping/parking lot sweeping Monday through Friday between the hours of seven (7) a.m. and six (6) p.m. anywhere in the city; and street sweeping between the hours of four-thirty (4:30) a.m. to six (6) p.m., Monday through Friday on the following streets/public parking plazas: El Camino Real, Santa Cruz Avenue (between Merrill Street and Johnson), Oak Grove Avenue (between University Avenue and Merrill Street), Menlo Avenue, Doyle Street, Curtis Street, Chestnut Street, Evelyn (between Santa Cruz and Menlo Avenue), Crane Street (between Menlo Avenue and Oak Grove Avenue), Maloney Lane, Johnson Lane, University Avenue (between Menlo Avenue and Oak Grove Avenue), Merrill Street, Willow Road (between Bay Front Expressway and Middlefield Road), O'Brien Drive, Hamilton Avenue (south of Willow Road), Adams Drive, Adams Court, Casey Court, Hamilton Court, Haven Avenue, Independence Drive, Chrysler Drive, Jefferson Drive, Constitution Drive, Kelly Court, Haven Court, Commonwealth Drive, Chilco Street (from Bay Front Expressway to the Dumbarton spur railway line), and Sand Hill Road (from Highway 280 to Santa Cruz), and all public parking plazas in the central business district (the area between El Camino Real, University Avenue, Menlo Avenue and Oak Grove Avenue);

(g) **Garbage Collection.** Garbage collection Monday through Friday between the hours of six (6) a.m. to six (6) p.m., throughout the city; and between the hours of two (2) a.m. to six (6) p.m., Monday through Friday, and between the hours of six (6) a.m. and six (6) p.m., on Saturdays, for properties abutting the following streets: El Camino Real, Santa Cruz Avenue (between Merrill Street and Johnson), Oak Grove Avenue (between University Avenue and Merrill Street), Menlo Avenue, Doyle Street, Curtis Street, Chestnut Street, Evelyn (between Santa Cruz and Menlo Avenue), Crane Street (between Menlo Avenue and Oak Grove Avenue), University Avenue (between Menlo Avenue and Oak Grove Avenue), Merrill Street, Willow Road (between Bay Front Expressway and Gilbert), O'Brien Drive, Hamilton Avenue (south of Willow Road), Adams Drive, Adams Court, Casey Court, Hamilton Court, Haven Avenue, Independence Drive, Kelly Court, Haven Court, Commonwealth Drive, Chilco Street (between Bayfront Expressway to the Dumbarton spur railway line), Chrysler Drive, Jefferson Drive and Constitution Drive;

(h) **Animals.** Sounds from animals or birds unless such animal or bird howls, barks, meows, squawks, or makes other noises continuously and/or incessantly for a period of five (5) minutes or intermittently for one-half (1/2) hour. For the purposes of this section, the animal or bird noise shall not be deemed a disturbance if a person is trespassing or threatening to trespass upon private property in or upon which the animal or bird is situated or if the noise is for any other legitimate cause, such as someone teasing or provoking the animal or bird. (Ord. 895 § 6, 1999; Ord. 892 § 2 (part), 1999).

8.06.050 Exemptions.

The following noise disturbances shall be exempt from the noise limitations set forth in Section 8.06.030:

(a) **Sound Generated by Motor Vehicles.** Sound generated by motor vehicles, trucks and buses operated on streets and highways, aircraft, trains, and other public transport.

(1) This exemption shall not apply to the operation of any vehicle including any equipment attached to any vehicle (such as attached refrigeration and/or heating units or any attached auxiliary equipment) for a period in excess of ten (10) minutes in any hour while the vehicle is stationary, for reasons other than traffic congestion.

(2) This exemption shall not apply to vehicles equipped with sound amplifiers which are not exempt. No person shall operate or drive any vehicle or cause any vehicle to be operated or

driven, or otherwise used, on any public street, which vehicle is equipped with a sound amplifying device or other machine or device for the production or reproduction of sound, which causes sound to carry onto private property or causes sound to be heard by others using the public streets or thoroughfares which exceeds the noise levels established in Section 8.06.030;

(b) **Emergencies.** Emergency repairs that deal with health or safety risk and emergency generators or powered equipment used during a power outage or other emergency;

(c) **Emergency Warning Devices.** Emergency warning devices such as fire alarms, burglar alarms, warning devices on emergency vehicles and train horns. This exemption shall not apply to the sounding of any burglar or fire alarm or any motor vehicle burglar alarm, except for emergency purposes, unless such alarm is terminated within ten (10) minutes of activation and no more than two (2) false activations within a four (4) hour period;

(d) **City and State Projects.** City and state construction work performed by the city and/or the state, their respective agents or contractors, for city and/or state maintenance, repair or construction projects which cannot be performed from seven (7) a.m. to six (6) p.m. Monday through Friday;

(e) **Special Events.** Any event or use for which a special event permit has been issued by the city that specifically allows noise levels to be exceeded;

(f) **Use Permits.** Any use for which a use permit has been issued by the city that specifically allows noise levels to be exceeded;

(g) **Athletic Fields/Playgrounds/Parks/Public Tennis Courts/Public Recreation Facilities.** From seven (7) a.m. to ten (10) p.m. any organized athletic events or activities occurring on athletic fields, playgrounds, parks, tennis courts or other public recreation facilities owned or operated by a school district, the city or the county; provided, no amplified music or sound system is utilized. (Ord. 892 § 2 (part), 1999).

12.3-139

8.06.060 Temporary permits, special event permits and use permits.

(a) If an applicant can demonstrate that a diligent investigation of available noise abatement techniques indicates that compliance with the requirements of this chapter would be impractical or unreasonable, the director of community development may issue a permit to allow an exclusion from the provisions contained in all or part of this chapter with appropriate conditions to minimize the public detriment caused by such exclusions. Any such permit shall be of as short duration as possible up to three (3) months, but renewable once for up to an additional three (3) month period upon showing of good cause, and shall be conditioned upon details and a schedule for compliance.

(b) The director of community development, or his/her designee, shall have authority to issue special event permits for special events which occur no more frequently than twice per calendar year. The nature, time and notice procedures of such permit process, including criteria for approval, shall be established by the director of community development. Any person dissatisfied with the decision of the director of community development may appeal such decision within ten (10) days of the date of such decision in accordance with Section 16.92.210.

(c) If an applicant can demonstrate that a diligent investigation of available noise abatement techniques indicates that compliance with the requirements of this chapter would be impractical or unreasonable, a use permit to allow an exclusion from the provisions contained in all or part of this chapter may be issued by the planning commission pursuant to the terms and provisions of Chapter 16.82, with appropriate conditions to minimize the public detriment caused by such exclusion. (Ord. 892 § 2 (part), 1999).

8.06.065 Ministerial permits.

(a) The director of community development, or his/her designee, shall issue a permit exempting an existing industrial facility from the provisions of this chapter and the provisions of Section 16.08.095 if the following objective standards are met by the applicant:

(1) The facility is on land that is zoned for industrial uses as of the effective date of the ordinance codified in this chapter* and is located on the San Francisco Bay side of State Highway 101 and

north of the Dumbarton spur railway line.

(2) The facility is at least twenty (20) acres in size. (The facility may be comprised of one (1) or more contiguous parcels under common ownership and use.)

(3) As of January 1, 1999, the facility conducted multi-shift operations that included night-time and weekend operations.

(4) All stationary sources of noise from the facility do not exceed the following noise levels as measured at a residential property line that is closest to the fence-line of the facility: sixty (60) dBA between the hours of six (6) a.m. and ten (10) p.m.; and fifty-seven (57) dBA between the hours of ten (10) p.m. and six (6) a.m. (If multiple residential property lines are the same distance from the facility fence-line and no one residence is closer, the facility operator shall carry-out qualification noise monitoring at the residential property line that receives the greatest amount of noise from the facility.) The date of the qualification noise monitoring by the applicant shall be specified by the director of community development. The qualification noise monitoring on the date specified by the director shall occur during four (4), ten (10) minute periods with one (1) each at mid-morning (nine (9) to ten (10) a.m.), mid-afternoon (three (3) to four (4) p.m.), late evening (ten (10) to eleven (11) p.m.), and early morning (five (5) to six (6) a.m.). An independent noise consultant chosen and paid for by the applicant, and subject to the approval of the director, shall conduct the qualification noise testing.

(5) The initial application for a permit pursuant to this Section 8.06.065 is filed with the director of community development within six (6) months of the effective date of this chapter.*

(b) A facility that has been issued a permit pursuant to this Section 8.06.065 shall operate its permitted facility in such a manner that all sources of noise on the facility do not exceed sixty (60) dBA as measured at residential property lines between the hours of six (6) a.m. and ten (10) p.m., or fifty-seven (57) dBA as measured at residential property lines between the hours of ten (10) p.m. and six (6) a.m.; provided, however, that mobile sources of noise on the facility (i.e., conventional over-the-road vehicles and powered industrial tractors or forklifts) may exceed the noise limits of this section for brief periods when vehicles are entering and exiting the site as part of shift changes.

(c) Every facility that is issued a permit pursuant to this Section 8.06.065 shall:

(1) Identify an individual with primary responsibility for noise monitoring and noise control at the facility;

(2) Maintain a log of any noise complaints received by the facility and a log of actions taken to respond to such complaints;

(3) Maintain a formal internal engineering review process that will ensure that any proposed changes at the facility that could significantly increase the noise from the facility are identified prior to the change and appropriately engineered so that the facility does not exceed the noise limitations specified in Section 8.06.065(b);

(4) For equipment located outside of buildings or on rooftops that is a significant noise source, at the time of replacement because of equipment breakdown, inefficiency, inadequate capacity or obsolescence, put forth a good-faith effort to replace such existing equipment with equipment that is designed and installed so as to reduce the noise level from the facility;

(5) Establish a formal inspection and preventive maintenance program for all pieces of equipment located outside of buildings or on rooftops that are significant noise sources at the facility (such a program should be designed to prevent noise problems from developing because of mechanical problems with the equipment and to detect significant changes in equipment noise levels during inspections so as to prevent nuisance noise complaints);

(6) Undertake an annual program of noise monitoring. The annual program of monitoring shall include, at a minimum, monitoring for three (3) consecutive weekdays and two (2) consecutive weekend days during which noise monitoring measurements occur for ten (10) minute periods, four (4) times per day during: mid-morning (nine (9) to ten (10) a.m.); mid-afternoon (three (3) to four (4) p.m.); late evening (ten (10) to eleven (11) p.m.); and early morning (five (5) to six (6) a.m.). The annual program of noise monitoring shall be designed to: (A) ensure compliance with the requirements of Section 8.06.065(b); (B) identify any significant changes in noise levels; and (C) identify possible opportunities for noise reduction. The annual program shall be a self-monitoring program at the option of the facility; provided, however, the director of community development shall have discretion to periodically request independent verification of such

monitoring data by an independent noise consultant chosen and paid for by the facility and subject to the approval of the director;

(7) Prepare and submit to the director of community development a report on the efforts to monitor and reduce the noise associated with the operation of the facility and to respond to any noise complaints (the noise monitoring and abatement report). The operator shall submit the noise monitoring and abatement report annually on February 1st following the issuance or renewal of a permit pursuant to this section. The noise monitoring and abatement report shall include a summary list of any noise complaints received during the reporting period and the actions taken, and describe: the results of the annual program of noise monitoring as set forth above; ongoing monitoring and maintenance of existing equipment in order to control noise; any specific noise reduction efforts during the reporting period, including specific projects and capital outlays, to reduce the amount of noise from the permitted facility; and any future plans to attempt to further reduce the noise generated from the operation of the facility.

(d) A permit issued pursuant to this Section 8.06.065 may be revoked by the director of community development if the director establishes by a preponderance of the evidence that sources of noise from the facility consistently exceeded the limits as specified above in Section 8.06.065(b) for eight (8) days within any twenty-eight (28) day period, except for construction work undertaken by the facility under a city building permit and conducted between the hours of eight (8) a.m. and six (6) p.m. Monday through Friday.

(e) A permit issued pursuant to this Section 8.06.065 shall be valid for an initial term of ten (10) years. A facility may apply for the renewal of a permit at any time prior to the expiration of the prior permit. The term of any renewed permit shall be five (5) years.

(f) Any decision of the director of community development pursuant to this Section 8.06.065 shall be subject to appeal as provided in Section 16.92.210. (Ord. 892 § 2 (part), 1999).

* Editor's Note: Ordinance 892, which enacted Chapter 8.06, is effective on May 20, 1999.

8.06.070 Time for compliance.

(a) Nonresidential operations in existence prior to May 20, 1999, shall be granted a six (6) month period within which to comply with provisions of this chapter. Any facility not in compliance by the end of such six (6) month period may apply for a temporary permit, as described in Section 8.06.060(a) to be excluded from the provisions of this chapter. This section shall apply only to nonresidential facilities already in existence or for which work of improvement had commenced prior to the date this chapter went into effect.*

(b) Except as provided in subsection (a) of this section, or as provided in Section 8.06.065, all other operations in existence prior to the date this chapter went into effect* shall have three (3) months to comply with the provisions of this chapter or apply for a temporary permit for additional time to comply. (Ord. 892 § 2 (part), 1999).

* Editor's Note: Ordinance 892, which enacted Chapter 8.06, is effective on May 20, 1999.

8.06.080 Administration.

The provisions of this chapter shall be administered by the chief of police and his or her authorized representatives, except where expressly provided otherwise. All other officers and employees of the city shall assist and cooperate in the administration and enforcement of this chapter. (Ord. 892 § 2 (part), 1999).

8.06.090 Violations.

First time violators will be warned and subsequent violations of the provisions of this chapter shall be guilty of an infraction and shall be punished as provided in Chapter 1.12.010(b). (Ord. 892 § 2

(part), 1999

Modesto Irrigation District
The Power to Grow

WATER & POWER
Serving Central California since 1887

October 1, 2007

Paul Maltzer
Environmental Review Officer
WSIP DEIR
1650 Mission Street, Suite 400
San Francisco, California 94103

Dear Mr. Maltzer:

As senior water rights holders and long-time stewards of the Tuolumne River, the Turlock and Modesto irrigation districts ("Districts") welcome the opportunity to provide comments on the Draft Program Environmental Impact Report ("PEIR") for the San Francisco Public Utilities Commission's Water System Improvement Program ("WSIP"). Written comments submitted on October 25, 2005 and April 26, 2007, during earlier phases of the EIR process, are attached hereto and incorporated herein by reference.

We offer the following comments on the June 29, 2007 version of the Draft PEIR.

General Comments

The Districts strongly support the City and County of San Francisco's ("CCSF") efforts to replace an aging infrastructure and to make the necessary earthquake retrofits and other improvements needed to meet modern seismic standards. However, we are concerned about the proposed operational changes and how those changes may impact the Tuolumne River flows or the Districts' water supplies.

The Districts previously requested copies of the models used by the CCSF in analyzing the impacts associated with the WSIP to evaluate the proposed project to determine if: (1) the assumptions made with respect to the Districts' operations are correct; (2) the impacts to the Districts' water and power resources; and (3) the impacts to the Tuolumne River and its fishery resources. Our review of the Draft PEIR reemphasized the need for the Districts to review the models in order to be able to provide informed comments on the Draft PEIR. For example, the logic and assumptions that the hydrologic model uses in its decision process are not clear and there are unexplained inconsistencies. It appears the maximum Don Pedro capacity stated on page 5.3.1-32 is too high, monthly storage values for Don Pedro shown on Table 2.6.3 of Appendix H2-1 appears incorrect, and the model appears to use incorrect criteria for the Districts' dry water year operations resulting in incorrect Don Pedro Reservoir storage numbers. Consequently, we are renewing our request for the models. In addition, we request a 60-day 01

L_MID-TID1

extension of the comment period after receipt of the models to allow for a full evaluation of the models and to enable the Districts to supplement the comments contained herein. 01 cont.

The WSIP relies upon assumptions related to the various water rights and entitlements claimed by the CCSF. The Draft PEIR should provide sufficient information to substantiate the validity of those rights, and the ability to increase the CCSF diversions from the Tuolumne River. With that rationale, the Districts can then evaluate the adequacy of the CCSF claims. 02

The stated fundamental principles guiding the WSIP are (1) "maintaining a clean, unfiltered water originating from Hetch Hetchy Reservoir…" and (2) to "maintain gravity-driven system." (Draft PEIR, page 5-6). This, of course, is understandable given that it is the best quality water available to CCSF and is delivered by gravity. However, CCSF uses these principles to reject alternatives to the project that would result in significantly less environmental impact on the Tuolumne River. It is also important to note that the surface water treatment technology used by most other water suppliers in California are available to meet water quality requirements for other water supply sources, and that most other water suppliers must use pumps to pressurize systems. Such programs can be more costly, but are available to help meet the CCSF's water supply needs. Conformance with the two fundamental principles and other specific "goals and objectives" are not sufficient grounds by themselves to summarily dismiss other available alternatives with less environmental impact. 03

Specific Comments

WSIP Flow and Volume Numbers Need to be Clarified

It is difficult for the Districts as well as other reviewers to evaluate the potential impacts of the WSIP or the validity of the assumptions made in modeling and evaluating the Tuolumne River system, without clarification of the flow and volume numbers used in the analysis. As previously indicated by the Turlock Irrigation District ("TID") in its April 26, 2007 letter, the CCSF should be clear in the Draft PEIR whether millions gallons per day ("MGD") numbers are intended to express an instantaneous rate of flow, such as cubic feet per second ("cfs"), or a total volume of water, such as acre-feet ("AF"). For clarity, we asked if the MGD is intended as an average rate of flow, then the expected minimum to maximum range of flow rates must be disclosed. If MGD is being used for a total volume of water, then both the MGD number and the intended AF number should be reported. 04

The MGD and AF numbers requested in the April 26, 2007 letter form the heart of the Tuolumne River issues and are absolutely necessary for meaningful analysis of the adequacy of the Draft PEIR. A preliminary review of the Draft PEIR shows that these issues have not been clarified as requested. As a result, it is unclear what the anticipated diversion amounts and flows will be with the WSIP, and how they differ from current conditions. Providing the aforementioned data, in a clear format, is essential for Districts to evaluate the WSIP. The Districts renew their request for the models; that the CCSF provide the requested flow data in tabular format; and that sufficient time is given to review the additional data and provide comments.

Proposed Water Transfers

Under Section 3.6.2 "Proposed Drought Water Supply" (pages 3-36 and 3-38) the Draft PEIR envisions the transfer of 27,000 AF of water from the Districts to the CCSF. The Districts do not believe there is sufficient water within the watershed under dry conditions to support the transfers as described in the Draft PEIR. It is inappropriate, therefore, to include the proposed transfer as a part of the CCSF's water supply plan. In addition, the Draft PEIR's discussion of the proposed water transfer from the Districts is [wholly] inadequate for CEQA purposes. A project-specific EIR is legally required to describe the proposed transfer in detail and to thoroughly assess all potential impacts. 05

The Draft PEIR does not discuss the publicly announced proposed Oakdale Irrigation District ("OID") water transfer involving a water exchange with the Modesto Irrigation District ("MID") and, consequently, does not state whether the proposed OID water transfer is intended to substitute for or to be in addition to the CCSF's proposed TID-MID water transfer. If the 28,000 AF OID transfer is intended to be in addition to the 27,000 AF TID-MID transfer, then the potential cumulative environmental impact of some 55,000 AF being eliminated from the Upper Tuolumne River and from the Lower Tuolumne River and the Delta could be significant. 06

Water Quality Impairments may Worsen with Additional Diversions Proposed by WSIP

The San Joaquin River system and its tributaries are currently listed as impaired for a variety of water quality parameters, with others being proposed. For example, the Department of Fish and Game has asked the Central Valley Regional Water Quality Control Board to "list" the San Joaquin River system as "impaired" for temperature, under Section 303(d) of the Clean Water Act. The Draft PEIR proposes increases in mean daily river temperatures of 1-2 degrees Celsius during 15% of the months modeled (page 5.3.3-19), which would be significant, if the river system is already "impaired." Any reductions in lower Tuolumne River flow could exacerbate current conditions. The impacts to the Tuolumne River or San Joaquin River water quality by the WSIP should be thoroughly evaluated and mitigation measures proposed where necessary to ensure that implementation of the WSIP would not result in reduced water quality or increased burdens on other water agencies within the San Joaquin River system. 07

Additional Instream Flow Requirements

In Section 3.7.1, page 3-43, the Draft PEIR states, "Although the fishery release requirements that FERC may impose in 2016 cannot be anticipated at this time, the CCSF assumes, for the purposes of the WSIP, that it will be able to continue its current agreement with TID and MID to pay them to provide all the additional water, if any, required for the fishery releases." CCSF should not assume that it will be able to purchase water from the Districts to meet its future instream flow requirements. 08

While the increased diversions proposed under the WSIP accrue solely to CCSF's benefit, they could potentially result in future measures being imposed by the Federal Energy Regulatory

Paul Maltzer
Environmental Review Officer
WSIP DEIR

Page 4

Commission ("FERC"), or other regulatory agencies. Under Article 8(a) of CCSF's Fourth Agreement with the Districts, CCSF has agreed that "any burdens or change in conditions imposed on account of benefits accruing to City shall be borne by City." As such, any new or additional water release requirements imposed on the Districts as a result of CCSF's increased diversions are to be borne by CCSF. 08 cont.

The CCSF should include in their analysis additional releases down the Tuolumne River to meet future instream flow requirements due to the future actions of the FERC, or other regulatory agencies. To accommodate the ability to increase instream flows, yet still provide the necessary water supplies to its customers, the CCSF should re-evaluate the potential opportunities to recapture some of those flows at a lower point in the system.

Compliance with the Raker Act Requirements

The Hetch Hetchy project, as described in the Draft PEIR, was developed under the authority of the Raker Act. The Raker Act, enacted by Congress in 1913, is a conditional grant of an easement through Yosemite National Park. It was the intent of the Raker Act that San Francisco first develop and use its own water resources before exporting Tuolumne River supplies. It states that CCSF may not export from beyond the San Joaquin Valley any more water of the Tuolumne watershed "than, together with the waters which it now has or may hereafter acquire, shall be necessary for its beneficial use for domestic and other municipal purposes." (38 Stat. 242, section 9(h).)

As stated in the Draft PEIR, the CCSF must adhere to the Raker Act. The program evaluated in the Draft PEIR proposes to increase diversions from the Tuolumne River. With today's technology there are additional resources available to the CCSF and its customers, that were not available in 1913, when the Raker Act was enacted, that if implemented, would eliminate the necessity for the CCSF to divert additional water from the Tuolumne River, and would continue to keep the CCSF in compliance with the Raker Act. Desalinization, advanced treatment processes, conservation options, reclamation projects, and other measures are now available which can provide significant water supplies. Many of these alternatives are evaluated in the Draft PEIR but were determined, for one reason or another, to not be in keeping with the key project principles or objectives. The Raker Act requirements supersede any project principles or objectives the CCSF may establish. As a result, the other alternatives must be fully developed before additional diversions from the Tuolumne River are considered. 09

Additionally, the portions of the Draft PEIR that deal with the expansion of water service appear to be driven by the future needs of the CCSF wholesale customers. Consistent with the Raker Act provisions, these additional needs should first be met through local and other available resources before proposing additional supplies be taken from the Tuolumne River. It is unrealistic to expect that the CCSF could accommodate all future demands of its wholesale customers by drawing additional supplies from the Tuolumne River watershed. Likewise, it would be imprudent for the CCSF to add additional wholesale customers.

Therefore, the Draft PEIR should evaluate the potential options for meeting future needs through the use of local and other available resources, and not rely so heavily upon the Tuolumne River watershed for its supply. 09 cont.

Reduction in Power Supplies

The Draft PEIR acknowledges that implementation of the WSIP will result in lower inflows and operating levels at the Don Pedro Reservoir which will reduce the Districts' hydroelectric production at its powerhouse. The impact of this loss, which is projected to be 14,000 mega-watt hours of clean, renewable energy each year (Draft PEIR page 5.3.9-3), has not been adequately addressed. 10 At a minimum, an evaluation should be made as to the impact, both to the Districts and the state as a whole, of replacing the renewable energy from a thermal resource and mitigation measures identified. This is particularly important in light of current laws and rules requiring the limiting the emissions of greenhouse gases. Simply dismissing the reduction of hydroelectric generation as deminimus is not sufficient.

Potential Impacts Resulting from Climate Change

The Districts question the adequacy of the Draft PEIR's analysis of the potential effects of climate change on the WSIP. A detailed analysis needs to be preformed on the potential impacts 11 to Tuolumne River water supplies resulting to the measures contained within the WSIP, with specific attention given to the proposed increased diversions and in-stream flow requirements.

CCSF's Lower Tuolumne River Diversion Alternative and
Adequacy of CCSF's Proposed Lower Tuolumne River Mitigation Measures

It is inappropriate to take additional water supply from the Tuolumne River watershed to supply to the San Francisco Bay Area when such an action results in redirected impacts to the river system. Additional supplies needed to meet demands within the San Francisco Bay Area should be supplied by resources available to CCSF in their service area. 12

More consideration should be given to the Lower Tuolumne Diversion and the two desalination options, which were determined to have less environmental impacts to the Tuolumne River watershed. We do not believe the evaluation of those options were adequate. All three were superior to the WSIP and the Modified WSIP in terms of reduced impacts to the Tuolumne River system.

Furthermore, the proposed mitigation measures designed to address the potential impacts of diverting more water from the Tuolumne River are inadequate. For example, the Draft PEIR envisions only one mile of river channel restoration as compensation for the long-term reduction 13 in Tuolumne River flows. In addition, there is no mitigation proposed for the impacts to the Districts associated with the reduced power generation that may result from the WSIP's proposed operational changes.

L_MID-TID1

The Districts appreciate the opportunity to provide these preliminary comments on the Draft PEIR. We anticipate that these preliminary comments will be addressed and incorporated into the Final PEIR; that the model and detailed information will be forthcoming; and that additional time will be provided to enable the Districts to complete their evaluation and provide additional comments.

Should you have any questions regarding these comments, please do not hesitate to contact Robert M. Nees at TID (209-883-8214) or Walter Ward at MID (209-526-7459).

Sincerely,

Walter P. Ward

Dear Mr. Maltzer:

Please find attached copies of the two letters referenced in the Turlock and Modesto irrigation districts' comment letter on the Draft PEIR, submitted October 1, 2007. These letters, dated October 25, 2005 and April 26, 2007, were previously submitted to the City and County of San Francisco as a part of the EIR process, and are therefore already a part of the record.

For your ease of reference, we had intended to include additional copies of the letters as a part of the October 1st comment submittal. It has come to our attention that they were inadvertently left off of the October 1st submittal. As a result, we are forwarding the additional copies now.

A copy of both letters was also sent via email.

Should there be any questions regarding the comments, please do not hesitate to contact Robert Nees at (209)883-8214 or Walter Ward at (209)526-7459.

Sincerely,

Debra C. Liebersbach

San Francisco Planning Department
Attn: Paul Maltzer, Environmental Review Officer
WSIP PIER
30 Van Ness Avenue Suite 4150
San Francisco, CA 94103

Dear Mr. Maltzer:

Thank you for the opportunity to comment on the San Francisco Public Utilities Commission's Water System Improvement Program (WSIP) document (dated February 28, 2005) prepared for the Programmatic Environmental Impact Report (the "WSIP Scoping Report"). The District's staff also reviewed the SFPUC Purchase Estimates and Water Supply Options Current Conditions and Year 2030 report, revised draft dated June 28, 2005 (the "Water Supply Options Report"). It is my hope that our comments will warrant special attention, given our status as the senior water right holder on the Tuolumne River. 14

As a long-time partner on the river with the City and County of San Francisco, the District is disappointed that CCSF staff did not discuss with the District the proposed water transfers from the District before the proposal was publicly announced. 15

The District concurs with the proposed action by the SFPUC to remove the proposed fourth pipeline from the WSIP. In making these comments, the District will assume that the fourth pipeline will in fact be excluded from the WSIP. 16 The District is also pleased to see that the SFPUC acknowledges that under agreements between the City and the Districts regarding the Don Pedro Project (specifically the 4th Agreement), the City has an obligation to contribute water for FERC-order fish flows for the lower Tuolumne River. 17

The District is still reviewing and analyzing the information contained in the above reports. The following is a partial list of major issues that we have identified thus far and we ask that they be specifically addressed in the appropriate environmental documents going forward:

1. The water needs analysis in the WSIP is driven by SFPUC's artificial Design Drought.[1] The Design Drought consists of the 1987-92 Drought plus 2 ½ years of the 1976-77 Drought. The 1987-92 Drought was in SFPUC's own words the "most extreme 18

[1] WSIP Scoping Report, pp. 17-18.

TID

historically experienced drought"[2] and the 1976-77 Drought was the most severe short-term drought of record for the Tuolumne River. To put the WSIP's water needs analysis in proper perspective, the EIR must include a parallel analysis that would compare the WSIP's Design Drought with the hydrology from the actual parallel historical period, 1987-94. 18 cont.

2. In order for the District to analyze the data and conclusions contained in the two reports and in the eventual EIR, the District requests that the SFPUC provide the District with an executable copy of each of the hydrologic/hydraulic computer models the SFPUC is employing "to simulate the system in order to most accurately estimate system capacity and capability under future demand conditions"[3] and to model the Districts' operation of Don Pedro Reservoir. As partners on the Tuolumne River, it is important that the District understands how CCSF is analyzing the data and deriving its conclusions. 19

3. CCSF states that "Illustrated in Figure 7 is the circumstances that Tuolumne River diversions during the Design Drought do not materially change with the increase in purchases..."[4] However, CCSF states that ultimately they are only going to increase their baseline by 35 mgd[5] during "Most Years" and 33 mgd during "Dry-Years." That ultimately, recycling and conservation "might" approach 10 mgd, rationing could be as high as 20% and the 117 mgd of the ultimate demand of 417 mgd will include rationing and reclaimed water. The District would like the EIR to address the impact of increasing both dry water year and average water year diversions from the Tuolumne River under existing baseline conditions to the respective increased mgd numbers needed to supply 417 mgd if the conservation and recycling programs are not completely successful. 20

4. The EIR should address whether CCSF is modeling an eventual water treatment scenario for its entire water supply. While Hetch Hetchy water currently undergoes minimal treatment, the District is interested to know if CCSF plans eventually to treat all of its water supply and how that may fit within the WSIP. 21

5. In light of Environmental Defense's legal opinion on CCSF's water rights, the EIR should include an analysis of the specific water rights CCSF would be relying upon to support its increased Tuolumne River diversions. 22

6. It is imperative that the WSIP define the characteristics of "additional water supply via district transfers." As the District has seen no official proposal and as such, has neither discussed nor accepted any terms for a transfer, the EIR must address this issue. The SFPUC regional water supply system "draws approximately 85% of its water from a 23

[2] Water Supply Options Report, p. 7.
[3] WSIP Scoping Report, p. 27.
[4] Water Supply Options Report, p. 27.
[5] Both reports use million gallons per day (MGD). At times, it not clear whether the reports are using MGD as an instantaneous rate of flow like cubic feet per second or as a total volume of water like acre-feet (AF). Also, when MGD is use as a rate of flow, the expected minimum to maximum range of flow rates is not disclosed. If MGD is being used for a total volume of water, then both the MGD number and the intended AF number should be reported, e.g., 100 MGD (112,000 AF) per year, and where a range of MGD flow rates are expected, then the expected minimum to maximum range should be reported.

L_MID-TID1

single remote watershed, feeding a single aqueduct system, delivering water 120 miles by gravity to Bay Area reservoirs and users."[6] That statement dramatically emphasizes that proposed water transfers from the Districts would place even further reliance on that "single remote watershed" and would not meet the SFPUC Program Objectives of providing reliable water and optimizing the system's ability to withstand disasters.[7] 23 cont.

Again, thank you for giving us the opportunity to comment on the WSIP. I look forward to hearing from you. Please feel free to contact me directly at (209) 883-8211 with any questions.

Sincerely,

Larry Weis

Re: Case No. 2007.0118E – San Joaquin Pipeline System Project

Dear Mr. Maltzer,

Thank you for the opportunity to comment on the proposed scope and content of the Environmental Impact Report for the proposed San Joaquin Pipeline System Project of the Water System Improvement Program (WSIP) as summarized in the Notice of Preparation of an Environmental Impact Report and Notice of Public Scoping Meeting dated March 28, 2007 (Notice). It is my hope that our comments will warrant special attention given our status as a senior water right holder and a partner with the City and County of San Francisco (CCSF) and the Modesto Irrigation District (MID) on the Tuolumne River and as a CEQA Responsible Agency for certain aspects of the WSIP (discussed below). Our comments dated October 25, 2005, are attached hereto and incorporated herein by reference. 24

Based upon the new information being provided by CCSF in the Notice and at the April 18 Scoping Meeting in Modesto, TID has the following comments on the proposed scope and content of the EIR:

1. **CCSF Needs to Clarify the WSIP Water Numbers.**

As previously pointed out by TID, CCSF staff uses the term "million gallons per day" or "MGD" in its WSIP documents. Many times, it not clear whether MGD is intended to express an instantaneous rate of flow, such as cubic feet per second (cfs), or a total volume of water, such as acre-feet (AF). Also, when MGD is intended as a rate of flow, the expected minimum to maximum range of flow rates are not disclosed. If MGD is being used for a total volume of water, then both the MGD number and the intended AF number must be reported for clarity, e.g., 100 MGD (112,000 AF) per year, and where a range of MGD flow rates are intended, then the expected minimum to maximum range should be reported. 25

TID

L_MID-TID1

For example, page 13 of the September 6, 2005 Notice of Preparation for the WSIP (Case No. 2005.0159E), states that the SFPUC would "Acquire up to 25 mgd of supplemental dry-year Tuolumne River water through water transfer agreements with Modesto Irrigation District and/or Turlock Irrigation District." Since a rate of 1 MGD for 365 days is 1,120 AF, 25 MGD can mean 28,000 AF per year. In Table 3, page 31 of June 28, 2005 Revised Draft SFPUC Purchase Estimates and Water Supply Options Current Conditions and Year 2030 Projections, lists a "Districts' Transfer" of 29,000 AF per year.

Over the last two years of WSIP planning, TID has noticed that the various numbers reported by CCSF have varied, which is understandable; however, it is difficult to ascertain what the current numbers being used are. Therefore, it is important that the DEIR clearly provide the following numbers* and the basis for their calculation in the CEQA documents: 25 cont.

Metric	Existing Baseline (???? – 200?)	New WSIP Numbers (2030 Level of Service)
San Joaquin Pipeline instantaneous maximum rate of flow	290 MGD ??? 449 cfs ???	313 MGD 484 cfs
San Joaquin Pipeline average annual delivery	260 MGD ??? _______ AF	300 MGD ??? _______ AF
San Joaquin Pipeline average daily flow when any one segment of the system is taken out of service for maintenance	____ MGD ____ cfs	271 MGD 419 cfs
San Joaquin Pipeline average annual delivery during the 30% driest water years (Critical and Dry water years)	_______ MGD _______ AF	_______ MGD _______ AF [projected]
Tuolumne River System Firm Yield	_______ MGD _______ AF	_______ MGD _______ AF
Local System Firm Yield	_______ MGD _______ AF	_______ MGD _______ AF
Total System Firm Yield	_______ MGD _______ AF	_______ MGD _______ AF

*TID staff could not ascertain the current numbers for many of the above key metrics from the WSIP documents so question marks and the blank spaces have been inserted as placeholders.

2. **Impacts of Global Warming on CCSF's Tuolumne River Water Supply.**

At the request of CCSF Hetch Hetchy Water and Power staff, TID staff ran an analysis of the possible impacts of global warming on the Tuolumne River watershed runoff using its state-of-art Hydrologic Forecasting Analysis Model (HFAM) developed by Dr. Norman 26

Crawford for the period 1931 to 2000. The preliminary results of the computer runs have been shared with CCSF staff. This EIR and the Programmatic EIR (PEIR) need to address the potential impact of global warming on CCSF's Tuolumne River System Firm Yield. 26 cont.

3. **<u>Project Alternative – Increased Diversions and Districts' Transfer through New Lower Tuolumne River Diversion.</u>**

Any permitted increase in diversions from the Tuolumne River and any mutually agreed upon water transfers from TID and/or MID should be made through a new lower Tuolumne River diversion facility, which would in part mitigate for any such increased diversions or water transfers.

TID has successfully completed the CEQA review process and is now in the design phase for its Regional Surface Water Supply Project. TID's project would divert up to 66 cfs of water from the Lower Tuolumne River at River Mile (RM) 26 near Fox Grove via an existing infiltration gallery with a maximum diversion capacity of 100 cfs that was constructed in 2003 in anticipation of the project and as part of a major riparian habitat restoration project, Special Run Pool 9, in which CCSF participated. The to-be-constructed water treatment plant will have a capacity to treat and deliver up to 42.5 MGD (47,680 AF per year) of surface water to the communities of Ceres, Hughson, Keyes, South Modesto, and Turlock within TID. This project will also benefit Chinook salmon and rainbow trout in the twenty-six mile stretch of the Tuolumne River from La Grange Dam to the infiltration gallery through increased instream flows especially during the summer months of drier water years.

27

CCSF's EIR should describe and evaluate a similar but larger diversion, treatment, and delivery project that would tie into the San Joaquin Pipeline. For example, a 100 cfs (64.6 MGD or up to 72,200 AF per year) diversion and treatment facilities at two possible locations on the Tuolumne River. The diverted surface water would be treated and delivered via a pipeline from the treatment plant to the San Joaquin Pipeline. The alternative diversion locations could be at the following general areas:

- At RM 25 and would include the riparian habitat restoration of Special Run Pool 10. This would be very similar to TID's project at RM 26 in that it would be in the gravel-bedded reach of the lower Tuolumne River where a buried infiltration gallery can be effectively employed.

- Nearer the mouth of the Tuolumne River within the sand-bedded reach of the river. The advantage of this location would be to provide additional flow for a much longer stretch of the river and a location that would be closer in distance to the San Joaquin Pipeline.

Adding a lower Tuolumne River diversion would also provide an alternative water supply when a segment of the San Joaquin Pipeline needed to be shut down for construction, maintenance, or emergencies. In fact, consideration should be given to constructing this

alternative first to lessen the impact on water deliveries from San Joaquin Pipeline shutdowns due to WSIP construction work or operational emergencies. 27 cont.

4. **<u>TID as a CEQA Responsible Agency for Certain Aspects of the WSIP.</u>**

The WSIP's proposed dry year water transfer from TID to CCSF described in Paragraph 1 above, the lower Tuolumne River diversion described in Paragraph 3, and most likely implementation of other aspects of the WSIP affecting TID's Tuolumne River water rights or water or power operations would require the discretionary approval of TID. The CEQA Guideline, specifically 14 Cal Code Reg § 15381, defines a "Responsible Agency" as including "all public agencies other than the Lead Agency which have discretionary approval over the project." TID would like to reach agreement with CCSF on TID's role as a Responsible Agency with regards to those proposed WSIP activities that are within TID's area of expertise and/or that are subject to TID's approval. 28

5. **<u>Coordination of the PEIR and the Specific Regional EIRs.</u>**

TID learned at the Scoping Meeting that the WSIP consists of 35 proposed regional projects and 35 proposed local projects and that the PEIR is intended to be the overarching CEQA document for all 70 projects. TID's proposed Lower Tuolumne River Diversion Alternative raises significant water supply alternatives, which presumably will be discussed in the PEIR, and illustrates that the PEIR and regional specific projects need to be closely coordinated. However, it is unclear from what CCSF has presented to date, how CCSF intends to insure that these separate but intertwined CEQA processes will be coordinated both as to scope and depth of environmental analysis and as to the timing of those different processes. 29

Thank you for giving us the opportunity to comment. I look forward to hearing from you. Please feel free to contact me directly at (209) 883-8211 if you have any questions or need additional information.

Sincerely,

Roger K. Masuda

Re: Hetch Hetchy/Local Simulation Model (HH/LSM) used in developing the Draft Program Environmental Impact Report (PEIR) on the Water System Improvement Program (WSIP)

Dear Ms. Sokolove:

Thank you for the information provided in your transmittal of October 4th. The CD contained some of the information previously requested. However, it did not contain an executable copy of the hydrologic/hydraulic models, or the modeling assumptions utilized in the analysis.

As stated in our earlier comments, the Districts require both the executable files, as well as the output files and modeling assumption documentation to adequately evaluate and "determine: (1) if the assumptions made with respect to the District's operations are correct; (2) the impacts to the Districts' water and power resources; and (3) the impacts to the Tuolumne River and its fishery resources." 01

Please provide the Districts with the aforementioned models, and simulation information as soon as possible to enable us to finalize our comments on the proposed WSIP. The requested 60-day time extension submitted in the Districts' October 1st comment letter is reiterated here. The additional time is required for the Districts to fully evaluate the models and provide any supplemental comments that may be necessary. If there are any questions regarding the information requested, please do not hesitate to contact Wes Monier, at (209) 883-8321 for clarification. 02

Sincerely,

PLANNING DEPARTMENT
MEA

San Francisco Planning Department
Attention: Paul Maltzer, Environmental Review Officer
WSIP PEIR
1650 Mission Street, Suite 400
San Francisco, CA 94103

Dear Mr. Maltzer:

The city of Millbrae appreciates the opportunity to support and comment on the comprehensive draft Program Environmental Impact Report (PEIR) which the Planning Department has prepared for the Water System Improvement Program (WSIP) developed by the San Francisco Public Utility Commission (SFPUC). This small bedroom community is completely reliant on potable water from the Hetch Hetchy Water System. We have explored the potential availability of ground water within our jurisdiction and found none. We have also explored the potential for providing recycled water to the Green Hills Golf Course and our schools but found the estimated costs to upgrade our waste water treatment plant processes and install a distribution system to be exorbitant and unaffordable at this time. We have also aggressively pursued water conservation best management practices since the early 90s and believe we have been a leader in this area with dedicated conservation staffing. It is crucial to the life and well-being of our community that the ability of SFPUC's water system to with stand earthquakes be improved as well as its long term reliability. 01

The draft we believe will satisfy the requirements of CEQA for program EIRs. We are also concerned that the urgency and critical nature of the work outlined in the WSIP has not been sufficiently highlighted in the PEIR. The loss of San Francisco PUC's Hetch Hetchy Water System for even one week would have a catastrophic effect on this region economically, medically, environmentally, and politically. The loss of this system for any length of time would likely affect the entire nation. We believe it is absolutely crucial to the viability of this region that the WSIP be prosecuted with all due haste. No project contained in the WSIP should be separated from the whole program because each piece is necessary to achieve a seismically safe and reliable system that can consistently produce high quality drinking water. 02

We support the "Environmentally Superior Alternative" outlined in PEIR. However, we 03
believe the PEIR is weak in distinguishing between the amount of water taken from the Tuolumne River by the SFPUC's system and the others who take water from the Tuolumne River. The SFPUC's share of water taken from the River is currently about 12% and even with the combined increases from retail and wholesale users would only 04

San Francisco Planning Department
September 28, 2007
Page 2

increase the total SFPUC draw to 13%. We believe this fact needs to be addressed in the PEIR. 04 cont.

We appreciate that the SF Planning Department will be evaluating the economic and environmental impacts of 10%, 20% and 30% water supply reductions due to droughts. We believe the current 20% reduction goal in the PEIR would have devastating economic and environmental impacts from which the entire Bay Area may not recover for decades, if ever. We are pleased that some economic evaluation of various levels of forced drought reductions in water supply will be evaluated. 05

Thank you for the opportunity to comment on the SFPUC's WSIP PEIR. We enthusiastically support a comprehensive review of the PEIR within the time limits planned by your department. We are very concerned that any delays would significantly increase the costs of the $4.3 billion WSIP, especially in the current busy construction environment. Again, we believe completion of the projects identified in the WSIP on schedule is critical to maintaining both the near-term and long-term seismic survivability and reliability of the SFPUC's water system and the well being of our community.

Sincerely,

Ronnald Popp
Director of Public Works

September 27, 2007

San Francisco Planning Department
Paul Maltzer, Environmental Review Officer, WSIP PEIR
1650 Mission St., Suite 400
San Francisco, CA 94103

Subject: City of Milpitas Comments on the SFPUC's Water System Improvement Program Draft Programmatic Environmental Impact Report

Dear Mr. Maltzer:

The City of Milpitas supports the SFPUC Water System Improvement Program (WSIP), and we appreciate the opportunity to review and provide comment on the draft PEIR. The WSIP is urgently needed to rehabilitate the aging SFPUC water delivery system. It provides necessary seismic upgrades to help the system withstand the major earthquakes that will inevitably strike this region. 01

The SFPUC system provides approximately 60% of the City of Milpitas water supply. The health and safety of our residents and economic viability of our businesses absolutely depend upon the continuing reliability of the system. Indeed, much of the San Francisco Bay Area quality of life and economic prosperity are directly due to this vital resource, so we urge the SFPUC to proceed with the WSIP without delay. 02

We have identified the following items that need to be corrected or clarified in the PEIR.

1. **Milpitas Water Supply.** Please make the following clarifications in Section 7.3.6 (Customer-Specific Summaries) in the City of Milpitas summary and wherever the Milpitas water supply is discussed. 03
   - Include the City's three sources: SFPUC (61%), Santa Clara Valley Water District (32%), and recycled water (7%).
   - Include a statement that the City of Milpitas maintains separate potable distribution systems that are not blended under normal conditions. 04
   - Include a statement that the City of Milpitas' projected increase in water demand will occur mainly in the Santa Clara Valley Water District service area and will not impact SFPUC's water system. In the year 2030, the estimated Milpitas demand for SFPUC water supply is 8.20 mgd which is less than the City's current Supply Assurance amount of 9.232 mgd, so no impact is expected. The following data is an excerpt from Table 3-1 of the City of Milpitas 2005 Urban Water Management Plan. 05

Source	2004-05	2029-30	difference
SFPUC	6.77 mgd	8.20 mgd	1.43 mgd
SCVWD	3.53 mgd	7.13 mgd	3.60 mgd
Recycled Water	0.72 mgd	1.77 mgd	1.05 mgd
Total	11.02 mgd	17.10 mgd	6.08 mgd

05 cont.

- Include the following text: "The City purchases water from the South Bay Recycling Program and distributes it to irrigation customers via 19 miles of recycled pipelines to more than 160 irrigation customers. Recycled water use decreases the amount of potable water the City needs to purchase, thus lowering potable water demands. The City is actively promoting appropriate use of recycled water and will increase its use in the future. The City anticipates that 10% of its water use in 2030 (1.77 million gallons per day, mgd) will be recycled water." 06

2. **Milpitas Water Demand.** In Section 7.3.6 (Customer-Specific Summaries) in the City of Milpitas summary, include a reference to Table 7.2 (Summary of 2030 Demand Projections, Water Supply Assumptions, and SFPUC Purchase Estimates) so it is clear where the referenced 48 percent and 46 percent come from. 07

3. **Water Conservation.** In Section 7.3.6 (Customer-Specific Summaries) in the City of Milpitas summary, include the following text:

The City of Milpitas is committed to water conservation. The adopted 2002 Midtown Specific Plan for redevelopment of this urban center includes policies requiring water conservation and use of recycled water (see item # 11 below for more details). The proposed Transit Area Specific Plan is expected to contain similar policies requiring water conservation and recycled water use. The City Council adopted Ordinance 238 titled "Water Efficient Landscapes" in 1993; see Attachment # 1. The City Council adopted Ordinance 240 titled "Water Conservation" in 1994; see Attachment # 2. See Attachment # 3 for samples of literature and program details. Estimates of water savings made for the period January 1993-October 2000 totaled 136 million gallons. The programs have continued since October 2000 but we have not tracked the savings. 08

Residential Programs: Milpitas residents have demonstrated their ability to conserve water with a per capita water use just under **80 gallons per day** as shown in Figure 4-4 from the City of Milpitas 2005 Urban Water Management Plan. Residents are conserving water by requesting free Water Wise House Calls. A technician from the Santa Clara Valley Water District will check for leaks as well as provide tips for water conservation. Residents are also conserving by participating in rebate programs for high efficiency toilets, washing machines, and shower heads. Some of these programs have been offered for over the last 10 years!

- Over **5,658 showerheads** given away in past 10 years
- Over **2,105 faucet aerators** given away in past 10 years
- Over **5,033 toilet rebates** given away in past 10 years
- Over **2,231 washing machine rebates** given away in past 12 years
- Over **227 Water Wise House Calls** were performed in the past 2 years

Commercial Programs: Commercial and industrial customers can track their water usage by **borrowing water meters** from the City. Commercial washing machine rebates are also available. Large industrial customers recognize the value of saving water; actual data from three Milpitas customers are shown in the table below:

	2000 Usage	2006 Usage	Savings
Company A	200,964 hcf	68,007 hcf	132,957 hcf **66%**
Company B	110,268 hcf	66,565 hcf	43,703 hcf **40%**
Company C	49,608 hcf	36,412 hcf	13,196 hcf **27%**

1 hcf = 748 gallons

08 cont.

Landscape Irrigation: The Santa Clara Valley Water District offers an Irrigation Technical Assistance Program to help evaluate the business' irrigation system as well as offer water saving techniques. **112** Milpitas sites have taken advantage of this program over the past 10 years. Landscaping for new developments are reviewed to insure compliance with AB 325 (City ordinance 238 Water Efficient Landscapes). For the past 10+ years, this amounted to 244 applications for **10,271, 805 square feet**.

Recycled Water: The City of Milpitas started delivering recycled water for landscape irrigation in 1997. The program has grown to 164 irrigation customers. Over 2 billion gallons of recycled water were used during the period of October 1997 through June 2006. There are plans to add about 70 more customers over the next few years. Some areas of the Midtown Specific Plan and the proposed Transit Area Specific Plan landscape area are intended to use recycled water for landscape irrigation.

4. **Project No. SV-2 (Calaveras Dam Replacement).** Indicate in Table 3.10 (WSIP Facility Improvement Projects), Table 3.12, and wherever Project No. SV-2 is mentioned that the City of Milpitas could experience construction-related traffic for this project. Vehicles over 4-tons traveling through Milpitas are required to follow approved routes as shown on Attachment # 4 (Truck Route Map). 09

5. **Project No. BD-2 (BDPL 3 & 4 Crossovers).** Indicate in Table 3.10 (WSIP Facility Improvement Projects), Table 3.12, and wherever Project No. SV-2 is mentioned that Milpitas is adjacent to the project site and is listed as an alternative site under consideration. Vehicles over 4-tons traveling through Milpitas are required to follow approved routes as shown on Attachment # 4 (Truck Route Map). Add a comment: If the project is relocated to Milpitas, then Milpitas requirements for noise, traffic, vibrations, etc., will be followed. 10

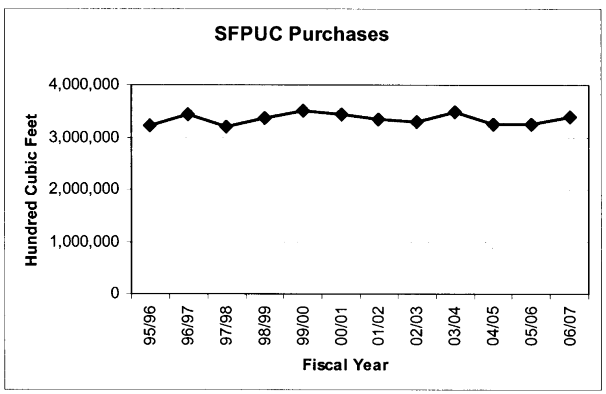
6. **Cumulative Impacts:** Construction has already begun for selected projects within the Milpitas Midtown Specific Plan area. The City of Milpitas anticipates approval of the Proposed Transit Area Specific Plan in 2007. This Plan encompasses redevelopment of 437 acres of land to a Transit Village with high-density mixed-use development. Construction is anticipated to begin shortly after Plan approval and continue over a 20-25 year period. Include the Midtown and Transit Area Specific Plans in Table 4.17-3 Cumulative Projects. 11

7. **Growth:** In Section 7.1.2 (Summary of Conclusions) on page 7-6, we disagree with the 2nd bullet that states *"Milpitas and East Palo Alto have experienced high rates of growth more recently."* The PEIR did not provide the source of data for this statement, so we assume that the "high rates of growth" refers to population.

We developed the following table showing populations for selected BAWSCA agencies. The data was extracted from BAWSCA's 2005-06 Annual Survey (Table V) and shows that there are many other agencies that have higher rates of growth than Milpitas.

	FY 1995-96	FY 2005-06	% Chg
Coastside	13,500	17,372	28.7%
Stanford	22,346	27,715	24.0%
Westborough	9,940	12,000	20.7%
Santa Clara	98,300	108,700	10.6%
Palo Alto	56,850	62,148	9.3%
Milpitas	59,725	64,998	8.8%
East Palo Alto	24,500	25,696	4.9%

Also, as the chart below shows, Milpitas' SFPUC purchases have remained fairly stable since 1995. 12



8. **Milpitas Customer-Specific Summary.** Section 7.3.6 (Customer-Specific Summaries) makes reference to growth that is due to large single-family residential categories that assumes larger homes with higher outdoor water usage. This assumption is incorrect and **does not accurately** reflect the City of Milpitas General Plan Land Use Element, previously approved Midtown 13

Specific Plan (2002), or the currently proposed Transit Area Specific Plan. The goals, policies, and objectives of these plans encourage and promote high-density residential development (20-60 dwelling units per acre) and mixed-used Transit Oriented Development (TOD). As stated below, both specific plans would generate a combined total of approximately 11,400 dwelling units (over a 20 year time period) which are high-density residential (not large single family homes). Milpitas does not have land available for large single family development.

The City is committed to **Smart Growth** and has been incorporating Smart Growth designs into many developments. City voters adopted **Measure Z** in 1998, which prohibits extension of City services such as water and sewer to the hillsides. The City adopted the **Midtown Specific Plan** in 2002, which incorporates high-density housing within the urban core. In addition, the City is currently developing the proposed **Transit Area Specific Plan**, located at the intersection of the existing light rail system and future BART system, that incorporates high-density mixed-use developments reaching up to 60 dwelling units per acre.

Both the Midtown Specific Plan and the Transit Area Specific Plan are in conformance with the Transit Village Development Act. They promote:

- Neighborhoods centered around a transit area with a variety of housing styles and retail centers;
- Access to an intermodal transit system consisting of light rail, pedestrian paths, bicycle routes, and future BART; and 13 cont.
- Infill development that preserves open space.

Water demands are conservatively based upon 2.7 persons per household for both the Midtown Specific Plan and Transit Area Specific Plan. However, with further analysis the population estimates for the Transit Area Specific Plan was based upon 2.52 persons per household, which partially explains the discrepancy of water demand compared to the population growth rate. Note that the Milpitas 2002 Water Master Plan includes an increase in Floor Area Ratio (FAR) for several non-residential zonings in the Midtown Specific Plan, which would increase the water demand per acre. The proposed Transit Area Specific Plan also includes FAR increases for several non-residential zonings.

Revise text to indicate the future trend for the City of Milpitas is "smart growth" with high-density residential housing.

Revise the billing categories in the demand model to eliminate the new single family residential category that assumes larger homes with higher outdoor water usage and replace with high density residential housing as described in the adopted 2002 Midtown and Proposed Transit Area Specific Plans.

Revise PEIR text accordingly.

9. **Table 7.8 (Population Estimates: Water Demand vs. General Plan), page 7-28.** We do not believe that the quoted "Water Customer – Selected Population Projection for 2030" for Milpitas is correct. It needs to be revised from 88,841 to 95,014. The 2002 General Plan population of 77,100 (Table 2-1 in the General Plan) already includes the 4,860 dwelling units from the Midtown Specific Plan. Replace footnote b with the following text: "The projected 14

population is based upon the population shown in the General Plan (77,100) plus the additional population accommodated by the proposed Milpitas Transit Area Specific Plan to account for 7,109 additional units with an assumed density of 2.52 persons per unit (an added population of 17,914, bringing the total population projection to 95,014). Upon adoption of the proposed Transit Area Specific Plan, the City will amend the General Plan." 14 cont.

10. **Elmwood Residential & Commercial Development, page E.6-2.** Revise text to indicate that this development does not receive SFPUC water, but receives District water for potable use and recycled water for some parks. 15

11. **Section E.4.2 (Santa Clara County).** Please add the following text below the existing Milpitas text. 16

Midtown Specific Plan and Transit Area Specific Plan

The City of Milpitas has two major specific plans that will impact the future development and land use within the City: 1) Midtown Specific Plan (adopted March 2002) and 2) Transit Area Specific Plan (currently being developed).

Midtown Specific Plan

The Midtown Specific Plan was adopted by the City of Milpitas in March 2002, and the plan provides for a new vision for approximately 1,000 acres of land. The overall strategy in the Midtown Specific Plan Area is to create a mixed-use community that includes high-density, transit-oriented housing and a central community "gathering place" while maintaining needed industrial, services and commercial uses. Key elements of the plan include:

- Allowing for up to 4,860 new housing units.
- High density residential development (31 to 40 units/per gross acre).
- Transit-Overlay Development (TOD) Zoning within 2000 ft. (41 to 60 units/per gross acre).
- Mixed-use to allow mixture of retail, office, housing services, and public/quasi-public uses.
- Create lively pedestrian-friendly environment.
- 20% Parking Reduction.
- Encourage assembly of parcels along S. Main Street to promote orderly development.

Included in the Midtown Specific Plan are:

- Policy 6.2: Reduce water consumption through a program of water conservation measures, such as use of recycled water, water saving features, and drought-tolerant landscaping.
- Policy 6.4: Continue to require new residential, commercial and industrial development south of the Hetch-Hetchy right-of-way to install recycled water lines with other utilities serving the site. Require conversion of landscape irrigation to recycled water as soon as available. Use recycled water to irrigate landscaping associated with street landscaping and the creek trail system as feasible.

Transit Area Specific Plan 16 cont.

The Transit Area Specific Plan was initiated in November 2004 to promote and encourage high- density residential and mixed-use development around the proposed new Milpitas BART Station located near Capitol Avenue and Montague Expressway. Currently, the Environmental Impact Report (EIR), General Plan and Zoning Change Amendments are being completed. It is anticipated that the Milpitas Planning Commission and City Council will consider the Transit Area Specific Plan within the next few months. Key elements of the plan includes:

- Allowing for up to 7,109 new housing units
- High density residential development (20 to 40 units/per gross acre)
- Transit-Overlay Development (TOD) Zoning within 2000 ft. (41 to 60 units/per gross acre)
- Mixed-use development (280,000+ sq. ft. commercial retail, 750,000+ sq. ft. professional office space)
- Open Space for passive and active recreational use
- 20% Parking Reduction
- Construction of a New BART Station

It is anticipated that this Plan will also include policies regarding water conservation and recycled water use.

Copies of the Midtown Specific Plan are available upon request, and the Transit Area Specific Plan is scheduled to be circulated for comment shortly.

If you have questions, please contact Kathleen Phalen at (408) 586-3345 or kphalen@ci.milpitas.ca.gov.

Sincerely,

Thomas C. Williams

MR PAUL MALTZER—ENVIRONMENTAL REVIEW OFFICER
WSIP PEIR—SAN FRANCISCO PLANNING DEPARTMENT
1650 MISSION STREET SUITE 400
SAN FRANCISCO CA 94103

Dear Mr. Maltzer:

The City of Mountain View appreciates the opportunity to provide comments regarding the comprehensive June 2007 Program Environmental Impact Report (PEIR) prepared by the City of San Francisco Planning Department for the San Francisco Public Utilities Commission's (SFPUC's) proposed Water System Improvement Program (WSIP) to improve the reliability of its Hetch-Hetchy regional water system.

City of Mountain View staff believes the PEIR should include a more focused discussion and greater emphasis on the urgent need to implement the WSIP improvements to protect the public health, safety and economic well-being of the more than 2.4 million Bay Area residents, businesses and community organizations that rely on the Hetch-Hetchy water system. 01

The urgent need to improve the short- and long-term seismic reliability and safety of the Hetch-Hetchy regional water system was the catalyst for the passage of AB 1832, the Wholesale Regional Water System Security and Reliability Act, and the environmental review process currently under way for the WSIP.

The PEIR should also more thoroughly acknowledge the aggressive efforts undertaken by jurisdictions and agencies throughout the Bay Area, including the City of Mountain View, to manage current and future water demand. Detailed information regarding the City of Mountain View's water conservation, water reclamation and resource-efficient land use practices is provided in Attachment 1 to this letter. 02

City of Mountain View staff has thoroughly reviewed the PEIR document and found no significant errors in the document's presentation of statistical or other information pertaining to the City of Mountain View. The City would, however, like to clarify that water service within its jurisdictional boundaries is provided by a City-owned and operated water utility, not a separate water service agency. 03

L_MtnVw

Mr. Paul Maltzer
September 28, 2007

October 1, 2007

Paul Maltzer, Environmental Review Officer
WSIP PEIR
1650 Mission Street Suite 400
San Francisco, CA 94103

Dear Mr. Maltzer:

Thank you for the opportunity to review and comment on the Program Environmental Impact Report for the San Francisco Public Utilities Commission's Water System Improvement Program (WSIP).

We understand the draft document currently under review is for the entire WSIP and project level analysis of individual facility improvements will be considered separately for each of the 22 projects that constitute the WSIP. The City of Newark will be directly impacted by Bay Division Pipeline #5 Reliability Upgrade, as well as the Bay Tunnel Project, within the boundaries of the City of Newark. Mitigation to minimize public inconvenience, ensure public safety including proper traffic control and emergency access during construction, as well as full mitigation of impacts to improvements disrupted by the project both during and as a result of construction, are the primary concerns of the City of Newark. The specific impacts and the proposed mitigation need to be addressed with the project level environmental analysis. 01

It should also be noted that the presence of a lease does not relieve the SFPUC from mitigating environmental impacts as a result of the project. Expenditure for environmental mitigation, being for a public purpose, cannot be deemed a gift of public funds. Further comment will be reserved for the more detailed project level environmental analysis. 02

Sincerely,

John Becker
City Manager

Re: **Draft Program Environmental Impact Report for the San Francisco Public Utilities Commission's Water System Improvement Program**

Dear Mr. Maltzer,

The City of Palo Alto receives all of its potable water supplies from the regional water system operated by the San Francisco Public Utilities Commission (SFPUC). Palo Alto has great interest in the Water System Improvement Program (WSIP) that aims to repair and upgrade the regional water system to increase its reliability. Palo Alto understands that the completion of the Draft Program Environmental Impact Report (PEIR) for the WSIP is a significant step towards timely completion of the urgent seismic improvement projects needed for improved earthquake reliability.

Summary of Comments

- Palo Alto commends the City of San Francisco for completing the very comprehensive PEIR for the WSIP. Preparing the Draft PEIR is a major undertaking and Palo Alto commends San Francisco on its substantial effort. Overall, Palo Alto would support a finding that the Draft PEIR on SFPUC's WSIP is adequate and, therefore, satisfies CEQA requirements.
- Palo Alto appreciates the precious nature and high quality of the water supplies delivered to it in a manner that utilizes a well-engineered system designed to flow by gravity from the pristine mountain source to end users in the Bay Area, and knows that the aging system of pipes, tunnels, dams and water treatment plants is in dire need of upgrades.
- Palo Alto urges San Francisco to move expeditiously to implement the seismic improvement projects contained in the WSIP as they are urgent for earthquake reliability. Palo Alto's City Council has named emergency preparedness as one of its top priorities. 01
- Palo Alto supports the environmentally superior alternative identified in the Draft PEIR, the "Modified WSIP" alternative. This alternative would result in less severe environmental impacts, particularly on the lower Tuolumne River. Palo Alto supports reducing diversions from the lower Tuolumne River as it believes that there is significant potential to conserve or recycle water rather than diverting more water from the river.
- Palo Alto believes there is a significant opportunity for implementing conservation measures through cooperative effort between the Bay Area's wholesale water purchasers and other diverters of Tuolumne River water. Palo Alto would support and commit to pay its share for aggressive conservation measures in these areas as well as in the SFPUC service area. Palo Alto is also committed to implementing cost-effective conservation and water recycling projects in Palo Alto itself.

P.O. Box 10250
Palo Alto, CA 94303
650.329.2477
650.328.3631 fax

- The WSIP should limit drought year reductions to no more than 10% per year. Palo Alto is concerned that a plan that incorporates up to 20% cutbacks in drought years discourages long-term investments in conservation measures by providing what amounts to a "penalty" for maximizing conservation in non-drought years. 01 cont.
- The PEIR should clarify how the 2030 water demand projections were developed using Palo Alto's Comprehensive Plan, which incorporates population and employment figures only through 2010. Further, the PEIR should explain the inconsistency between ABAG's 2030 population projections for Palo Alto and the population forecast used in the PEIR. Palo Alto considers the PEIR estimates to be reasonable and realistic based on anticipated development and historic growth rates for the City. 02
- The WSIP project schedule should be coordinated with Palo Alto's Gunn High School to minimize construction impacts of Project BD-2 on the school, its students, and any other users of the facilities. 03

The City of Palo Alto respectfully submits the following more detailed comments on the subject Draft PEIR:

1. **Palo Alto strongly supports timely completion of the seismic improvement projects contained in the WSIP.** Palo Alto has understood since 1999 that a large earthquake in the Bay Area could result in parts of the SFPUC service area being without water for up to 60 days. The Palo Alto City Council adopted Resolution #7986 (Attachment A) in July 2000 urging the SFPUC to take immediate steps to safeguard the regional water system from earthquakes and to secure water supplies for dry years. Subsequently, City Council adopted Resolutions #8135 and #8136 (Attachments B and C) in support of bills in the state legislature that would form entities that could provide funding for the projects to upgrade and repair the regional water system. 04

   The Palo Alto City Council has determined that emergency preparedness is the first of its top four priorities and strongly supports projects such as the WSIP that would increase the seismic preparedness for the community and better ensure its health and safety. Palo Alto has also supported major local capital projects to improve the reliability of the Palo Alto water distribution system.

2. **Palo Alto supports the "Modified WSIP" alternative, which is identified as the environmentally superior alternative.** Palo Alto believes that completing the seismic upgrades and repairs of the regional water system are critical. While ensuring adequate water supply for the future is important, it is not nearly as urgent as completing the seismic improvements to the regional system. Since water use by San Francisco's wholesale customers remains below the amount committed in the existing Master Water Contract, there is time to explore the development of alternate resources, including recycled water and more aggressive conservation measures. Palo Alto strongly supports the development of these alternate resources and is especially supportive of searching for water conservation opportunities wherever they make the most sense, including in the service areas of Modesto and Turlock Irrigation Districts (MID and TID). 05

L_PaloAlto

3. **Palo Alto believes that the transfers of conserved water from MID and TID that are part of the Modified WSIP alternative should be aggressively pursued, as this may be potentially the least expensive and most effective "new" water supply available for the regional water system.** Because MID and TID are by far the largest diverters of water from the Tuolumne River, they are an obvious source of conservation opportunities that would result in minimizing total river diversions. Palo Alto advocates that SFPUC's wholesale customers pay for the best conservation measures, wherever they exist, to improve environmental conditions on the Tuolumne River. Palo Alto supports aggressive pursuit of conservation opportunities in the MID and TID service areas and would support creating a net increase to flows in the lower Tuolumne River to improve environmental conditions. Palo Alto is concerned about the environmental impacts identified on the lower Tuolumne River and supports significant improvements. 06

4. **Palo Alto strongly supports efficient use of natural resources, including water.** Attachment D contains ordinances, resolutions, guidelines, policies, and reports that document that support. For example, Palo Alto adopted enforceable water use regulations in 1989 that made certain wasteful practices illegal, such as landscape runoff and using potable water to wash vehicles. In March 1991, Palo Alto produced a booklet "Using the Palo Alto Landscape Guidelines" to educate the public and developers on how to use effective water management methods such as automatic controller use, adjusting irrigation for evapotranspiration rates, zone planting for water needs, water budgeting, separating irrigation meters, etc. to limit water used for landscape irrigation. Palo Alto enforces landscape water efficiency standards that are in compliance with the State of California's Water Conservation in Landscaping Act (AB 325). 07

5. **Palo Alto also strongly supports stewardship of the natural environment, including responsible management of water resources and smart growth practices.** In October 2005, Palo Alto adopted modified Ahwahnee Water Principles. These principles address issues such as water contamination, storm water runoff, flood damage, and reliability of water supply. The principles promote compact community design, preservation of natural habitats, reduction of runoff, appropriate landscaping, use of permeable surfaces, dual plumbing for nonpotable water uses, and use of water conservation technologies. Palo Alto understands the relationship between land use practices and natural resource stewardship. Many of the Ahwahnee Water Principles are reflected in Palo Alto's land use ordinances and practices. For example, in 2005, Palo Alto's application for a Priority Development Area designation near a transit station with the potential for in-fill growth was approved. In 2006, Palo Alto adopted an ordinance amending its Municipal Code in support of pedestrian and transit oriented development combining district, to implement Palo Alto's Housing Element and Comprehensive Plan policies in support of resource conservation. An amendment to the Municipal Code in 2007 promotes sustainable landscaping (Chapter 18.40.130), stream corridor protection (Chapter 18.40.140), and storm water quality protection (Chapter 18.40.150). Also, in 2007, Palo Alto adopted an ordinance amending Municipal Code Chapters 18.76 and 18.77, which address Palo Alto's Sustainability Policy and Green Building practices. 08

6. **Palo Alto has long offered robust energy and water conservation programs, services and technical support, to its residential and business customers.** As a provider of natural gas and electricity as well as water, the City of Palo Alto Utilities can effectively promote efficiency improvements by informing customers through its Utilities bill inserts. Attachment E contains past bill inserts specifically related to water efficiency. Along with bill inserts, City of Palo Alto Utilities has produced and/or distributed marketing materials to its customers to promote efficiency. Attachment F contains a sampling of marketing materials specific to water efficient programs and practices. City of Palo Alto Utilities also makes extensive use of advertisements in print media to get out the message on efficiency. Attachment G contains copies of ads and articles promoting water efficiency. City of Palo Alto Utilities also has an active school education program to encourage efficient use of resources. Attachment H is a collection of materials, including workbooks, flyers, and brochures used in school water efficiency education programs.

7. **Palo Alto's efforts to manage demand citywide are effectively illustrated in the graphic showing actual water consumption since 1965 in Attachment I.** Palo Alto's water usage peaked in 1976 at almost 20,000 acre-feet per year (AFY). After lowered consumption during the 1976-1977 drought period, usage rebounded to almost 19,000 AFY in 1988. Efforts to curb consumption during the extended drought period from 1988 to 1992 were successful with consumption since the drought ranging between 14,000 AFY and 15,000 AFY. Consumption projections for the future are flat at about 15,000 AFY, far lower than actual usage in 1976 despite increases in population and economic activity in Palo Alto over the last 30 years. 09

8. **During both the 1976-77 and the 1988-1992 drought periods, Palo Alto implemented an extensive public education program on water conservation.** Palo Alto produced many materials designed to educate the public about the drought and promote water efficiency. A sampling of these materials is found in Attachment J.

9. **Palo Alto has long structured its residential retail water rates to promote efficient use of water.** Since July 1976, Palo Alto has had an "increasing block rate structure" for residents. Increasing block rates increase as the quantity used increases. This rate structure is considered by the California Urban Water Conservation Council to be water conserving pricing. Attachment K contains Palo Alto's residential water rates since July 1976. During the 1988-1992 drought, Palo Alto was able to achieve the goals for water use cutbacks by increasing the differential between the rates in lower and higher use tiers. Because the conservation pricing, extensive public education, conservation programs, use restrictions and related enforcement practices that were used were so effective, Palo Alto did not need to implement rations or limits for residential customers during that drought.

10. **Palo Alto's ongoing efforts to encourage and invest in conservation are not well served by the proposed drought-time rationing goal of cutbacks of up to 20%.** With the threat of a pre-determined rationing goal, Palo Alto and other wholesale customers may have difficulty continuing to invest in conservation measures and recycled water projects. To the extent that demands are limited and wastes are eliminated, getting an 10

L_PaloAlto

additional 20% reduction in usage is and will be difficult. The Draft PEIR evaluated a "water supply variant" with 10% maximum drought reduction and determined that the environmental impacts of such an option were similar to the impacts of the proposed program and that the average annual diversions from the Tuolumne River would be the same over a long period of time. Besides increasing supply reliability, the 10% rationing option would reduce the inevitable economic impact resulting from the extended reduction of water supplies. Palo Alto supports the 10% maximum drought reduction "water supply variant" and encourages San Francisco to select that option. In concert with the pursuit of additional conserved water from MID and TID, this option could result in no additional diversions from the Tuolumne River in droughts than the proposed program. 10 cont.

11. **The Draft PEIR addresses the concept of an additional intertie with the Santa Clara Valley Water District (SCVWD), but presents it only as a strategy that affects water supply sources.** This concept, which Palo Alto raised in its written comments regarding the Notice of Preparation of the PEIR, would increase desirable redundancy and operational flexibility for both regional systems (SFPUC and SCVWD) and offers improved emergency response. The concept could help meet or exceed the Level of Service goals for the project relating to seismic reliability and deliverability. The PEIR discusses a dry year transfer concept and a future water supply source for the SFPUC regional system and rejects those ideas with good reasons. However, the concept of using a new intertie for emergencies is not given adequate discussion. Such an intertie would be created by extending SCVWD's West Pipeline from the point where it currently ends at Foothill Expressway and Fremont Avenue in Mountain View to Foothill Expressway and Page Mill to Bay Division Pipelines 3&4. Alternately, the West Pipeline could be paralleled back to SCVWD's Rinconada Water Treatment Plant to improve reliability for both regional systems. 11

12. **Palo Alto understands that one of the crossovers between Bay Division Pipelines 3&4 for WSIP Project BD-2 is located in Palo Alto.** The site for the crossover in Palo Alto is identified in the Draft PEIR is "near Barron Creek, adjacent to the running track and sports fields at Gunn High School." According to the Draft PEIR, the project includes a valve vault of approximately 3,750 square feet with the drainage outfall located on the site and that piping to connect the facility to outfalls would be required. In addition, a control building (3 to 8 feet high) for electrical and mechanical equipment at the valve vault is required. Section 4.3 of the PEIR should include an elevation/schematic of the control building and/or vault so the reader has an understanding of what the facility will look like and how it may visually impact sensitive areas. Many of the mitigation measures for WSIP project impacts located within Palo Alto involve construction. The PEIR should state that mitigation measures may not violate City ordinances, including, but not limited to, noise and nuisance ordinances. In addition, Palo Alto expects to be involved in and consulted at an early stage in this project. 12

The City of Palo Alto respectfully submits the following comments with reference to specific sections and pages on the subject Draft PEIR:

13. **Pages 4.3-17 and 6-4** list several mitigations for construction impacts. The first measure listed on page 6-4, Neighborhood Notice, in and of itself is not mitigation. This measure may make it more palatable to neighboring residents because they will know when construction will occur, but it doesn't reduce the impact. As a substitute mitigation, Palo Alto suggests coordinating with Gunn High School in order to limit construction of the crossover to times during the school year that would be least likely to result in noise and other construction impacts on school activities. 13

14. **Page 4.3-22** mentions that additional right of way/easement could be needed for the crossover outfall at the Gunn/Veteran's Administration hospital location. The PEIR should identify how much additional land will be required, when that will be determined and where it will be located.

15. **Page 4.3-40** of the PEIR is ambiguous as to whether the control building and/or vault will be visible from Foothill Blvd. If it will not to be visible, then no mitigation is needed. If it is going to be visible, then it should be so stated in the PEIR.

16. **On page 4.12-10**, the first two sentences of the City of Palo Alto section should read: "Palo Alto has a total of 4,358 acres of parkland and open space areas including 32 City urban parks encompassing approximately 200 acres and several large open space and nature preserves. Foothills Park is approximately 1400 acres and the Arastradero Preserve is approximately 610 acres." Many of the City parks are dedicated parks, created by ordinance. The City Charter bans substantial building, construction, reconstruction, or development upon or with respect to any dedicated park lands except pursuant to ordinance subject to referendum. 14

17. **Page 6-6** in the last paragraph under the Cultural Resources section should clarify that it is San Francisco's Planning Department and Environmental Review Officer that will be responsible for these actions. 15

18. **Section 7.3** needs to be clarified regarding the population and employment forecasts used for the water demand projections and assumptions. The discussion should be clear that the City's projected population and employment forecasts in the PEIR for the year 2030 are assumed to be extrapolated from the Palo Alto 2010 Comprehensive Plan; the forecasts used in the analysis are within 10% and 16% of the 2010 Comprehensive Plan population and employment figures, respectively. ABAG's projected 2030 population growth cited in the PEIR for Palo Alto's Sphere of Influence is over 33% higher than the 2030 population projection for Palo Alto used in the PEIR. The PEIR does not explain why ABAG's population projections are significantly higher than the population projections used for the water demand plan given that both are for a 2030 horizon. The PEIR should explain that the City considers the forecast used in the PEIR to be a reasonable and realistic projection of Palo Alto's anticipated growth through 2030. Historically, Palo Alto has grown very slowly; the 2000 census showed a 5% increase in 16

L_PaloAlto

population over a thirty year period from 1970. Although in the last seven years, Palo Alto has experienced unprecedented new housing development resulting in an 8% increase in population (still far below the ABAG projections), this growth cannot be sustained given Palo Alto's limited land availability and redevelopment potential; therefore, the City considers the PEIR 2030 population forecast, which is approximately a 10% growth increase from our 2010 Comprehensive Plan projected population, to be a reasonable increase. 16 cont.

Palo Alto commends the City of San Francisco for completing the very comprehensive PEIR for the WSIP, especially in the context that the WSIP is a significant step towards timely completion of the urgent seismic improvement projects needed for improved earthquake reliability.

Sincerely,

Yoriko Kishimoto
Mayor

Purissima Hills Water District

September 28, 2007

Mr. Paul Maltzer, Environmental Review Officer, WSIP-PEIR
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, California 94103

Subject: **San Francisco Water Supply Improvement Program (WSIP) Comments on Programmatic Environmental Impact Report (PEIR)**

Dear Mr. Maltzer:

Purissima Hills Water District serves 6,000 people in Los Altos Hills with excellent quality water from the San Francisco Public Utilities Commission system. The PEIR addresses regional water supply issues that are critical to reliable water supply and fire safety in Los Altos Hills. The lack of a reliable water supply places billions of dollars of property at risk of fire including Foothill Jr. College with 18,000 enrolled students, a public elementary school, a large private high school, and over 3,000 high value residential buildings. 01

Background
Fifty-one years ago, soon after San Francisco constructed the Bay Division 3 and 4 pipelines, Purissima Hills Water District was formed to tap into this reliable and high quality water supply to replace a multitude of poor quality water wells. We, along with Palo Alto, Hayward, Burlingame, Millbrae, and other Districts have come to rely on the Hetch-Hetchy system as our primary supply source, since we have no other realistic supply options.

Fifty years ago, the Town of Los Altos Hills was founded with the objective of preventing uncontrolled development in the rural foothills just south of Palo Alto and Los Altos that enveloped the Purissima Hills service area. The Town founders established a principle of "Smart Development" to protect the abundant natural resources and prevent over-building by adopting a minimum lot size of one acre.

Since its inception, the Town has transitioned from apricot and prune orchards and a one room school house, to a desirable residential community with many large and beautiful homes. The Town has grown into a vibrant, environmentally oriented community in parallel with the economic growth of Silicon Valley. People from all around the area come to Los Altos Hills for education, walking, hiking, biking, and horse-back riding and to

enjoy the extensive open space preserves and adjacent parklands and natural and manmade amenities of the community.

Unjustified Criticism
We take offense at the mis-characterization of our Town as a community of water wasters who squander water for irrigating lawns. In our situation, using per capita water consumption as a measure of waste is misleading and contrary to the facts. Per capita figures ignore the impact of 18,000 students and faculty who outnumber the resident population by over 2:1. Adoption of "Smart Development" principles actually reduced water consumption in the Hills to between one-half to one-tenth that of neighboring communities on a per acre basis. These communities, with six to ten homes per acre and high density condominiums and apartments, use far more water per acre than we do. As a District that uses less than 1% of the Hetch-Hetchy supply, our daily consumption is far less than the amount of unaccounted water that leaks each day from the pipes in San Francisco. 02

Sense of Urgency
For most of this decade San Francisco has been laboring to develop a master plan for making the long overdue seismic improvements contained in the Water System Improvement Program. These vital improvements are in reality emergency measures that are exempt from CEQA requirements. Immediately after the Loma Prieta earthquake, East Bay MUD, the sister water utility across the Bay, developed a detailed plan for seismic improvements to their system. They are 95% complete with construction and in operation. By contrast, San Francisco has been in the EIR stage for the past two years, and is expected to continue for another three to five years for individual projects. 03

Eighteen years after Loma Prieta, we cannot wait any longer. Every day without the seismic improvements in place puts the life safety of 2.4 million people in jeopardy and risks a catastrophic loss of property resulting in wreckage of the local economy. The risk assessment included in the WSIP indicates a potential outage of up to 60 days from a major earthquake on the Hayward or San Andreas faults. The PEIR does not adequately address the catastrophic economic impacts of such a disaster. Within the past month, we have had two serious fires near our District, one on adjacent Stanford University's antenna site and one in Stevens Creek Park. Without a reliable water supply, our Town, Stanford, and the nearby businesses could have gone up in smoke, with billions of dollars of property loss, potential loss of life and immense destruction of the natural environment and wildlife. 04

Population and Water Use
We believe that "growth inducement" is a non-issue and that claims to discredit the increased water demands for 2030 are unsubstantiated. The growth documented in the WSIP to support the 300 MGD demand by 2030 is based on planned growth— derived, analyzed and approved by the legislative bodies of each entity, as well as ABAG. As history has shown, the growth will occur, not as a self-fulfilling prophesy, but as a natural 05

result of the Bay Area's economic dynamics and attractions. To ignore this growth would be irresponsible on the part of the SFPUC's planners. 05 cont.

Furthermore, the projected demand already includes the adoption of an array of conservation measures, including relative effectiveness developed by a consulting engineer. As documented by BAWSCA, per capita water consumption in the Bay Area has actually decreased significantly. While technology may offer more means for water conservation in the future, experience has shown that with the Best Management Practices already in place and demand reductions already achieved, further improvements are likely to be marginal. 06

Desalination

With regard to the proposed desalination modification, we are of the opinion that it will not improve reliability or provide a substitute for surface water or banked water in an emergency. Desalination is an energy intensive process; it contributes "Greenhouse" gas because of the energy usage; it relies on electricity that will not be available during an earthquake; and it produces brine that is damaging to the environment. Major desalination plants such as at Santa Barbara have been deactivated because of the extreme cost. By contrast, the use of stored surface water allows delivery to users entirely by gravity, and produces clean hydroelectric power with no Greenhouse emissions or environmental damage. 07

Conclusion

We eagerly support the WSIP as it was developed, as analyzed in the PEIR, and without variations or further modifications except for those that would speed up project implementation. We urge the San Francisco Planning Department and Planning Commission to proceed without delay to complete the PEIR as expeditiously as possible, and to work diligently to certify the document as required by CEQA so the time critical work of WSIP implementation can proceed without delay. 08

Editorial comments and corrections regarding portions of the PEIR documents are enclosed.

Sincerely,

Daniel J Seidel

Subject: **Case No. 2005.0159E, Draft Program Environmental Impact Report for the San Francisco Public Utilities Commission's Water System Improvement Program**

Dear Mr. Maltzer:

Thank you for providing the City of Redwood City (City) the opportunity to comment on the Draft Program Environmental Impact Report for the San Francisco Public Utilities Commission's (SFPUC) Water System Improvement Program (WSIP PEIR). The comments transmitted in this letter represent the combined comments of all City departments with interest in and/or responsibility for WSIP projects within the City's boundaries. Our comments are organized from general to specific topics.

Support for WSIP and PEIR

The City of Redwood City is a member of the Bay Area Water Supply and Conservation Agency (BAWSCA) and receives 100 percent of its potable water supply from the San Francisco regional water system. The Redwood City water utility serves over 83,000 people by supplying approximately 13,000 acre-feet of water annually. Our customers include individual single family homes, mixed use and stand-alone multi-family residential developments, schools, hospitals, a wide variety of retail services, the high tech industry, heavy industrial uses, the Port of Redwood City, recreational facilities, and other important contributors to the local community and regional economy. Just as these customers rely on the City to provide them with an uninterrupted and high quality potable water supply, the City relies on the San Francisco regional water system for this same uninterrupted and high quality water supply. Redwood City, therefore, supports the WSIP and believes that its importance and need cannot be understated. 01

While the Program Description chapter (Chapter 3) of the PEIR adequately describes the goals, objectives and details of the individual projects and water supply options associated with the Program, the **overarching urgency of program implementation** is somehow lost. This urgency is clearly conveyed in the program's legislative impetus, AB 1823, and needs to be communicated in the Summary and Program Description chapter. 02

The City of Redwood City also supports the programmatic approach to the environmental review for the WSIP. We believe the PEIR meets the requirements of the California Environmental Quality Act (CEQA) for program EIRs. 03

L_RdwdCty

Relationship of WSIP to Bay Division Pipeline Reliability Upgrade Project

The WSIP facility improvement project with the greatest potential to impact Redwood City is the Bay Division Pipeline Reliability Upgrade Project (BDPL Nos. 1 and 2), described in Section 3.8 of PEIR, Proposed Facility Improvement Projects. This is accurately reflected in Table 3.11 on page 3-60 of the PEIR. As you are aware, the San Francisco Planning Department is currently conducting project-level CEQA review for this project (Case No. 2005.0164E). Redwood City submitted a comment letter on the Notice of Preparation (NOP) for that project on July 7, 2006, and continues to work in collaboration with SFPUC engineering staff on the design drawings for this project. Rather than comment on the BDPL project through the WSIP PEIR, we will continue our involvement with SFPUC on this project through the project-level CEQA process. Based on recent communication with SFPUC staff, we understand that the Draft EIR for the BDPL project is scheduled for public release in early 2008. 04

Specific Comments

Section 3.4.4 – Water Demand Studies: This section describes the methodology and assumptions used by the SFPUC to develop the water demand projections that provide the basis for 2030 water purchase estimates from the SFPUC regional water system. These projections were developed in close collaboration with BAWSCA and its member agencies, including Redwood City. The City has reviewed this section and concurs with the water purchase estimates assumed for Redwood City. As noted in PEIR Tables 3.3 and 3.4, Redwood City's water purchase estimate from the regional water system in 2030 is a range of 11.60 to 12.60 million gallons per day (mgd). Redwood City's initial best estimate (April 2005) of future water purchases was 12.6 mgd, which is the value used for SFPUC planning purposes and evaluation in the PEIR. This methodology is supported by Redwood City. The future water purchase estimate was revised to 11.6 mgd in November 2005 to reflect implementation of the Redwood City recycled water project. Redwood City's contractual supply assurance from the regional water system is 10.93 mgd (12,243 acre feet per year). 05

Section 4.12.1 – Recreational Resources Setting: Recreational resources in Redwood City that could be affected by the BDPL project are described on page 4.12-11. Minor corrections should be made to the acreages of the parks described in this section. Fleishman Park is 0.64 acres, Hawes Park is 1.59 acres, and Red Morton Park is 30.89 acres. 06

Section 4.17.2 – Projects Considered in Cumulative Analysis: This section describes the cumulative projects identified by local and regional agencies that are assumed for the cumulative impacts analysis. The projects selected for Redwood City are still relevant, but it would be helpful to know the cut-off date used for project selection. Please identify for the reader the **date** this list was developed. 07

Section 7.3.6 – Customer-Specific Summaries: This section summarizes information regarding water demand and growth projections for each wholesale customer, as well as the consistency between the growth called for in the adopted general plan and that which could be supported by the WSIP. Page 7-53 contains the discussion for the City of Redwood City. The following correction should be made to the third paragraph in that discussion. The customer-selected population projection used for Redwood City in the demand study was the City's 2003 Urban Water Management Plan (UWMP). This document was chosen because the general plan in effect at the time the demand projections were prepared (2004) was the Redwood City Strategic General Plan adopted in 1990, and the 2003 UWMP contained the most current population, employment and growth projections for the City at that time. Contrary to the text in the WSIP, the 1990 Strategic General Plan **does not** contain a buildout population projection, and its horizon year is **2000,** not 2020 as indicated in the PEIR. Table 7.8 should also be corrected to indicate that the Redwood City population projection shown in the column titled "General Plan Population Projection for General Plan Projection Year" is the ABAG projection, not the City's 08

General Plan projection. The column titled "General Plan Projection Year" should either be changed to 2000 or changed to the projection date used by the ABAG reference. The reference to the population projections in the Downtown Precise Plan EIR is accurate. 08 cont.

It should be noted that Redwood City is in the process of developing a new General Plan. The General Plan will contain a Water Supply Element that is based on the City's most recent 2005 UWMP. The Water Supply Element will also highlight the significant water conservation actions the City has and will continue to implement, and will discuss how the City's Smart Growth principles support these water conservation efforts and overall water use efficiency in Redwood City.

<u>Section 9.2.4 – Aggressive Conservation/Water Recycling and Local Groundwater Alternative:</u> We understand that the purpose of this alternative is to identify potentially **new** conservation, recycling and renewable groundwater projects that, together with existing supplies, could meet the SFPUC system-wide normal year demand of 300 mgd in the year 2030. These projects would be in addition to those already identified in the WSIP. Table 9-11 on page 9-50 of the PEIR shows low and high range yields (in mgd) for various recycled water, groundwater and conservation projects that could conceivably make greater contributions to water supply than are assumed for the WSIP (thus, we assume, the term "aggressive" for this alternative). The Redwood City recycled water project is identified in the table as a Category 2 project, which are defined as "eligible projects in early planning stages." The table indicates that the recycled water project could generate an additional low range yield of 2.2 mgd and a high range yield of 4.5 mgd. This information is accurate, and was provided to the SFPUC as part of its preparation of a Technical Memorandum on Investigation of Regional Water Supply Option No. 4 (March 6, 2006). 09

We look forward to continued involvement in this project. Please do not hesitate to contact me if you need additional information or clarification on any of the comments provided in this letter.

Sincerely,

Chu Chang for Peter Ingram

San Francisco Planning Department,
1650 Mission Street, Suite 400,
San Francisco, CA 94103

SUBJECT: Water System Improvement Program PEIR Comments

Dear Mr. Maltzer:

The City of San Jose Municipal Water System (SJMWS) has reviewed the Programmatic Environmental Impact Report (PEIR) for San Francisco Public Utility Commission's (SFPUC) Water System Improvement Program (WSIP), and is pleased to provide comments and supplemental information supporting some of the WSIP's statements and conclusions. We believe the WSIP is a critically important and time sensitive project, which will ensure a reliable, sustainable system for the millions of local citizens who rely on the SFPUC for all or a portion of their water supply. San Jose is committed to working with our community to conserve natural resources and safeguard the environment for future generations. SJMWS generally supports the PEIR as written, and would like to take this opportunity to express support of the environmentally superior alternative, namely, the Modified WSIP, which will ensure continued delivery of a vital resource to the public while simultaneously promoting conservation and environmental preservation. 01

The WSIP highlights the need for local communities to work together in order to promote efficient use of supplies, and SJWMS has demonstrated continued support of this approach in its operations. The City of San Jose serves potable and recycled water to several portions of San Jose, including part of the North San Jose/Alviso area. SJMWS's North San Jose/Alviso service area meets its water demands through a combination of potable and recycled water supplies. Currently, 90% of demands are met by potable water from SFPUC, and 10% is supplied from recycled water. Additionally, SJMWS has implemented a wide range of conservation measures in order to reduce customer demands. While SJMWS generally supports the PEIR's project analysis, we would like to take this opportunity to provide corrections and supplemental facts to the information relating to San Jose. 02

3025 Tuers Road, San José, CA 95121 *tel* Administration (408) 277-4218, Engineering (408) 277-3671

Water Conservation

Water conservation activities for the SJMWS are implemented by the City of San Jose's Water Efficiency Program (WEP) and the Santa Clara Valley Water District (SCVWD). WEP has focused primarily on implementing indoor water conservation programs throughout the San Jose/Santa Clara Water Pollution Control Plant's tributary area. The SCVWD implements both indoor and outdoor water conservation programs throughout Santa Clara County. A sample of historic and current conservation programs, information, brochures and marketing materials promoted within the Santa Clara County area is included in Attachment A. In addition to these regional efforts, the City of San Jose has implemented additional water conservation policies, including Water Waste Prevention ordinances and inverted block rates to promote the efficient use of potable water supplies (see Attachment B). 03

SJMWS has been a signatory of the California Urban Water Conservation Council (CUWCC) since 1995. As a signatory, SJMWS is obligated to implement several conservation programs and submit Best Management Practice Activity Reports and Coverage Reports to the CUWCC reporting database on a biennial basis.

The City of San Jose is currently in the process of developing a City Water Conservation Plan (Plan), which will outline the City's commitment to increasing citywide water conservation by 30,000 acre-feet per year by 2030. The Plan will build upon the above mentioned programs and policies to outline the steps the City will take towards accomplishing this goal, and is anticipated to be presented for City Council adoption in spring 2008.

Growth

The City's North San Jose Area Development Policy (Policy) will guide the ongoing growth and development of the North San Jose area as an important employment center for San Jose. The Policy is a long-range planning effort, addressing future potential growth and development needs with an emphasis on efficient and sustainable development. The Policy promotes smart growth principles, and key goals of the effort include:

- Proactively plan for growth to allow more industrial development in a way that benefits current San Jose residents.
- Allow up to an additional 27 million square feet of research and development and office space in North San Jose. 04
- Bring up to 83,000 new jobs to San Jose, providing additional job opportunities for San Jose residents.
- Concentrate up to 16 million square feet of the new research and development and office space in a 600 acre Urban Corporate Center core area along the light rail corridor.
- Develop an average 1.2 FAR in the core area with typical buildings of 6-10 stories.
- Focus on high-tech and corporate headquarters development.
- Create a rich pedestrian environment within the core area to encourage use of the transit system.
- Generate approximately $520 million in funding for the construction of local and regional transportation improvements.

L_SanJose

- Provide new high-density residential development (up to 32,000 units) in close proximity to employment centers.

The North San Jose/Alviso area currently consists of mostly commercial and industrial development, with pockets of residential areas throughout. Industrial and commercial customers currently account for the largest percentage of water use within SJMWS' North San Jose/Alviso (NSJMWS) service area. With additional development adhering to the Policy guidelines, it can be expected that residential water use will eventually account for most of the water use within the NSJMWS area. Please see Attachment C for additional information on the Policy. 04 cont.

Water Supply and Demand Projections

The City of San Jose has historically demonstrated an effort to expand water supply sources in an effort to conserve the limited potable supplies available to the area. In continuing to promote efficient use of water supplies and to ensure a reliable supply for the public, NSJMWS' current and projected demands will be met from a variety of sources. ***The PEIR incorrectly states that "all current and projected demands adjusted for conservation will be met with SFPUC supplies." The projected demands listed in the PEIR do not account for the water demands to be met from sources other than the SFPUC.*** (see Attachment D) Future demands (adjusted for conservation) in the NSJMWS area will actually be supplied from a variety of sources, including SFPUC potable deliveries, recycled water, and groundwater. 05

Recycled water has been supplied to the NSJMWS area since 1998, and the system has continued to expand since that time. Recycled water is supplied to the area for a variety of uses, including irrigation, industrial processing, and dual plumbing (see Attachment E). As of the end of 2006, recycled water has supplied nearly 1.3 billion gallons to the NSJMWS area (see Figure 1). Throughout the past 5 years, recycled water has consistently accounted for between nine and eleven percent of the area's total water supply. Ultimately, when the area has been developed in accordance with the above mentioned Policy, recycled water is projected to account for almost 30% of the area's total water supply. The PEIR states that NSJMWS' 2030 demands will be met entirely with SFPUC supplies, while it is actually estimated that SFPUC supplies will only account for 59% of the area's total demands, with the remaining demands to be met with groundwater and recycled water. 06

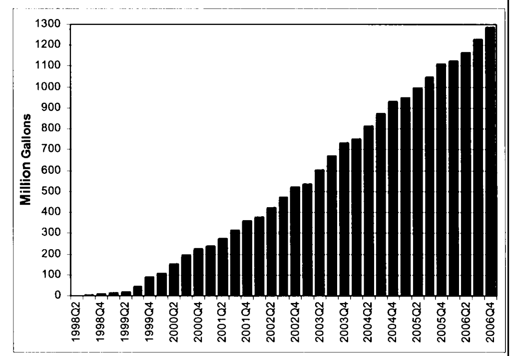

Figure 1. Cumulative Recycled Water Use in the NSJMWS Area

The expanded use of recycled water plays an integral role in meeting the increased demands associated with development of the NSJMWS area (see Figure 2). The City of San Jose, both as a recycled water wholesaler and retailer, employs many programs and strategies designed to encourage

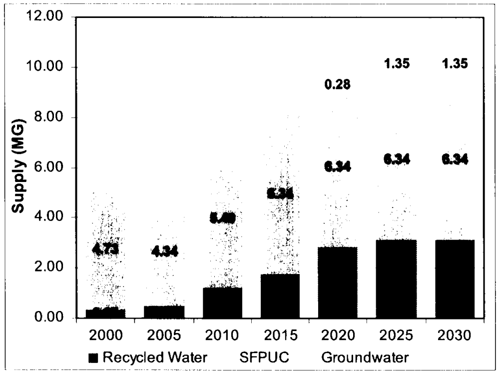

Figure 2. Historic and Projected Water Use in the NSJMWS Area

the use of recycled water, including grants, incentive programs, discounted rates, recycled water usage guidelines, and public education and outreach (see Attachment F). Additionally, if a development is located in the vicinity of the recycled water distribution system, the City's Municipal Code requires the use of recycled water for all landscaped areas in excess of ten thousand square feet. Continued and expanded implementation of these programs and requirements will help in growing the future use of recycled water. 06 cont.

While future water demands in the NSJMWS area will be met with a variety of sources, a reliable supply from the SFPUC system is an essential component to ensure that public needs continue to be met. Implementation of the WSIP will greatly improve the seismic and delivery reliability of a system which would otherwise be at great risk of catastrophic failure when the next large seismic event occurs. 07

The City of San Jose appreciates the opportunity to participate in the WSIP planning process, and looks forward to continued collaboration with the SFPUC with the goal of providing a high quality, reliable supply of water to the public. If you have any questions regarding any of the information provided, please feel free to contact me at (408) 277-4218.

Sincerely,

Mansour Nasser

Re: City of San Bruno Comments to SFPUC Water System Improvement Program, Draft Program EIR

Dear Commission:

The City of San Bruno ("San Bruno") appreciates the opportunity to provide the following comments to the Draft Program Environmental Impact Report ("PEIR") for the Water System Improvement Program ("WSIP").

PEIR, pp. S-18 and 3-56; also p. C-9 PEIR indicates as part of a regional conjunctive-use project, the SFPUC would construct about 10 new groundwater production wells in San Mateo County to develop about 6 mgd of potable groundwater for use as a supplemental drought-year supply. In nondrought years under this project, the SFPUC would provide potable water from the regional system to customers in Daly City, San Bruno, and South San Francisco to substitute for groundwater currently used for municipal purposes, thereby reducing groundwater pumping and allowing the groundwater basin to recharge naturally. In drought years, the groundwater would be available for local use to supplement the regional system water. This project would require agreements with the affected agencies see (Section 3.13). 01

San Bruno Comment The references to 6 mgd (6,700 AFY) and 10 wells are inconsistent with the 8,100 AFY and 15 wells currently used to describe the conjunctive use project. The rate of extraction changes the impact to the groundwater resource, so the actual anticipated production rate should be used, not an average including years without production. Groundwater use may be regional as well as local.

PEIR, pp. 3-18, 3-19, 5.7-87, 7-15, 7-18, 7-54, E.1-2. e.2-2, e.2-18; tables 3.3, 3.4, 7.2, 7.3, E.1.1, E.2.1, E.2-6 San Bruno Demand Projections. 02

San Bruno Comment San Bruno's projected cessation of groundwater is based on a worst-case groundwater scenario. San Bruno plans on maintaining its groundwater production capacity and

Oregon
Washington
California
Utah
Idaho

L_SBruno

utilizing groundwater supplies in the future. Please refer to San Bruno's UWMP, Table 13, footnote c. 02 cont.

PEIR, p. 3-42 As part of the WSIP, the SFPUC would utilize a groundwater conjunctive-use program in the Westside Groundwater Basin in northern San Mateo County. Under this program, wholesale customers in this area (such as Daly City, California Water Service Company, and San Bruno, which currently pump groundwater to meet a portion of their potable demand) would receive additional supplies from the regional system during nondrought years to offset their groundwater pumping, and would cease pumping and allow the aquifer to recharge naturally. In exchange, those customers would increase groundwater pumping during drought periods, thereby reducing the amount of their purchase requests during a drought and creating a temporary reduction in system demand. 03

San Bruno Comment The PEIR should be clear that the program is "proposed" as the local agencies have not agreed to terms.

PEIR, p. 3-72 An estimated 14 new groundwater wells in San Francisco, Daly City, San Bruno, and South San Francisco (Groundwater Projects, SF-2). 04

San Bruno Comment This reference is inconsistent with the 15 wells currently used to describe the conjunctive use project in San Mateo County alone.

PEIR, pp. 5.6-8, 5.7-86 As of 2006, Cal Water had not resumed pumping and San Bruno had resumed pumping at rates of approximately 1.5 mgd (1,700 afy). 05

San Bruno Comment San Bruno's 2006 groundwater production was 1,955 AF.

PEIR, p. 5.6-17 The City of San Bruno is constructing two monitoring wells along the bay side that should provide additional insight into the mechanisms preventing seawater intrusion. 06

San Bruno Comment This sentence should state, "The City of San Bruno constructed two monitoring wells clusters in 2006 along the bay side that have provided additional geologic information and allow for monitoring of groundwater levels and groundwater quality at different depths along the bay margin."

PEIR, p. 5.6-17 In the South Westside Groundwater Basin, manganese has exceeded the secondary drinking water standard in San Bruno and Daly City. 07

Portlnd3-1600991.1 0066062-00001

San Francisco Public Utilities Commission
October 1, 2007
Page 3

San Bruno Comment Clarify that exceedances are for untreated water prior to treatment. Treated water meets secondary standards. 07 cont.

PEIR, pp. 5.6-17, 5.7-86 The total increase in groundwater storage is approximately 13,000 acre-feet. 08

San Bruno Comment The PEIR should include the basis for the 13,000 AF estimate (water levels and estimated aquifer properties).

PEIR, pp. 5.6-21 thru 5.6-22 In accordance with Section 4.68.225 of the San Mateo County Code, the San Mateo County Environmental Health Division would not grant a well permit for a large well in a public park, cemetery, or golf course that could potentially cause overdraft of the South Westside Groundwater Basin or be located in an area subject to a specific and localized groundwater problem. 09

San Bruno Comment Section 4.68.225 applies to all wells except residential use, temporary construction, cathodic protection, geophysical exploration/monitoring, and emergency wells for drinking water purposes, not just public park, cemetery, or golf course wells.

PEIR, p. 5.6-25 During drought conditions, the SFPUC would be able to reduce the quantity of SFPUC system water delivered and the stored groundwater or banked water would be available for local use to supplement supplies from the regional water system. 10

San Bruno Comment It should be clarified that a portion of the banked water may be introduced into the regional water system under specified conditions.

PEIR, p. 5.6-26 The SFPUC would construct about 10 new groundwater production wells in San Mateo County with the capacity to develop about 7 mgd (or nearly 8,100 afy) of potable groundwater as a supplemental drought-year supply for the participating pumpers. The PEIR also suggests that groundwater withdrawals would be restricted to the amount of water banked. 11

San Bruno Comment 10 wells is inconsistent with the 15 wells currently used to describe the conjunctive use project. Supplemental supply would be for participating pumpers and for the regional system.

L_SBruno

San Francisco Public Utilities Commission
October 1, 2007
Page 4

Under the proposed project participating pumpers can pump both their "previously pumped quantities" as well as the quantity of banked water resulting from the project. Furthermore, the proposed cunjunctive use program does not restrict pumping as described. Existing pumpers rights to pump groundwater are not altered as a result of the proposed project. 11 cont.

PEIR, p. 5.7-87 The 2006 UWMP for San Bruno does not yet reflect long-term participation in the SFPUC's proposed conjunctive-use program, but participation in this program is expected to be included in the next revision of its UWMP. 12

San Bruno Comment Change to "but, if approved, participation in this program is expected to be included in the next revision of its UWMP."

PEIR, p. 5.7-90 To the south of this area, future pumping includes up to approximately 0.27 mgd (300 afy) of pumping from private wells and negligible irrigation pumping by the City of Burlingame. 13

San Bruno Comment Text should mention municipal pumping in future pumping estimates.

PEIR, p. 5.7-91 Although in a drought year, pumping under the Regional Groundwater Projects, in combination with municipal pumping by the participating pumpers could temporarily exceed historic high groundwater withdrawal rates, the proposed operating agreement(s), executed between the SFPUC and the participating pumpers, would outline allowable operating parameters for pumping during drought years to avoid adverse long-term conditions; an operating committee would be formed to develop annual operating maintenance plans as well as an annual operating schedule. 14

San Bruno Comment The text "could temporarily exceed" is more accurately stated as "is anticipated to significantly exceed." It should also be noted that the proposed agreements do not alter existing pumpers rights as to groundwater use.

PEIR, p. 5.7-91 Implementation of the operating agreement(s) would ensure that impacts related to basin overdraft, saltwater intrusion, and land subsidence would be less than significant. 15

San Bruno Comment Add "by, among others, restricting pumping from conjunctive use project wells should groundwater levels fall below historical lows."

San Francisco Public Utilities Commission
October 1, 2007
Page 5

PEIR, p. 5.7-91 Because there are no other planned future uses of groundwater in this portion of the basin, other than the those existing uses described above that would continue, and impacts of the WSIP would be less than significant due to implementation of the proposed operating agreement(s), cumulative groundwater impacts would be less than significant. 16

San Bruno Comment Under the proposed project participating pumpers can pump both their "previously pumped quantities" as well as the quantity of banked water resulting from the project. Furthermore, the proposed cunjunctive use program does not restrict pumping as described. Existing pumpers rights to pump groundwater are not altered as a result of the proposed project.

PEIR, p. 5.7-100 City of San Bruno Public Draft Urban Water Management Plan. December 2006. 17

San Bruno Comment Utilize the final UWMP, dated January 2007 and used elsewhere in the document.

PEIR, p. E.3-38 Not applicable for UWMP population projections. 18

San Bruno Comment San Bruno UWMP is available and contains population projections based on the draft general plan with comparisons to previous projections.

Best regards,

Barbara A. Brenner

Inquiry from the City of Santa Clara re: Public Hearing for the SFPUC's Water System Improvement Program

Gloria Sciara <gsciara@ci.santa-clara.ca.us> **Tue, Aug 28, 2007 at 3:39 PM**
To: wsip.peir.comments@gmail.com

** High Priority **

Dear Agency

Can you advise if this PEIR contains work in Santa Clara, regarding the "Bay Division Pipeline 3 and 4 Crossover Facilities Project".? If so, then we need to review the EIR. 01

Thank you for your quick response.

Water & Sewer Utilities

RECEIVED

AUG 27 2007

CITY & COUNTY OF S.F.
PLANNING DEPARTMENT
MEA

August 23, 2007

Paul Maltzer, Environmental Review Officer, WSIP PEIR
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103

Dear Mr. Maltzer:

The City of Santa Clara is pleased to offer our comments on the Water System Improvement Program (WSIP) Programmatic Environmental Impact Report (PEIR). The City of Santa Clara supports the PEIR as written. The City of Santa Clara also supports the San Francisco Public Utilities Commission's (SFPUC) WSIP preferred alternative as it is currently proposed. We urge the SFPUC to proceed with the current WSIP and not re-engineer projects. The WSIP is critical to ensuring a sustainable, reliable water system for both the City and County of San Francisco and the other bay area communities that also rely on the SFPUC system. The City is very concerned about potential service interruptions caused by earthquake damage to the SFPUC system or failure of critical infrastructure as a result of deferred maintenance. Such interruptions would not only cause disruption to a critical supply of water within Santa Clara but would even more significantly wreak havoc on our regional economy. The lack of redundancy in critical operational and delivery facilities is also of great concern given that maintenance has been deferred for many years on these critical facilities. 01

The City of Santa Clara is committed to the efficient use and sustainability of all of our regional water supplies. The City has demonstrated this commitment through the implementation of extensive water conservation, use of recycled water, and smart growth development. The following is a brief description of these programs and activities we are providing in order to help clarify the extent and benefits of these programs. 02

Water Conservation

The City of Santa Clara has a demonstrated commitment to water conservation. The City has a full compliment of water conservation programs that provide reductions for a wide variety of water uses. Copies of the various brochures and program descriptions are enclosed for reference. The individual programs are listed in the table below. Highlights of just some of these programs are also described in brief below. Detailed descriptions of the programs and 03

Wet Program	X		

03 cont.

Water Audit and Incentives

- *Residential leak detection*- According to the AWWA report Residential Ends Uses of Water (AWWA, 1999) leaks account for 13.7% of the water used inside an average home. The primary source of leaks is toilets. The City offers free leak checks to residents in an effort to reduce the amount of water lost through leaks.
- *WaterWise House Calls* - According to the District's literature, the average program participant reduced their water usage by 30 gallons per day as a result of the audit.

Residential Plumbing Retrofits

- *Ultra Low Flush Toilet programs.* The Ultra Low Flush Toilet Programs have taken a number of different forms over the years. Initially rebates were offered as an incentive to consumers to purchase Ultra Low Flush Toilets. A full service program offered the opportunity for residents to have an Ultra Low Flush Toilet installed for a nominal fee of $50 has been offered. One program consisted of distribution events where free low flow toilets are distributed to residents. A past program also offered a full service installation program exists for elderly, low income, and disabled individuals to provide qualifying individuals the opportunity to have an Ultra Low Flow Toilet installed at no cost to the resident. The current program offers a rebate for High Efficiency Toilets (HET)

Paul Maltzer, Environmental Review Officer
August 23, 2007
Page 3

- Free low flow devices such as showerheads and aerators have been distributed by City staff since the conservation program's inception.
- *High Efficiency Washer Rebate Program* - The District offers rebates for the purchase of high efficiency washers by residents or commercial facilities. According to District literature, the average household reduces water usage by 5,100 gallons per year by switching to a high efficiency washer.

Large Landscapes

- *Irrigation Technical Assistance Program (ITAP)-* The program was created by the District in 1994 to assist landscape managers improve efficiency of their irrigation systems. According to the District literature, the average commercial/multi family residential site reduces water usage by 600 to 800 hundred cubic feet per acre per year after participating in the program.

Public Information Program

- Water conservation and the programs referenced above are promoted within the City by means of newspaper articles, educational displays, and public events.

School Education

- The District operates an extensive public information and education program directed at school age children. In 1994, the District's Public Information Office hired a full-time, fully credentialed educator who holds lifetime Teaching and Administrative Services credentials to coordinate the school education programs. This included developing school programs, contracting with the Youth Science Institute for additional instructors, and supervising university student interns as classroom assistants. In 2001 a second, bilingual educator joined the district's full-time staff to assist with the program. As of 2005, over 4,000 students have been educated through this program.

WET Program

The Water Efficient Technology (WET) program is a conservation program that offers rebates to commercial and industrial customers for the installation of innovative water saving technologies. A rebate amount of up to $50,000 is available for each project. The specific rebate amount is based on the amount of water savings and the cost of the technologies installed. Examples of the types of projects and the amount of water saved are shown in the table below. These savings are permanent and will continue on into the future. WET program's combined 426 acre-feet of annual water savings comes at an very cost effective average cost of $1300/AF/yr.

Recycled Water

The City's recycled water system has been in operation since 1989. The City's recycled water program has grown significantly from the original system which merely supply irrigation to the City's golf course and a truck filling station (see Figure 4). The City has aggressively pursued customers for recycled water including its use in industrial processes, residential irrigation and dual plumbed buildings for toilet and urinal flushing. One of the largest recent developments in Santa Clara, the Rivermark development, which represents a 10% increase in the City's population, make extensive use of recycled water including irrigation for parks, a school, median strips, commercial and residential landscaping. In addition, the 1800-

Figure 1 Rivermark Development

03
cont.

Paul Maltzer, Environmental Review Officer
August 23, 2007
Page 5

residence Rivermark development consists of medium and high density housing with significantly less irrigated area than more traditional single family developments. The Rivermark development is pictured on the previous page.

Figure 2 Santa Clara University

The City has also pursued more traditional uses for recycled water as a drought proof water source for large turf area irrigation in commercial settings. The customers currently using recycled water for large scale landscape irrigation include Santa Clara University, the Great America Theme Park, the 49ers' training facility, Santa Clara Municipal Golf Course and the Mission City Cemetery.

The City has also promoted the use of recycled water in industrial processes such as paperboard manufacturing. California Paperboard has significant success in switching their pulping process over to using 80% recycled water. 03 cont.

Other uses for recycled water continue to be explored as well such as recycled water in cooling towers as at the City's new 147 MW Don Von Raesfeld Power Generation Facility. This state-of-the-art low emission generation facility represents one of the largest recycled water users in the City.

Recycled water use in the City has grown to the point where recycled water constitutes more than 10% of the total water supply to the City. Recycled water use has been steadily increasing over the years as seen in the graph below. In fiscal year 2006/07, recycled water customers used 994 million gallons of this highly treated, plentiful, drought proof water supply.

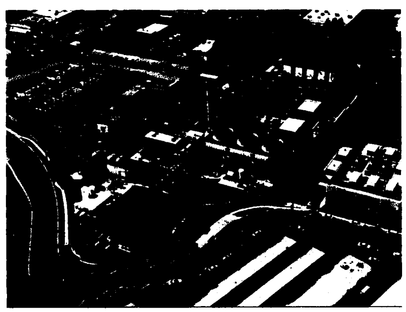

Figure 3 Don Von Raesfeld Power Generation Facility

L_SClara2

Paul Maltzer, Environmental Review Officer
August 23, 2007
Page 6

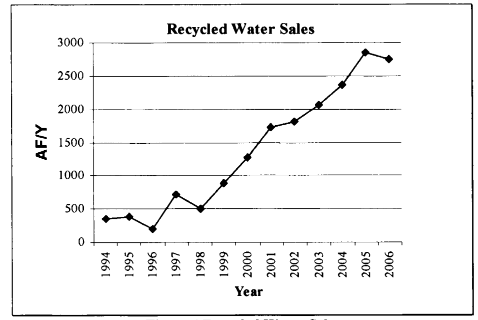

Figure 4 Recycled Water Sales

03 cont.

The City continues to promote recycled water and look for additional customers for recycled water that will replace potable water use. The next major pipeline extension to be funded by SBWR will supply recycled water to the City's Central Park as well as three schools and some street frontage landscaping. This will convert approximately 150 AF/year of potable water irrigation to recycled water usage. Two other pipeline alignments are identified for supply to commercial/industrial areas of the City. Although these pipeline extensions are not currently proposed for funding due to the reduction in flows to the WPCP, an additional 300 to 400 AF/year of recycled water could be utilized, primarily for irrigation and cooling. The City also continues to explore other non traditional uses for recycled water such as cooling water for large data centers.

Smart Growth 04

Santa Clara is a growing and thriving City. Most of the developments within the last 5 years have been higher density or mixed use developments and most of these projects were redevelopment of existing properties. These redevelopments are typically very compact, close to transportation corridors, and have minimal landscaped areas resulting in minimal outside

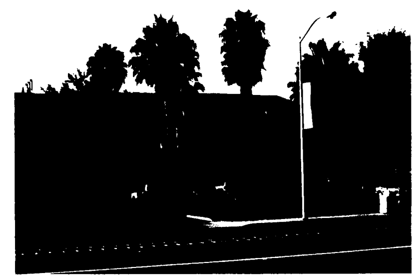

Figure 5 Example of mixed use development

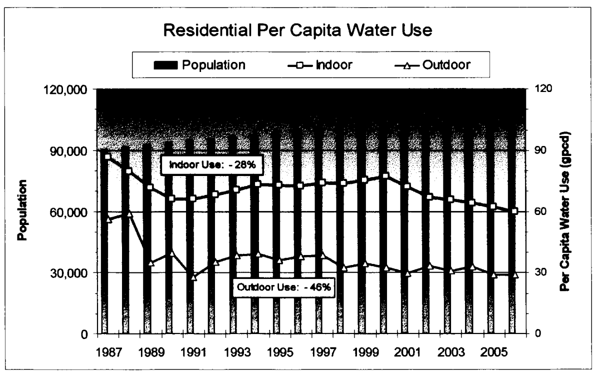
water use. The City's last General Plan Amendment (2002) provided for up to 7500 added residential dwelling units including an additional 2000 residential units with new designations for sites along El Camino Real as mixed use (commercial with residential) similar to that shown in Figure 4. The City's 2030 water demand projections includes this and probable future General Plan revisions and/or Amendments that would allow further in-fill and increased density near transportation hubs like the downtown multi-modal (train) station and proposed BART extension. The State's projections for regional housing needs will assign (via ABAG) approximately an additional 5900 housing units to the City of Santa Clara which will be addressed in the next planning period. 04 cont.

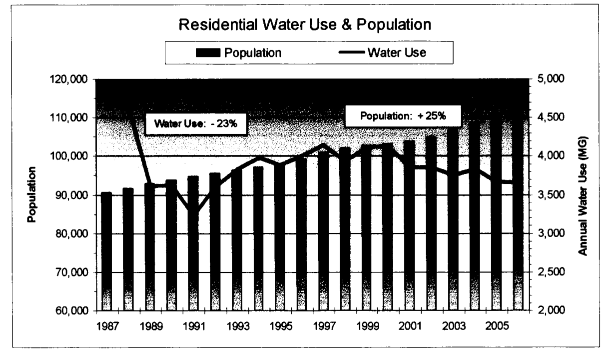
Documented results

The results of these water conservation, recycled water and Smart Growth programs are documented and measurable. Over the last 20 years the residential per capita water usage has decreased significantly. This steady decrease in the residential per capita water use is vividly displayed in the graph below. As shown in the graph below, by 2006 the residential per capita water use declined to just 89 gallons/person/day for combined indoor and outdoor water use. Over this 20 year period indoor per capita water use decreased by 28% and outdoor per capita water use decreased by 46%. 05



While it is true that over the last 20 years the City's populations has increased by 25%, the residential water demand has stayed relatively flat or decreased due to water conservation, changes in the plumbing code and the use of recycled water as shown by the graph below.

L_SClara2



05 cont.

As outlined above, the City of Santa Clara is concerned about the reliability and sustainability of its water supply and the water supplies of its neighboring cities. We have made investments and taken the steps available to us to ensure our ability to supply water to the residents and businesses that call Santa Clara home. However, as noted earlier we have significant concerns regarding the reliability of the SFPUC system. Therefore, we urge the SFPUC to proceed with the preferred alternative WSIP as expeditiously as possible. 06

If you have any questions regarding the information in these comments, please feel free to contact me at (408) 615-2011.

Sincerely,

Mr. Robin G. Saunders

Mr. Paul Maltzer
Environmental Review Officer
Water System Improvement Program PEIR
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103

Subject: Comments on the Draft PEIR

Dear Mr. Maltzer:

The Santa Clara Valley Water District (District) provides wholesale drinking water supply for 1.7 million residents and is the primary water resources manager for Santa Clara County. We manage the conjunctive use of surface and groundwater resources to ensure that water supply is reliable to meet current and future demands. We actively manage the groundwater basin to optimize beneficial uses and aggressively protect the groundwater basin from contamination and minimize inelastic land surface subsidence.

As you well know, San Francisco Public Utilities Commission (SFPUC) and the District share the responsibility of providing a clean, safe and reliable water supply to cities and entities in the northern portion of Santa Clara County. SFPUC supply comprises 15% of the overall water supply in Santa Clara County and constitutes 100% of the water supply to some cities.

We expect SFPUC to continue providing its water supply in Santa Clara County and meet the projected 2030 purchase requests submitted by the wholesale customers. This expectation is described and documented in the District's and the cities' 2005 Urban Water Management Plans. The cities collaborated with SFPUC on its demand projection and water use efficiency studies and arrived at reasonable and defensible projections on future water needs. These water supply and demand projections constitute the foundation of water resources planning for the next 30 years, for the cities, SFPUC and the District.

We urge San Francisco to adopt the proposed Water System Improvement Program (WSIP) and meet all the program goals and objectives. Any diminution in levels of service provided by SFPUC could result in significant impacts to water resources in Santa Clara County with associated environmental and socio-economic consequences. 01

Santa Clara Valley had a legacy of land subsidence in the 1920's and 1930's due to over-extraction of ground water. Through the District's water importation and conjunctive use management, land subsidence was halted by the late 1960's and the District has been vigilant in preventing its re-occurrence. Understandably, we are very concerned with any potential re-directed impacts on our groundwater basin and local or imported surface water resources due to SFPUC's reduction in supplies or level of service provided to Santa Clara County. We also urge San Francisco to fully address any potential impacts on water supplies for the State Water Project and Central Valley Project users. 02

L_SCVWD1

We support SFPUC's goal to maximize water conservation, recycling and desalination. The District has been very aggressive in implementing programs to maximize water use efficiency and further diversify our sources of supply. We believe these program areas are ideal for SFPUC and the District to partner with local land-use entities in their implementation. However, there are practical limits in "implementability" of these programs and they cannot be used as "stand-alone" substitute alternatives or variants because they fail to meet the overall program goals. 03

We look forward to San Francisco addressing our concerns adequately and adopting the PEIR and WSIP expediently so that the critical work of securing the water supply for the Bay Area communities can begin.

Sincerely,

Keith Whitman
Deputy Operating Officer
Water Supply Management Division

SAN FRANCISCO
BAY TRAIL

RECEIVED

SEP 25 2007

CITY & COUNTY OF S.F.
PLANNING DEPARTMENT

September 24, 2007

San Francisco Planning Department
Attention: Paul Maltzer, Environmental Review Officer, WSIP PEIR
1650 Mission Street, Suite 400
San Francisco, CA 94103

Subject: **Draft Program Environmental Impact Report for the San Francisco Public Utilities Commission Water System Improvement Program**

Dear Mr. Maltzer:

On behalf of the San Francisco Bay Trail Project, I am submitting comments on the Draft Program Environmental Impact Report (PEIR) for the San Francisco Public Utilities Commission's Water System Improvement Program (WSIP).

The Bay Trail Project is an organization administered by the Association of Bay Area Governments (ABAG) that coordinates implementation of the Bay Trail. When complete, the Bay Trail will be a continuous 500-mile network of bicycling and hiking paths encircling both the San Francisco and San Pablo bays. It will link the shoreline of all nine Bay Area counties, passing through 47 cities, and will cross major toll bridges in the region. To date, 290 miles of the proposed trail network has been developed.

The proposed Water System Improvement Program intersects with the Bay Trail alignment in the Bay Division Section (BD-1), specifically in Menlo Park. Please see the attached map showing the location of existing and proposed Bay Trail segments in this area (Exhibit A). The Bay Trail Project supports construction of the new Bay Division Pipeline 5, proposed as a five-mile underground pipeline from the Newark Valve Lot to the Ravenswood Valve Lot, because once underground, the new "Bay Tunnel" segment of the pipeline will have less impact on the adjacent marshland and recreation areas and may assist with completion of a gap in the Bay Trail. 01

The following comments should be considered as part of this environmental analysis:

- On page 4.12-7, the Draft PEIR states that the Bay Trail is a 400-mile corridor with 280 miles constructed. This should be corrected to state that, when complete, the Bay Trail will be a 500-mile corridor and 290 miles currently exist. 02

Administered by the Association of Bay Area Governments
P.O. Box 2050 • Oakland California 94604-2050
Joseph P. Bort MetroCenter • 101 Eighth Street • Oakland California 94607-4756
Phone: 510•464•7935
Fax: 510•464•7970

L_SFBayTrl

- On page S-14, Table S.2, the Draft PEIR states that portions of the above-ground Bay Division Pipeline Nos. 1 and 2 between the Newark Valve Lot and the Ravenswood Valve Lot will be decommissioned, but that decommissioning is not part of the project. We strongly recommend that the BDPL Nos. 1 and 2 be decommissioned *and* physically removed to reduce the existing impacts to habitat and allow for the closure of a Bay Trail gap in this area. 03

- On page 4-12-22, Table 4.12-2, the following should be added to "Potentially Affected Recreational Resources" for BD-1, Bay Division Pipline Reliability Upgrade: Ravenswood Open Space Preserve, San Francisco Bay Trail. 04

- On page 4.12-24, the Ravenswood Open Space Preserve and the San Francisco Bay Trail should be added to the list of recreational amenities in the vicinity of the pipeline alignment for the BDPL Reliability Upgrade Project (BD-1).

- A major gap in the Bay Trail exists in Menlo Park between the Dumbarton Bridge and the Ravenswood Open Space Preserve. In 2005, the City of Menlo Park completed a feasibility study, funded by the Bay Trail Project and the Coastal Conservancy, identifying feasible alternatives for completing this gap. Completion of this gap is difficult because of the Dumbarton Rail right-of-way and the presence of the BDPL Nos. 1 and 2. This important section of the Bay Trail is necessary to connect the existing Dumbarton Bridge pathway to existing trails in the Ravenswood Open Space District and future trails that will be constructed as part of the South Bay Salt Pond Restoration Project. Once completed, this gap will serve as a key regional commute route and recreational link. As the Water System Improvement Project moves forward, we request that the San Francisco Public Utilities Commission coordinate with the Bay Trail Project, the Coastal Conservancy and the Midpeninsula Regional Open Space District to complete this Bay Trail gap. 05

Thank you for the opportunity to comment on the PEIR. Please contact me at (510) 464-7935 or laurat@abag.ca.gov if you have any questions.

Sincerely,

Laura Thompson

LANDMARKS PRESERVATION ADVISORY BOARD

1650 Mission Street, Suite 400 | San Francisco, CA 94103-2479 TEL: 415.575.6916 | FAX: 415.558.6409

September 27, 2007

Mr. Bill Wycko
Acting Environmental Review Officer
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103

Dear Mr. Wycko,

On September 19, 2007, the Landmarks Preservation Advisory Board (Board) held public hearings and took public comment on the Draft Environmental Impact Report (DEIR) for the Water System Improvement Program dated June 30, 2007. After discussion the Board arrived at the following comments:

- The Board suggested including historic trees, garden, and landscaping in the project level evaluation. 01
- Historic and cultural resources were not mentioned at all in Chapter 9, CEQA Alternatives. The Board requests that these resources be included in the impact analysis of this chapter. 02
- The Board recommended that examples of historical materials and equipment that could be salvaged should be included into the mitigation measures. 03
- The Board suggested including in the historical context the opposition of building the system from PG&E, Spring Valley Water Company, and Great Western Power. The Board further recommended looking into the role of the Federal Government in funding part or all of the extension to O'Shaughnessy Dam in the 1930s. 04
- The Board would like to see clarification in the historical property list and confirm that the eligibility information came from SHPO/Feds. 05
- The Board suggested looking at the labor history, and the significance for the project of the population groups that worked on it as part of the historical context statement. 06
- The Board asked for clarification regarding project level impacts and coordination with the National Historic Preservation Act should there be any federal involvement. 07
- The Board stated its interest in ensuring that the water system as a whole as well as interconnected segments be evaluated as potential 08

historic and cultural resources, and that the possible existence of such resources not be lost during individual project level environmental review. 08 cont.

The Board appreciates the opportunity to participate in review of this environmental document.

Sincerely,

Robert Cherny, Vice President
Landmarks Preservation Advisory Board

Project: SFPUC Water System Improvement Program

Subject: CEQA comments regarding the Draft PEIR for the Water System Improvement Program for the San Francisco Public Utilities Commission

District Reference No: 200701227

Dear Mr. Maltzer:

The San Joaquin Valley Air Pollution Control District (District) has reviewed the project referenced above and concurs with the findings in the Air Quality section of the Draft PEIR.

District staff is available to meet with you and/or the applicant to further discuss the regulatory requirements that are associated with this project. If you have any questions or require further information, please call Jon Klassen at (559) 230-5843 and provide the reference number at the top of this letter. 01

San Francisco Planning Department
Attn: Paul Maltzer
Environmental Review Officer, WSIP PEIR
1650 Mission Street, Suite 400
San Francisco, CA 94103

Dear Mr. Maltzer,

The San Luis & Delta-Mendota Water Authority ("Authority"), Westlands Water District ("Westlands"), and Kern County Water Agency ("KCWA") respectfully submit this comment letter on the Draft Program Environmental Impact Report ("Draft PEIR") for the San Francisco Public Utilities Commission's ("SFPUC") Water System Improvement Program ("WSIP").

The Authority, which was formed in 1992 as a joint powers authority, consists of 32 member public agencies,[1] each of which contracts with the United

[1] The member agencies of the Authority are: Banta-Carbona Irrigation District; Broadview Water District; Central California Irrigation District; Centinella Water District; City of Tracy; Columbia Canal Company; Del Puerto Water District; Eagle Field Water District; Firebaugh Canal Water District; Fresno Slough Water District; Grassland Water District; James Irrigation District; Laguna Water District; Mercy Springs Water District; Oro Loma Water District; Pacheco Water District; Pajaro Valley Water Management Agency; Panoche Water District; Patterson Water District; Plain View Water District; Pleasant Valley Water District; Reclamation District 1606; San Benito County Water District; San Luis Canal Company; San Luis Water District; Santa Clara Valley Water District; Tranquillity Irrigation District; Turner Island Water District; West Side Irrigation District; West Stanislaus Irrigation District; Westlands Water District; and Widren Water District.

L_SLDWWKC

States Department of the Interior, Bureau of Reclamation ("Reclamation"), for supply of water from the Central Valley Project ("CVP"). The Authority's member agencies hold contracts with Reclamation for the delivery of approximately 3.3 million acre-feet of CVP water. Of that amount, the Authority's member agencies use approximately 2.7 million acre-feet of CVP water on agricultural lands within the western San Joaquin Valley, San Benito County, and Santa Clara County, California; 200,000 to 250,000 acre-feet of CVP water for municipal and industrial uses, including those within the Silicon Valley; and approximately 300,000 to 350,000 acre-feet of CVP water for environmental purposes, including for waterfowl and wildlife habitat in the San Joaquin Valley, California.

Westlands, a member of the Authority, is a California water district with a right to receive up to 1,150,000 acre-feet of CVP water annually. Westlands uses this water for municipal and industrial purposes, as well as for irrigation of approximately 500,000 acres on the west side of the San Joaquin Valley in Fresno and Kings Counties. Westlands' farmers produce more than 60 high quality commercial food and fiber crops sold for the fresh, dry, canned, and frozen food markets, both domestic and export. More than 50,000 people live and work in the communities that are dependent on Westlands' agricultural economy.

KCWA is a special act district organized and existing under California Water Code Appendix, Chapter 99 and is the largest agricultural contractor of State Water Project ("SWP") water. KCWA has a contract with the California Department of Water Resources ("DWR") for up to 998,730 acre-feet of SWP Table A water annually. KCWA is a wholesaler of SWP water for both agricultural and municipal and industrial uses. KCWA contracts with thirteen individual water districts in Kern County (also known as "member units") who supply the SWP water directly to water users for agricultural use. KCWA also contracts for the delivery of treated water supplies with four water purveyors who supply water directly to residents of the City of Bakersfield and surrounding areas. The service area for these member units and purveyors encompasses all the territory within the San Joaquin Valley portion of Kern County. The SWP provides a portion of, and in some cases the entire, water supply for approximately 719,000 acres of prime farmland, of which approximately 240,000 acres are permanent crops, and some 500,000 residents of Kern County.

The Authority, Westlands, and KCWA understand and appreciate the efforts of the SFPUC to meet the water demands of its customers. However, any such action must be pursued only after considering the reasonably foreseeable effects of the action, and either mitigating those impacts that are significant or finding that the significant impacts are unavoidable and overridden by the benefit of the actions. The fact that the City and County of San Francisco long ago dammed and diverted flows of the Tuolumne River, reducing flow in the San Joaquin River and inflow into the Sacramento-San Joaquin Rivers Delta ("Delta"), does not mean that the City and County of San Francisco can now ignore its impacts. The City and County of San Francisco cannot implement its WSIP by increasing its diversions without analyzing the impacts of that action on downstream resources. The Draft PEIR suggests that is exactly what the SFPUC is attempting.

The Draft PEIR contains no meaningful analysis of WSIP impacts on the San Joaquin River or the Delta, a considerable void in analysis for a project that could divert from the Tuolumne River as much as 89,761,996,921 additional gallons of water in a given year. Without such an analysis, the SFPUC cannot determine if the WSIP has significant effects on environmental conditions (habitat, fishery resources, etc.) within the San Joaquin River and the Delta or on water 01 users that depend on either waterbody for their water supply. The lack of analysis also precludes the SFPUC from mitigating its significant impacts or making a statement of overriding consideration, if significant impacts result. Those failures cause the Draft PEIR to violate California Environmental Quality Act ("CEQA").[2]

In addition, without a proper impact analysis, the SFPUC cannot determine if the WSIP runs counter to its own policy. The SFPUC's "Water Enterprise Environmental Stewardship Policy," a copy of which is attached, contains a commitment to "ensure that all operations of the SFPUC water system . . . protect and restore native species and the ecosystems that support them." Without an accurate understanding of all of the potential impacts of the WSIP, the SFPUC cannot reasonably assess whether the WSIP will protect and restore native species and the ecosystems that support them. In fact, a good first step towards 02 the SFPUC's commitment might be a reduction in the SFPUC's diversions from the Tuolumne River and pursuit of operational plans that reduce San Francisco's dependence on water currently diverted around the periphery of the Delta. Resolution Number 321-07 from the Board of Supervisors for the County and City of San Francisco directed the SFPUC to do just that.

On or about June 12, 2007, the Board of Supervisors for the County and City of San Francisco recognized the importance of the WSIP, but nonetheless

[2] The failure to analyze impacts to the San Joaquin River and to the Delta has significance for more then just CEQA compliance. To the extent the WSIP impacts the San Joaquin River and/or the Delta, species protected under the federal and state Endangered Species Acts may be affected, an affect that would require additional regulatory compliance with the federal and state Endangered Species Acts.

In addition, based upon an agreement between the City of San Francisco and the United States Department of the Interior ("DOI"), it appears that the DOI may have to undertake a discretionary action, prior to implementing any project that expands, alters, or otherwise modifies SFPUC water and power facilities along the Tuolumne River. If that is the case, the SFPUC should recognize that the DOI will comply with the National Environmental Policy Act, prior to the SFPUC certifying the final program environmental impact report for the WSIP and before the WSIP is implemented.

urged the SFPUC "to fully analyze a water supply alternative in the Program Environmental Report that will not result in increased diversions of freshwater from the Tuolumne River." The Board of Supervisors made its plea after recognizing:

> . . . More than half of the Tuolumne River's natural flow is diverted for urban and agricultural use, which has diminished the ecological value of the Tuolumne River watershed and the Sacramento-San Joaquin Delta, and
>
> * * * 02 cont.
>
> . . . Increasing diversion of water from the Tuolumne River watershed could further damage the health of the watershed and jeopardize the fish and wildlife species that depend on the Tuolumne for their survival.

(Board of Supervisors for the County and City of San Francisco, Resolution No. 321-07, a copy of which is attached.) Without a proper impact analysis, the SFPUC cannot determine if the WSIP or the alternatives considered in the Draft PEIR are consistent with the clear policy direction provided by the Board of Supervisors for the County and City of San Francisco.[3]

I. Overview Of CEQA And The Requirements Of An Environmental Impact Report

CEQA operates as an important means for holding public officials accountable and for ensuring public participation in the planning process. When "CEQA is scrupulously followed, the public will know the basis on which its responsible officials either approve or reject environmental action, and the public, being duly informed, can respond accordingly to action with which it disagrees." (*Laurel Heights Improvement Assn. v. Regents of the University of California,* 03 (1988) 47 Cal.3d 376, 392.) "[A] paramount consideration is the right of the public to be informed in such a way that it can intelligently weigh the environmental consequences of any contemplated action and have an appropriate voice in the formulation of any decisions." (*Environmental Planning and Information Council v. County of El Dorado* (1982) 131 Cal.App.3d 350, 354.) "[T]he requirement of a detailed environmental statement helps insure the integrity of the process of decision by precluding stubborn problems or serious criticisms from being swept under the rug.'" (*Sutter Sensible Planning, Inc. v. Board of Supervisors* (1981) 122 Cal.App.3d 813, 820.)

[3] The resolution of the Board of Supervisors for the County and City of San Francisco raises the questions whether the Draft PEIR must consider an alternative that reduces the amount of water the SFPUC currently appropriates from the Tuolumne River.

The California Supreme Court has explained that the environmental impact report is the "heart of CEQA" and an "environmental 'alarm bell' whose purpose it is to alert the public and its responsible officials to environmental changes before they have reached ecological points of no return." (*Laurel Heights Improvement Assn.*, *supra,* 47 Cal.3d at p. 392.) The environmental impact report is the "primary means" of ensuring that the public agencies "take all action necessary to protect, rehabilitate, and enhance the environmental quality of the state." (*Ibid.* [quoting Pub. Resources Code, § 21001, subd. (a)].) An environmental impact report must identify the environmental effects of a proposed project and evaluate ways of avoiding or minimizing those effects if they are significant. (Pub. Resources Code, §§ 21002, 21002.1(a), 21061.) 03 cont.

II. Specific Deficiencies Of The Draft PEIR

The Draft PEIR suffers from three main legal deficiencies. First, the Draft PEIR fails to adequately analyze impacts of the WSIP caused by reduced inflow to the San Joaquin River and thus the Delta. Second, the Draft PEIR uses an outdated environmental baseline to evaluate impacts. Third, the Draft PEIR includes an alternatives analysis that relies upon speculation and questionable assumptions. To be legally sufficient, the Draft PEIR must be revised to address these inadequacies. 04

A. The Draft PEIR Ignores Potentially Significant Impacts To The Delta

Through inappropriate, unsupported, and unlawful conclusions, the Draft PEIR fails to consider potentially significant adverse impacts. The Draft PEIR concludes: "the effects of the WSIP on flow along San Joaquin River and in the Delta would be *less than significant*, and no mitigation measures would be required." (Draft PEIR, p. 5.3.1-39.) The basis for that conclusion is two-fold. The San Joaquin River impact discussion in the Draft PEIR explains:

> The [State Water Resources Control Board] has established flow objectives for the San Joaquin River at Vernalis, just upstream of the Sacramento–San Joaquin Delta. Almost all of the time, the reductions in San Joaquin River flow attributable to the WSIP would not be sufficient to cause flow in the river at Vernalis to fall below the objective. Very infrequently, following protracted droughts, reductions in San Joaquin River flow attributable to the WSIP would be sufficient to cause flow in the river at Vernalis to fall below the objective. Under these circumstances, the [United States Bureau of Reclamation], the agency responsible for compliance with objectives for the San Joaquin River, would be expected to increase releases from New Melones Reservoir on the Stanislaus River to meet the flow objectives at Vernalis. Thus, the WSIP would not alter flow in 05

> the San Joaquin River below its confluence with the Tuolumne River such that it would be substantially outside the range experienced under existing conditions nor result in a violation of flow objectives.

(Draft PEIR, p. 5.3.1-38.)

Using similarly faulty logic, the Draft PEIR explains why the WSIP will have less than significant impacts on the Delta:

> The reductions in flow in the Tuolumne River below La Grange Dam attributable to the WSIP would also reduce inflow to the Sacramento–San Joaquin Delta. The [State Water Resources Control Board] has established objectives for Delta outflow as measured at Chipps Island, just upstream of Suisun Bay. Almost all of the time, the reductions in Delta inflow attributable to the WSIP would not be sufficient to cause Delta outflow to fall below the objective. Very infrequently, following protracted droughts, reductions in Delta inflow attributable to the WSIP would be sufficient to cause Delta outflow to fall below the objective. Under these circumstances, [Reclamation] and DWR, the respective operators of the Central Valley Project and [SWP], would be expected to decrease their diversions so that the Delta outflow objectives were met. Thus, the WSIP would not alter flow in the Sacramento–San Joaquin Delta such that it would be substantially outside the range experienced under the existing condition. 05 cont.

(Draft PEIR, pp. 5.3.1-38-39.) The Draft PEIR does not analyze impacts of CVP or SWP re-operation or impacts if the CVP or SWP is not re-operated. CEQA requires those evaluations.

1. CEQA Requires Analysis Of All Reasonably Foreseeable WSIP-Related Impacts

CEQA requires the evaluation of all reasonably foreseeable environmental impacts of a proposed project. (CEQA Guidelines § 15151 ["An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible"].) "[A]n EIR must include an analysis of the environmental effects" when they are "a reasonably foreseeable consequence of the initial project." (*Laurel Heights Improvement Assn., supra,* 47 Cal.3d at 396.) "Reasonably foreseeable requires the use of 'best efforts' to find out and disclose impacts." (CEQA Guidelines § 15144). To satisfy that well established rule, the Draft PEIR must consider the effects of reduced San Joaquin River flow and Delta inflow attributable to the WSIP. The Draft PEIR does not do that.

San Francisco Planning Department
Attn: Paul Maltzer, Environmental Review Officer
October 1, 2007
Page 7

Prior to rendering its "less than significant effects" conclusion, the Draft PEIR states that reductions in San Joaquin River flow and inflow to the Delta, at times, "would not be sufficient to cause flow in the river at Vernalis to fall below the objective" and "would not be sufficient to cause Delta outflow to fall below the objective." (Draft PEIR, p. 5.3.1-38.) Those statements do not constitute analyses, as required by CEQA. Nowhere in the Draft PEIR does it explore whether changes in flow impacts resources, notwithstanding satisfaction of water quality objectives. It simply makes the statements and provides the conclusion.

Similarly, the Draft PEIR states that reductions in Tuolumne River flow caused by the WSIP, at times, would be sufficient to cause exceedances of one or more water quality objectives. (Draft PEIR, p. 5.3.1-38-9.) The Draft PEIR again fails to consider the effects of those exceedances. Instead, it simply states that Reclamation and/or DWR will re-operate the CVP or SWP to ensure the WSIP does not: (1) alter San Joaquin River flow or Delta inflow beyond the range experienced under existing conditions, or (2) cause a violation of water quality objectives.[4] These statements do not amount to impact analyses.

The failure of the Draft PEIR to consider impacts with the San Joaquin River and the Delta is made more egregious by discussions in the Draft PEIR that suggest proper analyses of the impacts would show potentially significant effects. The Draft PEIR recognizes that its water diversion will increase salinity levels of all affected waterways, (Draft PEIR, pp. 5.3.3-7, 5.3.3-20), and increase the temperature of the water in the San Joaquin River and the Delta. (Draft PEIR, pp. 5.3.3-14, 5.3.3-15-16, 5.3.3-19.) 05 cont.

In sum, none of the statements cited above absolve the SFPUC from responsibility for analyzing the potential significant environmental impacts resulting from the WSIP.[5] None of these statements support a conclusion that the

[4] The SFPUC is well aware the San Joaquin River Agreement settled issues, at least in part, related to responsibility for the San Joaquin River Portion of the 1995 Water Quality Control Plan for the Bay Delta Estuary objectives that can be reasonably met through flow measures. The agreement was based on hydrologic and regulatory conditions at the time. If the SFPUC intends to implement the WSIP, as described in the Draft PEIR, by shifting additional burdens to Reclamation, the basis for the San Joaquin River Agreement could be undermined and may cause the agreement to terminate. The San Joaquin River Agreement, in section 13.2, provides: "It is the intent of all parties that this Agreement is to be re-negotiated and/or terminated, as appropriate, in the event of changes to the basic water supply, water rights, assumptions, facts or circumstances upon which this Agreement is based".)

[5] In the Draft PEIR, the Authority, Westlands, and KCWA found no analysis or modeling results of conditions in the San Joaquin River of the Delta, including analysis of impacts to biological resources in those water bodies. That failure must be caused by the conclusion in those sections addressing water supply and system operations that flow in the San Joaquin River and Delta will not change beyond the range experienced under existing conditions, or cause a violation of water quality objectives. As presented herein, that failure and the underlying basis for it render the Draft PEIR legally inadequate.

12.3-178

L_SLDWWKC

San Francisco Planning Department
Attn: Paul Maltzer, Environmental Review Officer
October 1, 2007
Page 8

impacts of the WSIP would be *less than significant*. The cursory fashion in which the conclusion is rendered deprives the public of informed participation and precludes informed decision-making. (*San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994) 27 Cal.App.4th 713, 722; *Galante Vineyards v. Monterey Peninsula Water Management Dist.* (1997) 60 Cal.App.4th 1109, 1117; *Berkeley Keep Jets Over the Bay Committee v. Board of Port Commissioners of the City of Oakland* (2001) 91 Cal.App.4th 1344, 1355.)

2. CEQA Requires Analysis Of The Impacts Of Reclamation's Reasonably Foreseeable Efforts To Mitigate For Reduced Delta Inflows

The Draft PEIR must evaluate whether Reclamation and DWR can and will re-operate the CVP and SWP to mitigate for the impacts of the WSIP on San Joaquin River flow and Delta inflow. The Draft PEIR must also evaluate the environmental impacts of the CVP and/or SWP re-operations if the re-operation occurs. The Draft PEIR does not conduct any of those analyses. Such failures violate CEQA. (CEQA Guidelines 15126.4(a)(1)(D); *Save Our Peninsula Committee v. Monterey County Bd. of Supervisors* (2001) 87 Cal.App.4th 99 [Court required the EIR to evaluate the environmental impact of the off-set water credits being used as mitigation].) The Court of Appeal has recently instructed: 05 cont.

> When agencies--even agencies with antagonistic positions--comply with their responsibilities for environmental review under CEQA, their action should be taken after consideration of the other's position and, as a result, their action may achieve a measure of coordination that would not have existed without that review.

(*County Sanitation District No. 2 of Los Angeles County et al. v. County of Kern* (2005) 127 Cal.App.4th 1544, 1603.) Currently, unevaluated but reasonably foreseeable impacts will result from changes in CVP and/or SWP re-operations resulting from the WSIP.

As an example, to mitigate for the impacts of the WSIP on San Joaquin River flow, the Draft PEIR states Reclamation "would be expected to increase releases from New Melones Reservoir on the Stanislaus River." (Draft PEIR, p. 5.3.1-38.) That CVP facility currently provides for flood control, irrigation and municipal water supplies, hydroelectric production, recreation, and fish and wildlife enhancement. Increased uses of water from New Melones Reservoir for WSIP mitigation would compromise Reclamation's ability to meet those existing purposes it serves. The Draft PEIR does not consider what might occur to those purposes if CVP water is used for WSIP mitigation.

Similarly, the Draft PEIR states, when reductions in Delta inflow attributable to the WSIP would be sufficient to cause Delta outflow to fall below the objective, Reclamation and DWR "would be expected to decrease their diversions so that the Delta outflow objectives were met." (Draft PEIR, p. 5.3.1-38-9.) The referenced diversions are used to provide water to approximately 25 million people and to approximately 3 million acres of highly productive farm land. Many of the water demands of those people and lands are not being met and may not be met in the future. To the extent the WSIP further restricts those diversions, the unmet demand would only increase and potentially a significant effect would result. As examples, reduced water supply available to those people and lands, could: (1) compromise CVP and/or SWP facilities (the integrity of conveyance and storage facilities), (2) cause land to be fallowed, and thus degrade air quality through increased dust, or (3) could increase groundwater use, and thus result in land subsidence. Again, none of the aforementioned impacts are identified, no less considered. 05 cont.

B. The Baseline Is Inaccurate And Irrelevant

The Draft PEIR uses 2005, the date of the Notice of Preparation, as the environmental baseline. However, since 2005, environmental conditions and regulatory requirements within the San Joaquin River watershed and Delta ecosystem have changed dramatically. Without updating the baseline accordingly, the analyses in the Draft PEIR are legally insufficient under CEQA.

An accurate baseline is essential to the preparation of a legally sufficient environmental impact report. The purpose of the baseline is to provide a point from which the WSIP can measure its impacts from the "real conditions on the ground." (*City of Carmel-by-the-Sea v. Board of Supervisors* (1986) 183 Cal.App.3d 229, 246; *County of Amador v. El Dorado County Water Agency* 1999 76 Cal.App.4th 931, 952.) Thus, an accurate baseline ensures that the Environmental Impact Report measures the impacts of a proposed WSIP on the existing environment, not a hypothetical situation. (*Id.,* at p. 955.) 06

While the environmental setting at the time the Notice of Preparation is published will "normally" constitute the baseline for a project, courts will find environmental impact reports legally inadequate when the conditions at the time of the Notice of Preparation no longer adequately reflect environmental conditions. (See *Friends of Eel River v. Sonoma County Water Agency* (2003) 108 Cal.App.4th 859, 874-875 [court directed decertification of an environmental impact report when the environmental setting did not accurately include impacts of water diversions on salmonid species or proposals to curtail diversions]; *Mira Monte Homeowners Association v. County of Ventura* (1985) 165 Cal.App.3d 357, 363-367 [court directed decertification of an environmental impact report when, several days prior to County approval, evidence was presented that existing impacts on wetlands were greater than initially identified and no new environmental analysis was conducted].)

> [T]he date for establishing baseline cannot be a rigid one. Environmental conditions may vary from year to year and in some cases it is necessary to consider conditions over a range of time periods. In some cases, conditions closer to the date the project is approved are more relevant to a determination of whether the project's impacts will be significant.

(*Save Our Peninsula Committee v. Monterey County Board of Supervisors* (2001) 87 Cal.App.4th 99, 125.) Because of the significant changes in environmental conditions and regulatory requirements within the San Joaquin River watershed and Delta ecosystem, the "normal" baseline cannot apply. Persisting with the use of an obsolete baseline provides responsible decision-makers and the public with an inaccurate description of the environmental impacts of the WSIP. A more current baseline is required. 06 cont.

C. Alternatives Analysis Unlawfully Relies Upon Questionable Assumptions And Pure Speculation

The analysis of alternatives is an essential and important component of an environmental impact report. (*Planning and Conservation League v. Department of Water Resources* (2000) 83 Cal.App.4th 892, 919-20.) "[I]t is the policy of the state that public agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant impacts of such projects…" (Pub. Resources Code, § 21002.) "Without meaningful analysis of alternatives in the EIR, neither the courts nor the public can fulfill their proper roles in the CEQA process." (*Planning and Conservation League, supra,* 83 Cal.App.4th at p. 920.)

The Draft PEIR's failure to adequately analyze WSIP-related impacts caused by reduced flows in the San Joaquin River and inflows into the Delta renders the alternatives analysis incomplete and legally deficient. Additionally, much of the alternatives analysis relies on questionable assumptions and pure speculation. For example, in rejecting the No WSIP Alternative as the environmentally superior alternative, the Draft PEIR concludes that, due to aging infrastructure and facilities, a similar level of repairs will be required regardless of whether the WSIP is implemented. (Draft PEIR, p. 9-95.) The Draft PEIR offers the same explanation for why the No WSIP Alternative will not ultimately reduce impacts on the Tuolumne River, as the need for additional water deliveries will ultimately lead the SFPUC or its customers to develop additional facilities which, in turn, will have additional and potentially more significant environmental impacts. (*Ibid.*) The problem with relying on assumptions of future conditions is that they simply may not come to pass. CEQA requires more than this type of guesswork. It mandates "comparative, quantitative analysis" of the relevant environmental impacts of the project alternatives. (*Kings County Farm Bureau v. City of Hanford* 07

San Francisco Planning Department

SAN FRANCISCO Public Utilities Commission

Water Enterprise Environmental Stewardship Policy
Published: 09/12/2006 | Updated: 03/06/2007
Published By: Land and Natural Resources Division

SFPUC Water Enterprise Environmental Stewardship Policy
FINAL
June 27, 2006

The mission of the San Francisco Public Utilities Commission (SFPUC) is to serve San Francisco and its Bay Area customers with reliable, high quality, and affordable water and wastewater treatment while maximizing benefits from power operations and responsibly managing the resources—human, physical, and natural—entrusted to its care.

The purpose of the Water Enterprise Environmental Stewardship Policy is to establish long-term management direction for SFPUC-owned lands and natural resources affected by operation of the SFPUC water system within the Tuolumne River, Alameda Creek, and Peninsula watersheds. Environmental stewardship is a fundamental component of the Water Enterprise mission, and a responsibility of all Water Enterprise employees.

The SFPUC is committed to responsible natural resources management that protects and restores viable populations of native species and maintains the integrity of the ecosystems that support them for current and future generations. The SFPUC strives to become a leader in science-based and collaborative environmental stewardship in order to continue providing high-quality and reliable water supplies to San Francisco residents and SFPUC customers.

Watershed Management

The SFPUC will proactively manage the watersheds under its responsibility in a manner that maintains the integrity of the natural resources, restores habitats for native species, and enhances ecosystem function. The SFPUC believes that partnership and collaboration with agencies, communities and other stakeholders in the watersheds are the best way to maximize investment in environmental stewardship.

To the maximum extent practicable, the SFPUC will ensure that all operations of the SFPUC water system (including water diversion, storage and transport), construction and maintenance of infrastructure, land management policies and practices, purchase and sale of watershed lands, and lease agreements for watershed lands protect and restore native species and the ecosystems that support them. In cases where the SFPUC has limited control, but where impacts of its operations exist, the SFPUC will work with responsible parties to improve ecosystem health.

It is the policy of the SFPUC to operate the SFPUC water system in a manner that protects and restores native fish and wildlife downstream of SFPUC dams and water diversions, within SFPUC reservoirs, and on SFPUC watershed lands. Releases from SFPUC reservoirs will (consistent with the SFPUC mission described above, existing agreements, and applicable state and federal laws), mimic the variation of the seasonal hydrology (e.g., magnitude, timing, duration, and frequency) of their corresponding watersheds in order to sustain the aquatic and riparian ecosystems upon which these native fish and wildlife species depend.

The SFPUC will actively monitor the health of the terrestrial and aquatic habitats both under SFPUC ownership and affected by SFPUC operations in order to continually improve ecosystem health. Relevant performance measures and indicators will be used to evaluate the effectiveness of implementation efforts under this policy.

Other SFPUC Lands

Rights of way and properties in urban surroundings under SFPUC management will be managed in a manner that protects and restores habitat value where available, and encourages community participation in decisions that significantly interrupt or alter current land use in these parcels.

Public Involvement

The SFPUC believes that public engagement is key to ensuring successful environmental stewardship. To that end, SFPUC will:

- Solicit input and collaboration on its plans and implementation from all interested and affected parties, including local, state, and federal agencies, non-governmental organizations, and members of the public.
- Encourage development of recreational uses that are compatible with protection and restoration of natural resources, and water quality and water supply reliability goals.
- Include communities and stakeholders in monitoring, restoration and other stewardship activities to the extent possible.
- Provide information and reports to the public that track activities related to implementation of this policy.

Implementation Strategy

The Environmental Stewardship Policy will be integrated into SFPUC Water Enterprise planning and decision-making processes and also directly implemented through a number of efforts. Below are examples of areas for integration and specific activities that will further the goals of this policy.

- Implementation and updating of the existing Alameda and Peninsula Watershed Management Plans.
- Development of Habitat Conservation Plans for the Alameda and Peninsula Watersheds.
- Development and implementation of the Watershed and Environmental Improvement Program, which will cover the Tuolumne River, Alameda Creek, and Peninsula watersheds.
- Development of the Lake Merced Watershed Plan.
- Active participation in local forums, including coordination with Yosemite National Park Service and Stanislaus National Forest in the Tuolumne River watershed, the Tuolumne River Technical Advisory Committee, the Alameda Creek Fisheries Restoration Workgroup, the Pilarcitos Creek Restoration Workgroup, and the Lake Merced Task Force.
- Integration of the policy into the Water System Improvement Program and individual infrastructure projects (i.e., repair and replacement programs).
- Ensure that the policy guides development of project descriptions, alternatives and mitigation for all SFPUC projects during the environmental review process under CEQA and/or NEPA.
- Seek support for and encourage all employees to integrate environmental stewardship into daily operations through communication and training.

Amendment of the Whole
in Board
6/12/07

FILE NO. 070754 RESOLUTION NO. 321-07

[Resolution urging environmental analysis of water supply alternatives that will not increase diversions of freshwater from the Tuolumne River and urging active implementation of conservation and recycled water programs.]

Resolution urging the San Francisco Planning Department to fully analyze a water supply alternative in the Program Environmental Impact Report that will not result in increased diversions of freshwater from the Tuolumne River and urging the San Francisco Public Utilities Commission to undertake and implement water conservation and recycled water programs.

WHEREAS, San Francisco is committed to building a sustainable urban environment, and

WHEREAS, San Francisco's environmental code encompasses objectives in a broad range of topic areas including air quality, biodiversity, energy, climate change, ozone depletion, food and agriculture, hazardous materials, human health, parks, open spaces and streetscapes, solid waste, transportation, water and wastewater, and

WHEREAS, Impacts due to San Francisco's use of natural resources extend beyond the city limits, and

WHEREAS, San Francisco owns and operates a water system that serves not only the city residents but also approximately 1.7 million people in San Mateo, Santa Clara, Tuolumne and Alameda Counties, and

WHEREAS, The San Francisco Public Utilities Commission is engaged in a critically important Water System Improvement Program to repair, replace and modernize aging and seismically vulnerable elements of its water system, and

WHEREAS, The San Francisco Planning Department will soon issue a draft Program Environmental Impact Report, which is a necessary component for the speedy implementation of the Water System Improvement Program, and

WHEREAS, Approximately eighty five percent of the water delivered by San Francisco's water system is diverted from the Tuolumne River, and

WHEREAS, More than half of the Tuolumne River's natural flow is diverted for urban and agricultural use, which has diminished the ecological value of the Tuolumne River watershed and the Sacramento-San Joaquin Delta, and

WHEREAS, Increasing diversion of water from the Tuolumne River watershed could further damage the health of the watershed and jeopardize the fish and wildlife species that depend on the Tuolumne for their survival, and

WHEREAS, Other California cities have successfully shown that they can reliably serve water to increasing populations without increasing the diversions from the natural environment by their conservation efforts; and

WHEREAS, It is in the City's and the public's long term interest to develop alternative methods of meeting the demand for water, including using less water and recycling water for various uses; and

WHEREAS, The San Francisco Public Utilities Commission is well-positioned to undertake efforts to educate the public about water conservation and develop programs to conserve water and recycle water; and

WHEREAS, Providing the Board of Supervisors and the citizenry with the most well documented analysis of a water supply alternative that will not result in increased diversions is in the public interest, now, therefore be it

RESOLVED, That the San Francisco Board of Supervisors urges the San Francisco Public Utilities Commission to explore and develop water supply options that will not divert more water from the Tuolumne River, including but not limited to (1) aggressively and actively developing and encouraging water conservation and

efficiency efforts, and (2) examining and developing programs and projects for the use of recycled water; and be it further

RESOLVED, That the San Francisco Board of Supervisors, pursuant to the City's stewardship responsibility for the Tuolumne River, urges the San Francisco Planning Department and Public Utilities Commission to fully analyze a water supply alternative in the Program Environmental Impact Report that will not result in increased diversions of freshwater from the Tuolumne River.

CITY OF SUNNYVALE CALIFORNIA

September 28, 2007

San Francisco Planning Department
Att: Paul Maltzer, Environmental Review Officer, WSIP PEIR
1650 Mission Street, Suite 400
San Francisco, CA 94103

Re: Response to Draft Program Environmental Impact Report for Water System Improvement Program

Mr. Maltzer:

The City of Sunnyvale appreciates the opportunity to review and respond to the Draft Program Environmental Impact Report (DPEIR) for Water System Improvement Program (WSIP). We have a few comments on the content of the report, and would also like to add some information related to the City of Sunnyvale (Sunnyvale), as a water customer of San Francisco.

Sunnyvale is correctly identified as a wholesale water customer of the San Francisco Public Utilities Commission (SFPUC). As a wholesale water customer, Sunnyvale is providing a complete response, from the perspective of an agency that is impacted by, and that benefits from, the work proposed for the WSIP.

The DPEIR correctly presents information previously provided to the SFPUC by Sunnyvale. However, we noted that the actual data on the Sunnyvale recycled water program differs notably from the 2004 projections. The Summary of Recycled Water Potential Table for the SFPUC Service Area (Table E.2.5 of the PEIR) lists Sunnyvale's 2004 projection as 0.81 MGD. The City's strong commitment to water conservation is demonstrated by the fact that the actual recorded water savings for 2004 was 1.5 MGD. Sunnyvale is committed to maintaining the 1.5 MGD level through 2030. 01

<u>**General Comments on Draft Program Environmental Impact Report**</u>

The City has general comments on the following issues:

a) ***Timing of Construction*** *(scheduling)* – given the safety concerns associated with the potential loss of water and the unpredictability of earthquakes, the Sunnyvale strongly advocates for the work being completed as soon as possible. 02

ADDRESS ALL MAIL TO: P.O. BOX 3707 SUNNYVALE, CALIFORNIA 94088-3707
TDD (408) 730-7501
Printed on Recycled Paper

L_Snnyvl

b) ***Schedule of Priorities*** *(scheduling)* – given the high earthquake potential, Sunnyvale advocates for the most vulnerable aspects of the work being completed first. Specifically, Sunnyvale recommends that the Calaveras Dam Replacement (SV-2) and the Seismic upgrade of BDPL pipelines Nos. 3 and 4 at Hayward Fault (BD-3) be the first projects completed. 02 cont.

c) ***System Capacity*** *(design)* – Sunnyvale recommends that the conveyance system be designed to provide the full volume of the future projected need for the Bay Area. While most of the existing system appears to already provide such capacity, the volume of water that flows through the system should be based on policy and programs, not limited by capacity. 03

d) ***Amount of Water Made Available*** *(policy)* – this issue can be discussed and resolved during construction of the system upgrades. Sunnyvale recommends an overall plan be established for all of the parties that draw from the water systems, including the urban and rural users, and a plan be established to maximize the utility of the water used while maintaining basic levels in the streams to address environmental concerns. The plan may include urban users subsidizing the development of new water management systems in rural areas to reduce the overall water demand through alternative irrigation systems. 04

e) ***Environmental Impacts*** *(policy)* – the City of Sunnyvale has established policy that promotes environmental protection. While the proposed plan does not suggest any direct impacts, or proposed mitigations, on the city, Sunnyvale is generally in support of solutions that minimize negative impacts on the environment, including severe impacts on stream flow. Given its commitment to supporting alternative energy sources, Sunnyvale is also concerned with negative impacts on hydrogenation, which is a green power source. 05

f) ***System Maintenance*** *(budgeting)* – Sunnyvale strongly recommends that a maintenance fund be established that requires an annual set-aside that is allocated to a fund earmarked exclusively for the on-going maintenance of the system. The fund should be restricted to a fixed schedule of maintenance and not be allowed for any other type of expenditure, including standard system operations. 06

<u>**Smart Growth, Water Conservation, Recycled (Reclaimed) Water**</u>

As referenced above, Sunnyvale has a long-standing commitment to environmental stewardship. Sunnyvale has incorporated "Smart Growth" and natural resource conservation into our current land use planning and development policies and practices. Smart Growth principles include promoting higher density growth in urban areas, including Mixed Use and Transit-Oriented Developments. This discourages sprawl, which protects the environment through reduced impacts on air quality, non-renewable fuel sources, and increased per capita water use.

During the public discussion on the DPEIR, concerns have been raised about the Bay Area's need for additional water from the Tuolumne River/Hetch-Hetchy System. The need is based on projected growth. California is expected to continue to grow significantly over the next 20 years. Encouraging those newer Californians to live in urban areas is the best way to minimize the overall environmental impact of that growth.

Even if the population growth is less than anticipated, more housing is being planned for in the South bay to address the current housing demand. The ratio of jobs to housing in Santa Clara County is too high – people who work in the area are unable to live here. That results in long commutes, which negatively impacts air quality and promotes the use of fossil fuels. At full build-out of the General Plan, Sunnyvale would have 2.5 jobs per housing unit. In the past five years, Sunnyvale has approved higher density residential and industrial developments in the Downtown Specific Plan, Moffett Park Specific Plan, El Camino Specific Plan, and is currently reviewing a proposal for a Mixed Use combining zoning district. Sunnyvale is seeking to build more housing units, and recently approved a General Plan Amendment from Industrial to Residential to allow for residential development on approximately 60 more acres. 07

Consistent with its strong commitment to environmental stewardship, Sunnyvale has utilized and promoted a number of programs aimed at water conservation. These include water saving devices, pricing techniques, educational programs, converting a wastewater treatment plant to a recycled water production plant and distribution system, and other similar programs, policies and services. The City of Sunnyvale's Water Resources Sub-Element of the General Plan includes the following goal and action statement:

***GOAL A**: MANAGE FUTURE DEMANDS TO ENSURE THAT EXISTING AND REALISTICALLY CERTAIN FUTURE WATER SUPPLIES WILL BE ADEQUATE.*

> ***Action Statements A.1b** Support reasonable, cost-effective, and environmentally sound water supply enhancement projects of San Francisco Water Department / Hetch-Hetchy and Santa Clara Valley Water District.* 08

In support of water conservation, Sunnyvale is active in the following areas (also see attached folder with services and program information):

Water Supply and Distribution Program
- Residential plumbing retrofit – providing low-flow showerheads and aerators to residents free of charge.
- System water audits, leak detection, and repair – all accounts are metered for accountability purposes, with the City offering help to residential customers to

determine if a leak exists in the property and implementing a city-wide pipeline leak detection program.
- Metering with commodity rates – the City encourages all new commercial, industrial, and multi-family developments to have dedicated water meters and separate accounts for landscape irrigation.
- Conservation pricing – Sunnyvale has an inverted rate structure involving different rate blocks with a minimum rate for basic water requirements, and rate increases for increased water usage.
- Recycled water – the City set up a pipeline system based on the concentration of potential customers, and has converted approximately 90 private and public sites, including the City's Baylands Park and municipal golf course, to recycled water for irrigation of turf areas.
- Regulated conservation in landscaping – Ordinance 19.38.070 regulates conservation in landscaping and applies to new and rehabilitated landscaping for public and private development projects.
- Water Waste Prohibition – the City has a list of non-essential water practices that are prohibited in Sunnyvale, such as broken or defective plumbing, sprinklers, watering or irrigation systems; water escaping and flowing into gutters or streets; using potable water to wash sidewalks, driveways, etc. unless an automatic shutoff valve is used; installation of a single pass cooling process in new construction; etc. 08 cont.
- Public information and school education programs – Sunnyvale offers a water pollution and conservation outreach program spearheaded by Water Pollution Control Plant staff. The program teaches youth about the function of wastewater treatment, water pollution prevention and water conservation. The Creek Education program, also offered, provides watershed, urban runoff, water pollution prevention, storm water, creek education, water conservation and wastewater information
- The City also participates in several of Santa Clara Valley Water District's water conservation programs, such as the Irrigation Technical Assistance Program (ITAP) for conservation in large landscapes; water audits for residential, industrial and commercial customers; High Efficiency clothes washer rebates; Ultra-Low-Flow toilet replacement programs; etc.
- In City facilities, install and use conservation devices, including new and experimental units where practical for benefit, study and publicity, as appropriate. Including, waterless and/or low water urinals, auto flush toilet valves, auto on/off faucets, low flow faucets
- The Public Safety Department has instituted the use of synthetic hose, to replace cotton jacketed hose, eliminating the need to use water to wash the hose.
- The Public Safety Department trains emergency responders to make runoff management at emergencies a high priority and to take early steps to mitigate fluid and other contaminant infiltration into the storm drains by means of dykes, adsorbents and other appropriate methods.

L_Snnyvl

Sunnyvale Supports the Water System Improvement Program

Sunnyvale strongly supports the WSIP being implemented as soon as possible to enable the Sunnyvale to continue to meet our goals. Sunnyvale has actively engaged in water conservation programs for several years and is committed to continuing those programs. Sunnyvale will advocate to ensure that sufficient water is available to allow for: 09

- Future residential growth (already committed through our General Plan),
- Maintenance and/or growth of a healthy economy, and
- Emergency needs.

Based on the brief summary of information provided in the DPEIR, it appears that the "environmentally superior alternative" may provide the basis for the best solution. Sunnyvale supports the Bay Area Water Supply and Conservation Agency (BAWSCA) proposal that the final PEIR further describe and analyze the Modified WSIP Alternative (the environmentally superior alternative). This may include exploring the feasibility of the Bay Area water customers financially supporting water conservation with agricultural interests on the lower Tuolumne River that will result in no net decrease in flows on the lower Tuolumne. BAWSCA's proposal is to conserve even more agricultural water, resulting in a net increase in lower Tuolumne River flows. This additional water could then be deployed at times and in volumes most beneficial for salmon and other important species in the lower Tuolumne River. Under BAWSCA's proposal, the implementation of the WSIP can improve, rather than degrade, flow conditions in the lower Tuolumne River. 10

Again, thank you for the opportunity to review and comment on the Draft Program Environmental Impact Report for the San Francisco Public Utility Commission's Water System Improvement Program. If there is need for any follow-up questions, discussion, or notification, please contact the following:

STANISLAUS COUNTY ENVIRONMENTAL REVIEW COMMITTEE

August 27, 2007

Paul Maltzer
Environmental Review Officer
WSIP PEIR
1650 Mission Street, Suite 400
San Francisco, CA 94103

SUBJECT: **ENVIRONMENTAL REFERRAL – AVAILABILITY OF DRAFT PROGRAM ENVIRONMENTAL IMPACT REPORT FOR THE SAN FRANCISCO PUBLIC UTILITIES COMMISSION'S WATER SYSTEM IMPROVEMENT PROGRAM**

Mr. Maltzer:

The Stanislaus County Environmental Review Committee (ERC) has reviewed the subject project and has the following comment(s):

- Applicant shall determine, to the satisfaction of the Department of Environmental Resources (DER), that a site containing (or formerly containing) residences or farm buildings, or structures, has been fully investigated (via Phase I study and Phase II study if necessary) prior to the issuance of a grading permit. If zoning will change from agricultural land to a commercial or residential zoning designation, DER recommends research be conducted to determine if pesticides were used on the proposed development site; if confirmed, suspect site areas should be tested for organic pesticides and metals. Any discovery of underground storage tanks, former underground storage tank locations, buried chemicals, buried refuse, or contaminated soil shall be brought to the immediate attention of DER. 01
- The construction/improvement project areas within Stanislaus County may be located at identified soil and/or groundwater contamination sites. Prior to construction activities, contact DER Site Mitigation staff and provide APNs or addresses to verify.

L_StanCoERC

- Applicant should contact the Department of Environmental Resources regarding appropriate permitting requirements for hazardous materials and/or wastes. Applicant and/or occupants handling hazardous materials or generating hazardous wastes must notify the Department of Environmental Resources relative to: (Calif. H&S, Division 20)

  A. Permits for the underground storage of hazardous substances at a new or the modification of existing tank facilities.
  B. Requirements for registering as a handler of hazardous materials in the County.
  C. Submittal of hazardous materials Business Plans by handlers of materials in excess of 55 gallons or 500 pounds of a hazardous material or of 200 cubic feet of compressed gas.
  D. The handling of acutely hazardous materials may require the preparation of a Risk Management Prevention Program that must be implemented prior to operation of the facility. The list of acutely hazardous materials can be found in SARA, Title III, Section 302. 01 cont.
  E. Genera tors of hazardous waste must notify the Department of Environmental Resources relative to the: (1) quantities of waste generated; (2) plans for reducing wastes generated; and (3) proposed waste disposal practices.
  F. Permits for the treatment of hazardous waste on-site will be required from the Hazardous Materials Division.
  G. Medical waste generators must complete and submit a questionnaire to the Department of Environmental Resources for determination if they are regulated under the Medical Waste Management Act.

The ERC appreciates the opportunity to comment on this project.

Sincerely,

Raul Mendez, Senior Management Consultant
Environmental Review Committee

Comments Sent by Email: wsip.peir.comments@gmail.com

Subject: Review Comments from Stanford University about San Francisco's Draft Program Environmental Impact Report for its Water System Improvement Program

Dear Mr. Maltzer,

Stanford University (Stanford) appreciates the opportunity to comment on the comprehensive draft Program Environmental Impact Report (PEIR) that the Planning Department has prepared for the Water System Improvement Program (WSIP) being developed by the San Francisco Public Utilities Commission (SFPUC). Stanford supports the WSIP goals and objectives and the comprehensive PEIR document analyzing the environmental impacts and program alternatives, as required by law. Stanford also supports the Bay Area Water Supply and Conservation Agency's (BAWSCA) proposal that the final PEIR further describe and analyze the draft PEIR's Modified WSIP Alternative (the environmentally superior alternative) and that the final PEIR explore the feasibility of the Bay Area water customers financially supporting water conservation with agricultural interests on the lower Tuolumne River that will result in no net decrease in flows on the lower Tuolumne. 01

Our comments are presented below as general and specific comments. In the specific comments we also provide additional information about Stanford's Water Conservation and Reuse Program to ensure that SFPUC has accurate information when questions about Stanford's water use and efficiency arise.

General Comments and Stanford University's Interest in the WSIP

As a member of BAWSCA, Stanford strongly supports sustainable water supplies and efficient water use. Stanford uses SFPUC water for its domestic water supply, and separately provides non-potable water for irrigation, and groundwater for back-up and emergency supply.

1. **For a reliable regional water supply system, SFPUC needs to proceed with the WSIP to restore and improve its infrastructure and reservoir capacity.** It is imperative for Stanford as well as Stanford University Hospitals – that are regional emergency support facilities - to have a reliable, high quality domestic water supply for the health and safety of its community, including a large dependent resident student population that relies on the university for their critical needs. Academic, research, and support facilities also rely on the high quality of the SFPUC water. 02

L_Stanford

2. **AB 1823 warns that following a major earthquake, the flow of water to communities could be disrupted for 30 to 60 days.** Given this warning, the PEIR should more clearly emphasize the critical importance of completing the WSIP and improving the system's current vulnerability to seismic events. Improvement of the SFPUC water supply system will protect health and safety of the people that live in the Bay Area today. We fully support BAWSCA comments, which discuss this critical issue of seismic risk in more detail. 03

3. **Stanford is already managing an aggressive water conservation and reuse program in addition to using non-potable water for irrigating most (85%) campus grounds.** We meter practically every building and outdoor use on campus and track our water use and trends. However, given that Stanford has been rigorous and successful in its conservation by reducing its water use by 17 percent, demand hardening has resulted and even with improving technologies, fewer opportunities remain for reducing water use, particularly during drought or other water shortage conditions. We clarify in the comments below our water-efficiency program and reasons for requesting additional domestic water allocation from SFPUC. 04

<u>Specific Comments and Clarification about Water Use at Stanford University</u>

1. **Losing access to SFPUC domestic water for 30 days or more will create severe operating problems for Stanford.** Following a major earthquake, SFPUC estimates potential for outages on the SFPUC water system from 30 to 60 days. (AB1823)

2. **The heating and cooling needs for both Stanford University and the two Stanford Hospitals are primarily served by a Central Energy Facility (CEF).** This facility produces chilled water and steam supply that are distributed throughout the campus. The chilled water serves more than 85 of the largest academic and medical research buildings, as well as Stanford hospitals and clinics. The steam supply serves more than 100 major facilities. These campus cooling and heating distribution systems are very efficient and save water as well as energy. The efficiency of the CEF chilled water and steam production is highly reliant on the high quality SFPUC water. The CEF produces the chilled water and steam and it uses almost 25 percent of our purchased SFPUC domestic water. Cooling towers at the CEF recycle the cooling water 10-15 times, which is extremely efficient and made possible by carefully managing the very high quality (low mineral content) SFPUC water. If we use groundwater (from wells with high mineral content) or recycled water (due to its low quality) we could only cycle the water one to two times in the cooling towers before it would be discharged to the sanitary sewer. Therefore, using groundwater or recycled water would likely require at least five times more water as well as more energy for pre-treatment and pumping. 05

3. **Stanford University Hospitals (Stanford Hospital and Clinics and Lucille Packard Children's Hospital) are considered critical emergency facilities** by Santa Clara County Office of Emergency Services and the community served by these hospitals depend on these critical facilities in times of disaster. Disruption to the SFPUC water supply would disrupt the cooling and steam supply, both critical for routine and emergency operations at the hospitals.

4. **Stanford University research and support facilities also rely on the cooling and steam as well as high quality SFPUC water supplies.** Computer hubs, pumps, electron microscopes, lasers, and virtually all research processes requiring cooling could not function without the chilled water supply used for re-circulating cooling systems. The consequences of lack of chilled water could significantly impact or shut down space cooling for temperature-controlled laboratory environments and computer server clusters, as well as building equipment requiring cooling.

5. **Stanford research facilities, similar to other biotech and hi-tech facilities in the San Francisco Bay Area, also use high-level water purification systems.** Water purification systems such as reverse osmosis (RO), are most efficient when using very high quality SFPUC water, typically using about two gallons of SFPUC water to produce one gallon of high purity water. However, with worse quality water, such as groundwater or recycled water, the process would use much more water and energy and require significant pre-treatment, which in turn would generate more water waste.

6. **Although Stanford has wells for emergency backup supply, using this hard, high mineral-content groundwater for an extended period, at a minimum, could cause operational problems**, as well as permanent damage to critical facilities and equipment, and would definitely use significantly more water.

7. **Stanford's Water Conservation and Recycling Programs reduce water demand and result in efficient water use.** We strongly support multi-faceted water efficiency programs for the long-term to effectively and sustainably manage our limited water supplies. Stanford has one of the most aggressive conservation programs in San Francisco Bay Area (Stanford adopted an enhanced plan C, with 20 site-specific water conservation measures). Since 2000, Stanford has reduced its domestic water use by 17 percent, due to water conservation. We are also constructing a recycled water facility for flushing high efficiency toilets and urinals, and some non-potable uses. Stanford is also the first university to join the California Urban Water Conservation Council as of December 2006. 05 cont.

8. **Stanford has retrofitted 95 percent of academic bathroom fixtures and is already irrigating 85 percent of the academic campus grounds with non-potable water.** Although continued maintenance of existing systems and improvements in technology will help improve efficiency in new and existing buildings, Stanford has already instituted the majority of its water conservation measures. We front-loaded water conservation and efficiency to enable us to stretch our water supply for new academic and student housing buildings.

9. **Stanford is fortunate to have diverse water supplies that enable us to manage water resources judiciously through smart growth, aggressive conservation, using recycled water, and local groundwater resources.** However, we may not be able to fully rely on the non-potable local supplies during droughts. Moreover, efficient on-going water management, by its virtue (maximizing efficiency), does reduce further opportunities for additional significant reductions.

10. **Stanford is committed to managing water resources efficiently; however, continued campus growth will require an additional high quality water supply.** Currently, Stanford purchases only 1.3 percent of total SFPUC-supplied water for wholesale customers. Although we will continue stretching our water supplies through efficient use, the campus is gradually growing. Our current General Use Permit (GUP) was approved by Santa Clara County in 2000, and we are confident that we can remain within our current allocation for the duration of the GUP; however, in order to assist with SFPUC planning, we project and are requesting an additional 1.167 mgd to cover the post-GUP period.

11. **Unlike much of the Bay Area, Stanford has not built out its facilities and will continue to grow to meet the need for high quality educational and research facilities.** In addition, the current GUP includes a significant increase in the 24-hour resident population on campus by providing more on-campus housing for graduate students and faculty. Stanford houses 95 percent of its undergraduate students and is planning to increase housing to house 80 percent of its graduate students. This increase in on-campus housing does not reflect population growth, but rather gives current commuting students and faculty the opportunity to become residents. This change has clear environmental benefits in reducing commuter traffic, but we believe that increasing the number of on-campus residents will likely increase water use.

12. **Campus growth will increase on the main campus.** Stanford is planning smart growth by concentrating its development in the main campus to minimize regional impacts from commute traffic. Stanford is also providing easy alternative (pedestrian, bicycle, or community shuttle) access to its facilities for the campus community. 05 cont.

13. **Per capita use is not an appropriate metric for Stanford's water consumption, because nearly 50 percent of Stanford's domestic water is used for academic research and support facilities.** Specifically, almost 25 percent of the domestic water use is for the CEF equipment and space cooling and heating of academic and hospital buildings. The SFPUC water is the most efficient (energy and water-efficient) to use for the CEF due to its high quality and the ability to recycle it 10-15 times. Additionally, 22 percent of Stanford's domestic water is used by research and academic programs. Another 27 percent is used by student housing and dining, mostly indoors, and only 23 percent is used by residential leaseholders.

14. **Problems with Mandatory Rationing to a Maximum of 20 Percent System-wide** (PEIR: p. 3-33)
We believe that conservation and recycling are key to stretching water supplies; however, we also see a need for fair treatment of utilities that can demonstrate that their water conservation programs are resulting in water savings. To this end, Stanford University and others who have invested their resources in reducing water consumption have to be treated fairly when mandates for water use reductions are dictated for all water agencies. These mandatory reductions should recognize and incorporate a separate scale for reductions for agencies that have hardened their water use due to demonstrated significant efficiencies from long-term conservation. As other agencies move forward with aggressive conservation, the ability of the region to accept 10 to 20 percent cutbacks without additional allocations could be very problematic. 06

Stanford is fortunate to have other sources of water in addition to the high quality domestic water from SFPUC. However, our local water sources are limited, especially during droughts, and also require prudent management. We need to reserve well capacity for emergency supplies, not routinely use them, in order to preserve aquifer supplies during droughts. Reduction in availability of non-potable water or groundwater would significantly impact Stanford's flexibility in managing water supplies and further increase reliance on SFPUC domestic water supply. Stanford's non-potable water supply would be limited or possibly not available during droughts; therefore we would expect this reduction in local water availability to be factored into regional mandatory use reduction formulas.

Factors negatively affecting availability of Stanford's local supplies include: 06 cont.

- Drought impacts on Stanford's non-potable water supply for irrigation.
- Potential regulatory requirements reducing availability of local water.
- Potential over-reliance and overuse of groundwater, reducing groundwater supply.

Thank you for this opportunity to comment on SFPUC's WSIP and the comprehensive PEIR document. We look forward to working with SFPUC to ensure this important program is implemented without delay.

Sincerely,

Clifford (Mike) Goff

"Vision In Action"

October 1, 2007

Paul Maltzer, Environmental Review Officer
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103

Dear Mr. Maltzer:

The Tuolumne County Chamber of Commerce is opposed to the San Francisco's Public Utilities Plan (SFPUC) to take more water from the Tuolumne River. 01

On March 14, 2007 the Chamber Board of Directors adopted a policy statement on water that "Strongly supports improving the state's surface water storage capacity." It also state's the importance of protecting existing water sources in the county. 02

We support the alternatives identified in your draft document that protect the Tuolumne River from new diversions. Requiring more water conservation, efficiency, and recycling is the best way to lessen impacts on the Tuolumne River while promoting a sustainable water plan for agencies supplied all or in part by the San Francisco Water System. 03

The Chamber also believes the SFPUC should adopt a policy of reducing diversions from the Tuolumne River and do a watershed study to assess the environmental impacts of the WSIP. 04

Sincerely,

George Segarini
President & CEO

San Francisco, CA 94103

Re: San Francisco Public Utilities Commission – Water System Improvement Program; Program Environmental Impact Report (PEIR)

Dear Mr. Maltzer:

The Tuolumne Utilities District (TUD) respectfully submits the following comments on the San Francisco Public Utilities Commission's Water System Improvement Program (WSIP) PEIR. TUD will be actively engaged in all hearings, proceedings, permitting and future actions related to this project.

TUD is the agency responsible for providing water supply to a population of 44,000 in Tuolumne County. As such, TUD is primarily concerned with continued water supply availability in the County of Origin to support current and future economic growth and ecosystem health. It is the position of TUD that the continued export of water from the County of Origin to serve the unrelenting growth in the Bay Area, particularly outside of the boundaries of the City and County of San Francisco, is both irresponsible and in conflict with the provisions of its entitlements under the Raker Act.

Given the current state of water crisis in the state, responsible public water agencies are adopting and implementing regional and interregional water management strategies which balance the needs of all water consumers, including the environment. It is prudent water management to plan for diversification of the community's water supply portfolio.

The PEIR is severely limited in its alternatives development with regard to supply diversification. For each supply alternative, the analysis seems to assume that the proposed project or program must meet the increased water supply objective on its own, rather than considering a diversified mix of smaller scale conservation, desalination, interconnection, groundwater sources, increased recycling as well as limiting, versus prohibiting, increases in wholesale purchase requests. For example, the PEIR neglects to evaluate the opportunity to install a smaller, year-round desalination facility in conjunction with a water recycling program which irrigates only agricultural lands, commercial and industrial landscaping. 01

The PEIR addresses only the negative political and economic impacts associated with denying future wholesaler purchase requests. The PEIR disregards the opportunity to evaluate 02 limiting new purchase requests which could be based on the level at which its wholesaler perform with regard to conservation and recycling efforts. Limiting new purchase requests will result in increased public acceptance of recycled water use and enhanced tolerance of aggressive conservation measures. 02 cont.

It is our understanding that on October 18, 2005, the County of Tuolumne submitted numerous comments and concerns for consideration during the public scoping process in preparation for the WSIP - PEIR. TUD agrees with and supports the October 18, 2005 County comments and supports their concerns and position stated in their September 25, 2007 PEIR response as well. 03

Upon review of the draft PEIR, we find that although many of the County's comments were discussed in the PEIR analysis, their concerns were not adequately addressed, and the findings and conclusions made in support of the recommended alternative lack adequate evaluation and consideration as follows:

1) **Water conservation and water recycling** - The PEIR estimates that requests to wholesale agencies to implement conservation measures at 20% during drought will result in a commensurate 20% reduction in supply needs. Unless conservation measures are strictly enforced and set at a higher percentage than the desired 20% conservation policy goal, it is highly unlikely that a 20% usage reduction will occur. The percentage of water usage reduction during conservation measures should be validated in the PEIR using industry standards, which are typically based on the water year rather than an arbitrary percentage.

   In addition, the PEIR assumes demand hardening during water conservation without documentation to show that hardening is occurring, or validation of the level at which its wholesale agencies are currently enforcing conservation, or the level of customer performance during previous conservation measures.

   The PEIR further states the assumption that water conservation and recycling can partially, but not fully meet the WSIP delivery reliability and water supply performance objectives. This assumption was developed based on cursory input from the wholesale customers, rather than research, analysis and presentation of factual data. No tables or data are included in the PEIR showing: 04

   a) The current level of water conservation and customer performance in each of the agencies served,
   b) The maximum possible level of conservation prior to demand hardening.
   c) The Average Daily Dry Weather flows into the wastewater plants in each of the wholesaler communities,
   d) The amount of treated wastewater effluent currently discharged into local waterways and the bay from each of the wastewater facilities,
   e) Total amount of treated effluent currently available for use on recycled water projects,
   f) Location of recycled water facilities and possible expansion areas,

L_TUD1

   g) An inventory of park, agricultural, industrial and commercial facilities which can be easily converted to irrigation with recycled water. 04 cont.

   Lacking the information detailed above, the maximum potential supply of recycled and conserved water to offset demand can not be accurately determined. Therefore, the PEIR does not adequately meet the requirement of the Raker Act to utilize local water sources before increasing Tuolumne diversions, nor does it adequately evaluate the positive and negative impacts of reduced wastewater discharges into receiving waters throughout the Bay Area. 05

   In Chapter 9, the PEIR places negative public perception of the use of recycled water in a higher priority position, to avoid, versus the significant negative environmental impacts identified through increased diversions from the Tuolumne River. 06

2) In its consideration of year-round desalination, the emphasis in the PEIR again appears to be in avoiding public acceptance concerns and cost avoidance rather than maximizing local water sources. The estimated environmental impacts of the desalination plant are overstated without substantive study or data presented. 07

3) The PEIR discusses the possibility of interconnection with the Santa Clara Valley Water District (SCVWD), but rejects this option due to the fact that water from SCVWD is only available during wet years, when it is not needed. The PEIR does not evaluate the option of charging the groundwater basin with water from the SCVWD during wet years, but rather contemplates the use of water received during wet years through transfer agreements with MID and TID to charge the groundwater basin. 08

In addition, the PEIR contemplates the transfer of water from the Modesto Irrigation District (MID) and Turlock Irrigation District (TID) during drought and non drought years to meet demand objectives. The entire factual basis for the recommended alternatives contained in the PEIR is flawed, as it is based on water to be transferred from a variety of public agencies, under agreements not yet consummated. The agencies from which the water transfers are contemplated:

   a) May or may not have the legal authority to approve such transfers;
   b) May not have adequate water supply or water rights to accomplish the transfer during all years, including drought;
   c) Do not have adequate infrastructure in place to deliver the water and construction of such may be determined impractical; 09
   d) May not approve water transfer agreements altogether or may impose conditions which considerably modify the flow assumptions, viability of alternatives and mitigation measures contained in the PEIR.

Although not revealed or evaluated in the PEIR, the MID/TID water transfers are presumably occurring as the result of proposed infrastructure improvements to convey water from the Oakdale Irrigation District's (OID) main canal on the Stanislaus River to the Modesto Reservoir. This water supply in Modesto Reservoir is proposed to be used to offset impacts to the Tuolumne River below New Don Pedro, caused by increased diversions from the

L_TUD1

Tuolumne River by the SFPUC above Don Pedro. Any water use from the Stanislaus River to meet the SFPUC demand objectives must be disclosed and evaluated in the PEIR. 09 cont.

In addition, without knowing the terms and conditions of agreements to be reached in the future with MID, TID and OID, it is impossible to adequately evaluate the environmental impacts of any related projects or water transfers.

The PEIR develops and supports critical project alternatives and mitigation measures which are based on the assumed success of these transfer agreements. A minimum of three water agencies in TID, MID and OID must publicly discuss and approve such agreements with the SFPUC before the alternatives analysis contained in the PEIR can be considered valid.

10 The Raker Act at Section 9(h) specifically mandates the beneficial use of water which San Francisco has or may acquire in the future, prior to increasing its use of water from the Tuolumne River. As previously stated, the SFPUC has available to it many options for increasing it's own supply including aggressive water conservation practices implemented and enforced in accordance with industry standards, as well as a stable source and increasing supply of recycled water.

11 The recommended alternative in the PEIR is based on flawed analysis which lack supporting data, is intended for cost avoidance and convenience of the SFPUC customers, and containing projects which incite the least local political controversy, all at the expense of the County of Origin of the Tuolumne River. Additional diversions from either the Tuolumne or Stanislaus Rivers will be vigorously opposed by the Tuolumne Utilities District.

COMMENT CARD

San Francisco Planning Department
Draft Program Environmental Impact Report on the
SFPUC's Proposed Water System Improvement Program
Sonora, CA. September 5, 2007

Thank you for participating in tonight's public hearing on the Draft Program Environmental Impact Report (PEIR) for the San Francisco Public Utilities Commission's proposed Water System Improvement Program (WSIP). This is also an opportunity for you to submit written comments on the Draft PEIR for the proposed WSIP.

Written comments will be accepted through close of business on Monday, October 1, 2007. Written comments may be submitted in one of three ways:

1. Leave your written comments in the designated "Comment Box" tonight. These cards are provided for your convenience.
2. Mail your comments by October 1, 2007 to the San Francisco Planning Department, Attention: Paul Maltzer, Environmental Review Officer, WSIP PEIR, 1650 Mission Street, Suite 400, San Francisco, CA 94103
3. E-mail written comments to wsip.peir.comments@gmail.com

CONTACT INFORMATION

Name: Barbara Balen - Board President

WRITTEN COMMENTS Write clearly and continue on back. Use multiple sheets if needed.

01 I am reinforcing the comments made by my General Manager - Pete Kampa. TUD recycles 100% of our wastewater. SFPUC PEIR needs to focus on agressively recycling & re-use of existing H2O supply. Spend the $ on toilet-to-toilet infrastructure. It is your only Source of reliable H2O. H2O transfers is paper H2O The environment is your customer also, it needs water. Tuo. River flows were already establi when designated W&S. Thank you.

Re: San Francisco Public Utilities Commission - Water System Improvement Program; Program Environmental Impact Report (PEIR)

Dear Mr. Maltzer:

The County of Tuolumne is submitting PEIR comments on the San Francisco Public Utilities Commission's Water System Improvement Program (WSIP) PEIR. The County will be involved through out the WSIP implementation.

October 18, 2005 this Board submitted scoping comments to be considered by the San Francisco Planning Department when developing the PEIR. That letter is attached for your reference.

It is the County's conclusion that the San Francisco Planning Department, in its preferred alternative identified in the PEIR, has not maximized water conservation and recovery options in lieu of additional water diversion from the Tuolumne River. Our Board was clear in the October 18th, 2005 scoping comment letter that alternatives to additional water diversion must be considered more aggressively than demonstrated in the preferred PEIR alternative. 01

This letter is drafted with the intent to identify and reestablish Tuolumne County's primary concerns, as outlined in the October 18th, 2005 letter regarding the WSIP objectives and implementation and recommends that the San Francisco Planning Department seriously consider the County's comments.

Reduced flows will harm the Tuolumne River's trout, salmon, and steelhead fisheries. The diversion would also degrade whitewater recreation and cause economic harm to Sierra communities that depend on seasonal recreation. San Francisco's proposal to divert more water from the Tuolumne River jeopardizes past conservation efforts and the future health of the watershed. As the County of Origin the County believes it is necessary for the San Francisco Planning Department to consider all mitigating circumstances that will most benefit the County of Tuolumne and choose an alternative that will eliminate the need to increase water diversions from the Tuolumne River, see the attached Board of Supervisor Resolution. If the San Francisco Planning Department proceeds with the selected PEIR alternative, as the preferred alternative, and the San Francisco Public Utilities Commission adopt that alternative to carry out WSIP implementation, the County will evaluate and exercise the necessary legal remedies to see that no further water diversions from the Tuolumne River occur. 02

Re: San Francisco Public Utilities Commission - Water System Improvement Program
Case Number 2005.0159E

Dear Mr. Maltzer:

Thank you for allowing Tuolumne County to submit scoping comments on the San Francisco Public Utilities Commission's Water System Improvement Program (WSIP). The County will be involved throughout the drafting and completion of the Program Environmental Impact Report (PEIR).

During the October 5, 2005 scoping meeting, at the Sonora Opera Hall, several comments were made by governmental and non-governmental agencies, utility municipalities and Tuolumne County citizens. Although many issues and concerns were discussed, the County believes the San Francisco Planning Department must consider the following when developing the PEIR:

1. The PEIR must consider the effects of all potential demand side improvements and other water conservation measures on the overall water needs analysis.
2. The PEIR must consider the effects of all possible waste water recovery and reutilization on the overall water needs analysis.
3. The PEIR must consider the effects of all improvements to capture and store storm water runoff on the overall water needs analysis.
4. The PEIR must consider the effects of inclusion of water desalinization processes on the overall water needs analysis.

03

5. Through your water needs analysis if you determine that there is a substantial water savings with other water source alternatives, will that result in eliminating of the need to divert additional water from the Tuolumne River or even a lessening of the amount of water currently diverted from the Tuolumne River? 03 cont.
6. Your analysis of additional water diversions from the Tuolumne River needs to address the potential impacts on the County's Tuolumne River water rights as the County of Origin. 04
7. An economic analysis must be completed on the environmental effects on Tuolumne County residents, businesses and tourism prior to approving additional diversions of water from the Tuolumne River. 05
8. If systemwide improvements include system redundancy for health and safety purposes, where is the line drawn between redundancy for health and safety and increasing capacity to serve additional customers? 06
9. How is San Francisco going to integrate and prepare for the variability of the Sierra Nevada snow pack as discussed in the California Water Plan Update? 07
10. How does your plan integrate with the Turlock Irrigation District, Modesto Irrigation District, CALFED - Bay Delta Program, Tuolumne County and any other users of the Great Central Valley Watershed? Your analysis of cumulative impacts must address potential impacts to the Tuolumne River, San Joaquin River and Bay Delta ecosystem caused by reasonably foreseeable projects of other entities. 08
11. How does your plan integrate with emerging Comprehensive Management Plans within Yosemite National Park and Tuolumne River Wild and Scenic Plans within the Stanislaus National Forest and the Yosemite National Park? 09
12. Lower water flows on the Tuolumne River will put greater demands on the Stanislaus River Watershed for meeting recreational and downstream water quality needs. This in turn impacts Tuolumne County, which receives the majority of its drinking water from the Stanislaus River. How does your plan consider the County's long-term sustainable water needs and the needs of down stream users if additional water flows in the Tuolumne River are diverted? 10

Paul Maltzer
October 18, 2005
Page 3

13. The sentence at the bottom of page 9 and top of page 11 of San Francisco's Notice of Preparation makes it clear that San Francisco intends to take whatever steps are necessary to retain its filtration exemption. We understand that EPA regulations regarding water quality requirements relating to cryptosporidium are being tightened. The PEIR must discuss alternatives to continued non-filtration, and must discuss mitigation measures if further recreational restrictions are imposed at Hetch Hetchy Reservoir. 11

14. A catastrophic fire in the GCSD service area would have devastating impacts on the environment and on the Tuolumne River. You must consider the unique position of the Groveland Community Services District (GCSD) and the fact that its rural water system provides for environmental and residential safety in the event there is a fire. The County believes you must consider lessening the rationing percentage specific to GCSD for safety reasons. 12

15. The PEIR must consider the effects of inclusion of surface water and ground water conjunctive use programs that reduce the impacts of seasonal and long-term watershed yields. 13

16. Significant groundwater infiltrates into the Mountain Tunnel relative to GCSD's annual water demand, and GCSD pays a surcharge for lost power revenue. GCSD should receive a credit for the infiltration of groundwater that leaves its service area, or the elimination of the surcharge altogether. In addition, the infiltration of groundwater into the water system must be accounted for and addressed in the overall water needs analysis. Furthermore, the PEIR must comply with the Tuolumne County Ordinance Code 13.20 et al. as the Code pertains to groundwater export via San Francisco's water system. 14

17. The WSIP calls for the Mountain Tunnel to be closed down for maintenance on an annual basis. The project should assist GCSD in finding a water supply of equal quality during times of tunnel maintenance.

18. Since most of the improvements to the water system are made west of Groveland, GCSD should not be asked to help pay for those improvements downstream of Groveland. 15

19. Since the Raker Act is essentially a federal license and a portion of San Francisco's water system resides on federal land, what role will the National Environmental Policy Act play in this review? 16

20. Per the City Charter when will City Officials deem the Hetch Hetchy water and hydroelectric systems complete and merged? 17

Paul Maltzer
October 18, 2005
Page 4

County of Origin

The possible reduction in flow of the Tuolumne River could have a profound effect on Tuolumne County's recreation, biological, riparian and economic resources. As the County of Origin the County believes it is necessary for the PEIR to consider all mitigating measures that will have an impact on Tuolumne County. 18

In the past, this Board of Supervisors has brought to the attention of San Francisco the inequities of their method of bidding construction contracts, especially for construction projects that occur in Tuolumne County. This Board considers it necessary for San Francisco to consider equally bids from local Tuolumne County contractors or even give higher consideration for local Tuolumne County contractors who bid on projects within Tuolumne County. 19

The County has not taken an official position regarding the restoration of Hetch Hetchy Valley. The County recommends that an economic analysis of alternatives discussed in the PEIR be broad in scope and include all alternatives for operation of the water system. 20

During the Sonora public scoping meeting, San Francisco staff advised the participants that San Francisco staff will only provide responses to those questions that they determine to be within the scope of the project. The County believes that San Francisco has the responsibility to respond to all of the questions as part of the scoping process.

The County recommends that the San Francisco Planning Department, during its review of the scoping comments, consider the County's issues and concerns during the subsequent drafting of the corresponding Draft Program Environmental Impact Report.

If you have any questions, please contact Steve Boyack, Natural Resources Analyst at (209) 533-5511.

Sincerely,

Paolo Maffei, Chairman

No. 140-07

Filed September 25, 2007

By [signature]
Clerk of the Board of Supervisors

RESOLUTION
OF THE BOARD OF SUPERVISORS OF THE COUNTY OF TUOLUMNE

WHEREAS, California is experiencing a serious water shortage and is likely to continue to do so in coming years due to drought, a long term trend toward warmer rains and earlier mountain runoff, a lack of storage capacity and population growth; and

WHEREAS, the Tuolumne River is a local, regional, and national treasure from its headwaters high in Yosemite National Park to its confluence with the San Joaquin River and contributes a vitally important water source to the Bay Delta ecosystem; and

WHEREAS, the waters of the Tuolumne River also sustain Agriculture, rural and urban communities, diverse natural and biological resources, and recreational uses that generate significant revenue for Tuolumne County and downstream economies; and

WHEREAS, Agriculture is an important industry requiring affordable, high quality, reliable water for food and fiber production, provides critically important sustenance for society in general, and provides numerous quality of life benefits to residents of the region, the State of California and the Nation; and

WHEREAS, 60% of the Tuolumne River is presently diverted for rural and urban uses and users currently depend on Tuolumne River water for a wide variety of needs including those above; and

WHEREAS, a section of the upper Tuolumne River is highly valued for its natural resource qualities, public benefit, and has been named a federally-designated Wild and Scenic River, and

WHEREAS, the Tuolumne River from headwaters to confluence supports a series of unique habitats and diverse biological communities that include migratory waterfowl, peregrine falcons, bald eagles, mule deer, black bears, foothill yellow-legged frogs, Sierra Nevada red fox, rainbow trout, steelhead, and Chinook salmon; and

WHEREAS recreation including boating and fishing on the Tuolumne River, Cherry Reservoir and Lake Don Pedro are important components of high quality of life experiences for people in the State and for local economies; and

WHEREAS, the San Francisco Public Utilities Commission (SFPUC) currently diverts 265 million gallons of water from the Tuolumne River daily and its proposed Water System Improvement Program (WSIP) seeks to divert an additional 25 million gallons of water per day from the Tuolumne River; and

WHEREAS; the SFPUC's WSIP Draft Program Environmental Impact Report (PEIR) fails to properly identify and address all the environmental, Agriculture, rural and urban, and recreational use impacts to Tuolumne County, downstream areas and the San Joaquin Water Shed including the Stanislaus River that would be generated by diverting additional water from the Tuolumne River; and

L_Tuol1

WHEREAS, water conservation and efficiency measures are the cheapest, easiest, and least destructive ways to meet demand and extend supply; and

WHEREAS, SFPUC has not demonstrated a sincere and sufficient effort to implement voluntary and/or mandatory conservation measures to the individual, private, and government agencies it serves; and

WHEREAS, significant potential exists for SFPUC to increase present conservation, recycling, and other efficiency measures.

NOW THEREFORE, BE IT RESOLVED that the Tuolumne County Board of Supervisors unequivocally opposes San Francisco PUC's proposed diversion of an additional 25 million gallons of water a day from the Tuolumne River, and

BE IT FURTHER RESOLVED that the County will seek and exercise the necessary legal remedies to see that no further water diversions occur from the Tuolumne River.

ADOPTED BY THE BOARD OF SUPERVISORS OF THE COUNTY OF TUOLUMNE ON 9/25/07,

AYES:	1st Dist. ———	NOES:	1st	Dist. Bass
	2nd Dist. Maffei			Dist.
	3rd Dist. Murrison	ABSENT:		Dist.

Re: San Francisco Public Utilities Commission (SFPUC) - Water System Improvement Program; Program Environmental Impact Report (PEIR)

Dear Mr. Maltzer:

Thank you for extending the PEIR comment period, but I believe the comment period should have been extended longer.

This letter is to re-enforce my concerns regarding two primary issues:

1. I believe the San Francisco Planning Department (SFPD) has not fully considered the economic impacts to the rafting industry that exists in Tuolumne County should the SFPUC decide to divert an additional 25 million gallons of water per day from the Tuolumne River. 01

2. I believe Tuolumne County has water rights on the Middle Fork and South Fork of the Tuolumne River. The SFPD has not addressed the County's water rights concerns in the PEIR. 02

In addition, I must restate my position that there is not enough baseline data and has not been enough time to gather baseline data to properly analyze the environmental consequences of diverting additional water from the Tuolumne River. 03 Furthermore, not only have you not addressed better water conservation and recycling in the Bay Area you 04 have not answered Tuolumne County's concerns about you arrangement within Lake Don Pedro. 05

Finally, I believe the PEIR is also deficient in addressing the water diversion and impacts in relation to the goals and strategies of the Sierra Nevada Frame Work and CalFed. Your PEIR should embrace a comprehensive watershed management approach which extends from the Sierra Nevada Crest to the Bay Area. 06

Thank you for addressing these concerns,

Sincerely,

Mark V. Thornton
District 4 Supervisor, Tuolumne County

Subject: SFPUC's Water System Improvement Program Draft Programmatic Environmental Impact Report

Dear Mr. Maltzer:

Thank you for the opportunity to review and comment on the Draft Programmatic Environmental Impact Report (DPEIR) for SFUPC's Water System Improvement Program (WSIP). Zone 7 has reviewed the DPEIR in the context of Zone 7's mission to provide drinking water, non-potable water for agriculture/irrigated turf, flood protection, and groundwater and stream management within the Livermore-Amador Valley. We offer the following comments for your consideration.

Zone 7 manages 425 square miles of the Upper Alameda Creek Watershed consistent with flood protection needs and in support of groundwater recharge operations that provide peak period water supply and drought protection in the Livermore-Amador Valley. In working with the resource agencies, Zone 7 has found that stream management projects are frequently viewed holistically and impacts are considered cumulatively. As such, Zone 7 is concerned that impacts to fisheries downstream of its service area are adequately addressed given their indirect effects on the management of upstream water resources.

In Section 5.4.5 – Fisheries of the DPEIR, SFPUC states that because the existing BART Weir is an impediment to steelhead migration, spawning and juvenile rearing, implementation of the WSIP will not impact steelhead migration; therefore, no impact analysis or conclusion was developed in the DPEIR. This conclusion is based on an incomplete assessment of the current status of steelhead fishery in Alameda Creek and the ongoing restoration efforts. The Alameda County Flood Control & Water Conservation District (ACFC&WCD) and the Alameda County Water District (ACWD) currently have an approved agreement to provide for fish passage designs at the BART weir and ACWD's middle inflatable dam to open up steelhead fish passage by the year 2010. In addition, as recognized in the DPEIR, the Alameda Creek Fisheries Restoration Workgroup, in which SFPUC, ACWD, Zone 7, and PG&E are participating, is conducting flow studies to determine flow requirements for a restored steelhead fishery. Finally, there have been annual steelhead sightings documented in the Alameda Creek Flood Control Channel. The implementation of the WSIP will substantially reduce winter and spring flows in Alameda Creek by up to 50% in normal years. This reduction may adversely impact flows available to steelhead that currently access Alameda Creek below the BART weir. Therefore, despite the BART weir being an impediment to upstream steelhead migration, implementation of the WSIP may have an impact on fisheries downstream of the BART weir. With these considerations, it would be prudent for SFPUC to analyze impacts implementing the WSIP will have on steelhead migration, assuming the BART weir could potentially be removed or modified in the future to become less of a migration barrier. 01

In addition to the Alameda Creek flow issues, Zone 7 is concerned about two other aspects of the WSIP. About 80 percent of Zone 7's water supply is conveyed by the State Water Project (SWP) through the Delta and into our service area. As a State Water Contractor (SWC), Zone 7 is concerned with impacts to SWP supplies and Delta water quality. SFPUC proposes to reduce inflow into the Don Pedro Reservoir, which will result in reduced inflow into the Tuolumne River and the Delta via the San Joaquin River. Although the flow reductions generally would be less than 200 cfs, there would be several years in which the flow reduction during a single month would exceed 1,000 cfs. A flow reduction of this scale would likely result in significant negative impacts to Delta water quality and/or SWP supply. As a member of the SWC Board of Directors, Zone 7 supports SWC's recommendation that the SFPUC either (1) adopt the Modified WSIP Alternative as the preferred alternative with appropriate supporting environmental analysis or (2) provide an analysis of WSIP implementation attempting to adjust the timing of Don Pedro Reservoir refill both to reduce the scale of monthly flow reductions in Tuolumne River below La Grange Dam and to coincide with periods of excess conditions in the Delta. 02

Finally, Zone 7 supports the exploration of water management techniques such as interconnections and water exchanges among SFPUC and other jurisdictions such as the Dublin San Ramon Service District, which would provide a regional benefit to water supply reliability. Having interconnections with the watersheds or groundwater basins of other jurisdictions may also assist San Francisco in increasing its own water supply reliability. 03

Again, we appreciate the opportunity to comment on this document. If you have any questions or comments, please feel free to contact me at your earliest convenience at 925-454-5000 or Mary Lim at 925-454-5036.

Sincerely,

G.F. Duerig
General Manager

Alameda Creek Alliance Comments on WSIP Draft PEIR

Attached are the comments of the Alameda Creek Alliance (ACA) on the Draft Program Environmental Impact Report (DPEIR) for the SFPUC's Water System Improvement Program (WSIP). The ACA is a community watershed group dedicated to the protection and restoration of the natural ecosystems of the Alameda Creek watershed. The ACA has over 1,450 members that live in or near the Alameda Creek watershed. The ACA has been working to restore steelhead trout and salmon to Alameda Creek and to protect endangered species in the Alameda Creek watershed since 1997.

The ACA supports the SFPUC's efforts to make needed repairs and earthquake safety retrofits to its water system, however we also expect the rebuilt water system infrastructure in the Sunol Valley (including Calaveras Dam and Reservoir, Alameda Diversion Dam, and San Antonio Reservoir) to be operated to allow restoration of steelhead trout and salmon to Alameda Creek. We have some serious concerns with the DPEIR. The failure of the DPEIR to address impacts to anadromous fish in Alameda Creek and its inadequate mitigation measures for special-status species has the potential to jeopardize the SFPUC's time table for implementing the WSIP projects. 01

We are very concerned that two of the WSIP projects proposed in the Sunol Valley Region, the Calaveras Dam Replacement Project and the Alameda Creek Fishery Enhancement Project, include proposals to divert additional streamflow from Alameda Creek, water diversions that which would severely impact native fish and other aquatic wildlife in Alameda Creek. The SFPUC already diverts 86% of the stream flows tributary to the Sunol Valley, from Alameda, Calaveras and San Antonio Creeks, with significant, unmitigated impacts to native fish and wildlife. 02

The SFPUC continues to illegally operate Calaveras and San Antonio Reservoirs, with no minimum bypass flows to keep native fish downstream in good condition. It is questionable whether the SFPUC has a legal water right to divert Alameda Creek streamflow at the Alameda Diversion Dam, and the WSIP plan to divert almost <u>all</u> of the winter and spring stream flows from upper Alameda Creek at this dam is unacceptable. 03 (03 cont.) It is inconceivable that the Calaveras Dam replacement, a major infrastructure project that should address and remedy the impacts of the dam on Alameda Creek fisheries, does not include adequate minimum flows for anadromous fish nor mitigations commensurate with the impacts of the operation of the dam. 04

With other agencies planning fish passage projects in lower Alameda Creek that could allow steelhead trout and chinook salmon to return to the upper watershed by 2010 (before construction of Calaveras Dam is complete), we are extremely disappointed that the WSIP does not include planning, environmental benefits and adequate mitigations for sustaining steelhead and salmon in Alameda Creek. 05

The ACA has made every effort since 2001 to communicate our concerns and suggestions regarding the SFPUC's Sunol Valley projects with potentially significant impacts to the fisheries of Alameda Creek, to every level of the SFPUC, at numerous public forums and meetings, and in numerous written comments. In 2005, 68 Bay Area conservation groups called on the SFPUC to improve its stewardship of local and regional watershed lands, specifically asking the SFPUC to restore stream flows in Alameda Creek sufficient to sustain steelhead and rainbow trout, protect rare fish populations in SFPUC reservoirs, remove the Alameda Diversion Dam, and abandon plans to construct a controversial dam as part of the Fishery Enhancement Project. 06

The public expects the SFPUC to operate a water system that adequately protects and restores the watersheds and wildlife habitats under the SFPUC's management. The WSIP should reflect this stewardship obligation and the PEIR should adequately analyze and mitigate for reasonably foreseeable significant impacts to all special-status species and rare habitats. 07

Sincerely,

Jeff Miller
Director, Alameda Creek Alliance

THE DPEIR FAILS TO CONSIDER IMPACTS AND INCLUDE ADEQUATE MITIGATIONS FOR ANADROMOUS FISH

The DPEIR approach to the issue of potential steelhead restoration in Alameda Creek is that since "there is no current steelhead migration above the BART weir" (page S-67) in lower Alameda Creek, there can be no impacts to steelhead from implementation of the WSIP. The DPEIR states:

> "For the purposes of full disclosure the PEIR provides this discussion of steelhead in lower Alameda Creek, and the potential for steelhead to be restored to the upper reaches of Alameda Creek (above the BART Weir). However, because this steelhead access does not currently exist and there is no current steelhead migration above the BART Weir, there would be no impact on steelhead migration, spawning, or juvenile rearing upstream of the BART Weir as a result of WSIP implementation. Further, as described in the preceding discussion, since a number of steps are required before steelhead migration further upstream can occur, it is speculative to assess the specific impacts that system operation under the WSIP might have on the potential future restoration of steelhead. Thus, no impact analysis or conclusion is developed in this PEIR. If and when steelhead are restored, the SFPUC will be required to conform its system operations to comply with the applicable Endangered Species Act requirements."

08

This approach is nonsensical. The WSIP contemplates construction and operation of facilities that will last decades, if not centuries. Over a dozen public agencies are working Alameda Creek restoration projects that will bring steelhead trout and salmon back into upper Alameda Creek, very likely before environmental review and construction have been completed for WSIP projects in the Sunol Valley. Operations of Calaveras Dam and other WSIP facilities are certain to impact these fish. It makes no sense to install major infrastructure and conduct environmental review for operating procedures that may then need to be modified or replaced to comply with wildlife protection laws.

Furthermore, on July 31, 2007, the Alameda County Flood Control and Water Conservation District and the Alameda County Water District signed a Memorandum of Understanding (MOU) for an agreement to develop a preliminary design of a fish passage facility in the Alameda Creek flood control channel. The MOU states the goal of these agencies to "have the Fish Passage Facility constructed by the end of calendar year 2010," before construction of Calaveras Dam begins. This facility will provide fish passage for anadromous fish past the BART weir and the middle ACWD rubber dam, the primary barriers to steelhead migration up lower Alameda Creek.

The lower ACWD rubber dam is scheduled for removal in 2008. The ACWD operates the upper ACWD rubber dam to have the dam deflated during winter storm events, which will allow some anadromous fish to bypass the dam and migrate into Niles Canyon during some winter flows. The next significant fish passage barriers on Alameda Creek are the USGS gaging station weir in lower Niles Canyon, owned by the SFPUC and

likely not a barrier to fish migration at higher flows, and a PG&E gas pipeline crossing in the Sunol Valley. The DPEIR (Table 5.7-13) states that the PG&E gas pipeline crossing fish passage project is scheduled for completion by 2009.

The construction of Calaveras Dam from 2009 through 2011 or 2012 clearly has a reasonably foreseeable impact on steelhead trout that could access Alameda Creek by 2010. The DPEIR claims that it is "speculative to assess the specific impacts that system operation under the WSIP might have on the potential future restoration of steelhead." As discussed above, it is not speculative to consider the impacts of the construction and operation of WSIP projects on migratory fish. Indeed, it is known that stream flows contemplated in the WSIP will be inadequate to protect steelhead and salmon. The DPEIR must assess potential impacts to all anadromous fish in Alameda Creek, including steelhead trout, chinook salmon and Pacific lamprey. 08 cont.

<u>Status of Fisheries</u>

Pacific lamprey are designated a state Species of Concern, and have declined severely in California. The species was petitioned for federal ESA listing in 2003. Pacific lamprey have been found recently in only three other streams in the Bay Area - Coyote Creek, Conn Creek and Sonoma Creek - so the Alameda Creek lamprey population is quite significant. Adult lamprey already have passage into upper Alameda Creek and are known to occur from the lower Sunol Valley through Sunol Regional Park. The DPEIR fails to discuss or analyze the impacts of WSIP projects on lamprey and whether proposed stream flows are adequate to keep lamprey populations below SFPUC dams in good condition. The DPEIR discussion of Alameda Creek fisheries (5.4.5-2) states that SFPUC fishery monitoring has documented successful lamprey spawning and rearing within Niles Canyon in recent years. The Alameda Creek Alliance citation given, *Comments on Central California Coast steelhead status review, October 19, 2004 (ACA, 2004)*, does not refer to lamprey. There is also documentation of lamprey in Alameda Creek from the Sunol Valley up to near the Calaveras Creek confluence. 09

The DPEIR discussion of Alameda Creek historical fisheries (section 5.4.5.1) should acknowledge that Alameda Creek also supported coho salmon and chinook salmon, and that there is historical evidence of steelhead trout in Arroyo de la Laguna, Arroyo Mocho, and Arroyo Valle – these occurrences have been extensively documented by the Alameda Creek Alliance (see http://www.alamedacreek.org/About_Alameda_Creek/Alameda%20Creek%20salmonid%20documentation%203-8-06.pdf). 10

The DPEIR discussion of the regulatory status of steelhead/rainbow trout should mention the SFPUC's role in eliminating proposed ESA protections for resident rainbow trout in Alameda Creek, and the resultant removal of Alameda Creek from designated critical habitat protections for Central California Coast steelhead. 11

The National Marine Fisheries Service (NMFS) proposed in June of 2005 to include resident trout and some landlocked steelhead, including those in Alameda Creek, as part of the Central Coast steelhead population, based on genetic evidence that Alameda Creek's resident fish are similar to adult ocean-run steelhead. Studies published by the U.S. Geological Survey in 1999 and 2003 demonstrated that native Alameda Creek rainbow trout and reservoir fish above SFPUC dams are genetically related to wild steelhead in the Central Coast steelhead population. The studies analyzed fin clips from adult steelhead captured at the Fremont BART weir in recent years by ACA volunteers, rainbow trout populations in upper Alameda Creek and its tributaries collected by Alameda County in 1999, and landlocked reservoir trout from surveys conducted by the SFPUC. Landlocked trout behind the two SFPUC reservoirs are thought to be the descendants of the original migratory steelhead run in Alameda Creek and represent the best native gene pool for restoring steelhead below the dams. 11 cont.

The SFPUC lobbied against listing Alameda Creek trout, despite compelling genetic evidence that these fish are descendants of wild steelhead, and the final NMFS determination in December 2005 excluded resident fish and excluded Alameda Creek from designated critical habitat for Central Coast steelhead. This issue will likely be revisited by the courts and NMFS, and it is foreseeable that resident rainbow trout in SFPUC reservoirs and in Alameda Creek could be listed under the ESA.

PROPOSED WATER SUPPLY OPERATIONS IN THE DPEIR FAIL TO COMPLY WITH STATE AND FEDERAL WILDLIFE PROTECTION LAWS AND THE SFPUC ENVIRONMENTAL STEWARDSHIP POLICY AND THE DPEIR HAS AN INCOMPLETE DISCUSSION OF REGULATORY REQUIREMENTS, REQUIRED ACTIONS AND APPROVALS

The WSIP states (pages S-10 and 3-39) that the proposed SFPUC water system operation strategy includes "complying with all water quality, environmental, and public safety regulations" and "meeting all downstream flow requirements." The DPEIR (page 3-43) claims that the SFPUC "will meet, at a minimum, all current and anticipated legal requirements for protection of fish and other wildlife habitat."

<u>State Fish and Game Codes</u>

The DPEIR fails to discuss relevant California Fish and Game Codes and California Department of Fish and Game (CDFG) requirements to protect native fish and wildlife.

The SFPUC currently operates Calaveras and San Antonio Reservoirs with no minimum bypass flows to keep native fish downstream in good condition, in violation of California Fish and Game Code §5937. California Fish and Game Code §5937 requires that the owner of a dam allow sufficient water to pass through a fishway or dam, to keep in "good condition" any fish that may be planted or exist below the dam. The law applies to any dam regardless of when it was built. 12

The California Department of Fish and Game submitted comments on the Notice of Preparation for the DPEIR on November 22, 2005, stating that "at this time, both the Alameda Creek Diversion Dam and Calaveras Reservoir are out of compliance with Fish

and Game Code 5937 which requires dam owners to release enough water to keep downstream fish populations in good condition."

Under the WSIP, the SFPUC proposes to operate the Alameda Diversion Dam in a manner that will violate §5937, diverting almost the entirety of late fall through spring flows from upper Alameda Creek, which will clearly fail to keep fish populations downstream of the diversion dam in good condition. The SFPUC also has not demonstrated that the proposed operation of Calaveras and San Antonio Reservoirs under the WSIP will keep fish populations downstream of these dams in good condition. The SFPUC must show that the minimum flows proposed for Calaveras Reservoir will maintain healthy fish and wildlife populations downstream. The CDFG commented that the SFPUC "will need to assess adequate flows for anadromous steelhead trout and will need to renegotiate with DFG such that adequate flows are released to comply with Fish and Game Code 5937."

The CDFG commented that the DPEIR should "consider utilizing the SFPUC's related water storage facilities within the Alameda Creek watershed (i.e., San Antonio Reservoir) to meet the needed minimum bypass flows in the affected reach of Alameda Creek and in particular passage flows needed through Sunol Valley." The WSIP does not include consideration of any minimum flows from San Antonio Reservoir. 12 cont.

The proposed operation of the Alameda Diversion Dam without fish passage violates California Fish and Game Code §5901, which makes it illegal to maintain any device which prevents or impedes the passing of fish up and down stream. The diversion dam blocks the upstream and downstream movements of both resident and transient fishes, including resident rainbow trout. Once fish passage projects in lower Alameda Creek are completed, the diversion dam could block upstream and downstream migration of steelhead trout. Operation of the diversion dam not only affects fish migration past the diversion dam, but also potential fish passage through Little Yosemite, by diverting the majority of the annual flow of upper Alameda Creek. Reducing the frequency of high flow periods downstream of the diversion dam reduces fish passage opportunities through Little Yosemite.[1]

The WSIP should also include feasible fish passage provisions for Calaveras and San Antonio Dams. Calaveras and San Antonio Dams block the upstream and downstream movements of both resident and migratory fishes, including steelhead trout.[2] The reservoir trout populations appear to be descended from native steelhead populations isolated behind the dam.[3] Calaveras Dam blocks steelhead access to the upper Calaveras watershed including its tributaries Arroyo Hondo, Smith, and Isabel Creeks, likely the

best historical steelhead spawning and rearing habitat in the entire Alameda Creek watershed. San Antonio Dam blocks steelhead access to San Antonio and Indian Creeks. 12 cont. These dams prevent gene flow between trout populations above and below the reservoirs, and may be affecting the long-term genetic viability of reservoir and stream populations.

<u>1997 MOU for Flows from Calaveras Reservoir</u>

The WSIP references a Memorandum of Understanding (MOU) the SFPUC signed with CDFG in 1997, to release up to 6,300 acre-feet per year of water to Calaveras and Alameda Creeks for enhancement of fisheries and the other natural resources. Compliance with the MOU would restore minimal stream flows to approximately five miles of Alameda Creek, at which point the water would be recaptured and diverted back into the SFPUC's water supply system.

To date the SFPUC has not released water for this purpose, but the WSIP proposes releasing these flows after completion of construction of Calaveras Dam. The DPEIR (pages 5.4.1-9 and 5.4.1-10) claims that implementation of the 1997 MOU is "hindered by the lack of sufficient cold-water storage in Calaveras Reservoir' and that the releases are "on hold due to lack of sufficient cold-water storage in the reservoir." The SFPUC has also stated in its *Final Conceptual Engineering Report* for Calaveras Dam that the 1997 MOU flows have "not been fully implemented because of the current limitations on storage" and "because of the storage restriction ordered by DSOD at the reservoir."

This is a misrepresentation of the limitations the DSOD drawdown places on the SFPUC's ability to immediately release flows from the reservoir. Although current water storage in Calaveras Reservoir is at 60% less than the maximum before the DSOD 13 drawdown, the SFPUC's yield (available treated water supply) from Calaveras has apparently only been minutely affected by the DSOD operating restrictions on Calaveras Reservoir. According to the Notice of Preparation for the WSIP PEIR published by the SFPUC in 2005, Calaveras yield was 219 mgd, fully 98% of the normal system yield of 223 mgd. This means that water was available for flow releases to Calaveras Creek and Alameda Creek, but that the SFPUC chose to divert this water to its water treatment plant instead. As discussed below, the resident trout population below Calaveras Dam is not being kept in good condition - low summer flows and high water temperatures have reduced native rainbow trout to remnant populations in upper Alameda Creek.

The MOU flows are intended to benefit resident rainbow trout in five miles of stream, and were not intended to meet the habitat needs of anadromous fishes such as steelhead trout, salmon, or lamprey. The MOU also allows these flow releases to be recaptured downstream in the vicinity of the Sunol Valley Water Treatment Plant. It is important to note that the MOU flows are required minimum stream flows at the confluence of Calaveras and Alameda Creeks, not flows that must be released from Calaveras Reservoir. During most winters, the flows required under the MOU from November 1 through March 15 could be met by natural stream flow in Alameda Creek, thus requiring little or no flow releases from Calaveras Reservoir by the SFPUC. For normal and wet water years, summer releases would be the only truly enhanced stream flow, so that in

SI_ACA1

most years the SFPUC would release only 3,150 acre-feet under the proposed Project. The DPEIR fails to discuss the rationale and scientific basis for the proposed flow schedule and whether these flows are adequate for all life stages of anadromous, or for that matter, resident fish. These flows will not allow for upstream and downstream migration of anadromous fish and will not provide rearing habitat for fish below the recapture point. The WSIP should include adequate flows for anadromous fish without downstream recapture as part of the operating criteria for the rebuilt Calaveras Reservoir.

The California Department of Fish and Game stated in their comments on the Notice of Preparation for the DPEIR on November 22, 2005, that the SFPUC must:

> "provide flow releases to the stream channel below Calaveras Reservoir dam to encourage riparian vegetation growth, invertebrate productivity, 13 cont. adequate dissolved oxygen, low water temperatures, and provide some rearing habitat for juvenile steelhead trout and spawning adult steelhead trout. The SFPUC, under the aforementioned 1997 MOU with DFG, agreed to specific flow releases to provide habitat for resident rainbow trout and other native fish species downstream of Calaveras Reservoir based on the knowledge of fish migration barriers being present in the lower downstream reaches of Alameda Creek. At this time, however, there is active fish passage remediation at these barriers. The SFPUC will need to assess adequate flows for anadromous steelhead trout and will need to renegotiate with DFG such that adequate flows are released to comply with Fish and Game Code 5937."

<u>Questions About SFPUC Water Rights</u>

The DPEIR discussion of existing water rights and entitlements (Section 2.5.1) does not mention the potential lack of a valid water right for the Alameda Diversion Dam, and also fails to mention that existing water rights can be adjudicated by the Sate Water Board to protect beneficial uses, including fisheries.

It is questionable whether the SFPUC has a legal water right to divert Alameda Creek streamflow at the Alameda Diversion Dam. The SFPUC has a valid pre-1914 appropriative right for Calaveras Dam and reservoir, but this water right does not mention the Alameda Creek diversion dam and tunnel, which were not built until the 1930s. The 14 WSIP plan to divert almost <u>all</u> of the winter and spring stream flows from upper Alameda Creek at this dam violates Fish and Game Code §5937. As noted by the State Water Resources Control Board in a DPEIR scoping comment letter to the SFPUC dated October 3, 2005, "an appropriative water right issued by the State Water Board is also required for any increased diversion from Alameda Creek."

In a letter submitted during the scoping phase for the PEIR, the State Water Resources Control Board (SWRCB) stated, "the DEIR should include sufficient information for the State Water Board to use the document for water right permitting purposes. Therefore, the document should evaluate the availability of unappropriated water after taking into consideration prior rights and the water required to maintain public trust resources. Division staff recommends that any evaluation utilize a cumulative flow impairment methodology, such as the assessment method described in the *Guidelines for Maintaining Instream Flows to Protect Fisheries Resources Downstream of Water Diversions in Mid-California Coastal Streams (Draft)* prepared by NOAA Fisheries Service and the Department of Fish and Game and dated June 17, 2002." The impact evaluation in the DPEIR does not employ a cumulative flow impairment methodology and falls short of answering the question of whether there is sufficient water available to maintain public trust resources. 14 cont.

The DPEIR should mention that in 2001 the SWRCB estimated that the entire Alameda Creek watershed is 72% "impaired," impairment representing the ratio of water appropriation under existing water rights to estimated stream flow, and that in 2002 the state Department of Water Resources DWR concludes the Alameda Creek watershed is "fully appropriated" and no further water diversions will be considered.

Misinterpretation of the Raker Act

The discussion of the Raker Act in the WSIP misinterprets the Act. The Raker Act, Section 9(h) provides:

> "That the said grantee shall not divert beyond the limits of the San Joaquin Valley any more of the waters from the Tuolumne watershed than, together with the waters which it now has or may hereafter acquire, shall be necessary for its beneficial use for domestic and other municipal purposes."

Since San Francisco must fulfill its "beneficial use" water needs with "waters which it now has or may hereafter acquire," Tuolumne River water must be a source of last resort for San Francisco. The DPEIR has interpreted this section of the Raker Act as follows: "section 9(h) of the Raker Act requires San Francisco to make full use of its local sources of water." The Notice of Preparation interpreted this requirement in the Raker Act in an overly narrow way: 15

> "under the WSIP, the regional water system would continue to comply with the conditions of all applicable institutional and planning requirements, including: . . . maximizing use of water from local watersheds."

The Raker Act does not define the "water which it now has" as "water from local watersheds." It is true that San Francisco "now has" water rights to water from Bay Area creeks including Alameda Creek. However, it is also true that San Francisco "now has" waters that it is discharging from waste water treatment plants that could be recycled, and waters recoverable through water use efficiency and water conservation measures.

SI_ACA1

Federal Endangered Species Act

The federal Endangered Species Act (ESA) prohibits unauthorized take of listed species. The DPEIR does not ensure that WSIP projects will be in compliance with the ESA, specifically with regards to adequate stream flows for steelhead trout in Alameda Creek.

The DPEIR claims that the U. S. Army Corps of Engineers (USACE) will not need to consult with the National Marine Fisheries Service (NMFS) on steelhead trout impacts for the operation of Calaveras Dam. The DPEIR states:

> "the UASCE is required under Section 7 of the ESA to consult with NMFS and the USFWS on designated species to obtain a biological opinion of no jeopardy and an incidental take statement. NMFS also advised the SFPUC that while the USACE would need to initiate a Section 7 consultation with NMFS on the Calaveras Dam Replacement project, it was unlikely that operation of Calaveras Dam would adversely affect steelhead in the area below the BART Weir by making conditions unsuitable for successful steelhead spawning, egg incubation, or juvenile rearing. For this reason, NMFS advised that the steelhead issues above the BART Weir would not be addressed in the Calaveras Dam Replacement project Section 7 consultation, and that incidental take coverage for steelhead in the upper watershed would have to be obtained through a habitat conservation plan (HCP) or through a re-initiated USACE consultation on the Calaveras Dam Replacement project after the lower passage problems are remedied." 16

This is incorrect. It would be illegal for the Corps to fail to consult on the impacts to steelhead. As noted above, steelhead trout will potentially have access to Alameda Creek stream reaches affected by the operation of Calaveras Reservoir (and San Antonio reservoir and the Alameda Diversion Dam) by 2010, including the Niles Canyon, Sunol Valley, Little Yosemite, and lower Calaveras Creek reaches managed by the SFPUC. It is reasonably foreseeable that listed anadromous steelhead will return to SFPUC stream reaches before or shortly after construction of Calaveras dam and will be significantly affected by operation of the SFPUC dams.

The DPEIR states that "if and when steelhead are restored, the SFPUC will be required to conform its system operations to comply with the applicable Endangered Species Act requirements." However, the DPEIR must analyze the reasonably foreseeable impacts to steelhead and other anadromous fish now, since it is highly probable that these species will be present in Alameda Creek during the construction and operation of the proposed Sunol Valley WSIP projects. Future operation of SFPUC dams and diversions to comply with the ESA requirements for steelhead will be dependent on current planning and inclusion of appropriate infrastructure in the WSIP projects.

The discussion of the Regulatory and Conservation Planning Framework in the DPEIR (p 4.6-23) mentions the need for consultation with federal wildlife agencies on listed species. The DPEIR should also discuss published recovery plans for listed species potentially affected by the WSIP and ensure that WSIP activities are consistent with these recovery plans. 16 cont.

Water Enterprise Environmental Stewardship Policy

One of the stated Program Goals of the WSIP is to enhance sustainability in all system activities and more specifically to manage natural resources and physical systems to protect watershed ecosystems. To further clarify their commitment to environmental stewardship, the SFPUC adopted the Water Enterprise Environmental Stewardship Policy in 2006. The policy states, "It is the policy of the SFPUC to operate the SFPUC water system in a manner that protects and restores native fish and wildlife downstream of SFPUC dams and water diversions, within SFPUC reservoirs, and on SFPUC watershed lands."

The DPEIR description of how the SFPUC manages the Alameda Creek watershed (page 5.4.1-3) with the "primary objective of conserving local watershed runoff for delivery to customers" and how it plans to operate Calaveras Reservoir and the Alameda Diversion Dam (pages 3-14, 3-39, and 5.4.1-7), appears to conflict with this policy. The proposed system operation strategy is to "maximize use of water from local watersheds." 17

Although the stewardship policy is cited in section 5.2.3 of the DPEIR, it is missing from Table 2.3, SFPUC Water Resource Policies Related to the WSIP. The SFPUC Water Enterprise Environmental Stewardship Policy is a foundational policy for the WSIP, and should be listed as a policy upon which the WSIP is supposed to be based, not simply one the WSIP should be "consistent" with. The Policy establishes environmental stewardship as a fundamental component of the Water Enterprise mission and was adopted with the explicit intent that implementation of the policy would occur through: "Integration of the policy into the Water System Improvements." Because the proposed WSIP program will have significant impacts on native fish and wildlife populations in the Alameda Creek watershed, the SFPUC has failed to "integrate" the Environmental Stewardship Policy into the WSIP.

THE DPEIR OMITS CONSIDERATION OF IMPACTS TO SEVERAL SPECIAL-STATUS SPECIES

The ACA has provided the SFPUC with specific information about the occurrence of special-status species as part of formal and informal comments on the Alameda Watershed Management Plan, Calaveras Dam Project, Alameda Creek Fishery Enhancement Project, Sunol valley Water Treatment Plant Project, Habitat Reserve Program, Habitat Conservation Plan, and WSIP PEIR scoping. Not all of this information is reflected in the DPEIR.

The SFPUC should publicly make available the species surveys and reports cited in the DPEIR (such as Entomological Consulting Services 2004 and 2005, Leeman 2006, Loran 2006), before the public and regulatory agencies can determine if adequate surveys have 18

SI_ACA1

been done for special-status species and if the assessment of potential impacts is reasonable. For example, for special-status plants, surveys may need to be made over several years to determine whether plant species are present, since plants do not necessarily germinate or flower in every year. Likewise, for many species, the Fish and Wildlife Service and CDFG have published protocol surveys to properly determine whether a species is present – the DPEIR should discuss whether protocol-level surveys have been completed for any special-status species.

Bay Checkerspot Butterfly

For the Bay checkerspot butterfly, the 2004 Entomological Consulting Services report referenced in the DPEIR (the 2005 report has not been publicly available) was based on surveys that did not specify how many days were spent searching for butterflies, how thorough the searches were, and exactly what dates the searches began and concluded. The 2004 report noted that "flight season for the Bay Checkerspot butterfly was already underway" when surveys started on an unspecified date in March. Since flight season for the Bay checkerspot butterfly can begin in late February and is typically four to six weeks in length, and it is known that the flight season began early in 2004 due to unseasonably warm weather, depending on when in March the surveys began, the surveys could have missed all or most of the butterflies of the 2004 flight season. Since individual adult butterflies live approximately ten days, the surveys could easily have missed butterflies that emerged early in the season. 18 cont.

The 2004 report also expressed the opinion that that the species is unlikely to occur in serpentine grassland habitats containing the checkerspot's larval and adult food plants within the Alameda Creek watershed. The U. S. Fish and Wildlife Service considers any site with appropriate habitat within the vicinity of the butterfly's range to be potentially occupied. Given the fact that populations of the checkerspot historically occurred north of the watershed at Mt. Diablo and south of the watershed in Santa Clara County, and the acknowledgment in the 2004 report that there are patches of the checkerspot's primary larval food plant growing in association with adult food plants (albeit in low abundance), there is potential for undetected populations of the checkerspot to persist within the watershed. Since the species is so rare, with only two known populations in existence, the SFPUC has an obligation to presume the species may be present and protect the remaining patches of habitat, no matter how fragmented.

Berkeley Kangaroo Rat

The DPEIR fails to consider potential impacts to the Berkeley kangaroo rat (*Dipodomys heermanni berkeleyensis*), which has recently been potentially rediscovered by the East Bay Regional Park District on ridges east of Calaveras Reservoir. The CDFG scoping comments on the PEIR noted that:

> "The Berkeley kangaroo rat has been considered extinct, but was historically known to live in a few locations near the hills of Berkeley, Eureka Peak, Orinda Lake, Mt. Diablo, and Calaveras Reservoir; it was

> found in the 1940's near the vicinity of Calaveras Dam. The Berkeley kangaroo rat should be added to the list of species present and assessments of the population (including genetic analyses) should be performed. A survey protocol for Berkeley kangaroo rat should be developed in concert with DFG and the U. S. Fish and Wildlife Service (USFWS). The SFPUC should conduct comprehensive surveys to determine conclusively whether the species is present in the area. If detected, the SFPUC should consider the impacts of covered activities on the Berkeley kangaroo rat. If shown to still exist, the species would likely be a candidate for emergency Federal listing."

Any impacts to the Berkeley kangaroo rat or suitable habitat for the species should be considered significant and should be avoided due to the rarity of this species.

<u>San Joaquin Kit Fox</u>

The DPEIR discusses potential impacts to the San Joaquin kit fox in the San Joaquin region, but fails to consider potential impacts in the Sunol Valley region. As noted in the DPEIR, a kit fox was seen near the former Sunol Dam site in 2006, suggesting "a small population may be reestablishing itself in the area." Any kit fox in the Sunol region 18 cont.
would be very significant, since this would be the western-most population of the species. Any impacts to the kit fox or suitable habitat for the species should be considered significant and should be avoided due to the rarity of this species.

<u>Calaveras Reservoir Species</u>

The DPEIR analysis of the potential impacts to special-status species at Calaveras Reservoir (page 5.4.6-1) omits impacts to landlocked steelhead/rainbow trout, California red-legged frog, California tiger salamander, and Alameda whipsnake during construction of the new dam. The impacts on rainbow trout could be particularly significant – the *Final Conceptual Engineering Report* for the Calaveras Dam Project mentions the potential for evacuating the reservoir to deadpool elevation, in other words nearly draining the reservoir, which could devastate the Calaveras Reservoir trout population. The DPEIR fails to discuss the impacts of the construction of Calaveras Reservoir on rainbow trout in the reservoir and Arroyo Hondo (page 5.4.5-1). The CDFG has also raised the issue of maintaining fish passage and connectivity between the reservoir and Arroyo Hondo so that trout can migrate into and out of Arroyo Hondo.

MITIGATIONS PROPOSED FOR SIGNIFICANT IMPACTS TO SPECIAL-STATUS SPECIES AND HABITATS ARE INADEQUATE

<u>Alameda Diversion Dam Operation</u> 19

The WSIP proposes to operate the Alameda Diversion Dam to divert almost <u>all</u> of the late fall, winter and spring stream flows from upper Alameda Creek. Aside from the questionable legality of this plan, the DPEIR acknowledges that this would nearly

SI_ACA1

eliminate low and moderate (1 to 650 cfs) flows in Alameda Creek downstream of the diversion dam that currently occur when the diversion gates are closed, and substantially reduce many higher (greater than 650 cfs) flows. The DPEIR categorizes this as a significant and unavoidable impact. We concur that the impact would be significant but the impact is clearly avoidable if the SFPUC removes the diversion dam or operates it in a lawful manner that protects fish and wildlife downstream of the dam.

The proposed operation of the diversion dam would be to divert all but 1 cfs of flow when the gates are open up to a flow of 650 cfs. Diverting the entire stream flow (except 1 cfs) and cutting the frequency of peak flows during December through May will clearly affect downstream fish passage, fish rearing, amphibian populations, and stream temperatures. The SFPUC has bypassed most flows past the diversion dam since 2002, and trout and aquatic resources below the diversion dam are dependent upon these natural stream flows.

The DPEIR acknowledges that:

> "under the WSIP, there is no requirement for maintaining minimum instream flows within Alameda Creek at the diversion dam to support fishery habitat downstream of the dam. The proposed diversion of most Alameda Creek flows below 650 cfs would result in a significant change in hydrologic conditions in Alameda Creek downstream of the diversion dam when compared to existing conditions. Diversion of most or all flows 19 cont.
> during the late winter and spring months could adversely affect the ability of resident rainbow trout to spawn and for eggs to successfully incubate in this reach. The diversion dam is equipped with control gates but does not include a positive barrier fish screen or other protective devise that would exclude trout or other fish from being entrained through the diversion structure into Calaveras Reservoir. Trout and other fish species inhabit Alameda Creek upstream of the diversion dam and may be diverted from the creek into the reservoir under the WSIP, preventing fish passage to downstream reaches of Alameda Creek. Passage through the diversion dam, however, has the potential to result in increased stress, physical abrasion, and vulnerability of fish to predation mortality within the reservoir, and other potentially adverse effects. Passage of fish over the diversion dam downstream in Alameda Creek may also result in stress and potential injury to trout and other fish species."

The DPEIR proposes the following mitigations for operation of the Alameda Creek Diversion Dam (Measure 5.4.1-2):

> "The SFPUC will establish and implement written operational criteria for the Alameda Creek Diversion Dam that directs that the diversion dam and tunnel shall be operated to pass flows down Alameda Creek when diversion of those flows is not required to maintain desired levels in Calaveras Reservoir in order to provide the maximum possible days of

winter and spring flows in Alameda Creek below the diversion dam. This measure reinforces the way the SFPUC generally operates the diversion tunnel now: that diversion gates are closed in the spring once desired Calaveras Reservoir storage have been reached. However, at times additional flows have been diverted from Alameda Creek after reservoir storage levels have been achieved such that the "excess" water has subsequently been released from the reservoir to maintain the appropriate water level. This measure would formalize Alameda Creek diversion procedures to maintain flows in Alameda Creek to the extent they are not needed to achieve required reservoir storage. This measure would reduce the flow reduction impact but not to a level that is less than significant."

This is a ridiculous mitigation measure, essentially promising to not divert the remainder of stream flows that are not diverted. Bypassing stream flows based solely on whether or not they are needed for water supply, without regard for the instream flow needs of downstream fish and wildlife is not an adequate mitigation measure. The DPEIR maintains that "after implementation of the WSIP, flow in this 2.85-mile reach of Alameda Creek below the diversion dam would approximate conditions experienced between 1935 and 2001." The DPEIR provides no information that the dam was operated legally or in a manner that adequately protected fish and wildlife during this period.

The mitigation measures also include Measure 5.4.5-3b, Diversion Restrictions or Fish Screens:

> "If, after 10 years of monitoring results for Measure 5.4.5-3a, Minimum Flows for Resident Trout in Alameda Creek, indicate that the measure does not sustain the resident trout population in Alameda Creek below the diversion dam, then the SFPUC shall also implement additional measures as follows: either implement seasonal restrictions on Alameda Creek diversions to Calaveras Reservoir to protect the downstream resident trout fishery during the critical spawning period (December 1 through April 30) or install and operate a fish passage barrier to "screen" the diversion facility (screening could consist of a behavioral barrier, such as electrical or sound barrier that deters fish, or a physical barrier – such as a screen facility)."

This mitigation measure is also inadequate, since it promises to continue to illegally divert Alameda creek stream flow for another decade, without necessarily bypassing flows sufficient to keep fish and wildlife downstream in good condition during that decade. Similarly, if the diversion tunnel is currently injuring or harming fish, it legally needs to be screened now, not in 10 years. The DPEIR acknowledges that Fish and Game Code Section 5980 contains requirements for an intake screen or other suitable method for avoiding and minimizing fish entrainment at the Alameda Creek Diversion Dam. The DPEIR also acknowledges that the Diversion Dam could block migration to any migrating steelhead that travel upstream of the Little Yosemite area. This would be a significant (and illegal) impact that is not mitigated in the WSIP. If and when steelhead

19 cont.

SI_ACA1

trout migrate upstream to the Little Yosemite and the diversion dam, the SFPUC has an obligation to ensure adequate stream flow, and a fish ladder or dam removal for fish passage at that time.

Minimum Flows for Resident Trout

The DPEIR fails to consider impacts and include adequate mitigations for resident fish.

The DPEIR contains mitigation measure 5.4.5-3a:

> "The SFPUC shall develop and carry out as part of the implementation of the Calaveras Dam Replacement (SV-2) project, an operational plan to implement minimum stream flows when precipitation generates runoff into the creek below the diversion dam to the Calaveras Creek confluence from December 1 through April 30 to support resident trout spawning and egg incubation. This is the period when winter precipitation typically would produce flows for spawning and egg incubation. The operational plan will identify the specific minimum flow requirements to support resident trout spawning and egg incubation, a detailed monitoring plan to survey and document trout spawning and egg incubation and any diversion facility modifications that are needed to implement the minimum stream flows. Minimum flow requirements to support resident trout spawning and egg incubation vary depending on stream reach conditions. Although site-specific studies are needed to determine an appropriate minimum flow requirement for each specific creek reach, based on the general size and characteristics of the Alameda Creek channel immediately downstream of the diversion structure it has been suggested that a minimum flow on the order of 10 cfs may be needed to support trout spawning and egg incubation. The SFPUC's Natural Resources Division will complete the site-specific studies needed to determine the appropriate minimum stream flow for this reach of the creek; studies may show that the minimum flow requirement is more or less than 10 cfs. This minimum flow requirement would be met when precipitation would naturally generate runoff in the creek (below the diversion dam) under unimpaired conditions between December 1 and April 30. When precipitation generates runoff in the creek, the SFPUC shall provide for bypass of flow up to the required minimum flow amount. The operational plan will allow for adapting minimum flow amounts to support resident trout spawning and egg incubation based on the monitoring results and best available scientific information."

This mitigation measure is likely inadequate to mitigate for the impacts of Calaveras Dam and the Alameda Diversion Dam on steelhead trout, Pacific lamprey, and chinook salmon, as it is targeting flows for resident trout, and does not provide for adequate flows for in-migration or out-migration of anadromous fish.

19 cont.

The DPEIR also seems to suggest that adequate flows for resident trout may not be implemented until after 10 years of monitoring. There is information indicating that the SFPUC may not currently be keeping resident trout below Calaveras Reservoir in good condition. The SFPUC has conducted annual monitoring since 1998 of Alameda Creek fisheries in a study reach including Calaveras Creek below Calaveras Dam, and Alameda Creek from the confluence with Calaveras Creek downstream to the Sunol Valley Water Treatment Plant. SFPUC monitoring data from 1998-2004 shows that observations of resident rainbow trout in this study reach have declined dramatically: 55 trout were observed in 1998; 5 trout in 1999; 5 trout in 2000; 3 trout in 2001; 1 trout in 2002; 2 trout in 2003; and 0 trout in 2004. The DPEIR does not contain adequate information to determine whether the 10 cfs proposed to support trout spawning and egg incubation will be sufficient. The DPEIR does not specify which stream reaches will have 10 cfs and which time of year. 10 cfs of cold water during summer that reaches areas where trout are rearing will provide more significant benefit than 10 cfs released during winter storms.

The DPEIR claims this measure "addresses the decrease in flow below the diversion dam that would occur under the WSIP as a result of re-instituting flow diversions to Calaveras Reservoir once the dam is replaced…and the loss of fish from the lower creek system that would result from fish entrainment through the unscreened diversion tunnel to Calaveras Reservoir." This measure does not address the impacts to rainbow trout and steelhead in Alameda Creek between the diversion dam and the Calaveras Creek confluence. 19 cont.

The DPEIR promises that if monitoring indicates that this measure does not sustain the resident trout fishery in this reach, then the SFPUC shall either modify the minimum stream flow to enhance downstream habitat conditions to fully meet the mitigation requirement or also implement mitigation measure 5.4.6-3, Operational Procedures for Calaveras Dam Releases:

> "During project-level CEQA review on the Calaveras Dam Replacement project (SV-2), the SFPUC will develop operational procedures for managing planned releases from Calaveras Dam to minimize habitat impacts on amphibians, their egg masses, and tadpoles. The goal of such releases, apart from benefits to fish, is to mimic a more natural pattern of hydrology regime as much as possible. The procedures will specify the minimum amount and frequency of planned releases and the rate of the increase and decrease of any individual release event. One of the specific goals of such releases would be to reduce the risk of mortality to breeding amphibians. Such operational procedures will be developed prior to completion of construction of the Calaveras Dam Replacement project. In addition, instream flow releases required under CDFG agreement with SFPUC (see Table 5.4.1-9) would begin upon completion of construction."

There is no evidence that the 1997 MOU flows are adequate to maintain rainbow trout or native amphibians such as the California red-legged frog or foothill yellow-legged frog that inhabit stream reaches below SFPUC dams. The potential releases under measure

5.4.6-3 would begin no earlier than 10 years after the construction of Calaveras Dam. What if the resident trout population below the SFPUC dams is extirpated by then? Mimicking the natural hydrograph will potentially benefit native stream amphibians, but again this measure is delayed 10 years. 19 cont.

Fishes

For all the reasons discussed above, the DPEIR contains inadequate or no mitigation measures for potential significant impacts of the construction and operation of WSIP projects on steelhead trout, chinook salmon or Pacific lamprey.

Mitigation measures for fishes (mitigation measure F1) should include: fencing cattle out of all spawning habitat in fish-bearing streams (lower Arroyo Hondo Creek and lower San Antonio and Indian Creeks above the reservoirs, and Alameda Creek below the reservoirs) to protect trout redds, spawning habitat and riparian vegetation; eradicating introduced bass from Calaveras and San Antonio Reservoirs to reduce predation on the small landlocked trout populations in the reservoirs; and increasing the dissolved oxygen content in Calaveras and San Antonio Reservoirs to provide adequate habitat for reservoir trout (the current dissolved oxygen levels are aimed at drinking water quality standards and are not necessarily adequate for cold water fish). 20

Butterflies

The proposed mitigations for listed butterfly species (mitigation measure I.3) states that "suitable habitat for Bay checkerspot and callippe silverspot butterflies will be avoided." "Suitable habitat" needs to be defined as any area with host plants or the ability to support host plants. As mentioned above, the Alameda Creek watershed contains fragmented, but nonetheless significant, potential habitat for these species. The DPEIR does not include mitigation measures for the potential impacts of dust from construction activities or roads – according to the U.S. Fish and Wildlife Service, adult and early larval stages of these butterflies are susceptible to mortality from dust.

Burrowing Owl

21

The proposed mitigations for western burrowing owls include passive relocation (mitigation measure B.3). For most passive relocations of burrowing owls conducted in California there is no way of knowing where the evicted owls go or whether they are able to breed successfully in other areas. The SFPUC mitigations should include monitoring of the areas where owls are evicted to determine the success of any passive relocation. Passive relocation of owls can work if the birds are moved short distances (i.e. under 5 miles) and the habitat they are moved to is managed for them. Burrowing owls should never be translocated or forced to move to unprotected private property. Predators must also be taken into consideration - if owls are moved from an area where they have only been exposed to feral cats, red-tailed hawks and northern harriers, they will probably do poorly if moved to an area with coyotes or red foxes. The SFPUC should commit to monitoring and managing habitat for moved owls and purchasing replacement habitat if moved owls do not successfully breed.

San Joaquin Kit Fox

The proposed mitigations for the San Joaquin kit fox include a provision that "limited destruction of potential dens may be allowed" if they are not currently in use. For the reasons discussed above, there should be no destruction of any potential kit fox dens allowed in the Sunol Valley region.

Mitigation Ratios

Mitigation for impacts to wetlands and aquatic resources should be at a greater than 1:1 replacement ratio for created wetlands, since created wetlands rarely have the same habitat value and function as natural wetlands.

Any impacts that have the potential to extirpate a local population of a special-status species (such as the kit fox or Berkeley kangaroo rat), affect essential breeding or migration habitat, or destroy or degrade designated critical habitat for a listed species should be mitigated at a much higher ratio than 1:1.

21 cont.

Habitat Reserve Program

As discussed in the ACA's August 28, 2007 letter to the SFPUC regarding the proposed Habitat Reserve Program, the reliance on mitigations proposed in the HRP may be inadequate to mitigate for potentially significant impacts to special-status species in the Sunol Valley for several reasons:

- The acreage of habitat protection proposed under the HRP is not sufficient to mitigate for the impacts to biological resources and habitat contemplated in the WSIP;
- The HRP includes very little protection of at-risk habitat for affected species through acquisition of or conservation easements on high biological value private land at risk of development;
- The HRP attempts to give the SFPUC mitigation credit for land management activities that should already be required to protect endangered and sensitive species, or are good management practices that should already be employed by the SFPUC as good stewardship of our public lands; and
- The HRP proposes conservation easements on public lands that are already owned by the SFPUC, of questionable benefit to sensitive species since these lands should be at no risk of development or mismanagement.

22

THE DPEIR CONTAINS INSUFFICIENT INFORMATION TO CLAIM MITIGATIONS WILL REDUCE IMPACTS TO LESS THAN SIGNIFICANT

As noted in the CDFG comment letter to the SFPUC on the Calaveras Dam Project dated November 22, 2005, the SFPUC needs to provide information as part of the environmental review process that will allow the public and regulatory agencies to

23

SI_ACA1

determine if impacts have been properly assessed and if mitigations are adequate.

The DPEIR fails to provide information on the following issues raised by the CDFG two years ago:

- A habitat-based stream assessment for Calaveras, Arroyo Hondo, and Alameda Creeks, done at a seasonally appropriate time period that incorporates habitat and life history criteria of species which may be impacted by the Calaveras Dam Project.
- A hydrologic study to determine the amount of water that is needed to support steelhead trout through critical reaches under various water year conditions within the reaches affected by the Calaveras Dam Project, specifically the reach of Alameda Creek from Alameda Creek Diversion Dam downstream to Alameda Creek's confluence with Arroyo de la Laguna.
- A specific proposal to provide minimum bypass flows for both Calaveras Dam and the Alameda Creek Diversion Dam for maintenance of habitat for fish and other aquatic species, taking into account current and projected water operation scenarios of the SFPUC's regional water system.
- An analysis of current and projected operational scenarios for Calaveras Reservoir and their impacts to the existing population of land-locked steelhead trout that utilize Calaveras Reservoir and Arroyo Hondo throughout various stage of the steelhead trout's life cycle. This study should include a plan to preserve the existing population of steelhead trout during interim operations (preconstruction) and post construction operations of Calaveras Dam. The concerns to be addressed include the following:

a) Maintain fish passage between the reservoir and Arroyo Hondo by keeping reservoir water elevations as high as possible during the period when adult trout migrate upstream from the reservoir through the end of the downstream (adult and juvenile trout) migration season.
b) Maintain channel integrity (maintain active channel / minimize delta / maximize hydrological connectivity) of Arroyo Hondo.
c) Maintain physical carrying capacity for trout in Calaveras Reservoir during the summer and fall period by keeping water elevations as high as possible.
d) Maintain adequate water temperatures and dissolved oxygen for trout in the reservoir throughout the summer and fall periods. The concentration of dissolved oxygen in reservoirs is often the limiting factor for trout survival in San Francisco Bay Area reservoirs. DFG recommends targeting a specific dissolved oxygen concentration of 7 mg/L so as to minimize impacts to landlocked steelhead especially during times of lowered surface water elevation (current operations as per DSOD requirements).
e) Provide flow releases to the stream channel below Calaveras Reservoir dam to encourage riparian vegetation growth, invertebrate productivity, adequate dissolved oxygen, low water temperatures, and provide some rearing habitat for juvenile steelhead trout and spawning adult steelhead trout.
f) Eliminate or minimize the loss of adult and juvenile trout from Alameda Creek through the Alameda Creek Diversion Dam.
g) Determine how operation and interim operation of Calaveras Reservoir could alter the operation of San Antonio Reservoir and result in adverse conditions for the adfluvial trout population in San Antonio Reservoir. DFG recommends that impacts to fisheries

23 cont.

upstream and downstream of San Antonio Reservoir be avoided as much as possible. If avoidance is not possible, impacts should be minimized and mitigated.

• A mitigation plan that assesses the potential impacts of the SFPUC's proposal to rebuild Calaveras Dam with a wider core that would accommodate enlargement of the dam in the future. The NOP states that although the "SFPUC does not reasonably foresee the need for a larger dam beyond one that restores the reservoir's historic capacity; the dam would be designed to allow potential future reuse of dam components without requiring otherwise more extensive dam removal and rebuilding if an enlargement were ever undertaken in the future." DFG recommends that the Calaveras Reservoir dam not be built to accommodate future size increases based on DFG's concern that future increases of the dam's surface water elevation could potentially extirpate the adfluvial population of steelhead trout as well as that of the foothill yellow-legged frogs. Raising the surface water elevation will likely also have serious impacts to the California red-legged frog, CTS, foothill yellow-legged frog, western pond turtle, Alameda whipsnake, Calliope silverspot butterfly, and a number of other special status plants and animals.

• A specific plan to screen as per DFG screening criteria at the new intake tower/adit(s) at Calaveras Reservoir and at the intake of the diversion at the Alameda Creek Diversion Dam so as to be in compliance with Fish and Game Code Section 6100.

• A specific plan to provide fish passage at the new Calaveras Reservoir dam and the Alameda Creek Diversion Dam so as to be in compliance with Fish and Game Code Sections 5901.

23 cont.

THE DPEIR RELIES UPON SPECULATIVE MITIGATIONS FOR SIGNIFICANT IMPACTS TO SPECIAL-STATUS SPECIES

It is speculative to rely upon the proposed Habitat Reserve Program speculative to mitigate for impacts to special-status species and habitat, since the amount and quality of habitat to be acquired and preserved is not yet defined, nor is it assigned to specific WSIP impacts. 24

The DPEIR discusses possible future flows to support rainbow/steelhead trout. The DPEIR references the flows studies being conducted by the Alameda Creek Fisheries Restoration Workgroup. At this point these are just studies, not a commitment on the part of SFPUC to provide adequate flows for steelhead or resident trout. Similarly, SFPUC plans to incorporate flow strategies into its Alameda Watershed Habitat Conservation Plan are speculative at this point. 25

The DPEIR fails to adequately consider water recycling and conservation alternatives

The DPEIR claims it is not feasible for the WSIP to meet 2030 purchase requests with reasonably foreseeable water conservation, recycled water and groundwater projects. The DPEIR underestimates the potential for water conservation and recycling, as numerous other municipalities have shown that an aggressive conservation and recycling program is possible. The proposed levels of water conservation (4%) and recycling (3%) in the DPEIR are unreasonably low. 26

SI_ACA1

Also, there is a discrepancy between the conservation and recycling goals set by the SFPUC and its wholesale customers in the Bay Area Water Users Association (BAWSCA). The BAWSCA Water Supply Master Plan from 2000 requires that wholesale customers employ their best efforts to use all sources of water owned or controlled by them, including groundwater. The SFPUC has identified numerous conservation, recycling, and groundwater possibilities that are available to wholesale customers, but the DPEIR does not adequately analyze these alternatives. 26 cont.

San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103
via email: wsip.peir.comments@gmail.com

Dear Mr. Maltzer,

On behalf of the Board of Directors, staff and members of Acterra I write this letter in regard to the SFPUC Water System Improvement Program Draft Programmatic Environmental Impact Report (PEIR). Acterra provides solution-oriented environmental services, including an integrated climate change response program, to members in the BAWSCA service area.

While we strongly support the seismic upgrade of the Hetch Hetchy water system, we find the PEIR flawed in fundamental ways. 01

First, and most important is the unnecessary coupling of seismic upgrades with diversion of water from the Tuolumne River. The SFPUC is attempting to link a "mother and apple pie issue" with a highly controversial plan to divert water from a federally-designated Wild and Scenic River. Clearly the plan is to force through a massive diversion of fresh water under cover of public safety. We believe that public policy decisions should be made based on the merits of the proposal, rather than riding on the coat tails of un-related proposals. 02

Public comments and the position of BAWSCA (The Almanac, Sept. 26, 2007, p.23) clearly indicate a desire to refine and improve the environmental impact analysis of the seismic upgrade portion of the PEIR, and to de-couple water demand and water supply issues from the water system improvement projects.

Hence, we strongly support the alternatives identified in the DPEIR that protect the Tuolumne River from new diversions. Requiring more water conservation, efficiency, and recycling is the best way to lessen 03

impacts on the Tuolumne River while promoting a sustainable water plan for the Bay Area. 03 cont.

Second, their are a number of flawed analyses concerning projected water demand, and the impact of water diversion on the Tuolumne River. Most alarming, we note the absence of any discussion of the impact of climate change on the Tuolumne river watershed. The State of California predicts that global warming could reduce the Sierra snowpack by 5% by 2030 and as much as 33% by 2060. Climate change will have a significant impact on all of California's water supply. These changes will include variation in the seasonality of precipitation (e.g. winter drought, extreme rainfall events/flooding, etc.), changes in precipitation amounts and intensity, and attendant changes on riparian ecology. These changes will further stress riparian ecosystems, especially those like the Tuolumne that are already impacted by human activities. Additionally, regional impacts of climate change will force alteration of water-use patterns, specifically in agriculture and urban outdoor water use. None of these impacts are taken into consideration in the PEIR, let alone an analysis of the obvious serious ecological consequences of increased diversion **coupled to** climate change. 04

In sum, any serious analysis of the future water demand to be met by increased diversion of the Tuolumne river into the Hetch Hetchy system must use: robust models for projecting water demand; improved analysis of the capacity of water conservation, water use efficiency and recycling to reduce demand in the face of growth; improved analysis of the upper watershed, and serious consideration of the impacts of climate change on the water supply and ecology of the Tuolumne river. 05

Hence Acterra strongly encourages the SFPUC to drop Tuolumne river diversion from the seismic upgrade projects and to re-visit water demand issues at a later date when a serious analysis can be done independently of the much needed, time-critical system improvements. Continued insistence on coupling these unrelated issues will un-necessarily delay the seismic improvements. 06

Sincerely,

David T. Smernoff, Ph.D.
Board Vice-President

Draft PEIR

Steve Lawrence <splawrence@sbcglobal.net> **Fri, Aug 17, 2007 at 6:51 PM**
To: wsip.peir.comments@gmail.com

Comments concerning the Draft PEIR for WSIP:

1. In section 2.4.3 it is asserted that a schedule complying with AB 1823 was submitted in or by March 2003. I do not believe so. The schedule does not show completion by 2010 of half of the capital program's projects in dollar terms.
2. The Fig. 3.6 Preliminary Construction Schedule is odd, and out-of-date. Jobs that have long been combined are shown separately: example: Advanced Disinfection + Tesla Portal Disinfection; also, Additional 40 + SVWTP Treated Water Res. Jobs that are large are not shown: University Mound, Crystal Springs #2, Alameda Siphon #4, Crystal Springs Bypass Tunnel, as examples. 01 Moreover, the schedule is fanciful; there is very little chance that all the work shown as starting in 2009 will start then, and no chance that all that is shown finishing by 2011 and 2012 will be substantially complete then. For this program SFPUC has never kept a schedule, and it certainly cannot keep this one. Why is it "Preliminary", and why is it sourced 2006? Is it trying to not be current? Perhaps; it shows Crystal Springs - San Andreas Transmission as completing in 2013 when the 5/07 CER shows the job completing March 2015, fifteen months later. So the schedule that is presented is not the latest or best schedule, rather it is obsolete; why? What else in the Draft PEIR is intentionally stale?
3. Desalination plant. Does the Draft PEIR say what electricity to run the plant would cost per kWh? It is estimated that 7500 kWh per million gallons would be required at Pittsburgh as water is less saline. One hopes that this estimate is made in realization that the plant will need to start production when fresh water flows ebb, so saline content will increase when the plant is needed; also saline content will rise as global warming swamps the Bay. I would like to see recognition of the foregoing in the document. Also, it would be nice to see a comparison of GWGs, Hetch Hetchy water vs desal water, so that the decision makers and public can compare both dollar 02 and environmental cost. Does the plant run 24/7? Must it run and draw juice during peak demand times, when electricity is most expensive (hot days July and August, say 4:00 pm)? Or does it produce its water at night when juice may be cheaper, and when night surplus capacity obviates the need for new plant? Unfortunately, peak water demand will likely occur during hot July/August days, but water storage may allow plant production to avoid times of peak electricity demand (and cost)--one hopes.
4. Throughout, the Draft PEIR analyzes the past 82 years. But it seems likely that the climate is changing, warming. Picking how it will change is not possible with consensus; any choice would be criticized. Still, choosing to ignore climate change is picking an unlikely--and benign--basis for analysis. Might express 03 recognition of the conundrum improve the decision-makers' full consideration?
5. Has global warming been considered? It seems likely to raise demand for water in 2030, especially in the service area where air conditioning, landscaping and fires may take more water.
6. Does water consumption rise during epidemics such as flu, SARs, bird flu or bioterror? We have not had such 04 for a long period, but prudent planning may call for a factor of safety.
7. What would the facilities needed for the alternative called Lower Tuolumne Diversion cost? What is the elevation for the intake, and is it at risk of Delta flooding? Would choosing this alternative, compared to the 05 preferred alternative, mean losing hydropower (thereby boosting global warming gas emissions)?
8. I hope there is a person who can master the complexity found in the Draft PEIR. I hope they sit on the Commission. I find it daunting. 06 Some of the larger charts, especially, do not help this reader; rather they overwhelm.

Thank you for your hard work producing the document, and for considering these comments.

Steve Lawrence, citizen of San Francisco, and Vice-chair and member of the Citizens Advisory Committee to PUC

Draft PEIR--further comments

Steve Lawrence <splawrence@sbcglobal.net> **Mon, Oct 15, 2007 at 2:17 PM**
To: wsip.peir.comments@gmail.com

Please accept these further questions concerning the Draft PEIR of late June 2007 for WSIP:

1. The preferred option requires buying water from the districts during dry years, 23 mgd. There is no contract for the same. Why is this a wise plan? Won't the districts have SFPUC over a barrel? Didn't PUC promise to 01 expand the system because it was vulnerable to drought? Expanding the system is relying on ourselves. Isn't a preferred option that relies on others for needed water contrary to the will of the voters of 2002?
2. The system is said in the draft PEIR to be "highly dependent upon storage". Yet WSIP eliminated plans for storage. (Sunol Reservoir, an enlarged Calaveras Dam and reservoir, and downsized storage at SVWTP Expansion). How much storage is needed? Is that presented? If not, explain why it is not important to calculate 02 and present how much storage is needed to weather the design drought when the system is "highly dependent upon storage".
3. Under the preferred option SF must conserve 4 mgd more than it will with plumbing code changes; sometimes called "aggressive conservation" or "Package C". Why isn't this set out so that all can see what will be 03 expected? What aggressive conservation efforts will be needed if the preferred option, or modified preferred option, is selected?
4. (Replace my 8/17 item 4 with this, please:) Environmental impacts are examined and analyzed assuming a repeat of precipitation and weather conditions that repeats the historical record, 82 years mostly during the 20th Century. Global warming almost certainly means that the upcoming years will be far less benign. So while rationing would be required only about 10% of the time assuming the old benign climate, and buying water 04 from the districts in about 29% of the years, it seems likely that the future will be less rosy. Why not present a more realistic future? a) Likewise, snow pack will be less, and snow melt faster. Yet doesn't the draft PEIR assume that water will flow into Hetch Hetchy in years ahead as it has in years past? Why is this a good assumption to make?
5. Who pays for Recycled Water? Do the wholesale customers? Why should SF reduce its take from the regional system in order to allow wholesale customers to increase theirs when the cost of recycled water in SF is so 05 high? a) If northern San Mateo County recycled water is used for Harding, will Recycled Water from the WSIP program not be used for Harding? What will be done with that expensively procured capacity then?
6. Does the proposed option take 25 or 27 mgd more from the Tuolumne River? If 27, it seems not to add up: 27 06 + 10 = 37; 300 - 265 = 35. If 25, well, why use 27 in the Draft PEIR?
7. Exploration of the desalination option won't be completed when a final decision is made whether to go with the preferred option. a) Desal at Pittsburg assumes 7500 kW per million gallons to make potable product. Explain how the assumed salinity of input water was determined to come to this figure. Surely you increased salinity because when the desal plant is needed, the flow of fresh water will be low. 07 Did you further decrease it for rise in sea levels? b) Where does the electricity for desal come from? From Hetchy power? If not, how much will it cost? If it comes from Hetchy, how is it transmitted to the plant, or can you trade with PG&E, providing power to it where convenient, while PG&E supplies the desal plant? (This adds to 8/17's item 3.)
8. When it is said that 245 mgd average will be taken from the Tuolumne, does that include Tuolumne water purchased from the districts, or is this figure for water taken by the RWS without compensation to the districts? 08 See table 8.5 or 8-5 ff.

Thank you, Steve Lawrence

San Francisco, CA 94103

Re: Tuolumne River Water Diversions

Dear Mr. Maltzer:

On behalf of California Trout's more than 7,500 members and supporters I am writing to express our deep concern about the San Francisco Public Utilities Commission's plan to take more water from the Tuolumne River. Because the plan fails to adequately identify and address environmental impacts to the River, it is imperative that the Commission undertakes additional studies before finalizing this document. 01

California Trout supports alternatives that protect the Tuolumne River from new diversions. Requiring greater water conservation, greater efficiency, and greater recycling is the best way to reduce impacts to the Tuolumne River while promoting a sustainable water plan for the Bay Area. 02

Thank you for your consideration to this request.

Sincerely,

Brian Stranko
Chief Executive Officer

SI_CAREP

October 14, 2007

Paul Maltzer, Environmental Review Officer
Water System Improvement Program PEIR
San Francisco Planning Department

Dear Mr. Maltzer:

The California Chapter of Republicans for Environmental Protection (CA REP) is urging the San Francisco Public Utilities Commission (SFPUC) to undertake additional studies of the Tuolumne River before finalizing the PEIR. We believe that the environmental review made by the SFPUC's plan to take 25 million gallons per day <u>more</u> water from the Tuolumne River by 2030 fails to adequately identify and address all of the environmental impacts to the Tuolumne. We urge SFPUC to undertake additional studies of the Tuolumne River before finalizing this document. 01

Protecting the Tuloumne is not only environmentally sound but also economically sensible. California is world renown for its recreational facilities, thus, enabling the tourism industry to be one of Califronia's leading economic drivers. Taking more water from the Tuolumne will harm important habitat for fish and wildlife, including chinook, salmon, and rainbow trout, degrade world-class recreation opportunities, and worsen San Francisco Bay-Delta water quality. Because of these factors, our rivers, such as the Tuolumne, attract visitors to California, our legendary landmarks, such as Yosemite National park, and the beautiful state parks that surround the Tuloumne. 02

Further, CA REP supports fiscal responsibility and accountability. While we support the Water System Improvement Program's (WSIP) to upgrade and refit the Hetch Hetchy water system so that it is seismically sound, we believe the water diversion component in the EIR will cause delay to the entire $4.3 billion project. Unnecessary cost delays coupled with the cost to divert Tuolumne River water will be very expensive. Moreover, water rates in San Francisco are projected to triple by 2015 and will increase significantly in other Bay Area cities, as well. The cost to businesses, such as agriculture, health care, and manufacturing, will be unnecessarily burdensome and have a trickle-down effect with transaction costs being passed to consumers and taxpayers. Therefore, CA REP urges SFPUC to be mindful of the fiscal impacts by not moving forward to divert water from the Tuolumne River. 03

CA REP supports water conservation, efficiency, and recycling measures. Indeed, we support the alternatives identified in your study that would eliminate the need to divert more water from the Tuolumne by at least 74%. We also support and urge SFPUC to follow best practices of other metropolitan areas, such as Seattle and Los Angeles, especially in the face of rapid population growth.

Requiring more water conservation, efficiency, and recycling is the best way to lessen impacts to the Tuolumne River while promoting a sustainable water solution for the San Francisco Bay Area. The Bay Area is known for its environmental stewardship and leadership, so CA REP hopes SFPUC will take a leadership role in water efficiency and conservation. Therefore, CA REP urges SFPUC to undertake additional studies and consider the preferred alternatives in its initial study so that the Tuolumne River will be protected for future generations. 04

Sincerely,

Buddy Burke,
CA REP President

Virginia Chang Kiraly
CA REP Vice President
Commissioner, California Commission for Economic Development

wsip.peir.comments@gmail.com

RE: San Francisco Public Utilities Commission WSIP DEIR

Dear Mr. Maltzer:

The California Native Plant Society (CNPS) appreciates the opportunity to comment on the *Water System Improvement Project (WSIP DEIR)*. CNPS is a non-profit organization of more than 10,000 professional and amateur botanists, scientists and lay persons distributed in 33 chapters throughout California. The mission of the CNPS is to increase the understanding and appreciation of California's native plants and to preserve them in their natural habitat through science, education, advocacy, horticulture and land stewardship.

The proposed WSIP asks for the removal of an additional 25 million gallons of water per day (mgd) from the already impacted Tuolumne River. This river is an important natural resource which is home to many native plants and animals. Withdrawal from the river would take place in the Sierra Nevada in the upper watershed where it magnifies the primary impacts upon the riparian communities at the source. But the impacts extend to the San Francisco/San Joaquin Delta where freshwater flows are already heavily depleted. The Tuolumne is the largest remaining source of freshwater to the San Joaquin River. There are also impacts across San Joaquin, Alameda, Santa Clara, and San Mateo counties from individual components of the system, and planned water withdrawals from creeks in Alameda and San Mateo counties. 01

We oppose the withdrawal of additional water because we believe that a concerted effort towards water conservation should precede additional projects which would cause significant environmental impact. We believe it is completely feasible to conserve the equivalent of 38 mgd for 2.4 million people, or about 15 gallons per day per person with education, cooperation and creativity.

Thank you for your consideration of the above comments.

Sincerely,

Amanda Jorgenson
Executive Director

Dedicated to the preservation of California native flora

SI_CNPS-EB1

California Native Plant Society
East Bay Chapter
Conservation Committee

October 1, 2007

Paul Maltzer
Environmental Review Officer
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103-2479

Dear Mr. Maltzer:

The East Bay Chapter of the California Native Plant Society (EBCNPS) appreciates the opportunity to comment upon the Draft Programmatic Environmental Impact Report (PEIR) for the San Francisco Public Utility Commission's Water System Improvement Program (WSIP). These comments are intended to supplement the statements that we made at the public hearing in Fremont on September 18th.

The California Native Plant Society (CNPS) is a non-profit organization of more than 10,000 laypersons and professional botanists in 32 chapters across the state. Our mission is to increase the understanding and appreciation of California's native plants and to preserve them in their natural habitat through scientific activities, education, and conservation.

While the chief focus of EBCNPS's concerns is upon the impacts that the WSIP will have upon the native flora throughout the system, we are especially concerned with impacts to native flora in Alameda County and with the role that local demand for water by the SFPUC's customers in the East Bay plays in driving the project. 01

General Considerations

Program Goals and Objectives

We believe that the general WSIP goals of assuring water quality, seismic reliability, delivery reliability, adequate water supply, and sustainability in a cost-effective way to its customers are basic responsibilities of the SFPUC. We believe that these goals are also reasonable and attainable. Many of the *qualitative* system performance objectives listed in Table S.1 are also reasonable steps to achieving the goals of the project. 02

However, there is a fundamental gap between the qualitative objectives and the quantified assumptions, particularly with respect to the overestimation of the perceived need (as distinct from demand) for water and the underestimation of the capacity of the 03

SFPUC and its customers for conserving water. We believe that this gap is created and maintained by a traditional and outmoded approach to solving the problem of water scarcity. In this approach the SFPUC operates as agent in a competing marketplace to get more water for its customers from dwindling supplies of surface flows. What is required is a more forward-thinking perspective whereby the SFPUC acts as steward of a limited supply that must be carefully husbanded. 03 cont.

The SFPUC has heard repeatedly from the public and from reliable water experts that the best approach to meeting demand is to reassess demand in light of much more intensive conservation efforts. Examples of other major metropolitan water districts in the west that have adopted this approach are available as models, including those mentioned in the Pacific Institute's Report referenced above.

A more recent example is provided by the Helix Water District of San Diego County which has undertaken 14 innovative conservation measures. Despite a population increase from 1990 of 3.02%, the annual per-capita water use has gone down from 0.19 afpc to 0.18 afpc, a decrease of 4.73%. It appears that the drought of 1990 resulted in permanent changes in water use habits—the actual use in 2000 was lower than that projected in the 1995 Urban Water Management Plan. Since 1990, Helix has been actively implementing the wise water management practices suggested by the California Urban Water Conservation Council and is a signatory to the council's best management practices (BMPs). Like all agencies that signed on, Helix agreed to implement 14 BMPs and to track progress toward meeting the intent of these goals (Bader, C. 2007. "Drip by Drip." *Water Efficiency*. Mar-Apr. Forester, Santa Barbara, CA) 04

Indeed SFPUC's own retail customers in the City of San Francisco show a decline in demand of 4.7 mgd, an excellent first step. The assumption that the SFPUC can do better with less underlies all of our comments on the draft PEIR since that issue lies at the crux of analyzing the impacts of the WSIP.

Methodologies, Models, and Supporting Documents

We find that certain methodologies and models that were used to ascertain biological resources, impacts, General Plan compliance, water demand, and mitigation were either flawed or simply the wrong tool. We make general observations in this section and more precise remarks under relevant sections below. 05

We also believe that the omission of any attempt to model or estimate global warming and its impacts upon water supplies and future need undermines the credibility of the EIR. Indeed, California Attorney General Jerry Brown has filed a CEQA claim against San Bernardino County for failing to address effects of global warming in its EIR for its General Plan update. (Barbara Schussman, Bingham McCutchen Law Offices, http://www.bingham.com/Media.aspx?MediaID=4936). Although it is impossible to know yet the full scope of the impacts of global warming upon the state's water supplies, the PEIR must make some attempt to include it in its determination of CEQA alternatives. The PEIR makes no reference to the California Water Plan Update 2005 which contains relevant current papers and discussions (see, for instance, "Accounting 06

SI_CNPS-EB1

for Climate Change," Roos, DWR). There are also excellent discussions on conservation and more innovative approaches to achieving efficiency (see "California 2030: An Efficient Future," Glieck and Cooley, Pacific Institute for Studies in Development, and Groves, Pardee RAND Graduate School). 06 cont.

There is an overall serious imbalance between the degree to which water demand and water flows have been painstakingly researched and documented and the relative lack of detail in identifying, documenting, and addressing impacts, especially to biological resources. There are dozens of charts, maps, and tables with data presented on water flows, variants, and scenarios, but only several tables and maps, and an incomprehensibly small bibliography on biological resources. There is one vegetation map per project region each of which has very general plant community information from the California Gap Analysis. There is no information from the Manual of California Vegetation (Sawyer and Keeler-Wolf, 1995) which contains the most recent classification of plant communities in the state. 07

There is also an imbalance in terms of general time frames and time scales used to make determinations. For instance, hydrological data from many decades (80+ years) are used to determine drought conditions, water flows, etc. in an effort to predict future drought conditions up to 2030. Yet, other than some few data on fish populations, there are no historical data presented to show the impacts upon the various watersheds and loss of habitat and species populations that have resulted from impoundment and withdrawal of water over the past century. The hydrological database is a readily available source of information, probably because water has been a commodity which has been bought and sold, while wildlife and plant resources have not been subject to such close accounting. Nonetheless, there are studies available that indicate a significant decline in riparian species from the loss of riparian habitat over the course of the past century (see The Manual of California Vegetation, Sawyer and Keeler-Wolf, 1995 for a discussion of riparian plant communities in California, and "The Riparian Bird Conservation Plan," California Partners in Flight and the Riparian Habitat Joint Venture, 2000). In place of relevant data, the PEIR makes broad sweeping statements about the massive alterations wrought in the environment from Hetch Hetchy to the Bay from water diversions and then dismisses the subject as outside the scope of the document. 08

Although there are a bewildering number of pages to the EIR, in some cases, the information has not been presented concisely enough to make clear determinations about the important conclusions to be drawn or the information is separated into different volumes. For instance, in the discussion of the various CEQA alternatives listed, it is impossible to get a clear understanding of the differences in impacts upon fish and riparian habitat that each alternative would have in the Alameda Creek watershed without having to go back to the chapter in which each particular reach of the creeks is identified. A second example is Table 3.12 that displays construction and operations assumptions in which reference is made under Existing Land Use to crossing the Cargill salt ponds with a portion of the Bay Division project. It's not clear whether this pipeline/tunnel has any portion above ground on protected public lands. It's therefore impossible to determine what the specific impacts to wetland habitat and species would be and what permits 09

would then be required. This information then turns up in a separate volume in Table C- 09
6 in Appendix C. cont.

Finally, given the array of programs that the SFPUC will be administering on its lands
including HCPs for both the Peninsula and Alameda Creek watersheds, the Habitat
Reserve Program throughout the entire WSIP system, various watershed management
plans, and the watershed environment improvement program (WEIP), there is ample
opportunity for the SFPUC to work at cross purposes, lose information, or simply
overburden itself with the task of coordination. It appears that already important 10
information on biological resources concerning plant species has not been incorporated
despite it having been submitted three years ago. We are attaching Dianne Lake's letter
to the SFPUC (July, 2004) in which she addresses omissions of CEQA-protected plants
from the scoping for the Alameda HCP. We suggest that the SFPUC undertake
coordination of these efforts at the earliest possible date, that all biological resources be
cross-referenced so that each project or program is working off of the same database, and
that the public be included in discussions of how these programs will interface.

Specific Considerations

<u>Water Demand and Patterns of Growth in East Bay Cities</u>

As part of its attempts to address water demand as a function of growth and development,
the PEIR refers to the General Plans of the cities in the SFPUC's service area. In the East
Bay, those cities include Hayward, Newark, Union City, and Fremont. The last three are
customers of the Alameda County Water District, a wholesale customer of the SFPUC.
Together the increase in purchase requests from these four cities accounts for a fifth of 11
the total 2030 purchase estimates of the SFPUC's Wholesale Service Area. The PEIR
briefly reviews the growth trends and policies for each city by looking at population and
employment projections and the General Plans that have been adopted to guide each
city's growth. In so doing, the PEIR attempts to find the "goodness of fit" between each
city's growth projections, its plans and policies to guide that growth, and its projected
water demand. The aim is to rectify the overall purchase requests from each wholesale
customer.

Hayward

None of these four cities has passed a growth ordinance. The City of Hayward is the
SFPUC's largest wholesale water customer. Its water purchases for FY 2001/2002 were
17.61 mgd, and its 2030 purchase estimates are 27.95, an increase of 10.34 mgd, the
largest proportional as well as absolute increase of all the wholesale customers. The 12
increase in demand is based largely on the assumption of development in the Hayward
hills of big, upscale "view" homes. These homes are built on larger lots with more
extensive landscaping that requires more water than older homes on smaller lots.
Irrigation for landscaping is one water use that can be tremendously pared down with
proper planning and implementation. Since these homes constitute a sector not yet fully
built and therefore subject to planning requirements, the City could cap water use for
irrigation purposes or impose a strict tier system for water rates.

SI_CNPS-EB1

Although the PEIR does not mention this, the hills above Hayward are part of the High
Hazard Zone for Wildfire. As such, residents of these homes can be required by local fire
departments to manage vegetation up to 100 feet from their homes and other structures
according to recent state legislation. Wise water planning on the part of the City could
involve requiring low water-use *and* fire-safe landscaping as part of new development.
Although it is beyond our scope to assess the relative preparedness of Hayward's water 12
supply in the event of a WUI fire, it is worth noting that one of the fundamental reasons cont.
that the 1991 Tunnel Fire in the Oakland Hills escaped control by firefighters was the
failure of the water supply system. A second documented factor was the absence of fire-
safe landscaping around homes. An important part of determining the growth footprint of
new hills developments is forecasting the actual water needs of the area as distinct from
the demand for water.

Alameda County Water District

The Alameda County Water District (ACWD), serving the cities of Newark, Fremont,
and Union City, gets a portion of its water from the SFPUC, a portion from groundwater
sources in the lower part of Alameda Creek, and 40% of its water from the Delta. This
past summer, the California Department of Water Resources temporarily turned off the
pumps that move water from the Delta to ACWD and other water agencies throughout
the state to protect the endangered Delta smelt. Although pumping has resumed, it's
clear that there will be repeated legal challenges to water diversions around the Delta.
The Summer, 2007 newsletter to the ACWD's customers contained an article about a 13
recent analysis of Delta issues by the Public Policy Institute of California. The report
recommended five different alternatives, two of which would reduce Delta water to cities
and farms. The AWCD wrote, *"As we have recently experienced with the shutdown of
Delta pumps, any solution that is based on reducing Delta exports would have immediate
and significant impacts to the local economy and health and well-being of families and
businesses in the Tri-City area."* In the same newsletter there were helpful "tips" on
saving water, but no imperative or requirement to conserve. The ACWD is in a good
position, with the help of the SFPUC, to shift from simply supplying water to its Tri-City
customers to instituting a coordinated plan for recycling water in these three cities as a
way to reduce its dependence upon the uncertainties of Delta water.

Fremont

In analyzing Fremont's growth patterns, the PEIR refers to "*goals related to growth
management articulated in the 2003 Fremont General Plan Land Use Element [which]
include conservation of the city's open space resources (Goal LU4) and protection of
"sensitive hill face and uses in the remainder of the hill area" consistent with the area's* 14
character and environmental constraints (Goal LU6)" (E.4-2). Interestingly, the
Fremont City Council also recently endorsed the Ahwahnee Principles for Resource-
efficient Communities, a set of principles designed to help local governments plan for
smart growth. However, despite these good intentions, the City of Fremont is actively
pursuing locating the Oakland A's new proposed baseball stadium in its own open space
land, despite the zoning in its General Plan and the specific Ahwahnee Regional Principle

that recommends locating large public facilities such as museums and stadiums in the urban core to minimize the impacts to open space, traffic and air quality. As yet, there are no projected figures for water demand for the stadium and the residential community that has been proposed to accompany it. It is unlikely that the enormous water requirements of such a facility were factored into the water purchase estimates of Fremont since plans for the stadium were only announced this past year. However, the stadium is a highly visible example of the gap between the language of intent of a General Plan and its implementation by city government. 14 cont.

Conservation Choices

It is nearly impossible to make sense of portion of the PEIR regarding the method by which the SFPUC attempted to ascertain willingness on the part of its wholesale customers to reduce demand through various conservation measures. It is understandable that each wholesale customer will have different end users with differing needs for water. However, without knowing the specific reasons why certain customers chose to embrace or reject any of the Programs (A,B,or C) or the rationale for the particular composition of each of these programs, it is impossible to assess a customer's commitment to water conservation. 15

A better approach would be to begin by requiring all BAWSCA members to endorse the Ahwahnee Water Principles of 2005 which are designed to help local governments envision and implement more sustainable water use practices. The Local Government Commission (LGC), a non-profit organization that assists local government agencies to deal effectively with large resource questions, has helped municipalities all over the country to plan for water needs so that each city doesn't reinvent the wheel. With 28 wholesale customers in close proximity to each other, the SFPUC is in a prime position to encourage a more systematic approach to conservation on the part of its customers.

<u>Mitigation of Growth-inducing Impacts</u>

The PEIR is required to identify growth-inducing impacts of the WSIP and to mitigate them. Again, the PEIR uses locally derived information to buttress its position that the project itself is not inherently growth-inducing, that local governments are in good control of their own growth, and that they are appropriately mitigating for the impacts of development. In this case, the PEIR makes use of the method of examining several EIRs from local (Bay Area) large-scale developments to see whether the EIRs identify and mitigate for impacts. One example cited from this very small sample is the One Quarry Road Residential Project in Brisbane. It's not clear from the project description in the PEIR whether the project is still being proposed despite being rejected by Brisbane voters in an election last year or whether the voters ultimately prevailed in defeating the project— whatever the case, it's an odd example to use to show that cities are reconciling large-scale projects with their General Plans or instituting adequate mitigations for them. Projects that incur such formidable opposition that they end up on a ballot and are defeated by local voters are rarely shining examples of environmentally suitable projects. A far better metric to use to determine how well a city complies with its General Plan would be to review the number of times that amendments and zoning changes have been 16

SI_CNPS-EB1

made to accommodate development or to inquire whether the city planning department is familiar with the California Natural Diversity Database as a resource incorporated into planning decisions. 16 cont.

<u>Alternative Analysis of Water Demand in the SFPUC</u>

The Pacific Institute, a non-profit organization that "provides research and policy analysis on threats to environmental, equitable, and economic sustainability" prepared a report, "From the Tuolumne to the Tap: Pursuing a Sustainable Water Solution for the Bay Area" that analyzes in depth the assumptions that drive the SFPUC's approach to analyzing water demand. EBCNPS endorses their findings. These six recommendations are: 17

1. Re-evaluate the projections of future water demand and conservation potential in light of flaws and inaccuracies in the studies.
2. Conduct a study to determine the maximum technical potential for conservation and efficiency savings within the SFPUC service territory.
3. Meet any additional water demand through increased investment in conservation, efficiency, and recycling.
4. Target future conservation efforts and recycling development in the areas of projected new demand growth, especially outdoor uses.
5. Pursue a new water sales agreement that will cap the sale of water from the Tuolumne River at current levels and encourage conservation, efficiency, and recycling.
6. Adopt policy to reduce diversions from the Tuolumne River over time.

<u>Biological Resources</u>

Basic Description

The PEIR Executive Summary refers on page 3-81 to the method by which the potential for sensitive plant species will be assessed in the project level EIRs: *The biologist would carry out a site survey by walking or driving over the project site, as appropriate, to note the general resources and whether any habitat for special status species is present. The biologist would then document the survey with a brief letter report or memo, setting* forth *the date of the visit, whether habitat for special status species is present, providing a map of description showing where sensitive areas exist within the site, and identifying any appropriate avoidance measures.* 18

This approach is inadequate in several ways: first, this level of survey should be conducted for the PEIR, not just the later project-level EIRs, in each of its project areas. Since extensive previous documents have already been prepared for the Alameda Watershed Management (WMP) and scoping for the HCP both of which included public comment, it is odd that the SFPUC still does not have a large database for the natural resources in the Alameda Creek watershed. The SFPUC may wish to review documents prepared for the East Bay Municipal Utility District in the mid 1990's by Dr. Robert Stebbins in which detailed priority lists were created to track and study various indicator and keystone species in its East Bay lands as a means to assessing the health of the watershed. Assuming the WSIP PEIR is certified, there will be huge momentum to approve each individual project. If sensitive status species exist, their presence should be used to influence the design of the WSIP as a system, not just for individual projects. 18 cont.

Second, the type of initial screening process to determine the potential for special status species of plants is entirely inadequate. Instead, focused floristic surveys at several times during the growing season and preferably over several years must be conducted to determine with any degree of reliability whether special status plants exist. 19

Currently, the description and depiction of what CEQA-protected plants are to be found on Alameda Creek watershed lands and on the Bay Division portion of the project are inadequate. Table 5.4.6-2 (Potential for Occurrence of Key Special-Status Plants and Plant Species of Concern in the WSIP Alameda Program Area) does not include all CEQA-protected plants that have the potential for occurrence in the watershed. The PEIR does not include reference to Dianne Lake's database of locally rare, significant, and unusual plant species in Alameda County though many of these are protected by CEQA. We are attaching a list of those plants along with a letter submitted to the SFPUC for its scoping process for its Alameda Creek Watershed Habitat Conservation Plan (see discussion above). 20

In addition, we include a letter from EBCNPS to the Alameda County Board of Supervisors regarding its moratorium on development along creeks in unincorporated areas of the county. This letter lists those creeks, including Alameda Creek, San Antonio Creek, Arroyo de Laguna, and their tributaries, that have the potential for sensitive status plant species and communities. It also references Todd Keeler-Wolf's recommendation that plant community surveys be performed along those specific creeks. The moratorium is still in place and should be referenced in the PEIR along with the Alameda County's *Specific Plan: Riparian Areas Flood Plain Zoning* (Alameda County Planning Department).

Figure 4.6-1a depicts the habitat types in the WSIP study area including the Sunol Valley and Bay Division project areas. Its source is the California Gap Analysis Project, 2005. The Gap Analysis is not a sufficiently fine filter for purposes of analyzing impact. The map does not depict the detail described in the narrative portions in which 6 sensitive plant communities are identified. We do not agree with the PEIR's conclusion that the remnant areas are too small to be mapped for a programmatic document (but could be mapped in a project-level EIR) since the document also concludes that there are significant impacts of the WSIP to these communities. 21

Impacts

As mentioned above, without current data from plant surveys using appropriate protocols, the PEIR cannot determine what the plant resources are in the project area. It follows that it is also therefore impossible to determine the true level of impacts. 22

A second problem in the approach to the analysis is the derivation of the level of significance of impact. SFPUC has not formally adopted significance standards for impacts related to biological resources. Instead there are qualitative criteria which are not fully measurable. These qualitative criteria are based on assumptions of substantiality which in turn are based upon three principal components (see PEIR pp 4.6-37-38): 23

magnitude and duration of the impact (substantial/not substantial)
uniqueness of the affected resource (rarity)
susceptibility of the affected resource to disturbance

Without quantified baseline data, no meaningful conclusions may be drawn about impacts. We recommend that focused surveys be initiated, that all sensitive plant communities be fully mapped according to currently accepted protocols, and that all CEQA-protected plants be surveyed and mapped. Appropriate levels of impact can then be determined along with proper mitigations. 24

A third problem with analysis of impacts derives from the time scales used. At various points in the PEIR the time scales vary according to whether water supply data are being analyzed for adequacy or whether biological resources are being considered for impact. On page 5.4.1-17, under Approach to Analysis, the document states with respect to impacts upon the Alameda Creek watershed:

For the purpose of impact analysis, CEQA Guidelines Section 15125 (a) considers the existing conditions baseline to be those conditions in existence at the time the environmental review is initiated, as marked by issuance of the notice of preparation (NOP). For the WSIP, the existing baseline used for the impact analysis reflects the range of hydrologic conditions that have resulted since the DSOD restrictions were imposed in December 2001 and continued through issuance of the NOP in 2005, and which are expected to continue until such time that a restored reservoir begins refilling. This PEIR does not use the historical range of hydrologic conditions that existed prior to the DSOD restriction as the basis of impact analysis of the WSIP impacts on stream flow. 25
And from an accompanying footnote: …*this environmental setting will normally constitute the baseline physical conditions by which the lead agency determines whether an impact is significant.*

By utilizing the relatively brief time period during which the Calaveras Reservoir has been at less than capacity, the PEIR can frame the context of impact in such a way as to minimize the finding of impact. However, in terms of restoration of habitat and mitigation, it makes more sense to view impacts over a longer period of time, particularly with plant communities such as woodlands.

As a result of these problems in the approach to analysis as described above, the PEIR can draw certain conclusions about the lack of significance of an impact. For instance, on page 5.4.6-22 under Impact 5.4.6-4: Effects on riparian habitat and related biological resources along Alameda Creek, from the confluence with Calaveras Creek to the confluence with San Antonio Creek: 26

Sensitive riparian communities in this section of Alameda Creek include sycamore alluvial woodland, Central Coast arroyo willow riparian forest, valley oak woodland, and white alder riparian forest. The WSIP would substantially reduce winter flows compared to those under existing conditions (they would be similar to, by slightly muted from, flows in the reach directly below the diversion dam). The change in flows would have no effect on woodland communities; for stand regeneration, sycamore woodland requires flows similar to unimpaired flows. The slight reduction in flows (as it relates to stand regeneration for willow and alder riparian forest) would be offset by increased summer flows under the 1997 MOU. Sustained winter and summer minimum flows could facilitate the conversion of existing riparian habitats, such as sycamore alluvial woodland and valley oak woodland, to alder-and willow-dominated habitats, but the extent of this potential impact would be small. Overall, these impacts would offset one another; as a result the impact on sensitive habitats would be less than significant, and no mitigation measures would be required. 26 cont.

The conversion of the rare sycamore alluvial woodland community cannot be considered to be an insignificant impact. In this manner, the PEIR's findings of level of significance of impacts must be seriously questioned.

Mitigations

EBCNPS has already submitted detailed comments on the SFPUC's Habitat Reserve Program (HRP), the chief mitigation measure for the WSIP. As we mentioned in those comments, it is impossible to assess the adequacy of the mitigations in advance of a more detailed description of the exact nature of the biological resources and the presumed impact upon them. 27

CEQA Alternatives

EBCNPS does not endorse any of the CEQA alternatives described in the PEIR since we believe the fundamental analysis of water supply and demand is flawed. 28

Instead, we recommend that the draft PEIR be re-circulated. Given the problems in methodology that our letter outlines, we believe that the conditions apply under which CEQA guidelines require a lead agency to re-circulate an EIR. CEQA Guidelines Section 15088.5 requires that a lead agency re-circulate an EIR when significant new information is added to the EIR after public notice for public review of the Draft EIR, but prior to certification. "Information" can include changes in the project or environmental setting as well as additional data or other information. New information added to an EIR is not "significant" unless the EIR is changed in a way that deprives the public of meaningful opportunity to comment upon a substantial adverse environmental effect of the project, or a feasible way to mitigate or avoid such an effect (including a feasible project alternative) that the project proponents have declined to implement. "Significant new information" requiring re-circulation includes, for example, a disclosure showing that: 29

SI_CNPS-EB1

1. a new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented;
2. a substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance; 29 cont.
3. a feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the environmental impacts of the project, but the project proponents decline to adopt it; and/or
4. the draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.

We look forward to commenting further as individual project-level EIRs for the WSIP are released. Please do not hesitate to call (510-849-1409) if you have any questions.

Sincerely,

Laura Baker

July 19, 2004

Alameda Watershed HCP
Land and Resources Management Section
San Francisco Public Utilities Commission
1657 Rollins Rd.
Burlingame, CA94010

Dear Director,

The Conservation Committee of the East Bay Chapter of the California Native Plant Society (CNPS) has reviewed the list of special status plant species proposed for coverage in the Alameda Watershed Habitat Conservation Plan (AW HCP) of the San Francisco Public Utilities Commission (SFPUC). We have also reviewed the evaluation criteria used to determine the list, and the checklist of plant species observed in the Alameda Watershed HCP study area compiled by Jones & Stokes in May and June of 2003.

CNPS is devoted to preserving the native flora and habitat of California and, as such, we are pleased to see the efforts thus far towards protecting the native flora and habitat on SFPUC lands in Alameda County.

However, we also feel that the current effort does not go far enough.

Three plant species listed as rare statewide by CNPS that are known from the watershed are not included in the list of protected species nor on the evaluation list: *Legenere limosa* (CNPS List 1B) occurs in Ohlone Regional Wilderness; *Monardella antonina* ssp. *antonina* (CNPS List 3) occurs at two sites in Sunol Regional Wilderness; *Lessingia hololeuca* (CNPS List 3) is known historically (1940) from Calaveras Reservoir. 30

In addition, *Campanula exigua*, *Malacothamnus hallii* and *Lessingia micradenia* var. *glabrata* (all CNPS List 1B) were on the evaluation list but were rejected as being out of range. However, *Campanula exigua* was vouchered in Sunol Regionl Wilderness in 1973. *Malacothamnus hallii* may have been known historically (1878) from Calaveras Reservoir (voucher site is unclear). In 2002 specimens of *Lessingia nemaclada* were found in Ohlone Regional Wilderness with some characters similar to *L. micradenia* var. *glabrata*. Hybrids of the two species have been found elsewhere and could occur in the Alameda watershed. Thus, these three species should be added to the list of species proposed for coverage.

Attachment to CNPS Comments ON WSIP PEIR

CNPS List 4 species are not included in your evaluation list and several occur in the Alameda Watershed, either on SFPUC lands or on adjacent lands owned by the East Bay Regional Park District (EBRPD) within the watershed. CNPS List 4 plants are generally of limited distribution in California and most are locally rare as well. As such, they qualify for inclusion in the AW HCP under the criteria listed at the end of the evaluation list in Appendix E and in step 2 of the March 20 2003 memo "Draft Covered Species Criteria" which refer to plants that are "unlisted and not rare but the covered activities may affect a substantial portion of the species' range or important habitat for this species." List 4 species that are known to occur in the Alameda Watershed area are: *Acanthomintha lanceolata*, *Calochortus umbellatus*, *Clarkia concinna* ssp. *automixa*, *Eriogonum umbellatum* var. *bahiiforme*, *Eriophyllum jepsonii*, *Galium andrewsii* var. *gatense*, *Linanthus acicularis*, and *Linanthus ambiguus*. Of these, only *Linanthus ambiguus* is currently known to occur in the HCP study area, the rest being on EBRPD lands, but habitat is present for them in the HCP study area and thus there is a strong potential for them to occur there and they should be included in the HCP plan.

There is also no mention of rare or significant plant communities proposed for coverage. Several communities considered as rare or threatened by the California Department of Fish and Game (CDFG) occur on the watershed, including Sycamore Alluvial Woodland, perennial native grasslands, serpentine communities, and willow riparian woodlands.

In addition, we are very concerned that no mention is made of, nor protection proposed for, locally rare species. The East Bay Chapter of CNPS has been tracking the native flora of Alameda and Contra Costa Counties for many years and has developed a ranking system that assesses local native plants by their rarity or endangerment in the two-county area.* Plants with a ranking of A1, A2, or A1x (occurring in only five or less places in Alameda and Contra Costa Counties) are afforded protection under the California Environmental Quality Act (CEQA) in sections 15380 and 15125(a) which address species of local concern and place special emphasis on environmental resources that are rare or unique to a region. 30 cont.

A table is attached of state and locally rare species that are known to occur either currently or historically in the Alameda Watershed. Of the 162 species in this table, only three are included on your list of special status species proposed for coverage under the AW HCP: *Helianthella castanea*, *Monardella villosa* var. *globosa*, and *Streptanthus albidus* ssp. *peramoenus*.

Thirty-seven of the species in the table are known to occur on SFPUC land managed by the SFPUC, and 19 occur on SFPUC land leased to the EBRPD within the HCP study area. One hundred eighteen species occur on lands owned by the EBRPD that are outside of the study area but within the Alameda watershed.

The table is an updated version of a list of CEQA protected plants occurring on San Francisco Water District lands in Alameda County that was sent to Michael Carlin, Director of Planning at the SFPUC on March 5, 2003 by Tony Morosco, then president of

Attachment to Comments by CNPS on WSIP PEIR

the East Bay Chapter of CNPS, and also on June 14, 2003 to Cheryl Davis, the Acting Assistant General Manager of Operations at the SFPUC and to Jon Ballestros at the Roberts Group as part of our original comments on the HCP. According to the description in Chapter 3.3.2 of sources used to determine the special-status plant species to be covered by the HCP, this list was not consulted. Nor was the publication *Unusual and Significant Plants of Alameda and Contra Costa Counties* by Dianne Lake (6th edition, 2001, CNPS, East Bay Chapter) which lists the state and locally rare plant species that are found in the two-county area.

Locally rare species are highly important because they often represent range limits and disjunct populations, often indicating somewhat different or stronger genetic makeup. These peripheral and isolated populations can be the only hope for the continuation of a species in the event of catastrophic events that can wipe out large populations at a time through climatic and geological shifts or the spread of contagious pathogens from one plant to another in areas where a plant is more common and populations are in close proximity to each other. Earthquakes, flooding, exotic weed and insect invasions, and other events have demonstrated the vulnerability of many of our native plants countless times in countless places. It has also been demonstrated many times that peripheral populations are the last to disappear when a species begins to decline where it is more common, again indicating that peripheral and isolated populations may have some genetic variations that make them less vulnerable to pathogens and other types of attacks. 30 cont.

In addition, these isolated populations can often indicate the presence of special features where they occur that are not present in other seemingly similar habitats. Geological variations, microclimates, limited pollinator distributions, water tables and water flow patterns, etc. are some of the factors that can contribute to the presence of these isolated populations. By preserving these populations, we can learn more about the ecology and interactions of their habitats and the processes that control species survival and species declines. It is important to remember that organisms in a habitat or environment depend on each other in many ways, some of which science has not yet discovered. Removal of even one organism can have a domino effect that can result in ecological disaster in an area.

Thus, the preservation of these populations of locally rare species is of the utmost importance.

In an area where so many locally rare species occur, protection, as well as further study of those populations, is highly important. Since the purpose of a Habitat Conservation Plan is to protect important habitats in an area, the locations of both state and locally rare plants must be determined through further field surveys and research, and protection must be afforded to them in the AW HCP.

Finally, although we realize that the plant checklist provided in Appendix B was compiled from surveys conducted only in May and June of 2003 and therefore is necessarily incomplete, we would like to alert the SFPUC and Jones & Stokes to the presence of the following additional plant species known to currently occur in the

Attachment to CNPS Comments on WSIP PEIR

Alameda Watershed study area: *Athyrium felix-femina, Perideridia californica, Artemisia dracunculus, Mentha arvensis, Mentha pulegium, Stachys pycnantha, Plantago major, Rumex conglomeratus, Rumex salicifolius var. denticulatus, Clematis lasiantha, Rhamnus ilicifolia, Rubus discolor, Salix laevigata, Salix exigua, Cordylanthus pilosus, Mimulus cardinalis, Carex nudata, Carex senta, Eleocharis acicularis, Scirpus acutus var. occidentalis, Scirpus cernuus, Juncus xiphioides, Calochortus argillosus, Melica imperfecta,* and *Hainardia cylindrica.*

Thank you for the opportunity to comment on this portion of your HCP, and we wish you well as you pursue this worthy endeavor.

Sincerely,

Dianne Lake

*The CNPS East Bay Chapter ranking system is as follows (the 162 species referred to in the text are all ranked as *A, A1, A1x or A2):

- *A1, *A2: Statewide listed rare plants occurring in Alameda and Contra Costa Counties
- A1: Plants occurring in 2 regions or less in Alameda and Contra Costa Counties
- A1x: Plants presumed extirpated from Alameda and Contra Costa Counties
- A2: Plants occurring in 3 to 5 regions here, or otherwise threatened
- B: Plants occurring in 6 to 9 regions here, or otherwise threatened
- C: A Watch List – species occurring in more than 10 regions here, but with potential threats

NOTE: Plant species followed by "(?)" have taxonomic or distribution problems and it is not clear if they occur here.

Dates indicated for historical species refer to last known record in the Alameda-Contra Costa Counties area.

Explanation of Ranks
***A1 or *A2**: Species in Alameda and Contra Costa counties listed as rare, threatened or endangered statewide by federal or state agencies or by the state level of CNPS.

A1x: Species previously known from Alameda or Contra Costa Counties, but now believed to have been extirpated, and no longer occurring here.

A1: Species currently known from 2 or less regions in Alameda and Contra Costa Counties.

A2: Species currently known from 3 to 5 regions in the two counties, or, if more, meeting other important criteria such as small populations, stressed or declining populations, small geographical range, limited or threatened habitat, etc.

Explanation of Location Site Codes
AlaCkSv – Alameda Creek in Sunol Valley, between Geary Rd. and San Antonio Reservoir
ClvrsRd – Calaveras Rd. from Geary Rd. to Alameda/Santa Clara boundary
ClvrsRsvr – Calaveras Reservoir or nearby
MssnPk – Mission Peak Regional Park
Nls – Niles Canyon (Note: Specific sites are unknown for most of these species and it is not clear if they occur on SFPUC property or not)

Explanation of Location Site Codes (cont.)
OhlnAr – Private land near Ohlone Regional Wilderness
OhlnP – Ohlone Regional Wilderness
PlstnRdg – Pleasanton Ridge Regional Park
SFWDAr – San Francisco Water District Property in Alameda County
SFWDPlstn – San Francisco Water District Property near Pleasanton Ridge
SFWDSunl – San Francisco Water District Property near Sunol Regional Wilderness
SnAntoRsvr – San Antonio Reservoir or nearby
SunlAr – Sunol area (unknown if refers to town, park, or valley)
SunlF – Sunol Regional Wilderness – Flag Hill
SunlMg - Sunol Regional Wilderness – Maguire Peaks
SunlOh - Sunol Regional Wilderness – Camp Ohlone area
SunlP - Sunol Regional Wilderness
SunlT – Town of Sunol
SunlVy – Sunol Valley

California Native Plant Society

East Bay Chapter P.O. B... Berkeley, CA 94705

May 4, 2006

Alameda County Board of Supervisors
1221 Oak Street
Oakland, CA 94607

RE: Support for the proposed moratorium on development in riparian areas in Alameda County – Board of Supervisors meeting on May 4, 2006 – Item #16.

Dear Esteemed Alameda County Supervisors:

The East Bay Chapter of CNPS (EBCNPS) thanks to Board of Supervisors for hearing our comments regarding the proposed moratorium on creek development in the unincorporated areas of Alameda County. The California Native Plant Society is a non-profit organization of more than 10,000 laypersons, professional botanists, and academics organized into 32 chapters throughout California. The Society's mission is to increase the understanding and appreciation of California's native plants and to preserve them in their natural habitat through scientific activities, education, and conservation.

Our goal is to provide science-based information on the ecological significance of the existing streams and associated riparian corridors, highlighting the fact that the ecological significance of these stream systems is born from the connectivity between the active channel (blue-line stream), the riparian area, and their associated floodplains[1]. The protection of these significant areas requires a policy that will encompass and protect the entire stream system as initially promulgated and agreed upon in the Draft Environmental Impact Report (DEIR) entitled *Specific Plan: Riparian Areas Flood Plain Zoning*, written by the Alameda County Planning Department. 31

EBCNPS is concerned with the lack of regulatory compliance with the DEIR and the repercussions that may ensue due to the County's non-compliance. The DEIR outlines a three step process by which active channels (streams) and their associated riparian areas and vegetation, and the floodplain. These areas are to be prioritized, studied, and finally areas are to be designated as significant areas on the "Assessors Blocks" books. This plan was certified by the Alameda County Board of Supervisors on November 4th, 1976.

EBCNPS would like to present known ecological information supporting the ecological significance of 13 of the 29 creeks listed in the abovementioned certified DEIR. The following creeks have known to have significant ecological value which may include 1) rare vegetation communities, 2) federally protected species, or 3) species

[1] Robert J. Naiman, Henri Decamps, and Michael Pollock. 1993. The Role of Riparian Corridors in Maintaining Regional Biodiversity, *Ecological Applications*, (3) 2, pp. 209-212

California Native Plant Society

protected under CEQA[2]. Although precise surveys and designations are the responsibility of the county, the CNPS vegetation team, led by California Department of Fish and Game biologist Todd Keeler-Wolf, has determined the need for surveys as prescribed in the DEIR of 1976. Todd Keeler-Wolf is the author of definitive methods for vegetation community identification[3] that have been adopted and/or utilized by California State Parks and the National Park Service among others, and his expertise in this area is well recognized. Creeks are listed in alphabetic order within the three designations of concern promulgated by CNPS: Creeks and riparian areas with known significant ecological value with regulatory protection, Creeks and riparian areas with high probability of having ecological significance and regulatory protection, and Creeks and riparian areas which require surveying in order to determine their ecological significance (CNPS does not have enough information to comment on these creeks).

Creeks and riparian areas with known significant ecological value with regulatory protection

Alameda Creek - Alameda creek is a high priority, particularly upstream from the gravel mines near the Hwy 680 crossing. A large stand of sycamores occurs between the gravel pits and Welch Creek Rd. Good riparian and associated upland watershed vegetation and habitat up Welsh Creek and other tributaries of Alameda creek above the gravel pits and into Sunol Regional Wilderness. This includes the Sycamore grove along San Antonio Creek both above and below San Antonio Dam. The portion of Alameda creek meandering through the Sunol area and Niles Canyon is of particular interest for Unusual and Significant species. 31 cont.

Altamont Creek - This drainage has some interesting springs and seeps with alkaline vegetation that is quite unusual for Alameda Co. Definitely some other wetland features exist in the vicinity of Brushy Peak (Brushy Creek drainage etc.). This drainage and Arroyo las Positas should be treated collectively here due to their hydrological and ecological connectivity. This drainage supports an abundance of Alkali vegetation communities and *Atriplex* spp. such as *A. depressa* and *A. joaquiniana* as well as *Centromadia parryi* ssp. *congdonii*. Areas of vegetation communities dominated by *Allenrolfea occidentalis* are also present.

Arroyo Mocho - A fine stand of sycamores on exists in the lower reaches of the stream. Excellent watershed values and good riparian in upper reaches above junction of del Valle Rd and Mines Road make this is one of the most biodiverse watersheds in Alameda Co. Serpentine soils and associated flora of the Mines Road portion of this drainage are especially sensitive for reasons of both serpentine communities and species.

Arroyo las Positas – Please see comments on Altamont Creek and its associated flora. Additionally, potential areas of vernal pools (vernal pool associates) may be present

California Native Plant Society

outside of the top-of-bank of this drainage, especially in areas of private land that haven't been surveyed.

Arroyo del Valle - Near south Livermore this drainage supports a large grove of *Platanus racemosa* (a sensitive natural community[3]). A majority of this community is located within Sycamore Grove Park and is protected but a small amount of this community may extend outside of the park. Although sycamore grove below the dam has suffered as a result of summer realease from the reservoir, the sycamore stand at Sycamore Grove park is still viable and much of the drainage above the Reservoir ranging south to Eylar Mountain is diverse and largely unspoiled.

Collier Canyon - Much private, un-surveyed land exists there they may support species found within the riparian corridor. Suitable habitat for alkaline vegetation communities and CEQA-protected species such as *Centromadia* spp. and *Atriplex* spp. are present.

Corral Hollow Creek - Interesting riparian and northern range limits of several species including Desert Olive (*Foresteria pubescens*) along this creek. This creek is probably the best example of an "east-side" San Joaquin River tributary in the county. Additionally, its tributaries are key here for Unusual and Significant species of both plants and animals (notably reptiles).

Tassajara Creek - The upper drainage in Contra Costa Co. is a high quality stream system. Riparian woodland is present in the lower portion (constituted of oaks and willows). However, probably heavy fragmentation and development pressure affects this creek. Also, alkaline sensitive natural communities and special status species here such as *Centromadia* spp. and *Atriplex* spp. are present.

31 cont.

Creeks and riparian areas with areas ecological significance with regulatory protection requiring more inventory and study of specific significant plants and communities

Collier Creek
Crow Creek
Cull Creek
Palomares Creek
San Leandro Creek
Sinbad Creek

Creeks and riparian areas which require surveying in order to determine their ecological significance (CNPS does not have enough information to comment on these creeks)

Alamo Creek
Arroyo de la Laguna
Arroyo Seco
Castro-Kelly Creek

Attachment to CNPS Comments on NSIP PEIR

California Native Plant Society

Castro Creek
Cametano Creek
Chabot Creek
Collier Canyon Creek
Cottonwood Creek
Dublin Creek
Eden Creek
Hollis Canyon Creek
Martin Canyon Creek
San Lorenzo Creek
Sulphur Creek
Ward Creek

In addition to providing known information about creek habitats, a second list of CEQA-protected plant species for thirteen (13) of the listed creeks: ***Alameda**, **Altamont**, Arroyo Mocho, Arroyo las Positas, Arroyo del Valle, Collier Canyon, Corral Hollow, Cull, Palomares, San Leandro, San Lorenzo, Sinbad,* and *Ward.* Please find these lists attached as appendices to the end of this document. Creek lists are organized alphabetically.

31 cont.

EBCNPS recommends that the County of Alameda Board of Supervisors adopt the presented moratorium on development in all areas delineated and described in the DEIR of 1976. EBCNPS recommends that the moratorium be enacted with the following conditions: a) the moratorium will restrict any new development in the areas delineated by the adopted DEIR: blue-line, riparian, and floodplain areas, and b) the moratorium be enacted for an indefinite period of time until Alameda county comes under compliance. Until further study can be conducted, and the adopted plan be enacted, the County of Alameda is in a state of non-compliance which may result in serious repercussions for both the environment and the people it serves.

Thank you for the opportunity to participate in this important proceeding and helping Alameda County maintain its commitment to environmental sustainability. If you have any questions, please contact me at (510) 734-0335

Sincerely,

Lech Naumovich
Conservation Analyst

Paul Maltzer, Environmental Review Officer

San Francisco Planning Department

1650 Mission Street, Suite 400

San Francisco, CA 94103

Re: SFPUC Water System Improvement Program ("WSIP"), Program EIR

Dear Mr. Maltzer,

I am writing to you on behalf of the Santa Clara Valley Chapter of the California Native Plant Society. We represent a diverse cross section of citizens concerned about the conservation, protection and restoration of native plants and their habitat in this state. We have reviewed the draft PEIR ("the Plan") issued by your department, and have several concerns about it.

Inadequate Level of Detail

From an overall perspective, we find the PEIR lacking sufficient detail and analysis to be able to support its own conclusions of the future needs of the regional water system, the environmental impact of the proposed projects, and what it proposes to be as appropriate mitigation measures. In many instances, the Plan acknowledges its possible lack of sufficient detail or completeness, and indicates that a subsequent Project 01

Report will be complete, addressing all concerns.

There are twenty-two WSIP Facility Improvement Projects listed in Table S.2. As of the final date of the public comment period for this PEIR, the SFPUC has only published NOPs/EIRs for nine of the Projects. The Plan's lack of detail and reliance on Project EIRs that are unavailable to the public at this time, make it impossible for the public to determine the validity of the impact analysis and its related mitigation measures provided in the Plan. We urge the SFPUC to timely publish all twenty-two projects, so they can be analyzed together, in a more coherent context. We also request that the commission provide local work sessions for each project, in the geographical areas affected by the projects. 01 cont.

Flawed Analysis of Demand Needs and Underestimate of Conservation Measures

We share the goals stated in Table S.1, and recognize the merit of maintaining high water quality and delivery reliability, providing for seismic and structural reliability, sustainable and cost effectiveness, and meeting customer needs. But, we are troubled by the analysis offered regarding the water supply needs and measures to meet them. 02

We do not believe that adequate consideration has been given to conservation measures. The PEIR substantially overestimates water demand in Santa Clara County because of faulty assumptions and flawed data sources. The total population of users is a biased and uses an invalid sampling method, resulting in an overstatement of future needs. The analysis also fails to take into consideration the reductions in demand achievable by conservation. We endorse the critiques of the demand analysis by the Pacific Institute[1] and the Loma Prieta Chapter of the Sierra Club. If this Plan is implemented as proposed it will have a substantial growth-inducing effect on Santa Clara County resulting in increased pressure on open space and demand for services and infrastructure, which are in no way covered by the proposed mitigations. We strongly urge that this PEIR be re-drafted reflecting more realistic projections of growth needs and conservation potential based on the findings cited above of the Pacific Institute. 03

Insufficient Impact Analysis and Mitigation Measures

Mitigations to compensate for the WSIP are proposed, by the Habitat Reserve Program[2] ("HRP") to take place in advance of actual analysis of impacts. And these have insufficient site specific data on which sound decisions can be made. 04

Data on impacts at specific sites must be presented and analyzed and mitigations designed which are appropriate and adequate to the expected project consequences. The information for both mitigations and impacts is far too sketchy for this document. It is not clear from the Plan where some of these mitigations would be, or if they are feasible, or perhaps already completed by some other agency. The Plan should specifically identify the mitigations anticipated, and verify their status as new mitigations, or if piggybacking or in any way related to a pre-existing mitigation, what the new mitigation effort is arising from this Plan.

Several of the mitigations presented lack any detail as to what the mitigation would be. A few examples cited below from Table S.4 exemplify this:

Measure 4.6-1a, Wetlands Assessment

"Wetland scientist will determine whether wetlands could be affected…and if so, perform a wetland delineation and develop mitigation."

Measure 4.6-3b, Standard Mitigation Measures for Key Special-Status Plants and Animals

"Implement measures to reduce impacts on key special-status species."

The HRP described its efforts in its NOP as the "coordinated and consolidated approach to compensate for habitat impacts" resulting from this Plan. Where, for example would the HRP's seventy-five acres of serpentine grassland be found? Would this be an acquisition of new land? The Santa Clara County HCP/NCCP is proposing acquiring thousands of acres of serpentine grassland in their county as mitigation for takes of serpentine endemics. How will this affect any contemplated acquisition? 04 cont.

The information on site impacts is equally vague. There is better data currently available from several sources which should be included and analyzed in the DEIR. Data is being developed by the Upland Habitat Goals project of the Bay Area Open Space Council which should be consulted. In the area of the Calaveras Reservoir data from the CNDDB show a population of most beautiful jewelflower (*Streptanthus albidus* ssp. *peramoenus*) in the Arroyo Hondo, (R. Preston, 2003). The habitat for the callippe silverstreak butterfly, the Johnny-jump-up (*Viola pedunculata*) larval plant was mapped by R. Arnold (ca 2005) and provided to the SFPUC.

Diversion of 25 million gallons per day from the Tuolumne River

We do not support this measure. The impact on the Tuolumne River is not sufficiently known to offer a diversion plan of 25 million gallons per day. There has not been a comprehensive study of the Tuolumne River in over fifteen years, and several sections of the proposed diversion lack strong scientific documentation. While the SFPUC began a study of the impact on the Tuolumne River in 2006, several years of study are required to provide sufficient data and analysis of the impact. Absent further information as to the environmental impact of this substantial change to the Tuolumne River, we find the Plan deficient. 05

In total, our organization believes that this proposed DEIR is fundamentally flawed for the reasons cited above. We think that the cumulative impact of the twenty-two WSIP projects will be staggering, significantly more environmentally harmful in the aggregate than this Plan envisions. In the attached Appendix A, we have identified several specific deficiencies in this Plan. We do not consider this an exhaustive list, but merely representative of the many inadequacies of the Plan. We urge your department to reject this Plan as it is currently drafted and send it back to the SFPUC for significant revisions. 06

Regards,

Kevin Bryant

President, Santa Clara Valley Chapter

California Native Plant Society

Sierra Club, Loma Prieta Chapter

Appendix A

Specific Examples of Matters of Concern

I. Inadequate Level of Detail

a. Calaveras Dam Replacement, though deferred due to land and water rights negotiation, is included as integral part of PEIR and Habitat Reserve Program but, without specifics on extensive excavation of Calaveras Creek and watershed, its proposed advance mitigation compounds cumulative impacts to vegetative habitat. 07

b. Pilarcitos Creek's emergency diversions to San Andreas and Crystal Springs Reservoirs are not detailed as to sustainable stream flows needed for 947-acre California endangered and federally threatened Marbled murrelet critical habitat. 08

c. This PEIR in legend on Figure 5.7-4 PP-1a states "Peninsula Watershed Habitat Conservation Plan (sub-project of Alameda WMP)" which is only reference to a doubling up on biological resource evaluation in two 09

SI_CNPS-SCV1

distinctly different watershed that has not been mentioned before in scoping documents or in Peninsula WMP. Is this an accurate statement of plans for an' under the radar' environmental review? 09 cont.

II. Flawed analysis of Demand Needs and Under Estimate of Conservation Measures

a. There appears to be bias in data sources used in 'demand needs' analysis, and with an invalid sampling of total population users it overstates future water needs. 10
b. Figure S.3 Annual Average Historical and Projected Future Customer Purchase Requests illustrates this critical difference between water usage by SFPUC Retail Water Customers and Wholesale Water Customers 11
c. Lack of substantiation of need for water use increases seems evident in requests by Alameda County Water District, Hayward, City of Santa Clara, Milpitas, City of San Jose (North), and City of East Palo Alto, where recycled water is readily available for anticipated shoreline development. Reduced water treatment plant outflows would result in less salt marsh conversion, and more in 40 mgd increase. 12
d. Upstream conservation capabilities exist for Stanford University who requests a 76% increase and Purissima Hills Water District a 51% increase. Purissima Hills Water District with 2100 connections is credited in PEIR with 94,555 residences in its 2000 sphere of influence, when it services part of Town population of 7902. 13

III. Insufficient Impact Analysis and Mitigation Measures

a. CEQA Law and Guidelines #15126 requires that all phases of a project must be considered when evaluating its impact on the environment and this includes c.) mitigation measures proposed to minimize the significant effects. 14

b. Cumulative Impacts, Mandatory Findings of Significance and Tiering are CEQA constraints that are not satisfactorily adhered to in this all-encompassing project. 15

c. In particular this entire PEIR is predicated on diversion of 25 mgd of Tuolumne River water from its upper watershed which may, as seen in 'Significant Effects' of CEQA "conflict with adopted plans and goals of community where it is located and interfere substantially with movement of any resident or migrating fish or wildlife species". The Tuolumne and San Joaquin Rivers have plans. 16

Paul Maltzer
Environmental Review Officer
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103-2479

October 15, 2007

Dear Mr. Maltzer,

In consideration of the extension of response time for comments upon the San Francisco Public Utility Commission's Water System Improvement Program (WSIP) Draft Programmatic Environmental Impact Report (PEIR), please accept an addendum to my attachment to the California Native Plant Society, Santa Clara Valley Chapter's letter of October 1, 2007, in regards substantive concerns of inadequacy in the PEIR.

~ A plan to increase Calaveras Reservoir capacity with the Calaveras Dam Replacement the PEIR states on page 9-118 has been rejected by SFPUC due to time constraints in satisfying DSOD requirements, but is dam replacement height to be at a level that will accommodate this future enlarged reservoir and if so, when can public input be made? Then, if present reservoir level is to remain, why are not sediment basins incorporated around Calaveras Reservoir (as exist on Crystal Springs and San Andreas Reservoirs) to extend life of reservoir capacity and create sites for feasible wetlands mitigation? Proposed mitigation associated with Calaveras Dam in regards recontouring streams, removing instream grade structures and natural (erosion controlling) habitats such as Coyote Bush, is to be geomorphologically engineered on existing stream flow data? Revegetation of restored stream channels based on historic hydrology is not proposed? 01

~ Pilarcitos Creek and Pilarcitos Reservoir impacts due to diversions to Crystal Springs and San Andreas Reservoirs are evaluated as less than significant without addressing environmental degradation of the 947-acre critical habitat of the Marbled murrelet, a California endangered and federally threatened species. This small seabird feeds at sea but nests "inland in mature conifer forests with open-crown canopies such as Douglas fir, western hemlock, Sitka spruce, coastal redwood, and mountain hemlock forests". Pilarcitos Creek flows through length of this critical habitat between Pilarcitos Lake and Stone Dam so can alteration, diminution or seasonal cessation of this streamflow so degrade health of the conifer forest as to impact critical Marbled murrelet habitat? Can PEIR provide model of data on amounts and timing of Pilarcitos flow diversions? Is there an evaluation of impacts to Half Moon Bay's groundwater basin as a result of upstream Pilarcitos Creek diversions? In drought will this cause saltwater intrusion? As treated water is stored in Crystal Springs and San Andreas Reservoirs, will transfer of this water to Pilarcitos Reservoir, as reserve, affect water quality to a degree that might impact critical habitat, native grasses and wetlands or special status species? 02

~ Is PEIR legend on Figure 5,7-4 PP-1a accurate when it states "Peninsula Watershed Habitat Conservation Plan (sub-project of Alameda WMP)"? Not only are these two watersheds distant geographically, but they are distinctly different biological regions. What mention of this is referenced in Peninsula Watershed Management Plan DEIR? 03

Much of Peninsula Watershed is a designated California Department of Fish & Game Refuge and as such qualifies for special level of conservation practices and protection. Surrounded by State, County and Open Space District parkland it provides continuity of wildlife corridor and high caliber vegetative habitat which needs to be accurately surveyed or its integrity will be diminished if not lost. Please reference the grassland vegetation designations as detailed by Toni Corelli, Rare Plant Botanist, in comment on this PEIR and with supporting maps and California Native Species Field Survey of Lessingia arachnoidea occurring throughout serpentine bunchgrass grassland between Crystal Springs Reservoir and #280. If this area is slated for high disturbance, could grassland specialists of our Native Plant Society collect seeds or salvage plantings? Can this PEIR confirm where mitigation serpentine grassland acreage is to be found? Will SFPUC provide alternatives to joining Peninsula and Alameda watershed HCP's? 04

~ In Volume 4 of 5, Page 6-5 SFPUC Construction Methods 8. Biological Resources: mentions that the biologist would carry out a site survey by walking or driving over project site to note general resources and presence of habitat for special status species. Is this survey protocol acceptable to California Department of Fish & Game? We do urge SFPUC to conduct surveys on foot and over a representative period of seasons and in wet and dry years. If they cannot conduct scientific surveys due to lack of staff or cost of consultants CNPS might field volunteers to assist project site assessment. As so much of terrain to be impacted by this Hetch Hetchy upgrade is pristine or at least so long undisturbed as to be an exceptional biological resource, could special BMP's be mandated for cleaning of boots and any construction equipment for project? Can special BMP's be instituted to reduce all possible introduction of invasives? 05

~ In regards Crystal Springs Reservoir, modified operation to manage inundation levels, as discussed in Section 5.5, it is preferred alternative if reservoir levels are adjusted to preserve the oak woodland habitat (as achieved prior to 1983) and not drown wetlands and request analysis of cumulative impacts of 'treated reservoir' waters on vegetation. Where would oak woodland mitigation acreage be reserved and will it be one for one? What impact will raised water levels have on sediment basins sited around reservoirs? 06

~ Flawed analysis of Demand Needs and Under Estimate of Conservation Measures is a critical element of PEIR and support data for assumptions must be given reevaluation? Please review legislative mandates that show water conservation is a State level issue; AB325, AB1881, and AB2717 clearly support 'water smart landscapes' for California.

~ Communities listed as requesting sizable water supply increases should be questioned for some substantiation of need and for documentation of water conservation efforts. Can data for these water supply requests be forwarded to State for verification? This is a consideration not only in regards to submitted landscape plans and ordinances, but State Water Resources has base data on public and private wells permitted in area. 07

~ Upstream conservation reservoirs and underground water tanks are essential elements of SFPUC facilities but shouldn't emphasis be placed on customers and water retail contractors incorporating these backup supply capabilities into their community plans?

~ Then, analysis of cumulative impacts resulting from increased water supply should include San Francisco Bay saltmarsh conversion from increased sewage plant outflow, an increase in flood hazards (from development runoff from impervious surfaces) to low lying and shoreline communities, and a loss of open space? Growth inducement potential in foothills and in higher density shoreline development would acerbate both these scenarios, as would predicted effect of global warming on rising Bay tide levels? Is State Department of Water Resources review mandated for evaluation of base data? 08

~ Recycled water use is way behind projections in areas such as North San Jose and East Palo Alto should place that as an option before considering use of groundwater. 09

~ Costs of alternate water supply sources such as desalination are almost prohibitive and when factored into general public's water bill (if caused by waste and careless consumption by privileged citizenry) can cause undue hardship. San Francisco's City Charter has as mandate (2) Establish equitable rates sufficient to meet and maintain operation, maintenance and financial health of the system: (7) Develop and implement a comprehensive set of environmental justice guidelines for use in connection with its operation and projects in the city. When San Francisco citizens approved bond money to upgrade SFPUC Hetch Hetchy system didn't they intend to receive equitable rates? 10

City Charter mandate (4) is to 'Protect and manage lands and natural resources used By SFPUC to provide utility services consistent with applicable laws in an environmentally sustainable manner.' Please take this mandate to heart and do not 'go lite' on evaluating impacts to biological resources. If time permitted I could cite many instances in the PEIR which do not fully reflect anticipated impacts to these resources. 11

SFPUC lands provide, to a large degree, a last frontier of unimpacted natural habitat. Please avail yourselves of all possible private volunteer assistance in preserving some vestige of this original California landscape. 12

Thank you for your kind consideration of these concerns.

RE: San Francisco Public Utilities Commission WSIP DEIR

Dear Mr. Maltzer:

The Willis L. Jepson Chapter of the California Native Plant Society (Solano County) appreciates the opportunity to comment on the *Water System Improvement Project (WSIP DEIR)*. The California Native Plant Society (CNPS) is a non-profit organization of more than 10,000 laypersons, professional, and academic botanists organized into 32 chapters throughout California. The mission of the CNPS is to increase the understanding and appreciation of California's native plants and to preserve them in their natural habitat through scientific activities, education, and conservation.

The proposed WSIP asks for the removal of an additional 25 million gallons of water per day (mgd) from the already impacted Tuolumne River. This river is an important natural resource which is home to many native plants and animals. Withdrawal from the river would take place in the Sierra Nevada in the upper watershed where it magnifies the primary impacts upon the riparian communities at the source. But the impacts extend to the San Francisco/ San Joaquin Delta where 01
freshwater flows are already heavily depleted. Further reductions in flow through the Delta have the potential to further destabilize this fragile ecosystem which has already been severely impacted. The Tuolumne is the largest remaining source of freshwater to the San Joaquin River. There are also impacts across San Joaquin, Alameda, Santa Clara, and San Mateo counties from individual components of the system, and planned water withdrawals from creeks in Alameda and San Mateo counties.

We oppose the withdrawal of additional water because we believe that a concerted effort towards water conservation should precede additional projects which would cause significant environmental impact. We believe it is completely feasible to conserve the equivalent of 38 mgd 02
for 2.4 million people, or about 15 gallons per day per person with education, cooperation and creativity.

Thank you for your consideration of the above comments.

Sincerely,

Tedmund J. Swiecki, Ph.D.
Conservation Committee Co-Chair

September 26, 2007

Mr. Paul Maltzer, Environmental Review Officer
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103

Dear Mr. Maltzer:

Your environmental review of the San Francisco Public Utilities Commission's plan to take more water from the Tuolumne River fails to adequately identify and address all of the environmental impacts to the River. I urge you to undertake additional studies before finalizing this document. 01

The Tuolumne River supports a diverse biological community and as the largest of three major tributaries to the San Joaquin River, the Tuolumne River contributes much-needed freshwater to the San Francisco Bay-Delta. About 60% of the Tuolumne River is already diverted for urban and rural uses, and increasing diversion will do further harm to the River. As part of its Water System Improvement Program (WSIP), the San Francisco Public Utilities Commission (SFPUC) has proposed diverting an additional 25 million gallons of water per day from the Tuolumne River. 02

Water conservation and efficiency measures are the cheapest, easiest, and least destructive ways to meet demand and extend supply. The SFPUC's "preferred alternative" ignores conservation, efficiency, and recycling measures that their own studies found could eliminate the need to divert more water from the Tuolumne by at least 74%. Per capita water use is projected to increase for wholesale customers, indicating they lack effective conservation programs. 03

Decreasing reliance on the Tuolumne is critical not only for protecting the health of the River, but also for preparing for the future uncertainty of the Sierra snowpack as a result of global warming. By pursuing a plan to divert additional water from the Tuolumne River, the SFPUC risks delaying their capital program, causing cost overruns and failing to increase the reliability of the water supply. 04

Recommendations

The SFPUC should re-evaluate its projections for future water demand and conservation potential in light of flaws and inaccuracies in their studies. You should conduct a study to determine the maximum technical potential for conservation and efficiency savings within the SFPUC service territory. 05 Any additional demand should be met through increased investment in conservation, efficiency, and recycling. The SFPUC should adopt a policy of reducing diversions from the Tuolumne River over time. 06 A comprehensive watershed study should be completed to adequately assess the environmental impacts of the WSIP. 07 I support the alternatives identified in your draft document that protect the Tuolumne River from new diversions. Only by ensuring that healthy amounts of water continue to flow into the Tuolumne River can we protect this irreplaceable natural treasure. 08

Sincerely,

Meredith Wingate

September 10, 2007

San Francisco Planning Department
Attention: Paul Maltzer
Environmental Review Officer, WSIP PEIR
1650 Mission Street, Suite 400
San Francisco, CA 94103

Dear Mr. Maltzer,

We at the Central Sierra Environmental Resource Center (CSERC) would like to emphasize our position in agreement with the views of the Tuolumne River Trust regarding the proposed Water System Improvement Program by the San Francisco Public Utilities Commission. We concur with the Tuolumne River Trust that there are immeasurable benefits to both wildlife and recreation in leaving the water in the Tuolumne River. 01

The Aggressive Conservation/Water Recycling and Local Groundwater Alternative is an excellent plan that should precede any additional diversion of water from the Tuolumne River. San Francisco lags behind other major metropolitan areas in water conservation, and with increased water conservation and recycling, San Francisco could potentially reduce consumption of water from the Tuolumne River rather than increase consumption. We encourage the SFPUC and citizens of San Francisco and surrounding counties to implement these conservation efforts before further degrading the already sensitive Tuolumne River habitat. 02

Thank you for taking the time to consider our comments. Feel free to contact CSERC if you have any further questions.

Sincerely,

Brenda Whited
Staff Biologist

Re: WSIP Draft PEIR Comments – Case # 2005.0159E

Dear Mr. Wycko:

On behalf of Clean Water Action, I would like to add the following comments to those submitted in conjunction with Tuolumne River Trust and the Sierra Club.

Our organization submitted scoping questions in October 2005 which have not been adequately addressed in this document, specifically;

There has been insufficient analysis of the ability of the program to meet current and foreseeable regulations. The Stage 2 Disinfection Byproducts Rule, adopted concurrently with the Long Term 2 Enhanced Surface Water Treatment Rule, is neither mentioned nor analyzed in the document. If no system changes will be required to meet the new rule, that determination and the justification for it should be included in this document. However, the level of disinfection byproducts currently found in the system is not sufficiently low to warrant an assumption of compliance with the Phase 2 Rule. 01

The impact of increased discharge to San Francisco Bay is not evaluated. Most of the increased demand is projected to occur in the South Bay. Because there is less scouring and mixing in this portion of the Bay, water quality is already compromised to such an extent that current regulations require tertiary treatment of all discharges. The increased pollutant loading that can be anticipated as a result of the additional demand should be analyzed in this document. 02

Thank you for allowing us the opportunity to comment on this document.

Sincerely,

Jennifer Clary
Water Policy Analyst

HEARINGS ON DRAFT PROGRAM EIR ON SFPUC WATER SYSTEM IMPROVEMENT PROGRAM

Thursday, September 20, 2007
City Hall, Room 400

COMMISSIONERS, Tony Gantner, President, District Three Democratic Club.

Our Club is deeply concerned about any action taken by the PUC that would allow more water to be diverted from the Tuolumne River. We believe that: The Rights of the Environment are Equal to Human and Civil Rights, and that Compassion for the Environment is as Compassion for our Fellow Human Beings.

Within that belief system, the proposed diversions---on their face---are presumptively harmful to fisheries and sensitive riparian habitat. It is our understanding that the draft EIR released by the PUC does not properly indentify and address the impacts of taking more water from the Tuolumne, and that such diversions would be for cutomers outside of San Francisco. 01 We realize that growth projections for the Bay Area over the next generation are pressuring the PUC to allow these increased diversions---but the rights of---and compassion for---the environment must be acknowledged. There must be limits to growth's impact on the environment---conservation and recycling are one solution. 02 In this City which can rightly be called the cradle of environmentalism, do not betray your heritage---the Tuolumne fisheries are as much entitled to healthy ecosytems as each of you is entitled to live in a clean and green urban environment.

Thank you.

PLANNING DEPARTMENT

10/3/07

Paul Maltzer, Environmental Review Officer
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103

Dear Mr. Maltzer:

Your environmental review of the San Francisco Public Utilities Commission's plan to take more water from the Tuolumne River fails to adequately identify and address all of the environmental impacts to the River. We urge you to undertake additional studies before finalizing this document. Only by ensuring that healthy amounts of water continue to flow into the Tuolumne River can we protect this irreplaceable natural treasure. 01

The Ecology Center is a membership-based ecological resource for the East Bay. One of our many functions is to bring pioneering sustainable living projects, such as the water-recycling greywater system at the Berkeley Eco House, to our members and the public as an alternative to increasing consumption.

We support the alternatives identified in your draft document that protect the Tuolumne River from new diversions. Requiring more water conservation, efficiency, and recycling is the best way to lessen impacts on the Tuolumne River while promoting a sustainable water plan for the Bay Area.

Conservation and recycling are the way of the future, in water as in other resources. Many other metropolitan areas have been able to reduce their water consumption even while growing, but the SFPUC projects Bay Area water demand to increase. The SFPUC's own studies found that conservation, efficiency, and recycling measures could reduce the need to divert more water from the Tuolumne. 02

Clearly the Bay Area could take advantage of more opportunities for water conservation and recycling than it does currently. Since water conservation and efficiency measures are the cheapest, easiest, and least destructive ways to meet demand and extend supply, conservation and development of recycling strategies is the only sensible route for meeting Bay Area water needs.

Sincerely,

Martin Bourque

San Francisco, CA 94103.

Re: Environmental Defense comments regarding the Draft Program Environmental Impact Report on the San Francisco Public Utilities Commission's Water System Improvement Program

Dear Mr. Maltzer:

Environmental Defense appreciates the opportunity to comment on the Draft Program Environmental Impact Report (PEIR) for the San Francisco Public Utilities Commission's (SFPUC) Water System Improvement Program (WSIP).

The WSIP is a comprehensive program with two stated interrelated but distinct goals: (1) to repair and modernize the SFPUC's aging and seismically vulnerable infrastructure, and (2) to develop additional water supplies to meet anticipated future demands in the SFPUC service area.

Environmental Defense fully supports the timely completion of projects necessary to repair existing infrastructure and protect the SFPUC's water supply system from earthquakes or other disasters. These projects are critical to ensure the reliable delivery of water supplies to Bay Area communities and should be completed as soon as possible. 01

The appropriate formulation of additions to the SFPUC's water supply portfolio that meets anticipated future needs is less clear. Fortunately, future needs are developed gradually and the program to meet them need not be fully developed at this time.

Environmental Defense recommends that the Planning Commission pursue such a two-tiered approach that accommodates timely completion of infrastructure repair projects and a thoughtful deliberate approach to a water supply portfolio that meets anticipated future demand. 02

The remainder of these comments will focus on aspects of the SFPUC's water supply portfolio that should be considered, including not only items analyzed in the Draft PEIR but others as well.

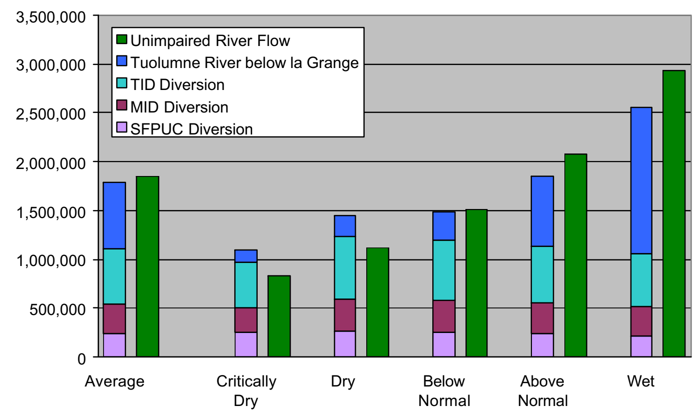
Diversions from the Tuolumne River

The alternatives considered in the Draft PEIR include up to 35 million gallons per day in increased diversions from the lower Tuolumne River to the San Francisco Bay Area. While the 03

proposed increase might be considered only a small portion of overall Tuolumne flows, Environmental Defense believes that it is time to put water back into California's rivers and streams, especially those in the Central Valley and Bay Delta watershed, rather than take more water out.

Figure 1 below provides a graphical view of how Tuolumne River flows are managed, reflecting operations of the Turlock and Modesto Irrigation Districts and of the San Francisco Public Utilities Commission (under its "Unconstrained" alternative). Note that while the lower river retains 38% of its flows on average, in dry and critically dry years it retains only 14% and 12%, respectively, of its natural flow. 03 cont.

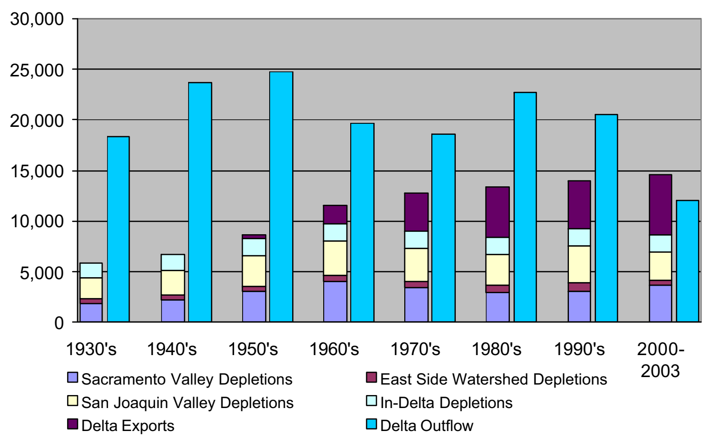
Environmental Defense concurs with the Draft PEIR that further dewatering the lower Tuolumne River would cause further harm to the river's health and make it more difficult for the river to support naturally reproducing Chinook salmon. 04



Additional diversions of water from the lower Tuolumne River would have impacts on the lower San Joaquin River and Bay-Delta estuary as well. The Delta's woes are well known, including the federal court ruling in late August that restricts exports at the State and federal pumps to prevent the extinction of Delta smelt. These new export restrictions are entirely due to increased flow requirements on two reaches of the lower San Joaquin River, specifically Old and Middle Rivers. 05

If the Tuolumne River is further depleted, so too will be the lower San Joaquin River. Either Delta smelt and other pelagic fish will suffer, or State and federal contractors will be forced to give up water to accommodate the additional diversions on the Tuolumne River. 05 cont.

Figure 2 provides an overview of how development of water supplies in the Bay-Delta and Central Valley Watershed has increased over time. Environmental Defense believes it is time to reverse this trend and leave more, not less, water in our rivers. 06



Accordingly, Environmental Defense is pleased that the Bay Area Water Supply and Conservation Association has chosen to pursue an approach that would invest in agricultural conservation in the Central Valley. BAWSCA's plan would more than offset incremental diversions to meet demand in the Bay Area, allowing additional flows to be managed for the benefit of the lower river[1]. There is precedent for similar arrangements in other parts of California, including mechanisms for verifying that reduced consumptive use actually takes place. Such a program would meet anticipated needs in the Bay Area and improve conditions in the lower Tuolumne River and Bay-Delta as well. 07

---

[1] This approach is outlined in BAWSCA's staff memorandum, September 14, 2007. The memorandum and Environmental Defense's letter of support for this approach are attached.

Lower Tuolumne Diversion

Environmental Defense supports the alternative considered in the PEIR that would install a diversion point on the lower Tuolumne River just above its confluence with the San Joaquin River, from which water would be diverted into the San Joaquin Pipelines. Such a diversion point would provide two principle benefits. First, it would increase flows and provide benefits to the health of the lower Tuolumne River. Second, it would provide the SFPUC important physical access to the lower Tuolumne River that would be indispensable in case access to its diversion point at Early Intake were rendered inoperable for any reason. 08

Such a diversion would need to be constructed so that its does not entrain fish. Presumably, a "gallery" under the river could be designed for this purpose. Additionally, this water would likely need to be filtered, either before being put into the San Joaquin Pipelines, or at the existing plant in Sunol. While it is understandable that the SFPUC may prefer not to add filtration capacity, doing so would add a level of water supply reliability that may well justify the cost.

Connection to the California Aqueduct

The Draft PEIR, in part citing the desire to avoid filtration, failed to consider a connection to the California Aqueduct (or Delta-Mendota Canal). The PEIR did consider, as described above, a lower Tuolumne River diversion point that would likely require filtration.

What makes sense, in terms of increased flexibility, is a filtration plant near the confluence of the Tuolumne and San Joaquin Rivers, which is also near the California Aqueduct. Combined, these facilities would add important diversity to the SFPUC system, which could, under some scenarios, avoid interruption of water supplies to 2.4 million people in San Francisco and other Bay Area communities. 09

To be clear, a physical connection to the California Aqueduct might only be used under emergency circumstances. It might never be used. There is no reason that the SFPUC should not rely on the high quality Tuolumne River for its imported water supply. The suggestion to connect the SFPUC to the California Aqueduct is not intended to mean that the SFPUC would rely on Delta supplies. It is a suggestion that the SFPUC could prevent potentially critical water supply outages by installing the physical capacity, along with institutional agreements with other parties as necessary, to access Delta supplies as backup in case Tuolumne supplies are not available or adequate.

Conservation / Water Use Efficiency

Environmental Defense supports aggressive urban water conservation programs. We have not closely followed the details of recent discussions of what is "feasible" within the SFPUC retail and wholesale service territories, but believe that the definition of feasibility should include the consideration that conserved water supplies help to protect the natural environment. We believe 10 the discussion of how much urban conservation is desirable should be continued as a water supply portfolio is developed. 10 cont.

Groundwater

We believe the SFPUC should pursue increased use of groundwater in dry years, as described in various PEIR alternatives. 11

Desalination

The Draft PEIR considers desalination as a potential source of water in two different ways: (1) a plant to be built near the beach in San Francisco and operated every year, and (2) a plant that would be co-owned with other Bay Area water agencies and used only in dry years. Environmental Defense believes both ideas are worthy of consideration and should be more fully developed but strongly cautions that desalination brings significant challenges as well. First, any project must address issues including the entrainment of fish and wildlife along with voluminous brine disposal considerations. Second, while desalination technology is improving, the energy needs are still significant and must be considered in light of California's commitment to reduce greenhouse gas emissions as specified by AB32. The cost of any desalination plant should reflect a plan to provide either energy through renewable resources or full mitigation for emissions incurred by its energy use. 12

Alameda Creek and Calaveras Dam

Environmental Defense supports replacement of Calaveras Reservoir to its design capacity of 97,000 acre-feet. 13

Environmental Defense supports restoration of steelhead trout in Alameda Creek. We believe that steelhead restoration will be best achieved if the Alameda Diversion Dam is removed and fishery flows, without downstream recapture, are incorporated in the operating criteria of the rebuilt Calaveras Reservoir. 14

Thank you for the opportunity to comment on the Draft PEIR. We look forward to continuing to work with the San Francisco Planning Department and the Public Utilities Commission to find ways to provide a reliable supply of high quality water to Bay Area communities as we protect and restore our natural environment.

San Mateo, California 94402

Re: Water Supply Objectives

Dear Ms. O'Mahony:

Environmental Defense has reviewed the staff memorandum, September 14, 2007, titled "Presentation and Discussion of Proposed BAWSCA Comments on Draft PEIR for Water Supply Improvement Program".

We concur with BAWSCA staff in two important respects.

First, we agree that it is urgent to complete improvements to aging and seismically vulnerable infrastructure as soon as possible.

Second, we are pleased and encouraged that BAWSCA has identified investments in agricultural conservation as a way to provide water supply for its members while increasing flows in the lower Tuolumne River. This is essentially the approach Environmental Defense laid out as far back as 1983 when we published "Trading Conservation Investments for Water". We believe this plan, if properly implemented, presents a cost-effective way to provide water to the urban Bay Area, improve on-farm conservation, and benefit not only the lower Tuolumne River but the lower San Joaquin River and Bay-Delta as well. 15

As BAWSCA pursues opportunities to improve agricultural conservation, we trust it will aggressively pursue conservation among its urban customers as well. In addition, while the plan may improve conditions on the lower river, we continue to have an interest in finding ways both to restore Hetch Hetchy Valley in Yosemite National Park and to protect the stretch of the river between Hetch Hetchy and Don Pedro Reservoir. 16

We look forward to working with BAWSCA in this and other efforts to improve our environment while providing reliable water supplies to California's cities and farms.

Sincerely,

DATE: September 14, 2007

RE: **Presentation and Discussion of Proposed BAWSCA Comments on Draft PEIR for Water Supply Improvement Program**

On June 29, the San Francisco Planning Department released for public review a five-volume draft of the Program Environmental Impact Report (PEIR) on the SFPUC's Water Supply Improvement Program (WSIP). Comments are due by October 1. BAWSCA staff, working with consultants, have carefully reviewed the lengthy and detailed draft PEIR. We have worked closely with the Technical Advisory Committee (TAC), comprising staff from each of BAWSCA's members, to develop a coordinated response.

The purpose of this report is to provide BAWSCA's Directors a summary of our analysis of the draft and our approach to preparing comments on it. The September 20th board meeting will include presentations and discussion of key concepts included in our comments to obtain board direction prior to finalizing and submitting written comments on the PEIR.

SUMMARY OF ANALYSIS AND PROPOSED COMMENTS

The Draft PEIR Meets the Legal Requirements of CEQA

The draft PEIR is a conscientious effort to satisfy CEQA requirements for Program EIRs. It provides a clear description of the program (the WSIP), the environmental impacts it is likely to cause, ways to mitigate the impacts identified where possible, and a range of alternatives to the program as formulated by the SFPUC, including an "environmentally superior alternative." It is an objective document prepared by competent professionals in a variety of disciplines. While it is not perfect by any means, there are no fundamental or pervasive flaws. In our view, it satisfies the standard for EIRs established by California courts.

Basic Aims of BAWSCA's Comments

BAWSCA comments on the draft PEIR will, of course, point out errors in the document. But they will go beyond that to proactively supplement the draft's treatment of important topics which are given less emphasis or analysis than we think they deserve. BAWSCA's comments will:

1. Refocus attention on the underlying reason for the WSIP – the protection of 2.5 million people from the human and economic catastrophe that would result from a 30-60 day interruption of water after a major earthquake.

SI_EnvDef

2. Provide additional facts that demonstrate BAWSCA members' success in developing diverse portfolios of water supply sources, their customers' frugal use of water compared to the rest of California, and their plans for future increased efficiency in the use of potable water supplies.

3. Support the "Environmentally Superior Alternative" and encourage the SF Planning Department to expand the description of the alternative in the final PEIR. The core of this alternative – that the Bay Area support agricultural water conservation efforts in the Tuolumne River Basin itself - has the prospect of satisfying a broad range of environmental and economic goals and warrants more detailed analysis.

Organization of BAWSCA's Comments

1. BAWSCA will focus on the regional picture. Individual agencies will provide specific information on water use within their service areas, including current and planned-for conservation and development of alternate sources; projected growth in population, jobs, and water use; and the impact of curtailed water deliveries during drought in their communities.

2. BAWSCA comments will be separated into two sections. Section One will address three broad themes, while Section Two will contain detailed comments to correct, clarify, or expand the treatment of specific issues on a section-by-section basis.

Main Themes in BAWSCA's Comments

1. It is urgent to complete the rehabilitation of the regional system as soon as possible.

   The draft PEIR is surprisingly thin on the basic reason for the WSIP: to protect public health and safety and the economic well-being for 2.5 million existing residents and over 31,000 businesses in the counties of Alameda, Santa Clara, San Mateo and San Francisco. BAWSCA will review the Bay Area's exposure to seismic hazards, the USGS estimated probability of a major earthquake by 2030, the regional water system's heightened risks (key facilities directly on or over faults, old, history of poor maintenance) the SFPUC's forecast of facilities likely to fail in a major earthquake, and the public health, safety and economic consequences of an extended (30-60 day) lack of water to the metropolitan area.

2. Most alternatives to the WSIP discussed in the PEIR have serious defects.

   - No Project. With this alternative, the metropolitan area remains at risk of the system's catastrophic failure in an earthquake, as well as more of frequent outages due to failures of aging components.

   - No More Water for Wholesale Customers. The draft PEIR states that this alternative is intended to limit growth in the BAWSCA service area and thereby avoid the environmental impacts associated with growth (traffic, air pollution, etc.). The BAWSCA response will be twofold. First, this tactic is not likely to succeed in achieving its goal, since BAWSCA agencies may secure water from other sources (with their own environmental consequences) or add people and jobs as contemplated in their general plans without additional water supplies. Second, if growth in the BAWSCA service area is prevented or delayed in this manner, the environmental consequences would be worse. Growth would simply be deflected to the periphery of the Bay Area or into the Central Valley -- with more severe impacts on air quality, carbon emissions, and water use. "Smart growth" of the kind now encouraged by communities in the already urbanized Bay Area core (i.e., the BAWSCA service area) is environmentally preferable to diffuse growth on agricultural lands at the fringes of the region or even beyond.

- Aggressive Conservation and Recycling. The draft PEIR recognizes that it is not feasible to meet all of the region's projected growth in demand through 2030 solely from intensified conservation, building more recycled water plants, and pumping more groundwater within the BAWSCA service area. It also recognizes the environmental impacts of such a strategy. One such impact that deserves further attention is the impact that "hardening" demand through conservation has on a community's ability to further reduce water use during a drought. The draft recognizes that this alternative would require more severe (25% systemwide) rationing during droughts and that this would occur much more often. BAWSCA will address the environmental and economic harm that a 25% systemwide reduction would have and recommend that the final PEIR clarify how a 25% system-wide reduction would be applied to San Francisco retail customers as compared to wholesale customer agencies. The comments will also explain why a goal of 10% maximum systemwide rationing (included in the draft PEIR as a "variant") is economically and environmentally preferable.

3. The "Environmentally Superior Alternative" holds promise and should be more thoroughly analyzed in the final PEIR.

This alternative assumes a more realistic goal of achieving an additional 5 mgd in water conservation or recycling in BAWSCA service area by 2030. The centerpiece of this alternative is for Bay Area communities to support water efficiency initiatives in the agricultural areas adjacent to the Tuolumne River itself – specifically Modesto Irrigation District (MID) and Turlock Irrigation District (TID). MID and TID together divert about 50% of the average flow of the river at New Don Pedro, whereas San Francisco and BAWSCA combined use is only about 12%. (And even the additional demand forecast for 2030 represents only a 1.6% increase in total Tuolumne River diversions.) 17

BAWSCA, with the assistance of experts in agricultural irrigation and natural resource economics, has identified opportunities for saving considerable amounts of water in the MID/TID area at considerably less cost than comparable efforts in the Bay Area, where major investments in water efficiency have already been made. In fact, it may be possible to support water efficiency measures in the MID/TID service areas that would more than offset incremental San Francisco diversions necessary to meet gradually increasing Bay Area demand. These additional savings could then be committed to provide water at the times and in the quantities most beneficial for salmon in the lower Tuolumne River. The alternative could be further improved by the new water agreement

allowing BAWSCA agencies to freely exchange water entitlements among themselves. This alternative offers the prospect of (1) allowing Bay Area communities continued access to high quality drinking water, (2) not only maintaining, but increasing, flows in the lower Tuolumne River, and (3) supporting growers in their efforts to keep prime agricultural land in production. 17 cont.

CONCLUSION

We look forward to reviewing these points with the board, answering questions and providing further background to our proposal that BAWSCA endorse the Environmentally Superior Alternative.

RECEIVED
OCT 03 2007
CITY & COUNTY OF S.F.
PLANNING DEPARTMENT
M E A

Dear Mr Maltzer,

I am writing on behalf of Greenpeace to express our concern with the current plan as laid out by the SFPUC to divert an additional 25 million gallons of water from the Tuolumne River every day. The SFPUC already diverts one third of the River's water. In total we divert 60% of the Tuolumne's water for urban and rural usage. Diverting more of the water will have a serious impact on wildlife, the surrounding ecosystems and the Bay Area Delta that relies on the Tuolumne for freshwater. 01

The modeling used to determine the anticipated increase in water demand by the Draft Program Environmental Impact Report (PEIR) is flawed thus inflating projected future needs. 02 Additionally the PEIR fails to properly identify and address all of the impacts of taking more water from the Tuolumne River due to the fact that it lacks an adequate and current baseline study of the Upper Tuolumne River. 03 The PEIR also fails to address the impact climate change will have on precipitation in the Tuolumne River basin. Additional studies should be undertaken before finalizing the PEIR. 04

Conservation and environmental awareness are values that the Bay Area prizes. However when it comes to water usage we are not doing enough. Metropolitan areas such as Seattle and Los Angeles have managed to reduce their water demand in the face of growth. The draft PEIR identifies conservation measures and Greenpeace supports those measures. Conservation, efficiency and recycling are the best way to provide for the needs of the Bay Area in a sustainable manner while protecting this vital resource and a California treasure from further diversions. 05

Re: Draft Program Environmental Impact Report, WSIP

Dear Mr. Malzer:

I am writing to you as Conservation Chairperson on behalf of the Golden West Women Flyfishers, a 25 year old angling club with a long history of supporting conservation, environmental and educational efforts. We have approximately 125 members in Northern California. Please accept these comments for the record on the Draft Program EIR.

We strongly object to the increased diversions from the Tuolumne River which is enduring more than a 60% diversion rate since it would put this wonderful fishery at great risk. I have personally fished many sections of the river, from the Poopenaut Valley to the area above the Don Pedro Reservior as well as the lower Tuolumne. 01

We are currently working hard to restore and protect the threatened Central Valley Steelhead which reside below La Grange dam and also to provide adequate flows for the Fall Run Chinook salmon which are at an extremely low population level due to low water flows. To divert more water out of this beleagered river, which is designated as Wild and Scenic, would do great harm to these fish. 02

We urge reassessment of water needs in the future and consideration of increased water conservation and efficiency of usage.

Thank you for your consideration,

Cindy Charles
Conservation Chair

Paul Maltzer, Environmental Review Officer
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103

Dear Mr. Maltzer:

Many of our members and supporters are frequent visitors to both the Tuolumne River and the great City of San Francisco. We are concerned that your environmental review of the San Francisco Public Utilities Commission's plan to take more water from the Tuolumne River fails to adequately identify and address all of the environmental impacts to the River. We urge you to undertake additional studies before finalizing this document. 01

We support the alternatives identified in your draft document that protect the Tuolumne River from new diversions. Requiring more water conservation, efficiency, and recycling is the best way to lessen impacts on the Tuolumne River while promoting a sustainable water plan for the Bay Area. 02

Only by ensuring that healthy amounts of water continue to flow into the Tuolumne River can we protect this irreplaceable natural treasure.

Sincerely,

/s/ Joseph Vaile

Re: Draft Program EIR for the San Francisco Public Utilities System Water System Improvement Program

Dear Mr. Maltzer:

We are writing in response to the Draft Environmental Impact Report ("DEIR") for the proposed San Francisco Public Utility Commission ("SFPUC") Water System Improvement Program ("WSIP"). We represent Menlo Business Park LLC, owner of a business park in Menlo Park, California, which likely will be affected by the construction activities that are planned as part of the Bay Division Pipeline Reliability Upgrade Project (the "Project") portion of the WSIP. Project impacts of particular concern include traffic, parking, and public safety. It is our understanding that the SFPUC will address these issues in project-level environmental review and we are submitting comments to the Project EIR team under separate cover. We want to share these concerns with the Program EIR team as well in the event the SFPUC elects to include analyses or mitigation in the WSIP EIR. 01

Background

Menlo Business Park LLC ("MBP") is the owner of Menlo Business Park, a 50-acre/15 building complex located east of the 101 Freeway in the City of Menlo Park, California (see attached map). MBP provides high quality, modern industrial and research and development facilities in a planned campus environment with landscaping, on-site parking, and very high standards of tenant service. Current tenants include Boise-Cascade (Office Max), United Parcel Service, PPD Discovery, DepoMed and a variety of high technology and biotech firms. The property has also served as corporate headquarters for two of the Peninsula's success stories, Cisco Systems, which outgrew the MBP facility and Guidant, which was purchased by Johnson & Johnson. 02

In 1983, the predecessor of MBP, Dumbarton Distribution Center, purchased from the City and County of San Francisco ("CCSF") multiple easements on CCSF land directly adjacent to the business park. MBP and its tenants use these easements for, among other things, parking, ingress, egress, and landscaping. It is our understanding that the Bay Division Pipeline Reliability Upgrade Project will involve excavating and installing a new water transmission pipeline in the easement area. The goal of MBP is to avoid or minimize any adverse Project-related impacts to MBP or its tenants.

DLA PIPER

Comments

MBP understands that the nature of a "program" EIR on a project program of this scale is inherently general, and we wish to bring to your attention specific concerns of MBP related to the Bay Division Pipeline Reliability Upgrade Project that are not addressed in the WSIP DEIR. We ask that the SFPUC address these issues in the "project-level" environmental review. Specifically we are concerned about: (1) the disruption of traffic circulation and pedestrian access at and in the vicinity of Menlo Business Park, (2) the displacement of parking at Menlo Business Park and street parking in the vicinity of Menlo Business Park, and (3) the logistics of returning the construction work areas at Menlo Business Park to pre-Project conditions. 03
