F_NPS-YOS-02 The commenter expresses concern that the WSIP could make archaeological resources within Yosemite Park boundaries vulnerable to damage by "pot hunters." The WSIP does not include the construction of facilities within park boundaries and consequently would not result in damage to archaeological resources related to construction activities. The WSIP could make archaeological resources within the inundation areas of the SFPUC's reservoirs more vulnerable to damage by pot hunters if the WSIP resulted in reservoir drawdowns greater than those that occur under the existing condition, in which case portions of the inundation areas that are currently inaccessible could become accessible to pot hunters.

Two of the SFPUC's reservoirs, Lake Eleanor and Hetch Hetchy Reservoir, lie within Yosemite National Park. As noted in the Draft PEIR (Vol. 3, Chapter 5, p. 5.3.1-30), the WSIP would have essentially no effect on storage and water levels in Lake Eleanor. Consequently, archaeological resources in the Lake Eleanor inundation area would be no more vulnerable to damage under the WSIP than they are under the existing condition.

The Draft PEIR (Vol. 3, Chapter 5, pp. 5.3.1-21 to 5.3.1-24) describes the existing and with-WSIP operations of Hetch Hetchy Reservoir. As shown in Figure 5.3.1-9 (p. 5.3.1-23), storage and water levels in Hetch Hetchy Reservoir fluctuate annually under the existing condition. Storage is typically at its maximum of 360,400 acre-feet in late June or early July, when Hetch Hetchy Reservoir is usually full. The maximum storage level corresponds with a water surface elevation of 3,806 feet above mean sea level. Storage and water levels drop gradually until snowmelt begins in the following April or May. Under most conditions, storage in the reservoir does not fall below 150,000 acre-feet, which corresponds with a water surface elevation of 3,684 feet above mean sea level. The same pattern of filling in the snowmelt period and drawdown for the rest of the year would continue with the WSIP. As under existing conditions, the water level in the reservoir with the WSIP would rarely fall below the elevation of 3,684 feet above mean sea level. Thus, under most conditions, archaeological resources in the Hetch Hetchy Reservoir inundation area would be no more vulnerable to damage with the WSIP than they are under the existing condition. Annual reservoir drawdown would be greater with the WSIP than under the existing condition because of the expected increase in water demand by 2030, but the annual drawdown would not typically expose areas otherwise inaccessible to pot hunters.

As noted in the Draft PEIR (Vol. 3, Chapter 5, p. 5.3.1-24), Hetch Hetchy Reservoir is drawn down to a very low level occasionally under the existing condition. Occasional drawdowns could be even greater with the WSIP. Under the existing condition, the water level could be drawn down to an elevation of 3,573 feet above sea level once in the 82-year hydrologic record. With the WSIP, it could be drawn down to an elevation of 3,562 feet above sea level. Thus, on rare occasions, a portion of the inundation area not accessible to pot hunters under the existing condition would be available to them with the WSIP.

The SFPUC and Yosemite National Park have for many years cooperated to protect water quality and other natural resources in the Hetch Hetchy watershed. Cooperative actions are defined in the Hetch Hetchy Watershed Protection Agreement signed by both parties in 2005. Under the terms of the agreement, NPS staff from the Hetch Hetchy Entrance Station patrol the reservoir perimeter and tributaries within one mile of the reservoir to prevent activities that might contaminate the reservoir water as well as other unauthorized or illegal activities, which would include prevention of pot hunting.

The Hetch Hetchy Watershed Protection Agreement expires in June 2010, and a new five-year agreement would likely be negotiated. The SFPUC and the NPS may choose to specifically mention patrolling to prevent pot hunting in the new agreement.

U.S. Bureau of Reclamation, Richard J. Woodley, Regional Resources Manager, 1106/07

F_USBR-01 This comment addresses concerns that the Draft PEIR does not adequately address the potential indirect effects of the WSIP on the Central Valley Project (CVP) operated by the U.S. Bureau of Reclamation and the State Water Project (SWP) operated by the Department of Water Resources (DWR) or, in turn, the indirect effects on fisheries, water quality, and/or water users served by the CVP and SWP. Please refer to **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14) for additional discussion of the WSIP's effects on the San Joaquin River and the Delta analyzed in the PEIR.

WSIP impacts on flow along the San Joaquin River and Delta region are analyzed in the Draft PEIR under Impact 5.3.1-5: Effects on Flow along the San Joaquin River and the Sacramento–San Joaquin Delta (Vol. 3, Chapter 5, pp. 5.3.1-38 and 5.3.3-39). Related effects on water quality are analyzed under Impact 5.3.3-2: Effects on Water Quality along the San Joaquin River and Sacramento–San Joaquin Delta (Vol. 3, Chapter 5, pp. 5.3.3-19 and 5.3.1-20). Indirect impacts on fisheries and aquatic resources are analyzed under Impact 5.3.6-5: Effects on Fishery Resources along the San Joaquin River (Vol. 3, Chapter 5, pp. 5.3.6-32 to 5.3.6-37). With respect to adverse effects on San Joaquin River and Delta water users, including impacts on SWP and CVP operations, see the discussion under Impact 5.3.4-1: Effects on Tuolumne River, San Joaquin River, and Stanislaus River Water Users, and Impact 5.3.4-2: Effects on Delta Water Users (Vol. 3, Chapter 5, pp. 5.3.4-5 to 5.3.4-11).

F_USBR-02 Refer to **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14, Section 14.8.3) for additional discussion of potential effects on CVP and SWP operations.

F_USBR-03 Refer to Draft PEIR Impact 5.3.4-2 (Vol. 3, Chapter 5, pp. 5.3.4-9 to 5.3.4-11), and **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14, Section 14.8.3), for discussions of potential effects on SWP and CVP operations.

F_USBR-04 This comment states that the Draft PEIR does not apply the informal significance standards for impacts related to water supplies to WSIP-related impacts on the San Joaquin River and the Delta. Please refer to **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14, Section 14.8.3) for pertinent response to this comment.

F_USBR-05 This comment restates the previous comment. Refer to **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14, Section 14.8.3).

F_USBR-06 Refer to **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14).

U.S. Department of Agriculture, Tom Quinn, Forest Supervisor, 10/03/07

F_USDAFS-01 The Draft PEIR (Vol. 1, Chapter 3, Section 3.6, pp. 3-33 to 3-39) describes the increased diversion of water from the Tuolumne River that would occur with the WSIP. The Draft PEIR (Vol. 3, Chapter 5, pp. 5.3.1-1 to 5.3.1-40) provides a comprehensive analysis of the impacts of the WSIP on stream flow in the Tuolumne River and water levels in the SFPUC's reservoirs.

F_USDAFS-02 The impacts of WSIP-induced changes in stream flow and reservoir water levels on biological resources are described in the Draft PEIR in Section 5.3.6 (Fisheries) and Section 5.3.7 (Terrestrial Biological Resources).

F_USDAFS-03 As noted in the Draft PEIR (Vol. 3, Chapter 5, p. 5.3.1-29), the WSIP would have almost no effect on water levels in Lake Lloyd and flows in Cherry Creek below Lake Lloyd. Consequently, it would have no effect on recreational users of Lake Lloyd and Cherry Creek. (Please also see Vol. 3, Chapter 5, pp. 5.3.8-23 and 5.3.8-24.)

The commenter notes that, "Effects are projected on recreation due to a decrease in rafting flows." The effects of the WSIP on rafting flows are described in the Draft PEIR (Vol. 3, Chapter 5, pp. 5.3.8-27 to 5.3.8-32). The effects of the WSIP on the availability of water for river rafting would be minor and were determined to be less than significant.

F_USDAFS-04 The Draft PEIR used available data to characterize the baseline or existing condition. The San Francisco Planning Department has concluded that the existing data are sufficient to make a reasonable assessment of environmental consequences. CEQA Guidelines Section 15151 notes that an "evaluation of environmental effects of a proposed project need not be exhaustive."

The program effects on the Tuolumne River ecosystem would be the consequence of changes in flow attributable to the WSIP. As indicated in the Draft PEIR (Vol. 3, Chapter 5, p. 5.3.1-25), under the existing condition only the minimum required releases are made from O'Shaughnessy Dam in 837 months of the 987-month hydrologic record, or in about 84 percent of the total months. The WSIP would have no effect on river flow in these months and thus would have no effect on the river ecosystem. The primary effect of the WSIP would be to shorten (for a few days) the period during which flows in excess of the minimum required are released from O'Shaughnessy Dam. The analysis in the Draft PEIR concluded that existing data on the river below O'Shaughnessy Dam were sufficient to determine that WSIP-induced flow changes would have a less-than-significant effect on resident fish and a potentially significant effect on biological resources in the streamside meadow in the Poopenaut Valley. The flow changes might also affect riparian vegetation elsewhere in the reach of the river between Hetch Hetchy and Don Pedro Reservoirs, but any effects would diminish in a downstream direction as tributaries enter the main stem of the river and flow is returned to the river at Early Intake. A proposed mitigation measure calling for managed releases (Measure 5.3.7-2) would reduce the impacts on biological resources in the Poopenaut Valley meadow to a less-than-significant level (Chapter 6, pp. 6-49 and 6-50). The mitigation measure would also lessen the effects on riparian vegetation elsewhere in the reach of the river between Hetch Hetchy and Don Pedro Reservoirs. For additional information regarding potential impacts along the upper Tuolumne River, please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14).

F_USDAFS-05 The San Francisco Planning Department invited comments from the Stanislaus National Forest on the Draft PEIR through direct mailings of notices and CEQA documentation, including the Notice of Preparation in September 2005 and the Draft PEIR in June 2007. In addition to notifications directly associated with the WSIP, in August 2005 the SFPUC established the Tuolumne River Stakeholders Group, which includes the U.S. Forest Service, to coordinate SFPUC efforts within the Tuolumne River watershed. The SFPUC met with this group in October and December 2005, April and October 2006, March and November 2007, and March 2008.

In addition, the Planning Department's Major Environmental Analysis Division and the SFPUC held several public outreach efforts to inform the general public, regulatory agencies, and special interest groups in all counties potentially affected by the proposed program. Public outreach efforts included four informational meetings during the earlier part of the environmental review process; notification of the public hearings in local newspapers; five public scoping meetings following release of the Notice of Preparation; and six public hearings following the release of the Draft PEIR. Public comments on the Draft PEIR were accepted from June 29, 2007 through October 15, 2007. However, public comments on the Draft PEIR received through December 31, 2007 were addressed in the Comments and Responses document; comments received after December 31, 2007 were included in Appendix M (Vol.8). Further, the SFPUC has dedicated a webpage to the WSIP PEIR that has been continually updated to inform the public of progress and upcoming hearings.

The Draft PEIR describes the resources within the Stanislaus National Forest between Hetch Hetchy and Don Pedro Reservoirs that could be affected by the WSIP in Vol. 3, Chapter 5, Section 5.3. The locations of Stanislaus National Forest resources are shown in the Draft PEIR on Figure 5.2-1 (Vol. 3, Chapter 5, p. 5.2-9) and Figure 5.3.1-1a (Vol. 3, Chapter 5, p. 5.3.1-3). The

Draft PEIR also includes a summary of the Raker Act requirements in Vol. 1, Chapter 2, pp. 2-33 and 2-34, and it is acknowledged that the Raker Act provides regulatory authority to the U.S. Department of Agriculture for the protection of lands in the Stanislaus National Forest. The SFPUC would welcome an opportunity to meet with the Stanislaus National Forest to discuss concerns regarding the WSIP.

F_USDAFS-06 The public comment period on the Draft PEIR lasted for 108 days, from June 29, 2007 through October 15, 2007. In addition, six public hearings were held during this period to receive oral comments on the Draft PEIR, including a meeting in Sonora on September 5, 2007. The San Francisco Planning Department has determined that this extended public review provided ample time for agencies and the public to review and comment on the Draft PEIR. As stated in **Response F_USDAFS-05**, the SFPUC would welcome an opportunity to meet with the Stanislaus National Forest to discuss concerns regarding the WSIP.

The Stanislaus National Forest will be included on the mailing list for the Comments and Responses document.

F_USDAFS-07 The comment expressing the opinion of the Stanislaus National Forest is acknowledged. The commenter expressed support of an alternative “which does not divert additional water which would affect the Stanislaus National Forest.” As described in Vol. 3, Chapter 5, Section 5.3, the Draft PEIR determined that impacts of the proposed program on resources along the Tuolumne River within the Stanislaus National Forest would be less than significant. For information on alternatives that do not include additional diversions from the Tuolumne River, refer to the descriptions of the Year-round Desalination at Oceanside Alternative (Vol. 4, Chapter 9, Section 9.2.4), and Aggressive Conservation/Water Recycling and Local Groundwater Alternative (Without Tuolumne River Supplement) (Vol. 4, Chapter 9, Section 9.2.6). The SFPUC will consider the Final PEIR before making a decision on the proposed program.

U.S. Fish and Wildlife Service, San Francisco Bay National Wildlife Refuge Complex, G. Mendel Stewart, Manager, 09/26/07

F_USFWS-01 This comment introduces concerns with the Bay Division Pipeline Reliability Upgrade project (BD-1) that are more specifically stated in Comments F_USFWS-02 through F_USFWS-04; please refer to **Response F_USFWS-02** regarding issues related to Bay Division Pipelines (BDPL) Nos. 1 and 2. The commenter's specific concerns with the BDPL Reliability Upgrade project will be addressed in the project-level CEQA analysis for that project. The Draft PEIR includes program mitigation measures that have been identified to minimize program-level, construction-related impacts on biological resources. During the project-level CEQA analysis, the programmatic mitigation measures will be reevaluated, and if applicable, will be either confirmed, refined, or replaced with an equivalent measure. In addition, SFPUC Construction Measure #8 (Vol. 4, Chapter 6, p. 6-5) and Mitigation Measure 4.6-3a (Vol. 4, Chapter 6, p. 6-12) require site-specific biological surveys to identify areas of potential impact on wildlife and habitat. Also refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2) for additional discussion of the issues raised by this comment. This master response provides a discussion of the appropriate level of detail of an impact analysis at the program level versus the project level.

F_USFWS-02 The commenter is concerned that noise, vibration, and human disturbance during construction and operation would have an adverse impact on wildlife. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2) for detailed discussion of the issues raised by this comment. This master response provides information on the appropriate level of detail of an impact analysis at the program level versus the project level. The commenter's specific concerns with the BDPL Reliability Upgrade project (BD-1) will be addressed in the project-level CEQA analysis for that project. Table 6.1 (Vol. 4, Chapter 6, p. 6-14) lists programmatic mitigation measures for special-status species that will be applied to the BDPL Reliability Upgrade project as appropriate, including measures for raptors, California clapper rail, snowy plover, salt marsh harvest mouse, vernal pool invertebrates, California red-legged frog, California tiger salamander, and western burrowing owl. These measures will ensure that construction does not result in significant impacts on special-status species, even though construction may occur during sensitive breeding and nesting periods; as part of the project-level environmental review, these programmatic mitigation measures will be reevaluated and refined as necessary to address site-specific project details to further ensure that potential construction impacts on special-status species would be reduced to less-than–

significant levels. Surveys required under Mitigation Measure 4.6-3a (Vol. 4, Chapter 6, p. 6-12) will refine the list of species that could be affected by each WSIP project, and additional protection, avoidance, minimization, and compensation measures could be added.

It should be noted that the segments of BDPL Nos. 1 and 2 traversing the wildlife refuge would remain in place under the WSIP, since the BDPL Reliability Upgrade project (BD-1) would involve construction of an underground tunnel in this area. BDPL Nos. 1 and 2 may be decommissioned and abandoned in-place, but this determination would be made only after the BD-1 tunnel has been inspected and the warranty has expired (the warranty period could be one to five years). Alternatively, the SFPUC is considering maintaining the transbay sections of BDPL Nos. 1 and 2 (i.e., between Newark and Ravenswood) and associated facilities for potential future use in emergencies or during maintenance of the new tunnel proposed under the BDPL Reliability Upgrade project. Potential impacts on sensitive biological resources in the vicinity of tunnel portals and aboveground segments of BDPL Nos. 1 and 2 across the bay will be evaluated in the project-level EIR.

F_USFWS-03 The commenter is concerned about access issues during the construction and operation phase and consequent impacts on wetlands in the Don Edwards San Francisco Bay National Wildlife Refuge. Please refer to **Response F_USFWS-02** regarding SFPUC plans for the segments of BDPL Nos. 1 and 2 that traverse the wildlife refuge. Since this section of the BDPL Reliability Upgrade project (BD-1) would be an underground tunnel, potential impacts on wetlands would be limited to the tunnel shaft vicinities. As indicated in Draft PEIR Impact 4.6-1 (Vol. 2, Chapter 4, p. 4.6-48), the BD-1 pipeline could affect degraded saline emergent wetland habitat near the valve lots at the edge of San Francisco Bay, especially at the Newark Valve Lot where the staging area would be located for the tunnel segment of the pipeline. The tunnel shaft area would be accessed via a new roadway (about one-quarter mile long) that would extend between the shaft site and Willow Drive to the east. The tunnel shaft site would be located about 500 feet east of the point where BDPL Nos. 1 and 2 emerge and would extend westward above ground. With respect to the Ravenswood tunnel shaft, there is already an access road to the Ravenswood Valve Lot that connects with University Avenue in East Palo Alto. Paved parking areas could be added in this area to accommodate tunnel-related construction equipment.

The BDPL Reliability Upgrade project's potential impacts on wetlands are identified as potentially significant, but the Draft PEIR concludes that these impacts could be mitigated to a less-than-significant level with implementation of several mitigation measures. Please also refer to SFPUC Construction Measure #3 (Vol. 4, Chapter 6, p. 6-4), which calls for preservation of existing vegetation, use of wind erosion control measures, stabilization of site ingress and egress locations to minimize erosion, and measures to minimize fugitive dust emissions. SFPUC Construction Measure #8 and Mitigation Measure 4.6-3a (Vol. 4, Chapter 6, pp. 6-7 and 6-12) also call for surveys, documentation, protection, avoidance, minimization, restoration, and compensation for impacts on sensitive habitats and those that support special-status species. Mitigation Measures 4.6-1a and 4.6-1b (Vol. 4, Chapter 6, pp. 6-11 and 6-12) identify further specific measures to avoid, minimize, and compensate for impacts on wetlands. The potential impacts on special-status species during construction and maintenance activities would be avoided or minimized through implementation of the programmatic biological resource mitigation measures outlined in Table 6.2 (Vol. 4, Chapter 6, p. 6-16), and through consultation with the CDFG and USFWS in accordance with permit requirements. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Sections 14.4.2 and 14.4.3) for additional discussion of the issues raised by this comment.

F_USFWS-04 Refer to **Response F_USFWS-02** regarding SFPUC plans for the segments of BDPL Nos. 1 and 2 that traverse the wildlife refuge. The commenter's request to remove the existing BDPL Nos. 1 and 2 to avoid potential impacts associated with leaving these pipelines in place is acknowledged.

F_USFWS-05 Table 4.17-3 (Vol. 2, Chapter 4, p. 4.17-16) lists the Dumbarton Rail Corridor Project as a cumulative project that would be built during the same time period as construction of the BDPL Reliability Upgrade project (BD-1) (approximately between 2008 and 2010). Potential cumulative impacts cited in Table 4.17-3 include impacts on sensitive habitats and species. Section 4.17 (Vol. 2, Chapter 4, pp. 4.17-51 and 4.17-52) also identifies cumulative bioregional impacts related to the loss of sensitive biological resources that could result from the WSIP in conjunction with other proposed projects. Mitigation Measure 4.6-2 (Vol. 4, Chapter 6, p. 6-12) requires that staging areas for the WSIP projects be coordinated where possible to minimize habitat loss by making repeated use of staging/construction areas and access roads. The project-level EIR for the BDPL Reliability Upgrade project will also include a project-specific cumulative impact analysis and evaluate whether additional mitigation measures are required.

Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Sections 14.4.2 and 14.4.3) for additional discussion of the issues raised by this comment. This master response provides information on the appropriate level of detail of an impact analysis at the program level versus the project level. Requested coordination of the BDPL Reliability Upgrade project (BD-1) with the San Mateo County Transit District's Dumbarton Rail Corridor Project to minimize the habitat impacts of both projects has been added to Table C.6 (Vol. 5, Appendix C, p. C-26) for consideration in the project-level EIR for the BDPL Reliability Upgrade project.

F_USFWS-06 The USFWS's interest in acquiring clean dredge material generated by the BDPL Reliability Upgrade project (BD-1) for use in the South Bay Salt Pond Restoration Project has been noted in Table C.6 (Vol. 5, Appendix C, p. C-26) for consideration in the project-level EIR for the BDPL Reliability Upgrade project. Please note that Impact 4.6-1 (Vol. 2, Chapter 4, pp. 4.6-48 and 4.6-49) also identifies the potential for temporary impacts on wetlands associated with the placement of spoils, but indicates that potential use of these spoils as part of the restoration effort could result in a long-term beneficial impact.

F_USFWS-07 As discussed in **Response F_USFWS-03**, the SFPUC will coordinate with the USFWS on any project that has the potential to affect listed species, including informal or formal consultation and development of a Biological Opinion, as appropriate, for each WSIP project. The USFWS's recommendation to coordinate with the Sacramento Fish and Wildlife Office for endangered species and to contact the wildlife refuge has been added to Table C.6 (Vol. 5, Appendix C, p. C-26) for consideration in the project-level EIR for the BDPL Reliability Upgrade project (BD-1).

15.2 State Agencies

STATE AGENCIES

STATE AGENCIES THAT SUBMITTED COMMENTS ON THE DRAFT PEIR

Comment Letter Format	Comment Letter ID	Name of Commenter	Title	Organization/ Affiliation	Page

California Department of Transportation, Tom Dumas, Chief of Office for Metropolitan Planning, 07/23/07

S_Caltrans-01 Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.3) for detailed discussion of the issues raised by this comment. Caltrans's interest in determining which WSIP facility projects would encroach on state facilities and in coordinating required environmental studies for any encroachment permits has been noted in Table C.6 of the Draft PEIR (Vol. 5, Appendix C, p. C-26) for consideration in all project-level CEQA review.

Coastal Conservancy, Sam Schuchat, Executive Officer, 10/01/07

S_CC-01 The information regarding the Coastal Conservancy's role in the South Bay Salt Pond Restoration Project and the availability of the Final EIR/EIS for that project is acknowledged. This information, however, does not pertain to the adequacy or accuracy of the Draft PEIR. Also, please refer to **Response S_CC-03** and to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.3) for detailed discussion regarding the SFPUC's coordination efforts with other agencies during project planning.

S_CC-02 The commenter raises concerns similar to those expressed by the U.S. Fish and Wildlife Service regarding the plan to decommission/abandon-in-place the existing Bay Division Pipelines (BDPL) Nos. 1 and 2. Please refer to **Response F_USFWS-02** and **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2).

S_CC-03 The commenter requests that the SFPUC coordinate with the Don Edwards San Francisco Bay National Wildlife Refuge on the South Bay Salt Pond Restoration Project as the BDPL Reliability Upgrade project (BD-1) proceeds. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Sections 14.4.2 and 14.4.3) for detailed discussion of the issues raised by this comment. The Coastal Conservancy's interest in acquiring clean dredge material generated by the BDPL Reliability Upgrade project for use in the South Bay Salt Pond Restoration Project, particularly within the Don Edwards San Francisco Bay National Wildlife Refuge, has been noted in Draft PEIR Table C.6 (Vol. 5, Appendix C, p. C-26) for consideration in the project-level EIR for the BDPL Reliability Upgrade project.

S_CC-04 This comment summarizes the Coastal Conservancy's plans to complete a gap in the San Francisco Bay Trail, which encircles San Francisco Bay and San Pablo Bay. Since BDPL Nos. 1 and 2 would be constructed in the vicinity of the Association of Bay Area Government's (ABAG) Bay Trail project, the commenter requests coordination with the SFPUC as the BDPL Reliability Upgrade project (BD-1) proceeds. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Sections 14.4.2 and 14.4.3) for detailed discussion of the issues raised by this comment. The Coastal Conservancy's request for coordination has been noted in Draft PEIR Table C.6 (Vol. 5, Appendix C, p. C-26) for consideration in the project-level EIR for the BDPL Reliability Upgrade project.

California Department of Fish and Game, W.E. Loudermilk, Regional Manager, 10/01/07

S_CDFG1-01 The Draft PEIR describes the existing institutional agreement associated with releases for the Moccasin Fish Hatchery (Vol. 1, Chapter 2, p. 2-41). Under the agreement between the SFPUC and the California Department of Fish and Game (CDFG), the SFPUC can interrupt water supply to the Moccasin Fish Hatchery at any time to undertake maintenance. The WSIP would not affect or change any terms of this agreement. With implementation of the WSIP, the SFPUC would meet, at a minimum, all current and anticipated legal requirements for the protection of fish and other wildlife habitat, consistent with the WSIP sustainability goal and system performance objectives indicated in Draft PEIR Table 3.2 (Vol. 1, Chapter 3, p. 3-9).

S_CDFG1-02 Implementation of the maintenance program under the WSIP is not projected to result in impacts on the Moccasin Fish Hatchery, as described in **Response S_CDFG-01**. As described in the Draft PEIR (Vol. 4, Chapter 9), alternatives to the WSIP were identified based on their potential to avoid or reduce the identified impacts of the WSIP while attaining most of the program's basic objectives. Since no impact was identified on the Moccasin Fish Hatchery, CEQA does not require the development of an alternative to provide bypass pipelines or other features that would modify the hatchery operations. Neither the proposed WSIP nor any of the identified alternatives would include any structural changes to facilities east of the Oakdale Portal.

California Department of Fish and Game, Charles Armor, Regional Manager, Bay Delta Region, 10/01/07

S_CDFG2-01 The Draft PEIR (Vol. 2, Chapter 4, p. 4.6-32) describes the authority of the California Department of Fish and Game (CDFG) under Fish and Game Code Sections 1600–1607 to develop mitigation measures and enter into streambed alteration agreements (SAAs) with applicants. During project-level planning, environmental review, and implementation of the various WSIP facility improvement projects, the SFPUC will consult with the CDFG, as appropriate, regarding the need for SAAs. The WSIP would include construction of numerous facility improvement projects and would also alter operations of its regional water system to meet the WSIP goals and objectives (Vol. 1, Chapter 3, p. 3-9). The Draft PEIR includes a program-level impact analysis of the facility improvement projects (Vol. 2, Chapter 4, Sections 4.1 through 4.17, pp. 4.1-1 to 4.17-67). The program-level analysis determined that at least 12, and probably more, of the facility improvement projects would require SAAs (Vol. 5, Appendix C, Table C.6, p. C-26). Final identification of the need for SAAs would occur during project-level CEQA analysis. Please also refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14).

The Draft PEIR (Vol. 3, Chapter 5) describes potential impacts on water resources in the Tuolumne River, Alameda Creek, San Mateo Creek, and Pilarcitos Creek watersheds associated with the proposed modifications to water system operations to meet the WSIP goals and objectives. Under the WSIP, the SFPUC would continue operation of water diversions from streams and rivers at the same locations as under existing conditions, and the diversions would occur in accordance with agreements for minimum instream flows where such agreements exist. The SFPUC has reviewed Section 1600 of the Fish and Game Code and has made a preliminary determination that the altered operation of its existing diversions as proposed under the WSIP would not require SAAs for operations associated with Stone Dam and Early Intake Diversion Dam. As part of WSIP implementation, the SFPUC will coordinate with the CDFG to determine appropriate permit requirements for facilities that could affect stream flows or streambeds within the SFPUC's water supply watersheds, including proposed modifications to the Alameda Creek Diversion Dam (ACDD), which will be assessed as part of the Calaveras Dam Replacement project (SV-2) EIR.

S_CDFG2-02 The WSIP would not cause the SFPUC to re-evaluate or revise the 1987 instream flow agreement. However, as described in the Draft PEIR (Vol. 1, Chapter 3, p. 3-83), the SFPUC is currently conducting studies of the Tuolumne River between O'Shaughnessy Dam and Early Intake that may lead to revision of the 1987 agreement. The flows specified in the 1987 instream flow agreement are shown in Table 5.3.1-2 of the Draft PEIR (Vol. 3, Chapter 5, p. 5.3.1-13); the SFPUC currently releases a minimum stream flow from Hetch Hetchy Reservoir in accordance with the 1987 agreement and would continue to do so under the WSIP. At the time of the 1987 agreement, the SFPUC and the U.S. Fish and Wildlife Service (USFWS) agreed that certain supplemental flows might be provided if determined necessary by a subsequent study to enhance conditions for resident trout, but the SFPUC disagreed with the results of the study at that time; the USFWS has not yet made the determination whether and when such flows might be required.

Plans for the SFPUC's current studies were reviewed by the Tuolumne River Stakeholder Group, which includes the CDFG, USFWS, National Park Service, U.S. Forest Service, Tuolumne County, Groveland Community Services District, Bay Area Water Supply and Conservation Agency, Tuolumne River Trust, and recreation and whitewater rafting interests. Studies of stream hydrology and geomorphology are in progress, and two preliminary reports have been published. A study of fish habitat is planned and will include the use of the USFWS's Instream Flow Incremental Methodology or similar method for relating flow and the extent and value of fish habitat.

When the 1987 agreement was executed, the focus of concern was the maintenance of minimum instream flows in the summer for the benefit of resident trout. The agreement did not address streamside meadows, the ecological health of which is probably more influenced by seasonal high flows than seasonal minimum flows. As discussed in the Draft PEIR (Vol. 3, Chapter 5, pp. 5.7-28 to 5.7-31), the summertime release of more water for resident trout would reduce the total amount of water available for release from Hetch Hetchy Reservoir during the spring high-flow period, which could adversely affect streamside meadows.

S_CDFG2-03 The studies described in **Response S_CDFG2-02** will consider the life histories of native resident fish and include an analysis using the Instream Flow Incremental Methodology or similar method for relating flow and the extent and value of fish habitat. The studies will take some years to complete, and limited information (on geomorphology) was available for use in the Draft PEIR. Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14) for more information on the adequacy of existing data to analyze the impacts of the WSIP on fisheries and other biological resources.

The National Park Service is currently carrying out studies of the streamside meadows in the Poopenaut Valley, which will provide better information on special-status species. As described in the Draft PEIR, once data from the studies are available, the information could be used to refine the implementation of Mitigation Measure 5.3.7-2, Controlled Releases to Recharge Groundwater in Streamside Meadows; this biological resources measure calls for monitoring groundwater and vegetation as a means of mitigating potential impacts on riparian resources in the upper Tuolumne River (see Vol. 4, Chapter 6, pp. 6-49 and 6-50). Although the commenter suggests a more robust and comprehensive protocol, the Draft PEIR analysts concluded that groundwater recharge and the resulting vegetation response will be the fundamental metrics for measuring meadow and riparian health, which in turn determines habitat for other elements of the ecosystem. The SFPUC will continue to work with the CDFG, USFWS, National Park Service, and U.S. Forest Service on upper Tuolumne River ecosystem studies.

S_CDFG2-04 Implementation of system operations to meet 2030 purchase requests under the WSIP would result in a reduction in the average total volume of water released from O'Shaughnessy Dam during the spring snowmelt period and a delay of a few days in the initial release. The Draft PEIR concluded that this change in flow pattern could have a significant adverse effect on terrestrial biological resources of the Poopenaut Valley, but that it would have a less-than-significant adverse effect on resident native trout below Hetch Hetchy Reservoir (Vol. 3, Chapter 5, Impact 5.3.7-2, pp. 5.3.7-21 and 5.3.7-22, and Impact 5.3.6-2, pp. 5.3.6-26 to 5.3.6-28). Accordingly, Mitigation Measure 5.3.7-2 (Vol. 4, Chapter 6, pp. 6-49 and 6-50) was specifically designed to lessen or eliminate the potential significant adverse effects of the WSIP on terrestrial biological resources in the Poopenaut Valley. Because the effects of the WSIP on resident native fish were determined to be less than significant, no mitigation measures are proposed to reduce impacts on fish.

The San Francisco Planning Department is required by statute to monitor, or delegate an agency to monitor, any mitigation measures to which the SFPUC commits pursuant to the Planning Department's responsibilities as a lead agency for CEQA compliance (Section 21081.6 of the California Public Resources Code). The primary purpose of CEQA mitigation monitoring is to ensure that mitigation measures are in fact implemented; however, the state's guidelines for tracking CEQA mitigation measures notes that the information gathered in the course of monitoring may help refine or make mitigation measures more effective. Following certification of the Final PEIR, the SFPUC will be required to adopt a mitigation monitoring and reporting program (MMRP) at the same time as it adopts the CEQA findings, prior to approving and adopting the WSIP. The MMRP will have dual purposes: to track mitigation measures in accordance with statutory requirements, and to gather the information necessary to evaluate the effectiveness of Mitigation Measure 5.3.7-2 and refine its implementation if needed.

As noted in **Responses S_CDFG2-02** and **S_CDFG2-03**, the SFPUC has begun a program of study intended to improve understanding of the relationship between flow in the Tuolumne River below O'Shaughnessy Dam and the riverine ecosystem. The studies will include an Instream Flow Incremental Methodology analysis or similar analysis that will determine the availability and quality of native fish habitat under different flow conditions. In planning the fish habitat studies, the SFPUC will continue to work with the Tuolumne River Stakeholder Group, which includes the CDFG. The fish habitat studies will provide information that will enable an assessment of the effects on native fish resulting from the flow shaping and pulse releases that constitute Mitigation Measure 5.3.7-2. Also, data from the studies will be used to determine whether the 1987 instream flow agreement needs to be modified.

In addition to the SFPUC's studies, the National Park Service is conducting groundwater-level and special-status species studies in the Poopenaut Valley. Data from these studies will provide baseline information on ecological conditions in the Poopenaut Valley. As noted in Measure 5.3.7-2, the data from these ongoing studies could be useful in augmenting the baseline data and in refining the implementation of the measure.

The commenter makes reference to Fish and Game Code Section 5937 and the California Endangered Species Act. Operations at Hetch Hetchy Reservoir are currently in compliance with these statutes and would continue to be in compliance under the WSIP.

S_CDFG2-05 Please refer to Section **14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Sections 14.7.3 and 14.7.4) for a discussion of Federal Energy Regulatory Commission (FERC) flow requirements. This comment, which notes that evidence suggests current FERC flow requirements may not be sufficient to protect the Chinook salmon run, is acknowledged. The fact that the CDFG has written to FERC requesting additional flows is also acknowledged.

The commenter opines that the effects of the WSIP and other past, present, and possible future actions on the anadromous fish populations of the Tuolumne River below La Grange Dam are cumulatively significant. The analysis in the Draft PEIR concluded that long-term WSIP-induced flow changes in the Tuolumne River below La Grange Dam could have a significant adverse effect on anadromous fish in that reach of river, and concluded that implementation of Mitigation Measures 5.3.6-4a and 5.3.6-4b would reduce these impacts to a less-than-significant level (Vol. 4, Chapter 6, pp. 6-48 and 6-49). The cumulative analysis in the Draft PEIR assumes that Mitigation Measures 5.3.6-4a and 5.3.6-4b would be effective and would reduce the impacts of the WSIP on anadromous fish to a less-than-significant level. The cumulative analysis in the

Draft PEIR also includes a discussion of the New Don Pedro Project, the 1995 FERC Settlement Agreement (as stated in the comment), and the FERC relicensing scheduled for 2016. With this assumption and in consideration of the FERC agreement, the WSIP's contribution to cumulative impacts would not be cumulatively considerable, as explained in more detail in the Draft PEIR (Vol. 3, Chapter 5, Impact 5.7.2-2, pp. 5.7-33 to 5.7-44).

The commenter provides technical information on the decline of Chinook salmon populations in the Tuolumne River and makes the case that the decline is attributable to limiting factors associated with the Tuolumne River rather than other limiting factors such as ocean harvests and water diversions in the Delta. Information is presented on the relationship between spring flow below La Grange Dam and salmon escapement 2.5 years later. The San Francisco Planning Department acknowledges receipt of the technical information. Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.2) for further discussion of the decline of Chinook salmon.

This same comment also provides technical information on the relationship between water temperature and adult salmon brood year production. The commenter points out that water temperature depends on the temperature and magnitude of releases from La Grange Dam, and that lower water temperatures result in higher salmon production.

The commenter's assertion that the WSIP could cause anadromous fish populations of the Tuolumne River to drop below self-sustaining levels and further reduce the range of the federal threatened Central Valley steelhead is acknowledged. As noted above, the Draft PEIR concluded that long-term WSIP-induced flow changes in the Tuolumne River below La Grange Dam could have a significant adverse effect on anadromous fish in that reach of river if left unmitigated. The analysis in the Draft PEIR indicates that implementation of Mitigation Measures 5.3.6-4a and 5.3.6-4b would reduce these impacts to a less-than-significant level (Vol. 4, Chapter 6, pp. 6-48 and 6-49).

S_CDFG2-06 For the reasons discussed in **Response S_CDFG2-05**, the commenter expressed the preference that the SFPUC obtain additional water from sources other than the Tuolumne River. The comment is acknowledged. It should be noted that the Draft PEIR analyzes impacts based on increased Tuolumne River diversions under 2030 purchase request conditions, and that lower purchase requests (i.e., water demand), smaller increases in diversions, and therefore less severe impacts would be expected in the interim. Refer to Section 13.4, Phased WSIP Variant (Vol. 7, Chapter 13) for additional discussion on this issue. In 2014, when FERC reconsiders the requirements for Project 2299, the SFPUC may need to revise its operations and/or its operational agreements with the licensees in order for

Project 2299 to meet all FERC-ordered requirements. At the same time, if the SFPUC approves the WSIP or any portion/modification of it analyzed in the PEIR, the SFPUC would continue to implement mitigation measures identified in the PEIR, consistent with the CEQA findings and the MMRP.

In addition, as required by CEQA, the Draft PEIR (Vol. 4, Chapter 9) analyzes alternatives that would avoid or substantially lessen the significant adverse effects of the WSIP. The analysis includes two alternatives that would not increase average annual diversions from the Tuolumne River—the Aggressive Conservation/Water Recycling and Local Groundwater Alternative (no supplemental Tuolumne River water) and the Year-round Desalination at Oceanside Alternative—as well as three alternatives that would substantially reduce future increases in diversions from the Tuolumne River—the No Program Alternative, No Purchase Request Increase Alternative, and Aggressive Conservation/Water Recycling and Local Groundwater Alternative (with supplemental Tuolumne River water). Please also refer to **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14), which describes how this alternative would reduce future increases in Tuolumne River diversions compared to the WSIP. As described in Section 11.2 of the Comments and Responses document (Vol. 6, Chapter 11, p. 11-2), the ultimate decision on whether to approve and implement the WSIP or any alternative, portion, or modification of the WSIP will be made by the SFPUC. Also refer to Section 13.4 of this document for additional discussion regarding the Phased WSIP Variant.

S_CDFG2-07 The commenter's reference to the mitigation measure to reduce impacts on fisheries below La Grange Dam is incorrect; the correct reference should be Measure 5.3.6-4a, not Measure 5.4-3a. Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.8) and **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14) for further discussion of Mitigation Measure 5.3.6-4a regarding the avoidance of flow changes below Don Pedro Reservoir through the pursuit of a water transfer agreement that is based on conserved water.

The commenter indicates concern that this mitigation measure could potentially be transferring WSIP impacts to another watershed; however, this is a misinterpretation of the measure. Based on this comment, the text of Mitigation Measure 5.3.6-4a (Vol. 5, Chapter 6, p. 6-48, first sentence) is clarified as follows:

> **Measure 5.3.6-4a:** The SFPUC will pursue a water transfer arrangement with MID/TID and/or other water agencies such that the water acquired is developed through actions that result in reduction of demand on Don Pedro Reservoir as a result of conservation, improved delivery efficiency, inter-agency water transfer <u>of conserved water,</u> or use of an alternative supply such as groundwater.

The SFPUC acknowledges the commenter's request "to implement and mandate enforceable water recycling/conservation strategies or upgrades for its wholesale customers and their constituents who elect not to use feasible water recycling/conservation strategies or upgrades." As described in the Draft PEIR (Vol. 1, Chapter 2, p. 2-43), the SFPUC currently holds individual agreements with its wholesale customers; these agreements provide terms for the rate schedule, operating costs, and supply assurance and also require wholesale customers to employ best efforts to use all sources of water owned or controlled by them. Regarding the SFPUC's authority to require or impose mandatory conservation, the SFPUC does have the regulatory authority to implement conservation programs in the retail customer service area; however the SFPUC's ability to influence the wholesale customers is limited to its contractual agreements with them. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for detailed discussion of this issue. The Modified WSIP Alternative would include increased conservation, recycling, and groundwater use in the wholesale customer service areas. Please refer to **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14) for more information.

S_CDFG2-08 The commenter's reference to the mitigation measure to reduce impacts on fisheries below La Grange Dam is incorrect; the correct reference should be Measure 5.3.6-4b, not Measure 5.4-3b. Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.9) for further discussion of Mitigation Measure 5.3.6-4b regarding fishery habitat enhancement.

S_CDFG2-09 Refer to **Response S_CDFG2-07**, above.

S_CDFG2-10 Refer to **Response S_CDFG2-08** and **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.9) for further discussion of Mitigation Measure 5.3.6-4b regarding the proposed lower Tuolumne River fishery mitigation conclusion.

The San Francisco Planning Department acknowledges the recommendation that the SFPUC coordinate with the National Marine Fisheries Service, USFWS, and CDFG to develop mitigation measures for the lower Tuolumne River fishery.

S_CDFG2-11 The commenter correctly summarizes the Division of Safety of Dams (DSOD) restriction on Calaveras Reservoir in terms of restricted capacity. The commenter also correctly summarizes the proposal under the WSIP to restore the reservoir to its historical operating level prior to DSOD restrictions to enable the SFPUC to meet the WSIP goals and objectives. The commenter then describes the flow releases under the 1997 Memorandum of Understanding to provide habitat for resident trout and other native fish species, and states that current plans regarding fish migration barrier improvements at the BART weir would mean these flows would need to be re-assessed for anadromous steelhead and other stream-dependent native species. Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14) for a detailed discussion of potential future-occurring anadromous steelhead in the Alameda Creek watershed and the release/bypass flows designed to provide sufficient habitat for steelhead life stages. Additionally, refer to the **Response S_CDFG2-15**, below, regarding the revision of mitigation measures to provide habitat for other native stream-dependent species in addition to resident rainbow trout.

The commenter proposes mitigating the effects of the future flow releases by instituting a program of screening as well as bullfrog and non-native centrarchids control to protect California red-legged frog, California tiger salamander, and foothill yellow-legged frog. The San Francisco Planning Department acknowledges this comment. The Draft PEIR (Vol. 2, Chapter 4, p. 4.6-1), however, describes the program-level impacts of the Calaveras Dam Replacement project operations specific to that project in order to explain the nature and magnitude of potential WSIP effects on species and habitats and to frame appropriate broad mitigation strategies where necessary. A more detailed, site-specific impact analysis will be conducted as part of the project-level EIR for the Calaveras Dam Replacement project (SV-2), which will more fully address this concern.

The commenter also suggests that the environmental review for the Calaveras Dam Replacement project (SV-2) should include an assessment of operations to ensure water elevations are sufficient for passage of rainbow trout between Calaveras Reservoir and Arroyo Hondo during critical upstream and downstream migration periods. Under the WSIP, Calaveras Reservoir would be restored to pre-DSOD storage levels and water elevations would typically be increased. This is unlikely to present a passage impediment to migrating resident rainbow trout (adult and juvenile). A more detailed, site-specific impact analysis will be conducted as part of the project-level EIR for the Calaveras Dam Replacement project, which will more fully address this concern.

S_CDFG2-12 This comment consists of a summary of Draft PEIR Mitigation Measures 5.4.5-3a and 5.4.1-2 (Vol. 4, Chapter 6, pp. 6-51 to 6-53). The commenter provides an accurate summary of these measures. As described in Section 13.2 of the Comments and Responses document (Vol. 7, Chapter13, p. 13-3), subsequent to the publication of the Draft PEIR, the SFPUC has modified the project description of the Calaveras Dam Replacement project to include construction of bypass facilities at the ACDD; this has resulted in minor changes to the text of this mitigation measure to acknowledge these proposed project revisions. Please refer to Chapter 16 of the Comments and Responses document (Vol. 7) for the specific changes.

S_CDFG2-13 The commenter's reference to the mitigation measure to reduce impacts on fisheries below the ACDD is incorrect. The correct reference should be Measure 5.4.5-3a, not Measure 5.4.3-3a. This biological resources measure (Vol. 4, Chapter 6, Measure 5.4.5-3a, pp. 6-52 and 6-53) calls for the SFPUC to develop and implement an operational plan to sustain minimum flows in Alameda Creek below the diversion dam. These minimum flows would be established to benefit resident trout. The commenter notes that steelhead could be restored to the watershed above the BART weir in the future, and that the mitigation flows outlined in Measure 5.4.5-3a would need to be reassessed to provide adequate protection for anadromous steelhead and to comply with Fish and Game Code Section 5937. Mitigation Measure 5.4.5-3a would reduce impacts related to resident trout spawning and egg incubation to a less-than-significant level, but is not designed to protect anadromous steelhead or habitat. For a detailed discussion of potential future-occurring steelhead in the upper watershed and protective measures designed to support anadromous steelhead life stages and habitat, please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14).

The commenter also states that an objective of Mitigation Measure 5.4.5-3a should include providing sufficient bypass flows to support populations of California red-legged frog and foothill yellow-legged frog. In response to this comment, Measure 5.4.5-3a (Vol. 4, Chapter 6, p. 6-52, next to last paragraph, first sentence) is revised as follows:

> **Measure 5.4.5-3a:** The SFPUC shall develop and carry out as part of the implementation of the Calaveras Dam Replacement (SV-2) project, an operational plan to implement minimum ~~stream~~ bypass flows when precipitation generates runoff into the creek below the diversion dam to the Calaveras Creek confluence from December 1 through April 30 to support ~~resident trout~~ spawning and egg incubation for resident trout as well as breeding habitat for other native stream-dependent amphibians.

S_CDFG2-14 This comment accurately summarizes Draft PEIR Mitigation Measure 5.4.5-3b (Vol. 4, Chapter 6, p. 6-54). The commenter goes on to suggest additional measures to be incorporated into Measure 5.4.5-3b, including decommissioning and removal of the ACDD, retrofitting the ACDD for fish passage, and adaptation of the measure, if necessary, in response to results of analysis and monitoring.

Measures 5.4.5-3a and 5.4.5-3b are designed to mitigate potential impacts on resident trout due to implementation of the WSIP. Measure 5.4.5-3a includes a detailed monitoring plan and is thus designed to adapt to changing conditions. Measure 5.4.5-3b, which includes modification of ACDD operations, would be implemented if Measure 5.4.5-3a fails to sustain the resident trout population in Alameda Creek below the ACDD. Decommissioning and removal of the ACDD, however, is not proposed as part of either of these mitigation measures because the analysis in the Draft PEIR did not conclude that this would be necessary to mitigate the impacts of the WSIP. The ACDD is an existing structure and part of the existing conditions; as such, it is considered part of the environmental baseline for the WSIP, and mitigation of impacts associated with existing conditions is not required under CEQA. However, as described in Section 13.2 (Vol. 7, Chapter 13), subsequent to publication of the Draft PEIR, the SFPUC has proposed to incorporate modification of the ACDD to provide a new bypass structure needed to implement bypass stream flows as part of the Calaveras Dam Replacement (SV-2) project. For a detailed discussion on proposed project revisions to the Calaveras Dam project, adaptive management, and monitoring and protective measures for fisheries in Alameda Creek, please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14).

The commenter also states that the 10-year monitoring period is too long a time before screening of the diversion tunnels at the ACDD is implemented, and that screening should take place concurrently with the Calaveras Dam Replacement project (SV-2). Comment acknowledged. This impact and the mitigation measure will be reevaluated and refined at a project level of detail as part of the EIR for the Calaveras Dam Replacement project

S_CDFG2-15 Mitigation Measure 5.4.1-2, Diversion Tunnel Operations (Vol. 4, Chapter 6, pp. 6-51 and 6-52) is included in the Draft PEIR as a feasible approach to reducing flow impacts in Alameda Creek below the diversion dam; however, as explained in the Draft PEIR (Vol. 3, Chapter 5, p. 5.4.1-35), this measure could help reduce the impact but would not fully mitigate it. The reestablishment of the diversions from Alameda Creek to Calaveras Reservoir that would occur under the WSIP is necessary to achieve the SFPUC water supply objective, and full mitigation could not be accomplished without foregoing the needed diversions. Therefore, Impact 5.4.1-2 would remain significant and unavoidable even with implementation of Measure 5.4.1-2.

The commenter notes that Mitigation Measure 5.4.5-3a (Vol. 4, Chapter 6, p. 6-52) commits to bypass flows only after December 1, and expresses concern that the release schedule for bypass flows described in Measure 5.4.5-3a will not sufficiently augment surface flows in Alameda Creek due to increased infiltration from depleted groundwater caused by the increased diversions. The commenter recommends further study to determine whether sufficient water will be available for different life stages of fish and aquatic wildlife. As described in the Draft PEIR, Measure 5.4.5-3a includes the requirement for the SFPUC to complete site specific studies to determine flow requirements to support spawning and egg incubation for resident. However, as described above in Response S_CDFG2-13, measure has been revised to address breeding habitat for other native stream-dependent species. In addition, this impact and associated mitigation measure will be reevaluated at a project level of detail during environmental review of the Calaveras Dam Replacement project (SV-2), which may include more detailed mitigation requirements. Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14) for more discussion of adaptive measures regarding bypass flows for fishery resources as well as studies being conducted in Alameda Creek to determine bypass and release flows to support steelhead and resident trout.

In response to this comment, Mitigation Measure 5.4.5-3a has been expanded to address other wildlife species in addition to fish, and the following excerpts from the Draft PEIR are revised as follows:

(Vol. 3, Chapter 5, p. 5.4.6-19, third full paragraph, third sentence):

> Measure 5.4.5-3a, Minimum Flows for Resident Trout on Alameda Creek, calls for developing and implementing an operational plan to provide minimum bypass flows below the diversion dam to support habitat for rainbow trout and other native stream-dependent species from December through April.

(Vol. 4, Chapter 6, p. 6-52, next to last paragraph, first sentence):

> **Measure 5.4.5-3a:** The SFPUC shall develop and carry out as part of the implementation of the Calaveras Dam Replacement (SV-2) project, an operational plan to implement minimum ~~stream~~ bypass flows when precipitation generates runoff into the creek below the diversion dam to the Calaveras Creek confluence from December 1 through April 30 to support ~~resident trout~~ spawning and egg incubation for resident trout as well as breeding habitat for other native stream-dependent amphibians.

(Vol. 4, Chapter 6, p. 6-53, first paragraph, last sentence):

> The operational plan will allow for adapting minimum flow amounts to support resident trout spawning and egg incubation and other native stream-dependent species based on the monitoring results and best available scientific information.

S_CDFG2-16 The commenter accurately notes that under existing conditions, the SFPUC attempts to capture all runoff from the upper San Mateo Creek watershed, and only rarely releases water to the lower San Mateo Creek from Lower Crystal Springs Dam. As noted in the Draft PEIR, releases under the WSIP would continue to be infrequent and would be of about the same magnitude as those occurring under existing conditions (Vol. 3, Chapter 5, p. 5.5.1-14). Because the WSIP would have little or no effect on existing releases to lower San Mateo Creek, it would also have a less-than-significant impact on fisheries and streamside terrestrial biological resources. For this reason, no mitigation measures are proposed in the Draft PEIR to address biological conditions in the lower creek.

The proposed improvements to Lower Crystal Springs Dam are included as one of the WSIP facility improvement projects, and its potential environmental effects are addressed at the program level in the Draft PEIR (Vol. 2, Chapter 4). A project-level CEQA analysis of the Lower Crystal Springs Dam Improvements project (PN-4) is in progress, and potential impacts on San Mateo Creek will be evaluated in more detail as site-specific project information is developed. In addition, various permits from the CDFG and other agencies will be needed before construction can proceed. The CDFG may choose to raise the issue of additional releases of water from Lower Crystal Springs Reservoir in the context of project-level CEQA compliance and permit applications.

The commenter's opinion with respect to the need to protect fish in San Mateo and Pilarcitos Creeks, as well as in Alameda Creek, is acknowledged.

S_CDFG2-17 The commenter requests clarification of fisheries impacts from the Lower Crystal Springs Dam Improvements project (PN-4) through potential hydrological disconnects between habitat units. The comment states that the project could result in passage impediments for *O. mykiss* migrating between the reservoir and tributaries to spawn as well as for out-migrating smolts due to the lack of a defined active channel.

Draft PEIR Section 5.5.5 (Vol. 3, Chapter 5, pp. 5.5.5-1 to 5.5.5-9) and Impact 5.5.5-1 (pp. 5.5.5-6 and 5.5.5-7) discuss impacts on fishery resources due to implementation of WSIP water supply and system operations, and more specifically, the Crystal Springs Dam Improvements project. Based on the hydrologic modeling results presented in the Draft PEIR (Vol. 3, Chapter 5, pp. 5.5.1-14 to 5.5.1-16), it is unlikely that implementation of the WSIP, including the Crystal Springs Dam Improvements project, would result in hydrological disconnects that would impede passage for *O. mykiss* migrating between the reservoir and upstream habitat. In addition, the hydrologic modeling indicated that the average monthly storage in Crystal Springs Reservoir would be greater under proposed WSIP operations than under existing conditions. Increased reservoir storage would provide an increase in the volume of habitat available for resident fish species inhabiting the reservoir, including both warmwater and coldwater fish species. The increase in storage elevation under the WSIP could also provide greater opportunities for connectivity and migration of fish between the reservoir and upstream tributary habitat. As a result of these factors, increased reservoir storage under proposed operations is considered a beneficial impact on fishery resources.

However, model projections show that restoring water storage levels in Crystal Springs Reservoir could cause a potential loss of stream channel and potential spawning area in San Mateo Creek. The Draft PEIR indicates that upstream areas may provide suitable replacement habitat, and this prospect is being evaluated in the project-level CEQA review for the Lower Crystal Springs Dam Improvements project. However, in the absence of site-specific information on the availability and feasibility of replacement habitat, this impact is considered potentially significant and unavoidable at the program level of analysis as a conservative determination in the Draft PEIR.

The Draft PEIR identifies Mitigation Measure 5.5.5-1, Create New Spawning Habitat Above Crystal Springs Reservoir (Vol. 4, Chapter 6, p. 6-62), as a strategy for surveying and creating suitable spawning habitat, but at a programmatic level of analysis, the feasibility of this measure remains unknown and thus the impact is considered potentially significant and unavoidable. This impact and mitigation measure will be evaluated in more detail during the project-level CEQA review for the Lower Crystal Springs Dam Improvements project (PN-4) when more site-specific information and project details are available to identify the nature and magnitude of the impact and to reevaluate the appropriateness and effectiveness of the mitigation measure. Project-level analysis may determine that this impact can be reduced to a less-than-significant level. Refer to Section 14.4, Master Response on PEIR Appropriate Level of Analysis (Vol. 7, Chapter 14, Section 14.4.2) for a discussion regarding the difference between project-level and program-level analysis.

S_CDFG2-18 The WSIP would include the diversion of additional water from Pilarcitos Creek to meet increased water demand in the Coastside County Water District service area. As the commenter correctly notes, the Draft PEIR indicates that the WSIP would have significant adverse impacts on surface water quality, fisheries, and terrestrial biological resources in Pilarcitos Reservoir and along Pilarcitos Creek as a result of increased diversions. To reduce these impacts to a less-than-significant level, the Draft PEIR identified Mitigation Measure 5.5.3-2 (Vol. 4, Chapter 6, p. 6-56). Under Measure 5.5.3-2, the SFPUC would develop an operations plan for the Pilarcitos watershed facilities that would closely resemble operations under existing operations. After completion of the Draft PEIR, the SFPUC attempted to develop the protocols necessary to implement Measure 5.5.3-2, but it became apparent that more practical measures would be preferred and replacement mitigation measures were identified; please refer to Vol. 7, Chapter 13, Section 13.3 for a discussion of the updated and refined analysis of resources in the Pilarcitos watershed and a description of the replacement mitigation measures. The replacement mitigation measures would reduce the impacts of the WSIP in the Pilarcitos Creek watershed to a less-than-significant level, including impacts on San Francisco garter snake and California red-legged frog.

The commenter's opinion with respect to the need for removal or modification of Stone Dam and the restoration of Pilarcitos Creek is acknowledged. However, the purpose of the replacement mitigation measures is to prevent degradation of Pilarcitos Creek and associated resources attributable to the WSIP relative to the existing condition, not to improve the creek relative to the existing condition. The SFPUC is currently participating in the Pilarcitos Creek Restoration Workgroup with the CDFG and other stakeholders to assess existing conditions and develop a strategy for creek restoration (see Vol. 3, Chapter 5, p. 5.2-21), but these activities are independent of the WSIP CEQA process. The CDFG's concurrence with the NMFS recommendations for steelhead restoration in Pilarcitos Creek is acknowledged.

S_CDFG2-19 The San Francisco Planning Department acknowledges receipt of the technical information contained in the appendix to the CDFG letter. The information provides further support of the conclusion in the Draft PEIR that long-term WSIP-induced flow reductions in the Tuolumne River below La Grange Dam could have a significant adverse (but mitigable) impact on anadromous fish. Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14) for discussion of fishery impacts in the lower Tuolumne River.

California State Assembly, Sally Lieber, Assemblywoman, 22nd District, 10/01/07

S_CSA-01 This comment, which expresses an opinion regarding the importance and urgency to rebuild the regional water system's infrastructure, is acknowledged. Please see **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Sections 14.1.2, 14.1.3, and 14.1.4) for an expanded discussion on the overall need for the WSIP and of the potential consequences of not implementing the proposed program.

S_CSA-02 This comment, which expresses concern regarding additional Tuolumne River diversions and requests that additional studies of alternatives that minimize diversions from the Tuolumne River be conducted, is acknowledged. Please refer to **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14) for more discussion and analysis of the environmentally superior alternative. Please also see **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.2) for more information regarding the SFPUC's adherence to the minimum required flows with or without the WSIP.

S_CSA-03 This comment opposing additional diversions from the Tuolumne River and supporting additional conservation is acknowledged. The comment praising BAWSCA and its member agencies for reducing residential usage is also acknowledged. Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) regarding water conservation and recycling projects proposed by the SFPUC in San Francisco and by the SFPUC's wholesale customers in their respective service areas.

S_CSA-04 This comment, which expresses support for agricultural conservation to reduce diversions from the Tuolumne River, is acknowledged. Please refer to **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14) for more discussion of a water transfer agreement based on conserved water to avoid flow changes below Don Pedro Reservoir.

S_CSA-05 This comment, which stresses the immediate need for infrastructure repair of the system, is acknowledged. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Sections 14.1.2 and 14.1.3) for more discussion.

S_CSA-06 This comment expresses support for the environmentally superior alternative and for implementation of the WSIP; comment acknowledged.

California Department of Water Resources, Floodway Protection Section, Christopher Huitt, Staff Environmental Scientist, 07/23/07

S_DWR-01 Based on the information available during preparation of the Draft PEIR, it is uncertain, at a programmatic level of analysis, whether the San Joaquin Pipeline System project (SJ-3) would encroach on a designated floodway for the San Joaquin River or its tributaries, as identified in the State Adopted Plan of Flood Control. However, the Draft PEIR (Vol. 2, Chapter 4, p. 4.5-25) acknowledges that pipeline projects, including the San Joaquin Pipeline System project, would be subject to encroachment permits from the local flood control district or other appropriate local agency. The potential for encroachment of a designated floodway will be analyzed as part of project-level CEQA review for each WSIP project, including a discussion of the encroachment permitting requirements of the Reclamation Board if appropriate. Please refer to **Section 14.4**, **Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Sections 14.4.2 and 14.4.3) for information on the appropriate level of detail of an impact analysis at the program level versus the project level and for information regarding the SFPUC's coordination efforts with other agencies.

Regional Water Quality Control Board, Central Valley Region, Greg Vaughn, Senior Engineer, 10/17/07

S_RWQCBCV-01 This comment requests that the discussion of beneficial uses of surface waters be expanded to indicate that beneficial uses are designated in the State's Water Quality Control Plans for surface waters and ground water basins. In response to this comment, the Draft PEIR is revised as follows:

(Vol. 2, Chapter 4, p. 4.5-9, end of first full paragraph)

> These agencies also implement the Waste Discharge Requirements (WDR) Program, which regulates discharges of waste to land under the California Water Code as well as discharges of waste into waters of the state that are outside federal jurisdiction, as defined under the Clean Water Act.

(Vol. 2., Chapter 4, p. 4.5-9, end of second full paragraph)

> The San Francisco Bay RWQCB adopted its Basin Plan in 1995, and most recently revised the plan in December 2006. ~~November 2004. A general update to the plan was approved by the San Francisco Bay RWQCB in 2005 and by the SWRCB in April 2006. The update is undergoing review by the Office of Administrative Law.~~ The Central Valley RWQCB adopted its Basin Plan in 1998, and most recently revised the plan in October 2007~~September 2004~~.

S_RWQCBCV-02 In response to this comment, the Draft PEIR (Vol. 2, Chapter 4, p. 4.5-9, third paragraph) is revised as follows:

> Beneficial uses ~~of surface waters~~ serve as a basis for establishing water quality objectives and discharge prohibitions to attain ~~beneficial use goals~~ the goal of achieving the highest water quality consistent with the maximum benefit to the people of the state. Beneficial uses are designated in Basin Plans for surface waters and groundwater basins, and in the case of the San Francisco Bay Basin, wetlands. **Table 4.5-1** lists the designated beneficial uses for those water bodies that could be affected by the WSIP. ~~project activities, as defined in the Basin Plans.~~

The Draft PEIR is organized as follows: Vol. 2, Chapter 4 pertains to the environmental setting and impacts associated with the WSIP facility improvement projects, and Vol. 3, Chapter 5 pertains to the environmental setting and impacts associated with the WSIP water supply and system operations. Since the issues related to the Tuolumne River are addressed in Chapter 5, the requested supplemental information on the Tuolumne River and groundwater basin has been added to Vol. 3, Chapter 5. Therefore, in response to this comment, the Draft PEIR (Vol. 3, Chapter 5, p. 5.3.3-1, second full paragraph) is revised as follows:

> The Tuolumne River flows from the crest of the Sierra Nevada westward to its confluence with the San Joaquin River. The San Joaquin River flows north to the Sacramento–San Joaquin Delta. Water from the Delta discharges to the San Francisco Bay Estuary and the Pacific Ocean. The Tuolumne River system and downstream water bodies are shown in Figure 5.1-1. Beneficial uses of the Tuolumne River, as designated in the *Water Quality Control Plan for the Sacramento and San Joaquin River Basins*, include the following:
>
> - Source to (New) Don Pedro Reservoir: Municipal and Domestic Supply (MUN); Agricultural Supply (AGR); Hydropower Generation (POW); Water Contact Recreation (REC-1); Non-water Contact Recreation (REC-2); Warm Freshwater Habitat (WARM); Cold Freshwater Habitat (COLD); and Wildlife Habitat (WILD)
>
> - New Don Pedro Reservoir: MUN (Potential); POW; REC-1; REC-2; WARM; COLD; and WILD
>
> - New Don Pedro Dam to San Joaquin River: MUN (Potential); AGR; REC-1; REC-2; WARM; COLD; Migration of Aquatic Organisms (MIGR); Spawning, Reproduction, and/or Early Development (SPWN); and WILD

The following reference is added to the end of Section 5.3.3 (Vol. 3, Chapter 5, p. 5.3.3-21):

State Water Resources Control Board (SWRCB), California Regional Water Quality Control Board, Central Valley Region, *Water Quality Control Plan (Basin Plan) for the Sacramento and San Joaquin River Basins*, Fourth Edition, Revised October 2007 with approved amendments.

In addition, the following text is added to the Draft PEIR (Vol. 3, Chapter 5, p. 5.3.5-1, end of the second full paragraph):

> The Tuolumne River flows from the crest of the Sierra Nevada westward to its confluence with the San Joaquin River. The San Joaquin River flows north to the Sacramento–San Joaquin Delta. The Tuolumne River system and downstream water bodies are shown in Figure 5.3.1-1. Unless otherwise designated by the California Regional Water Quality Control Board, all groundwaters in the Central Valley region are considered to be suitable or potentially suitable, at a minimum, for municipal and domestic supply, agricultural supply, industrial service supply, and industrial process supply.

S_RWQCBCV-03 In response to this comment regarding state regulation of activities in wetlands, the Draft PEIR is revised as follows:

(Vol. 2, Chapter 4, p. 4.5-12, insert new first paragraph under the heading Construction in Waters of the State and of the United States)

> The Regional Water Quality Control Board (RWQCB) has regulatory authority over construction in waters of the United States and waters of the state, including activities in wetlands, under both the Clean Water Act and the State of California's Porter-Cologne Water Quality Control Act (California Water Code, Division 7). Under the Clean Water Act, the RWQCB has regulatory authority over actions in waters of the United States through the issuance of water quality certifications under Section 401 of the Clean Water Act, which are issued in conjunction with permits issued by the Army Corps of Engineers (Corps) under Section 404 of the Clean Water Act. When the RWQCB issues a Section 401 certification for a project, the project is also regulated under State Water Resources Control Board Order No. 2003-0017-DWQ, "General Waste Discharge Requirements for Dredge and Fill Discharges That Have Received State Water Quality Certification," which requires compliance with all conditions of the water quality certification. Activities in areas that are outside the jurisdiction of the Corps (e.g., isolated wetlands, vernal pools, or stream banks above the ordinary high water mark) are regulated by the RWQCB under the authority of the Porter-Cologne Act. Activities that lie outside of Corps jurisdiction may require the issuance of either individual or general waste discharge permits.

(Vol. 2, Chapter 4, p. 4.6-32, fourth full paragraph)

> The state's authority to regulate activities in wetlands and water at the project sites resides primarily with the ~~State Water Resources Control Board (SWRCB)~~ California Regional Water Quality Control Board (RWQCB), which regulates construction in waters of the United States and waters of the state, including activities in wetlands, under both the Clean Water Act and the State of California's Porter-Cologne Water Quality Control Act. .... The RWQCB ~~SWRCB, acting through the nine Regional Water Quality Control Boards,~~ must certify that a Corps permit action meets state water quality objectives (Section 401, Clean Water Act).

S_RWQCBCV-04 The commenter correctly summarizes the general analysis presented in Impact 4.5-1 (Vol. 2, Chapter 4, pp. 4.5-21 to 4.5-28) regarding water quality degradation due to erosion and sedimentation.

SFPUC Construction Measure #3, described in the Draft PEIR (Vol. 1, Chapter 3, p. 3-80) identifies the *minimum* measures that would be taken to reduce adverse effects related to sedimentation and erosion. The

San Francisco Planning Department and SFPUC acknowledge the recommendation of the commenter to consider scheduling and phasing of construction activities as a feasible and effective best management practice to limit areas and periods of disturbance to the maximum extent practicable and to minimize the area of disturbed soil during the wet season.

S_RWQCBCV-05 The biological impact analysis in the Draft PEIR considers the requirements of the Porter-Cologne Water Quality Control Act. In response to this comment, the Draft PEIR (Vol. 2, Chapter 4, p. 4.6-37, third significance criterion) is revised as follows:

- Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act and as protected under the Porter-Cologne Water Quality Control Act (including but not limited to marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means (Evaluated in this section)

S_RWQCBCV-06 As noted in **Response S_RWQCBCV-03**, the Draft PEIR has been revised to indicate that the RWQCB's authority over wetlands of any type, including areas that are outside of Corps jurisdiction under the Clean Water Act.

In response to this comment, the mitigation measure for wetland impacts is revised as follows:

(Vol. 4, Chapter 6, p. 6-11, Measure 4.6-1b, first paragraph)

> **Measure 4.6-1b:** If the wetland delineation indicates that the WSIP project will affect jurisdictional wetlands or aquatic resources, then, in accordance with state and federal permit requirements, the SFPUC will avoid and minimize direct and indirect impacts such as erosion and sedimentation, alteration of hydrology, and degradation of water quality. As a first priority, the SFPUC will implement (1) avoidance measures. For unavoidable impacts, the SFPUC will implement (2) minimization of unavoidable impacts, (3) restoration procedures, and (4) compensatory creation or enhancement to ensure no net loss of wetland extent or function.

The San Francisco Planning Department and the SFPUC acknowledge that for all impacts on wetlands, the SFPUC will be required to demonstrate to the RWQCB that they have avoided and minimized impacts to the maximum extent practicable before considering compensation measures.

S_RWQCBCV-07 This comment corroborates information presented in a footnote in the Draft PEIR (Vol. 2, Chapter 4, p. 4.6-31), where the current regulatory environment regarding wetlands is discussed.

S_RWQCBCV-08 Section 5.2 of the Draft PEIR (Vol. 3, Chapter 5, p. 5.2-6) includes a brief summary of the Clean Water Act, with the intent of providing an overview of the regulations generally governing the SFPUC's water supply and system operations as they would be affected by the WSIP. Additional description of sections of the Clean Water Act relevant to the construction and operation of the facility improvement projects under the WSIP are provided in the Draft PEIR (Vol. 2, Chapter 4, pp. 4.5-9 to 4.5-17 and pp. 4.6-31 to 4.6-32), including mention of Section 401 of the Clean Water Act.

The following text is added to the Draft PEIR (Vol. 3, Chapter 5, p. 5.2-6, end of the fourth full paragraph) to augment the description of the Clean Water Act:

> Under Section 401 of the Clean Water Act, every applicant for a federal permit for any activity that may affect waters of the state must obtain a water quality certification that the proposed activity will comply with state water quality standards.

S_RWQCBCV-09 The commenter accurately summarizes the analysis presented in Impact 5.3.7-2 (Vol. 3, Chapter 5, pp. 5.3.7-15 to 5.3.7-22) regarding impacts on alluvial features that support meadow and riparian habitat along the Tuolumne River below Hetch Hetchy Reservoir. The commenter also notes the importance of baseline studies to assess the effectiveness of pulse flows per Mitigation Measure 5.3.7-2 (Vol. 4, Chapter 6, p. 6-50). This corroborates the requirements of the mitigation measure, which states that the SFPUC will gather "baseline data regarding the extent, species composition and condition of the existing meadow vegetation…"

S_RWQCBCV-10 Please refer to **Section 4.11, Master Response on Climate Change** (Vol. 7, Chapter 14) for additional discussion of climate change to augment the discussion presented in Section 5.7.6 of the Draft PEIR (Vol. 3, Chapter 5, pp. 5.7-92 to 5.7-96). Section 4.11 provides more detailed and up-to-date information on climate change as it relates to the SFPUC regional water supply and the proposed WSIP.

Regional Water Quality Control Board, San Francisco Bay Region, Keith H. Lichten, Senior Engineer, 10/03/07

S_RWQCBSF-01 Please refer to **Response S_RWQCBCV-01**.

S_RWQCBSF-02 Refer to **Response S_RWQCBCV-02** for a description of Draft PEIR text revisions related to beneficial uses. In addition, in response to this comment, additional information is added to Table 4.5-1 (Vol. 2, Chapter 4, p. 4.5-10) as follows:

TABLE 4.5-1
DESIGNATED BENEFICIAL USES

Water Body	Designated Beneficial Uses
San Joaquin Region	
San Joaquin River	MUN (potential), AGR, IND, MIGR, REC-1, REC-2, WARM, SPWN, WILD
California Aqueduct	MUN, AGR, IND, REC-1, REC-2, WILD
Delta-Mendota Canal	MUN, AGR, REC-1, REC-2, WARM, WILD
Sunol Valley Region	
Alameda Creek	AGR, COLD, GWR, MIGR, REC-1, REC-2, SPWN, WARM, WILD
Arroyo Hondo	COLD, FRSH, MUN, REC-1, REC-2, SPWN, WARM, WILD
Calaveras Reservoir	COLD, MUN, REC-1 (limited), REC-2, SPWN, WARM, WILD
San Antonio Reservoir	COLD, MUN, REC-1 (limited), REC-2, SPWN, WARM, WILD
Niles Cone Groundwater	MUN, PROC, IND, AGR
Bay Division Region	
Guadalupe River	COLD, MIGR (potential), REC-1 (potential), REC-2, SPWN (potential), WARM, WILD
Santa Clara Valley Groundwater	MUN, PROC, IND, AGR (potential)
Peninsula Region	
San Mateo Creek	COLD (potential), FRSH, RARE, REC-1 (potential), REC-2 (potential), SPWN, WILD
Crystal Springs Reservoir	COLD, MUN, RARE, REC-2, SPWN, WARM, WILD
San Andreas Reservoir	COLD, MUN, RARE, REC-1 (limited), REC-2, SPWN, WARM, WILD
San Mateo Plain Groundwater	MUN, PROC, IND, AGR (potential)
San Francisco Region	
Lake Merced	COLD, MUN (potential), REC-1, REC-2, SPWN, WARM, WILD
Westside Groundwater	MUN, PROC (potential), IND (potential), AGR
San Francisco Bay	
San Francisco Bay, Lower	COMM, EST, IND, MIGR, NAV, RARE, REC-1, REC-2, SHELL, SPWN (potential), WILD
San Francisco Bay, South	COMM, EST, IND, MIGR, NAV, RARE, REC-1, REC-2, SHELL, SPWN (potential), WILD

Beneficial Uses Key:

MUN (Municipal and Domestic Supply); AGR (Agriculture); REC-1 (Body Contact Recreation); REC-2 (Noncontact Recreation); WARM (Warm Freshwater Habitat); COLD (Cold Freshwater Habitat); MIGR (Fish Migration); SPWN (Fish Spawning); WILD (Wildlife Habitat); NAV (Navigation); GWR (Groundwater Recharge); FRSH (Freshwater Replenishment); RARE (Preservation of Rare and Endangered Species); SHELL (Shellfish Harvesting); COMM (Ocean, Commercial, and Sport Fishing); EST (Estuarine Habitat); IND (Industrial Service Supply); PROC (Industrial Process).

Note: Beneficial uses for specific wetland sites affected by the WSIP facility improvement projects in the San Francisco Bay region will be determined as needed based on the process described in the San Francisco Bay Basin Plan.

S_RWQCBSF-03 Refer to **Response S_RWQCBCV-03**.

S_RWQCBSF-04 The information regarding the RWQCB's ongoing development of a Municipal Regional Urban Runoff Phase I NPDES Stormwater Permit that will replace the municipal stormwater permits in Alameda, Santa Clara, and San Mateo Counties is acknowledged.

In response to this comment, the Draft PEIR (Vol. 2, Chapter 4, p. 4.5-13, second full paragraph) is revised as follows:

> The C.3 requirements are similar for all counties. However, local municipalities are phasing in these requirements, and specific procedures and application requirements may differ from one municipality to another. Reconstruction projects located within ~~Projects completed in~~ a public street or road right-of-way, such as some pipeline projects proposed as part of the WSIP, are exempt from the C.3 requirements where ~~when~~ both sides of the right-of-way are developed.

S_RWQCBSF-05 Refer to **Response S_RWQCBCV-04**.

S_RWQCBSF-06 The commenter correctly summarizes the analysis in Impact 4.5-2 (Vol. 2, Chapter 4, p. 4.5-29) and the associated Mitigation Measure 4.5-2 (Vol. 4, Chapter 6, pp. 6-9 and 6-10) regarding the depletion of groundwater resources. The commenter also notes the potential relationship between Impact 4.5-2 and wetland habitat.

The commenter states that Mitigation Measure 4.6-1a (Vol. 4, Chapter 6, p. 6-11) should be expanded to include an evaluation of indirect effects on aquatic and riparian habitat for the New Irvington Tunnel project (SV-4). During preparation of the project-level EIR, baseline surveys will be identified and carried out based on the defined footprint, the project description and construction methods, and more complete and current ecological information that would better identify indirect impacts. The "three step review process" cited by the commenter and recommended for inclusion is explicitly required by CEQA Guidelines Section 15370 and does not need to be restated in the text. To clarify, however, the Draft PEIR (Vol. 4, Chapter 6, p. 6-11, second full paragraph) is revised as follows:

> **Measure 4.6-1b:** If the wetland delineation indicates that the WSIP project will affect jurisdictional wetlands or aquatic resources, then, in accordance with state and federal permit requirements, the SFPUC will avoid and minimize direct and indirect impacts such as erosion and sedimentation, alteration of hydrology, and degradation of water quality. As a first priority, the SFPUC will implement (1) avoidance measures. For unavoidable impacts, the SFPUC will implement (2) minimization of unavoidable impacts, (3) restoration procedures, and

> (4) compensatory creation or enhancement to ensure no net loss of wetland extent or function.

S_RWQCBSF-07 The commenter correctly summarizes the analysis in Impact 4.5-3 (Vol. 2, Chapter 4, pp. 4.5-31 to 4.5-33) regarding construction dewatering discharges.

In response to this comment, the Draft PEIR (Vol. 2, Chapter 4, p. 4.5-31, last paragraph) is revised as follows:

> For projects that are subject to the Construction General Permit (described in Impact 4.5-1, above), the discharges could possibly be made in accordance with this permit, provided it could be demonstrated that the water is uncontaminated. … Discharge to a local sanitary sewer system would comply with the requirement of the local permitting agency. Other General Permits in the San Francisco Region under which dewatered groundwater may be discharged include the following General NPDES Permits:
>
> - General NPDES Permit for VOC Cleanups (Order No. R2-2004-0055)
> - General NPDES Permit for Fuel Cleanups (Order No. R2-2006-0075)
> - General NPDES Permit for Groundwater Dewatering (Order No. R2-2006-0075)
>
> Before discharging under any general permit, the SFPUC must submit a completed Notice of Intent that includes a dewatering plan with appropriate treatment and monitoring specifications. The SFPUC should also allow at least 60 days for the RWQCB review and acceptance of the Notice of Intent and dewatering plans.

S_RWQCBSF-08 The San Francisco Planning Department acknowledges the RWQCB's recommendation that the SFPUC evaluate the potential to plumb blowoff valves, crossover facilities, and other potable water discharge locations to treatment plants and sanitary sewers, where feasible, rather than draining to a surface water body. During project-level environmental review of the individual WSIP facility improvement projects, more detailed and site-specific analysis of this impact will be conducted to determine the applicability and feasibility of these measures on a project-by-project basis.

S_RWQCBSF-09 The commenter summarizes the analysis in Impact 4.5-6 (Vol. 2, Chapter 4, pp. 4.5-49 to 4.5-54) regarding the degradation of water quality due to altered drainage patterns or an increase in impervious surfaces. In response to the clarification indicated by the commenter, the Draft PEIR (Vol. 2, Chapter 4,

p. 4.5-50, first and second full paragraphs under "Other Projects") is revised as follows:

> With the exception of San Francisco and San Joaquin County, the municipal stormwater permits for the counties within the WSIP study area require new development and redevelopment projects that involve the creation or replacement of impervious surfaces to incorporate treatment measures and other appropriate source control and site design features to reduce the pollutant load in stormwater discharges and to manage runoff flows; the applicability of countywide MS4 stormwater management controls to the WSIP will be determined on a project-by-project basis as part of project-level review of individual WSIP projects. In each county, projects subject to these controls that involve the creation or replacement of one or more acres of impervious surfaces were required to comply with the new development and redevelopment requirements as of February 15, 2005. Projects subject to countywide MS4 stormwater management controls that involve the creation or replacement of 10,000 square feet or more of impervious surfaces were required to comply with the requirements by August 15, 2006. These thresholds apply to individual projects and are not applied to a cumulative set of projects if the locations of the cumulative set of projects under a single program are noncontiguous and/or are not part of a single common plan of development. To the extent that projects subject to countywide MS4 stormwater management controls are part of a single common plan of development that cumulatively exceeds 10,000 square feet of new or replaced impervious surface, the smaller amount of impervious surface from each sub-project would require appropriately sized stormwater treatment BMPs. ~~such as the WSIP. The applicability of the municipal stormwater permit requirements to specific projects would depend on the amount of impervious surface that would be created or replaced.~~
>
> In addition, projects subject to countywide MS4 stormwater management controls that involve land disturbance of more than one acre would be required to include post-construction erosion and sediment control BMPs in the SWPPP prepared for the project (Described in the Setting and in Impact 4.5-1). For projects subject to countywide MS4 stormwater management controls, the post-construction erosion and sediment control BMPs for projects located in Alameda, Santa Clara, and San Mateo Counties and creating or replacing more than one acre of impervious surface must also comply with requirements in the Hydrograph Modification Management Plans for those counties. Post-construction BMPs could include minimizing land disturbance or the amount of impervious surfaces; treating stormwater runoff using infiltration, detention/retention, or biofilters; using efficient irrigation systems; ensuring that interior drains are not connected to a storm sewer system; and using appropriately designed and constructed energy dissipation devices. These measures would be designed to ensure that drainage patterns are not changed in a way that results in offsite erosion or flooding, and must be consistent with all

local post-construction stormwater management requirements, policies, and guidelines. Coverage under the General Construction Permit cannot be terminated until the site is in compliance with all local stormwater management requirements and a post-construction stormwater management plan is in place, as described in the SWPPP.

The commenter's concern that watershed management actions pertaining to onsite stormwater collection and drainage systems be continued for the life of the system/facility at all SFPUC facilities is acknowledged.

S_RWQCBSF-10 Please refer to **Response S_RWQCBCV-05**.

S_RWQCBSF-11 Refer to **Responses S_RWQCBCV-03, S_RWQCBCV-06,** and **S_RWQCBSF-07**.

S_RWQCBSF-12 Refer to **Responses S_RWQCBCV-03** and **S_RWQCBCV-07**.

S_RWQCBSF-13 Refer to **Response S_RWQCBCV-08**.

S_RWQCBSF-14 The comment requests that: (1) the Alameda Creek sediment transport setting discussion in the Draft PEIR include discussion of Leopold's "effective work concept," which concludes that a change in discharge or sediment load may initiate changes in channel morphology; (2) potential changes in both the timing of sediment input and water flows along Alameda Creek downstream of the diversion dam be assessed, since they have the potential to affect channel shape and sediment transport; and (3) continuous modeling over the period of record be used for the assessment in the PEIR.

The Draft PEIR includes an assessment of impacts on geomorphology in Alameda Creek (Vol. 3, Chapter 5, pp. 5.4.2-1 to 5.4.2-4), which includes projected changes in sediment transport and channel formation resulting from stream flow changes associated with WSIP implementation. The assessment is based on generalized channel bed/bedrock characteristics and historical operations and stream flow. Based on the qualitative analysis presented in the Draft PEIR and discussed further below, the geomorphic impacts would be less than significant, and therefore the requested additional detailed quantitative analysis is not necessary for CEQA purposes.

Current geomorphic surfaces within the creek downstream of the Alameda Creek Diversion Dam (ACDD) have been heavily influenced by the construction of the dam in 1932. Since that time, flow in Alameda Creek downstream of the diversion dam has been regulated by diversions through the Alameda Diversion Tunnel to Calaveras Reservoir. Operational records for the ACDD are not readily available, except for recent (post-2002) operations, as shown in Section 5.4.1 of the Draft PEIR (Vol. 3, Chapter 5, pp. 5.4.1-7 to

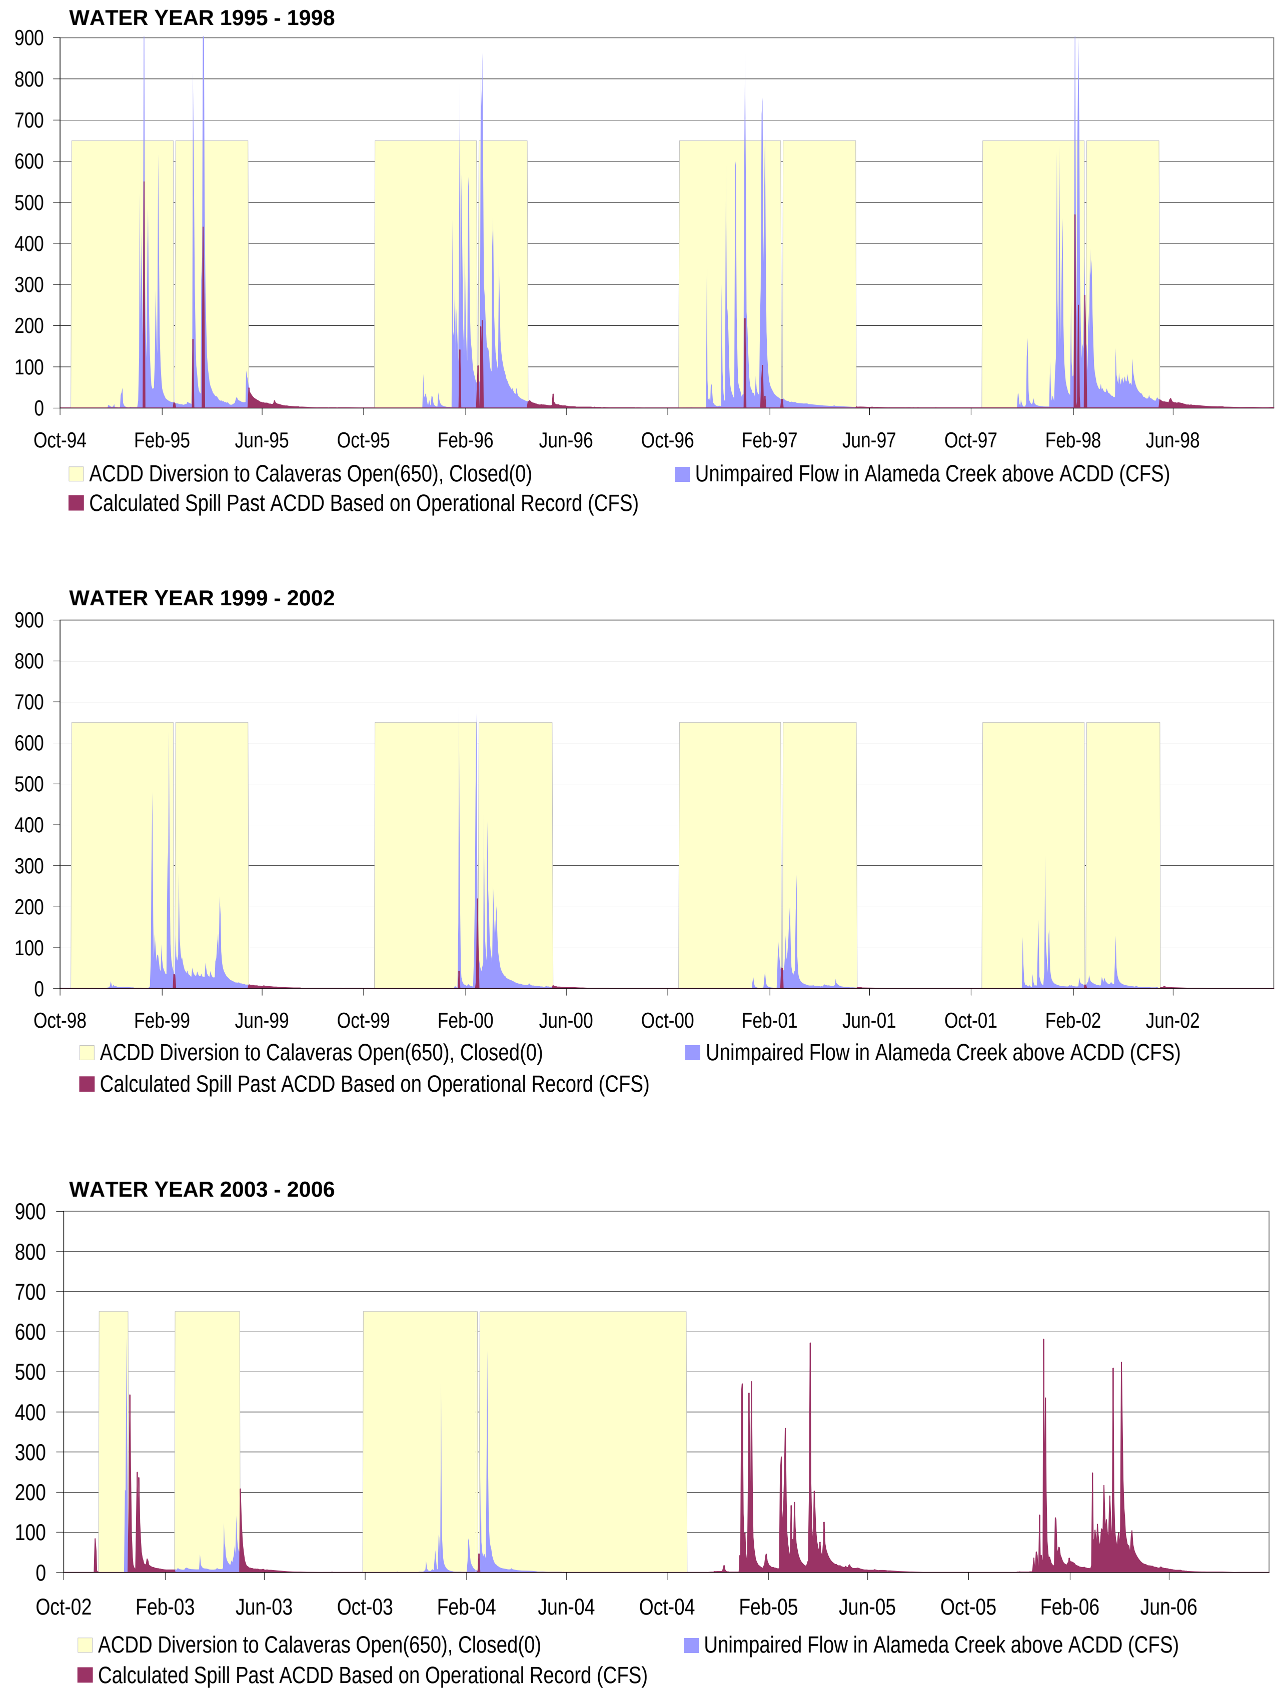
5.4.1-13). As noted in this section, prior to the Division of Safety of Dams (DSOD) restrictions on operation of Calaveras Reservoir (pre-2002), the SFPUC operational procedure was to divert flows of up to 650 cubic feet per second (cfs) from Alameda Creek above the diversion dam to Calaveras Reservoir for the majority of the wet season, and annually to sluice/flush sediment from behind the dam into the downstream reach of Alameda Creek. Since implementation of the DSOD-restricted operating condition in Calaveras Reservoir, diversions to Calaveras Reservoir have continued during drier years; however, the frequency of diversion as well as the quantities of water diverted have been substantially reduced due to the reduced capacity of the reservoir. Accordingly, more flow currently bypasses the dam and sediment loading/transport downstream of the dam has increased from pre-2002 operations.

Figure 15.2-1 shows changes in flow conditions at the ACDD over the period of available gage record, incorporating operational variations that have occurred pre- and post-DSOD restrictions. The blue area of the figure represents inflow from upper Alameda Creek to the diversion dam; the maroon area represents the calculated flow below the diversion dam; and the yellow area indicates when the diversion gates were open to allow flows to be diverted to Calaveras Reservoir.

The SFPUC began implementing the DSOD restriction in water year 2002, which means that it discontinued operating Calaveras Reservoir at its full historical capacity in the autumn of 2001. However, due to hydrological/ meteorological conditions, diversions from Alameda Creek to Calaveras Reservoir continued in 2002, partially in 2003, and again in 2004. Diversions did not occur in 2005 or 2006, both above-normal hydrologic years when Calaveras fill limits were met entirely from reservoir watershed flows; diversions were initiated again in 2007, a dry year, and early in 2008 (not shown on the chart).

Since implementation of the DSOD restriction, the frequency and magnitude of diversions have become more variable, with reduced overall diversions to Calaveras Reservoir, particularly during wetter years; this has resulted in more flow in Alameda Creek downstream of the diversion dam as compared to the unrestricted pre-DSOD condition.

As noted by the commenter, these more frequent moderate flows occurring during the current operating condition have likely mobilized and transported sediment in Alameda Creek downstream of the diversion dam that would not have been mobilized by the lesser flows under the unrestricted pre-2002 condition. However, it should be noted that implementation of the DSOD restriction has not resulted in a cessation of all diversions; under the



SOURCE: SFPUC Water System Improvement Program

Notes:
- Assumes that under pre-DSOD restriction conditions, diversion gates were opened on 10/15 and closed on 4/15 each year
- Assumes a two day sluice in February of each year except in 2002

SFPUC Water System Improvement Program . 203287

Figure 15.2-1
Flow Conditions at Diversion Dam under Various Operational Scenarios– pre- vs. post-DSOD Restrictions

DSOD-restricted condition, winter flow conditions in Alameda Creek below the ACDD are similar to pre-DSOD operations in lower-flow years. Therefore, sediment supply and movement characteristics similar to those under historical (pre-2002) conditions continue to occur in lesser rainfall years.

As stated above, the creek channel, in its current form, is largely a result of ACDD operations since the dam was built in 1932. Operational records for the diversion dam are not available for that entire period. However, it may be assumed that SFPUC management practices and policies, water demands, hydrology, and maintenance activities have resulted in a range of operating conditions over that time period.

Implementation of the WSIP would result in changes in flow and sediment delivery below the ACDD. However, with respect to diversion dam operations, with the exception of the bypass flows included as protective measures under the Calaveras Dam Replacement project (SV-2) as described in Section 13.2 (Vol. 7, Chapter 13), the WSIP would represent a return to historical operations. Channel form and sediment characteristics found downstream in Alameda Creek are largely a result of the historical operation of the diversion dam, not of the current, temporarily restricted operating condition. Current operations of the diversion dam, while different from pre-2002 operations, are likely within the range of operations performed over the last 76 years. Similarly, the current range of flows and sediment delivery to Alameda Creek below the dam are likely within the historical range that has resulted in the creek channel in its present form. Therefore, a return to near-historical operations is not expected to significantly alter the geomorphology below the ACDD, since these conditions have formed over several decades under variable hydrologic and operating conditions that have not differed significantly from those currently occurring.

Thus, operational variability, the continued diversions above the ACDD (albeit at a reduced rate), and the fact that current geomorphology downstream of the diversion dam is a result of over 70 years of managed flows have all contributed to the widely varying patterns of sediment transport and geomorphic processes. The sediment supply and flow rates that would occur under the WSIP would likely be within the historical range. The proposed return to historical diversion patterns would change the timing of sediment load to Alameda Creek below the diversion dam compared to the existing condition. However, due to the sluicing/flushing procedure, the quantity and particle-size distribution of sediments would not be altered considerably.

It should be noted that in and below the Sunol Valley, sand/gravel extraction activities and the recent removal of the Niles and Sunol Dams have had, and would continue to have, a larger effect on sediment transport and stream geomorphology than any changes in flows and sediment transport from the upper Alameda Creek watershed. Mining activities in the Sunol Valley have altered both the groundwater table and creek form in the vicinity of the quarries. The drawn down groundwater table in the quarry reach currently reduces flow in Alameda Creek by increasing surface water loss to groundwater, reducing the capacity of the creek to transport sediment, particularly at lower to moderate flows. The channelization of the creek has likely increased the velocity of higher flows through the reach, altering the timing and character of sediment deposited and transported in the quarry reach. Farther downstream, within Niles Canyon, the Sunol and Niles Dams have recently been removed, exposing sediments deposited in the former backwaters of the dams. Studies performed for the removal of the dams estimated that the sediment stored in the former backwaters would migrate downstream over the course of several decades, redistributing throughout Niles Canyon and eventually farther downstream.

In addition to these factors, implementation of Mitigation Measures 5.4.1-2 and 5.4.5-3 (Vol. 4, Chapter 6, pp. 6-51 to 6-53) and bypass flows included as protective measures under the Calaveras Dam Replacement Project would act to dampen the change in flow regime from current intermittent diversion characteristics to the future condition with much more sustained diversion. Mitigation Measure 5.4.1-2 would require that the SFPUC not divert excess flow, that is, diversion would be limited only to the water necessary to fill Calaveras Reservoir. Once the reservoir is full, diversion gates would be closed and flow during the remainder of the season would continue over the dam, carrying suspended sediments with it. Once the diversion gates are closed, the full flow in Alameda Creek would continue past the diversion dam. The magnitude of these flows, if any, would depend on year-to-year hydrological and meteorological conditions.

In summary, channel shape and sediment characteristics in Alameda Creek below the diversion dam have been significantly influenced by the historical operation of the dam. The current operating condition of the diversion dam, which continues to divert flow to Calaveras Reservoir in a reduced capacity and to annually sluice/flush sediments, is expected to be within the range of operating conditions that have occurred since construction of the dam. While the current, restricted operating condition may provide a steadier supply of sediment and higher flow rates in Alameda Creek below the diversion dam than historical operating conditions, it is not expected to have significantly altered Alameda Creek geomorphology over the short timeframe and variable operating conditions that have occurred since the 2001 DSOD restriction was implemented. Based on the above analysis, continuous modeling over the period of record is not necessary to identify this programmatic impact.

Please refer to **Response L_ACWD-13** (Vol. 7, Chapter 12, Section 12.3) for further discussion of geomorphology in Alameda Creek.

S_RWQCBSF-15 The commenter states that the Draft PEIR does not include an evaluation of potential water quality impacts associated with the sluicing of sediment from behind the ACDD. As explained below, such an analysis was not undertaken because the WSIP is expected to improve water quality below the ACDD compared with existing conditions.

The Draft PEIR (Vol. 3, Chapter 5, p. 5.4.2-2) states that the SFPUC uses the sluice gates to discharge approximately 900 cubic yards per year of accumulated sediment from behind the ACDD. This activity is largely sediment flushing to remove sand and gravel that has settled behind the diversion dam.

This SFPUC flushing operation is intended to remove accumulations of coarse sediment to protect the facility, maintain storage capacity (and thus diversion capacity) above the diversion dam, and support downstream geomorphic processes by passing the sediment. Sediment flushing of the diversion dam typically occurs in February, at which time the sluice gates are opened to flush coarse sediments from upstream of the dam. Operations normally occur over a 48-hour period during high-flow events (necessary to develop the velocity to mobilize coarse sediments behind the dam). Flushing operations occur whether or not any flows from the creek are being diverted to the diversion tunnel. The sluice gates remain closed except during the flushing procedure. In the infrequent event that creek flows exceed the tunnel capacity (650 cubic feet per second), excess creek waters flows over the top of the dam. As described in the Draft PEIR (Vol. 1, Chapter 2, p. 2-24), if water is not diverted via the diversion gates to the reservoir, the entire volume of the creek flows over the top of the dam. These SFPUC sediment flushing activities and sluice gate operations would continue, unchanged, under the WSIP.

It is likely that more sediment would be transported to Calaveras Reservoir with the WSIP than under current conditions because of the increased flows diverted to Calaveras Reservoir. Many of these sediments would settle out in the reservoir, reducing the overall quantity of sediments in the creek. Therefore, less sediment would be available for transport (either in flows over the dam or via sluicing/flushing operations) down both the upper and lower reaches of Alameda Creek. It is unclear whether this is the case in reality, because the sluice gates may have been left open for longer than 48 hours to allow flows to pass at those times when diversions were not occurring during post-2002-conditions.

Operation of the proposed bypass structure at the ACDD as part of the Calaveras Dam Replacement project (SV-2) would maintain the transport of sediment during periods of low-flow to some extent and would transport finer-grained material. This would act to reduce the amount of the slug passed during sluicing/flushing.

Thus, it is likely that downstream sediment transport, deposition, and turbidity associated with sluicing/flushing operations would decrease with the WSIP compared to existing conditions. The following water quality information is provided for informational purposes.

No water quality data are available for Alameda Creek immediately below the diversion dam for use in analyzing the direct water quality impacts associated with sediment flushing behind the dam. However, water quality data collected by the Alameda County Water District (ACWD) and analyzed for total dissolved solids (TDS) were examined to identify the general characteristics of TDS farther downstream in Alameda Creek (see Draft PEIR, Table 5.4.3-4, Vol. 3, Chapter 5, p. 5.4.3-6). Samples were collected at approximately five-day intervals near Sunol in Alameda Creek, above Arroyo de la Laguna, from 1997 through 2005, on a total of 270 days.[1] This sampling location is about 10 miles downstream from the ACDD, and the water quality of Alameda Creek at this location is affected by numerous upstream inflows and land uses, including the diversion dam, Calaveras Dam, Welch Creek, Turner Dam, and gravel mining operations and quarries.

Review of the ACWD data at Sunol indicate that high levels of TDS occurred on numerous occasions during this period. The TDS levels were largely independent of season and flow. Because high TDS levels were recorded throughout the year and under a wide range of flow conditions, it is not evident if the elevated TDS levels are related to natural watershed processes (e.g., erosion) and/or land use activities in the watershed. There is no correlation between the TDS levels and the SFPUC's annual 48-hour sediment flushing operation at the ACDD that typically occurs in February. Therefore, it is assumed that implementation of the WSIP would not affect TDS levels, and the water quality impact would be less than significant.

Settleable material may include fine alluvial sediments. The settling of fine material onto spawning gravels can cause decreased survival and emergence of

1 Note that there are several periods of data gaps. The ACWD has indicated that these data may not have been subject to the rigorous QA/QC procedures required for scientific studies, and therefore should not be used for purposes other than to indicate general conditions, unless otherwise specified by the ACWD (see **Response L_ACWD-14**).

salmonid eggs and alevin (newly hatched fish in larval stage not yet emerged from the nesting area). If the sluice gates are closed suddenly and not incrementally during sediment flushing operations, stream depth and flow velocity can change substantially over a short period of time. If this occurs during or after rainbow trout spawning, areas where fish have spawned may become dewatered or otherwise unsuitable for the development of embryos or fry through the settling of fines onto the spawning gravels. If releases are gradually reduced at a rate that does not exceed the typical flow reductions occurring under the natural hydrograph, these effects on spawning grounds would be substantially avoided. A more detailed analysis of this potential effect on fishery habitat below the ACDD will be conducted as part of the EIR for the Calaveras Dam Replacement project (SV-2). However, under the WSIP, increased diversions to Calaveras Reservoir would transport more settleable material to the reservoir than is currently carried with sediments transported to Alameda Creek. Therefore, the volume of materials to be sluiced/flushed from the ACDD under the WSIP is likely to be reduced compared with current conditions, which would result in a less-than-significant water quality impact with respect to settleable materials.

Suspended material would consist of the same material present in the channel, alluvial sediments, and waters of Alameda Creek. The 48-hour sediment flushing operation is assumed to have a less-than-significant water quality impact with respect to suspended material, because flushing operations occur during high-flow events when suspended material is typically elevated, and would therefore add minimally to the overall suspended sediment load and turbidity in the flows.

The ACWD turbidity data described above show that turbidity was below 50 NTU approximately 95 percent of the time. Turbidity exceeded 50 NTU on 14 days (see table below). Elevated turbidity was largely associated with elevated flow rates and occurred throughout the December through March period, and is an existing phenomenon within the watershed resulting from high wet-weather flows and erosion in the watershed. Furthermore, although the WSIP would increase the volume of sediment flushed and transported downstream, it would not create an additional sediment load in the Sunol Valley. These sediments would presumably have a similar fate once past the ACDD as under existing conditions, which is that the sediments would be transported downstream at a rate determined by the carrying capacity of the creek. The 48-hour sediment flushing operation is assumed to have a less than significant water quality impact with respect to turbidity because operations occur during high flow events when turbidity is typically well above 50 NTU.

TURBIDITY IN ALAMEDA CREEK NEAR SUNOL, ABOVE ARROYO DE LA LAGUNA (1997–2005)

Date	Turbidity (NTU)	Flow (cfs)	Date	Turbidity (NTU)	Flow (cfs)
12/2/1997	100	18	1/18/2000	141	80
12/12/1997	100	301	1/25/2000	93.4	250
12/15/1997	182	83	2/15/2000	81.5	30
1/12/1998	1,000	600	2/29/2000	65.7	650
2/16/1998	117	1,500	3/6/2000	56.8	730
2/24/1998	171	2,300	3/5/2002	112	10
2/9/1999	1,000	1,000	2/26/2004	347	350

These ACWD TDS data may not have been subject to the rigorous QA/QC procedures required for scientific studies, and therefore should not be used for purposes other than to indicate general conditions, unless otherwise specified by the ACWD.

SOURCE: ACWD, 2006.

As noted above, compared to the existing condition, more sediment would be directed toward Calaveras Reservoir with the increased diversions, and therefore the sluicing/flushing procedures under the WSIP would decrease potential water quality impacts with respect to settleable material, suspended material, and turbidity. The implementation of bypass flows included as protective measures under the Calaveras Dam Replacement project (SV-2), as well as Mitigation Measure 5.4.5-3a, Minimum Flows for Resident Trout on Alameda Creek (Vol. 4, Chapter 6, pp. 6-52 and 6-53), would result in the transport of fine sediments past the ACDD during those periods when flow is present in upper Alameda Creek.

In response to this comment, new text is added to the Draft PEIR (Vol. 3, Chapter 5, Impact 5.4.3-3, p. 5.4.3-11, following the third paragraph under "Reach 1") as follows:

> **Settleable Materials, Suspended Materials, and Turbidity.** Sections 5.4.1.1 and 5.4.2.1 describe the SFPUC flushing activities intended to remove accumulations of coarse sediment to protect the facility, maintain storage capacity (and thus diversion capacity) above the Alameda Creek Diversion Dam, and support downstream geomorphic processes by passing sediment. The flushing procedure involves opening the sluice gates to flush coarse sediments from upstream of the diversion dam. Sediment flushing discharges approximately 900 cubic yards of sediment from behind the diversion dam each year, and typically occurs in February. This sediment typically consists of sands and gravels. Operations normally occur over a 48-hour period during high-flow events to develop the necessary velocity to mobilize the coarse sediments behind the dam. Flushing operations occur whether or not flows from the creek are being diverted to the diversion tunnel. The sluice gates remain closed year-round, except during the sluicing procedure. If water is not diverted via the diversion gates to the reservoir, the entire volume of the creek flows through the sluice gates in

the dam or over the top of the dam. It is assumed that these SFPUC sediment flushing activities and sluice gate operations would continue under the WSIP.

Three water quality parameters—settleable materials, suspended materials, and turbidity—could be affected by changes in the Alameda Creek Diversion Dam operations and sediment flushing procedures. It is likely that more sediment would be transported to Calaveras Reservoir with the WSIP than under current conditions because of increased flows diverted to Calaveras Reservoir. Many of these sediments would settle out in the reservoir, reducing the overall quantity of sediments in the creek. Therefore, less sediment would be available for transport (either in flows over the dam or via sluicing/flushing operations) down Alameda Creek compared to the existing condition. Therefore, the sluicing/flushing procedures under the WSIP would have less-than-significant water quality impacts with respect to settleable materials, suspended materials, and turbidity.

S_RWQCBSF-16 Please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14) for additional discussion of climate change to augment the discussion in Section 5.7.6 of the Draft PEIR (Vol. 3, Chapter 5, pp. 5.7-92 to 5.7-96). Section 14.11 provides more detailed and up-to-date information on climate change as it relates to the SFPUC regional water supply and the proposed WSIP.

Alameda County Community Development Agency, Bruce Jensen, Senior Planner, 10/15/07

L_ACCDA-01 This comment identifies some of the topical areas where potential impacts could result from implementation of WSIP facility improvement projects; it acknowledges that mitigation is identified in the Draft PEIR to reduce the levels of impact significance, and that, in some cases, the Draft PEIR makes a conservative determination that these effects would be potentially significant and unavoidable. During subsequent project-level environmental review of the individual projects, it may be determined that these effects can be avoided or mitigated to a less-than-significant level; however, if during the project-level environmental review the impacts are determined to be significant and unavoidable, it will be necessary to adopt a Statement of Overriding Considerations.

L_ACCDA-02 Regarding Alameda County requiring the SFPUC to apply for a Finding of General Plan Conformance under California Government Code Section 65402, the Draft PEIR (Vol. 2, Chapter 4, p. 4.2-9) acknowledges that the SFPUC will notify local agencies of proposed plans and meet consistency determination requirements pursuant to Section 65402(b). It should be noted that these consistency determinations are advisory to the SFPUC rather than binding. As stated in the Draft PEIR (Vol. 2, Chapter 4, p. 4.2-9), approval of the WSIP would not trigger this requirement, but the requirement would be triggered by implementation of the individual WSIP projects. Therefore, these determinations would be made by the pertinent jurisdictions following preparation of project-specific CEQA documentation and notification by the SFPUC pursuant to state law (Vol. 2, Chapter 4, p. 4.2-16).

The commenter's topics of concern (land use, biology, visual resources, growth inducement, etc.) will be addressed as part of project-level CEQA review. The program-level impacts in Alameda County related to these topics are discussed in the Draft PEIR under the Sunol Valley and Bay Division Regions (Vol. 2, Chapter 4, pp. 4.3-7 to 4.4-50; pp. 4.6-37 to 4.6-74; pp. 4.16-8 and 4.16-16; and Vol. 4, Chapter 7, p. 7-1).

The Draft PEIR (Vol. 2, Chapter 4, p. 4.2-9) acknowledges that individual projects could, in select cases, require encroachment permits from local agencies. The need for local conditional use permits will be determined during project-level CEQA review.

L_ACCDA-03 Appendix B (Vol. 5, p. B-15) lists the significance criteria used in the Draft PEIR to determine the significance of impacts on mineral resources. They include whether the project would: (a) result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state; or (b) result in the loss of availability of a locally important mineral resource recovery site delineated in a local general plan, specific plan, or other land use plan. The Draft PEIR (Vol. 5, Appendix B, p. B-16) concludes that, at a program level, none of the WSIP projects would result in the loss of mineral resources or make them inaccessible. Furthermore, the construction of pipelines and other public engineering projects is excluded from Surface Mining and Reclamation Act regulation. Therefore, impacts related to the loss of mineral resources would not be applicable to the WSIP projects. However, the effects of each WSIP project on current mining patterns and access to mineral resources will be considered during project-level CEQA review, as acknowledged by the commenter. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2) for detailed information regarding the intent of the programmatic impact analysis.

Alameda County Flood Control and Water Conservation District, Kwablah Attiogbe, Environmental Services, 10/1/07

L_ACFCWCD-01 In response to this comment regarding conversion factors for degrees Celsius and Fahrenheit, the following is added to the list of conversion factors provided at the back of the glossary in the Draft PEIR (Vol. 1, Glossary, p. xxxviii):

Temperature

Degrees Celsius (°C) = 5/9 x (°F – 32)

Degrees Fahrenheit (°F) = 9/5 x (°C) + 32

L_ACFCWCD-02 Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.2).

L_ACFCWCD-03 Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.2).

L_ACFCWCD-04 Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.3).

L_ACFCWCD-05 Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.6). In addition, refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14) for additional discussion of climate change to augment the discussion presented in Section 5.7.6 of the Draft PEIR (Vol. 3, Chapter 5, pp. 5.7-92 to 5.7-96). Section 14.11 provides more detailed and up-to-date information on climate change as it relates to the SFPUC regional water supply and the proposed WSIP.

L_ACFCWCD-06 Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.4). The general location of the Alameda Creek Fishery Enhancement project (SV-1) is described in Draft PEIR Table 3.10 (Vol. 1, Chapter 3, p. 3-50); however, because the precise location has not yet been identified, this project location is not shown in Figure 3.5a (Vol. 1, Chapter 3, p. 3-57).

L_ACFCWCD-07 While implementation of the WSIP would result in increased diversions from Alameda Creek compared to the existing condition, the proposed level of diversions would be similar to the historical level of diversions that occurred for about 70 years prior to the 2001 Division of Safety of Dams restriction on Calaveras Dam. As described in the Draft PEIR (Vol. 1, Chapter 2, p. 2-10), the SFPUC considers the current reduced storage level in Calaveras Dam and associated reduced diversion level as an impaired operating mode that puts the regional system at risk of being unable to adequately meet existing customer water demands in the event of an emergency or a prolonged drought. The restoration of storage capacity in Calaveras Reservoir and associated increased diversions from Alameda Creek are needed to meet existing customer water demand during drought or other emergency conditions and to provide both delivery and seismic reliability; it is also needed to maximize the use of local water supplies. This component of the WSIP is not driven by the need to meet the projected increase in purchase requests.

This comment incorrectly implies that 2000 Association of Bay Area Governments (ABAG) data (probably referring to *Projections 2000*) were used to develop the demand projections. ABAG's *Projections 2002* was used as the source of many of the population projections and most of the employment projections used in the demand model. The use of *Projections 2002* was appropriate as it was the current projections series at the time. The Draft PEIR (Vol. 4, Chapter 7, sidebar on p. 7-22, and pp. 7-22 through 7-26, and Vol. 5, Appendix E.3) reviews changes in the ABAG projections series since *Projections 2002* was issued and compares the later projections to the assumptions used in projecting 2030 water demand. Also refer to **Responses SI_PacInst-76** and **SI_PacInst-77**.

L_ACFCWCD-08 This comment incorrectly implies that water use and water efficiency were not reviewed and analyzed. The SFPUC, in conjunction with its wholesale customers, conducted extensive studies as part of the WSIP planning effort, including technical studies on conservation and recycled water use potential and water demand studies that included a detailed evaluation of existing water use in order to establish base-year conditions. These studies are described in the Draft PEIR (Vol. 1, Chapter 3, pp. 3.16 to 3-22, and Vol. 5, Appendix E.2); in addition, **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) presents an expanded discussion of existing and planned conservation.

As described above in **Response L_ACFCWCD-07**, the need for additional water diversions from Alameda Creek and the associated restoration of storage in Calaveras Reservoir is driven primarily by the need to meet existing customer demand during drought or other emergency conditions and to increase both delivery and seismic reliability. Nevertheless, the Draft PEIR (Vol. 4, Chapter 9) provides a detailed evaluation of aggressive conservation and water recycling as part of the alternatives analysis. However, all alternatives analyzed in the Draft PEIR, including the aggressive conservation and recycling alternatives, rely on the restoration of Calaveras Reservoir to its historical capacity and associated increased diversions from Alameda Creek.

L_ACFCWCD-09 Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.4).

L_ACFCWCD-10 The Draft PEIR (Vol. 2, Chapter 4, p. 4.5-25) acknowledges that pipeline projects may be subject to encroachment permits from the local flood control district or other appropriate local agency. The ACFCWCD's request that pipeline crossings conform to specific design requirements is acknowledged. In addition, the need for any encroachment permits is noted in **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.3) and added to Table C.6 (Vol. 5, Appendix C, p. C-26) for consideration during the project-level CEQA review for individual WSIP projects. As described in Section 14.4.3, identification of specific local agency requirements is not needed to determine a level of impact significance for this programmatic analysis; this issue will be addressed in the project-level environmental documentation for each WSIP project as appropriate.

L_ACFCWCD-11 Implementation of the WSIP would include releases from Calaveras Dam and/or bypasses at the Alameda Creek Diversion Dam in order to comply with the 1997 California Department of Fish and Game Memorandum of Understanding. The releases would be designed and implemented to provide a beneficial impact on downstream fisheries. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.3) for discussion of notification and coordination with the ACFCWCD.

L_ACFCWCD-12 The commenter requests that the significance determinations in the Initial Study checklist for the following topic areas be changed from "Less than Significant" to "Potentially Significant": Transportation and Circulation (5a), Biological Resources (12a, 12b, 12c, 12d), and Hydrology and Water Quality (14b, 14c). However, the Initial Study checklist (Draft PEIR, Vol. 5, Appendix B) classifies all but one of these items as "Less than Significant with Mitigation Incorporated," while 14c is classified as "Less than Significant." Item 14c is classified as "Less than Significant" because it assumes implementation of SFPUC Construction Measure #3 (Onsite air and water quality measures) as well as compliance with applicable stormwater control regulations; this impact is discussed in the Draft PEIR as Impact 4.5-1 (Vol. 2, Chapter 4, pp. 4.5-21 to 4.5-28. The significance determinations for the other items in this checklist identified by the commenter were classified assuming the mitigation measures will be applied and therefore already acknowledge that the impact is potentially significant. The mitigation measures will be incorporated into the Mitigation Monitoring and Reporting Program, which the SFPUC will be required to adopt as part of the CEQA findings from the certified Final PEIR; thus, in effect, the final decision-makers will not have the option of rejecting the measures as infeasible, as is the case with mitigation measures identified in the PEIR text. The "Less than Significant with Mitigation Incorporated" determination indicates that the impact is potentially significant but would be reduced to a less-than-significant level when mitigation measures contained in the Draft PEIR are implemented. The checklist's "Less than Significant" determination can indicate that the impact is potentially significant but would be less than significant with implementation of SFPUC Standard Construction Measures and applicable regulations. These determinations correspond to the Draft PEIR's "Potentially Significant, Mitigatable" (PSM) and "Less than Significant" (LS) significance determinations. These determinations are defined in Sections 4.1 and 5.1 of the Draft PEIR (Vol. 2, p. 4.1-5, and Vol. 3, p. 5.1-18).

L_ACFCWCD-13 Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Sections 14.9.2 and 14.9.4).

In response to this comment, the following text from the Draft PEIR (Vol. 3, Chapter 5, p. 5.4.1-4, third full paragraph, last sentence) is revised as follows:

> A flow control structure known as the BART weir (owned by the ACFCWCD and located where the BART and railroad tracks cross Alameda Creek in Fremont) provides ~~grade control~~ structural protection of the footings of the BART and railroad bridge crossing and is a barrier to fish passage along this reach.

L_ACFCWCD-14 Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.3, under the heading Impacts on Stream Flow and Fisheries Downstream of the BART Weir, and Section 14.9.5, under the heading Warmwater Fish Species and their Habitats in Alameda Creek).

L_ACFCWCD-15 Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.2, under the headings Biological Distinctions and Regulatory Status for Steelhead and Rainbow Trout, Anadromous Steelhead in Lower Alameda Creek, and Consideration of Fish Passage at the Niles Gaging Station; and Section 14.9.4).

L_ACFCWCD-16 Prior to the certification hearing on the PEIR, the San Francisco Planning Department will distribute the Comments and Responses document for review to the public and affected agencies, including the commenter and all other individuals and organizations that submitted comment letters on the Draft PEIR. In accordance with CEQA Guidelines Section 15088.5(b), recirculation is not required "where the new information added to the EIR merely clarifies or amplifies or makes insignificant modifications" to the EIR. The additional information provided in this Comments and Responses documents falls in that category, and recirculation of the PEIR is not warranted.

Alameda County Water District, Paul Piraino, General Manager, 9/26/07

L_ACWD-01 This comment corroborates information presented in the Draft PEIR—that the ACWD's 2030 estimated purchase request from the SFPUC of 13.76 million gallons per day (mgd), as shown in Draft PEIR Table 3.3 (Vol. 1. Chapter 3, p. 3-18) and others, is the same as its existing contractual entitlement, or supply assurance, of 13.76 mgd (Vol. 5, Appendix E.1, Table E.1.1). As shown in Table 3.4 (Vol. 1, Chapter 3, p. 3-19) and Table 7.3 (Vol. 4, Chapter 7, p. 7-18), the ACWD's 2030 purchase estimate represents an increase of approximately 15 percent over its purchases in the 2001 base year of 11.99 mgd. A review of the current Bay Area Water Supply and Conservation Agency's Annual Survey (BAWSCA, 2007; p. 76) indicates that the ACWD purchased between 511,590,900 and 607,476,100 cubic feet per year (equal to 10.48 to 12.45 mgd) for BAWSCA fiscal years 2002/2003 through 2005/2006.

L_ACWD-02 This comment, which expresses the ACWD's support for a high-quality water supply and a reliable storage and conveyance system for the San Francisco Bay Area at a reasonable cost, is acknowledged.

L_ACWD-03 The commenter's support of BAWSCA's proposal regarding the Modified WSIP Alternative, which involves exploring the feasibility of increased agricultural water conservation in the lower Tuolumne River watershed, is acknowledged. Please refer to **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14, Section 14.10.3) for further discussion.

L_ACWD-04 This comment provides background information related to the Alameda Creek watershed that is generally consistent with the description provided in the Draft PEIR (Vol. 3, Chapter 5, pp. 5.4.1-1 to 5.4.1-4). The Draft PEIR focuses on impacts in the southern Alameda Creek watershed, which is the portion of the overall watershed that would be affected by the proposed program. This comment summarizes the more detailed comments presented in Comments L_ACWD-05 through L_ACWD-25; refer to **Responses L_ACWD-05** through **L_ACWD-25** for the specific responses, which address downstream impacts on the ACWD's water supplies and potential impacts on steelhead.

L_ACWD-05 The commenter requests clarification on whether the Alameda Creek Fishery Enhancement project (SV-1) would recapture more water than is being released upstream, resulting in downstream flow impacts (ACWD Comment No. 1). Under the WSIP, the SFPUC would release flows upstream from the confluence of Alameda and Calaveras Creeks (i.e., releases from Calaveras Dam and/or bypasses at the Alameda Creek Diversion Dam) in accordance with the 1997 California Department of Fish and Game (CDFG) Memorandum of

Understanding (MOU), and the Alameda Creek Fishery Enhancement project would recapture those flows at a downstream location, also in accordance with the 1997 CDFG MOU. The Alameda Creek Fishery project includes structural and nonstructural alternatives to recapture only those flows released to meet the requirements of the MOU. It could include a water recapture facility downstream of the Sunol Valley Water Treatment Plant (WTP), or could involve SFPUC coordination with other water agencies to develop and implement other means of recapturing MOU flows. The hydrological modeling used in the impact analysis of proposed water supply and system operations in the Draft PEIR assumed only recapture of flow from the creek consistent with the 1997 CDFG MOU. Therefore, all downstream flow impact analyses in the Draft PEIR considered implementation of the recapture component of the Alameda Creek Fishery Enhancement project (SV-1).As described in Section 13.2 (Vol. 7, Chapter 13), the SFPUC has incorporated project revisions and protective measures for steelhead into the project descriptions of the Alameda Creek Fishery Enhancement (SV-1) and Calaveras Dam Replacement (SV-2) projects which would modify implementation of the 1997 CDFG MOU. Please also refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.1) for a description of protective measures that the SFPUC has incorporated into the Alameda Creek Fishery project.

As noted by the commenter (ACWD Comment No. 2), the BDPL Nos. 3 and 4 Crossovers (BD-2) and Seismic Upgrade of BDPL Nos. 3 and 4 at Hayward Fault (BD-3) projects and part of the Bay Division Pipeline Reliability Upgrade project (BD-1) are located on lands that overlie the Niles Cone Groundwater Basin. The commenter requests an impact analysis for this basin. The Draft PEIR (Vol. 2, Chapter 4, p. 4.5-30) concluded that potential impacts on groundwater resources in this groundwater basin associated with construction of these projects would be less than significant because the projects would not include long-term dewatering (which could deplete groundwater supplies) or interfere substantially with groundwater recharge. In addition, to avoid cross-contamination of aquifers, groundwater dewatering would not be conducted at the Newark Tunnel Shaft to be constructed under the BDPL Reliability Upgrade project (BD-1). Furthermore, temporary dewatering during construction would not be expected to substantially deplete shallow groundwater resources, and impacts related to the depletion of shallow groundwater due to construction dewatering are considered less than significant for all WSIP projects (Vol. 2, Chapter 4, p. 4.5-28).

The commenter is concerned that construction-related discharges to creeks and waterways in the Alameda Creek watershed could affect downstream ACWD water intakes and requests analysis of impacts on these intakes (ACWD Comment No. 3). Impact 4.5-1 in the Draft PEIR (Vol. 2, Chapter 4, p. 4.5-26) identifies potential construction-related water quality impacts due to erosion, sedimentation, or hazardous materials releases, and indicates that projects in the

Sunol Valley would be subject to the National Pollutant Discharge Elimination System (NPDES) permitting requirements of the Regional Water Quality Control Board (RWQCB) and SFPUC Construction Measure #3 (Onsite Air and Water Quality Measures During Construction) (Vol. 2, Chapter 4, p. 4.5-32). The stormwater pollution prevention plan (SWPPP) required under the NPDES permit would specify erosion control measures as well as requirements for providing secondary containment and berming of the diesel or other chemical storage areas to prevent any potential release from reaching an adjacent waterway or stormwater collection system (Vol. 2, Chapter 4, p. 4.5-23). For WSIP facility projects in the Sunol Valley Region, these plans would take into account potential effects on downstream water intakes at ACWD facilities in the flood control channel. Additionally, the ACWD has requested to be notified in the event of a spill or release to any waterway in the Alameda Creek system that could affect water quality. This request is acknowledged. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.3) for a discussion of SFPUC coordination with other agencies as part of project-level CEQA review.

The commenter is concerned that dewatering and construction-related discharges could adversely affect downstream water users in the Alameda Creek watershed if control measures fail, and requests more evaluation as well as development of a notification plan as mitigation (ACWD Comment No. 4). Impact 4.5-3 in the Draft PEIR (Vol. 2, Chapter 4, pp. 4.5-31 to 4.5-35) addresses potential degradation of water quality due to construction dewatering discharges and states that contractor(s) would be required to obtain necessary permits from the local flood control district or any appropriate local agencies for construction-related dewatering discharges and treated-water discharges.

All of the above potential impacts will be addressed in the project-level CEQA documentation for each WSIP project in the Sunol Valley Region. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2) for additional discussion of the issues raised by this comment. This master response provides a more detailed discussion of the appropriate level of detail of an impact analysis at the program level versus the project level.

L_ACWD-06 The commenter is concerned that flooding and associated sediment and contaminant releases could affect downstream water users (ACWD Comment No. 5), and requests an evaluation of impacts on the ACWD’s diversion and groundwater recharge facilities. Draft PEIR Impact 4.5-4 (Vol. 2, Chapter 4, pp. 4.5-37 and 4.5-38) identifies potentially significant flooding impacts for the Alameda Creek Fishery Enhancement (SV-1), New Irvington Tunnel (SV-4), and San Antonio Backup Pipeline (SV-6) projects because, based on the preliminary project description information available during preparation of the Draft PEIR, these projects could potentially contribute sediments or contaminants to flood flows. Subsequent project-level CEQA review of these three projects will reevaluate the significance of this impact. At a program level of analysis, the Draft PEIR determined that potential impacts due to these projects (if any) on the ACWD's diversion and recharge facilities would be mitigated through implementation of Measure 4.5-4a (flood protection measures incorporated into SWPPPs) and Measure 4.5-4b (site-specific flooding analysis). During project-level CEQA review, these programmatic mitigation measures would be reevaluated to determine if they are still applicable and if so, then either confirmed, refined or replaced with an equivalent measure.

As stated above, operation of the WSIP facility improvement projects is not expected to exacerbate flooding or generate contaminants that would affect the ACWD's diversion or recharge facilities. A more detailed analysis of potential impacts on these facilities will be provided in the project-level CEQA review for each project. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2) for additional discussion of the issues raised by this comment. This master response provides more information on the appropriate level of detail of an impact analysis at the program level versus the project level. Also refer to Section 14.4.3 of the master response for discussion of notification and coordination with the ACWD.

L_ACWD-07 The commenter requests discussion of the possible impacts of discharges on Alameda Creek flow conditions and the ACWD's downstream inflatable dam and diversion operations due to operation of the WSIP facility improvement projects. Draft PEIR Impact 4.5-5 (Vol. 2, Chapter 4, pp. 4.5-45 and 4.5-46) addresses potential discharges to surface water during operation of WSIP projects in the Sunol Valley Region and potential water quality degradation effects. This impact states that the Additional 40-mgd Treated Water Supply (SV-3) and SVWTP – Treated Water Reservoirs (SV-5) projects would require only occasional maintenance-related discharges of treated water, and these discharges would be regulated by the RWQCB under the Regionwide General NPDES Permit for Discharges from Surface Water Treatment Facilities for Potable Supply. Under the San Antonio Backup Pipeline project (SV-6), discharges to San Antonio Creek and Alameda Creek would be dechlorinated, dissipated, and discharged in accordance with NPDES permit requirements and the requirements of other regulatory agencies. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.3) for discussion of notification and coordination with the ACWD.

The Draft PEIR (Vol. 3, Chapter 5, Section 5.4.1) describes potential impacts on Alameda Creek stream flow due to WSIP water supply and system operations; the PEIR analysis of downstream flow conditions and the ACWD's inflatable dam and diversion operations is augmented in **Section 14.9, Master Response**

on Alameda Creek Fishery Issues (Vol. 7, Chapter 14, Section 14.9.3), which includes a discussion of impacts related to flow changes downstream of Niles Canyon. Please also refer to **Response L_ACWD-12**, below, for a discussion of the effects of the WSIP water supply and system operations on downstream flows in Alameda Creek.

L_ACWD-08 The commenter states that the SFPUC should coordinate with the ACWD earlier (during the planning and design phases of facility projects) rather than during the construction phase, as specified in Draft PEIR Mitigation Measure 4.11-1h (Vol. 2, Chapter 6, p. 6-44). Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.3) for a discussion of coordination with the ACWD. In response to this comment, the ACWD's request for early coordination has been noted in Table C.6 as revised (Vol. 7, Chapter 16) for consideration in the project-level EIR for several facility improvement projects, including the Bay Division Pipeline Reliability Upgrade (BD-1) and Calaveras Dam Replacement (SV-2) projects. Issues such as early coordination with the ACWD, presence of an onsite ACWD inspector, and need for ACWD approval will be considered during the implementation phase for applicable WSIP facility improvement projects as appropriate. This level of detail is not required for a Program EIR or program-level mitigation measures.

L_ACWD-09 The commenter states that the description of the watershed boundary in the Draft PEIR is incomplete and that the PEIR should be revised to include the downstream section of the watershed to San Francisco Bay, including the underlying Niles Cone Groundwater Basin. Figure 5.4.1-1 in the Draft PEIR (Vol. 3, Chapter 5, p. 5.4.1-2) depicts the Alameda Creek watershed boundary based on the delineation performed by CalWater, an Interagency Watershed Mapping Committee, working through the California Resources Agency and California Environmental Protection Agency. By definition, the boundaries of the drainage area as a hydrologic area are defined by hydrographic and topographic criteria that delineate an area of land upstream from a specific point on a river, stream, or similar surface waters. Figure 5.4.1-1 shows the correct Alameda Creek watershed boundary, which, according to this system of delineation, extends downstream only as far as Niles Canyon. In the lower 12 miles of the creek, there is no defined watershed other than a very large urban watershed that covers most of the developed cities along that portion of San Francisco Bay.

It should be noted, however, that the Draft PEIR describes the watershed as extending to the bay (Vol. 3, Chapter 5, pp. 5.4.1-1 to 5.4.1-4). In addition, the Draft PEIR addresses the Niles Cone Groundwater Basin in Section 5.4.4 (Vol. 3, Chapter 5, p. 5.4.4-1). The Draft PEIR provides detailed descriptions of existing conditions and impacts on resources potentially affected by the WSIP, including resources in the downstream section of the watershed as appropriate. Consistent with CEQA guidelines, impacts are addressed at a level of detail commensurate with the effects that could be attributable to the WSIP. Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.3) for further discussion of downstream effects on the Alameda Creek watershed.

L_ACWD-10 This comment, which supports the use of baseline conditions under the operating restrictions for Calaveras Reservoir imposed by the Division of Safety of Dams (DSOD), is acknowledged.

L_ACWD-11 As noted by the commenter, the Draft PEIR uses data from a monthly time-step model—the Hetch Hetchy/Local Simulation Model—to estimate changes in stream flow and reservoir storage levels attributable to the WSIP. While these monthly data may have limitations with respect to identifying day-to-day effects, they were used in the Draft PEIR to provide an overview of the anticipated range of impacts, which were then categorized by hydrologic year types. However, as stated in the Draft PEIR (Vol. 3, Chapter 5, p. 5.4.1-18), patterns from actual flow data were used to supplement the model results in order to provide additional detail and context for assessing potential impacts. Daily data from U.S. Geological Survey gages along Alameda Creek were used to provide a better understanding of stream flow characteristics, as shown in Tables 5.4.1-4 and 5.4.1-5 (pp. 5.4.1-12 and 5.4.1-13) and Figures 5.4.1-9 through 5.4.1-12 (pp. 5.4.1-28 to 5.4.1-31), and these data were used together with the monthly model results to determine impacts on water resources within the Alameda Creek watershed.

For additional information on this issue, please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.3).

L_ACWD-12 This comment questions the adequacy of the Draft PEIR's analysis of downstream impacts on Alameda Creek flows. This response focuses on impacts related to the WSIP water supply and system operations; please refer to **Response L_ACWD-07** for a discussion of impacts related to WSIP facility improvement projects.

In response to this comment, supplemental analysis of WSIP stream flow effects in lower Alameda Creek was conducted to augment the stream flow analysis presented in the Draft PEIR (Vol. 3, Chapter 5, Section 5.4.1). This supplemental analysis is included in **Appendix N** of this Comments and Responses document (Vol. 8) and summarized in **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.3). The commenter correctly summarizes information in the Draft PEIR regarding WSIP-induced flow reductions of approximately 50 percent during normal years and approximately 30 percent during above-normal and wet years (Vol. 3, Chapter 5, Table 5.4.1-11, p. 5.4.1-42); however, it should be noted that these estimates refer to Alameda

Creek below the San Antonio Creek confluence and not to lower Alameda Creek. The supplemental analysis presented in Appendix N provides quantitative estimates of the WSIP's effects in lower Alameda Creek, specifically at the Niles gage; unlike the analysis in the Draft PEIR, this analysis accounts for tributaries downstream of San Antonio Creek as well as other effects contributing to flow conditions at the Niles gage.

Similar to the analysis conducted for the Draft PEIR, the supplemental effort analyzed monthly mean data, which were adequate to determine the general magnitude and timing of potential effects; monthly data were also adequate to determine those instances when no change (no impact) would occur. Model applicability and the use of monthly time-step data for this analysis are further discussed in the **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.3).

As quantified in the supplemental flow analysis provided in Appendix N, implementation of the WSIP is estimated to result in flow changes in lower Alameda Creek in wet months (December to May) of normal to wet year types, and these flow changes would range from a -18 percent decrease to a +13 percent increase in flow. Flow in lower Alameda Creek would remain unchanged in the remainder of months (June to November) in normal to wet year types and in all months of below-normal (except for a slight decrease in February) and dry year types. This analysis corroborates the conclusion in Draft PEIR Impact 5.4.1-4 (Vol. 3, Chapter 5, pp. 5.4.1-39 to 5.4.1-43) that flow impacts in lower Alameda Creek would be less than significant because downstream tributaries (such as Arroyo de la Laguna) would substantially dampen the impacts resulting from WSIP-related flow changes in the upper Alameda Creek watershed.

The supplemental analysis indicated that lower Alameda Creek would experience lower average monthly flows in most winter months (December to March) of normal to wet years, ranging from a 2 to 18 percent reduction, with implementation of the WSIP. These months are generally the highest flow months of the year at Niles Canyon. The analysis also indicated that the WSIP would increase flow in lower Alameda Creek during April and May of normal to wet years, ranging from 2 to 13 percent. April and May are generally not the highest flow months of the year, and this increase in flow is therefore not expected to exceed the capacity of existing flood control infrastructure. As a result, the WSIP would generally be beneficial to flood control objectives in lower Alameda Creek.

The ACWD relies on water from the Alameda Creek watershed for approximately 15 percent of its water supply (ACWD, 2008). Flow in the creek is augmented with water from the State Water Project discharged to Vallecitos Creek, which flows into Arroyo de la Laguna near its confluence with Alameda

Creek, and the ACWD then recovers the water in lower Alameda Creek. The ACWD captures water from the creek behind three large, inflatable rubber dams that divert water to recharge ponds, where the water percolates to recharge the underlying Niles Cone Groundwater Basin, and subsequently pumps groundwater from the Niles Cone basin and to provide water supply to its customers.

As noted above, flow rates in lower Alameda Creek under the WSIP are estimated to decrease in most winter months of normal to wet years compared to current flows with Calaveras Reservoir operating under DSOD-restricted conditions. Flow rates would, however, increase in comparison to those under pre-DSOD-restricted conditions. This comparison to the pre-2002 operation of Calaveras Reservoir is relevant because the ACWD management and use of the Niles Cone Groundwater Basin predates the DSOD-restricted operating condition. Therefore, although implementation of the WSIP would alter flows in lower Alameda Creek in winter months of normal to wet years, the projected flows would be greater than the historical conditions in existence when the ACWD recharge facilities were constructed in 1972 to 1989.

The ACWD has operated facilities and made use of groundwater in the Niles Cone Groundwater Basin under historical lower-flow conditions (pre-2002) and under the recent higher-flow condition (post-2002). Flows in lower Alameda Creek under the WSIP would be bracketed within this range of flows. Therefore, the WSIP would have a less-than-significant impact on water supply operations in lower Alameda Creek.

Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.3) for a discussion of coordination with the ACWD.

L_ACWD-13 The commenter states that the Draft PEIR should evaluate the significance of potential geomorphology impacts relative to the existing condition. The Draft PEIR determined that the long-term historical condition of the Alameda Creek watershed was relevant to the analysis of geomorphology impacts because the current form of Calaveras, Alameda, and San Antonio Creeks has developed over many years. The geomorphology and sediment transport systems have been substantially altered by dams, weirs, channelization, aggregate mining, induced erosion, vegetation changes, land development, and structures in the channels. These influences have controlled the geomorphologic systems for more than 100 years. The result has been a long period of regulated stream flow, trapping of sediment behind the dams, and changes in channel erosion and aggradation below the dams. In sum, the existing stream geomorphology is the product of substantial, long-term, direct and indirect manipulation of the fluvial system.

The commenter states that the Draft PEIR should include an evaluation of downstream impacts on geomorphology and sediment transport in Niles Canyon. An average of approximately 270,000 tons (160,000 cubic yards) of sediment is transported by Alameda Creek annually (Weiss Associates, 2004a). At the Sunol Dam site, these sediments are about one-quarter to one-third sand and two-thirds to three-quarters gravel. These sediments are transported by high winter flows in the creek; for example, the estimated 3.5-year stream flow of Alameda Creek at the Sunol Dam site (approximately 7,000 cubic feet per second [cfs]) transports a volume of sediment equal to about 25 percent of the average annual sediment load in the creek (Weiss Associates, 2004a). Sediment transport curves developed by Weiss Associates for Alameda Creek near Niles indicate minimal sediment transport with flows of less than 20 cfs; thus, little sediment transport occurs during summer periods. During historical dam operations, summer flows in Alameda Creek were cut off and no sediment transport occurred. Sediment transport increases from 10 to 1,000 tons per day when stream flows increase from 100 to 1,000 cfs. At a flow of 2,000 cfs, estimated sediment loads approach 10,000 tons per day, which include both suspended sediment and bedload transport. At Niles Canyon, there is virtually no bedload transport with stream flows under 1,000 cfs, and 2,500 to 6,000 tons per day with flows of 10,000 cfs (Weiss Associates, 2004a).

In response to this comment, the Draft PEIR Impact 5.4.2-2 (Vol. 3, Chapter 5, p. 5.4.2-3, last paragraph) is revised as follows:

> **Impact 5.4.2-2: Effects on channel formation and sediment transport along Alameda Creek downstream of the diversion dam <u>and downstream of the San Antonio Creek confluence.</u>**

In addition, the following text is added to the description of Impact 5.4.2-2 (Vol. 3, Chapter 5, p. 5.4.2-4, after the first partial paragraph):

> <u>Implementation of the WSIP would reduce flow in Alameda Creek downstream of the San Antonio Creek confluence in winter months of normal to wet years, ranging from a -18 percent decrease to a +13 percent increase in flow at the USGS Niles gage station. In the majority of winter months (December to March), flows at this location would decrease, but in April and May the flows would exhibit small to moderate increases. Although implementation of the WSIP would result in additional flow in Alameda Creek in summer months as part of the 1997 CDFG MOU releases, these additional flows would not mobilize significant amounts of sediment and could be recaptured at a location downstream of the Sunol Valley WTP. This net decrease in flow in Alameda Creek below the San Antonio Creek confluence when compared to the existing condition would likely result in a slight decrease in the amount of sediment transported in Niles Canyon and lower Alameda Creek and would therefore decrease sediment and debris loading on lower Alameda Creek facilities.</u>

As noted in Impacts 5.4.2-1 and 5.4.2-3, flows and the resulting impacts on geomorphology upstream of the San Antonio Creek confluence are expected to be within the range of conditions that have been experienced since development of water supply and flood control facilities in the upper and lower Alameda Creek watershed. Therefore, implementation of the WSIP would not significantly alter bed or channel form or introduce substantial new sources of sediment.

As a result of this net decrease in sediment transport in Niles Canyon and the less-than-significant impacts in upper Alameda Creek, the impact related to geomorphologic characteristics and sediment transport along Alameda Creek downstream of the San Antonio Creek confluence would be *less than significant*. It should also be noted that the Arroyo de la Laguna watershed is the major contributor to sediment supply in Niles Canyon and lower Alameda Creek.

L_ACWD-14 The commenter cites three concerns regarding the Alameda Creek water quality information presented in Section 5.4.3.1 of the Draft PEIR (Vol. 3, Chapter 5): (1) the reference to field temperature data is incorrect; (2) water quality data may not have been subject to quality assurance/quality control (QA/QC) procedures; and (3) the location of monitoring stations is unclear.

In response to these comments, the following text from the Draft PEIR (Vol. 3, Chapter 5, p. 5.4.3-4, second full paragraph) is revised to avoid confusion about the monitoring location:

> Water quality in Alameda Creek is generally good and is protective of beneficial uses. In terms of aquatic life, the key water quality parameter is temperature, which is directly related to hydrologic flow conditions. **Table 5.4.3-3** summarizes weekly water temperature data collected by the ACWD near Sunol, above Arroyo de la Laguna, from 1997 through 2005. ~~The ACWD continuously samples, analyzes, and monitors the quality of water in Alameda Creek at a special monitoring facility located at the mouth of Niles Canyon near Mission Boulevard and at other key locations throughout the watershed (ACWD, 2007).~~ Average monthly water temperatures show an expected seasonal trend (i.e., cooler during the winter and warmer during the summer).

The footnote in Table 5.4.3-3 (Vol. 3, Chapter 5, p. 5.4.3-5) is revised as follows to identify the source of the field temperature data:

> SOURCES: ACWD (raw data provided by Laura Hidas); Merritt Smith Consulting (data reduction). Note that ACWD temperature data may not have been subject to the rigorous QA/QC procedures required for scientific studies, and therefore should be used only to indicate general conditions (unless otherwise specified by the ACWD).

The footnote in Table 5.4.3-4 (Vol. 3, Chapter 5, p. 5.4.3-6) is revised as follows to identify the source of the field temperature data:

> SOURCES: ACWD (raw data provided Laura Hidas); Merritt Smith Consulting (data reduction). Note that ACWD TDS data may not have been subject to the rigorous QA/QC procedures required for scientific studies, and therefore should be used only to indicate general conditions (unless otherwise specified by the ACWD).

L_ACWD-15 The commenter correctly quotes the Draft PEIR, which states: "…most of the summer and fall flows in Alameda Creek below its confluence with Arroyo de la Laguna originate from the South Bay Aqueduct" (Vol. 3, Chapter 5, p. 5.4.3-5). Flows in Alameda Creek below the confluence with Arroyo de la Laguna tend to be warm, because coldwater sources are largely unavailable in these reaches and base flows are low during this time of year, allowing waters to warm towards their natural temperature in equilibrium with meteorological conditions. Further, Arroyo de la Laguna appears to be a source of elevated total dissolved solids (TDS) and chloride, as noted in RWQCB (2008):

> Arroyo de la Laguna has an average TDS concentration of 630 mg/L, and an average chloride concentration of 117 mg/L. Above the confluence, Alameda Creek has a much lower average TDS concentration of 280 mg/L and an average chloride concentration of 28 mg/L. Below the confluence, both TDS and chloride in Alameda Creek increase significantly. The average TDS concentration is 437 mg/L and the average chloride concentration is 71 mg/L. (RWQCB, 2008, p. 13/17 Fact Sheet Appendix F-1)

These findings indicate that Arroyo de la Laguna is a considerable source of TDS (and chloride) in Alameda Creek.

In response to this comment, the Draft PEIR (Vol. 3, Chapter 5, p. 5.4.3-5, end of first full paragraph) is revised as follows:

> ~~In addition, most of the summer and fall flows in Alameda Creek below its confluence with Arroyo de la Laguna originate from the South Bay Aqueduct. This South Bay Aqueduct water may be warmer and is higher in total dissolved solids (TDS) than the flows in Alameda Creek originating from the Sunol Valley watershed.~~ Summer and fall flows in Alameda Creek and its tributaries are at their seasonal low. Thus, flows in Alameda Creek below its confluence with Arroyo de la Laguna tend to be warmer during these periods, because coldwater sources are largely unavailable in these reaches and base flows are low during this time of year, allowing waters to warm towards their natural temperature in equilibrium with meteorological conditions. In addition, flows in Arroyo de la Laguna appears to be higher in total dissolved solids (TDS) than the flows in Alameda Creek originating from the watershed upstream of Arroyo de la Laguna (RWQCB, 2008).

The following reference is added to the end of Section 5.4.3 (Vol. 3, Chapter 5, p. 5.4.3-12):

Regional Water Quality Control Board - San Francisco Bay (RWQCB). 2008. Final Order No. R2-2008-0011, NPDES Permit No. CAG982001 General Permit for Discharges from Aggregate Mining, Sand Washing, and Sand Offloading Facilities to Surface Waters. February 15. http://www.waterboards.ca.gov/sanfranciscobay/board_decisions/adopted_orders/2008/february/r2-2008-0011final.pdf

L_ACWD-16 Please refer to **Response S_RWQCBSF-15.**

L_ACWD-17 The commenter expresses concern that the potential effects on the Niles Cone Groundwater Basin due to reductions in flow in Alameda Creek are not adequately addressed, since the Niles Cone relies on flows in Alameda Creek to replenish the groundwater basin. Please refer to **Response L_ACWD-12,** above, **Appendix N** (Vol. 8), and **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.3) for discussions of the WSIP's impacts on flow in lower Alameda Creek.

In response to this comment, the discussion of Draft PEIR Impact 5.4.4-1 (Vol. 3, Chapter 5, p. 5.4.4-6) is revised as follows:

Impact 5.4.4-1: Changes in groundwater levels, flows, quality, and supplies.

Compared to current conditions, increased diversions and storage under the WSIP would reduce peak flows in Alameda Creek between the diversion dam and the confluence with San Antonio Creek. Seasonally, the WSIP would reduce flows in the high-flow months and increase flows in the low-flow months due to fishery releases. It would also increase storage in Calaveras Reservoir. The overall effect of these changes in groundwater supplies downstream in the Sunol aquifer areas is expected to be minor (either slightly positive or slightly negative), depending on the year's rainfall and seasonal conditions. The WSIP would reduce potential infiltration in the Sunol groundwater basin by reducing peak flows in wet years. ~~However, impacts on groundwater in the Niles Cone would be dampened by inflow from non-SFPUC watershed streams and aquifers, removal of the Sunol and Niles Dams, and ongoing withdrawals at the infiltration galleries above the water temple; as a result, impacts are expected to be minimal.~~ Impacts on groundwater in the Niles Cone would be less than significant because flows in Alameda Creek downstream of Niles Canyon would be maintained within the range of flows experienced since the Niles Cone began to be managed and utilized as a water supply resource. The program's minor changes in groundwater levels would not affect groundwater quality. This impact would be *less than significant*, and no mitigation measures would be required.

L_ACWD-18 Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.4) for a discussion of the future cumulative scenario for steelhead.

L_ACWD-19 Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Sections 14.9.3, 14.9.4, and 14.9.5) for discussion of fishery issues in lower Alameda Creek.

L_ACWD-20 The referenced Draft PEIR figure (Figure 5.7-3 in Vol. 3, Chapter 5, p. 5.7-55) has been revised and is included in **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.4) as well as in Chapter 16, Staff-Initiated Text Changes.

L_ACWD-21 As acknowledged in the Draft PEIR (Vol. 2, Chapter 4, p. 4.5-25), construction activities that could cause erosion, sedimentation, or hazardous materials releases would be subject to permits from the local flood control district or other appropriate local agency, the NPDES permitting requirements of the RWQCB, as well as SFPUC Construction Measure #3 (Onsite Air and Water Quality Measures During Construction). The SWPPP required under the NPDES permit would specify erosion control measures as well as requirements for providing secondary containment and berming of the diesel or other chemical storage areas to prevent any potential release from reaching an adjacent waterway or stormwater collection system.

The need for encroachment permits is discussed in **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.3) and noted in Table C.6 (Vol. 5, Appendix C, p. C-26) for consideration during all project-level CEQA reviews. As summarized in Section 14.4, identification of specific local agency requirements is not needed to determine the level of impact significance for this programmatic analysis, but will be addressed in the project-level environmental documentation for each WSIP project. The project-level CEQA review of all Sunol Valley projects will take into account the potential effects on downstream water intakes at the ACWD's facilities in the flood control channel.

L_ACWD-22 Please refer to **Response L_ACWD-12** regarding effects on ACWD operations and facilities. Refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.3) for a discussion of notification and coordination with the ACWD.

L_ACWD-23 The commenter states that the proposed flow releases under Draft PEIR Mitigation Measure 5.4.5-3a are contingent on future studies, and that the Draft PEIR should commit to a minimum level of flow releases to support fisheries. Consistent with CEQA Guidelines Section 15126.4(a) (1) (B), this mitigation measure, assuming it is adopted as part of the Mitigation Monitoring and

Reporting Program, would commit the SFPUC to minimum stream flow releases, and specifies performance standards to mitigate the significant effects of the WSIP (i.e., the flows must meet the minimum flow requirements to support resident trout spawning and egg incubation based on monitoring results and best available scientific information). Subsequent to publication of the Draft PEIR, the SFPUC modified the project description of the Calaveras Dam Replacement project (SV-2), as described in Sections 13.2 and 14.9.1 of this Comments and Responses document (Vol. 7, Chapters 13 and 14, respectively). These modifications address fishery resources in Alameda Creek and minimum flow requirements. Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14) for further discussion.

L_ACWD-24 Regarding the first point in this comment, Draft PEIR Table 7.2 (Vol. 4, Chapter 7, p. 7-15) shows the percentage of the ACWD's total 2030 demand met by SFPUC purchases; Table 7.3 (p. 7-18) shows the percentage of the ACWD's base-year 2001 demand met by SFPUC purchases; and the customer-specific summary for the ACWD (pp. 7-35 and 7-36) also indicates the percentage of its total water demand that would be met by SFPUC purchases in 2030. The purpose of Table 7.10 (the subject of this part of the comment) is to show how the total projected change in water demand for each customer, as developed by the Demand Side Management Least-Cost Planning Decision Support System model, compares with the projected change in overall employment and population for each customer's service area, irrespective of the source(s) of water supply used by customers to meet their total demand. The column referenced in this comment shows the percentage of total demand (not the percentage of total SFPUC purchases), and provides the reader with a sense of each customer's overall size for context in reviewing the demographic and demand comparisons presented in the table. Given that every table cannot show all attributes of each water customer's water supply, and that information on the percentage of the ACWD's demand met by SFPUC purchases is presented elsewhere in the chapter, no change is needed to Table 7.10.

Regarding the second point in this comment, each customer's current supply assurance is indicated in the customer-specific summaries presented in the Draft PEIR (Vol. 4, Chapter 7, pp. 7-35 to 7-58) and shown in Table E.1.1 (Vol. 5, Appendix E.1, p. E.1-2). As discussed in **Response L_ACWD-01**, the ACWD's recent purchases indicated by the current BAWSCA Annual Survey (for BAWSCA fiscal year 2002/2003 through 2005/2006), and its purchases in the 2001 base year used in the water demand study were somewhat lower than ACWD's contractual supply assurance. The statement in this comment—that in fiscal year 2006/2007 (for which published data are not available) the ACWD purchased its full contractual quantity—is acknowledged. Existing actual use, rather than a contractual maximum, is the appropriate baseline for evaluating the actual change in demand for 2030, and is what the Draft PEIR uses.

The third point in this comment correctly notes that the horizon years of the adopted general plans in the service area do not extend to 2030, the planning horizon for the WSIP. As discussed in Chapter 7, it is the purview of land use agencies and the elected representatives of a jurisdiction to make decisions about land use and the appropriate levels of growth in the jurisdiction. The level of growth approved in *currently adopted* general plans or plan elements, as represented by the population and employment projections in those plans, is shown in Tables 7.8 and 7.9 (Vol. 4, Chapter 7, pp. 7-28 and 7-30). The Draft PEIR acknowledges (p. 7-7) that water agencies' planning horizons are, of necessity, sometimes longer than those of land use planning agencies and the jurisdictions served by the water agencies.[1] Because some of the adopted general plans have a shorter planning horizon than the WSIP, whereas those of ABAG go to 2030, ABAG projections are also included as another point of comparison. Using 2030 instead of 2020 (as suggested in the comment) is preferred because it is the WSIP horizon year.

L_ACWD-25 Refer to **Response L_ACWD-08** regarding early coordination with the ACWD and **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.3) for a discussion of notification and coordination with the ACWD.

[1] Urban water management plans require a minimum 20-year planning horizon (Water Code, Section 10631, subdivision [a]).

Bay Area Water Supply and Conservation Agency, Arthur Jensen, General Manager, 10/1/07

L_BAWSCA1-01 This comment summarizes more detailed comments presented in Comments L-BAWSCA1-02 through L-BAWSCA1-53; refer to **Responses L-BAWSCA1-02** through **L-BAWSCA1-53**.

L_BAWSCA1-02 This comment regarding the fundamental need for the WSIP due to the regional system's vulnerability to seismic hazards is acknowledged. The Draft PEIR (Vol. 2, Chapter 4, pp. 4.4-4 to 4.4-13) describes the regional faulting and seismic hazards along the SFPUC regional water system and includes a map of major faults in the vicinity of the system (Figure 4.4-1, Vol. 2, Chapter 4, pp. 4.4-7 to 4.4-8). Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Sections 14.1.2, 14.1.3, and 14.1.4) for more discussion.

L_BAWSCA1-03 This information provided by the commenter regarding seismic hazards is acknowledged. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Sections 14.1.3 and 14.1.4) for pertinent discussion.

L_BAWSCA1-04 The information provided by the commenter regarding potential impacts of earthquakes on BAWSCA customers is acknowledged. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Sections 14.1.2, 14.1.3, and 14.1.4) for pertinent discussion.

L_BAWSCA1-05 The information provided by the commenter, which pertains to the potential economic consequences associated with SFPUC facility failures due to an extended loss of water, is acknowledged. This comment, which does not address the adequacy or accuracy of the PEIR, was submitted by multiple commenters; refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.6) for additional information.

L_BAWSCA1-06 This information regarding Assembly Bill 1823, the Wholesale Regional Water System Security and Reliability Act, is acknowledged, and corroborates information presented in the Draft PEIR (Vol. 1, Chapter 2, pp. 2-34 and 2-35).

L_BAWSCA1-07 This information regarding the passage of Measures A and E in the San Francisco November 2002 local election is acknowledged, and corroborates information presented in the Draft PEIR (Vol. 1, Chapter 3, p. 3-10).

L_BAWSCA1-08 This comment expresses an opinion on the PEIR alternatives that is based on more detailed comments; refer to **Responses L_BAWSCA-09** through **L_BAWSCA-39**.

L_BAWSCA1-09 The Draft PEIR analyzes the No Program Alternative (Vol. 4, Chapter 9, pp. 9-23 to 9-40) as required by CEQA Guidelines Section 15126.6(e). As described in the Draft PEIR, Section 9.3.1, Comparison of Alternatives (Vol. 4, Chapter 9, pp. 9-84 to 9-95), the No Program Alternative would leave the SFPUC and its customers at significant risk of supply reduction or disruption during an earthquake or other emergency or during a drought, and the Draft PEIR concluded that this is not a feasible or acceptable alternative. The Draft PEIR also demonstrates that the No Program Alternative would not be the environmentally superior alternative, since it could ultimately result in greater environmental effects than the proposed program.

L_BAWSCA1-10 This comment expresses agreement with the Draft PEIR discussion of the feasibility issues associated with the No Program Alternative. Comment acknowledged.

L_BAWSCA1-11 This comment describing potential disaster scenarios in the Bay Area is acknowledged. This comment neither relates to any section in the Draft PEIR nor addresses the adequacy or accuracy of the PEIR. However, because this comment was submitted by multiple commenters, a discussion is provided in **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.4).

L_BAWSCA1-12 This comment regarding the consequences of adoption of the No Program Alternative is acknowledged. The Draft PEIR states that the No Program Alternative is not a feasible or acceptable alternative (Vol. 4, Chapter 9, p. 9-85).

L_BAWSCA1-13 This comment implies that the No Purchase Request Increase Alternative does not meet its stated purpose. The purpose of including the No Purchase Request Increase Alternative in the PEIR alternatives analysis was "to evaluate the consequences of the SFPUC not meeting the future increase requested by its customers in an effort to avoid or minimize the potential growth-inducing effects and secondary effects of growth" (Draft PEIR Vol. 4, Chapter 9, p. 9-41). The Draft PEIR states that this alternative "would have less growth-inducement potential than the WSIP" because the SFPUC would provide less water to the wholesale customers (p. 9-46). The Draft PEIR also acknowledges the possibility that the alternative's growth-inducement potential could be similar to that of the proposed program (as cited in this comment) because growth can occur without a corresponding increase in water supply, and states that if growth were to decrease in the

Bay Area it would likely increase elsewhere. The PEIR analysis achieved the goal of evaluating the consequences of the SFPUC not meeting the requested increase and, with respect to future growth, acknowledges uncertainties. It was appropriate to include this alternative in the range of alternatives evaluated in the PEIR in order to provide agencies and others with this information and thus to foster informed decision-making and public participation. Moreover, this alternative would meet most of the program objectives (see Table 9.6, beginning on p. 9-14) and would reduce numerous impacts associated with fisheries, terrestrial biology, and stream flow in the Tuolumne River watershed (refer to Table 9.7, beginning on p. 9-17).

L_BAWSCA1-14 This comment correctly summarizes information presented on the No Purchase Request Increase Alternative. The Draft PEIR summarizes the adverse impacts associated with developing alternative sources of water supply in Table 9.10 (Vol. 4, Chapter 9, p. 9-35); the level of detail with which these impacts are described is consistent with CEQA requirements (CEQA Guidelines Section 15126.6[d]). As indicated in the Draft PEIR (Vol. 4, Chapter 9, p. 9-26), an assessment of the specific projects that each wholesale customer would pursue, and the likelihood that they could successfully implement the projects, would be speculative.

L_BAWSCA1-15 Regarding characterization of the impacts of "displaced" growth (whereby growth potential reduced in the Bay Area under the No Purchase Request Increase Alternative would cause increased growth pressure elsewhere), the Draft PEIR (Vol. 4, Chapter 9, p. 9-47) states that "growth in these outlying areas would have similar types of environmental impacts [as growth in communities served by the regional system] but of potentially greater magnitude and consequences due to the effects of new development or 'sprawl' versus the infill that would occur in the existing Bay Area communities served by the SFPUC's regional system."

L_BAWSCA1-16 This comment, which cites studies that indicate the advantages of "smart growth," is acknowledged. As it does not address the adequacy or accuracy of the PEIR, no response is provided.

L_BAWSCA1-17 This comment regarding the advantages of smart growth is acknowledged, but as it does not address the adequacy or accuracy of the PEIR, no response is provided.

L_BAWSCA1-18 This comment, which expresses the commenter's opinion that planned growth in San Francisco's neighboring communities is consistent with smart growth principles, is acknowledged. As it does not address the adequacy or accuracy of the PEIR, no response is provided.

L_BAWSCA1-19 This comment on the No Purchase Request Increase Alternative asserts that, “If growth does not occur in the SFPUC service area, it is likely to occur instead on the eastern and southern fringes of the Bay Area, as well as in the communities on the western borders of the San Joaquin Valley,” and requests that the PEIR present additional information on the impacts caused by displaced growth and compare the impacts of such growth to the impacts of “the growth the WSIP will accommodate in San Francisco and its immediately adjacent neighboring communities.”

Information from the Draft PEIR on growth patterns identified under the No Purchase Request Increase Alternative, and the environmental impacts of growth under this alternative, is provided in the Draft PEIR (Vol. 4, Chapter 9, pp. 9-46 and 9-47) and is summarized below.

Growth Patterns Under the No Purchase Request Increase Alternative

The Draft PEIR states that this alternative “would have less growth-inducement potential than the WSIP” because the SFPUC would provide less water to the wholesale customers (p. 9-46). The Draft PEIR also acknowledges the possibility that the alternative’s growth-inducement potential could be similar to that of the proposed program because growth can occur without a corresponding increase in water supply and “it is not expected that [implementation of this alternative] would deter communities from taking actions to support planned growth” (p. 9-47). Some of that growth could occur elsewhere in the form of displaced growth (defined in **Response L_BAWSCA1-15**). The Draft PEIR (p. 9-47) identifies the following areas where such displaced growth could manifest: eastern Contra Costa County, Solano and Sonoma Counties, and parts of the Central Valley.

Indirect Effects of Growth for the No Purchase Request Increase Alternative

To the extent that growth under this alternative still occurred in the wholesale customers’ service areas, the impacts would be as described in the Draft PEIR (Vol. 4, Chapter 7, pp. 7-60 to 7-78).

Regarding displaced growth, the Draft PEIR (Vol. 4, Chapter 9, p. 9-47) states that “growth in these outlying areas would have similar types of environmental impacts [as growth in communities served by the regional system] but of potentially greater magnitude and consequences due to the effects of new development or ‘sprawl’ versus the infill that would occur in the existing Bay Area communities served by the SFPUC’s regional system.”

The implied opinion of the commenter—that the WSIP would result in smart growth (in San Francisco and the Bay Plain) and that the No Purchase Request Increase (or No Program) Alternatives would result in sprawl (in the "outer" Bay Area and the western Central Valley)—is acknowledged.

L_BAWSCA1-20 Refer to **Response L_BAWSCA-19**.

L_BAWSCA1-21 Refer to **Response L_BAWSCA-19**.

L_BAWSCA1-22 Refer to **Response L_BAWSCA-19**.

L_BAWSCA1-23 Refer to **Response L_BAWSCA-19**.

L_BAWSCA1-24 Refer to **Response L_BAWSCA-19**.

L_BAWSCA1-25 The Draft PEIR includes a brief description of San Francisco's water rights (Vol. 1, Chapter 2, pp. 2-36 and 2-37), a summary of provisions of the Raker Act (Vol. 1, Chapter 2, pp. 2-33 and 2-34), and a description of SFPUC Resolution 93-0084, Defense of Water Rights (Vol. 1, Chapter 2, p. 2-45) to provide background information on the existing conditions and to provide context for understanding the WSIP. The planning horizon for the WSIP is 2030, and none of the WSIP alternatives analyzed in the Draft PEIR contemplate or require San Francisco to abandon its water rights as a condition of implementation within the planning horizon. However, the Draft PEIR analyzes impacts that could result from the adoption of alternatives that limit sales to the wholesale customers, including the possibility that wholesale customers would be expected to pursue supplemental supplies to make up for the 2030 shortfall (Vol. 4, Chapter 9, Section 9.2, pp. 9-4 to 9-84).

L_BAWSCA1-26 This comment summarizes and draws conclusions based on the more detailed comments L_BAWSCA-13 through L_BAWSCA-25, which argue that the No Purchase Request Increase Alternative is misguided and infeasible. Please refer **Responses L_BAWSCA-13** through **L_BAWSCA-25**.

L_BAWSCA1-27 This comment, which expresses agreement with statements in the Draft PEIR (Vol. 4, Chapter 9, p. 9-53) regarding the feasibility of the Aggressive Conservation/Water Recycling and Local Groundwater Alternative, is acknowledged. While the PEIR identifies technical, institutional, financial, and public acceptance challenges that would need to be overcome in order to implement this alternative, it was nonetheless included in the PEIR because of substantial public and agency interest in exploring ways to maximize conservation and recycling in place of increasing surface water diversions.

L_BAWSCA1-28 This comment characterizing per-capita water use and conservation levels in the Bay Area is acknowledged.

L_BAWSCA1-29 This comment presents the following information for the wholesale customers: water savings associated with existing plumbing codes and conservation programs; how conservation savings are accounted for in the demand projections; conservation measures considered in development of the 2030 purchase estimates; and conservation measures currently being implemented and planned for implementation. This information is acknowledged and is generally consistent with information presented in the Draft PEIR. **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) presents an expanded discussion of existing and planned conservation and recycling for the wholesale (and retail) customers to address misconceptions reflected in comments on the Draft PEIR.

L_BAWSCA1-30 This comment characterizing the existing diversified water supply portfolios of BAWSCA member agencies is acknowledged.

L_BAWSCA1-31 This comment characterizing the existing and projected diversified water supply portfolios of BAWSCA member agencies is acknowledged.

L_BAWSCA1-32 This comment characterizing San Francisco's existing water supplies is acknowledged.

L_BAWSCA1-33 The commenter is correct in the assertion that the Aggressive Conservation/Water Recycling and Local Groundwater Alternative was designed to address the impacts on the Tuolumne River, Alameda Creek, and Peninsula watersheds. Furthermore, the commenter's assertion that the Modified WSIP Alternative does a "better job at reducing overall identified impacts" is also consistent with the Draft PEIR, since the PEIR identified the Modified WSIP Alternative as the environmentally superior alternative. However, it should be noted that the Draft PEIR provides an analysis of the environmental effects of the Aggressive Conservation/Water Recycling and Local Groundwater Alternative compared to the WSIP (Vol. 4, Chapter 9, pp. 9-55 to 9-59) as required by CEQA; it does not present a direct comparison of impacts with the Modified WSIP Alternative, although it does include a general comparison of alternatives in Section 9.3.1 (pp. 9-84 to 9-95).

L_BAWSCA1-34 Assuming mitigation measures are implemented, the impacts on fisheries would be the same under the Aggressive Conservation/Water Recycling and Local Groundwater Alternative and the Modified WSIP Alternative.

L_BAWSCA1-35 The commenter's assertion is correct regarding the recreational experience of hikers along Alameda Creek in the Sunol Regional Wilderness, although the basis of the comparison depends on several assumptions, including whether or not mitigation is applied to reduce impacts to less-than-significant levels. Please refer to **Response L_BAWSCA-34**.

L_BAWSCA1-36 The commenter's assertion is correct regarding the visual effects along Alameda Creek in the Sunol Regional Wilderness, although the basis of the comparison depends on several assumptions, including whether or not mitigation is applied to reduce impacts to less-than-significant levels. Please refer to **Response L_BAWSCA-34**.

L_BAWSCA1-37 The information regarding demand hardening is acknowledged, and as indicated by the commenter, it corroborates the description of demand hardening presented in the Draft PEIR. In addition, the commenter states in footnote 5 that the Draft PEIR does not consider the environmental impacts of increased storage as a means "to bolster the drought reliability of the system." The concept of increased storage is discussed in the Draft PEIR as part of the alternatives identification and screening process (Vol. 4, Chapter 9, Table 9.14, pp. 9-106 to 9-110), and concepts involving increased storage, such as enlarging Calaveras Reservoir, were eliminated from further analysis because they did not satisfy the screening criteria sufficiently to warrant additional study (see Vol. 4, Chapter 9, pp. 9-97 to 9-128).

L_BAWSCA1-38 The information regarding the benefits of greenscapes is acknowledged, as is the assertion that aggressive conservation measures could negatively affect greenscapes. This corroborates information presented in the Draft PEIR as part of the description of demand hardening (Vol. 4, Chapter 9, p. 9-28).

L_BAWSCA1-39 The commenter's explanation of reasons for increased water use during summer and fall is acknowledged. Since this information does not affect the analysis in the Draft PEIR, no further response is provided.

L_BAWSCA1-40 The commenter's opinion that the WSIP Variant 3 – 10% Rationing is environmentally and economically superior is acknowledged. The Draft PEIR concludes that the Modified WSIP Alternative would be the environmentally superior alternative. As provided by CEQA Guidelines Section 15064, economic changes resulting from a project are not to be treated as significant effects on the environment, and therefore economic changes were not considered in the determination of the environmentally superior alternative. Moreover, WSIP Variant 3 – 10% Rationing does not reduce the significant environmental impacts of the proposed WSIP. Please refer to **Response L_BAWSCA-45**, below.

L_BAWSCA1-41 The commenter correctly describes the WSIP level of service objective of limiting rationing to a maximum of 20 percent systemwide during extended droughts. The commenter is correct in stating that such a 20 percent systemwide reduction in water service could result in some customers being required to reduce water service by less than 20 percent and others by more than 20 percent. The Draft PEIR (Vol. 1, Chapter 3, p. 3-14) states that "this systemwide level of 20 percent rationing translates into different percentages of allocation adjustments for each individual SFPUC customer. These percentages are dependent on the allocation plans … as well as further agreements among the wholesale customers. SFPUC wholesale customer allocation adjustments for a 20 percent systemwide rationing scenario could range from 12 to 40 percent for individual customers."

L_BAWSCA1-42 The comment regarding the environmental and economic consequences of a 25 percent year-round reduction in water use in the wholesale service area is acknowledged. Both the San Francisco Planning Department and the SFPUC acknowledge that the consequences of a severe water shortage would be substantial. However, as stated in the Draft PEIR, water shortages do not necessarily result in physical changes in the environment (Vol. 4, Chapter 9, p. 9-31). In accordance with CEQA Guidelines Section 15064, "the economic and social changes resulting from a project shall not be treated as significant effects on the environment." Therefore, the Draft PEIR does not analyze the economic impacts of rationing.

Nonetheless, as requested in comments submitted by BAWSCA on the Notice of Preparation (NOP) for the Draft PEIR, the PEIR (Vol. 4, Chapter 9, pp. 9-28 to 9-31) presented information on the effects of droughts and rationing on customers. The discussion draws from several published sources, including the William Wade report cited in this comment, and the California Department of Water Resources' *California Water Plan Update 2005* and *Preparing for California's Next Drought, Changes Since 1987–92*. As described on Draft PEIR p. 9-29 (under the discussion of the No Program Alternative), the experiences among water suppliers and their customers during the 1987–1992 drought varied considerably, as will likely be the case for future droughts. Relative to existing conditions, or future conditions expected to occur if the WSIP is not implemented, the WSIP would lessen the severity of economic effects, as well as environmental effects, associated with rationing. As described in the Draft PEIR (Vol. 4, Chapter 9, p. 9-13), the need for 20 percent systemwide rationing under the proposed program is projected to occur in 2 years out of the 82-year period of hydrologic record. This compares with 8 years under the existing condition and 10 years under the No Program Alternative. Therefore, implementation of the WSIP would result in fewer years of rationing, relative to the existing condition, and no further analysis or mitigation is required.

L_BAWSCA1-43 As described in the Draft PEIR (Vol. 1, Chapter 2, pp. 2-18, 2-30, and 2-34), the SFPUC currently operates the regional water system consistent with the Water First Policy, which gives priority to the production and protection of water supply over the production of hydropower generation in the operation of the Hetch Hetchy system. This existing operating strategy would continue under the WSIP (Vol. 1, Chapter 3, p. 3-39, third bullet) and is also assumed to be incorporated into all variants and alternatives analyzed in the PEIR.

L_BAWSCA1-44 The commenter correctly describes the component of the WSIP's dry-year operations strategy to secure water transfer agreements with the Turlock Irrigation District (TID) and/or the Modesto Irrigation District (MID). The opinion of the commenter regarding the source of the water transfer (i.e., conjunctive use in the Central Valley) is acknowledged. The Draft PEIR (Vol. 4, Chapter 6, p. 6-48) indicates that under Mitigation Measure 5.3.6-4a, conjunctive use of groundwater is a possible supplemental source for the water transfer agreement. Please refer to **Section 14.3, Master Response on Proposed Dry-Year Water transfer** (Vol. 7, Chapter 14, Section 14.3.2) for additional information.

L_BAWSCA1-45 The commenter correctly cites Table 8.2, footnote a, of the Draft PEIR (Vol. 4, Chapter 8, p. 8-6) regarding WSIP Variant 3 – 10% Rationing. The description and analysis of the variants are included in the PEIR at the request of the project sponsor and are not part of the CEQA requirements. As stated in the Draft PEIR, "the variants are designed to meet or exceed all WSIP goals and objectives but differ with respect to water supply source or drought-year level of service. The variants are not intended to be alternatives to the proposed program that would lessen or avoid environmental impacts as required by the California Environmental Quality Act (CEQA)" (Vol. 4, Chapter 8, p. 8-1). The WSIP Variant 3 – 10% Rationing would not reduce the significant effects of the proposed program. No additional information on the variants is needed for the Final PEIR.

L_BAWSCA1-46 Please see Section **14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14) for additional discussion and analysis of this alternative. Please also refer to **Section 14.3, Master Response on Proposed Dry-Year Water Transfer** (Vol. 7, Chapter 14, Section 14.3.2) for a detailed description of the dry-year water transfer assumptions analyzed in the PEIR.

L_BAWSCA1-47 The information provided in the commenter's Figure 17 regarding the distribution of Tuolumne River runoff is reasonably consistent with similar information presented in the Draft PEIR (Vol. 3, Chapter 5, pp. 5.7-33 and 5.7-34). The commenter is correct in stating that it is currently unknown what sources of water would be involved in a water transfer agreement between the SFPUC and TID/MID and if those sources of water could be conserved water. Therefore, in the absence of this information, the analysis and modeling conducted for the Draft PEIR used reasonable worst-case assumptions that the water would be taken out of TID/MID storage in Don Pedro Reservoir in order to provide a conservative analysis of potential impacts. Please refer to **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14) for additional discussion and analysis of the proposed water transfer of conserved water. Please also refer to **Section 14.3, Master Response on Proposed Dry-Year Water Transfer** (Vol. 7, Chapter 14, Section 14.3.2) for additional details.

The commenter's opinions on the following topics are acknowledged: (1) the commenter's support for meeting Coastside County Water District's increased demand by pumping from Crystal Springs Reservoir is conditioned on the economic impact of that approach; (2) the commenter's support for increased stream flow in a particular reach of Alameda Creek is not meant to suggest that the commenter disagrees with Alameda County Water District comments; (3) the commenter does not support the notion of permanently fallowing agricultural lands as an ongoing source of water for the Bay Area; (4) the commenter does not believe that greater urbanization of the Central Valley is likely to result in less water use on a per-acre basis; (5) the commenter corroborates the feasibility of the concept in the Modified WSIP Alternative that the dry-year water transfer should involve conserved rather than stored water; and (6) the commenter believes that the use of conserved water can provide benefits to agriculture, the urban Bay Area, and the lower Tuolumne River. Regarding the fifth comment listed above, please see **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14) for discussion and analysis of the proposed water transfer of conserved water.

L_BAWSCA1-48 This comment regarding water rights is acknowledged.

L_BAWSCA1-49 This comment expressing the recommendation of the BAWSCA board of directors is acknowledged. The Final PEIR includes additional discussion and analysis of the Modified WSIP Alternative, including the recommended water transfer based on conserved water. Please refer to **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14) for additional discussion and analysis of this alternative. However, because CEQA does not require that the PEIR evaluate the financial aspects of the alternatives, the Final PEIR does not address the feasibility of Bay Area water customers financially supporting water efficiencies in the TID and MID; that issue can be considered in the findings prepared as part of the WSIP approval process.

L_BAWSCA1-50 This comment describes opportunities for partnerships with agricultural interests to allow more water to flow through the Tuolumne River while still providing water to accommodate San Francisco and its neighboring communities. Comment acknowledged.

L_BAWSCA1-51 This comment, which expresses BAWSCA's support for the component of the Modified WSIP Alternative that calls for additional water conservation, recycling, and local groundwater in the BAWSCA service area, is acknowledged. The comment indicating BAWSCA's interest in being responsible for this component is also acknowledged.

L_BAWSCA1-52 This comment, which provides excerpts from the California Water Code related to the SFPUC regional water system and to BAWSCA's statutory authority, is acknowledged.

L_BAWSCA1-53 The commenter's preference—that BAWSCA coordinate the development of 5 to 10 mgd through regional conservation, local groundwater, or recycled water projects—is acknowledged. The SFPUC will continue to work cooperatively with BAWSCA and the individual wholesale customers to provide reliable water to meet customer's needs, regardless of whether the WSIP or an alternative is ultimately adopted.

The comment recommending a potential funding mechanism for the regional conservation, local groundwater, or recycled water projects is acknowledged.

L_BAWSCA1-54 The summary section of the Draft PEIR addresses the issue of aging water system infrastructure (Vol. 1, Summary, p. S-2), and Chapter 2 provides additional details and some examples of historical facility failures (Vol. 1, pp. 2-27 and 2-28). This information is included in the Draft PEIR to provide the reader with sufficient background and context regarding the existing system and problems to understand the purpose and need for the

WSIP; it is not intended to serve as a detailed listing of system failures. Additional discussion of system failures is presented in **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.2). The examples of regional system failures provided by the commenter are acknowledged, but have not been confirmed.

L_BAWSCA1-55 The summary section of the Draft PEIR provides the basic information relevant to the program description. Additional details regarding the water service area and customers served by the regional water system are included in Chapter 3 (Vol. 1, pp. 3-5 to 3-7), where it states that the "SFPUC serves about one-third of its water supplies directly to retail customers in San Francisco." Table 3.1 (p. 3-7) lists the major customers and indicates that the City and County of San Francisco does not receive water supplies from sources other than the SFPUC. No text changes to the Draft PEIR are warranted.

L_BAWSCA1-56 This comment on the Draft PEIR Summary (Vol. 1, p. S-2) is acknowledged; refer to **Responses L_BAWSCA-30** and **L_BAWSCA-31**.

L_BAWSCA1-57 In response to this comment, Figure S.3 (Vol. 1, Summary, p. S-5) and Figure 5.1-2 (Vol. 3, Chapter 5, p. 5.1-6) are revised as follows. The label on the right-hand side of the figure should say:

Annual Average Forecasted ~~Demands~~ <u>Deliveries</u>

L_BAWSCA1-58 The preliminary schedule for implementation of the WSIP projects is presented in Figure 3.6 of the Draft PEIR (Vol. 1, Chapter 3, p. 3-62). The SFPUC developed this schedule based on priorities related to the vulnerability of a facility to seismic damage, a facility's importance to system operations, system operational requirements, and projected funding. As discussed in the Draft PEIR (p. 3-61), the project schedule is considered preliminary and was the best available at the time of Draft PEIR preparation. The SFPUC will refine the schedule as the WSIP and related projects are further developed. Project-level CEQA documentation prepared for each WSIP project will address the updated schedule and will include an appropriate analysis of potential cumulative impacts based on the updated schedule. The dates shown on the preliminary schedule reflect construction periods, not project closeout dates.

L_BAWSCA1-59 The information requested in the comment regarding the presence of historic resources is presented in Draft PEIR Table 4.7-4 (Vol. 2, Chapter 4, beginning on p. 4.7-64).

L_BAWSCA1-60 The information and concern regarding water quality and public health issues associated with drinking water is acknowledged. As stated in the

Draft PEIR (Vol. 1, Chapter 3, pp. 3-5, 3-8, and 3-9), the fundamental mission and one of the primary goals of the WSIP is to maintain high-quality water.

L_BAWSCA1-61 The San Antonio Pump Station is located in the Sunol Valley (see Figure 2.2 in Vol. 1, Chapter 2, p. 2-9) adjacent to the Alameda Siphons. Constructed in 1968 and modified in 1992, its purpose is to pump Hetch Hetchy water to the Sunol Valley Water Treatment Plant (WTP), San Antonio Reservoir, or San Antonio Creek. Pumping Hetch Hetchy water to the Sunol Valley WTP, San Antonio Reservoir, or San Antonio Creek is necessary when the water does not meet water quality standards for delivery to customers (SFPUC, 2004). Since this information is not fundamental to the adequacy or accuracy of the Draft PEIR, no changes in the PEIR text are required.

L_BAWSCA1-62 The Draft PEIR (Vol. 1, Chapter 2, p. 2-12) states that the SFPUC's intertie with the Santa Clara Valley Water District (SCVWD) "serves as a means to transfer water between the SCVWD during an emergency or during periods of planned maintenance work on critical facilities." Thus, the water exchange between the SCVWD and SFPUC described in the next paragraph on that same page is a short-term activity.

L_BAWSCA1-63 The Draft PEIR (Vol. 1, Chapter 3, p. 3-7) describes aging infrastructure as one of the key reasons the WSIP is needed. The WSIP facility improvement projects (listed in Vol. 1, Chapter 3, pp. 3-23 to 3-25) were selected and designed to address the "operational areas and issues which act as drivers for the WSIP," or, in other words, the facilities that the SFPUC has identified as most critical and in need of major repair. It would be speculative to describe what could happen during a major seismic event, other than as already described in the Draft PEIR (Vol. 1, Chapter 3, pp. 3-15 and 3-16) based on the system performance studies conducted in support of the WSIP. Moreover, the additional information requested by the commenter is not needed to evaluate the impacts of implementing the WSIP. The description of existing system maintenance (Vol. 1, Chapter 2, pp. 2-27 and 2-28) includes examples of how existing operations and maintenance are affected by the aging infrastructure, including reasons why the Irvington, Pulgas, Crystal Springs Bypass, and Stanford Tunnels are difficult to shut down for inspection and maintenance. Additional discussion is provided in **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.2). Also refer to **Response L_BAWSCA1-54** for examples of recent outages provided by the commenter.

L_BAWSCA1-64 The commenter is correct in noting the change in the basic service level used to define the WSIP's seismic reliability system performance objective that occurred between issuance of the NOP and the Draft PEIR. The NOP stated a 215 mgd basic service level and the Draft PEIR stated 229 mgd. The originally estimated basic service level of 215 mgd was based on information developed in the SFPUC *Water Supply Master Plan* (April 2000), but these estimates were updated prior to publication of the Draft PEIR for use in determining the WSIP level of service objectives by applying winter reduction factors to average-day demands. The updated basic service level was developed using customer billing data for winter months in the 1992 to 2005 period (SFPUC, 2006a).

L_BAWSCA1-65 The WSIP level of service objective of limiting rationing to a maximum of 20 percent systemwide during an extended drought is part of the proposed program as defined by the project sponsor. CEQA does not require the sponsor to justify its selection of project components, only to describe the project's objectives. The Draft PEIR (Vol. 1, Chapter 3, p. 3-42) describes the SFPUC's management of water supplies during drought years. Note that modeling performed for the Draft PEIR analysis indicates that drought-year shortages of 20 percent would occur in only 2 years out of the 82-year hydrologic cycle (Vol. 4, Chapter 9, p. 9-13). Also refer to **Response L_BAWSCA1-42** regarding analysis of the impacts of rationing.

L_BAWSCA1-66 The Draft PEIR (Vol. 1, Chapter 3, p. 3-14, last sentence of last paragraph) states: "SFPUC *wholesale* [emphasis added] customer allocation adjustments for a 20 percent systemwide rationing scenario could range from 12 to 40 percent for individual customers." No further clarification is needed.

L_BAWSCA1-67 The statement that the SFPUC "has not committed to any level of increased water conservation or recycling in 2030, and have treated water conservation and recycling in San Francisco as a component of the WSIP" requires clarification. The SFPUC has proposed the WSIP, which includes conservation and recycling in San Francisco. Like the wholesale customers, the SFPUC already implements conservation programs. Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional discussion of conservation in San Francisco.

L_BAWSCA1-68 This comment stating that Menlo Park Water District receives 100 percent of its water supply from the SFPUC is correct. Refer to **Response L_Menlo1-08** for further discussion.

L_BAWSCA1-69 Refer to Section **14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14).

L_BAWSCA1-70 In response to this comment, the text in Item E (Vol. 1, Chapter 3, p. 3-25) of the Draft PEIR is revised as follows:

E. **Regional Recycled Water Projects** (note that these are different than the project #22, Recycled Water Projects, listed above under A). The SFPUC expects <u>that</u> ~~to consider and develop~~ some recycled water projects that would be located outside of San Francisco <u>will be developed</u> in coordination with other jurisdictions. As these projects are developed and designed, they will be reviewed to determine the appropriate <u>lead agency and</u> level of environmental review.

L_BAWSCA1-71 In response to this comment, the text in the Draft PEIR (Vol. 1, Chapter 3, p. 3-27) is revised by adding the following as the last paragraph of Section 3.5.1:

<u>Other water quality regulations of significance to the SFPUC could include the Stage 2 Disinfectants and Disinfection Byproducts Rule, Candidate Contaminant List, California Action Levels, and California Public Health Goals. The SFPUC will address these regulations as appropriate as part of its ongoing operations as well as to ensure consistency with the WSIP water quality levels of service.</u>

L_BAWSCA1-72 The commenter is correct in noting that if a facility is sized to meet one of several objectives, the facility may be able to operate beyond other minimum levels of performance. As described in the Draft PEIR (Vol. 1, Chapter 3, pp. 3-10 and 3-11), the SFPUC has conducted numerous planning and engineering studies of the regional system with respect to its vulnerability, reliability, and performance, and the Draft PEIR presents only a brief summary of the key studies and relevant results needed to demonstrate that the proposed improvements could meet or exceed the WSIP level of service objectives. More detail regarding the studies, assumptions, and analytical methods used in determining the system performance is not required under CEQA. However, it should be noted that design of the WSIP project facilities is driven by all of the program objectives in combination—seismic reliability, delivery reliability, water quality, and water supply. All four of these goals are factored into the decision on how to size the WSIP's individual facilities. The commenter is referred to the document *WSIP System Assessment for Levels of Service Objectives* (SFPUC, 2006a) and to the SFPUC memorandum *Water System Improvement Program Facilities Capacity* (SFPUC, 2008b).

L_BAWSCA1-73 The Draft PEIR (Vol. 1, Chapter 3, p. 3-30, first bullet) provides a definition and description of "Delivery During a Hetch Hetchy Water Quality Event." On rare occasions, meteorological or other conditions affect the quality of water in the Hetch Hetchy system, and the water does not meet drinking water standards and cannot be delivered to customers without filtration. During such a Hetch Hetchy water quality event, the normal system operations are constrained. The system assessment indicated that while some water could be served to customers (see the "Existing System Performance" column in Table 3.7, p. 3-31), the SFPUC would be unable to deliver the average annual demand.

L_BAWSCA1-74 The guiding principles for implementing the WSIP's sustainability and cost-effectiveness goals are listed as system performance objectives in the Draft PEIR, Table 3.2 (Vol. 1, Chapter 3, p. 3-9).

L_BAWSCA1-75 The commenter's opinion expressing agreement with the proposed system operations strategy is acknowledged.

L_BAWSCA1-76 This comment providing additional operating objectives for the SFPUC is acknowledged. The objectives for the proposed program were provided by the SFPUC to the San Francisco Planning Department. Should the SFPUC wish to change or add to the objectives of the program, it will notify the San Francisco Planning Department.

L_BAWSCA1-77 Please refer to **Response L_BAWSCA-76**. A programmatic analysis of flood-related issues is provided in the Draft PEIR (Vol. 2, Chapter 4, Impact 4.5-4, pp. 4.5-37 to 4.5-41).

L_BAWSCA1-78 The information regarding the current *Interim Water Shortage Allocation Plan* is acknowledged.

L_BAWSCA1-79 As stated in the Draft PEIR (Vol. 1, Chapter 3, p. 3-43), the SFPUC will meet, at a minimum, all current and anticipated legal requirements for the protection of fish and other wildlife habitat. The chapter further states: "Although the fishery release requirements that FERC [Federal Energy Regulatory Commission] may impose in 2016 cannot be anticipated at this time, the SFPUC assumes, for purposes of the WSIP, that it will be able to continue its current agreement with TID and MID to pay them to provide all of the additional water, if any, required for the fishery releases." It would be speculative at this time to provide any further information on anticipated future fishery release requirements.

L_BAWSCA1-80 The Draft PEIR describes the proposed water delivery operations strategy (Vol. 1, Chapter 3, pp. 3-45 and 3-46), including a strategy to optimize local water storage. The strategy integrates replenishment of local reservoirs with the need to meet increased purchase requests through 2030 and to institutionalize a planned maintenance program for the regional system facilities. With the increased conveyance capacity and addition of redundant facilities under the WSIP, the SFPUC would meet or exceed the system performance objectives delineated in Draft PEIR Table 3.2 (Vol. 1, Chapter 3, p. 3-9). This includes providing operational flexibility and system capacity to replenish local reservoirs as needed to meet the seismic reliability, delivery reliability, and water supply goals of the WSIP. Under existing conditions, the SFPUC operates the system to replenish local reservoirs to the extent possible, but it currently performs this function to meet a lower demand level and without a regular, planned maintenance program. The facilities sizing proposed under the WSIP is needed to achieve all of the program objectives in combination—seismic reliability, delivery reliability, water quality, and water supply. All four of these goals are factored into the decision on how to size the WSIP's individual facilities; the replenishment rate of local reservoirs is only one factor and cannot be separated from the other factors.

L_BAWSCA1-81 The commenter's opinion expressing agreement with the proposed system operations strategy is acknowledged.

L_BAWSCA1-82 Regarding existing system maintenance, Section 2.3.6 of the Draft PEIR (Vol. 1, Chapter 2, p. 2-27), states: "Many of the tunnels in the system are important for water delivery to customers and lack redundancy, so it is difficult to shut them down for inspections. These include the Irvington, Pulgas, Crystal Springs Bypass, and Stanford Tunnels. Some of these tunnels have not been inspected for 20 to 30 years." Additional discussion is provided in **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.2).

L_BAWSCA1-83 This comment, which expresses a preference for the components to be included in the San Joaquin Pipeline System project (SJ-3), is acknowledged. More detailed project description information will be developed and identified in the project-level environmental documentation.

L_BAWSCA1-84 Please refer to **Response L_BAWSCA1-82**. Additional discussion regarding maintenance needs and redundancy is provided in **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.2).

L_BAWSCA1-85 Staffing issues are not considered physical environmental effects, and therefore are not analyzed in the Draft PEIR.

L_BAWSCA1-86 In response to this comment, the Draft PEIR (Vol. 1, Chapter 3, p. 3-82, last paragraph) is revised as follows:

> As the preliminary schedule indicates, construction of projects is expected ~~to begin in 2008 and~~ to be completed by the end of 2014; there would be an intense period of construction from 2009 to 2010, when 18 of the 22 projects would be under construction ~~constructed~~ concurrently.

L_BAWSCA1-87 Permits, approvals, and other decisions associated with alternatives to the WSIP are listed in Draft PEIR Table 9.4 (Vol. 4, Chapter 9, pp. 9-11 and 9-12), and the table includes the information provided by the commenter.

L_BAWSCA1-88 The commenter requests that the PEIR present the beneficial seismic safety effects of the WSIP in graphic and tabular format; however, the Draft PEIR already presents this information. Sections 3.4.2 and 3.5.2 (Vol. 1, Chapter 3, pp. 3-15 and 3-27) summarize findings of the seismic vulnerability studies and present the WSIP's seismic reliability goals. Table 3.10 (Vol. 1, Chapter 3, p. 3-49) identifies which WSIP projects address seismic reliability (see Column 3 of this table), while Figure 4.4 (Vol. 2, Chapter 4, p. 4.4-7) graphically depicts the locations of all WSIP projects listed in Table 3.10 in relation to the major faults.

L_BAWSCA1-89 See **Response L_BAWSCA1-42**.

L_BAWSCA1-90 The proposed system operations strategy under the WSIP is presented in the Draft PEIR, Section 3.7 (Vol. 1, Chapter 3, pp. 3-39 and 48), which includes a description of proposed reservoir storage levels and operational flexibility needed for the proposed level of system maintenance.

L_BAWSCA1-91 This comment refers to a statement in the Draft PEIR regarding spills or releases from local reservoirs (Vol., 3, Chapter 5, p. 5.1-17, first paragraph). This statement is part of a discussion on model limitations, and it is presented in the context of explaining how model output of monthly data was used to explain phenomena that may last only a few days. However, the commenter uses this statement out of context to inquire about reservoir operations and downstream flooding.

Existing operations for system reservoirs are described in Draft PEIR Section 2.3 (Vol. 1, Chapter 2, pp. 2-16 to 2-28), which states that the local reservoirs are managed to maintain sufficient available storage and to minimize uncontrolled spills. While none of the SFPUC reservoirs have specific flood control requirements, the SFPUC operates all dams and reservoirs to avoid downstream flooding. Refer also to **Response BAWSCA1-77**.

L_BAWSCA1-92 The referenced mitigation tables (Draft PEIR, Vol. 4, Chapter 4, pp. 6-65 to 6-189) are intended to provide a quick reference guide for the reader to understand the significance determination for each project under each impact and the level of mitigation required to support this determination. For example, a determination of "less than significant" may mean that the impact is potentially significant but would be reduced to a less-than-significant level with implementation of mitigation measures and/or SFPUC standard construction measures that would ensure compliance with regulations or policies. In other cases, the impact may simply be less than significant without the need to implement mitigation measures. These tables are not intended to document the level of detail requested by the commenter. The mitigation tables are already over 100 pages long, and the addition of more detailed information would make them even more lengthy and cumbersome. As noted by the commenter, the full citations are included in Chapters 4 and 5 of the Draft PEIR.

L_BAWSCA1-93 This comment, which states that the potentially unanalyzed impacts of growth are either the same as those analyzed in the Draft PEIR or are so small as to be insignificant, and that over 90 percent of the WSIP's indirect growth impacts has already been analyzed in the CEQA documents for local jurisdictions' general plans, is noted. The potential impacts of growth that could occur beyond the projections indicated in local general plans and related land use plans are discussed in the Draft PEIR (Vol. 4, Chapter 7, pp. 7-70 and 7-71).

L_BAWSCA1-94 As stated in the Draft PEIR (Vol. 4, Chapter 8, p. 8-1), the description and analysis of variants were included in the PEIR at the request of the SFPUC and not to fulfill any CEQA requirement. Because one of the variants was identified as being able to reduce the impacts associated with increased diversions from the Tuolumne River, it was included in the CEQA alternatives analysis in Chapter 9 of the Draft PEIR.

L_BAWSCA1-95 The commenter cites summary statements in the Draft PEIR regarding the comparison of all the major impacts (significant unavoidable or potentially significant unavoidable) of the variants with those of the proposed program. However, the commenter omits a key phrase from the statement in the Draft PEIR. The complete statement from the Draft PEIR (Vol. 4, Chapter 8, p. 8-77) is as follows: "With the exception of the BARDP [Bay Area Regional Desalination Project] component of Variant 2, all three variants would have the same significant unavoidable or potentially significant unavoidable impacts as the proposed program, *although in some cases, there would be slight differences in severity of the impact.*" The Draft PEIR further states that the greatest differences among the proposed program and the variants are associated with facilities-related impacts of the BARDP and other facilities-related impacts are minor. It should be noted that the two conclusions stated by the commenter reflect the opinion of the commenter and not the conclusions of the Draft PEIR.

L_BAWSCA1-96 The information presented in Draft PEIR Table 9.2 (Vol. 4, Chapter 9, p. 9-4) is identical to that in Table 3.5 (Vol. 1, Chapter 3, p. 3-26) and compares existing and proposed regional system levels of service. It does not present a comparison of system performance. Therefore, the descriptor “not defined” is an appropriate depiction of the existing system’s level of service for seismic response. Table 3.6 (Vol. 1, Chapter 3, p. 3-29) provides a comparison of existing and future system performance for seismic response.

L_BAWSCA1-97 This comment regarding the absence of actual total cost information on the alternatives is acknowledged. The SFPUC has no additional information to provide on total costs at this time; cost is one of the factors that the SFPUC can consider in evaluating the feasibility of alternatives at the time of program approval.

L_BAWSCA1-98 See **Response L_BAWSCA1-60**.

L_BAWSCA1-99 Draft PEIR Table 9.7 (Vol. 4, Chapter 9, p. 9-17) includes a column entitled “Proposed Program” that summarizes the impact analysis for the WSIP as presented in Vol. 3, Chapter 5. The three bullet-point summary comparisons presented by the commenter are correct, although the actual number of individual impacts does not necessarily relate to the magnitude or severity of individual impacts.

L_BAWSCA1-100 The Draft PEIR (Vol. 4, Chapter 9, p. 9-26) states that “the ability of the wholesale customers to develop additional water supplies is uncertain, and further studies would be required to evaluate technical and institutional feasibility.” Part of these further studies would include determining whether and how the SFPUC system infrastructure could be used in concert with alternative supplies, and analysis of the constraints on the regional system for these purposes is beyond the scope of this PEIR. The Draft PEIR provides a thorough analysis of the environmental impacts of the proposed water supply under the WSIP, and, consistent with CEQA Guidelines Section 15126.6, the environmental impacts of the alternative supplies are evaluated at sufficient detail to allow meaningful comparison with the proposed program. With regard to the example provided by the commenter, Draft PEIR Table 9.10 (Vol. 4, Chapter 9, pp. 9-35 and 9-36) summarizes the types of projects and range of environmental impacts that could occur if the wholesale customers were to develop alternative water supplies.

L_BAWSCA1-101 This comment, which states that some urban water customers are contracting to buy conserved water from agricultural water users, is acknowledged.

L_BAWSCA1-102 This comment, stating that the wholesale customers expect to provide 13 mgd from conservation and 9 mgd from recycled water and desalination projects by 2030, is acknowledged. These water savings are factored into the 2030 water demand projections and are presented in the Draft PEIR (Vol. 1, Chapter 3, p. 3-18).

L_BAWSCA1-103 This comment states that the analysis of the Aggressive Conservation/ Water Recycling and Local Groundwater Alternative must consider the existing water demand and supply sources as well as projections for future water demand and water supply diversity. This comment provides comparisons of current and future water supply sources for the San Francisco retail area and the BAWSCA member agencies in the form of pie charts.

The intent of the word “consider” in this comment (i.e., the additional analysis being requested) is unclear. The analysis of the Aggressive Conservation/Water Recycling and Local Groundwater Alternative assumes this water supply diversity will continue, that the wholesale customers—in partnership with the SFPUC and BAWSCA—will actively participate in developing additional recycled water/groundwater/ conservation projects, and that the wholesale customers would pursue additional supplemental supply. BAWSCA’s objections to and criticisms of this alternative are raised elsewhere in this submittal (and addressed in other responses). In any case, the assertions regarding water supply diversity do not affect the adequacy of the PEIR.

(Note that the data presented for the BAWSCA agencies’ existing water use by source of supply are for fiscal year 2005/2006, which is not the base year used for the water demand projections. The data presented for the BAWSCA agencies’ 2030 water sources are somewhat inconsistent with the data in the Draft PEIR, indicating that the BAWSCA agencies’ 2030 water supply will total 320.61 mgd, rather than 323 to 325 mgd, as estimated in the demand projections; however, BAWSCA’s purchases from the SFPUC and supply diversity remain the same as presented in the Draft PEIR.)

L_BAWSCA1-104 This comment, which refers to a critical statement made by other organizations concerning single-family residential per-capita outdoor water use, is acknowledged. The SFPUC estimates of single-family residential per-capita demand for 2030 compiled for the 2006 Sustainable Water

Supply Briefing (SFPUC, 2006b)[1] differ somewhat from those cited in this comment; for additional information on this topic, please refer to **Response SI_PacInst-68** as well as **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the heading Outdoor Water Use, and Section 14.2.3, Table 14.2-12).

L_BAWSCA1-105 This comment refers to a statement by other organizations that the proposed WSIP ignores conservation, efficiency, and recycling measures. Comment acknowledged. The WSIP includes implementation of 22 to 25 mgd of conservation and recycling in the wholesale area and an additional 8 mgd in the San Francisco retail service area.

L_BAWSCA1-106 This comment refers to a recommendation by other organizations that the SFPUC conduct a study about maximum potential for conservation and efficiency savings. This comment and the BAWSCA response are acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information on this topic.

L_BAWSCA1-107 According to the SFPUC, the nonresidential sector is responsible for over 80 percent of the projected 2030 demand increase; refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the heading Outdoor Water Use).

L_BAWSCA1-108 This comment refers to a statement by other organizations that outdoor water use represents over 40 percent of the increase in nonresidential demand. This comment and the BAWSCA response are acknowledged. According to the SFPUC, about 35 percent of the increase in nonresidential demand is due to outdoor water use. Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the heading Outdoor Water Use).

L_BAWSCA1-109 This comment, which rebuts a critical statement regarding the demand studies' purported failure to account for the impact of rising prices on water consumption, is acknowledged. For additional information on this topic, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the heading Consideration of Water Price in WSIP

[1] For more information on this briefing, refer to the introduction to the responses to comments received from the Pacific Institute **(SI_PacInst)**.

Background Studies) and **Response SI_PacInst-62** (Vol. 7, Chapter 15, Section 15.4).

L_BAWSCA1-110 This comment, which consists of BAWSCA's response to statements regarding evapotranspiration controllers to reduce outdoor water use, states that BAWSCA is currently awaiting the results of a multiyear study on the effectiveness of weather-based evapotranspiration controllers in the Bay Area. Comment acknowledged. For additional information on the Irvine Ranch Water District study, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3, under the heading Frequently Submitted Comments Addressing Conservation and Recycling).

L_BAWSCA1-111 This comment, which consists of BAWSCA's response to statements regarding conservation technologies that can reduce residential water demand, is acknowledged. The Draft PEIR acknowledges that additional water savings become more difficult to achieve as more conservation measures are implemented. For additional information on this topic, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3, under the heading Frequently Submitted Comments Addressing Conservation and Recycling). With respect to the change in single-family residential per-capita demand stated in a previous L_BAWSCA1 comment, refer to **Response L_BAWSCA1-104**.

L_BAWSCA1-112 Please refer to **Response L_BAWSCA1-04** as well as **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Sections 14.1.2, 14.1.3, and 14.1.4) for pertinent discussion of this issue.

L_BAWSCA1-113 This comment, submitted in support of Comment L_BAWSCA1-23, is an excerpt from a report by the Greenbelt Alliance that provides information about actions taken in Alameda, San Mateo, and Santa Clara Counties to preserve the Bay Area Greenbelt, and estimates the acreage of greenbelt land in each county at high, medium, and low risk of conversion to urban use. This information is acknowledged; as it does not address the adequacy or accuracy of the PEIR, no response is provided.

L_BAWSCA1-114 This comment consists of BAWSCA's *Water Conservation Program's Annual Report FY 2006/7*. Refer to **Response L_BAWSCA1-23**.

L_BAWSCA1-115 The contents of the report entitled *An Economic Evaluation of the Water Supply Reliability Goal in the SFPUC Water System Improvement Plan* are acknowledged. BAWSCA commissioned this report with the purpose of reviewing the WSIP water supply level of service objective, which would limit rationing to a maximum of 20 percent systemwide during extended droughts. The report includes recommendations to the SFPUC to review and revise its water supply planning goals, and states the opinion that the SFPUC should consider the economic costs of mandatory rationing. The report does not address the adequacy or accuracy of the Draft PEIR, and therefore no response from the San Francisco Planning Department is required. It can be noted, however, that hydrologic modeling conducted for the Draft PEIR environmental analysis indicates that 20 percent systemwide rationing would only be required for 2 years out of the 82-year period of hydrologic record (or 1 in 41 years) if the WSIP were implemented. **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.6) provides additional discussion of the obligation under CEQA to evaluate the economic impacts of mandatory rationing.

L_BAWSCA1-116 This comment, which consists of the affidavit of Anson B. Moran, former general manager of the SFPUC, regarding the planning and operation of the SFPUC water facilities during a drought, is acknowledged. The affidavit does not address the adequacy or accuracy of the PEIR, and no response from the San Francisco Planning Department is required.

Bay Area Water Supply and Conservation Agency, Arthur Jensen, General Manager, 9/20/07

L_BAWSCA2-01 This comment suggests that the PEIR more clearly emphasize the importance of completing the WSIP in order to protect the public health and safety of the Bay Area's residents. For a response to this comment, please refer to **Response L_BAWSCA1-02**. For additional discussion of this topic, also refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Sections 14.1.2 and 14.1.3).

L_BAWSCA2-02 This comment lists the following points in support of the WSIP: (1) several of the SFPUC regional water system's tunnels, reservoirs, and pipelines are located on or cross one or more active fault(s); (2) there is a greater than 60 percent chance of a major earthquake before 2032; and (3) subsequent to a major earthquake, the flow of water to communities could be disrupted for 30 to 60 days. Please refer to **Response L_BAWSCA1-02** for a response to this issue. For additional discussion of this topic, also refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.3).

L_BAWSCA2-03 This comment, which characterizes water use and existing and future conservation among BAWSCA member agencies, is acknowledged. Please refer to **Responses BAWSCA1-28** and **BAWSCA1-29** as well as **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14).

L_BAWSCA2-04 Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.5) and **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.6) for clarification regarding current and estimated future municipal and agricultural diversions from the Tuolumne River.

This comment expresses support for the Modified WSIP Alternative, and for opportunities for agricultural conservation along the lower Tuolumne River as a way to offset incremental increases in Tuolumne River diversions while providing water supplies for the Bay Area. Comment acknowledged. Please refer to **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14, Section 14.10.3) for a discussion of agricultural water conservation in the services areas of TID, MID, and/or another water agency as a means of securing water for the conserved water transfer to the SFPUC. Please also refer to **Responses L_BAWSCA1-47, L_BAWSCA1-49, and L_BAWSCA1-50**.

Bay Area Water Supply and Conservation Agency, Nicole Sandkulla, Senior Water Resources Engineer, 9/5/07

[See Public Hearing Transcript, Sonora, pp. 17–20]

L_BAWSCA3-01 Please see **Response L_BAWSCA1-02**. Also see **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Sections 14.1.2 and 14.1.3) for relevant response.

L_BAWSCA3-02 The issues presented in this comment were also raised throughout the BAWSCA1 letter; refer to the responses to that letter (specifically, regarding an expected decline in residential per-capita water use, see **Response BAWSCA1-28**; regarding the need for the WSIP with respect to earthquake hazards, see **Response BAWSCA1-02**). Please also see **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.3) for additional discussion of earthquake hazards.

Bay Area Water Supply and Conservation Agency, Nicole Sandkulla, Senior Water Resources Engineer, 9/6/07

[See Public Hearing Transcript, Modesto, pp. 12-14]

L_BAWSCA4-01 Please refer to **Response L_BAWSCA1-02** for a response to this comment. For additional discussion of this topic, also refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Sections 14.1.2 and 14.1.3).

L_BAWSCA4-02 Statements presented in this comment were also raised throughout the BAWSCA1 letter; refer to the responses to that letter (in particular, regarding an expected decline in residential per-capita water use, see **Response BAWSCA1-28**).

Bay Area Water Supply and Conservation Agency, Steven Miller, Lawyer, 9/20/07

[See Public Hearing, San Francisco City Hall, September 20, 2007, pp. 9–11]

L_BAWSCA5-01 Issues presented in this comment were also raised in the L_BAWSCA1, L_BAWSCA2, L_BAWSCA3, and L_BAWSCA4 comment letters. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Sections 14.1.2, 14.1.3, and 14.1.4) for response.

L_BAWSCA5-02 Statements presented in this comment were also made throughout the BAWSCA1 letter; refer to the responses to that letter (in particular, regarding an expected decline in residential per-capita water use, see **Response BAWSCA1-28**).

L_BAWSCA5-03 Like Comment L_BAWSCA5-02, statements presented in this comment were also made throughout the BAWSCA1 comment letter and in BAWSCA2-04. Please refer to **Responses L_BAWSCA1-47, L_BAWSCA1-49,** and **L_BAWSCA1-50** for responses to these issues.

Bay Area Water Supply and Conservation Agency, Arthur Jensen, General Manager, 10/11/07

[See Public Hearing Transcript, San Francisco City Hall, October 11, 2007, pp. 39–42]

L_BAWSCA6-01 Issues presented in this comment were also raised in the L_BAWSCA1, L_BAWSCA2, L_BAWSCA3, L_BAWSCA4, and L_BAWSCA5 comment letters. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Sections 14.1.2, 14.1.3, and 14.1.4) for response.

L_BAWSCA6-02 This comment states that the Draft PEIR does not adequately describe or analyze the Modified WSIP Alternative. Please refer to **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14) in response to this comment.

L_BAWSCA6-03 This comment summarizes BAWSCA's commitment to meeting a portion of it demand through conservation and recycling measures. The comment also expresses support for the environmentally superior alternative, the Modified WSIP Alternative. Please refer to **Response L_BAWSCA1-47** in response to this comment. Also refer to **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14) for additional details.

L_BAWSCA6-04 Statements raised in this comment are similar to those made in **L_BAWSCA1-49.** Please refer to **Responses L_BAWSCA1-49** and **L_BAWSCA1-50** in response to this comment.

San Francisco Bay Conservation and Development Commission, Sara Polgar, Planner, 9/6/07

L_BCDC-01 The commenter's summary of the project description for the proposed Bay Division Pipeline (BDPL) Reliability Upgrade project (BD-1), as described in Draft PEIR Table 3.10 (Vol. 1, Chapter 3, p. 3-52) and Table C.1 (Vol. 5, Appendix C, p. C-4), is correct.

The description of the BDPL Reliability Upgrade project (BD-1) is based on the most accurate information available at the time the Draft PEIR was prepared, and the fixed locations of valve lots and construction activities were not known. Therefore, these items are not described in detail or shown precisely on figures in the Draft PEIR. Section 15142 (b) and (h) (3) and Section 15168 of the CEQA Guidelines do not require that a Program EIR provide a level of detail greater than that of the known program being analyzed (in this case the WSIP). The locations of the valve lots and construction activities for the BDPL Reliability Upgrade project will be identified and analyzed in the project-level EIR.

Draft PEIR Table C.1 (Vol. 5, Appendix C, p. C-4) and the description in the Land Use and Visual Quality section (Vol. 2, Chapter 4, p. 4.3-5, third full paragraph) may be misleading in that they suggest that the locations of the project components are known more accurately than as analyzed in the Draft PEIR, because most of the pipeline alignment for the BDPL Reliability Upgrade project (BD-1) is located adjacent to the existing SFPUC right-of-way for BDPL Nos. 1 and 2. Accordingly, in Table C.1, the project description and the description of existing land uses, facility locations, and land acquisitions are generally known because the BDPL Reliability Upgrade project is proposed to be constructed adjacent to the existing BDPL Nos. 1 and 2. Similarly, the referenced paragraph (Vol. 2, Chapter 4, p. 4.3-5) identifying aboveground facilities refers to the existing setting and aboveground structures associated with the existing BDPL Nos. 1 and 2, not the future BDPL Reliability Upgrade project.

The Draft PEIR (Vol. 2, Chapter 4, p. 4.2-8) states that the bay tunnel portion of the BDPL Reliability Upgrade project (BD-1) would be buried 100 to 150 feet below mean seal level and result in approximately 355,000 cubic yards of bay mud excavation/spoils, and acknowledges that this project could be subject to certain provisions of the SF Bay Plan.

Based on this program-level of information, the Draft PEIR did not determine the extent of BCDC's jurisdictional and permitting authority over the BDPL Reliability Upgrade project (BD-1). BCDC will have the opportunity to review detailed project information and determine jurisdiction during preparation of the project-level EIR for this project. At this stage of project planning, it is reasonable for the commenter to assume that this project falls under BCDC jurisdiction (worst-case conditions); however, this determination will be made as part of project-level CEQA review. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vo1. 7, Chapter 15, Section 14.4.2) for detailed information on the issues raised by this comment.

L_BCDC-02 The commenter's description of BCDC's authority to issue permits and to enforce policies within its area of jurisdiction is consistent with that presented in the Draft PEIR (Vol. 2, Chapter 4, p. 4.2-8). Because detailed information about filling or dredging associated with this project was not available during preparation of the Draft PEIR, the PEIR provided a broad overview of land use plans and policies applicable to the WSIP rather than listing individual policies of each plan and evaluating each WSIP project's consistency with these policies. As the commenter notes, SF Bay Plan policies concerning filling, dredging, and public access could be applicable to the BDPL Reliability Upgrade project (BD-1); however, depending on final project plans for the BD-1 tunnel segment and associated shaft structures, other BCDC policies (pertaining to such topics as fish, other aquatic organisms, and wildlife; water quality; and appearance, design, and scenic views) could also be applicable. Since project components had not yet been developed beyond a program level of detail, it was not possible for the Draft PEIR to determine the applicability of these policies.

As stated in the Draft PEIR (Vol. 2, Chapter 4, p. 4.2-10), because the policy language found in a land use plan is susceptible to varying interpretations, it is often difficult to determine whether a proposed project is consistent or inconsistent with such policies. Further, because land use plans often contain numerous policies emphasizing differing legislative goals, the BDPL Reliability Upgrade project (BD-1) may be consistent with the SF Bay Plan, taken as a whole, even though it may appear to be inconsistent with specific policies within the plan. BCDC would typically determine a project's consistency at the project (rather than program) level.

Potential BCDC jurisdiction over the BDPL Reliability Upgrade project (BD-1) is already identified in Draft PEIR Table C.6 (Vol. 5, Appendix C, p. C-26) for consideration during project-level CEQA review. Based on project-specific information regarding the siting, design, construction, and operation of the BD-1 bay tunnel segment, the project-level EIR for this project will evaluate BCDC's jurisdictional authority and summarize the applicable policies of the SF Bay Plan. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2), for more information on the issues raised by this comment.

As requested by the commenter, the text of the Draft PEIR has been augmented to further describe BCDC's jurisdictional authority and the types of Bay Plan policies that could be applicable to the BDPL Reliability Upgrade project (BD-1). The Draft PEIR (Vol. 2, Chapter 4, p. 4.2-8, last sentence of the second paragraph) is revised as follows:

San Francisco Bay Conservation and Development Commission, San Francisco Bay Plan

The San Francisco Bay Plan (SF Bay Plan), prepared by the San Francisco Bay Conservation and Development Commission (BCDC) in 1968 in accordance with the McAteer-Petris Act of 1965, is an enforceable plan that guides the protection and use of San Francisco Bay and its shoreline (BCDC, 2005). Under the McAteer-Petris Act, BCDC has the authority to issue or deny permit applications for placing fill, extracting materials, or changing the use of any land, water, or structure within the area of its jurisdiction and to enforce policies aimed at protecting the bay and its shoreline.[3a] The SF Bay Plan designates shoreline areas that should be reserved for water-related purposes like ports, industry, public recreation, airports, and wildlife refugees. Since its adoption by BCDC in 1968, the SF Bay Plan has been amended periodically to keep pace with changing conditions and to incorporate new information concerning the bay. The new Bay Division Pipeline Tunnel No. 5 proposed under the BDPL Reliability Upgrade project (BD-1) includes approximately five miles of tunnel under the Don Edwards San Francisco Bay Wildlife Refuge, Newark Slough, and San Francisco Bay. The pipeline would be buried between 100 and 150 feet below mean sea level and result in approximately 355,000 cubic yards of bay mud excavation/spoils. As a result, this project could be subject to ~~certain provisions~~ SF Bay Plan policies concerning the placement of fill in the bay, dredging, public access, and other policies and provisions contained in the SF Bay Plan (BCDC, 2005), depending on the final siting, construction, and operation of the BDPL Reliability Upgrade project.

[3a] BCDC has jurisdiction over all of San Francisco Bay up to mean high tide, areas of marsh up to 5 feet above mean sea level, a shoreline band lying 100 feet inland from the bay, as well as salt ponds, managed wetlands, and certain waterways.

In addition, the following text is added to the Draft PEIR (Vol. 2, p. 4.2-16, fourth full paragraph):

San Francisco Bay Plan

Implementation of the Bay Division Pipeline Reliability Upgrade project (BD-1) includes construction of a tunnel to replace aboveground pipelines located in San Francisco Bay. Depending on the final scope of work undertaken with respect to this project, SF Bay Plan policies could be relevant to the project. The proposed five-mile tunnel under Don Edwards San Francisco Bay Wildlife Refuge, Newark Slough, and San Francisco Bay is generally straight, which provides for ease in constructability, but is also designed to minimize environmental disruption, particularly with respect to protected species. Programmatic

> mitigation measures described in Chapter 6, if determined to be applicable, identify measures to protect and restore natural resources and habitats, including special-status species. Compliance with BCDC permitting requirements and consideration of applicable SF Bay Plan policies would also ensure that relevant policies of the SF Bay Plan are addressed and carried out to minimize environmental effects on the bay. The WSIP would, on the whole, be consistent with policies contained in the SF Bay Plan.

L_BCDC-03 As indicated in **Response L_BCDC-02**, the Draft PEIR impact analysis of the WSIP facility improvement projects does not discuss the individual policies of local and regional plans because their applicability cannot be determined until more detailed information on siting, design, construction, and operation is available for each project. Instead, the Draft PEIR seeks to provide the reader and decision-makers with an overview of the jurisdictional purview and permitting authority of federal, state, regional, and local agencies (Vol. 1, Chapter 3, p. 3-86; Vol. 5, Appendix C, p. C-26), and an overview of policies that could be applicable to the program (Vol. 2, Chapter 4, p. 4.2-1).

The Regulatory and Conservation Planning Framework section in the Draft PEIR (Vol. 2, Chapter 4, pp. 4.6-23 to 4.6-25) describes the federal and state laws pertaining to the protection of endangered species, as defined by the Federal Endangered Species Act, California state law (Fish and Game Code Sections 3511, 4700, 5050, and 5515), and the California Native Plant Protection Act, and other statutes, codes, and policies affording limited species protection under federal and state laws. Whereas BCDC relies on its policies related to fish, other aquatic organisms, and wildlife; tidal marshes and tidal flats; and salt ponds in reviewing permit applications for bay lands within its jurisdiction, the statutes and government codes described in the Draft PEIR identify specific endangered species and set forth legal requirements for the preservation and protection of these species. The BCDC policies cited by the commenter provide guidance for the protection of fish and wildlife and their habitats that are generally consistent with the legal statutory requirements for the protection and preservation of rare or endangered biological resources. However, since these BCDC policies are not laws or statutes, they are not included in the Draft PEIR regulatory discussion.

Potential BCDC jurisdiction over the BDPL Reliability Upgrade project (BD-1) is already identified in Draft PEIR Table C.6 (Vol. 5, Appendix C, p. C-26) for consideration in the project-level EIR for this project. Although it is premature to list pertinent BCDC plans and policies for the above reasons, the following discussion of BCDC jurisdiction and policies is added to the PEIR (Vol. 2, Chapter 4, p. 4.6-33, before the second full paragraph):

Local Laws, Regulations, and Policies Applying to Natural Resource Protection

The San Francisco Bay Conservation and Development Commission (BCDC) was formed in 1969 under the McAteer-Petris Act to regulate development in and around San Francisco Bay. BCDC developed the San Francisco Bay Plan to guide the wise use of the bay's water and shorelines. In reviewing permit applications for projects within its jurisdiction, BCDC relies on its Bay Plan policies to ensure the protection of habitats and biological resources, including fish, other aquatic organisms, and wildlife, and water quality; as well as policies on uses of the bay and shoreline.

L_BCDC-04 The commenter requests that the PEIR address whether the additional Tuolumne River diversions under the proposed program would conflict with the freshwater inflow policies in the Bay Plan. Any indirect effects of the WSIP on salinity in San Francisco Bay would be contingent on any WSIP-related changes in salinity due to reduced Delta inflow. The Draft PEIR analysis of impacts on flow and water quality along the Delta region first evaluated the changes in flow that would occur with the WSIP, and then estimated changes in water quality and temperature. The WSIP's impacts on flow in the Delta region are analyzed under Impact 5.3.1-5: Effects on flow along the San Joaquin River and the Sacramento–San Joaquin Delta (Vol. 3, Chapter 5, pp. 5.3.1-38 and 5.3.1-39), and the related effects on water quality are analyzed under Impact 5.3.3-2: Effects on water quality along the San Joaquin River and Sacramento–San Joaquin Delta (Vol. 3, Chapter 5, pp. 5.3.3-19 and 5.3.3-20). Based on the Draft PEIR finding that the WSIP's effects on flow and water quality in the Delta would be less than significant, the WSIP would not result in significant effects on flow farther downstream into San Francisco Bay. In response to this comment, several revisions have been made to Section 5.2 of the PEIR to clarify WSIP consistency with BCDC's freshwater inflow policies.

The following row is added to Table 5.2-1 (Vol. 3, Chapter 5, pp. 5.2-3 to 5.2-5, under the State of California heading):

The following paragraph is added to the Draft PEIR (Vol. 3, Chapter 5, p. 5.2-12, under the State Statutes and Agreements heading, above Porter-Cologne Water Quality Control Act):

McAteer-Petris Act

The McAteer-Petris Act was passed by the state legislature in 1965 to promote responsible planning and regulation of San Francisco Bay. The act designates the San Francisco Bay Conservation and Development Commission (BCDC) as the agency responsible for maintaining and carrying out the provisions of the act and the SF Bay Plan (for additional information on the act, see Chapter 4, Section 4.2, p. 4.2-8).

TABLE 5.2-1
APPLICABLE FEDERAL, STATE, AND LOCAL STATUTES AND AGREEMENTS

Statute or Agreement / Responsible Agency[a]	Summary Description	Associated Statutes and Plans	Applicability to WSIP Water Supply and System Operations Issues
State of California			
McAteer-Petris Act / BCDC	Promotes responsible planning and regulation of San Francisco Bay. Establishes BCDC as the agency responsible for carrying out the provisions of the act and of the SF Bay Plan.	San Francisco Bay Plan	Described in Section 5.2.3 and evaluated in Section 5.2.4 for consistency. Analyzed in Section 5.3.3.

The following paragraph is added to the Draft PEIR (Vol. 3, Chapter 5, p. 5.2-12, under the Local and Regional Agencies heading, above City and County of San Francisco):

San Francisco Bay Conservation and Development Commission

The San Francisco Bay Conservation and Development Commission (BCDC) is the agency responsible for maintaining and carrying out the provisions of the McAteer-Petris Act and the SF Bay Plan. In the public interest, BCDC is authorized to control bay filling and dredging and bay-related shoreline development. Due to the regulatory authority of the State Water Resources Control Board (SWRCB), San Francisco Bay Regional Water Quality Control Board, U.S. Environmental Protection Agency, and the U.S. Army Corps of Engineers, BCDC's scope of authority over water quality issues is limited. (For additional information on BCDC's regulatory authority, see Chapter 4, Section 4.2, p. 4.2-8.)

The following paragraph is added to the Draft PEIR (Vol. 3, Chapter 5, p. 5.2-20, above Regional Habitat Conservation Plans):

San Francisco Bay Plan

The SF Bay Plan, completed and adopted by BCDC in 1968, is an enforceable plan that guides the protection and use of San Francisco Bay and its shoreline. For a discussion of the SF Bay Plan's applicability to individual WSIP facility projects, see Section 4.2 (Vol. 2, Chapter 4, p. 4.2-16).

The SF Bay Plan is founded on the belief that water quality in San Francisco Bay will be maintained at levels sufficiently high to protect the beneficial uses of the bay. The SF Bay Plan includes findings and policies related to freshwater inflow and changes in salinity. The freshwater inflow findings contained in the SF Bay Plan stress the importance of maintaining a balance between fresh and saltwater. The related policies assert that the impact of freshwater diversions should be monitored by the SWRCB to ensure compliance with water quality standards.

The second paragraph in Section 5.2.4 of the Draft PEIR (Vol. 3, Chapter 5, p. 5.2-27, under the heading Consistency with Regional Natural Resource Protection Plans) is revised as follows:

Consistency with Regional Natural Resource Protection Plans

WQCPs [water quality control plans] identify water quality issues and prescribe enforceable water quality objectives/criteria for specific water bodies and their tributaries. Because these standards are based on designated beneficial uses of the respective waterways, violation of the water quality objectives/criteria can adversely affect fish, wildlife, and other protected resources. SFPUC operations currently comply with water quality standards contained in the WQCPs, and the WSIP goals and objectives would be consistent with the applicable WQCPs. <u>Further, as future SFPUC operations would be consistent with the water quality standards contained in the WQCPs, SFPUC operations would also be consistent with the SF Bay Plan freshwater inflow policies.</u> The potential impacts of WSIP implementation on water quality in the Tuolumne River watershed <u>and Sacramento–San Joaquin Delta</u>, Alameda Creek watershed, Peninsula watershed, and Westside Groundwater Basin are analyzed in Sections 5.3.3, 5.4.3, 5.5.3, and 5.6, respectively.

L_BCDC-05 All pertinent BCDC plans and policies, including policies related to the safety of fill materials and sea level rise, will be evaluated as part of the project-level CEQA review for each WSIP facility project, including the BDPL Reliability Upgrade project (BD-1).

The Draft PEIR's Regulatory Framework discussion in Section 4.5, Hydrology and Water Quality (Vol. 2, Chapter 4, p. 4.5-9) addresses federal laws under the Clean Water Act and the California Water Code. Additionally, the Regional Water Quality Control Board regulates water under the federal Porter-Cologne Water Quality Control Act. The policies of local agencies are not discussed in this section because it addresses the statutory requirements and regulations pertaining to water quality. With respect to listing individual BCDC policies in the text of the Draft PEIR, please refer to **Response L_BCDC-02**.

City of Brisbane, Randy Breault, Director of Public Works, 9/27/07

L_Brisbane-01 This comment, which supports the need of the SFPUC to meet the seismic and reliability goals of the WSIP in a timely manner, is acknowledged.

L_Brisbane-02 The opinion of the commenter in support of the Modified WSIP Alternative as the preferred alternative is acknowledged.

L_Brisbane-03 In response to this comment, the City of Brisbane has been removed entirely from Draft PEIR Table 3.11, WSIP Improvement Projects – Affected Jurisdictions (Vol. 1, Chapter 3, p. 3-60). The table is revised as follows:

Affected County and City Jurisdictions	SF-2, Groundwater Projects
~~Brisbane~~	~~X~~

L_Brisbane-04 This comment correctly summarizes information presented in Draft PEIR Chapter 7 and Appendix E and supplements information on the demographic projections used to develop Brisbane and Guadalupe Valley Municipal Improvement District's 2030 water demand; it also provides additional information regarding the City's water conservation and smart growth efforts for future development. This comment is acknowledged.

L_Brisbane-05 This comment is not inconsistent with, and expands on, demand information for Brisbane and Guadalupe Valley Municipal Improvement District presented in the Draft PEIR (Vol. 5, Appendix E, pp. E.2-5 to E.2-19).

L_Brisbane-06 This comment provides information on Brisbane's involvement in the South San Francisco–San Bruno Recycled Water Feasibility Study since the *Wholesale Customer Recycled Water Potential Technical Memorandum* was prepared. This comment is acknowledged.

City of Burlingame Public Works Department, Syed Murtuza, Director of Public Works, 9/20/07

L_Burlgme-01 The 2030 purchase estimate of 4.70 mgd (not 4.68 as stated in this comment) shown in the Draft PEIR (Vol. 1, Table 3.3, p. 3-18 and Vol. 4, Tables 7.2 and 7.3, pp. 7-15 and 7-18) is based on the "Wholesale Customer Best Estimate of Water Purchases from the SFPUC" form submitted by the City of Burlingame (dated November 8, 2004) to the SFPUC, and is also reflected in the *SFPUC 2030 Purchase Estimate Technical Memorandum* (URS, 2004b). This comment indicates that the City of Burlingame has updated its 2030 demand projection since the WSIP planning effort, and that its purchase estimate has increased by approximately 0.35 mgd (to 5.03 mgd). Comment noted. This updated projection does not alter the analysis or conclusions presented in the Draft PEIR. The demand projections and associated purchase estimates will evolve somewhat over time; the City's change is reflective of this fact.

L_Burlgme-02 The opinion of the commenter supporting WSIP Variant 3 – 10% Rationing is acknowledged. However, the commenter should note that Draft PEIR Table 8.2 (Vol. 4, Chapter 8, p. 8-5) compares the frequency of rationing that would occur under the proposed program and Variant 3 based on the hydrologic modeling over the 82-year hydrologic record, and the results indicate that the difference between the proposed program and Variant 3 would be slight. As shown on the table, there would be 8 out of the 82 years that systemwide rationing would be required under the WSIP, with 2 years of 20 percent rationing and 6 years of 10 percent rationing. Variant 3 would also require systemwide rationing for 8 of the 82 years, although rationing would be at 10 percent for all 8 years. Thus, the only difference between the proposed program and Variant 3 would be that for 2 years out of 82, the proposed program would required 20 percent systemwide rationing instead of 10 percent.

The commenter's statement that Variant 2 would require 20 percent rationing in 5.5 years of an 8-year drought is in error; Variant 2 – Regional Desalination for Drought would have the same frequency of 20 percent rationing as the proposed program, or 3.5 years of an 8-year drought. Variant 1 – All Tuolumne would require 20 percent rationing in 5.5 years of an 8-year drought.

The Draft PEIR (Vol. 4, Chapter 9, p. 9-27) discusses feasibility issues related to demand hardening and the increasing difficulty of achieving rationing goals as more and more long-term conservation measures are implemented.

California Water Service Company, Thomas Salzano, Water Resources Planning Supervisor, 9/28/07

L_CalWater-01 This comment, which expresses Cal Water's support of the WSIP goals and objectives, is acknowledged.

L_CalWater-02 This comment, which expresses support for the WSIP's conjunctive-use program in the Westside Groundwater Basin, is acknowledged.

L_CalWater-03 This comment, which notes that the projected growth presented in the Draft PEIR is consistent with current projections, that future growth will be redevelopment in existing neighborhoods, and that per-capita water demand has remained constant, is acknowledged. As it does not address the adequacy or accuracy of the PEIR, no response is provided.

L_CalWater-04 This comment, which expresses support for increasing the reliability and availability of locally produced water and for implementation of the Calaveras Dam Replacement project (SV-2), is acknowledged.

L_CalWater-05 This comment, which describes Cal Water's support for increasing the use of recycled water and its efforts in this regard, is noted.

Contra Costa Water District, Leah Orloff, Senior Water Resources Specialist, 10/1/07

L_CCWD-01 This comment requests additional information on Delta water quality effects. Please refer to **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14) for additional discussion of the WSIP's effects on Delta water quality analyzed in the PEIR.

L_CCWD-02 This comment also requests additional information on Delta water quality effects and potential effects on the CCWD. Please refer to **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14) for additional discussion of the WSIP's effects on Delta water quality analyzed in the PEIR.

Coastside County Water District, Joe Guistino / Cathleen Brennan, Interim General Manager / Water Resources Analyst, 9/24/07

L_CoastsideCWD-01 This comment expressing Coastside County Water District's (Coastside CWD) support of the WSIP's goals and objectives is acknowledged.

L_CoastsideCWD-02 The comment regarding the status of the noncontiguous areas of the Coastside CWD is acknowledged. In response to this comment, revisions have been made to the three identical figures, Figure S.2 (Vol. 1, Summary, p. S-4), Figure 3.2 (Vol. 1, Chapter 3, p. 3-6), and Figure 7.1 (Vol. 4, Chapter 7, p. 7-20); an asterisk has been placed next to the labels to these noncontiguous areas, and the following footnote added:

- Portions of Coastside County Water District not served by the SFPUC regional water system.

The revised figures can be found in Volume 7, Chapter 16, Staff-Initiated Text Changes.

L_CoastsideCWD-03 This comment expressing Coastside CWD's support of the WSIP's goals and objectives is acknowledged.

L_CoastsideCWD-04 The commenter notes that proposed Mitigation Measure 5.5.3-2 would involve the development of a revised operations plan for the SFPUC's facilities in the Pilarcitos Creek watershed (Vol. 4, Chapter 6, p. 6-56). With Measure 5.5.3-2 in place, the SFPUC would operate its Pilarcitos Creek facilities much as it does under existing conditions. After publication of the Draft PEIR, the SFPUC determined that Measure 5.5.3-2 would be technically challenging to implement, and that more practical solutions were available. As described in Vol. 7, Chapter 13, Section 13.3, replacement mitigation measures were developed that would reduce the impacts of the WSIP in the Pilarcitos Creek watershed to a less-than-significant level. The request that the SFPUC coordinate development of revised operations plans in the Pilarcitos Creek watershed with Coastside CWD is acknowledged.

L_CoastsideCWD-05 Coastside CWD's request to be involved in the development of the adaptive management program for Crystal Springs Reservoir, which will be developed as part of the operations phase of the Lower Crystal Springs Dam Improvements (WSIP facility improvement project PN-4), is acknowledged. The purpose of the adaptive management program is to protect biological resources in and around the reservoir. With the WSIP, the storage capacity and maximum water surface elevation in Crystal Springs Reservoir would increase compared to the existing condition. The Draft PEIR concludes that biological resources in the zone between the existing maximum water level and the future (with-WSIP) maximum water level could potentially be harmed by inundation (Vol. 3, Chapter 5, Sections 5.5.5 and 5.5.6). The adaptive management program would involve the development of reservoir management practices that take advantage of the increase in reservoir capacity but also protect biological resources around the existing reservoir perimeter (Mitigation Measures 5.5.6-1a and 5.5.6-1b). It is not expected that the portion of the adaptive management program that deals with maximum water surface elevations would have any effect on Coastside CWD's water supply from Crystal Springs Reservoir.

Biological resources around the perimeter of the reservoir could also be harmed during the periodic drawdown of the reservoir during maintenance of the transmission system from the Tuolumne River; therefore, the adaptive management program would address effects on biological resources due to low as well as high water levels. During maintenance of the transmission system, which would typically occur about every five years in November and December, the water needs of San Francisco and its suburban customers would be met from the local reservoirs. Coastside CWD has two water intakes at Crystal Springs Reservoir at elevations of 245 feet and 265 feet above sea level. With the WSIP and during maintenance of the transmission system, the water level in the reservoir could occasionally fall to about the elevation of the higher intake. During such times, Coastside CWD would be able to obtain water from the reservoir using the lower intake.

In response to this comment, Coastside CWD has been added to Draft PEIR Table C.6 (Vol. 5, Appendix C, p. C-26) as an agency that has requested consultation during the planning and design phases of certain WSIP projects. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.3) for a discussion of coordination with Coastside CWD.

L_CoastsideCWD-06 Please refer to **Response L_CoastsideCWD-20**, below.

L_CoastsideCWD-07 The commenter notes that infrastructure limitations prevent Coastside CWD from taking water from Pilarcitos Creek and Crystal Springs Reservoir simultaneously. Accordingly, in response to this comment, the Draft PEIR (Vol. 1, Chapter 2, p. 2-24, last paragraph, next to last sentence) is revised as follows:

> …. In the summer months, when Coastside CWD's water demand is at its seasonal maximum, its water supply from Pilarcitos Creek ~~is supplemented by water pumped from Crystal Springs Reservoir.~~ becomes insufficient to meet its needs. At that point, Coastside CWD ceases diversions from Pilarcitos Creek and obtains its water by pumping from Crystal Springs Reservoir.

L_CoastsideCWD-08 As noted by the commenter, the Draft PEIR describes current actions by the SFPUC in making experimental releases in Pilarcitos Creek below Stone Dam (Vol. 1, Chapter 2, p. 2-24, and Chapter 3, p. 3-43). The Draft PEIR also includes a description of the SFPUC's current participation with the Pilaracitos Creek Restoration Workgroup, of which Coastside CWD is a member (Vol. 3, Chapter 5, p. 5.2-21). Coastside CWD's request to be involved with the SFPUC's decisions regarding changes to its physical system and operations in the Pilarcitos Creek watershed is acknowledged.

L_CoastsideCWD-09 This comment expressing Coastside CWD's support for optimizing water storage in the Peninsula watershed is acknowledged.

L_CoastsideCWD-10 This comment stating Coastside CWD's participation in the Pilaracitos Creek Restoration Workgroup, which is preparing the Pilarcitos Creek Integrated Watershed Management Plan, is noted. This information is included in the Draft PEIR under the description of the Pilarcitos Creek Integrated Watershed Management Plan (Vol. 3, Chapter 5, p. 5.2-21).

L_CoastsideCWD-11 As part of its current operations, the SFPUC attempts to limit releases to Pilarcitos Creek after Pilarcitos Reservoir has filled to the amount of water needed by Coastside CWD. This is because the SFPUC prefers to divert water from Pilarcitos Creek to the San Mateo Creek watershed from Pilarcitos Reservoir rather than from Stone Dam. Water diverted at Pilarcitos Reservoir flows by gravity to San Andreas Reservoir, but water diverted at Stone Dam flows to the lower elevation Crystal Springs Reservoir. Ultimately, water in Crystal Springs Reservoir must be pumped to San Andreas Reservoir for treatment and distribution to customers. Energy costs are minimized if the SFPUC's Pilarcitos Creek water is diverted directly to San Andreas Reservoir.

Although it is the SFPUC's goal to limit releases to Pilarcitos Creek after Pilarcitos Reservoir has filled to the amount of water needed by Coastside CWD, this goal may not always be achieved because the two diversions cannot be operated to precisely correspond to runoff resulting from changing hydrologic conditions. Also, during periods when the SFPUC is making experimental releases of water below Stone Dam, the source of the releases is Pilarcitos Reservoir. At such times, releases from Pilarcitos Reservoir would be at least the sum of Coastside CWD's water needs and the experimental releases.

In response to this comment, the Draft PEIR (Vol. 3, Chapter 5, p. 5.5.1-9, third full paragraph, last sentence) is revised as follows:

> … After the reservoir has filled, the ~~only water~~ SFPUC <u>attempts to limit</u> releases from Pilarcitos Reservoir ~~is~~ <u>to</u> that amount requested by Coastside CWD to meet its water needs. <u>However, at times, additional water may be released from Pilarcitos Reservoir and diverted to Crystal Springs Reservoir at Stone Dam or released from Stone Dam (see discussion below regarding experimental releases from Stone Dam to Pilarcitos Creek).</u>

L_CoastsideCWD-12 Please refer to **Response L_CoastsideCWD-07**.

L_CoastsideCWD-13 With the WSIP as originally proposed, the SFPUC planned to serve a portion of Coastside CWD's increased water demand with water from Pilarcitos Creek. However, as described in Section 13.3 (Vol. 7, Chapter 13), subsequent to the publication of the Draft PEIR, the SFPUC refined its assumptions for the Pilarcitos facilities operations. Under the WSIP, the SFPUC now plans to supply most of Coastside CWD's increased demand with water from Crystal Springs Reservoir.

L_CoastsideCWD-14 The commenter notes that, under existing conditions, Coastside CWD already maximizes its use of water from Pilarcitos Creek. During the rainy season, natural runoff in Pilarcitos Creek provides sufficient water to meet Coastside CWD's needs. As runoff decreases in the late spring and early summer, water is released from Pilarcitos Reservoir to supplement natural runoff and to meet Coastside CWD's needs. At some time during some summers, storage in Pilarcitos Reservoir becomes depleted, reservoir releases are curtailed, and insufficient water reaches Stone Dam to meet Coastside CWD's needs. At that time, Coastside CWD ceases diversions from Pilarcitos Creek and is served water from Crystal Springs Reservoir.

As one of the replacement mitigation measures for potential impacts on Pilarcitos watershed resources (see Vol. 7, Chapter 16), the SFPUC would install a pumping station at Pilarcitos Reservoir, which would enable it to access additional storage in the reservoir and to maintain flow in Pilarcitos Creek during the summer of dry years. The purpose of the pumping station would be to maintain sufficient flow in the creek to protect biological resources. It would not likely affect the proposed system operations under the WSIP, including the date on which the

SFPUC would begin supplying Coastside CWD from Crystal Springs Reservoir rather than from Pilarcitos Creek.

As described in the Draft PEIR (Vol. 3, Chapter 5, p. 5.2-21), the SFPUC is a participant in the Pilarcitos Creek Restoration Workgroup, which is developing the Pilarcitos Creek Integrated Watershed Management Plan. Consideration of this plan is included in the determination that the cumulative effects of the WSIP water supply and system operations on the Pilarcitos Creek watershed would be less than significant (Vol. 3, Chapter 5, pp. 5.7-80 to 5.7-84). Also refer to **Responses L_CoastsideCWD-08** and **L_CoastsideCWD-13**.

L_CoastsideCWD-15 The Draft PEIR considers the possibility that the increase in maximum storage capacity of Crystal Springs Reservoir and the altered operations to take advantage of the increased storage capacity (both of which are part of the WSIP) could adversely affect water quality (Vol. 3, Chapter 5, pp. 5.5.3-5 and 5.5.3-6). However, this is a possible effect rather than a certain consequence of the WSIP. The possible effect was identified in two studies conducted for the SFPUC by Merritt-Smith Consulting and other consultants in 2002 and 2006 (see Vol. 3, Chapter 5, Section 5.5.3 for the complete references).

The Draft PEIR describes a chain of events that could increase algae concentrations in Crystal Springs Reservoir. For algae concentrations to increase, two phenomena—neither of them certain—would have to occur. The proportion of Hetch Hetchy water in Crystal Springs Reservoir would have to increase compared to the existing condition, and phosphorous concentrations would also have to increase.

If the proportion of Hetch Hetchy water in Crystal Springs Reservoir increased compared to the existing condition, nitrogen concentrations in the reservoir water could increase. Hetch Hetchy water contains more nitrogen (a plant nutrient) than local runoff because Hetch Hetchy water has been disinfected with chloramine (which contains nitrogen) prior to discharge into Crystal Springs Reservoir. With the WSIP, it is expected that the proportion of Hetch Hetchy water in the reservoir would be about the same as it is under the existing condition most of the time, but it is possible that it could increase at times.

Algae growth in Crystal Springs Reservoir has historically been limited by both nitrogen and phosphorous concentrations. After the SFPUC began disinfecting Hetch Hetchy water with chloramine, and thereby adding nitrogen, phosphorous became the limiting nutrient. Without a change in phosphorous concentrations, a WSIP-induced increase in nitrogen concentrations would have no effect on algae growth. A WSIP-induced increase in phosphorous concentrations could occur if the increase in water depth attributable to the WSIP resulted in more stable thermal stratification, oxygen depletion in deeper waters, and a consequent release of phosphorous from sediments. If an increase in phosphorous concentration occurred at the same time the amount of Hetch Hetchy water with higher nitrogen concentrations increased, then the WSIP could increase the growth of algae. However, it should be noted that the relationship between nutrient levels and algae growth is extremely difficult to predict, so it is uncertain that the chain of events described above would in fact result in increased algae growth.

If the WSIP is implemented, it would likely be many years, if ever, before it could be determined whether WSIP-induced changes had affected algae concentrations in the reservoir. The SFPUC routinely monitors water quality in its reservoir, but any changes in reservoir water quality attributable to the WSIP are likely to be small and difficult to distinguish from changes attributable to other factors (weather, conditions in the watersheds, etc.). As described in the Draft PEIR (Vol. 2, Chapter 4, p. 4.2-5), the SFPUC's *Peninsula Watershed Management Plan* provides a policy framework for decisions regarding activities that are appropriate on watershed lands. The primary goal of the plan is to maintain and improve source water quality to protect public health and safety, and, as Policy WQ3 specifically states, to minimize nutrient loading to the water supply. Thus, management of nutrient loading and water quality in Crystal Springs Reservoir is part of the SFPUC's ongoing operations and maintenance practices.

The SFPUC shares Coastside CWD's concerns with respect to algae concentrations and, should they become problematic for whatever reason, would take appropriate corrective action in order to maintain high water quality for all of its customers.

L_CoastsideCWD-16 The Draft PEIR describes current actions by the SFPUC in making experimental releases in Pilarcitos Creek below Stone Dam (Vol. 1, Chapter 3, p. 3-43), due in part to the concerns of the National Marine Fisheries Service. Please refer to **Response L_CoastsideCWD-08**. The SFPUC acknowledges Coastside CWD's request to be involved in any activities that affect Pilarcitos Creek. The SFPUC currently has no plans to modify Stone Dam.

L_CoastsideCWD-17 This comment correctly points out that the Pilarcitos Creek watershed and Pilarcitos Creek, as delineated in Draft PEIR Figure 5.5.1-1 (Vol. 3, Chapter 5, p. 5.5.1-2), are not within the boundaries of the Golden Gate National Recreation Area. However, while it is true that no recreational activities are allowed in Pilarcitos Reservoir or in the Pilarcitos Creek watershed, recreational uses are present along Pilarcitos Creek in the vicinity of Half Moon Bay State Beach. The following text changes are made to the Draft PEIR (Vol. 3, Section 5.5.7, p. 5.5.7-3, first full paragraph):

> Pilarcitos Creek starts at Pilarcitos Reservoir within the SFPUC Peninsula watershed. No water recreation or access to this reservoir is allowed. The creek runs south until it reaches Highway 92, then runs west ~~through portions of the Golden Gate National Recreation Area (GGNRA) and Rancho Corral de Tierra~~ to its mouth on the Pacific Ocean within Half Moon Bay State Beach. ~~Numerous public trails throughout the GGNRA and Rancho Corral del Tierra provide access to Pilarcitos Creek.~~ No organized recreational activities are established within or adjacent to the creek in the upper watershed. However, ~~T~~trails within Half Moon Bay State Beach run adjacent to and across Pilarcitos Creek, and the public is allowed access to portions of ~~the~~ this stretch of the creek (Bay Area Hiker, 2007).

L_CoastsideCWD-18 The San Francisco Planning Department acknowledges Coastside CWD’s request for involvement in developing the revised operations plans for Pilarcitos watershed facilities, as described in Mitigation Measure 5.5.3-2 (Vol., 4, Chapter 6, p. 6-56). As described in the response to L_CoastsideCWD-04 above, Measure 5.5.3-2 has been replaced by several other mitigation measures (see Vol. 7, Chapter 13, Section 13.3 for more information).

L_CoastsideCWD-19 This comment, which describes growth management provisions in the Coastside CWD service area, the challenges of projecting population growth, the limitations on use of local water supply sources, and the agency’s increased reliance on the SFPUC to meet future water demand, expands on the information presented in the Draft PEIR and is acknowledged.

L_CoastsideCWD-20 The determination that the WSIP would support a degree of growth above that planned for in the Half Moon Bay 1993 *Local Coastal Program Land Use Plan* (the adopted general plan for the city) is based on a comparison of the 2030 population assumed for the Coastside CWD service area in the demand study with the buildout population presented in the *Local Coastal Program Land Use Plan* (shown in Draft PEIR Table 7.8, Vol. 4, Chapter 7, p. 7-28). This comment regarding growth control and limits on service connections in the Coastside CWD service area is consistent with, and expands on, the information presented in the Draft PEIR (Vol. 4, Chapter 7, pp. 7-40 and 7-41).

L_CoastsideCWD-21 Please refer to **Response L_CoastsideCWD-07**.

L_CoastsideCWD-22 As noted in **Response L_CoastsideCWD-05**, Coastside CWD has two water intakes at Crystal Springs Reservoir at elevations of 245 feet and 265 feet above sea level. During maintenance of the transmission system from the Tuolumne River, the water level in the reservoir could occasionally fall to about midway between the two intakes. During such times, Coastside CWD would be able to obtain water from the reservoir using the lower intake.

L_CoastsideCWD-23 This comment expressing concern about alternatives requiring greater than 20 percent rationing is acknowledged. The commenter is correct in noting that two alternatives analyzed in the Draft PEIR—the No Program Alternative and the Aggressive Conservation/Water Recycling and Local Groundwater Alternative with no supplemental Tuolumne River water—would result in water shortages requiring systemwide rationing greater than 20 percent, as shown in Table 9.5 (Vol. 4, Chapter 9, p. 9-13). The No Program Alternative is included in the PEIR analysis because it is required by CEQA; however, as described in Table 9.6 (p. 9-15), it would not meet most of the WSIP objectives. The Aggressive Conservation/Water Recycling and Local Groundwater Alternative is included in the PEIR because it would avoid the potentially significant impacts associated with the WSIP's increased diversions from the Tuolumne River. However, this alternative to the WSIP would have feasibility issues associated with demand hardening and would fail to accomplish many of the WSIP objectives, as described in the Draft PEIR (Vol. 4, Chapter 9, p. 9-53 to 9-55).

L_CoastsideCWD-24 The commenter's concern about alternatives that would fail or partially fail the seismic reliability objective is acknowledged. These alternatives, as identified in Table 9.6 (Vol. 4, Chapter 9, p. 9-14), include the No Program, No Purchase Request Increase, Aggressive Conservation/Water Recycling and Local Groundwater, and Lower Tuolumne River Diversion Alternatives; none of these alternatives were identified as the environmentally superior alternative.

L_CoastsideCWD-25 Please refer to **Responses L_CoastsideCWD-13** and **L_CoastsideCWD-14**. As the commenter notes, it is expected that with the WSIP, and on average, Coastside CWD would have to switch from its Pilarcitos Creek water source to its Crystal Springs Reservoir water source at an earlier date than it does under the existing condition.

L_CoastsideCWD-26 The San Francisco Planning Department acknowledges Coastside CWD's request for the SFPUC to consider making improvements to both the Pilarcitos facilities and Coastside CWD's Crystal Springs facilities. At this time, the WSIP does not include any facility improvement projects related to the Pilaracitos facilities or to Coastside CWD's facilities at Crystal Springs Reservoir. However, as noted in Table 4.17-4 (Vol. 2, Chapter 4, p. 4.17-23), the Draft PEIR's cumulative impact analysis identifies two planned non-WSIP SFPUC projects related to Pilarcitos facilities that address improvement issues and increased reliability: the Pilarcitos Pipeline Inspection, and the Pilarcitos Pipeline Replacement.

L_CoastsideCWD-27 The Draft PEIR provides supporting information on Coastside CWD's water sources (Vol. 5, Appendix H2-3, pp. 1 to 16). The information was compiled from various sources, including the water delivery records maintained by SFPUC operators. References for the sources can be found in Appendix H2-3 (Vol. 5, Appendix H).

Coastside CWD's proportional use of its water sources depends on hydrologic conditions in any particular year. In the five-year period from 2001 through 2005, Coastside CWD obtained an annual average of 0.76 million gallons per day (mgd) from its wells and 1.78 mgd from the SFPUC. Of the water supplied by the SFPUC, an annual average of 0.92 mgd was obtained through diversions from Pilarcitos Creek at Stone Dam, and 0.86 mgd was pumped from Crystal Springs Reservoir. The statement in the Draft PEIR that the commenter refers to, "The SFPUC currently serves Coastside CWD primarily from the Pilarcitos Reservoir" is misleading, because in a recent five-year period the SFPUC has supplied Coastside CWD with almost equal amounts of water from Pilarcitos Creek and Crystal Springs Reservoir.

In response to this comment, the Draft PEIR (Vol. 4, Chapter 9, p. 9-90, second full paragraph, third sentence) is revised as follows:

> … The SFPUC currently serves Coastside CWD ~~primarily~~ with about equal quantities of water from ~~the~~ Pilarcitos ~~Reservoir~~ Creek and Crystal Springs Reservoir.

As the commenter notes, Coastside CWD already maximizes its use of Pilarcitos Creek water given its current level of demand (about 1.8 mgd from the SFPUC between 2001 and 2005). Under the WSIP, the SFPUC would supply water to meet Coastside CWD's 2030 estimated purchase request, and some of the additional water would be diverted from Pilarcitos Creek. As a result of the increased diversion, Pilarcitos Creek would be subject to certain environmental impacts. The impacts were described in the Draft PEIR; additional information on the impacts is provided in Vol. 7, Chapter 13, Section 13.3. Under the No Purchase Request Increase Alternative, the SFPUC would not attempt to meet Coastside CWD's full 2030 purchase request. It would divert slightly more water from Pilarcitos Creek than under the existing condition to meet Coastside CWD’s demand but less than it would under the WSIP. Consequently, hydrologic changes, and the environmental impacts that stem from the hydrologic changes, in the Pilarcitos Creek watershed under the No Purchase Request Increase Alternative would be less than those that would occur under the WSIP.

City of Daly City, Patricia Martel, City Manager, 10/1/07

L_DalyCty-01 This comment is an opening statement regarding the City of Daly City's detailed comments presented in Comments L_DalyCty-03 through L_DalyCty-53; refer to **Responses L_DalyCty-03** through **L_DalyCty-53** for the specific responses.

L_DalyCty-02 This background information on Daly City is acknowledged, and provides additional setting information insofar as it relates to how Daly City could be affected by the WSIP as a wholesale customer as well as by the WSIP facility improvement projects shown in Draft PEIR Table 3.11 (Vol. 1, Chapter 3, p. 3-60).

L_DalyCty-03 This information regarding Daly City's unmetered pipeline connections to the SFPUC regional system and protection of Daly City's municipal wells from contamination is acknowledged. The Draft PEIR includes a program-level analysis of the contamination of drinking water due to groundwater pumping in the Westside Groundwater Basin (Impact 5.6-5, Vol. 3, Chapter 5, pp. 5.6-31 and 5.6-32). The PEIR states that the SFPUC would develop a drinking water source assessment for each of the conjunctive-use wells, and that impacts related to the potential for contamination of one of these wells would be reduced to a less-than-significant level with implementation of Mitigation Measure 5.6-5, Drinking Water Source Assessments for Groundwater Wells (Vol. 4, Chapter 6, p. 6-59). This measure would require development and implementation of a source water protection program for wells that are considered vulnerable to contamination. The project-level CEQA review of the Regional Groundwater Projects (SF-2) will include a more detailed analysis of this impact and will address site-specific information such as that provided by the commenter.

L_DalyCty-04 This comment describing Daly City's water pricing structure, per-capita demand, and conservation practices is noted. This information is consistent with, and expands on, information in the Draft PEIR and in this Comments and Responses document (see **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** [Vol. 7, Chapter 14] and **Response L_BAWSCA1-28**).

L_DalyCty-05 This information regarding Daly City's participation in the conjunctive-use and recycled water programs with the SFPUC is acknowledged. The Draft PEIR includes a program-level description of the In-Lieu Recharge Demonstration Study through 2005 (Vol. 3, Chapter 5, p. 5.6-17). The commenter provides updated information regarding the In-Lieu Recharge Demonstration Study through 2007. This updated information corroborates the information used to assess impacts in the Draft PEIR's program-level analysis of groundwater impacts in the South Westside Groundwater Basin (Impacts 5.6-1, 5.6-3, 5.6-4, 5.6-5, and 5.6-6, Vol. 3, Chapter 5, pp. 5.6-23 to 5.6-32). The project-level CEQA review of the Regional Groundwater Projects (SF-2) will include a more detailed analysis of the conjunctive-use program and will address the information provided by the commenter.

L_DalyCty-06 This comment, which provides information on Daly City's Tertiary Recycled Water Facility and the provision of recycled water to the Olympic Club, Lake Merced, Daly City's Westlake Park, and San Francisco Golf Club, is acknowledged. The Draft PEIR includes a program-level description of the replacement of irrigation pumping with recycled water (Vol. 3, Chapter 5, p. 5.6-8). This supplemental information corroborates the information used to assess impacts in the Draft PEIR's program-level analysis of groundwater impacts in the South Westside Groundwater Basin (Impacts 5.6-1, 5.6-3, 5.6-4, 5.6-5, and 5.6-6, Vol. 3, Chapter 5, pp. 5.6-23 to 5.6-32). The project-level CEQA review of the Regional Groundwater Projects (SF-2) will include a more detailed analysis of the replacement of irrigation pumping with recycled water produced by the North San Mateo County Sanitation District (a subsidiary to Daly City) and will address the information provided by the commenter.

L_DalyCty-07 This comment summarizes more detailed comments related to seismic risk, conservation, and 10 percent rationing presented in Comments L_DalyCty-08 through L_DalyCty-10; refer to **Responses L_DalyCty-08** through **L_DalyCty-10** for the specific responses.

L_DalyCty-08 See **Response L_BAWSCA1-02.**

L_DalyCty-09 This comment on Daly City's projected conservation savings and implementation of Program B is noted. A minor clarification is that the *SFPUC Wholesale Customer Water Conservation Potential Technical Report* (Table 5-1, p. 5-2 in URS, 2004a) indicates a savings of 0.448 million gallons per day (mgd) under Program B for Daly City.

L_DalyCty-10 During development of the WSIP, the SFPUC Commission considered both 10 percent and 20 percent rationing scenarios, and, as a policy decision, selected the 20 percent maximum systemwide reduction in water service during drought periods for further study (Draft PEIR Vol. 1, Chapter 3, p. 3-14). Thus, under the WSIP, the SFPUC would establish a level of service of up to 20 percent systemwide rationing during extended droughts. The analysis conducted for the Draft PEIR (Vol. 4, Chapter 8, p. 8-5) determined that the frequency of 20 percent rationing under the proposed program over the 82-year hydrologic record would be approximately once in 41 years. The Draft PEIR (Vol. 4, Chapter 9, p. 9-27) discusses feasibility issues related to demand hardening and the increasing difficulty of achieving rationing goals as more and more long-term conservation measures are implemented.

The information regarding Daly City's water consumption rates is acknowledged.

The opinion of the commenter supporting WSIP Variant 3 – 10% Rationing is acknowledged. See **Response L_Burlgme-02** for clarification of the difference between the proposed program and Variant 3.

L_DalyCty-11 The commenter's interpretation of Figure S.3 (Vol. 1, Summary, p. S-5) is consistent with that used in the Draft PEIR.

L_DalyCty-12 This comment, which expresses support for the proposed water supply approach to meet the projected 35-mgd increase in average annual purchase requests, is acknowledged.

L_DalyCty-13 See **Response L_DalyCty-10**.

L_DalyCty-14 This comment, which expresses Daly City's expectation that it will continue working with the SFPUC toward implementing the conjunctive-use program under the Regional Groundwater Projects (SF-2), is acknowledged.

L_DalyCty-15 As discussed in the Draft PEIR (Vol. 1, Chapter 3, pp. 3-23 to 3-25), the SFPUC has identified numerous projects for funding through the WSIP bond measure. In addition to the recycled water projects included as part of the WSIP facility improvement project SF-3, there are regional recycled water projects that the SFPUC expects to consider and develop; these projects would be located outside of San Francisco in coordination with other jurisdictions.

L_DalyCty-16 This suggestion to use stormwater data developed under the joint Daly City/SFPUC Lake Merced Pilot Stormwater Enhancement Project as a baseline if treated stormwater is used for restoration of Lake Merced water levels under the Local Groundwater Projects (a component of WSIP facility project SF-2) is acknowledged, as is the suggestion to use groundwater sampling data around Lake Merced and in Daly City. The Draft PEIR includes a program-level analysis of water quality impacts related to restoration of Lake Merced water levels (Impact 4.5-5, Vol. 2, Chapter 4, pp. 4.5-47 to 4.5-49); the PEIR analysis concludes that water quality impacts related to the addition of treated stormwater to Lake Merced would be potentially significant for the Groundwater Projects (SF-2), but would be reduced to a less-than-significant level with treatment to remove nutrients from stormwater and implementation of groundwater monitoring in the vicinity of Lake Merced (as specified in Mitigation Measure 4.5-5). The suggested stormwater and groundwater data would support the implementation of Measure 4.5-5, and the project-level CEQA review of the Local Groundwater Projects will include a more detailed analysis of baseline stormwater and groundwater quality that addresses the information provided by the commenter.

L_DalyCty-17 The commenter expresses concurrence with the Draft PEIR significance determinations for impacts related to basin overdraft, potential effects on surface water, and seawater intrusion in the South Westside Groundwater Basin (Vol. 3, Chapter 5, pp. 5.6-23 to 5.6-29). As noted in the comment, the potential for seawater intrusion into the Westside Groundwater Basin would occur in the North Westside Groundwater Basin, north of Lake Merced, as described on p. 5.6-28 of the Draft PEIR.

L_DalyCty-18 This comment notes that future growth will mainly be infill lots aimed at mixed-use developments, and provides an exhibit showing examples of Smart Growth in Daly City to which this comment refers. Comment acknowledged.

L_DalyCty-19 This comment regards concerns raised during the scoping process about the development of demand projections, and expresses the commenter's opinion that the appropriate issue is the consistency of the methodology used rather than the availability of newer information. Comment noted. As a point of clarification, in the process of developing future water demand estimates each wholesale customer was asked to select the published population projection source to be used for its service area, as described in the Draft PEIR (Vol. 1, Chapter 3, p. 3-21 and Vol. 4, Chapter 7, p. 7-14). About two-thirds of the wholesale customers selected *Projections 2002*, the Association of Bay Area Governments' (ABAG) current projections series at the time, for their population projections. *Projections 2002* was used as the source of employment projections for all but two of the wholesale customers. For a more detailed discussion of the use of *Projections 2002* and updated forecasts presented in subsequent ABAG projections series, refer to **Responses SI_PacInst-76** and **SI_PacInst-77**.

L_DalyCty-20 The opinion of the commenter, expressing support for Variant 3 – 10% Rationing and opposition to the No Program and No Purchase Request Increase Alternatives, is acknowledged.

L_DalyCty-21 This comment, which expresses concern about the Aggressive Conservation/ Water Recycling and Local Groundwater Alternative and describes Daly City's water conservation and recycling projects and efforts related to conjunctive use, is acknowledged.

L_DalyCty-22 Please refer to **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14) for additional discussion and analysis of this alternative, as well as to **Response L_BAWSCA1-47**.

L_DalyCty-23 This comment, which addresses consistency in the application of demand projection methodology and the existence of new information or different criteria, is acknowledged. Please refer to **Response L_DalyCty-19**, above.

L_DalyCty-24 This comment concurring with and expanding on the information presented in the Draft PEIR is noted. Regarding the second paragraph in this comment, Daly City's conservation savings of 0.44 mgd is shown in the referenced table (Table 3.3, Vol. 1, Chapter 3, p. 3-18). As the table shows, conservation savings and the use of groundwater (also shown) are integral elements of the assumed supply mix, along with purchases from the SFPUC, to meet Daly City's projected demand.

L_DalyCty-25 As discussed in **Response L_DalyCty-24**, conservation and the use of other water supply sources were factored into the purchase estimates.

L_DalyCty-26 Draft PEIR Table 3.3 (Vol. 1, Chapter 3, p. 3-18), which is referenced in the section cited in this comment, includes a footnote explaining the purchase estimate range submitted by Daly City. This comment does not question the accuracy of the information presented, and the suggested revision would not alter the analysis or conclusions of the PEIR; therefore, no text change is needed.

L_DalyCty-27 The information regarding the potential for the SFPUC to work with other local agencies to provide recycled water to San Francisco is acknowledged.

L_DalyCty-28 The referenced description of Package C is the way Package C is defined in *City and County of San Francisco Retail Water Demands and Conservation Potential* (Hannaford and Hydroconsult, 2004, p. 39, second paragraph). The analogous Program C developed in the Draft PEIR for each of the wholesale customers is similarly described in the *SFPUC Wholesale Customer Water Conservation Potential Technical Report*: "Wholesale customers selected measures for Program C based on the full extent of what appeared cost-effective and implementable" (URS, 2004a, p. 4-3, last paragraph). Neither Program C nor Package C consists of any and all conservation measures considered in the respective studies, but rather resulted from a screening process that started with a larger number of potential measures. The process is summarized in the Draft PEIR (Vol. 1, Chapter 3 and Vol. 4, Chapter 7) and described in more detail in Appendix E.2 (Vol. 5, pp. E.2-12 to E.2-15).

L_DalyCty-29 The commenter states that the use of the term "additional" is an important consideration that distinguishes conjunctive-use pumping under the Regional Groundwater Projects (a component of WSIP facility improvement project SF-2) and normal historical (i.e., municipal) groundwater pumping. This comment is acknowledged and is consistent with the interpretation used in the Draft PEIR. Groundwater pumping under the Regional Groundwater Projects is described in Chapter 3 (Vol. 1, pp. 3-36 to 3-38 and 3-56). The impacts of this proposed conjunctive-use pumping are evaluated in Section 5.6 (Impacts 5.6-1 through 5.6-6, Vol. 3, Chapter 5, pp. 5.6-21 to 5.6-31), while the cumulative impacts of drought-year groundwater pumping under the WSIP combined with municipal groundwater pumping from the South Westside Groundwater Basin are addressed in Impact 5.7.5-2 (Vol. 3, Chapter 5, pp. 5.7-90 and 5.7-91).

L_DalyCty-30 See **Response L_DalyCty-29**.

L_DalyCty-31 The commenter notes that increased pumping by the participating pumpers during a drought year will make more water available to users who do not have alternate water supplies. In response to this comment, the following text from the Draft PEIR (Vol. 1, Chapter 3, p. 3-42, first full paragraph, last sentence) is revised as follows:

> In exchange, those customers would increase groundwater pumping during drought periods, thereby reducing the amount of their purchase requests during a drought and ~~creating a temporary reduction system demand~~ making more water available for serving regional water system demand.

L_DalyCty-32 The commenter expresses an expectation that any use of groundwater within San Francisco would remain consistent with Daly City's effort to preserve the Westside Groundwater Basin for municipal purposes—the best and highest use. Table 3.10 of the Draft PEIR, referred to by the commenter, addresses components of each WSIP facility project (Vol. 1, Chapter 3, p. 3-55). Water quality objectives for the Groundwater Projects (SF-2) are addressed at a program level in Section 5.6 of the Draft PEIR and are based on maintaining beneficial uses of the groundwater basin established by the Regional Water Quality Control Board in the Basin Plan (Vol. 3, Chapter 5, p. 5.6-22).

L_DalyCty-33 In response to this comment, the City of Daly City has been added to Table 3.11, WSIP Improvement Projects – Affected Jurisdictions, under SF-3, Recycled Water Projects (Vol. 1, Chapter 3, p. 3-60). The table is revised as follows:

Affected County and City Jurisdictions	**SF-3, Recycled Water Projects**
Daly City	X

L_DalyCty-34 The comment is correct about the square mileage of the North and South Westside Groundwater Basins, and these areas are provided in the discussion of the Westside Groundwater Basin aquifer system (Vol. 3, Chapter 5, pp. 5.6-4 and 5.6-5).

L_DalyCty-35 This comment, which indicates that the In-Lieu Recharge Demonstration Study is also referred to as the Aquifer Recharge Study, is acknowledged. The name of this study used in the Draft PEIR is consistent with the name used in the Luhdorff and Scalmanini report documenting the results of the study (Luhdorff and Scalmanini, 2005).

L_DalyCty-36 The commenter states that in 2005, the North San Mateo County Sanitation District (a subsidiary of the City of Daly City) delivered a total of 155.24 million gallons of recycled water to golf clubs. This supplemental information supports the program-level description of the replacement of irrigation pumping with recycled water (Vol. 3, Chapter 5, p. 5.6-8). The project-level CEQA review of the Regional Groundwater Projects (SF-2) will include a more detailed analysis of the replacement of irrigation pumping with recycled water produced by North San Mateo County Sanitation District and will address the information provided by the commenter.

L_DalyCty-37 The commenter indicates that Daly City records of historical pumping rates show a range of 278 to 305 acre-feet per year (afy), as opposed to the 120 to 150 afy stated in the Draft PEIR. The City and County of San Francisco acknowledges the information provided by the commenter and will use this and other updated data to refine the ongoing modeling being conducted to identify the potential for adverse conditions in the South Westside Groundwater Basin. The commenter correctly quotes the estimated historical pumping rates by the California Golf Club presented in the Draft PEIR (Vol. 3, Chapter 5, p. 5.6-8, footnote 8); this range is based on studies performed on behalf of the SFPUC (Luhdorff and Scalmanini, 2006). While historical groundwater pumping rates and uses were considered to determine the effects of groundwater pumping under WSIP's proposed conjunctive use program (part of the Regional Groundwater Projects, a component of SF-2), this updated information does not affect the impact analysis presented in the Draft PEIR (Vol. 3, Chapter 5, pp. 5.6-23 to 5.6-31) because the proposed groundwater pumping would be conducted consistent with operating agreements between the SFPUC and participating pumpers. The operating agreements would specify that an operating committee be established to develop annual operating and maintenance plans, and monitoring and modeling would be conducted to assess the conjunctive use program's performance and to identify and avoid potential problems. Updated information, such as that provided by the commenter, would be used to inform decisions to modify the recharge or pumping strategy as necessary (Vol. 3, Chapter 5, p. 5.6-26). The project-level CEQA review of the Regional Groundwater Projects will include an updated and more detailed review and analysis of historical pumping in the South Westside Groundwater Basin.

L_DalyCty-38 The commenter suggests identifying the beneficial uses of Lake Merced to provide a better understanding of the intent of the Local Groundwater Projects (a component of SF-2) and also describes the rapid rise in lake levels beginning in the 1930s and the original operation of Lake Merced as a systemwide balancing reservoir. In addition, this comment describes the previous misperception of Lake Merced as a surface expression of groundwater and the current understanding of the interrelationship of Lake Merced and the groundwater system, which indicates that the lake levels are only indirectly connected to the primary production aquifer and can be separately and distinctly managed. This comment is acknowledged.

The Draft PEIR (Vol. 3, Chapter 5, pp. 5.6-13 to 5.6-15) provides background information on Lake Merced as part of the description of existing conditions, and includes a discussion of the historical fluctuation of the lake and the relationship between Lake Merced and the underlying groundwater system. The beneficial uses of Lake Merced are identified in Table 4.5-1 of the Draft PEIR (Vol. 2, Chapter 4, p. 4.5-10). In response to this comment, the following text from the Draft PEIR (Vol. 3, Chapter 5, p. 5.6-13, end of third full paragraph) is revised as follows:

> However, Lake Merced has not been used as a potable water supply since the 1930s. <u>Refer to Table 4.5-1 for a description of the existing beneficial uses of Lake Merced.</u>

L_DalyCty-39 This comment, which expresses concern that the Draft PEIR discussion may create a misperception that groundwater levels in the Daly City area continue to decline, rather than having reached a stabilized level, is acknowledged. However, the Draft PEIR (Vol. 3, Chapter 5, pp. 5.6-16 and 5.6-17) includes text that should avoid this misperception; it states that: "Along the coastline to the south of Lake Merced, including Fort Funston and Thornton Beach, it appears that faulting and steeply dipping beds of the Merced Formation provide a physical barrier between the South Westside Groundwater Basin aquifer system and the Pacific Ocean; this barrier has prevented seawater intrusion, despite the fact that groundwater levels in Daly City were lowered to over 120 feet below msl prior to implementation of the In-Lieu Recharge Demonstration Study (described in Section 5.6.1.9)."

This statement does not address whether or not groundwater levels had stabilized beneath Daly City, but is intended to demonstrate the effectiveness of the barrier in preventing seawater intrusion, even though groundwater levels were 120 feet below sea level.

The commenter also states that the Draft PEIR should include additional information regarding the physical barrier that prevents seawater intrusion west of the Daly City pumping area, and that seawater intrusion is more likely to the north in San Francisco's Sunset District, where the physical barrier is thinned out. The presence of the barrier to the west of the Daly City pumping area is discussed at a program level in the Draft PEIR (Vol. 3, Chapter 5, p. 5.6-16) and is one basis for the determination that potential impacts related to seawater intrusion would be less than significant for the Regional Groundwater Projects (SF-2) in the South Westside Groundwater Basin (Impact 5.6-3, Vol. 3, Chapter 5, p. 5.6-29).

The absence of the barrier to the north of Lake Merced is described in the Draft PEIR (Vol. 3, Chapter 5, p. 5.6-16) as follows: "Even though the shallow aquifer in the North Westside Groundwater Basin is in direct connection with the ocean near the coastline, limited development of this portion of the groundwater basin and a groundwater gradient towards the ocean have prevented seawater intrusion in this area, with the exception of temporary effects on the shallow aquifer that occurred during dewatering for construction of the Oceanside Water Pollution Control Plant in the mid-1990s."

The lack of the barrier in this portion of the groundwater basin is one basis for the determination that potential impacts related to seawater intrusion would be potentially significant for the Local Groundwater Projects (SF-2) in the North Westside Groundwater Basin (Impact 5.6-3, Vol. 3, Chapter 5, pp. 5.6-28 and 5.6-29).

L_DalyCty-40 This comment, which indicates that the In-Lieu Recharge Demonstration Study is also referred to as the Aquifer Recharge Study, is acknowledged. The name of this study used in the Draft PEIR is consistent with the name used in the Luhdorff and Scalmanini report documenting the results of the study (Luhdorff and Scalmanini, 2005), and reflects the fact that the groundwater basin would be recharged because the SFPUC would provide system water to the participating pumpers in-lieu of the municipal pumping that would otherwise occur.

The commenter also provides additional and updated information regarding Daly City's participation in the study from October 2002 to May 2007. The Draft PEIR description of the In-Lieu Recharge Demonstration Study is based on the October 2005 Luhdorff and Scalmanini report (Vol. 3, Chapter 5, p. 5.6-17). The project-level CEQA analysis of the Regional Groundwater Projects (SF-2) will address this updated information provided by the commenter.

L_DalyCty-41 The commenter suggests revisions to the Draft PEIR description of Daly City's well permitting requirements specified in Chapter 13.20 of the Daly City Municipal Code. In response to this comment, the following text from the Draft PEIR (Vol. 3, Chapter 5, p. 5.6-21, last sentence of third full paragraph) is revised as follows:

> Chapter 13.20 of the Daly City Municipal Code specifies well permitting requirements for Daly City. ~~, but~~ Although this code does not include provisions related to overdraft of the Westside Groundwater Basin, Section 13.20.070 allows for denial of a permit when the request is judged not to be in the public interest.

L_DalyCty-42 The commenter suggests clarification to the Draft PEIR description of the delivery of system water during drought conditions. In response to this comment, the following text from the Draft PEIR (Vol. 3, Chapter 5, p. 5.6-25, last sentence of third full paragraph) is revised as follows:

> During drought conditions, the SFPUC would be able to reduce the quantity of SFPUC system water delivered to the participating pumpers, and the stored groundwater, or banked water, would be available for local use to supplement supplies from the regional water system.

The commenter suggests that to help distinguish conjunctive-use pumping under the Regional Groundwater Projects (SF-2) from historical pumping within the South Westside Groundwater Basin, a clarification should be added to the top of

p. 5.6-26 stating that the conjunctive-use program pumping would be restricted to the amount of banked groundwater. The Draft PEIR already includes this statement in the following description of groundwater withdrawals (Vol. 3, Chapter 5, p. 5.6-26): "*Because groundwater withdrawals would be restricted to the amount of water banked under the Regional Groundwater Projects* [emphasis added], groundwater levels as a result of implementation of the proposed conjunctive-use program would be expected to be consistently in a range higher than those that have resulted from long-term historical groundwater pumping." A similar statement is included on p. 5.6-29 of the Draft PEIR.

Additionally, the potential cumulative impacts of drought-year groundwater pumping under the WSIP combined with municipal groundwater pumping from the South Westside Groundwater Basin are addressed in Impact 5.7.5-2 (Chapter 5, pp. 5.7-90 and 5.7-91). No further clarification is required to distinguish conjunctive-use pumping from historical pumping within the South Westside Groundwater Basin.

The commenter suggests revisions to footnote 15 on p. 5.6-26 of the Draft PEIR to clarify that conjunctive-use pumping would be conducted in combination with municipal pumping by the participating pumpers. See **Response L_DalyCty-29**. No change to footnote 15 is needed because this footnote addresses only pumping under the proposed Regional Groundwater Projects (SF-2).

L_DalyCty-43 This comment, which states that recycled water was made available from the North San Mateo County Sanitation District, a subsidiary to the City of Daly City, as a substitute irrigation supply, is acknowledged. The Draft PEIR (Vol. 3, Chapter 5, p. 5.7-86) includes a program-level description of the replacement of irrigation pumping with recycled water based on the best information available at the time of preparation of the Draft PEIR. This supplemental information provided by the commenter supports the program-level analysis related to groundwater impacts in the South Westside Groundwater Basin. The project-level CEQA review of the Regional Groundwater Projects (SF-2) will include a more detailed analysis of the replacement of irrigation pumping with recycled water produced by the North San Mateo County Sanitation District and will address the information provided by the commenter

L_DalyCty-44 This comment, which provides clarification that the municipal groundwater pumping during a drought year would be equivalent to Daly City's historical 3.75 mgd pumping established for the Aquifer Recharge Study from October 2002 to May 2007, is acknowledged. The Draft PEIR includes a program-level description of historical municipal pumping in the South Westside Groundwater Basin (Vol. 3, Chapter 5, p. 5.7-86) based on studies performed on behalf of the SFPUC (Luhdorff and Scalmanini, 2006). This supplemental, updated information provided by the commenter supports the program-level analysis of groundwater impacts in the South Westside Groundwater Basin. The project-level CEQA review of the Regional Groundwater Projects (SF-2) will include a more detailed analysis of historical pumping from the South Westside Groundwater Basin and will address the updated information provided by the commenter.

The commenter also requests that a reference to Table 4-4 of the Daly City Urban Water Management Plan (UWMP) be included in the Draft PEIR. In response to this comment, the following text from the Draft PEIR (Vol. 3, Chapter 5, p. 5.7-87, first bullet) is revised as follows:

- In its 2005 UWMP, the City of Daly City estimates that future municipal groundwater pumping under the WSIP conjunctive-use program (Regional Groundwater Projects, SF-2) would range from 1.34 mgd (1,501 afy) during a nondrought year when surface water is supplied by the SFPUC to 3.76 mgd (4,212 afy) during a drought year when the city is also allowed to pump its banked groundwater (City of Daly City, 2005). These projected pumping volumes are presented in Table 4-4 of the 2005 UWMP.

L_DalyCty-45 The commenter suggests adding clarification to the second bullet point at the top of p. 5.7-91 of the Draft PEIR to refer to the "program" as the "conjunctive use program." In response to this comment, the following text from the Draft PEIR (Vol. 3, Chapter 5, p. 5.7-91, second bullet) is revised as follows:

- Under the proposed conjunctive-use program, the participating pumpers collectively would not be allowed to pump more than the quantity of banked groundwater resulting from the in-lieu delivery of SFPUC system water.

L_DalyCty-46 This comment, which is similar to Comment L_DalyCty-24 and states the City's concurrence with the Daly City data presented in Draft PEIR Table 7.2, is noted.

L_DalyCty-47 This comment concurring with and expanding on the information presented in Draft PEIR Table 7.3 is noted.

L_DalyCty-48 This comment correctly states that conservation savings (0.44 mgd) are not included in the demand estimate for Daly City shown in Table 7.10. Conservation savings are reflected in the City's 2030 purchase estimate, which is not shown in this table. Please also refer to **Response L_DalyCty-24**.

L_DalyCty-49 Refer to previous responses in this letter and to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14).

L_DalyCty-50 See **Response L_DalyCty-10**.

L_DalyCty-51 This comment, which states Daly City's concurrence with and expands on information presented in the Draft PEIR (Vol. 5, Appendix E.1, Table E.1.1,

p. E.1-2, and Table E.2.1, p. E.2-2) and provides similar information to that in Comment L_DalyCty-24, is noted. Information on Daly City's expected groundwater use, and its effects on Daly City's expected purchases, is included in Draft PEIR Table E.2.6 (Appendix E.2, p. E.2-18) as well as in Table 7.2 (Vol. 4, Chapter 7, p. 7-15).

L_DalyCty-52 This comment, which supplements information on adjustments to the Demand Side Management Least-Cost Planning Decision Support System model for Daly City (described in Draft PEIR Vol. 5, Appendix E.2, p. E.2-7) and describes Daly City's review of local planning efforts in determining future demand estimates, is acknowledged.

L_DalyCty-53 Daly City's concurrence with the information shown for conservation savings in Draft PEIR Table E.2.4 (Vol. 5, Appendix E.2), and with the explanation for the purchase estimate range in Table E.2.6, is noted. The information presented in Table E.2.5 is based on the *SFPUC Wholesale Customer Recycled Water Potential Technical Memorandum* (RMC, 2004). Demand projections, the use of other sources (including recycled water), and associated purchase estimates will evolve somewhat over time, and the City's update of information on the yield of current and planned recycled water projects is reflective of this fact. The comment correctly notes that the WSIP demand studies considered water supply sources that would offset demand for potable supplies and did not include demand that is exclusively for nonpotable supplies in the baseline and projected future demands. Similarly, the recycled water potential studies distinguished between total recycled water projects and those that would replace potable supplies; only recycled water that would replace potable supplies is shown in the Draft PEIR tables. The information presented in this comment regarding Daly City's other recycled water projects is acknowledged.

L_DalyCty-54 This comment indicates that the starting point and endpoint values in Draft PEIR Tables E.3.4, E.3.5, and E.3.6 (Vol. 5, Appendix E.3, pp. E.3-6 to E.3-8) are correct, that Daly City records have slight differences in the numbers presented between the period 2005–2025 and 2005–2030, and that the differences are not significant. Comment noted. As it does not address the adequacy or accuracy of the PEIR, no response is provided.

L_DalyCty-55 This comment concurs with numbers presented in Draft PEIR Table E.3.37 (Vol. 5, Appendix E.3, p. E.3-43) but cautions that the water demand estimate for 2030 does not include water conservation potential consistent with Program B. Comment acknowledged. As it does not address the adequacy or accuracy of the PEIR, no response is provided.

Dublin San Ramon Services District, Bert Michalczyk, General Manager, 9/28/07

L_DSRSD-01 The information presented in Draft PEIR Section 3.4.6 (Vol. 1, Chapter 3, pp. 3-23 to 3-25), consists of the projects that the SFPUC had identified for funding through the WSIP bond measure as of the publication of the Draft PEIR in June 2007. As stated in that section, the SFPUC is continuing to develop and refine the WSIP projects. The information provided by the commenter regarding regional interconnecting projects is acknowledged for future consideration by the SFPUC. The SFPUC currently has a number of interties with other Bay Area water agencies, including the Santa Clara Valley Water District and East Bay Municipal Utility District, for use during emergencies or planned maintenance on critical facilities (Vol. 1, Chapter 2, p. 2-12) as part of its overall water supply reliability of existing operations. As described in the Draft PEIR (Vol. 4, Chapter 9, Tables 9.13 and 9.14, pp. 9-104 to 9-110), numerous alternative strategies and concepts were identified, including consideration of regional groundwater and recycling projects and additional interties, many of which were incorporated into the CEQA alternatives analysis in Chapter 9.

East Bay Municipal Utility District, William Kirkpatrick, Manager of Water Distribution Planning, 8/27/07

L_EBMUD-01 This comment, which expresses appreciation for the opportunity to comment on the Draft PEIR and requests that the East Bay Municipal Utility District remain on the project mailing list, is acknowledged.

East Bay Regional Park District, Chris Barton, Senior Planner, 10/1/07

L_EBRPD-01 The commenter is concerned that the WSIP could affect the park user's experience. The significance criteria applied in the Recreational Resources section (Draft PEIR, Vol. 2, Chapter 4, p. 4.12-17) relate to projects that develop recreational facilities and projects that would result in an increase in demand for recreational activities. The City and County San Francisco (CCSF) CEQA Checklist includes an additional significance criterion related to projects that could adversely affect existing recreational resources. Under this third criterion, the Draft PEIR impact analysis considered whether the project would result in: (1) direct removal of or damage to existing recreational resources; (2) indirect impacts such as air quality and noise effects that degrade the quality of the recreational experience; and (3) disruption of access to existing recreation facilities. These topics are typically covered under the Land Use, Aesthetics, Traffic, Air Quality, and Noise sections. The impact analysis in the Draft PEIR takes into account the types of activities described by the commenter that provide park users with recreational experiences at East Bay Regional Park District (EBRPD) facilities as well as recreational facilities throughout the WSIP study area.

Further, Section 15382 of the CEQA Guidelines emphasizes that a significant effect on the environment is a substantial adverse change in the physical condition of the project area. Impacts on the subjective experiences of nature appreciation, hiking, and photography could occur as a result of physical environmental impacts (such as traffic, air quality, noise, park access, biological resources, and visual impacts). Thus, the above-added criteria are intended to tie physical environmental impacts to effects on the recreational experience. The recreational impact analysis in the Draft PEIR (Vol. 2, Chapter 4, pp. 4.12-18 to 4.12-28) considered physical impacts such as siting, construction, and operation of WSIP facilities in the evaluation of impacts on the quality of the recreational experience. One example is the evaluation of the Calaveras Dam Replacement project (SV-2), which considered potential temporary and long-term impacts on visual resources at borrow sites and spoils areas as seen from the Sunol Wilderness Area. The analysis determined this impact to be significant and unavoidable due to the loss of oak woodland and changes in views of affected hillsides from across the reservoir. Thus, this physical impact is identified as significant because it could diminish the recreational experience of hikers and photographers, even though this adverse visual impact would not constitute a physical impact on recreational facilities.

Air quality and noise impacts were noted parenthetically as examples of the types of physical impacts that could adversely affect the recreational experience. Citing air quality and noise as examples did not preclude or dismiss other types of physical impacts that could disrupt or deteriorate the quality of the park users' experience, such as traffic, land use access, biological resource, and visual resource impacts.

Please refer also to **Response L_EBRPD-02** for further discussion of these issues.

L_EBRPD-02 As discussed in **Response L_EBRPD-01**, under Section 15382 of the CEQA Guidelines, impacts on recreational resources would occur if there were physical effects on recreational facilities, such as physical deterioration or adverse impacts related to the construction or expansion of recreational facilities. The recreational impact analysis (Vol. 2, Chapter 4, pp. 4.12-18 to 4.12-28) considers physical environmental impacts on the recreational experience.

In response to this comment, the following text is added to the Approach to Analysis discussion in Section 4.12, Recreational Resources (Vol. 2, Chapter 4, p. 4.12-18, second full paragraph):

> To determine potential direct effects of WSIP projects construction activities and/or land acquisition, project areas were compared with the locations of identified recreational resources. Potential indirect effects on recreational resources were identified through the same means, as well as by reviewing the impact findings from Section 4.3, Land Use and Visual Quality; Section 4.5, Hydrology and Water Quality; Section 4.9, Air Quality; and Section 4.10, Noise and Vibration. Indirect impacts that would typically result from other physical impacts and could adversely affect the recreational experience include the following: removal of vegetation that could alter views (Section 4.3, Land Use and Visual Quality); construction-related noise that could affect hiking or nature appreciation (Section 4.10, Noise); or impeded access to hiking trails (Section 4.8, Traffic, Transportation, and Circulation).

Also refer to **Responses L_EBRPD-03, L_EBRPD-06, L_EBRPD-09, and L_EBRPD-10** for additional discussion of visual, traffic, air quality, and noise impacts on recreational resources.

L_EBRPD-03 The commenter expresses concern regarding the potential impacts of temporarily closing Calaveras Road during construction of the Calaveras Dam Replacement project (SV-2). The Draft PEIR (Vol. 2, Chapter 4, p. 4.12-23) presents a programmatic discussion of the recreational impacts associated with temporary closure of Calaveras Road during the construction period based on a preliminary project description. Because this disruption to recreational access would be temporary and an alternate route into the wilderness area would be available, this impact was determined to be less than significant. This impact determination assumes that the SFPUC would implement the Standard Construction Measures, including Measure #6 requiring that the contractors prepare a traffic control plan. Programmatic construction-related traffic impacts resulting from implementation of the WSIP as well as other projects in the region are evaluated in Section 4.8, Traffic, Transportation, and Circulation; Section 4.16, Collective Impacts Related to WSIP Facilities; and Section 4.17, Cumulative Effects (Vol. 2, pp. 4.8-10 to 4.8-22; pp. 4.16-33 and 4.16-34; and p. 4.17-61). The PEIR analysis determined that the WSIP projects in the Sunol Valley, either individually or collectively, would have potentially significant impacts on traffic during construction. The Draft PEIR includes Mitigation Measures 4.8-1 and 4.16-6c, requiring coordinated and combined Sunol Valley traffic control plans (Vol. 4, Chapter 6, pp. 6-30 to 6-33), which would further serve to reduce the impacts of the temporary road closure on recreational users.

However, the project-level EIR for the Calaveras Dam Replacement project (SV-2) will analyze access issues and impacts on recreational resources in more detail based on the most up-to-date construction plans and schedule, and will identify additional and/or more specific traffic mitigation measures as appropriate. Please also refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2) for discussion of the appropriate level of detail of an impact analysis at the program level versus the project level.

L_EBRPD-04 The Draft PEIR (Vol. 2, Chapter 4, p. 4.12-23) concludes that at a programmatic level of analysis, implementation of SFPUC Standard Construction Measures #1, #3, #5, and #6 (neighborhood notice, air quality, traffic, and noise) would reduce impacts on recreational resources. In addition, Mitigation Measure 4.8-1a (Vol. 4, Chapter 6, pp. 6-30 and 6-31) and Mitigation Measure 4.16-6c (p. 6-33) provide a programmatic approach to mitigating potential traffic impacts and specify 22 measures that could be included in traffic control plans that will be required to mitigate the impacts of construction vehicle traffic. However, in response to this comment, the EBRPD has been added to Table C.6 (Vol. 5, Appendix C, p. C-26) as an agency that has requested consultation during the planning and design phases of certain WSIP projects in the Sunol Valley.

The project-level EIR for the Calaveras Dam Replacement project (SV-2) will analyze the project in more detail based on the most up-to-date construction plans and schedule, and will provide more detailed traffic mitigation measures (including consideration of the commenter's suggested measures to mitigate impacts associated with the temporary closure of Calaveras Road between Geary Road and Felter Road). Please also refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2) for discussion of the appropriate level of detail of an impact analysis at the program level versus the project level.

L_EBRPD-05 The construction schedule information used in the Draft PEIR impact assessment is presented in Table C.4 (Vol. 5, Appendix C, p. C-21), which indicates that construction of the Calaveras Dam Replacement project (SV-2) would occur over a two- to three-year period. Since details regarding the duration of the temporary closure of Calaveras Road between Geary Road and Felter Road were not available at the time of Draft PEIR preparation, the assessment assumed that Calaveras Road would be closed for the duration of the construction period of two to three years as a worst-case scenario. The text in Section 4.3, Land Use and Visual Quality, and Section 4.8, Traffic, Transportation, and Circulation (Vol. 2, Chapter 4, pp. 4.3-15 and 4.8-12) correctly refers to the two- to three-year construction duration. Although this is consistently evaluated in the Draft PEIR, the text describing the construction duration in the Traffic section (Vol. 2, Chapter 4, p. 4.8-22, third full paragraph) has been revised to indicate the "two-to three-year construction duration." Text changes to this paragraph are indicated under **Response L_EBRPD-06** below.

Please also refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2) for discussion of the appropriate level of detail of an impact analysis at the program level versus the project level. The project-level EIR for the Calaveras Dam Replacement project (SV-2) will analyze the project in more detail based on the most up-to-date construction plans and schedule, and will identify additional and/or more specific mitigation measures for significant impacts. Additional details related to the duration of the temporary closure of Calaveras Road between Geary Road and Felter Road and associated impacts will be included in the project-level EIR.

L_EBRPD-06 The programmatic traffic analysis (Vol. 2, Chapter 4, p. 4.8-22) indicates that construction of the Calaveras Dam Replacement project (SV-2) would require closure of Calaveras Road between Geary Road and Felter Road to through-traffic during the two- to three-year construction period. Based on information on the Calaveras Dam Replacement project available at the time the Draft PEIR was prepared, it was not possible to determine the extent to which direct access to EBRPD trails could be restricted during closure of Calaveras Road. The Ohlone Wilderness Trail, located north of Geary Road, could be directly affected, and the Bay Area Ridge Trail connection from the west could be indirectly affected. The Bay Area Ridge Trail connects to the Ohlone Wilderness Trail from the Mission Peak Regional Preserve. At the programmatic level, the Draft PEIR (Vol. 2, Chapter 4, p. 4.8-22) states that implementation of SFPUC Standard Construction Measure #5 (traffic control plan) and additional traffic control measures identified in Mitigation Measure 4.8-1a (Vol. 4, Chapter 6, p. 6-30) would mitigate this potential impact to a less-than-significant level. This programmatic mitigation measure specifies detailed elements of the traffic control plan and requires coordination with local jurisdictions for affected roadways and intersections.

The project-level EIR for the Calaveras Dam Replacement project (SV-2) will provide the site-specific analysis of the potential impacts on EBRPD trails based on more detailed and up-to-date project information.

Based on clarifications provided in this comment and the previous comment (**L_EBRPD-05**), the Draft PEIR (Vol. 2, Chapter 4, p. 4.8-22, third full paragraph) is revised as follows:

> Construction of Calaveras Dam (SV-2) would require temporary closure of Calaveras Road between Geary Road and Felter Road to through-traffic during the two- to three-year construction period. Through-traffic using Calaveras Road would be required to find an alternate route for the duration of the construction period and would likely use I-680. Access to the East Bay Regional Park District's (EBRPD) Sunol Regional Wilderness would still be provided via Calaveras Road and Geary Road from the north, and emergency vehicles would continue to have access to temporarily closed roads. Direct access to ~~some~~ the EBRPD Ohlone Wilderness Regional Trail may be restricted, including access to the Bay Area Ridge Trail connection from the west. There are no private residences or commercial uses on this segment of Calaveras Road. This project would be evaluated as part of separate, project-level CEQA review. Implementation of SFPUC Construction Measure #5 (traffic control plan) and additional traffic control measures identified in Measure 4.8-1a would be adequate to ensure acceptable levels of traffic, pedestrian, and bicycle flow and to reduce any *potentially significant* circulation and access impacts to a less-than-significant level.

L_EBRPD-07 As stated in Mitigation Measure 4.8-1a (Vol. 4, Chapter 6, p. 6-31), the traffic control measures require that roadway rights-of-way be repaired or returned to their original condition or better upon the completion of construction. This measure typically includes inspection of roadways prior to and after completion of the project, and if project-related roadway damage were detected, the SFPUC would be required to enter into an agreement with local jurisdictions for implementing a post-construction repair/rehabilitation program. This measure would also typically address the condition of roadways during project construction. Mitigation Measures 4.8-1a and 4.16-6c (Vol. 4, Chapter 6, pp. 6-30 and 6-33) require coordination with local jurisdictions, which will include Alameda County, in developing these measures.

L_EBRPD-08 The commenter raises concerns regarding the effectiveness of traffic-related Mitigation Measure 4.16-6c (Vol. 4, Chapter 6, p. 6-33) to mitigate potentially significant impacts associated with overlapping schedules for projects in the Sunol Valley Region. Given the programmatic nature of the impact assessment and mitigation measures, the use of the word "could" rather than "shall" is appropriate for this mitigation measure, because this programmatic measure specifies various measures that *could* be included in the Sunol Valley Traffic Control Plan, and this plan *shall* be required to mitigate the collective or combined impacts of construction vehicle traffic. Project-level CEQA review for WSIP facility projects in the Sunol Valley Region will identify mitigation measures that respond to the specific requirements of each project's construction and identified significant impacts. The project-level CEQA documents will include mitigation measures that utilize the words "should" or "shall," as suggested by the commenter. Please also refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2) for discussion of the appropriate level of detail of an impact analysis at the program level versus the project level.

L_EBRPD-09 Draft PEIR Sections 4.9, Air Quality, and 4.16, Collective Impacts Related to WSIP Facilities (Vol. 2, Chapter 4, pp. 4.9-20 and 4.16-29) present a programmatic impact assessment of the air quality impacts. Table 4.9-4 (Vol. 2, Chapter 4, p. 4.9-24) presents average daily total construction-related emissions that would be generated in each region during construction of all WSIP projects. The Draft PEIR (Vol. 2, Chapter 4, p. 4.9-23) acknowledges that most of the estimated emissions are attributable to the three largest WSIP projects: San Joaquin Pipeline System (SJ-3), Calaveras Dam Replacement (SV-2), and Bay Division Pipeline Reliability Upgrade (BD-1). Therefore, air quality in the Sunol Valley Region would be primarily affected by the Calaveras Dam Replacement project.

The Draft PEIR (Vol. 2, Chapter 4, p. 4.9-25) classifies construction emissions associated with the WSIP projects in the Sunol Valley Region to be potentially significant, requiring implementation of the dust and exhaust control measures recommended by the Bay Area Air Quality Management District (BAAQMD) for all of these projects, even if the project by itself would not exceed BAAQMD operational significance thresholds. Dust control measures typically reduce PM_{10} emissions by 50 percent. As indicated in Table 4.9-5 (Vol. 2, Chapter 4, p. 4.9-24), the combined average PM_{10} emissions in the Sunol Valley Region (52 pounds per day) would not exceed the BAAQMD operational significance threshold of 80 pounds per day, and implementation of dust control measures could reduce project emissions to 25 pounds per day—well below the threshold. Pollutant emissions associated with equipment exhaust would exceed BAAQMD thresholds and would significantly contribute to the degradation of regional air quality. The Draft PEIR (Vol. 2, Chapter 4, p. 4.16-29) classifies these regional contributions as potentially significant and unavoidable, given the San Francisco Bay Area Air Basin's nonattainment status for ozone and particulate matter.

When evaluating the effects of short-term construction emissions, the Draft PEIR focuses on sensitive receptors that cannot relocate during project construction and that, therefore, cannot avoid exposure to pollutant emissions. While it is acknowledged that recreationists are also sensitive receptors, they are mobile (not stationary) receptors and can choose to use other regional parks (or other trails within the park) on a short-term basis to avoid emissions, if air quality is a concern. It should also be noted that recreationists would be exposed to project-related construction emissions for short periods of time. Nevertheless, impacts on recreational resources will be specifically evaluated as part of project-level CEQA review for all WSIP projects in the Sunol Valley Region. Please also refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2) for discussion of the appropriate level of detail of an impact analysis at the program level versus the project level.

L_EBRPD-10 The commenter's statement pertaining to the significant impact on recreational resources is addressed in **Response L_EBRPD-01**. The commenter correctly summarizes the Draft PEIR statement (Vol. 2, Chapter 4, p. 4.3-2) that views of WSIP facilities may be available from public trails in the Sunol Regional Wilderness. The Sunol Regional Wilderness is not specifically called out as a visual resource on the page referenced by the commenter (p. 4.3-8) because that discussion is an overview of the approach to the visual quality impact analysis in its entirety, and does not identify individual visual resources.

"Visual Resources" is the subheading for the last paragraph on p. 4.3-2 (Draft PEIR, Vol. 2). Each of the visual features discussed in the paragraph under this subheading is recognized in the Draft PEIR as a visual resource, including available views of the Calaveras Dam Replacement project (SV-2) from the Sunol Regional Wilderness. The visual assessment conducted for the Draft PEIR determined that Calaveras Dam is not visible from the Ohlone Regional Wilderness; however, any potential for visibility from the Ohlone Regional Wilderness or any other EBRPD facilities will be assessed in greater detail as part of project-level CEQA review for the Calaveras Dam Replacement project.

Potential impacts on views from the Sunol Regional Wilderness due to the Calaveras Dam Replacement project (SV-2) are identified in Draft PEIR Table 4.3-4 (Vol. 2, Chapter 4, p. 4.3-21) and described under Impact 4.3-4 (p. 4.3-38). Excavation and grading activities associated with dam construction would remove vegetation and create visual discontinuity that would affect views from surrounding areas, including the Sunol Regional Wilderness. Mitigation Measures 4.3-4a through 4.3-4d (Vol. 4, Chapter 6, pp. 6-7 and 6-8) would minimize these visual impacts; however, even with mitigation, visual impacts resulting from tree removal and grading in the vicinity of Calaveras Dam were determined to be significant and unavoidable. The project-level EIR for the dam project will further analyze the visual impacts on Sunol Regional Wilderness and other EBRPD facilities, if applicable, and identify site-specific mitigation measures to help reduce these impacts.

L_EBRPD-11 The Draft PEIR (Vol. 2, Chapter 4, p. 4.2-5) states that the purpose of the *Alameda Watershed Management Plan* (Alameda WMP) is to provide a policy framework for the SFPUC to make decisions about the activities on watershed lands, and to provide watershed management implementation guidelines. While Alameda WMP policies must be implemented for all SFPUC projects located within Alameda WMP boundaries, Alameda WMP goals and policies are not intended to provide project-specific requirements for preserving and protecting visual resources. In addition, the Alameda WMP does not address protection or preservation of visual resources that are not located on CCSF-owned property.

The Alameda WMP recognizes that the CCSF-owned watershed lands are endowed with visual features; however, the Alameda WMP also states its primary goal is to "Maintain and protect water quality for public health and safety." Because the SFPUC water distribution, storage, and maintenance facilities are already located and built within CCSF-owned watershed lands (such as with the Calaveras Dam Replacement project, SV-2), the SFPUC does not have the flexibility to site or designate locations for major facilities and construction staging areas that entirely avoid onsite and offsite visual impacts. Instead, the Alameda WMP policies require viewshed studies and implementation of design guidelines to avoid and minimize visual impacts to the extent feasible. Two design guidelines from the Alameda WMP that are included in the Draft PEIR (Vol. 2, Chapter 4, pp. 4.3-37 and 4.3-38) refer to protecting existing visual resources within the watershed lands by contouring slopes and landforms for compatibility with the surrounding environment, and by minimizing grading and the visibility of cut banks. In addition, SFPUC Standard Construction Measure #10 (construction site maintenance/restoration) will require sites to be returned to the general condition that existed before construction, including regrading of the site and revegetation of disturbed areas. Implementation of both of these guidelines and Measure #10 would minimize the visual impacts of WSIP facilities within SFPUC Alameda watershed lands.

In addition to identified Alameda WMP design guidelines (Vol. 2, Chapter 4, pp. 4.3-37 and 4.3-38), the Draft PEIR requires implementation of Mitigation Measure 4.3-2, Facility Siting Studies (Vol. 4, Chapter 6, p. 6-7) for the Additional 40-mgd Treated Water Supply (SV-3) and San Antonio Backup Pipeline (SV-6) projects, which includes consideration of alternative site locations. Siting and viewshed studies will be completed as necessary as part of project-level CEQA review for all WSIP projects (including ancillary project features such as haul roads or borrow sites) in visually sensitive areas, including the Sunol Valley.

Please also refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2) for discussion of the appropriate level of detail of an impact analysis at the program level versus the project level.

L_EBRPD-12 With respect to the need for viewshed studies for the Calaveras Dam Replacement project (SV-2), the commenter references the impact discussion in Chapter 5 (Vol. 3, p. 5.4.7-4). This chapter (which begins on p. 5.1-1) evaluates potential environmental impacts of the proposed water supply and system operations, which are distinct from the impacts of constructing WSIP facility improvement projects (such as the Calaveras Dam Replacement), which are described and analyzed in Chapter 4 of the Draft PEIR. Therefore, the conclusion of the Draft PEIR (Vol. 3, Chapter 5, p. 5.4.7-4) that Policy WA-9 viewshed studies would not be required is appropriate, as it applies to changes in views as a result of proposed changes in water supply and system operations. The Draft PEIR (Vol. 3, Chapter 5, pp. 5.4.7-5 and 5.4.7-6) states that potential recreational and visual impacts attributable to changes in WSIP water supply or regional system operations would more likely involve changes in water flows in Alameda Creek, which could in turn affect the visual experience of EBRPD visitors.

As noted in the Draft PEIR (Vol. 2, Chapter 4, p. 4.2-9), the SFPUC seeks to work cooperatively with local jurisdictions to avoid land use conflicts. The project-level EIR for the Calaveras Dam Replacement project (SV-2) will determine the need for a viewshed study for this project, as specified in Policy WA-9 of the Alameda WMP.

L_EBRPD-13 The commenter expresses concern that the WSIP could result in reduced flows in Alameda Creek, with a resulting decrease in the recreational experience for EBRPD users and a reduction in the fish and wildlife habitat in several parks that feature Alameda Creek as a recreational feature. The commenter's concerns with reduced flows in Alameda Creek, the need to manage flows to maximize benefits for amphibians and fish, and the recreational experience for EBRPD users are addressed in the Draft PEIR as follows: stream flow—Impact 5.4.1-2 (Vol. 3, Chapter 5, pp. 5.4.1-25 to 5.4.1-35); fisheries—Impact 5.4.5-3 (Vol. 3, Chapter 5, pp. 5.4.5-18 to 5.4.5-20); terrestrial biological resources—Impact 5.4.6-2 (Vol. 3, Chapter 5, pp. 5.4.6-18 and 5.4.6-19); and recreational and visual resources—Impact 5.4.7-1 (Vol. 3, Chapter 5, pp. 5.4.7-5). Mitigation Measure 5.4.5-3a (Vol. 4, Chapter 6, p. 6-52) calls for biological studies as well as an operational plan to manage minimum flows for resident trout; this measure has been expanded to address other aquatic-dependent species, including amphibians. Subsequent to publication of the Draft PEIR, the SFPUC modified the project description of the Calaveras Dam Replacement project (SV-2), as described in Vol. 7, Chapter 13, Section 13.2 of this Comments and Responses document, which has resulted in a reduction in severity of Impact 5.4.7-1 from potentially significant to less than significant. Please also refer to **Response S_CDFG2-15** and **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14) for additional discussion of the issues raised by this comment, including a discussion of steelhead fisheries in Alameda Creek.

L_EBRPD-14 The commenter refers to a provision in the land use plan for the EBRPD's Sunol and Ohlone Wilderness Regional Preserves "to coordinate the timing of water for the Calaveras Dam with the SFPUC to maximize the benefits to these [amphibians and anadromous fish] species." The SFPUC is solely responsible for all operations related to Calaveras Dam, including the timing of releases from the dam. As discussed in the Draft PEIR (Vol. 3, Chapter 5, p. 5.2-20), the SFPUC is currently participating in the Alameda Creek Fisheries Restoration Workgroup, of which the EBRPD is also a member, to manage the Alameda Creek watershed and to plan for restoration of steelhead in Alameda Creek. The SFPUC's participation in the Workgroup will continue independent of the WSIP. Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14) for discussion of steelhead (anadromous fish species) issues. Also refer to **Response L_EBRPD-19** regarding the status of the land use plan for the Sunol and Ohlone Wilderness Regional Preserves and to **Response S_CDFG2-15** regarding mitigation measures to address other stream-dependent species (amphibians).

L_EBRPD-15 This comment, which suggests that the SFPUC consider giving the EBRPD the opportunity to review and comment on the operation plan for establishing minimum flows in Alameda Creek for resident trout, is acknowledged. As indicated by the commenter, Mitigation Measure 5.4.5-3a (Vol. 4, Chapter 6, pp. 6-52 and 6-53) incorporates coordination with the Alameda Creek Fisheries Restoration Workgroup, of which the EBRPD is a member. In addition, the EBRPD's interest in coordinating their resource management efforts with those of the SFPUC has been noted in Draft PEIR Table C.6 (Vol. 5, Appendix C, p. C-26) for consideration in the project-level EIR for the Calaveras Dam Replacement project (SV-2). Please also refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.3) for additional information about the SFPUC's coordination efforts with other agencies. The commenter is also referred to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14) for a description of changes in the Calaveras Dam Replacement project to include protective measures for fisheries.

L_EBRPD-16 The commenter states concerns over the use of land already managed for watershed protection that might be used as mitigation for new projects (Draft PEIR, Vol. 4, Chapter 6, pp. 6-11 and 6-12). However, watershed land already owned by the CCSF is not necessarily precluded from development. For example, extensive areas of CCSF-owned land in the Sunol Valley are in use for viticulture, golf courses, commercial nurseries, and gravel mining, and therefore are not conserved as natural habitat. Placing a conservation easement over natural habitat on SFPUC land could provide an added degree of protection, if such land could be used for other purposes without compromising its function in watershed protection.

In addition, some CCSF-owned land may be deemed extraneous for watershed protection purposes and could be sold. The Sheep Ranch is one such example; this area, which comprises about 400 acres, is under CCSF ownership but is situated in the Arroyo de la Laguna watershed, not the Alameda Creek watershed in the Sunol Valley. A conservation easement over the Sheep Ranch could ensure that this land would not be sold and subsequently developed.

Some of the land owned by the CCSF in the Sunol Valley has been highly disturbed, and restoration or enhancement could considerably increase habitat values. Some examples are abandoned commercial nurseries, stock ponds with eroded outlets, and former oak woodlands that were cut down for timber and firewood many decades ago. Watershed and water quality management objectives do not necessarily require that such lands be restored to full ecological function and productivity. Thus, ecological restoration would not necessarily take place unless it was part of a mitigation program for capital projects. If such lands were placed under a conservation easement and restored under WSIP mitigation and Habitat Reserve Program management, such improvements would be both mandated and funded.

L_EBRPD-17 The Draft PEIR (Vol. 2, Chapter 4, pp. 4.6-55 and 4.6-56) indicates that Mitigation Measure 4.6-1b, implementation of the Habitat Reserve Program or a similar habitat compensation program, would provide a mechanism for offsite identification, protection, restoration and management of compensation land.

The commenter's concern regarding the long-term effectiveness of conservation easements over private lands is acknowledged. In fact, any lands set aside for long-term mitigation and conservation can be compromised by unforeseen management problems. However, conservation easements, besides being routinely accepted as CEQA mitigation, often have the advantage of remaining in the private sector, thus providing economic incentives for the landowner to maintain the property. In addition, use of conservation easements could enable the SFPUC to protect more land than could be protected under a fee purchase program, since easements are typically less expensive than fee purchases.

L_EBRPD-18 The commenter requests application of a 5 dB CNEL increase as a significance criterion for impacts on park users. As defined in the Draft PEIR, CNEL is a 24-hour noise level that includes a 10-dB penalty for nighttime noise (Vol. 2, Chapter 4, p. 4.10-1). This threshold is typically used to evaluate the impact of noise sources associated with project operations, such as operation of facility equipment or permanent increases in traffic. Construction-related noise is more sporadic and can vary from hour to hour and day to day. In addition, most construction activities occur during the day, so it is inappropriate to evaluate changes in the ambient noise environment over a 24-hour period. For projects where only daytime construction would occur, the use of CNEL would underestimate the noise impact. Therefore, the Draft PEIR defines as significant any noise increase that interferes with activities during the day and/or night (speech and sleep interference), whichever is applicable (Vol. 2, Chapter 4, pp. 4.10-12 and 4.10-13). These thresholds are based on Leq rather than CNEL and are more rigorous for construction noise since they account for hourly variations in noise increases.

While passive recreational areas can be sensitive to noise, the significance of construction-related noise impacts are determined, in part, by the nature of the recreational use (trail versus picnic area) in areas where recreationists using the facilities cannot avoid construction noise. Although there are trails in the Sunol Regional Wilderness, potential noise increases were not identified as significant since hikers could choose to use other parts of the park located away from facility construction areas. Hikers using trails near construction areas would be exposed to short-term noise increases, but only when hiking on the trail section located near the construction area. The hilly topography in the Sunol Valley would help limit the extent of area affected by construction noise, since hills would block the construction noise. Nevertheless, the site-specific impacts on recreational resources will be evaluated as part of project-level CEQA review for all WSIP projects in the Sunol Valley Region.

L_EBRPD-19 The EBRPD has adopted over 40 land use plans for its regional parks and preserves. Land use plans evaluate park resources, document and recommend programs for managing and conserving park resources, discuss key planning issues and relevant policies, and offer proposals for future recreational and service facilities (EBRPD, 2007e). Not all EBRPD parklands have adopted land use plans, although it is the District's long-term goal to create such a plan for every park. According to the EBRPD, the land use plan for the Sunol and Ohlone Regional Wilderness Preserves has not been adopted, but a draft plan was completed in 2003 (Still, 2008).

In response to this comment, the Draft PEIR (Vol. 2, Chapter 4, p. 4.12-2, last paragraph) is revised as follows:

> **East Bay Regional Parks.** The EBRPD has jurisdiction over numerous regional parks located in Alameda and Contra Costa Counties. Several major EBRPD facilities encompassing thousands of acres of parks and open space are clustered in the East County/Sunol Valley area, including Del Valle Regional Park, Ohlone Regional Wilderness, Sunol Regional Wilderness, Vargas Plateau Regional Preserve, and Mission Peak Regional Park. <u>The long-term goal of the EBRPD is to adopt land use plans to guide the management and use of all of its facilities. The EBRPD has adopted a land use plan for Del Valle Regional Park; other land use plans are in draft form at various stages of planning.</u>

L_EBRPD-20 In the event that construction of the WSIP facilities requires the SFPUC to access or cross EBRPD trails or parklands, trail or encroachment permits would be required from the EBRPD if the SFPUC does not have a property interest that provides access without a permit. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.3) for detailed discussion of the issues raised by this comment. The EBRPD's interest in determining which WSIP facility projects would encroach on District property has been noted in Draft PEIR Table C.6 (Vol. 5, Appendix C, p. C-26) for consideration in all project-level CEQA review of WSIP projects in the Sunol Valley Region.

L_EBRPD-21 At the time the Draft PEIR was prepared, there were alternative tunnel alignments under consideration for the New Irvington Tunnel project (SV-1), as indicated in Table C.3 (Vol. 5, Appendix C, p. C-17). The Draft PEIR impact assessment encompassed the range of possible impacts that could result from proposed and alternative tunnel alignments. Potential impacts on EBRPD facilities will be evaluated in greater detail as part of project-level CEQA review for the New Irvington Tunnel project based on the most up-to-date and detailed project plans regarding the tunnel location. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2) for discussion of the appropriate level of detail of an impact analysis at the program level versus the project level.

L_EBRPD-22 The commenter's concerns with flooding impacts as a result of the Alameda Creek Fishery Enhancement project (SV-1) are addressed in the Draft PEIR (Vol. 2, Chapter 4, p. 4.5-38); the PEIR analysis determined that potential flooding impacts under this project would be potentially significant because the construction of dams in Alameda Creek could impede flood flows or exacerbate flooding issues. Implementation of the site-specific flooding analysis specified in Mitigation Measure 4.5-4b (Vol. 4, Chapter 6, p. 6-10) would be required to reduce this impact to a less-than-significant level. Such analysis will be required as part of project-level CEQA review for this project. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2) for discussion of the appropriate level of detail of an impact analysis at the program level versus the project level.

L_EBRPD-23 The EBRPD Public Safety Division provides law enforcement and fire protection services for 65 park facilities in Alameda and Contra Costa Counties. In response to this comment, the EBRPD has been added to the list of agencies that provide fire protection and law enforcement services in the Sunol Valley Region.
Table 4.11-2 of the Draft PEIR (Vol. 1, Chapter 4, p. 4.11-4) is revised as follows:

TABLE 4.11-2
LAW ENFORCEMENT AND FIRE PROTECTION SERVICE PROVIDERS WITHIN THE WSIP STUDY AREA

Jurisdiction	Law Enforcement Agencies	Fire Protection Service Agencies
Alameda County		
Unincorporated areas including, San Lorenzo and Castro Valley	Alameda County Sheriff's Department East Bay Regional Park District Police Department	Alameda County Fire Department East Bay Regional Park District Fire Department

As indicated in **Response L_EBRPD-04**, the EBRPD has been added to Draft PEIR Table C.6 (Vol. 5, Appendix C, p. C-26) as an agency that has requested consultation during the planning and design phases of certain WSIP projects in the Sunol Valley. At that time, the EBRPD will have the opportunity to coordinate fire suppression planning and response (including review of traffic control plans). Please also refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.3) for additional information about the SFPUC's planned coordination efforts with other agencies.

L_EBRPD-24 The locations of the Calaveras Dam Replacement (SV-2) borrow and spoil areas are based on the preliminary project information available at the time the Draft PEIR was prepared. The Draft PEIR discloses programmatic temporary and long-term impacts on visual and biological resources that could occur at the borrow sites and spoils areas. The Draft PEIR (Vol. 2, pp. 4.3-38 and 4.6-55) identifies potentially significant visual and biological impacts due to the extensive grading proposed in borrow areas on slopes east of the reservoir and the resulting removal of riparian communities (such as coast live oak riparian forest, etc.). Mitigation measures are identified to reduce these impacts, but visual impacts would not be reduced to a less-than-significant level and would be unavoidable. The addition of impacts associated with the borrow area at the south end would not alter these significance determinations. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2) for discussion of the appropriate level of detail of an impact analysis at the program level versus the project level. The project-level EIR for the Calaveras Dam Replacement project will describe and map the geographic limits of the borrow and spoils areas, and will assess site specific visual and biological impacts associated with this project.

L_EBRPD-25 In response to this comment, the Draft PEIR reference to the Habitat Preserve Program (Vol. 4, Chapter 6, p. 6-55, third sentence of the second full paragraph) is corrected as follows:

One alternative for implementing such habitat compensation is the Habitat Reserve Program (HRP) currently being developed by the SFPUC. The purpose of the HRP is to provide a comprehensive, coordinated approach to mitigation and related regulatory compliance for WSIP projects and operations. This related SFPUC project is described further in Chapter 3, Section ~~3.11~~ 3.12.3.

L_EBRPD-26 The Quarry Lakes Regional Recreation Area and the Coyote Hill Regional Park, and their locations with respect to Alameda Creek and the Alameda Creek Trail, are described in the Draft PEIR (Vol. 3, Chapter 5, p. 5.4.7-3). These facilities were not specifically called out in the setting overview referenced by the commenter on Draft PEIR p. 5.4.7-1. Even with the addition of new information on these existing parks, the impact discussion of recreational facilities and/or activities and visual effects on scenic resources remain the same as described in the Draft PEIR for these recreational facilities (Vol. 3, Chapter 5, pp. 5.4.7-5 and 5.4.7-6, respectively). Potential recreational and visual effects were identified only for the Sunol Regional Wilderness. No impacts were identified in the Draft PEIR for the other EBRPD parklands described on pp. 5.4.7-2 and 5.4.7-3.

In response to this comment, the Vargas Plateau Regional Preserve has been added to the inventory of EBRPD parks described in Section 5.4.7.1 of the Draft PEIR (Vol. 3, Chapter 5, pp. 5.4.7-2 and 5.4.7-3), and potential recreational and visual impacts were also added. No significant visual or recreational impacts would occur at the Vargas Plateau Regional Preserve as a result of program-related changes in water supply and regional system operations. Views of Alameda Creek from the Vargas Plateau Regional Preserve would be minimally affected by program-related changes in flows, because any changes in flows would be substantially moderated by inflow from Arroyo de la Laguna and Arroyo Mocho, which are not controlled by the SFPUC. In addition, the WSIP would result in increased low-flow releases in the summer, which would add to the visual amenities afforded by the creek during those times. The WSIP would not affect the visual or recreational amenities of Alameda Creek in the Coyote Hills Regional Park because of the intervening flows and the tidal nature of that reach of the creek.

In response to this comment, the Draft PEIR (Vol. 3, Chapter 5, p. 5.4.7-1, third full paragraph) is revised as follows:

Alameda Creek Recreation and Visual Quality

Alameda Creek runs through several local parks, ~~and~~ municipalities (including ~~Sunol Regional Wilderness,~~ Alameda County), and the cities of Fremont and Union City. Alameda Creek also runs through the Sunol Regional Wilderness and is adjacent to the Vargas Plateau Regional Preserve, Quarry Lakes Regional Recreation Area, and Coyote Hills

> Regional Park, all of which are operated by the EBRPD. The recreational uses of the creek are described below.

The following paragraph is added to the Draft PEIR just before the paragraph on the Quarry Lakes Regional Recreation Area (Vol. 3, Chapter 5, p. 5.4.7-3, first full paragraph):

> **Vargas Plateau Regional Preserve**
>
> The Vargas Plateau Regional Preserve, managed by the EBRPD, is located adjacent to the SFPUC Alameda watershed along a common boundary line on the east side of the preserve. Its northern boundary touches Alameda Creek for a distance of about 2,500 feet. A portion of the decommissioned Sunol Aqueduct crosses the park within a utility easement. Currently, the preserve is not suitable for active public use due to the lack of public road access, the need to protect natural or man-made resources, and other factors related to public safety and access. The EBRPD is currently in the process of adopting the *Vargas Plateau Regional Park Land Use Plan*, which would create a regional park that provides trails, outdoor recreation, campgrounds, and nature appreciation areas (EBRPD, 2007e).

The following reference is added to the Draft PEIR (Vol. 3, Chapter 5, p. 5.4.7-6):

East Bay Regional Park District (EBRPD), *Draft Vargas Plateau Regional Park Land Use Plan*, October 2007e, available online at http://www.ebparks.org/planning/lup, accessed January 25, 2008.

City of Foster City, Ramon Towne, Director of Public Works, 10/1/07

L_FosterCty-01 This comment, which states Estero Municipal Improvement District's goal to "Pursue Reliable and Uninterruptible Alternative Sources of Water Supply" and encourages that seismic retrofits to the regional water system be implemented expeditiously, is acknowledged.

L_FosterCty-02 Table 3.3, Table 7.2, Table 7.3, Table E.2.1, and Table E.2.6 in the Draft PEIR show that projected 2030 demand for Estero Municipal Improvement District is 6.8 mgd, consistent with this comment. Tables 3.4 and E.1.1 referenced in this comment show only the 2030 purchase estimates, not projected demand. The source of the range shown for the 2030 purchase estimate is the *SFPUC 2030 Purchase Estimates Technical Memorandum* (Table 3, p. 1-5 of that report; URS, 2004a), which is based on information submitted by the wholesale customers. The source for the estimated range of 0.0 to 0.6 mgd in conservation savings (which accounts for the difference between the projected demand and the purchase estimate) was the form entitled "Wholesale Customer Best Estimate of Water Purchases from the SFPUC" (dated November 17, 2004), which Estero Municipal Improvement District submitted to the SFPUC. The submitted form states:

> The Estero Municipal Improvement District (EMID) projects that it will purchase 100% of its estimated total water demand from the SFPUC in 2030. Based on the information collected and analyses conducted in developing overall Demand Projections this total demand equates to 6.8 mgd (annual average). Based on the same information collected and analyses conducted, EMID projects that this total demand may be reduced by as much as 0.6 MGD if the equivalent of all "Category A" and "Category B" conservation measures as analyzed for EMID were adopted and achieve their maximum potential savings. It is understood that this estimate will be used by the SFPUC for purposes of planning and environmental review and is subject to change based on changed conditions, such as the future cost of water, new pricing structures, and new developments in the area of conservation Best Management Practices.

Based on this comment, the SFPUC assumes that Estero Municipal Improvement District will not realize any conservation savings in 2030 and plans to purchase 6.8 mgd from the regional water system (SFPUC, 2008a); this would correspond to the high end of the purchase estimate range and the low end of the conservation estimate range shown in the Draft PEIR tables. The SFPUC selected the high range purchase estimate totaling 300 mgd as the target goal for the average annual water delivery, as stated in the Draft PEIR (Vol. 4, Chapter 7, p. 7-16). The demand projections and/or associated purchase estimates are expected to evolve somewhat over time (including the eventual emergence of a single figure in the cases where a range had been assumed), and the clarification of Estero Municipal Improvement District's estimate of 2030 purchases and conservation savings is an example of this; no change to the referenced tables is needed.

L_FosterCty-03 This comment, which concurs with and expands on information about Estero Municipal Improvement District's service area presented in the Draft PEIR, is noted. As discussed in the Draft PEIR (Vol. 4, Chapter 7, p. 7-14), the source of population projections used to develop water demand projections was selected by the wholesale customers. As discussed in the more detailed description of demand projection development (see Appendix E.2, pp. E.2-6 et seq.), a "blend" of ABAG cities was created in order to reconcile ABAG projections with those for the wholesale customers' service areas. The percentage of wholesale customer service area within jurisdictional boundaries is shown in Chapter 7, Table 7.1 (p. 7-12).

L_FosterCty-04 This comment, which expresses support for the Modified WSIP Alternative and for the adoption of the 10 percent rationing goal during drought periods, is acknowledged. The support of the commenter for WSIP Variant 3 – 10% Rationing is acknowledged. See **Response L_Burlgme-02** for clarification of the difference between the proposed program and Variant 3.

L_FosterCty-05 This information related to Estero Municipal Improvement District's development of an Emergency Sanitation Annex Plan and the importance of the complete rehabilitation of the Hetch Hetchy system is noted.

City of Fremont, Transportation and Operations Department, Rene Dalton, 10/9/07

L_Fremont-01 Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Sections 14.4.2 and 14.4.3) for detailed discussion of the issues raised by this comment. The City of Fremont has been added to Draft PEIR Table C.6 (Vol. 5, Appendix C, p. C-26) as an agency that has requested consultation during the planning and design phases of the following projects: Bay Division Pipeline (BDPL) Reliability Upgrade (BD-1), New Irvington Tunnel (SV-4), and Seismic Upgrade of BDPL Nos. 3 and 4 at Hayward Fault (BD-3).

While the City has requested the use of jack-and-bore construction for the pipeline crossings of arterial streets in Fremont, it should be noted that the Draft PEIR (Vol. 2, Chapter 4, p. 4.8-13) indicates the cut-and-cover construction method would be used to cross Mission Boulevard, Paseo Padre Parkway, and Fremont Boulevard, which was based on preliminary information available at the time the Draft PEIR was prepared. The project-level EIR for the BDPL Reliability Upgrade project (BD-1) will analyze the project in more detail, including the up-to-date design details for construction across roadways, and will identify additional mitigation measures for significant impacts associated with cut-and-cover construction across multiple-lane arterials, including coordination with the City of Fremont.

L_Fremont-02 The last bullet item under Mitigation Measure 4.8-1a (Vol. 4, Chapter 6, p. 6-31) refers to the state's *Manual of Traffic Controls for Construction and Maintenance Work Areas*. In late 2006, the *California Manual on Uniform Traffic Control Devices* replaced the 1996 version of the *Manual of Traffic Control for Construction and Maintenance Work Areas*. In response to this comment, the text of the Draft PEIR has been revised to update this reference and to include Caltrans' *2006 Standard Plans*. The Draft PEIR (Vol. 4, Chapter 6, p. 6-31, last bullet item under Measure 4.8-1a) is revised as follows:

> To the extent applicable, the traffic control plan will conform to the ~~state's *Manual of Traffic Controls for Construction and Maintenance Work Areas*~~ *California Manual on Uniform Traffic Control Devices for Streets and Highways: Part 6 Temporary Traffic Control* and Caltrans' *2006 Standard Plans*.

L_Fremont-03 The commenter states that applications for encroachment permits and traffic control plan reviews must be submitted to the City of Fremont two months in advance of construction, and provides information on the application process. The SFPUC will obtain encroachment permits when access is needed to public rights-of-way where the SFPUC has no property interest that provides access without a permit.

Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.3) for more discussion of the issues raised by this comment. The City of Fremont has been added to Draft PEIR Table C.6 (Vol. 5, Appendix C, p. C-26) as an agency that has requested consultation (including the need for encroachment permits and development and review of traffic control plans) during the planning and design phases of the following projects: the BDPL Reliability Upgrade (BD-1), New Irvington Tunnel (SV-4), and Seismic Upgrade of BDPL Nos. 3 and 4 at Hayward Fault (BD-3).

L_Fremont-04 The commenter requests coordination with City of Fremont staff regarding the need to close bicycle trails and maintenance access roads during construction near Paseo Padre Parkway. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Sections 14.4.2 and 14.4.3) for more discussion of the issues raised by this comment. The City of Fremont has been added to Draft PEIR Table C.6 (Vol. 5, Appendix C, p. C-26) as an agency that has requested consultation during the planning and design phases of the following projects: BDPL Reliability Upgrade (BD-1), New Irvington Tunnel (SV-4), and Seismic Upgrade of BDPL Nos. 3 and 4 at Hayward Fault (BD-3).

L_Fremont-05 The commenter states that the City of Fremont requires submittal of site-specific plans for all work within city limits that could affect Fremont's transportation network. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Sections 14.4.2 and 14.4.3) for more discussion of the issues raised by this comment. The City of Fremont has been added to Draft PEIR Table C.6 (Vol. 5, Appendix C, p. C-26) as an agency that has requested consultation during the planning and design phases of any WSIP project that could affect the Fremont transportation network.

City of Hayward Department of Public Works, Robert Bauman, Director of Public Works, 9/17/07

L_Hayward-01 The commenter correctly describes the purpose of the CEQA EIR process. The comments describing the urgent need for the WSIP facility improvement projects for water quality, seismic, and delivery reliability are acknowledged. Please see **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.2) for more discussion.

L_Hayward-02 This comment advocating a two-tiered approach that separates the proposed seismic improvements from the proposed changes in water supply (i.e. additional Tuolumne River diversions) is acknowledged. Please see the discussion in **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.5).

L_Hayward-03 This comment, which provides considerable background on future planned growth in Hayward and the basis for its projected 2030 water demand, as well as information regarding the City's commitment to smart growth and water conservation, is acknowledged.

Town of Hillsborough, Cyrus Kianpour, City Engineer, 9/27/07

L_Hillsb-01 This comment expressing support for the WSIP goals and objectives and the Draft PEIR is acknowledged.

L_Hillsb-02 This comment addresses the need and urgency to repair the regional system to avoid failure in a significant seismic event. Section 3.3 of the Draft PEIR (Vol. 1, Chapter 3, pp. 3-5 to 3-8) describes the need for and objectives of the WSIP. In addition, the PEIR describes the regional faulting and seismic hazards along the SFPUC regional water system (Vol. 2, Chapter 4, pp. 4.4-4 to 4.4-13) and includes a map of major faults in the vicinity of the system (Figure 4.4-1, Vol. 2, Chapter 4, pp. 4.4-7 and 4.4-8). The No Program Alternative (Vol. 4, Chapter 9, pp. 9-23 to 9-40) describes the consequences and environmental effects of not improving SFPUC system facilities, which include increasing the risk of prolonged water outages (see in particular p. 9-32). The purpose of the PEIR is to evaluate the environmental effects of implementing the WSIP as well as several alternatives to the WSIP identified in the PEIR. The requested economic evaluation is outside the scope and purview of this PEIR (see CEQA Guidelines Section 15064). In its comments on the Draft PEIR, the Bay Area Water Supply and Conservation Agency (BAWSCA) provided information regarding potential the economic consequences associated with SFPUC facility failures due to an extended loss of water (refer to Comment L_BAWSCA1-05). The information in L_BAWSCA1-05 is based on a 2002 report by the Bay Area Economic Forum. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Sections 14.1.2 and 14.1.3) for more discussion.

L_Hillsb-03 This comment expressing support for the Modified WSIP Alternative is acknowledged.

L_Hillsb-04 This comment expressing the Town of Hillsborough's support for the Modified WSIP Alternative is acknowledged. Please refer to **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14) for additional discussion and analysis of this alternative, and **Response L-BAWSCA1-47**.

L_Hillsb-05 The first sentence of this comment, which recommends that the Draft PEIR discuss the possibility of the SFPUC and its wholesale customers entering into a new contract that would maintain established entitlements, is acknowledged. The Draft PEIR (Vol. 1, Chapter 2, pp. 2-43 and 2-44) describes the customer agreements between the SFPUC and its wholesale customers; the analysis in the Draft PEIR is based on the existing terms of the agreement. The second sentence in this comment, which supports BAWSCA taking the lead on regionally funded conservation through increased water rates, is also acknowledged.

L_Hillsb-06 This comment emphasizes the need to implement the proposed WSIP facility projects to improve the regional water system's performance and reliability, and expresses concern that the proposed changes in water supply sources could delay implementation of these facility improvements. Comment acknowledged.

L_Hillsb-07 This comment expressing support for the 10 percent rationing goal during prolonged drought periods is acknowledged. See **Response L_Burlgme-02** for clarification of the difference between the proposed program and Variant 3 – 10% Rationing.

L_Hillsb-08 The commenter indicates that the WSIP would result in the construction of facilities within Hillsborough's boundaries. However, Table 3.11 (Vol. 1, Chapter 3, p. 3-60) indicates that no WSIP facility projects evaluated in the Draft PEIR would be located within the town boundaries. This table indicates that the Crystal Springs/San Andreas Transmission Upgrade project (PN-2) would be located in San Mateo County, and that several cities (including Hillsborough) are close to that project site. The project-level CEQA analysis for this project will identify any offsite impacts that would affect the town.

L_Hillsb-09 This comment describing the Town of Hillsborough's conservation program efforts is noted.

Los Altos Hills County Fire District, Dorothy Price, President, 9/21/07

L_LAHCFD-01 This comment regarding the critical need for water reliability for the purposes of firefighting is acknowledged. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.4) for more discussion.

L_LAHCFD-02 This comment, which supports conservation measures and additional restrictions on water use to the extent feasible, and describes the Fire District's water conservation measures, is noted. For information on alternatives evaluated in the Draft PEIR that do not include additional diversions from the Tuolumne River, refer to the descriptions of the Year-round Desalination at Oceanside Alternative (Vol. 4, Chapter 9, Section 9.2.6) and the Aggressive Conservation/Water Recycling and Local Groundwater Alternative (Without Tuolumne River Supplement) (Vol. 4, Chapter 9, Section 9.2.4, p. 9-47). Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional response regarding conservation programs and recycling projects proposed by the SFPUC and its wholesale customers.

L_LAHCFD-03 This comment urging rapid completion of the environmental review process and implementation of the WSIP is acknowledged.

Town of Los Altos Hills, Craig Jones, Mayor, 9/14/07

L_LosAltosH-01 This comment regarding the critical need for water reliability for the purposes of firefighting is acknowledged. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.4) for more discussion.

L_LosAltosH-02 This comment reiterates projected future water demand in the SFPUC service area through 2030 as presented in the Draft PEIR. To clarify the information related to water supplies presented in this comment, water supply sources during nondrought and drought periods under the proposed program would consist of runoff from local watersheds (with Calaveras and Lower Crystal Springs Reservoirs restored), increased average annual diversions from the Tuolumne River, and recycled water/groundwater/additional conservation in San Francisco. During drought sequences, this supply would be augmented first through implementation of a conjunctive-use program in the Westside Groundwater Basin, and then by additional Tuolumne River diversions through a water transfer with Turlock Irrigation District and Modesto Irrigation District. Information related to future conservation measures and recycled water projects proposed by the SFPUC wholesale customers is provided in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3).

L_LosAltosH-03 This comment, which asserts that the Town of Los Altos Hills has implemented Smart Growth principles by requiring a minimum lot size of one acre, is acknowledged. More typically, the concept of “smart growth” refers to more intensive development at densities that encourage the use of public transit and reduce the overall footprint of the built environment. The Los Altos Hills approach does result in the use of less water per acre relative to denser housing, but does so by limiting the number of households and population that can be accommodated within the city limits.

L_LosAltosH-04 This comment describing the town’s conservation efforts is noted.

L_LosAltosH-05 This comment urging rapid certification of the Draft PEIR and expeditious implementation of the WSIP is acknowledged.

City of Menlo Park, Kent Steffens, Director of Public Works, 10/1/07

L_Menlo1-01 This comment regarding the vulnerability of the regional system to seismic hazards and the need to proceed expeditiously with the WSIP is acknowledged. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 4, Chapter 14, Section 14.1.3) for more discussion.

L_Menlo1-02 Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Sections 14.4.2, and 14.4.3) for detailed discussion of the issues raised by this comment. The City's request for coordination of reasonable construction mitigation measures has been noted in Draft PEIR Table C.6 (Vol. 5, Appendix C, p. C-26) for consideration in the project-level EIR for the Bay Division Pipeline Reliability Upgrade project (BD-1).

L_Menlo1-03 Noise limits specified in Section 8.06.030 and time limits specified in Section 8.06.040 of the Menlo Park Noise Ordinance are summarized in Draft PEIR Table 4.10-2 (Vol. 2, Chapter 4, p. 4.10-7), and these limits are consistent with the noise ordinance sections attached to the commenter's letter. Draft PEIR Impact 4.10-1 (Vol. 2, Chapter 4, p. 4.10-19) acknowledges that temporary construction-related noise impacts associated with the Bay Division Pipeline Reliability Upgrade project (BD-1) would be potentially significant at some locations due to the proximity of sensitive noise receptors to the pipeline alignment. The Draft PEIR's potentially significant and unavoidable (PSU) significance determination for this impact acknowledges that the language "to the extent feasible" contained in SFPUC Construction Measure #6 (Vol. 1, Chapter 3, p. 3-80) and Draft PEIR Mitigation Measure 4.10-1a (Vol. 4, Chapter 6, p. 6-39) may not reduce impacts to a less-than-significant level, since these measures do not guarantee compliance with local noise ordinances. Measure 4.10-1a indicates that for some WSIP projects, nighttime construction cannot be avoided (e.g., tunnel construction must occur 24 hours per day), and in these situations, construction noise would be required to comply with applicable noise ordinance nighttime limits or not exceed the 50-dBA sleep interference criterion to the extent feasible. The City's concerns with construction noise and compliance with the City's Noise Ordinance will be addressed in detail as part of project-level CEQA review for the Bay Division Pipeline Reliability Upgrade project.

L_Menlo1-04 The City's comment identifying the need for settlement monitoring where the proposed Bay Tunnel crosses under existing levees in Menlo Park is addressed under Draft PEIR Impact 4.4-4 (Vol. 2, Chapter 4, p. 4.4-31) for the Bay Division Pipeline Reliability Upgrade project (BD-1). The impact discussion identifies this impact as potentially significant but mitigated to a less-than-significant level with implementation of a subsidence monitoring program (Measure 4.4-4) to detect potential ground movement well before major subsidence occurs. Corrective action, such as increased tunnel support, would be implemented if measured displacement reached a designated minimum trigger amount. This impact would be evaluated in more detail as part of project-level CEQA review for this project.

L_Menlo1-05 Trucks operating onsite within the pipeline right-of-way are considered part of the onsite construction activities described under Draft PEIR Impact 4.10-1 (Vol. 2, Chapter 4, p. 4.10-19) and would be subject to ordinance time limits as specified in SFPUC Construction Measure #6. However, the impacts associated with trucks operating offsite along construction haul routes (mostly public streets for this project) are described under Draft PEIR Impact 4.10-2 (Vol. 2, Chapter 4, p. 4.10-25), and these trucks would be subject to restrictions such as avoiding local residential streets, using designated truck routes, and avoiding nighttime hours (10 p.m. to 7 a.m.) depending on the proximity of residential uses to haul routes (Vol. 4, Chapter 6, Mitigation Measures 4.10-2a and 4.10-2b, p. 6-41). The City's concerns with truck noise along haul routes will be addressed in detail as part of project-level CEQA review for the Bay Division Pipeline Reliability Upgrade project.

L_Menlo1-06 The commenter raises concerns regarding the effectiveness of the traffic mitigation measures (Vol. 4, Chapter 6, p. 6-30, Measures 4.8-1a and 4.8-1b) to mitigate potentially significant traffic impacts when the Bay Division Pipeline Reliability Upgrade project (BD-1) is being constructed through Menlo Park, and the need to develop the traffic control plan in consultation with the City of Menlo Park prior to submitting this project to bid. As indicated in Draft PEIR Mitigation Measure 4.8-1a (Vol. 4, Chapter 6, p. 6-30), the SFPUC and its contractors will prepare the traffic control plan in coordination with Caltrans and local jurisdictions. The project-level EIR for the Bay Division Pipeline Reliability Upgrade project will analyze traffic impacts in more detail based on the most up-to-date design details, and will identify additional mitigation measures for significant impacts.

Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2, Intent of Programmatic Impact Analysis, and Section 14.4.3) for detailed discussion of the issues raised by this comment. The City's request for coordination of construction traffic routing and appropriate mitigation measures has been noted in Draft PEIR Table C.6 (Vol. 5, Appendix C, p. C-26) for consideration in the project-level EIR for the Bay Division Pipeline Reliability Upgrade project (BD-1).

L_Menlo1-07 Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2) for detailed discussion of the issues raised by this comment. This master response provides information on the appropriate level of detail of an impact analysis at the program level versus the project level. The project-level EIR for the Bay Division Pipeline Reliability Upgrade project (BD-1) will analyze vibration impacts in more detail and, if warranted, identify additional mitigation measures for significant impacts, such as preparation of a mitigation monitoring program that includes vibration monitoring.

L_Menlo1-08 This comment correctly states that Menlo Park (i.e., the Menlo Park Water District) receives 100 percent of its water supply from the SFPUC. Ninety-six percent of Menlo Park's existing demand is met through SFPUC purchases (as shown in Draft PEIR Table 7.3, Vol. 4, Chapter 7, p. 7-18); however, because Menlo Park purchases the balance of its supply from East Palo Alto (according to the BAWSCA Annual Survey [BAWSCA, 2006]), all of its supply is ultimately provided by the SFPUC. In response to this comment, and to clarify and avoid double counting of existing supply, Table 3.1 (Vol. 1, Chapter 3, p. 3-7) has been revised as follows:

TABLE 3.1
SFPUC REGIONAL WATER SYSTEM CUSTOMERS

Wholesale Regional Customers[a] (BAWSCA Members)		
Peninsula	**South Bay**	**Other Major Customers**
	City of Menlo Park*b	

* Indicates customers that currently receive additional water supplies from sources other than the SFPUC.

a Not shown on the table because they are not a BAWSCA member, the Cordilleras Mutual Water Association is also a wholesale customer receiving water from the SFPUC. It is a small water association serving 18 single-family homes located in San Mateo County.

b Menlo Park receives all of its water supply from the SFPUC; however, a portion of the supply is obtained indirectly from the SFPUC through purchases from East Palo Alto (BAWSCA, 2006).

SOURCES: CDM, 2005; URS, 2004a.

The following has been added to the Chapter 3 references (p. 3-88):

Bay Area Water Supply and Conservation Agency (BAWSCA), *Bay Area Water Supply and Conservation Agency Annual Survey FY2004-05*, April 2006.

Although the comment does not raise this issue with respect to Table 3.4 (Vol. 1, Chapter 3, p. 3-19), for consistency with the revised Table 3.1, Table 3.4 has also been revised, as follows:

TABLE 3.4
SUMMARY OF SFPUC 2030 PURCHASE ESTIMATES

SFPUC Customer	Fiscal Year 2001/2002 Purchases from the SFPUC (mgd)	2030 Purchase Estimates (mgd)	Change in Water Purchases from the SFPUC (mgd)
Wholesale Customers			
City of Menlo Park[a,c] [g]	3.57	4.54	0.97

[a] Wholesale customer that currently receives water supplies from sources other than the SFPUC, including local groundwater, local surface water, recycled water, and other sources of supply.
[c] Wholesale customer that currently receive water supplies from other sources but projects receiving only SFPUC water by 2030
[g] Menlo Park purchased 96 percent of its 2001/2002 supply directly from the SFPUC; the balance of its 2001/2002 purchases also came from the SFPUC regional system, but was purchased from East Palo Alto. Menlo Park projects that it will purchase all of its 2030 supply directly from the SFPUC.

SOURCES: URS, 2004c; City of Redwood City, 2005; Westborough Water District, 2007.

Please also refer to the description of Menlo Park in Chapter 7 (Vol. 4, pp. 7-47 and 7-48), which identifies Menlo Park's other sources of supply.

Menlo Park Planning Commission, Kirsten Keith, Employee, 9/18/07

[See Public Hearing Transcript, Fremont, pp. 24–25]

L_Menlo2-01 This recommendation to read the book *Cadillac Desert* is acknowledged, but as it does not address the adequacy or accuracy of the Draft PEIR, no response is provided.

City of Menlo Park, Kelly Fergusson, Mayor, 9/19/07

[See Public Hearing Transcript, Palo Alto, pp. 43–44]

L_Menlo3-01 This comment states that the Mayor of Menlo Park and the City of Menlo Park's Public Works Director were present at the September 19, 2007 public hearing on the Draft PEIR held in the city of Palo Alto. No response is necessary.

Modesto Irrigation District, Walt Ward, President of the Board of Directors, 9/6/07

[See Public Hearing Transcript, Modesto, pp. 25–26]

L_MID-01 This comment requests an extension of the public review period for the WSIP Draft PEIR by 30 days or longer. The public review period on the Draft PEIR was initially scheduled for 90 days, from June 29, 2007 through October 1, 2007, but was extended by an additional 15 days, to October 15, 2007. Further, comments received after the October 15, 2007 deadline were accepted and are responded to in this Comments and Responses document. In accordance with CEQA Guidelines Section 15105, the public review period for draft EIRs that require review by state agencies must not be less than 45 days, unless a shorter period, not less than 30 days, is approved by the State Clearinghouse. Thus, the public review period provided for the Draft PEIR meets and exceeds the public review requirements under CEQA.

L_MID-02 Please refer to **Section 14.3, Master Response on Proposed Dry-Year Water Transfer** (Vol. 7, Chapter 14, Section 14.3.3) for detailed discussion of this issue.

Modesto Irrigation District / Turlock Irrigation District, Walter Ward / Robert Nees, Assistant General Manager / Assistant General Manager, 10/1/07

L_MID-TID1-01 In response to the request of the commenter, on October 4, 2007, the San Francisco Planning Department sent the Turlock Irrigation District (TID) and Modesto Irrigation District (MID) a CD containing hydrologic model output as well as related files to help TID and MID to understand the data. In addition, a meeting was held on November 28, 2007 to discuss the Hetch Hetchy/Local Simulation Model (HH/LSM) and its use in support of the Draft PEIR, and included representatives from TID, MID, the SFPUC, and the PEIR consultant team (representing the San Francisco Planning Department). The SFPUC representative described how the HH/LSM was used to analyze the WSIP and estimate its effects on Tuolumne River flows, and identified assumptions made in the analysis. A slide presentation was made and hard copy of the presentation was provided to meeting attendees (see Attachment L_MID-TID1-1). The meeting was conducted informally, and the SFPUC answered questions raised by TID and MID attendees.

At the November 28, 2007 meeting, the SFPUC noted that the assumptions and modeling approach used for the TID and MID in the HH/LSM are consistent with the assumptions and approach used in the modeling of the San Joaquin River and modeling for MID's recent water treatment plant project. TID and MID are using CalSim II, the statewide model developed by the Department of Water Resources and the U.S. Bureau of Reclamation, to model the San Joaquin River.

At the end of the meeting, the TID and MID representatives indicated that the SFPUC representative had answered all of their questions with respect to the HH/LSM, and that an executable copy of the model would be sent to TID and MID. The model was transmitted to the Districts on December 21, 2007.

With regard to the request to extend the comment period on the Draft PEIR, please refer to **Response L_MID-01**. In addition, because the SFPUC planned to refine the HH/LSM runs used in the Draft PEIR in 2008 in support of the Final PEIR, the Districts were invited to submit comments on the modeling in advance of preparation of this Response to Comments document. The comments would be considered if submitted to the SFPUC in a timely manner.

For further information on the HH/LSM, please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14).

L_MID-TID1-02 The Draft PEIR (Vol. 1, Chapter 2, pp. 2-35 to 2-37) provides a summary description of the City and County of San Francisco's (CCSF) rights to Tuolumne River water. The SFPUC believes that the diversion of water from the Tuolumne River as proposed in the WSIP is consistent with the CCSF's water rights.

L_MID-TID1-03 The commenter's summary of the two fundamental principles pertaining to the existing system is consistent with the description in the Draft PEIR (Vol. 1, Chapter 3, p. 3-8). These principles are used as the basis for the WSIP goals and objectives. Chapter 9 of the Draft PEIR (Vol. 4) identifies and analyzes alternatives to the proposed program that would meet most of the basic program goals and objectives while at the same time avoiding or substantially lessening significant environmental effects of the WSIP. The PEIR analyzes one alternative that would involve treatment and pumping of Tuolumne River water—the Lower Tuolumne River Diversion Alternative (Vol. 4, Chapter 9, pp. 9-59 to 9-66). In addition, the Draft PEIR provides further discussion of the reasons for rejecting filtration of Sierra source water as an alternative strategy (Vol., 4, Chapter 9, pp. 9-119 and 9-120).

However, as noted in Section 11.2 (Vol. 6, Chapter 11, p. 11-2), following certification of the Final PEIR, decision-makers have the discretion to approve the WSIP or any portion/modification/alternative of the WSIP analyzed in the PEIR.

L_MID-TID1-04 The flows expressed as million gallons per day (mgd) do not express an instantaneous rate of flow. When used in the text of the Draft PEIR, the flow expressed in mgd is typically qualified as an average annual, monthly, or daily flow. (For an example, see the first full paragraph of Vol. 1, Chapter 2, p. 2-37 of the Draft PEIR.) Annual flows are expressed in mgd in the Draft PEIR, rather than in acre-feet per year (afy), because municipal water supply agencies typically use mgd (and not afy) as their primary units of flow.

Projected purchase requests (water demand) for the SFPUC in 2030 is 300 mgd (336,066 afy), an increase of 35 mgd (39,207 afy) compared to the 2005 condition.

With respect to the units of flow used in the Draft PEIR, please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.8). With respect to the request for a copy of the water supply model, refer to **Response L_MID-TID1-01**.

L_MID-TID1-05 Please refer to **Section 14.3, Master Response on Proposed Dry-Year Water Transfer** (Vol. 7, Chapter 14) for more detail on the proposed water transfer from TID/MID to the SFPUC. Also refer to **Response L_TUD1-09**.

The SFPUC has determined that the proposed water transfers from TID and MID would be feasible technically, based on HH/LSM model runs that use 82 years of historical hydrology as well as assumptions that are consistent with those used in the modeling of the San Joaquin River for the Department of Water Resources and in the modeling for MID's recent water treatment plant project (see **Response L_MID-TID1-01**). This 82-year hydrologic record includes several extended drought sequences, and the modeling conducted for the Draft PEIR analysis using the HH/LSM indicated that the WSIP water supply level of service could be achieved during drought periods with the combination of water transfer, a conjunctive-use program in the Westside Basin, and a maximum systemwide rationing of 20 percent.

The analysis in the Draft PEIR is based on the worst-case assumption (in terms of environmental consequences) that the proposed water transfer from TID and MID would originate from stored water in Don Pedro Reservoir. Consequently, the river flow estimates and the reservoir storage estimates for the with-WSIP scenario shown in the Draft PEIR include the effects of the proposed transfer (Vol. 3, Chapter 5, pp. 5.3.1-1 to 5.3.1-40). Most of the environmental effects of the WSIP on the Tuolumne River would stem from WSIP-induced changes in reservoir storage and river flow. The effects of WSIP-induced reservoir storage and river flow changes on other environmental elements, including water quality, groundwater, fisheries, terrestrial biological resources, recreation/visual resources, and energy, are described in Vol. 3, Chapter 5, Sections 5.3.2 through 5.3.9 of the Draft PEIR. These PEIR sections provide a project-level analysis of the effects of the proposed water transfer on the Tuolumne River and its natural resources, as required by CEQA. However, additional CEQA documentation could be required once any facilities needed to execute the transfer have been designed.

L_MID-TID1-06 In its planning, the SFPUC determined that a dry-year water transfer from TID/MID would be needed if the SFPUC is to deliver water to customers during the design drought without requiring rationing of greater than 20 percent systemwide. An approximately 26,000-acre-foot transfer from TID and MID, averaged over the 8.5-year design drought, was analyzed using the HH/LSM, and the environmental impacts of such a transfer are characterized in the Draft PEIR. After publication of the Draft PEIR, updated and refined modeling using the HH/LSM indicated that a dry-year transfer of approximately 29,000 acre-feet would be needed. The increase in the size of the dry-year transfer would have a negligible effect with respect to the environmental impacts of the WSIP described in the Draft PEIR, because the full 29,000-acre-foot transfer would be needed so rarely. The SFPUC is not considering transfers substantially greater than 29,000 acre-feet, so the Draft PEIR does not analyze larger transfers. Please also refer to **Section 14.3,**

Master Response on Proposed Dry-Year Water Transfer (Vol. 7, Chapter 14, Section 14.3.2) for additional information.

L_MID-TID1-07 Neither the Tuolumne River nor the San Joaquin River is currently listed for water temperature in the State Water Resources Control Board's Clean Water Act Section 303(d) list.

The WSIP would have no effect on water temperature in the Tuolumne River below La Grange Dam in most months, because flow in this reach of river equals the minimum required flow in most months. Flow in the river would be the same with the WSIP as under the existing condition in 717 months of the 984-month (82-year) hydrologic record. As stated in the Draft PEIR, on infrequent occasions (12 months in the 984-month hydrologic record), WSIP-induced flow reductions would cause mean daily temperature increases of 1 or 2 degrees Celsius (see Draft PEIR Vol. 3, Chapter 5, p. 5.3.3-19). The statement in the comment letter that an increase of 1 to 2 degrees would occur in 15 percent of the months modeled—157 months in the 984-month record—is incorrect.

The Draft PEIR also notes that the WSIP could cause an exceedance of the water quality objective (i.e., the objective prohibiting an increase of more than 5 degrees Fahrenheit, or 2.8 degrees Celsius) in three or four months of the 984-month hydrologic record (Vol. 3, Chapter 5, p. 5.3.3-19). Because exceedances would be so infrequent that they would not impair the river's ability to support its designated beneficial uses, it was concluded that the WSIP would have a less-than-significant impact on water temperature.

The primary purpose of the water temperature objective is to protect aquatic life, and particularly cold-water fish. As indicated in the Draft PEIR, the reductions in flow combined with the increases in water temperature attributable to the WSIP would have a potentially significant adverse impact on fishery resources in the lower Tuolumne River (Vol. 3, Chapter 5, pp. 5.3.6-29 to 5.3.6-32). A proposed mitigation measure, Measure 5.3.6-4a (Vol. 4, Chapter 6, p. 6-48), would essentially eliminate the effects of the WSIP on flow and water temperature in the lower Tuolumne River and the San Joaquin River.

L_MID-TID1-08 Please refer to **Sections 14.6 and 14.7, Master Responses on the Upper and Lower Tuolumne River Issues** (Vol. 7, Chapter 14), respectively, regarding additional instream flow requirements.

L_MID-TID1-09 As stated in the Draft PEIR, the CCSF must adhere to the Raker Act (Vol. 1, Chapter 2, pp. 2-33 and 2-34). The WSIP is consistent with Raker Act requirements, including Section 9(h), with respect to the export of additional water from the Tuolumne River watershed, since the additional diversions under the WSIP would be for municipal and domestic purposes. Also refer to **Response L_TUD1-05**.

The WSIP does not seek to meet the entire increase in purchase requests (water demand) projected to occur between 2005 and 2030 by diverting more water from the Tuolumne River. The projected purchase request in 2030 is 300 mgd (336,066 afy), an increase of 35 mgd (39,207 afy) compared to the 2005 condition. Local demand would be reduced by about 4 mgd (4,481 afy) through water conservation measures over and above those already planned. Approximately 6 mgd (6,721 afy) of the additional demand would be met from local sources to be developed under the WSIP—2 mgd from groundwater wells in San Francisco (WSIP facility improvement project SF-2), and 4 mgd from reclamation and recycling of San Francisco's wastewater (WSIP facility improvement project SF-3).

The SFPUC is not planning to add new wholesale customers and is considering several options that would limit the use of Tuolumne River water to meet the wholesale customers' needs. An alternative, the No Purchase Request Increase Alternative, which would limit deliveries to the wholesale customers' current purchase requests, is evaluated in Chapter 9 of the Draft PEIR (Vol. 4). The Modified WSIP Alternative, which is also discussed in Chapter 9, would include an additional 5 to 10 mgd of water conservation, recycling, and groundwater use in the wholesale customers' service areas.

L_MID-TID1-10 The WSIP would result in an overall increase in average annual hydropower generation, but a decrease in average annual hydropower generation at TID/MID facilities, as noted in the Draft PEIR (Vol. 3, Chapter 5, p. 5.3.9-3). If TID/MID replaced the hydropower lost with power produced at a fossil-fuel plant, then the replacement would cause the emission of additional air pollutants and greenhouse gases. However, any emissions would be more than offset by the emission reductions resulting from the SFPUC's increase in hydropower generation, which would replace power produced through the combustion of fossil fuels. Please refer to the Draft PEIR (Vol. 2, Chapter 4, Section 4.9) for a description of the WSIP's effects related to greenhouse gas emissions.

L_MID-TID1-11 Please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14) for a discussion of climate change that augments the discussion presented in Section 5.7.6 of the Draft PEIR (Vol. 3, Chapter 5, pp. 5.7-92 to 5.7-96). Section 14.11 provides more detailed and up-to-date information on climate change as it relates to the SFPUC regional water supply and the proposed WSIP.

L_MID-TID1-12 The comment expressing an opinion on the appropriateness of additional diversions from the Tuolumne River is acknowledged.

The opinion of the commenter that greater consideration should be given to the Lower Tuolumne River Diversion Alternative and the two desalination alternatives is acknowledged. The San Francisco Planning Department disagrees that the Lower Tuolumne River Diversion, Year-round Desalination at Oceanside, and Regional Desalination for Drought Alternatives would have fewer environmental impacts than the WSIP or Modified WSIP Alternative. As described in the Draft PEIR (Vol. 4, Chapter 9, p. 9-93 and 9-94), although these alternatives would have lesser effects on the Tuolumne River than the WSIP and the Modified WSIP Alternative, they would result in substantially greater construction and operations impacts associated with a treatment plant, intake structures, transmission and distribution pipelines, and possibly a storage facility. In addition to the likelihood of substantially greater impacts on land use, traffic, air quality, noise, biological resources, and energy, these alternatives would also result in indirect effects associated with greater energy use. Obtaining the additional energy would have its own environmental impacts, which would likely include the emission of air pollutants and greenhouse gases.

As noted above in **Response L_MID-TID1-03** and in Section 11.2 (Vol. 6, Chapter 11, p. 11-2), following certification of the Final PEIR, decision-makers have the discretion to approve the WSIP or any portion/modification/alternative of the WSIP analyzed in the PEIR.

L_MID-TID1-13 If the proposed and preferred Mitigation Measure 5.3.6-4a (Vol. 4, Chapter 6, p. 6-48) proves to be feasible and is implemented, then the WSIP would have minimal effects on the Tuolumne River below La Grange Dam. If Measure 5.3.6-4a proves to be infeasible, then the SFPUC would implement Mitigation Measure 5.3.6-4b (Vol. 4, Chapter 6, pp. 6-48 and 6-49). Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14) for detailed discussion of these measures.

The Draft PEIR does not provide a mitigation measure for TID/MID's loss of hydropower identified under Impact 5.3.9-1 (Vol. 3, Chapter 5, pp. 5.3.9-2 and 5.3.9-3) because this impact is economic rather than environmental and consequently does not need to be addressed in a CEQA document. Depending on how TID/MID replaced the lost power, greenhouse gases could be emitted. However, as noted **Response L_MID-TID-10**, any increased emissions would be more than offset, because the WSIP would produce a net increase in hydropower. Refer to the Draft PEIR for information on greenhouse gas emissions under the WSIP (Vol. 2, Chapter 4, Section 4.9).

L_MID-TID1-14 This comment requesting special attention is acknowledged.

L_MID-TID1-15 This comment, which expresses TID's opinion regarding prior discussion of the water transfers, is acknowledged. Please refer to **Section 14.3, Master Response on Proposed Dry-Year Water Transfer** (Vol. 7, Chapter 14, Section 14.3.2) for additional information.

L_MID-TID1-16 This comment, which expresses TID's concurrence with the removal of the fourth pipeline from the WSIP, is acknowledged. The WSIP facility improvement projects (Vol. 1, Chapter 3, Table 3.10, p. 3-49) include the San Joaquin Pipeline System project (SJ-3), which would consist of partial segments of a fourth San Joaquin Pipeline and additional crossover facilities.

L_MID-TID1-17 This comment regarding the agreements between the CCSF and the Districts (TID and MID) is acknowledged. The Draft PEIR (Vol. 1, Chapter 2, pp. 2-42 and 2-43) includes a summary description of the Fourth Agreement among the CCSF, TID, and MID regarding the New Don Pedro Project.

L_MID-TID1-18 The SFPUC chose a design drought more severe than any drought in the hydrologic record because of San Francisco's unusual vulnerability to droughts and its experiences during earlier droughts. Most agricultural water agencies and many municipal water agencies have both surface water and groundwater supply sources. During droughts, these agencies can increase pumping from their groundwater sources to make up for any shortfall in surface water supplies. When planning for the future, these agencies typically establish their design drought based on the historical record. If the historical record proves to be unreliable and droughts more severe than those in the historical record occur, the agencies can always turn to their groundwater supplies or, in the case of the agricultural agencies, fallow some land. In this way, they can avoid severe economic losses. Unlike these agencies, San Francisco depends almost exclusively on surface water supplies, and its water rights are restricted in a manner that means little or no water is available to the SFPUC from its primary source, the Tuolumne River, in very dry years. As a result, the risk of a severe water shortage, with attendant economic losses, is much greater for San Francisco than for most other urban or agricultural communities. Because of these circumstances, the SFPUC determined that it would take a more conservative posture than many water agencies in choosing a design drought.

The disadvantages for the SFPUC of choosing a design drought based on the historical record were illustrated during the 1987–1992 drought. Toward the end of this extended drought, San Francisco's water supplies were almost exhausted, and the SFPUC was initiating programs to achieve a 45 percent reduction in system wide water deliveries (described in Vol. 1, Chapter 2,

p. 2-26). Absent an unseasonably large spring storm (the “March miracle”), severe rationing would have been imposed and economic losses incurred.

For the reasons noted above, the SFPUC concluded that it would be imprudent to base its design drought entirely on historical hydrology. Consequently, it does not see the need for a parallel analysis of the WSIP using a design drought based on historical hydrology. If such an analysis were performed, it would likely reduce the size of the transfer needed to meet the SFPUC’s water needs during droughts. Although the design drought is an extreme event without precedent in the historical record, dry-year transfers, when needed, would typically be smaller than the estimated maximum.

L_MID-TID1-19 Please refer to **Response L_MID-TID1-01**.

L_MID-TID1-20 The SFPUC has conducted sufficient background studies, which have identified the feasibility of developing approximately 10 mgd of additional water from conservation, recycling, and groundwater development in San Francisco. If the SFPUC were unable to meet the demand of retail customers through conservation, recycling, and groundwater use, more water would have to be diverted from the Tuolumne River to meet the WSIP goals and objectives. This possibility was examined as Variant 1 in Vol. 4, Chapter 8, pp. 8-7 to 8-10 of the Draft PEIR. The environmental consequences of Variant 1 are described in Vol. 4, Chapter 8, pp. 8-70 to 8-72 of the Draft PEIR.

L_MID-TID1-21 The WSIP does not include plans to fully treat the SFPUC’s entire water supply. The federal Safe Drinking Water Act generally requires filtration of drinking water supplies; however, the U.S. Environmental Protection Agency and California Department of Health Services have approved the use of unfiltered water from the Hetch Hetchy watershed because Hetch Hetchy water is of such high quality. These agencies and the SFPUC concluded that watershed protection and disinfection are sufficient to produce a safe water supply. The SFPUC does not expect to be required to filter Hetch Hetchy water by 2030, and so full treatment was not included in the WSIP. The improvements contained in the WSIP are compatible with the addition of filtration, if filtration ever becomes necessary in the future.

L_MID-TID1-22 Refer to **Response L_MID-TID1-02**.

L_MID-TID1-23 Refer to **Response L_MID-TID-05** and **Section 14.3, Master Response on Proposed Dry-Year Water Transfer** (Vol. 7, Chapter 14) for more detail on the proposed water transfer from TID/MID to the SFPUC.

L_MID-TID1-24 Refer to **Response L_MID-TID-14**.

L_MID-TID1-25 Some of the information requested in this comment is available and pertinent to the PEIR. As noted in the Draft PEIR, the 2005 regional system firm yield is estimated to be 219 mgd (Vol. 1, Chapter 3, Table 3.5, p 3-26). This is lower than the normal regional system firm yield of 226 mgd because of current restrictions on storage in Calaveras Reservoir. The expected 2030 regional system firm yield with the WSIP is estimated to be 256 mgd. However, the requested information on the Tuolumne River and local system firm yield is not relevant (or available), since the WSIP was designed with consideration of the regional system as a whole. The average annual delivery via the San Joaquin Pipeline under 2005 conditions is about 247,700 acre-feet. The corresponding value under 2030 conditions with the WSIP would be about 274,500 acre-feet. Other project-specific data on the San Joaquin Pipeline system is relevant to the programmatic impact analysis in the PEIR and would be considered as necessary during project-level environmental review of the San Joaquin Pipeline System project (SJ-3).

With respect to units of flow, please refer to **Response L_MID-TID1-04**. With respect to the assumptions used in WSIP water supply planning and modeling, refer to **Response L_MID-TID1-01**, which addressed the commenter's request for flow assumptions.

L_MID-TID1-26 Please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14) for a discussion of climate change that augments the discussion presented in Section 5.7.6 of the Draft PEIR (Vol. 3, Chapter 5, pp. 5.7-92 to 5.7-96). Section 14.11 provides more detailed and up-to-date information on climate change as it relates to the SFPUC regional water supply and the proposed WSIP.

L_MID-TID1-27 Comment noted with respect to TID's opinion that any additional diversions from the Tuolumne River should be made from the lower reaches of the river.

The Draft PEIR analyzes an alternative under which the SFPUC would divert water from the Tuolumne River just upstream of the river's confluence with the San Joaquin River. It is referred to as the Lower Tuolumne River Diversion Alternative and is described in Vol. 4, Chapter 9, pp. 9-59 to 9-66 together with its potential environmental consequences.

The Draft PEIR did not evaluate a lower Tuolumne River alternative involving diversion at about River Mile 25, close to the existing diversion for TID's future Regional Water Supply Project. Such an alternative would be more costly than the Lower Tuolumne River Diversion Alternative examined in the Draft PEIR and, as noted in the comment letter, would have fewer environmental benefits.

L_MID-TID1-28 Please refer to the Draft PEIR (Vol. 1, Chapter 3, pp. 3-86 to 3-88) for a description of the required actions and approvals applicable to the overall WSIP. This discussion identifies TID and MID as responsible for review and approval of water transfer agreements with the SFPUC and/or for amendments to the SFPUC's water bank account in Don Pedro Reservoir. Please also refer to **Section 14.3, Master Response on Proposed Dry-Year Water Transfer** (Vol. 7, Chapter 14, Section 14.3.3) for additional information.

L_MID-TID1-29 The Draft PEIR provides a description of the purpose of the program environmental impact report (Vol. 1, Chapter 1, pp. 1-1 to 1-4), as well as a description of WSIP project refinements and other WSIP components that had been developed since the SFPUC's issuance of the preliminary WSIP program description in January 2006 (Vol. 1, Chapter 3, pp. 3-23 to 3-25). The San Francisco Planning Department is responsible for preparation of the PEIR and the environmental review of individual WSIP projects. The Planning Department maintains a mailing list for the WSIP PEIR and also uses this list for the project-level CEQA documents for individual WSIP projects to inform all potentially affected agencies, organizations, and individuals.

The commenter's impression (gained at the scoping meeting) that the PEIR would be the overarching document for all projects funded through the WSIP bond measure is incorrect (see Draft PEIR Vol. 1, Chapter 3, pp. 3-23 and 3-24). Some water system improvements funded through the WSIP bond measure are treated as independent projects, are not addressed in the PEIR, and would be subject to separate CEQA compliance processes.

The Lower Tuolumne Diversion Alternative is evaluated in Chapter 9 of the Draft PEIR (Vol. 4, pp. 9-59 to 9-66). The SFPUC recognizes that if it chose to proceed with this alternative, or any course of action described in the PEIR, it would have to coordinate with TID and MID, and that regional and specific projects would need to be closely coordinated. TID's Regional Surface Water Supply Project is described in the Draft PEIR cumulative impact analysis (Vol. 3, Chapter 5, Section 5.7).

Modesto Irrigation District / Turlock Irrigation District, Walter Ward / Robert Nees, Assistant General Manager / Assistant General Manager, 10/29/07

L_MID-TID2-01 See **Response L_MID-TID1-01**.

L_MID-TID2-02 See **Response L_MIDTID1-01**.

City of Millbrae, Ronald Popp, Director of Public Works, 9/28/07

L_Millbr-01 This comment, which describes the City of Millbrae's evaluation of groundwater and recycled water projects, its pursuit of conservation practices, and its reliance on the SFPUC for water supplies, is noted.

L_Millbr-02 This comment regarding the urgency and critical nature of the WSIP and the need to proceed expeditiously with the WSIP is acknowledged. Please refer to **Section 14.1**, **Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.2) for more discussion.

L_Millbr-03 This comment expressing the City of Millbrae's support for the Modified WSIP Alternative is acknowledged. Please refer to **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14) for additional discussion and analysis of this alternative.

L_Millbr-04 Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.5) and **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.6) for clarification regarding current and estimated future municipal and agricultural diversions from the Tuolumne River.

L_Millbr-05 The Draft PEIR analyzes the environmental impacts of the proposed program, which includes a level of service objective to limit rationing during an extended drought to a maximum of 20 percent systemwide. Chapter 8 of the Draft PEIR analyzes a WSIP variant in which rationing during an extended drought would be limited to a maximum of 10 percent systemwide (Vol. 4, Chapter 8, pp. 8-33 to 8-35). The PEIR does not include a variant with 30 percent systemwide rationing, although the No Program Alternative and Aggressive Conservation/Water Recycling and Local Groundwater Alternative would result in rationing greater than 20 percent systemwide during drought periods. With respect to CEQA requirements related to economic evaluations, please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 7, Section 14.1.6).

City of Milpitas, Thomas Williams, City Manager, 9/27/07

L_Milpts-01 This comment regarding the urgency to rehabilitate the SFPUC water delivery system to help the system withstand a major earthquake is acknowledged. Please see **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.4) for more details related to this issue.

L_Milpts-02 This comment emphasizing the City of Milpitas' reliance on SFPUC water supplies and urging rapid implementation of the WSIP is acknowledged.

L_Milpts-03 This comment, which contains information on the current percentage of Milpitas' supply provided by the SFPUC and additional information on Milpitas' other sources of supply, is noted. The percentages of supply provided by the SFPUC, as shown in Draft PEIR Table 7.3 (Vol. 4, Chapter 7, p. 7-18), are from the 2001 base year used in the wholesale customer demand study, and the percentage shown in Table 3.3 (Vol. 1, Chapter 3, p. 3-18) and Table 7.2 (Vol. 4, Chapter 7, p. 7-15) and the customer summary referenced in this comment is the projected percentage for 2030. For wholesale customers with multiple sources of supply, such as Milpitas, the percentage of water supplied by the SFPUC would be expected to vary from year to year, as this comment illustrates. This change does not alter the analysis or conclusions presented in the Draft PEIR. By virtue of the City's making this comment, this information is included as part of the Final PEIR.

L_Milpts-04 This comment on Milpitas' maintenance of separate potable distribution systems is noted. By virtue of the City's making this comment, this information is included in the Final PEIR.

L_Milpts-05 As shown in Table 7.3 (Vol. 4, Chapter 7, p. 7-18), the City of Milpitas' 2001 to 2030 projected demand increase is 48 percent, while its change in purchases from the SFPUC is only 20 percent; this substantial difference between demand and purchases noted in the Draft PEIR is consistent with information provided in this comment (i.e., that a larger portion of the City's future demand increase is expected in areas served by the Santa Clara Valley Water District). The customer-specific summary (Chapter 7, p. 7-49) notes that Milpitas' 2030 purchase estimate of 8.2 million gallons per day (mgd) is below its current water supply assurance of 9.23 mgd. By virtue of the City's making this comment, this information is included in the Final PEIR.

L_Milpts-06 This comment describing Milpitas' recycled water use is noted. Draft PEIR Table 3.3 (Vol. 1, Chapter 3, p. 3-18) and Table 7.2 (Vol. 4, Chapter 7, p. 7-15) show the City's 2030 projected use of 1.77 mgd of recycled water which, as this comment notes, represents approximately 10 percent of its total 2030 water supply.

L_Milpts-07 The introduction to Section 7.3.6, Customer-Specific Summaries, of the Draft PEIR (Vol. 4, Chapter 7, p. 7-34) indicates that the discussions in this section refer to Table 7.2.

L_Milpts-08 This comment providing additional information regarding the City's water conservation programs is acknowledged.

L_Milpts-09 Draft PEIR Tables C.4 and C.5 (Vol. 5, Appendix C, pp. C-21 and C-24) indicate that the SFPUC proposes to utilize Calaveras Road for the Calaveras Dam Replacement (SV-2) construction access route for workers, equipment, and haul/delivery trucks. The City's concerns with potential construction-related traffic impacts on Milpitas streets will be addressed in detail as part of project-level CEQA review for the Calaveras Dam Replacement project.

L_Milpts-10 Draft PEIR Table C.3 (Vol. 5, Appendix C, p. C-16) indicates there are no alternative locations under consideration in Milpitas. In response to this comment, the City of Milpitas has been added to Table 3.11, WSIP Improvement Projects – Affected Jurisdictions, under SV-2, Calaveras Dam Replacement project (Vol. 1, Chapter 3, p. 3-60). The table is revised as follows:

Affected County and City Jurisdictions	SV-2, Calaveras Dam Replacement
Milpitas	A

L_Milpts-11 The commenter requests that the Midtown and Transit Area Specific Plans for Milpitas be added to Draft PEIR Table 4.17-3 (Vol. 2, Chapter 4, p. 4.17-14) in Section 4.17, Cumulative Effects. Since the Draft PEIR cumulative analysis did not include specific plans, these plans have not been included. In general, many factors determine how and when growth will occur in a specific plan area, and it is therefore too speculative to assume that all or some portion of the expected growth in a specific plan area would coincide with the construction of WSIP facility projects. As stated in note "b" of Table 4.17-3 (Vol. 2, Chapter 4, p. 4.17-20), the schedules of projects included in the cumulative projects list were based on the most current information available during preparation of the Draft PEIR, as of July 2006.

The Draft PEIR (Vol. 2, Chapter 4, p. 4.17-2) states that the project information listed in Tables 4.17-1 through 4.17-5 (Vol. 2, Chapter 4, pp. 4.17-3 to 4.17-35) was compiled based on consultations with local jurisdictions within the San Joaquin, Sunol Valley, Bay Division, Peninsula, and San Francisco Regions (the local planning, community development, and public works/engineering departments of these agencies) as well as review of EIRs and information posted on agency websites. Specific development projects are listed in Tables 4.17-1 through 4.17-5, and they include projects located within specific plan areas. Several development projects in the Midtown Specific Plan area could be included in

Table 4.17-3: the North Main Street utilities and streetscape improvements, Milpitas Public Library, Devries Place senior housing, and the Santa Clara Valley Health Center Milpitas and Parking Structure. These projects are already under construction along the Main Street corridor. Since none of them are adjacent to any proposed WSIP facility projects, the cumulative impacts resulting from these projects in combination with the WSIP projects and other projects listed in the Draft PEIR would be limited to cumulative construction-related traffic impacts on I-880 and Highway 237 as well as associated regional air quality and noise impacts. The Draft PEIR identifies cumulative traffic, air quality, and noise impacts as potentially significant and unavoidable. The significance of these impacts would remain unchanged when these projects are added.

L_Milpts-12 The bullet characterizing growth in Milpitas and East Palo Alto as more recent is in reference to the preceding bullet, which indicates that the highest rates of growth within most cities in the wholesale customer service area occurred in the decades following World War II (i.e., the 1950s through the 1970s). By contrast, according to the Milpitas General Plan (p. 1-1), "with the exception of the Great Mall…and some scattered subdivisions and buildings along Main Street, virtually the entire City has been built over the last 30 years" (City of Milpitas, 2002a). Additional information on growth trends in select jurisdictions in the service area, including Milpitas, is presented in Draft PEIR Appendix E.4. The additional information on growth over the past decade provided in this comment supplements, and is not inconsistent with, the information presented in the Draft PEIR on the longer-term development trends in the area.

L_Milpts-13 This comment states that the Draft PEIR characterization of growth for the city (Vol. 4, Chapter 7, pp. 7-49 and 7-50) is incorrect and cites examples of smart growth planning. The City's commitment to smart growth described in this comment is acknowledged. The PEIR text referenced in this comment accurately describes adjustments that were made to the Demand Side Management Least-Cost Planning Decision Support System (DSS) model, which reflected assumptions about future growth in the city at the time. Model assumptions and adjustments were made in close consultation with city staff, and the City submitted a form concurring with the projected demands. While the City of Milpitas faults the characterization of future growth within the city and suggests that adjustments be made to the demand model, Comment L_Milpts-05 shows that the City's purchase request is consistent with that presented in the Draft PEIR. Therefore, no change to the PEIR text or to the description of account categories in the demand model is warranted.

L_Milpts-14 The "Water Customer – Selected Population Projection for 2030" column in Draft PEIR Table 7.8 (Vol. 4, Chapter 7, p. 7-28) refers to population projections used in the DSS demand model, based on the projection source selected by each wholesale customer. The information presented in this column (including a 2030 population of 88,841 for Milpitas) is based on the *SFPUC Wholesale Customer Demand*

Technical Memorandum (URS, 2004b, Table 4-1, p. 4-5 of the memorandum), which also indicates that the Association of Bay Area Governments' (ABAG) *Projections 2002* subregional series was Milpitas' choice of projections source. This is consistent with the "Wholesale Customer Population Projection Selection Form" submitted by Milpitas (dated February 6, 2004), which indicated the City selected ABAG as the projections source, and that this selection was a revision of an earlier projections source selection.

With respect to the general plan projection, contrary to the information in the Draft PEIR (and consistent with information presented in this comment), the Midtown Milpitas Specific Plan is included in the current general plan projection of 77,100.[1] Therefore, in response to this comment, the Draft PEIR has been revised as shown below. However, the suggested revision (of taking the additional population expected to result from the proposed Transit Area Specific Plan project and adding it to the general plan projection) has not been made, because the comparison of general plan and water demand study projections presented in Table 7.8 and discussed in the individual customer summaries is between the demand study projections and those in *adopted* general plans; the Transit Area Specific Plan has not yet been adopted.

The entry for Milpitas in Table 7.8 (Vol. 4, Chapter 7, p. 7-28) has been revised as shown on the following page.

The customer-specific summary (Vol. 4, Chapter 7, p. 7-50, first full paragraph) for Milpitas is revised as follows:

> The customer-selected population projection used for Milpitas in the demand study is ~~generally consistent with~~ approximately 15 percent greater than the growth identified in the city's general plan and is generally consistent with (about 3 percent less than) the growth projected by ABAG. ~~The 2030 Milpitas population presented in the demand study is approximately 6 percent less than that cited in the city's general plan, as amended by the Midtown Milpitas Specific Plan, and projected by ABAG.~~ The City of Milpitas is currently preparing a Transit Area Specific Plan that is expected, upon adoption, to result in a buildout population of 95,014, somewhat greater than the population projection used in the demand study (Williams, 2007).

[1] This is at variance with the *Midtown Milpitas Specific Plan Draft Environmental Impact Report* (DEIR) analysis (Chapter 5 of that report, p. 5-1), which states that ABAG projected a 2020 population of 77,100 for Milpitas based on the land use regulations and land availability in effect prior to the adoption of the specific plan. (*Projections 2000*, published in 1999, shows this projection of 77,100 in 2020 and is assumed to be the projection series cited in the specific plan DEIR.)

TABLE 7.8
COMPARISON OF WATER DEMAND POPULATION ESTIMATES AND GENERAL PLAN POPULATION ESTIMATES

Customer	UWMP Population in 2030	*Projections 2005* Population in 2030	Water Customer-Selected Population Projection for 2030	General Plan Population Projection for General Plan Projection Year[a]	General Plan Projection Year[a]	Difference: Water Customer Population and General Plan Population	% Difference (Water Customer Population and General Plan Population)
Customer-selected projection less than or equal to general plan projection							
City of East Palo Alto	32,712	43,600	32,712	34,600	2020	-1,888	-5.5%

City and County of San Francisco[h]	849,942	903,300	849,942	811,100	2020	38,842	4.8%
City of Santa Clara	140,698	142,100	140,698	129,900	2010	10,798	8.3%
Customer-selected projection more than 10% greater than general plan projection							
City of Burlingame[h,i]	31,900	31,900	34,967	31,500	2010	3,467	11.0%
City of Milpitas[b]	91,400	91,400	88,841	94,400	2020	5,559	-5.9%
Coastside County Water District[j]	24,973	27,100	24,973	21,065	2020	3,908	18.6%
Estero Municipal Improvement District (MID)[j,k]	40,866	32,500	40,096	30,803	2010	9,293	30.2%

NOTE: Most wholesale customer service areas are not contiguous with city limits (or with the city and its planning area), and therefore the population projections from the jurisdictions' general plans and ABAG should be considered as general comparisons only. The following are not included, because the water service area and jurisdictional boundaries are not comparable or the general plan of the corresponding jurisdiction does not provide a comparable population projection: Brisbane, CWS–Bear Gulch, CWS–Mid-Peninsula, Menlo Park, North Coast County Water District, Purissima Hills Water District, San Jose North, Skyline County Water District, and Stanford University.

a The general plan population projection and projection year are the most distant population projection and the year of the most distant population projection available in the general plan or general plan element.
b The general plan population is based on the 2002 Milpitas General Plan. ~~population shown in the general plan (77,100) plus the additional population accommodated by the Milpitas Midtown Specific Plan, as advised by Milpitas Planning Department staff (Carrington, 2006), to account for 5,000 additional units with an assumed density of 3.46 persons per unit (i.e., an added population of 17,300). The City has amended to general plan to incorporate the specific plan.~~
c The service area of Sunnyvale's water district is contiguous with the city limits; however, another water utility (CWS) serves several small areas within the city.
d CWS = California Water Service Company.
e CWS–South San Francisco serves South San Francisco, Colma, a small portion of Daly City, and the unincorporated area of Broadmoor. The water customer estimate for the Westborough Water District is from the district's Urban Water Management Plan. The general plan figure is the combined total projected population in the South San Francisco and Colma general plans (67,400 and 1,285 respectively); the general plan projection year shown (2020) is for South San Francisco, the projection year for Colma is 2005. The *Projections 2005* figure is for South San Francisco and Colma (71,800 and 1,860, respectively).
f The Mid-Peninsula Water District serves Belmont, portions of San Carlos, and unincorporated areas of San Mateo County. The general plan figure is for the city of Belmont, from the 2002 housing element.
g The San Bruno UWMP (City of San Bruno, 2007) shows two population projections for 2030: 50,700, based on ABAG's *Projections 2005*, and 48,229, based on the City's Adjusted Draft General Plan.
h UWMP and *Projections 2005* figures are for household population, since the customer-selected figure is for household population.
i Burlingame's water system also serves portions of unincorporated Burlingame and a few properties in the city of San Mateo and town of Hillsborough.
j The general plan figure is for the city of Half Moon Bay only, from the 1993 Half Moon Bay Local Coastal Program Land Use Plan (Table 9.3, Chapter 9, page 189). In addition to incorporated Half Moon Bay, the Coastside County Water District serves unincorporated areas of Half Moon Bay and the unincorporated communities of El Granada, Miramar, and Princeton by the Sea.
k Estero MID serves Foster City and a portion of the city of San Mateo. The general plan figure is for Foster City.

SOURCES: ABAG, 2004; ACWD, 2005; CWS-South San Francisco, 2006; ~~Carrington, 2006;~~ City and County of San Francisco, 2004; City of Belmont, 2002a; City of Burlingame, 2002a; City of Burlingame, 2005; City of Daly City, 2004a; City of Daly City, 2005; City of East Palo Alto, 1999a; City of East Palo Alto, 2006; City of Foster City, 2001a; City of Fremont, 2003a; City of Half Moon Bay, 1993; City of Hayward, 2002a; City of Hayward, 2005; City of Millbrae, 1998a; City of Millbrae, 2005; City of Milpitas, 2002a; City of Milpitas, 2005; City of Mountain View, 2002a; City of Mountain View, 2005; City of Newark, 2002a; City of Palo Alto, 1998a; City of Palo Alto, 2005b; City of Redwood City, 2005b; City of Redwood City, 2007a; City of San Bruno, 2003a; City of San Bruno, 2007; City of Santa Clara, 2002a; City of Santa Clara, 2005; City of South San Francisco, 2002a; City of Sunnyvale, 2002a; City of Sunnyvale, 2005; City of Union City, 2002a; Coastside County Water District, 2005; Estero MID, 2005; Hannaford and Hydroconsult, 2004; Mid-Peninsula Water District, 2006; SFPUC, 2005; Town of Colma, 1999a; Town of Hillsborough, 2002a; URS, 2004a, Westborough Water District, 2005.

The first bullet on p. 7-27, Section 7.3.3, General Plan Projections, is revised as follows:

> The population projections used for ~~three~~ <u>two</u> of the wholesale customers (East Palo Alto~~, Milpitas,~~ and Sunnyvale) in the water demand studies are less than (from 2 to 6 percent less) the projections assumed in the general plans of the jurisdictions served by them.

The first two bullets on p. 7-29 are revised as follows:

> The population projections assumed by ~~three~~<u>four</u> of the water customers (Burlingame, Coastside County Water District, ~~and~~ Estero Municipal Improvement District<u>, and Milpitas)</u> appear to be more than 10 percent greater than the projections assumed in the respective general plans. The difference in these projections results from the longer 2030 planning horizon used for water planning and differences in the geographic area covered by the two sets of projections. Based on the difference in projections, however, the growth assumed in the demand models of these wholesale customers does not appear to be fully addressed in the general plans of the cities served by these customers.
>
> Two of the ~~three~~<u>four</u> customers assuming greater population growth than is reflected in the respective general plan also show somewhat greater growth than is forecasted in *Projections 2005*. Both of these customers (Burlingame and Estero MID) serve unincorporated areas outside the city's jurisdictional boundaries and ABAG subregional areas. In addition, Estero MID serves a non-segregable part of the city of San Mateo that is not included with the *Projections 2005* forecast for Foster City used in this comparison. The other customer (Coastside County Water District) assumes less growth than is forecasted in *Projections 2005* for 2030.

In response to this comment and comment L_RdwdCty-08, the last complete bullet on p. 7-7, Section 7.1.2, Summary of Conclusions, is revised as follows:

> The population growth assumed in the demand projections for most (~~17~~<u>15</u> of ~~20~~19) of the water customers for which comparable general plan projections are available is similar to the growth anticipated in the general plans of the cities served by them.

In Vol. 1, Summary, p. S-62, the last full paragraph, second from the last sentence, is revised as follows:

> In some jurisdictions (Foster City, Half Moon Bay<u>, Milpitas,</u> and Burlingame), the WSIP could support more population growth than is forecasted in adopted general plans.

In Vol. 5, Appendix E.3, the entries for Milpitas in Tables E.3.34 and E.3.36 (pp. E.3-38 and E.3-40) are revised as shown on the following pages.

TABLE E.3.34
COMPARISON OF GENERAL PLAN POPULATION PROJECTIONS TO ABAG PROJECTIONS 2005, UWMPS, AND WATER CUSTOMER DEMAND PROJECTIONS FOR GENERAL PLAN PROJECTION YEAR

	Population in General Plan Population Year[a] Shown in:

n.a. = Not available.

[a] Population shown is for the year of the most distant population projection available in the general plan, housing element, or other relevant local document (see note b). For example, populations in all columns for cities in the group titled “Cities with GP Population Projections for 2005” are populations projected for or estimated in 2005.
[b] Population estimates are from each city’s general plan (GP) or the general plan’s EIR.
[c] Estimates for years between 2001 and 2030 are derived by Mundie & Associates, based on linear interpolations of water customer projections, except for the 2020 San Francisco projection, which is included in the Retail Demand Study (Hannaford and Hydroconsult, 2004).
[d] CWS – South San Francisco District (Colma, parts of Daly City and South San Francisco, plus unincorporated areas) UWMP projection for 2020 is 64,050, and Westborough Water District (which serves part of South San Francisco) UWMP projection for 2020 is 14,150; the CWS-South San Francisco water customer projection for 2020 is 56,006 and the Westborough Water District water customer projection is the same as its UWMP projection (14,150).

a CWS – South San Francisco District (Colma, parts of Daly City and South San Francisco, plus unincorporated areas) UWMP projection for 2030 is 60,150; water customer projection for 2030 is 59,584.
b Estero MID (Foster City and part of San Mateo) projection for 2030 is 40,096.
c Mid-Peninsula Water District (Belmont, part of San Carlos, and portions of unincorporated San Mateo County) UWMP projection for 2030 is 28,930; water customer projection is 27,997.
d Figure shown is for the City of Burlingame Water Agency, which also serves some unincorporated area.
e Figure shown is for the portion of Menlo Park (less than half of the city's population) served by the City of Menlo Park Water Agency.
f CWS – Bear Gulch District (Atherton, parts of Menlo Park, Portola Valley, and Woodside, plus unincorporated areas) projection for 2030 is 73,719; UWMP population projection is 59,220 in 2030.
g Figure shown is for the City of Mountain View Water Agency, which serves most of Mountain View.
h CWS – Mid-Peninsula District (parts of the cities of San Mateo and San Carlos plus unincorporated areas) water customer population projection for 2030 is 139,834; UWMP population projection for 2030 is 134,010.
i The Housing Element of the Daly City General Plan projects this population within the city limits and a population of 120,000 within the (planning) area that corresponds to the ABAG subregional study area.
j Figure shown is for the portion of Daly City served by the City of Daly City Water Agency.
k Parts of Daly City and South San Francisco are served by CWS – South San Francisco District.
l Alameda County Water District (cities of Fremont, Newark, and Union City) projection for 2030 is 379,931.
m Figure shown is for the Coastside County Water District, which also serves unincorporated Half Moon Bay.
n Based on Milpitas General Plan~~ adjusted to include 5,000 housing units added by the Midtown Milpitas Specific Plan (Carrington, 2006)~~.
o Figure shown is for City of Redwood City Water Agency, which also serves part of the City of San Carlos, part of the Town of Woodside, and portions of unincorporated San Mateo County.
p San Bruno UWMP (City of San Bruno,2007) shows two population projections for 2030: 50,700, based on ABAG's *Projections 2005*, and 48,229, based on the City's Adjusted Draft General Plan.
q Figure shown is for the City of San Bruno Water Agency, which also serves some unincorporated areas.
r Figures shown are for the CWS – South San Francisco District plus Westborough Water District. For the Westborough Water District, the water customer projection is the same as the UWMP projection.
s Figure shown is for the Town of Hillsborough Water Agency, which also serves some unincorporated area.
t Purissima Hills Water District, (part of Los Altos Hills and some unincorporated area) projection is 6,763.
u Los Trancos County Water District was acquired by CWS in 2006, and is now part of the CWS – Bear Gulch District. Because it was a separate entity when these projections were prepared, it is presented separately in this analysis.
v Includes a portion of Portola Valley.
w Portola Valley is served by CWS – Bear Gulch District; a portion of the city was previously served by the Los Trancos County Water District, which is now part of CWS – Bear Gulch.

SOURCE: See sources for Table E.3.34.

In Vol. 5, Appendix E.3, the footnote and source information for Milpitas in Table E.3.34 (p. E.3-39) is revised as follows:

l Based on Milpitas General Plan ~~adjusted to include 5,000 housing units added by the Midtown Milpitas Specific Plan~~.

Vol. 5, Appendix E.4 (p. E.4-8, second paragraph) is revised as shown:

> …With the Midtown Milpitas Specific Plan, the city's general plan population at buildout is projected to be 77,100 ~~94,400~~ (City of Milpitas, 2002a; City of Milpitas, 2002c~~; Carrington, 2006~~).

In addition, the entry for Milpitas in Table E.4.1 (p. E.4-3) is revised as shown on p. 5.3-141.

L_Milpts-15 This comment stating that the Elmwood development receives water from sources other than the SFPUC is noted. Draft PEIR Appendix E.6 presents a review of select EIRs on major projects within wholesale customer service areas. The purpose of the review was to see whether mitigation measures identified in a given jurisdiction's general plan EIR were being applied (if appropriate) at the project level within the jurisdiction. The summary regarding Elmwood does not address the source of water for this development, which, as indicated, is not germane to this program-level review. Therefore, the text revision suggested in this comment is not necessary.

L_Milpts-16 This comment, which expands on and is not inconsistent with the summary of information on the Midtown Milpitas Specific Plan presented in Draft PEIR Appendix E.4.2, is noted. This information does not alter the analysis or conclusions of the Draft PEIR. By virtue of the City's making this comment, this additional information is included in the Final PEIR, and no change to the Draft PEIR text is required.

TABLE E.4.1
CURRENT POPULATION ESTIMATES AND FORECASTS OF SELECT JURISDICTIONS

	Actual Population	Current Population Estimates			Forecasts

[a] ACWD = Alameda County Water District; U.S. Census, ABAG, Department of Finance (DOF), and general plan figures are the combined estimates for Fremont, Newark and Union City.
[b] The Newark general plan projection shown is from the 2002 housing element. The general plan (adopted in 1992) projected a buildout population of 51,942 by the year 2007.
[c] The general plan population is based on the population shown in the general plan~~ (77,100) plus the additional population accommodated by the Milpitas Midtown Specific Plan, as advised by Milpitas Planning Department staff (Carrington, 2006), to account for 5,000 additional units with an assumed density of 3.46 persons per unit (i.e., an added population of 17,300). The City has amended to general plan to incorporate the specific plan~~.
[d] The general plan figure for Santa Clara is the average of the range projected in the general plan at buildout of 124,800 to 135,000.
[e] The SFPUC provides 100 percent of Redwood City's potable water. The remaining 8 percent of demand indicated here is met by recycled water.
[f] The city of San Mateo is served by the CWS–Mid-Peninsula District and Estero MID, both of which serve other jurisdictions as well; therefore, the 2030 population assumed by the wholesale customers is not comparable to projections for the city. The SFPUC supplies all of the CWS–Mid Peninsula District's and Estero MID's water.
[g] The customer-selected projection is the combined 2030 estimates for the CWS–South San Francisco District (which also serves Colma and a small portion of unincorporated San Mateo County), based on the 2004 demand study, and the Westborough Water District, based on the district's 2005 UWMP. The SFPUC would supply approximately 85 percent of the CWS–South San Francisco District's water supply in 2030 and 100 percent of Westborough Water District's. The other figures are for South San Francisco only.

City of Mountain View, Cathy Lazarus, Public Works Director, 9/28/07

L_MtnVw-01 This comment regarding the urgent need to implement the WSIP improvements to protect public health, safety, and the economic well-being of Bay Area residents is acknowledged. Please see **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Sections 14.1.2 to 14.1.4) for more discussion.

L_MtnVw-02 This comment, which requests acknowledgement for water agencies' efforts to manage water demand and provides additional information on the City of Mountain View's water conservation programs, is acknowledged. The Draft PEIR (Chapter 3, Table 3.3, p. 3-18 and Chapter 7, Table 7.2, p. 7-15) indicates the projected savings from conservation in 2030 for each wholesale customer. The additional information provided in Attachment 1 of the comment letter is included in the administrative record for the Draft PEIR.

L_MtnVw-03 This comment, which clarifies that water service within Mountain View's jurisdictional boundaries is provided by a City-owned and -operated water utility, is noted.

City of Newark, John Becker, City Manager, 10/1/07

L_Newark-01 The commenter indicates that the City of Newark will be directly affected by the Bay Division Pipeline Reliability Upgrade project (BD-1) and identifies the need for mitigation to address public inconvenience, public safety (traffic controls and emergency access), and construction-related disruption. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2) for detailed discussion of the issues raised by this comment. This master response provides information on the appropriate level of detail of an impact analysis at the program level versus the project level. The project-level EIR for Bay Division Pipeline Reliability Upgrade project will present more detailed information and provide additional analysis of impacts in Newark, including more detailed mitigation measures.

L_Newark-02 This comment is acknowledged. Please refer to **Response L_Newark-01**.

City of Palo Alto, Yoriko Kishimoto, Mayor, 9/25/07

L_PaloAlto-01 This comment expresses support for the WSIP and the adequacy of the Draft PEIR in satisfying CEQA requirements. It summarizes the more detailed comments presented in Comments L_PaloAlto-04 through L_PaloAlto-06; refer to **Responses L_PaloAlto-04** through **L_PaloAlto-06** for the specific responses.

L_PaloAlto-02 This comment requests clarification on the development of the water demand projections. The Draft PEIR (Vol. 1, Chapter 3, pp. 3-16 to 3-22) describes the methodology used to develop the 2030 water demand projections; more detailed information is provided in Draft PEIR Appendix E.2 (Vol. 5). As described on p. 3-21, each wholesale customer selected the source of the demographic projections to be used in the development of the water demand projections for its service area. According to the *SFPUC Wholesale Customer Water Demand Projections Technical Memorandum* (Table 4-1 of that report, p. 4-5; URS, 2004a), the Association of Bay Area Governments' (ABAG) *Projections 2002* was used to develop water demand for Palo Alto, not the comprehensive plan (as implied in this comment). The "Wholesale Customer Population Selection Form" submitted by the City of Palo Alto to the SFPUC also indicates that *Projections 2002* was the City's choice of projections for use in the demand model. The inconsistency between ABAG's 2030 projections and the population forecast used is discussed in the customer summary presented in Draft PEIR Chapter 7 (Vol. 4, pp. 7-51 and 7-52). The comment that the Draft PEIR demand estimates for Palo Alto are realistic is acknowledged.

L_PaloAlto-03 The commenter's request for coordination of the construction schedule for the BDPL Nos. 3 and 4 Crossovers project (BD-2) with Palo Alto's Gunn High School is addressed by SFPUC Construction Measure #1, Neighborhood Notice (Draft PEIR, Vol. 4, Chapter 6, p. 6-4), which states, "Where schools would be affected, the SFPUC will coordinate with school facility managers to schedule construction for time periods with the least impact on school activities to ensure student safety and to minimize disruption to educational and recreational uses of the school property."

L_PaloAlto-04 The comment stressing support for the timely completion the seismic improvement projects contained in the WSIP is acknowledged. The information related to Palo Alto City Council Resolution #7986 is also noted. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.2) for more discussion.

L_PaloAlto-05 This comment expressing Palo Alto's support for the Modified WSIP Alternative is acknowledged. Please see **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14) for additional discussion and analysis of this alternative. In addition, this comment noting the critical need for completing the seismic upgrades and repairs of the regional system is also acknowledged. Please see **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Sections 14.1.2 and 14.1.3) for further discussion.

L_PaloAlto-06 This comment expressing Palo Alto's support for the transfers of conserved water as a component of the Modified WSIP Alternative is acknowledged. The commenter also expresses support for the following: wholesale customers paying for the best conservation measures; aggressive pursuit of conservation opportunities in the Modesto and Turlock Irrigation District service areas; and creating a net increase in flows in the lower Tuolumne River to improve environmental conditions. These comments are acknowledged. See **Response L-BAWSCA1-47**.

L_PaloAlto-07 This information related to the City of Palo Alto's support for the efficient use of natural resources, including water supplies, is noted. Please see **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14), for more discussion on assumptions regarding conservation and recycling used in the development of the WSIP. Please also refer to **Section 14.3, Master Response on Proposed Dry-Year Water Transfer** (Vol. 7, Chapter 14, Section 14.3.2) for additional discussion regarding the proposed dry-year transfer under the WSIP.

L_PaloAlto-08 This comment, which describes Palo Alto's commitment to stewardship of the natural environment and smart growth practices, is acknowledged. As it does not address the adequacy or accuracy of the PEIR, no response is provided.

L_PaloAlto-09 This comment, which describes Palo Alto's energy and water conservation programs, water consumption patterns, and water rates, is acknowledged. This information is conceptually included in the PEIR by virtue of its inclusion in this comment letter.

L_PaloAlto-10 The opinion of the commenter supporting WSIP Variant 3 – 10% Rationing is acknowledged. See **Response L_Burlgme-02** for clarification of the difference between the proposed program and Variant 3.

L_PaloAlto-11 As described in the Draft PEIR (Vol. 4, Chapter 9, pp. 9-116 and 9-122 to 9-123), the SFPUC investigated several alternatives for an exchange or transfer with the Santa Clara Valley Water District (SCVWD) as part of the WSIP background studies exploring regional water supply opportunities. The SFPUC and SCVWD explored options using the existing intertie or a new intertie, as well as exchanges through delivery to the eight customers in common to both the SCVWD and SFPUC. In general, an exchange would involve the SFPUC advancing water in wet years to the SCVWD in exchange for supplies from the SCVWD in dry years. However, the SCVWD does not have the capacity or need for additional water supplies during wet years. At times when the SFPUC has additional supplies available for delivery to the SCVWD, the SCVWD cannot use the water directly or store it. Additionally, the SCVWD does not have excess water to transfer to the SFPUC in normal or dry years. Therefore, this concept was eliminated from further consideration because it would not provide a dependable future water source for the SFPUC regional system.

L_PaloAlto-12 The commenter requests that the PEIR include an elevation/schematic of the control building and/or vault associated with the BDPL Nos. 3 and 4 Crossovers project (BD-2). Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2) for detailed discussion of the issues raised by this comment. This master response provides information on the appropriate level of detail of an impact analysis at the program level versus the project level. At the programmatic level, design details for individual WSIP projects are not presented or evaluated in the Draft PEIR. The City will have the opportunity to review and comment on the design details of this project during project-level CEQA review.

The commenter states that the mitigation measures should not allow WSIP projects to violate city ordinances (including but not limited to noise and nuisance ordinances), and that the City should be consulted at an early stage in this project. The Draft PEIR (Vol. 2, Chapter 4, p. 4.2-9) states that the SFPUC is exempt from complying with the building and zoning ordinances of other cities. However, project consistency with the provisions of other local ordinances (including noise and tree ordinances) will be determined during the preparation of project-level CEQA documentation. The Palo Alto tree, vegetation, and noise ordinances are identified in Tables 4.6-1 and 4.10-2 (Vol. 2, Chapter 4, pp. 4.6-34 and 4.10-7). As stated in the Draft PEIR (Vol. 2, Chapter 4, p. 4.10-6), time and noise limits prescribed in local noise ordinances were used in the PEIR as criteria to determine the significance of project impacts under CEQA. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.3) regarding the City's request for early consultation. This request for early consultation has been noted in Draft PEIR Table C.6 (Vol. 5, Appendix C, p. C-26).

L_PaloAlto-13 The commenter requests substitution of SFPUC Construction Measure #1 with specific language requiring coordination with Gunn High School, but such coordination is already required, as described in **Response L_PaloAlto-03**.

The commenter also mentions that additional right-of-way/easement could be needed for the BDPL Nos. 3 and 4 Crossovers project (BD-2), and also questions the visibility of the control building/vault from Foothill Boulevard. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2) for information on the appropriate level of detail of an impact analysis at the program level versus the project level. As a program-level document, the Draft PEIR does not present or evaluate the design details for the individual WSIP projects. The City will have the opportunity to review and comment on the design details of this project during project-level CEQA review.

L_PaloAlto-14 The commenter requests that information on the city's parks and open space be updated. The number of parks and total urban park acreage presented in the Draft PEIR (Vol. 2, Chapter 4, p. 4.12-10) are based on information cited in the *City of Palo Alto Comprehensive Plan* (1998) and subsequent revisions to the plan made in July 2007. In response to this comment, the Draft PEIR (Vol. 2, Chapter 4, p. 4.12-10, fourth full paragraph) has been revised as follows:

City of Palo Alto

According to the City of Palo Alto, the city has a total of 4,358 acres of parkland and open space areas, including 32 urban parks encompassing approximately 200 acres and several large open-space and nature preserves. Foothill Park is approximately 1,400 acres and the Arastradero Preserve is approximately 610 acres (City of Palo Alto, 2007). ~~Palo Alto operates 29 parks encompassing approximately 190 acres. Palo Alto Baylands Nature Preserve, a popular hiking and bird-watching area on San Francisco Bay, encompasses 1,940 acres and contains 15 miles of multi-use trails, a segment of the Bay Trail, an athletic center, picnic facilities, an art park, and the Baylands Nature Interpretive Center.~~ The City of Palo Alto owns the wetlands south of Cooley Landing (in East Palo Alto) in the vicinity of the BDPL Reliability Upgrade (BD-1) pipeline alignment (City of Palo Alto, 1998). A BDPL Nos. 3 and 4 Crossovers (BD-2) crossover facility would be adjacent to the sports fields at Gunn High School.

The following reference has been added to the Draft PEIR (Vol. 2, Chapter 4, p. 4.12-29):

City of Palo Alto, Yoriko Kishimoto, Mayor, letter communication, September 25, 2007.

L_PaloAlto-15 The commenter's recommendation to correct the last paragraph under the Cultural Resources section (Vol. 4, Chapter 6, p. 6-6) is not necessary. The Environmental Review Officer represents the Planning Department.

L_PaloAlto-16 This comment repeats points made in Comment L_Palo Alto-02 about the projections source used in the demand model and differences between ABAG projections and those used in the demand model. Please refer to **Response L_PaloAlto-02**. The Draft PEIR (Vol. 4, Chapter 7, p. 7-52) indicates that the population and employment projections used for Palo Alto in the demand study are about 10 percent and 16 percent higher, respectively, than those shown for 2010 in the comprehensive plan (referred to as the general plan), consistent with this comment's request. The comment that the City considers the forecast shown in the PEIR to be reasonable is acknowledged.

Purissima Hills Water District, Daniel Seidel, President, 9/28/07

L_PHWD1-01 This comment regarding the critical need for a reliable water supply and fire safety in Los Altos Hills is acknowledged. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.4) for more discussion.

L_PHWD1-02 The commenter correctly indicates that Foothill Community College is within the Purissima Hills Water District, although the data presented in the comment (number of students and ratio of students to residents) were not specific factors in the SFPUC's demand model. As described in the Draft PEIR (Vol. 1, Chapter 3, pp. 3-20 and 3-21), base-year water usage was established using actual account data, and the growth rates reflected in the selected source of population and employment projections were used to project future water demand. According to the *SFPUC Wholesale Customer Water Demand Projections Technical Report*, Foothill College is the District's largest water customer (URS, 2004a, Appendix A, p. A-5). The comment comparing the District's per-acre water consumption with more densely developed communities is acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2) for further discussion of per-capita demand.

L_PHWD1-03 This comment regarding the urgency for the seismic improvements contained in the WSIP is acknowledged. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.3) for more discussion.

L_PHWD1-04 Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.2) for an expanded discussion of the overall need for the WSIP and of the potential consequences of not implementing the proposed program.

L_PHWD1-05 This comment expressing an opinion related to growth inducement is acknowledged. The growth-inducement potential associated with the WSIP is analyzed in Chapter 7 of the Draft PEIR (Vol. 4).

L_PHWD1-06 This comment, which states that water conservation measures are included in projected demand estimates and that, as these measures are implemented, further improvements in water conservation will be more difficult to achieve, is acknowledged. As a point of clarification, the column showing "2030 Demand (with Plumbing Code Savings)" in Table 3.3 (Vol. 1, Chapter 3, p. 3-18), Table 7.2 (Vol. 4, Chapter 7, p. 7-15), and Table 7.3 (Vol. 4, Chapter 7,

p. 7-18) does not include conservation measures but only savings that would result from plumbing codes and natural fixture replacement. Projected savings from conservation measures are shown in a separate column in Tables 3.3 and 7.2, and are reflected in the estimates of 2030 purchases from the SFPUC regional system shown in all three tables.

L_PHWD1-07 The opinion of the commenter regarding the reliability and impacts of desalination is acknowledged. This is consistent with information presented in the Draft PEIR regarding Variant 2 – Regional Desalination for Drought (Vol. 4, Chapter 8, pp. 8-24 to 8-32).

L_PHWD1-08 This comment urging rapid certification of the WSIP PEIR and expeditious implementation of the WSIP is acknowledged.

L_PHWD1-09 In response to this comment, the typographical error in the Draft PEIR (Vol. 4, Chapter 7, p. 7-52, fourth paragraph, third sentence) is revised as follows:

> In 2001, the Purissima Hills Water District served 6,032—or 64 percent—of the approximately ~~94,555~~ 9,455 residences estimated for the town and its sphere of influence in 2000.

L_PHWD1-10 This comment questions the Draft PEIR's inclusion of employment estimates for Los Altos Hills, stating "There are no commercial enterprises in Los Altos Hills" and estimating institutional employment in Los Altos Hills "in the 450–470 range."

The employment estimates presented in the Draft PEIR (Vol. 5, Appendix E.3, Tables E.3.12, E.3.24, and E.3.35, pp. E.3-16, E.3-17, and E.3-40) are from the Association of Bay Area Governments' (ABAG) *Projections 2002*, *Projections 2003*, and *Projections 2005* and include public employees (for example, city and school district jobs). These projections furnish the following detail for the estimates of existing employment in 2000 for Los Altos Hills:

	Projections 2002 and Projections 2003	**Projections 2005**
Agriculture & Mining	30	80
Manufacturing & Wholesale	60	190[a]
Retail	50	60
Service	2,290	1,560
Financial & Professional		440
Health, Educational, & Recreational		1,120
Other	290	490
Total	2,720	2,380

[a] Manufacturing, wholesale, and transportation

SOURCES: ABAG, *Projections 2002*, *Projections 2003*, and *Projections 2005.*

According to ABAG staff, the *Projections* employment estimates are based on information from the Census Transportation Planning Package, adjusted to include self-employed workers as well as those who might have been on vacation or otherwise absent from work during the census week (Wong, 2008). This information is assembled by census place (not census tract): for example, Los Altos Hills (Los Altos would be a separate and distinct census place). ABAG staff also note that Foothill College is located in Los Altos Hills (as indicated in Comment L_PHWD-02). The Foothill–De Anza Community College District employs 1,185 workers (604 full-time and 577 part-time) in Los Altos Hills at the college and the district's central offices (Parisi, 2008).

L_PHWD1-11 Information on the town's website (http://www.losaltoshills.ca.gov/government/general planupdate.html) indicates that the revision of the Land Use Element has not yet been initiated. The Open Space and Recreation Element adopted in April 2007 and currently posted on the town's website was reviewed to ensure there were no differences between it and the version cited in the Draft PEIR relevant to the PEIR's growth-inducement analysis or conclusions. The following text from the Draft PEIR (Vol. 4, Chapter 7, p. 7-62 and p. 7-90) is revised as follows:

> Land Use Element (n.d.) and Open Space~~,~~ and Recreation Element~~s~~ ~~(n.d.)~~ (2007).

The following reference on page 7-90 of the Draft PEIR is revised as follows to reflect the above text revision:

> Town of Los Altos Hills Land Use, Open Space, and Recreation Elements, http://www.losaltoshills.ca.gov/government/town-documents.html (website accessed March 15, 2006), 2007.

Purissima Hills Water District, Daniel Seidel, President, 9/19/07

[See Public Hearing Transcript, Palo Alto, pp. 23–27]

L_PHWD2-01 This comment raises a similar issue to that raised in Comment PHWD1-02 (concerning the influence of the community college on water demand). Please refer to **Response L_PHWD1-02**.

L_PHWD2-02 This comment expresses concern related to the vulnerability of the regional water system to seismic hazards and urges rapid completion of the CEQA process so that seismic improvements can be made. Comment noted. Please see **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Sections 14.1.2 to 14.1.4) for more discussion of the numerous reasons the program is need.

Redwood City, Peter Ingram (sent by Chu Chang), Community Development Services Director, 9/27/07

L_RdwdCty-01 This comment, which provides background information related to Redwood City's water service area and expresses support for the WSIP, is acknowledged.

L_RdwdCty-02 This comment regarding the overall urgency of program implementation is acknowledged. Please see **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.2) for more discussion.

L_RdwdCty-03 This comment expressing support for the programmatic approach to the environmental review of the WSIP is acknowledged.

L_RdwdCty-04 The commenter's description of the City of Redwood City's current involvement with SFPUC engineering staff on the design drawings for the Bay Division Pipeline (BDPL) Reliability Upgrade project (BD-1) is acknowledged. The City indicates that its involvement with the SFPUC on this project will continue through the project-level CEQA process, which is the appropriate process for addressing concerns specific to that project.

L_RdwdCty-05 This comment, which states concurrence with the demand methodology and the water demand estimates for Redwood City presented in the Draft PEIR, is acknowledged.

L_RdwdCty-06 The commenter provides minor corrections for the acreages of some city parks described in the Draft PEIR. The acreages for Fleishman Park, Hawes Park, and Red Morton Parks presented in the Draft PEIR (Vol. 2, Chapter 4, p. 4.12-11) were the acreages listed on Redwood City's website for the Recreation and Community Department. The acreage provided by the commenter for Hawes Park (1.59 acres) is the same acreage presented in the Draft PEIR.

In response to this comment, the Draft PEIR text (Vol. 2, Chapter 4, p. 4.12-11, first full paragraph) is revised as follows:

> **City of Redwood City**
>
> Redwood City owns and operates 30 parks, including small neighborhood parks, larger multi-use parks, a dog park, a skate park, and two outdoor pools (City of Redwood City, 2007c). The BDPL Reliability Upgrade project (BD-1) is in the vicinity of Fleishman Park, Hawes Park, and Red Morton Park. The 0.64~~0.63~~-acre Fleishman Park has play equipment, a play area, picnic area, barbeque pits, and restrooms (City of Redwood City, 2007a). Hawes Park contains ball fields and restroom facilities on ~~covering~~ 1.59 acres (City of Redwood City, 2007a~~b~~). Red

> Morton Park encompasses 30.89 ~~31.74~~ acres and has pools, ball fields, play areas and equipment, picnic areas, barbeque pits, tennis courts, basketball courts, and restroom facilities (City of Redwood City, 2007a~~d~~). An alternative site for the BDPL 3 and 4 Crossovers project (BD-2) could also be located in Redwood City (City of Redwood City, 1991).

The corresponding references are revised as follows (Vol. 2, Chapter 4, p. 4.12-29):

> City of Redwood City, Peter Ingram, Community Services Director, letter communication, September 27, 2007a.
>
> ~~City of Redwood City, Parks, Recreation and Community Services, Fleishman Park, available online at www.redwoodcity.org/parks/parksandpools/parks/parks_fleishman.html, accessed May 17, 2007a.~~
>
> ~~City of Redwood City, Parks, Recreation and Community Services, Hawes Park, available online at www.redwoodcity.org/parks/parksandpools/parks/parks_hawes.html, accessed May 17, 2007b.~~
>
> City of Redwood City, Parks, Recreation and Community Services, Parks and Pools, available online at www.redwoodcity.org/parks/parksandpools/index.html, accessed May 17, 2007b~~c~~.
>
> ~~City of Redwood City, Parks, Recreation and Community Services, Red Morton Park, available online at www.redwoodcity.org/parks/parksandpools/parks/parks_red.html, accessed May 17, 2007d.~~"

L_RdwdCty-07 The commenter requests to know the cutoff date used for project selection in Section 4.17.2, Projects Considered in Cumulative Analysis. As stated in note "b" of Table 4.17-3 (Vol. 2, Chapter 4, p. 4.17-20), the schedules of projects included in the cumulative projects list were based on the most current information available during preparation of the Draft PEIR as of July 2006.

L_RdwdCty-08 The explanation for using the urban water management plan (UWMP) as the source for the population projection in the demand model is noted. A comparison of jurisdictions' general plans is presented in the growth-inducement analysis because, unlike UWMPs, general plans (and general plan elements) reflect the land uses and level of growth planned for a jurisdiction by the land use planning agency; general plans also receive environmental review under CEQA prior to adoption, and are formally adopted or approved by the local decision-making body (i.e., city council or county board of supervisors).

Contrary to the information presented in the Draft PEIR, the recent Downtown Precise Plan was not adopted as an amendment to Redwood City's general plan, and therefore the 1990 general plan stands as the currently adopted plan. The 1990 general plan states that: "… Redwood City can be expected to experience a brisk housing market and a steady population increase through the next decade, reaching 70,000 by the year 2000" but that this estimate may need to be raised or lowered, depending on various contingencies (Redwood City Strategic General Plan, Population Characteristics, Chapter 4, p. 4-1). This population projection provides a sense, within the adopted general plan, of the City's expectations regarding future growth, which is what the "General Plan Projection" column of Draft PEIR Table 7.8 (Vol. 4, Chapter 7, p. 7-28) and the reference to general plan projections in the customer summaries is meant to convey. However, as stated in the Draft PEIR (p. 7-27, footnote 19; p. 7-28, table note; and p. 7-29, footnote 21), general plans with projection years earlier than 2005 were not considered comparable to the 2030 population and employment projections used in the water demand studies and consequently were not included in Tables 7.8 or 7.9 (and tables comparing WSIP projections with general plan projections in Appendix E.3). Since the buildout year for Redwood City's 1990 Strategic General Plan is 2000, as noted in this comment, the general plan projection should not be included in the table.

Therefore, in response to this comment, the Draft PEIR is revised as follows:

> In Chapter 7, p. 7-27, the first paragraph, second sentence, of Section 7.3.3, and footnotes 19 and 20, are revised as follows:
>
> > The general plans of ~~22~~21 cities that are served in whole or part by SFPUC and its wholesale customers have population projections that are generally comparable to the water customer-selected population projections.[19, 20]
> >
> > [19] ….The ~~22~~21 cities, served by ~~20~~19 water customers, represent approximately two-thirds of 32 cities served by the SFPUC regional system.
> >
> > [20] The ~~22~~21 cities are served by ~~19~~18 wholesale customers and the SFPUC (for the retail service area), referred to collectively here as ~~20~~19 water customers.
>
> In Chapter 7, p. 7-27, the second from the last bullet is revised as follows:
>
> > The population projections assumed for ~~14~~13 of the water customers (ACWD, CWS-South San Francisco in combination with Westborough Water District, Daly City, Hayward, Hillsborough, Mid-Peninsula Water District, Millbrae, Mountain View, Palo Alto, ~~Redwood City,~~ San Bruno, San Francisco, and Santa Clara) are

> higher but within 1 to 10 percent of the projections presented in the respective general plans.

In response to this comment and comment L_Milpts-14, the last complete bullet on p. 7-7, Section 7.1.2, Summary of Conclusions, is revised as follows:

> The population growth assumed in the demand projections for most (~~17~~15 of ~~20~~19) of the water customers for which comparable general plan projections are available is similar to the growth anticipated in the general plans of the cities served by them.

The entry for Redwood City in Table 7.8 (p. 7-28) is revised as shown on the following page.

The customer-specific summary (Chapter 7, Section 7.3.6, p. 7-53, third full paragraph) for Redwood City is revised as follows:

> The customer-selected population projection used for Redwood City in the demand study is ~~generally consistent with the buildout population identified in the city's general plan (which has a 2020 planning horizon), and~~ 24 percent lower than ABAG's 2030 population projection of 122,300 for the city and its sphere of influence. The 2030 Redwood City population used in the demand study is approximately 7 percent more than the 2020 projection shown in the city's Downtown Precise Plan ~~(a recent amendment of the general plan)~~, which cites ABAG's *Projections 2005* forecast for 2020 for the city within its jurisdictional boundary. The city's water service area includes only a portion of the city's sphere of influence (Bonte, 2006), which probably accounts for the difference between the ABAG projection for the city and its sphere of influence and that assumed in the demand study. ABAG's 2030 projection of 94,300 for Redwood City within the city limits only is within 1 percent of the demand study projection. Because the population projection included in the city's 1990 general plan is for 2000 (earlier than 2005), it is not considered comparable to the 2030 WSIP population projection for this analysis. According to the city, the 2003 UWMP was selected for use in the demand study because the UWMP contained the most current population and employment projections at the time.

In response to this comment and Comment L_Milpts-14, the last complete bullet on p. 7-7 in Chapter 7, Section 7.1.2, Summary of Conclusions, is revised as shown in **Response L_Milpts-14**.

In Vol. 5, Appendix E.3, the entries for Redwood City have been deleted from Tables E.3.34 and E.3.36 (pp. E.3-38 and E.3-40), as shown on pp. 15.3-158 to 15.3-159.

TABLE 7.8
COMPARISON OF WATER DEMAND POPULATION ESTIMATES AND GENERAL PLAN POPULATION ESTIMATES

Customer	UWMP Population in 2030	*Projections 2005* Population in 2030	Water Customer-Selected Population Projection for 2030	General Plan Population Projection for General Plan Projection Year[a]	General Plan Projection Year[a]	Difference: Water Customer Population and General Plan Population	% Difference (Water Customer Population and General Plan Population)
Customer-selected projection less than or equal to general plan projection							
City of East Palo Alto	32,712	43,600	32,712	34,600	2020	-1,888	-5.5%
City of Milpitas[b]	91,400	91,400	88,841	94,400	2020	5,559	-5.9%
City of Sunnyvale[c]	159,100	159,100	151,610	154,600	2020	-2,990	-1.9%
Customer-selected projection 1–10% greater than general plan projection							
Alameda County Water District	405,900	404,700	379,931	359,113		20,818	5.8%
Fremont	*257,100*	*257,200*		*229,213*	2020		
Newark	*53,500*	*53,400*		*49,800*	2020		
Union City	*95,300*	*94,100*		*80,100*	2020		
CWS–South San Francisco District and Westborough Water District[d,e]	83,450	73,660	73,884	68,685	2020	5,199	7.6%
City of Daly City	115,651	127,200	115,651	113,000	2020	2,651	2.3%
City of Hayward	162,800	171,500	162,757	160,300	2025	2,457	1.5%
Town of Hillsborough		11,800	12,708	11,800	2025	908	7.7%
Mid-Peninsula Water District[f]	28,930	28,800	27,997	27,800	2010	197	0.7%
City of Millbrae	24,200	24,500	25,174	24,860	2015	314	1.3%
City of Mountain View	81,700	89,600	81,670	75,200	2010	6,470	8.6%
City of Palo Alto	69,199	92,200	69,199	62,880	2010	6,319	10.0%
~~City of Redwood City~~	~~93,329~~	~~122,300~~	~~93,535~~	~~87,100~~	~~2020~~	~~6,435~~	~~7.4%~~
City of San Bruno	See note g	50,700	48,229	46,400	2020	1829	3.9%
City and County of San Francisco[h]	849,942	903,300	849,942	811,100	2020	38,842	4.8%
City of Santa Clara	140,698	142,100	140,698	129,900	2010	10,798	8.3%
Customer-selected projection more than 10% greater than general plan projection							
City of Burlingame[h,i]	31,900	31,900	34,967	31,500	2010	3,467	11.0%
Coastside County Water District[j]	24,973	27,100	24,973	21,065	2020	3,908	18.6%
Estero Municipal Improvement District (MID)[j,k]	40,866	32,500	40,096	30,803	2010	9,293	30.2%

NOTE: Most wholesale customer service areas are not contiguous with city limits (or with the city and its planning area), and therefore the population projections from the jurisdictions' general plans and ABAG should be considered as general comparisons only. The following are not included, because the water service area and jurisdictional boundaries are not comparable or the general plan of the corresponding jurisdiction does not provide a comparable population projection: Brisbane, CWS–Bear Gulch, CWS–Mid-Peninsula, Menlo Park, North Coast County Water District, Purissima Hills Water District, Redwood City, San Jose North, Skyline County Water District, and Stanford University.

a The general plan population projection and projection year are the most distant population projection and the year of the most distant population projection available in the general plan or general plan element.
b The general plan population is based on the population shown in the general plan (77,100) plus the additional population accommodated by the Milpitas Midtown Specific Plan, as advised by Milpitas Planning Department staff (Carrington, 2006), to account for 5,000 additional units with an assumed density of 3.46 persons per unit (i.e., an added population of 17,300). The City has amended to general plan to incorporate the specific plan.
c The service area of Sunnyvale's water district is contiguous with the city limits; however, another water utility (CWS) serves several small areas within the city.
d CWS = California Water Service Company.
e CWS–South San Francisco serves South San Francisco, Colma, a small portion of Daly City, and the unincorporated area of Broadmoor. The water customer estimate for the Westborough Water District is from the district's Urban Water Management Plan. The general plan figure is the combined total projected population in the South San Francisco and Colma general plans (67,400 and 1,285 respectively); the general plan projection year shown (2020) is for South San Francisco, the projection year for Colma is 2005. The *Projections 2005* figure is for South San Francisco and Colma (71,800 and 1,860, respectively).
f The Mid-Peninsula Water District serves Belmont, portions of San Carlos, and unincorporated areas of San Mateo County. The general plan figure is for the city of Belmont, from the 2002 housing element.
g The San Bruno UWMP (City of San Bruno,2007) shows two population projections for 2030: 50,700, based on ABAG's *Projections 2005*, and 48,229, based on the City's Adjusted Draft General Plan.
h UWMP and *Projections 2005* figures are for household population, since the customer-selected figure is for household population.
i Burlingame's water system also serves portions of unincorporated Burlingame and a few properties in the city of San Mateo and town of Hillsborough.
j The general plan figure is for the city of Half Moon Bay only, from the 1993 Half Moon Bay Local Coastal Program Land Use Plan (Table 9.3, Chapter 9, page 189). In addition to incorporated Half Moon Bay, the Coastside County Water District serves unincorporated areas of Half Moon Bay and the unincorporated communities of El Granada, Miramar, and Princeton by the Sea.
k Estero MID serves Foster City and a portion of the city of San Mateo. The general plan figure is for Foster City.

n.a. = Not available.

a Population shown is for the year of the most distant population projection available in the general plan, housing element, or other relevant local document (see note b). For example, populations in all columns for cities in the group titled “Cities with GP Population Projections for 2005” are populations projected for or estimated in 2005.

b Population estimates are from each city’s general plan (GP) or the general plan’s EIR.

c Estimates for years between 2001 and 2030 are derived by Mundie & Associates, based on linear interpolations of water customer projections, except for the 2020 San Francisco projection, which is included in the Retail Demand Study (Hannaford and Hydroconsult, 2004).

d CWS – South San Francisco District (Colma, parts of Daly City and South San Francisco, plus unincorporated areas) UWMP projection for 2020 is 64,050, and Westborough Water District (which serves part of South San Francisco) UWMP projection for 2020 is 14,150; the CWS-South San Francisco water customer projection for 2020 is 56,006 and the Westborough Water District water customer projection is the same as its UWMP projection (14,150).

a CWS – South San Francisco District (Colma, parts of Daly City and South San Francisco, plus unincorporated areas) UWMP projection for 2030 is 60,150; water customer projection for 2030 is 59,584.
b Estero MID (Foster City and part of San Mateo) projection for 2030 is 40,096.
c Mid-Peninsula Water District (Belmont, part of San Carlos, and portions of unincorporated San Mateo County) UWMP projection for 2030 is 28,930; water customer projection is 27,997.
d Figure shown is for the City of Burlingame Water Agency, which also serves some unincorporated area.
e Figure shown is for the portion of Menlo Park (less than half of the city's population) served by the City of Menlo Park Water Agency.
f CWS – Bear Gulch District (Atherton, parts of Menlo Park, Portola Valley, and Woodside, plus unincorporated areas) projection for 2030 is 73,719; UWMP population projection is 59,220 in 2030.
g Figure shown is for the City of Mountain View Water Agency, which serves most of Mountain View.
h CWS – Mid-Peninsula District (parts of the cities of San Mateo and San Carlos plus unincorporated areas) water customer population projection for 2030 is 139,834; UWMP population projection for 2030 is 134,010.
i The Housing Element of the Daly City General Plan projects this population within the city limits and a population of 120,000 within the (planning) area that corresponds to the ABAG subregional study area.
j Figure shown is for the portion of Daly City served by the City of Daly City Water Agency.
k Parts of Daly City and South San Francisco are served by CWS – South San Francisco District.
l Alameda County Water District (cities of Fremont, Newark, and Union City) projection for 2030 is 379,931.
m Figure shown is for the Coastside County Water District, which also serves unincorporated Half Moon Bay.
n Based on Milpitas General Plan adjusted to include 5,000 housing units added by the Midtown Milpitas Specific Plan (Carrington, 2006).
~~o Figure shown is for City of Redwood City Water Agency, which also serves part of the City of San Carlos, part of the Town of Woodside, and portions of unincorporated San Mateo County.~~
p San Bruno UWMP (City of San Bruno,2007) shows two population projections for 2030: 50,700, based on ABAG's *Projections 2005*, and 48,229, based on the City's Adjusted Draft General Plan.
q Figure shown is for the City of San Bruno Water Agency, which also serves some unincorporated areas.
r Figures shown are for the CWS – South San Francisco District plus Westborough Water District. For the Westborough Water District, the water customer projection is the same as the UWMP projection.
s Figure shown is for the Town of Hillsborough Water Agency, which also serves some unincorporated area.
t Purissima Hills Water District, (part of Los Altos Hills and some unincorporated area) projection is 6,763.
u Los Trancos County Water District was acquired by CWS in 2006, and is now part of the CWS – Bear Gulch District. Because it was a separate entity when these projections were prepared, it is presented separately in this analysis.
v Includes a portion of Portola Valley.
w Portola Valley is served by CWS – Bear Gulch District; a portion of the city was previously served by the Los Trancos County Water District, which is now part of CWS – Bear Gulch.

SOURCE: See sources for Table E.3.34.

In Vol. 5, Appendix E.3, the footnote and source information for Redwood City in Table E.3.34 (p. E.3-39) are deleted as follows:

~~m Figure shown is for City of Redwood City water agency, which also serves part of the City of San Carlos, part of the Town of Woodside, and portions of unincorporated San Mateo County.~~

In Vol. 5, Appendix E.3, References – Appendix E.3 (p. E.3-51), the entry for the Downtown Precise Plan is deleted as follows:

~~City of Redwood City, *Downtown Precise Plan Draft Environmental Impact Report* (October 2006) and *Final Environmental Impact Report*, State Clearinghouse #2005052027, certified March 2007.~~

In Vol. 5, Appendix E.4 (p. E.4-14, first full paragraph), the fourth and fifth sentences are revised as follows:

> During the 1970s and 1980s, changes in industry and housing occurred, with the craft industries of the city's early years giving way to high-technology and information-age industries (City of Redwood City, 1990). <u>The 1990 Redwood City General Plan indicated that the city was expected to reach a population of 70,000 by the year 2000 (Redwood City, 1990, Chapter 4, p. 4-1).</u> The EIR for the Downtown Precise Plan~~, a recent amendment of the general plan,~~ cites ABAG's *Projections 2005* forecasts for the city (not including its sphere of influence) of 87,100 in 2020.

In Vol. 5, the entry for Redwood City in Table E.4.1 (p. E.4-3) is revised as shown on the following page.

L_RdwdCty-09 This comment, which accurately characterizes the description of the Aggressive Conservation/Water Recycling and Local Groundwater Alternative, is acknowledged.

a ACWD = Alameda County Water District; U.S. Census, ABAG, Department of Finance (DOF), and general plan figures are the combined estimates for Fremont, Newark and Union City.
b The Newark general plan projection shown is from the 2002 housing element. The general plan (adopted in 1992) projected a buildout population of 51,942 by the year 2007.
c The general plan population is based on the population shown in the general plan (77,100) plus the additional population accommodated by the Milpitas Midtown Specific Plan, as advised by Milpitas Planning Department staff (Carrington, 2006), to account for 5,000 additional units with an assumed density of 3.46 persons per unit (i.e., an added population of 17,300). The City has amended to general plan to incorporate the specific plan.
d The general plan figure for Santa Clara is the average of the range projected in the general plan at buildout of 124,800 to 135,000.
e The SFPUC provides 100 percent of Redwood City's potable water. The remaining 8 percent of demand indicated here is met by recycled water.
f The city of San Mateo is served by the CWS–Mid-Peninsula District and Estero MID, both of which serve other jurisdictions as well; therefore, the 2030 population assumed by the wholesale customers is not comparable to projections for the city. The SFPUC supplies all of the CWS–Mid Peninsula District's and Estero MID's water.
g The customer-selected projection is the combined 2030 estimates for the CWS–South San Francisco District (which also serves Colma and a small portion of unincorporated San Mateo County), based on the 2004 demand study, and the Westborough Water District, based on the district's 2005 UWMP. The SFPUC would supply approximately 85 percent of the CWS–South San Francisco District's water supply in 2030 and 100 percent of Westborough Water District's. The other figures are for South San Francisco only.

City of San Jose, Mansour Nasser, Deputy Director, Water Resources Division, 9/27/07

L_SanJose-01 This comment expressing support for the Modified WSIP Alternative is acknowledged.

L_SanJose-02 This comment summarizes more detailed comments presented in Comments L_SanJose-03 through L_SanJose-07; refer to **Responses L_SanJose-03** through **L_SanJose-07** for the specific responses.

L_SanJose-03 This comment, which provides additional information regarding the water conservation programs of the San Jose Municipal Water System, is noted.

L_SanJose-04 This comment provides information about growth permitted under San Jose's North San Jose Area Development Policy ("Policy"), including information on current and future population in the area generally within the North San Jose/Alviso service area of the San Jose Municipal Water System that is served by the SFPUC (San Jose North). San Jose North provides service to only a small portion of San Jose and only a small portion of the area governed by the Policy. As shown in the Draft PEIR (Vol. 5, Appendix E.3, p. E.3-36), the agency's urban water management plan anticipates employment of 3,353 in 2030, an increase from the estimate of 2,500 jobs in 2001. Similarly, the *Wholesale Customer Water Demand Projections Technical Report* (URS, 2004a) estimates a 2001 population of 11,098 in the area served, increasing to 13,686 in 2030.

This information about additional growth (outside the area served by an SFPUC wholesale customer) does not address the adequacy or accuracy of the PEIR; therefore, no response is provided.

L_SanJose-05 This comment does not state the location of the alleged Draft PEIR quotation, which is in fact inconsistent with information presented in the Draft PEIR. Table 7.3 (Vol. 4, Chapter 7, p. 7-18) indicates that 96 percent (not 100 percent) of San Jose North's demand was met by SFPUC purchases in 2001. According to the *SFPUC Wholesale Customer Water Demand Projections Technical Report* (URS, 2004a, p. A-5), recycled water supplied the remaining 4 percent. The Draft PEIR customer summary (Vol. 4, Chapter 7, pp. 7-54 and 7-55) states that while the SFPUC would be San Jose North's only source of potable supply *in 2030*, the City has used other sources of water supply. The information on other sources of supply presented in Table 3.3 (Vol. 1, Chapter 3, p. 3-18) and Table 7.2 (Vol. 4, Chapter 7, p. 7-15) is for 2030—the WSIP planning horizon—and does not purport to represent any interim years.

Information on 2030 purchases and conservation is based on the *SFPUC Wholesale Customer 2030 Purchase Estimates Technical Memorandum* (URS, 2004b, Table 9, p. 5-1) and the "Wholesale Customer Best Estimate of Water Purchases from the SFPUC" form submitted by the City of San Jose to the SFPUC (dated November 16, 2004). The purchase estimate technical memorandum indicates that San Jose would receive 97.6 percent of total demand in 2030; conservation savings (shown in Draft PEIR Table 7.2) would meet the remaining demand. The Wholesale Customer Best Estimate of Water Purchases from the SFPUC form submitted by San Jose to the SFPUC states:

> Based on the information collected and analyses conducted in developing overall Demand Projections, City of San Jose estimates that it will purchase 6.343 mgd (annual average) from the SFPUC in 2030. It is understood that this estimate will be used by the SFPUC for purposes of planning and environmental review and conforms to the 2030 Water Demand Projection of 6.5 mgd, and the Conservation Savings Range of 0.157 mgd. The estimate is subject to change based on changed conditions, such as the future cost of water, new pricing structures, and other modified contract arrangements.

Thus, according to the submitted form, the SFPUC supply plus conservation would meet the projected demand, as indicated in the Draft PEIR Chapter 7 summary and reflected in Tables 7.2 and 7.3.

With respect to recycled water use discussed in this and the following comment, it is important to note that the focus of the WSIP demand studies was on demand for potable supplies. Existing demand currently met by recycled water that would not be met in the future by potable supplies was not included in the demand baseline. Similarly, the *Wholesale Customer Recycled Water Potential Technical Memorandum* (RMC, 2004) distinguishes between recycled water projects that would replace potable water supply and those that would not. The recycled water shown in Tables 3.3 and 7.2 offset demand for potable water supplies. It appears that at least a portion of the recycled water use described in this comment refers to recycled water that does not replace potable supplies.

San Jose North is one of three wholesale customers served by the South Bay Water Recycling Project, which currently provides 3.1 mgd of recycled water that offsets potable demand (see Draft PEIR Table E.2.5, Vol. 5, Appendix E.2, p. E.2-17). Information on the allocation of this supply among the three participating jurisdictions is not provided in the technical memorandum (and may change from year to year), but San Jose North's participation in this project is consistent with the City of San Jose's use of recycled water to meet 4 percent of its 2001 demand. However, as discussed above, the projected use of recycled water is not assumed to offset the 2030 demand according to the purchase estimate form submitted by the City.

L_SanJose-06 The Draft PEIR (Vol. 1, Chapter 3, pp. 3-16 to 3-22, and Vol. 5, Appendix E, pp. E.2-1 to E.2-20) contains a discussion of the demand projection methodology. As part of this effort, each wholesale customer, including San Jose North, provided an estimate of 2030 purchases from the SFPUC taking into account water savings from conservation and other water supply sources (refer to **Response L_SanJose-05**). This comment states that recycled water accounts for 9 to 11 percent of the San Jose North water supply; however, this information was not indicated as part of the purchase estimate submitted by the City. Based on Figure 2 of this comment, it appears that the use of recycled water and groundwater would not alter the SFPUC purchase estimate of 6.34 mgd, but would alter the City's overall demand projections, which would be approximately 10 mgd (compared to 6.5 mgd shown in the Draft PEIR) in 2030. As discussed in **Response L_SanJose-05**, the difference between the total demand indicated in Figure 2 of this comment and that identified in the WSIP demand studies and the Draft PEIR apparently stems from the inclusion in Figure 2 of all expected recycled water use within San Jose North, whereas the WSIP demand studies considered only water supply sources that would offset demand for potable supplies; this would include some but not all of the recycled water projects in the service area.

L_SanJose-07 This comment regarding the essential need for a reliable supply from the SFPUC system is acknowledged. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.2) for more discussion.

L_SanJose-08 This comment, an attachment referenced in Comment L_SanJose-05, contains a list of San Jose North demand projection citations that the commenter asserts are incorrect. However, the numbers mentioned in Tables 3.3 (Vol. 4, Chapter 7, p. 7-18), 7.2 (Vol. 4, Chapter 7, p. 7-15), 7.3 (Vol. 4, Chapter 7, p. 7-18), Section 7.3.6 (Vol. Chapter 7, pp. 7-54 to 7-55), and Tables E.2.1 (Vol. 5, Appendix E, p. E.2-2) and E.2.6 (Vol. 5, Appendix E, p. E.2-18) in the Draft PEIR are consistent with information presented in SFPUC background documents and submitted to the SFPUC by the City of San Jose, as stated in **Response L_SanJose-05**; therefore, no text revisions are necessary. Regarding the commenter's suggested deletion of footnote "c" in Table 3.4 (Vol. 1, Chapter 3, p. 3-19), the "Wholesale Customer Best Estimate of Water Purchases from the SFPUC" form, submitted by the City of San Jose to the SFPUC, indicates that San Jose North would purchase all of its projected 2030 demand, except the portion offset by conservation savings, from the SFPUC (refer to **Response L_SanJose-05**). Thus, this suggested text change is unnecessary. As for the commenter's suggested text change to Table E.2.5 (Vol. 5, Appendix E, p. E-2-17), no text revision is necessary because information obtained from the technical memorandum, *Wholesale Customer Recycled Water Potential Technical Memorandum* (RMC, 2004) is correctly cited and is consistent with the purchase estimate form submitted by San Jose. Please refer to **Response L_SanJose-05** for additional information regarding these citations in the Draft PEIR.

City of San Bruno, Barbara A. Brenner, Stoel Rives, Attorneys at Law, 10/1/07

L_SBruno-01 The commenter correctly summarizes the Draft PEIR description of the regional conjunctive-use project. The commenter notes that the Regional Groundwater Projects (a component of WSIP facility improvement project SF-2) has been updated to include development of 15 wells instead of the 10 wells described in Chapter 3 of the Draft PEIR, and notes that the planned groundwater extraction using these 15 wells would be 8,100 acre-feet per year (afy). The Draft PEIR notes that the project descriptions presented in Table 3.10 and Appendix C are based on the best available information at the time the Draft PEIR was prepared and are appropriate for the evaluation of the overall magnitude of effects expected from implementation of the WSIP as a whole (Vol. 1, Chapter 3, p. 3-48). The Draft PEIR also notes that any changes in project details would be addressed during subsequent, project-specific environmental review (Vol. 1, Chapter 3, p. 3-61).

As indicated by the commenter, analysis conducted subsequent to preparation of the Draft PEIR has demonstrated that more than 10 wells will be required to achieve a pumping capacity of 8,100 afy. However, the planned pumping capacity of the Regional Groundwater Projects (SF-2) has not changed (see Vol. 1, Chapter 3, p. 3-39). Therefore, Section 5.6 of the Draft PEIR adequately addresses impacts on the South Westside Groundwater Basin at a program level. Consistent with the approach described in the Draft PEIR, the project-level CEQA analysis of the Regional Groundwater Projects will analyze the effects of the preferred alternative for the conjunctive-use program at a more detailed level, and will address any changes in the planned number and location of wells to be installed in the South Westside Groundwater Basin.

The commenter also questions the references to a pumping capacity of 6 mgd (equivalent to approximately 6,700 afy) on pp. S-18 and 3-56 of the Draft PEIR. While the proposed pumping capacity under the conjunctive-use program of 8,100 afy is approximately equivalent to 7 mgd, the actual pumping rate under the WSIP would be different because of the way that the extraction component of the conjunctive-use program would occur. This is described in the Draft PEIR as follows (Vol. 1, Chapter 3, p. 3-39, footnote 23):

> The conjunctive-use program has been designed to provide an extraction capacity of approximately 8,100 acre-feet during a dry year, equivalent to about 7 mgd, over 7.5 years. While the initiation of the extraction component of the conjunctive use program would occur as the first response to anticipated drought, the realization of a drought does not typically occur until the second year of a dry sequence. Thus, in the 8.5-year design drought, the extraction component of the conjunctive-use

program would only occur for 7.5 years. Groundwater pumping of about 7 mgd over 7.5 years is approximately equivalent in volume to 6 mgd over 8.5 years.

A similar footnote is included in Section 5.6 (Vol. 3, Chapter 5, p. 5.6-26, footnote 15). Note that, as discussed in the Draft PEIR, the amount of water withdrawn under the Regional Groundwater Projects (SF-2) would be limited to the amount of groundwater banked through in-lieu delivery of SFPUC system water to participating pumpers, and the participating pumpers would enter into an operating agreement(s) specifying the terms and conditions of groundwater storage and withdrawals to ensure that adverse conditions do not occur (Vol. 3, Chapter 5, pp. 5.6-25 and 5.6-26). These restrictions on groundwater withdrawals and the formation of operating agreement(s) would ensure that impacts related to basin overdraft are less than significant in the South Westside Groundwater Basin.

L_SBruno-02 The commenter states that San Bruno's projected cessation of groundwater pumping (cited on many pages of the Draft PEIR) is based on a worst-case scenario, and that San Bruno plans on maintaining its groundwater production capacity and utilizing groundwater resources in the future. This comment about potential future use of groundwater by San Bruno is noted. The "worst case scenario" described by the commenter is from the point of view of water supply planning, not from the point of view of potential environmental impacts. As required by CEQA, the Draft PEIR analyzes the potential impacts from the point of view of worst-case environmental impacts, which would be if San Bruno were to pump groundwater for municipal purposes in combination with drought-year pumping under the proposed conjunctive-use program (Impact 5.7.5-2, Vol. 3, Chapter 5, pp. 5.7-90 and 5.7-91).

As summarized in this impact analysis, the combined conjunctive-use and municipal pumping could temporarily exceed historical high groundwater withdrawal rates, but impacts related to this increased pumping rate would be less than significant with implementation of the proposed operating agreement(s) to be executed between the SFPUC and the participating pumpers. The agreement(s) would outline allowable operating parameters for pumping during drought years to avoid adverse long-term conditions. In addition, an operating committee would be formed to develop annual operating maintenance plans as well as an annual operating schedule, and groundwater monitoring and modeling would also be conducted to identify the potential for adverse conditions and inform decisions to modify the recharge or pumping strategy in response to changing conditions over time. These measures would ensure that future municipal groundwater pumping by San Bruno, should it be necessary, would not cause adverse effects in the South Westside Groundwater Basin.

L_SBruno-03 The commenter notes that the proposed conjunctive-use program in the South Westside Groundwater Basin (to be implemented under the Regional Groundwater Projects, SF-2) should be referred to as “proposed” since the local agencies have not agreed to the terms. The Draft PEIR identifies implementation of an operating agreement(s) between the SFPUC and the participating pumpers as a required action that would need approval for the Regional Groundwater Projects (Vol. 1, Chapter 3, p. 3-88; Vol. 2, Chapter 5, pp. 5.6-25, 5.6-26, 5.7-90, and 5.7-91).

L_SBruno-04 The commenter notes that the Regional Groundwater Projects (SF-2) currently include installation of 15 wells in the South Westside Groundwater Basin, instead of the 10 wells described in the Draft PEIR. As described in **Response L_SBruno-01**, project analysis conducted subsequent to preparation of the Draft PEIR has demonstrated that more than 10 wells will be required to achieve a pumping capacity of 8,100 afy. However, the planned pumping capacity of the Regional Groundwater Projects has not changed. Therefore, Section 5.6 of the Draft PEIR adequately addresses impacts on the South Westside Groundwater Basin at a program level. Consistent with the approach described in the Draft PEIR, the project-level CEQA analysis of the Regional Groundwater Projects will analyze the effects of the preferred alternative for the conjunctive-use program at a more detailed level, and will address any changes in the planned number and location of wells to be installed in the South Westside Groundwater Basin.

The commenter also indicates that the Draft PEIR reference to an estimated 14 wells in San Francisco, Daly City, San Bruno, and South San Francisco (Vol. 1, Chapter 3, p. 3-72) is inconsistent with the description of the Regional Groundwater Projects (SF-2) which, in the Draft PEIR, includes development of 10 wells in the South Westside Groundwater Basin. However, the 14 new groundwater wells referenced on p. 3-72 of the Draft PEIR includes four wells proposed in the North Westside Groundwater Basin under the Local Groundwater Projects (also part of SF-2) and 10 wells proposed in the South Westside Groundwater Basin under the Regional Groundwater Projects (see Table 3-12, Vol. 1, Chapter 3, p. 3-67).

L_SBruno-05 This comment stating that San Bruno’s groundwater production in 2006 was 1,955 afy is acknowledged. The Draft PEIR (Vol. 3, Chapter 5, p. 5.7-86) cites a figure of approximately 1,700 afy for San Bruno’s 2006 pumping rate. The groundwater production rate provided in the Draft PEIR is based on studies performed on behalf of the SFPUC and the best available information at that time. This updated information will be incorporated into modeling to be conducted to identify the potential for adverse conditions in the South Westside Groundwater Basin and inform decisions to modify the recharge or pumping strategy (Vol. 3, Chapter 5, p. 5.6-26), and will be addressed as part of the project-level CEQA analysis of the Regional Groundwater Projects (SF-2) with respect to groundwater pumping impacts on the South Westside Groundwater Basin.

L_SBruno-06 This comment provides clarification of the Draft PEIR text regarding groundwater monitoring by San Bruno in order to clarify that the wells described as proposed in the Draft PEIR have already been installed. In response to this comment, the following text from the Draft PEIR (Vol. 3, Chapter 5, p. 5.6-17, last sentence of first full paragraph) has been revised as follows:

> The City of San Bruno ~~is~~ construct<u>ed</u>~~ing~~ two monitoring well~~s~~ <u>clusters in 2006</u> along the bay side that ~~should~~ <u>have</u> provide<u>d</u> additional <u>geologic information and allow for monitoring of groundwater levels and groundwater quality at different depths along the bay margin.</u> ~~insight into the mechanisms preventing seawater intrusion.~~

L_SBruno-07 This comment provides clarification of the Draft PEIR text regarding the statement that, in the South Westside Groundwater Basin, manganese has exceeded the secondary drinking water standard in San Bruno and Daly City. In response to this comment, the following text from the Draft PEIR (Vol. 3, Chapter 5, p. 5.6-17, third full paragraph, last sentence) has been revised as follows:

> In the South Westside Groundwater Basin, manganese has exceeded the secondary drinking water standard in San Bruno and Daly City <u>in the untreated groundwater, but the</u> water <u>is treated to meet secondary standards prior to use in the water supply.</u>

L_SBruno-08 The commenter suggests that the Draft PEIR should include the basis for the estimated 13,000 afy of groundwater storage in the South Westside Groundwater Basin. The Draft PEIR (Vol. 3., Chapter 5, pp. 5.6-17 and 5.7-86) presents this information as part of the results of the In-Lieu Recharge Demonstration Study through 2005. The estimated 13,000 afy included 6,300 afy in the Daly City area, 3,600 afy in the South San Francisco area, and 3,000 afy in the San Bruno area. The project-level CEQA analysis of the Regional Groundwater Projects (SF-2) will include a more detailed and up-to-date analysis of the conjunctive-use program and will address the information provided by the commenter.

L_SBruno-09 The commenter provides clarification regarding what types of wells Section 4.68.225 of the San Mateo County Code applies to. In response to this comment, the following text from the Draft PEIR (Vol. 3, Chapter 5, last paragraph on p. 5.6-21 and ending on p. 5.6-22) has been revised as follows:

> In accordance with Section 4.68.225 of the San Mateo County Code, the San Mateo County Environmental Health Division would not grant a well permit for a large well[12] ~~in a public park, cemetery, or golf course~~ that could potentially cause overdraft of the South Westside Groundwater

> Basin or be located in an area subject to a specific and localized groundwater problem. The Environmental Health Division could also deny, revoke, or suspend a permit for a large well to avoid pollution or contamination of water resources.

In addition, the following text from the Draft PEIR (Vol. 3, Chapter 5, p. 5.7-91, last paragraph) has been revised as follows:

> Furthermore, as discussed in Section 5.6, the San Mateo County Environmental Health Division would not grant a well permit for a large well ~~in a public park, cemetery, or golf course~~ that could potentially cause overdraft of the South Westside Groundwater Basin or be located in an area subject to a specific and localized groundwater problem…..

L_SBruno-10 The commenter suggests that the text on p. 5.6-25 (in Chapter 5 of the Draft PEIR) should be clarified to state that a portion of the banked groundwater would be introduced into the regional water system under specified conditions. The commenter is correct in noting that some of the banked groundwater could be introduced into the regional system. Impacts related to the introduction of treated groundwater into the distribution system are addressed in Impact 5.6-6 (Vol. 3, Chapter 5, p. 5.6-32), where it is acknowledged that the SFPUC would continue to meet all drinking water standards in the use of groundwater to supplement its current supply during both nondrought and drought periods. The text on p. 5.6-25 referenced by the commenter addresses potential impacts related to basin overdraft due to pumping from the South Westside Groundwater Basin (Impact 5.6-1), and the suggested text changes do not apply to this impact.

L_SBruno-11 This comment provides updated information that the Regional Groundwater Projects (SF-2) would develop 15 wells instead of the 10 wells described in the Chapter 3 of the Draft PEIR, and that the supplemental supply of groundwater would be for the participating pumpers and for the regional system. See **Response L_SBruno-01**.

The text referred to by the commenter (Vol. 3, Chapter 5, p. 5.6-26) addresses potential impacts related to basin overdraft due to pumping from the South Westside Groundwater Basin (Impact 5.6-1). Drought-year system operations are discussed in Section 3.7.1 of the Draft PEIR (Vol. 1, Chapter 3, pp. 3-42 and 3-43), and this section acknowledges that groundwater will be available to the regional system in a drought year.

The commenter also states that the proposed Regional Groundwater Projects (SF-2) does not restrict municipal pumping to previously pumped quantities. The Draft PEIR evaluates the cumulative effects of municipal pumping in combination with drought-year pumping under the Regional Groundwater Projects in Impact 5.7.5-2 (Vol. 3, Chapter 5, pp. 5.7-90 and 5.7-91). This impact analysis does not state that the amount of groundwater pumped would be restricted to the amount of groundwater previously pumped as well as the amount of banked water resulting from the project. Rather, the analysis concludes that the combined conjunctive-use and municipal pumping could temporarily exceed historical high groundwater withdrawal rates, but that impacts related to this increased pumping rate would be less than significant with implementation of the proposed operating agreement(s) to be executed between the SFPUC and the participating pumpers. The agreement(s) would outline allowable operating parameters for pumping during drought years to avoid adverse long-term conditions. In addition, an operating committee would be formed to develop annual operating maintenance plans as well as an annual operating schedule, and groundwater monitoring and modeling would also be conducted to identify the potential for adverse conditions and inform decisions to modify the recharge or pumping strategy in response to changing conditions over time. These measures would ensure that future groundwater pumping by San Bruno, should it be necessary, would not cause adverse effects in the South Westside Groundwater Basin.

L_SBruno-12 The commenter requests edits to p. 5.7-87 of the Draft PEIR to reflect revisions to San Bruno's urban water management plan (UWMP) that would be needed if the Regional Groundwater Projects (SF-2) is approved. In response to this comment, the following text from the Draft PEIR (Vol. 3, Chapter 5, p. 5.7-87, first sentence of the third bullet) has been revised as follows:

> The 2006 UWMP for the San Bruno does not yet reflect long-term participation in the SFPUC's proposed conjunctive-use program, but, <u>if approved,</u> participation in this program is expected to be included in the next revision of its UWMP.

L_SBruno-13 The commenter states that the text on p. 5.7-90 of the Draft PEIR should mention municipal pumping in future pumping estimates. In response to this comment, the following text from the Draft PEIR (Vol. 3, Chapter 5, p. 5.7-90, the first sentence of Impact 5.7.5-2) has been revised as follows:

> Future <u>and continuing</u> projects identified in the northern portion of the South Westside Groundwater Basin include the WSIP conjunctive-use program (the regional component of SF-2)<u>, municipal pumping by the participating pumpers,</u> and continued irrigation pumping at 2,600 afy.

L_SBruno-14 The commenter states that on p. 5.7-91 of the Draft PEIR, it would be more accurate to say that the combined conjunctive-use and municipal pumping "is anticipated to significantly exceed" historical high groundwater withdrawal rates, rather than "could temporarily exceed" these rates. The commenter also notes that the proposed operational agreement(s) do not alter existing pumpers' rights regarding their use of groundwater. These comments are acknowledged.

As discussed in **Response L_SBruno-11**, the Draft PEIR evaluates the cumulative effects of municipal pumping in combination with conjunctive-use pumping under the Regional Groundwater Projects (SF-2) in Impact 5.7.5-2 (Vol. 3, Chapter 5, pp. 5.7-90 and 5.7-91). This impact analysis concludes that the combined conjunctive-use and municipal pumping could temporarily exceed historical high groundwater withdrawal rates, but that impacts related to this increased pumping rate would be less than significant with implementation of the proposed operating agreement(s) to be executed between the SFPUC and the participating pumpers. The agreement(s) would outline allowable operating parameters for pumping during drought years to avoid adverse long-term conditions. In addition, an operating committee would be formed to develop annual operating maintenance plans as well as an annual operating schedule, and groundwater monitoring and modeling would also be conducted to identify the potential for adverse conditions and inform decisions to modify the recharge or pumping strategy in response to changing conditions over time. These measures would ensure that future groundwater pumping would not cause adverse effects in the South Westside Groundwater Basin, even if groundwater withdrawal rates were to "significantly exceed" historically high withdrawal rates.

L_SBruno-15 This comment suggests adding text to Chapter 5, p. 5.7-91 of the Draft PEIR stating that one method of controlling adverse effects on the South Westside Groundwater Basin under the operating agreement(s) would be to restrict pumping from the conjunctive-use wells if groundwater levels were to fall below historical lows. Comment acknowledged. A number of options could be appropriate for avoiding potentially adverse effects on the South Westside Groundwater Basin during a drought year, and, as discussed in Impact 5.7.5-2 (Vol. 3, Chapter 5, pp. 5.7-90 and 5.7-91), operating agreement(s) between the SFPUC and participating pumpers would outline allowable operating parameters for pumping during drought years to avoid adverse long-term conditions. In addition, an operating committee would be formed to develop annual operating maintenance plans as well as an annual operating schedule, and groundwater monitoring and modeling would also be conducted to identify the potential for adverse conditions and inform decisions to modify the recharge or pumping strategy in response to changing conditions over time. Specific options for avoiding adverse conditions in the South Westside Groundwater Basin are not addressed in the program-level discussion provided in the Draft PEIR, but would be identified on the basis of groundwater monitoring and modeling conducted in accordance with the operating agreement(s). The project-level CEQA analysis of the Regional Groundwater Projects (SF-2) will include a more detailed analysis of options for avoiding adverse conditions in the groundwater basin and will address the information provided by the commenter.

L_SBruno-16 See **Response L_SBruno-11**.

L_SBruno-17 The commenter requests that the discussion on p. 5.7-100 of the Draft PEIR utilize the final UWMP dated January 2007. In response to this comment, the following text from the Draft PEIR (Vol. 3, Chapter 5, p. 5.7-87, third bullet) has been revised as follows (edits shown include edits in **Response L-SBruno-12**):

> The 200~~6~~7 UWMP for the San Bruno does not yet reflect long-term participation in the SFPUC's proposed conjunctive-use program, but, if approved, participation in this program is expected to be included in the next revision of its UWMP. In its 200~~6~~7 UWMP, the City of San Bruno estimates that overall, groundwater usage will decrease from 2.5 mgd (2,800 afy) in 2010 to zero in 2030 through implementation of conservation measures and increased purchases from the SFPUC. In a drought year, groundwater use between 2010 and 2030 is projected to range from 0.80 mgd (896 afy) to a maximum of 2.5 mgd (2,800 afy) (City of San Bruno, 200~~6~~7).

In addition, the following text from the Draft PEIR (Vol. 3, Chapter 5, p. 5.7-100, sixth reference under Westside Groundwater Basin Resources) has been revised as follows:

> City of San Bruno, ~~*Public Draft*~~ *Final Urban Water Management Plan*. ~~December 2006~~ January 2007.

L_SBruno-18 This comment refers to Draft PEIR Table E.3.34 (Vol. 5, Appendix E, p. E.3-38), noting that population projections are available in San Bruno's UWMP (adopted January 2007), contrary to the indication in the table that population projections were not available. Table E.3.34 presents a comparison of projections in the general plan projection year; therefore, the appropriate year for reporting the San Bruno UWMP population estimate is 2020, as this is the year for which a projection is available in the City's adopted general plan housing element.

In response to this comment, Table E.3.34 (Vol. 5, Appendix E.3, p. E.3-38) has been revised as follows:

(City)	General Plan	UWMP	SFPUC Water Customer Projection	***Projections 2005***
San Bruno	46,400	~~n.a.~~see note r	45,642	47,700

r The UWMP (Table 2) reports three population projections: the draft general plan (2006), ABAG subregional (2005), and adjusted draft general plan (2001), although the draft general plan (2006) does not include a projection for 2020. The projections for 2020 are, respectively, 43,400 (based on a straight-line interpolation from projections shown for 2005 and 2025), 47,700, and 43,400.

City of Santa Clara Planning Division, Gloria Sciara, Development Review Officer, 8/28/07

L_SClara1-01 This comment states that the City of Santa Clara must review the PEIR if any work associated with the BDPL Nos. 3 and 4 Crossovers project (BD-2) would occur in Santa Clara. The San Francisco Planning Department responded by email on September 18, 2007, indicating that this project would require work in Santa Clara, and a CD of the full Draft PEIR was mailed to the City of Santa Clara on the same day.

City of Santa Clara Water and Sewer Utilities, Robin Saunders, Director of Water and Sewer Utility, 8/23/07

L_SClara2-01 This comment, which expresses the City of Santa Clara's concern regarding potential service interruptions caused by earthquake damage to the SFPUC system or failure of critical infrastructure as a result of deferred maintenance, is acknowledged. Please see **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14) for more discussion.

L_SClara2-02 This comment stating the City of Santa Clara's commitment to the efficient use and sustainability of regional water supplies is acknowledged.

L_SClara2-03 This comment describing water conservation and recycling programs in Santa Clara is acknowledged.

L_SClara2-04 This comment, which cites the Santa Clara's smart growth planning policies, is acknowledged. As it does not address the adequacy or accuracy of the PEIR, no further response is provided.

L_SClara2-05 This comment illustrating a decrease in per-capita water use over the past 20 years is noted.

L_SClara2-06 This comment expressing concern about the reliability and sustainability of the regional water system and urging the SFPUC to proceed with the preferred alternative WSIP is acknowledged.

Santa Clara Valley Water District, Water Supply Management Division, Keith Whitman, Deputy Operation Officer, 9/26/07

L_SCVWD1-01 This comment urging the SFPUC to adopt the WSIP and meet all program goals and objectives is acknowledged.

L_SCVWD1-02 The commenter states concern with any potential for re-directed impacts on the Santa Clara Valley groundwater basin and local or imported surface water resources due to SFPUC's reduction in supplies or level of service provided to Santa Clara County. The historical information on land subsidence in the Santa Clara Valley due to groundwater pumping provided by the commenter is acknowledged. Under the proposed program, the SFPUC would fully achieve the WSIP goals and objectives and serve wholesale customers' purchase requests during nondrought and drought periods through 2030. The PEIR also includes environmental analysis of a number of alternatives and variants that, while reducing impacts on the Tuolumne River, would reduce the reliability and/or the water supply delivery to customers. These include the No Program Alternative, the No Purchase Request Alternative, Aggressive Conservation/ Water Recycling/Local Groundwater Alternative, and the Phased WSIP Variant (see Vol. 4, Chapter 9 for the first three alternatives and Vol. 7, Chapter 13 for the variant). As part of the environmental analyses of these alternatives/variant, the PEIR identifies potential impacts associated with possible water supply acquisition projects that wholesale customers could pursue, including groundwater pumping (see Vol. 4, Chapter 9, Table 9.10, p. 9-35). In addition, please see Section 13.4, Phased WSIP Variant, for a discussion of how a water delivery shortfall could affect the wholesale customers.

Regarding the commenter's request that the SFPUC address potential impacts on water supplies for the State Water Project and the Central Valley Project users, please refer to **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14).

L_SCVWD1-03 This comment, which expresses support for the SFPUC's goal to maximize water conservation, recycling, and desalination, is acknowledged. In addition, the comment regarding the practical limits in "implementability" of water-use efficiency programs is also acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects proposed by SFPUC and its wholesale customers.

Santa Clara Valley Water District, Amy Fowler, Staff Member, 9/19/07

[See Public Hearing Transcript, Palo Alto, pp. 29–32]

L_SCVWD2-01 This information related to Santa Clara Valley Water District's (SCVWD) service area and water supplies is acknowledged, but as this comment does not address the adequacy or accuracy of the PEIR, no additional response is provided.

L_SCVWD2-02 This comment expresses support for the WSIP goals and objectives and expresses concern regarding the potential for secondary impacts on the SCVWD's water supplies in the event that the water supplies or level of service provided by the SFPUC to Santa Clara County is reduced. This comment also expresses support for maximizing water conservation, recycling, and desalination and urges the expedient adoption of the PEIR. In addition, the comment regarding the practical limits in "implementability" of water-use efficiency programs is also acknowledged. For additional information related to conservation and recycling measures, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3).

San Francisco Bay Trail, Laura Thompson, Project Manager, 9/24/07

L_SFBayTrl-01 This comment, which expresses support for the new underground "Bay Tunnel" segment of the Bay Division Pipeline (BDPL) No. 5 under the BDPL Reliability Upgrade project (BD-1), is acknowledged.

L_SFBayTrl-02 The commenter requests a correction in the length of the Bay Trail (from 400 to 500 miles) and in the number of miles that have been completed (from 280 to 290 miles). However, the referenced statement cannot be changed since it refers to the proposed length specified in the adopted *Bay Trail Plan.* Instead, the following text change updates information on the Bay Trail (Vol. 2, Chapter 4, p. 4.12-7, fourth and fifth full paragraphs):

> **The Bay Trail.** Senate Bill 100, passed in 1987, directed the Association of Bay Area Governments (ABAG) to identify an alignment and develop a plan to create a public trail system encircling San Francisco Bay. The *Bay Trail Plan*, adopted by ABAG in 1989, proposed a continuous 400-mile corridor that would eventually link the shorelines of all nine Bay Area counties and 47 cities around San Francisco and San Pablo Bays. Since its adoption, the *Bay Trail Plan* has received widespread public support as a means of preserving and enhancing public access to the San Francisco Bay waterfront. Most of the jurisdictions along the proposed trail alignment have adopted the plan and incorporated the appropriate Bay Trail segments into their local plans and policies. <u>When complete, the Bay Trail corridor will be 500 miles long.</u>
>
> Development of the Bay Trail is overseen by the Bay Trail Project, a nonprofit organization established in 1990. The Bay Trail Project does not own land or easements; instead, it encourages local jurisdictions to construct and maintain segments of the Bay Trail, often in partnership with other local nonprofit groups. ~~As of 2005, a~~Approximately ~~280~~<u>290</u> miles, or just over half of the envisioned trail, ~~had~~<u>has</u> been completed. Some portions of the Bay Trail are paved pathways, while others consist of dirt trails or sidewalks. The main trail, referred to as the "spine trail," follows the San Francisco Bay shoreline to the extent possible. Where it is not able to follow the shoreline, "spur trails" provide access from the spine trail to points of interest along the waterfront. In addition, "connector trails" provide links to other nearby recreational facilities, residential neighborhoods and employment centers (Association of Bay Area Governments Bay Trail Project, 2005). Segments of the Bay Trail exist near the proposed pipeline alignments for the BDPL Reliability Upgrade (BD-1) project.

L_SFBayTrl-03 The commenter strongly recommends that BDPL Nos. 1 and 2 be decommissioned and physically removed to reduce impacts on habitat and allow for closure of the Bay Trail gap in this area. Please refer to **Response F_USFWS-02** for discussion of issues related to BDPL Nos. 1 and 2.

L_SFBayTrl-04 The commenter requests that the Ravenswood Open Space Preserve and San Francisco Bay Trail be added to the recreational resources located in the vicinity of the BDPL Reliability Upgrade project (BD-1). The requested text additions to Impact 4.12-1 would not alter the significance determination (PSM) identified for this project in the Draft PEIR (Vol. 2, Chapter 4, p. 4.12-24). In response to this comment, the following text changes are made to update information in Table 4.12-2 (Vol. 2, Chapter 4, p. 4.12-22, under BD-1):

TABLE 4.12-2
PUBLIC PARKS AND RECREATIONAL FACILITIES IN THE PROJECT VICINITY

Projects	Potentially Affected Recreational Resources
BD-1: Bay Division Pipeline Reliability Upgrade	Don Edwards San Francisco Bay Regional Wildlife Refuge; Ravenswood Open Space Preserve; San Francisco Bay Trail; local parks in Fremont, Newark, San Mateo County, and Redwood City; numerous school properties in East Palo Alto, Fremont, Menlo Park, Newark, and Redwood City

These resources are also added to the impact discussion under Impact 4.12-1, Bay Division Region (Vol. 2, Chapter 4, p. 4.12-24, first full paragraph):

> Of the WSIP projects proposed for construction in the Bay Division Region, the BDPL Reliability Upgrade project (BD-1) would have the greatest potential impact on recreational facilities in the area. The preferred pipeline alignment for the new Bay Division Pipeline (No. 5) would pass beneath the Don Edwards San Francisco Bay Regional Wildlife Refuge, with an approximately five-mile tunnel segment installed beneath marshlands and San Francisco Bay. The two cut-and-cover sections of pipeline (approximately seven miles from the Irvington Tunnel Portal to the Newark Valve House and nine miles from the Ravenswood Valve House to the Pulgas Tunnel Portal) would be located within the existing SFPUC right-of-way. The Ravenswood Open Space Preserve and San Francisco Bay Trail are also located in the vicinity of the Ravenswood Valve House.

L_SFBayTrl-05 The commenter requests that the SFPUC coordinate with the Bay Trail Project, Coastal Conservancy, and Midpeninsula Open Space District to complete this Bay Trail gap. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Sections 14.4.2 and 14.4.3) for detailed discussion of the issues raised by this comment. The Coastal Conservancy's request for coordination with the SFPUC regarding completion of the Bay Trail gap through SFPUC lands has been noted in Table C.6 (Vol. 5, Appendix C, p. C-26) for consideration in the project-level EIR for the BDPL Reliability Upgrade project (BD-1).

San Francisco City Planning Commission, Christina Olague, Vice President, 9/20/07

[See Public Hearing Transcript, San Francisco City Hall, September 20, 2007, pp. 39–41]

L_SFCPC1-01 This comment expresses an opinion that the public hearing on the Draft PEIR should have been held earlier in the public comment period and recommends that the comment period be extended.

On June 29, 2007, printed copies of the Draft PEIR or CDs of the draft document were distributed to 70 state and local agencies and 365 additional organizations and individuals. The San Francisco Planning Department notified agencies and the public in writing and via email regarding the availability of the Draft PEIR and the public hearing dates and locations. On June 29, 2007, a Notice of Availability (NOA) of the draft document was sent by first class mail to over 1,627 entities (individuals or organizations). On August 27, 2007, a follow-up notice of the public hearings and comment period was distributed to an expanded list of approximately 1,751 entities. Legal notices and display ads of the public hearings and information on how to obtain a copy of the Draft PEIR and provide comments were placed in the legal classified section of local newspapers in Tuolumne, Stanislaus, San Joaquin, San Mateo, and San Francisco Counties. The NOA and notice of public hearings were posted on the SFPUC and San Francisco Planning Department websites. Printed copies of the Draft PEIR and associated reference materials, as well as the NOA and notice of the public hearings were posted in public libraries in Tuolumne, Stanislaus, San Joaquin, Alameda, San Mateo, and San Francisco Counties.

In accordance with CEQA Guidelines Section 15105, when a draft EIR is submitted to the State Clearinghouse for review by state agencies, the public review period must not be less than 45 days, unless the State Clearinghouse approves a shorter period (but not less than 30 days). CEQA does not require formal hearings at any stage of the environmental review process and allows public comments to be restricted to written communication (CEQA Guidelines Section 15202). However, as stated in CEQA Guidelines Section 15202, “A draft EIR or Negative Declaration should be used as a basis for discussion at a public hearing. The hearing may be held at a place where public hearings are regularly conducted by the Lead Agency or at another location expected to be convenient to the public.”

The public review period on the Draft PEIR, initially scheduled for 90 days (from June 29, 2007 through October 1, 2007), was extended by an additional 15 days, to October 15, 2007. All comments received through December 31, 2007 were accepted by the San Francisco Planning Department and are responded to in this Comments and Responses document. The San Francisco Planning Department initially scheduled five public hearings on the Draft PEIR at: Sonora on September 5, 2007; Modesto on September 6, 2007; Fremont on September 18, 2007; Palo Alto on September 19, 2007; and San Francisco on September 20, 2007. Following recommendations by the San Francisco City Planning Commission, a sixth public hearing was held in San Francisco, on October 11, 2007. Thus, the public review period provided for the Draft PEIR meets and exceeds all public review requirements under CEQA. Please refer to **Response F_USDAFS-05** and **Appendix J1** (Vol. 8) of this Comments and Responses document for more information on public outreach efforts conducted by the Planning Department's Major Environmental Analysis Division and the SFPUC.

L_SFCPC1-02 While it is true that the SFPUC and not the San Francisco City Planning Commission will ultimately have the authority to approve the program, the Planning Commission is responsible for certifying the Final PEIR on the WSIP.

L_SFCPC1-03 In this comment, Commissioner Christina Olague requested that an informational presentation of the WSIP be held at a subsequent public hearing for the purpose of briefing the Planning Commission on the WSIP and the program elements.

In response to Commissioner Olague's request, a sixth public hearing was held before the San Francisco City Planning Commission on October 11, 2007, and the public review period for the Draft PEIR was extended to October 15, 2007. Prior to opening up the October 11, 2007 hearing for public comment, Tony Irons, SFPUC Deputy General Manager, gave a presentation on the history and current condition of the regional water system, and the facility improvements, water supplies, and operational changes proposed under the WSIP. Diana Sokolove, Senior Environmental Planner with the San Francisco Planning Department, Major Environmental Analysis Division, provided an overview of the organization of the Draft PEIR and of the impacts and mitigation measures identified therein.

San Francisco City Planning Commission, Michael Antonini, Commissioner, 9/20/07

[See Public Hearing Transcript, San Francisco City Hall, September 20, 2007, pp. 42–43]

L_SFCPC2-01 This comment by Commissioner Michael Antonini, which expresses the fiduciary responsibility of the City and County of San Francisco due to the size of the regional system, is acknowledged. Commissioner Antonini's comment indicating that the seismic upgrades should move forward is also acknowledged.

L_SFCPC2-02 This comment regarding per-capita water consumption is noted. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2) for information on per-capita water use in the wholesale customer service area (which, as the commenter surmises, is higher than usage within San Francisco).

San Francisco City Planning Commission, Kathrin Moore, Commissioner, 9/20/07

[See Public Hearing Transcript, San Francisco City Hall, September 20, 2007, pp. 43–44]

L_SFCPC3-01 This comment, which expresses Commissioner Kathrin Moore's opinion that the Draft PEIR lacks sufficient measures aimed at environmental sustainability, is acknowledged. However, it should be noted that the WSIP includes a program goal to enhance sustainability in all system activities (see Vol. 1, Chapter 3, Table 3.2, p. 3-9). The system performance objectives include: manage natural resources and physical systems to protect watershed ecosystems; meet, at a minimum, all current and anticipated legal requirements for protection of fish and other wildlife habitat; and manage natural resources and physical systems to protect public health and safety. Furthermore, as described on p. 3-82, the SFPUC has committed to specific greenhouse gas reduction actions as part of the WSIP. As described in the Draft PEIR (Vol. 1, Chapter 3, Section 3.6.1), the proposed program also includes implementation of local groundwater projects in the North Westside Groundwater Basin, recycled water projects on the west side of San Francisco, and additional conservation programs within the San Francisco retail service area. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information regarding conservation programs and recycling projects proposed by the SFPUC and its wholesale customers.

L_SFCPC3-02 The indirect effects of growth that would be supported by the WSIP are discussed on pp. 7-59 to 7-78 of the Draft PEIR (Vol. 4, Chapter 7); more detailed information on the impacts of growth identified in the EIRs prepared for the general plans that guide development within service area jurisdictions is presented in Draft PEIR Appendix E.5 (Vol. 5). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2) for a discussion of the methodologies used by the SFPUC and the Bay Area Water Supply and Conservation Agency to project future water demand.

Impacts on scenic resources are analyzed in Section 4.3, Land Use and Visual Quality, of the Draft PEIR (Vol. 2, Chapter 4). Most of the proposed upgrades would occur at existing SFPUC facilities and along existing pipeline alignments. As discussed in the Draft PEIR (Vol. 4, Chapter 6, p. 6-7), implementation of Mitigation Measure 4.3-2, Facility Siting Studies, would ensure that the SFPUC identifies and evaluates alternative site locations, access roads, building configurations, and facility operations to minimize or avoid land use impacts.

San Francisco City Planning Commission, Kathrin Moore, Commissioner, 10/11/07

[See Public Hearing Transcript, San Francisco City Hall, October 11, 2007, pp. 31–32]

L_SFCPC4-01 This comment expressing Commissioner Kathrin Moore's approval of working with local people and not outsourcing this project is acknowledged.

L_SFCPC4-02 The commenter asked why there are no WSIP facility improvement projects in the Hetch Hetchy Region. As explained by Tony Irons (the SFPUC's Deputy General Manager) at the public hearing, improvements needed in the Hetch Hetchy region are limited to periodic maintenance of the granite tunnels; no capital improvements are needed. Therefore, there are no WSIP facility improvement projects in the Hetch Hetchy region.

L_SFCPC4-03 This comment expresses concern with respect to seismic hazards at the Priest and Moccasin Reservoirs. The Priest and Moccasin Reservoirs are in the Sierra Nevada foothills, near Groveland. The nearest active faults to these reservoirs are the Great Valley 7 and Great Valley 8 blind-thrust faults, which are more than 50 miles to the west. These reservoirs lie within the Foothills Fault System, which, as described in the Draft PEIR (Vol. 2, Chapter 4, p. 4.4-5), is considered potentially active. However, the potential for rupture along one of the faults in this system is low, and no known fault traces cross the reservoirs.

As described in the Draft PEIR (Vol. 1, Chapter 3, pp. 3-15 and 3-16), the SFPUC conducted an extensive series of facility reliability and system performance studies to identify critical projects for achieving seismic reliability of the regional water system, as well as achieving the other goals of the WSIP. These studies identified no reservoirs, other than the Calaveras and Lower Crystal Springs Reservoirs, as critical facilities needing upgrade to current seismic standards to reduce the overall vulnerability of the regional water system to earthquake damage.

San Francisco City Planning Commission, Michael Antonini, Commissioner, 10/11/07

L_SFCPC5-01 The commenter questions whether extending an alternative pipeline at a distance away from the pipelines in the San Joaquin Pipeline System could ensure that a seismic event would not take the whole system out of operation. Surface fault rupture presents the greatest potential for seismic damage to pipelines where they cross a fault. The San Joaquin Pipeline System traverses the Great Valley 7 blind-thrust fault at its west end, just east of Tesla Portal, as described in the Draft PEIR (Vol. 2, Chapter 4, Figure 4.4-1b, p. 4.4-8). Thrust faults have no surface expression, and movement along these faults occurs on subsurface planes (see p. 4.4-5 in the Draft PEIR). Therefore, the potential for surface fault rupture associated with this fault is low, and as stated in the Draft PEIR (p. 4.4-32), impacts related to fault rupture would be less than significant for the San Joaquin Pipeline System project (SJ-3). Therefore, constructing an alternative pipeline at a distance away from the San Joaquin system would not provide additional protection from seismic hazards.

Instead, as summarized in Table 3.10 of the Draft PEIR (Vol. 1, Chapter 3, p. 3-49), the San Joaquin Pipeline System project (SJ-3) includes additional facilities to upgrade the hydraulic capacity of the San Joaquin Pipeline System and to provide redundancy to the existing pipeline, and the Rehabilitation of Existing San Joaquin Pipelines project (SJ-4) includes rehabilitation and reconditioning of the existing pipelines. The goal of both of these projects is to increase the reliability of the water system. Although the San Joaquin Pipeline System could be subjected to strong groundshaking in the event of an earthquake on the Great Valley 7 fault, or one of the other regional faults, the proposed improvements would be designed to withstand seismic hazards and maintain water service in accordance with the SFPUC's *General Seismic Design Requirements* (Vol. 2, Chapter 4, p. 4.4-32), which would reduce the potential for damage to the system in the event of an earthquake.

L_SFCPC5-02 The commenter asks whether the new pipes for the San Joaquin Pipeline System project (SJ-3) would be constructed of non-concrete or a material with greater tensile strength. The proposed new pipeline would be a welded-steel pipe lined with cement-mortar or low-profile material, with a dielectric coating. The final design will not be available until the SFPUC has completed value engineering and detailed cost estimating.

L_SFCPC5-03 The commenter asks whether the portions of the Bay Division Pipelines Nos. 1 and 2 that are aboveground and traverse the bay would remain or be removed. Please refer to **Response F_USFWS-02** for a discussion of issues related to these two pipelines. Please also refer to **Section 14.4, Master Response on**

PEIR Appropriate Level of Analysis (Vol. 7, Chapter 14, Section 14.4.2) for discussion regarding the intent of the programmatic impact analysis.

L_SFCPC5-04 The commenter's suggestion that the Bay Division Pipelines Nos. 1 and 2 pipelines serve as an alternative line if needed in an emergency is acknowledged. Please refer to **Response F_USFWS-02** for discussion of this issue. Please also see **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2) for additional discussion regarding the intent of the programmatic impact analysis.

Landmarks Preservation Advisory Board, Robert Cherny, Vice President, 9/27/07

L_SFLandmarks-01 The commenter's suggestion to include historic trees, gardens, and landscaping in project-level evaluations is acknowledged. The San Francisco Planning Department, Major Environmental Analysis Division staff will ensure that, where appropriate, evaluations of historic cultural and designed landscapes are performed during project-level CEQA review for each WSIP facility improvement project.

L_SFLandmarks-02 The Draft PEIR (Vol. 4, Chapter 9, pp. 9-98 and 9-99) identifies impacts and potential strategies to avoid or lessen significant effects as part of the alternatives identification and screening process. As noted on p. 9-99, the Draft PEIR identified potentially significant impacts on cultural and historic resources associated with facility siting and design issues. These include potentially significant and unavoidable (PSU) impacts for the Calaveras Dam Replacement (SV-2), New Irvington Tunnel (SV-4), Crystal Springs/San Andreas Transmission Upgrade (PN-2), and Lower Crystal Springs Dam Improvements (PN-4) projects. However, in some cases, the PSU impacts were identified as such because there was not enough site-specific information at the program level of analysis to determine whether the impact would be less than significant, or whether the identified mitigation measures could reduce the severity of the impact to a less-than-significant level. The programmatic strategies identified to avoid or minimize impacts on cultural resources include refinement of project site selections and/or facility layout designs. However, as discussed on p. 9-112, this approach to reducing impacts on cultural and historic resources is more appropriately considered during the project-level environmental review of individual WSIP projects, at which time more detailed and site-specific project and siting information will be available. Please note that the CEQA alternatives section in the Draft PEIR (Vol. 4, Chapter 9, pp. 9-4 to 9-21) focuses on water supply alternatives that would meet most of the project's basic objectives and avoid or lessen the significant environmental impacts of the proposed program. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2), and **Response L_SFLandmarks-08** for additional response.

L_SFLandmarks-03 The commenter recommends that mitigation measures include provisions to salvage examples of historic materials and equipment. In response to this comment, the following text is added to the end of Mitigation Measure 4.7-4a (Vol. 2, Chapter 6, p. 6-27):

> Representative features such as aqueduct/pipe sections, valves subject to replacement, decorative elements, or plaques/inscriptions from buildings or other portions of structures demolished as a part of the WSIP projects could be preserved and displayed. Most of these types of structures are of sufficient size that they would form "monumental" commemorative structures. For example, an original pipeline valve replaced by modern equipment might be mounted and displayed on publicly accessible SFPUC property with informative placards. Such displays, if located in other jurisdictions, might be subject to those jurisdiction's requirements related to public art, safety, and liability considerations.

L_SFLandmarks-04 The commenter suggests including in the historical context information regarding the opposition to building the system from various interests. In response to this comment, the following text is added to the Draft PEIR context statement (Vol. 2, Chapter 4, p. 4.7-24, after the first partial paragraph):

> Opposition to construction of the Hetch Hetchy project came from a variety of interests. Understandably, the Spring Valley Water Company opposed this project, which effectively ended the company's role as the utility company supplying San Francisco with its municipal and domestic water.[21a] The Hetch Hetchy project was designed to transmit electrical power to San Francisco from a power plant at Moccasin. A politically charged conflict over this electric power and associated revenue pitted public power advocates against the privately financed electric power industry. Opposition came from electrical power-generating companies like Pacific Gas and Electric Company (PG&E) and Great Western Power Company (GWP), two utilities that served San Francisco and the Bay Area. These private power companies opposed the competing generation and sale of electricity by public agencies, which was a provision of the Raker Act. The CCSF planned to acquire PG&E's and GWP's distribution systems within its service area, but between 1927 and 1941 the public consistently rejected bond issues required to fund their acquisition; allegedly, this opposition to the bond measures was largely funded by PG&E.[21b] The CCSF's agreements to have PG&E (which had acquired GWP in the 1930s) wheel its power through the company's existing transmission and distribution systems for delivery to San Francisco agencies, and its purchase of city power for resale, caused a longstanding controversy between the federal government, public power advocates, and the CCSF.[21c]

The corresponding references are added to the Draft PEIR (Vol. 2, Section 4.7):

> [21a] Elmo R. Richardson, "The Struggle for the Valley: California's Hetch Hetchy Controversy, 1905–1913," *California Historical Society Quarterly*, Vol. 38, 1959.

[21b] Norris Hundley, *The Great Thirst: Californians and Water, 1770s–1990s*. University of California Press, pp. 187–189, 1992; Stephen P. Sayles, "Hetch Hetchy Reversed: A Rural Urban Struggle for Power." *California History*, 64:4, p. 256, Fall 1985.

[21c] San Francisco Public Utilities Commission (SFPUC), *San Francisco Water and Power*, pp. 57–61, June 1949.

The commenter also recommends adding a discussion of the federal government's role in funding O'Shaughnessy Dam improvements in the 1930s. In response to this comment, the following text is added to the Draft PEIR (Vol. 2, Chapter 4, p. 4.7-25, after the third full paragraph):

O'Shaughnessy Dam was designed and built in a manner that would allow it to be raised. In the 1930s, President Franklin D. Roosevelt sought to provide America with a New Deal, a government-sponsored socioeconomic initiative that among its most prominent programs included dam construction projects as massive public works. Not long after Roosevelt's election (November 1932) and the start of the New Deal (after his inauguration in March 1933), the CCSF received a grant from the federal government covering 30 percent of the cost of labor and materials for raising O'Shaughnessy Dam. The money came from the National Recovery Administration, which was formed by the National Industrial Recovery Act of June 1933. The SFPUC reported that on November 7, 1933, the citizens of San Francisco passed a bond measure for $3.5 million to cover the city's portion of the cost of enlarging O'Shaughnessy Dam. The federal grant also stipulated that all available unemployed workers in Tuolumne County had to be put to work before unemployed people from San Francisco could be used. Soon thereafter, the state requested that the CCSF use 500 to 600 unemployed laborers it had available for "maintenance of municipal property" under the State Emergency Relief Act (SERA). By March 1934, the CCSF had erected seven SERA work camps capable of housing and feeding nearly 700 workers. Later, the state's SERA program for unemployment relief was absorbed into the federal Works Progress Administration. The CCSF issued the contract for the Hetch Hetchy Dam enlargement project on April 8, 1935 to the Transbay Construction Company, and the dam's raising was completed more than three years later, on July 1, 1938.[22a]

The corresponding references are added to the Draft PEIR (Vol. 2, Section 4.7):

[22a] San Francisco Public Utilities Commission (SFPUC), *San Francisco Water and Power*, pp. 59–60, June 1949; Ted Wurm, *Hetch Hetchy and its Dam Railroad*, Trans-Anglo Books, Glendale, CA, p. 251, 1973.

L_SFLandmarks-05 The commenter requests clarification in the historical property list and confirmation that the eligibility information came from state and federal agencies. In response to this comment, the following footnote is added to the Regulatory Framework section of the Draft PEIR (Vol. 2, Chapter 4, p. 4.7-37, end of second full paragraph, before bullet list):

> [29a] These properties have been determined eligible for listing in the National Register through consensus between a federal agency and the State Historic Preservation Officer. Information regarding National Register eligibility was acquired through a records search conducted at the Northwest Information Center at Sonoma State University, which is one of regional offices of the California Historical Resources Information System established by the California Office of Historic Preservation.

L_SFLandmarks-06 The commenter suggests that the historical context statement in the Draft PEIR examine the labor history and significance of the Hetch Hetchy project with respect to the population groups that worked on it. In response to this comment, the following text is added to the Draft PEIR (Vol. 2, Chapter 4, p. 4.7-24, after the third full paragraph):

> Multi-purpose dam and water conveyance projects proliferated within river basins throughout America in the early decades of the 20th century. The projects were built for a variety of purposes: municipal water supplies, federal land reclamation, irrigation, and electric power generation. Thousands of workers contributed to this construction work, often under tight schedules and difficult, even dangerous, conditions. Hetch Hetchy water project contract workers and wage laborers consisted of a varied group of individuals stratified by skill, race, and ethnicity. The largest proportion was low-paid, unskilled laborers, both native-born and immigrants. Above them were the better-paid skilled workers and craftsmen, and at the top was a smaller group consisting of managers, supervisors, administrative personnel, and skilled professionals such as civil and electrical engineers, hydrographers, and surveyors. Over more than 25 years of construction activity, the Hetch Hetchy project provided employment to many thousands of workers in many fields of industrial labor; these workers built everything from mountain roads, railroads, labor camps, buildings, bridges, and trestles that served as project infrastructure, to dams, tunnels, pipelines, siphons, and penstocks that stored and conveyed municipal water. Many of the lesser-skilled construction laborers were highly migratory, non-unionized workers whose employment was seasonal, with peak employment coming during the summer and autumn and minimal opportunities in winter and spring.

> While some workers were more sedentary and lived in towns or work camps with their families, the majority of the workers—who

were predominantly unmarried, mobile, and male—resided in boardinghouses or labor camps near their work sites. The ethnic makeup of the workingmen's boarding houses was often quite diverse, according to 1920 census records. For example, one lumber camp near Groveland was operated by an American civil engineer whose wife kept house with the assistance of one cook. Twenty-five boarders lived there, including painters, carpenters, contractors, lumberjacks, millwrights, and the lumberyard foreman. While the nationality of the boarders was predominately native-born, there were also Hungarians, Poles, Swedes, Germans, and Italians represented among the lodgers. Similarly, a tunnel camp in Groveland Precinct in 1920 contained boarding houses operated by a Swedish immigrant and a Canadian-born mine superintendent. While the Swedish-run operation catered mostly to about 20 Swedish, Norwegian, and native-born tunnel workers, the Canadian establishment lodged a diverse clientele of 22 workers, including tunnel miners and laborers, blacksmiths, foremen, and electricians. They were a diverse lot by nationality, including Canadians, native-born Americans, Spanish, German, Swedish, Italian, Irish, and Austrian workers. This pattern of boarding house occupation by workers of various nationalities was borne out at other tunnel camps and dam construction camps located outside the town of Groveland and at Lake Eleanor.[21d]

Unsafe working conditions and inadequate wages were issues that periodically contributed to labor strife and fostered efforts to unionize the rural industrial labor force assembled to construct the Hetch Hetchy project. During August of 1920, workers at some of the city's construction camps, particularly in the Mountain Tunnel Division, staged a general strike that lasted until May 1921. City officials, particularly O'Shaughnessy, had expressed general support for trade or craft unionism, but objected to "radicals" who organized the day laborers/construction workers hired by the CCSF and advocated worker solidarity, class conflict, and direct action (strikes) at the point of production. These radical labor leaders included representatives of the Industrial Workers of the World (I.W.W., or "Wobblies"), which variously functioned as an umbrella labor organization and revolutionary social movement, and the International Union of Mine, Mill & Smelter Workers, a labor union with militant roots in the copper, nickel, lead, and gold mines of the American West and British Columbia. During the 1920s and 1930s, Mine and Mill, as the union was known, made concerted efforts to organize unskilled national minorities such as Mexican-Americans and African-Americans in the American Southwest. City records indicated that Swedish/Finnish tunnel crews and Mexican laborers were among the more ardent supporters of the radical unionization effort.[21e]

Construction of Hetch Hetchy Dam, ancillary water storage structures, the city's extensive water conveyance system, and its power plant at Moccasin proceeded over several decades, from 1913 into the late 1930s. In 1925, in his report to the CCSF on Hetch Hetchy's progress, O'Shaughnessy made little mention of labor problems or strife over organizing, and no comments related to national groups and/or the ethnic composition of the workforce. He reported that the total number of men productively employed on the project ranged widely between 1914 and mid-1925: there were over 500 at the end of 1914 and less than a hundred at the beginning of 1915, with a gradual increase (with ebbs and flows) to about 750 in 1919. Thereafter the numbers increased quickly, reaching over 2,000 in 1922 before dropping off again to less than 400 by mid-1925.[21f] After 1925, the bulk of the construction effort shifted to the Foothill and Coast Range Tunnels and installation of the San Joaquin Pipeline, leading eventually to the delivery of Hetch Hetchy water into the city in October 1934.[21g]

The corresponding references are added to the Draft PEIR (Vol. 2, Section 4.7):

L_SFLandmarks-07 The commenter requests clarification regarding project-level impacts and coordination under the National Historic Preservation Act (i.e., whether there should be any federal involvement). The Draft PEIR identifies potential cultural resources impacts at a program level of detail. The project-level CEQA review will identify and evaluate impacts associated with each facility improvement project based on more detailed project information. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2) for additional discussion regarding this issue.

Several WSIP facility improvement projects will require review and approval by the U.S. Army Corps of Engineers and other federal agencies. If a project is considered a federal undertaking, appropriate Section 106 studies will be completed.

L_SFLandmarks-08 The commenter states an interest in ensuring that the historical value of the water system as a whole is evaluated during individual project-level environmental review, and that this historical value is not lost during project implementation. The overview presented in the Draft PEIR regarding the nature and historical development of the SFPUC's water facilities addresses this issue (Vol. 2, Chapter 4, pp. 4.7-11 to 4.7-27). Also, Impact 4.7-3 (Vol. 2, Chapter 4, pp. 4.7-69 to 4.7-75) addresses this issue by identifying impacts on the historical significance of a historic district or a contributor to a historic district. This analysis assesses impacts on potentially interrelated groups of facilities and resources (united by historical plan and function) that could be considered discrete historic districts. The WSIP would have an effect on potential historic districts within the water system if it were to remove or alter individual resources within a district in a manner that would diminish the district's historical integrity. Mitigation Measure 4.7-3 requires evaluation, by a qualified historian, of all water system facilities affected by the WSIP facility projects to determine whether they contribute to a historic district. The CCSF is currently undertaking supplemental studies to assess potential historic districts containing water system facilities that could be affected by one or more WSIP project(s). The results of those supplemental studies will be presented in project-specific CEQA documentation as appropriate.

San Joaquin Valley Air Pollution Control District, Arnaud Marjollet, Permit Services Manager, 10/1/07

L_SJVAPCD-01 The commenter’s contact information and concurrence with the air quality analysis in the Draft PEIR (Vol. 2, Chapter 4, pp. 4.9-1 to 4.9-48) are acknowledged.

San Luis & Delta-Mendota Water Authority, Westlands Water District, and Kern County Water Agency, Daniel Nelson, Executive Director; Thomas W. Birmingham, General Manager; and James Beck, General Manager, 10/1/07

L_SLDWWKC-01 This comment raises concerns that the Draft PEIR does not adequately address the WSIP's effects on the San Joaquin River or the Delta. Please refer to **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14) for a review of the PEIR analysis and additional discussion of the WSIP's effects on the San Joaquin River and the Delta.

L_SLDWWKC-02 The SFPUC Water Enterprise Environmental Stewardship Policy is discussed in the Draft PEIR in the section on plans and polices relevant to the WSIP water supply option and system operations (Vol. 3, Chapter 5, pp. 5.2-24 to 5.2-25 and 5.2-29). As described in the Draft PEIR, the WSIP would be consistent with the *underlying* [emphasis added] goals of this policy, particularly with respect to the WSIP sustainability goal and the WSIP system performance objective to "manage natural resources and physical systems to protect watershed ecosystems." The Draft PEIR acknowledges and analyzes the potential effects on stream flow and downstream habitats that would occur under the WSIP in the Tuolumne River, Alameda Creek, and Peninsula watersheds (Chapter 5, Sections 5.3, 5.4, and 5.5, respectively). Mitigation measures described in Chapter 6 identify measures to reduce potential impacts on fisheries and other biological resources, including operational approaches to managing releases from SFPUC reservoirs.

As a measure of its commitment to the stewardship policy, the SFPUC is coordinating with a wide range of stakeholders in each of the watersheds as part of its overall stewardship policy implementation efforts. These include the Tuolumne River Stakeholder Group, the Alameda Creek Fisheries Restoration Workgroup, and Pilarcitos Creek Restoration Workgroup. These activities are being conducted in conjunction with, but independent of, the PEIR.

The Draft PEIR evaluates eight CEQA alternatives in detail, as listed in Table 9.3 (Vol. 4, Chapter 9, pp. 9-7 and 9-8). Two of the alternatives would not involve increased diversions from the Tuolumne River—the Aggressive Conservation/Water Recycling and Local Groundwater Alternative with no supplemental Tuolumne River supply, and the

Year-round Desalination at Oceanside Alternative. Both of these alternatives meet the requirements of the San Francisco Board of Supervisors Resolution No. 321-07.

L_SLDWWKC-03 This comment, which provides general comments on the role of CEQA in an EIR, is acknowledged.

L_SLDWWKC-04 This comment provides a summary of three key issues raised by the commenter regarding the adequacy of the Draft PEIR. These three issues are presented in detail in the following three comments. Please refer to **Reponses L_SLDWWKC-05**, **L_SLDWWKC-06**, and **L_SLDWWKC-07**. Also refer to **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14) for additional information.

L_SLDWWKC-05 This comments states that the Draft PEIR does not adequately address potential impacts on the Delta and does not analyze the potential indirect effects of the WSIP on Central Valley Project (CVP) and State Water Project (SWP) operations. Please refer to **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14) for further discussion of the WSIP's effects on the Delta and on CVP and SWP operations and users.

L_SLDWWKC-06 This comment states that the baseline used in the Draft PEIR to describe existing conditions is inaccurate and irrelevant. Please refer to **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14) for a discussion of the baseline used in the PEIR impact analysis.

L_SLDWWKC-07 This comment raises concerns about the Draft PEIR analysis of alternatives. One concern is that the PEIR does not adequately analyze impacts on the San Joaquin River or the Delta and therefore does not appropriately identify an alternative(s) to address impacts on the San Joaquin River and the Delta. However, the PEIR does analyze the WSIP's impacts on the San Joaquin River and the Delta (Vol. 3, Chapter 5, Section 5.3). Please refer to **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14) for a review of the PEIR analysis of these issues and for further discussion of WSIP effects. The Draft PEIR analysis and the supplemental analysis conducted for this Comments and Responses effort concluded that the WSIP's effects on the San Joaquin River and the Delta, as well as indirect effects on the CVP and SWP systems and uses supported by these systems, would be less than significant. While mitigation is not required to address these less-than-significant effects, Mitigation Measure 5.3.6-4a, Avoidance of Flow Changes by Reducing Demand for Don Pedro Reservoir Water, proposed to address the WSIP's effects on fisheries and riparian habitat in the lower Tuolumne River; this measure, which calls for the SFPUC to acquire conserved water for the proposed water transfer element of the WSIP, would also further reduce WSIP effects on the San Joaquin River and the Delta. Further, the Draft PEIR does analyze alternatives that would reduce or avoid additional diversions from the Tuolumne River compared to those under the WSIP and therefore would also reduce or avoid effects on the San Joaquin River and the Delta. The Draft PEIR evaluates eight CEQA alternatives in detail, as listed in Table 9.3 (Vol. 4, Chapter 9, pp. 9-7 and 9-8). Two of the alternatives would involve no increased diversions from the Tuolumne River—the Aggressive Conservation/Water Recycling and Local Groundwater Alternative with no supplemental Tuolumne River supply, and the Year-round Desalination at Oceanside Alternative. Other alternatives would reduce Tuolumne River diversions. The Draft PEIR provides a thorough review of potential alternatives to the proposed program. Furthermore, Section 13.4 (Vol. 7, Chapter 13) of this Comments and Reponses document contains additional discussion regarding the Phased WSIP Variant.

The comment raises concerns about the analysis of the No Program Alternative, stating that the scenario described and analyzed in the PEIR may not come to pass. The Draft PEIR evaluates eight CEQA alternatives in detail (Vol. 4, Chapter 9) and provides a reasoned discussion of likely actions expected to occur under the No Program Alternative. If the WSIP were not implemented, it is assumed that the SFPUC would continue to make water deliveries to its customers through the regional system. Deliveries could increase as customer purchase requests increase over time and would be met by the SFPUC to the extent possible under its existing water rights on the Tuolumne River. As described, the SFPUC has sufficient existing water rights to continue to meet projected customer demands through 2030 in normal and above-normal hydrologic years. In dry years and drought periods, customers would experience increasing delivery shortages. Further, under the No Program Alternative, the SFPUC would not implement the proposed comprehensive program of system facility upgrades and improvements. The regional system facilities would continue to age and would have to be repaired and replaced on a piecemeal basis over time as they deteriorate and/or fail. The system would remain vulnerable to substantial risk of seismic damage and deteriorating reliability. As described accurately in the Draft PEIR, the No Program Alternative is not a scenario under which the SFPUC limits diversions from the Tuolumne River to existing levels. The PEIR accurately describes and adequately discusses the potential effects of the No Program Alternative.

City of Sunnyvale, Jamie McLeod, Associate Planner, and James Craig, Superintendent of Field Services, 9/28/07

L_Snnyvl-01 The Draft PEIR (Vol. 4, Chapter 7, Table 7.2, p. 7-15) states that the City of Sunnyvale's projected use of recycled water for 2030 is 1.5 mgd, consistent with the information provided in this comment. This comment, which states that Sunnyvale is seeking to build more housing units to accommodate existing demand as well as future growth in the South Bay, is acknowledged. As it does not address the adequacy or accuracy of the PEIR, no response is provided.

L_Snnyvl-02 The preliminary schedule for implementation of the WSIP projects is presented in Figure 3.6 of the Draft PEIR (Vol. 1, Chapter 3, p. 3-62). This schedule is based on the priority of each project with respect to its vulnerability to seismic damage, importance to system operations, system operational requirements, and projected funding. As discussed on p. 3-61 of the Draft PEIR, the project schedule is considered preliminary and will be subject to further refinement as the SFPUC proceeds with development of the WSIP. The Calaveras Dam Replacement project (SV-2) is a high-priority project that is scheduled to start in 2009, and the Seismic Upgrade of BDPL Nos. 3 and 4 at Hayward Fault (BD-3) is scheduled to start in 2010.

L_Snnyvl-03 The commenter's recommendation that the conveyance system be designed to provide the full amount of the future projected need for the Bay Area, and that the volume of water flowing through the system be based on policy and programs, not limited by capacity, is acknowledged. As stated in the Draft PEIR (Vol. 1, Chapter 3, p. 3-25), the WSIP proposes levels of service for the regional water system that are intended to meet system performance objectives through 2030 and to provide design criteria for the facility improvement projects. The SFPUC designed the WSIP to provide comprehensive improvements in the overall system reliability for its customers, including the need to serve future water demands. Designing for system reliability improvements is integrated with designing for increased capacity and involves a host of interrelated system parameters that affect water deliveries, including factors related to physical facilities and water supply sources. The WSIP as designed would meet the system reliability and future (2030) capacity needs of the customers as defined by the goals and objectives in Table 3.2 (Vol. 1, Chapter 3, p. 3-9).

L_Snnyvl-04 This comment, which expresses the City of Sunnyvale's recommendation for an overall plan to maximize the utility of the water used while maintaining basic water levels in the streams to address environmental concerns, is acknowledged. The Draft PEIR (Vol. 1, Chapter 3) presents the WSIP goals and objectives for water supply and delivery reliability as well as sustainability and watershed ecosystem protection, and describes the facility improvement projects needed to implement the WSIP.

L_Snnyvl-05 This comment expressing the City of Sunnyvale's support of solutions that minimize negative impacts on the environment is acknowledged. The commenter's reference to "hydrogenation" may be misdirected ("hydrogenation" refers to a class of chemical reactions). Assuming the commenter is referring to the WSIP's impact on hydropower generation, the Draft EIR addresses this issue in Impact 5.3.9-1 (Vol. 3, Chapter 5, pp. 5.3.9-2 and 5.3.9-3), which describes how the proposed changes in water supply and system operations would result in a net increase in hydropower generation compared to the existing conditions.

L_Snnyvl-06 This comment advocating a system maintenance fund for the ongoing maintenance of the system is noted.

L_Snnyvl-07 This comment, which states that Sunnyvale is seeking to build more housing units to accommodate existing demand as well as future growth in the South Bay, is acknowledged. As it does not address the adequacy or accuracy of the PEIR, no response is provided.

L_Snnyvl-08 This comment describing the City's water conservation programs is acknowledged.

L_Snnyvl-09 This comment expressing the City of Sunnyvale's support of the WSIP is acknowledged.

L_Snnyvl-10 Please refer to **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14), as well as **Response L_BAWSCA1-47** for additional discussion and analysis of this alternative.

Stanislaus County Environmental Review Committee, Raul Mendez, Senior Management Consultant, 8/27/07

L_StanCoERC-01 The commenter is concerned that any site containing an existing or former residence or farm be fully investigated (i.e., that Phase I and II studies be completed as necessary) prior to issuing a grading permit. SFPUC Construction Measure #7 (see Draft PEIR, Chapter 6, Vol. 4, p. 6-7) will be applied to all WSIP projects, and requires completion of a site assessment to evaluate the potential for soil or groundwater contamination at each site prior to construction. This assessment is intended to ensure that contaminated materials are handled in accordance with applicable laws and regulations, and that a contingency plan is prepared that specifies measures to be taken should unanticipated contamination be identified during construction. If a site assessment performed during project-level CEQA review of any WSIP facility project identifies a potentially significant impact, implementation of Mitigation Measures 4.14-1a and 4.14-1b (preparation of a site health and safety plan and materials disposal plan) (Vol. 4, Chapter 6, pp. 6-45 and 6-46) will be required to control exposure to contaminants and ensure proper handling of contaminated soil. Such measures would reduce this impact to a less-than-significant level.

The Draft PEIR (Vol. 2, Chapter 4, pp. 4.3-21 and 4.3-22) indicates that additional right-of-way/easement could be required for associated power requirements and access roads for the San Joaquin Pipeline System project (SJ-3). The Draft PEIR (Vol. 2, Chapter 4, p. 4.2-9) also indicates that the SFPUC is exempt from complying with local building and zoning ordinances when locating or constructing facilities for the production, generation, storage, treatment, or transmission of water. Therefore, the rezoning requirements (evaluation of pesticide levels) specified by the commenter may not apply.

Stanford University, Clifford (Mike) Goff, Director of Utilities, 10/1/07

L_Stanford-01 This comment expressing Stanford University's support for the WSIP goals and objectives is acknowledged. Please refer to **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14) for more discussion and analysis of this alternative and the potential for coordination efforts between SFPUC and BAWSCA in support of water conservation of agricultural uses on the lower Tuolumne River.

L_Stanford-02 This comment regarding Stanford University and associated hospitals' reliance on a high-quality water supply is acknowledged. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.2) for relevant discussion.

L_Stanford-03 This comment regarding the critical importance of completing the WSIP and improving the system with respect to seismic hazards is acknowledged. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.3) for more discussion.

L_Stanford-04 This comment describes reductions in water use at Stanford and expresses concern about the need to make further reductions during a drought. The Draft PEIR acknowledges the difficulties of implementing water cutbacks in the future due to demand hardening, and characterizes in general terms the socioeconomic, environmental, and health effects based on data from the 1987–1992 drought (Vol. 4, Chapter 9, pp. 9-29 to 9-31).

L_Stanford-05 This comment, which provides additional information on water use, conservation programs, use of recycled water, campus growth, and Stanford's water consumption, is acknowledged.

L_Stanford-06 The commenter correctly notes that the WSIP proposes a level of service for drought-year rationing of up to 20 percent systemwide. However, the WSIP does not provide details regarding the allocation of rationing requirements among customers in the event of an extended drought. The proposed drought-year system operations (see Draft PEIR Vol. 1, Chapter 3, pp. 3-42 and 3-43) would consist of a four-stage response program to ensure that water is delivered to customers continuously through the duration of a drought. The first stage of response would be to initiate dry-year water supplies and would not affect customer deliveries. Stages 2 and 3 of the response program would include up to 10 and 20 percent systemwide rationing, respectively. The procedures would include customer notification, customer allocation if necessary, and evaluation of customer performance.

The SFPUC would implement the drought response program in close coordination with all retail and wholesale customers and the Bay Area Water Supply and Conservation Agency (BAWSCA). As described in the Draft PEIR (Vol. 1, Chapter 2, p. 2-26), in 2000 the SFPUC adopted the *Interim Water Shortage Allocation Plan* in collaboration with BAWSCA; the plan identifies a water allocation method to be used to determine the share of water for wholesale customers during shortages caused by drought, and the WSIP would not affect any aspect of this plan.

The comment, which describes Stanford University's current efforts to implement conservation and water saving programs and the associated difficulties in implementing further reductions due to rationing, is acknowledged. Please refer to **Response L_Stanford-04**, above, regarding demand hardening issues.

It should be noted that hydrologic modeling conducted for the environmental analysis in the Draft PEIR indicates that the frequency of the need to implement 20 percent rationing would be very low. Based on the 82-year hydrologic record, there would be only 2 out of the 82 years (or 1 in 41 years) that 20 percent systemwide rationing would be required if the WSIP is implemented.

Tuolumne County Chamber of Commerce, George Segarini, President & CEO, 10/1/07

L_TCCC-01 The opinion of the Tuolumne County Chamber of Commerce opposing any additional diversions from the Tuolumne River is acknowledged.

L_TCCC-02 This information (related to the policy statement on water adopted by the Tuolumne County Chamber of Commerce) stating the importance of protecting existing water sources in the county is noted; however, as it does not address the adequacy or accuracy of the PEIR, no additional response is provided.

L_TCCC-03 The opinion of the Tuolumne County Chamber of Commerce supporting the alternatives that protect the Tuolumne River from new diversions is acknowledged. The comment indicating that requiring more water conservation, efficiency, and recycling is the best way to lessen impacts on the Tuolumne River is acknowledged. The Draft PEIR identifies two alternatives that would not increase diversions from the Tuolumne River: the Aggressive Conservation/Water Recycling and Local Groundwater Alternative (with no supplemental Tuolumne River supply), and the Year-round Desalination at Oceanside Alternative.

L_TCCC-04 The opinion of the Tuolumne County Chamber of Commerce expressing that the SFPUC should adopt a policy of reducing diversions from the Tuolumne River is noted. Regarding the request for additional watershed studies to assess the environmental impacts of the WSIP, the San Francisco Planning Department has determined that the currently available information is sufficient for conducting the environmental review of potential impacts. CEQA Guidelines Section 15151 states that an EIR should be prepared with a sufficient degree of analysis to provide decision-makers with information enabling them to make a decision that intelligently takes account of environmental consequences. An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in light of what is reasonably feasible.

Tuolumne Utilities District, Peter J. Kampa, General Manager, 9/28/07

L_TUD1-01 The Draft PEIR (Vol. 4, Chapter 9, pp. 9-1 to 9-128) evaluates eight alternatives at a comparative level detail to the evaluation of the WSIP, as required by CEQA Guidelines Section 15126.6. The eight alternatives represent a broad range of options in terms of how to implement key aspects of the proposed program while at the same time avoiding or substantially lessening the potentially significant or significant adverse impacts identified for the WSIP. Six of the eight alternatives include a variation on the water supply sources—either for nondrought years, drought years, or both—compared to that proposed for the WSIP. Draft PEIR Table 9.4 (p. 9-11) describes the differences in water supply sources among the eight alternatives. The water supply sources evaluated under these six alternatives encompass a diverse range of sources other than Tuolumne River water and include the following: (1) varying levels of regional recycled water/conservation/groundwater in the wholesale service area; (2) diversion of Tuolumne River water near the confluence with the San Joaquin River instead of at Hetch Hetchy Reservoir; (3) year-round desalination of seawater; and (4) regional desalination of brackish water. The various water sources under each alternative are used in combinations that would attain *most* of the WSIP's basic objectives, including the water supply objectives for nondrought and drought periods where feasible. Similar to the example provided by the commenter, the Year-round Desalination at Oceanside Alternative would include a small desalination plant on the west side of San Francisco as well as recycled water projects in San Francisco (WSIP facility improvement project SF-3) that would provide irrigation water for parks, the San Francisco Zoo, and median strips.

L_TUD1-02 The No Purchase Request Increase Alternative analyzed in the Draft PEIR (Vol. 4, Chapter 9, pp. 9-40 to 9-47) is based on the assumption that the SFPUC would limit the wholesale customers' future purchases to the terms of the existing Master Water Sales Agreement instead of providing them the full amount of their 2030 purchase request. In accordance with CEQA, the Draft PEIR discusses the SFPUC actions, wholesale customer actions, feasibility issues, and ability to meet the WSIP objectives associated with this alternative as well as its environmental impacts compared to those of the WSIP. The Draft PEIR does not, as the commenter asserts, address the political and economic impacts of the alternative (which is not required under CEQA), although it does discuss institutional and legal issues associated with this alternative.

The commenter's suggestion that a wholesale customer's new purchase requests could be limited based on its performance level with regard to conservation and recycling efforts is acknowledged. The statement that limiting new purchase requests would result in increased public acceptance of recycled water and enhanced tolerance of aggressive conservation measures is also acknowledged. As described in the Draft PEIR (Vol. 1, Chapter 2, pp. 2-43 and 2-44), the SFPUC currently holds individual agreements with its wholesale customers based on the Master Water Sales Agreement, which requires that wholesale customers employ best efforts to use all sources of water owned or controlled by them. In addition, some of the wholesale customers are solely dependent on the SFPUC for their water supply, while others have other sources of water available to them (see Vol. 1, Chapter 3, Table 3.1, p. 3-7). The 27 wholesale customers vary widely in their population and land use characteristics, including their abilities to implement recycled water and conservation programs. Refer to **Response S_CDFG2-07** and **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for further discussion on this issue.

L_TUD1-03 This comment, which expresses the Tuolumne Utilities District's support of the comments and concerns submitted by Tuolumne County on October 18, 2005 during the public scoping period and on September 25, 2007 during public review of the Draft PEIR, is acknowledged. Both letters are on file with the San Francisco Planning Department as part of the WSIP PEIR environmental review record. The comment letter from Tuolumne County dated September 25, 2007 included its October 18, 2005 letter as an attachment; therefore, both letters referenced by the commenter are included in this Comments and Responses document (coded as L-Tuol1), and the responses to the 20 comments are provided herein.

L_TUD1-04 The first paragraph in this comment asserts that the Draft PEIR estimated that requests to wholesale customer agencies to implement conservation measures at 20 percent during drought would result in a commensurate 20 percent reduction in supply needs, and that (according to the commenter) conservation measures would need to be set at a higher percentage in order to achieve 20 percent reduction in usage. While it is correct that the SFPUC could impose systemwide rationing of up to 20 percent in any one year of a drought as part of the drought supply planning under the WSIP, the statement that the PEIR estimated that requests to implement conservation measures at 20 percent would result in a commensurate 20 percent reduction in use is incorrect. The Draft PEIR describes the rationale for adopting the 20 percent rationing policy (Vol. 1, Chapter 3, p. 3-32 and pp. 3-36 to 3-39). As described, the SFPUC's drought response is a multi-step program to achieve the targeted system firm yield through: (1) existing local watersheds and Tuolumne River resources; (2) conservation, water recycling, and groundwater supply programs (implemented in all years); (3) water transfers; (4) groundwater conjunctive-use programs; and (5) restoration of storage in Crystal Springs and Calaveras Reservoirs. As stated in the Draft PEIR, the SFPUC would first pursue other strategies (e.g., groundwater pumping) before resorting to implementation of up to 20 percent systemwide rationing. The 20 percent systemwide rationing would not be implemented uniformly among all of the customers (because of differences among the customers with respect to their reliance on the regional system, ability to access alternative supply sources, etc.). The specific policies that the wholesale and retail customers would adopt to meet mandatory cutbacks would differ somewhat, in part based on different water use patterns within their respective service areas. Differences between actual and planned cutbacks can be expected and have been documented in previous droughts; as with previous droughts, water agencies can adapt drought rationing policies to make them more effective. There is sufficient discretionary water use on a systemwide basis to accommodate 20 percent cutbacks. (For information on the experiences of water agencies and their customers during the 1987–1992 drought, refer to Draft PEIR Vol. 4, Chapter 9, p. 9-29.)

The comment regarding demand hardening requires clarification. As stated in the Draft PEIR (Vol. 4, Chapter 9, p. 9-28), demand hardening refers to the increasing difficulty and expense of achieving short-term water conservation levels during droughts as more long-term conservation measures are implemented and water use efficiency increases. The *California Water Plan Update 2005* (DWR, 2005) acknowledges that demand hardening is a concern for California water agencies (see quoted text from the *California Water Plan Update 2005* in the Draft PEIR, Vol. 4, Chapter 9, p. 9-28). Where long-term conservation measures save water that would have been saved through short-term, drought-year measures (e.g., replacement of turf with water-efficient landscaping), then the latter will be less effective. Nonetheless, water agencies will adopt the measures needed to achieve the requisite cutbacks.

Contrary to this comment, the Draft PEIR does not attempt to validate "the level at which [the] wholesale agencies are currently enforcing conservation." Rather, the PEIR documents existing and planned levels of long-term conservation in the retail and wholesale customer service areas based on data used in, and generated by, modeling for the demand projections. **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) provides additional information on existing and planned levels of conservation. Regarding the "level of customer performance during previous years," in the 1976–1977 and 1986–1992 droughts, Bay Area water agencies used a variety of short-term conservation measures (steeply inclining block rate pricing, public education campaigns, water restrictions, and ordinances, some of which threatened to shut off water to non-responsive customers) to reduce water use temporarily from about 20 to over 50 percent (Association of California Water Agencies, 1991).

The third paragraph in this comment asserts that the statement in the PEIR—that water conservation and recycling can partially, but not fully, meet the WSIP delivery reliability and water supply performance objectives—is based on cursory input from the wholesale customers rather than research, analysis, and factual data. This assertion, which apparently refers to the analysis of the Aggressive Conservation/Water Recycling and Local Groundwater Alternative, is incorrect. As part of the planning effort for the proposed program, the SFPUC, in conjunction with its wholesale customers, conducted extensive studies—including technical studies on conservation and recycled water use potential and water demand studies that involved detailed evaluation of existing water use—in order to establish base-year conditions. These studies are described in the Draft PEIR (Vol. 1, Chapter 3, pp. 3.16 to 3-22, and Vol. 5, Appendix E.2); Section 14.2.3 (Vol. 7, Chapter 14) presents an expanded discussion of existing and planned conservation.

The *SFPUC Wholesale Customer Recycled Water Potential Technical Memorandum* (RMC, 2004) entailed a review of existing documents on water recycling in the area, including the only comprehensive study on recycled water potential in the Bay Area, the *1999 Bay Area Regional Water Recycling Program Master Plan*; technical memoranda from the Draft Bay Area Water Quality and Water Supply Reliability Program, a CALFED-supported program that includes water recycling as one of the elements being examined; and recycled water planning studies completed by agencies in the wholesale service area. This information was updated as needed through contacts with the wholesale customers. The recycled water use potential in the retail service area was identified in the *City and County of San Francisco Recycled Water Master Plan* (RMC, 2006).

In addition to the technical studies prepared for the proposed program, the SFPUC, in cooperation with its wholesale customers and the Bay Area Water Supply and Conservation Agency (BAWSCA), undertook a study to assess the potential for additional conservation and recycled water projects, including potential regional projects, that were not already considered to be implemented locally by 2030 as part of the WSIP purchase estimates, as described in the Draft PEIR (Vol. 4, Chapter 9, pp. 9-47 to 9-51). The results of this study, *Investigation of Regional Water Supply Option No. 4 Technical Memorandum* (SFPUC, 2007) provided the basis for the Aggressive Conservation/Water Recycling and Local Groundwater Alternative evaluated in the Draft PEIR (Vol. 4, Chapter 9, pp. 9-47 to 9-59) as well as an element of the Modified WSIP Alternative (Vol. 4, Chapter 9, pp. 9-78 to 9-84). The PEIR assessment of this alternative is based on these extensive background studies, contrary to the assertion in this comment. In addition, although the Draft PEIR concludes that the feasibility of the Aggressive Conservation/Water Recycling and Local Groundwater Alternative (Vol. 4, pp. 9-47 to 9-59) depends on numerous technical, institutional, financial, and public acceptance issues that would need to be overcome prior to implementation, the Modified WSIP Alternative recognizes that the analysis conducted by the SFPUC and BAWSCA of additional conservation and recycled water projects, including potential regional projects, indicates there is more potential for both additional conservation and water recycling than is currently included in the WSIP. The Draft PEIR identified this alternative as the environmentally superior alternative. For more information on this alternative, please refer to **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14).

Regarding the list of data items this comment states is missing from the PEIR, note that CEQA does not require that alternatives be evaluated at the same level of detail as a proposed project. Consistent with CEQA Guidelines Section 15126.6(d), the Draft PEIR includes sufficient information about and analysis of the Aggressive Conservation/Water Recycling and Local Groundwater Alternative, the Modified WSIP Alternative, and each of the other program alternatives considered in the Draft PEIR (Vol. 4, Chapter 9) to afford decision-makers and the public a meaningful comparison with the proposed program.[1] Also consistent with Section 15126.6(d), the Draft PEIR discusses the significant effects of each alternative.

L_TUD1-05 The commenter states that the Raker Act requires San Francisco to utilize local water sources before increasing Tuolumne River diversions. This is a misinterpretation of Raker Act Section 9(h). The Raker Act does not require the City and County of San Francisco (CCSF) to develop and use local water sources before it diverts out of the Tuolumne River watershed.

As described in the Draft PEIR (Vol. 1, Chapter 2, pp. 2-33 and 2-34), the Raker Act of 1913 granted to the CCSF rights-of-way and use of public lands in Yosemite National Park and Stanislaus National Forest to develop and use water and power. The act imposed many conditions and obligations on the CCSF, including the requirement that Tuolumne River water could be used in the Bay Area for municipal and domestic purposes, but not for agricultural irrigation. Specifically, Section 9(h) of the Raker Act provides that San Francisco:

> … shall not divert beyond the limits of the San Joaquin Valley any more of the water from the Tuolumne watershed than, together with the water which it now has or may hereafter acquire, shall be necessary for its beneficial use for domestic and other municipal purposes.

The commenter also asserts that the PEIR does not adequately evaluate the impacts of reduced wastewater discharges into receiving waters throughout the Bay Area. Changes in wastewater discharges into receiving waters in the SFPUC

[1] While the data items listed in this comment are not needed to provide sufficient evaluation and analysis of the program alternatives, note that the information requested as item (a) in the comment is included in the Draft PEIR (Vol. 1, Chapter 3); aggregated information on existing levels of conservation is presented on p. 3-16 (footnote 16) and disaggregated information on planned conservation is presented on p. 3-18.

service area would be an indirect effect associated with implementation of the WSIP. Insofar as the WSIP would result in changes in municipal and domestic water use patterns, there would also be associated changes in wastewater discharge patterns for municipal and industrial uses, with much of the change attributed to population growth. The Draft PEIR addresses the indirect effects of growth in Chapter 7 (Vol. 4, pp. 7-60 to 7-78); as this chapter indicates, these indirect effects, including impacts on wastewater treatment facilities and wastewater treatment capacities, were identified as significant but mitigable in the environmental impact reports for the general and specific plans in the service area. In the cases where the WSIP would result in increased use of recycled water, the associated effects on wastewater discharges will be addressed in the project-level environmental documentation for the recycled water projects.

L_TUD1-06 As part of the feasibility issues associated with the Aggressive Conservation/ Water Recycling and Local Groundwater Alternative, the Draft PEIR notes that public acceptance issues exist in some communities with regard to recycled water use (Vol. 4, Chapter 9, p. 9-53). However, this discussion is separate and distinct from the analysis of the environmental impacts of the alternative, and this information is not relied upon in the Draft PEIR to determine the environmentally superior alternative.

L_TUD1-07 As part of the feasibility issues associated with the Year-round Desalination at Oceanside Alternative, the Draft PEIR notes that there could be public acceptance issues from residents on the west side of San Francisco as well as from recreational users in the area with regard to desalination and the associated facilities (Vol. 4, Chapter 9, p. 9-69). However, this discussion is separate and distinct from the analysis of the environmental impacts of the alternative, and this information is not relied upon in the Draft PEIR to determine the environmentally superior alternative. Preliminary studies for both the regional desalination plant and the Oceanside desalination plant provided adequate information for the comparative analysis of the environmental impacts of the WSIP alternatives, as provided for in CEQA Guidelines Section 15126.6. Thus, the impacts described are general in nature based on preliminary studies and analysis of similar projects, and as stated by the commenter, not based on detailed study or data. With only preliminary information available, the discussion of environmental impacts is necessarily conservative, rather than "overstated" as asserted by the commenter.

L_TUD1-08 The commenter correctly describes the alternative strategy presented in the Draft PEIR, which involves an intertie with the Santa Clara Valley Water District (SCVWD), and correctly identifies the reason for rejecting this strategy (i.e., that the SCVWD does not have the capacity or need for additional water supplies during wet years) (Vol. 4, Chapter 9. pp. 9-122 and 9-123).

The conjunctive-use program included as part of the proposed WSIP dry-year supply (described in Vol. 3, Chapter 5, pp. 5.6-25 and 5.6-26) does not include active recharge of the groundwater basin during wet years; rather, the participating pumpers would receive potable water from the regional system during wet years, and the groundwater basin would recharge naturally. The PEIR does not evaluate the option of recharging the groundwater basin with water from the SCVWD during wet years because the SCVWD uses its excess supply in wet years to bank in their groundwater storage systems and has no excess supplies available to the SFPUC.

L_TUD1-09 This comment addresses the proposed dry-year water transfer included in the WSIP. The SFPUC proposes to secure a water transfer to help meet its dry-year water supply needs and identified the Turlock and Modesto Irrigation Districts (TID and MID) as the first agencies it would pursue for such an arrangement. The SFPUC has conducted a preliminary assessment of such a water transfer with TID and MID and determined it would be technically feasible and cost-effective because the existing infrastructure is adequate to implement this transfer and no additional facilities would be required. The existing agreements among the SFPUC, TID, and MID regarding storage space in Don Pedro Reservoir (see Draft PEIR, Vol. 1, Chapter 2, pp. 2-37 to 2-39) allow for the exchange of water among these agencies, and the proposed water transfers under the WSIP would be implemented through supplemental agreements with TID and MID. Please refer to **Section 14.3, Master Response on Proposed Dry-Year Water Transfer** (Vol. 7, Chapter 14, Section 14.3.2) for further discussion on this issue.

The analysis in the Draft PEIR is based on the worst-case assumption (in terms of environmental consequences) that the proposed water transfer from TID and MID would originate from water stored in Don Pedro Reservoir; TID and MID would presumably have the legal authority to approve such transfers based on their water rights and as owners and operators of the reservoir. The analysis of the impacts of this water transfer on the Tuolumne River, described in Impact 5.3.1-4 (Vol. 3, Chapter 5, pp. 5.3.1-30 to 5.3.1-38), examined the potential effects of the WSIP based on 82 years of historical hydrology and on assumptions that are consistent with those used in the modeling of the San Joaquin River for the Department of Water Resources and in the modeling for MID's recent water treatment plant project. This 82-year hydrologic record includes several extended drought sequences, and the modeling conducted for the PEIR analysis using the Hetch Hetchy/Local Simulation Model indicated that the WSIP water supply level of service could be achieved during drought periods with the combination of the proposed water transfer, a conjunctive-use program in the Westside Groundwater Basin, and a maximum systemwide rationing of 20 percent. While SFPUC staff has had some preliminary discussion with TID and MID, there has been no formal transfer request or negotiations.

As indicated in the Draft PEIR, the proposed WSIP would result in potentially significant impacts on fisheries and on riparian habitat along the Tuolumne River below La Grange Dam. Implementation of Mitigation Measure 5.3.6-4a (Vol. 4, Chapter 6, p. 6-48) would avoid these impacts by reducing the demand for Don Pedro Reservoir water. This measure states, "The SFPUC will pursue a water transfer arrangement with MID/TID and/or other water agencies such that the water acquired is developed through actions that result in reduction of demand on Don Pedro Reservoir as a result of conservation, improved delivery efficiency, interagency water transfer, or use of an alternative supply such as groundwater." The Draft PEIR acknowledges that MID/TID and/or other agency might be involved in the proposed transfer, but does not imply one way or the other that the water transfer would be from the Oakdale Irrigation District. However, as mentioned in the Draft PEIR (Vol. 4, Chapter 6, p. 6-60), regardless of the source of the water transfer, there would be additional CEQA environmental review of potential effects for any source other than stored water in Don Pedro Reservoir (which was already analyzed in the Draft PEIR). Consistent with CEQA Guidelines Section 15126.4(a)(1)(D), the Draft PEIR includes a section describing the potential impacts of mitigation measures (Vol. 4, Chapter 6, pp. 6-60 to 6-64), including the potential impacts of measures that affect other water sources. Thus, the Draft PEIR reviews the potential effects of implementing a water transfer that involves conserved water rather than stored water. It is expected that the appropriate transferring agency (TID, MID, or other agency) would conduct additional CEQA review if needed to address any aspects of the water transfer proposal not already analyzed in the PEIR. Nonetheless, agreements or approvals from MID, TID, or any other water agencies regarding the proposed water transfer are not required prior to certification of the PEIR and adoption of the WSIP, and the absence of such agreements does not affect the validity of the environmental analysis presented in the Draft PEIR.

Please refer to **Section 14.3, Master Response on Proposed Dry-Year Water Transfer** (Vol. 7, Chapter 14) for more detail on the proposed water transfer from MID/TID to the SFPUC. See also **Response L_MID-TID1-05 and L_MID-TID-06**.

L_TUD1-10 See **Response L_TUD1-05** regarding interpretation of the Raker Act. The commenter is correct in noting that the SFPUC has available options for increasing its water supply. One of the objectives of the WSIP is for the SFPUC to diversify its water supply options during drought and nondrought periods, and the proposed WSIP water supply includes the following new sources: recycled water/groundwater/conservation in San Francisco, a conjunctive-use program in the Westside Groundwater Basin, and dry-year water transfers.

L_TUD1-11 The position of the Tuolumne Utilities District vigorously opposing additional diversions from either the Tuolumne or Stanislaus Rivers is acknowledged. The analyses of the WSIP and alternatives contained in the Draft PEIR are based on extensive studies, as evidenced by the numerous and lengthy lists of references cited in each chapter of the PEIR. All information and supporting data used in the Draft PEIR are available for review at the San Francisco Planning Department. See **Response L_Tuol1-04** regarding Tuolumne County's County of Origin water rights.

Tuolumne Utilities District, Barbara Balen, Board President, 9/10/07

L_TUD2-01 This comment, which expresses support for aggressive recycling and reuse as well as the need to protect the Tuolumne River's environment, is acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for further discussion of the conservation and recycling practices within the SFPUC service area.

Tuolumne Utilities District, Peter J. Kampa, General Manager, 9/5/07

[See Public Hearing Transcript, Sonora, pp. 34–36]

L_TUD3-01 Please refer to **Response L_SFCPC1-01** for information regarding extension of the public review period.

L_TUD3-02 Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for further discussion of the conservation and recycling practices within the SFPUC service area.

L_TUD3-03 Refer to **Response L_TUD1-09** for a response to this comment.

L_TUD3-04 The opinion of the Tuolumne Utilities District that 20 percent rationing is below the industry standard is acknowledged. In conducting the drought planning and water supply studies in support of the WSIP, the SFPUC addressed the problems and issues that occurred from the drought periods in the last 30 years, notably the 1976–1977 and 1987–1992 droughts, as described in the Draft PEIR (Vol. 1, Chapter 2, pp. 2-25 to 2-27). These studies were used in the development of the WSIP proposed rationing scenario (the level of service objective of limiting rationing to a maximum of 20 percent systemwide), which was ultimately selected by the SFPUC commissioners (see Vol. 1, Chapter 3, p. 3-14).

L_TUD3-05 Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for further discussion of the conservation and recycling practices within the SFPUC service area.

Tuolumne County, Mark Thornton, Chairman, Tuolumne County Board of Supervisors, 9/25/07

L_Tuol1-01 The Draft PEIR analyzes two alternatives to the proposed program that would include increased levels of water conservation compared to the WSIP (Vol. 4, Chapter 9), and the Comments and Responses describes and analyzes the Phased WSIP Variant which also addresses increased levels of water conservation (Vol. 7, Chapter 13). The alternatives with increased levels of conservation are the Aggressive Conservation/Water Recycling and Local Groundwater Alternative and the Modified WSIP Alternative. The Aggressive Conservation/Water Recycling and Local Groundwater Alternative focuses on *maximizing* water conservation/water recycling and local groundwater in the wholesale customer service area (up to 19 mgd) with the objective of avoiding or minimizing increased diversions from the Tuolumne River (see Vol. 4, Chapter 9, pp. 9-47 to 9-59). The Modified WSIP Alternative would include increased levels of water conservation/ water recycling/local groundwater (up to 10 mgd) as well as implementing agricultural conservation in the San Joaquin Valley (see Vol. 7, **Section 14.10, Master Response on Modified WSIP Alternative**). The Phased WSIP Variant would defer a long term decision on additional diversions from the Tuolumne River until additional effort is made towards implementing additional local recycled water, groundwater, and demand management actions (see Vol. 7, Section 13.4, Phased WSIP Variant).

In addition the Draft PEIR identifies four additional alternatives that would divert less water from the Tuolumne River than would be diverted under the WSIP. These alternatives are shown in Table 9-5 (Vol. 4, Chapter 9, p. 9-13) and are as follows: No Program Alternative; No Purchase Request Increase Alternative;; Year-round Desalination at Oceanside Alternative; and Regional Desalination for Drought Alternative. These alternatives represent a range of reduced diversions from the Tuolumne River (i.e., the increase in average annual diversions under these alternatives would range from 0 to 20 million gallons per day (mgd), compared to the 27 mgd average annual increase that would occur under the WSIP).

L_Tuol1-02 The first part of this comment addresses the effects of reduced stream flows under the WSIP and the related effects on fisheries and recreation. The Draft PEIR analyzes the potential effects of the WSIP on the trout, salmon, and steelhead fisheries in the Tuolumne River (Vol. 3, Chapter 5, pp. 5.3.6-1 to 5.3.6-35). This analysis examined the fishery impacts along two reaches of the Tuolumne River below O'Shaughnessy Dam. Although the WSIP would result in changes in the existing flow and water temperature patterns in the reach between Hetch Hetchy and Don Pedro Reservoirs, the PEIR analysis demonstrated that the extent and frequency of the changes would not result in adverse effects on the resident fisheries, including rainbow trout; therefore, this impact (Impact 5.3.6-2) was determined to be less than significant, and no mitigation would be required. However, for the impact on the fishery resources along the Tuolumne River below La Grange Dam (Impact 5.3.6-4), the Draft PEIR concluded that the WSIP's effects on flow and temperature would infrequently contribute to potentially significant effects on fishery resources, but that implementation of Mitigation Measure 5.3.6-4a (Vol. 4, Chapter 6, p. 6-48) would ensure flow changes are avoided by reducing demand for Don Pedro Reservoir water, which would reduce this impact to a less-than-significant level. Due to the uncertainty in implementing this measure or in the event this measure proves to be infeasible, the Draft PEIR also includes Mitigation Measure 5.3.6-4b (Vol. 4, Chapter 6, pp. 6-48 and 6-49); this measure, which requires fishery habitat enhancement, would reduce these adverse impacts to a less-than-significant level.

With regard to the effect on whitewater recreation, Impact 5.3.8-2 in the Draft PEIR (Vol. 3, Chapter 5, pp. 5.3.8-27 to 5.3.8-34) analyzed the effects of the WSIP on whitewater rafting in the Tuolumne River between Cherry Creek and Don Pedro Reservoir, and in Cherry Creek between Holm Powerhouse and the Tuolumne River. In both cases, the PEIR concluded that the effects on whitewater rafting would be less than significant, since the difference between the WSIP and existing conditions would typically be limited to a few days in May or June. Thus, this small change from existing conditions would not be expected to result in noticeable effects for the Sierra communities associated with seasonal recreation.

The Draft PEIR also considers other past, present, and future projects or activities and analyzes cumulative impacts on resources in the Tuolumne River watershed, including fisheries and recreation (Vol. 3, Chapter 5, pp. 5.7-5 to 5.7-52). The PEIR analysis demonstrated that cumulative impacts on fisheries and recreation would be less than significant (Impacts 5.7.2-1 and 5.7.2-2 for the Tuolumne River from Hetch Hetchy to Don Pedro Reservoir, and from Don Pedro Reservoir to the San Joaquin River, respectively), and no additional mitigation beyond those measures described above would be required.

The San Francisco Planning Department, as the CEQA lead agency, acknowledges receipt of Resolution 40-07 by the Board of Supervisors of the County of Tuolumne; this resolution formalizes the County's opposition to the SFPUC's proposed diversion of additional water from the Tuolumne River and indicates its intent to seek legal remedies to see that no further water diversions occur from the Tuolumne River. Note that the San Francisco Planning Department is responsible for the preparation of the PEIR in compliance with CEQA, but it is the responsibility of the SFPUC, the project sponsor, to select and adopt the WSIP or an alternative to the WSIP based on review and consideration of the certified PEIR. Please see the Draft PEIR (Vol. 1, Chapter 3, pp. 3-86 to 3-88) for a description of the required actions and approvals. The underlying substantive County of Origin water rights issue is addressed in **Response L_Tuol1-04**, below.

The descriptions of 13 conditions (prefaced by the term "whereas") listed in Resolution 40-07 by the Board of Supervisors of the County of Tuolumne are acknowledged. The following discussion provides a response to the listed conditions where corrections or clarification is warranted:

- The ninth condition in the resolution contains misinformation. The 265 mgd described in the Draft PEIR represents the average annual *purchase requests* currently served by the SFPUC. It does not represent the current level of *diversions* from the Tuolumne River. Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for a description of the difference between the increase in purchase requests and the increase in diversions from the Tuolumne River.

- The tenth condition in the resolution contains misinformation. Consistent with CEQA guidelines, the Draft PEIR addresses and identifies the impacts of the WSIP that could affect Tuolumne County, as presented in both Chapter 4 (Vol. 2) and Chapter 5 (Vol. 3). Chapter 4 (pp. 4.3-1 to 4.17-64) includes the programmatic analysis of all environmental impacts of the proposed construction and operation of the portions of the San Joaquin Pipeline System (SJ-3) and Rehabilitation of Existing San Joaquin Pipelines (SJ-4) located in Tuolumne County, including activities in the vicinity of the Oakdale Portal. It identifies environmental impacts related to rural and urban land uses (Section 4.3), recreational resources (Section 4.12), and agricultural resources (Section 4.13), as well as impacts on visual resources (Section 4.3), geology (Section 4.4), hydrology (Section 4.5), biological resources (Section 4.6), cultural resources (4.7), traffic and transportation (Section 4.8), air quality (Section 4.9), noise (Section 4.10), services and utilities (Section 4.11), hazards (Section 4.14), and energy (Section 4.15).

  Chapter 5 (pp. 5.3.1-1 to 5.3.9-3) provides the analysis of water supply and system operations impacts on the Tuolumne River watershed and downstream water bodies. The analysis in Chapter 5 includes environmental impacts on environmental resources in Tuolumne County related to stream flow and reservoir water levels (Section 5.3.1), geomorphology (Section 5.3.2), surface water quality (Section 5.3.3), surface water supplies (Section 5.3.4), groundwater (Section 5.3.5), fisheries (Section 5.3.6), terrestrial biological resources (Section 5.3.7), recreational and visual resources (Section 5.3.8), and energy (Section 5.3.9). The proposed water supply option under the WSIP would not affect the Stanislaus River or related resources, and therefore the Draft PEIR does not discuss impacts on the Stanislaus River.

For a response to the last three conditions, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14) for a detailed discussion of those issues.

L_Tuol1-03 In response to items 1 and 2 regarding conservation and recycling, the Draft PEIR (Vol. 1, Chapter 3, pp. 3-16 to 3-22) discusses assumptions used in determining the existing and future water demands, including conservation and recycled water potential; in addition, please refer to **Section 14.2, Master Response on Demand**

Projections, Conservation, and Recycling (Vol. 7, Chapter 14) for a detailed discussion of those issues. The Draft PEIR also analyzes more aggressive conservation and water recycling strategies as part of the alternatives analysis in Chapter 9.

In response to item 3 regarding stormwater, Table 9.14 in the Draft PEIR identifies this as an alternative concept raised during the PEIR scoping process (Vol. 4, Chapter 9, p. 9-109). The concept of capturing and storing stormwater runoff was determined not to meet any of the basic program objectives for delivery reliability or water supply. However, the concept is considered under a component of one of the WSIP facility improvement projects, Groundwater Projects (SF-2), in which treated urban stormwater could be used to maintain water levels in Lake Merced.

In response to item 4 regarding desalination, the Draft PEIR considers and analyzes two possible approaches to supplementing the SFPUC water supply with desalination. The Draft PEIR analyzes the SFPUC's participation in a regional desalination program as a supplemental drought supply both as a variant to the WSIP (Vol. 4, Chapter 8, pp. 8-10 to 8-33) and as a CEQA alternative (Vol. 4, Chapter 9, pp. 9-74 to 9-78). The PEIR also analyzes year-round desalination at the Oceanside plant in San Francisco to avoid additional diversions from the Tuolumne River as a CEQA alternative (Vol. 4, Chapter 9, pp. 9-66 to 9-74).

In response to item 5, studies conducted to evaluate options for reducing the need for diversions from the Tuolumne River yielded six alternatives (including the No Program Alternative), which are described and evaluated in Draft PEIR Chapter 9 (Vol. 4). All six alternatives would divert less water from the Tuolumne River than would be diverted under the WSIP, but none of the alternatives would divert less than under existing (2005) conditions. The Aggressive Conservation/Water Recycling and Local Groundwater Alternative specifically considered the potential for these water demand and supply options to completely offset proposed diversions from the Tuolumne River (refer to Draft PEIR Vol. 4, Chapter 9, pp. 9-47 to 9-59).

L_Tuol1-04 The commenter asserts that the PEIR must analyze the impacts of the WSIP on Tuolumne County's County of Origin water rights. The California Water Code contains three provisions that are known as the area of origin rights. The County of Origin statute (Water Code Section 10505) only applies to water rights held by the Department of Water Resources for the State Water Project. The Watershed of Origin statute (Water Code Sections 11460 et seq.) only applies to water rights held by the Department of Water Resources and the U.S. Bureau of Reclamation for the State Water Project and the Central Valley Project. Finally, the Area of Origin statute (Water Code Sections 1215 et seq.) only applies to appropriative surface water rights initiated after January 1, 1985; the City and County of San Francisco's (CCSF) Tuolumne water rights are not subject to the statute, as its Tuolumne River water rights were filed before 1914. Any attempt to analyze impacts on Tuolumne County's inchoate County of Origin water rights, if any, to the Tuolumne River would be speculative. The CCSF notes that the Tuolumne Utilities District has determined it has the water resources to meet Tuolumne County's needs through the year 2035, and that it intends to seek its next increments of water supply from New Melones Reservoir and water rights filings on the South Fork Stanislaus River, as described in the *Tuolumne Utilities District Urban Water Management Plan, 2005 Update* (pp. 14 and 15).

L_Tuol1-05 This comment states that an economic analysis must be completed to determine the environmental effects on Tuolumne County residents, businesses, and tourism prior to approval of additional diversions of water from the Tuolumne River. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.6) for a response to this comment.

L_Tuol1-06 The WSIP as designed would meet the system reliability and capacity needs of SFPUC customers, as defined by the goals and objectives shown in Draft PEIR Table 3.2 (Vol. 1, Chapter 3, p. 3-9). The need for increased capacity of specific transmission components and treatment plants is largely created by two independent functions: (1) the SFPUC must retain the ability to provide capacity to replenish local storage following a drought, seismic event, unplanned shutdown, or maintenance shutdown period (ensuring that the local system has enough stored water to meet three months of demand strictly from the local system); and (2) the SFPUC must retain the ability to meet demand while performing maintenance or in the event of a seismic outage.

Thus, system reliability addresses a host of interrelated parameters affecting water deliveries, such as seismic reliability, delivery reliability, and the ability to maintain water quality standards. These same factors are also considered in planning efforts to provide capacity to serve planned growth, so it is difficult to make a clear distinction between system reliability and capacity for additional customers. The SFPUC has determined that the design capacity of the WSIP project facilities would be the same regardless of whether the WSIP were implemented as proposed or whether average annual diversions from the Tuolumne River were to remain within the current historical record (SFPUC, 2008b). Nevertheless, the Draft PEIR (Vol. 4, Chapter 7, Impact 7-1, pp. 7-60 to 7-78) recognizes that the WSIP would support planned growth in the SFPUC service area and considers this indirect growth-inducement impact to be significant and unavoidable.

L_Tuol1-07 In general, the SFPUC uses the historical hydrology specific to the regional system for future water supply planning. The historical records for the Hetch Hetchy system date back to 1920, with even earlier records for parts of the Peninsula watershed, and these records encompass a wide range of hydrologic conditions.

However, the SFPUC also keeps abreast of statewide water planning efforts, including the Department of Water Resources' *California Water Plan Update*. Please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14, Section 14.11.5) for further discussion of the SFPUC's actions to address climate change.

L_Tuol1-08 The Draft PEIR (Vol. 3, Chapter 5, pp. 5.7-2 to 5.7-51) provides an assessment of cumulative effects on the Tuolumne River system and downstream water bodies consistent with the CEQA Guidelines, Sections 15065(a) and 15130. This analysis considers the effects of past, present, and reasonably foreseeable future projects and evaluates the WSIP's contribution to cumulative impacts. In addition to SFPUC projects, the analysis considers projects by other agencies or jurisdictions, including the Turlock Irrigation District, Modesto Irrigation District, National Park Service (NPS), and a host of project sponsors involved in projects that could contribute to cumulative effects on the San Joaquin River and/or Delta (see Table 5.7-1, pp. 5.7-14 to 5.7-21).

L_Tuol1-09 The Draft PEIR (Vol. 4, Chapter 5, pp. 5.2-1 to 5.2-29) includes a discussion of how the WSIP relates to applicable land use and resource plans and policies. Under the Wild and Scenic Rivers Act, the NPS administers the designated wild and scenic rivers or reaches of rivers located within the national park system; the U.S. Forest Service administers the designated wild and scenic rivers located within national forests. The NPS is currently preparing the *Tuolumne Wild and Scenic River Comprehensive Management Plan* (Wild and Scenic Plan) for the 54 miles of designated wild and scenic reaches of the Tuolumne River within Yosemite National Park, but the plan has not been adopted. A discussion of the plan and related reports prepared by NPS is provided in the Draft PEIR (Vol. 3, Chapter 5, pp. 5.2-16 and 5.2-17). As the Wild and Scenic Plan is still under development and is not yet adopted, no determination regarding the consistency of the WSIP with its provisions is made in the PEIR.

The Draft PEIR (Vol. 3, Chapter 5, pp. 5.2-15 and 5.2-16) provides a description of the Wild and Scenic Plan as it applies to the 29 miles of the Tuolumne Wild and Scenic River located outside of Yosemite National Park. As stated in the Wild and Scenic Rivers Act (Section 3[a] [53]), the Wild and Scenic Plan does not apply to the exercise of the CCSF's water rights under the Raker Act. However, overall WSIP consistency with the management objectives, standards, and guidelines contained in the Wild and Scenic Plan related to biological resources planning and recreational/visual resources is discussed in the Draft PEIR in Sections 5.3.7 and 5.3.8, respectively. As indicated in the discussion of Impact 5.3.7-7 (Vol. 3, Chapter 5, pp. 5.3.7-26 and 5.3.7-27), potential conflicts with the provisions of the Wild and Scenic Plan with respect to biological resources planning would be less than significant. The effects of the WSIP on recreational resources along the Tuolumne River are discussed under Impact 5.3.8-2 (Vol. 3, Chapter 5, pp. 5.3.8-27 to 5.3.8-34) and would also be less than significant. With respect to the aesthetic values of the Tuolumne Wild and Scenic River, no significant effects are expected, as discussed under Impact 5.3.8-3 (Vol. 3, Chapter 5, pp. 5.3.8-34 and 5.3.8-35).

L_Tuol1-10 The Draft PEIR (Vol. 3, Chapter 5) analyzes potential impacts downstream of the confluence of the Tuolumne and San Joaquin Rivers with respect to stream flow changes (Impact 5.3.1-5, pp. 5.3.1-38 and 5.3.1-39), water quality (Impact 5.3.3-3, pp. 5.3.3-19 and 5.3.3-20), surface water supplies (Impacts 5.3.4-1 and 5.3.4-2, pp. 5.3.4-5 to 5.3.4-11), fisheries (Impact 5.3.6-5, pp. 5.3.6-32 and 5.3.6-33), and recreation (Impact 5.3.8-2, pp. 5.3.8-27 to 5.3.7-34). All of the listed impacts were determined to be less than significant. As described in the Draft PEIR (Vol. 3, Chapter 5, pp. 5.3.1-38 and 5.3.1-39), the WSIP would not alter flow in the San Joaquin River below its confluence with the Tuolumne River such that flow would be substantially outside the range experienced under existing conditions.

L_Tuol1-11 The Draft PEIR addresses the concept of an alternative that would require filtration of the Sierra source water as part of the overall alternatives analysis (Vol. 4, Chapter 9). As indicated by the commenter, the concept of filtering the Sierra source water was raised during the scoping period, and it is discussed in the Draft PEIR (Vol. 4, Chapter 9, pp. 9-119 and 9-120). As a stand-alone alternative, this concept would not meet any of the basic program objectives, would not avoid or lessen any of the impacts of the WSIP, and would result in additional construction and operational impacts associated with a new treatment facility. However, one of the alternatives analyzed in the Draft PEIR, the Lower Tuolumne River Diversion Alternative (Vol. 4, Chapter 9, pp. 9-59 to 9-66), would include construction of conveyance and treatment facilities for diversions from the lower Tuolumne River near the confluence with the San Joaquin River rather than increasing diversions from Hetch Hetchy Reservoir. One of the overall goals of the WSIP is to maintain high-quality water for the regional water system, and one of the performance objectives is to meet current and future federal and state water quality regulations. The WSIP facility improvements include the Advanced Disinfection project (SJ-1), which would be designed to provide treatment for *Cryptosporidium*.

L_Tuol1-12 This comment regarding the devastating effects of a catastrophic fire in the Groveland Community Services District (GCSD) is acknowledged. In the event of a water shortage, the SFPUC would work with the GCSD to determine appropriate rationing levels, regardless of whether or not the WSIP is implemented. The rationing levels described in the Draft PEIR are in terms of systemwide rationing, and the appropriate level for individual customers would be determined as necessary on a case-by-case basis.

L_Tuol1-13 The proposed program includes a groundwater conjunctive-use program as part of its proposal for water supply during drought (see Draft PEIR Vol. 1, Chapter 3, p. 3-37).

L_Tuol1-14 This comment regarding groundwater infiltration to Mountain Tunnel and the GCSD's payment of a surcharge for lost power revenue is acknowledged. The issue of GCSD's water payments is outside the scope of the PEIR, since it is not related to potential physical environmental effects.

Infiltration to Mountain Tunnel and accretions and depletions within the regional water system are accounted for within the hydrology incorporated into the SFPUC's modeling. The SFPUC model accounts for flows under the Hetch Hetchy Water and Power project in the water balance for the basin upstream of La Grange Dam.

If infiltration to Mountain Tunnel is considered to be groundwater, this phenomenon has been occurring for years, and its use by the SFPUC would therefore be in compliance with Tuolumne County Ordinance Code Section 13.20 pertaining to groundwater.

The comment requesting assistance for the GCSD in finding an alternative water supply during times of tunnel maintenance is acknowledged.

L_Tuol1-15 This comment regarding the GCSD's role in paying for the proposed system improvements is acknowledged; since this comment does not address the adequacy of the environmental analysis in the PEIR, no response is required.

L_Tuol1-16 The Draft PEIR (Vol. 1, Chapter 3, pp. 3-86 to 3-88) describes the required actions and approvals necessary for overall adoption of the WSIP and subsequent implementation of the proposed program. As indicated in the PEIR, no federal approvals are required for the overall WSIP as a program, and therefore the overall program is not subject to the National Environmental Policy Act (NEPA). However, individual facility improvement projects under the WSIP might require federal permits and approvals and associated NEPA compliance; this determination will be made as part of the project-level environmental review of each project.

L_Tuol1-17 This question regarding the merging of Hetch Hetchy water and hydroelectric systems is acknowledged; since this comment does not address the adequacy of the environmental analysis in the PEIR, no response is required.

L_Tuol1-18 Please refer to **Response L_Tuol1-02**. In addition, the Draft PEIR (Vol. 4, Chapter 6, pp. 6-60 to 6-64) acknowledges that some of the mitigation measures could result in significant effects separate from the identified WSIP impacts, and it includes a section that describes the impacts of mitigation measures.

L_Tuol1-19 This comment regarding local Tuolumne County contractors is noted; since this comment does not address the adequacy of the environmental analysis in the PEIR, no response is required.

L_Tuol1-20 The Draft PEIR (Vol. 4, Chapter 9, pp. 9-1 to 9-128) evaluates eight alternatives at a comparative level detail to that provided for the WSIP, as required by CEQA Guidelines Section 15126.6. The eight alternatives represent a broad range of options in terms of how to implement key aspects of the proposed program while at the same avoiding or substantially lessening potentially significant or significant adverse impacts identified for the WSIP. The alternatives analysis focuses on the comparative merits of the alternatives with respect to physical environmental effects, although it includes a discussion of feasibility issues associated with each alternative. In some cases, the alternatives have feasibility issues that could have economic implications (pp. 9-27 to 9-31), but there is no clear relationship between any economic effects and direct physical effects on the environment. Further, as provided by CEQA Guidelines Section 15064, economic changes resulting from a project are not to be treated as significant effects on the environment. Therefore, the PEIR does not include an economic analysis of alternatives.

The concept of restoring the Hetch Hetchy Valley is discussed in the Draft PEIR as an alternative concept that was raised during the scoping period (Vol. 4, Chapter 9, pp. 9-127 and 9-128).

Tuolumne County, Mark Thornton, District 4 Supervisor, Tuolumne County, 10/15/07

L_Tuol2-01 The effects of the WSIP on rafting flows in the Tuolumne River and Cherry Creek are described in the Draft PEIR (Vol. 3, Chapter 5, pp. 5.3.8-27 to 5.3.8-32). The effects of the WSIP on the availability of water for river rafting are minor and are judged to be less than significant. CEQA does not require an analysis of economic effects unless they would result in indirect physical environmental effect (CEQA Guidelines Section 15131). Please refer to **Response L_Tuol1-05**.

L_Tuol2-02 The City and County of San Francisco (CCSF) is unaware of any water-right permits or licenses held by Tuolumne County, Tuolumne Utilities District (TUD), or TUD's predecessor, the Tuolumne County Water District No. 2, on the Middle or South Forks of the Tuolumne River. In the past, Tuolumne County agencies filed or joined filings for water-rights applications on several projects within the Tuolumne River watershed, but all applications were dismissed by the State Water Resources Control Board after the agencies terminated the projects. Please refer to **Response L_Tuol1-04** regarding Tuolumne County water-right issues.

L_Tuol2-03 This comment states that there is a lack of adequate baseline data for the Tuolumne River, and that without such data it is not impossible to properly analyze the environmental consequences of additional diversions. As described in the Draft PEIR (Vol. 3, Chapter 5, pp. 5.1-7 to 5.1-18), the basic approach to the analysis of impacts on water and related resources was to first evaluate the changes in the river flow and reservoir levels that would occur with the WSIP, then to estimate changes in water quality and temperature, and finally to combine this information to determine potential impacts on fisheries and other biological resources. The analysis used the existing 82-year historical hydrologic record, coupled with the Hetch Hetchy/Local Simulation Model to depict the overall regional water system operations and to project the extent of changes in flow that could occur in the future. These results were used for the PEIR water supply and system operations impact analysis.

As described in **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.4), the CEQA Guidelines (Section 15151) impose a standard of adequacy that is "reasonably feasible" and sufficient to allow decision-makers to make a decision that takes account of environmental consequences. Data gathering need not be "exhaustive." The Draft PEIR analysis of the WSIP water supply and system operations with respect to fisheries and biological resources along the Tuolumne River was based on current knowledge of the composition and condition of the resources and in consideration of the potential interactive responses of plant and animal species to the hydrologic changes resulting from the WSIP as indicated by the model results. The analysis relied on ecological principles, scientific literature, existing data, and site visits. The Draft PEIR analysis was conservative in finding that an impact could be potentially significant if there was a possibility of impacts from the WSIP water supply and system operations.

The San Francisco Planning Department believes these data are sufficient to reasonably assess the general magnitude, frequency, and extent of the WSIP's environmental consequences, and to identify appropriate mitigation measures to offset potentially significant impacts on the Tuolumne River watershed and related resources. The mitigation measures were developed to include performance standards based on ecological principles, with the understanding that data from ongoing and future studies could be useful in augmenting the baseline data and in refining the implementation of each measure. As described in Draft PEIR Mitigation Measure 5.3.7-2 (Vol. 4, Chapter 6, pp. 6-49 and 6-50), **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.2), and **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.2), several studies of the Tuolumne River are in progress by the SFPUC, National Park Service, U.S. Fish and Wildlife Service, National Marine Fisheries Service, California Department of Fish and Game, and other agencies. Data from these studies would be used to augment the existing data and allow for refinement of the implementation of the mitigation measure to better achieve the identified performance standards.

L_Tuol2-04 Please refer to **Response L_Tuol1-01** and **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14) for a detailed discussion of these issues.

L_Tuol2-05 The Draft PEIR provides background information on the existing regional water supply, including a description of the agreements between the SFPUC and the Turlock and Modesto Irrigation Districts regarding the New Don Pedro Project (Vol. 1, Chapter 2, pp. 2-37 to 2-39). One of the agreements allocates storage space in Don Pedro Reservoir for a specified volume of Tuolumne River water within the CCSF's entitlement under the Raker Act.

L_Tuol2-06 This comment states that the Draft PEIR is deficient in addressing WSIP consistency with the Sierra Nevada Framework and CALFED; in this response, "CALFED" is interpreted to mean the Bay Delta Conservation Plan. In response to this comment, the Draft PEIR is revised to include the following discussion under the heading Federal Statutes and Agreements (Vol. 3, Chapter 5, p. 5.2-6).

<u>*National Forest Management Act*</u>

<u>The National Forest Management Act, enacted by Congress in 1976, is the primary statute governing the administration of national forests. The act requires the Secretary of Agriculture to assess forest lands, and to develop</u>

and implement a resource management plan for each unit of the National Forest System. The management plans must: ensure consideration of both economic and environmental factors; provide for wildlife and fish; provide for the diversity of plant and animal communities; ensure timber harvesting will occur only where water quality and fish habitat are adequately protected from serious detriment; and ensure clearcutting and other harvesting will occur only where it may be done in a manner consistent with the protection of soil, watersheds, fish, wildlife, recreation, aesthetic resources, and regeneration of the timber resource. The management plans must be updated at least once every 15 years. In the overall WSIP region, the Sierra Nevada Framework is the management plan governing Stanislaus National Forest. The provisions of the Sierra Nevada Framework are implemented by the U.S. Forest Service.

The Draft PEIR is revised to include the following discussion under the heading Relevant Plans, Policies, and Planning Actions (Vol. 3, Chapter 5, p. 5.2-14).

U.S. Forest Service, Sierra Nevada Framework

In January 2001, the U.S. Forest Service adopted the Sierra Nevada Forest Plan Amendment (SNFPA or Sierra Nevada Framework), a plan for the management of 11 national forests and 11.5 million acres of national forest land in the Sierra Nevada mountain range, including Stanislaus National Forest. In January 2004, in response to concerns about the flexibility and compatibility of the SNFPA with other programs related to wildland fire management, the U.S. Forest Service amended the Sierra Nevada Framework to provide additional provisions for fire and fuels treatments. The amended Framework outlines procedures used to manage and protect forests, wildlife habitats, and communities from a variety of threats, including catastrophic fires, and provides a programmatic framework within which project-level decisions are designed and implemented. Key aspects of the SNFPA include: a commitment to restoration and protection of old-growth forest habitat; protection of all trees greater than 30 inches on 11 million of the 11.5 million acres of public land managed by the U.S. Forest Service; designation of riparian conservation areas; improvement and protection of suitable habitat for California spotted owl (*Strix occidentalis occidentalis*), northern goshawk (*Accipiter gentiles*), and willow flycatcher (*Empidonax traillii*); adoption of an integrated vegetation management strategy with the primary objective of protecting communities and modifying landscape-scale fire behavior to reduce the size and severity of fires; and provisions for increased land use management, including grazing, timber production, road construction, and recreation activities. The SNFPA is administered by the U.S. Forest Service (USDA Forest Service, 2004). As no WSIP facility improvement projects are proposed within Stanislaus National Forest, and the resources protected by the SNFPA would not be affected by the WSIP water supply and system operations, the WSIP would be consistent with the provisions of the SNFPA.

Bay Delta Conservation Plan

The Bay Delta Conservation Plan (BDCP) is an effort driven by Delta water users to provide for the conservation and management of certain aquatic species, both listed and non-listed, and their habitats, while providing for regulatory assurances related to water supply reliability and water quality for the Sacramento–San Joaquin River Delta. Activities that would be covered under the BDCP include water supply operations related to the State Water Project and the Central Valley Project, and the power plant operations of the Mirant Corporation. Under the BDCP, water users would pay for new infrastructure, wetlands restoration, and other related projects in return for guaranteed stable water supplies. As the BDCP is still under development and is not yet adopted, no determination regarding potential conflicts of the WSIP with its provisions has been made.

The following reference is added to the Draft PEIR (Vol. 2, Chapter 4, Section 4.2, p. 4.2-19):

USDA Forest Service, *Sierra Nevada Forest Plan Amendment Final Supplemental Environmental Impact Statement*, January 2004.

Alameda County Flood Control and Water Conservation District, Zone 7, G.F. Duerig, General Manager, 10/1/07

L_Zone7-01 Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.3).

L_Zone7-02 Zone 7's support for the Modified WSIP Alternative is acknowledged. Please refer to **Section 14.8**, **Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14) for further discussion of the WSIP's effect on the San Joaquin River and the Delta, including potential effects on State Water Project operations and resulting indirect effects. Please refer to **Section 14.10**, **Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14) for further discussion and analysis of the Modified WSIP Alternative.

L_Zone7-03 This comment, which expresses Zone 7's support for the exploration of interconnections and water exchanges among the SFPUC and other jurisdictions, such as the Dublin San Ramon Services District, is acknowledged. As discussed in Draft PEIR Section 9.4.4 (Vol. 4, Chapter 9, p. 9-116), the SFPUC explored some options for interconnections and water exchanges during development of the WSIP, but the SFPUC eliminated this concept from further consideration because it would not provide a reliable future water source consistent with the WSIP goals and objectives. However, as part of its overall water supply planning (irrespective of the WSIP), the SFPUC will continue to work with other Bay Area water agencies.

Alameda Creek Alliance, Jeff Miller, Director, 10/01/07

SI_ACA1-01 This comment states that the Draft PEIR fails to address impacts on anadromous fish in Alameda Creek. This comment also states that the Draft PEIR's mitigation measures for special-status species are inadequate and jeopardize the SFPUC's schedule for implementation of the WSIP facility improvement projects. Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14) for an expanded discussion of existing fishery resources in Alameda Creek, potential WSIP impacts on steelhead in lower Alameda Creek below the Bay Area Rapid Transit District (BART) weir, and potential WSIP impacts under a future scenario in which steelhead have been restored to the reaches of Alameda Creek above the BART weir. Section 14.9 also includes a discussion of new protective measures that have been incorporated into the WSIP program description for the Calaveras Dam Replacement (SV-2) and the Alameda Creek Fishery Enhancement (SV-1) projects to address future-occurring steelhead in Alameda Creek above the BART weir, and text revisions to Mitigation Measure 5.4.5-3a (Vol. 3, Chapter 6, p. 6-52 and 6-53) that further define the fishery protection measures addressed in the PEIR.

SI_ACA1-02 Under the WSIP (through implementation of the Calaveras Dam Replacement project, SV-2), the SFPUC would reestablish historical diversions from upper Alameda Creek to Calaveras Reservoir such that diversions would be similar to those occurring prior to the 2001 Division of Safety of Dams (DSOD) restriction on Calaveras Reservoir. The Draft PEIR (Vol. 3, Chapter 5, Sections 5.4.5 and 5.4.6) describes potential impacts on fisheries and other biological resources due to the proposed changes in system operations. Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Sections 14.9.3 and 14.9.4) for discussions addressing the commenter's concerns that implementation of the Calaveras Dam Replacement (SV-2) and the Alameda Creek Fishery Enhancement (SV-1) projects would divert additional stream flow from Alameda Creek and adversely affect native fish and other aquatic wildlife.

The commenter states that the SFPUC already diverts 86 percent of the stream flows tributary to the Sunol Valley from Alameda, Calaveras, and San Antonio Creeks. This statement is not derived from information contained in the Draft PEIR. Information on the current percentage of stream flow diverted by the SFPUC is not necessary for the impact analysis in the PEIR. Please refer to Draft PEIR, Vol. 3, Chapter 5, Section 5.4.1 for information used in the PEIR to analyze stream flows in the Alameda Creek watershed.

SI_ACA1-03 This comment states that the SFPUC's current operation of Calaveras and San Antonio Reservoirs does not include minimum bypass flows to keep native fish downstream in good condition. The commenter also questions the SFPUC's legal water right to divert Alameda Creek stream flow at the diversion dam. The SFPUC's existing water rights and entitlements for the Alameda watershed water supplies are described in the Draft PEIR (Vol. 1, Chapter 2, pp. 2-35 to 2-37). The SFPUC is currently operating Calaveras and San Antonio Reservoirs in compliance with applicable regulations and institutional considerations, which are described in the Draft PEIR (Vol. 1, Chapter 2, Sections 2.4 and 2.5, respectively). In addition, the existing and proposed diversion of water from the Alameda Creek watershed is consistent with the City and County of San Francisco's (CCSF) water rights (Vol. 1, Chapter 2, Section 2.5.1).

Implementation of the WSIP would result in increased diversions from Alameda Creek compared to the existing condition, but the proposed level of diversions would be similar to the historical level of diversions that occurred for about 70 years prior to the 2001 DSOD restriction on Calaveras Dam. Under the WSIP, the SFPUC would continue to operate the regional water system in compliance with applicable regulations.

Impact 5.4.5-3 in the Draft PEIR (Vol. 3, Chapter 5, pp. 5.4.5-18 to 5.4.5-20) analyzes effects on fishery resources along Alameda Creek downstream of the Alameda Creek Diversion Dam. Mitigation Measure 5.4.5-3a in the Draft PEIR (Vol. 4, Chapter 6, pp. 6-52 and 6-53) outlines minimum flows in Alameda Creek for maintaining habitat suitable for resident trout downstream of the diversion dam. **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.4) discusses in detail the impact of the WSIP on habitat and fishery resources in Alameda Creek, including impacts on potential future-occurring steelhead, and describes minimum bypass flows (included as part of the Calaveras Dam Replacement project description) for protecting future-occurring steelhead. Please refer to **Response S_CDFG2-11** for additional information related to the future operation of Calaveras Dam and Reservoir under the WSIP; refer to **Response S_CDFG2-14** for additional information on Draft PEIR Measure 5.4.5-3b.

SI_ACA1-04 Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.4) for discussion of minimum flows for anadromous fish.

SI_ACA1-05 Please refer to **Section 13.2, Program Description Changes Affecting System Operations** (Vol. 7, Chapter 13) and to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Sections 14.9.4 and 14.9.5) for discussion of protective measures for steelhead in Alameda Creek.

SI_ACA1-06 This comment regarding the Alameda Creek Alliance's efforts to communicate its concerns and suggestions to the SFPUC regarding projects in the Sunol Valley is acknowledged.

SI_ACA1-07 As described in the Draft PEIR (Vol. 3, Chapter 5, pp. 5.2-24 and 5.2-25), the SFPUC's adopted Water Enterprise Environmental Stewardship Policy establishes a long-term management direction for CCSF-owned lands and natural resources affected by operation of the SFPUC regional water system, including lands within the Alameda Creek watershed. In addition, the WSIP's goals and objectives shown in Table 3.2 of the Draft PEIR (Vol. 1, Chapter 3, p. 3-9) include a system performance objective to "manage natural resources and physical systems to protect watershed ecosystems."

The Draft PEIR addresses impacts on biological resources, including special-status species and rare habitats, and mitigations for significant impacts in the following sections: Vol. 2—Section 4.5, Section 4.16 (pp. 4.16-16 to 4.16-19), and Section 4.17 (pp. 4.17-51 and 4.17-52); Vol. 3—Sections 5.3.6, 5.3.7, 5.4.5, 5.4.6, 5.5.5, 5.5.6, and 5.7 (pp. 5.7-31, 5.7-32, 5.7-41, 5.7-42, 5.7-63, 5.7-64, 5.7-77, 5.7-81, 5.7-82); Vol. 4—Sections 6.3.5, 6.4.2, 6.4.3, and 6.4.4; and Vol. 5—Appendix D.

SI_ACA1-08 Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Sections 14.9.4 and 14.9.5) for discussion of steelhead and other fish species in Alameda Creek.

SI_ACA1-09 Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.5) for discussion Chinook salmon, coho salmon, Pacific lamprey, and other fish species in Alameda Creek.

SI_ACA1-10 Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.5). The comment stating that there is historical evidence of steelhead trout in Arroyo de la Laguna, Arroyo Mocho, and Arroyo Valle is acknowledged. The existing setting related to fisheries in Arroyo de la Laguna, Arroyo Mocho, and Arroyo Valle, including a description of the historical setting, is discussed in the Draft PEIR (Vol. 3, Chapter 5, pp. 5.4.5-2 and 5.4.5-3).

SI_ACA1-11 The regulatory status, life history, and distinctions between resident and migratory populations of steelhead and rainbow trout, as well as flows needed to support populations of these fish, are discussed in the Draft PEIR (Vol. 3, Chapter 5, pp. 5.4.5-4 to 5.4.5-11). Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.2) for additional discussion of the regulatory status of steelhead and rainbow trout. The information provided by the commenter regarding background studies leading to the designation of steelhead as a federally listed threatened species is acknowledged.

SI_ACA1-12 The commenter's assertion that SFPUC currently operates Calaveras and San Antonio Reservoirs in violation of California Fish and Game Code is noted. California Fish and Game Codes relevant to the WSIP are discussed in **Response SI-TRT-CWA-SierraC-84**; please refer to that response for details. Whether or not the SFPUC is currently operating the regional water system in compliance with the California Fish and Game Code, including Section 5937, is not a CEQA issue. As described in the Draft PEIR (Vol. 1, Chapter 2, p. 2-41), Calaveras Dam and Reservoir is the only SFPUC facility in the Alameda Creek watershed operating under an agreement to make releases in support of fisheries, although due to the current DSOD restrictions on Calaveras Dam, the CDFG has agreed that implementation of the flow releases can be suspended until the Calaveras Dam Replacement project is completed. Operation of Turner Dam on San Antonio Reservoir is not currently subject to a release agreement to support fisheries.

The commenter states that the current operations and implementation of the WSIP, specifically the operation of the Alameda Creek Diversion Dam (ACDD), would violate California Fish and Game Code Sections 5901 and 5937. As described in Section 13.2 of this Comments and Responses document (Vol. 7, Chapter 13), the SFPUC has modified the project description of the Calaveras Dam Replacement project (SV-2) to include construction of a new bypass structure at the diversion dam and protective measures for fishery resources, including releases at the ACDD consistent with flows required under the 1997 CDFG MOU. The proposed modifications and protective measures included in the Calaveras Dam Replacement project are designed to minimize impacts on potential future-occurring steelhead in the upper Alameda Creek watershed in the event that man-made barriers in Alameda Creek are successfully removed and steelhead migration, spawning, and rearing have been restored in Alameda Creek above the BART weir. In addition, the Draft PEIR has identified Measure 5.4.5-3a, Minimum Flows for Resident Trout in Alameda Creek, to reduce potential impacts of the WSIP on fisheries.

For a discussion of WSIP impacts on potential future-occurring steelhead in Alameda Creek and a description of protective flow measures included as part of the WSIP program description (part of Calaveras Dam Replacement and Alameda Creek Fishery Enhancement projects) to minimize impacts on steelhead life stages and habitat requirements, including minimum bypass flows and releases at the Alameda Creek Diversion and Calaveras Dams, please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.4). Additionally, refer to **Response SI_ACA1-03**, above, as well as **Responses S_CDFG2-11** and **S_CDFG2-14** for further discussion of minimum bypass flows for resident fish.

The San Francisco Planning Department received comments from the CDFG on the PEIR Notice of Preparation (NOP) in a letter dated January 19, 2007. The CDFG letter dated November 22, 2005 referred to by the commenter was in regard to the NOP for the Calaveras Dam Replacement project (SV-2). The information quoted from the CDFG letter regarding flows for anadromous steelhead and use of storage facilities to meet minimum bypass flows is noted.

Implementation of the WSIP would result in increased diversions from Alameda Creek compared to the existing condition, but the proposed level of diversions would be similar to the historical level of diversions that occurred for about 70 years prior to the 2001 DSOD restriction on Calaveras Dam. The Draft PEIR (Vol. 3, Section 5.4.5) addresses impacts on fisheries in the Alameda Creek watershed that would result from the WSIP. Draft PEIR Impact 5.4.5-3 (Vol. 3, Chapter 5, pp. 5.4.5-18 to 5.4.5-20) analyzes effects on fishery resources along Alameda Creek downstream of the ACDD. Impacts on fishery resources below Calaveras Dam and Turner (San Antonio) Dam are discussed in Impacts 5.4.5-2 and 5.4.5-5 (Vol. 3, Chapter 5, pp. 5.4.5-17 and 5.4.5-21), respectively. The Draft PEIR concluded that impacts on fishery resources below Calaveras Dam would be beneficial due to the instream flow releases that would be implemented as part of the WSIP, and that impacts on fishery resources below San Antonio Reservoir would be less than significant because the seasonal patterns of instream flow releases to San Antonio Creek would be similar under the existing condition and with the WSIP. The fact that Calaveras and Turner Dams currently act as a complete barrier to fish migration would be unchanged under the WSIP and are, therefore, not subject to review under CEQA.

SI_ACA1-13 The description and implementation status of the 1997 CDFG MOU provided by the commenter corroborates the information presented in the Draft PEIR (Vol. 1, Chapter 2, p. 2-41 and Vol. 3, Chapter 5, p. 5.4.1-9). The commenter also provides an interpretation of the DSOD restrictions on Calaveras Dam and discusses the SFPUC fishery release flows from Calaveras Reservoir; those comments confuse regional water system firm yield and Calaveras yield (a subset of the regional water system), and a correction is provided here. Currently, due to the DSOD operating restrictions on Calaveras Dam, the system firm yield of the regional water system was reduced to 219 million gallons per day (mgd), a 7 mgd reduction from the normal system firm yield (i.e., prior to the 2001 DSOD restrictions) of 226 mgd (not 223 mgd as stated by the commenter). The DSOD restrictions reduced the total storage capacity of Calaveras Reservoir by about 60 percent, and the total working storage capacity of the SFPUC's local reservoirs by over 30 percent (see Draft PEIR, Vol. 1, Chapter 2, p. 2-10). Although the SFPUC is currently not releasing water from Calaveras Reservoir to meet the requirements of the 1997 CDFG MOU, the SFPUC reduced diversions from Alameda Creek above the diversion dam when the DSOD imposed the restrictions on Calaveras Dam in 2001, thereby increasing natural flow in Alameda

Creek downstream of the diversion dam. The Draft PEIR provides a detailed discussion of flows below the Alameda Creek Diversion and Calaveras Dams following the DSOD restrictions (Vol. 3, Chapter 5.4, pp. 5.4.1-9 to 5.4.1-13).

The commenter states that the resident trout population below Calaveras Dam is not in good condition, and that the Draft PEIR fails to adequately discuss minimum flows for anadromous steelhead and resident trout life stages and habitat requirements. **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.4) provides a detailed discussion of minimum bypass flows to protect fishery resources on Alameda Creek. The information provided by the commenter from the CDFG letter dated November 22, 2005 was in regard to the NOP for the Calaveras Dam Replacement project (not the WSIP PEIR); please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.4) for discussion of the issues identified by the CDFG in this letter. For further information related to the CDFG review of WSIP impacts on Alameda Creek fishery resources, please refer to **Responses S_CDFG2-01** and **S_CDFG2-11** to **S_CDFG2-15**.

SI_ACA1-14 Under the WSIP, the SFPUC does not propose to increase diversions in excess of the water rights the CCSF now holds in the Alameda Creek watershed, and, consequently, the CCSF does not require new water rights from the State Water Resources Control Board. The diversion of water in and from the Alameda Creek watershed is consistent with the CCSF's water rights. The CCSF holds a water right to divert from Alameda Creek into Calaveras Reservoir along with the rights it holds to divert and store water in Calaveras Reservoir from Arroyo Hondo and Calaveras Creek (see Vol. 1, Chapter 2, Section 2.5.1).

The comment regarding the State Water Resources Control Board's estimate of impairment in the Alameda Creek watershed is acknowledged. This statement is not derived from information contained in the Draft PEIR, and this information on the current percentage of impairment in Alameda Creek is not necessary for the impact analysis in the PEIR. Please refer to Draft PEIR, Vol. 3, Chapter 5, Section 5.4.1 for information used in the PEIR to analyze stream flows in the Alameda Creek watershed. The comment stating that the Department of Water Resources considers the Alameda Creek watershed "fully appropriated' is also acknowledged.

SI_ACA1-15 The Raker Act does not require San Francisco to develop and use local water sources before it can divert out of the Tuolumne River watershed. Rather, the Raker Act restricts San Francisco's use of Tuolumne River water in the Bay Area to municipal and domestic purposes only. Under the WSIP, the SFPUC would continue to maximize its use of local resources and develop those local resource projects and programs that are feasible, reasonable, and cost-effective consistent with responsible stewardship of Tuolumne River resources.

As stated in the Draft PEIR, the CCSF must adhere to the Raker Act (Vol. 1, Chapter 2, pp. 2-33 and 2-34). The WSIP is consistent with Raker Act requirements, including Section 9(h), with respect to the export of additional water from the Tuolumne River watershed, since the additional diversions under the WSIP would be for municipal and domestic purposes. Also refer to **Responses L_TUD1-05** and **L_MID-TID-09**.

Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for a discussion of conservation and water recycling in San Francisco.

SI_ACA1-16 Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.4) with regard to the effects of the WSIP on steelhead and SFPUC plans to consult with the U.S. Fish and Wildlife Service (USFWS), National Marine Fisheries Service, and CDFG for compliance with the Federal and California Endangered Species Acts.

The commenter correctly quotes the Draft PEIR regulatory status description relevant to steelhead (Vol. 3, Chapter 5, pp. 5.4.5-4 and 5.4.5-11); this description remains valid, although updated information on the SFPUC's proposed protective measures for steelhead is provided in **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14). The opinion of the commenter that steelhead trout could have access to Alameda Creek stream reaches affected by the SFPUC dams by 2010 is acknowledged, and Section 14.9 also addresses this potential future scenario.

With regard to the comment regarding consultation with federal wildlife agencies on listed species, the subsequent environmental review of individual WSIP project will include consultation with resource agencies as determined appropriate based on the project-level, site specific analysis. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14).

The Draft PEIR (Vol. 2, Chapter 4, pp. 4.6-33 to 4.6-37) describes habitat conservation plans for species listed as threatened or endangered under the Federal and California Endangered Species Acts that could potentially be affected by the WSIP. These include the San Joaquin County Multi-Species Habitat Conservation and Open Space Plan, the Draft Santa Clara Valley Habitat Conservation Plan/Natural Communities Conservation Plan, the SFPUC Alameda and Peninsula Watershed Habitat Conservation Plans, and the San Joaquin River National Wildlife Refuge Comprehensive Conservation Plan. Impact 4.6-5 (Vol. 2, Chapter 4, pp. 4.6-73 and 4.6-74) describes the potential for conflict with the provisions of applicable plans; it was concluded that impacts from the WSIP projects would be less than significant or could be reduced to a less-than-significant level through the implementation of identified mitigation measures.

SI_ACA1-17 The commenter correctly states that one of the goals of the WSIP is to enhance sustainability in all system activities (Draft PEIR, Table 3.2, Vol. 1, Chapter 3, p. 3-9). The commenter's description of the SFPUC Water Enterprise Environmental Stewardship Policy corroborates the description presented in the Draft PEIR (Vol. 3, Chapter 5, p. 5.2-25). It should be noted that this policy is subsidiary to the overall mission of the SFPUC, which, as described in the Draft PEIR (Vol. 1, Chapter 3, p. 3-5), is "to serve San Francisco and its Bay Area customers with reliable, high-quality and affordable water, while maximizing benefits from power operations and responsibly managing the resources entrusted to its care." The consistency of the WSIP with the stewardship policy is described in the Draft PEIR (Vol. 3, Chapter 5, p. 5.2-29).

In response to this comment, Table 2.3 (Vol. 1, Chapter 2, p. 2-45) is revised to include the Water Enterprise Environmental Stewardship Policy as the last row in the table:

TABLE 2.3
SFPUC WATER RESOURCES POLICIES RELATED TO THE WSIP

Date	Resolution Number	Description
June 2006	06-0105	*Water Enterprise Environmental Stewardship Policy* The Environmental Stewardship Policy will be integrated into SFPUC Water Enterprise planning and decision-making processes and also directly implemented through a number of efforts, including: • Implementation and updating of the existing Alameda and Peninsula Watershed Management Plans • Development of Habitat Conservation Plans for the Alameda and Peninsula Watersheds • Development and implementation of the Watershed and Environmental Improvement Program, which will cover the Tuolumne River, Alameda Creek, and Peninsula watersheds • Development of the Lake Merced Watershed Plan • Active participation in local forums, including coordination with Yosemite National Park Service and Stanislaus National Forest in the Tuolumne River watershed, the Tuolumne River Technical Advisory Committee, the Alameda Creek Fisheries Restoration Workgroup, the Pilarcitos Creek Restoration Workgroup, and the Lake Merced Task Force • Integration of the policy into the WSIP and individual infrastructure projects (i.e., repair and replacement programs) • Reliance on the policy to guide the development of project descriptions, alternatives and mitigation for all SFPUC projects during the environmental review process under CEQA and/or NEPA • Providing support for and encouragement to all employees to integrate environmental stewardship into daily operations through communication and training

SI_ACA1-18 The commenter makes reference to several cited technical reports (Vol. 3, Chapter 5, pp. 5.4.6-6 and 5.4.6-11), which are part of the administrative record for the PEIR, and therefore are available to the public on request from the San Francisco Planning Department. It should be noted, however, that CEQA does not require that an agency perform all research or study recommended by commenters, as long as a good faith effort at full disclosure is made in the EIR (CEQA Guidelines Section 15204[a]).

The commenter states that the Draft PEIR omits consideration of impacts on several special-status species. For a discussion of the issues raised by this comment, please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.4). This master response describes the appropriate level of detail of a biological resources impact analysis at the program level versus the project level. As discussed in Draft PEIR Section 5.4.6, WSIP water supply and system operations in the Alameda watershed would not affect species dependent on upland habitats, such as the Callippe silverspot butterfly, San Joaquin kit fox, or Berkeley kangaroo rat. Impacts on upland-dependent special-status species as a result of WSIP projects, such as construction of the Calaveras Dam Replacement project (SV-2), are analyzed at a program level in the PEIR and will be analyzed in more detail in project-specific CEQA documents. Responses to species-specific comments are provided below.

Bay checkerspot butterfly and San Joaquin kit fox. At the programmatic level and using the best available data, the Draft PEIR analysis determined that Bay checkerspot butterfly and San Joaquin kit fox are not present in the Sunol Valley Region (Vol. 2, Chapter 4, pp. 4.6-18 and 4.6-22). However, the project-specific EIRs prepared for the individual WSIP projects will not be constrained by the species occurrence data presented in the PEIR, and must reevaluate all species identified in the PEIR as potentially affected by program elements. If new or additional data are available at the time the project-specific EIRs are prepared, or if the legal or identified status of species changes in the interim, potential impacts would be evaluated at that time and appropriate mitigations would be identified. If the determination is made that impacts on these species could occur, the standard mitigation measures presented in the Draft PEIR (Vol. 4, Chapter 6, Tables 6.1 and 6.2, pp. 6-14 through 6-20) would apply to Bay checkerspot butterfly (Measure I.3) and San Joaquin kit fox (Measure M.2). In addition, standard construction measures to reduce project footprints as well as construction monitoring would minimize potential impacts on all special-status species.

Berkeley kangaroo rat. The commenter notes that impacts on Berkeley kangaroo rat are not analyzed in the Draft PEIR. Please refer to the Draft PEIR discussion of the programmatic impact methodology (Vol. 2, Chapter 4, p. 4.6-1). The PEIR focuses on those special-status species and key sensitive habitats that are formally listed or designated under the California and Federal Endangered Species Acts, as these species/habitats are considered to have the highest degree of ecological sensitivity and legal protection. Berkeley kangaroo rat has no formal status with either the CDFG or USFWS. Separate, project-level CEQA review will be conducted as appropriate for the WSIP projects; this review will describe project impacts on the full range of biological resources more precisely and, where necessary, tailor the mitigation measures presented in the PEIR. As noted above, no upland-dependent special-status species were found to be affected by WSIP operations.

Calaveras Reservoir Species. Although the commenter states that potential impacts on California red-legged frog, California tiger salamander, and Alameda whipsnake are not analyzed, Table 4.6-3 in the Draft PEIR (Vol. 2, Chapter 4, p. 4.6-41) and Table 5.4.6-3 (Vol. 3, Chapter 5, p. 5.4.6-8) list each of these species as present in program area, including Calaveras Reservoir, and the programmatic impact assessment for the Calaveras Dam Replacement project (SV-2) identifies impacts on these species as potentially significant (Vol. 2, Chapter 4, p. 4.6-63). Table 6.1 in the Draft PEIR (Vol. 4, Chapter 6, p. 6-14) identifies programmatic mitigation measures for these species that would apply to the Calaveras Dam Replacement project and other projects in the Sunol Valley Region.

SI_ACA1-19 The opinion of the commenter regarding the WSIP's effects on stream flow below the ACDD (Impact 5.4.1-2, Vol. 3, Chapter 5, p. 5.4.1-25) is noted. The PEIR concludes that this impact would be significant and unavoidable because the WSIP would substantially reduce stream flows and alter the stream hydrograph of Alameda Creek below the diversion dam compared to the existing condition with the DSOS restrictions on Calaveras Dam. As part of the WSIP water supply option, the proposed program would reestablish the historical level of diversions from Alameda Creek to Calaveras Reservoir (Vol. 3, Chapter 5, pp. 5.4.1-33 to 5.4.1-35).

The commenter correctly quotes Mitigation Measure 5.4.1-2, Diversion Tunnel Operation (Vol. 4, Chapter 6, p. 6-51), and the commenter's opinion of this measure is noted. The commenter states that Measure 5.4.1-2 is not adequate to protect fish and wildlife resources on Alameda Creek downstream of the diversion dam. However, Measure 5.4.1-2 was designed to mitigate impacts on creek hydrology below the diversion dam resulting from the reduction in peak flows (due to the resumption of historical diversions to Calaveras Reservoir)—not specifically to mitigate impacts on fish and wildlife due to WSIP flow reductions (see Mitigation Measures 5.4.5-3a and 5.4.5-3b, Vol. 4, Chapter 6, pp. 6-52 to 6-54). As stated, Measure 5.4.1-2 is intended to reduce the impacts of reduced stream flow below the diversion dam, but would not reduce the impact to a less-than-significant level.

Draft PEIR Impact 5.4.5-3 analyzes the effects of the WSIP on fisheries due to changes in stream flow below the diversion dam (Vol. 3, Chapter 5, pp. 5.4.5-18 to 5.4.5-20). Although the commenter correctly quotes excerpts from this impact analysis, the indented quotation is not accurate since it does not indicate that some intervening sentences are missing. The analysis in Impact 5.4.5-3 concluded that the WSIP would result in potentially significant but mitigable impacts on resident rainbow trout habitat along Alameda Creek immediately downstream of the diversion dam.

The commenter correctly quotes the first two paragraphs of Draft PEIR Mitigation Measure 5.4.5-3a; please refer to **Chapter 16, Staff-Initiated Text Revisions** (Vol. 7) for revisions made to this measure since PEIR publication to reflect changes in the project description of the Calaveras Dam Replacement project (SV-2). This measure includes performance criteria and would reduce Impact 5.4.5-3 to a less-than-significant level; in addition to providing for minimum flows in support of resident trout, it includes monitoring, adaptive management, and coordination with resource agencies as well as other agencies/organizations involved in fishery studies on Alameda Creek. The commenter is correct in noting that the PEIR does not contain detailed information to determine whether 10 cubic feet per second is sufficient to support trout spawning and egg incubation; however, Mitigation Measure 5.4.5-3a provides for site-specific studies to identify and implement the appropriate minimum stream flow. The measure specifies that minimum stream flows would be required when precipitation would naturally generate runoff in the creek below the diversion dam under unimpaired conditions between December 1 and April 30.

To ensure the adequacy and effectiveness of the mitigation, the Draft PEIR also includes Mitigation Measure 5.4.5-3b, which provides a timeline tied to a performance measure along with supplemental actions that would reduce the impact to a less-than-significant level. The commenter correctly quotes the first paragraph of Measure 5.4.5-3b.

The commenter raises the issue that the diversion tunnel may currently be injuring or harming fish; however, CEQA does not require that projects provide mitigation for existing conditions.

For impacts related to steelhead migration, please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.4). For impacts on Pacific lamprey and Chinook salmon, refer to Section 14.9.5 of this master response. The information provided by the commenter on recent fishery monitoring results in Alameda Creek is acknowledged.

The commenter correctly quotes the provisions of Mitigation Measure 5.4.6-3, Operational Procedures for Calaveras Dam Releases (Vol. 4, Chapter 6, p. 6-55); however, the commenter incorrectly links this measure with impacts on resident rainbow trout below the diversion dam and incorrectly states that it would begin no earlier than 10 years after the construction of Calaveras Dam. Measure 5.4.6-3 was developed to reduce potentially significant impacts associated with Impact 5.4.6-3 (effects on riparian habitat and related biological resources along Calaveras Creek, from Calaveras Reservoir to the confluence with Alameda Creek) and would be implemented prior to the completion of Calaveras Dam.

The objectives of the flows specified in the 1997 CDFG MOU were developed prior to and independent of the WSIP and therefore are not a CEQA issue subject to evaluation in the PEIR. The Draft PEIR does not rely on the MOU flows to mitigate the WSIP's impacts on species, but rather evaluates the effects of implementation of the MOU as part of the WSIP. Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14) for a discussion of proposed changes related to the MOU releases and other bypass flows proposed as part of the Calaveras Dam Replacement project (SV-2). In addition, Section 14.9.4 of this master response presents a detailed analysis of WSIP impacts on steelhead as well as protective measures designed to provide minimum flows for potential future-occurring steelhead.

SI_ACA1-20 The commenter states that the Draft PEIR contains inadequate mitigations for significant WSIP impacts on steelhead, Chinook salmon, and Pacific lamprey. Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Sections 14.9.4 and 14.9.5).

The commenter refers to standard mitigation measure F1 listed in Table 6.2 in the Draft PEIR (Vol. 4, Chapter 6, p. 6-16). As indicated in the Draft PEIR, the measures listed in this table are generic measures and will be modified based on site-specific conditions and applied to each WSIP project as appropriate. These measures are intended to be the minimum necessary actions, and the project-specific CEQA analyses may identify additional measures for key special-status species once more site-specific information is available. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14).

The commenter suggests mitigation measures for the protection of aquatic wildlife, including fencing out cattle from streams to protect spawning habitat and riparian vegetation, eradicating bass from Calaveras and San Antonio Reservoirs, and increasing dissolved oxygen (DO) in reservoirs to provide habitat for reservoir-residing trout. As described below, these measures are either already being implemented by the SFPUC or have been determined to be unnecessary as programmatic mitigation for the WSIP.

Livestock Grazing. Livestock grazing on the Alameda watershed has been a standard practice for more than a century and is a crucial management tool for wildfire protection. The SFPUC has taken measures to reduce the potential impacts of erosion, native plant displacement, and water quality degradation often associated with grazing. Grazing management practices, including fencing creeks to keep out livestock and limiting the number of animals allowed in the watershed, have helped to maintain high water quality and reduce the threat of wildfire while also providing protection to aquatic wildlife. Grazing is an important tool in managing fire by reducing the amount of grass and other vegetation that presents a fire hazard if left unmanaged during the hot, dry summers typical of the region. The *Alameda Watershed Management Plan* (SFPUC, 2001) outlines management actions for periodically and systematically inspecting watershed perimeter fencing, access gates, and locks and for repairing/replacing them as required to minimize trespassing, straying cattle, and illegal dumping.

Specific grazing management actions listed in the *Alameda Watershed Management Plan* detail methods the SFPUC follows to effectively manage and contain grazing activities so that the beneficial aspects related to fire management can be realized without jeopardizing water quality/quantity and biological resources. These management actions specify the implementation of structural protection measures to reduce the risk of viable pathogen discharges into watershed streams and reservoirs, as well as the strategic placement of fencing around reservoirs and streams to restrict cattle access and around riparian pastures to restrict access by calves. The fencing prevents cattle from entering these areas while at the same time providing for adequate wildlife access.

Dissolved Oxygen Management. Currently, the SFPUC manages DO levels in Calaveras Reservoir through liquid oxygen supply based on a feasibility study conducted in 2003. As described in the Draft PEIR, levels of DO are managed to provide for and protect fish habitat and drinking water quality (Vol. 3, Chapter 5, p. 5.4.3-2). The oxygenation management system has the capability to provide this same protection in a larger reservoir and would continue to be operated once the dam is replaced and storage levels are restored to the historical levels in place prior to the 2001 DSOD operating restriction. Dissolved oxygen levels in Calaveras Reservoir would remain equal to or would possibly improve over those under the existing condition. Under existing conditions, the reduced water pool in the lowered reservoir has constrained reservoir habitat for trout, since the water column that provides suitable temperatures and oxygenation for trout survival has severely decreased. Higher water elevations with implementation of the WSIP would provide increased habitat for aquatic species and an increase in coldwater pool storage. Dissolved oxygen levels in San Antonio Reservoir are not expected to change significantly as a result of WSIP implementation. However, the SFPUC is investigating an oxygenation system for San Antonio Reservoir.

<u>Predator Control</u>. Draft PEIR Section 5.4.5 and Impacts 5.4.5-1 and 5.4.5-4 (Vol. 3, Chapter 5) discuss fishery resources and the impacts of WSIP implementation. For the Calaveras and San Antonio Reservoirs, the WSIP would increase the storage volume from that under current conditions. In assessing the fishery-related impacts due to this change, it was concluded that the increase would offer the potential for increased coldwater pool storage and would also benefit coldwater fish species downstream of Calaveras Reservoir. Additionally, this increased coldwater pool volume within the reservoirs would increase the volume of habitat available for resident fish species, including both warmwater and coldwater species. While this increase in habitat could increase the abundance of non-native predators, the overall impact on fishery resources is deemed beneficial due to the improved habitat conditions, along with greater connectivity and migration of fish between the reservoir and upstream tributaries; therefore, no mitigation measures are necessary.

SI_ACA1-21 The comments regarding the Draft PEIR's programmatic mitigation measures for potential impacts on special-status butterflies, burrowing owl, and San Joaquin kit fox are noted. As stated above in **Response SI_ACA1-20**, these standard programmatic measures for biological resources are generic measures and will be modified based on site-specific conditions and applied to each WSIP project as appropriate. The measures are intended to be the minimum necessary actions and are consistent with mitigations currently accepted by the resource agencies. As more site-specific information becomes available, the project-specific CEQA analyses for the WSIP projects may identify additional measures for key special-status species. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.4).

<u>Butterflies</u>. The location, quality, and extent of suitable habitat for special-status invertebrate species will be identified at the project-specific EIR level, and Mitigation Measure I.3 would be implemented (Vol. 4, Chapter 6, Tables 6.1 and 6.2, pp. 6-14 to 6-20). Fugitive dust can be a problem for the host plants of these butterflies; however, this type of impact is normally addressed at the project level when project footprints and construction methods have been better defined.

<u>Burrowing owl</u>. The commenter is correct in that passive relocation of burrowing owls does not ensure their survival, only that mortality is avoided. Passive relocation of owls as proposed is consistent with current CDFG guidance (*Staff Report on Burrowing Owl Mitigation*, memorandum dated October 17, 1995, signed by C.F. Raysbrook, CDFG Interim Director). However, PEIR mitigations do include habitat replacement, such as those under the Habitat Reserve Program. While long-term monitoring of the fate of relocated burrowing owls is an excellent conservation practice, it is not required under CEQA for owls or any other species.

San Joaquin kit fox. The commenter states that there should be no destruction of potential San Joaquin kit fox dens in the Sunol Valley. Potentially suitable dens (excavations with a minimum 4-inch aperture) are plentiful due to the presence of resident California ground squirrels and other fossorial (digging) animals; the availability of dens is not a limiting factor for kit fox. By contrast, active dens with known kit fox use are protected as endangered species habitat. Please refer to Mitigation Measure M.2 (Vol. 4, Chapter 6, Table 6.2, p. 6-19 and 6-20) for standard programmatic measures for the protection of San Joaquin kit fox and its habitat.

Mitigation ratios. This comment stating that mitigation ratios for impacts on wetlands and critical habitat for a listed species should be higher than 1:1 is acknowledged. The actual mitigation ratios for wetlands, sensitive habitats, key special-status species, and other species of concern affected by the individual WSIP projects will be developed at the project level when the extent, location, and quality of affected habitat are known. Mitigation Measure 4.6-1b states that, "SFPUC will develop and implement compensation plans that meet the appropriate regulatory requirements and permit conditions with respect to compensation ratios…." (Vol. 4, Chapter 6, p. 6-11).

In response to this comment, the Draft PEIR (Vol. 4, Chapter 6, p. 6-11, third paragraph) is revised as follows:

> For each WSIP project, a qualified biologist will quantify the magnitude and extent of impacts to wetlands, sensitive habitats, and key special-status species and other species of concern, and the SFPUC will develop and implement restoration and/or compensation plans that meet the appropriate regulatory requirements and permit conditions with respect to restoration and/or compensation ratios. Compensation ratios typically range from a minimum of 1:1 for common habitats to 2:1 or higher for rare and sensitive habitats. If individual project requirements of the RWQCB, CDFG, or USFWS differ somewhat from these ratios, they are still intended to achieve the same purpose of full restoration and/or compensation, ~~other conservation measures and management requirements~~ to mitigate project impacts to less-than-significant levels, and to ensure no net reduction in the populations of any species listed as threatened or endangered by the state or federal resource agencies.

SI_ACA1-22 This comment refers to and consists of comments from the Alameda Creek Alliance letter to the San Francisco Planning Department (dated August 28, 2007), which provides scoping comments on the Habitat Reserve Program. As described in the Draft PEIR (Vol. 1, Chapter 3, pp. 3-84 and Vol. 4, Chapter 6, p. 6-11), the Habitat Reserve Program is being designed as a comprehensive, coordinated approach to implementing mitigation measures for impacts on biological resources and related regulatory compliance for the WSIP projects. In most cases, the Habitat Reserve Program would augment the project-specific mitigation measures, focusing on habitat compensation requirements. However, it should be noted that the Habitat Reserve Program is presented as one alternative for implementing offsite habitat compensation. Please refer also to **Response L_EBRPD-16** regarding the Habitat Reserve Program.

SI_ACA1-23 This comment refers to and consists of comments from the CDFG letter to the San Francisco Planning Department (dated November 22, 2005) responding to the NOP on the Calaveras Dam Replacement project (SV-2).

As stated in **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2), the PEIR provides a foundation for any necessary future environmental review documents that focus on individual WSIP projects and presents a general, program-level analysis of the types of impacts that could occur under the individual WSIP facility improvement projects (see Vol. 2, Chapter 4). Thus, the requested site-specific analysis of construction and operation of the Calaveras Dam Replacement project (SV-2) is more appropriately addressed in the CEQA document for that project.

However, the PEIR does provide a project-level analysis of impacts related to the WSIP water supply and system operations, relevant in part to the operational component of the Calaveras Dam Replacement project (SV-2). The issues listed in this comment regarding the WSIP water supply and system operations include: flow issues related to steelhead (see Vol. 7, Chapter 14, **Section 14.9, Master Response on Alameda Creek Fishery Issues**); minimum bypass flows for fisheries at Calaveras Dam and ACDD (see Vol. 3, Chapter 5, Section 5.4.5); and impacts on fisheries upstream and downstream of San Antonio Reservoir (see Vol. 3, Chapter 5, Impacts 5.4.5-4 and 5.4.5-5, p. 5.4.5-21). The remaining issues listed in this comment are more appropriately addressed in the EIR for the Calaveras Dam Replacement project, especially in light of the fact that the intent of the CDFG letter was to provide guidance in the development of the scope of that EIR.

SI_ACA1-24 Please refer to **Response SI_ACA1-22**, above.

SI_ACA1-25 Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.4).

SI_ACA1-26 The SFPUC wholesale customers are represented by the Bay Area Water Supply and Conservation Agency (BAWSCA), which was created by the California legislature in 2002 with adoption of Assembly Bill 2058; BAWSCA, which was formerly known as the Bay Area Water Users Association (BAWUA), was founded in 1958 to oversee administration of the Master Water Sales Agreement. As part of the WSIP planning process, the SFPUC, in cooperation with its wholesale customers and BAWSCA, undertook a study to assess the potential for additional conservation and recycled water projects, including potential regional projects that were not identified in the previous studies and already considered to be implemented locally by 2030. The study considered projects that would be feasible if implemented regionally, including projects that may have been found to be infeasible for individual customers. This study, the *Investigation of Regional Water Supply Option No. 4 Technical Memorandum* (URS, 2006), provided the basis for the Aggressive Conservation/Water Recycling and Local Groundwater Alternative discussed in Draft PEIR Chapter 9 (Vol. 4, pp. 9-47 to 9-59). As indicated on p. 9-49, this alternative could meet about 75 percent of the additional projected 2030 average annual water supply need; however, at least 6 mgd of the 2030 purchase requests would be unmet.

Regarding the statement that the Draft PEIR underestimates the potential for water conservation and recycling, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3). Regarding the comparison of SFPUC service area conservation to that in other metropolitan areas, refer to Section 14.2.3 under the heading Frequently Submitted Comments Addressing Conservation and Recycling. The commenter's opinion that recycled water use in the SFPUC service area is comparatively low is acknowledged.

Draft PEIR Table 3.3 (Vol. 1, Chapter 3, p. 3-18) and Table 7.2 (Vol. 4, Chapter 7, p. 7-15) show the estimated levels of water conservation and recycling assumed in the purchase estimates submitted by each water customer. The averages of the estimated ranges of conservation (13 to 19 mgd) and recycling (9 to 14 mgd) represent about 4 percent and 3 percent, respectively, of the total 2030 demand (417 mgd) for the service area, as this comment states. The commenter's opinion that these levels are unreasonably low is acknowledged. Note, however, that a comparison of per-capita water consumption in each hydrologic region of the state, as shown in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3), indicates that per-capita consumption in the Bay Area is low compared to other parts of the state.

The commenter's opinion that there is a discrepancy between the conservation and recycling goals set by the SFPUC and those of its wholesale customers is acknowledged. This comment refers to BAWSCA's 2000 Water Supply Master Plan; this document was primarily authored by SFPUC, in conjunction with BAWSCA. The requirement in the master plan (according to this comment) that wholesale customers employ their best efforts to use all sources of water owned or controlled by them, including groundwater, is consistent with the Master Water Sales Agreement requirements discussed in the Draft PEIR (Vol. 1, Chapter 2, p. 2-44 and Vol. 4, Chapter 7, p. 7-13). Tables 14.2-6 and 14.2-7 in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) show the conservation measures currently being implemented or planned for implementation under the WSIP by each wholesale customer and by the SFPUC for the retail service area.

The commenter incorrectly states that the Draft PEIR does not adequately analyze alternatives that include the potential for conservation, recycling, and groundwater by the wholesale customers. The Draft PEIR included multiple alternatives involving higher levels of conservation and recycling than were proposed under the WSIP, including the Aggressive Conservation/Water Recycling and Local Groundwater Alternative and the Modified WSIP Alternative, which are fully analyzed in the Draft PEIR (Vol. 4, Chapter 9, pp. 9-47 to 9-59 and pp. 9-78 to 9-84, respectively). Also refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3, under the heading Additional Conservation and Water Recycling Potential), **Section 14.10, Master Response on Modified WSIP Alternative**, and **Section 13.4, Phased WSIP Variant,** for more detailed discussion and analysis of additional conservation, water recycling, and groundwater projects in the wholesale customer service area.

Alameda Creek Alliance, Jeff Miller, Director, 09/18/07

[See Public Hearing Transcript, Fremont, pp. 17–20]

SI_ACA2-01 Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.4).

The commenter is correct in noting that compliance with the law is not necessarily the same as mitigation for impacts under CEQA. As discussed in the Draft PEIR (Vol. 2, Chapter 4, pp. 4.1-6 and 4.1-7), there are some cases where compliance with regulations could avoid or minimize a significant impact; in other cases, there may be no applicable regulations or the regulations by themselves would not be sufficient to avoid or minimize a significant impact. In the latter case, the PEIR identifies whether feasible measures are available that could reduce significant impacts to a less-than-significant level.

The SFPUC is currently operating the Alameda Creek Diversion Dam in compliance with all applicable regulations and would continue to do so under the WSIP. The commenter's statement that this organization is calling on the SFPUC to remove the diversion dam is noted.

The Draft PEIR identifies programmatic impacts and mitigation related to construction and operation of the Calaveras Dam Replacement (SV-2) and Alameda Fishery Enhancement (SV-1) projects in Vol. 2, Chapter 4. Impacts of the proposed WSIP water supply and system operations as they relate to these two WSIP projects are analyzed in Vol. 3, Chapter 5, Section 5.4.

SI_ACA2-02 This comment expressing support for conservation, water recycling, and efficiency and opposition to additional diversions from Alameda Creek or the Tuolumne River is acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects proposed by the SFPUC and its wholesale customers.

Acterra Action for a Sustainable Earth, David T. Smernoff, Ph.D., Board Vice-President, 09/28/07

SI_ACT-01 This comment expresses support for the seismic improvements proposed under the WSIP, but states that the commenter found the PEIR to be flawed. This is an opening statement, and the specific comments follow in Comments SI_ACT-02 through SI_ACT-05; please refer to **Responses SI_ACT-02** through **SI_ACT-05** for the specific responses.

SI_ACT-02 This comment advocates for a two-tiered approach that separates the proposed seismic improvements from the proposed changes in water supply (i.e. additional Tuolumne River diversions). Comment acknowledged. Please refer to the discussion in **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.5) for more information on this topic.

Refer to **Response L_Tuol1-09** regarding the applicability of the federal Wild and Scenic Rivers Act to the Tuolumne River and the overall consistency of the WSIP with the act.

The opinion stating that public policy decisions should be based on the merits of the proposal is acknowledged. Extensive public comments, including several comment sets from the Bay Area Water Supply and Conservation Agency, were received on the Draft PEIR; these comments, representing a wide range of opinions, are reproduced in Volume 6 of the PEIR, and responses to all comments received on the Draft PEIR are included in Volume 7 of the PEIR.

SI_ACT-03 This comment, which expresses support for alternatives identified in the Draft PEIR that protect the Tuolumne River from new diversions, is acknowledged. The comment stating that additional water conservation, efficiency, and recycling is the best way to lessen impacts on the Tuolumne River is also acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to demand projections and to conservation programs and recycling projects proposed by the SFPUC and its wholesale customers.

SI_ACT-04 This comment asserting that the demand projections are flawed is addressed in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2). The impacts of water diversions on the Tuolumne River are addressed in the Draft PEIR (Vol. 3, Chapter 5, Section 5.3).

The Draft PEIR provides a discussion of impacts related to climate change on the Tuolumne River watershed (Vol. 3, Chapter 5, pp 5.7-92 to 5.7-96). Please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14) for additional discussion of this issue. Section 14.11 provides detailed and up-to-date information on climate change as it relates to the SFPUC regional water supply and the proposed WSIP. The discussion includes a qualitative assessment of WSIP impacts with consideration of climate change effects and corroborates the conclusion that the Draft PEIR provides a reasonable assessment of environmental effects that accounts for potential climate change effects through the SFPUC planning horizon of 2030.

SI_ACT-05 The SFPUC conducted thorough studies of water demand before estimating the total water demand (purchase request) that the regional water system must satisfy in 2030 (Vol. 1, Chapter 3, pp. 3-16 to 3-22). The estimate of SFPUC system demand assumed continued implementation of current water conservation programs as well as the implementation of a number of local water recycling projects and additional conservation programs. The 2030 SFPUC system purchase request was estimated to be 300 million gallons per day (mgd). Under the WSIP, about 8 mgd of the estimated 2030 SFPUC system demand would be satisfied through additional conservation and recycled water programs in San Francisco (that is, in addition to those already accounted for prior to estimating the 300 mgd purchase request). Another 2 mgd would be satisfied through the development of groundwater resources on the San Francisco Peninsula. For more information on this topic, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14).

The effects of climate change are described in the Draft EIR (Vol. 3, Chapter 5, Section 5.7.6). For more information on this topic, please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14).

SI_ACT-06 This comment, which encourages the SFPUC to drop Tuolumne River diversions from the seismic upgrade projects and to revisit water demand issues at a later date, is acknowledged. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.5) for relevant response related to the integration of the seismic improvements and water supply option to meet program objectives. Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2) for a detailed discussion of the demand projections.

Citizens Advisory Committee to PUC, Steve Lawrence, Vice Chair, 08/17/07

SI_CAC1-01 The commenter states that the project schedule included in Figure 3.6 of the Draft PEIR (Vol. 1, Chapter 3, p. 3-62) is out of date, is "fanciful," and does not accurately list the WSIP projects. As discussed in the Draft PEIR (Vol. 2, Chapter 3, p. 3-2 and pp. 3-23 to 3-25), the SFPUC classifies as part of the WSIP all capital improvements and projects that received financing from the 2002 voter-approved bond measure, which fall into six categories: key regional projects, regional projects, local projects, WSIP-related activities, regional recycled water projects, and Bay Division Pipeline No. 4 condition assessment. The Draft PEIR analyzes only the *key regional WSIP projects* (in addition to the WSIP water supply and system operations) as the proposed program for CEQA purposes (see Vol. 1, Chapter 3, pp. 3-23 to 3-25). Other WSIP-funded activities in the remaining five categories that are not evaluated as part of the proposed program are undergoing CEQA review independent of the PEIR and are therefore not included in Figure 3.6.

Figure 3.6 shows the preliminary construction schedule for each of the key regional WSIP projects described in Section 3.4.6 of the Draft PEIR. This schedule was provided by the SFPUC at the time of Draft PEIR preparation and was based on the priority of the project in terms of vulnerability to seismic damage, importance to system operations, system operational requirements, and projected funding. Figure 3.6 is presented in the Draft PEIR to provide general information on the construction timeframe of each project as well as to demonstrate which projects' construction schedules might have a potential to overlap, which could exacerbate environmental effects due to construction activities. The collective effects of the WSIP projects analyzed in the Draft PEIR are addressed in Vol. 3, Chapter 4, Section 4.16. The cumulative effects of these WSIP projects, other SFPUC projects (including other WSIP projects deemed to have independent utility), and projects of other jurisdictions are addressed in Section 4.17 of the Draft PEIR.

As discussed in the Draft PEIR (Vol. 1, Chapter 3, p. 3-61), the preliminary schedule is subject to further refinement during the ongoing planning and development of each project. The project-level CEQA documentation prepared for each WSIP project will address changes in the schedule and will include an appropriate analysis of potential cumulative impacts based on the updated schedule.

SI_CAC1-02 The Draft PEIR (Vol. 3, Chapter 8, Section 8.3) analyzes a variant to the WSIP that would provide supplemental dry-year water through the Bay Area Regional Desalination Project (BARDP). As indicated in the Draft PEIR (pp. 8-18 to

8-21), a pre-feasibility study has been completed for the BARDP, and the commenter is referred to the references cited in the Draft PEIR for the assumptions used in developing this project (URS Corporation, *Bay Area Regional Desalination Project Pre-feasibility Final Report*, 2003). The Draft PEIR analysis was based on this preliminary information and, as the PEIR states, is a conceptual-level, generalized impact analysis that is intended to provide sufficient information to allow decision-makers to consider this variant to the WSIP, not to provide a site-specific environmental analysis. The level of detail of information requested by the commenter is not required for the purposes of this impact analysis in the PEIR.

SI_CAC1-03 As indicated by the commenter, refer to **Response SI_CAC2-04**.

SI_CAC1-04 The specific emergencies identified in this comment (e.g., epidemics) were not a factor in WSIP planning efforts, although water supply planning includes a margin of safety to address atypical conditions such as epidemics.

SI_CAC1-05 Cost estimates for the Lower Tuolumne River Alternative are included in the Water Supply Options Report (SFPUC 2007). The alternative would require the construction of several new facilities that are not included in the WSIP, as described in the Draft PEIR (Vol. 4, Chapter 9, p. 9-60). The major new facilities would include an intake and pumping plant on the lower Tuolumne River, a 15-mile-long, 48-inch-diameter pipeline from the intake to near Tesla Portal, a 55-million-gallon-per-day water treatment plant, and a pumping plant to convey treated water to Tesla Portal. The capital cost of the new facilities, not including lifecycle costs, could be upwards of $354 million; this cost estimate, provided in response to this comment, is not relevant under CEQA, which requires only consideration of the comparative environmental impacts of alternatives.

The elevation of the intake on the Tuolumne River would depend on the exact site chosen. The elevation of the land surface in the vicinity of the confluence of the Tuolumne River and the San Joaquin River is about 30 feet above sea level. Ideally, the intake would take the form of an infiltration gallery under the bed of the Tuolumne River. The San Joaquin River at its confluence with the Tuolumne River is not tidal, and saltwater from the Delta does not penetrate this far upstream.

Large-scale flooding in the Delta could occur if a major earthquake caused many of the levees to fail. However, it is expected that if this alternative is selected for further consideration and design, the intake and other facilities needed for the Lower Tuolumne River Alternative would be designed to comply with applicable standards for water supply facilities, including provisions for adequate flood protection. As described in the Draft PEIR (Vol. 4, Chapter 9, p. 9-65), this alternative would result in increased annual energy demand compared to the proposed program, which in turn could result in secondary impacts from air pollution and greenhouse gas emissions, depending on the source of power.

SI_CAC1-06 The Draft PEIR presents the information in a way intended to be both comprehensive and understandable to decision-makers, regulatory and local agencies, and the public. The authors acknowledge that some of the topics covered in the Draft PEIR are technical, but a discussion of these topics is important for full disclosure of the changes proposed under the WSIP and its potential environmental impacts. A glossary of technical terms is included in Volume 1 to assist the reader in understanding the document. Further, the San Francisco Planning Department scheduled a 108-day public review period, rather than the 45-day public review period required under CEQA, to allow additional time for agencies and the public to review and evaluate the adequacy and accuracy of the Draft PEIR.

Citizens Advisory Committee to PUC, Steve Lawrence, Vice Chair, 10/15/07

SI_CAC2-01 The opinions of the commenter regarding the merits of the proposed dry-year water transfer are noted. Please refer to **Section 14.3, Master Response on Proposed Dry-Year Water Transfer** (Vol. 7, Chapter 14, Section 14.3.2) for further discussion of this component of the proposed program. Under CEQA, the purpose of the PEIR is to disclose the environmental effects of the proposed program to decision-makers, not to determine or judge its merits.

SI_CAC2-02 The commenter is correct in noting that the regional water system is highly dependent on storage, since the majority of the water for the regional system is located about 150 miles from customers, and nearly all precipitation occurs in the winter months. Background studies conducted for the WSIP determined that the proposed seismic, delivery, and water reliability levels of service could be achieved by restoring the historical capacities of Calaveras and Crystal Springs Reservoirs (Vol. 1, Chapter 3, pp. 3-25 to 3-39). Information regarding storage capacities of the major facilities in the existing system is presented in Table 2.2 (Vol. 1, Chapter 2, p. 2-6), which shows both the existing (restricted) capacities of the Calaveras and Crystal Springs Reservoirs and the historical capacities. The reasons for rejecting an enlarged Calaveras Reservoir include uncertainties regarding water rights and environmental permits (see Draft PEIR Vol. 4, Chapter 9, pp. 9-118 and 9-119).

SI_CAC2-03 This comment addresses future conservation in San Francisco. Under the proposed WSIP, up to 4 million gallons per day (mgd) of conservation savings[1] would offset total demand in the retail service area (including San Francisco), as shown in Draft PEIR Table 3.3 (Vol. 1, Chapter 3, p. 3-18). The conservation measures included in Packages A, B, and C for the retail customer service area are shown in Table 19, Selection of Conservation Measures by Package, which is included as an attachment at the end of Draft PEIR Appendix E.2 (Vol. 5): Tables 14.2-7 and 14.2-8 of **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) identify current and proposed conservation measures for the retail service area. As the discussion in this master response indicates, Package C is not the same as the “Aggressive Conservation” referred to in the Aggressive Conservation/Water Recycling and Local Groundwater Alternative evaluated in the Draft PEIR

[1] This is part of the 10 mgd from conservation, recycled water, and groundwater projects planned to offset retail service area demand under the WSIP.

(Vol. 4, Chapter 9, pp. 9-47 to 9-59). Rather, Package C was one of three suites of measures[2] considered for implementation by the individual water customers.

As described in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14), the SFPUC also conducted a study to identify additional water conservation, recycling, and groundwater projects that could be feasible if implemented regionally, including some projects that were determined to be infeasible when considered by the individual water customers. This study provided the basis for the Aggressive Conservation/Water Recycling and Local Groundwater Alternative. The additional projects considered in this alternative are shown in Table 9.11 (Vol. 4, Chapter 9, pp. 9-50 and 9-51).

Under the Modified WSIP Alternative (Vol. 4, Chapter 9, pp. 9-78 to 9-84), the SFPUC would institute a program to work with the wholesale customers to develop an additional supply contribution of approximately 5 to 10 mgd from conservation, recycled water, and local groundwater projects in the wholesale service area, as identified in Table 9.11. This additional amount of water from conservation, recycled water, and groundwater projects is in addition to the amount from conservation, recycled water, and groundwater projects accounted for in the 2030 purchase request assumed under the WSIP. Because the specific projects have not been identified, the Modified WSIP Alternative provides a reasonable range of supply contribution that could feasibly be implemented. Please refer to **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14, Section 14.10.3) for further discussion.

SI_CAC2-04 The comment is correct in noting that the Draft PEIR analysis of impacts related to the WSIP water supply and system operations (Vol. 3, Chapter 5) is based on the 82-year period of hydrologic record, from 1920 to 2002. The Draft PEIR (Vol. 3, Chapter 5, Section 5.7.6) discusses the general types of climate change impacts that could affect water resources in California and presents the SFPUC's initial modeling of climate change effects on the regional system. Please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14) for additional discussion of climate change effects on the regional system and how the analysis presented in the Draft PEIR remains valid when climate change effects are considered.

Table 9.5 in the Draft PEIR (Vol. 4, Chapter 9, p. 9-13) presents the anticipated frequency of rationing under the WSIP and the alternatives based on the 82-year hydrologic record. The commenter correctly states that rationing would be required about 10 percent of the time, corroborating the information shown in the

[2] These suites of conservation measures are referred to as Packages A, B, and C in the retail customer service area conservation potential study and as Programs A, B, and C in the wholesale customer service area study.

table—that under the WSIP, rationing would be required in 8 out of 82 years (6 years at 10 percent rationing and 2 years at 20 percent).

As indicated by the commenter, the proposed dry-year supplies would be required under the WSIP in 24 out of the 82-year hydrological record (about 29 percent of the time). Please refer to **Section 14.3, Master Response on Proposed Dry-Year Water Transfer** (Vol. 7, Chapter 14, Section 14.3.2) for information on how and when the SFPUC would obtain water from the Turlock and Modesto Irrigation Districts (TID and MID).

SI_CAC2-05 This comment presents a series of questions related to the recycled water component of the WSIP. As described in the Draft PEIR (Vol. 1, Chapter 3, p. 3-34), the proposed water supply option under the WSIP includes 10 mgd from a combination of conservation, recycled water, groundwater projects in San Francisco. The recycled water projects would be implemented through the WSIP facility improvement project, Recycled Water Projects (SF-3), and the preliminary project description for this project is presented in Table 3.10 (Vol. 1, Chapter 3, p. 3-56). However, since preparation of the Draft PEIR, the SFPUC has continued studies in support of planning and development of the Recycled Water Projects, and these studies have shown that the existing North San Mateo County Sanitation District recycled water treatment facility in Daly City has sufficient capacity to provide recycled water for irrigation of the Harding Park Golf Course. The necessary infrastructure to serve Daly City's recycled water to Harding Park under this project may be constructed and implemented in partnership between the SFPUC and Daly City. Although the Harding Park project is part of the Recycled Water Projects (SF-3), it will likely be implemented separately from SF-3; however, the amount of recycled water supplied to Harding Park would count towards the WSIP's goal to obtain 10 mgd from conservation, recycled water, and groundwater projects in San Francisco. The preliminary WSIP project descriptions provided in the PEIR will be updated and refined as part of the project-level environmental analyses, as described in **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2). Thus, additional details regarding the Recycled Water Projects are currently under development.

And, as noted in the Draft PEIR (Vol. 1, Chapter 3, p. 3-25), in addition to the recycled water projects under SF-3, the SFPUC expects to consider and develop recycled water projects that would be located outside of San Francisco in coordination with other jurisdictions.

SI_CAC2-06 Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

SI_CAC2-07 The Draft PEIR (Vol. 3, Chapter 8, Section 8.3) analyzes a variant to the WSIP that would provide supplemental dry-year water through the Bay Area Regional Desalination Project (BARDP). As indicated in the Draft PEIR (pp. 8-18 to 8-21), a pre-feasibility study has been completed for the BARDP, and the commenter is referred to the references cited in the Draft PEIR for the assumptions used in developing this project (URS Corporation, *Bay Area Regional Desalination Project Pre-feasibility Final Report*, 2003). Please also refer to **Response SI_CAC1-02**.

SI_CAC2-08 Table 9.5 of the Draft PEIR (Vol. 4, Chapter 9, p. 9-13) shows the SFPUC's estimated average annual Tuolumne River diversions, as determined by modeling results using the Hetch Hetchy/Local Simulation Model, which is based on the 82-year period of hydrologic record from 1920 to 2002. Under the proposed program, the SFPUC's average annual diversions would be 245 mgd. This volume of water is within the City and County of San Francisco's (CCSF) existing water rights and entitlements as provided for under the Raker Act (see Vol. 1, Chapter 2, pp. 2-36 and 2-37); in most years (nondrought), no compensation is required to TID and MID for this volume of water, other than the SFPUC's recognition and assurance of the senior water rights of these two districts. However, as described in the Draft PEIR (Vol. 1, Chapter 2, pp. 2-37 to 2-39 and 2-42), the CCSF has entered into several agreements with TID and MID that allow for bypass flows for downstream uses and may include appropriate compensation to the districts. Please also refer to **Section 14.3, Master Response of Proposed Dry-Year Water Transfer** (Vol. 7, Chapter 14, Section 14.3.2) for additional information.

California Trout, Brian Stranko, Chief Executive Officer, 09/28/07

SI_Caltrout-01 This comment expresses opposition to additional Tuolumne River diversions and requests that additional studies be conducted before the PEIR is finalized. As described in the Draft PEIR (Vol. 3, Chapter 5, pp. 5.1-7 to 5.1-18), the basic approach to the analysis of impacts on water and related resources was to first evaluate the changes in the river flow and reservoir levels that would occur with the WSIP, then to estimate changes in water quality and temperature, and finally to combine this information to determine potential impacts on fisheries and other biological resources. The analysis used the existing 82-year historical hydrologic record, coupled with the Hetch Hetchy/Local Simulation Model (HH/LSM), to depict the overall regional water system operations and to project the extent of changes in flow that could occur in the future. These results were used for the PEIR water supply and system operations impact analysis.

As described in **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.4), the CEQA Guidelines (Section 15151) impose a standard of adequacy that is "reasonably feasible" and sufficient to allow decision-makers to make a decision that takes account of environmental consequences. Data gathering need not be "exhaustive." The Draft PEIR analysis of the WSIP water supply and system operations with respect to fisheries and biological resources along the Tuolumne River was based on current knowledge of the composition and condition of the resources and in consideration of the potential interactive responses of plant and animal species to the hydrologic changes resulting from the WSIP as indicated by the model results. The analysis relied on ecological principles, scientific literature, existing data, and site visits. The Draft PEIR analysis was conservative in finding that an impact could be potentially significant if there was a possibility of impacts from the WSIP water supply and system operations.

The San Francisco Planning Department believes these data are sufficient to reasonably assess the general magnitude, frequency, and extent of the WSIP's environmental consequences, and to identify appropriate mitigation measures to offset potentially significant impacts on the Tuolumne River watershed and related resources. The mitigation measures were developed to include performance standards based on ecological principles, with the understanding that data from ongoing and future studies could be useful in augmenting the baseline data and in refining the implementation of each measure. As described in Draft PEIR Measure 5.3.7-2 (Vol. 4, Chapter 6, pp. 6-49 and 6-50), **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.2), and **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.2), several studies of the Tuolumne River are in progress by the SFPUC, National Park Service, USFWS, NMFS, CDFG, and other agencies. Data from these studies would be used to augment the existing data and allow for refinement of the implementation of the mitigation measure to meet the performance standards.

SI_Caltrout-02 This comment, which expresses support for alternatives identified in the Draft PEIR that protect the Tuolumne River from new diversions, and for additional water conservation, efficiency, and recycling, is acknowledged. Please see **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14), for additional information related to demand projections as well as conservation programs and recycling programs proposed by the SFPUC and its wholesale customers.

Republicans for Environmental Protection, Protection Commissioner, California Commission for Economic Development, Buddy Burke, CA REP President, and Virginia Chang Kiraly, CA REP Vice President, 10/14/07

SI_CAREP-01 This comment, which requests that additional studies of the Tuolumne River be conducted before the PEIR is finalized, is acknowledged. Please refer to **Response SI_Caltrout-01** for a response to this comment. Also refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

SI_CAREP-02 The commenter expresses concern that flow reductions would degrade the Tuolumne River's "world-class recreation opportunities," which would also reduce visitors and tourism to Yosemite National Park and the surrounding region.

Section 5.3.8.1 of the Draft PEIR (Vol. 3, Chapter 5) describes current water and off-water recreational visitor use of the upper Tuolumne River corridor and evaluates the region's recreational resources. A particularly extensive analysis of whitewater recreation was performed to assess both the current use levels and the potential for WSIP-related changes to reduce future recreational use. The analysis of the timing and magnitude of the WSIP-related changes in water releases within the upper Tuolumne River concluded that effects on recreation would be less than significant, predominantly because shifts in water releases would reduce upper Tuolumne flows during the river's high-flow months (April through June) or during the low recreation season (November to March), which would not significantly impair use of the river for whitewater rafters or other recreationists. In addition, during the peak visitor months of July and August, SFPUC releases for whitewater rafting would continue to be provided when operationally practical. Furthermore, the flow reductions would only occur during drier-than-normal hydrologic years and would be relatively limited (i.e., 3 percent or less reductions in average monthly flows); such a reduction in flows would be imperceptible to most recreationists.

SI_CAREP-03 This comment expresses concern that the proposed WSIP water supply would delay implementation of the seismic facility improvements, increase water rates, and result in burdensome costs to business, which in turn would have a trickle-down effect with transaction costs being passed to consumers and taxpayers. Comment acknowledged. The commenter urges the SFPUC to be mindful of these fiscal impacts by not moving forward to divert water from the Tuolumne

River. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.5) for a discussion of this topic.

SI_CAREP-04 The commenter’s support for water conservation, efficiency, and recycling measures and for alternatives that would eliminate increased diversions from the Tuolumne River is acknowledged. The commenter’s suggestion that the SFPUC undertake additional studies is also acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for a discussion of this topic.

Commonwealth Institute, Katherine Forrest, Member, 09/19/07

[See Public Hearing Transcript, Palo Alto, pp. 38–39]

SI_CI-01 This comment, which expresses an opinion on the role that state and local governments could play in providing incentives for water conservation and penalties for excessive use (such as permitting gray water systems for individual homes and limiting large irrigation systems), is acknowledged. Note that the California Department of Water Resources, Office of Water Use Efficiency and Transfers, is in the process of updating the existing Model Water Efficient Landscape Ordinance. The update must be completed by January 1, 2009, and local agencies must adopt the model ordinance, or one that is at least as effective as the updated model ordinance, by January 1, 2010.

The Draft PEIR describes local groundwater projects, recycled water projects, and additional conservation measures that would be implemented under the WSIP as part of the nondrought water supply (Vol. 1, Chapter 3, p. 3-34). Table 9.11 of the Draft PEIR (Vol. 4, Chapter 9, p. 9-50) identified additional conservation, recycled water, and groundwater projects that could be implemented by the wholesale customers to reduce demand and supplement supplies to meet future delivery requests, assuming the projects are feasible and implementable (refer to Vol. 7, Chapter 13, Section 13.4 for further discussion of the information presented in Table 9.11). For additional information regarding existing and proposed conservation measures by the SFPUC wholesale and retail customers, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3).

California Native Plant Society, Amanda Jorgenson, Executive Director, 09/25/07

SI_CNPS-01 This comment, which opposes additional Tuolumne River diversions and encourages additional efforts to conserve the equivalent of the projected customer purchase requests through 2030, is acknowledged. See **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3), for additional information regarding the conservation and recycling programs proposed by the SFPUC and its wholesale customers. Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9), for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions. Also note that the projected increase in average annual purchase requests is 35 mgd, not 38 mgd. Please refer also to **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14, Section 14.8.2), for relevant response regarding the WSIP's impacts on the San Joaquin River and Delta.

California Native Plant Society, East Bay Chapter, Laura Baker, Conservation Committee Chair, 10/01/07

SI_CNPS-EB1-01 Comment noted regarding potential impacts on native flora in the East Bay.

SI_CNPS-EB1-02 This comment expressing support for the WSIP goals and objectives is acknowledged.

SI_CNPS-EB1-03 This comment expresses the opinion that the WSIP overestimates the need for additional water supplies from rivers and creeks and underestimates the capacity of the SFPUC and its customers to conserve water. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Sections 14.2.2 and 14.2.3) for additional information related to demand projections as well as conservation programs and recycling projects proposed by the SFPUC and its wholesale customers.

SI_CNPS-EB1-04 Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3, under the heading Frequently Submitted Comments Addressing Conservation and Recycling) regarding the Pacific Institute's comparisons of SFPUC conservation efforts to those of other water districts referenced in this comment. The information regarding the Helix Water District provided in this comment is acknowledged. In the SFPUC service area, population and employment are projected to increase (refer to Table 7.4 in Vol. 4, Chapter 7, p. 7-21) while per-capita demand is projected to decrease (refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling**, Section 14.2.2, under the heading Per-Capita Demand). The basis for the statement that "retail customers in San Francisco show a decline in demand of 4.7 mgd" is unclear. As shown in Table 7.3 (Vol. 4, Chapter 7, p. 7-18), demand in the retail service area is projected to decline by 0.2 mgd in 2030 (despite increases in population and employment). Refer to **Section 14.2** (Vol. 7, Chapter 14, Section 14.2.3) for detailed information on existing and proposed conservation by the wholesale and retail customers; Tables 14.2-7 and 14.2-8 in the master response show the California Urban Water Conservation Council's best management practices that the retail and wholesale customers are implementing or have committed to implement.

SI_CNPS-EB1-05 The comment expresses the general opinion that certain methodologies and models used in the Draft PEIR were either flawed or the wrong tool. For each environmental issue, the PEIR includes a section entitled "Approach to Analysis" to describe and explain the methodologies and models used to assess and identify potential impacts. The methodologies and models used in the Draft PEIR are standard, professionally accepted approaches employed in the respective fields of study, with the exception of the water resources model—the Hetch Hetchy/Local Simulation Model (HH/LSM)—which is unique to the regional system and is the best available tool (see Vol. 3, Chapter 5, pp. 5.1-9 to 5.1-17). Refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14) for additional information on the model itself and the appropriateness of its use for the PEIR. This comment summarizes the specific comments that follow in Comments SI_CNPS-EB1-06 through SI_CNPS-EB1-10; refer to **Responses SI_CNPS-EB1-06** through **SI_CNPS-EB1-10** for the specific responses.

SI_CNPS-EB1-06 Draft PEIR Impact 4.9-7 addresses the potential effects of the WSIP facility improvement projects with regard to greenhouse gas emissions (Vol. 2, Chapter 4, pp. 4.9-42 to 4.9-47). In addition, the Draft PEIR discusses the potential effects of climate change on water resources in Section 5.7.6 (Vol. 3, Chapter 5, pp. 5.7-92 to 5.7-96). Draft PEIR Table 5.7-21 (p. 5.7-93) describes the report by Maurice Roos cited by the commenter. The reference to the article on conservation and innovative approaches to efficiency is acknowledged.

Please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14) for additional discussion of climate change to augment the discussion presented in Section 5.7.6 of the Draft PEIR (Vol. 3, Chapter 5, pp. 5.7-92 to 5.7-96). Section 14.11 provides more detailed and up-to-date information on climate change as it relates to the SFPUC regional water supply and the proposed WSIP.

SI_CNPS-EB1-07 The commenter states that Figure 4.6-1a (Vol. 2, Chapter 4, pp. 4.6-3 to 4.6-5) is inadequate. In any CEQA analysis, a wide range of natural resource classification types is available to the analyst. Gap Analysis Project (GAP) mapping provides a good compromise between systems. The commenter observes that the GAP analysis is a "coarse filter" overview of the natural communities at this scale, but the text identifies a "fine filter" description of the presence of sensitive natural communities within the GAP analysis polygons potentially affected by WSIP operations. In addition, the sensitive natural communities identified in the California Natural Diversity Database are described for each region in Vol. 2, Chapter 4, pp. 4.6-9 and 4.6-17 for the program-level analysis; and in Vol. 3, Chapter 5, pp. 5.3.7-4 and 5.3.7-5, pp. 5.4.6-3 to 5.4.6-7, and pp. 5.5.6-3 and 5.5.6-4 for the project-level analysis of WSIP water operations.

SI_CNPS-EB1-08 With regard to the timescale used in the impact analyses, the hydrology section follows the CEQA-mandated requirement that impacts be analyzed relative to current prevailing conditions appropriate to the resource and the nature of the impact. The Draft PEIR (Vol. 3, Chapter 5, p. 5.4.6-14) acknowledges that the existing structure and composition of natural communities are products of conditions that prevailed for decades prior to the current hydrologic regime. For this reason, the Draft PEIR impact analysis of terrestrial biological resources includes a discussion of historical surface water flows where appropriate because of their role in shaping existing conditions, such as the structure and composition of riparian vegetation. This broader view of relevant timescales is the context for the conclusion reached in the Draft PEIR (Vol. 3, Chapter 5, p. 5.4.6-22). Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.4) for further discussion of the rationale for considering the effects of hydrologic flow regimes on riparian resources.

Although historical conditions are important for understanding ecological dynamics, analyses under CEQA must concentrate on changes relative to current conditions (see CEQA Guidelines Section 15125). Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.4) for additional details regarding this issue.

SI_CNPS-EB1-09 The Draft PEIR provides a project-level analysis of the potential environmental impacts of the proposed changes in water supply sources and system operations under the WSIP. The Draft PEIR presents a summary of the significant water supply and system operations impacts within the Alameda Creek watershed that would occur under each of the CEQA alternatives (see Vol. 4, Chapter 9, Table 9.8, pp. 9-18 and 9-19). As indicated in the table, impacts on fisheries in the Alameda Creek watershed would be similar to those under the proposed program for all of the CEQA alternatives except for the Modified WSIP Alternative, which would result in fewer impacts than the proposed program. With respect to riparian habitat, impacts under all of the CEQA alternatives would be the same as those under the proposed program.

The Draft PEIR provides a program-level evaluation of the potential environmental impacts of constructing and operating each of the regional WSIP facility improvement projects (Vol. 2, Chapter 4) and describes the key regional projects proposed under the WSIP (see Vol. 1, Chapter 3, Table 3.10, pp. 3-39 to 3-56). The more detailed information regarding project facilities, locations, and permits provided in Vol. 5, Appendix C is based on the best information available when the Draft PEIR was prepared, at which time the exact location and alignment of the facility improvements may not have been known. The project description information is presented at a level of detail appropriate to identify the overall magnitude of effects expected from WSIP implementation. Once additional project details and site-specific information are developed for the individual projects, the project-level environmental review will provide further evaluation of project-specific impacts. Refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2) for additional discussion regarding the level of detail at which the program-level impacts were evaluated for the individual WSIP facility improvement projects.

SI_CNPS-EB1-10 Comment noted. The preparers of the Draft PEIR concur with the commenter's observation about the benefits of coordination and of sharing biological information across various SFPUC activities and projects. The attached 2004 CNPS letter is not directed toward the proposed WSIP or PEIR, but its contents are noted.

SI_CNPS-EB1-11 Consistent with the CEQA definition of growth-inducement impacts and as discussed in the Draft PEIR (Vol. 4, Chapter 7, pp. 7-2 and 7-4), water supply projects are inherently growth inducing. The Draft PEIR compares the wholesale and retail customer-selected projections for 2030 with general plan projections because general plans present the level of growth adopted by the land use planning agencies in the areas receiving SFPUC water and, when considered in context with other local planning efforts (e.g., growth ordinances and amendments adopted subsequent to general plan approval), characterize potential buildout within these jurisdictions.

The commenter's statement that "…together the increase in purchase requests from these four cities [Hayward, Newark, Union City, and Fremont] accounts for a fifth of the total purchase estimates of the SFPUC's Wholesale Service Area" is correct if edited as follows:

> …together the ~~increase in~~ total 2030 purchase requests from these four cities account for a fifth of the total purchase estimates of the SFPUC's wholesale service area.

The last two sentences in this comment do not correctly interpret the approach and intent of the PEIR's growth-inducement analysis. While the analysis does compare wholesale and retail customer-selected projections for 2030 with general plan projections (as described in the first paragraph of this response), and with the Association of Bay Area Governments' projections, these comparisons did not involve a formal statistical analysis as may be implied by the term "goodness of fit," and the aim of the analysis was not "to rectify the overall purchase requests from each wholesale customer." The approach to the analysis of growth inducement and secondary effects of growth is summarized in the Draft PEIR (Vol. 4, Chapter 7, pp. 7-4 and 7-5) and presented in more detail in Section 7.3 (Vol. 4, Chapter 7, pp. 7-19 to 7-59).

SI_CNPS-EB1-12 None of the four cities discussed in this comment letter (Hayward, Newark, Union City, and Fremont) currently has a growth ordinance, as this comment suggests.[1] According to city planners who were contacted during preparation of the Draft PEIR (three of the four cities cited in this comment), policies in the respective general plans are intended, in part, to guide and manage growth (Slafter, 2005; Leonard, 2005; Rizk, 2005). This comment correctly states that Hayward has the largest increase in 2030 estimated purchases, in absolute terms. (It is surpassed in terms of percentage increase in purchases by two small water customers; refer to Draft PEIR Table 7.3 in Vol. 4, Chapter 7, p. 7-18.) The Draft PEIR (Vol. 4, Chapter 7, pp. 7-45 to 7-47) explains why the increase in water demand projected for Hayward is considerably greater than the projected growth in population and employment used in the demand model. Part of the increase in demand is associated with Hayward's expectation that new housing developed in the city will have comparatively larger lots than former development and will have more landscaping. (The City of Hayward has indicated that former development was poorly designed, without adequate open space and residential landscaping, and the City is encouraging renovation efforts that include landscaping assistances for homeowners and landscaping in common areas within neighborhoods to improve the overall appearance of the city and the quality of life of its residents.) Some of this new housing may be in hillside areas, as suggested by the commenter; however, the specific examples of recent and planned development provided by the City of Hayward (see the attachment following Comment L_Hayward-03) are multifamily, mixed-use, transit-oriented developments that are not in hillside areas. Other factors contributing to the projected increase in demand include renovation efforts for existing residential accounts (including landscaping in common areas), new industrial uses (Hayward expects to attract high-technology manufacturing industries that would have higher water usage than the current warehousing operations in the city), and an adjustment in unaccounted-for water. For additional information, please refer to Comment L_Hayward-03.

The comment's suggestions for the City of Hayward to reduce future demand (capping or limiting irrigation water use, imposing a strict tier system for water rates, requiring fire-safe landscaping) are acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for information on existing and planned conservation in Hayward (and other wholesale and retail customers). In Comment L_Hayward-03, the City states that it

[1] The comment states that none of the four cities has passed a growth ordinance. The City of Union City formerly had a growth management ordinance, which was revoked about 10 years ago (Leonard, 2005). Thus, none currently has a growth ordinance in place, as suggested by this comment.

envisions contemporary residential landscaping based on typically low-water-use plants and shrubs, consistent with its Water Efficient Landscaping Ordinance adopted 15 years ago, which will be updated in accordance with the provisions of Assembly Bill 1881.

SI_CNPS-EB1-13 This comment states that the Alameda County Water District (ACWD) is in a good position, with assistance from the SFPUC, to institute a coordinated plan for recycling water in the three cities it serves and thus to reduce its dependence on Delta water sources that may be uncertain in the future. As described in the Draft PEIR (Vol. 1, Chapter 3, p. 3-22 and Vol. 5, Appendix E.2, pp. E.2-16 and E.2-17), the SFPUC undertook technical studies to identify recycled water potential in the wholesale and retail service areas. The ACWD currently uses 3.5 mgd of recycled water (refer to Table E.2.5, p. E.2-17), although this recycled water is used for marsh restoration and does not replace potable supplies (RMC, 2004). The ACWD plans to use an additional 1.4 mgd of recycled water in the future (for two future golf courses and some existing end-users), which will offset potable supplies (refer to Table 3.3 or Table 7.2 [Vol. 1, Chapter 3, p. 3-18 or Vol. 4, Chapter 7, p. 7-15]). The SFPUC also undertook a regional study (SFPUC, 2007, Appendix D) to identify any additional recycled water and conservation projects that would be feasible if implemented regionally, including projects that may have been found to be infeasible for individual customers. The results of this study provided the basis for the Aggressive Conservation/Water Recycling and Local Groundwater Alternative (Vol. 4. Chapter 9, pp. 9-47 to 9-59). As indicated in Table 9.11 (p. 9-50), no additional potentially feasible recycled water projects were identified in the ACWD service area. (Approval of the WSIP would not preclude the ACWD from pursuing recycled water projects in the future; adoption of the Modified WSIP Alternative would establish and fund a program to provide 5 to 10 mgd from recycled water, conservation, and local groundwater projects within the regional wholesale service area.)

Refer also to Comment L_ACWD-01, in which the ACWD describes its water supply management strategies.

SI_CNPS-EB1-14 The illustration presented in this comment (of an apparent gap between the City of Fremont’s general plan and adoption of the Ahwahnee Principles for Resource-Efficient Communities on the one hand, and the City’s pursuit of a baseball stadium and development on lands designated and zoned as open space on the other), is acknowledged.

As noted in the Draft PEIR (Vol. 4, Chapter 7, p. 7-2), the SFPUC does not have authority to make land use decisions in its service area or to approve or disapprove development proposals; this is the responsibility of the cities and counties to which the SFPUC and its wholesale customers provide water. Although general plans may be amended and typically receive periodic updates to reflect new information and revised circumstances within the given jurisdiction, such changes involve a public process, including CEQA review, and are subject to approval by the local body responsible for making land use decisions. Substantial changes can occur to a project—either a development proposal or a general plan revision—from the initial proposal phase to the final project or plan that is approved or adopted, and proposed (unapproved) projects do not necessarily reflect the view of the decision-making body. Therefore, the Draft PEIR growth analysis appropriately references the adopted general plans for information on the *general* land use goals, plans, and policies of the jurisdictions in the service area, as well as the Association of Bay Area Governments' projections.

SI_CNPS-EB1-15 This comment states that it is impossible to assess the wholesale customers' individual commitment to water conservation without knowing the rationale for the particular composition of the programs (A, B, or C) or the specific reasons why certain customers chose to embrace or reject any of these programs. The Draft PEIR summarizes the process by which wholesale customers evaluated prospective conservation measures as follows (from Vol. 5, Appendix E.2, p. 12):

> The DSS end-use model was used to estimate water savings and evaluate the cost-effectiveness of implementing the 32 measures. Taking into account the cost-benefit analysis and estimated water savings for each measure, as well as service area water characteristics, retail customer behavior patterns, budgetary considerations, and relative ease of implementation, each wholesale customer compiled three packages of conservation measures, referred to as Programs A, B, and C. Water savings resulting from the natural replacement of fixtures under current plumbing codes was assumed to occur with or without any of the three programs. In general, Program A consists of measures that are currently being implemented; Program B consists of the measures in Program A plus additional measures that were considered to be the most readily implemented; and Program C includes the measures in Programs A and B plus all other measures that appeared to be both feasible and cost-effective to implement.

More information can be found in the *SFPUC Wholesale Customer Water Conservation Potential Technical Report* (URS, 2004b); Appendix D of that report (entitled SFPUC Wholesale Customer Conservation Information) presents the results of the conservation measure evaluation for each wholesale customer. Also refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3).

The commenter's opinion (that all Bay Area Water Supply and Conservation Agency members should be required to endorse the Ahwahnee Water Principles of 2005, and that the SFPUC is in a prime position to encourage a more systematic approach to conservation on the part of its customers) is acknowledged.

Note that the Modified WSIP Alternative (Vol. 4, Chapter 9, pp. 9-78 to 9-84) identifies several approaches to expanding conservation, water recycling, and groundwater projects that may not be cost-effective at the local level, but may be more economically viable if developed and funded as regional projects contributing to the overall regional water system. Refer to **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14, Section 14.10.3).

SI_CNPS-EB1-16 This comment contains several incorrect statements about the growth-inducement analysis presented in the Draft PEIR (Vol. 4, Chapter 7). The second sentence in the comment states that "…the PEIR uses locally derived information to buttress its position that the project itself is not growth inducing, that local governments are in good control of their own growth, and that they are appropriately mitigating for the impacts of development." Consistent with the CEQA definition of growth inducement, and as stated in the Draft PEIR (Vol. 4, Chapter 7, pp. 7-2 and 7-4 et seq.), the WSIP and other water supply projects that remove a potential obstacle to growth (lack of a reliable water supply) *are inherently growth inducing*. Regarding local government control of growth, cities and counties have the authority and obligation to conditionally approve or deny development proposals in a manner consistent with their general plans. Pursuant to CEQA Guidelines Section 15126.2(d), the Draft PEIR does not assume that growth is beneficial or detrimental (p. 7-2), but instead focuses on the secondary effects of growth.

The Draft PEIR uses "locally derived information" (180 general plans, general plan revisions, general plan amendments, specific plans, precise plans, updated land use and housing elements, and related CEQA documents (see Vol. 4, Chapter 7, pp. 7-78 to 7-91) and five project-specific EIRs (see Vol. 5, Appendix E.6, p. E.6-4) in several ways: (a) to determine whether the WSIP would support growth levels consistent with, or exceeding, levels identified by local land use planning agencies (i.e., planned versus unplanned growth); (b) to identify the environmental impacts associated with planned growth; (c) to identify mitigation commitments made by local agencies to reduce the environmental impacts of planned growth; and (d) to assess the efficacy of local agency implementation of mitigation strategies adopted for planned growth at the project-specific level.

The majority of growth that the WSIP would support is consistent with growth anticipated in the adopted general plans within the service area; consequently, the EIRs prepared for those general plans provide the appropriate analyses of impacts associated with that growth. The Draft PEIR reviewed those general plan EIRs that could be obtained and summarized the impacts and mitigation measures contained therein in Chapter 7 (Vol. 4, pp. 7-60 to 7-69) and Appendix E.5. The Draft PEIR also reviewed a selection of EIRs of major projects currently being undertaken in the SFPUC service area. The purpose of the review was to assess whether, at least for the small selection of EIRs reviewed, the mitigation measures identified in general plan EIRs were being implemented at the project level, and the Draft PEIR states the limited nature of the review (Vol. 4, Chapter 7, p. 7-71 and Vol. 5, Appendix E.6). As stated in the Draft PEIR, the review indicated that in these instances mitigation measures are being identified to reduce the impacts of growth consistent with measures identified in the general plan EIRs. To the extent that the WSIP would support a level of growth beyond that reflected in the adopted general plans, there could be additional or more severe impacts than those identified in the general plan EIRs. These impacts are discussed in the Draft PEIR (Chapter 7, pp. 7-69 to 7-71).

The comment questions the selection of the One Quarry Road project (one of five projects reviewed to determine whether project-specific EIRs were implementing the mitigation measures identified in the general plan EIRs) as an example because, since voters defeated that development, the commenter assumes the project was not environmentally suitable. The point of the exercise in the Draft PEIR was to compare the project-level impact assessment and mitigation with the city’s general plan EIR; the PEIR analysis accomplished this irrespective of the ultimate disposition of the project. Reviewing the number of times that amendments and zoning changes have been made to accommodate development, as suggested in this comment, would not answer the question the PEIR analysis was, in essence, asking: Are the land use planning agencies requiring project-specific mitigation consistent with the mitigation measures adopted as conditions of approving their general plans?

SI_CNPS-EB1-17 This comment, which endorses the findings and recommendations of the Pacific Institute report, is acknowledged. The Pacific Institute’s report recommendations are presented as Comments SI_PacInst-12 to SI_PacInst-24 and repeated in Comments SI_PacInst-85 to SI_PacInst-97. The six recommendations included in this comment do not exactly correspond to Pacific Institute recommendations, but verbatim copies of recommendations #1 through #3 were presented in numerous comment letters and are addressed in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14). Regarding recommendation #4, refer to Section 14.2.2 of that master response, under the heading Outdoor Water Use; regarding recommendation #5, refer to **Response SI_PacInst-24**; regarding recommendation #6, refer to **Response C_Raffa-12**.

SI_CNPS-EB1-18 The commenter requests that biological surveys be conducted at each WSIP project site as part of the PEIR process, not just during preparation of the subsequent project-level EIRs. The Draft PEIR text excerpt cited by the commenter (Vol. 1, Chapter 3, p. 3-81) refers to SFPUC Construction Measure #8, which will be implemented as part of all SFPUC projects, including the WSIP projects identified in the Draft PEIR. The biological screening surveys required by Measure #8 were not performed as part of the PEIR process because project locations (construction footprints) and designs for most of the WSIP projects had not yet been precisely defined; these surveys will be carried out during project-level CEQA review, as appropriate.

SFPUC Construction Measure #8 was developed to ensure that some level of biological resource assessment is carried out, even though it is expected that many of the WSIP facility projects would be sited in previously developed areas that are largely devoid of natural habitats. The initial surveys required under this measure do not represent the full biological resource assessment, but rather a screening step designed to confirm the presence or absence of sensitive resources, even in areas where they may not be expected. This requirement is amplified in Draft PEIR Mitigation Measure 4.6-1a, Wetlands Assessment (Vol. 4, Chapter 6, p. 6-11), which states that a qualified wetland scientist will conduct a site visit to determine whether wetlands are present and could be affected by a project, and, if wetlands could be affected, that a wetland delineation will be carried out. The biological screening survey required by SFPUC Construction Measure #8 will identify any sensitive habitats and heritage trees and will determine the potential for key special-status species or other species of concern to be present at the site. Mitigation Measures 4.6-2, Habitat Restoration/Tree Replacement, and 4.6-3a, Protection Measures During Construction for Key Special-Status Species and Other Species of Concern (Vol. 4, Chapter 6, pp. 6-12 and 6-13) call for avoidance, protection, minimization, restoration, and compensation with respect to impacts on these resources, including preconstruction surveys at an appropriate time of year as well as implementation of the applicable standard mitigation measures listed in Mitigation Measure 4.6-3b, Standard Mitigation Measures for Specific Plants and Animals (Vol. 4, Chapter 6, p. 6-13).

The commenter advises better coordination of mitigation efforts as well incorporation of mitigation measures into the design of the WSIP as a whole. This comment identifies the additive effect of multiple projects in the same area or on species affected by several projects. These effects are identified as the "Multi-regional Collective Impacts" and the "Localized Collective Impacts" of the WSIP, and are discussed under Impact 4.16-4 (Vol. 2, Chapter 4, pp. 4.16-16 to 4.16-19). Implementation of Mitigation Measures 4.16-4a, Bioregional Habitat Restoration Measures, and 4.16-4b, Coordination of Construction Staging and Access (Vol. 4, Chapter 6, pp. 6-13 to 6-21), would reduce identified multi-regional and localized collective impacts to a less-than-significant level, except in the Sunol Valley Region. The Draft PEIR (Vol. 2, Chapter 4, p. 4.16-18) identifies the collective impact of multiple WSIP project construction activities on sensitive biological resources in the Sunol Valley as potentially significant and unavoidable because of the number of WSIP projects to be implemented in this region, and the extent of overlap in terms of construction activity and timing. It is possible, however, that the project-level CEQA review for each project in this region will determine that this potentially significant collective impact can be mitigated to a less-than-significant level based on more detailed information about the project site locations, schedules, and construction methods. Refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.4) for additional discussion regarding the level of detail of biological information presented in the PEIR.

SI_CNPS-EB1-19 The commenter requests that focused floristic surveys be conducted several times during the growing season, preferably over several years, to reliably determine the presence of special-status plants. The screening survey required at all WSIP project sites under SFPUC Construction Measure #8 will determine the potential for special-status species to be present based on the presence of suitable habitats. Due to the project schedules, the initial assessments might not be carried out at an optimum time of year for all biological resources. However, a qualified biologist who is familiar with the habitat requirements of special-status plants known to occur in the region would be able to determine whether further floristic surveys at appropriate times of the year should be carried out as part of the project-level CEQA review. Also refer to **Response SI_CNPS-EB1-18** for discussion of required project-level biological surveys.

SI_CNPS-EB1-20 Special-status plants with the potential to occur in the WSIP area are discussed at a program level for individual WSIP facility improvement projects, and at a project level for the proposed changes in water supply sources and regional water system operations. As discussed in the Draft PEIR (Vol. 2, Chapter 4, p. 4.6-1), "key special-status species" were analyzed at the program level only; these were defined as species listed under either the Federal Endangered Species Act or the California Endangered Species Act. Sensitive habitats were also discussed on the basis that most other plant species of concern are found in sensitive habitats, such as vernal pools, seeps and springs, serpentine grasslands, and so forth. It was not practical to analyze the full suite of species in the Draft PEIR because of the large number of species involved throughout the program area and the lack of project definition at this time. When each WSIP project is analyzed at the project level (including those within the Alameda Creek watershed and the Bay Division Region), the evaluation will include a detailed review of all species relevant to specific project locations, which could include *all* CNPS List 1A and 1B species as well as CNPS List 2 plants (Vol. 3, Chapter 5, Section 5.4.6).

Although Dianne Lake's database of locally rare, significant, and unusual plant species in the East Bay was not cited, all of the CEQA-required plants appearing on her database were considered in the PEIR analysis. The commenter is correct that CEQA allows for the lead agency to recognize species of local concern, and impacts on unusual and significant plants of the East Bay may be discussed, if applicable, in the project-level EIRs for the individual WSIP projects.

With respect to the Alameda County moratorium on development along creeks in unincorporated areas of the county, all WSIP projects would be designed to avoid and minimize development on and near creeks to the extent feasible; however, Alameda County restrictions do not apply to the SFPUC.

SI_CNPS-EB1-21 For the program-level analysis, the extent of affected sensitive natural communities could not be determined because individual project descriptions and construction footprints had not been defined. However, for all WSIP projects located near sensitive natural communities and that could cause impacts on these communities, the Draft PEIR determined that such impacts would be potentially significant (Vol. 2, Chapter 4, pp. 4.6-43 to 4.6-59). Once the project descriptions and construction footprints have been defined during the project-level analysis, the significance determination could change.

SI_CNPS-EB1-22 The commenter is correct that impacts on special-status plants are not fully analyzed at the program level. Because the project descriptions and construction footprints are still in the development stage for most of the WSIP projects, the impacts could not be fully analyzed, even if protocol-level survey data were available. However, the Draft PEIR is conservative in its determination that impacts on special-status plants would be potentially significant for all WSIP projects, except for the HTWTP Long-Term Improvements at the Harry Tracy Water Treatment Plant (PN-3), which would be located entirely on graded surfaces that are maintained free of vegetation, and three projects in the San Francisco Region (San Andreas Pipeline No. 3 Installation, SF-1; Groundwater Projects, SF-2; and Recycled Water Projects, SF-3), which would be located entirely in urbanized areas. In any event, the SFPUC would carry out reconnaissance-level surveys for all WSIP projects, and protocol-level botanical surveys for those projects where impacts on any natural habitat or potential habitat for special-status species could occur.

SI_CNPS-EB1-23 The significance criteria adopted for the Draft PEIR biological resources analysis (Vol. 2, Chapter 4, pp. 4.6-37 and 4.6-38) are fully described and consistent with CEQA guidelines and precedent. It is true that many of these rely on professional judgment by qualified biologists. The three components of determining the extent of impact (duration, sensitivity, and susceptibility) are cited by the commenter accurately, and form the basis of a defensible significance determination. However, to clarify an error in the comment letter, the San Francisco Planning Department is responsible for CEQA compliance for the City and County of San Francisco (not the SFPUC) and is responsible for determining appropriate significance criteria.

SI_CNPS-EB1-24 Quantified baseline data, detailed mapping of sensitive natural communities, and floristic surveys at appropriate times of the year will be carried out as deemed appropriate during the project-level analyses for all WSIP projects. All plant species that must be addressed under CEQA (CNPS List 1 and 2) will be surveyed and mapped according to standard CNPS protocols. Developing this level of information at the program level is infeasible for the WSIP facility improvement projects because many details of the project description have not been defined, such as the location of accessways, borrow and fill disposal sites, and staging areas. As a result, detailed surveys of the project footprints cannot be carried out or impacts assessed. Please also refer to **Section 14.4, Master Response** (Vol. 7, Chapter 14, Section 14.4.4).

For analysis of WSIP water supply and system operations, the Draft PEIR provided appropriate level of detail of analysis of biological resources based on modeled estimates of changes in hydrological conditions. Please also refer to **Section 14.4, Master Response** (Vol. 7, Chapter 14, Section 14.4.4) and **Response SI_Caltrout-01** for additional response.

SI_CNPS-EB1-25 As noted by the commenter, the CEQA Guidelines require an analysis of impacts based on existing conditions. However, as stated in the Draft PEIR (Vol. 3, Chapter 5, p. 5.4.6-14), "…riparian structure today is the result of physical responses that have prevailed over the lifetime of the plants…. Therefore, the condition, distribution, and abundance of short-lived or young plants in the Alameda Creek watershed reflect existing stream flow conditions, and those of moderately aged trees and shrubs reflect a combination of both older (pre-2002) and existing flow conditions. The impact analysis uses the existing conditions baseline, but the history of flows in Alameda Creek is discussed in the impact analysis where appropriate because of the role of historical flow in shaping existing resources such as the riparian vegetation." In this way, the Draft PEIR preparers endeavored to represent impacts more realistically rather than minimizing them by comparing them *only* with existing conditions. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.4) for additional discussion.

The Draft PEIR discussion of impacts on riparian vegetation along Alameda Creek comparing existing "Calaveras Down" conditions versus pre-2002 "Calaveras Up" conditions addresses only willow and mixed riparian habitat along the creek channel (not sycamore alluvial woodland, which is formed and sustained only under very high periodic flows such as those found in unimpeded streams). The distribution of willow and mixed riparian habitats is primarily the result of prevailing flows over several decades; in other words, the operational conditions described as "Calaveras Up," which maximized diversions at the Alameda Creek Diversion Dam prior to the 2001 Division of Safety of Dams (DSOD) restriction on Calaveras Reservoir operations. The CEQA baseline for the WSIP (i.e., Calaveras Down) reflects reduced diversions and therefore increased flows in Alameda Creek below the diversion dam. Although substantially lower than existing flows under the Calaveras Down scenario, the proposed WSIP flows would resemble prior Calaveras Up conditions. As a result, the PEIR concluded that the impact on these riparian habitats would be less than significant.

Consistent with the CEQA Guidelines, the Draft PEIR uses the conditions in 2005 to represent the baseline conditions for the analysis of impacts of WSIP water supply and system operations on Alameda Creek. This baseline condition, referred to as Calaveras Down due to the DSOD restriction on Calaveras Dam, provides for a worst-case environmental analysis since it represents the greatest change in stream flow conditions from those that would occur under the WSIP. As described in the Draft PEIR (Vol. 3, Chapter 5, Section 5.1), the impacts of water supply and system operations are analyzed using the Hetch Hetchy/Local Simulation Model, which uses the existing conditions (i.e., the SFPUC operating conditions and facilities restrictions in 2005) and predicts the reservoir spills and releases (i.e., stream flow conditions downstream from SFPUC reservoirs) over an 82-year record of historical hydrology, and not the actual "brief" period of time during which the Calaveras Reservoir has been operated under restricted conditions.

SI_CNPS-EB1-26 With regard to the Draft PEIR conclusion that the impact on sycamore woodlands would be less than significant, the flow regime in the Alameda watershed under the WSIP would provide higher year-round flows in Alameda Creek because of fishery releases. It could thus facilitate the development of a different natural riparian community in a narrow band along the low-flow channel. Any of the other natural riparian communities that could form, such as willow scrub or mixed riparian scrub or forest, are also considered sensitive natural communities by the California Natural Diversity Database. Thus, one sensitive natural community could be replaced by another sensitive natural community. More importantly, in this instance the extent of such replacement would be limited to the edge of the low-flow channel and would most likely be very narrow. Although the sycamore alluvial woodland in this section of Alameda Creek is extensive, the sycamore trees themselves are very widely spaced. As a result, the number of existing individual sycamores experiencing any change in available groundwater would be low, and the increase in available water would be tolerated by them. Moreover, established, mature sycamores are expected to compete successfully with other riparian species that would grow as a result of increased flows. It is likely that few or no sycamore trees would be lost as a result of the modified flow regime proposed under the WSIP, and therefore the change in the structure and effective extent of sycamore alluvial woodland would be very slight. As a result, the Draft PEIR (Vol. 3, Chapter 5, p. 5.4.8-22) concluded that this potential impact would be less than significant. It is likely that this subject will be revisited, with more quantitative data, in the EIR for the Calaveras Dam Replacement project (SV-2).

SI_CNPS-EB1-27 The commenter is correct that the adequacy of the mitigation, such as the Habitat Reserve Program (HRP), for the WSIP projects cannot be assessed in advance of a more detailed description of the exact nature of the biological resources and the presumed impacts upon them. The Draft PEIR does not attempt to propose the amount of mitigation required for the WSIP projects, since details on the magnitude, location, and type of impacts cannot be defined at the program level. Instead, the type and extent of adequate and appropriate mitigation would be determined at the project EIR stage. The HRP would not provide all mitigation for project impacts; avoidance, minimization, and restoration would also take place on the project site. Offsite compensatory mitigation could be provided by a program such as the HRP, and the type and amount of such mitigation would be determined by the resource agencies. If the HRP does not provide sufficient or appropriate mitigation, then other mitigations would be required. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.4).

SI_CNPS-EB1-28 This comment, which states that the East Bay Chapter of the CNPS does not endorse any of the CEQA alternatives, is acknowledged. It is also acknowledged that this statement contradicts Comment SI_CNPS-EB2-01 by representatives of the same organization. This comment (SI_CNPS-EB1-28) states the opinion that the analysis of water supply and demand is flawed. Please refer to **Responses SI_CNPS-EB1-11** through **SI_CNPS-EB1-14** and **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14) for a detailed discussion of why the water supply and demand analysis used in the Draft PEIR is appropriate and adequate for this planning level of study.

SI_CNPS-EB1-29 The comment is noted. The San Francisco Planning Department has determined that recirculation of the Draft PEIR is not warranted, consistent with CEQA guidelines.

SI_CNPS-EB1-30 This comment is comprised of a CNPS letter addressed to the SFPUC, dated July 19, 2004, which comments on the special-status species proposed for coverage in the Alameda Watershed Habitat Conservation Plan. The PEIR preparers appreciate the submittal, but the Habitat Conservation Plan process operates under different guidelines and for different purposes than the WSIP PEIR, focusing on species currently or anticipated to be protected under the Federal Endangered Species Act. The letter restates many of the points made in the body of the CNPS letter; see **Responses SI_CNPS-EB1-05**, **SI_CNPS-EB1-08**, and **SI_CNPS-EB1-18** through **SI_CNPS-EB1-27** for the specific responses.

This letter notes the recent observation of several CNPS List 1B plants from the Alameda Creek watershed, mostly on East Bay Regional Park District lands. It also notes the existence of 162 unusual and significant plant species in the Alameda Creek watershed. As noted in the Draft PEIR (Vol. 2, Chapter 4, p. 4.6-1), the impact analysis addresses, at a programmatic level of detail, sensitive natural communities and “key” special-status species listed by the U.S. Fish and Wildlife Service or California Department of Fish and Game. The operational analysis presented in Chapter 5 in the Draft PEIR addresses, at a project level of detail, species recognized as rare and endangered (CNPS List 1B or 2), as required under CEQA. The project-specific analyses of the individual WSIP projects may present more detailed information, as deemed appropriate, on unusual and significant plants in the East Bay.

SI_CNPS-EB1-31 This comment is comprised of a CNPS letter addressed to the Alameda County Board of Supervisors, dated May 4, 2006. In this letter, the East Bay Chapter of the CNPS commented on the proposed moratorium on creek development in the unincorporated areas of Alameda County. The letter notes the high ecological value of Alameda Creek, especially upstream of the gravel quarries near Interstate 680, and a list of rare and unusual plants of Alameda Creek is attached. Receipt of the letter and attachment is acknowledged. The actions of Alameda County are not necessarily applicable to the PEIR analysis, but please note that the rare and endangered (CNPS List 1 and 2) plants and sensitive natural communities referenced in the letter are discussed in the Draft PEIR (Vol. 3, Chapter 5, pp. 5.4.6-1 to 5.4.6-12).

California Native Plant Society, East Bay Chapter, Lech Naumovich, 09/18/07

[See Public Hearing Transcript, Fremont, pp. 25–28]

SI_CNPS-EB2-01 This comment, which expresses the support of the California Native Plant Society, East Bay Chapter, for the Aggressive Conservation/Water Recycling and Local Groundwater Alternative, is acknowledged. Note that this contradicts Comment SI_CNPS-EB1-28 by representatives of the same organization, who indicated that the California Native Plant Society, East Bay Chapter does not endorse any of the alternatives in the Draft PEIR.

SI_CNPS-EB2-02 This comment, which expresses an opinion in favor of the seismic improvements but against any additional Tuolumne River diversions, is acknowledged.

SI_CNPS-EB2-03 This commenter does not think it necessary to divert any water from Alameda Creek, and that WSIP implementation will undermine species and habitat restoration efforts by other organizations.

The Draft PEIR (Vol. 1, Sections 3.3 and 3.6, and Vol. 3, Section 5.4) discusses the purpose of and need for WSIP implementation and the need for diversions from Alameda Creek to meet current and future water supply and system reliability objectives. As shown in Figure 2.4 of the Draft PEIR (Vol. 1, Chapter 2, p. 2-18), the Alameda Creek watershed currently provides about 13 percent of the water supply to the regional system and, importantly, is the major source of local water supplies to the regional system. Implementation of the WSIP would result in increased diversions from Alameda Creek compared to the existing condition, but the proposed level of diversions would be similar to the historical level of diversions that took place for about 70 years prior to the Division of Safety of Dams operating restriction placed on Calaveras Dam in 2001. As described in the Draft PEIR (Vol. 1, Chapter 2, p. 2-10), the SFPUC considers the current reduced storage level in Calaveras Dam and the associated reduced diversion level to be an impaired operating mode that puts the regional system at risk of being unable to adequately meet existing customer water demand in the event of an emergency or a prolonged drought. The restoration of storage capacity in Calaveras Reservoir and the associated increased diversions from Alameda Creek are needed to meet existing customer demand during a drought or other emergency condition and to provide both delivery and seismic reliability; it is also needed to maximize use of local water supplies.

As described in the Draft PEIR (Vol. 3, Chapter 5, pp. 5.2-24 and 5.2-25), the SFPUC's adopted Water Enterprise Environmental Stewardship Policy establishes a long-term management direction for CCSF-owned lands and natural resources affected by operation of the SFPUC regional water system, including lands within the Alameda Creek watershed. It states "It is the policy of the SFPUC to operate the regional water system in a manner that protects and restores native fish and wildlife downstream of SFPUC dams and water diversions, within SFPUC reservoirs, and on SFPUC watershed lands." The SFPUC actively monitors the health of the terrestrial and aquatic habitats under CCSF ownership or otherwise affected by SFPUC operations in order to continually improve ecosystem health.

In addition, the SFPUC has entered into partnerships with various organizations (see Draft PEIR, Vol. 3, Chapter 5, p. 5.2-20). One of these partnerships, the Alameda Creek Fisheries Restoration Workgroup (ACFRW), is a multi-agency stakeholder group formed to pursue the restoration of steelhead to Alameda Creek. The ACFRW is composed of numerous community and citizens' groups, state and federal resource agencies, and local water management and flood control agencies, including the SFPUC. The SFPUC is also working with the U.S. Fish and Wildlife Service and National Marine Fisheries Service and is in the process of developing a Habitat Conservation Plan for the Alameda Creek watershed. Further discussion of these partnerships and restoration efforts is presented in **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14), which includes a description of proposed modifications to the Calaveras Dam Replacement project (SV-2) to include protective measures for steelhead.

SI_CNPS-EB2-04 The information provided by the commenter (regarding water recycling practices in other parts of the world) is acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2), for a detailed discussion of the water recycling assumptions used in developing the demand projections.

SI_CNPS-EB2-05 Please refer to **Section 14.3, Master Response on Proposed Dry-Year Water Transfer** (Vol. 7, Chapter 14, Section 14.3.2), regarding future water transfer agreements with the Turlock Irrigation District and the Modesto Irrigation District for supplemental Tuolumne River water as part of the proposed program.

SI_CNPS-EB2-06 Please see **Response SI_CNPS-EB1-18**.

California Native Plant Society, Kevin Bryant, President, Santa Clara Valley Chapter, 10/01/07

SI_CNPS-SCV1-01 The commenter indicates that the public cannot determine the validity of the impact analysis and mitigation measures due to the Draft PEIR's lack of detail as well as reliance on project EIRs that are currently unavailable to the public. For discussion of the issues raised by this comment, please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2). This master response provides information on the appropriate level of detail of an impact analysis at the program level versus the project level. The Draft PEIR (Vol. 2, Chapter 4, pp. 4.16-1 to 4.16-38) also evaluates the multi-regional and localized combined or collective impacts associated with implementation of the WSIP (all WSIP facility projects combined), and provides mitigation measures (all those numbered 4.16-x) that address collective impacts (Vol. 4, Chapter 6, pp. 6-8, 6-13, 6-32, 6-38, and 6-42), including those impacts that cannot be effectively analyzed or mitigated through the CEQA process for projects individually.

This comment also expresses that the PEIR does not provide sufficient detail and analysis to support its conclusions regarding the future needs of the regional water system. For a discussion of this issue, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2).

This comment also notes that of the 22 WSIP facility improvement projects, the SFPUC has published Notices of Preparation and EIRs for nine projects, and that considerable information is therefore unavailable to the public regarding impact and mitigation. The commenter requests that the SFPUC publish environmental documents for all 22 projects in a timely fashion so that they can be analyzed together in a coherent manner. As shown in Chapter 4 of the Draft PEIR, these projects are analyzed at a programmatic level of detail. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2) for discussion regarding the intent of the programmatic analysis versus the project-level analysis. The commenter also requests that the SFPUC provide local work sessions in the geographical areas affected by each project. Once the WSIP facility improvement projects begin, public scoping meetings and informational meetings will be held as necessary.

SI_CNPS-SCV1-02 This comment expressing concern about "water supply needs and measures to meet them" is acknowledged. Comment SI_CNPS-SCV1-03 details these concerns; refer to **Response SI_CNPS-SCV1-03**.

SI_CNPS-SCV1-03 Regarding the assertions that adequate consideration has not been given to conservation measures, and that the Draft PEIR substantially overestimates water demand in Santa Clara County because of faulty assumptions and flawed data sources, refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14).

The basis for the assertion regarding invalid sampling methods is not specified and is thus unclear. The methodology used to develop the demand estimates and to identify conservation and water recycling potential is described in Draft PEIR Chapter 3 (Vol. 1, pp. 3-16 to 3-22) and in more detail in Appendix E.2 (Vol. 5); as the descriptions indicate, sampling was not an integral part of the process, but actual consumption among all billing categories was (see the paragraph below).

The "total population of users," which the comment states is biased, apparently refers to the residential and nonresidential users within the service area. The comment provides no evidence to support or explain this general assertion, and no evidence of bias is apparent to the PEIR authors. As described in the Draft PEIR (Vol. 1, Chapter 3, p. 3-20), actual billing data along with published information on demographics and housing stocks, from such sources as the California Department of Finance and U.S. Census Bureau, were used to develop base-year water usage by end-use. Once base-year usage was established, future water demand was projected by using published population and employment projections to develop growth rates for residential and nonresidential water accounts, respectively. Each wholesale customer selected the published population projection source to be used for its service area; since the Association of Bay Area Governments (ABAG) *Projections 2002* was the current source of employment projections, it was used to develop the nonresidential demand estimates. Assuming the assertion of bias refers to the use of ABAG's *Projections 2002*, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14).

The Pacific Institute's evaluation of the demand estimates prepared for the WSIP, which this comment endorses, was submitted as Comment Letter SI_PacInst; please refer to the responses to that submittal. The commenter's approval of the Loma Prieta chapter analysis is acknowledged.

The comment provides no evidence to support the assertion that implementation of the WSIP would have substantial growth-inducing effects on Santa Clara County that are “in no way covered by the proposed mitigations.” As explained in the Draft PEIR (Vol. 4, Chapter 7, pp. 7-59 to 7-77), measures to mitigate the indirect effects of planned growth have been identified in the EIRs prepared for the adopted plans of the jurisdictions in the areas served, including those in Santa Clara County. In approving a plan that could cause environmental impacts determined to be unavoidable, the decision-making body must indicate the reasons for approving the plan despite unavoidable impacts in a “statement of overriding considerations.” Draft PEIR Table 7.12 (Vol. 4, Chapter 7, p. 7-68) presents a summary of overriding considerations frequently cited by agencies. As shown in Draft PEIR Table E.5.1 (Vol. 5, Appendix E.5, pp. E.5-3 to E.5-18), the EIRs for the general or specific plans of several jurisdictions within Santa Clara County identified impacts on open space and public services, as this comment indicates, and provided measures to reduce those impacts.

SI_CNPS-SCV1-04 The commenter is concerned that the mitigations to compensate for biological resources impacts through the Habitat Reserve Program (HRP) would be implemented in advance of actual project-level impact analyses, and that there is insufficient site-specific data from which sound decisions can be made. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.4, under the heading Habitat Reserve Program).

The commenter is correct that the quantity and type of compensatory action cannot be determined until the impacts of a proposed project have been analyzed at a project level of detail, as will occur in the project-specific CEQA documents prepared for the individual WSIP projects. The HRP is being designed to create habitat enhancements that would be applied as appropriate to WSIP project impacts, and while this is the preferred mitigation approach for impacts on biological resources associated with the WSIP projects, it is not the only option. As described in the Draft PEIR (Vol. 4, Chapter 6, p. 6-11), the HRP is presented as one option for implementing offsite habitat compensation for the WSIP projects; the SFPUC will compensate for affected sensitive habitats and will comply with applicable environmental regulations addressing sensitive habitats and species for each WSIP project, either on a project-by-project basis or through the HRP. Therefore, at a programmatic level of analysis, the Draft PEIR mitigation measures provide adequate guidance for the project-level impact analyses and mitigation development. Site-specific information on habitat compensation will be addressed as appropriate during project-level CEQA review. The level of detail at which the impacts of the WSIP facility projects are evaluated and mitigation specified in the Draft PEIR is consistent with CEQA Guidelines Section 15168.

The project description for the HRP states that no habitat enhancements applicable to WSIP project impacts have been or would be applied as mitigation for other SFPUC projects, and that these enhancements would be separate from any compensation developed for the watershed's habitat conservation plans, the Watershed and Environmental Improvement Program, or other regulatory or permitting purposes. The commenter's description of the HRP is noted, and, as stated above, the application of the HRP as mitigation to individual WSIP projects will be determined as part of project-level CEQA review. Also, please refer to **Response SI_CNPS-EB1-18** for discussion of required project-level biological surveys, impact analyses, and mitigation requirements. Refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2) for discussion regarding the intent of the programmatic impact analysis.

SI_CNPS-SCV1-05 This comment opposes additional Tuolumne River diversions and states that the impacts of the WSIP on the Tuolumne River cannot be adequately evaluated without additional data collection and analysis and the preparation of a comprehensive study of the watershed. Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions. Regarding the commenter's statement that additional studies are needed to evaluate the impacts of the WSIP on the Tuolumne River, refer to **Response SI_CRS-07**.

SI_CNPS-SCV1-06 This comment summarizes more detailed comments presented in Comments SI_CNPS-SCV1-01 through SI_CNPS-SCV1-05 and in Comments SI_CNPS-SCV-07 through SI_CNPS-SCV-16; refer to **Responses SI_CNPS-SCV1-01** through **SI_CNPS-SCV1-05** and **Responses SI_CNPS-SCV-07** through **SI_CNPS-SCV-16**. Also refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Sections 14.4.2 and 14.4.4) for additional discussion regarding the intent of the programmatic impact analysis and the level of detail of biological information presented in the PEIR.

SI_CNPS-SCV1-07 The commenter identifies specific examples of concern, including the Calaveras Dam Replacement project (SV-2); the comment states that this project is included in the PEIR and HRP, but that without specifics on the extensive excavation related to this project, its proposed advance mitigation will compound cumulative impacts on vegetative habitat. Please refer to **Responses SI_CNPS-SCV1-01** and **SI_CNPS-SCV1-04** and to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Sections 14.4.2 and 14.4.4),regarding program-level versus project-level analyses, the Draft PEIR's consideration of collective impacts from all WSIP projects, and concerns regarding advance mitigation through the HRP. Also refer to **Response SI_CNPS-EB1-18** for discussion of required project-level biological surveys, impact analyses, and mitigation requirements. In addition, the Draft PEIR (Vol. 2, Chapter 4, pp. 4.17-1 to 4.17-64) identifies cumulative impacts associated with the WSIP in combination with other approved and proposed development in the region.

SI_CNPS-SCV1-08 In regard to potential effects of the WSIP on federal-threatened marbled murrelet, nesting habitat for this species consists of old-growth conifer forest (such as Douglas-fir forest), which is not considered riparian vegetation and is unaffected by stream flows in Pilarcitos Creek.

SI_CNPS-SCV1-09 This comment points out a typographical error in the legend for Figure 5.7-4 (Vol. 3, Chapter 5, p. 5.7-71). The legend is revised as follows:

> PP-1a Peninsula Watershed Habitat Conservation Plan (sub-project of ~~Alameda~~ Peninsula WMP)

SI_CNPS-SCV1-10 This comment, which states that the water demand projections used biased data sources and an invalid sampling of the total population of users and overstated future water needs, restates comments made in Comment SI_CNPS-SCV-03; please refer to **Response SI_CNPS-SCV1-03**.

SI_CNPS-SCV1-11 This comment, which states that Draft PEIR Figure S.3 (Vol. 1, Summary, p. S-5) illustrates the difference in water usage by the SFPUC retail and wholesale customers, is acknowledged. Please refer to **Responses SI_PacInst-54** through **SI_PacInst-56** and to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the heading Per-Capita Demand).

SI_CNPS-SCV1-12 This comment states that the need for additional water is not substantiated by the requests of several wholesale customers that are located in areas where recycled water is readily available for anticipated shoreline development. As described in the Draft PEIR, the SFPUC conducted a study to identify the potential for using recycled water within the wholesale service area (RMC, 2004). Table E.2.5 in the Draft PEIR (Vol. 5, Appendix E.2, p. E.2-17) shows the potential recycled water projects at various stages of planning, and with various degrees of certainty, in the service area. Some of the projects would serve jurisdictions cited in this comment, although not all of the recycled water produced would replace potable supplies. In addition, as described in the Draft PEIR (Vol. 4, Chapter 9, pp. 9-47 to 9-51), the SFPUC, in cooperation with its wholesale customers and the Bay Area Water Supply and Conservation Agency, undertook a study to assess the potential for additional conservation and recycled water projects, including potential regional projects, that were not already considered to be implemented locally by 2030 as part of the WSIP purchase estimates. The results of this study provided the basis for the Aggressive Conservation/Water Recycling and Local Groundwater Alternative evaluated in the Draft PEIR (Vol. 4, Chapter 9, pp. 9-47 to 9-59) as well as an element of the Modified WSIP Alternative (Vol. 4, Chapter 9, pp. 9-78 to 9-84). However, the study identified no additional opportunities for recycled water use in the jurisdictions cited in this comment.

Regarding substantiation of the projected increases in demand, refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14).

SI_CNPS-SCV1-13 This comment, which states that conservation capabilities exist for two wholesale customers requesting large increases (Stanford University and Purissima Hills Water District), is acknowledged. Tables 3.3 and 7.2 of the Draft PEIR (Vol. 1, Chapter 3, p. 3-18 and Vol. 4, Chapter 7, p. 7-15, respectively) show the projected conservation savings from measures to which these customers have committed. These measures are shown in Table 14.2-4 of **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14).

Please refer to **Response L_PHWD1-09** for a correction of the town’s population.

SI_CNPS-SCV1-14 Consistent with CEQA Guidelines Section 15126, the Draft PEIR presents an analysis of all phases of the WSIP. Chapter 4 (Vol. 2) includes a program-level analysis of the construction and operational phases of the proposed facility improvement projects, and Chapter 5 (Vol. 3) includes a project-level analysis of the proposed water supply and system operations. Chapter 6 (Vol. 4) describes the mitigation measures identified in Chapters 4 and 5 that would (in most cases) reduce the potentially significant impacts to a less-than-significant level; however, in a few cases, impacts were identified as significant and unavoidable even with the implementation of mitigation measures.

SI_CNPS-SCV1-15 Consistent with CEQA Guidelines Section 15130, the Draft PEIR analyzed the cumulative impacts of the WSIP (see Vol. 2, Chapter 4, Section 4.17 and Vol. 3, Chapter 5, Section 5.7).

The CEQA process consists of issuing a draft EIR and final EIR for public review, followed by certification of the final EIR by the CEQA lead agency. If a public agency, such as the SFPUC, decides to approve a project for which an EIR has been certified and which identifies one or more significant environmental effects, it must make "findings" for each of those significant effects, accompanied by a brief explanation of the rationale for each finding (CEQA Guidelines Section 15091). For the WSIP PEIR, the SFPUC will issue findings following certification of the Final PEIR and if/when it decides to approve or modify the proposed program.

According to CEQA Guidelines Section 15152, tiering refers to applying the general analysis contained in a broader EIR to subsequent EIRs and negative declarations on narrower projects. In the context of the WSIP PEIR, tiering refers to use of the analysis presented in the PEIR in subsequent project-level environmental review of the individual WSIP projects.

SI_CNPS-SCV1-16 As described in the Draft PEIR (Vol. 1, Chapter 2, p. 2-36), the City and County of San Francisco has sufficient water rights for existing operations and facilities as well as for proposed operations and facilities under the WSIP. Proposed diversions, it should be noted, would be 27 mgd, not 25 mgd. Section 5.2 of the Draft PEIR (Vol. 3, Chapter 5, pp. 5.2-1 to 5.2-29) presents plans and policies relevant to the SFPUC regional water system and describes program consistency with the applicable, adopted land use and resource plans and policies; this section also includes plans relevant to the Tuolumne and San Joaquin Rivers. The Draft PEIR analyzes the potential effects of the WSIP on fishery and other biological resources associated with the Tuolumne River, including wildlife species and resident and migratory fish, in Sections 5.3.6 and 5.3.7 (Vol. 3, Chapter 5).

California Native Plant Society, Santa Clara Valley Chapter, Libby Lucas, Conservation, 10/15/07

SI_CNPS-SCV2-01 In 2002, the California Department of Water Resources, Division of Safety of Dams (DSOD) imposed interim restrictions on Calaveras Dam operations with the caveat that the SFPUC continue to pursue an aggressive schedule for the remediation of Calaveras Dam. The SFPUC has rejected the concept of an enlarged Calaveras Reservoir because of uncertainty about the ability to obtain the necessary water rights and environmental permits within the timeframe needed to satisfy DSOD requirements. As stated in the Draft PEIR (Vol. 4, Chapter 9, p. 9-118), the Calaveras Dam Replacement project (SV-2) includes a base design that would technically allow the dam to be raised in the future, but the currently proposed height of the reservoir would not accommodate reservoir storage beyond its historical capacity. In the future, any discretionary action by the SFPUC to raise the height of the dam and increase storage capacity would be subject to CEQA review requirements (including public disclosure), and water rights and environmental issues would need to be resolved at that time. The comment also asks why there are no sediment basins at Calaveras Reservoir. The reservoir is not expected to have the kind of sediment issues that warrant sediment basins, which are not usually suitable as mitigation due to the periodic maintenance requirements.

The commenter requests clarification on the design capacity of the Calaveras Dam Replacement project (SV-2) and mitigation related to wetlands, streams, and habitat. The project-level EIR for this project will present detailed project design information, provide a more detailed impact assessment, and refine PEIR mitigation measures to specifically address this project. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2) for detailed discussion of the issues raised by this comment.

SI_CNPS-SCV2-02 Please refer to **Response SI_CNPS-SCV1-08**. Within the Pilarcitos Creek watershed, suitable nesting habitat for the marbled murrelet is located within upland forest habitats that are unaffected by flows in Pilarcitos Creek.

The Draft PEIR (Vol. 3, Chapter 5, pp. 5.5.1-5 to 5.5.1-12) describes the SFPUC's operations in Pilarcitos Reservoir and along Pilarcitos Creek. Impact 5.5.1-2 (Vol. 3, Chapter 5, pp. 5.5.1-19 to 5.5.1-22) describes the effects of WSIP implementation on flow along Pilarcitos Creek based on a review of historical data and SFPUC reservoir operating practices (see the discussion of model limitations in Section 5.1, pp. 5.1-14 to 5.1-17); the impact was determined to be less than significant with respect to stream flow changes in Pilarcitos Creek below both Pilarcitos and Stone Dams. Impact 5.5.4-1 (Vol. 3, Chapter 5, p. 5.5.4-3) describes the effects of changes in stream flow in Pilarcitos Creek on groundwater levels and water quality, which were determined to be less than significant because the WSIP would have very little effect on flow in Pilarcitos Creek below Stone Dam. Because inflow to Pilarcitos Creek below Stone Dam is the primary source of groundwater recharge, minor changes in upstream flow associated with the WSIP would not be expected to affect the groundwater and would not cause seawater intrusion during droughts.

The last part of this comment, asking whether the transfer of water from Crystal Springs Reservoir to Pilarcitos Reservoir would affect critical habitat, native grasslands, wetlands, or special-status species, is discussed in Impact 5.5.6-1 (Vol. 3, Chapter 5, p. 5.5.6-14 to 5.5.6-17). Impacts on these resources were found to be potentially significant, but implementation of Mitigation Measure 5.5.6-1a, Adaptive Management of Freshwater Marsh and Wetlands, Mitigation Measure 5.5.6-1b, Compensation for Impacts on Terrestrial Biological Resources, and Mitigation Measure 5.5.6-1c, Compensation for Serpentine Seep-Related Special-Status Plants (Vol. 4, Chapter 6, pp. 6-57 and 6-58), would reduce these impacts to less-than-significant levels.

SI_CNPS-SCV2-03 Please refer to **Response SI_CNPS-SCV1-09**.

SI_CNPS-SCV2-04 This comment regarding the salvage of *Lessingia arachnoidea* is noted. With the appropriate permits and approvals, this and other listed plants could be salvaged from areas where the populations would otherwise be lost. The commenter correctly states that much of the Peninsula is a state game refuge, and although this designation does not directly equate with an assessment of its biological value, the PEIR acknowledges the importance of its biodiversity and many unique natural features. Regarding the mitigation land for serpentine grassland, the SFPUC will work with county and non-governmental organizations to identify and protect high-quality serpentine grassland in San Mateo County, or will include such areas within the Habitat Reserve Program once specific impacts have been identified in project-specific EIRs. Lastly, the commenter appears to suggest either joining (combining) the Peninsula and Alameda Watershed Habitat Conservation Plans (HCPs) or perhaps avoiding the HCPs in some way. Regardless of the intent and meaning of the comment, the HCP process is consistent with the Draft PEIR, but is a separate process conducted under the Endangered Species Act rather than CEQA.

SI_CNPS-SCV2-05 Please refer to **Responses SI_CNPS-EB1-18, SI_CNPS-EB1-19**, and **SI_CNPS-EB1-20**. SFPUC Construction Measure #8, which requires the performance of screening surveys, is not offered as an adequate inventory but rather the start of the process for any construction action. For example, see Draft PEIR Mitigation Measure 4.6-3a (Vol. 4, Chapter 6, p. 6-12), which describes the role of detailed preconstruction surveys.

Regarding best management practices for invasive species, the SFPUC—like all land stewards in the Bay Area—is aware of the problems related to the introduction of non-native plant species. The commenter is referred to Draft PEIR Mitigation Measure 4.6-3a (Vol. 4, Chapter 6, pp. 6-12 and 6-13), which mandates a weed control plan for all WSIP projects.

SI_CNPS-SCV2-06 The commenter has asked whether oak mitigation would be compensated at a ratio of 1:1 and where such mitigation land would be reserved. The California Department of Fish and Game generally establishes mitigation ratios for the replacement of habitats such as oak woodland, but often at a ratio higher than 1:1 if the affected habitat is of good quality. The location of compensation land has not been determined, but would be located within the program region. Such compensation land may or may not be located within lands already managed by the SFPUC, but a higher compensation would apply if the land is already under some degree of protection and a lower compensation would apply if protection under a conservation easement were established on land not otherwise designated as such.

The commenter also asked what effect raising the water levels in Crystal Springs Reservoir would have on sediment basins sited around the reservoirs. Some of the sediment basins are within the proposed operational elevation range for the reservoir itself. If the reservoir were maintained at these higher levels during the rainfall season, the sediment basins would not function as designed; most likely, sediment would accumulate upstream where the flowing water slows as it encounters still water. More importantly for biological resources, some of the sediment catchment basins have been designed to function in an ecologically similar manner to sag ponds, with periods of inundation and seasonal drying. Operation of the reservoir at higher levels could alter the ecological function of these basins, changing the habitat quality for species such as California red-legged frog and San Francisco garter snake. This impact will be analyzed in detail in the EIR for the Lower Crystal Springs Dam Improvements project (PN-4).

SI_CNPS-SCV2-07 There are three issues discussed in this comment. Regarding the comment that the demand analysis is flawed and conservation measures are underestimated, please refer to **Section 14.2, Master Response on**

Demand Projections, Conservation, and Recycling (Vol. 7, Chapter 14, Section 14.2.3). Regarding Assembly Bills 1881 and 2717, refer to **Response SI_PacInst-73**. The comment regarding Assembly Bill 325, which was adopted in 1990 and requires jurisdictions to either adopt a landscape ordinance or issue findings that no ordinance is necessary, is acknowledged. Regarding the second part of this comment, stating that communities requesting sizable water supply increases should be required to substantiate the need for water and to document water conservation efforts, refer to **Section 14.2, Master Response on Demand Projections**, **Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the heading Substantiation of the Need for Sizable Water Supply Increases and Documentation of Water Conservation Efforts). The third part of this comment, in which the commenter asks whether customers and water retail contractors should not also incorporate backup supply capabilities (in addition to SFPUC facilities) into their community water plans, is acknowledged.

SI_CNPS-SCV2-08 The commenter indicates that the analysis of cumulative impacts in the Draft PEIR should include San Francisco Bay saltmarsh conversion from increased sewage plant outflow. The commenter is correct in noting that changes in wastewater discharges into receiving waters in the SFPUC service area would be an indirect effect associated with implementation of the WSIP, since increases in water use directly correlate to increases in wastewater discharges. Insofar as the WSIP would result in changes to municipal and industrial water use patterns, there could be associated changes in wastewater discharge patterns for municipal and industrial uses. The Draft PEIR addresses the indirect effects of growth in Chapter 7 (Vol. 4, pp. 7-60 to 7-78), and it indicates that these effects, including impacts on wastewater treatment facilities and wastewater treatment capacities, have been identified as significant but mitigable in the environmental impact reports of the general and specific plans in the service area. Any incremental increases in sewage treatment plant discharges would not likely result in saltmarsh conversion, since the National Pollutant Discharge Elimination System permitting requirements associated with sewage treatment plant discharges are designed to protect the beneficial uses of San Francisco Bay, including saltmarsh habitat, where appropriate.

The potential impacts associated with flooding and increases in impervious surfaces are evaluated in the Draft PEIR under Impacts 4.5-4 and 4.5-6 (Vol. 2, Chapter 4, pp. 4.5-37 to 4.5-54). Growth-inducement impacts associated with the WSIP are analyzed in Chapter 7 (Vol. 4). The effects of global climate change on water resources are discussed in Section 5.7.6 (Vol. 3, Chapter 5, pp. 5.7-92 to 5.7-96), although the WSIP is not expected to increase water levels in the bay. Table C.6 (Vol. 5, Appendix C, p. C-26) shows the agency permits and approvals that may be required for the WSIP facility improvement projects, including possible review and approvals by the Department of Water Resources. Also refer to **Response S_DWR-01**.

SI_CNPS-SCV2-09 This comment, stating that recycled water use is behind projections in North San Jose and East Palo Alto, and that recycled water should be used before groundwater, is acknowledged. While it is unclear to what projections the comment is referring, note that the City of San Jose participates, along with the Cities of Milpitas and Santa Clara, in the South Bay Water Recycling Project. As shown in Table E.2.5 (Vol. 5, Appendix E.2, p. E.2-17), this project currently produces 3.1 million gallons per day (mgd) of recycled water and is projected to potentially provide an additional 2.1 mgd in the future. According to the *SFPUC Wholesale Customers Recycled Water Potential Study*, all of the current and projected recycled water from this project replaces potable supplies (RMC, 2004, Table 5). As discussed in **Response SI_CNPS-SCV1-12** and described in the Draft PEIR (Vol. 4, Chapter 9, pp. 9-47 to 9-51), the SFPUC, in cooperation with its wholesale customers and the Bay Area Water Supply and Conservation Agency, also undertook a study (SFPUC, 2007) to assess the potential for additional conservation and recycled water projects, including potential regional projects, that were not already considered to be implemented locally by 2030 as part of the WSIP purchase estimates. The results of this study provided the basis for the Aggressive Conservation/Water Recycling and Local Groundwater Alternative evaluated in the Draft PEIR (Vol. 4, Chapter 9, pp. 9-47 to 9-59) as well as an element of the Modified WSIP Alternative (Vol. 4, Chapter 9, pp. 9-78 to 9-84). This study revised the 2004 study's estimates of recycled water potential for Milpitas and Santa Clara and provided the basis for the estimates shown for these cities (1.77 mgd and 4.0 mgd, respectively) in Draft PEIR Tables 3.3 and 7.2 (Vol. 1, Chapter 3, p. 3-18, and Vol., 4, Chapter 7, p. 7-15). North San Jose currently uses 0.59 mgd of recycled water; however, this amount was deducted from North San Jose's baseline and projected demand and therefore is not shown as a component of supply in the Draft PEIR tables. The 2004 RMC study estimated that future projects could provide an additional 1.91 mgd to North San Jose (revised to 2.07 mgd in the 2007 study). However, this recycled water from future projects for North San Jose is expected to serve users that are not part of the projected 2030 demand and therefore is also not shown in the Draft PEIR tables. The study identified no other opportunities for recycled water use in the jurisdictions cited in this comment.

SI_CNPS-SCV2-10 Comment noted regarding an economic analysis of water rates, which is not within the scope of the PEIR.

SI_CNPS-SCV2-11 This comment regarding City Charter mandate (4) is acknowledged.

SI_CNPS-SCV2-12 This comment, requesting that the City and County of San Francisco avail itself "of all possible private volunteer assistance" in preserving natural habitat on SFPUC lands, is acknowledged.

California Native Plant Society, Willis Jepson Chapter, Tedmund Swiecki, Conservation Committee Co-Chair, 10/01/07

SI_CNPS-WLJ-01 This comment opposes the WSIP due to the additional withdrawal of 25 mgd from the Tuolumne River. Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

The potential environmental impacts of the proposed changes in water supply sources and regional water system operations are evaluated at a project level and organized by watershed in the Draft PEIR (Vol. 3, Chapter 5, Sections 5.3 through 5.5). The potential impacts on biological resources related to individual WSIP facility improvement projects are evaluated at a programmatic level in Section 4.6 (Vol. 2, Chapter 4, pp. 4.6-37 to 4.6-74). As this comment does not address the adequacy or accuracy of the PEIR, no additional response is provided.

SI_CNPS-WLJ-02 This comment opposes additional Tuolumne River diversions and promotes additional water conservation to meet future water demand in the SFPUC service area. It should be noted that the projected increase in customer purchase requests through 2030 is 35 mgd, and not 38 mgd as implied by this commenter. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects proposed by the SFPUC and its wholesale customers.

Center for Resource Solutions, Meredith Wingate, Brad Drda, Director Clean Energy Policy Design and Implementation Program, 09/26/07

SI_CRS-01 This comment expresses opposition to additional Tuolumne River diversions and requests that additional studies be conducted before the PEIR is finalized. Please refer to **Response SI_Caltrout-01** for response.

SI_CRS-02 The background information related to the Tuolumne River provided by the commenter is acknowledged; however, as it does not address the adequacy or accuracy of the PEIR, no additional response is provided. Please refer to **Section 14.5**, **Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

SI_CRS-03 This comment incorrectly states that the WSIP ignores conservation, efficiency, and recycling measures. Please refer to the Draft PEIR, Section 3.6.1, Proposed Nondrought Water Supply (Vol. 1, Chapter 3, pp. 3-34 to 3-36) and the last three projects listed in Table 3.10, WSIP Facility Improvement Projects (Vol. 1, Chapter 3, pp. 3-49 to 3-56) for information regarding the conservation measures, recycled water projects, and groundwater projects that would be implemented under the WSIP. The topics raised in this comment have also been submitted by numerous commenters; please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) under the heading Frequently Submitted Comments Addressing Conservation and Recycling, for additional information.

SI_CRS-04 This comment, which expresses concern that the SFPUC risks delaying its capital improvement program, causing cost overruns, and failing to increase the reliability of the water supply, is acknowledged. The Draft PEIR evaluated the potential impacts of climate change/global warming on the implementation of the WSIP (Vol. 3, Chapter 5, pp. 5.7-92 through 5.7-96). Please also refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14) for additional information on climate change as it relates to the SFPUC regional water supply and the proposed WSIP.

SI_CRS-05 The recommendations included in this comment—that the SFPUC reevaluate water demand projections; that a study be conducted to determine maximum potential conservation and efficiency; and that any additional demand be met through increased investment in conservation, efficiency, and recycling—have been submitted by numerous commenters; please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14). The Draft PEIR evaluated a No Purchase Request Increase Alternative (Vol. 4, Chapter 9, pp. 9-40 to 9-47) and an Aggressive Conservation/Water Recycling and Local Groundwater Alternative, one variation of which involved no supplemental water from the Tuolumne River (Vol. 4, Chapter 9, pp. 9-47 to 9-59). Neither of these was identified as the environmentally superior program alternative (refer to Vol. 4, Chapter 9, pp. 9-95 and 9-96). Regarding the suggestion to invest in conservation, refer to Tables 14.2-2, 14.2-3, and 14.2-4 (Vol. 7, Chapter 14, Section 14.2), which identify the measures the SFPUC is currently implementing and planning to implement under the WSIP. As the comment does not specify the particular issue(s) for which the commenter believes the demand and conservation studies are flawed or inaccurate, no additional response is provided.

SI_CRS-06 The recommendation from the Center for Resource Solutions—that the SFPUC adopt a policy of reducing diversions from the Tuolumne River over time—is acknowledged. The Draft PEIR describes existing SFPUC water resources policies related to the WSIP in Table 2.3 (Vol. 1, Chapter 2, pp. 2-45 to 2-46).

SI_CRS-07 This comment requests that a comprehensive watershed study be conducted to adequately assess the environmental impacts of the WSIP. Please refer to **Response SI_Caltrout-01** for response.

SI_CRS-08 This comment, which expresses support for the Aggressive Conservation/Water Recycling and Local Groundwater Alternative (No Supplemental Tuolumne River Water) and the Year-round Desalination at Oceanside Alternative, is acknowledged.

Central Sierra Environmental Resource Center, Brenda Whited, Staff Biology, 09/10/07

SI_CSERC-01 This comment, which supports the views of the Tuolumne River Trust regarding the WSIP, is noted.

SI_CSERC-02 This comment, which expresses support for the Aggressive Conservation/Water Recycling and Local Groundwater Alternative and for the implementation of additional conservation measures to offset the need for additional Tuolumne River diversions, is noted. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional response related to conservation programs and recycling projects proposed by the SFPUC and its wholesale customers.

Clean Water Action, Jennifer Clary, Water Policy Analyst, 10/01/07

SI_CWA1-01 The commenter states, albeit incorrectly, that the Stage 2 Disinfectants and Disinfection Byproducts Rule (DBP Rule) is neither mentioned nor analyzed in the Draft PEIR, and indicates that a justification for not including it should be provided. Chapter 2 of the Draft PEIR (Vol. 1, p. 2-32) lists the Stage 2 DBP Rule as one of the major federal drinking water regulations that would apply to the WSIP. As described in the Draft PEIR (Vol. 1, Chapter 3, pp. 3-26 and 3-27), the WSIP proposes a change in treatment processes so that the Hetch Hetchy water supply will meet the *Cryptosporidium* inactivation requirement stipulated in the U.S. EPA's Long Term 2 Enhanced Surface Water Treatment Rule. However, because the SFPUC implements chloramination of its water supply, no treatment changes would be required to achieve compliance with the U.S. EPA's Stage 2 DBP Rule. Since chloramination of the regional water supply began in February 2004, the average levels of the regulated total trihalomethanes and five haloacetic acids (as measured at compliance monitoring locations in San Francisco and throughout the transmission system) have been less than 50 percent of the corresponding maximum contaminant levels. The existing and ongoing chloramination treatment has substantially improved the SFPUC's ability to comply with the Stage 2 DBP Rule; therefore, the WSIP does not propose any further treatment processes or facilities to comply with this rule.

SI_CWA1-02 The commenter is correct in noting that the increased water demand by 2030 associated with the WSIP would result in increased water usage, which would in turn likely result in increased wastewater discharges. Changes in wastewater discharges into receiving waters in the SFPUC service area would be an indirect effect associated with implementation of the WSIP, since increases in water supply usage are directly correlated to increases in wastewater discharges. Insofar as the WSIP would result in changes in municipal and domestic water use patterns, there could be associated changes in wastewater discharge patterns for municipal and industrial uses. The Draft PEIR addresses the indirect effects of growth in Chapter 7 (Vol. 4, pp. 7-60 to 7-78); as the analysis indicates, these effects—including impacts on wastewater treatment facilities and wastewater treatment capacities—have been identified as significant but mitigable in the environmental impact reports prepared on the general and specific plans within the SFPUC service area. The analysis of impacts associated with increased wastewater discharges, if any, including potential increases in pollutant loading to San Francisco Bay, would be covered as part of the CEQA review of any changes to individual wastewater treatment and disposal facilities in the regional service area, if needed, although it is likely that minor, incremental increases in wastewater discharges may already be covered by existing environmental documentation.

Clean Water Action, Jennifer Clary, Water Policy Analyst, 09/20/07

[See Public Hearing Transcript, San Francisco City Hall, September 20, 2007, pp. 20–23]

SI_CWA2-01 This comment requests that the PEIR evaluate the impacts of climate change as a result of the WSIP in greater detail. Please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14) for additional discussion of climate change to augment the discussion presented in Section 5.7.6 of the Draft PEIR (Vol. 3, Chapter 5, pp. 5.7-92 to 5.7-96). Section 4.11 provides more detailed and up-to-date information on climate change as it relates to the SFPUC regional water supply and the proposed WSIP.

District 3 Democratic Club, Tony Gantner, President, 09/20/07

SI_D3Dem1-01 The potential environmental impacts of the additional diversions from the Tuolumne River proposed under the WSIP are presented in the Draft PEIR in Vol. 3, Chapter 5, Sections 5.1 through 5.5. As this comment does not specify the particular issue(s) for which the commenter believes the Draft PEIR analysis is inadequate, no additional response is provided.

SI_D3Dem1-02 This comment expresses the opinion that increases in future water demand due to population growth could be offset by additional conservation and recycling. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional response related to conservation programs and recycling projects proposed by the SFPUC and its wholesale customers.

District 3 Democratic Club, Tony Ganter, President, 09/20/07

[See Public Hearing Transcript, San Francisco City Hall, September 20, 2007, pp. 12–13]

SI_D3Dem2-01 This comment opposing additional Tuolumne River diversions is noted.

SI_D3Dem2-02 The comment expresses the opinion that the Draft PEIR does not properly identify or address the impacts of taking more water from the Tuolumne River. The Draft PEIR identifies and addresses the impacts of taking more water from the Tuolumne River as required by CEQA (Vol. 3, Chapter 5, Sections 5.3.1 through 5.3.9). The projections of future water demand that would be satisfied by increased water diversions from the Tuolumne River, increased water conservation and recycling, and increased use of local groundwater are provided in the Draft PEIR (Vol. 1, Chapter 3, pp. 3-16 to 3-21). As the commenter accurately notes, the increased water demand is due to customers outside of the city of San Francisco.

SI_D3Dem2-03 This comment expresses the opinion that increases in future water demand due to population growth could be offset by additional conservation and recycling. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional response related to conservation programs and recycling projects proposed by the SFPUC and its wholesale customers.

Ecology Center,
Martin Bourque, Executive Director, 10/03/07

SI_EcoCtr-01 This comment requesting that the SFPUC undertake additional studies prior to finalizing the PEIR is acknowledged. Please refer to **Response SI_Caltrout-01** for response.

SI_EcoCtr-02 This comment expresses support for the Aggressive Conservation/Water Recycling and Local Groundwater Alternative (No Supplemental Tuolumne River Water) and the Year-round Desalination at Oceanside Alternative, and promotes greater conservation, efficiency, and recycling to prevent additional Tuolumne River diversions. Comment noted. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional response related to conservation programs and recycling projects proposed by the SFPUC and its wholesale customers.

Environmental Defense,
Spreck Rosekrans, Senior Analyst, 10/01/07

SI_EnvDef-01 This comment, which summarizes the WSIP goals and expresses support for the facility improvement projects necessary to repair existing infrastructure and protect the regional water system from seismic events and other disasters, is acknowledged.

SI_EnvDef-02 This recommendation to pursue a two-tiered approach that separates the seismic improvements from the proposed changes in water supply sources is acknowledged. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.5) regarding the integration of the seismic improvements and water supply options to meet program objectives and for a discussion of the advantages of using a program EIR to evaluate the proposed program as a whole.

SI_EnvDef-03 This comment incorrectly states that the alternatives considered in the Draft PEIR include up to 35 million gallons per day (mgd) in increased diversions from the lower Tuolumne River. Under the proposed program, 35 mgd represents the increase in purchase requests from the SFPUC regional system that are projected to occur by 2030 compared to the purchase requests under existing conditions (2005). Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the difference between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions. Table 9.5 (Vol. 4, Chapter 9, p. 9-13) presents the average annual increase in Tuolumne River diversions under each of the CEQA alternatives evaluated in the Draft PEIR, and an updated table showing average annual Tuolumne River diversions under the Modified WSIP Alternative is included in **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14, Table 14.10-1). The commenter's opinion that it is time to put water back into California's rivers rather than take more water out is acknowledged.

The commenter notes that the proportion of unimpaired flow diverted collectively by the SFPUC, Turlock Irrigation District (TID), and Modesto Irrigation District (MID) in dry and critically dry years is greater than it is in average years. The information cited by the commenter is generally consistent with assumptions used in the preparation of the Draft PEIR.

SI_EnvDef-04 This comment indicates that the commenter agrees with the conclusions in the Draft PEIR—that the environmental effects of the WSIP on Chinook salmon in the lower Tuolumne River are potentially significant. However, as indicated in the Draft PEIR (Volume 3, Chapter 5, Sections 5.1 through 5.5), all potentially significant impacts on resources in the lower Tuolumne River could be reduced to a less-than-significant level with implementation of mitigation measures prescribed in the PEIR. Mitigation measures developed for the purpose of offsetting the effects of the WSIP on the lower Tuolumne River include either Measure 5.3.6-4a (Vol. 4, Chapter 6, p. 6-48) or Measure 5.3.6-4b (pp. 6-48 and 6-49) for impacts on fisheries, and either Measure 5.3.6-4a or Measure 5.3.7-6 (pp. 6-50 and 6-51) for impacts on biological resources. Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Sections 4.7.8 and 4.7.9) for supplementary information on Chinook salmon along this reach of the river, and for additional discussion of Measures 5.3.6-4a and 5.3.6-4b, including text revisions to Measure 5.3.6-4b that add further definition to the habitat enhancement effort.

SI_EnvDef-05 This comment, which expresses concern about impacts on the San Joaquin River and the Bay-Delta estuary due to the WSIP, is acknowledged. Please refer to **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14, Section 14.8.3) for a review and update of the Draft PEIR analysis of these issues.

SI_EnvDef-06 This comment, which expresses the opinion that it is time to reverse the trend of increased development of water supplies in the Bay-Delta and Central Valley watersheds and leave more water in these rivers, is acknowledged. Since this comment does not address the adequacy or accuracy of the Draft PEIR, no further response is necessary.

SI_EnvDef-07 This comment, which supports opportunities for agricultural conservation along the lower Tuolumne River as a way to offset incremental increases in Tuolumne River diversions while providing water supplies for the Bay Area, is acknowledged. Please refer to **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14, Section 14.10.3) for a discussion of agricultural water conservation in the services areas of TID, MID, and/or another water agency as a means of securing water for the conserved water transfer to the SFPUC.

SI_EnvDef-08 This comment expressing support for the Lower Tuolumne River Diversion Alternative is acknowledged. As indicated in the Draft PEIR (Vol. 4, Chapter 9, Table 9.5, p. 9-13), the average annual increase in Tuolumne River diversions under this alternative would be the same as under the proposed program.

SI_EnvDef-09 This comment, which suggests that the SFPUC install the physical capacity and secure the appropriate institutional agreements to access Delta supplies as backup in case Tuolumne supplies are not available, is acknowledged. The alternatives analysis section of the Draft PEIR provides a discussion of Delta diversions, including a potential connection to the California Aqueduct or Delta-Mendota Canal, as part of rejected strategies/concepts that affect water supply sources (Vol. 4, Chapter 9, pp. 9-125 and 9-126). This concept was eliminated from further consideration due to uncertainties regarding the availability of water supplies and pumping capacities.

SI_EnvDef-10 This comment expresses support for aggressive urban water conservation programs and recommends that the discussion of urban conservation potential be continued throughout the development of future water supplies. Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) and **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14, Section 14.10.3) for additional response related to conservation programs and recycling projects proposed by the SFPUC and its wholesale customers.

SI_EnvDef-11 This comment supporting the use of groundwater as supplemental drought-year supplies is noted.

SI_EnvDef-12 This comment supports the continued consideration of the Year-round Desalination at Oceanside Alternative and Regional Desalination for Drought Alternative (same as WSIP Variant 2), but cautions that a desalination project must address entrainment issues and must either include a plan to provide energy through renewable resources or implement full mitigation for emissions incurred by its energy use. These issues are addressed in the environmental analysis of these alternatives in Draft PEIR Sections 9.2.6 and 9.2.7 (Vol. 4, Chapter 4, pp. 9-66 to 9-78).

SI_EnvDef-13 This comment, which supports implementation of the Calaveras Dam Replacement project (SV-2) to restore the design capacity of Calaveras Reservoir (96,800 acre-feet), is acknowledged.

SI_EnvDef-14 The commenter's support of steelhead restoration in Alameda Creek and removal of the Alameda Creek Diversion Dam is acknowledged. Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14) for further discussion of steelhead in Alameda Creek.

SI_EnvDef-15 Please refer to **Response SI_EnvDef-07**, above.

SI_EnvDef-16 This comment supports opportunities for both agricultural and urban conservation and expresses Environmental Defense's interest in the restoration of Hetch Hetchy Valley and the protection of the Tuolumne River between Hetch Hetchy and Don Pedro Reservoirs. This comment is acknowledged. Refer to **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14, Section 14.10.3) for additional information related to agricultural conservation along the lower Tuolumne River. Refer to

Section 14.6, Master Response on Upper Tuolumne River Issues (Vol. 7, Chapter 14) for further discussion of the Tuolumne River between Hetch Hetchy and Don Pedro Reservoirs.

SI_EnvDef-17 In this comment, Environmental Defense expands on one of the themes contained in the Bay Area Water Supply and Conservation Agency's (BAWSCA) comments on the Draft PEIR related to the Modified WSIP Alternative, and expresses support for opportunities for BAWSCA member agencies to invest in water efficiency initiatives in the agricultural areas adjacent to the Tuolumne River itself. Please refer to **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14) for relevant discussion.

Greenpeace, Krikor Didonian, 09/22/07

SI_GreenP-01 Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.5) and **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.6) for clarification regarding current and estimated future municipal and agricultural diversions from the Tuolumne River. The commenter's opinion with respect to increased diversions is noted. Also refer to **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14) for additional information.

SI_GreenP-02 This comment, which states that the demand modeling in the Draft PEIR is flawed and inflates projected future needs, has been submitted by numerous commenters; please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2).

SI_GreenP-03 This comment asserts that the PEIR fails to properly identify and address all of the impacts of taking more water from the Tuolumne River due to lack of adequate baseline data. Please refer to **Response SI_Caltrout-01** for a response to this comment.

SI_GreenP-04 Please refer to the discussion presented in Section 5.7.6 of the Draft PEIR (Vol. 3, Chapter 5, pp. 5.7-92 to 5.7-96) and **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14) for additional discussion of climate change effects on the regional water system. Section 14.11 provides detailed and up-to-date information on climate change as it relates to the SFPUC regional water supply and the proposed WSIP.

SI_GreenP-05 This comment promotes conservation, efficiency, and recycling as the best way to provide for the water needs of the Bay Area in a sustainable manner. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling water projects proposed by the SFPUC and its wholesale customers.

Golden West Women Flyfishers, Cindy Charles, Conservation Chair, 09/29/07

SI_GWWF1-01 This comment opposing any additional Tuolumne River diversions is acknowledged.

SI_GWWF1-02 This comment expresses concerns related to the effects of additional Tuolumne River diversions on restoration efforts aimed at protecting fall-run Chinook salmon and Central Valley steelhead below La Grange Dam. As described in the Draft PEIR, the San Francisco Planning Department determined that long-term WSIP-induced flow changes in the Tuolumne River below La Grange Dam could have a significant adverse effect on anadromous fish, including fall-run Chinook salmon, along this reach of river (Vol. 3, Chapter 5, pp. 5.3.6-28 to 5.3.6-32). Regarding potential impacts on steelhead below La Grange Dam, the Draft PEIR provides setting information and a discussion on the presence of steelhead within the Tuolumne River (Vol. 3, Chapter 5, pp. 5.3.6-1 to 5.3.6-24). However, the data on habitat conditions within the lower Tuolumne River indicate that this reach of the river is unsuitable for significant populations of steelhead due to high temperatures during the summer months. Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.3) for additional information.

The Draft PEIR acknowledged that the WSIP's small but incremental contribution to adverse effects on the lower river would make planned restoration of habitat and fishery resources more difficult. As a result, the impact of the WSIP on these fishery resources in the lower Tuolumne River was determined to be potentially significant. Implementation of Mitigation Measures 5.3.6-4a, Avoidance of Flow Changes by Reducing Demand for Don Pedro Reservoir Water, or 5.3.6-4b, Fishery Habitat Enhancement, would reduce these impacts to a less-than-significant level (Vol. 4, Chapter 6, pp. 6-48 and 6-49). Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Sections 14.7.2, 14.7.8, and 14.7.9) for supplementary information on the presence of Chinook salmon along this reach of the lower river, and additional discussion on Mitigation Measures 5.3.6-4a and 5.3.6-4b, including text revisions to Measure 5.3.6-4b that add further definition to the habitat enhancement effort.

Golden West Women Flyfishers, Cindy Charles, Chairperson, 09/20/07

[See Public Hearing Transcript, San Francisco City Hall, September 20, 2007, pp. 14–15]

SI_GWWF2-01 The range of current urban and rural diversions from the Tuolumne River presented in this comment is inaccurate. Please refer to **Section 14.6, Master Response on Upper Tuolumne Issues** (Vol. 7, Chapter 14, Section 14.6.5) and **Section 4.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.6) for clarification regarding current and estimated future municipal and agricultural diversions from the Tuolumne River.

SI_GWWF2-02 This comment expresses concerns related to the effects of the WSIP facility improvement projects and changes in water supply and system operations on restoration efforts aimed at improving steelhead passage in the Alameda Creek watershed. Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.4 and 14.9.5), for discussion of protective measures for steelhead in Alameda Creek.

Klamath-Siskiyou Wildlands Center, Joseph Vaile, Campaign Director, 09/27/07

SI_KSWC-01 This comment requesting that additional studies of the Tuolumne River be conducted before the PEIR is finalized, is acknowledged. Please refer to **Response SI_Caltrout-01** for a response to this comment.

SI_KSWC-02 This comment expresses support for the CEQA alternatives that do not include additional Tuolumne River diversions and promotes additional conservation, efficiency, and recycling to prevent the need for additional Tuolumne River diversions. Comment noted. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects proposed by the SFPUC and its wholesale customers.

Menlo Business Park LLC (on behalf of DLA Piper US LLP), J. Wesley Skow, Attorney, 12/12/2007

SI_MenloBP-01 This is an opening statement regarding the detailed comments submitted by DLA Piper on behalf of Menlo Business Park LLC presented in Comments SI_MenloBP-02 through SI_MenloBP-09; refer to **Responses SI_MenloBP-02** through **SI_MenloBP-09** for the specific responses.

SI_MenloBP-02 The commenter notes that easements located adjacent to the Menlo Business Park were purchased from the City and County of San Francisco (CCSF). The commenter is concerned with parking, access, and landscaping within the easements during construction of the Bay Division Pipeline (BDPL) Reliability Upgrade project (BD-1). Please refer to **Section 14.4**, **Master Response on PEIR Appropriate Level of Analysis** (Vo1. 7, Chapter 14, Section 14.4.2) for detailed discussion of the issues raised by this comment. The master response provides information on the appropriate level of detail of an impact analysis at the program level versus the project level. The project-level EIR for this project will analyze the impacts of construction in more detail based on the most up-to-date design details and will identify additional mitigation measures for significant impacts if needed.

SI_MenloBP-03 The commenter summarizes more detailed comments presented under Comments SI_MenloBP-04 through SI_MenloBP-08; refer to **Responses SI_MenloBP-04** though **SI_MenloBP-08** for the specific responses. Please also refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2) for information on the appropriate level of detail of an impact analysis at the program level versus the project level.

SI_MenloBP-04 The commenter acknowledges that the Draft PEIR appropriately considers impacts associated with construction under the BDPL Reliability Upgrade project (BD-1). However, the commenter raises concerns regarding the impacts of open-trench construction on access to driveways and streets as well as to buildings within the Menlo Business Park. In the Draft PEIR, Impact 4.8-3 (Vol. 2, Chapter 4, p. 4.8-23) acknowledges that access to local businesses could be disrupted during construction of this project. As part of the project's traffic control plan, Mitigation Measure 4.8-1a (Vol. 4, Chapter 6, p. 6-31) will require coordination with facility owners or administrators of sensitive land uses such as police, fire, etc. (see bullet item #14) and will require that pedestrian access be maintained during project construction where it is safe to do so (see bullet item #9). As indicated in **Response SI_MenloBP-02**, the project-level EIR for this project will analyze these construction-related access impacts in more detail based on the most up-to-date design details and will identify additional mitigation measures for significant impacts. Please also refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2) for information on the appropriate level of detail of an impact analysis at the program level versus the project level.

SI_MenloBP-05 The commenter requests that the project-level EIR for the BDPL Reliability Upgrade project (BD-1) include an assessment of construction impacts at the Menlo Business Park, which utilizes easements on SFPUC land for parking and for ingress and egress to the business park. The commenter is correct in stating that the localized impacts of project construction are more appropriately addressed in the project-level EIR. As indicated in **Response SI_MenloBP-02**, the project-level EIR for this project will analyze the localized impacts of construction in more detail. Please also refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.2) for information on the appropriate level of detail of an impact analysis at the program level versus the project level.

SI_MenloBP-06 The commenter raises concerns regarding construction impacts within portions of the SFPUC right-of-way currently used for parking by Menlo Business Park tenants and customers. Draft PEIR Impact 4.8-4 (Vol. 2, Chapter 4, p. 4.8-26) acknowledges that on-street parking would be temporarily displaced at some locations during construction of the BDPL Reliability Upgrade project (BD-1). The Draft PEIR indicates that temporary parking impacts would be mitigated to a less-than-significant level through implementation of SFPUC Construction Measure #5 (Vol. 4, Chapter 6, p. 6-5), which requires preparation of a traffic control plan, and through the additional traffic control measures identified in Mitigation Measure 4.8-1a (Vol. 4, Chapter 6, p. 6-30). The project-level EIR for the BDPL Reliability Upgrade project will analyze the localized construction-related impacts in more detail, including temporary effects on parking capacity and access to adjacent land uses, and will identify additional mitigation measures for significant impacts.

SI_MenloBP-07 The commenter identifies concerns related to the displacement of parking within the SFPUC right-of-way currently used by tenants and customers of the Menlo Business Park, and requests that the project-level EIR for the BDPL Reliability Upgrade project (BD-1) include coordination with the Menlo Business Park and individual business owners. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.3) for additional discussion of the issues raised by this comment. Requested coordination of the BDPL Reliability Upgrade project with the Menlo Business Park to minimize parking impacts has been added to Table C.6 (Vol. 5, Appendix C, p. C-26) for consideration in the project-level EIR for this project.

SI_MenloBP-08 The commenter is concerned with the timeline of post-construction restoration along CCSF easements in the vicinity of the Menlo Business Park following implementation of the BDPL Reliability Upgrade project (BD-1). As required by SFPUC Construction Measure #10 (Project Site), in cases where construction easements or staging areas are located on non-SFPUC land, the SFPUC will restore these areas to their prior condition so that the owner may return them to their previous use, unless otherwise arranged with the property owner. At the time of Draft PEIR preparation, detailed information related to the construction of individual facility projects was not available. The project-level CEQA document for the BDPL Reliability Upgrade project will provide a more detailed analysis of the potential impacts of construction activities on surrounding land uses.

SI_MenloBP-09 This is a closing statement. No response is needed.

Northern California/Nevada Council of the Federation of Fly Fishers Steelhead Committee, Dougald Scott, Chair, 09/23/07

SI_NCFFSC-01 The commenter states that under the WSIP the SFPUC would divert an additional 25 million gallons per day (mgd) from the Tuolumne River. The Draft PEIR indicates that the WSIP proposes to meet an increase in average annual purchase requests of 25 mgd and to divert an additional annual average of 27 mgd from the Tuolumne River to meet the requests. For clarification, please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9).

The Draft PEIR describes the decline of the Chinook salmon population in the Tuolumne River (Vol. 3, Chapter 5, pp. 5.3.6-13 to 5.3.5-17). The most recent data (not included in the Draft PEIR) show the decline continuing, with very low numbers of salmon returning to spawn in the Tuolumne River in 2005 and 2006.

As the commenter notes, the San Francisco Planning Department concluded that WSIP-caused changes in river flow would have a potentially significant adverse effect on anadromous fish in the Tuolumne River below La Grange Dam (Vol. 3, Chapter 5, pp. 5.3.6-28 to 5.3.6-32). In reaching this conclusion, the Planning Department considered both Chinook salmon and steelhead. However, implementation of Mitigation Measure 5.3.6-4a, Avoidance of Flow Changes by Reducing Demand for Don Pedro Reservoir Water, or Mitigation Measure 5.3.6-4b, Fishery Habitat Enhancement (Vol. 4, Chapter 6, pp. 6-48 and 6-49) would reduce these impacts to a less-than-significant level. One of the mitigation measures, Measure 5.3.6-4a, would greatly reduce the effects of the WSIP on flow in the Tuolumne River below La Grange Dam.

SI_NCFFSC-02 As the commenter notes, the WSIP would reduce flow in the San Joaquin River and the Delta. The San Francisco Planning Department concluded that the WSIP could potentially affect fish and fish habitat in the San Joaquin River, but that the impact would be less than significant (Vol. 3, Chapter 5, pp. 5.3.6-32 and 5.3.6-33). This determination was made because WSIP-caused flow reductions and increased water temperatures would only be of sufficient magnitude to adversely affect fish habitat conditions in the San Joaquin River very infrequently. Because the Planning Department concluded that WSIP-caused changes in river flow would have a potentially significant adverse effect on anadromous fish in the Tuolumne River below La Grange Dam, the Draft PEIR includes mitigation measures that would reduce the impacts a less-than-significant level (Measures 5.3.6-4a and 5.3.6-4b, Vol. 4, Chapter 6, pp. 6-48 and 6-49). Measure 5.3.6-4a, which was designed to reduce the effects of the WSIP on flow in the Tuolumne River below La Grange Dam, would also reduce the effects of the WSIP on flow in the San Joaquin River and the Delta.

The State Water Resources Control Board has promulgated water quality and flow objectives for the Delta designed to protect anadromous fish. The California Department of Water Resources (DWR) and the U.S. Bureau of Reclamation (USBR), the largest water diverters from the Delta, are responsible for maintaining compliance with the objectives for the Delta. Most of the time the changes in flow resulting from the WSIP would be too small to have any effect on the ability of the DWR and USBR to meet the Delta objectives. Occasionally, after a long sequence of dry years, the WSIP could change flows in the San Joaquin River at Vernalis and in the Delta by an amount that could affect the two agencies' ability to meet Delta objectives. During such times, the DWR and USBR would have to curtail diversions or release water from their reservoirs to meet the Delta objectives. For this reason, it was concluded that the flow changes associated with WSIP would have no effect on Delta fisheries. For additional information on the DWR and USBR obligations with respect to Delta standards, please refer to the Draft PEIR (Vol. 3, Chapter 5, Section 5.3.4) and **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14, Section 14.8.2).

In recent years, it has become apparent that the water quality and flow objectives for the Delta are insufficient to protect all fish species. Delta smelt, an endangered species, has been in decline for many years. Many biologists attribute its decline to the large-scale diversion of water from the Delta by the State Water Project and Central Valley Project. A 2000 Record of Decision for the CALFED EIR/EIS established an Environmental Water Account that enables pumping curtailments at times when delta smelt are present in the vicinity of the pumps without a loss of water to the DWR's and USBR's contractors. Despite the creation and operation of the Environmental Water Account, the decline of delta smelt has continued. In December 2007, the Wanger Decision rejected a federal biological opinion with respect to delta smelt, a judgement that led to further curtailments of pumping by the State Water Project and Central Valley Project.

The Wanger Decision has accelerated efforts to find ways to better balance the need for water supply, flood reduction, and environmental protection in the Delta. The next decade is likely to see changes in physical facilities in the Delta, water management system operations, and environmental regulations. Whatever the future changes in facilities, operations, and regulations, it is not expected that the WSIP would have a substantial effect on environmental quality in the Delta. This is because the increment in diversion of water associated with the WSIP represents a small proportion of all water diverted upstream of the Delta.

SI_NCFFSC-03 This commenter's suggestion (to modify the minimum flow schedule set forth in the 1997 California Department of Fish and Game Memorandum of Understanding for Alameda Creek below the confluence of Alameda and Calaveras Creeks) is acknowledged. The commenter's support for minimum flows for Alameda Creek below the diversion dam is acknowledged.

Please refer to **Section 14.9, Master Response on Alameda Creek Fishery Issues** (Vol. 7, Chapter 14, Section 14.9.4) for more information on this topic.

SI_NCFFSC-04 The commenter states that the WSIP and Draft PEIR do not adequately address strategies and conservation measures to replace increased diversions from the Tuolumne River. The Draft PEIR examined several WSIP variants and CEQA alternatives that would reduce diversions from the Tuolumne River compared to the WSIP (Vol. 4, Chapters 9 and 10). Several of the CEQA alternatives propose conservation measures that go beyond those included in the WSIP. The WSIP variants and CEQA alternatives include Variant 2, Regional Desalination for Drought, the No Program Alternative, the No Purchase Request Increase Alternative, the Aggressive Conservation/Water Recycling and Local Groundwater Alternative, the Year-round Desalination at Oceanside Alternative, and the Modified WSIP Alternative. Also, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter14, Section 14.2). In addition, see **Section 13.4, Phased WSIP Variant**, for updated strategies to augment conservation and water recycling and to reduce effects on the Tuolumne River.

The commenter's reference to a 25-mgd increase in diversions from the Tuolumne River is incorrect. Please refer to **Response SI_NCFFSC-01**, above.

Pacific Institute
Dr. Peter H. Gleick, President, 10/1/2007

Introduction

The report presented as part of this submittal (beginning at Comment SI_PaciInst-25) was prepared in August 2006, before the WSIP Draft PEIR was published. References to information on the SFPUC service area apparently are largely based on material provided as background information for the Sustainable Water Supply Briefing held on September 28, 2006. The Sustainable Water Supply Briefing document (SFPUC, 2006a) is on file and available for review at the offices of the San Francisco Planning Department, Major Environmental Analysis Division. At the request of the participating groups, the SFPUC provided technical background information using its demand models. That information is not derived from the Draft PEIR but is consistent with it (and the underlying data used in the demand models is the same).

The responses presented below include information provided by the SFPUC's technical consultant Mr. Bill Maddaus. Mr. Maddaus has expertise in the development and evaluation of water demand projections and conservation programs; he assisted the SFPUC and Bay Area Water Supply and Conservation Agency (BAWSCA) in the development of the wholesale customer demand projections and conservation assessment conducted as part of the planning effort used to develop the WSIP.[1] Mr. Maddaus reviewed the Pacific Institute comment letter and provided information to assist in addressing questions about how water conservation potential in the SFPUC service area was evaluated and incorporated into the WSIP (Maddaus, 2008). Maddaus Water Management modeled demand and conservation potential in the wholesale customer service area using the Demand Side Management Least-Cost Planning Decision Support System (DSS) end-use model. In the following responses, Mr. Maddaus is referred to as the SFPUC's DSS technical consultant.

Many of the comments in this submittal were also submitted by other commenters and are addressed in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14); more detailed and specific comments that concern the same issues but are unique to this submittal are addressed in the individual responses below. The comments addressed herein largely critique the SFPUC's demand projections as too high and the conclusions regarding conservation and recycled water potential as too low. As discussed in the responses below, and in Section 14.2, the SFPUC and its technical consultants relied on reasonable assumptions and used accepted methodologies to forecast demand as well as conservation and recycled water potential within the service area, and the Draft PEIR reflects the City and County of San Francisco's (CCSF) best efforts at analysis and disclosure. Even if the SFPUC overestimated demand and underestimated conservation and recycled water potential, the likely effect would be a reduction in the use of water from the Tuolumne River and local

1 The *SFPUC Wholesale Customer Water Demand Projections Technical Report* prepared by URS Corporation and Maddaus Water Management, 2004 (URS, 2004a) and the *SFPUC Wholesale Customer Water Conservation Potential Technical Report* prepared by URS Corporation, Maddaus Water Management, and Jordan Jones and Goulding, 2004 (URS, 2004b).

watersheds, which could result in a reduction in impacts on those watersheds. Also, to the extent that the SFPUC has overestimated demand based on growth projections, the PEIR may overestimate the impacts associated with induced growth. The comments regarding the accuracy of conservation and recycled water potential may be taken into account by decision-makers in evaluating the feasibility of alternatives, but do not indicate that the PEIR underestimated the impacts of the WSIP.

SI_PacInst-01 This comment questioning the need for additional water supplies is prefatory to more detailed comments that follow; please refer to **Responses SI_PacInst-03** through **SI_PacInst-97** and to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14) and other master responses as indicated. In addition, the Draft PEIR (Vol. 1, Chapter 3, pp. 3-16 to 3-22, and Vol. 5, Appendix E.2) describes the methodology used to develop demand projections and determine the portion of that demand that would be offset by conservation savings and the use of recycled water, groundwater, and other surface supplies. The demand projections and estimates of 2030 purchases necessarily entail the use of assumptions about factors that cannot be known or predicted with absolute certainty. With respect to forecasting, CEQA Guidelines Section 15144 states the following:

> Drafting an EIR or preparing a Negative Declaration necessarily involves some degree of forecasting. While foreseeing the unforeseeable is not possible, an agency must use its best efforts to find out and disclose all that it reasonably can.

The analysis in the Draft PEIR is consistent with CEQA Guidelines Section 15144. In addition to describing in detail the demand methodology (Vol. 5, Appendix E.2), the Draft PEIR presents a detailed review and comparison of the demographic projections used in the demand models with more recent projections (Vol. 4, Chapter 7, p. 7-22 and Vol. 5, Appendix E.3) and represents the CCSF's best efforts at disclosure. The PEIR does not need to accurately predict future growth and demand but rather to inform the public and decision-makers about how the alternative programs would perform in the future under consistent reasonable growth and demand assumptions in order to allow for an informed choice of program and implementation of mitigation measures. The evaluation of demand model forecasts contained in the PEIR represents the CCSF's best efforts and allows for informed consideration of the program, alternatives, and impacts.

Note also that the Draft PEIR includes an alternative that evaluates the implementation of aggressive conservation and recycling to enable the public and decision-makers to weigh the relative merits of such an alternative and the proposed program with respect to their feasibility in meeting program objectives and minimizing environmental impacts. (Refer to Draft PEIR Vol. 5, Chapter 9, pp. 9-47 to 9-59.)

SI_PacInst-02 This comment summarizes Pacific Institute's conclusions regarding its review of the SFPUC's demand projections and is a preamble to the comments that follow. Please refer to **Responses SI_PacInst-03** through **SI_PacInst-97**, **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14), and other master responses as indicated.

SI_PacInst-03 This comment incorrectly states that per-capita demand for the wholesale customers is projected to increase over current (2001) per-capita demand. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the heading Per-Capita Demand).

SI_PacInst-04 This comment states that SFPUC retail and wholesale demand does not include price-driven efficiency improvements despite an estimated quadrupling of the price of water from the SFPUC by 2015. By efficiency improvements the commenter presumably refers to implementation of conservation measures that allow the achievement of given purposes using less water. Such measures may be technological, such as replacement of water-using appliances and fixtures with ones that use less water, or behavioral, such as changing a watering schedule to minimize water losses due to evaporation and transpiration.[2] In fact, contrary to this comment, the conservation potential studies for both the wholesale and retail service areas considered the future price of water. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the heading Effects of Future Price on Water Demand). With respect to other comments on the use of water rates to encourage conservation and comparisons with studies on the effectiveness of conservation pricing raised in Comments SI_PacInst-46 and SI_PacInst-47, see **Responses SI_PacInst-46** and **SI_PacInst-47**, below.

SI_PacInst-05 This comment states that increased residential demand is largely due to outdoor water use and that the projected increase in per-capita outdoor use indicates that conservation does not adequately address outdoor residential use. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling**, (Vol. 7, Chapter 14, Section 14.2.2, under the heading Outdoor Water Use).

SI_PacInst-06 This comment, which correctly states that the nonresidential sector is responsible for over 80 percent of the projected 2030 demand increase and that 35 percent of that increase is due to outdoor use, is noted. Also refer to **Section 14.2, Master**

[2] This description of the term is consistent with the discussion of conservation and efficiency in the Pacific Institute's *Waste Not, Want Not: The Potential for Urban Water Conservation in California*, cited frequently in the SI_PacInst comments.

Response on Demand Projections, Conservation, and Recycling (Vol. 7, Chapter 14, Section 14.2.2, under the heading Outdoor Water Use) for additional information on this topic.

SI_PacInst-07 This comment, which summarizes more detailed comments made in Comment SI_PacInst-79, is addressed in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the heading Use of Total Jobs Projections for the Wholesale Customer Service Area).

SI_PacInst-08 This comment, which summarizes more detailed comments made in Comments SI_PacInst-76 and SI_PacInst-77, is addressed in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the heading Employment Projections – Use of ABAG's *Projections 2002*).

SI_PacInst-09 This comment correctly states that conservation measures (not including plumbing code savings) reduce 2030 demand by 4 percent. Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3, under the heading Frequently Submitted Comments Regarding Conservation and Recycling) regarding the studies that were undertaken to identify conservation potential, the conservation measures the SFPUC and wholesale customers are implementing or have committed to implement under the WSIP, and response regarding comparisons to other areas. Also refer to the comparison of hydrologic regions within the state in Section 14.2.3 (also under the heading Frequently Submitted Comments), which indicates that the San Francisco Bay hydrologic region has low per-capita water usage compared to other regions in the state.

SI_PacInst-10 This comment summarizes more detailed comments presented in Comments SI_PacInst-81 and SI_PacInst-82; refer to **Responses SI_PacInst-81** and **SI_PacInst-82**.

SI_PacInst-11 This comment is a preamble to recommendations made in Comments SI_PacInst-12 through SI_PacInst-24; refer to **Response SI_ PacInst-12** through **Response SI_PacInst-24**.

SI_PacInst-12 This comment states that the SFPUC should reevaluate nonresidential demand for its wholesale customers using industry-specific growth projections, water use, and conservation potential; that the initial reevaluation efforts should be regional in scope or focused on the agencies with high non-residential use; and that if the results of this effort differ from the DSS demand study, new detailed analyses should be conducted for each wholesale customer. The DSS technical consultant retained by the SFPUC to model future demand in the wholesale customer service area indicates that, in his professional judgment, it is unlikely that regional nonresidential water demand factors that would improve on the individual agency approach used in the wholesale customer demand study could be developed from available data, given that such water use factors are not available at the local level (Maddaus, 2008). Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the heading Use of Total Jobs Projections for the Wholesale Service Area). Regarding conservation, the SFPUC conducted studies, in consultation with each wholesale customer, to identify the potential for conservation measures to offset demand in the wholesale customer service area (refer to **Section 14.2,** Section 14.2.3). Note that those agencies with high nonresidential water use do not necessarily have high nonresidential water conservation potential, since conservation potential depends on how the water is being used and the current level of efficiency.

SI_PacInst-13 This comment summarizes more detailed comments made in Comment SI_PacInst-62 and is addressed in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the heading Effects of the Future Price of Water on Projected Demand).

SI_PacInst-14 This comment states that the assessment of the cost-effectiveness of conservation measures should include benefits to consumers and quantification of the value of maintaining ecosystem flows in the Tuolumne River. A community perspective benefit-cost analysis, reflecting consumer benefits, was presented to the wholesale customers (refer to **Response SI_PacInst-52** below for more information). Neither the background reports on conservation and recycled water potential nor the Draft PEIR quantify benefits to the ecosystem of the Tuolumne River in the manner suggested in this comment. The intended focus of CEQA is on potential physical environmental effects rather than social or economic effects. Therefore, the Draft PEIR includes multiple alternatives that involve a reduction in diversions from the Tuolumne River to reduce attendant environmental impacts; several of these alternatives would involve increased levels of conservation and recycling (Vol. 4, Chapter 9, beginning on p. 9-4). The evaluation of alternatives will enable decision-makers to weigh the environmental tradeoffs associated with these various approaches.

SI_PacInst-15 The statements in this comment regarding nonresidential account data and standardized reporting methods summarize more detailed comments made in Comment SI_PacInst-79, and are addressed in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the heading Use of Total Job Projections for the Wholesale Customer Service Area). The statement regarding a focus on outdoor water use apparently refers to more specific comments on nonresidential and outdoor use and conservation potential provided in Comments SI_PacInst-62, SI_PacInst-63, and SI_PacInst-80, and may also refer to more detailed comments on residential outdoor use in Comments SI_PacInst-05, SI_PacInst-71, and SI_PacInst-72. Refer to **Responses SI _PacInst-62** and **SI_PacInst-63**, below, and to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the heading Outdoor Water Use, and Section 14.2.3, under the heading Frequently Submitted Comments Addressing Conservation and Recycling). Table 14.2-8 in Section 14.2.3 shows existing and proposed conservation measures for nonresidential accounts in the wholesale customers' service areas.

SI_PacInst-16 This comment states that multiple scenarios should be included in order to determine a range of future demand. This comment is premised on the assumption that the projections method used is faulty and, as a result, demand is overstated. Comments SI_PacInst-75 through SI_PacInst-79 present the commenter's criticisms of the demand projection methodology. As indicated in **Responses SI_PacInst-75** through **SI_PacInst-79** and in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the headings Employment Projections – Use of ABAG's Projections 2002 and Use of Total Jobs for the Wholesale Customer Service Area), these criticisms do not warrant the requested changes to the demand projections methodology. In addition, given the length of time required to implement water system improvements, the advantage of multiple scenarios over the approach taken is unclear, since a decision about future demand would still, ultimately, be required based on incomplete information.

SI_PacInst-17 This comment regarding recycled water potential summarizes a conclusion from more detailed comments SI_PacInst-81 and SI_PacInst-82. Please refer to **Responses SI_PacInst-81** and **SI_PacInst-82**.

SI_PacInst-18 This comment recommending that the impact of climate change be the subject of future studies is noted. Also refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14).

SI_PacInst-19 This comment, which recommends that each agency assess the factors that drive demand and take a proactive role in identifying ways to reduce demand, is addressed in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3, under the heading Conservation Measures Suggested by Commenters).

SI_PacInst-20 This comment, which recommends that the SFPUC and its wholesale customers implement water and wastewater rate structures that encourage water conservation and fund conservation programs, is addressed in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling**

(Vol. 7, Chapter 14, Section 14.2.3, under the heading Conservation Measures Suggested by Commenters).

SI_PacInst-21 This comment expressing the opinion that all agencies should sign the CUWCC's Memorandum of Understanding (MOU) and work to implement the CUWCC's BMPs is noted; please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3, under the heading Conservation Measures Suggested by Commenters).

SI_PacInst-22 This comment recommending that the SFPUC and BAWSCA work together to implement regional conservation and recycling programs is noted. As described in the Draft PEIR (Vol. 4, Chapter 9, pp. 9-47 to 9-51), the SFPUC, in cooperation with its wholesale customers and BAWSCA, undertook a study to assess the potential for additional conservation and recycled water projects, including potential regional projects, that were not already considered to be implemented locally by 2030 as part of the WSIP purchase estimates. The results of this study provided the basis for the Aggressive Conservation/Water Recycling and Local Groundwater Alternative evaluated in the Draft PEIR (Vol. 4, Chapter 9, pp. 9-47 to 9-59) as well as an element of the Modified WSIP Alternative (Vol. 4, Chapter 9, pp. 9-78 to 9-84). Under the Modified WSIP Alternative, the SFPUC and/or BAWSCA would pursue additional efforts to generate supplemental supply and/or demand offset equivalents in the range of 5 to 10 million gallons per day (mgd). Please also refer to **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14).

SI_PacInst-23 BAWSCA performs many of the functions listed in this comment: encouraging implementation of water conservation measures, information sharing, program evaluations, and conservation data collection and reporting. Please refer to Appendix K of this Comments and Responses document (Vol. 8), which consists of a listing of the attachments provided by all commenters; it includes numerous examples and descriptions of wholesale customers' conservation and efficiency measures. Regarding economic incentives for demand reductions and conservation pricing for wholesale customers, refer to **Responses SI_PacInst-47** and **SI_PacInst-62**.

SI_PacInst-24 This comment recommends that purchases from the SFPUC be capped at current levels and that financial incentives/disincentives be instituted to encourage conservation and discourage growth in demand. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3, under the heading Conservation Measures Suggested by Commenters).

SI_PacInst-25 This comment is a preamble to more specific comments and conclusions that follow in Comments SI_PacInst-26 through SI-PacInst-84. Please refer to **Responses SI_PacInst-26** through **SI-PacInst-84**.

SI_PacInst-26 This comment provides an overview of the SFPUC system and WSIP planning that contains several minor factual errors as well as terminology that may be misleading if not clarified, as follows:

- The SFPUC now delivers water to 27 wholesale customers (not 28) (Draft PEIR, Vol. 1, Chapter 3, p. 3-5).

- The SFPUC's study of a regional supply option to offset the projected 35 mgd increase in purchases from the SFPUC system using only groundwater, recycled water, and conservation measures, entitled *Investigation of Regional Water Supply Option No. 4 Technical Memorandum* (SFPUC, 2007, Appendix D), identified projects that could potentially offset 28.5 mgd (not 28 mgd) of the projected 35 mgd increase in purchases (Draft PEIR, Vol. 4, pp. 9-47 to 9-49).

- With respect to the terminology used in this comment, the projected increase of 38 mgd for wholesale customers referenced in this comment refers to the increase in *purchases* from the SFPUC system, not the projected increase in demand (with plumbing codes) for the wholesale customers determined by the end-use demand models. While the projected purchases may be characterized as demand *specifically on the SFPUC system*, use of the term "demand" in this context could be misleading. The projected increase in demand for the wholesales customers is 52 mgd (Draft PEIR, Vol. 4, Chapter 7, Table 7.3, p. 7-18). Implementation of conservation measures and the use of other water sources (recycled water, groundwater, and other surface water) accounts for the difference between the wholesale customers' projected increase in demand and their projected increase in purchases from the SFPUC system.

This comment correctly states that a series of comprehensive studies were prepared to determine the estimated increase in purchases from the SFPUC system of 35 mgd, and that the SFPUC expects to satisfy this increase in the estimated purchases by relying on increased diversions from the Tuolumne River and offsetting 10 mgd through conservation, water recycling, and groundwater supply within the retail service area. Note that the estimated 35 mgd increase in purchases from the SFPUC system already factors in expected conservation savings, water recycling, and use of other potable supplies for the wholesale service area, as noted above in this response, but not for the retail service area. Therefore, as indicated here and in the Draft PEIR, the 35 mgd purchase estimate would be offset by the 10 mgd of conservation, water recycling, and groundwater in the retail service area.

SI_PacInst-27 This comment, which states that the wholesale and retail demand studies may overestimate future demand and underestimate demand management and the use of recycled water, is a preamble to the more specific Comments SI_PacInst-28 through SI_PacInst-35, which repeat Comments SI_PacInst-03 through SI_PacInst-10. Refer to **Responses SI_PacInst-28** through **SI_PacInst-35** for the appropriate response referrals. As the responses indicate, the commenter does not, in fact, make the case that either demand is overestimated or that conservation and recycled water use is underestimated.

Note that in this and all other comments addressing the perceived shortfall in conservation potential presented in this submittal, the comment does not address the fact that the WSIP as proposed anticipates that even with the increases in water supplies, the system will experience water shortages and that rationing will be required during extended droughts, possibly because the report presented in this submittal was prepared prior to publication of the Draft PEIR. As described in the Draft PEIR (Vol. 1, Chapter 3, pp. 3-32 et seq.), the WSIP-proposed level of service is to limit rationing (required reductions is water use) during drought periods to a maximum of 20 percent systemwide. Put another way, during an extended sequence of dry years, the wholesale and retail customers might be required to reduce water use by up to 20 percent on a systemwide basis. These cutbacks would be in addition to reductions in potable water use achieved through existing and planned conservation and recycling. As indicated in the Draft PEIR (Vol. 4, Chapter 9, p. 9-28), "To the extent that water conservation is already being practiced and will increase in the future, the more difficult it will be to implement adequate cutbacks in water use in the future to achieve the rationing that may be required during a drought period. Demand hardening refers to the increasing difficulty and expense of achieving short-term water conservation levels during shortages as more long-term conservation measures are implemented and water-use efficiency maximized." Refer to the Draft PEIR discussion related to the effects of droughts and rationing on customers (Vol. 4, Chapter 9, pp. 9-28 to 9-31).

SI_PacInst-28 This comment repeats Comment SI_PacInst-03 and is addressed in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the heading Per-Capita Demand).

SI_PacInst-29 This comment repeats Comment SI_PacInst-04; refer to **Response SI_PacInst-04**.

SI_PacInst-30 This comment repeats Comment SI_PacInst-05 and is addressed in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the heading Outdoor Water Use).

SI_PacInst-31 This comment repeats Comment SI_PacInst-06; refer to **Response SI_PacInst-06**.

SI_PacInst-32 This comment, which repeats Comment SI_PacInst-07 and summarizes more detailed comments made in Comment SI_PacInst-79, is addressed in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the heading Use of Total Jobs Projections for the Wholesale Customer Service Area).

SI_PacInst-33 This comment, which repeats Comment SI_PacInst-08 and summarizes more detailed comments presented in Comments SI_PacInst-76 and SI_PacInst-77, is addressed in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the heading Employment Projections – Use of ABAG's Projections 2002).

SI_PacInst-34 This comment repeats Comment SI_PacInst-09; refer to **Response SI_PacInst-09**.

SI_PacInst-35 This comment repeats Comment SI_PacInst-10, which in turn summarizes more detailed comments presented in Comments SI_PacInst-81 and SI_PacInst-82; refer to **Responses SI_PacInst-81** and **SI_PacInst-82**.

SI_PacInst-36 This comment stating the commenter's conclusion that demand and conservation studies are inadequate and fail to realize efficiency levels achieved elsewhere summarizes the commenter's conclusion of more specific Comments SI_PacInst-28 through SI_PacInst-35, which repeat Comments SI_PacInst-03 through SI_PacInst-10. Refer to **Responses SI_PacInst-28** through **SI_PacInst-35** for the appropriate response referrals. Also refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3, under the heading Frequently Submitted Comments Addressing Conservation and Recycling) for a discussion of comparisons to other areas. As the responses demonstrate, the "achievements elsewhere" turn out not to be valid comparisons to the SFPUC service area, and these comparisons and other related comments do not in fact support the contention that the demand and conservation studies are flawed. The comment correctly states that it is critical that water demand forecasts be based on good data and appropriate assumptions. As the referenced responses indicate, the demand and conservation studies are based on appropriate assumptions and good data. The SFPUC's water contracts with wholesale customers (see Draft PEIR, Vol. 1, Chapter 2, pp. 2-43 to 2-44) currently include provisions that wholesale customers employ best efforts to use all sources of water owned or controlled by them, including groundwater. The recommendation that the contracts be written to encourage conservation and efficiency improvements is noted.

SI_PacInst-37 This comment correctly summarizes information on the SFPUC and its service area, except that the SFPUC now delivers water to 27 wholesale customers, not 28 (Draft PEIR, Vol. 1, Chapter 3, p. 3-5). Given this change, 25—not 26—of its customers are public entities, and two are private water utilities.

SI_PacInst-38 This comment correctly summarizes information on BAWSCA and the coordination of the SFPUC and BAWSCA on a pre-rinse spray valve program, except that BAWSCA now represents 27—not 28—wholesale customers. According to Comment SI_PacInst-80 (Vol. 6, Chapter 12, Section 12.4), pre-rinse spray valves is one of the "most promising technologies" for the nonresidential sector identified in a Pacific Institute report.

SI_PacInst-39 This comment correctly states that the SFPUC and the wholesale customers depend on a variety of water sources to meet their water needs; however, to clarify, groundwater is currently the only other water source used by the SFPUC for the retail service area (although the CCSF currently uses a limited amount of recycled water (less than 1 mgd) for wastewater treatment plant process water and washdown operations; recycled water is also used in San Francisco for soil compaction and dust control during construction). That there is considerable variation in the supply mix used to meet demand for the wholesale customers is true, but certainly not "hidden," as implied by this comment. Refer to Table 3.3 (Vol. 1, Chapter 3, p. 3-18) and Table 7.2 (Vol. 4, Chapter 7, p. 7-15) and the individual customer summaries (Vol. 4, Chapter 7, pp. 7-35 to 7-59); as stated in the Draft PEIR, "the water customers vary in size, their overall projected demand for 2030, the change the 2030 demand represents in absolute terms (i.e., in mgd) and as a percentage of 2001 demand, and the degree to which they depend on the SFPUC for their water supply" (Vol. 4, Chapter 7, p. 7-34). Regarding the sources of supply used to meet 2001–2002 demand, see *SFPUC Wholesale Customer Demand Technical Report* (URS, 2004a, p. 1-3, Table 1-2) and BAWSCA Annual Surveys.

SI_PacInst-40 This comment correctly states that the SFPUC and the wholesale customers participate in a range of ongoing conservation programs; the information on signatories of the CUWCC MOU is updated as follows: the SFPUC and 14 of 27 wholesale customers are signatories of the CUWCC MOU (CUWCC, 2008), and 3 additional wholesale customers that are not signatories participate through the Santa Clara Valley Water District (SCVWD), which is a CUWCC signatory (BAWSCA, 2008, p. 75).

SI_PacInst-41 This comment and the table to which it refers correctly show the CUWCC BMPs to which the SFPUC and wholesale customers have committed to implement (SFPUC, 2006a, p. 23). The comment correctly notes that BMPs 5 and 9, which target commercial, industrial, and institutional water uses, show the lowest participation, and that BMPs 4, 6, and 11 show the highest participation. However, several measures show higher participation than BMP 8; BMP 7, Public Information, with all but two agencies participating, is among the four BMPs with the highest participation.

SI_PacInst-42 This comment, which states that although agencies may be implementing a BMP, they "may not meet the full coverage requirements of that BMP and thus may not be in compliance with the MOU," may be based on a note in the table of "Conservation Best Management Practices Implemented by BAWSCA Members - FY 2004-05" in BAWSCA's FY 2004-05 annual survey (the source cited for

Table 1 of Comment SI_PacInst-41). This comment is acknowledged. While the CUWCC does not monitor compliance with BMP requirements, agencies report annually on BMP implementation. The estimates of conservation savings submitted by the wholesale customers and assumed for WSIP planning were based on customer-specific evaluations of conservation potential in each wholesale customer service area.

SI_PacInst-43 This comment, which expresses the commenter's opinion regarding the CUWCC BMPs, and the opinion that these BMPs are a minimum level of conservation that agencies should be implementing, is noted. Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) regarding conservation measures the SFPUC and its wholesale customers are implementing or have committed to implement under the WSIP.

SI_PacInst-44 This comment correctly states that BAWSCA and the SCVWD are signatories to the CUWCC MOU and that the SCVWD implements the CUWCC BMPs among the jurisdictions its serves, including eight SFPUC wholesale customers. The information presented in the comment on BAWSCA conservation programs, citing BAWSCA's *2006 Water Conservation Programs Annual Report*, is noted. BAWSCA's *2007 Water Conservation Programs Annual Report* is included in Comment Letter L_BAWSCA1 (Vol. 6, Chapter 12, Section 12.3); see **Comment L_BAWSCA-114** for the 2007 report.

SI_PacInst-45 This comment correctly states that the SFPUC implements conservation programs among its retail customers, implements all of the CUWCC BMPs in the retail service area, coordinates with BAWSCA on a pre-rinse spray valve program, and participates in a number of regional programs, including a regional water rebate program. These are described in more detail in the Sustainable Water Supply Briefing document (SFPUC, 2006a, pp. 6 to 7).

SI_PacInst-46 This comment correctly states that conservation pricing is BMP 11 of the CUWCC's BMPs. As shown in Table 1 of this comment letter (referenced in Comment SI_PacInst-45 [Vol. 6, Chapter 12, Section 12.4]) and Tables 14.2-7 and 14.2-8 in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3), all the wholesale customers and the SFPUC (for the retail customers) implement BMP 11. The comment correctly states that the SFPUC implements increasing block rates for most of its retail customers and for wastewater for its residential customers. Note that the water rates for the SFPUC's wholesale customers are set in contractual agreements with the wholesale customers. The rate for wholesale water service is set pursuant to the Master Sales Agreement between the CCSF and the SFPUC wholesale customers.

SI_PacInst-47 This comment states that increasing block rate pricing is effective in encouraging water conservation, citing a study in the Southwest that found that per-capita water use is typically lower in cities with dramatically increasing block rates, and recommends that the SFPUC and its wholesale customers evaluate and implement water and wastewater rate structures that encourage water conservation.

As discussed in **Response SI_PacInst-62**, below, water pricing, which has been used in conjunction with other measures during drought emergencies, is recognized as an important tool that water managers have employed to reduce discretionary use. However, as discussed in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the heading Effects of Future Price of Water on Projected Demand), studies have been unable to distinguish between the effects of conservation pricing and other conservation programs when more than conservation pricing is implemented. The limitations of a tiered rate structure for effecting substantial reductions during nonemergency (normal rainfall) periods are discussed below.

All of the wholesale customers and the SFPUC (for the retail customers) implement conservation pricing (CUWCC's BMP 11), as indicated in the previous comment (Vol. 6, Chapter 12, Section 12.4) and response, and 17 of 27 wholesale customers currently have increasing block rates (SFPUC, 2006a, pp. 99 to 100). However, these customers (and others) have found that it is not possible to generate significant water savings from such rates (Maddaus, 2008). The SFPUC's DSS technical consultant has considered the feasibility and potential water savings from conservation-oriented rate structures, particularly three or more tiered rate structures (as cited in this comment) as discussed below.

A three or more tiered tariff structure provides the opportunity to address the very high water users directly. The higher blocks (third and fourth tiers, or blocks) are usually set at the levels of water use related to certain percentages of the total accounts (e.g., the top 20 percent or the top 10 percent of all accounts), with a view toward discouraging discretionary usage at these levels. According to its proponents, this type of rate structure promotes economic efficiency by charging rates that more closely reflect the costs of meeting peak demand to those who cause the need for peak capacity and this approach discourages wasteful water practices and promotes conservation through the direct message of higher prices in the realm of discretionary water use (Maddaus, 2008).

The third and fourth tiers are generally set at 15 to 20 percent above the prior tier. Sometimes the top tier is set very high to discourage peak water use if peaking is a particular problem. The reason for the nominal rate difference is that, the larger the rates are in the higher (e.g., third and fourth) tiers, the lower the first-and/or second-tier rates must be to maintain revenue neutrality. California law prohibits utilities from collecting revenues in significant excess of costs. (Note that the study cited in this comment addressed urban water use efficiency “across the southwest.”) Very large differences force the first tier rate to be so low that it becomes an affordability rate (i.e., a “lifeline” rate for low-income households) and the second block is, for all practical purposes, a single rate applied to 80 percent or more of total volume. Thus, for almost all customers (except for the relatively few that fall into the top blocks), this type of rate structure would offer no effective price-related conservation incentive (Maddaus, 2008).

Note also that this comment does not address rationing that would be imposed during drought periods and attendant demand hardening that could occur. Regarding the relationship between the implementation of long-term conservation measures and the imposition of short-term cutbacks in water use during drought periods, refer to **Response SI_PacInst-27**.

SI_PacInst-48 This comment describing the demand studies conducted in the retail and wholesale service areas is acknowledged.

SI_PacInst-49 This comment, which correctly summarizes the initial screening of conservation measures, is acknowledged.

SI_PacInst-50 This comment describes steps taken in the retail service area to model conservation potential and summarizes the commenter’s more detailed comments on the evaluation of nonresidential conservation potential presented in Comments SI_PacInst-76 through SI_PacInst-79. Refer to **Response SI_PacInst-78** and to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the headings Employment Projections – Use of ABAG’s Projections 2002 and Use of Total Jobs Projections for the Wholesale Customer Service Area).

SI_PacInst-51 The commenter’s statement regarding differing levels of commitment to conservation is noted. The description of the conservation potential studies presented in this comment is somewhat at variance with the process described in the conservation potential technical reports (URS, 2004b; Hannaford and Hydroconsult, 2004). Refer to the summary description of the screening process employed in the conservation potential studies presented in the Draft PEIR (Vol. 5, Appendix E.2, pp. E.2-11 to E.2-15). Also refer to Tables 14.2-6, 14.2-7, and 14.2-8 in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for a description of existing and planned conservation measures for the retail and wholesale customers.

Note that this comment does not address rationing that would be imposed during drought periods and attendant demand hardening that could occur. Regarding the relationship between the implementation of long-term conservation measures and the imposition of short-term cutbacks in water use during drought periods, refer to **Response SI_PacInst-27**.

SI_PacInst-52 This comment states that both the DSS and Hannaford models[3] assess the economics of the conservation measures and programs from the "utility perspective" and that community costs and benefits, although discussed secondarily, were not used to evaluate the measures.

This statement is incorrect. The *Wholesale Customer Water Conservation Potential Technical Report* (URS, 2004b, Table 3-3, p. 3-18) presents the "Utility-Customer" Benefit-Cost Ratio for conservation measures for an example customer, and Appendix D presents them by customer for each of the 32 measures. Each measure includes costs and benefits to the customer as defined in the report (p. 3-17): "Utility-Customer benefits and costs: utility customer benefits equal utility benefits plus retail customer energy benefits (cost to heat water). Utility-customer costs include the sum of utility and retail customer costs." Wholesale customers were provided with this information when they selected measures for their alternative programs.

SI_PacInst-53 This comment cites high-efficiency clothes washer promotion programs as an example of a measure that could be overlooked as a result of only considering the utility perspective.

As discussed in **Response SI_PacInst-52**, the community perspective was considered in the cost-benefit analyses. With respect to clothes washer promotion programs, this was evaluated (as measure 5) in the wholesale conservation report (URS, 2004b); utility and community benefit-cost ratios (as defined above) were published. In addition, clothes washer rebate programs are included as CUWCC BMP 6. As shown in Tables 14.2-7 and 14.2-8 in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3), and in Table 1 of Comment SI_PacInst-45 (Vol. 6, Chapter 12, Section 12.4), the SFPUC (for the retail service area) and all of the wholesale customers have adopted this measure.

SI_PacInst-54 This comment, which includes a figure showing historical and projected water demand for the wholesale and retail customer service areas, states that conservation and efficiency offset increases in water use due to population and employment growth in the retail customer service area but not in the wholesale customer service area. Regarding historical trends, refer to **Figure 14.2-2** in

[3] Referring to the end-use demand and conservation potential models used in the wholesale customer service area and retail customer service area, respectively.

Section 14.2, Master Response on Demand Projections, Conservation, and Recycling (Vol. 7, Chapter 14, Section 14.2.2, under the heading Per-Capita Demand), which shows that on a per-capita basis, the wholesale and retail service areas had similar historical water demand trends. Regarding water demand, the comment correctly states that population and economic growth in the wholesale service area is expected to increase water demand. The growth in water demand will be offset to some extent by implementation of conservation measures, as indicated in the aforementioned discussion of per-capita demand.

SI_PacInst-55 This comment introduces the commenter's Table 3, which includes information on base-year demand, 2030 demand with plumbing codes, and 2030 demand with plumbing codes and conservation; this information essentially corresponds to the information presented in Tables 7.2 and 7.3 of the Draft PEIR (Vol. 4, Chapter 7, pp. 7-15 and 7-18). Minor differences are assumed to be due to rounding and some updated information in the Draft PEIR tables. Table 3 also includes information on the change in demand with conservation that is consistent with the information presented in the other columns. The text of this comment correctly summarizes information on projected increases in population and employment, changes in demand (in mgd and percent), and changes in demand after conservation savings are factored in.

The figures in Table 3 are consistent with information in the demand model and in Tables 7.2, 7.3, and 7.4 of the Draft PEIR (Vol. 4, Chapter 7, pp. 7-15, 7-18, and 7-20), except for rounding, some updated information reflected in the Draft PEIR tables, and the fact that, for those customers that submitted a range of conservation savings, the PEIR tables reflect the range rather than a single number.

SI_PacInst-56 This comment, which correctly states that there is variation in the changes in water demand among the wholesale and retail service area customers and that four wholesale customers account for nearly 80 percent of the increase in demand projected for 2030, and expresses the commenter's opinion that four wholesale customers are "responsible for a disproportionate amount of 2030 demand growth," is acknowledged.

SI_PacInst-57 This comment characterizes past per-capita demand and projected 2030 per-capita demand in the wholesale customer service area. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the heading Per-Capita Demand).

SI_PacInst-58 This comment characterizes past gross per-capita demand and projected 2030 per-capita demand in the retail customer service area. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and**

Recycling (Vol. 7, Chapter 14, Section 14.2.2, under the heading Per-Capita Demand).

SI_PacInst-59 This comment characterizes trends over time in the retail and wholesale customer service areas (similar to Comments SI_PacInst-57 and SI_PacInst-58), stating that the comparison indicates that water-use efficiency improvements are not being implemented effectively for the wholesale customers and citing improvements that have been achieved in other water districts. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the heading Per-Capita Demand) for a discussion of past per-capita demand trends and projected demand in the retail and wholesale customer service areas. Regarding the comparisons to other areas, refer to **Section 14.2** (Vol. 7, Chapter 14, Section 14.2.3, under the heading Frequently Submitted Comments Addressing Conservation and Recycling).

SI_PacInst-60 This comment correctly notes (in footnote 32) that water use trends for the retail and wholesale service areas are similar, but that retail area trends are less variable because the retail service area has less outdoor water use, which is sensitive to climate variations. While climate unquestionably affects outdoor water use, shorter term variations in weather (as opposed to climate) can cause variations in outdoor water use from year to year. This comment also states (in footnote 33) that for Tables 5 and 6 (cited in Comment SI_PacInst-68), “current” is defined as 2001 for the wholesale customers and as 2005 for the retail customers. While this comment is acknowledged, note that, as described in the Draft PEIR (Vol. 1, Chapter 3, p. 3-20), 2000 was used as the base year for the retail service area conservation and demand studies. The year 2001 was used as the base year for wholesale service area studies, consistent with the approach described in footnote 33.

SI_PacInst-61 This comment (in footnote 42) states that the commenter’s conclusion regarding the percentage savings that would result from the proposed change in plumbing requirements described in Comment SI_PacInst-74 (Vol. 6, Chapter 12, Section 12.4) is based on the assumption that all toilets currently have a flush volume of 1.6 gallons per flush and all urinals have a flush volume of 1.0 gallon per flush. For the purposes of calculating projected savings, this would be a conservative estimate, as this comment states, since the current average volume of gallons per flush for toilets and urinals is somewhat higher. The average flush volume in 2001 in the wholesale customer service area was determined by SFPUC studies to be 3.0 gallons per flush (Maddaus, 2008).

SI_PacInst-62 This comment focuses on issues related to the price of water and the consideration of price-driven efficiency improvements in the demand studies. Some price-related topics raised in this comment were also raised by other commenters and are addressed, as noted in this response, in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2). Regarding the level of conservation savings identified in the SFPUC service area and the alleged failure of conservation programs to adequately capture potential savings as compared to savings achieved in other assessments, refer to the discussion of comparisons to other areas in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3, under the heading Frequently Submitted Comments Addressing Conservation and Recycling).

Price elasticity of water demand. The comment discusses the price elasticity of water demand and cites the results of a survey of price elasticities conducted by the Pacific Institute, which found that typical California price elasticity of water demand is about -0.20 for single-family homes, -0.10 for multifamily homes, and -0.25 for the nonresidential sector. Price elasticity of demand is an economic term that refers to the sensitivity of consumers to the price of a given product (i.e., how much demand rises or falls in response to the fall or rise in price). The price elasticity of water demand, or elasticity factor, is defined as the ratio of the percentage change in the quantity of water used to the percentage change in the price of water (DWR, 1998). In general, demand for a good is considered elastic if the percentage change in price results in an equivalent (or greater) percentage change in demand (the absolute value of the calculated elasticity factor is 1 or greater). Demand is inelastic (that is, the consumer is relatively insensitive to changes in price) if the percentage change in price results in a smaller percentage change in demand (the absolute value of the calculated elasticity factor is less than 1).

The elasticity factors cited in this comment (which have absolute values of 0.2, 0.1, and 0.25) indicate that water demand in the studies surveyed is relatively inelastic. A Department of Water Resources (DWR) survey of elasticity studies and an evaluation of the effects of water pricing and non-pricing demand reduction actions commissioned by the DWR for the 1998 *California Water Plan* similarly found that “residential water demand is usually inelastic, i.e., water users were relatively insensitive to price for the price ranges evaluated.” The DWR study covered single-family residential use in eight cities and water districts (four in the Bay Area and four in southern California) and identified an elasticity factor of -0.16. The urban water demand forecast used for the 1998 *California Water Plan* assumed single-family residential price elasticity factors of -0.1 for winter months and -0.2 for summer months.

Another example of the variation in elasticity of water demand that exists, cited by the SFPUC’s DSS technical consultant (Maddaus, 2008), is a recent (2007) pricing study in the Bay Area city of Sonoma, which derived much lower elasticity factors: -0.028 for indoor use (December through February) and -0.061 for outdoor use (June through September). This study, which normalized water use to account for weather, compared water use and prices in 1999 and 2000 (similar use years) with 2005 and 2006 (similar use years). The indoor price increased 90 percent over that span and usage decreased by 2.5 percent in gallons per day per account; the outdoor water price increased 85.9 percent and usage decreased 5.3 percent. Changes in water price had statistically insignificant impacts on other account groups (City of Sonoma, 2007). During the time this study was being conducted, in addition to the effect of the plumbing codes on new homes and natural fixture replacements, the local water agency was implementing conservation programs that offered single-family residential customers ultra low-flush toilet rebates, home water audits, and free water-saving fixtures and devices (Pollard, 2007). Thus, this elasticity study showed that the price elasticity factors were low even when other conservation programs were being implemented and all savings were attributed to the price increases. Had the researchers been able to separate out the influence of price and the non-price conservation programs, the price elasticity may have been even lower (Maddaus, 2008).

A range of factors can affect the price elasticity of water demand, including climate, housing type, income, the percentage of the water user's budget represented by the water bill, the water rate structure, water conservation measures and education, and user preferences regarding water use. Because of these variables, the DWR discussion of elasticities cautions that "elasticity factors derived in one geographic area are not necessarily representative of another area" (DWR, 1998, p. 4A-3), a point the commenter also makes. Similarly, the SFPUC's DSS technical consultant has found that price elasticities are "rarely directly transportable from one utility to another" (Maddaus, 2008).

<u>Effect of future price on demand</u>. Regarding the statements that demand projections for the SFPUC retail and wholesale customers "do not include price-driven efficiency improvements" and that "[n]either the SFPUC retail nor wholesale customer demand analyses… consider price-driven efficiency," please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the heading Effects of Future Price on Projected Demand).

<u>Water pricing as a water agency tool</u>. Even though studies have shown that water demand is relatively inelastic, water pricing is recognized as an important tool that allows water managers to reduce discretionary water use, as this comment indicates. In times of water shortage emergency, most water agencies have used water pricing as part of an overall strategy to reduce water use. In the 1976–1977 and 1986–1992 droughts, Bay Area water agencies used steeply inclining block rate pricing, public education campaigns, water restrictions, and ordinances,

some of which contained threats to shut off water to non-responsive customers, to reduce water use temporarily from about 20 to over 50 percent (Association of California Water Agencies, 1991). During such drought emergencies most of the reductions have come from drastically reduced discretionary use, which landscape irrigation is often considered to be. Such reductions have not come without impacts on water customers who have lost landscaping, on individuals and companies that depend on the landscaping and gardening industries for a livelihood, and on manufacturing companies that have had to cut back production and lay off workers due to water rationing programs (Barakat and Chamberlin, Inc., 1991).

Conservation pricing, CUWCC BMP 11, has been adopted by the SFPUC for the retail service area and by all the wholesale customers for ongoing, nonemergency conditions (refer to **Response SI_PacInst-46)**. Regarding the potential for tiered pricing to affect substantial conservation savings, refer to **Response SI_PacInst-47**.

Regarding the statement that "per capita water use remains high, particularly for the wholesale customers," the total gross per-capita average water use for the wholesale customers appears to be relatively low, not high, compared to per-capita demand in other parts of the state. Refer to the discussion of per-capita demand and to Tables 14.2-10 and 14.2-11 in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3, under the heading Frequently Submitted Comments Addressing Conservation and Recycling).

Note also that this comment does not address rationing that would be imposed during drought periods and attendant demand hardening that could occur. Regarding the relationship between the implementation of long-term conservation measures and the imposition of short-term cutbacks in water use during drought periods, refer to **Response SI_PacInst-27**.

SI_PacInst-63 This comment addresses projected water use by residential and nonresidential sectors in the wholesale customer service area. First it should be noted that "demand" as used in this comment takes into account plumbing code savings and active conservation programs, in contrast to use of the term in the Draft PEIR.[4] As shown in Table 7-3 of the Draft PEIR (Vol. 4, Chapter 7, p. 7-18), the total increase in demand in the wholesale service area from 2001, taking into account plumbing code savings, is 52 mgd. The comment does not indicate the source of Figures 3 and 4 (two bar charts) included with the comment, nor is the source

4 As used in the Draft PEIR discussion of demand projections and methodology (Vol. 1, Chapter 3, Section 3.4.4, pp. 3-16 to 3-21; Vol. 4, Chapter 7, Section 7.2.2, pp. 7-14 to 7-18; and Vol. 5, Appendix E.3) demand includes plumbing code savings but not savings from active conservation unless otherwise noted; conservation savings are presented separately and included in the 2030 purchase estimates.

apparent. The SFPUC used the demand models to calculate the information shown in the bar charts; the results, shown below, differ slightly with those in the bar charts. (The differences may be due to rounding.)

SFPUC calculation of data shown in Figure 3 of the comment (wholesale customer demand change, 2001–2030, with plumbing codes and proposed conservation):

- Wholesale Nonresidential = 23.6 mgd
- Residential = 9.5 mgd
- Unaccounted-for Water = 3.8 mgd
- Total = 36.8 mgd

SFPUC calculation of data shown in Figure 4 of the comment (retail customer demand change, 2000–2030, with plumbing codes and proposed conservation):

- Retail Nonresidential = 2.9 mgd
- Residential = -6.5 mgd
- Unaccounted-for Water = -1.0 mgd
- Total = -4.6 mgd

Regarding the statement that the nonresidential sector accounts for about two-thirds of the increase, or 24.1 mgd, the SFPUC calculated a slightly different result, perhaps due to rounding: the increase from 2001 to 2030 was calculated to be 23.6 mgd (from 97.0 to 120.6 mgd), which is about 64 percent of the total demand increase for that same period for the wholesale customer service area.

Regarding the statement that over 40 percent of the increase in nonresidential demand is due to outdoor use, the SFPUC calculates that 39 percent of the increase is from outdoor use.

SI_PacInst-64 This comment correctly states that in the retail customer service area conservation and efficiency improvements reduce total demand (as they do in the wholesale service area).

The comment also states that nonresidential demand increases by 3.1 mgd, all of which is for indoor use, and that residential demand and unaccounted-for water decrease by 6.5 mgd and 1 mgd, respectively, so that total demand decreases by 4.7 mgd. Refer to **Response SI_PacInst-63,** above, regarding the figures the SFPUC calculated, based on the demand models, for the sectors referenced in this comment. As shown, the SFPUC calculations are slightly different from the figures stated in this comment. The statement that for the retail service area "[a]ll of the projected increase in non-residential demand is due to indoor use" is incorrect. Data on the split between indoor and outdoor water use were not available for retail service area nonresidential demand, and therefore were not included in the Sustainable Water Supply Briefing materials. The commenter may have therefore assumed that there is no outdoor use, which may be the basis for this statement. However, assuming that the ratio of indoor/outdoor use for nonresidential demand in the retail service area in 2000 can be applied to 2030, the SFPUC calculates that nonresidential outdoor use would increase from 1.66 mgd in 2000 to 1.83 mgd in 2030. This change in nonresidential outdoor use, 0.17 mgd, is 5.9 percent of the total increase in nonresidential demand for the retail service area.

SI_PacInst-65 This comment, which includes a figure correctly showing residential per-capita water use in the wholesale and retail service areas and states in the comment text that data were not available to allow the commenter to distinguish single-family and multifamily water use and indoor and outdoor water use, is noted.

SI_PacInst-66 This comment characterizes water use data over the past 15 years, stating that residential per-capita water use has been constant, that indoor per-capita use has likely declined, and that indoor efficiency improvements have been offset over this period by increases in outdoor use.

The term "constant" may overstate the consistency of demand shown in Figure 5 of this comment. Because demand was not static, but instead shows variation for the years presented, "relatively" constant or stable may better characterize demand over the past 10 to 15 years, with the wholesales service area showing more variation than the retail service area. Figure 5 shows historical per-capita water use that is consistent with information provided in Sustainable Water Supply Briefing materials to the years 2001–2002 (SFPUC, 2006a) and (for the wholesale service area only) is consistent with information in the BAWSCA annual survey for the years 2002 to 2005. As noted in Comment SI_PacInst-65, the historical data on which this and related comments are based did not include a breakdown of water use for single- and multifamily residences, and the assumptions and conclusions drawn in the comment are therefore speculative. Data from the demand models for 2001 indicate a substantially higher percentage of single-family housing in the wholesale service area than is shown in the Table 4 of this comment: the model input data indicate that single-family housing made up approximately 93 percent of the residential housing in 2001, compared to 63 and 62 percent shown for 2000 and 2005, respectively, in this comment.

SI_PacInst-67 This comment, which correctly states that residential per-capita water demand is higher in the wholesale service area than in the retail service area, and that the higher percentage of multifamily housing units and fewer outdoor uses in the retail service area relative to wholesale service area tend to lower average residential per-capita water use, is acknowledged.

The comment also states that although differences in water use efficiency cannot be determined they will be discussed (in comments that follow). As noted in

Response SI_PacInst-66, the commenter's table showing percentages of single- and multifamily housing, to which this comment also refers, is not consistent with base-year data for the wholesale service area, which has a much higher proportion of single-family housing than the table shows. With respect to comparisons between retail and wholesale service areas, refer to **Response SI_PacInst-54** and **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the heading Per-Capita Demand). The last statement of this comment introduces the discussion to follow; refer to the responses that follow.

SI_PacInst-68 This comment refers to two tables that correctly show baseline and projected single-family and multifamily total, indoor, and outdoor per-capita water use for the SFPUC wholesale customers and retail service area. The comment correctly states that single-family residential outdoor water use in Hayward and the Purissima Hills Water District is projected to increase substantially. The comment also states that in areas where 2001 per-capita demand was 300 gallons per capita per day (gpcd), demand was largely due to high outdoor water use; and that savings from conservation between 2001 and 2030 are due to reductions in indoor water use.

The statement that savings from conservation between 2001 and 2030 are due to reductions in indoor use is a generalization, apparently based on average usage, which overlooks the 18 wholesale customers that show reductions in single-family residential per-capita outdoor water use between 2001 and 2030. The use of "only" to characterize the reduction in per-capita use suggests the commenter's opinion about the magnitude of the reductions, which is stated more explicitly in Comments SI_PacInst-71 and SI_PacInst-72. These comments are addressed in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3, under the heading Frequently Submitted Comments Addressing Conservation and Recycling).

SI_PacInst-69 This comment states that projected water demand reductions for multifamily residential customers are larger than for single-family customers, and that the savings are due to efficiency improvements in indoor use because outdoor use is projected to remain constant. More accurately stated, the savings are *mainly* due to efficiency improvements in indoor use. (Although the comment is correct that average water use for multifamily customers does not change [as shown in Table 6 of this comment], this generalization overlooks variations among the wholesale customers. For most customers, per-capita outdoor use does not change; however, for four customers—East Palo Alto, Hayward, Millbrae, and Stanford—it decreases, although these declines are offset by increases for one customer—Redwood City.)

SI_PacInst-70 This comment states that demand reductions for single-family and multifamily residential use are more substantial in the retail service area than in the wholesale service area, and correctly states that a reduction of 10 gpcd, or 16 percent, is projected for total single-family use in the retail service area and a reduction of 11 gpcd, or 19 percent, is projected for total multifamily use in the retail service area. This statement characterizes the comparison of the retail service area with the average of the wholesale service area, although individual wholesale customers projected more or less than the average, and some show greater reductions than does the retail service area. Regarding comparisons between the retail customer and wholesale customer service areas, refer to **Response SI_PacInst-54** and **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the heading Per-Capita Demand).

SI_PacInst-71 This comment refers to several studies as evidence that the wholesale and retail customers can do more to reduce indoor and outdoor demand. Please refer to the discussion of comparisons to other areas in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3, under the heading Frequently Submitted Comments Addressing Conservation and Recycling).

SI_PacInst-72 This comment states that additional attention and effort must be focused on reducing outdoor water use and cites studies documenting improvements in outdoor water-use efficiency in the Southwest and southern California. Please refer to the discussion of comparisons to other areas in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3, under the heading Frequently Submitted Comments Addressing Conservation and Recycling).

SI_PacInst-73 This comment, which describes recently adopted legislation that may encourage additional improvements in indoor and outdoor water use efficiency is acknowledged. The landscape ordinances described in this comment had not been adopted when the wholesale conservation potential study was conducted in 2003–2004. Changes in available technology and/or legal requirements will inevitably arise and will inform future conservation efforts by the SFPUC, BAWSCA, and the wholesale customers.

SI_PacInst-74 This comment describing provisions of an Assembly Bill 2496, which would have updated 1991 plumbing code standards for toilets and urinals had it not been vetoed, is noted.

SI_PacInst-75 This comment repeats the point made in Comment SI_PacInst-06 and summarizes more detailed comments made in SI_PacInst-79; refer to **Response SI_PacInst-06** and **Section 14.2, Master Response on Demand**

Projections, Conservation, and Recycling (Vol. 7, Chapter 14, Section 14.2.2, under the heading Use of Total Job Projections for the Wholesale Customer Service Area), which provides a response to Comment SI_PacInst-79. The statement that wholesale customers account for 90 percent of the projected growth in nonresidential demand is acknowledged.

SI_PacInst-76 This comment states that the Association of Bay Area Governments (ABAG) has issued more recent demographic projections than were used to project nonresidential water demand and that the water demand projections based on *Projections 2002* may be overstated and need to be revised. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the heading Employment Projections – Use of ABAG's Projections 2002).

SI_PacInst-77 This comment states that the 2030 employment levels assumed in the demand model are unlikely and should be adjusted using more realistic employment projections. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the heading Employment Projections – Use of ABAG's Projections 2002).

SI_PacInst-78 This comment, which correctly summarizes steps taken in the DSS demand modeling process to establish base-year conditions and forecast future demand, is acknowledged.

SI_PacInst-79 This comment states that the methodology used to forecast nonresidential demand in the wholesale customer service area contains errors that could lead to large inaccuracies in forecasted demand. Regarding the nonresidential growth rates assumed in the DSS demand models and variability among water users, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the heading Use of Total Job Projections for the Wholesale Customer Service Area). Regarding the list of water use coefficients presented in Table 8 of this comment, note that with the exception of golf courses, the last six entries in the table (which have the highest water use values) are absent from the wholesale customer service area (Maddaus, 2008).

SI_PacInst-80 This comment, which states that the conservation potential identified for the SFPUC wholesale and retail customers is weak and misses important efficiency opportunities, cites other conservation assessments that have found substantially higher conservation potential in the nonresidential sector. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3, under the heading Frequently Submitted Comments Addressing Conservation and Recycling) for a discussion of comparisons to other areas. Regarding the relationship between the implementation of long-term conservation measures and the imposition of short-term cutbacks in water use during drought periods, refer to **Response SI_PacInst-27**.

SI_PacInst-81 This comment, which describes recycled water and its use to supplement potable water supplies and correctly summarizes information presented in the *Wholesale Customer Recycled Water Potential Technical Memorandum* (RMC, 2004), is acknowledged. Specific information on recycled water is presented in the Draft PEIR (Vol. 5, Appendix E.2) and **Section 4.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3).

SI_PacInst-82 This comment summarizes current recycled water use within the SFPUC retail service area and findings of the *City and County of San Francisco Recycled Water Use Master Plan Update*, including that 11 mgd of recycled water could be provided in the retail service area by feasible recycled water projects by 2030. It is correct that under the WSIP in 2030, 9 mgd of recycled water would be used in the wholesale customer service area and 4 mgd would be used in the retail service area to offset demand for potable supplies from the SFPUC regional system. As shown in Table 3.3 (Vol. 1, Chapter 3, p. 3-18) and Table 7.2 (Vol. 4, Chapter 7, p. 7-15) of the Draft PEIR, a range of 9–10 mgd of recycled water is projected for the wholesale service area. This comment includes a figure that indicates the currently projected breakdown of water supplies to meet 2030 supplies under the WSIP. This figure appears to be based on the breakdown of supplies shown in Figure 2 of the *Investigation of Regional Water Supply Option No. 4 Technical Memorandum* (SFPUC, 2007, Appendix D, p. 1-4), adjusted to reflect an additional 2 mgd of groundwater, 4 mgd of conservation, and 4 mgd of recycled water (consistent with SFPUC plans to use groundwater, conservation, and recycled water to offset 10 mgd of demand in the retail service area). This comment is acknowledged.

SI_PacInst-83 This comment states that implementation of recycled water projects involves challenges, but that use of recycled water is increasing, and that examples of recycled water use in southern Florida and a new community in southern California indicate that opportunities exist to increase water recycling in the SFPUC service area to reduce the need for new potable water supplies.

Factors affecting the feasibility of implementing recycled water projects in another state or a new southern California community may be fundamentally different from those in long-established communities, such as those within the SFPUC's service area. The proposed use of recycled water to offset potable demand in 2030 is reflected in 2030 purchase estimates. The *Investigation of Regional Water Supply Option No. 4 Technical Memorandum* (SFPUC, 2007, Appendix D) investigated additional opportunities to implement programs that could potentially be implemented on a regional level. The findings of that report were used to develop the Aggressive Conservation/Water Recycling and Local

Groundwater Alternative evaluated in the Draft PEIR (Vol. 4, Chapter 9, pp. 9-47 to 9-59) as well as an element of the Modified WSIP Alternative (Vol. 4, Chapter 9, pp. 9-78 to 9-84). Also refer to **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14).

SI_PacInst-84 This comment correctly states that water purchases from the SFPUC regional water supply system are projected to increase by 35 mgd. To meet the projected increase, the preferred water supply option under the WSIP includes increased diversions from the Tuolumne River and 10 mgd of recycled water/ groundwater/conservation projects in San Francisco; during dry years, the regional supply would be supplemented by water transfers from the Modesto and Turlock Irrigation Districts and/or other water agency, a conjunctive-use program in the Westside Groundwater Basin, and the restored capacities of Calaveras and Crystal Springs Reservoirs (Vol. 1, Chapter 3, pp. 3-33 to 3-39). Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

The second paragraph states that the commenter's foregoing analysis indicates that future demand may be significantly overestimated and demand management opportunities underestimated, and reiterates other statements made in the preceding SI_PacInst comments. With respect to the reiteration and summary of the commenter's previous comments, please refer to the previous responses.

SI_PacInst-85 This comment repeats Comment SI_PacInst-12; refer to **Response SI_PacInst-12**.

SI_PacInst-86 This comment repeats Comment SI_PacInst-13; refer to **Response SI_PacInst-13**.

SI_PacInst-87 This comment repeats Comment SI_PacInst-14; refer to **Response SI_PacInst-14**.

SI_PacInst-88 This comment repeats Comment SI_PacInst-15; refer to **Response SI_PacInst-15**.

Pilarcitos Creek Advisory Committee, Tim Frahm, Chair, 9/28/2007

SI_PilarCrk-01 This comment states the position held by the Pilarcitos Creek Advisory Committee that current SFPUC facilities and operations in the upper Pilarcitos Creek watershed have reduced opportunities to accomplish the goals of "restoration and balance" in the Pilarcitos Creek watershed. Comment noted.

SI_PilarCrk-02 The purpose of the Draft PEIR is to describe the consequences of the proposed WSIP relative to the existing condition (CEQA Guidelines Section 15125[a]). CEQA does not require an EIR to evaluate whether the existing condition is satisfactory.

The commenter correctly notes that the cross-basin transfer of water from Pilarcitos Creek to the San Mateo Creek watershed causes dewatering within a reach of Pilarcitos Creek immediately below Stone Dam most of the time. This situation occurs under existing conditions. The purpose of the analysis in the Draft PEIR was to determine whether the WSIP would alter the existing condition and, if so, whether the alteration would represent a significant adverse environmental impact.

Under the WSIP, the SFPUC would serve a portion of Coastside County Water District's increased water demand with water from Pilarcitos Creek, which would affect flow in the creek below Stone Dam, as discussed in the Draft PEIR (Vol. 3, Chapter 5, pp. 5.5.1-19 to 5.5.1-22). However, Draft PEIR Mitigation Measure 5.5.3-2 (Vol. 4, Chapter 6, p. 6-26) would require the SFPUC to modify the operation of its Pilarcitos Creek facilities so that flow in Pilarcitos Creek with the WSIP would be very similar to flow under existing conditions. Therefore, with implementation of Measure 5.5.3-2, the SFPUC would supply Coastside County Water District's increased water demand with water from Crystal Springs Reservoir, and there would no change from existing conditions with respect to flows in Pilarcitos Creek.

SI_PilarCrk-03 As noted above, the purpose of the Draft PEIR is to describe the consequences of the WSIP relative to the existing condition. CEQA does not require an EIR to evaluate whether the existing condition is compliant with environmental laws and policies. See also **Response S_CDFG2-18**.

SI_PilarCrk-04 Stone Dam and Pilarcitos Dam are existing structures that must comply with applicable regulations for dam safety. No modifications to either structure are proposed as part of the WSIP. For this reason, the Draft PEIR did not and does not need to include an analysis of dam failure. As indicated in the Draft PEIR (Vol. 1, Chapter 2, p. 2-35), Pilarcitos Dam and Reservoir are under the jurisdiction of the California Department of Water Resources, Division of Safety of Dams (DSOD). A dam safety inspection is conducted regularly. Permanent piezometers are read once per month for groundwater levels and surveys of dam monuments are conducted twice per year. If the surveyor determines that maintenance is required, a maintenance work order is prepared. Maintenance work typically consists of clearing vegetation on the face of the dam and cleaning out the spillway. Unlike Pilarcitos Dam, Stone Dam is not an earthen dam and therefore is not under DSOD jurisdiction. However, Stone Dam is visually inspected many times per month (almost daily). Engineering inspections, which are conducted annually or more frequently as needed, include inspection of the pipeline and tunnel leaving the reservoir. The screens on Stone Dam are cleaned and the facility's meter is read on a weekly basis. Additional maintenance, such as cleaning the spillway, is performed as needed.

SI_PilarCrk-05 As noted above, the purpose of the Draft PEIR is to describe the consequences of the WSIP relative to the existing condition. CEQA does not require an EIR to evaluate whether the existing condition is satisfactory. However, the SFPUC recognizes that the existing or baseline condition restricts upstream migration of native steelhead and limits the biological productivity of Pilarcitos Creek, particularly in the reach of the creek immediately below Stone Dam. As described in the Draft PEIR (Vol. 1, Chapter 2, p. 2-24), the SFPUC is currently conducting an experimental release of several cubic feet per second at Stone Dam to determine whether such a release would improve conditions for steelhead and other plant and animal species. See also **Response S_CDFG2-18**.

SI_PilarCrk-06 The baseline condition for an EIR is the condition that existed at the time the Notice of Preparation for the EIR was published. The Notice of Preparation for the WSIP Draft PEIR was published in September 2005, and the baseline conditions represent SFPUC operations at that time. Experimental releases from Stone Dam were initiated in October 2006 and therefore are not included as part of the baseline condition.

SI_PilarCrk-07 This comment is a closing statement summarizing the more detailed comments presented in Comments SI_PilarCrk-02 through SI_PilarCrk-06; refer to **Responses SI_PilarCrk-02** through **SI_PilarCrk-06** for the specific responses.

Restore Hetch Hetchy; Committee to Save Lake Merced, Jerry Cadagan, Board Member/Founder, 09/30/07

SI_RHH1-01 This comment summarizes the standards for determining the legal sufficiency of an EIR under CEQA. More detailed comments related to the specific issues in which the commenter believes the Draft PEIR is inadequate are presented in Comments SI_RHH1-02 through SI_RHH1-07; refer to **Responses SI_RHH1-02** through **SI_RHH1-07** for the specific responses.

SI_RHH1-02 The commenter refers to Section 3.6.1 of the Draft PEIR (Vol. 1, Chapter 3, pp. 3-34 and 3-35), which states that under the WSIP during nondrought conditions, the SFPUC proposes to meet the increased 35 million gallons per day (mgd) in purchase requests through a combination of conservation, water recycling, and groundwater supply programs in San Francisco and increased diversions from the Tuolumne River. The commenter correctly notes that 10 mgd of this increase in purchase requests would be served through conservation, water recycling, and groundwater supply programs in San Francisco.

The comment is also correct in noting that the *Recycled Water Master Plan for the City and County of San Francisco* (RMC, 2006) identified a total annual average of 11.8 mgd in potentially feasible recycled water *demand*; however, the report does not describe 11.8 mgd of specific recycled water *projects* in sufficient detail for near-term implementation. Consistent with the CEQA Guidelines, the Draft PEIR summarizes the relevant information from this report (Vol. 1, Chapter 3, p. 3-22); the commenter is referred to the referenced report for a more detailed analysis of the potential for water recycling in San Francisco.

The report indicated that serving the identified recycled water demand requires consideration of user water quality needs and other implementation constraints, such as onsite retrofits, extent of the distribution system, acceptance by customers and regulatory agencies, and public perception. It identified a long-term alternative for distributing recycled water throughout San Francisco, but due to uncertainties associated with the SFPUC’s Sewer System Master Plan (still under development), particularly with regard to facilities and users in the northeast and southeast portions of the city, the report identified the most feasible, short-term projects as Phase 1 projects. Under the WSIP, the SFPUC would develop about 4 mgd of recycled water projects (through implementation of facility improvement project SF-3), which were identified as Phase 1 uses in the Recycled Water Master Plan. The report indicates that the remaining portions of the SFPUC’s preferred long-term alternative for recycled water may need to be adjusted in the future based on the outcomes of the Sewer System Master Plan and the maintenance and improvement of the Auxiliary Water Supply System

Bond Measure. Therefore, it would be speculative to assume any additional recycled water use in San Francisco as part of the WSIP until the SFPUC has identified, confirmed, and developed additional specific recycled water projects.

The information provided by the commenter regarding the status of San Francisco's water recycling record is acknowledged. The City and County of San Francisco currently uses a limited amount of recycled water (less than 1 mgd) for wastewater treatment plant process water and washdown operations; recycled water is also used in San Francisco for soil compaction and dust control during construction. Historically (from 1932 to 1981), San Francisco used recycled water for nonpotable uses; the McQueen Treatment Plant in Golden Gate Park supplied recycled water for irrigation and flow augmentation of the park's streams and lakes until the plant was shut down in 1981 (when it could not meet the current health standards), and groundwater generally replaced recycled water as the source for the park's irrigation water uses.

The comments regarding the adequacy of references used in the background report, *Recycled Water Master Plan for the City and County of San Francisco* (RMC, 2006), are noted.

SI_RHH1-03 The projected use of recycled water assumed under the WSIP for wholesale customers and the SFPUC (for the retail service area) is shown in Draft PEIR Table 3.3 (Vol. 1, Chapter 3, p. 3-18). (Note that the quantities shown reflect the amounts that would offset potable water supplies; additional recycled water projects that do not replace potable supplies, such as recycled water used for marsh or wetland restoration projects, are not shown in Table 3.3.) Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for more information on existing and planned recycled water projects, the recycled water studies undertaken as part of WSIP planning, and information in the Draft PEIR on this topic. Draft PEIR Table 9.11 (Vol. 4, Chapter 9, pp. 9-50 and 9-51) referenced by the commenter provides information about potential additional supplies from regional recycled water, groundwater, and conservation projects that were included as part of the Aggressive Conservation/Recycled Water and Local Groundwater Alternative, one of the WSIP alternatives evaluated in Draft PEIR Chapter 9. Also refer to **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14, Section 14.10.3) regarding the potential for additional recycling efforts by the SFPUC's wholesale customers included in this alternative beyond the amount assumed in the proposed program.

SI_RHH1-04 The alternatives analysis in the Draft PEIR includes a detailed evaluation of the Aggressive Conservation/Water Recycling and Local Groundwater Alternative (Vol. 4, Chapter 9, pp. 9-47 to 9-59). The water supply source for this alternative would include up to an additional 19 mgd of recycled water, groundwater, and conservation in the wholesale service area in addition to the 10 mgd of recycled water, groundwater, and conservation in San Francisco included under the proposed program. The level of detail presented in the PEIR is consistent with CEQA requirements and provides sufficient information to enable the public and decision-makers to weigh the relative merits of the alternatives and the proposed program. Refer to **Response L_TUD1-05** for discussion of Raker Act, Section 9(h).

SI_RHH1-05 The commenter correctly notes that Chapter 10 of the Draft PEIR lists 20 significant and unavoidable impacts that could result from implementation of the WSIP. Eighteen of the impacts are associated with the program-level analysis of the facility improvement projects, which was based on worst-case assumptions derived from preliminary project information. Therefore, the significance determinations made in the Draft PEIR are conservative for these impacts, and the project-level and site-specific environmental review of these projects may be determine that these effects can be avoided or mitigated to a less-than-significant level.

The other two impacts identified in the Draft PEIR as significant and unavoidable are related to the proposed WSIP water supply and system operations (one in the Alameda Creek watershed and the other in the Peninsula watershed). The SFPUC is currently investigating potential methods to reduce the severity of these impacts; however, as of the publication of the Draft PEIR, it was uncertain whether proposed mitigation could reduce the impacts to a less-than-significant level, so a conservative determination was made that the impacts would be significant and unavoidable. These two significant, unavoidable impacts related to water supply and system operations will be reevaluated as part of the project-level CEQA review of the WSIP facility improvement projects, or specifically, the Calaveras Dam Replacement (SV-2) and Lower Crystal Springs Dam Improvements (PN-4) projects.

SI_RHH1-06 The opinion of the commenter regarding his desire for the SFPUC or the San Francisco Board of Supervisors to cooperate in the removal of O'Shaughnessey Dam is acknowledged. The Draft PEIR (Vol. 4, Chapter 9, pp. 9-127 and 9-128) describes why the removal of O'Shaughnessy Dam is not considered an alternative to the WSIP and why it is not evaluated in detail in the Draft PEIR. Also refer to **Response SI_RHH4-01**.

SI_RHH1-07 Please refer to **Section 14.3, Master Response on Proposed Dry-Year Water Transfer** (Vol. 7, Chapter 14, Section 14.3.2) for detailed discussion related to this element of the proposed water supply option.

Restore Hetch Hetchy,
Bob Hackamack, Tech/Engineering Chair, 09/05/07

SI_RHH2-01 The Draft PEIR (Vol. 1, Chapter 2) presents a description and overview of the existing regional water system to provide context for understanding the WSIP and its potential environmental effects. The description refers to the 1912 Freeman Report (p. 2-36) only with respect to its implication regarding San Francisco's water rights, and does not include unnecessary explanation of the history of the regional system.

The opinion of the commenter that the system was built for "maximum hydroelectric profit" is acknowledged. The calculations of firm yield provided by the commenter are also acknowledged, but, as discussed below, the statement about hydroelectric profit is not consistent with the SFPUC's Water First Policy, and the commenter's calculations are not consistent with its firm yield calculations and rationing estimates.

The Draft PEIR describes the system firm yield under existing conditions as well as the design drought that the SFPUC uses for regional water system planning (Vol. 1, Chapter 2, p. 2-25). The design drought is a planning and operation tool that the SFPUC has defined as a reasonable worst-case drought scenario based on historical hydrology; employing a conservative approach to regional water system planning, the SFPUC uses a design drought based on the hydrology of the six years of the worst historical drought (1987–1992) coupled with the 2.5 years of the 1976–1977 drought, for a combined total of an 8.5-year design drought sequence. The design drought represents a drought sequence that is more severe than any on record, but the SFPUC considers it prudent to use such a scenario for planning purposes. The SFPUC designed the WSIP to achieve the level of service objectives for drought-year rationing (Vol. 1, Chapter 3, Table 3.5, p. 3-26) such that the regional water system could accommodate customer deliveries under hydrologic conditions equivalent to the design drought with a maximum of 20 percent systemwide rationing. This table shows that the system firm yield is 219 million gallons per day (mgd) under existing conditions and would be 256 mgd under the WSIP.

During a hypothetical design drought sequence, the SFPUC anticipates utilizing its entire portfolio of resources, including the use of stored groundwater and water purchases during the second year of drought. During the remainder of the drought, the SFPUC would continue to use these resources in combination with staged delivery reductions, but would not impose rationing of greater than 20 percent systemwide. The SFPUC considers this planning approach as a prudent method by which to plan for uncertainty in future hydrologic events.

Based on modeling conducted for the Draft PEIR using 82 years of historical hydrology, the SFPUC determined that there would be drought-year shortages in approximately 24 out of 82 years under the WSIP, but that 10 percent systemwide rationing would only be required in 6 out of 82 years, and 20 percent systemwide rationing in 2 out of 82 years (Vol. 4, Chapter 9, Table 9.5, p. 9-13). The regional water system would not experience any years with shortages greater than 20 percent over the 82-year hydrologic record. Note that Figure 2.5 in the Draft PEIR (Vol. 1, Chapter 2, p. 2-19) refers to *existing* conditions, and the commenter is referred to Figure 3.4 (Vol. 1, Chapter 3, p. 3-37) for *future* conditions with implementation of the WSIP.

SI_RHH2-02 Please refer to **Response SI_RHH2-01**.

SI_RHH2-03 The commenter's suggestions regarding capping diversions from the Tuolumne River and employing water efficiency, recycled water, groundwater banking, water purchases, and desalination of brackish water are acknowledged. As described in the Draft PEIR (Vol. 1, Chapter 3, pp. 3-33 to 3-39), the proposed program would expand the SFPUC's existing water supply portfolio to include recycled water, conservation, and groundwater projects in San Francisco, water transfers, and groundwater conjunctive use. The desalination of brackish water and seawater is evaluated under alternatives to the proposed program (Vol. 4, Chapter 9).

SI_RHH2-04 This comment, which supports the Aggressive Conservation/Water Recycling and Local Groundwater Alternative and alternatives that include groundwater banking and conjunctive use, desalination, and a lower Tuolumne River diversion, is acknowledged.

SI_RHH2-05 The commenter's suggestion regarding capping diversions from the Tuolumne River is acknowledged. Please refer to **Section 13.4, Phased WSIP Variant**, for a discussion of SFPUC's current planning approach to use of Tuolumne River water. As noted by the commenter, the WSIP includes a facility improvement project, San Joaquin Pipeline System project (SJ-3), that would construct portions of a fourth San Joaquin Pipeline to improve the reliability of the system, but the proposed improvement would limit the hydraulic capacity of the San Joaquin Pipeline System to 314 mgd (Vol. 1, Chapter 3, Table 3.10, p. 3-49). This is a minor increase compared to the capacity of the existing three San Joaquin Pipelines of 290 to 300 mgd (Vol. 1, Chapter 2, Table 2.2, p. 2-6).

SI_RHH2-06 The water supply objective presented at the scoping meeting remains the same as the one included in the Draft PEIR (Vol. 1, Chapter 3, Table 3.2, p. 3-9). This WSIP objective is to "improve use of new water sources and drought management, including use of groundwater, recycled water, conservation, and transfers." The WSIP would achieve this objective under the proposed program by expanding the SFPUC's existing water supply portfolio to include recycled water, conservation, and groundwater projects in San Francisco, water transfers, and groundwater conjunctive use (Vol. 1, Chapter 3, pp. 3-33 to 3-39).

Refer to **Response L_TUD1-05** for discussion of Raker Act Section 9(h).

Restore Hetch Hetchy, Bob Hackamack, Tech/Engineering Chair, 09/05/07

[See Public Hearing Transcript, Sonora, pp. 21–22]

SI_RHH3-01 This comment, which expresses the opinion that the SFPUC regional water system was built for "maximum hydroelectric profit" and not according to John Freeman's vision, is acknowledged. Please refer to **Response SI_RHH2-01** for response.

SI_RHH3-02 This comment opposing any additional Tuolumne River diversions is acknowledged.

SI_RHH3-03 The commenter states that the Raker Act requires San Francisco to utilize local water sources before increasing Tuolumne River diversions. Please refer to **Response L_TUD1-05** for a discussion of Raker Act Section 9(h).

Restore Hetch Hetchy; Committee to Save Lake Merced, Jerry Cadagan, Board Member/Founder, 09/05/07

[See Public Hearing Transcript, Sonora, pp. 23–25]

SI_RHH4-01 The commenter's suggestion that the PEIR include a mitigation measure in which the SFPUC would agree to cooperate in the restoration of Hetch Hetchy Valley is acknowledged. CEQA Guidelines Section 15126.4 states that "an EIR shall describe feasible measures which could minimize significant adverse impacts, including where relevant, inefficient and unnecessary consumption of energy." An agreement to cooperate in the restoration of Hetch Hetchy Valley would not provide any physical measures that would address significant adverse impacts identified in the Draft PEIR. The concept of removing O'Shaughnessy Dam and restoring Hetch Hetchy Valley is not reasonably related to a reduction or elimination of the significant impacts of the WSIP, but such a concept suggests far greater changes than those necessary to address any impacts the WSIP would cause on the Tuolumne River and related resources. The concept of restoring Hetch Hetchy Valley—while at the same time providing equivalent water and power to the SFPUC in an alternative manner—would likely in itself result in numerous, significant environmental impacts associated with construction and operation of unknown new storage, conveyance, and treatment facilities at unknown locations, and it would likely require increased long-term energy requirements compared to the existing regional system.

SI_RHH4-02 The commenter requests clarification regarding the 10 mgd of water that would be provided by the WSIP through recycling, conservation, and groundwater extraction. The commenter requests that the PEIR address this issue relative to the 11.8 mgd of recycled water that the City and County of San Francisco's *Recycled Water Master Plan* indicates could be generated. Please refer to Section 3.6.1 of the Draft PEIR (Vol. 1, Chapter 3, pp. 3-34 and 3-35), which states that the WSIP would provide about 2 mgd through local groundwater development, 4 mgd through recycled water projects, and 4 mgd through additional water conservation measures.

Also, please refer to **Response SI_RHH1-02** regarding the 11.8 mgd of recycled water proposed in the *Recycled Water Master Plan* and the relationship of this plan to the WSIP and Draft PEIR.

Santa Clara County Creeks Coalition, Mondy Lariz, 09/28/07

SI_SCCCC-01 This comment opposing any additional Tuolumne River diversions is acknowledged.

SI_SCCCC-02 This comment, which states that the demand modeling in the Draft PEIR is flawed and inflates projected future needs, was submitted by numerous commenters; please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2).

SI_SCCCC-03 This comment requests that additional studies of the Tuolumne River be conducted before the PEIR is finalized is acknowledged. Please refer to **Response SI_Caltrout-01** for response.

SI_SCCCC-04 This comment expresses support for the Aggressive Conservation/Water Recycling and Local Groundwater Alternative (No Supplemental Tuolumne River Water) and the Year-round Desalination at Oceanside Alternative, and promotes additional conservation, efficiency, and recycling to prevent additional Tuolumne River diversions. Comment noted.

Coalition for San Francisco Neighborhoods, Joan Girardot, 09/20/07

[See Public Hearing Transcript, San Francisco City Hall, pp. 27–29]

SI_SFNeigh-01 The commenter states that the historical tables indicate that the average delivery from the regional system is about 240 million gallons per day (mgd) rather than 261 mgd for the 2001 baseline water demand, and that the increase to 300 mgd by 2030 is a much larger increase if the starting point is 240 mgd. The commenter requests that the historical table be included in the PEIR.

Consistent with the information provided by the commenter, the Draft PEIR (Vol. 1, Chapter 2, p. 2-37) states that, from fiscal year 1968 to 2004, annual deliveries to SFPUC customers averaged about 248 mgd. This amount represents an average of deliveries over 36 years, a period that resulted in increased population growth as well as changes in water use patterns in the Bay Area; this period includes two severe droughts, the 1976–1977 and 1987–1992 droughts, during which time deliveries were reduced due to supply shortages, and rationing was imposed. The information on historical deliveries is presented graphically in the Draft PEIR in Figure 7.3 (Vol. 4, Chapter 7, p. 7-17), which the San Francisco Planning Department has determined to be a sufficient level of detail for the PEIR.

Also consistent with the information provided by the commenter, the Draft PEIR (Vol. 1, Chapter 3, p. 3-17) states that in fiscal year 2000/2001 about 261 mgd was purchased from the SFPUC regional system. The 2000/2001 period was selected as the base year for the demand projections because it represented a typical year in terms of both rainfall and economic conditions (Vol. 1, Chapter 3, p. 3-20).

SI_SFNeigh-02 This comment corroborates information presented in the Draft PEIR that the projected increase in demand (as well as the increase in water purchases) will occur in the wholesale service area rather than San Francisco (the retail service area), as shown in Draft PEIR Table 7.3 (Vol. 4, Chapter 7, p. 7-18).

Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

The commenter's reference to average residential water use within San Francisco is consistent with historical per-capita consumption information prepared by the SFPUC.[1] This information shows that 61 gallons per capita per day (gpcd) was the median total residential consumption in the retail service area for the years 1988/1989 to 2003/2004 (SFPUC, 2006, p. 128). The SFPUC also prepared historical per-capita information for the wholesale service area, which provides weighted average per-capita consumption for fiscal years 1985/1986 to 2001/2002. The median of the weighted average residential per-capita consumption over this period was 92 gpcd (SFPUC, 2006, p. 144). The commenter's assertion that 61.19 gpcd is 12 percent below what the Environmental Protection Agency recommends for indoor usage is noted. The comment also states that outdoor use in San Francisco is negligible. According to information prepared by the SFPUC (SFPUC, 2006, p. 106), external water use for single-family residences in the retail service area is projected to account for approximately 1 percent of consumption in 2030 (1.5 gallons per day per account [gpda] of a total of 132.8 gpda), and external water use for multifamily residences is expected to be negligible. This comment suggests that a table comparing the per-capita water use of the wholesale customers be included in the PEIR. Please refer to Table 5 and Table 6 in Comment SI_PacInst-68. Table 5 shows base-year 2001 ("current") and projected 2030 single-family residential per-capita consumption, and Table 6 shows 2001 and 2030 multifamily residential per-capita consumption. The SFPUC has verified the information in these tables, which appear to be based on information prepared by the SFPUC (SFPUC, 2006a, pp. 150 and 156). By virtue of being included in the Pacific Institute comment on the Draft PEIR, this information is included in the PEIR.

SI_SFNeigh-03 Historical information from the SFPUC confirms that 61 gpcd was the median total residential consumption for the years 1988/1989 to 2003/2004 (see **Response SI_SFNeigh-02**), and the SFPUC projects that residential per-capita consumption in 2030 will be 52 gpcd with implementation of plumbing codes, without additional conservation, and will be 50 gpcd with plumbing codes, with additional planned conservation (SFPUC, 2006, pp. 129 and 130). As shown in **Table 14.2-5** in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3), the projected estimated 2030 water savings from conservation and recycling would be shared among the wholesale and retail customers. The table indicates that wholesale customers would contribute about 47 to 50 mgd in water savings from conservation and recycling by 2030, while the retail customers would contribute about 11 to 20 mgd.

[1] The SFPUC prepared per-capita information in response to specific requests by participants at the September 2006 Sustainable Water Supply Briefing; for more information, refer to the introduction to the responses to comments submitted by the Pacific Institute (SI_PacInst).

Sierra Club, Tuolumne Group, Blaine Rogers, 09/24/07

SI_SierraC1-01 This comment discusses the uses of Tuolumne River water by natural systems and by rural and urban users, and promotes increased conservation, recycling, and efficiency to prevent the need for additional Tuolumne River diversions. Comment noted. This comment requests that additional studies of the Tuolumne River be conducted before the PEIR is finalized is acknowledged. Please refer to **Response SI_Caltrout-01** for response.

Sierra Club, Sandra Wilson, Chair, 09/06/07

[See Public Hearing Transcript, Modesto, pp. 27–29]

SI_SierraC2-01 The commenter states concerns about salmon and wildlife habitat on the lower Tuolumne River below La Grange Dam, including the Tuolumne River Regional Park and the marsh habitat at the San Joaquin Wildlife Refuge for wintering Aleutian Canada geese. The commenter is correct that under the WSIP flows in the Tuolumne River would be reduced by an average of less than 10 percent during the winter months (Draft PEIR, Vol. 3, Chapter 5, p. 5.3.1-34), although reductions could be as much as 25 percent. Reductions would occur primarily in wet and above-normal rainfall years and would not affect releases in critically dry years when minimum releases are mandated. Under the WSIP, delayed spring releases and reductions in average peak flows and total flow would incrementally affect riparian communities and could also reduce stand diversity and incrementally reduce suitable conditions for the recruitment of some riparian species (Vol. 3, Chapter 5, p. 5.3.7-25). Because these impacts would take place incrementally in an already stressed system, they were determined to be potentially significant. Several mitigation measures were proposed to offset these impacts. Mitigation Measure 5.3.6-4a (Vol. 4, Chapter 6, p. 6-48) would avoid changes in flow by reducing demand for Don Pedro Reservoir water, thus offsetting the anticipated impacts due to increased diversions. If this measure is not feasible, Mitigation Measure 5.3.7-6 (Vol. 4, Chapter 6, p. 6-50) would provide for riparian habitat enhancement on the lower Tuolumne River.

SI_SierraC2-02 This comment expresses concern for potential effects on the San Joaquin Wildlife Refuge as a result of reduced flows. Please refer to **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14, Section 14.8.3) for a relevant response to the effects of the WSIP on to the San Joaquin River and Delta.

SI_SierraC2-03 Please see **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14) for additional discussion of climate change to augment the discussion presented in Section 5.7.6 of the Draft PEIR (Vol. 3, Chapter 5, pp. 5.7-92 to 5.7-96). Section 14.11 provides more detailed and up-to-date information on climate change as it relates to the SFPUC regional water supply and the proposed WSIP.

Sierra Club, Bill Young, Member, 09/19/07

[See Public Hearing Transcript, Palo Alto, pp. 18–20]

SI_SierraC3-01 This comment is an opening statement regarding the Sierra Club's detailed comments presented in Comments SI_SierraC3-02 through SI_SierraC3-04; refer to **Responses SI_SierraC3-02** through **SI_SierraC3-04** for the specific responses.

SI_SierraC3-02 The commenter's opinion with respect to the need for decreasing reliance on the Tuolumne River and local creeks, such as Pilarcitos Creek, and the need for comprehensive watershed studies is acknowledged. The San Francisco Planning Department believes that comprehensive watershed studies, while desirable, are not needed to make an adequate analysis of the environmental impacts of the WSIP. Although comprehensive data on all of the SFPUC water supply watersheds may not be available at this time, sufficient information is available to evaluate the potential for the WSIP to result in significant effects on rivers and creeks and their related resources located downstream of the SFPUC reservoirs. As described in the Draft PEIR (Vol. 3, Chapter 5, Section 5.1.4), the approach to analyzing potential impacts on these resources is based first on the analysis of changes in stream flow and reservoir water levels that would occur under the WSIP compared to the existing condition. This analysis, combined with basic information on the watersheds and scientific understanding of the resources, was sufficient to make an adequate evaluation of the environmental impacts of the WSIP. Refer also to **Response SI_Caltrout-01** for further discussion.

SI_SierraC3-03 Please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14), which provides detailed and up-to-date information on climate change as it relates to the SFPUC regional water supply and the proposed WSIP. Also refer to the discussion presented in Section 5.7.6 of the Draft PEIR (Vol. 3, Chapter 5, pp. 5.7-92 to 5.7-96).

SI_SierraC3-04 The proposed program would expand the SFPUC's current water supply portfolio and includes groundwater projects, recycled water projects, additional conservation measures, water transfers, and conjunctive water use (see Draft PEIR Vol. 1, Chapter 3, pp. 3-33 to 3-39). The commenter is correct in noting that the proposed program would increase diversions from the Tuolumne River.

This comment, which states that the Sierra Club believes there are more cost-effective and less environmentally harmful ways to secure and maintain a clean, reliable water supply, is acknowledged. The comment expressing support for increased water efficiency in urban and agricultural sectors, use of groundwater storage, and safe expansion of water reclamation and water recycling is also noted. The commenter's suggestion that the SFPUC invest in the most efficient water resources, a more diverse mix of water supplies, and reduce consumption is noted as well.

Sierra Club, Richard Zimmerman, Member, 09/19/07

[See Public Hearing Transcript, Palo Alto, pp. 20–23]

SI_SierraC4-01 This comment expressing support for seismic improvements to the regional water system is acknowledged.

SI_SierraC4-02 The comment that water conservation is the cheapest, easiest, and least destructive way to meet future demand was submitted by numerous commenters; for a discussion of this topic, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) under the heading Frequently Submitted Comments Addressing Conservation and Recycling. Numerous commenters also asserted that the Bay Area lags behind other areas in terms of reducing water consumption; for a response to this comment, refer to the discussion of wholesale customers' per-capita water use under Frequently Submitted Comments Addressing Conservation and Recycling in Section 14.2.3.

The opinion expressed in this comment that the SFPUC must provide strong leadership to make water conservation a fact in the Bay Area is acknowledged. Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects proposed by SFPUC and its wholesale customers.

SI_SierraC4-03 This comment correctly states that the SFPUC projects a 19 percent increase in water demand in the wholesale customer service area, as shown in Draft PEIR Table 7.3 (Vol. 4, Chapter 7, p. 7-18). With implementation of planned conservation measures, projected 2030 demand would be 308 to 311 million gallons per day (as shown in Table 7.2 in Vol. 4, Chapter 7, p. 7-15), representing a 14 percent increase over 2001 base-year demand. In addition to the 19 percent increase in population forecasted for the wholesale customer service area mentioned in this comment, employment is projected to increase by 31 percent (refer to Table 7.4 in Vol. 4, Chapter 7, p. 7-20). The comment correctly states that a decrease in demand is projected in the retail service area (as shown in Table 7.3).

Regarding the comment about projected outdoor water use, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2) under the heading Outdoor Water Use.

Numerous comments were submitted regarding the level of conservation achieved in other areas; for a discussion of this topic, please refer to

Section 14.2, Master Response on Demand Projections, Conservation, and Recycling (Vol. 7, Chapter 14, Section 14.2.3) under the heading Frequently Submitted Comments Addressing Conservation and Recycling. Also refer to **Response SI_PacInst-72** regarding comparisons to Las Vegas, Nevada and Austin, Texas.

Sierra Club, Gwynn MacKellen, Member, 09/20/07

[See Public Hearing Transcript, San Francisco City Hall, September 20, 2007, pp. 11–12]

SI_SierraC5-01 This comment expresses the Sierra Club's opposition to any additional Tuolumne River diversions and states that Sierra Club members and other members of the public submitted 800 comment cards expressing opposition to such diversions. See Comment Letter C_Form2 for a sample of the comment cards submitted by the Sierra Club at the September 20, 2007 public hearing in San Francisco on behalf of Sierra Club members and other members of the public. Please refer to **Response C_Form2-01** for the specific response.

Sierra Club, San Francisco Bay Chapter, John Rizzo, Executive Committee Member, 09/20/07

[See Public Hearing Transcript, San Francisco City Hall, September 20, 2007, pp. 25–27]

SI_SierraC6-01 This comment opposes any additional Tuolumne River diversions and states that the Sierra Club would submit formal comments on the Draft PEIR in conjunction with other environmental groups. Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions. Refer to Comment Letter SI_TRT-CWA-SierraC for comments on the Draft PEIR submitted by the Tuolumne River Trust, Clean Water Action, and the Sierra Club; see **Responses SI_TRT-CWA-SierraC-01** through **SI_TRT-CWA-SierraC-199** for the specific responses.

SI_SierraC6-02 This comment states that additional review is necessary "to bring the impacts of the growth number up to 2030 and also to review the impacts of the ABAG [projections] which only go to 2025." Please refer to **Section 14.2, Master Response on Demand Projections, Conservation and Recycling**, under the heading Employment Projections – Use of ABAG's Projections 2002 (Vol. 7, Chapter 14, Section 14.2.2).

SI_SierraC6-03 This comment states that there is a lack of adequate baseline data for the Tuolumne River to properly analyze the environmental consequences of additional diversions on river flows and fisheries. Please refer to **Response SI_Caltrout-01** for response.

Sierra Club-San Francisco Bay Chapter, John Rizzo, Executive Committee Member, 10/11/07

[See Public Hearing Transcript, San Francisco City Hall, October 11, 2007, pp. 42–44]

SI_SierraC7-01 This comment expresses support for seismic improvements to the regional water system and states that the comments that follow (SI_SierraC7-02 through SI_SierraC7-13) focus on impacts related to increased Tuolumne River diversions. Refer to **Responses SI_SierraC7-02** through **SI_SierraC7-13** for the specific responses.

Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

The designation of the Tuolumne River as a wild and scenic river is discussed in Draft PEIR Section 5.2 (Vol. 3, Chapter 5, p. 5.2-8).

SI_SierraC7-02 This comment states that the analysis of impacts on the Tuolumne River inside Yosemite National Park as a result of changes in releases from O'Shaughnessy Dam is inadequate. As described in the Draft PEIR (Vol. 1, Chapter 2, pp. 2-33 and 2-34), the Raker Act granted to the City and County of San Francisco rights-of-way and use of public lands in the affected areas to construct, operate, and maintain facilities for developing and using water and power; these public lands include lands within Yosemite National Park. The Draft PEIR analyzes the potential impacts on environmental resources within Yosemite National Park associated with changes in Hetch Hetchy Reservoir levels and changes in releases from O'Shaughnessy Dam (see Vol. 3, Section 5.3). The analysis includes impacts on stream flow, geomorphology, water quality, groundwater, fisheries, terrestrial biological resources, recreation, and visual resources. Refer also to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14) for additional information regarding the impact analysis for the upper Tuolumne River.

SI_SierraC7-03 The comment that "growth statements" rely on published studies that don't cover the time period up to 2030 and have not undergone environmental review apparently refers to the use of ABAG's *Projections 2002* in the water demand models, and repeats issues raised in Comment SI_SierraC6-02. Please refer to **Response SI_SierraC6-02**.

SI_SierraC7-04 This comment states that there is a lack of adequate baseline data for the Tuolumne River to properly analyze the environmental consequences of additional diversions on river flows and fisheries. Please refer to **Response SI_Caltrout-01** for response.

SI_SierraC7-05 As indicated in the Draft PEIR, the analysis determined that impacts of the WSIP on stream flow in the Tuolumne River would be less than significant (Vol. 3, Chapter 5, Impacts 5.3.1-1 [pp. 5.3.1-21 to 5.3.1-28] and 5.3.1-4 [pp. 5.3.1-30 to 5.3.1-38]), and no mitigation measures are required. In addition, the analysis determined that impacts of the WSIP on fishery resources would be less than significant in the Tuolumne River between Hetch Hetchy and Don Pedro Reservoirs (Vol. 3, Chapter 5, Impact 5.3.6-2, pp. 5.3.6-26 to 5.3.6-28), and no mitigation measures are required. However, the analysis determined that impacts of the WSIP on fishery resources would be potentially significant in the Tuolumne River below La Grange Dam (Vol. 3, Chapter 5, Impact 5.3.6-4, pp. 5.3.6-28 to 5.3.6-33), but implementation of Mitigation Measures 5.3.6-4a or 5.3.6-4b (Vol. 4, Chapter 6, pp. 6-48 to 6-49) would reduce this impact to a less-than-significant level. Please also refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14) for further discussion of mitigation for potential impacts on fisheries, and additional discussion of Measures 5.3.6-4a and 5.3.6-4b, including text revisions to Measure 5.3.6-4b that add further definition to the habitat enhancement effort.

SI_SierraC7-06 Please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14) for additional discussion of climate change to augment the discussion presented in Section 5.7.6 of the Draft PEIR (Vol. 3, Chapter 5, pp. 5.7-92 to 5.7-96). **Section 14.11** of this document provides more detailed and up-to-date information on climate change as it relates to the SFPUC regional water supply and the proposed WSIP.

SI_SierraC7-07 This comment asserting that demand projections are faulty has been submitted by numerous commenters; please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2).

SI_SierraC7-08 Refer to **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14).

SI_SierraC7-09 The reference to the San Francisco Board of Supervisors resolution is acknowledged. It is assumed that the commenter is referring to Resolution No. 321-07 dated June 12, 2007, which urges environmental analysis of water supply alternatives that will not increase diversions of freshwater from the Tuolumne River as well as active implementation of conservation and recycled water programs. The PEIR is consistent with this resolution in that it evaluates two alternatives that would not increase diversions from the Tuolumne River: the Aggressive Conservation/Water Recycling and Local Groundwater

Alternative (see Vol. 4, Chapter 9, Section 9.2.4, pp. 9-47 to 9-59), No Supplemental Tuolumne River Water; and the Year-round Desalination at Oceanside Alternative (see Vol. 4, Chapter 9, Section 9.2.6, pp. 9-66 to 9-74). In addition, the WSIP includes 10 million gallons per day of recycled water, conservation, and groundwater projects as part of the proposed water supply option.

SI_SierraC7-10 This comment references Comment Letter S_CDFG2, dated October 1, 2007. Please refer to **Responses S_CDFG2-05** and **S_CDFG2-06** for specific responses.

SI_SierraC7-11 This comment references Comment Letter S_CDFG2, dated October 1, 2007. Please refer to **Response S_CDFG2-02** for response.

SI_SierraC7-12 Please refer to **Response L_Tuol1-02** regarding the Tuolumne County Board of Supervisors' resolution formalizing the Board's opposition to the increased diversions from the Tuolumne River.

SI_SierraC7-13 This comment, which recommends dropping the proposed increased diversions of Tuolumne River water from the WSIP, is acknowledged.

San Francisco Planning and Urban Research Association, Laura Tam, Sustainable Development Policy Director, 10/01/07

SI_SPUR-01 This comment is an overview statement of the comments submitted by the San Francisco Planning and Urban Research Association (SPUR). The specific comments are presented in Comments SI_SPUR-02 through SI_SPUR-07; refer to **Responses SI_SPUR-02** through **SI_SPUR-07** for the specific responses.

SI_SPUR-02 This comment expressing SPUR's support of the seismic improvements to the regional water system is acknowledged. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.2) for a more detailed discussion of the overall need for the WSIP and of the potential consequences of not implementing the seismic facility improvements.

SI_SPUR-03 This comment, which recommends more robust implementation of conservation and efficiency measures by the SFPUC's retail and wholesale customers, is acknowledged. Some of the information presented in the comment regarding projected changes in water demand, population, and employment requires clarification. As shown in Draft PEIR Table 7.4 and Table 7.10 (Vol. 4, Chapter 7, p. 7-20 and p. 7-33, respectively), population in the wholesale customer service area is expected to increase by 19 percent by 2030 (as the comment states) and employment is expected to increase by 31 percent (not 30 percent). As the comment states, water demand in the wholesale service area is projected to increase by 19 percent (refer to Draft PEIR Table 7.3 and Table 7.10, Vol. 4, Chapter 7, p. 7-18 and p. 7-33, respectively). Both population and employment growth were factored into the demand model; the suggestion that growth in demand is driven exclusively by increased employment does not appear to be based on information in the Draft PEIR, except insofar as more employment than population growth is expected. Regarding the employment projections assumed in the demand models, as well as expectations regarding per-capita demand, refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2).

The comment correctly notes that water savings are projected to result from active and passive conservation and from planned recycled water projects; expected savings from these components are shown Tables 14.2-5 and 14.2-9 of **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2). The 2030 purchase estimates submitted by the SFPUC and its wholesale customers do not assume any water savings from desalination projects (refer to Draft PEIR Table 7.2, Vol. 4, Chapter 7, p. 7-18), although the Draft PEIR analyzes the use of desalination technologies as a supplemental water supply in the discussions for the

Year-round Desalination at Oceanside Alternative (Vol. 4, Chapter 9, Section 9.2.6) and Variant 2 – Regional Desalination for Drought (Vol. 4, Chapter 9, Section 9.2.7).

Both population and employment in San Francisco are projected to increase, as this comment notes. As shown in Draft PEIR Table 7.10 (Vol. 4, Chapter 7, p. 7-33), population is projected to increase by 12 percent, employment is projected to increase by 25 percent, and water demand is projected to decrease very slightly (0.2 percent). The 11 percent decline referenced in this comment refers to the change in water "purchases" (that is, surface water supplies from the SFPUC regional system), as shown in Draft PEIR Table 7.3 (Vol. 4, Chapter 7, p. 7-18). The SFPUC retail demand will be met through regional water system supplies that include surface water, recycled water, and groundwater, as well as conservation.

The commenter's opinion—that the "environmentally superior alternative" identified in the Draft PEIR represents a better approach, that the WSIP should exceed or meet the California Urban Water Conservation Council (CUWCC) Best Management Practices (BMPs) for water conservation, and that all agencies should continuously be improving their conservation practices—is acknowledged. Please refer to Tables 14.2-3 and 14.2-4 in **Section 14.2, Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2) regarding the CUWCC BMPs and other conservation measures that are being implemented or planned by the SFPUC and its wholesale customers. Regarding the recommendation that the environmentally superior alternative be more fully described and evaluated, refer to **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14).

SI_SPUR-04 Please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14) for additional discussion of climate change to augment the discussion presented in Section 5.7.6 of the Draft PEIR (Vol. 3, Chapter 5, pp. 5.7-92 to 5.7-96). Section 4.11 provides information on climate change as it relates to the SFPUC regional water supply and the proposed WSIP.

SI_SPUR-05 SPUR's request that climate change be examined, but not at the expense of the seismic improvements to the regional water system, is acknowledged. Please refer to Section 5.7.6 of the Draft PEIR (Vol. 3, Chapter 5, pp. 5.7-92 to 5.7-96) and **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14). Section 14.11 provides more detailed and up-to-date information on climate change as it relates to the SFPUC regional water supply and the proposed WSIP.

SI_SPUR-06 This comment expressing support for the Modified WSIP Alternative is acknowledged.

SI_SPUR-07 Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues,** and **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14) for relevant response related to the WSIP's impacts on Tuolumne River flows, including the effects of the proposed program on biological and fishery resources.

This comment stating the need for the regional water system to be as robust as possible for any future climate scenario is acknowledged. Refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14, Section 14.11.5) for a discussion of SFPUC actions to evaluate its water supply planning with respect to climate change effects.

State Water Contractors, Terry Erlewine, General Manager, 09/25/07

SI_SWC-01 This comment addresses concerns that the Draft PEIR does not adequately address the potential indirect effects of the WSIP on the State Water Project (SWP) operated by the Department of Water Resources (DWR) or the indirect effects on Delta water quality and SWP supply. Please refer to **Section 14.8, Master Response on San Joaquin River and Delta Issues** (Vol. 7, Chapter 14, Section 14.8.3) for a review of the PEIR analysis of these issues and additional information about the potential effects on Central Valley Project (CVP) and SWP operations and related indirect environmental effects.

SI_SWC-02 This comment supporting the environmentally superior alternative and encouraging additional environmental analysis due to the likely significant impacts associated with implementation of the WSIP is acknowledged. Please refer to **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14, Section 14.10.3) for additional information regarding updated model results for the proposed WSIP and Modified WSIP Alternative.

SI_SWC-03 This comment recommends two options: (1) that the SFPUC adopt the Modified WSIP Alternative as the preferred alternative, or (2) that the SFPUC provide an updated analysis of the proposed WSIP that would include adjusting the timing of Don Pedro Reservoir refill in order to reduce the scale of monthly flow reductions in the Tuolumne River below La Grange Dam and to coincide with periods of excess conditions in the Delta. Please refer to **Section 14.8, Master Response on San Joaquin River and Delta Issues** (Vol. 7, Chapter 14, Section 14.8.3) for further discuss on WSIP effects on CVP and SWP operations. The PEIR determined that WSIP effects on the CVP and SWP operations would be less than significant and no mitigation is required. However, Mitigation Measure 5.3.6-4a (Avoidance of Flow Changes By Reducing Demand for Don Pedro Reservoir Water) proposed to address WSIP effects on fisheries and riparian habitat in the Lower Tuolumne River (which calls for the SFPUC to acquire conserved water for the proposed water transfer element of the WSIP), would also further reduce WSIP effects on the San Joaquin River and the Delta.

Tuolumne County Farm Bureau, Stan Kellogg, President, 09/05/07

[See Public Hearing Transcript, Sonora, pp. 10–11]

SI_TCFB-01 This comment opposing any additional Tuolumne River diversions is acknowledged.

Tuolumne River Outfitters Association, Stephen Welch, President, 10/01/07

SI_TROA-01 This comment, which opposes any changes to the SFPUC regional water system that could potentially degrade the quality of the Tuolumne River Outfitters Association's (TROA) trips, is acknowledged. The commenter notes that the proposed withdrawals from the Tuolumne River could be detrimental to TROA's business while also recognizing that the SFPUC and TROA have worked together successfully to develop an understanding of each entity's needs and constraints. The San Francisco Planning Department and the SFPUC recognize the importance of reliable and adequate river flows to the commercial outfitters. In the Draft PEIR, the San Francisco Planning Department concluded that the WSIP would have a less-than-significant impact on whitewater rafting (Vol. 3, Chapter 5, pp. 5.3.8-27 to 5.3.8-32). The SFPUC would continue to work cooperatively with the commercial outfitters, as it does currently, whether or not the WSIP is implemented.

SI_TROA-02 The commenter notes that the Draft PEIR accurately describes the situation with respect to rafting flows and the working relationship between the SFPUC and the commercial rafting outfitters (Vol. 3, Chapter 5, pp. 5.3.8-9 and 5.3.8-10). The San Francisco Planning Department and the SFPUC acknowledge that the flows referred to as "minimum" and "adequate" are less than those preferred by the rafting outfitters and have noted the information provided by the commenter regarding TROA's opinion on optimal flow conditions.

SI_TROA-03 The commenter, who represents expert opinion with respect to commercial rafting on the Tuolumne River, offers the following correction, which the San Francisco Planning Department accepts. In response to this comment, the following text from the Draft PEIR (Vol. 3, Chapter 5, p. 5.3.8-10, third full paragraph) is revised as follows:

> ~~A 900-cfs~~ A 1,100-cfs flow at Lumsden Campground is the minimum required for whitewater paddle boats and oar boats; a ~~600-cfs~~ 900-cfs flow is the minimum required for kayaks~~ and oar boats~~, and a ~~1,200-cfs~~ 1,500- to 2,000-cfs flow is considered optimal. The commercial outfitters prefer ~~a six-hour~~ an eight-hour release, but a ~~three-hour~~ four-hour release allows them to launch one-, two- and three-day trips.

SI_TROA-04 The commenter expresses hope that the current "minimum" flows and the potential for future "optimal" flows would not be jeopardized by the WSIP. As noted in the Draft PEIR (Vol. 3, Chapter 5, pp. 5.3.8-27 to 5.3.8-32), the WSIP would have a less-than-significant impact on whitewater rafting. The potential for future optimal flows would be the same with or without the WSIP.

Tuolumne River Trust, Amy Meyer, Founding Member, 09/28/07

SI_TRT1-01 This comment opposes any additional Tuolumne River diversions and promotes additional conservation and water recycling. Comment noted. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for information related to conservation programs and recycling projects proposed by the SFPUC and its wholesale customers.

SI_TRT1-02 This comment, which states that the SFPUC's pricing structure does not encourage enough conservation and recycling, is acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) under the heading Conservation Measures Suggested by Commenters for a discussion of conservation pricing.

Tuolumne River Trust, Cynthia King, Sierra Nevada Program Director, 09/05/07

[See Public Hearing Transcript, Sonora, pp. 14–16]

SI_TRT2-01 This comment states that there is a lack of adequate baseline data for the Tuolumne River to properly analyze the environmental consequences of additional diversions on river flows, fisheries, riparian habitat, and associated species. Please refer to **Response SI_Caltrout-01** for a response to this comment.

SI_TRT2-02 This comment states that the demand projections are flawed because they use outdated employment projections and ignore the effect of price increases on future demand. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2) for additional information.

SI_TRT2-03 Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Sections 14.7.8 and 14.7.9) for an expanded discussion of Mitigation Measures 5.3.6-4a and 5.3.6-4b, including text revisions to Measure 5.3.6-4b that add further definition to the habitat enhancement effort.

Tuolumne River Trust, Galen Weston, Part-time Employee, 09/05/07

[See Public Hearing Transcript, Sonora, pp. 25–29]

SI_TRT3-01 Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.5) for relevant response related to the integration of the seismic improvements and water supply option to meet program objectives. Also refer to **Section 14.5**, **Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions. This comment also refers to the San Francisco Board of Supervisor's Resolution No. 321-07, dated June 12, 2007, in which the Board urges the SFPUC to fully analyze water supply alternatives that would not result in increased Tuolumne River diversions. The Draft PEIR evaluated alternatives that do not propose additional diversions from the Tuolumne River, including the Year-round Desalination at Oceanside Alternative (Vol. 4, Chapter 9, Section 9.2.4) and the Aggressive Conservation/ Water Recycling and Local Groundwater Alternative (With No Supplemental Tuolumne River Water) (Vol. 4, Chapter 9, Section 9.2.6). Also refer to **Section 13.4, Phased WSIP Variant** (Vol. 7, Chapter 13) for new information related to a variation of the program, called the Phased WSIP Variant, in which the SFPUC would meet only the current Master Sales Agreement commitment of serving the SFPUC wholesale customers up to 184 million gallons per day (mgd) through 2018, at which time the SFPUC would reevaluate the wholesale customer supply delivery and future water supplies.

SI_TRT3-02 Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2) for pertinent responses related to future demand projections and to conservation programs and recycling projects proposed by the SFPUC and its wholesale customers. The commenter expresses concern regarding the WSIP's compliance with the Raker Act of 1913. However, the City and County of San Francisco believes that the WSIP is consistent with the Raker Act, including Section 9(h), with respect to the export of additional water from the Tuolumne River watershed, since the additional diversions under the WSIP would be for municipal and domestic purposes. Please also refer to **Response L_TUD1-05** for additional information.

SI_TRT3-03 This comment states that the baseline data used in the Draft PEIR to analyze impacts on the Tuolumne River related to proposed changes in water supply sources and regional water system operations is inadequate. Please refer to **Response SI_Caltrout-01** for a response to this comment.

SI_TRT3-04 Mitigation Measure 5.3.6-4a, Avoidance of Flow Changes by Reducing Demand for Don Pedro Reservoir Water, is proposed to lessen the impacts of the WSIP on fishery and biological resources in the lower Tuolumne River below La Grange Dam (Vol. 4, Chapter 6, p. 6-48). The measure would involve actions that prevent the WSIP from causing water levels in Don Pedro Reservoir to be drawn down any farther than they are under the existing condition, which would require a reduction in water use by the Turlock Irrigation District, Modesto Irrigation District, or another water agency. Please refer to **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14, Section 14.10.3) for additional information regarding additional water conservation/recycling under the Modified WSIP Alternative.

SI_TRT3-05 Please refer to **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14, Sections 14.8.2 and 14.8.3) for discussion of the responsibilities of the U.S. Bureau of Reclamation and California Department of Water Resources regarding compliance with Delta water quality and flow objectives.

SI_TRT3-06 The Draft PEIR evaluated the Aggressive Conservation/Water Recycling and Local Groundwater Alternative (With No Supplemental Tuolumne River Water), which relies on conservation and recycling to meet future water demand needs (Vol. 4, Chapter 9, Section 9.2.6). The Draft PEIR also evaluated the Year-round Desalination at Oceanside Alternative, which includes a 25-mgd desalination plant in San Francisco to serve the full projected increase in customer purchase requests through 2030 without additional Tuolumne River diversions (Vol. 4, Chapter 9, Section 9.2.4). As summarized in Table 9.6 (Vol. 4, Chapter 9, pp. 9-14 to 9-16), the Aggressive Conservation/Water Recycling and Local Groundwater Alternative (With No Supplemental Tuolumne River Water) would not be capable of meeting WSIP objectives related to water supply, and it is uncertain whether or not this alternative would meet all WSIP objectives related to seismic reliability, delivery reliability, and cost-effectiveness. The Year-round Desalination at Oceanside Alternative would only partially meet the WSIP objectives related to delivery reliability and cost-effectiveness, and it is uncertain whether or not this alternative would meet all WSIP objectives related to sustainability.

Tuolumne River Trust, Meg Gonzalez, Director of Community Outreach and Education, 09/06/07

[See Public Hearing Transcript, Modesto, p. 10]

SI_TRT4-01 The commenter states concern that efforts to restore the ecological integrity of the lower Tuolumne River would be undermined by the WSIP. Please refer to **Response SI_SierraC2-01**.

Tuolumne River Trust, Patrick Koepele, Central Valley Program Director, 09/06/07

[See Public Hearing Transcript, Modesto, pp. 18–21]

SI_TRT5-01 This comment expresses concerns related to the effects of additional Tuolumne River diversions on restoration efforts aimed at protecting fall-run Chinook salmon and Central Valley steelhead below La Grange Dam. As described in the Draft PEIR, the San Francisco Planning Department determined that long-term WSIP-induced flow changes in the Tuolumne River below La Grange Dam could have a significant adverse effect on fishery resources along this reach of river (Vol. 3, Chapter 5, pp. 5.3.6-28 to 5.3.6-32). The Draft PEIR acknowledged that the WSIP's small but incremental contribution to adverse effects on the lower river would make planned restoration of habitat and fishery resources more difficult. As a result, the impact of the WSIP on fishery resources in the lower Tuolumne River was determined to be potentially significant. Implementation of Mitigation Measure 5.3.6-4a, Avoidance of Flow Changes by Reducing Demand for Don Pedro Reservoir Water, or 5.3.6-4b, Fishery Habitat Enhancement, would reduce this impact to a less-than-significant level (Vol. 4, Chapter 6, pp. 6-48 and 6-49). Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Sections 14.7.2, 14.7.8, and 14.7.9) for supplementary information on the presence of steelhead and Chinook salmon along this reach of the lower river, and additional discussion on Measures 5.3.6-4a and 5.3.6-4b, including text revisions to Measure 5.3.6-4b that add further definition to the habitat enhancement effort.

SI_TRT5-02 The commenter notes that additional diversions of water from the Tuolumne River could harm steelhead that use the reach of the river below La Grange Dam. The focus of the Draft PEIR analysis was on Chinook salmon rather than steelhead, because conditions in this reach of river are generally considered to be unsuitable for steelhead under the existing condition. Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Sections 14.7.2, 14.7.3, 14.7.8, and 14.7.9) for information on the presence of steelhead and Chinook salmon along this reach of the lower river, and for additional discussion on Mitigation Measures 5.3.6-4a and 5.3.6-4b, including text revisions to Measure 5.3.6-4b that add further definition to the habitat enhancement effort.

SI_TRT5-03 The San Francisco Planning Department agrees with the commenter that the WSIP-caused flow reductions could have a potentially significant adverse effect on the riparian forest along the lower Tuolumne River (Vol. 3, Chapter 5, p. 5.3.7-25). Mitigation Measure 5.3.7-2, Controlled Releases to Recharge Groundwater in Streamside Meadows and Other Alluvial Deposits, would require that the SFPUC manage releases from Hetch Hetchy Reservoir during the spring in order to recharge groundwater, which supports meadow and riparian habitat in the upper Tuolumne River. Implementation of Measure 5.3.6-4a, Avoidance of Flow Changes by Reducing Demand for Don Pedro Reservoir Water, or, if Measure 5.3.6-4a is not feasible, implementation of Measure 5.3.7-6, Lower Tuolumne River Riparian Enhancement, would address impacts on riparian habitat below La Grange Dam. Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.4) and **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.8) for additional discussion of impacts on riparian habitat along the Tuolumne River, including text revisions to Measures 5.3.7-2 and 5.3.6-4a that further specify the mitigation requirements.

SI_TRT5-04 The commenter indicates that the proposed mitigation for the impact on fishery resources in the lower Tuolumne River is inadequate. Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.9) for an expanded discussion of the impact analysis for the lower Tuolumne River, including revisions to Measures 5.3.6-4a and 5.3.6-4b that further define the mitigation requirements.

SI_TRT5-05 This comment opposing additional Tuolumne River diversions and encouraging additional conservation efforts is acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for pertinent response related to conservation programs and recycling projects proposed by the SFPUC in San Francisco and by the wholesale customers in their respective service areas.

Tuolumne River Trust,
Eric Wesselman, Executive Director, 09/06/07

[See Public Hearing Transcript, Modesto, pp. 21–25]

SI_TRT6-01 This comment stresses the need for seismic improvements to the regional water system but expresses concerns that the proposed WSIP water supply option and changes in system operations may delay the seismic improvements. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.5) regarding the integration of the seismic improvements and water supply options to meet program objectives, and for a discussion of the advantages of using a program EIR to evaluate the proposed program as a whole. Also refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

SI_TRT6-02 The statements made in this comment regarding demand projections have been submitted by numerous commenters. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2) for additional information.

SI_TRT6-03 This comment states that there is a lack of adequate baseline data for the Tuolumne River to properly analyze the environmental consequences of additional diversions. Please refer to **Response SI_Caltrout-01** for a response to this comment.

SI_TRT6-04 The commenter accurately notes that the SFPUC currently pays the Turlock and Modesto Irrigation Districts to release fish flows at La Grange Dam on its behalf. Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.4) for a response to this comment.

SI_TRT6-05 This comment asserts that the PEIR does not adequately analyze the WSIP's impacts on the Delta. Please refer to **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14, Sections 14.8.2 and 14.8.3) for a discussion of the WSIP's effects on the San Joaquin River and Delta, and of the responsibilities of the U.S. Bureau of Reclamation and California Department of Water Resources regarding compliance with Delta water quality and flow objectives.

Tuolumne River Trust, Eric Wesselman, Executive Director, 09/18/07

[See Public Hearing Transcript, Fremont, pp. 12–17]

SI_TRT7-01 This comment opposing additional Tuolumne River diversions is acknowledged. Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions. Please refer to **Section 14.6, Master Response on Upper Tuolumne Issues** (Vol. 7, Chapter 14, Section 14.6.5) and **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.6) for clarification regarding current and estimated future municipal and agricultural diversions from the Tuolumne River.

SI_TRT7-02 This commenter's support for more conservation and recycling to meet water demand and opposition to additional diversions from the Tuolumne River is acknowledged. As described in the Draft PEIR, the WSIP includes 22 to 34 million gallons per day (mgd) of projected water conservation and recycling savings in addition to 36 mgd of passive conservation savings due to the implementation of plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives that would reduce diversions from the Tuolumne River, please refer to the following sections of the Draft PEIR: Sections 9.2.2 through 9.2.4, and Sections 9.2.6 and 9.2.7. For additional information, refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3).

SI_TRT7-03 This comment regarding the effect of price on demand was submitted by numerous commenters; please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2).

SI_TRT7-04 It is assumed that this comment refers to the *Investigation of Regional Water Supply Option No. 4 Technical Memorandum* (SFPUC, 2007, Appendix D). This study was used in the development of the Aggressive Conservation/Water Recycling and Local Groundwater Alternative analyzed in the Draft PEIR (Vol. 4, Chapter 9). In response to the commenter's reference to "the reformulation of new demand projections," please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3, under the heading Maximum Conservation and Water Recycling Potential).

SI_TRT7-05 This comment regarding the employment projections used in the demand study was submitted by numerous commenters; please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2).

SI_TRT7-06 This comment regarding per-capita demand increase was submitted by numerous commenters; please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14).

SI_TRT7-07 This comment states that there is a lack of adequate baseline data for the Tuolumne River to properly analyze the environmental consequences of additional diversions. Please refer to **Response SI_Caltrout-01** for a response to this comment.

SI_TRT7-08 CEQA defines a significant effect on the environment as a substantial, or potentially substantial, adverse change in the environment (Public Resources Code Section 21068). When determining whether a project may have a significant effect on the environment, CEQA calls for careful judgment on behalf of the lead agency based upon scientific and factual data to the extent possible. However, CEQA does not set quantifiable criteria because the significance of an activity may vary with the setting (CEQA Guidelines Section 15604). Appendix B of the Draft PEIR (SFPUC WSIP Initial Study Checklist) lists the significance criteria used to determine the significance of potential impacts. As stated in the Draft PEIR (Vol. 2, Chapter 4, p. 4.1-5), the impact significance criteria are based on San Francisco Planning Department, Major Environmental Analysis Division (MEA) standard guidance regarding the environmental effects to be considered significant. Note that the Draft PEIR includes additional significance criteria in cases where potential environmental issues associated with the WSIP are identified but are not clearly addressed by MEA's standard guidance.

The Draft PEIR (Vol. 2, Chapter 4, pp. 4.1-5 to 4.1-7) identifies the significance determination categories (e.g., not applicable, less than significant, or potentially significant but mitigable) and describes the significance determination process. The impact analyses evaluate whether compliance with applicable regulations would reduce a potentially significant impact to a less-than-significant level. If so, compliance with the regulation is assumed, and the impact is considered to be less than significant. In addition, the impact analyses determine whether the WSIP projects would be subject to the policies set forth in the SFPUC Alameda or Peninsula Watershed Management Plans. The analyses also consider whether implementation of the SFPUC's Standard Construction Measures (described in Chapter 3, Section 3.11 of the Draft PEIR) could reduce impacts to a less-than-significant level. An impact is considered potentially significant in cases where there are no applicable regulations or SFPUC Standard Construction Measures, or where such regulations and measures exist but by themselves would not reduce the impact to a less-than-significant level. If there are feasible measures available that would reduce a potentially significant impact to a less-than-significant level, then the impact is considered potentially significant but mitigable, and the PEIR identifies mitigation measure(s) to address the potentially significant impact.

SI_TRT7-09 Please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14, Sections 14.11.4 and 14.11.5) for a response related to the SFPUC's approach to addressing climate change in its water supply planning.
Section 14.11 augments the discussion presented in Section 5.7.6 of the Draft PEIR (Vol. 3, Chapter 5, pp. 5.7-92 to 5.7-96). Section 14.11 provides more detailed and up-to-date information on climate change as it relates to the SFPUC regional water supply and the proposed WSIP.

Tuolumne River Trust, Peter Drekmeier, Bay Area Program Director, 09/19/07

[See Public Hearing Transcript, Palo Alto, pp. 12–16]

SI_TRT8-01 This comment opposing additional Tuolumne River diversions is acknowledged. Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

SI_TRT8-02 These comments, which assert that demand is inflated, that demand projections do not account for increases in the price of water, and that per-capita consumption is expected to increase, have been submitted by many commenters; please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2). The comment does not indicate the basis for the assertion that "we are shifting from manufacturing to service and information, which use considerably less water" or sufficiently specify information to allow for a specific response. However, the comment apparently refers to use in the demand model of employment projections that are not industry-specific. For additional information related to conservation programs and recycling projects proposed by the SFPUC and its wholesale customers, refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3).

SI_TRT8-03 Regarding the assertion that the full potential for water recycling and conservation has not been examined, refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3). The basis for the statement that the proposed WSIP includes only a 3 percent increase in water recycling is unclear. The recycled water potential studies distinguish between total recycled water projects and those that would replace potable supplies; only recycled water that would replace potable supplies is shown in Draft PEIR Table 3.3 (Vol. 1, Chapter 3, p. 3-18). According to the *SFPUC Wholesale Customer Recycled Water Potential Technical Memorandum* (RMC, 2004), existing (2004) recycled water projects replace 4.3 million gallons per day (mgd) of potable water supply. Therefore, the estimated 10.4 mgd of recycled water for the wholesale service area shown in Draft PEIR Table 3.3 represents a 243 percent increase in recycled water use. For the service area as a whole, the estimated 12.4 mgd of recycled water (assuming 2 mgd for the SFPUC retail service area, the average of the range shown in Table 3.3) represents a 288 percent increase in the use of recycled water that replaces potable supplies. It is the case, based on the projected 2030 recycled water use and 2030 demand shown in Table 3.3, that recycled water represents about 3 percent of total 2030 demand, which may have been the commenter's point. This estimate is acknowledged.

Regarding the statement that 60 percent of 2030 water demand is for outdoor irrigation, refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2) for a discussion of water use for different sectors.

SI_TRT8-04 This comment states that there is a lack of adequate baseline data for the Tuolumne River to properly analyze the environmental consequences of additional diversions on river flows, fisheries, riparian habitat, and associated species. Please refer to **Response SI_Caltrout-01** for a response to this comment.

SI_TRT8-05 With respect to the use of monthly average and daily flows in the analysis of impacts on biological resources, please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.3).

SI_TRT8-06 Please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14) for additional discussion of climate change to augment the discussion presented in Section 5.7.6 of the Draft PEIR (Vol. 3, Chapter 5, pp. 5.7-92 to 5.7-96). Section 14.11 provides more detailed and up-to-date information on climate change as it relates to the SFPUC regional water supply and the proposed WSIP.

SI_TRT8-07 With respect to the dry-year transfer, please refer to **Section 14.3, Master Response on Proposed Dry-Year Water Transfer** (Vol. 7, Chapter 14) for a discussion of feasibility and implementation issues and the requirement for subsequent project-level CEQA review of the transfer prior to ratification of such an agreement.

Also refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

Tuolumne River Trust, Eric Wesselman, Executive Director, 09/20/07

[See Public Hearing Transcript, San Francisco City Hall, pp. 18–20]

SI_TRT9-01 This comment opposing additional Tuolumne River diversions is acknowledged. Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions. Please refer to the Draft PEIR (Vol. 3, Chapter 5, pp. 5.2-7 to 5.2-9) regarding the Tuolumne River's designation as a wild and scenic river.

SI_TRT9-02 The purpose of the Draft PEIR is not to "justify or define" the need for more water. Consistent with CEQA, the PEIR evaluates the environmental impacts of the proposed program as defined by the project sponsor (in this case, the SFPUC) and identifies and analyzes alternatives that would reduce or eliminate those impacts. Regarding the comment that the price elasticity of water demand was not considered in the demand analysis, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2).

SI_TRT9-03 It is assumed that this comment refers to the *Investigation of Regional Water Supply Option No. 4 Technical Memorandum* (SFPUC, 2007, Appendix D). This study was used in the development of the Aggressive Conservation/Water Recycling and Local Groundwater Alternative analyzed in the Draft PEIR (Vol. 4, Chapter 9, Section 9.2.4). Please also refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3, under the heading Additional Conservation and Water Recycling Potential).

SI_TRT9-04 This comment regarding the use of the Association of Bay Area Governments' *Projections 2002* in the demand analyses was submitted by numerous commenters; refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2).

SI_TRT9-05 This comment regarding per-capita demand was submitted by numerous commenters; please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2).

SI_TRT9-06 This comment, which stresses the need for seismic improvements to the regional water system while expressing concern that the proposed WSIP water supply option and changes in system operations could delay the seismic improvements, is acknowledged. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.5) regarding the integration of the seismic improvements and water supply options to meet program objectives, and for a discussion of the advantages of using a program EIR to evaluate the proposed program as a whole.

Tuolumne River Trust, Peter Drekmeier, Bay Area Program Director, 10/11/07

[See Public Hearing Transcript #2, San Francisco City Hall, pp. 37–39]

SI_TRT10-01 This comment expressing support for seismic improvements to the regional water system but opposing additional Tuolumne River diversions is acknowledged. Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

SI_TRT10-02 With respect to the dry-year transfer included as part of the proposed program, please refer to **Section 14.3, Master Response on Proposed Dry-Year Water Transfer** (Vol. 7, Chapter 14). With respect to the agricultural conservation that would occur as part of a water transfer under the Modified WSIP Alternative, refer to Section 14.10, Master Response on Modified WSIP Alternative (Vol. 7, Chapter 14, Section 14.10 This section discusses feasibility and implementation issues as well as the requirement for subsequent project-level CEQA review of the transfer prior to ratification of such an agreement. With respect to the potential effects of the WSIP on the Tuolumne River between O'Shaughnessy Dam and La Grange Dam, the Draft PEIR (Vol. 3, Chapter 5, Sections 5.3.1 through 5.3.9) included a project-level analysis of impacts on fisheries and terrestrial biological resources that would result from the proposed water supply option and changes in system operations. The results of the analysis indicated potentially significant adverse impacts on alluvial features that support meadow and riparian habitat (Impact 5.3.7-2, Vol. 5, Chapter 5, pp. 5.3.7-21 and 5.3.7-22) along this reach of the Tuolumne River. However, implementation of Mitigation Measure 5.3.7-2, Controlled Releases to Recharge Groundwater in Streamside Meadows and Other Alluvial Deposits (Vol. 4, Chapter 6, pp. 6-49 and 6-50) was prescribed to reduce these impacts to a less-than-significant level. Refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14) for further discussion of the analysis of the effects of the WSIP on the upper Tuolumne River, and additional discussion of Mitigation Measure 5.3.7-2, including text revisions to Measure 5.3.7-2 that further define the mitigation requirements.

SI_TRT10-03 This comment states that there is a lack of adequate baseline data for the Tuolumne River to properly analyze the environmental consequences of additional diversions on river flows, fisheries, riparian habitat, and associated species. Please refer to **Response SI_Caltrout-01** for a response to this comment.

SI_TRT10-04 With respect to the dry-year transfer included as part of the proposed program, please refer to **Response SI_TRT10-02**, above. The commenter is correct that the California Department of Fish and Game has asked the Federal Energy Regulatory Commission to consider requiring greater releases of water from La Grange Dam to support anadramous fish. The commenter's opinion with respect to certification of the PEIR is noted.

Tuolumne River Trust, Clean Water Action, Sierra Club, Peter Drekmeier, Jennifer Clary, John Rizzo, 10/01/07

SI_TRT-CWA-SierraC-01 This comment consists of a summary of detailed comments contained in this comment letter. Responses to these comments are provided below in **Responses SI_TRT-CWA-SierraC-02** through **SI_TRT-CWA-SierraC-199**. In addition, many of these comments are addressed in **Sections 14.5, 14.6,** and **14.7, Master Responses on Water Resources Modeling, Upper Tuolumne River Issues,** and **Lower Tuolumne River Issues** (Vol. 7, Chapter 14), respectively.

SI_TRT-CWA-SierraC-02 The commenter correctly quotes the SFPUC's Water Enterprise Environmental Stewardship Policy. The Draft PEIR describes and evaluates the consistency of the WSIP with the Water Enterprise Environmental Stewardship Policy in two places: in Section 4.2 (Vol. 2, Chapter 4, p. 4.2-6 and pp. 4.2-15 and 4.2-16) with respect to the proposed facility improvement projects, and in Section 5.2 (Vol. 3, Chapter 5, pp. 5.2-24, 5.2-25, and 5.2-29) with respect to the proposed water supply and system operations. As described in these sections, the WSIP would be consistent with the underlying goals of the Water Enterprise Environmental Stewardship Policy, particularly with respect to the WSIP sustainability goal and the WSIP objective to manage natural resources and physical systems to protect watershed ecosystems (refer to Table 3.2, Vol. 1, Chapter 3, p. 3-9).

Impacts of the WSIP on downstream native fish and wildlife populations are analyzed in the Draft PEIR in Sections 5.3.6, 5.4.5, and 5.5.5 for the Tuolumne River system, Alameda Creek system, and Peninsula watershed, respectively. The following impacts on downstream fishery resources were found to be less than significant: along the Tuolumne River between Hetch Hetchy Reservoir and Don Pedro Reservoir (Impact 5.3.6-2); along the San Joaquin River (Impact 5.3.6-5); along Calaveras Creek below Calaveras Dam and along Alameda Creek below the confluence with Calaveras Creek (Impact 5.4.5-2); along San Antonio Creek below San Antonio Reservoir (Impact 5.4.5-5); along Alameda Creek below the confluence with San Antonio Creek (Impact 5.4.5-6); and along San Mateo Creek below Crystal Springs Reservoir (Impact 5.5.5-3). The following impacts on downstream fishery resources were found to be potentially significant but mitigable: along the Tuolumne River below Don Pedro Reservoir (Impact 5.3.6-4); along Alameda Creek below the Alameda Creek Diversion Dam (Impact 5.4.5-3); and along Pilarcitos Creek below Pilarcitos Reservoir (Impact 5.5.5-5). Implementation of identified mitigation measures for downstream fishery resources would reduce the impacts associated with the WSIP to a less-than-significant level.

SI_TRT-CWA-SierraC-03 The Draft PEIR used available data to characterize the baseline or existing condition. The San Francisco Planning Department believes that the data are sufficient to make a reasonable assessment of environmental consequences associated with implementation of the WSIP. The CEQA Guidelines (Section 15151) note that an "evaluation of environmental effects of a proposed project need not be exhaustive." For more information, please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol.7, Chapter 14, Section 14.4.4).

SI_TRT-CWA-SierraC-04 This comment expresses the opinion that biological baseline data are inadequate to assess the impacts of the WSIP. For information on this topic, please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol.7, Chapter 14, Section 14.4.4).

With respect to data on streamside meadows, please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.3).

CEQA does not require that an EIR evaluate whether the existing condition is compliant with environmental laws and policies. The purpose of the Draft PEIR is to describe the consequences of the proposed WSIP relative to the existing condition (CEQA Guidelines Section 15125[a]).

With respect to the frequency and severity of impacts, refer to **Response SI_TRT-CWA-SierraC-44**.

SI_TRT-CWA-SierraC-05 This comment consists of a summary of comments on specific baseline data. Responses to detailed comments are provided in **Responses SI_TRT-CWA-SierraC-06** through **SI_TRT-CWA-SierraC-29**.

SI_TRT-CWA-SierraC-06 Please refer to **Response SI_TRT-CWA-SierraC-84** regarding Fish and Game Code Section 5937. In addition, as stated in **Response SI_TRT-CWA-SierraC-04**, CEQA does not require that an EIR evaluate whether the existing condition is compliant with environmental laws and policies. The purpose of the Draft PEIR is to describe the consequences of the proposed WSIP relative to the existing condition (CEQA Guidelines 15125[a]). As indicated in **Response SI_TRT-CWA-SierraC-03**, the San Francisco Planning Department believes that the data available from existing studies are sufficient to make a reasonable assessment of the environmental consequences of the WSIP for CEQA purposes. Also, please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol.7, Chapter 14, Section 14.4.4).

The commenter correctly notes that a draft report prepared by the U.S. Fish and Wildlife Service (USFWS) in 1992 recommended an increase in minimum releases from O'Shaughnessy Dam, based on an Instream Flow Incremental Methodology study. As described in the Draft PEIR (Vol. 3, Chapter 5, p. 5.7-7), the SFPUC provided comments on the draft study questioning the basis for some of the recommendations, but the matter was left unresolved. Beginning in 2005, the SFPUC began working with the USFWS to resolve issues regarding additional releases. Cooperative field studies are in progress, and the SFPUC and the USFWS expect to reach agreement on the releases in 2009. Please also refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.2).

The supplemental releases referred to in the comment of 4,400 to 15,000 acre-feet per year (afy) were included in the analysis of cumulative impacts. As described in the Draft PEIR (Vol. 3, Chapter 5, pp. 5.7-28 to 5.7-32), the increase in minimum flows would benefit resident trout but could also have adverse effects on spawning trout and on the flora and fauna of streamside meadows. Release of the additional water from Hetch Hetchy Reservoir in most months would increase drawdown of the reservoir, which would reduce the total volume of water released in the spring and delay the release by a few days. The reduction in volume and delay in the release could have adverse impacts on spawning trout and on the flora and fauna of streamside meadows.

SI_TRT-CWA-SierraC-07 The Draft PEIR (Vol. 1, Chapter 2, pp. 2-35 to 2-37) provides a summary description of the City and County of San Francisco's (CCSF) water rights. These water rights are adequate for the proposed water supply option proposed under the WSIP; consequently, the CCSF will not seek new appropriative water rights.

The region identified by the National Marine Fisheries Service (NMFS) and California Department of Fish and Game (CDFG) in the 2002 draft guidelines referred to by the commenter does not include watersheds affected by SFPUC facilities; further, the NMFS and CDFG explicitly state that the draft guidelines "are not developed for use in areas outside of the identified mid-coastal range" (NMFS and CDFG, 2002).

SI_TRT-CWA-SierraC-08 The commenter accurately notes that a flow/habitat assessment methodology was not used in the Draft PEIR analysis of the WSIP. A study that relates flow to trout habitat value will be part of the SFPUC's and USFWS's ongoing cooperative studies, as described in **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.2).

With respect to compliance with existing environmental laws and policies, please refer to **Response SI_TRT-CWA-SierraC-04**.

SI_TRT-CWA-SierraC-09 Please refer to **Section 14.7, Master Response on the Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.2).

SI_TRT-CWA-SierraC-10 The commenter notes that the Modesto Irrigation District (MID) and Turlock Irrigation District (TID) routinely divert less water than allowed under their water rights. Although it would be theoretically possible for MID and TID to divert more water from the Tuolumne River than they have done historically, their current average diversion of about 867,000 afy is close to the practical maximum, taking account of available storage in Don Pedro Reservoir, flood control requirements, and requirements for minimum releases to the river. The assumed value for future diversions by TID and MID used in the Draft PEIR is consistent with the value that TID and MID provided to the Department of Water Resources for California Water Plan purposes. The SFPUC has no reason to believe that TID's and MID's diversions will increase in the future. For additional information on the assumed future diversions by MID and TID used in the Hetch Hetchy/Local Simulation Model (HH/LSM), refer to the discussion in **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.6).

SI_TRT-CWA-SierraC-11 Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.3).

SI_TRT-CWA-SierraC-12 The commenter notes that the lack of an established monitoring program to assess the status of steelhead (*O. mykiss*) in the Tuolumne River makes it impossible to evaluate impacts on this species due to the proposed flow changes. On the contrary, the San Francisco Planning Department believes that sufficient information is available to reach a conclusion with respect to the potential impact of the WSIP on steelhead for the reasons noted below.

As described in the Draft PEIR, the San Francisco Planning Department determined that long-term WSIP-induced flow changes in the Tuolumne River below La Grange Dam could have a significant adverse effect on anadromous fish (Vol. 3, Chapter 5, pp. 5.3.6-28 to 5.3.6-32). Although no significant populations of steelhead are known to exist in this reach of the river, individual steelhead could be adversely affected by WSIP-induced flow changes **(**for more information, please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.3).

The Draft PEIR lists the possible mechanisms for harm to anadromous fish (Vol. 3, Chapter 5, p. 5.3.6-29). Although the WSIP would have little or no effect on average monthly flow in the lower river in most summer, fall, and winter months in all hydrologic year types, it would reduce flows in many spring and early summer months. As indicated in the Draft PEIR, the largest percentage reductions in Tuolumne River stream flow downstream of La Grange Dam due to the WSIP would occur in June. Flow reductions in May and June would likely result in seasonally elevated water temperatures and a corresponding reduction in the linear extent of suitable habitat for Chinook salmon and steelhead/rainbow trout rearing. Juvenile Chinook salmon typically migrate downstream in May, but could be adversely affected by the reduction in suitable habitat. Steelhead/rainbow trout rear within the river system throughout the year and would be adversely affected by seasonally elevated water temperatures during summer months.

Although steelhead are not abundant in the Tuolumne River (refer to Vol. 7, Chapter 14, **Section 14.7, Master Response on Lower Tuolumne River Issues**, Section 14.7.3), these changes in stream flow and water temperature could reduce habitat quality and availability for summer rearing. The more abundant juvenile Chinook salmon could also be adversely affected by WSIP-induced changes in flow and water temperature. As a result, the impact of the WSIP on these fishery resources in the lower Tuolumne River was determined to be potentially significant. Implementation of Mitigation Measures 5.3.6-4a or 5.3.6-4b would reduce these impacts to a less-than-significant level (Vol. 4, Chapter 6, pp. 6-48 and 6-49).

Additionally, the commenter notes that it is possible that current water storage and diversion operations on the Tuolumne River have led to unacceptable conditions in the river for steelhead. Furthermore, the fact that steelhead were once abundant and now are rare emphasizes the need to re-operate the water system in a manner that increases steelhead populations.

The purpose of the Draft PEIR is to describe the consequences of the proposed WSIP relative to the existing condition. CEQA does not require that an EIR evaluate whether the existing condition is compliant with all environmental laws and policies. The Draft PEIR does include an assessment of the effects of the WSIP on fisheries in the context of all past, present, and expected future actions that have or will affect this resource (Vol. 3, Chapter 5, Section 5.7). In this section, it is acknowledged that past and present water management practices and other past and present human activities, such as gravel and gold mining, have substantially altered habitat for anadromous fish in the lower Tuolumne River. The already degraded condition of the anadromous fish population in this reach of the river contributed to the conclusion that WSIP-induced flow reductions would have a significant adverse effect in the absence of appropriate mitigation measures. Please also refer to **Response S_CDFG2-05**.

SI_TRT-CWA-SierraC-13 This comment on the need for monitoring is acknowledged. With respect to the ability to reach impact conclusions for CEQA purposes using available data and to devise appropriate mitigation measures to reduce impacts on fisheries in the lower Tuolumne River, please refer to **Responses SI_TRT-CWA_SierraC-03** and **SI_TRT-CWA-SierraC-12** and **to Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.4).

SI_TRT-CWA-SierraC-14 The commenter accurately notes that there has been no recent comprehensive study of the upper Tuolumne River. As indicated in **Response SI_TRT-CWA-SierraC-03**, the San Francisco Planning Department believes that the data available from existing studies are sufficient to make a reasonable assessment of the environmental consequences of the WSIP for CEQA purposes. Also, please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.4).

For discussion of data on streamside meadows, please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.3).

Several studies are in progress that will improve knowledge of the upper Tuolumne River and its natural resources. The SFPUC began studies of river hydrology and geomorphology in 2006, and the early results of the studies were available to the authors of the Draft PEIR. The SFPUC has already begun cooperative studies with the USFWS that may lead to a revision of instream flow requirements below O'Shaughnessy Dam. Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.2). The National Park Service has conducted studies as part of the development of its *Tuolumne Wild and Scenic River Comprehensive Management Plan* and continues to conduct groundwater, rare species, and vegetation studies in the Poopenaut Valley.

Although the SFPUC expects to approve the WSIP in 2008, implementation will take many years. The results of many of the studies identified above will become available during implementation of all of the elements of the WSIP. The results of these studies, together with the results of the monitoring component of Mitigation Measure 5.3.7-2, would provide data for the adaptive management component of Measure 5.3.7-2.

The SFPUC cannot currently meet its level of service goals without an increase in water supplies, and its ability to meet the level of service goals will further deteriorate as water demand in the suburban customers' service areas increases. If the source of water is the Tuolumne River, as envisaged under the WSIP, some increase in diversions from the river are needed immediately, although the full 27 million gallons per day (mgd) would not be needed until 2030.

SI_TRT-CWA-SierraC-15 Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.3). The National Park Service is collecting data on rare species, vegetation, and groundwater in the Poopenaut Valley.

SI_TRT-CWA-SierraC-16 Please refer to **Section 4.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.3) and **Response SI_TRT-CWA-SierraC-14**, above.

SI_TRT-CWA-SierraC-17 Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.4).

SI_TRT-CWA-SierraC-18 Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Sections 14.6.3 and 14.6.4).

SI_TRT-CWA-SierraC-19 No mitigation measures are proposed to lessen impacts of the WSIP on visual and recreational resources in the Tuolumne River corridor because the impacts of the WSIP on these resources were determined to be less than significant (Vol. 3, Chapter 5, pp. 5.3.8-20 to 5.3.8-35).

A steep trail descends about 1,400 feet from the north side of Hetch Hetchy Road and provides access to the Poopenaut Valley. Access to the south bank of the Tuolumne River within the valley is provided by the trail, but the river must be forded to reach the north bank of the river. The WSIP would have no effect on access to the Poopenaut Valley.

SI_TRT-CWA-SierraC-20 Please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14).

SI_TRT-CWA-SierraC-21 The California Global Warming Solutions Act of 2006 (Assembly Bill No. 32), described in Draft PEIR Section 4.9, Air Quality (Vol. 2, Chapter 4, pp. 4.9-12 to 4.9-15), establishes a statewide greenhouse gas (GHG) emissions cap for 2020 that is equivalent to the 1990 emissions levels. Impacts associated with WSIP-related GHG emissions are analyzed in Impact 4.9-7 (Vol. 2, Chapter 4, pp. 4.9-42 to 4.9-47). Due to actions being actively taken by the CCSF and SFPUC to reduce GHG emissions, the PEIR analysis concludes that implementation of the WSIP would not conflict with the state's goal of reducing GHG emissions to 1990 levels by 2020. The CCSF and SFPUC actions to reduce GHG emissions are described in the Draft PEIR (Vol. 2, Chapter 4, pp. 4.9-17 to 4.9-19).

Refer to **Response SI_PacInst-03** regarding per-capita water use; this response describes why per-capita water demand in all sectors is projected to *decrease* between 2001 and 2030.

Since the proposed program was determined to have a less-than-significant impact related to GHG emissions, the alternatives analyzed in the Draft PEIR do not address GHG emissions, consistent with CEQA Guidelines Section 15126.6(a).

SI_TRT-CWA-SierraC-22 Please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14).

SI_TRT-CWA-SierraC-23 As the commenter accurately notes, the Draft PEIR concluded that the WSIP would have a less-than-significant impact on groundwater in the Tuolumne River corridor (Vol. 3, Chapter 5, pp. 5.3.5-4 and 5.3.5-5). The reasons for the conclusion are described below. The only way that the WSIP could affect groundwater in the Tuolumne River corridor is if WSIP-induced changes in river flow altered groundwater recharge or discharge rates.

The Tuolumne River between Hetch Hetchy and Don Pedro Reservoirs flows in a deep canyon and is largely confined within a bedrock channel. Most of the alluvial deposits in the river corridor are limited in size, with the exception of the meadow in the Poopenaut Valley (Vol. 3, Chapter 5, pp. 5.3.2-1 and 5.3.2-2). There are no large groundwater bodies associated with this reach of the river, and no municipal water agencies, homeowners, or irrigators obtain their water supplies from groundwater in this portion of the Tuolumne River corridor. The rocks underlying the river are impermeable, so little or no water would be expected to percolate from the river into the ground. Groundwater probably enters the river from springs and seeps in the canyon walls.

WSIP-induced changes in flow in this reach of the river would manifest themselves as a reduction in the volume of water in the spring snowmelt period and a delay of a few days in the initial release of the snowmelt. This could result in a reduction in groundwater recharge in streamside alluvial deposits, particularly in the Poopenaut Valley, which could have a significant adverse impact on terrestrial biological resources (Vol. 3, Chapter 5, pp. 5.3.7-21 and 5.3.7-22). The significant impact on terrestrial biological resources would be reduced to a less-than-significant level by shaped releases of water from O'Shaughnessy Dam (see Mitigation Measure 5.3.7-2). WSIP-induced river flow changes would have no other effects on groundwater in the Tuolumne River corridor between Hetch Hetchy and Don Pedro Reservoirs.

The Tuolumne River between La Grange Dam and the San Joaquin River flows though alluvial deposits, as described in the Draft PEIR (Vol. 3, Chapter 5, pp. 5.3.2-3 and 5.3.2-4). For most of this reach, the river gains water from the groundwater because the groundwater table in the lands surrounding the river is at a higher elevation than the river. Because a pumping depression has developed in central Modesto, a five-mile reach of the river in Modesto loses water to the groundwater.

WSIP-induced changes in flow in the river between La Grange Dam and the San Joaquin River would manifest themselves as a reduction in the volume of water in the winter and spring and an altered pattern of releases in that period. During the winter and spring, flow in the

Tuolumne River below La Grange Dam would be less at times with the WSIP than under the existing condition. Because water levels in the river would be lower, the gradient between the elevation of the groundwater table in the surrounding lands and the river water surface elevation would increase slightly, and groundwater discharge to the river could increase slightly in most of the river reach. In the Modesto area, the loss of water from the river to the groundwater could decrease slightly as a result of the WSIP-induced reduction in flow.

The groundwater hydrology of the lands on both banks of the Tuolumne River between La Grange Dam and the San Joaquin River is quite complex. Groundwater occurs both in shallow, unconfined water bodies and in deep, confined aquifers. The deep aquifers, which are the primary source of groundwater for irrigation and municipal supply, are not directly connected to the Tuolumne River and are thus unaffected by the WSIP. The shallow groundwaters are connected to the Tuolumne River, but the river's influence on groundwater levels is small compared to the influence of precipitation and applied irrigation water. Some farmers and homeowners in the river corridor may use wells extending into shallow groundwater for irrigation or domestic water supplies. However, because groundwater flow is generally toward the river from the surrounding land rather than away from it, the Draft PEIR concludes that the WSIP would not have a significant affect on groundwater levels and agricultural and domestic wells.

SI_TRT-CWA-SierraC-24 The commenter expresses concern that the yield of the Westside Groundwater Basin is underestimated because of the lack of historical data and because the yield estimate did not consider the potential for using local stormwater to enhance local aquifer recharge.

As discussed in the Draft PEIR (Vol. 3, Chapter 5, p. 5.6-24), estimates of recharge to the North Westside Groundwater Basin are being refined as part of ongoing groundwater modeling efforts on behalf of the SFPUC, and this analysis indicates that recharge to the basin could range from about 4,850 afy to 6,950 afy (Luhdroff and Scalmanini, 2007). While accurately estimating recharge to the North Westside Groundwater Basin is difficult because of the lack of reliable historical data regarding groundwater use, the SFPUC started metering the use of water for irrigation at Golden Gate Park and the San Francisco Zoo, the major uses of the groundwater basin in 2005. This more accurate information will be used to develop a better estimate of the safe yield of the groundwater basin, as required by Mitigation Measure 5.6-1 of the Draft PEIR (Vol. 4, Chapter 6, pp. 6-58 and 6-59). This measure requires that the basin's yield be determined on both a regular (average annual) and an intermittent (dry-year or emergency) basis, in accordance with Element 3 of the SFPUC's *Final Draft North Westside Groundwater Basin Management Plan* (SFPUC, 2005). A project-specific CEQA document will address the Westside Groundwater Project (part of the WSIP Regional Groundwater Projects, SF-2) in more detail.

The commenter also states that the groundwater yield estimate did not consider the potential for using local stormwater to enhance local aquifer recharge. In San Francisco, the SFPUC is examining options for recharging the Westside Groundwater Basin with stormwater, including restoration of Lake Merced water levels with stormwater. As discussed in the Draft PEIR (Table 3.10, Vol. 1, Chapter 3, p. 3-55), treated stormwater is one water supply under consideration for restoring Lake Merced water levels under the Local Groundwater Projects (SF-2). Under this project, treatment wetlands would be constructed to supply approximately 360 afy, or 0.32 mgd, of treated stormwater to Lake Merced. Because Lake Merced indirectly recharges the Westside Groundwater Basin, this project would result in a very small increase in the groundwater basin yield. However, the incremental increase in yield would be very small compared to the average annual increase in purchase requests of 35 mgd by 2030. Furthermore, the estimated range of recharge to the basin identified in the Draft PEIR (Vol. 3, Chapter 5, p. 5.6-24) includes recharge from Lake Merced.

In addition, the SFPUC evaluated recharge of the Westside Groundwater Basin with stormwater as part of the *Vista Grande Watershed Study* (RMC Water and Environment, 2006). This study demonstrated that construction of stormwater detention basins with a combined capacity of 54.4 million gallons would provide only approximately 694 afy (0.62 mgd) of recharge to the Westside Groundwater Basin. Aquifer recharge with stormwater would therefore require large amounts of land to achieve a substantial recharge benefit, and this land is not available in San Francisco and San Mateo County, which are mostly built out. The estimated cost would be $22,000 to $42,000 per acre-foot of water recharged. This is many times the cost of desalinated seawater, itself one of the more costly water sources potentially available to the SFPUC. Therefore, active recharge of the Westside Groundwater Basin with stormwater is not considered a feasible or cost-effective alternative to increase the yield of the groundwater basin because of high cost and the large amount of land that would be needed to achieve a substantial aquifer recharge benefit.

SI_TRT-CWA-SierraC-25 The commenter states that the Draft PEIR should confirm at the beginning of Section 5.6 that both the Local and Regional Groundwater Projects (SF-2) are subject to project-level CEQA review. Impacts of the proposed Local and Regional Groundwater Projects are addressed in Section 5.6 of the Draft PEIR (Vol. 3, Chapter 5). The analysis in this section demonstrates at a program level that identified impacts can be mitigated to a less-than-significant level. As stated in each impact analysis, the impacts and proposed mitigation would be subject to more detailed analysis as part of the project-level CEQA documentation for both projects, as determined by the San Francisco Planning Department.

SI_TRT-CWA-SierraC-26 The commenter expresses confusion regarding Figures 5.6-3 and 5.6-4, and states that the figures should reflect total pumping volumes. Figures 5.6-3 and 5.6-4 in the Draft PEIR (Vol. 3, Chapter 5, pp. 5.6-7 and 5.6-9, respectively) are included for different purposes. The purpose of Figure 5.6-3 is to illustrate total historical pumping from the Westside Groundwater Basin, including pumping for municipal water supply, cemetery irrigation, and golf course irrigation. As described in the Draft PEIR (Vol. 3, Chapter 5, p. 5.6-6), groundwater usage for municipal purposes is metered, while usage for irrigation of cemeteries and golf courses has not historically been metered. Therefore, it is impossible to include a continual record of groundwater usage for irrigation of golf courses and cemeteries in this figure, and only one dot representing historically high pumping rates is included. This figure illustrates historically high pumping rates compared to 2005 groundwater pumping rates once much of the pumping for golf course irrigation was replaced with recycled water and municipal groundwater pumping was reduced during the In-Lieu Recharge Demonstration Study. The purpose of Figure 5.6-4 is to provide more detail regarding municipal groundwater pumping during the In-Lieu Recharge Demonstration Study.

SI_TRT-CWA-SierraC-27 The commenter asks why groundwater use at the Golden Gate Cemetery is not metered and what the plans are for measuring this groundwater use. Subsequent to preparation of the Draft PEIR, the SFPUC contacted the U.S. Department of Veterans Affairs and found that they no longer irrigate the Golden Gate Cemetery with groundwater. In response to this updated information, the text of the

Draft PEIR (Vol. 3, Chapter 5, p. 5.6-8, last paragraph) is revised as follows:

> Other continued uses of irrigation pumping in the South Westside Groundwater Basin in 2005 were consistent with historical pumping rates and are estimated at up to 2.1 mgd (2,400 afy) of irrigation pumping for cemeteries in Colma, and 0.1 mgd (120 to 150 afy) of irrigation pumping for the California Golf Club[8] in South San Francisco~~, and an undetermined amount of groundwater pumping for irrigation of the Golden Gate National Cemetery in San Bruno~~ (Luhdorff and Scalmanini, 2006). The Golden Gate National Cemetery in San Bruno has historically used groundwater for irrigation, but the cemetery has not been irrigated using groundwater for over 20 years (Schem, 2007).

The following reference is added to the Draft PEIR (Vol. 3, Chapter 5, p. 5.6-33).

> Schem, Clifford, U.S. Department of Veterans Affairs, National Cemetery Administration, personal communication with Greg Bartow, San Francisco Public Utilities Commission, September 7, 2007.

SI_TRT-CWA-SierraC-28 The commenter states that the available aquifer storage in the South Westside Groundwater Basin is greater than the capacity of Crystal Springs Reservoir, and that the Draft PEIR should evaluate the potential for proactive recharge of the groundwater basin with stormwater.

The Draft PEIR (Vol. 3, Chapter 5, p. 5.6-13) states that, based on the 2005 study by Luhdorff and Scalmanini, there is approximately 75,000 acre-feet of vacated aquifer storage in the South Westside Groundwater Basin in the Daly City, South San Francisco, and northern San Bruno areas. The proposed Regional Groundwater Projects (SF-2) are intended to take advantage of this vacated aquifer storage and to increase groundwater levels in the South Westside Groundwater Basin through in-lieu deliveries of potable water from the SFPUC regional system to the participating pumpers. While the vacated aquifer storage is greater than the historical capacity of the Crystal Springs Reservoir (69,300 acre-feet, Vol. 1, Chapter 2, Table 2.2, p. 2-6), the SFPUC studied recharge of the South Westside Groundwater Basin by stormwater, but found it to be infeasible.

The SFPUC investigated the potential for recharging the South Westside Groundwater Basin with stormwater in the *Vista Grande*

Watershed Study. The goal of the study was to identify potential solutions to flooding problems at the Vista Grande canal and in the Vista Grande drainage basin (RMC, 2006). This study evaluated the detention of stormwater to reduce both regional flooding as well as local flooding of the Vista Grande canal and tunnel.

As stated in **Response SI_TRT_CWA-SierraC-24**, the *Vista Grande Watershed Study* demonstrated that construction of stormwater detention basins with a combined capacity of 54.4 million gallons would provide only approximately 694 afy (0.62 mgd) of recharge to the Westside Groundwater Basin. Aquifer recharge with stormwater would therefore require huge amounts of land to achieve a substantial recharge benefit, and this land is not available in San Francisco and San Mateo County, which are largely built out. The estimated cost would be $22,000 to $42,000 per acre-foot of water recharged. Therefore, active recharge of the Westside Groundwater Basin with stormwater is not considered a feasible or cost-effective alternative to increase the yield of the groundwater basin because of the high cost to construct the basins and the large amount of land that would be needed to achieve a substantial aquifer recharge benefit.

SI_TRT-CWA-SierraC-29 The commenter states that a source water assessment should be part of the Draft PEIR, along with potential actions to address contamination of a water supply well. As stated in the Draft PEIR (Vol. 3, Chapter 5, p. 5.6-31), the SFPUC would develop a drinking water source assessment for each well constructed under the Local and Regional Groundwater Projects (SF-2). At a minimum, the assessment would include a delineation of the area around the well(s) through which contaminants might move and reach the well(s), referred to as the groundwater protection zone; an inventory of possible contaminating activities that could lead to a release of microbiological or chemical contaminants within the delineated area; and a determination of the potentially contaminating activities to which the well(s) are most vulnerable. Until production well locations are selected and a drinking water source assessment performed, the potential for contamination of a drinking water well cannot be fully evaluated. Therefore, impacts related to potential contamination of each well are conservatively considered potentially significant for the Local and Regional Groundwater Projects (SF-2) at the program level, but would be reduced to a less-than-significant level with implementation of Mitigation Measure 5.6-5, Drinking Water Source Assessments for Groundwater Wells (Vol. 4, Chapter 6, p. 6-59). This measure would require development and implementation of a source water protection program for wells that are considered vulnerable to contamination. The drinking water source assessment would be conducted as part of the project-level analysis and would identify actions to address potential contamination.

SI_TRT-CWA-SierraC-30 The model used in the analysis for the Draft PEIR (the HH/LSM) is a state-of-the-art water system model comparable with those used by other California state and local water agencies for planning purposes. Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.6).

The second part of this comment consists of a summary of comments on modeling and data analysis. Responses to these detailed comments are provided in **Responses SI_TRT-CWA-SierraC-31** through **SI_TRT-CWA-SierraC-54**.

SI_TRT-CWA-SierraC-31 This comment restates the comments submitted by the Pacific Institute (Comments SI_PacInst-03, SI_PacInst-04, SI_PacInst-05, SI_PacInst-07, SI_PacInst-08) and numerous other commenters; please refer to responses to the Pacific Institute letter and **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14).

SI_TRT-CWA-SierraC-32 Regarding the assertion that the demand projections used to develop the WSIP are inflated, refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14).

Regarding the comparison between percent difference in jobs and population between growth rates used to develop the demand projections and general plans, the commenter may be mistakenly referencing the comparison between Association of Bay Area Governments (ABAG) 2002 and 2005 projections. Table 7.8 in the Draft PEIR (Vol. 4, Chapter 7, p. 7-28) presents comparisons between water customer-selected population projections for 2030 and general plan population projections on a customer-by-customer basis; Table 7.9 (p. 7-30) presents the same information for employment projections. The percentages vary among the wholesale customers; as noted in the table, most wholesale customers service areas are not contiguous with city limits (or with the city and its planning area); therefore, the population projections from the jurisdictions' general plans and ABAG should be considered as general comparisons only.

The CCSF disagrees with the assertion that "it is speculative to make conclusions about consistency" between projections used to estimate future water demand and those contained in general plans. The Draft PEIR provides these comparisons because general plans present the level of growth adopted by the land use planning agencies in the areas receiving SFPUC water and, when considered in context with other local planning efforts (e.g., growth ordinances and amendments adopted subsequent to general plan approval), characterize potential buildout within these jurisdictions. The Draft PEIR identifies important issues salient to comparisons between the projections, noting the differences between planning-year horizons (Vol. 4, Chapter 7, pp. 7-7 et seq.), differences between service area boundaries and city boundaries (see preceding paragraph), and the age of some of the general plans and infrequency of general plan updates (p. 7-8). Partly because of these issues, the PEIR also compares the water-customer-selected population projections with those of the ABAG *Projections* series, since (a) ABAG is the official regional planning agency of the San Francisco Bay region; (b) the projections have a longer planning horizon than all of the general plans; and (c) the projections are updated (within information provided by Bay Area cities and counties) every two years.

Contrary to the comment, the PEIR does not assume nor speculate that "the local jurisdictions would plan for a continuing rate of growth beyond their [the general plans'] horizon years"; refer to note (a) in Tables 7.8 and 7.9 (Vol. 4, Chapter 7, pp. 7-28 and 7-30).

The comment also states that the general plan EIRs do not adequately cover the growth allowed by the increased water supply. As stated in the Draft PEIR (Vol. 4, Chapter 7, p. 7-70), "Given that the WSIP projections extend beyond the projections of many adopted general plans, especially in terms of expected employment growth, this analysis also considers the potential impacts of growth that could occur beyond the projections indicated in local general plans and related land use plans." The referenced analysis of growth beyond the previously evaluated growth (e.g., growth evaluated in general plan EIRs) is presented on Draft PEIR pp. 7-70 and 7-71.

Lastly, the comment correctly states that ABAG projections are not subject to environmental review; Bay Area cities and counties (not ABAG) are responsible for evaluating and approving future development. The CCSF believes that the Draft PEIR approach to evaluating growth, which is based not only on comparisons with ABAG projections but also on review of 180 general plans, general plan revisions, general plan amendments, specific plans, precise plans, updated land use and housing elements, and related CEQA documents (see Vol. 4, Chapter 7, pp. 7-78 to 7-91), is appropriate and consistent with CEQA requirements for a growth-inducement analysis.

SI_TRT-CWA-SierraC-33 This comment, which states that the Draft PEIR looks at the indirect effects of growth on air quality, traffic, and water quality but not on the other factors mandated by CEQA, is incorrect. Refer to Draft PEIR Section 7.4.1 (Vol. 4, Chapter 7, pp. 7-60 to 7-78). Table 7.11 (pp. 7-65 and 7-66) summarizes the significant impacts of planned growth, including impacts in the areas listed in this comment, and Table E.5.1 (Vol. 5, Appendix E.5, pp. E.5-3 to E.5-18) presents a more detailed summary of impacts and the measures that were identified to mitigate them in the EIRs prepared for the general plans of jurisdictions in the service area. In addition to these impacts on service area jurisdictions, the Draft PEIR identifies effects related to traffic, air quality, and hydrology/water quality as the key *regional* impacts of growth (i.e., in addition to these impacts within individual jurisdictions), which may be the basis for the comment's mischaracterization of the impact analysis.

SI_TRT-CWA-SierraC-34 Please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14).

SI_TRT-CWA-SierraC-35 This comment regarding the Draft PEIR review of the project-level impacts on growth requires clarification. In addition to reviewing those general plan EIRs that could be obtained and summarizing the impacts and mitigation measures contained therein (Vol. 4, Chapter 7, pp. 7-60 to 7-69, and Vol. 5, Appendix E.5), the Draft PEIR preparers also reviewed a selection of EIRs for major projects currently being undertaken in the SFPUC service area (Vol. 4, Chapter 7, p. 7-71, and Vol. 5, Appendix E.6), to which this comment refers. The purpose of this project-level review was to assess whether, at least for the selection of EIRs reviewed, the mitigation measures identified in general plan EIRs were being implemented at the project level, and the Draft PEIR states the limited nature of the review (p. 7-71 and Appendix E.6).

The Draft PEIR review of general plan documents and related CEQA documents (Vol. 4, Chapter 7, pp. 7-78 to 7-91) indicated that the majority of growth the WSIP would support is consistent with the growth anticipated in the adopted general plans within the service area. To the extent that the WSIP would support a level of growth beyond that reflected in the adopted general plans, there could be additional or more severe impacts than those identified in the general plan EIRs. These impacts are discussed on pp. 7-69 to 7-71 of the Draft PEIR.

SI_TRT-CWA-SierraC-36 As described in Draft PEIR program description (Vol. 1, Chapter 3, pp. 3-28 to 3-30), the existing system could not meet average daily demand if any one of the five critical facilities were shut down for maintenance. SFPUC studies indicate that adequate redundancy for these critical facilities, including the Irvington Tunnel, is necessary to meet day-to-day customer water supply needs and allow sufficient operational flexibility to meet water delivery reliability goals. Without adequate redundancy of critical facilities, the SFPUC has limited operational flexibility in the event of an emergency or a system failure, as well as constraints on conducting adequate system inspection and maintenance. Consequently, the WSIP proposes to provide redundancy of some critical facilities in order to meet system reliability goals. The redundancy of individual facilities does not necessarily result in an overall increase in system capacity because of constraints in other parts of the system; therefore, the projected levels of water demand and related assumptions used in the Draft PEIR to estimate demand (Vol. 4, Chapter 7, pp. 7-9 to 7-18) provide the appropriate basis to assess expectations of future growth that would be served, in part, by the proposed program. Note also that the capacity of the existing Irvington Tunnel is not a constraint to growth, and the SFPUC is not proposing to use the second (new) tunnel and existing tunnel simultaneously.

SI_TRT-CWA-SierraC-37 This comment correctly states a requirement of the Master Water Sales Agreement that wholesale customers employ their best efforts to use all sources of water owned or controlled by them (Draft PEIR, Vol. 1, Chapter 2, p. 2-44 and Vol. 4, Chapter 7, p. 7-13).

The assertion that the analysis of the Aggressive Conservation/ Water Recycling and Local Groundwater Alternative was based on the additional conservation and recycling potential identified in the SFPUC's *Investigation of Regional Water Supply Option No. 4 Technical Memorandum* (SFPUC, 2007, Appendix D), as this comment suggests, is correct. The analysis of this and other alternatives presented in the Draft PEIR (Vol. 4, Chapter 9) evaluated the comparative merits of the alternatives and included sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed program, consistent with CEQA Guidelines Section 15126.6.

The statement that gross per-capita demand is projected to increase is incorrect; refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the heading Per-Capita Demand).

Regarding the wholesale customers' planned conservation measures, refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3). The statement referring to "foreseeable changes" apparently refers to legislation mentioned in Comment SI_PacInst-72; refer to **Response SI_PacInst-72**.

The statement that 60 percent of the planned increase in demand is projected to arise from outdoor water use does not appear to be based on Pacific Institute comments submitted on the Draft PEIR, but may be based on information provided at the Sustainable Water Supply Briefing; refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3, under the heading Outdoor Water Use).

SI_TRT-CWA-SierraC-38 The commenter's opinion that the recycled water potential for the wholesale agencies falls below the recycling goals of the state and certain water agencies is acknowledged. Note that the 3 percent cited in this comment apparently refers to the 9 to 10 mgd of recycled water that has been identified as a component of the wholesale customers' 2030 water supply, shown in Draft PEIR Table 3.3 (Vol. 1, Chapter 3, p. 3-18). Note that this estimate of recycled water use is assumed in the customer's 2030 purchase estimates. The *SFPUC Wholesale Customer Recycled Water Potential Technical Memorandum* (RMC, 2004) identifies the *potential* for additional recycled water projects to be developed at some point in the future (refer to Draft PEIR Vol. 5, Appendix E.2, Table E.2.5, p. E.2-17).

SI_TRT-CWA-SierraC-39 As the comment correctly states, the additional potential for conservation measures and the use of recycled water and groundwater to offset demand on the SFPUC regional water system, as identified in the *Investigation of Regional Water Supply Option No. 4 Technical Memorandum* (SFPUC, 2007, Appendix D), was not incorporated into the proposed WSIP, and the SFPUC has committed to implementing identified measures in the retail customer service area that would offset 10 mgd of demand on the regional system. However, the findings of this study were used to inform the Aggressive Conservation/Water Recycling and Local Groundwater Alternative analyzed in the Draft PEIR (Vol. 4, Chapter 9, pp. 9-47 to 9-59). Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for more information on this alternative. The reference to "6 mgd of savings" in this comment apparently refers to the difference between the maximum conservation savings considered to be feasible and cost-effective ("Program C") in the *SFPUC Wholesale Customer Water Conservation Technical Report* (URS, 2004b). Regarding the conservation measures to which the wholesale customers have committed, refer to Section 14.2.3 of the above-referenced master response.

SI_TRT-CWA-SierraC-40 This summary of the conservation potential studies conducted by the SFPUC in the retail customer and wholesale customer service areas requires clarification on several points. As the commenter states, the retail service area conservation potential study initially considered 48 conservation measures, of which 38 were selected for further consideration. Ultimately the SFPUC committed to implementing all 38 (Program C) as part of the WSIP (refer to Draft PEIR, Vol. 5, Appendix E.2, p. E.2-15); the wholesale customers' conservation potential study initially considered 75 measures, of which 32 were selected for further consideration by the wholesale customers. The commenter's estimate that an average of fewer than 10 measures was selected in the wholesale service area is noted. Draft PEIR Table 3.3 (Vol. 1, Chapter 3, p. 3-18) shows the projected conservation savings for each wholesale customer and for the retail service area, and Table E.2.4 (Vol. 5, Appendix E.2) shows the estimated conservation savings in relation to the three theoretical programs of measures (Programs A, B, and C) that were considered in the conservation potential assessments. Tables 14.2-7 and 14.2-8 in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14) show the measures being implemented or planned in the retail and wholesale customer service areas.

The commenter correctly states that the 32 measures selected for consideration by the wholesale customers were in general found to be cost-effective.[1] However, the incremental cost of adopting additional conservation measures is not as important as concerns about the feasibility of implementing additional measures in an agency's decision not to adopt additional measures, as discussed in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2,

1 Most of the 32 measures were cost-effective for most customers, although there were some exceptions; not all measures were cost-effective for all customers.

under the heading Effects of Future Price of Water on Projected Demand).

This comment also asserts that the wholesale customer conservation potential study failed to determine the total cost-effective conservation potential of the region. Since cost/benefit analyses of the programs of compiled measures (Programs A, B, and C) prepared for each customer found the programs to be cost-effective, the cumulative total conservation potential of Program C (shown in Table E.2.4, Vol. 5, Appendix E.2, p. E.2-14) could be considered a regional total for the individual wholesale customers. In addition, as part of the WSIP planning process, the SFPUC, in cooperation with its wholesale customers and the Bay Area Water Supply and Conservation Agency, undertook a study to assess the potential for additional conservation and recycled water projects, including projects that could be feasible if implemented regionally but that may have been found to be infeasible for individual customers. This study, *Investigation of Regional Water Supply Option No. 4 Technical Memorandum* (SFPUC, 2007, Appendix D), provided the basis for the Aggressive Conservation/Water Recycling and Local Groundwater Alternative analyzed in the Draft PEIR (Vol. 4, Chapter 9, pp. 9-47 to 9-59).

SI_TRT-CWA-SierraC-41 This comment seeks a response to two attachments regarding water pricing and the potential for water conservation and recycling: Attachments I and J. These attachments are shown as Comments SI_TRT-CWA-SierraC-196 through SI_TRT-CWA-SierraC-199 (refer to those responses).

SI_TRT-CWA-SierraC-42 The Draft PEIR provides a detailed analysis of the stream flow, geomorphology, groundwater, and fishery issues referred to in this comment (Vol. 3, Chapter 5, Sections 5.3.1, 5.3.2, 5.3.5, and 5.3.6). The analysis of potential WSIP impacts on these environmental elements extends along the length of the Tuolumne River, from Hetch Hetchy Reservoir to the river’s confluence with the San Joaquin River and then along the San Joaquin River to the Delta. For additional discussion of changes in flow and the rationale for considering flows under the WSIP to be within the range of existing flows, please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Sections 14.6.5 and 14.6.6).

SI_TRT-CWA-SierraC-43 CEQA Section 21068 defines a significant effect on the environment as “a substantial, or potentially substantial, adverse change in the environment.” While CEQA requires that an EIR determine the significance of the environmental effects caused by a project, CEQA Guidelines Section 15064(b) states that “an ironclad definition of significant effect is not always possible because the significance of an activity may vary with the setting.” CEQA Guidelines Section 15064(d) provides further guidance, stating “in evaluating the significance of the environmental effect of a project, the Lead Agency shall consider direct physical changes in the environment which may be caused by the project and reasonably foreseeable indirect physical changes in the environment which may be caused by the project.” In terms of establishing significance criteria, CEQA Guidelines Section 15064.7 states “a threshold of significance is an identifiable quantitative, qualitative or performance level of a particular environmental effect.”

The CCSF has not formally adopted significance standards for analysis of environmental impacts, but as the CEQA lead agency for the CCSF, the San Francisco Planning Department generally applies the standards contained in Appendix G of the CEQA Guidelines, supplemented by additional topics specific to San Francisco.

In the Draft PEIR, the San Francisco Planning Department employs significance criteria appropriate to the range of the WSIP’s environmental effects, drawing from the significance standards contained in Appendix G of the CEQA Guidelines where applicable and augmenting them where needed to address topics that could be affected by the WSIP but are not addressed in Appendix G, such as stream flow or greenhouse gas emissions. The Draft PEIR evaluates impacts associated with the WSIP in accordance with the CEQA Guidelines described above, identifying the applicable significance criteria and using quantitative, qualitative, or performance levels where appropriate to determine impact significance. Often, the significance criteria are based on standards set pursuant to state or federal law, which may be numerical or non-numerical. Each section in the Draft EIR describing the WSIP’s impacts on a particular environmental element begins with a subsection entitled “Approach to Analysis” that describes how the numerical and non-numerical standards are used in the analysis of impacts.

As an example of a quantitative analysis, Impact 4.9-1 (Vol. 2, Chapter 4, pp. 4.9-21 to 4.9-27) provides a quantitative estimate of WSIP construction-related air pollutant emissions and compares them to quantitative significance criteria established by the air district to determine the impact significance. Impact 4.5-1 (Vol. 2, Chapter 4, p. 4.5-21) is an example of a qualitative impact analysis in which the potential for erosion and sedimentation during construction is identified but not quantified, and the impact significance is based on the effectiveness of known erosion and sedimentation control measures. Impact 4.10-4 (Vol. 2, Chapter 4, p. 4.10-33) is an example of a performance-level analysis in which disturbance due to long-term noise increases is identified, and the impact significance is based on the ability to comply with local noise ordinances. For some impacts in the Draft PEIR, the assessment of impact significance requires analysis of both the severity and frequency of an impact relative to a quantitative threshold; an example of this is Impact 5.3.3-2 (Vol. 3, Chapter 5, p. 5.3.3-17), which analyzes effects on water quality along the Tuolumne River below La Grange Dam and determines impact significance by considering both the magnitude of changes in water temperature relative to water quality objectives and the frequency of changes exceeding the objectives.

With respect to the need to consider both the frequency and severity of an impact, refer to **Response SI_TRT-CWA-SierraC-44**. With respect to the comment on cumulative impacts, refer to **Response SI_TRT-CWA-SierraC-45**. Also, see **Response SI_CNPS-EB1-23** for addition discussion of this topic.

SI_TRT-CWA-SierraC-44 The San Francisco Planning Department considered both severity and frequency of an impact when determining whether it was significant. Many of the potential impacts of the WSIP would stem from WSIP-caused changes in river flow, as depicted in Figure 5.1-3 (Vol. 3, Chapter 5, p. 5.1-8). However, river flow in watersheds fed by surface runoff is an inherently variable phenomenon, and the frequency of occurrence of noticeable flow changes from the existing condition is an important descriptor in understanding the effects of the WSIP on river flow. In most cases where the terms “occasional” or “rare” are used, they follow a more precise descriptor such as “x months in the 82-year hydrologic record.”

The rationale behind the impact significance determinations can best be illustrated by examples. In very dry periods under the current condition, the pool of cool water in Hetch Hetchy Reservoir becomes depleted and warmer water is released to the Tuolumne River below O’Shaughnessy Dam. This is a rare occurrence—once or twice in the 82-year period of hydrologic record. The WSIP would make this situation slightly worse; it would still be rare (occurring once or twice in the 82-year hydrologic record) but it might persist for two or three weeks rather than a few days or a week. The release of warm water from the reservoir would increase water temperatures in the river toward the upper end of the optimal range for rainbow trout. Because the event would be rare and the consequences of limited severity to the affected resource, the conclusion was reached that the WSIP would have a less-than-significant adverse impact on fisheries in the Tuolumne River below O'Shaughnessy Dam.

Another example is that the WSIP would delay the start of the release of water from La Grange Dam in the late winter and early spring in excess of the minimum required instream flow. In most cases the delay would be a matter of a few days. Infrequently, the delay could be several weeks, during which time flows in the river below the dam would remain at the minimum required instream flow and water temperatures would be higher than under the existing condition. As indicated in the Draft PEIR, Chinook salmon populations in the lower Tuolumne River are much below historical levels. Although WSIP-caused substantial reductions in flow and increases in water temperature would be rare, it was concluded that the impact of the changes could be severe, bearing in mind the fragility of the Chinook salmon population. The impact of the WSIP on fisheries in this reach of the river was accordingly determined to be potentially significant, and appropriate mitigation measures are proposed (Measures 5.3.6-4a and 5.3.6-4b).

SI_TRT-CWA-SierraC-45 The San Francisco Planning Department identified the criterion indicating whether an impact would be "substantially … outside of the range of pre-project conditions" as appropriate to determine the significance of changes in stream flow associated with the WSIP, and applied this criterion on an impact-by-impact basis. Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.5), and **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.6), for a description of how the criterion was applied to determine that stream flow impacts on the Tuolumne River would be less than significant. However, this same criterion, when applied to the effect of WSIP on stream flow in Alameda Creek (Impact 5.4.1-2, Vol. 3, Chapter 5, p. 5.4.1-25), resulted in the conclusion that the impact would be significant and unavoidable.

The Draft PEIR discusses the possibility that impacts determined to be less than significant could combine with other less-than-significant impacts from a future project to create a significant impact (Vol. 3, Chapter 5, Section 5.7, Cumulative Projects and Impacts Related to WSIP Water Supply and System Operations).

SI_TRT-CWA-SierraC-46 Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.3) for a discussion of the model time interval. The conclusions with respect to impacts on fisheries and riparian habitat were determined after consideration of both monthly and daily flows.

SI_TRT-CWA-SierraC-47 Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.4) for a discussion of the use of averages within hydrologic year types.

SI_TRT-CWA-SierraC-48 Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Sections 14.5.3 and 14.5.4) for discussions of the model time interval and the use of averages within hydrologic year types. Also, refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.6) and **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.7) for discussions of the use of flow data in the analysis of impacts on geomorphology.

SI_TRT-CWA-SierraC-49 As the commenter notes, stream ecology may respond to a finer timescale than monthly flows, and stream geomorphology may respond to peak flows that occur rarely. These concepts are reflected in the Draft PEIR impact analyses. For more information on the statistical analysis of flow data, please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Sections 14.5.3 and 14.5.4). For more information on the use of peak flow data in the analysis of geomorphology, refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.6) and **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.7). Estimates of monthly and daily flows were used in evaluating the effects of the WSIP on stream ecology. Daily flow information was estimated as described in the Draft PEIR (Vol. 3, Chapter 5, Section 5.3.1) and then used in the analysis of fisheries and terrestrial biology (Vol. 3, Chapter 5, Sections 5.3.6 and 5.3.7).

SI_TRT-CWA-SierraC-50 Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.3).

SI_TRT-CWA-SierraC-51 The commenter states that the Draft PEIR should set measurable criteria for the evaluation of groundwater impacts. The San Francisco Planning Department identified the following significance criteria for evaluating groundwater impacts in the Draft PEIR (Vol. 3, Chapter 5, p. 5.6-22). An impact is considered significant if it would:

- Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of preexisting nearby wells would drop to a level that would not support existing land uses or planned uses for which permits have been granted)
- Potentially result in onsite or offsite land subsidence that would cause substantial structural damage, increased flooding, or altered drainage patterns
- Violate any water quality standards or waste discharge requirements
- Otherwise substantially degrade water quality

As stated in the Draft PEIR (Vol. 3, Chapter 5, p. 5.6-22), criteria for evaluating the depletion of groundwater resources are based on whether groundwater pumping would reduce groundwater levels to a degree that adverse effects would occur, including saltwater intrusion, effects on surface water resources, or land subsidence. Criteria for evaluating groundwater quality are based on beneficial uses and water quality objectives established by the San Francisco Bay Regional Water Quality Control Board in the *Water Quality Control Plan for the San Francisco Bay Basin*, as authorized under the Porter-Cologne Water Quality Control Act and Clean Water Act. In addition, for groundwater to be used as a public water supply, it must meet groundwater quality evaluation criteria based on the California Drinking Water Standards, as established by the state and federal Safe Drinking Water Acts.

Support of beneficial uses, recommended as a criterion by the commenter, is addressed in evaluating impacts related to the depletion of groundwater resources, the violation of water quality standards, and other degradation of water quality.

The Draft PEIR analyzes the impacts of the proposed Local and Regional Groundwater Projects (WSIP facility improvement project

SF-2) (Vol. 3, Chapter 5, Section 5.6) and demonstrates at a program level that identified impacts can be mitigated to a less-than-significant level. As stated in each impact analysis, the impacts and proposed mitigation would be subject to more detailed, site-specific analysis as part of the project-level CEQA review for both projects.

For additional information on significance criteria and thresholds, please refer to **Response SI_TRT-CWA-SierraC-43**.

SI_TRT-CWA-SierraC-52 Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.5).

SI_TRT-CWA-SierraC-53 Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.3). The conclusions with respect to environmental impacts were arrived at after consideration of monthly, daily, and peak flows.

SI_TRT-CWA-SierraC-54 The sentence referred to on Draft PEIR p. 9-89 (Vol. 4, Chapter 9) is accurate and consistent with information presented in Table 9.7 (Vol. 4, Chapter 9, p. 9-17). The four alternatives mentioned would avoid the *significant* impacts on fishery resources below La Grange Dam, but would not necessarily avoid all impacts on this reach of the river. The Aggressive Conservation/Water Recycling and Local Groundwater Alternative (with No Supplemental Tuolumne River Water) and the Year-round Desalination for Drought Alternative would essentially avoid all impacts on the Tuolumne River below La Grange Dam. The Modified WSIP Alternative would also avoid all impacts on the Tuolumne River below La Grange Dam, provided Mitigation Measure 5.3.6-4a is implemented. The No Purchase Request Increase Alternative would have impacts similar to (but much less severe than) those of the WSIP. Its impacts on the reach of the river below La Grange Dam were judged to be less than significant.

SI_TRT-CWA-SierraC-55 This comment consists of a summary of comments on assumptions used in the Draft PEIR. Responses to detailed comments are provided below in **Responses SI_TRT-CWA-SierraC-55** through **SI_TRT-CWA-SierraC-73**. With regard to assumptions used in the HH/LSM, please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.6).

SI_TRT-CWA-SierraC-56 The Draft PEIR (Vol. 1, Chapter 2, pp. 2-35 to 2-37) provides a summary description of the CCSF's water rights. These water rights are adequate for the water supply option proposed under the WSIP;

consequently, the CCSF will not seek new appropriative water rights. No further information is provided because the validity or otherwise of water rights is not a CEQA issue.

The Raker Act does not require San Francisco to develop and use local water sources before it can divert out of the Tuolumne River watershed. Rather, the Raker Act restricts San Francisco's use of Tuolumne River water in the Bay Area to municipal and domestic purposes only. The SFPUC will continue to maximize its use of local resources and develop those local resource projects and programs that are feasible, reasonable, and cost-effective, consistent with responsible stewardship of Tuolumne River resources. For further information on this issue, please refer to **Response L_TUD1-05**.

SI_TRT-CWA-SierraC-57 Please refer to **Response SI_TRT-CWA-SierraC-56**, above.

SI_TRT-CWA-SierraC-58 Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.8).

The SFPUC does not know if TID and MID are willing to consider an arrangement like that described in Mitigation Measure 5.3.6-4a and elaborated upon in **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14). That is why the Draft PEIR acknowledges the uncertainty associated with the measure. For more information on the transfer, please refer to **Section 14.3, Master Response on Proposed Dry-Year Water Transfer** (Vol. 7, Chapter 14, Section 14.3.3).

SI_TRT-CWA-SierraC-59 The commenter's opinion with respect to gravel augmentation under Mitigation Measure 5.3.6-4b as poorly matched for the identified impact is acknowledged. Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.9).

SI_TRT-CWA-SierraC-60 The commenter's opinion with respect to pond removal as part of Mitigation Measure 5.3.6-4b is acknowledged. Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.9).

SI_TRT-CWA-SierraC-61 The potential effects of the WSIP on steelhead are described in the Draft PEIR (Vol. 3, Chapter 5, pp. 5.3.6-28 to 5.3.6-32). Please also refer to **Response SI_TRT-CWA-SierraC-12**, above.

SI_TRT-CWA-SierraC-62 The commenter's opinion with respect to Mitigation Measure 5.3.6-4b is acknowledged. Please refer to **Section 14.7, Master**

Response on Lower Tuolumne River Issues (Vol. 7, Chapter 14, Section 14.7.9). Various measures are being taken to improve habitat for salmonids in the lower Tuolumne River. It will take some time to determine the effectiveness of the measures. The types of measures included in Measure 5.3.6-4b were devised based on factors known to be adversely affecting salmonid habitat. As described in Section 14.7.9, Measure 5.3.6-4b has been clarified to include surveys and actions to meet performance standards.

SI_TRT-CWA-SierraC-63 The analysis in the Draft PEIR compares conditions with the WSIP to those under the existing condition. The WSIP includes a transfer of water from TID and MID to the SFPUC that would enable the SFPUC to meet customer demand in dry years without greater than 20 percent systemwide rationing. The transfer was included in the Hetch Hetchy/Local Simulation Model (HH/LSM) and is reflected in the flow estimates provided in the Draft PEIR (Vol. 3, Chapter 5, Section 5.3.1). Furthermore, the transfer is reflected in the assessment of WSIP impacts on the Tuolumne River between Hetch Hetchy and Don Pedro Reservoirs and below La Grange Dam (Vol. 3, Chapter 5, Sections 5.3.2 through 5.3.9).

SI_TRT-CWA-SierraC-64 Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.4).

SI_TRT-CWA-SierraC-65 Please refer to **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14, Sections 4.8.2 and 4.8.3).

SI_TRT-CWA-SierraC-66 Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.2).

SI_TRT-CWA-SierraC-67 Please refer to **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14, Sections 4.8.2 and 4.8.3).

SI_TRT-CWA-SierraC-68 With regard to the assumptions made in the HH/LSM, please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.6).

The commenter correctly notes that an agreement has not yet been reached on a transfer of water from TID and MID to the SFPUC. Such agreements with TID and MID cannot be formalized until the PEIR is certified and the WSIP is approved and adopted by the SFPUC. Please refer to **Section 14.3, Master Response on**

Proposed Dry-Year Water Transfer (Vol. 7, Chapter 14, Section 14.3.2) for more information on the transfer.

The commenter correctly notes that the WSIP would reduce inflow to Don Pedro Reservoir compared to the existing condition. This would occur in all but very dry years because water demand is greater with the WSIP than under the existing condition, and much of the increased demand would be met through diversions from the Tuolumne River at Hetch Hetchy Reservoir. Consequently, the water that TID and MID would capture for their own diversion and use (an average of 867,000 afy) would represent a higher proportion of reservoir inflow with the WSIP than under the existing condition, as described in the Draft PEIR (Vol. 3, Chapter 5, Section 5.3.1).

SI_TRT-CWA-SierraC-69 Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.6) for information on expected future diversions by TID and MID. Expected future diversions are much less than TID's and MID's full water rights.

The conversion of agricultural lands to urban uses has occurred rapidly in the TID and MID service areas in the last 30 years and can be expected to continue once the effects of the sub-prime mortgage crisis passes. Increases in urban water use would be almost exactly offset by reductions in agricultural water use. Typical urban neighborhoods use about the same amount of water per acre each year as typical irrigated agricultural land.

SI_TRT-CWA-SierraC-70 With regard to the hydrologic assumptions used in the analysis, please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.6). With respect to the effects of climate change, refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14).

SI_TRT-CWA-SierraC-71 It is conventional practice in water supply system planning to estimate future demand by assuming a continuation of whatever water conservation and recycling practices are already in place or can reasonably be predicted. This practice produced the total water demand for the SFPUC service area of 417 mgd in 2030. Further consideration by the SFPUC's wholesale customers of additional feasible conservation programs and alternative local water supplies resulted in the 2030 purchase estimates for the regional water system of 300 mgd shown in Table 9.4 (Vol. 4, Chapter 9, p. 9-11). One of the proposed alternatives (the Aggressive Conservation/Water Recycling and Local Groundwater Alternative) includes more aggressive conservation measures and recycling practices. The water saved or used twice as a result of these practices can be treated as a new source of water or as a reduction in demand; how this saved water is viewed makes little practical difference in the planning process or impact analysis under CEQA.

The SFPUC chose to treat the 10 mgd of proposed groundwater/ recycled water/conservation projects in San Francisco (one component of the WSIP water supply option) as a reduction in water demand for the regional system. Consequently, 290 mgd would have to be delivered from the regional system's other water sources. Modeling of the system assumed that 290 mgd would be provided from the system's other sources, and that shortages and rationing in droughts would be estimated based on a demand of 290 mgd rather than a demand of 300 mgd. Because of this, and contrary to the comment, the estimated total demand of 300 mgd in 2030 does not skew the modeling of drought-year shortages.

SI_TRT-CWA-SierraC-72 This comment refers to the demand hardening discussion in the Draft PEIR, which is included in the analysis of the Aggressive Conservation/Water Recycling and Local Groundwater Alternative's ability to meet the program objectives (Vol. 4, Chapter 9, p. 9-54). As indicated on Table 9.6 (Vol. 4, Chapter 9, p. 9-15), this alternative would have a limited ability to meet the WSIP's level of service objectives for water supply. For the scenario in which no supplemental Tuolumne River water would be provided to customers, this alternative would neither meet the average annual 2030 purchase request of 300 mgd during nondrought years nor meet the 20 percent systemwide rationing limit during droughts; this means that shortages would occur in all years, and, as shown in Table 9.5 (Vol. 4, Chapter 9, p. 9-13), there would be 15 years out of the 82-year period of hydrologic record that shortages would reach 25 percent. For the scenario in which supplemental Tuolumne River water would be provided to serve the 2030 purchase request of 300 mgd during nondrought years, this alternative would meet the WSIP water supply level of service objective during nondrought years; during drought years (Table 9.5, p. 9-13), there would be 7 out of 82 years with 10 percent shortages and 8 out of 82 years with 20 percent shortages. However, under both scenarios, the demand hardening would occur as a result of the increased water-use efficiency, and customers would have limited options for accommodating water shortages during drought periods.

With regard to the comment asserting that 60 percent of the increased 2030 water demand is for outdoor use, refer to

Response SI_PacInst-63 as well as **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14) for a detailed discussion of assumptions used in determining water demand.

SI_TRT-CWA-SierraC-73 Conjunctive use typically means the coordinated use of groundwater and surface water sources to avoid shortages in years when surface waters are in short supply. Because no additional surface water is available under the “no additional diversions” alternative, conjunctive use in the Westside Groundwater Basin is not feasible.

It is not clear how the Aggressive Conservation/Water Recycling and Local Groundwater Alternative would affect water levels in the Westside Groundwater Basin. The use of recycled wastewater to satisfy some irrigation demand that is now met with well water could potentially raise groundwater levels. On the other hand, aggressive conservation measures that reduce the use of water outside homes could reduce recharge and lower groundwater levels. These issues will be examined in detail in the project-level CEQA document for the Westside Groundwater Project (part of the WSIP Regional Groundwater Projects, SF-2).

SI_TRT-CWA-SierraC-74 No federal permits or approvals are needed for the SFPUC to approve, adopt, or implement the overall WSIP as a program and policy; therefore, compliance with the National Environmental Policy Act is not needed. As described in the Draft PEIR (Vol. 1, Chapter 2, p. 2.-33), the Raker Act granted the CCSF the rights-of-way and use of public lands in the affected areas to construct, operate, and maintain reservoirs, dams, conduits, and other structures necessary or incidental to developing and using water and power. Consequently, there is no federal nexus requiring compliance with the National Environmental Policy Act. However, as described in the Draft PEIR (Vol. 1, Chapter 3, p. 3-86), some of the individual WSIP facility improvement project may require federal approvals, but those actions would be distinct from the approval of the WSIP as a whole.

SI_TRT-CWA-SierraC-75 This comment expresses an opinion that there was inadequate noticing of the Draft PEIR public hearing dates. Please refer to **Responses F_USDAFS-05** and **L_SFCPC1-01** (Vol. 7) and **Appendix J1** (Vol. 8) of this Comments and Responses document for detailed information on the public outreach efforts conducted by the San Francisco Planning Department’s Major Environmental Analysis Division and the SFPUC.

SI_TRT-CWA-SierraC-76 Draft PEIR Section 5.1 (Vol. 3, Chapter 5) is entitled "Overview" and is intended to provide the reader with an overall understanding of the HH/LSM and its use in the Draft PEIR analysis of the WSIP. Table 5.1-1 (Vol. 3, Chapter 5, p. 5.1-12) lists key differences between the existing condition and the WSIP scenarios. The assumption with respect to the diversion of water by TID and MID was not included because it was the same in the two scenarios. Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.6) for more information on the basis for the TID and MID diversion assumption.

SI_TRT-CWA-SierraC-77 The commenter questions the use of data from the 82-year period of record to model future hydrologic conditions in the Draft PEIR. The use of historical hydrologic data is conventional practice in water supply system modeling and has been for many years, although recently many water agencies have begun to examine the possibility that climate change could alter future hydrology. The climate change analysis in the Draft PEIR used a similar assumptions as those used in other recent EIRs on water projects (e.g. *DEIR on the Monterey Amendment to the State Water Project Contracts*, California Department of Water Resources, October 2007).

Refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14) for more information on the effects of climate change on the SFPUC regional water system.

SI_TRT-CWA-SierraC-78 The commenter notes that temporal availability of water is likely to change, and that the model underestimates hydrology impacts as well as the biological and geomophological impacts that result from hydrologic changes. The current understanding of climate change science and how it applies to California's water resources and the SFPUC regional system is discussed in detail in **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14).

SI_TRT-CWA-SierraC-79 The HH/LSM in the form used in the Draft PEIR did not accurately simulate water system operations in the Pilarcitos Creek watershed for two reasons. The model did not accurately represent limitations in the capacity of the conveyance system from Stone Dam to the Coastside County Water District (Coastside CWD) treatment plant, and it assumed that water would be pumped from Pilarcitos Reservoir to Pilarcitos Creek when the water level in Pilarcitos Reservoir fell below its outlet elevation. Because of these deficiencies, information from operational records rather than the HH/LSM was used to analyze potential WSIP effects on Pilarcitos

Creek. The San Francisco Planning Department believes that the operational data are sufficient to make a reasonable environmental assessment.

Since publication of the Draft PEIR, the model deficiencies have been corrected and the HH/LSM was used to estimate the effects of the WSIP on reservoir levels and stream flow in the Pilarcitos Creek watershed (see Vol. 7, Chapter 13, Section 13.3). The results of modeling, together with the results of biological field reconnaissance, enabled a more precise identification of the potential impacts of the WSIP in the Pilarcitos Creek watershed. No new impacts were identified that were not documented in the Draft PEIR, but several impacts identified as potentially significant in the Draft PEIR were reclassified as less than significant. The revised impacts are shown in **Chapter 16, Staff-Initiated Text Changes** (Vol. 7). The modeling results are included in Appendix O1 (Vol. 8).

The Draft PEIR indicated that the significant adverse effects of the WSIP in the Pilarcitos Creek watershed would be avoided with the implementation of Mitigation Measure 5.5.3-2. Under Measure 5.5.3-2, the SFPUC would modify operation of its Pilarcitos Creek facilities so that flow in Pilarcitos Creek with the WSIP would be very similar to flow under existing conditions. After publication of the Draft PEIR, the SFPUC concluded that implementation of Measure 5.5.3-2 would be technically challenging and less practical than other available measures. Replacement mitigation measures were developed and are described in **Chapter 16, Staff-Initiated Text Changes**. The replacement mitigation measures would reduce the impacts of the WSIP in the Pilarcitos Creek watershed to a less-than-significant level.

With the WSIP, the SFPUC had planned to serve a portion of Coastside CWD's increased water demand from Pilarcitos Creek. However, this would not be possible because of conveyance system capacity limits, and so almost all of Coastside's increased demand would be met from Crystal Springs Reservoir. This would slightly increase the amount of water diverted from the Tuolumne River under the Modified WSIP Alternative.

With respect to the accuracy of the model, please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.5).

SI_TRT-CWA-SierraC-80 Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.8).

SI_TRT-CWA-SierraC-81 Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.8).

SI_TRT-CWA-SierraC-82 Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.3). Information on daily flows in the Tuolumne River and Alameda Creek are provided in the Draft PEIR (Vol. 3, Chapter 5, Sections 5.3.1 and 5.4.1).

SI_TRT-CWA-SierraC-83 Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.3). Information on daily flows in the Tuolumne River and Alameda Creek are provided in the Draft PEIR (Vol. 3, Chapter 5, Sections 5.3.1 and 5.4.1).

SI_TRT-CWA-SierraC-84 This comment refers to Table 5.2-1, Applicable Federal, State, and Local Statues and Agreements, in the Draft PEIR (Vol. 3, Chapter 5, pp. 5.2-3 to 5.2-5) and states that there is no mention of Fish and Game Code 5937, which requires: "The owner of any dam shall allow sufficient water at all times to pass through a fishway, or in the absence of a fishway, allow sufficient water to pass over, around or through the dam, to keep in good condition any fish that may be planted or exist below the dam."

In response to this comment, Draft PEIR Table 5.2-1 is revised to include the following text under the State Agencies heading (Vol. 3, Chapter 5, p. 5.2-4):

Statute or Agreement/Responsible Agency

California Fish and Game Code / Fish and Game Commission and CDFG

Summary Description

Provides a system for the restoration and preservation of California's fish and wildlife resources

Associated Statutes and Plans

California Endangered Species Act (CESA), California Environmental Quality Act (CEQA), Lake and Streambed Alterations

Applicability to WSIP Water Supply and System Operations Issues

CEQA review of the proposed water supply and system operations aspects of the WSIP is presented in Chapter 5, including the impacts of the WSIP on species listed under CESA, as discussed in Sections 5.3.7, 5.4.6, and 5.5.6.

In response to this comment, the Draft PEIR is revised to include the following text (Vol. 3, Chapter 5, p. 5.2-10) under the State Agencies heading:

California Fish and Game Commission

The California Fish and Game Commission (Commission) has the statutory authority to formulate guidance policies for the California Department of Fish and Game (CDFG). The Commission has over 200 powers and duties listed in the statutes of the Fish and Game Code. Principal among these are legislatively granted powers for the regulation of the sport take and possession of birds, mammals, fish, amphibians, and reptiles. The Commission oversees the establishment of wildlife areas and ecological reserves and regulates their use, and prescribes the terms and conditions under which permits or licenses may be issued by the CDFG. A primary responsibility of the Commission is to afford an opportunity for full public input and participation in the decision- and policy-making process of adopting regulations or taking other actions related to the well-being of California's fish and wildlife resources.

The Commission sets policy for the CDFG, while the CDFG is the lead state agency charged with implementing, safeguarding, and regulating the uses of fish and wildlife.

California Department of Fish and Game

The mission of the CDFG is to manage California's diverse fish, wildlife, and plant resources, and the habitats upon which they depend, for their ecological values and for their use and enjoyment by the public. The CDFG enforces multiple programs dedicated to the conservation and preservation of habitats and species in California, including the California Endangered Species Act (CESA), California Environmental Quality Act (CEQA), and California Fish and Game Code. Under CESA, the CDFG is responsible for consulting with state lead agencies to determine if their actions would affect a state-listed threatened or endangered species. Under CEQA, the CDFG is responsible for consulting with lead and responsible agencies and providing the requisite biological expertise to review and comment upon environmental documents and impacts arising from project activities. The CDFG is also responsible for enforcing the provisions of the California Fish and Came Code.

In response to this comment, the Draft PEIR is revised to include the following text (Vol. 3, Chapter 5, p. 5.2-11) under the State Statutes and Agreements heading:

California Fish and Game Code

The Fish and Game Code provides a system for the protection of California's fish and wildlife resources and includes:

provisions related to fish and wildlife protection and conservation; fish and game management; wetlands mitigation banking; endangered species; and operation of dams, conduits, and screens.

SI_TRT-CWA-SierraC-85 Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.2). With respect to compliance with the Fish and Game Code, CEQA does not require that an EIR evaluate whether the existing condition is compliant with all environmental laws and policies. The adequacy of baseline data is addressed in **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol.7, Chapter 14, Section 14.4.4).

SI_TRT-CWA-SierraC-86 Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.2).

SI_TRT-CWA-SierraC-87 The Draft EIR states that the SFPUC and the U.S. Department of the Interior agreed to the minimum release schedule from O'Shaughnessy Dam shown in Table 5.3.1-2 (Vol. 3, Chapter 5, p. 5.3.1-13), and that the SFPUC has made and continues to make releases in accordance with the minimum schedule. Furthermore, the Draft PEIR notes that field studies undertaken between 1989 and 1992 of the river reach between O'Shaughnessy Dam and Early Intake confirmed successful reproduction, rearing, and maintenance of adult populations of rainbow and brown trout (Vol. 3, Chapter 5, p. 5.3.6-2). Contrary to the statement in this comment, the Draft PEIR does not venture an opinion on whether the releases and the trout populations they support are sufficient (see **Response S_CDFG2-02**). The Draft PEIR confines itself to assessing the effects of WSIP-induced flow changes on resident trout. For more information, please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.2).

SI_TRT-CWA-SierraC-88 The information provided in Figures 5.3.1-8 and 5.3.1-9 and the accompanying narrative provide a comprehensive summary description of the effects of the WSIP on storage in Hetch Hetchy Reservoir (Vol. 3, Chapter 5, pp. 5.3.1-21 to 5.3.1-24).
Figure 5.3.1-8 shows that average monthly storage in Hetch Hetchy Reservoir over the 82-year period of record would be less with the WSIP than under the existing condition by a small amount in every month. For example, in October average monthly storage under the existing condition would be about 270,000 acre-feet; with the WSIP it would be about 255,000 acre-feet. The highest storage in October under the existing condition and with the WSIP would be

325,000 acre-feet. The lowest storage in October under the existing condition would be about 90,000 acre-feet; with the WSIP it would be about 40,000 acre-feet.

Figure 5.3.1-8 does not provide information on the differences between storage in Hetch Hetchy Reservoir under the existing condition and with the WSIP in any month in the 82-year period of hydrologic record. This information is provided graphically in Figure 5.3.1-9 and in tabular form in Appendix H2-1 (Vol. 5, Tables 2.3-1, 2.3-2, and 2.3-3 on pp. 17, 18, and 19). Storage in Hetch Hetchy Reservoir under the existing condition and with the WSIP in any given month would be different depending on hydrologic circumstances and reservoir management practices. The differences between monthly storage with and without the WSIP would be greatest under conditions similar to those that occurred in 1976 and 1977. As noted in the Draft PEIR, water levels in Hetch Hetchy Reservoir during extreme droughts could be as much as 64 feet lower than under the existing condition (Vol. 3, Chapter 5, p. 5.3.1-24).

The description of the effects of the WSIP on storage in Hetch Hetchy Reservoir contained in the Draft PEIR is accurate (Vol. 3, Chapter 5, pp. 5.3.1-21 to 5.3.1-24). Storage and water levels in Hetch Hetchy Reservoir fluctuate within a wide range under the existing condition. Although water levels in the reservoir would often be lower with the WSIP than under the existing condition, most of the time they would remain in the same range as they do under the existing condition, and few if any environmental impacts would result. Occasionally, in extreme droughts, the water level with the WSIP would fall below levels experienced under the existing condition. During these conditions, the WSIP could have adverse impacts on water quality, as described in the Draft PEIR (Vol. 3, Chapter 5, pp. 5.3.3-14 to 5.3.3-16).

SI_TRT-CWA-SierraC-89 Under the existing condition, average monthly storage in Hetch Hetchy Reservoir ranges from a maximum of 360,400 acre-feet to a minimum of about 34,000 acre-feet. As shown in Appendix H2-1, monthly storage with the WSIP would fall below 34,000 acre-feet in only 2 months of the 984-month hydrologic record (Vol. 5, Appendix H2-1, Tables 2.3-1, 2.3-2, and 2.3-3 on pp. 17, 18, and 19). This is the basis for stating that the water levels in Hetch Hetchy Reservoir with the WSIP would remain within the range currently experienced most of the time.

SI_TRT-CWA-SierraC-90 Please refer to **Responses SI_TRT-CWA-SierraC-88** and **SI_TRT-CWA-SierraC-89**.

SI_TRT-CWA-SierraC-91 The commenter restates information contained in the Draft PEIR; namely, that the issue of the degree to which parties that divert water upstream of the Delta, including the SFPUC, are responsible for meeting Delta objectives remains unresolved (Vol. 3, Chapter 5, p. 5.3.1-18). The commenter's opinion—that the SFPUC should not consider providing additional water to its suburban customers until the SFPUC's role in meeting Delta objectives is clarified—is acknowledged. For more information, please refer to **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14).

SI_TRT-CWA-SierraC-92 It is possible that the Vernalis Adaptive Management Program (VAMP) may demonstrate the value of increased releases from reservoirs on the San Joaquin River and its tributaries during the spring to protect migratory fish. If increased releases from Don Pedro Reservoir are necessary in a VAMP-like program after 2011, or as a result of Don Pedro Project relicensing in 2016, the SFPUC's customers would be subject to more frequent and severe water shortages than currently planned with the WSIP; however, the analysis in the Draft PEIR is based on the currently known operations of Don Pedro Reservoir and it would be speculative to assume anything other than a continuation of the existing conditions.

The WSIP does not foreclose options for releasing more water in a VAMP-like program should such a release be determined to be necessary to protect migratory fish. The additional quantity of water that would be diverted from the Tuolumne River under the WSIP is small compared to the total amount of water currently diverted from the river for municipal and agricultural purposes. The additional diversion would have little effect on the ability of the SFPUC, TID, and MID to manage reservoir storage and provide a VAMP-like release.

SI_TRT-CWA-SierraC-93 "Pre-project" in this context means the condition without the WSIP.

CEQA does not require that an EIR evaluate whether the existing or pre-project condition is compliant with environmental laws and policies. The purpose of the Draft PEIR is to describe the environmental consequences of the proposed WSIP relative to the existing or pre-project condition (CEQA Guidelines

Section 15125[a]). Cumulative impacts are addressed in the Draft PEIR (Vol. 3, Chapter 5, Section 5.7).

SI_TRT-CWA-SierraC-94 The commenter's opinion with respect to Figure 5.3.1-9 is acknowledged. The figure provides a useful graphical overview of the effects of the WSIP on reservoir storage and releases to the Tuolumne River. The data used to construct the figure are available in Appendix H2-1 (Vol. 5, Appendix H2-1, Tables 2.3-1 through Table 2.3-6, pp. 17 to 23).

As the commenter notes, HH/LSM results indicates that storage in Hetch Hetchy Reservoir in the winters of 1987, 1988, and 1989 would be 10 to 25 percent lower with the WSIP compared to the existing condition. This change would be attributable to the WSIP, but the change would not translate directly into an environmental impact. The water levels with the WSIP would remain in the range experienced under the current condition, and no environmental resources would be adversely affected by WSIP-induced water level changes in these years.

SI_TRT-CWA-SierraC-95 The fourth full paragraph on p. 5.3.1-25 of the Draft PEIR (Vol. 3, Chapter 5, Section 5.3.1) is accurate and does not contradict information provided elsewhere in the PEIR. As stated in the third full paragraph on the same page, the model indicates that under the existing condition, the minimum required release would be made in 837 months of the 82-year hydrologic record. The WSIP would have no effect on flow in these months, and thus would have no effect on river flow 84.2 percent of the time.

As described in the Draft PEIR (Vol. 3, Chapter 5, pp. 5.3.1-24 to 5.3.1-28), the WSIP would primarily affect releases from Hetch Hetchy Reservoir, and flow in the Tuolumne River below O'Shaughnessy Dam in the spring snowmelt period, which typically occurs in late April, May, and early June. Because water demand with the WSIP would be greater than current demand, Hetch Hetchy Reservoir would be drawn down farther just before snowmelt with the WSIP than it is under the existing condition. A higher proportion of snowmelt runoff from the watershed would be needed every year to refill the reservoir with the WSIP than under the existing condition; consequently, a smaller volume of water would be released from the reservoir to the river compared to the existing condition. The reductions in flow are reflected in Table 5.3.1-4 as reductions in average monthly flows in the months of April, May, and June in all hydrologic year types. As stated in the fourth full paragraph of p. 5.3.1-25, the effects of the WSIP are greatest in normal, below-normal, and dry years because a greater proportion of total snowmelt runoff would be needed in these year types to refill the reservoir. In wet years, total runoff would be much greater, and a smaller proportion of total runoff would be needed to refill the reservoir.

SI_TRT-CWA-SierraC-96 In very dry years, when the volume of inflow to Hetch Hetchy Reservoir is small, all the snowmelt runoff could be needed to refill the reservoir. Under these conditions, releases to the Tuolumne River below O'Shaughnessy Dam are limited to the minimum required. As indicated in the fourth paragraph on p. 5.3.1-27 of the Draft PEIR (Vol. 3, Chapter 5), under the existing condition, no releases in excess of the minimum required would occur in 15 years of the 82-year hydrologic record. With the WSIP, no releases in excess of the minimum required would occur in 18 years of the hydrologic record.

SI_TRT-CWA-SierraC-97 As indicated in **Response SI_TRT-CWA-SierraC-96** above, flows in the Tuolumne River below O'Shaughnessy Dam would be the same with the WSIP as under the existing condition in most months of most years, but the WSIP would reduce flow in the snowmelt period. As stated in the Draft PEIR (Vol. 3, Chapter 5, p. 5.3.1-27), the WSIP would reduce the total volume of water released from Hetch Hetchy Reservoir during the snowmelt period and delay the start of snowmelt releases. It would also likely reduce the length of the period during which flows in the river are in excess of the minimum required. The length of the period during which flows in the river are in excess of the minimum required would depend on both the volume of water available for release and the choices made by the operators of the reservoir. The operators could choose to release a modest volume for weeks or a large volume of water for a few days.

The WSIP would have a negligible effect on large, infrequent peak flows. For more information, refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.5).

SI_TRT-CWA-SierraC-98 Table 5.3.1-5 of the Draft PEIR (Vol. 3, Chapter 5, p. 5.3.1-26) contains information on monthly flows averaged for individual months within five different hydrologic year types. It is accurately titled "Estimated Average Monthly Flows for the Tuolumne River Below O'Shaughnessy Dam under Various Conditions." It correctly indicates that the greatest average reduction in monthly flow attributable to the WSIP would be 30 percent and would occur in May of dry years.

The information contained in the table is correct. It is recognized by the authors of the Draft PEIR that changes in average monthly flow within year types do not provide a complete picture of the consequences of the WSIP. This is why the fifth full paragraph on p. 5.3.1-25 notes that considerably greater percentage reductions in monthly flows would occur in some years. Estimated flows in the Tuolumne River below O'Shaughnessy Dam in each month in each year of the hydrologic record with and without the WSIP can be found in Appendix H2-1 (Vol. 5, pp. 21 to 23).

SI_TRT-CWA-SierraC-99 For discussion of the use of flow data in the geomorphology analysis, please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.6).

SI_TRT-CWA-SierraC-100 The average monthly flows shown in Table 5.3.1-6 for the existing condition and the "future with WSIP" were all estimated using HH/LSM, the SFPUC's water supply planning model. For the existing condition, the model simulates the regional water system as it existed in 2005 and calculates the reservoir storage levels and releases that would occur over the 82-year period of hydrologic record, assuming the 2005 water demand of 265 mgd. For the "future with WSIP" condition, the model simulates the regional water system as it would be in 2030 after the improvements that are part of the WSIP are completed. It then calculates the reservoir storage levels and releases that would occur over the 82-year period of hydrologic record assuming the 2030 water demand of 300 mgd.

For a discussion of model accuracy, please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.5).

SI_TRT-CWA-SierraC-101 Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Sections 14.5.3 and 14.5.5).

SI_TRT-CWA-SierraC-102 Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Sections 14.5.3 and 14.5.5).

SI_TRT-CWA-SierraC-103 For discussion of whether the WSIP would cause flows in the Tuolumne River below O'Shaughnessy Dam to fall outside the existing range of flows, please refer to **Section 14.6, Master**

Response on Upper Tuolumne River Issues (Vol. 7, Chapter 14, Section 14.6.5).

SI_TRT-CWA-SierraC-104 Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Sections 14.6.5) for a description of the basis for the conclusion that the WSIP would not cause flows in the Tuolumne River below O'Shaughnessy Dam to fall outside the existing range of flows.

SI_TRT-CWA-SierraC-105 Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.5) for a discussion of the WSIP's effects on the range of flows experienced in the Tuolumne River below O'Shaughnessy Dam. Please refer to **Section 14.5, Master Response on Water Resources Modeling (**Vol. 7, Chapter 14, Section 14.5.3) for a discussion of the use of monthly and daily flow data in the Draft PEIR.

SI_TRT-CWA-SierraC-106 Contrary to this comment, Hetch Hetchy Reservoir fills in 74 years of the 82-year hydrologic period, or about 90 percent of the years. Also, please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.5).

SI_TRT-CWA-SierraC-107 The opinion expressed with respect to the significance of impacts is acknowledged. Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.3) for a discussion of the use of monthly and daily flow data in the Draft PEIR.

SI_TRT-CWA-SierraC-108 A figure similar to Figure 5.3.1-8 for Lake Lloyd was not included in the Draft PEIR because storage in Lake Lloyd is the same under the existing condition and with the WSIP in almost all instances. Figure 2.4-1 in Appendix H2-1 is a plot of storage in Lake Lloyd with and without the WSIP over the 82-year period of hydrologic record. A green line shows storage with the WSIP; a red line shows storage under the existing condition. Most of the time, the green line overlays the red line, indicating that storage is the same under the two conditions. With the WSIP, Lake Lloyd would be drawn down farther in 1992, at the end of a long dry period, than it would under the existing condition. This is because Hetch Hetchy Reservoir would be drawn down farther with the WSIP than under the existing condition, reducing the amount of water that the SFPUC could release from that reservoir to meet TID's and MID's water-right entitlements. In this circumstance, the SFPUC would release water from Lake Lloyd to fulfill the entitlements.

Once in the 82-year hydrologic record, Lake Lloyd would be drawn down considerably farther with the WSIP than it would under the existing condition. It is not expected that this would result in adverse environmental effects.

SI_TRT-CWA-SierraC-109 The title of Draft PEIR Table 5.3.1-6 (Vol. 3, Chapter 5, p. 5.3.1-35) accurately describes its contents. It does not purport to contain extreme values of monthly flow differences between the existing and with-WSIP conditions. As the commenter notes, the extreme values are identified in the text.

SI_TRT-CWA-SierraC-110 For a discussion related to the use of average monthly flows and to averaging flow within water-year types, please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Sections 14.5.3 and 14.5.4). For a discussion of the use of flow data in determining the WSIP's impacts on geomorphology, refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 4.6.6) and **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 4.7.7). Monthly, daily, and peak flows were all used in the analysis of biological impacts.

SI_TRT-CWA-SierraC-111 Table 5.3.1-6 (Vol. 3, Chapter 5, p. 5.3.1-35) indicates that 13 of the 60 month by year type combinations indicate a reduction in flow of 5 percent or more. This represents 22 percent of the month by year type combinations rather than 33 percent, as stated by the commenter. The effects of the reductions in flow shown in Table 5.3.1-6 on geomorphology, water quality, fisheries, and terrestrial biological resources are described in the Draft PEIR (Vol. 3, Chapter 5, Sections 5.3.2, 5.3.3, 5.3.6, and 5.3.7). The impact analyses do not rely exclusively on the WSIP-induced changes in average monthly flows shown in Table 5.3.1-6. As explained in the text of the sections, peak and daily flow were also considered in reaching conclusions with respect to the impacts of WSIP-induced flow changes on stream geomorphology and biological resources.

SI_TRT-CWA-SierraC-112 The statement in the Draft PEIR was not derived from model output. It was based on operating practices at Don Pedro Reservoir and experience with historical peak flows.

As described in the Draft PEIR, the WSIP would result in reductions in releases from La Grange Dam in winter and spring in certain years. This is because with the WSIP the SFPUC would divert more water from the Tuolumne River at Hetch Hetchy Reservoir. As a result, inflow to and storage in Don Pedro Reservoir would be reduced and a greater proportion of winter and spring flows would be needed to refill the reservoir.

The conclusions in the Draft PEIR with respect to peak flows in the Tuolumne River below La Grange Dam were arrived at as follows. Don Pedro Reservoir is a large multi-purpose reservoir. Water is released from the reservoir and diverted into the Turlock and Modesto Canals at La Grange Dam, approximately two miles downstream of Don Pedro Reservoir. Flow in the Tuolumne River below La Grange Dam consists entirely of releases from the dam.

In many months of above-normal, below-normal, and dry years, and in all months of critically dry years, only the minimum required releases are made from La Grange Dam. Releases in excess of the minimum required are made when they are necessary to preserve the flood storage reservation in the reservoir, which is in effect from early September to early June, or when the reservoir is full or is expected to fill. Operators attempt to limit releases to 10,000 cubic feet per second (cfs) because flows greater than this can cause flooding in the Modesto area.

Extreme peak flows in the Tuolumne River below La Grange typically occur when rain falls on accumulated snow in the watershed above Don Pedro Reservoir. Runoff into the reservoir increases rapidly, and operators must make releases to maintain the flood storage reservation. Such an event occurred in January 1997, when the water level in Don Pedro Reservoir was at its maximum consistent with the flood storage reservation. Operators had to release water in an amount approximately equal to reservoir inflow to maintain the flood storage reservation. Daily flow in the Tuolumne River below La Grange Dam peaked at 58,000 cfs.

Figure 5.3.1-12 shows storage in Don Pedro Reservoir under the existing condition and with the WSIP for the 82-year period of hydrologic record (Vol. 3, Chapter 5, p. 5.3.1-33). As shown in the figure, in January 1997 storage in Don Pedro Reservoir with the WSIP would be the same as it was under the existing condition. Therefore, the release and peak flow with the WSIP would be virtually the same as it was under the existing condition.

SI_TRT-CWA-SierraC-113 Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.6).

SI_TRT-CWA-SierraC-114 With respect to whether flows in the Tuolumne River below La Grange Dam with the WSIP would remain within the current range, please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.6).

The question of whether flows in a water body with the WSIP would remain within the current range was considered only to determine the significance of hydrological impacts. Separate and independent significance determinations were made with respect to environmental elements affected by WSIP-induced flow changes, such as biological resources and geomorphology. Because the effects of the WSIP on the hydrology of the Tuolumne River below La Grange Dam were determined to be less than significant does not mean that the effects of WSIP-induced flow changes on biological resources or geomorphology would also be less than significant. In fact, the impacts of the WSIP on both fisheries and terrestrial biological resources were determined to be potentially significant.

With respect to the analysis of current operating practices, CEQA does not require that an EIR evaluate whether the existing condition is environmentally desirable or compliant with existing laws and regulations.

SI_TRT-CWA-SierraC-115 With respect to whether flows in the Tuolumne River below La Grange Dam with the WSIP would remain within the current range, please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.6). Because flows in the river with the WSIP would remain in the current range, the character of the river—that is, its channel cross-section, sinuosity, and appearance—would remain unaltered or would be altered very little. If a project altered the range of current flows by, for example, reducing peak flows to one-third of their pre-project value, then the character of the river would likely change; the cross-section would diminish and vegetation would encroach into the former stream channel.

SI_TRT-CWA-SierraC-116 The commenter opines that the use of the term “rare” is subjective and that it is not defined. In most instances in the Draft PEIR, where the terms “rare” or “infrequent” are used to describe an event, their use is followed by a reference to the number of times the event would be expected to occur in the 82-year period of hydrologic record. The sentence from the Draft PEIR quoted by the commenter (“Flow reductions of these magnitudes would be rare events occurring four or five times in the period of hydrologic record") provides an example.

The San Francisco Planning Department considered both the severity and frequency of an impact when determining its significance. Please also refer to **Response SI_TRT-CWA-SierraC-44**.

SI_TRT-CWA-SierraC-117 The flow reductions in the San Joaquin River referred to in the Draft PEIR occur in wet or above-normal years after a series of dry years (Vol. 3, Chapter 5, p. 5.3.1-38). A wet or above-normal spring enables operators to refill Don Pedro Reservoir after it has been drawn down in the dry years. Large flow reductions are unlikely to occur in successive years, but may persist for more than one month in the year that they occur.

The effects of the flow reductions on water quality are described in the Draft PEIR (Vol. 3, Chapter 5, Section 5.3.3).

SI_TRT-CWA-SierraC-118 Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.6) for a description of how the significance conclusion was reached. Although it was concluded that the effects of the WSIP on the hydrology of the Tuolumne River below La Grange Dam would be less than significant, the effects of WSIP-induced flow reductions on fisheries and terrestrial biology in this reach of the river were determined to be potentially significant (Vol. 3, Chapter 5, Sections 5.3.6 and 5.3.7).

SI_TRT-CWA-SierraC-119 For general aspects related to the approach to analysis and a discussion of the baseline condition, please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.4).

The commenter's opinion that the analysis of sediment transport and gravel bed conditions is qualitative and largely speculative is noted. The San Francisco Planning Department acknowledges that the analysis is qualitative but disagrees that it is largely speculative. Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.6) and **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.7).

SI_TRT-CWA-SierraC-120 For a discussion of the baseline condition, please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14).

The commenter notes that bed armoring is a major factor driving the loss of salmonid spawning habitat in the Central Valley. In the upper Tuolumne River, bed armoring probably occurred in the first few decades after construction of Hetch Hetchy Reservoir, Lake Lloyd, and Lake Eleanor when the bedload supply to the river reaches below the dams was eliminated. The trout that populate the upper Tuolumne River are adapted to the current channel bed conditions and the lack of gravel supply from upstream. The WSIP would have little or no effect on bedload movement from the watersheds above the reservoirs to the upper Tuolumne River and thus would neither decrease nor increase channel bed armoring.

Bed armoring is probably only one of a number of factors limiting the availability of salmonid spawning habitat in the lower Tuolumne River. The loss of bedload from above La Grange Dam, channel reshaping as a result of past mining, and the discharge of fine sediment in runoff from agricultural and urban lands are also important factors in limiting the availability of suitable spawning gravel. The WSIP would have little or no effect on bedload movement from the watershed above La Grange Dam to the lower Tuolumne River and thus would neither decrease nor increase channel bed armoring or otherwise affect the availability of salmonid spawning habitat. The WSIP would affect the bankfull peak flows in the river below La Grange Dam that occur every one to three years and could reduce the rate of downstream movement of artificially placed or other gravel in the lower Tuolumne River (refer to Vol. 7, Chapter 14, **Section 14.7, Master Response on Lower Tuolumne River Issues**, Section 14.7.7).

SI_TRT-CWA-SierraC-121 The SFPUC's geomorphology studies, conducted by McBain and Trush, indicate that the similarities between the upper Tuolumne River and the Clavey River are sufficient for data from the latter to be useful in analyzing the former (McBain and Trush and RMC, 2007). The Clavey River and the reach of the Tuolumne River between Hetch Hetchy Reservoir and the confluence with the Clavey River are at about the same elevation, and both rivers flow in a bedrock channel.

SI_TRT-CWA-SierraC-122 Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.5) for a discussion of the WSIP's effects on the magnitude, frequency, and duration of river flows, and to Section 14.6.6 of that master response for a discussion of WSIP-induced flow changes on channel form and sediment.

SI_TRT-CWA-SierraC-123 The WSIP would have very little effect on sediment transport in the upper Tuolumne River because most downstream migrating sediment was interrupted when Hetch Hetchy Reservoir and Lakes Lloyd and Eleanor were built. The armoring of sediments below O'Shaughnessy Dam likely occurred many years ago and results primarily from the elimination of sediment transport from the watershed above Hetch Hetchy Reservoir. The reduction in frequency of moderate-sized to small floods that occur more than once in 10 years as a result of the WSIP would not be expected to have much effect on the armoring phenomenon.

The reduction in frequency of moderate-sized to small floods that remove sediment from interstitial spaces in spawning gravels could have some adverse effect on the quality of spawning and rearing habitat for resident trout. However, the SFPUC proposes Mitigation Measure 5.3.7-2 (Vol. 4, Chapter 6, pp. 6-49 and 6-50), which would involve shaping releases of water from Hetch Hetchy Reservoir to increase the frequency of groundwater recharge in the Poopenaut Valley. The same measure would also wash sediment from spawning gravel.

Also, please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.5) for a discussion of the WSIP's effects on the magnitude, frequency, and duration of river flows, and to Section 14.6.6 of that master response for a discussion of WSIP-induced flow changes on channel form and sediment.

SI_TRT-CWA-SierraC-124 The authors of the Draft PEIR did not refer to the USFWS's 1992 draft Instream Flow Incremental Methodology report because the information in it is out-of-date. As the commenter notes, the report would enable an assessment of the changes that may have occurred in sediment conditions between 1992 and the present once the current SFPUC studies are completed.

SI_TRT-CWA-SierraC-125 Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.7).

SI_TRT-CWA-SierraC-126 The WSIP would have little effect on the magnitude of large flood flows, such as the flood that occurred in 1997, which radically reshaped the channel. However, in this reach of the river, the primary channel-forming events are peak flows that occur every one to three years, which would be affected by the WSIP. Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.7) for more information.

For a discussion of the WSIP's effects on bedload armoring, please refer to **Response SI_TRT-CWA-SierraC-120**, above.

SI_TRT-CWA-SierraC-127 There are many reasons for the decline of the salmonid populations in the Tuolumne River, including past water system development, gravel and gold mining in the river channel, the clearing of the riparian forest, channel encroachment by agriculture and urban development, and ocean harvesting and conditions. Past water development created barriers to fish passage and sediment movement, depleted flow, and altered seasonal flow patterns. The cumulative effects of past and present activities on the lower Tuolumne River and its fishery resources are described in the Draft PEIR (Vol. 3, Chapter 5, Section 5.7). Compared to the effects of past actions, the WSIP would have only minor effects on sediment transport in the reach of the river below La Grange Dam.

The degraded condition of the river ecology below La Grange Dam as a result of these past activities is acknowledged in the Draft PEIR (Vol. 3, Chapter 5, Section 5.7). Although the WSIP-related adverse changes in the condition of this reach of the river are relatively minor, including somewhat reduced sediment transport, the San Francisco Planning Department concluded that WSIP-caused incremental impacts on fisheries and terrestrial biological resources would be significant. The conclusion was reached because biological resources in this reach of the river are in a stressed and vulnerable condition.

SI_TRT-CWA-SierraC-128 With respect to the information in Table 5.3.3-2 (Vol. 3, Chapter 5, p. 5.3.3-3), please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.5, under the heading Impacts on Water Quality).

The commenter accurately notes that the table does not include any critically dry years. None occurred between 1996 and 2004. Maximum water temperatures in critically dry years could be greater than the values shown in the table.

SI_TRT-CWA-SierraC-129 Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.5).

SI_TRT-CWA-SierraC-130 Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.5). For more information on recorded temperatures in the Tuolumne River below La Grange Dam, see *2005 Ten Year Summary Report*, FERC Project No. 2299-024, Turlock Irrigation District/Modesto Irrigation District, 2005. For a discussion of the potential effects of global warming, please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14).

SI_TRT-CWA-SierraC-131 Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.7).

SI_TRT-CWA-SierraC-132 Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.7). For a discussion of the frequency and severity of impacts, refer to **Response SI_TRT-CWA-SierraC-44**.

SI_TRT-CWA-SierraC-133 For a discussion of the potential effects of global warming, please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14).

SI_TRT-CWA-SierraC-134 The Draft PEIR states that the optimum temperatures for Chinook spawning are 8 to 16 degrees Celsius (ºC) and optimum temperatures for juvenile rearing are 12 to 18 ºC (Vol. 3, Chapter 5, p. 5.3.6-16). Optimum temperatures for steelhead in California are considered to be in the range of 10 to 15 ºC, but water temperatures up to 20 ºC are considered suitable for juvenile summer rearing.

The commenter uses the information in Figures 5.3.3-3 and 5.3.3-4 to estimate the length of the river below La Grange Dam that would be suitable for steelhead rearing with and without the WSIP under conditions prevailing in 1993 and 1999. There is no disagreement with the commenter's estimates. It is acknowledged in the Draft PEIR that the length of the river reach suitable for juvenile salmonids would be truncated at times as a result of WSIP-caused elevated water temperatures (Vol. 3, Chapter 5, p. 5.3.6-32).

The occasional substantial increases in water temperature in the Tuolumne River below La Grange Dam, together with other factors, contributed to the conclusion that the WSIP could have a significant adverse effect on salmonids in this reach of the river (Vol. 3, Chapter 5, pp. 5.3.6-28 to 5.3.6-32).

SI_TRT-CWA-SierraC-135 For a discussion of the potential effects of global warming, please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14).

SI_TRT-CWA-SierraC-136 As stated in the Draft PEIR, the WSIP would cause water temperatures in the reach of the river between La Grange Dam and the San Joaquin River to exceed the water quality objective of 5-degree-Fahrenheit increase in three or four months of the 82-year hydrologic record (Vol. 3, Chapter 5, p. 5.3.3-19). The San Francisco Planning Department concluded that the impacts of the WSIP on water quality would be less than significant because the exceedences would be rare and because they would not impair the river's ability to support its designated beneficial uses. However, as noted above, the occasional increases in water temperature in the Tuolumne River below La Grange Dam, together with other factors, contributed to the conclusion that the WSIP could have a significant adverse effect on salmonids (Vol. 3, Chapter 5, pp. 5.3.6-28 to 5.3.6-32).

SI_TRT-CWA-SierraC-137 The WSIP would not cause exceedences of water quality objectives at Vernalis or in the Delta. Responsibility for compliance with the water quality objectives belongs to two of the junior water-rights holders, the California Department of Water Resources (DWR) and U.S. Bureau of Reclamation (USBR). During the infrequent periods when flow in the San Joaquin River would be substantially reduced under the WSIP, the DWR and USBR would reduce diversions from their facilities to meet flow and water quality objectives at Vernalis and in the Delta as necessary (Vol. 3, Chapter 5, p. 5.3.1-39). Please refer to **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14, Section 14.8).

For a discussion of how the frequency and severity of impacts were accounted for in the analysis, please refer to **Response SI_TRT-CWA-SierraC-44**, above.

SI_TRT-CWA-SierraC-138 Table 5.3.3-6 (Vol. 3, Chapter 5, p. 5.3.3-10) shows water quality objectives for the San Joaquin River basin. The water quality objective for dissolved oxygen in the San Joaquin River between Turner Cut and Stockton shown in the table is revised as follows:

> 6.0 mg/L (September 1 to November 30) <u>and 5.0 mg/L (December 1 to August 30)</u>

As shown in Table 5.3.4-4 (Vol. 3, Chapter 5, p. 5.3.4-7), the WSIP would rarely affect flow in the San Joaquin River by more than 100 cfs in September, October, and November (8 months out of 246 months). During those months, if the flow reductions attributable to the WSIP could cause exceedences of water quality or flow objectives for the San Joaquin River at Vernalis, the USBR would have to make releases from its facilities to ensure that the objectives were met. This would lessen any adverse effects of the WSIP on dissolved oxygen levels in the lower San Joaquin River. Please refer to **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14, Section 14.8.2) for additional discussion of the effects of the WSIP on the San Joaquin River and Delta, including potential effects on Central Valley Project and State Water Project operations.

SI_TRT-CWA-SierraC-139 With respect to dissolved oxygen concentrations in the lower San Joaquin River, please refer to **Response SI_TRT-CWA-SierraC-138**. The commenter accurately notes that exceedences of the dissolved oxygen objective in the Stockton area are already common. The causes for the condition are many and include municipal wastewater discharges, agricultural tailwater discharges, and depleted flow due to diversions for agricultural and municipal purposes. The San Francisco Planning Department concluded that the WSIP's contribution to low dissolved oxygen conditions near Stockton was small compared to the effects of the other factors, and that the impact of the WSIP would be less than significant.

SI_TRT-CWA-SierraC-140 The Draft PEIR text referred to by the commenter (Vol. 3, Chapter 5, p. 5.3.4-5, third paragraph) is accurate but could be clarified. The text in this paragraph is revised as follows:

> As described in Section 5.3.1, under existing conditions in the majority of years classified as below-normal or drier, almost all of the winter and spring runoff from the watershed upstream of Don Pedro Reservoir on the Tuolumne River is captured in the reservoir. Only the minimum required releases to the Tuolumne River below La Grange Dam are made. The WSIP would have no effect on flow in the Tuolumne River below La Grange Dam or the San Joaquin River ~~under these conditions~~ <u>in months when only the minimum flows are currently released.</u> In years when the reservoir fills, usually wet or above-normal years, excess water is released in some months to the Tuolumne River. In the future with the WSIP, TID and MID would draw Don Pedro Reservoir down farther in most years than they would under the existing condition, and consequently a greater proportion of spring runoff would

be needed to refill the reservoir. As a result, the volume of excess water released to the Tuolumne River would be reduced in ~~some normal, above normal and wet years compared to the existing condition~~ all wet years, most above-normal years, and occasional below-normal and dry years.

SI_TRT-CWA-SierraC-141 For a discussion of how the frequency and severity of impacts were accounted for in the analysis, please refer to **Response SI_TRT-CWA-SierraC-44**, above.

The commenter combines long-term monthly flow data averaged over several years, and shown in Table 5.3.1-1 (Vol. 3, Chapter 5, p. 5.3.1-12), with modeled flow data from a single month referred to in the text and shown in Table 5.3.4-4 (Vol. 3, Chapter 5, p. 5.3.4-7). This approach produces misleading information.

Table 5.3.1-1 shows gaging data for the Tuolumne River below La Grange Dam, and as the commenter notes, average monthly flow in the river in February is 1,884 cfs. This is the measured flow in February averaged over a 30-year period. Table 5.3.1-6 (Vol. 3, Chapter 5, p. 5.3.1-35) shows average monthly flows for the Tuolumne River below La Grange for an 82-year period of hydrologic record estimated using the HH/LSM. The table shows that average monthly flow in the river in February over the 82-year period would be 1,723 cfs under the existing condition and 1,638 cfs with the WSIP, a reduction of about 5 percent.

As noted by several commenters, and concurred with by the authors of the Draft PEIR, average values alone do not provide a basis for reaching conclusions with respect to environmental impacts. Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Sections 14.5.3 and 14.5.4) for more information on this topic.

Because average values alone do not provide a basis for assessing environmental impacts, the average monthly data within hydrologic year types that are shown in Table 5.3.1-6 are supplemented by data on average flows for each month in the 82-year hydrologic record in Table 5.3.4-4. As shown in Table 5.3.4-4, the WSIP would have no effect on flows in the Tuolumne River below La Grange in critically dry years and little effect in dry and below-normal years. In seven months in the 82-year hydrologic record, the WSIP would reduce flows in the Tuolumne River below La Grange Dam by more than 1,000 cfs. The San Francisco Planning Department concluded that these flow reductions represent a less-than-significant impact on hydrology because they would not cause flows in the river to be outside the range experienced under the existing conditions. Even though WSIP-induced substantial reductions in flow would occur infrequently, it was concluded that the effects of the flow reductions on fisheries and terrestrial biology in this reach of the river would be potentially significant (Vol. 3, Chapter 5, Sections 5.3.6 and 5.3.7). The Draft PEIR includes mitigation measures designed to reduce the impacts of flow reductions on biological resources to a less-than-significant level (Measures 5.3.6-4a and 5.3.6-4b, Vol. 4, Chapter 6, pp. 6-48 and 6-49).

SI_TRT-CWA-SierraC-142 The commenter combines long-term monthly flow data averaged over several years (shown in Table 5.3.1-1) with flow data from a single month (shown in Table 5.3.4-4). This approach produces misleading information.

The commenter notes that the WSIP would reduce flows in the Tuolumne River below La Grange in the fall and winter under conditions that prevailed in 1964. This is one of 2 years in the 82-year hydrologic record when the WSIP would have an effect on flow in this reach of the river in a dry or critically dry year. The flow reduction probably results from the fact that, under the conditions prevailing in the fall and winter of 1964, Don Pedro Reservoir would be at its maximum water level consistent with the flood storage reservation. Any rainstorms over the watershed would cause reservoir operators to release water to the river. With the WSIP, the water level in the reservoir in the fall and winter of 1964 would be slightly lower than under the existing condition, and the reservoir operators would be able to capture some of the runoff from the rainstorms without encroaching on the flood storage reservation. Less water would be released to the river, but the minimum required flows in the river below La Grange Dam would have to be maintained.

SI_TRT-CWA-SierraC-143 The comment with respect to the readability and utility of Table 5.3.4-4 (Vol. 3, Chapter 5, p. 5.3.4-7) is acknowledged. The San Francisco Planning Department respectfully disagrees with the comment. The estimated changes in flow attributable to the WSIP for each month in the 82-year period are a necessary supplement to the average monthly flow data provided elsewhere in Chapter 5 of the Draft PEIR.

SI_TRT-CWA-SierraC-144 Please refer to **Response SI_TRT-CWA-SierraC-141**, above.

SI_TRT-CWA-SierraC-145 As stated in the Draft PEIR, substantial WSIP-induced flow reductions in the San Joaquin River between its confluence with the Tuolumne River and its confluence with the Stanislaus River would occur four or five times in the 82-year period of hydrologic record (Vol. 3, Chapter 5, p. 5.3.1-38). As the commenter notes, the Tuolumne River provides a substantial fraction of the flow in the San Joaquin River. However, the WSIP-induced reductions in flow in the San Joaquin River would not have any effect on compliance with State Water Resources Control Board–imposed flow and water quality objectives at Vernalis or in the Delta. Responsibility for compliance with the objectives belongs to two of the junior water-rights holders, the DWR and USBR. During the infrequent periods when flow in the San Joaquin River would be substantially reduced by the WSIP, the DWR and USBR would reduce diversions from their facilities to meet flow and water quality objectives at Vernalis and in the Delta as necessary (Vol. 3, Chapter 5, p. 5.3.1-39). Also, please refer to **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14).

SI_TRT-CWA-SierraC-146 For a brief description of the monitoring program referred to by the commenter, please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.2). The San Francisco Planning Department concluded that sufficient information is available to reach conclusions with respect to the impacts of the WSIP on fishery resources in the Tuolumne River below O’Shaughnessy Dam. Please refer to **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.4).

SI_TRT-CWA-SierraC-147 Please refer to **Response SI_TRT-CWA-SierraC-14**, above.

SI_TRT-CWA-SierraC-148 Please refer to **Response SI_TRT-CWA-SierraC-14**, above, and to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.2).

SI_TRT-CWA-SierraC-149 Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.2).

SI_TRT-CWA-SierraC-150 Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.3) and **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.4).

SI_TRT-CWA-SierraC-151 Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.3).

SI_TRT-CWA-SierraC-152 The comment raises concern over the biological distinctions made between steelhead and rainbow trout in describing steelhead presence and abundance within the lower Tuolumne River. The comment references the polymorphic nature of the species within the context that any *O. mykiss* surveyed within this area could potentially adopt an anadromous life-history strategy and are therefore subject to protection under the Federal Endangered Species Act.

Section 5.3.6 (Vol. 3, Chapter 5) of the Draft PEIR discusses steelhead presence and abundance within the lower Tuolumne River. This section discusses rainbow trout/steelhead presence and abundance based on biological surveys conducted between 1982 and 2004 (p. 5.3.6-18). Impact 5.3.6-4 (p. 5.3.6-28 to 5.3.6-32) discusses potential impacts on anadromous salmonids within the lower Tuolumne River and provides specific discussion of the impacts on steelhead within the affected reach. Implementation of Mitigation Measures 5.3.6-4a and 5.3.6-4b (Vol. 4, Chapter 6, pp. 6-48 and 6-49) would reduce these potentially significant impacts to a less-then-significant level. The legal status of steelhead, including details regarding steelhead protection under the Federal Endangered Species Act, is described in the (Vol. 3, Chapter 5, p. 5.3.6-23, under the heading Regulatory Setting). Further discussion of steelhead presence and abundance in the lower Tuolumne River is provided in **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.3) and in **Response SI_TRT-CWA-SierraC-12**, above.

Studies by the Federal Energy Regulatory Commission (FERC, 1996) present findings indicating that, although there are steelhead in the lower Tuolumne River, no significant populations are present. Data presented in the Draft PEIR show water temperatures in the lower Tuolumne River to be in the 25 to 30 ºC range for extended periods during the summer in many locations. Water temperature data presented in Draft PEIR Table 5.3.3-2 (Vol. 3, Chapter 5, p. 5.3.3-18 and 5.3.3-19) demonstrate that only the reach immediately downstream of La Grange Reservoir is characterized by water temperatures suitable for steelhead rearing. The increased temperatures in reaches farther downstream and in the San Joaquin River during spring and summer may preclude successful out-migration of juveniles. Trout surveys conducted between 1982 and 2004 (see Vol. 3, Chapter 5, p. 5.3.6-18) found that the geographic range of *O. mykiss* reflected this thermal regime, and that the species was found with greatest frequency above River Mile 45 and not below River Mile 38.

Impact 5.3.6-4 (Vol. 3, Chapter 5, pp 5.3.6-28 to 5.3.6-32) discusses steelhead along the Tuolumne River below La Grange Dam as a federally listed threatened species that inhabits this portion of the river in low abundance. As presented under Impact 5.3.6-4, the largest percentage reductions in Tuolumne River stream flow downstream of La Grange Dam under WSIP operations are expected to occur in June. These summer flow reductions would likely elevate water temperatures and reduce the linear extent of suitable rearing habitat for steelhead/rainbow trout, which are acknowledged as rearing within the river system throughout the year.

As stated on p. 5.3.6-32, the flow reductions coupled with the projected infrequent water temperature increases that could result under the WSIP would have an adverse impact on habitat conditions for juvenile steelhead/rainbow trout. The flow reductions would reduce available habitat in the entire reach of the river used by juvenile steelhead/rainbow trout below La Grange Dam. The elevated temperatures, although infrequent, would truncate the length of the river reach suitable for juvenile steelhead/rainbow trout. These adverse effects on flow and temperature in the river under the WSIP would not substantially alter or degrade fishery habitat or jeopardize the continuation of the fishery populations in the lower Tuolumne River in most years. However, the WSIP's effects on flow and temperature would infrequently contribute to potentially significant effects on fishery resources. The *Habitat Restoration Plan for the Lower Tuolumne River Corridor* (McBain and Trush, 2000) establishes goals for fishery habitat restoration, and the NMFS and others have identified goals for fishery enhancement on the lower river. The WSIP's small but incremental contribution to adverse effects on the lower river would make planned restoration of habitat and fishery resources more difficult. As a result, the impact of the WSIP on these fishery resources in the lower Tuolumne River would be potentially significant. Implementation of Mitigation Measure 5.3.6-4a, Avoidance of Flow Changes by Reducing Demand for Don Pedro Reservoir Water, would reduce this impact to a less-than-significant level. This measure involves some uncertainty because its implementation depends on the SFPUC reaching agreement with MID and TID and possibly other water agencies. If this measure proves to be infeasible, the SFPUC will implement Mitigation Measure 5.3.6-4b, Fishery Habitat Enhancement, to enhance fishery habitat in the lower Tuolumne River. Implementation of Measure 5.3.6-4a or 5.3.6-4b would reduce these adverse impacts on steelhead/rainbow trout to a less-than-significant level.

SI_TRT-CWA-SierraC-153 Please refer to **Response SI_TRT-CWA-SierraC-152**.

SI_TRT-CWA-SierraC-154 The commenter concurs with the text of the Draft PEIR stating that low flow and high water temperatures in this reach stress juvenile salmon and enhance predation by bass (Vol. 3, Chapter 5, p. 5.3.6-20). Further, the commenter notes that WSIP-induced flow reductions and increased water temperatures would increase the loss of salmonids to non-native predators. The authors of the Draft PEIR agree with the commenter; this is one of the reasons why it was determined that the WSIP would have a potentially significant adverse effect on salmonids in this reach of the river (Vol. 3, Chapter 5, pp. 5.3.6-28 to 5.3.6-32). The proposed mitigation measures (Measures 5.3.6-4a and 5.3.6-4b) would reduce the impacts to a less-than-significant level.

SI_TRT-CWA-SierraC-155 The commenter's opinion regarding the desirability of increasing flows in the Tuolumne River below La Grange Dam to decrease suitable habitat for non-native predators is acknowledged. Please also refer to **Response SI_TRT-CWA-SierraC-154** and **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.8).

SI_TRT-CWA-SierraC-156 Refer to **Response SI_TRT-CWA-SierraC-43** regarding how the San Francisco Planning Department identifies significance criteria.

The comment describing the goal of doubling anadromous fish populations above their baseline averages in the Anadromous Fish Restoration Program is acknowledged.

The Draft PEIR (Vol. 2, Chapter 4, p. 4.6-23 and 4.6-24) summarizes the Federal Endangered Species Act as it applies to the WSIP and describes how provisions under this act are incorporated into the PEIR impact analysis on biological resources. This section of the Draft PEIR includes a description of the situations in which the act permits the "taking" of federally listed species.

SI_TRT-CWA-SierraC-157 Please refer to **Response SI_TRT-CWA-SierraC-14**, above, and **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.2).

SI_TRT-CWA-SierraC-158 Please refer to n **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Sections 14.5.3 and 14.5.4). The flow reductions in the reach of the river below O'Shaughnessy Dam that would be attributable to the WSIP would manifest themselves as a delay in the initial release of water in excess of the minimum required releases in the spring snowmelt period. It was determined that the delay in the release would not be expected to have a significant adverse effect on rainbow trout or other resident fish (Vol. 3, Chapter 5, p. 5.3.6-27).

SI_TRT-CWA-SierraC-159 With regard to water quality objectives, please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.7). With regard to climate change, please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14).

SI_TRT-CWA-SierraC-160 Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.7).

SI_TRT-CWA-SierraC-161 The analysis of fishery impacts in the Tuolumne River below La Grange Dam focused on Chinook salmon because this species was once abundant in this reach of the river and has been the subject of considerable management efforts in the last decade. The analysis in the Draft PEIR considered steelhead, but acknowledged that surveys conducted between 1982 and 2004 suggested that large anadromous steelhead occur in the river very infrequently (Vol. 3, Chapter 5, p. 5.3.6-18).

The San Francisco Planning Department concluded that the occasional flow reductions and increases in water temperature attributable to the WSIP would have a significant adverse impact on anadromous fish in the Tuolumne River below La Grange Dam. Although the focus of the analysis was Chinook salmon, it was acknowledged that the changes would affect habitat for summer rearing of steelhead (Vol. 3, Chapter 5, p. 5.3.6-31).

The purpose of the Draft PEIR is to describe the environmental consequences of the proposed WSIP relative to the existing condition. CEQA does not require that an EIR evaluate whether the existing condition is satisfactory for steelhead and compliant with all environmental laws and policies. The Draft PEIR does include an assessment of the effects of the WSIP on fisheries in the context of all past, present, and expected future actions that have or will affect the resource (Vol. 3, Chapter 5, Section 5.7). In this section, it is acknowledged that past and present water management practices and other past and present human activities, such as gravel and gold mining, have substantially altered habitat for anadromous fish in the lower Tuolumne River. The degraded condition of anadromous fish in this reach of the river contributed to the conclusion that WSIP-induced flow reductions would have a significant adverse impact in the absence of appropriate mitigation measures.

SI_TRT-CWA-SierraC-162 Please refer to **Response SI_TRT-CWA-SierraC-161**, above.

SI_TRT-CWA-SierraC-163 Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.6).

SI_TRT-CWA-SierraC-164 As indicated in **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.7), the WSIP would have little effect on large infrequent peak flows in the reach of the river below La Grange Dam, and therefore would have little or no effect on the movement of coarse sediments in this reach of the river. The WSIP would not affect the recruitment of coarse sediment in this reach of the river because La Grange and Don Pedro Dams prevent the downstream movement and recruitment of coarse sediment. For a discussion of the effects of the WSIP on the movement of fine sediment, please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.7).

SI_TRT-CWA-SierraC-165 Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.2).

SI_TRT-CWA-SierraC-166 Please refer to **Response SI_TRT-CWA-SierraC-134**, above.

SI_TRT-CWA-SierraC-167 Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.3) for more information on the use of monthly and daily data in the environmental analysis. Refer to **Response SI_TRT-CWA-SierraC-44** for more information on the frequency and severity of impacts.

Most flow reductions below La Grange Dam attributable to the WSIP would manifest themselves as a delay in late winter or early spring releases. On some days in the winter or spring, flow in the Tuolumne River with the WSIP would be the minimum required. On those same days under the existing condition, flow in the river would be greater because the spring release would have begun.

The releases to the river under the existing condition in 2000 are shown in Figure 5.3.1-13 (Vol. 3, Chapter 5, p. 5.3.1-37). Reservoir operators in 2000 were releasing the minimum required, 300 cfs, in January and the early part of February. In mid-February, reservoir operators began to release water in excess of the minimum required, raising flow in the river to about 3,000 cfs over about one week.

With the WSIP, the release would have been delayed by a few days and thus flow in the river would have remained at 300 cfs for a few days longer. In those few days, flow with the WSIP would be 90 percent less than under the existing condition.

The temperature model was used to simulate two scenarios: one where the WSIP would cause a 90 percent reduction in flow in the lower Tuolumne River, and one where it would cause a 50 percent reduction in flow. The results are shown in Figures 5.3.3-3 and 5.3.3-4 (Vol. 3, Chapter 5, pp. 5.3.3-18 and 5.3.3-19). In most years, flow reductions of this magnitude would last only a few days.

The San Francisco Planning Department concluded that the flow reductions attributable to the WSIP, and the consequent increase in water temperatures, would not represent a significant adverse effect on water quality in the Tuolumne River below La Grange Dam. However, the increase in water temperatures, together with other factors, contributed to the conclusion that the WSIP could have a significant adverse effect on salmonids in this reach of the river (Vol. 3, Chapter 5, p. 5.3.6-28 to 5.3.6-32).

SI_TRT-CWA-SierraC-168 For a discussion of the potential effects of global warming, please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14). Refer to **Response SI_TRT-CWA-SierraC-44** for more information on the frequency and severity of impacts. The commenter's statement that even small changes in water temperature can have a dramatic effect on salmon survival is acknowledged

SI_TRT-CWA-SierraC-169 The commenter concurs with the statement in the Draft PEIR (Vol. 3, Chapter 5, p. 5.3.6-32) that the WSIP's incremental contribution to adverse effects on the reach of the river below La Grange Dam would make the planned restoration of habitat and fishery resources more difficult.

The sentence referred to by the commenter is awkwardly stated. The intent was to indicate that, although the WSIP would have a substantial adverse effect on salmonid habitat in some years, it would not jeopardize the existence of salmonid populations because there would always be a reach of the river immediately below La Grange Dam where conditions would be suitable for salmonids.

In response to this comment, the Draft PEIR is revised as follows (Vol. 3, Chapter 5, p. 5.3.6-32, fourth sentence in the first partial paragraph):

> These adverse effects on flows and temperature in the river under the WSIP would not substantially alter or degrade ~~fishery habitat~~ salmonid habitat in most years or jeopardize the continuation of the ~~fishery~~ salmonid populations in the lower Tuolumne River ~~in most years~~.

SI_TRT-CWA-SierraC-170 With respect to Mitigation Measure 5.3.6-4a, please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.8). With respect to Mitigation Measure 5.3.6-4b, refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.9).

SI_TRT-CWA-SierraC-171 The commenter's agreement with the quoted text on Draft PEIR p. 5.3.6-36 (Vol. 3, Chapter 5) is acknowledged.

SI_TRT-CWA-SierraC-172 Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.4) for a discussion of FERC-required minimum flows in the lower Tuolumne River. As the commenter notes, the minimum flows were developed to facilitate Chinook salmon recovery, and little or no consideration was given to steelhead because the available evidence suggested that steelhead either no longer exist in the river or exist in very small numbers. Refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.3) with respect to data on steelhead in the lower Tuolumne River.

The minimum required instream flows will be reviewed in the future when the Don Pedro Project's FERC relicensing process begins, or perhaps earlier. Based on the poor returns of Chinook salmon in recent years, the CDFG has requested that FERC require the operators of the Don Pedro Project to increase releases to the river for salmonids. The CDFG's request focuses on recovery of Chinook salmon rather than steelhead.

The sentence quoted by the commenter states that during dry periods the WSIP would have no effect on flow in the San Joaquin River. This is because in dry periods the minimum required release would be made from La Grange Dam with or without the WSIP.

SI_TRT-CWA-SierraC-173 For information on significance criteria, please refer to **Response SI_TRT-CWA-SierraC-43**. Refer to **Response SI_TRT-CWA-SierraC-44** for more information on the frequency and severity of impacts. Flow in the San Joaquin River does not depend solely on water from the Tuolumne River. As a result, the WSIP-caused changes in flow in the San Joaquin River are less pronounced than in the lower Tuolumne River. Because of this, and because substantial WSIP-caused changes in flow in the San Joaquin River would be infrequent, the San Francisco Planning Department concluded that the impacts of the WSIP on fisheries in the San Joaquin River would be less than significant.

However, it should be noted that the preferred mitigation measure (Measure 5.3.6-4a) proposed to reduce the impacts of the WSIP on salmonid fisheries in the lower Tuolumne River would also reduce or eliminate the effects of the WSIP on fisheries in the San Joaquin River.

SI_TRT-CWA-SierraC-174 In response to this comment, Draft PEIR, Vol. 5, Appendix H1, p. H1-10, third full paragraph, seventh sentence is revised as follows:

> Studies suggest that there is a 30 percent chance that the SFPUC system will experience a drought in the next 75 years equal to or more severe than the 1987–1992 drought (Beck, 1994).

In addition, Draft PEIR, Vol.5, Appendix H1, p. H1-39, the following text is added as the first reference:

> Beck, R.W. *Design Drought Analysis*. Prepared for Modesto Irrigation District and Turlock Irrigation District, August 1994.

SI_TRT-CWA-SierraC-175 Refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.3) for a description of how monthly flows produced by the HH/LSM were supplemented by daily flow estimates derived from operational records.

SI_TRT-CWA-SierraC-176 Lake Eleanor and Lake Lloyd are located on Cherry Creek and do not contribute inflow to Hetch Hetchy Reservoir.

SI_TRT-CWA-SierraC-177 Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter1 4, Section 14.5.6).

SI_TRT-CWA-SierraC-178 The SFPUC has not reached agreement with TID and MID with respect to the dry-year water transfer. Please refer to **Section 14.3, Master Response on Proposed Dry-Year Water Transfer** (Vol. 7, Chapter 14, Section 14.3.2) for more information. The commenter's observation with respect to the uncertainty associated with the transfer is acknowledged. The CCSF has worked with TID and MID for many years in analyzing water supply availability from the Tuolumne River, and the HH/LSM modeling indicates that there could be water available for a dry-year transfer without a loss of water to TID and MID.

SI_TRT-CWA-SierraC-179 The commenter opines that the data contained in Draft PEIR Appendix H2-1 (Vol. 5, Table 2.1-1, p. 11) is difficult to review in the tabular format and that it should be displayed in a graphical form. Much of the data used in the impact analysis are displayed graphically, either in the appendix or in the body of the Draft PEIR. For example, the data shown in Table 2.2-1 are shown graphically in Figure 2.2-1. The data contained in Tables 2.3-1, 2.3-2, and 2.3-3 on storage in Hetch Hetchy Reservoir are plotted in Figures 2.3-1, 2.3-2, 2.3-3, and 2.3-4 in Appendix H2-1. Figure 2.3-1 is included in the main body of the PEIR as Figure 5.3.1-9 (Vol. 3, Chapter 5, p. 5.3.1-23).

SI_TRT-CWA-SierraC-180 The comment misstates the content of Table 2.3-3 (Vol. 5, Appendix H2-1, p. 19), which shows differences in Hetch Hetchy Reservoir storage with and without the WSIP. The data contained in Table 2.3-3 are plotted in Figure 2.3-3 (Vol. 5, Appendix H2-1, p. 20).

SI_TRT-CWA-SierraC-181 Please refer to **Response SI_TRT-CWA-SierraC-180**, above.

SI_TRT-CWA-SierraC-182 Please refer to **Response SI_TRT-CWA-SierraC-180**, above.

SI_TRT-CWA-SierraC-183 The comment misstates the content of Table 2.3-4 (Vol. 5, Appendix H2-1, p. 21), which shows releases from Hetch Hetchy Reservoir to the Tuolumne River with the WSIP. The data contained in Table 2.3-4 are plotted in Figure 2.3-1 (Vol. 5, Appendix H2-1, p. 16).

SI_TRT-CWA-SierraC-184 The comment misstates the content of Table 2.3-5 (Vol. 5, Appendix H2-1, p. 22), which shows releases from Hetch Hetchy Reservoir to the Tuolumne River under the existing condition. The data contained in Table 2.3-5 are plotted in Figure 2.3-1 (Vol. 5, Appendix H2-1, p. 16).

SI_TRT-CWA-SierraC-185 The comment misstates the content of Table 2.3-6 (Vol. 5, Appendix H2-1, p. 22), which shows differences in releases from Hetch Hetchy Reservoir to the Tuolumne River under the existing condition and with the WSIP. The data contained in Table 2.3-6 are not directly plotted, but can be seen by observing the differences between the with- and without-WSIP releases plotted in Figure 2.3-1 (Vol. 5, Appendix H2-1, p. 16).

SI_TRT-CWA-SierraC-186 The data contained in Table 2.4-1 (Vol. 5, Appendix H2-1, p. 27) are not directly plotted, but can be seen by observing the differences between the with- and without-WSIP releases plotted in Figure 2.4-1 (Vol. 5, Appendix H2-1, p. 25).

SI_TRT-CWA-SierraC-187 The comment misstates the content of Appendix H2-1 Tables 2.6-1 through 2.6-8. Tables 2.6-1 and 2.6-2 show storage in Don Pedro Reservoir with and without the WSIP, and Table 2.6-3 shows the differences in storage between the two scenarios. Table 2.6-4 shows differences in reservoir inflow between the two scenarios. Tables 2.6-5 and 2.6-6 show releases from Don Pedro Reservoir to the Tuolumne River with and without the WSIP, and Table 2.6-7 shows the differences in releases between the two scenarios. Table 2.6-8 shows the same information as Table 2.6-7, but the information is ranked in descending order of wetness, based on the San Joaquin River index. The data in Tables 2.6-1, 2.6-2, 2.6-5, and 2.6-6 are plotted in Figure 2.6-1 (Vol. 5, Appendix H2-1, p. 30). The data contained in Table 2.6-3, Table 2.6-7, and 2.6-8 are not directly plotted, but can be seen by observing the differences between the with- and without-WSIP storage and releases plotted in Figure 2.6-1.

SI_TRT-CWA-SierraC-188 Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 4.7.8) regarding Mitigation Measure 5.3.6-4a, as well as to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.6). Because of uncertainties regarding Measure 5.3.6-4a, an alternative mitigation measure, Measure 5.3.6-4b, is identified in the Draft PEIR (Vol. 4, Chapter 6, pp. 6-48 and 6-49).

SI_TRT-CWA-SierraC-189 Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.9). It is recognized that the current understanding of the factors influencing salmonid productivity in the Tuolumne River below La Grange Dam is incomplete. Mitigation Measure 5.3.6-4b has been clarified to include surveys and actions to meet performance standards (refer to Vol. 7, **Chapter 16, Staff-Initiated Text Changes**). The comment regarding the possibility that providing additional spawning habitat for salmonids could cause crowding of rearing habitat is acknowledged.

SI_TRT-CWA-SierraC-190 Please refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.9). A part of Mitigation Measure 5.3.6-4 is based on the belief of some fisheries experts that the gravel pits provide habitat for salmonid predators, and that elevated numbers of predators reduce salmon survival. The comment questioning the evidence that predators are a problem is acknowledged. Also refer to **Response SI_TRT-CWA-SierraC-189**. The commenter's opinion that Measure 5.3.6-4b would not provide benefits to terrestrial biological resources is acknowledged. As noted in the Draft PEIR (Vol. 4, Chapter 6, p. 6-50), if Measure 5.3.6-4a proves to be infeasible and Measure 5.3.6-4b is implemented, an additional mitigation measure (Measure 5.3.7-6) would be implemented to reduce the impacts of the WSIP on terrestrial biological resources in the Tuolumne River below La Grange Dam to a less-than-significant level.

SI_TRT-CWA-SierraC-191 It is acknowledged in the Draft PEIR that past and current actions have harmed salmon habitat in the Tuolumne River (Vol. 3, Chapter 5, Section 5.7).

Studies of rainbow trout and salmon habitat in the Tuolumne River are in progress. Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.2) for a description of studies the SFPUC is conducting, in consultation with the USFWS, in the Tuolumne River below O'Shaughnessy Dam. TID and MID are currently conducting studies of the lower Tuolumne River pursuant to their license to operate the Don Pedro Project granted by FERC in 1996. If the WSIP is implemented, the results of these studies, together with the results of monitoring that is a part of several mitigation measures, would provide information for the adaptive management program associated with the WSIP's mitigation measures.

SI_TRT-CWA-SierraC-192 Please refer to **Response SI_TRT-CWA-SierraC-191**, above.

SI_TRT-CWA-SierraC-193 Receipt of the information provided by the commenter is acknowledged. The table labeled "Table 1" is included in the Draft PEIR (Vol. 3, Chapter 5, p. 5.3.1-12). The Draft PEIR includes a table of additional releases for trout in the Tuolumne River below O'Shaughnessy Dam (Vol. 3, Chapter 5, p. 5.7-30), but it is not the same as the table labeled "rough draft" and provided by the commenter. The information provided does not raise any new issues that have not been addressed in the Draft PEIR.

SI_TRT-CWA-SierraC-194 Receipt of the information provided by the commenter on Chinook salmon production in the Tuolumne River is acknowledged. It is similar to but more detailed than information presented in the Draft

PEIR in Table 5.3.6-2 (Vol. 3, Chapter 5, p. 5.3.6-15). The information provided does not raise any new issues that have not been addressed in the Draft PEIR.

SI_TRT-CWA-SierraC-195 Receipt of the information provided by the commenter on water demand is acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14) and the responses to comments from the Pacific Institute (**SI_PacInst**).

SI_TRT-CWA-SierraC-196 Receipt of the information provided by the commenter on water conservation is acknowledged. The comment (Attachment I), entitled Studies on Water Conservation, is a list of studies primarily on conservation in Seattle and southern California intended to support the assertion that the Bay Area is not doing enough in these areas. Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3, under the heading Frequently Submitted Comments Addressing Conservation and Recycling); **Responses SI_PacInst-59** and **SI_PacInst-71** regarding specific assertions based on Seattle studies; and **Reponses SI_PacInst-72** and **SI_PacInst-80** regarding studies on urban water conservation potential in southern California.

SI_TRT-CWA-SierraC-197 Receipt of the information provided by the commenter on water demand and conservation is acknowledged. Regarding issues raised in the presentations refer to responses to the Pacific Institute letter (**SI_PacInst**).

SI_TRT-CWA-SierraC-198 Receipt of the information provided by the commenter on water demand and conservation is acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3). In particular, refer to the discussion under the heading Effects of the Future Cost of Water on Projected Demand.

SI_TRT-CWA-SierraC-199 Receipt of the information provided by the commenter on water pricing and demand is acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3). In particular, refer to the discussion under the heading Effects of the Future Cost of Water on Projected Demand.

Amy Adams, 09/19/07

[See Public Hearing Transcript, Palo Alto, pp. 32–35]

C_AdamsA-01 This comment expresses the opinion that the SFPUC should pursue a two-tiered approach that separates the seismic improvements from the proposed water supply option. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.5) regarding the integration of the seismic improvements and water supply option to meet program objectives, and for a discussion of the advantages of using a program EIR to evaluate the proposed program as a whole.

C_AdamsA-02 This comment in support of conservation and efficiency is acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects proposed by SFPUC and its wholesale customers.

Sambhu Agarwala, 09/20/07

C_Agarw-01 This comment opposing additional Tuolumne River diversions and encouraging additional conservation and recycling efforts to conserve the projected increase in water demand through 2030 is acknowledged. The commenter incorrectly infers that SFPUC wholesale customers in the East Bay account for 60 percent of the proposed increase in diversions from the Tuolumne River. Alameda County Water District and the City of Hayward, the two SFPUC wholesale customers in the East Bay, together account for 35 percent of the purchase request increase (approximately 12.1 mgd of the projected 35 mgd increase in purchase requests) relative to 2001/2002 purchases. Refer to Draft PEIR Table 7.2 and Table 7.3 (Vol. 4, Chapter 7, pp. 7-15 and 7-18) regarding expected future demand and purchases and the change in demand and purchases from 2001. Please also refer to the discussion in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2, under the heading Outdoor Water Use), for more information on outdoor demand, and to Section 14.2 (Vol. 7, Chapter 14, Section 14.2.3) for more information regarding conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

Casey Allen, 09/20/07

C_AllenC-01 This comment opposing additional Tuolumne River diversions is acknowledged.

C_AllenC-02 This comment expresses concern for impacts to wildlife and biodiversity that could result from the proposed increase in Tuolumne River diversions. The Draft PEIR (Vol. 3, Chapter 5, Sections 5.3.6 and 5.3.7) included a project-level analysis of impacts on fisheries and terrestrial biological resources that would result from the proposed water supply option and changes in system operations. As described, implementation of the WSIP would result in several potentially significant adverse impacts on the Tuolumne River and its resources; the Draft PEIR identified mitigation measures to reduce these impacts to less-than-significant levels.

C_AllenC-03 Regarding the commenter's concerns about impacts to local businesses, please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 4, Section 14.1.6) regarding CEQA requirements related to economic evaluations, and the environmental effects that some commenters perceive could cause economic impacts for Tuolumne County residents, businesses, and tourism.

Thomas Allen, 09/22/07

C_AllenT-01 This comment expressing an opinion on the WSIP is acknowledged.

Rita Allison, 08/28/07

C_Allis-01 This comment expressing opposition to additional diversions from the Tuolumne River and support for additional conservation is acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for discussion of conservation programs and recycling projects proposed by the SFPUC and its wholesale customers. Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

Grudy Alter, 09/20/07

C_Alter-01 This comment opposing additional diversions from the Tuolumne River and in support of additional conservation and recycling is acknowledged. Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for information on the conservation programs and recycling projects being implemented or planned by the SFPUC and its wholesale customers. Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.5) and to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.6), for clarification regarding current and estimated future municipal and agricultural diversions from the Tuolumne River.

Eric Arons, 09/14/07

C_Arons-01 This comment opposing additional diversions from the Tuolumne River and urging the protection of river habitat and recreational boating is acknowledged. The Draft PEIR (Vol. 3, Chapter 5, Sections 5.3.1 through 5.3.8) analyzed the effects of the WSIP on the hydrology, geomorphology, water quality, groundwater, terrestrial biology, fisheries, recreation, and visual quality of the Tuolumne River corridor. As described, implementation of the WSIP would result in several potentially significant adverse impacts on the Tuolumne River and its resources; the Draft PEIR identified mitigation measures to reduce these impacts to less-than-significant levels.

Christopher Bail, 09/28/07

C_Bail-01 This comment opposing additional Tuolumne River diversions is acknowledged. The Draft PEIR (Vol. 3, Chapter 5, Sections 5.3.1 through 5.3.8) analyzed the effects of the WSIP on the hydrology, geomorphology, water quality, groundwater, terrestrial biology, fisheries, recreation, and visual quality of the Tuolumne River corridor. As described, implementation of the WSIP would result in several potentially significant adverse impacts on the Tuolumne River and its resources; the Draft PEIR identified mitigation measures to reduce these impacts to less-than-significant levels.

C_Bail-02 Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.5) and to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7. Chapter 14, Section 14.7.6), for clarification regarding current and estimated future municipal and agricultural diversions from the Tuolumne River. Regarding the effects of global warming on the Tuolumne River, refer to **Section 14.11**, **Master Response on Climate Change** (Vol. 7, Chapter 14, Section 14.11.5) for information on current studies and models that are being used to forecast the effects of climate change on the SFPUC's regional water system. This comment incorrectly implies that the purchase estimates prepared for the WSIP do not include increased conservation and recycling efforts to mitigate demand. For additional information on the methodologies used by SFPUC in collaboration with its wholesale customers and the Bay Area Water Supply and Conservation Agency (BAWSCA) to assess future water demand, and on the conservation programs and recycling projects proposed by the SFPUC and its wholesale customers, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14).

C_Bail-03 This comment opposing additional Tuolumne River diversions and recommending that the SFPUC consider the possibility of reducing diversions from the river is acknowledged.

John Barbey, 10/01/07

C_Barbe1-01 This comment states that the supply capacity of the Hetch Hetchy Water System is reaching its limitations. While the SFPUC is currently able to serve customer demands during certain hydrologic and operating conditions and has the "capacity" to continue to do so through 2030, the existing system is currently unable to meet WSIP level of service objectives for reliably serving customers needs over a range of operating conditions and these deficiencies will become more severe in the future. As shown in the Draft PEIR, Table 3.5 (Vol. 1, Chapter 3, p. 3-26), the WSIP would improve overall system reliability with respect to water quality, seismic response after a major earthquake, customer deliveries during system maintenance, and water supply during drought periods. All of these factors influence the understanding of "capacity limitations" for the regional system.

C_Barbe1-02 This comment expresses support for additional water storage in the form of dams and water impoundments, and for implementation of desalination projects to meet future water demand in the SFPUC service area. The WSIP includes implementation of two facility improvement projects that would increase water storage in existing Bay Area reservoirs: the Calaveras Dam Replacement (SV-2) and Lower Crystal Springs Dam Improvements (PN-4) projects.

The PEIR analyzes the use of desalination technologies as a supplemental water supply in the Regional Desalination for Drought Alternative – Variant 2 (Vol. 4, Chapter 9, Section 9.2.7) and the Year-round Desalination at

Oceanside Alternative (Vol. 4, Chapter 9, Section 9.2.6). As indicated in Table 9.6 (pp. 9-14 to 9-16), it is uncertain whether these two alternatives are capable of meeting all WSIP goals and objectives related to sustainability and the cost-effective use of funds, and these alternatives would only partially meet the WSIP objective of maintaining a gravity-driven system. Also, the Year-round Desalination at Oceanside Alternative would only partially meet WSIP objectives related to delivery reliability during planned maintenance.

C_Barbe1-03 The comment asserts that San Francisco water customers are conserving so that suburban customers can squander the “saved” water. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) regarding conservation programs and water recycling projects being implemented or planned in the retail and wholesale customer service areas.

C_Barbe1-04 The Draft PEIR, (Vol. 1, Chapter 3, pp. 3-16 to 3-22) describes the demand projection methodology. As described, projections for both retail and wholesale customers were developed using end-use demand models that break down total water use by customer type to specific end uses, such as toilets, faucets and irrigation. To project future demand, account growth rates were developed for residential and nonresidential accounts using published population and employment projections, respectively. For a more detailed discussion of the demand forecasting methodology, refer to Draft PEIR Appendix E2 (Vol. 5). The comment implies that the demand projections were prepared as part of the Draft PEIR. The demand projections were prepared by the SFPUC and its technical consultants, along with the SFPUC’s wholesale customers, as a component of WSIP planning. For additional information on the methodologies used by the SFPUC in collaboration with its wholesale customers and BAWSCA to assess future water demand, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2).

John Barbey, 09/20/07

[See Public Hearing Transcript, San Francisco City Hall, September 20, 2007, pp. 7-8]

C_Barbe2-01 This comment expresses an opinion that there was inadequate noticing of the Draft PEIR public hearing dates. Please see **Responses F_USDAFS-05** and **L_SFCPC1-01**, and **Appendix J1** (Vol. 8) of this Comments and Responses document for detailed information on the public outreach efforts conducted by the San Francisco Planning Department’s Major Environmental Analysis Division and the SFPUC.

C_Barbe2-02 This comment expressing an opinion that San Francisco's water supplies should be safeguarded and that additional conservation is not capable of meeting future water demand is acknowledged.

Cris Barsanti, 09/10/07

C_Barsa-01 The commenter expresses the concern that WSIP-related changes in Tuolumne River flow due to additional Tuolumne River diversions and changes in water system operations would reduce opportunities for whitewater recreation.

The Draft PEIR (Vol. 3, Section 5.3.8) provides an extensive discussion of existing whitewater recreational resources in the Tuolumne River watershed and evaluates the potential magnitude of impacts on future whitewater recreation under the WSIP. The detailed analysis of the timing and magnitude of the WSIP-related changes in water releases within the upper Tuolumne River watershed (see Impact 5.3.8-2: Effects on river recreation due to changes in water system operations, pp. 5.3.8-27 through 5.3.8-34) conclude that the effects on whitewater recreation would be less than significant since shifts in water releases and associated reductions in flow along the upper Tuolumne River would generally be limited to high flow months (April through June) or the low recreation season (November to March) and thus, would not significantly impair whitewater recreation. In addition, during other peak visitor months of July and August, SFPUC releases for whitewater rafting would continue to be provided when operationally practical. Furthermore, flow reductions during these months are projected to only occur during drier than normal hydrologic years and be relatively limited (i.e. 3 percent or less reductions in average monthly flows) so as to be imperceptible to most recreationists.

C_Barsa-02 This comment in support of additional conservation and recycling to serve future water demand and against additional diversions from the Tuolumne River is acknowledged. For descriptions of alternatives evaluated in the Draft PEIR that do not include additional diversions from the Tuolumne River, refer to the descriptions of the Year-round Desalination at Oceanside Alternative (Vol. 4, Chapter 9, Section 9.2.4), and Aggressive Conservation/Water Recycling and Local Groundwater Alternative (Without Tuolumne River Supplement) (Vol. 4, Chapter 9, Section 9.2.6). Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

Cedric De La Beaujardiere and Susan Stansbury, 09/19/07

[See Public Hearing Transcript, Palo Alto, pp. 36-38]

C_Beauj-01 This comment expressing support of more conservation and recycling is acknowledged. Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for information on conservation programs and recycling projects being implemented or planned by the SFPUC and its wholesale customers.

C_Beauj-02 This comment expressing support for the proposed seismic upgrades, opposition to additional diversions from the Tuolumne River, and support for future decreases in diversions from the river is acknowledged.

Bonnie Berg, 09/11/07

C_Berg-01 This comment opposing additional Tuolumne River diversions is acknowledged. This commenter requests that water demand projections in the SFPUC service area be reevaluated and urges more conservation and recycling. The 2030 purchase estimates prepared for the WSIP include 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, Section 3.4.4, pp. 3-16 to 3-22). For additional information on the methodologies used by the SFPUC in collaboration with its wholesale customers and BAWSCA to assess future water demand, and on the conservation programs and recycling projects proposed by the SFPUC and its wholesale customers, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14). For descriptions of alternatives that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78).

Allan Berkowitz, 09/07/07

C_Berko-01 This comment opposing additional Tuolumne River diversions is acknowledged. Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9), for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

C_Berko-02 This comment questions the demand and conservation projections and suggests that the SFPUC determine the maximum potential for conservation and efficiency savings, and that additional demand be met through increased investment in conservation, efficiency, and recycling. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14) for additional information on the methodologies used by SFPUC in collaboration with its wholesale customers and the Bay Area Water Supply and Conservation Agency (BAWSCA) to assess future water demand, and on the conservation programs and recycling projects proposed by the SFPUC and its wholesale customers.

C_Berko-03 This comment expressing an opinion that the SFPUC should adopt a policy of reducing additional Tuolumne River diversions over time is acknowledged.

C_Berko-04 This comment was submitted by multiple commenters; refer to **Response C_Breso-01**.

Gabie Berliner, 09/20/07

C_Berli-01 This comment opposing additional Tuolumne River diversions is noted. Please refer to **Response L_Tuol1-09** regarding the potential effects of the WSIP on those reaches of the Tuolumne River designated as wild and scenic.

John Beviacqua, 09/19/07

C_Bevia-01 This comment, which expresses support for more conservation and recycling to meet water demand and opposing additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP include 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Draft PEIR, Vol. 1, Chapter 3, pp. 3-16 to 3-22). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3), for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers. Refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9), for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions. For more information regarding impacts on Chinook salmon, refer to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.2).

Marty Bigos, 10/01/07

C_Bigos-01 This comment opposing urban sprawl development in the Bay Area is acknowledged.

C_Bigos-02 This comment expressing support for the CEQA alternatives that would not include additional Tuolumne River diversions and that would promote additional conservation, efficiency, and recycling to prevent the need for additional Tuolumne River diversions is acknowledged. For a discussion of the alternatives evaluated in the Draft PEIR that do not include additional diversions from the Tuolumne River, refer to the descriptions of the Year-round Desalination at Oceanside Alternative (see Draft PEIR Vol. 4, Chapter 9, Section 9.2.6, p. 9-66) and Aggressive Conservation/Water Recycling and Local Groundwater Alternative (Without Tuolumne River Supplement) (see Section 9.2.4, p. 9-47). Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for a discussion of the conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

Martin Blake, 09/05/07

C_Blake-01 This comment opposing additional diversions from the Tuolumne River and supporting additional conservation is acknowledged. Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3), for additional information related to the conservation programs and recycling projects being implemented or planned by the SFPUC and its wholesale customers.

Sean Bourke, MD, 09/11/07

C_Bourk-01 This comment opposing additional diversions from the Tuolumne River is acknowledged. Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

Dolores Boutin, 09/05/07

[See Public Hearing Transcript, Sonora, pp. 11-13]

C_BoutiD-01 This comment opposing additional Tuolumne River diversions is acknowledged. Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9), for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

Fred Boutin, 09/05/07

[See Public Hearing Transcript, Sonora, p. 17]

C_BoutiF-01 This comment expresses an opinion that the Water System Improvement Program (WSIP) is not an improvement program, but rather an expansion program, and should be renamed accordingly. This comment is acknowledged.

C_BoutiF-02 The request for studies evaluating the maximum potential for water conservation has been submitted by numerous commenters; please refer to the discussion in **Section 14.2, Master Response on Demand Projections, Conservation and Recycling** (Vol. 7, Chapter 14, Section 14.2.3), under the heading Frequently Submitted Comments Addressing Conservation and Recycling. Refer to Table 7.3 in the Draft PEIR (Vol. 4, Chapter 7, p. 7-18) regarding where the increase in water demand and increase in water purchases from the SFPUC regional system is projected to occur.

Darryl Bramlette, 09/06/07

C_BramlD1-01 The Draft PEIR (Vol. 3, Chapter 5, Sections 5.3.1 through 5.3.8) analyzed the effects of the WSIP on the hydrology, geomorphology, water quality, groundwater, terrestrial biology, fisheries, recreation, and visual quality of the Tuolumne River corridor. As described, implementation of the WSIP would result in several potentially significant adverse impacts on the Tuolumne River and its resources; the Draft PEIR identified mitigation measures to reduce these impacts to less-than-significant levels. Refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14) and **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14) for additional information related to the impact analysis for the Tuolumne River. (Regarding the use of desalination technologies to supplement water supplies, refer to **Response C_BramlD1-02**.)

C_BramlD1-02 This comment questions why the SFPUC has not considered using desalination technologies to achieve "all of the key elements" of the WSIP and then provides information on desalination. The Draft PEIR analyzed the use of desalination technologies as a supplemental water supply as part of the Regional Desalination for Drought Alternative – Variant 2 (Vol. 4, Chapter 9, Section 9.2.7) and the Year-round Desalination at Oceanside Alternative (Vol. 4, Chapter 9, Section 9.2.6). As indicated in Table 9.6 (pp. 9-14 to 9-16), it is uncertain whether these two alternatives are capable of meeting all WSIP goals and objectives related to sustainability and the cost-effective use of funds, and these alternatives would only partially meet the WSIP objective of maintaining a gravity-driven system. Also, the Year-round Desalination at Oceanside Alternative would only partially meet WSIP objectives related to delivery reliability during planned maintenance.

C_BramlD1-03 The commenter suggests several ways to control seawater intrusion. The suggested methods for control of seawater intrusion mentioned in this comment are acknowledged and recognized as feasible. Management of groundwater withdrawals and positioning of wells is incorporated into the project design for both the Local and Regional Groundwater Projects (SF-2) (Draft PEIR, Vol. 3, pp. 5.6-24 and 5.6-25). Other methods of control that are mentioned in the comment (recharge with basins or wells to maintain freshwater pressure, interception with a line of pumping wells, and placement of a subsurface groundwater barrier) involve remediation for seawater intrusion and would not be needed because the Local and Regional Groundwater Projects would be conducted in a manner to avoid seawater intrusion as discussed below.

The potential for seawater intrusion to the North and South Westside Groundwater Basins is evaluated in Impact 5.6-3 of the Draft PEIR (Vol. 3, pp. 5.6-28 and 5.6-29). Potential impacts related to seawater intrusion are considered potentially significant for the North Westside Groundwater Basin because the shallow aquifer is in direct connection with the ocean from approximately Lake Merced to the north. However, determination of the basin safe yield in accordance with Measure 5.6-1 (Vol. 4, Chapter 6, pp. 6-58 and 6-59) would reduce impacts related to basin overdraft and potential seawater intrusion to a less-than-significant level. This measure requires determination of the basin's yield on both a regular (average annual) and an intermittent (dry-year or emergency) basis, in accordance with Element 3 of SFPUC's *Final Draft North Westside Groundwater Basin Management Plan* (SFPUC, 2005), as well as implementation of groundwater level and quality monitoring in accordance with Element 1 of the Groundwater Management Plan. The monitoring data would be used to inform decisions regarding appropriate pumping patterns to avoid overdraft and the undesirable effects associated with overdraft.

In the South Westside Groundwater Basin potential impacts related to seawater intrusion are less than significant because faulting and folding of the Merced Formation along the western border with the Pacific Ocean and the presence of bedrock and bay mud along the eastern border with the bay block seawater intrusion, as discussed in the Draft PEIR (Vol. 3, p. 5.6-29). Furthermore, monitoring and modeling would also be conducted to assess the conjunctive-use program's performance and to identify and avoid potential problems (Draft PEIR, Vol. 3, p. 5.6-26). Based on monitoring data and modeling results, conjunctive-use management strategies would be adjusted and implemented as necessary to avoid adverse conditions.

C_BramlD1-04 The commenter states that the environmental impacts of the increased delivery demands on the Tuolumne River were not addressed in the Draft PEIR. The Draft PEIR (Vol. 3, Chapter 5, Sections 5.3.1 through 5.3.8) analyzed the effects of the WSIP on the hydrology, geomorphology, water quality, groundwater, terrestrial biology, fisheries, recreation, and visual quality of the Tuolumne River corridor. As described, implementation of the WSIP would result in several potentially significant adverse impacts on the Tuolumne River and its resources; the Draft PEIR identified mitigation measures to reduce these impacts to less-than-significant levels. Refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14) and **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14) for additional information related to the impact analysis for the Tuolumne River.

Darryl Bramlette, 09/27/07

C_BramlD2-01 This comment characterizes oral comments presented at a public meeting on the Draft PEIR ("The number one problem: San Francisco needs more water!"; "The number two problem: the increasing diversion will do further harm to the Tuolumne River"). Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.5) regarding the integration of the seismic improvements and water supply option to meet program objectives, and for a discussion of the advantages of using a program EIR to evaluate the proposed program as a whole. Please refer also to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

C_BramlD2-02 This comment expressing support for more conservation and recycling to meet water demand, and opposition to additional diversions from the Tuolumne River is acknowledged. The 2030 purchase estimates prepared for the WSIP include 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, Section 3.4.4, pp. 3-16 to 3-22). For descriptions of alternatives that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). This comment also expresses doubt that projected water demand for San Francisco and its wholesale customers can be met by Tuolumne River diversions, conservation, efficiency, and recycling. As discussed in the Draft PEIR (Vol. 4, Chapter 7, p. 7-9) and shown in Table 3.3 and Table 7.2 (Vol. 1, Chapter 3, p. 3-18 and Vol. 4, Chapter 7, p. 7-15, respectively), for about half the wholesale customers, the SFPUC is one of several sources of supply. For additional information on the methodologies used by SFPUC in collaboration with its wholesale customers and BAWSCA to assess future water demand, and on the conservation programs and recycling projects proposed by the SFPUC and its wholesale customers, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14).

C_BramlD2-03 This comment expresses the opinion that the SFPUC should write an EIR on the development of alternative water supply sources. The Draft PEIR (Vol. 4, Chapter 9) evaluates various supplemental water supply alternatives involving more conservation and water recycling (see the Aggressive Conservation/Water Recycling and Local Groundwater Alternative, Sections 9.2.4 and 9.2.5); alternative locations for Tuolumne River diversion (see the Lower Tuolumne River Diversion Alternative, Section 9.2.5): desalination technologies (see the Regional Desalination for Drought [Variant 2], Section 9.2.7, and the Year-round Desalination at Oceanside Alternative, Section 9.2.6); and an alternative involving a modification of system operations (see Modified WSIP Alternative, Section 9.2.8).

Darryl Bramlette, 09/05/07

[See Public Hearing Transcript, Sonora, pp. 29-30]

C_BramlD3-01 This comment opposes additional Tuolumne River diversions and supports the use of desalination as a source of supplemental water supplies. Please refer to **Response C_BramlD1-02** for response.

C_BramlD3-02 This comment supporting additional conservation among SFPUC customers to meet future water demands is acknowledged. Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to the conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

C_BramlD3-03 This comment implies that the SFPUC illegally sells Tuolumne River water to other communities for profit. The Raker Act imposed many conditions and obligations on the City and County of San Francisco (CCSF), including the requirement that Tuolumne River water could be used in the Bay Area for municipal and domestic purposes, but not for agricultural irrigation. See **Response L_TUD1-05** regarding CCSF's water rights and the Raker Act.

Darryl Bramlette, 09/06/07

[See Public Hearing Transcript, Modesto, pp. 15-16]

C_BramlD4-01 See **Response C_BramlD1-02**.

Jobst Brandt, 09/24/07

C_Brand-01 This comment opposing additional Tuolumne River diversions but in support of seismic improvements to the regional water system is acknowledged. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.5) for a discussion related to the integration of the seismic improvements and water supply options to meet program objectives, and for a discussion of the advantages of using a program EIR to evaluate the proposed program as a whole.

Mark Bresolin, 10/11/07

C_Breso-01 This comment expresses opposition to additional Tuolumne River diversions and requests that additional studies be conducted before the PEIR is finalized. As described in the Draft PEIR (Vol. 3, Chapter 5, pp. 5.1-7 to 5.1-18), the basic approach to the analysis of impacts on water and related resources was to first evaluate the changes in the river flow and reservoir levels that would occur with the WSIP, then to estimate changes in water quality and temperature, and finally to combine this information to determine potential impacts on fisheries and other biological resources. The analysis used the existing 82-year historical hydrologic record, coupled with the Hetch Hetchy/Local Simulation Model (HH/LSM), to depict the overall regional water system operations and to project the extent of changes in flow that could occur in the future. These results were used for the PEIR water supply and system operations impact analysis.

As described in **Section 14.4, Master Response on PEIR Appropriate Level of Analysis** (Vol. 7, Chapter 14, Section 14.4.4), the CEQA Guidelines (Section 15151) impose a standard of adequacy that is "reasonably feasible" and sufficient to allow decision-makers to make a decision that takes account of environmental consequences. Data gathering need not be "exhaustive." The Draft PEIR analysis of the WSIP water supply and system operations with respect to fisheries and biological resources along the Tuolumne River was based on current knowledge of the composition and condition of the resources and in consideration of the potential interactive responses of plant and animal species to the hydrologic changes resulting from the WSIP as indicated by the model results. The analysis relied on ecological principles, scientific literature, existing data, and site visits. The Draft PEIR analysis was conservative in finding that an impact could be potentially significant if there was a possibility of impacts from the WSIP water supply and system operations.

The San Francisco Planning Department believes these data are sufficient to reasonably assess the general magnitude, frequency, and extent of the WSIP's environmental consequences, and to identify appropriate mitigation measures to offset potentially significant impacts on the Tuolumne River watershed and related resources. The mitigation measures were developed to include performance standards based on ecological principles, with the understanding that data from ongoing and future studies could be useful in augmenting the baseline data and in refining the implementation of each measure. As described in Draft PEIR Measure 5.3.7-2 (Vol. 4, Chapter 6, pp. 6-49 and 6-50), **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.2), and **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.2), several studies of the Tuolumne River are in progress by the SFPUC, National Park Service, USFWS, NMFS, CDFG, and other agencies. Data from these studies would be used to augment the existing data and allow for refinement of the implementation of the mitigation measure to meet the performance standards.

C_Breso-02 This comment incorrectly states that the preferred alternative ignores conservation, efficiency, and recycling. The statements in this comment were submitted by numerous commenters and are responded to in **Section 14.2, Master Response on Demand Projections, Conservation and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) under the heading Frequently Submitted Comments Addressing Conservation and Recycling. The commenter's support for alternatives that protect the Tuolumne River from new diversions is acknowledged. For descriptions of alternatives evaluated in the Draft PEIR that do not include additional diversions from the Tuolumne River, refer to the descriptions of the Year-round Desalination at Oceanside Alternative (Vol. 4, Chapter 9, Section 9.2.4), and Aggressive Conservation/Water Recycling and Local Groundwater Alternative (Without Tuolumne River Supplement) (Vol. 4, Chapter 9, Section 9.2.6).

Beverly Britts, 09/05/07

C_Britt-01 This comment advocating greater public awareness of the environmental impacts of additional Tuolumne River diversions and of the need for increased conservation, is acknowledged. Please refer to **Section 14.2, Master Response Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for information regarding conservation programs and recycling projects being implemented and planned by the SFPUC and its wholesale customers. As shown in Tables 14.2-6, 14.2-7, and 14.2-8, public information programs are being implemented throughout the SFPUC service area.

Liz Brooking, 09/11/07

C_BrookL-01 This comment, which advocates educating the public as to the value of conservation and reductions in water consumption, expresses support for more conservation and recycling to meet water demand, and opposes additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP include 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Draft PEIR, Vol. 1, Chapter 3, pp. 3-16 to 3-22). Please refer to **Section 14.2, Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for information regarding conservation programs and recycling projects being implemented or planned by the SFPUC and its wholesale customers. As shown in Tables 14.2-6, 14.2-7, and 14.2-8 of Section 14.2, public information programs are being implemented throughout the SFPUC service area.

Louis Bryan, 10/01/07

C_Bryan-01 This comment expresses opposition to additional Tuolumne River diversions and requests that additional studies be conducted before the PEIR is finalized. Please see **Response C_Breso-01**.

Keith Buckingham, 09/20/07

C_Bucki-01 This comment states that growth projections seem to be excessive. This comment was submitted by numerous commenters and is responded to in **Section 14.2, Master Response on Demand Projections, Conservation and Recycling** (Vol. 7, Chapter 14, Section 14.2.2).

C_Bucki-02 This comment, advocating more water conservation, is acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) regarding conservation programs and recycling projects being implemented or planned in the SFPUC service area. Regarding comparisons to other areas refer to the discussion in Section 14.2.3 under the heading Frequently Submitted Comments Addressing Conservation and Recycling.

June Bug, 09/20/07

[See Public Hearing Transcript, San Francisco City Hall, September 20, 2007, pp. 33-37]

C_Bug-01 This comment opposing additional Tuolumne River diversions is acknowledged.

Juan Byron, 09/19/07

C_Byron-01 This comment in support of tiered water rates as a conservation incentive is acknowledged. Please refer to **Responses SI_PacInst-46** and **SI_PacInst-47** for relevant discussions of conservation pricing. Please refer also to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) regarding conservation programs and recycling projects being implemented or planned by the SFPUC and its wholesale customers.

C_Byron-02 This comment stating that the 82-year hydrologic record, which is used as the baseline for hydrologic modeling in the Draft PEIR, lacks consideration of "earlier historical, geological, and anthropological evidence that pre-modern and modern societies thrived in the [SFPUC] service area for hundreds of years with almost no water storage or distribution" is acknowledged. The water supplies of historical societies in the SFPUC service area are not relevant to the CEQA review process. As this comment does not address the adequacy or accuracy of the Draft PEIR, no additional response is provided.

C_Byron-03 This comment expressing an opinion that the significance determinations "identified for the Tuolumne, Alameda, and Peninsula watersheds are unacceptable because water conservation is more economical for the consumer and the utility" is acknowledged. Refer to **Section 14.2 Master Response on Demand Projections, Conservation and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for information on conservation programs and water recycling projects proposed by SFPUC and its wholesale customers. The commenter also expressed the opinion that "engineering best practices will allow seismic upgrade of the water distribution system without the above impacts because of the vastly redundant nature of the nine major reservoirs and multiple parallel pipelines that characterize this system." This comment does not accurately characterize the regional water system. The Draft PEIR provides a program-level evaluation of the potential environmental impacts of constructing and operating the 22 regional WSIP facility projects (Vol. 2, Chapter 4). The analysis, which is based on preliminary information about the projects and their general site locations, presents a reasonable worst-case scenario regarding the potential environmental impacts that could occur. Project-level CEQA review will be conducted for each facility project, as appropriate, and will confirm the degree of impact.

C_Byron-04 The commenter states that potential impacts to groundwater resources are unacceptable given that voluntary conservation measures would meet realistic water supply objectives for the WSIP. As described in Draft PEIR (Vol. 1, Chapter 3, Section 3.4.1), the SFPUC conducted several planning efforts and studies to address future water supply needs for the SFPUC service area, and these efforts concluded that use of groundwater resources would diversify the regional system's water supply portfolio during both drought and nondrought periods. Under WSIP, the proposed Local and Regional Groundwater Projects (SF-2) would include measures as part of the project or as mitigation of potential impacts to ensure that adverse groundwater effects do not occur.

Potential impacts of the Local and Regional Groundwater projects on groundwater and surface water resources are addressed in Section 5.6 of the Draft PEIR (Vol. 3, Chapter 5, pp. 5.6-1 to 5.6-33). In the North Westside Groundwater Basin, potentially significant impacts related to potential basin overdraft and seawater intrusion would be reduced to less than significant with implementation of Measure 5.6-1 (Vol. 4, Chapter 6, pp. 6-58 and 6-59) requiring determination of the basin's yield on both a regular (average annual) and an intermittent (dry-year or emergency) basis, in accordance with Element 3 of the Groundwater Management Plan, as well as with implementation of groundwater level and quality monitoring in accordance with Element 1 of the Groundwater Management Plan (Draft PEIR, Vol. 3, pp. 5.6-24 and 5.6-25). The monitoring data would be used to inform decisions regarding appropriate pumping patterns to avoid overdraft and the undesirable effects associated with overdraft.

Potentially significant impacts related to effects on water levels in Lake Merced and other surface water features would be reduced to less than significant with implementation of Measure 5.6-1 (Vol. 4, Chapter 6, pp. 6-58 and 6-59), and Measure 5.6-2 (p. 6-59). (See Draft PEIR, Vol. 3, pp. 5.6-27 and 5.6-28 for the impact analysis.) Measure 5.6-1 includes groundwater and surface water monitoring as specified in Elements 1 and 2 of the Groundwater Management Plan to monitor the effects of groundwater pumping on surface water features. The monitoring data would be used to inform decisions regarding the alteration of pumping patterns to avoid undesirable effects on surface water features. Measure 5.6-2 includes development and implementation of a lake level management plan identifying strategies for altering pumping patterns or lake augmentation to maintain Lake Merced water levels within the desired long-term range, should monitoring conducted under Measure 5.6-1 indicate the potential for adverse effects on lake levels due to groundwater pumping. The SFPUC would coordinate the implementation of both measures.

Following CEQA environmental review, implementation of the Regional Groundwater Projects in the South Westside Groundwater Basin would be subject to approval of an operating agreement(s) between the SFPUC and the participating pumpers as described in Section 3.14, Required Actions and Approvals and on pp. 5.6-25 and 5.6-26 of the Draft PEIR. The proposed operating agreement(s) would outline allowable operating parameters for pumping during drought years to avoid adverse long-term conditions. In addition, an operating committee would be formed to develop annual operating maintenance plans as well as an annual operating schedule, and groundwater monitoring and modeling would be conducted to identify the potential for adverse conditions and inform decisions to modify the recharge or pumping strategy in response to changing conditions over time.

Potentially significant effects related to groundwater contamination from pumping would be less than significant with development of a drinking water source assessment in accordance with applicable regulations (Draft PEIR, Vol. 3, p. 5.6-31), and preparation of a drinking water source assessments for each well in accordance with Measure 5.6-5 (Vol. 4, Chapter 6, p. 6-59).

Prudent management of groundwater resources in the North and South Westside Groundwater Basins as described above and in the Draft PEIR (Vol. 3, Sections 5.6 and 5.7.5) would ensure that groundwater resources are not depleted, and that use of the groundwater would be consistent with beneficial uses identified by the RWQCB without leaving the SFPUC exposed to catastrophic risk. Furthermore, there would be a larger quantity of groundwater in the South Westside Groundwater Basin during nondrought years due to the in-lieu recharge resulting from deliveries of SFPUC system water and correspondingly reduced groundwater pumping (Draft PEIR, Vol. 3, p. 5.6-25). Subsequent to the PEIR, project-level environmental review will be conducted on the local and regional groundwater projects.

The opinion of the commenter regarding the Wetlands Water District is noted.

C_Byron-05 This comment expressing an opinion that an alternative similar to the Modified WSIP combined with the “no purchase request increase” alternative should be implemented is acknowledged. Please refer to Sections 9.3 (Vol. 4, Chapter 9, pp. 9-84 through 9-96) and Table 9-7 (Vol. 4, Chapter 9, pp. 9-17 through 9-21) for a comparison of impacts among the evaluated alternatives. The PEIR provides the environmental analysis of the proposed program as well as detailed analysis of a wide range of alternatives. Thus, consistent with CEQA, the PEIR, if certified, will enable the SFPUC to make an informed decision regarding program approval on a wide range of alternatives that may include a combination of the alternatives analyzed in the PEIR.

C_Byron-06 This comment states that the use of groundwater to augment supplies would exacerbate groundwater overdraft problems. See **Response C_Byron-04**.

C_Byron-07 This comment opposing the Year-round Desalination at Oceanside Alternative is acknowledged.

C_Byron-08 This comment expressing support for further evaluation of the Regional Desalination for Drought Alternative – Variant 2 acknowledged.

C_Byron-09 This comment essentially restates Comment C_Byron-01; please refer to **Response C_Byron-01**.

C_Byron-10 This comment expressing support for restoration of Hetch Hetchy Valley is acknowledged. This concept was considered during the preliminary screening phase but because it did not meet any of the basic program goals or objectives, the concept was eliminated from further consideration. Please refer to the O'Shaughnessy Dam removal alternative concept in Section 9.5 (Vol. 4, Chapter 9, pp. 9-127 to 9-128) for further discussion.

C_Byron-11 This comment is a closing statement expressing opinions regarding the history of water development in the Bay Area and water resource management in general. As the comment contains no specific comment on the adequacy or accuracy of the PEIR, no response is provided.

John Cant, 09/18/07

[See Public Hearing Transcript, Fremont, pp. 8-10]

C_Cant-01 This comment addressing levels of conservation and recycling in the SFPUC service area was submitted by numerous commenters and is responded to in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3); regarding comparisons to other areas, refer to the discussion under the heading Frequently Submitted Comments Addressing Conservation and Recycling. As noted in the Draft PEIR (Vol. 4, Chapter 7, p. 7-35), the Alameda County Water District (ACWD) (which provides water to Fremont) currently purchases about

25 percent of its supply, and in 2030 would purchase approximately 23 percent of its supply, from the SFPUC after conservation has been implemented.

C_Cant-02 The commenter states concerns that the acreage of mitigation proposed by the Habitat Reserve Program (HRP) is insufficient to compensate for impacts from the WSIP. The HRP is intended to provide a "reserve" of mitigation values that can be applied to mitigation needs for each WSIP project as needed. Since mitigation requirements for each WSIP project will be determined as part of the project-level studies, all mitigation values developed under the HRP may or may not be sufficient to compensate for each project. If the HRP mitigation values are not sufficient or are not of the kind required for in-kind mitigation, additional mitigation will be developed as needed as part of project-level studies. All mitigation values developed by the HRP, the impacts of which would be analyzed in a project-level EIR, would be available for WSIP projects and would not be applied to other SFPUC mitigation needs unless they were deemed excess.

C_Cant-03 This comment restates issues raised in Comments C_Cant-01 and C_Cant-02 and advocates the SFPUC "pushing "our more recalcitrant neighbors" into doing more conservation. Refer to **Responses C_Cant-01** and **C_Cant-02**, and to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3).

Robert Caughlan, 09/24/07

C_Caugh-01 This comment regarding population and family planning is acknowledged. As this comment does not address the adequacy or accuracy of the Draft PEIR, no response is provided.

Birgit Chase, 09/20/07

C_Chase-01 This comment opposing additional diversions from the Tuolumne River and supporting additional conservation is acknowledged. Refer to the discussion in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) regarding water conservation and recycling projects proposed by SFPUC in San Francisco and its wholesale customers in their respective service areas.

Lynn Chiapella, 09/30/07

C_Chiap-01 The percentage of diversions from the Tuolumne River attributed to the SFPUC presented in this comment is inaccurate. Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.5) and to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7. Chapter 14, Section 14.7.6), for clarification regarding current and estimated future municipal and agricultural diversions from the Tuolumne River. The Draft PEIR (Vol. 1, Chapter 2, pp. 2-35 to 2-37) provides a summary description of the CCSF's water rights. Please refer to **Response L_TUD1-05** for additional discussion of CCSF's water rights and the Raker Act.

This comment also incorrectly implies that a profit motive is driving the WSIP. The WSIP would improve the reliability of the existing regional water system that provides water to people in San Francisco, San Mateo, Santa Clara, Alameda, and Tuolumne Counties. The program is not driven by profit but is needed due to public health and safety and water reliability reasons. Refer also to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.2) for information regarding the purpose of the program. For additional information related to future conservation measures being implemented or planned by the SFPUC and its wholesale customers refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3).

C_Chiap-02 This comment in support of tiered water rates as a conservation incentive is acknowledged. Please refer to **Responses SI_PacInst-46** and **SI_PacInst-47** for further discussion of conservation pricing. Please also refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for information regarding conservation programs being implemented or planned by the SFPUC and its wholesale customers.

C_Chiap-03 This comment criticizes excessive outdoor water use and supports additional conservation and recycling. Please refer **Section 14.2, Master Response on Demand Projections, Conservation and Recycling** (Vol. 7, Chapter 14) for information on outdoor water use within the SFPUC service area, existing and proposed recycled water programs, and alternatives involving higher levels of conservation and recycling than the preferred WSIP. Please refer also to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

Bernie Chodeu, 09/20/07

[See Public Hearing Transcript, San Francisco City Hall, September 20, 2007, pp. 29-30]

C_Chode-01 For a discussion of the effects of climate change on the SFPUC regional water system and related SFPUC actions, please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14, Sections 14.11.4 and 14.11.5). Also see the discussion presented in Section 5.7.6 of the Draft PEIR (Vol. 3, Chapter 5, pp. 5.7-92 to 5.7-96). Section 14.11 of this document provides more detailed and up-to-date information on climate change as it relates to the SFPUC regional water supply and the proposed WSIP.

Ann Clark, Katherine Howard, 09/20/07

C_Clark1-01 This comment summarizes the more detailed comments presented in Comments C_Clark1-02 through C_Clark1-16; refer to **Responses C_Clark1-02** through **C_Clark1-16** for the specific responses.

C_Clark1-02 The PEIR describes general funding of the WSIP for informational purposes (Vol. 1, Chapter 3, p. 3-10), and as provided under CEQA, the PEIR addresses the environmental consequences, not the specific funding and financing, of the proposed program. However, it should be noted that following certification of the PEIR, if the SFPUC adopts the WSIP (or an alternative to it that is covered in the PEIR), the SFPUC would also be required to adopt a Mitigation Monitoring and Reporting Program that will commit the SFPUC to implement mitigation measures identified in the PEIR as appropriate to the program adopted. The commenters concerns regarding cost and funding of the WSIP and associated mitigation measures are acknowledged.

C_Clark1-03 This comment requests that both a detailed cost analysis and the specific contract conditions for wholesale customers be included with the final PEIR. CEQA does not require inclusion of detailed costs and funding as part of the environmental document, and therefore this information is not provided in the PEIR.

The comment also states that the 2009 contract between the SFPUC and its wholesale customers will have an environmental impact on the WSIP and that environmental analysis of the 2009 contract needs to be included in the final PEIR. As described in the Draft PEIR (Vol. 1, Chapter 2, pp. 2-43 and 2-44), the SFPUC and each of its wholesale customers currently have agreements specifying the terms and conditions for purchasing water from the regional system. The individual agreements include terms set forth in the 1984 Master

Water Sales Agreement, which includes a supply assurance. Even though the current master contract expires in June 2009, the contract specifies that the supply assurance remains effective following termination of the Master Water Sales Agreement. The WSIP was developed to address anticipated customer demand on the regional system through 2030. To the extent that the individual agreements and/or the Master Water Sales Agreement may affect water supply (through 2030) and related environmental resources, the PEIR addresses those environmental issues (see Vol. 3, Chapter 5). Prior to approving a water sales agreement, the SFPUC will adopt CEQA findings documenting that the contract is consistent with the scope of the analysis contained in the PEIR.

The commenter also states that the PEIR need to include specific 2009 contract conditions for rates and charges for water use, including wholesale and retail incentives for water conservation requirements. As discussed above, CEQA does not require inclusion of detailed costs and funding as part of the environmental document, and therefore this information is not provided in the PEIR. For information regarding wholesale and retail conservation efforts and requirements, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14).

C_Clark1-04 This comment requests additional analysis of impacts to the Tuolumne River brought about by the cumulative effects of drought cycles, climate change, and global warming. Please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14, Sections 14.11.4 and 14.11.5) for a discussion of the effects of climate change on the SFPUC regional water system and related SFPUC actions.

C_Clark1-05 This comment questions the feasibility of the dry-year transfers from the Modesto Irrigation District (MID) and Turlock Irrigation District (TID). The analysis of the proposed program in the Draft PEIR incorporates the dry-year transfer as one component of the program and assumes a worst-case scenario that water would be from water stored in Don Pedro Reservoir. See **Section 14.3, Master Response on Proposed Dry-Year Water Transfer** (Vol. 7, Chapter 14) for a description of the assumptions used in the Draft PEIR to evaluate the dry-year water transfer and a discussion of the feasibility of the proposed transfer.

C_Clark1-06 Please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14, Section 14.11.5) for response.

C_Clark1-07 Regarding the effects of climate change on the SFPUC regional water system and related SFPUC actions, refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14, Sections 14.11.4 and 14.11.5). The description of actions taken by the East Bay Municipal Utility District is noted. Regarding demand management strategies being implemented or proposed for implementation by SFPUC retail and wholesale customers (e.g., existing and proposed levels of conservation, conservation best management practices adopted by the SFPUC and wholesale customers), refer to **Section 14.2, Master Response on Demand Management, Conservation and Recycling** (Vol. 7, Chapter 14, Section 14.2.3).

C_Clark1-08 This comment requests additional research and analysis to address the effects of climate change, global warming, and drought cycles and to protect the Tuolumne River from significant environmental impacts. Please see **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14, Section 14.11.5) for information regarding SFPUC's current efforts to evaluate their water supply planning with respect to climate change. This comment also requests that the PEIR focus on conservation, recycling, and re-use alternatives. Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for information on the conservation programs and recycling projects being implemented or proposed by SFPUC and its wholesale customers.

C_Clark1-09 This comment, which states that there are "major discrepancies in the assumptions, research models, and recommendations" applied to the wholesale customers and the retail customers that result in "diametrically opposed policies for water use and active conservation," reflects some basic misconceptions about the methodology used by the SFPUC in consultation with its wholesale customers to evaluate 2030 water demand and conservation potential.

The Draft PEIR (Vol. 1, Chapter 3, p. 3-16 to 3-17 and Vol. 5. Appendix E.2) describes the methodology used to forecast demand and evaluate conservation and recycled water potential. As described therein, similar, although not identical, approaches were taken to model demand in the retail customer and wholesale customer service areas. To evaluate demand in each wholesale customer service area, the SFPUC employed an end-use model (the Decision Support System, or DSS, model) that breaks down existing water use by customer type into detailed water end uses, and then uses population and employment projections to develop residential and nonresidential account growth rates, to project future water demand by end use. Demand projections for the SFPUC retail customer service area were developed using a similar end-use model, although nonresidential demand was evaluated using composite employee water use rates with Association of Bay Area Governments (ABAG) industry-specific employment projections (rather than using employment forecasts to develop nonresidential account growth rates). Regarding the reasons this approach was not taken in the wholesale customer service area, refer to the discussion in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2), under the heading Use of Total Jobs Projections for the Wholesale Customer Service Area.

As part of the modeling effort the SFPUC also used the end-use models to evaluate conservation potential in the wholesale and retail service areas. As with the demand modeling, wholesale customer conservation potential modeling was conducted in close consultation with the wholesale customers. Three suites of theoretically feasible and cost-effective conservation programs (Programs A, B, and C) were identified for each wholesale customer and for the retail customer service area. The SFPUC also conducted studies to evaluate the potential for recycled water projects to offset demand for potable water in the retail and wholesale service areas. Based on the information generated by these studies and modeling efforts, the wholesale customers and the SFPUC (for the retail service area) submitted their best estimates of 2030 water purchases from the SFPUC. Each customer's estimates of conservation savings and the use of recycled water, groundwater, and other supply sources as well as its 2030 purchase estimate is shown in Draft PEIR Table 3.3 (Vol. 1, Chapter 3, p. 3-18).

As part of the WSIP planning process, the SFPUC in cooperation with its wholesale customers and BAWSCA also undertook a study to assess the potential for additional conservation and recycled water projects, including potential regional projects that were not identified in the previous studies or already considered to be implemented locally by 2030. This study, *Investigation of Regional Water Supply Option No. 4 Technical Memorandum* (SFPUC, 2007, Appendix D), provided the basis for the Aggressive Conservation/Water Recycling and Local Groundwater Alternative analyzed in the Draft PEIR (Vol. 4, Chapter 9, pp. 9-47 to 9-59). The SFPUC subsequently incorporated into the WSIP the San Francisco local projects categorized in the Regional Water Supply Option No, 4 study as likely to be implemented.

Draft PEIR Table 3.3 (Vol. 1, Chapter 3, p. 3-18) summarizes the water supply assumptions used in developing the 2030 demand projections. The table indicates that in the retail service area projected conservation savings range from 0 to 4 mgd, projected use of groundwater ranges from 3 to 5 mgd, and projected use of recycled water ranges from 0 to 4 mgd, for a total of 3 to 13 mgd that could offset demand. In the wholesale service area, the table indicates projected conservation savings range from 13 to 15 mgd, projected use of groundwater ranges from 39 to 42 mgd, and projected use of recycled water ranges from 9 to 10 mgd, for a total of an estimated 61 to 67 mgd of groundwater, recycled water, and conservation savings that would offset wholesale customer demand for water from the SFPUC regional system. An additional 53 mgd would be provided by other surface water sources in the wholesale service area.

Tables 14.2-6, 14.2-7, and 14.2-8, in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) describe existing and planned conservation measures, including measures incorporating incentives and disincentives for water uses for wholesale and retail customers. As shown in these tables, many of the conservation measures that the SFPUC plans to implement in the retail service area also are planned for the wholesale customer service areas.

Policies related to conservation inevitably will change over time; for example, programs that may not have been considered feasible for an individual wholesale customer to implement may prove more economical and feasible – and therefore will be pursued – on a regional basis. Also, technological developments likely will create new demand management strategies over the project performance period (to year 2030). Nothing in the WSIP precludes that process from occurring.

The statement in the comment that wholesale conservation goals are left to suggested methods and parameters in respective urban water management plans apparently refers to text in the Draft PEIR evaluation of WSIP alternatives (Vol. 4, Chapter 9, pp. 9-23 to 9-96). As described therein, the evaluation of alternatives includes a discussion of the actions by the SFPUC as well as possible wholesale customer actions that each alternative would entail. The alternatives analysis reasonably points out differences in supply assumptions and wholesale customer actions that the alternatives would entail and the sources of supply, conservation, and related wholesale customer activities that are reflected in current urban water management plans. As discussed above, extensive background studies in the wholesale and retail service areas – not urban water management plans – provided the basis for the estimates of conservation and use of recycled water assumed for the WSIP proposed by the SFPUC. However, it is assumed that the WSIP planning studies informed the urban water management plans, which for most customers were finalized in 2005, after the 2004 WSIP planning studies.

The statement in the comment that the wholesale model “does not penalize additional water usage” requires clarification. The model does not make policy. As described above, conservation potential was evaluated in the modeling undertaken as part of WSIP planning. However, it was up to each wholesale customer to determine which measures were feasible and cost effective to implement in its service area. Some wholesale customers have adopted water pricing strategies, during normal years and/or during dry years, that penalize individual customer accounts for higher rates of consumption. Refer to **Responses SI_PacInst-46** and **SI_PacInst-47** (Vol. 7, Chapter 15, Section 15.4) for more information on tiered pricing.

The statement in the comment that "additional mandatory conservation will not be required for wholesalers" requires clarification. The wholesale customers have committed to implementing conservation and recycling at levels shown in Table 3.3 (Draft PEIR Vol. 1, Chapter 3, p.3-18). The Draft PEIR evaluates two alternatives that would involve higher levels of conservation and recycling by wholesale customers: the Aggressive Conservation/Water Recycling and Local Groundwater Alternative, and the Modified WSIP Alternative. Approval of either alternative would require higher levels of conservation and/or recycling by the wholesale customers; BAWSCA (which represents the wholesale customers) has expressed opposition to the Aggressive Conservation/Water Recycling and Local Groundwater Alternative and support for the Modified WSIP Alternative (refer to various comments in the submittal L_BAWSCA1). Regarding the authority of the SFPUC to condition future water purchase agreements on demand management measures, refer to the discussion in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3), under the heading Frequently Submitted Comments Addressing Conservation and Recycling.

. The statements in the comment that the Draft PEIR recommends that additional water be diverted from the Tuolumne River also require clarification. The WSIP PEIR (Draft PEIR Chapter 3) characterizes the WSIP as proposed by SFPUC and analyses the environmental impacts of the proposed program (Vol. 2, Chapter 4, Vol. 3, Chapter 5, and Vol. 4, Chapters 6 and 7); in the alternatives analysis (Vol. 4, Chapter 9, p. 9-96), the Draft PEIR identifies as the environmentally superior alternative the Modified WSIP Alternative. The California Environmental Quality Act (CEQA) requires that agencies consider the environmental consequences of projects as part of their decision-making process; the WSIP PEIR provides that information for the WSIP and alternatives to the WSIP. Individuals with approval authority[1] over the WSIP and the PEIR will consider information in the PEIR, including input received during the public review process, in deciding whether to approve the preferred WSIP or an alternative to it.

C_Clark1-10 Regarding comparisons with water use patterns in other jurisdictions and existing and planned conservation, refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) under the heading Frequently Submitted Comments Addressing Conservation and Recycling.

[1] The San Francisco Planning Commission, SFPUC, and San Francisco Board of Supervisors; see Draft PEIR pp. 3-86 and 3-87 (Vol. 1, Chapter 3) for a complete list.

C_Clark1-11 Regarding comparisons with water use patterns in other jurisdictions and existing and planned conservation, refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) under the heading Frequently Submitted Comments Addressing Conservation and Recycling. Regarding the commenter's request for a regional analysis of specific projects in the wholesale customer service areas that affect water use, Chapter 7 of the PEIR contains an extensive analysis of growth associated with implementation of the WSIP, and the environmental impacts associated with that growth. See Tables 14.2-6, 14.2-7, and 14.2-8 regarding conservation programs proposed as part of the WSIP or otherwise planned by wholesale customers

C_Clark1-12 This comment states that additional research be conducted to evaluate the combined long-term effects of additional diversions from the Tuolumne River and climate change on the health and welfare of the river, endangered species and habitats, and Delta ecosystems. Please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14, Section 14.11.4) for response.

C_Clark1-13 This comment requests that mitigation measures in the Draft PEIR be revised when the additional research and analysis requested by the commenter in Comments C_Clark1-08, -11, and -12 is completed. The Final PEIR includes staff-initiated text revisions to the Draft PEIR, including modifications and refinement of some of the mitigation measures in the Draft PEIR. These revisions are explained and documented in Chapter 16 of this Comment and Responses document, including any appropriate revisions to mitigation measures.

The Draft PEIR provides a program-level evaluation of the potential environmental impacts of constructing and operating the 22 regional WSIP facility projects (Vol. 2, Chapter 4). The analysis, which is based on preliminary information about the projects and their general site locations, presents a reasonable worst-case scenario regarding the potential environmental impacts that could occur and provides programmatic mitigation measures for all potentially significant impacts. Project-level CEQA review will be conducted for each facility project, as appropriate, and will confirm the degree of impact and the applicability of the mitigation measures presented in the WSIP PEIR. As necessary, these mitigation measures will be re-evaluated to be confirmed, refined or replaced with an equivalent measure to better address the project-specific impacts.

The Draft PEIR provides a project-level evaluation of the potential environmental impacts of the proposed changes in water supply sources and regional water system operations organized by watershed in the Draft PEIR

(Vol. 3, Chapter 5) and identifies mitigations for significant and potentially significant impacts. As discussed in **Response C_Breso-01**, above, the San Francisco Planning Department believes the data used to analyze project-level impacts on water and related resources are sufficient to reasonably assess the general magnitude, frequency, and extent of the WSIP's environmental consequences, and to identify appropriate mitigation measures to offset potentially significant impacts on the Tuolumne River, Alameda Creek, and Peninsula watersheds and related resources. The mitigation measures were developed to include performance standards based on ecological principles, with the understanding that data from ongoing and future studies could be useful in augmenting the baseline data and in refining the implementation of each measure.

C_Clark1-14 This comment opposing Tuolumne River diversions and in support of "equitable conservation requirements" is acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for discussion on conservation program and recycling projects proposed by SFPUC and its wholesale customers.

C_Clark1-15 This comment supporting the Aggressive Conservation/Water Recycling and Local Groundwater Alternative (No Supplemental Tuolumne River Supply) is acknowledged.

C_Clark1-16 This comment expresses an opinion regarding the responsibility of San Francisco in environmental leadership. The WSIP includes a program goal to enhance sustainability in all system activities (see Vol. 1, Chapter 3, Table 3.2, p. 3-9). The system performance objectives include: manage natural resources and physical systems to protect watershed ecosystems; meet, at a minimum, all current and anticipated legal requirements for protection of fish and other wildlife habitat; and manage natural resources and physical systems to protect public health and safety. Furthermore, as described on p. 3-82, the SFPUC has committed to specific greenhouse gas reduction actions as part of the WSIP. As described in the Draft PEIR (Vol. 1, Chapter 3, Section 3.6.1), the proposed program also includes implementation of local groundwater projects in the North Westside Groundwater Basin, recycled water projects on the west side of San Francisco, and additional conservation programs within the San Francisco retail service area. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information regarding conservation programs and recycling projects proposed by the SFPUC and its wholesale customers.

Ann Clark, 09/20/07

[See Public Hearing Transcript, San Francisco City Hall, September 20, 2007, pp. 31-33]

C_Clark2-01 See **Response C_Clark1-02**.

C_Clark2-02 This comment states that the 2009 water contracts with the wholesale agencies are directly connected to the WSIP and that environmental review of the contract is needed. Please refer to **Response C_Clark1-03**, above.

The commenter further states that any promises to do more conservation with agricultural users should be expressly stated in the contractual terms. Conservation by agricultural users is not included in the proposed program, although it was identified as a mitigation measure for the potential impacts on the lower Tuolumne River and also as a component of the Modified WSIP Alternative. Please refer to **Sections 14.7 and 14.10, Master Responses on Lower Tuolumne River Issues and Modified WSIP Alternative**, respectively, for further discussion.

C_Clark2-03 This comment states that the Draft PEIR does not adequately address the combined effects of climate change, global warming, and drought. Please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14, Sections 14.11.4 and 14.11.5) for a discussion of the effects of climate change on the SFPUC's system operations and water yield, and related SFPUC actions.

Gary Clossman, 09/18/07

C_Closs-01 This comment expressing support for more conservation and recycling to meet water demand and opposing additional diversions from the Tuolumne River is acknowledged. The 2030 purchase estimates prepared for the WSIP include 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). For additional information, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3).

Caroline Coleman, no date

C_Colem1-01 This comment opposing additional Tuolumne River diversions, expressing concern regarding the reliability of Tuolumne River water supplies, and in support of conservation and recycling to serve future water demand, is acknowledged. However, this comment does not address the content or adequacy of the Draft PEIR; therefore, no response is needed.

Caroline Coleman, 09/21/07

C_Colem2-01 This comment opposes additional Tuolumne River diversions and requests that additional studies be conducted to evaluate the WSIP-related effects on fish and wildlife in the Tuolumne River watershed. Please refer to **Response C_Breso-01**.

With respect to conservation and recycling efforts, the 2030 purchase estimates prepared for the WSIP include 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). For additional information, refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3).

Robert Collin, 09/27/07

C_Colli-01 This comment opposing additional Tuolumne River diversions is acknowledged.

C_Colli-02 Please see **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14, Section 14.11.4) for additional discussion of climate change to augment the discussion presented in Section 5.7.6 of the Draft PEIR (Vol. 3, Chapter 5, pp. 5.7-92 to 5.7-96). Section 14.11 of this document provides more detailed and up-to-date information on climate change as it relates to the SFPUC regional water supply and the proposed WSIP.

C_Colli-03 Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions. Regarding potential impacts on downstream waterbodies from increased diversions from the Tuolumne River, refer to **Section 14.8, Master Response on Delta and San Joaquin Issues** (Vol. 7, Chapter 14, Section 14.8.2). As stated in that section, impacts on the Delta attributable to the WSIP were determined to be less than significant; therefore, any impacts on resources downstream of the Delta, such as those associated with San Francisco Bay, would be less than significant. This comment expressing support of more conservation and recycling to meet water demand and against additional diversions from the Tuolumne River is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, Section 3.4.4, pp. 3-16 to 3-22). For descriptions of alternatives that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). For additional information, please refer to the discussion in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3).

Leland & Shirley Dahlin, 09/08/07

C_Dahli-01 This comment, which expresses support for more conservation and recycling to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). For additional information, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3).

Mary Davey, 09/09/07

C_Davey-01 This comment, which expresses support for more conservation and recycling to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Draft PEIR, Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections of the Draft PEIR (Sections 9.2.2 through 9.2.4 and Sections 9.2.6 and 9.2.7). For additional information, refer to **Section 14.2, Master Response on Demand Projections, Conservation and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for discussion of conservation programs and recycling projects proposed by the SFPUC and its wholesale customers. Please also refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

Joel Davidson, 10/01/07

C_David-01 This comment, which expresses support for more conservation and recycling to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). For additional information, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3).

Joseph Day, 09/05/07

[See Public Hearing Transcript, Sonora, pp. 44-45]

C_DayJ-01 This comment, opposing additional Tuolumne River diversions and water transfers from TID/MID as supplemental dry-year supplies, is acknowledged. For pertinent response regarding the proposed dry-year water transfers, refer to **Section 14.3, Master Response on Dry Year Water Transfer** (Vol. 7, Chapter 14).

C_DayJ-02 This comment expresses support for the use of desalination technologies for supplemental water supplies. Please refer to **Response C_BramlD1-02**.

Lisa Day, 09/20/07

C_DayL-01 This comment, which expresses support for more conservation and recycling to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). For additional information, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3). Regarding the Draft PEIR's consideration of the Tuolumne River's status as a federally designated Wild and Scenic River and potential impacts relevant to that designation, please refer to **Response L_Tuol1-09**.

Dan Dippery, 09/19/07

[See Public Hearing Transcript, Palo Alto, pp. 17-18]

C_Dippe-01 This comment, which refers to the report *Investigation of Regional Water Supply Option No. 4 Technical Memorandum*, was submitted by numerous commenters and is responded to in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3); refer to the discussion under the heading Frequently Submitted Comments Addressing Conservation and Recycling.

C_Dippe-02 This comment requesting a study on the maximum technical potential for conservation and efficiency savings has also been submitted by numerous commenters and is also responded to in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3); refer to the discussion under the heading Frequently Submitted Comments Addressing Conservation and Recycling.

Denise Dougherty, 09/20/07

[See Public Hearing Transcript, San Francisco City Hall, September 20, 2007, p. 38]

C_Dough-01 This comment, which expresses support for more conservation and recycling to meet water demand and opposition to additional diversions from the Tuolumne

River, is acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3).

Diane Dulmage, 09/18/07

C_Dulma-01 The Draft PEIR (Vol. 3, Chapter 5, Sections 5.3.6 and 5.3.7) included a project-level analysis of impacts on fisheries and terrestrial biological resources that would result from the proposed water supply option and changes in system operations. As described, implementation of the WSIP would result in several potentially significant adverse impacts on the Tuolumne River and its resources; the Draft PEIR identified mitigation measures to reduce these impacts to less-than-significant levels. Refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14) and **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14) for additional information related to the impact analysis for the Tuolumne River. A discussion on the occurrence of Chinook salmon in the Tuolumne River watershed is presented in Section 14.7.2.

C_Dulma-02 This comment expresses concern regarding the effects of additional Tuolumne River diversions on the salinity of the San Francisco Bay-Delta Estuary. Please see Draft PEIR, Section 5.3.3 (Vol. 3, Chapter 5, pp. 5.3.3-19 and 5.3.3-20), which explains why the effect of the WSIP would be too small to substantially affect salinity in the Delta, and refer to **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14, Section 14.8.2) for additional discussion.

C_Dulma-03 This comment expressing support for more conservation and recycling is acknowledged. For a discussion of the alternatives evaluated in the Draft PEIR that do not include additional diversions from the Tuolumne River, refer to the descriptions of the Year-round Desalination at Oceanside Alternative (see Draft PEIR Vol. 4, Chapter 9, Section 9.2.6, p. 9-66) and Aggressive Conservation/ Water Recycling and Local Groundwater Alternative (Without Tuolumne River Supplement) (see Section 9.2.4, p. 9-47). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for discussion of conservation programs and recycling projects being implemented or proposed by SFPUC and its wholesale customers. The statement regarding the findings of a Pacific Institute study is acknowledged. For specific responses to the Pacific Institute submittal on the Draft PEIR refer to **Responses SI_PacInst-01** through **SI_PacInst-97** (Vol. 7, Chapter 15, Section 15.4).

C_Dulma-04 This comment supports desalination of brackish water as an alternative source of water supply. Please refer to **Response C_BramlD1-02**.

C_Dulma-05 This comment is a closing statement that summarizes Comments C_Dulma-01 through C_Dulma-04; refer to **Responses C_Dulma-01** through **C_Dulma-04**, above.

Fred Duperrault, 09/25/07

C_Duper-01 This comment expressing support for more conservation and recycling to meet water demand and opposition to additional diversions from the Tuolumne River is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, Section 3.4.4, pp. 3-16 to 3-22). For descriptions of alternatives that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). For additional information, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3). Please also refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

Jeb Eddy, 09/30/07

C_Eddy1-01 The Draft PEIR (Vol. 1, Chapter 3, pp. 3-17 to 3-21 and Vol. 5, Appendix E.2) summarizes the steps involved in establishing base year water usage and projecting future demands. Projections were not based solely on population growth, as the comment suggests, but also considered future employment, customer-specific information on usage; levels of conservation, recycling and use other water sources that would offset demand for water from the SFPUC regional system, and other factors. As described in Draft PEIR Appendix E.2 (p. E.2-6) the selected sources used for population and employment provided forecasts in five- or ten-year increments (as opposed to a linear projection to the horizon year as suggested by this comment). ABAG, for example, provides projections in five-year increments. To develop yearly projections to 2030 for each source, the population and employment increase for each five- or ten-year increment was divided evenly and applied yearly throughout the five- or ten-year period (depending on the increment used in the particular projection) to form a linear yearly projection *between increments.* For additional discussion of the methodology used by SFPUC in collaboration with its wholesale customers and BAWSCA to project future demand, refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2).

C_Eddy1-02 This comment supporting seismic improvements to the regional water system is acknowledged.

C_Eddy1-03 Refer to **Response C_Eddy1-01**. This comment expressing support of more conservation and recycling to meet water demand and against additional diversions from the Tuolumne River is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, Section 3.4.4, pp. 3-16 to 3-22). For descriptions of alternatives that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Note also that the water demand models used in the wholesale and retail service areas are not based on per-capita consumption, as this comment suggests, but rather are end-use models. Refer to Draft PEIR Appendix E.2 (Vol. 5) for a detailed description of demand methodology. Refer also to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3).

Jeb Eddy, 09/19/07

[See Public Hearing Transcript, Palo Alto, pp. 40-43]

C_Eddy2-01 This comment advocating the use of markets/pricing to decrease demand is acknowledged. Please refer to **Response SI_PacInst-62** and also to **Section 14.2, Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2) for information pertinent to this comment.

C_Eddy2-02 This comment questions the demand forecasting and suggests that market influences could create different kinds of water supply for different kinds of users and needs, thus changing market structures (and, therefore, demand). The comment appears to suggest that separate markets for recycled water or conserved water may decrease future demand for Tuolumne River water. While market structures may change in the future, as new technologies become available, it would be speculative for the PEIR to evaluate water demand based upon markets that have not been established. The implication in this comment that the demand projections are based on per-capita estimates is incorrect. Demand projection methodology is described in Draft PEIR Chapter 3 (Vol. 1, pp. 3-16 to 3-22) and in more detail in AppendixE.2 (Vol. 5). As the Draft PEIR discussion indicates, the models used to develop water demand are end-use models and not based on per-capita consumption. The demand projections include savings from “passive conservation” resulting from plumbing codes, and the 2030 purchase estimates reflect savings from active conservation programs and recycling projects, as well as the use of other water sources. Please also refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2) for additional information pertinent to this comment.

Elanie Elbizri, 09/24/07

C_Elbiz-01 The Draft PEIR (Vol. 3, Chapter 5, Sections 5.3.1 through 5.3.8) analyzed the effects of the WSIP on the hydrology, geomorphology, water quality, groundwater, terrestrial biology, fisheries, recreation, and visual quality of the Tuolumne River corridor. As described, implementation of the WSIP would result in several potentially significant adverse impacts on the Tuolumne River and its resources; the Draft PEIR identified mitigation measures to reduce these impacts to less-than-significant levels. Refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14), and **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14), for additional information related to the impact analysis for the Tuolumne River. As this comment does not specify the particular issue(s) in which the commenter believes the analysis presented in the Draft PEIR is inadequate, no specific response is provided.

C_Elbiz-02 This comment, which cites reductions in demand growth achieved in other areas, was submitted by numerous commenters and is responded to in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7. Chapter 14, Section 14.2.3) under the heading Frequently Submitted Comments Addressing Conservation and Recycling.

C_Elbiz-03 This comment supporting the Aggressive Conservation/Water Recycling and Local Groundwater Alternative (No Supplemental Tuolumne River Water) and the Year-round Desalination at Oceanside Alternative is acknowledged.

C_Elbiz-04 This comment, requesting additional studies on the Tuolumne River, was submitted by numerous commenters; see **Response C_Breso-01** for response.

Claire Elliott, 09/19/07

[See Public Hearing Transcript, Palo Alto, pp. 27-29]

C_EllioC-01 This comment expresses the opinion that the SFPUC should pursue a two-tiered approach that separates the seismic improvements from the proposed water supply option. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.5) regarding the integration of the seismic improvements and water supply options to meet program objectives, and for a discussion of the advantages of using a program EIR to evaluate the proposed program as a whole.

C_EllioC-02 The commenter's opinion on the diversion from the Tuolumne River is acknowledged. The commenter also asserts that the PEIR does not adequately evaluate the impacts on salt marshes of increased wastewater discharges into the San Francisco Bay receiving waters throughout the Bay Area. Changes in wastewater discharges into receiving waters in the SFPUC service area would be an indirect effect associated with implementation of the WSIP. Insofar as the WSIP would result in changes in municipal and domestic water use patterns, there would also be associated changes in wastewater discharge patterns for municipal and industrial uses, with much of the changes attributed to population growth. The Draft PEIR addresses the indirect effects of growth in Chapter 7 (Vol. 4, pp. 7-60 to 7-78); as this chapter indicates, these indirect effects, including impacts on wastewater treatment facilities and wastewater treatment capacities, were identified as significant but mitigable in the environmental impact reports for the general and specific plans in the service area. In the cases where the WSIP would result in increased use of recycled water, the associated effects on wastewater discharges would be or have been addressed in the project-level environmental documents for the recycled water projects.

C_EllioC-03 This comment encouraging additional water recycling is acknowledged. Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for information on current and planned recycling projects in the SFPUC retail and wholesale customer service areas.

Patricia Elliott, 09/05/07

[See Public Hearing Transcript, Sonora, pp. 31-33]

C_EllioP-01 This comment expresses concern regarding the effects of additional Tuolumne River diversions on the towns of Groveland and Big Oak Flat. Please refer to

Section 14.1, Master Response on WSIP Purpose and Need (Vol. 7, Chapter 14, Section 14.1.6) regarding the scope of the PEIR with respect to economic evaluations.

Dave Ellison, 09/18/07

[See Public Hearing Transcript, Fremont, pp. 11-12]

C_Ellis-01 This comment advocating more conservation and public education regarding water efficiency is acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for discussion of conservation measures being implemented and planned by the SFPUC and SFPUC wholesale customers. As shown in Tables 14.2-6, 14.2-7, and 14.2-8 of Section 14.2, public information programs are being implemented throughout the SFPUC service area.

Benjamin L. Farnum, 10/01/07

C_Farnu-01 This comment, which expresses support for more conservation and recycling to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). For additional information on conservation programs and recycling projects being implemented or planned by the SFPUC and its wholesale customers, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3).

Jan Fenwick, 09/30/07

C_Fenwi-01 This comment refutes statements made by the Tuolumne River Trust and does not address the content or adequacy of the Draft PEIR; no response is needed.

David Fielding, 10/01/07

C_Field-01 This comment, which expresses support for more conservation to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). For additional information on conservation programs and recycling projects being implemented or planned by the SFPUC and its wholesale customers, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3).

John and Janet Fiore, 10/01/07

C_Fiore-01 This comment, expressing the commenter's opinion on water sales by the CCSF, does not address the content or adequacy about the Draft PEIR; no response is necessary.

M. Flanigan, 09/20/07

C_Flani-01 This comment, which expresses opposition to additional diversions from the Tuolumne River and support for more conservation and recycling to meet additional water demand is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22), which offset a portion of the projected demand. For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). For additional information on the conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customer, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3).

E. Fleming-Hasegaue, 09/20/07

C_Flemi-01 This comment opposing additional Tuolumne River diversions is acknowledged.

Kirsten Flynn, 09/27/07

C_Flynn-01 This comment opposing additional Tuolumne River diversions is acknowledged.

C_Flynn-02 This comment expressing support for more conservation and recycling is acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3).

Peter Fox, 09/25/07

C_Fox-01 This comment provides a personal perspective on the Tuolumne River and does not address the content or adequacy of the Draft PEIR. No response is provided.

Jimmy Gado, 09/05/07

[See Public Hearing Transcript, Sonora, pp. 33-34]

C_Gado-01 This comment expresses concern regarding the use of monthly average values of river flow to evaluate the WSIP's impacts on recreational uses along the Tuolumne River. The Draft PEIR (Vol. 3, Section 5.3.8) provides an extensive discussion of existing whitewater recreational resources in the Tuolumne River watershed and evaluates the potential magnitude of impacts on future whitewater recreation under the WSIP. The detailed analysis of the timing and magnitude of the WSIP-related changes in water releases within the upper Tuolumne River watershed as related to whitewater rafting was based on review of daily flow and operations information, in addition to monthly average river flow (see Impact 5.3.8-2: Effects on river recreation due to changes in water system operations, pp. 5.3.8-27 through 5.3.8-34).

C_Gado-02 This comment, which expresses opposition to additional diversions from the Tuolumne River and support for additional conservation and recycling programs, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by SFPUC and its wholesale customers.

Caroline Garbarino, 09/22/07

C_Garba-01 This comment, which states that flawed demand modeling inflates future demand and that other metropolitan areas have reduced demand despite growth, was submitted by numerous commenters and is responded to in **Section 14.2, Master Response on Demand Projections, Conservation and Recycling** (Vol. 7, Chapter 14, Section 14.2.2).

C_Garba-02 This comment, requesting that SFPUC conduct additional studies on the Tuolumne River, was submitted by numerous commenters; see **Response C_Breso-01** for response.

C_Garba-03 This comment states that the Draft PEIR does not take into consideration the impact of climate change on precipitation in the Tuolumne River watershed. Please refer to **Section, 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14, Section 14.11.4).

Ruben Garcia, 09/20/07

C_Garci-01 This comment opposing additional diversions from the Tuolumne River is acknowledged. The Draft PEIR includes multiple alternatives to the WSIP that would reduce diversions from the Tuolumne River; refer to the following sections in Chapter 9 (Vol. 4): Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for discussion of conservation programs and recycling projects being implemented or proposed by SFPUC and its wholesale customers.

Robert Gelman, 09/05/07

[See Public Hearing Transcript, Sonora, pp. 43-44]

C_Gelma-01 This comment questions the volume of water to be diverted from the Tuolumne River. Please refer to the Draft PEIR Chapter 3 (pp. 3-16 to 3-22) for information regarding development of demand projections and purchase estimates. Demand projections are described in more detail in Draft PEIR Appendix E.2 (Vol. 4). For additional information, refer to **Section 14.2, Master Response on Demand Projections, Conservation and Recycling** (Vol. 7, Chapter 14, Section 14.2.2). Please also refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

C_Gelma-02 Please see **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14) for additional discussion of climate change to augment the discussion presented in Section 5.7.6 of the Draft PEIR (Vol. 3, Chapter 5, pp. 5.7-92 to 5.7-96). Section 14.11 of this document provides more detailed and up-to-date information on climate change as it relates to the SFPUC regional water supply and the proposed WSIP.

Marylyn Genovese, 09/29/07

C_Genov-01 This comment states that the impact analysis presented in the Draft PEIR did not adequately address the environmental impacts to the Tuolumne River. Please refer to **Response C_Breso-01** for response.

The commenter also requests that the SFPUC re-evaluate the projections for future water demand and conservation potential. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14) for a discussion of the methodology used by SFPUC in collaboration with its wholesale customers and BAWSCA to project future demand, and for additional information related to conservation programs and recycling projects proposed by the SFPUC and its wholesale customers.

C_Genov-02 This comment, which supports reducing reliance on the Tuolumne River due to the uncertainty of climate change effects, implementation of more conservation and recycling to meet water demand, and alternatives that protect the Tuolumne River from additional diversions, is acknowledged. Regarding the effects of climate change on the Tuolumne River, refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14, Section 14.11.4).

The commenter's support for conservation and recycling and opposition to additional diversions from the Tuolumne River is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, Section 3.4.4, pp. 3-16 to 3-22). For descriptions of alternatives that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please also refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

Ernest Goitein, 10/14/07

C_Goite-01 This comment states that there will be impacts on the Tuolumne River. The Draft PEIR (Vol. 3, Chapter 5, Sections 5.3.1 through 5.3.8) analyzed the effects of the WSIP on the hydrology, geomorphology, water quality, groundwater, terrestrial biology, fisheries, recreation, and visual quality of the Tuolumne River corridor. As described, implementation of the WSIP would result in several potentially significant adverse impacts on the Tuolumne River and its resources; the Draft PEIR identified mitigation measures to reduce these impacts to less-than-significant levels. Refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14) and **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14) for additional information related to the impact analysis for the Tuolumne River.

C_Goite-02 This comment expressing opposition to additional diversions from the Tuolumne River and support for more water conservation, including pricing incentives, and water recycling, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, Section 3.4.4, pp. 3-16 to 3-22). For descriptions of alternatives that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by SFPUC and its wholesale customers.

Shawna Gokener, 09/20/07

[See Public Hearing Transcript, San Francisco City Hall, September 20, 2007, p. 33]

C_Goken-01 This comment expresses a general concern about water supply management and does not address the content or adequacy of the Draft PEIR; no response is needed.

Kathleen Goldfein, 09/25/07

C_Goldf-01 This comment in support for alternatives that reduce diversions from the Tuolumne River is acknowledged. The second part of this comment presents observations on personal conservation practices and demand hardening. Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) regarding the specific conservation measures currently being implemented and those to which the SFPUC and SFPUC wholesale customers have committed under the WSIP.

C_Goldf-02 Please refer to **Response C_Breso-01**.

Rebecca Goodman, 09/26/07

C_Goodm-01 This comment summarizes more specific issues discussed in Comment C_Goodm-02; refer to **Response C_Goodm-02**.

C_Goodm-02 This comment encourages consideration of biological resources along the Tuolumne River, and encourages additional conservation and recycling in lieu of additional diversions. The Draft PEIR (Vol. 3, Chapter 5, Sections 5.3.1 through 5.3.8) analyzed the effects of the WSIP on the hydrology, geomorphology, water quality, groundwater, terrestrial biology, fisheries, recreation, and visual quality of the Tuolumne River corridor. As described, implementation of the WSIP would result in several potentially significant adverse impacts on the Tuolumne River and its resources; the Draft PEIR identified mitigation measures to reduce these impacts to less-than-significant levels. Refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14), and **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14), for additional information related to the impact analysis for the Tuolumne River.

For descriptions of alternatives that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the

Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer also to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for information related to conservation programs and recycling projects being implemented or proposed by SFPUC and its wholesale customers.

Ben Graves, 09/27/07

C_Grave-01 This comment has been submitted by numerous commenters; please refer to **Response C_Breso-01**.

C_Grave-02 This comment expressing support for more conservation and recycling to meet water demand and for alternatives that protect the Tuolumne River from additional diversions is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, Section 3.4.4, pp. 3-16 to 3-22). For descriptions of alternatives that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented of proposed by the SFPUC and its wholesale customers.

David Greene, 09/11/07

C_GreenD-01 This comment, expressing support for more conservation and recycling rather than additional diversions from the Tuolumne River to meet additional demand and requesting that the SFPUC re-evaluate its studies, is acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation and Recycling** (Vol. 7, Chapter 14) regarding the studies conducted to project water demand and conservation and recycled water potential and for information on the conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

C_GreenD-02 This comment stating that SFPUC adopt a policy of reducing diversions from the Tuolumne River is noted.

C_GreenD-03 This comment requests that the Draft PEIR take into account the impact of climate change on precipitation in the Tuolumne River watershed. Please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14, Section 14.11.4).

C_GreenD-04 This comment expressing support for more conservation and recycling is acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for discussion of conservation programs and recycling projects proposed by SFPUC and its wholesale customers.

Katherine Greene, 09/21/07

C_GreenK-01 This comment, which expresses support for more conservation and recycling to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please also refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects proposed by SFPUC and its wholesale customers.

Doris Grinn, 09/20/07

[See Public Hearing Transcript, Sonora, pp. 38-40]

C_GrinnD-01 This comment does not address the accuracy or adequacy of the Draft PEIR; no response is provided.

Jim Grinnell, 09/20/07

[See Public Hearing Transcript, Sonora, pp. 40-41]

C_GrinnJ-01 This comment, which expresses support for more conservation and less development in the Bay Area if needed to protect resources, is acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for pertinent response on the conservation programs and recycling projects proposed by SFPUC and its wholesale customers.

Andrew Gross, 09/20/07

C_Gross-01 See **Response C_Agarw-01**.

Bob Hackamack, 10/01/07

C_Hacka1-01 This comment expressing an opinion that SFPUC adopt a policy of reducing diversions from the Tuolumne River is noted. This comment also requests that the impact discussion presented in the Draft PEIR be expanded to include a discussion of San Francisco's water rights on the Tuolumne River. A brief discussion of existing water rights and entitlements is included in the Draft PEIR, Section 2.5.1 (Vol. 1, Chapter 2, pp. 2-35 to 2-37) for informational purposes. Issues related to the validity or otherwise of CCSF's water rights is not a CEQA issue and therefore not addressed in the PEIR.

C_Hacka1-02 This comment requests additional discussion regarding three items: (1) the impact of export reduction from the Tuolumne River on the operation under the Raker Act; (2) the impact of the Lower Tuolumne River Diversion Alternative on San Francisco's water rights; and (3) the impact of the Lower Tuolumne Diversion Alternative on the operation of the Raker Act. See **Response L_TUD1-05** regarding CCSF's water rights and the Raker Act.

C_Hacka1-03 This comment requests additional discussion regarding the impact of the Lower Tuolumne Diversion Alternative on the operation of the four agreements among San Francisco, Tuolumne Irrigation District (TID), and Modesto Irrigation District (MID). The descriptions of the CEQA alternatives presented in the Draft PEIR are conceptual, and the evaluation of the alternatives is based on the available information and reasonable assumptions about how each alternative would be implemented. Uncertainties regarding the feasibility of each alternative are discussed in the Draft PEIR and were taken into consideration during the screening process. As discussed in the Draft PEIR (Vol. 4, Chapter 9, pp 9-62), the Lower Tuolumne River Diversion Alternative would pose a number of institutional challenges including agreements with TID/MID for making the necessary releases from Don Pedro Reservoir, and approval by the State Water Resources Control Board (SWRCB) for a change in the point of diversion and possibly additional appropriation license to recover the water. See also **Response L_TUD1-05**.

C_Hacka1-04 The Draft PEIR analyzed impacts on water and off-water recreational uses in the lower Tuolumne River (see Vol. 3, Section 5.3.8), including boating, fishing, swimming, camping, day-use, and picnicking at the principal public park and river access sites in Stanislaus County (La Grange Regional Park, Turlock Lake State Recreation Area, Fox Grove Regional Park, and Tuolumne River Regional Park). Impacts on reservoir recreation due to changes in water system operations were found to be less than significant (Impact 5.3.8-1, pp. 5.3.8-23 through 5.3.8-27). Impacts on river recreation due to changes in water system operations were also found to be less than significant (Impact 5.3.8.2, pp. 5.3.8-27 through 5.3.8-34).

C_Hacka1-05 This comment states that "improving and enlarging of the Lower Cherry Aqueduct may not be provided for in Raker Act documents and a full EIR is requested." The relevant past and future SFPUC projects presented in the cumulative impact analysis are summarized solely for the purpose of evaluating the WSIP's contribution to cumulative impacts and are not proposed as part of the WSIP. Improving and enlarging Lower Cherry Aqueduct is a component of the Hetch Hetchy Repair and Rehabilitation Program (see Vol. 3, Chapter 5, pp. 5.7-6 and 5.7-7). Project-level CEQA review will be conducted as appropriate to provide additional information and analyses. However, as stated above, issues related to the validity or otherwise of CCSF's water rights is not a CEQA issue.

Bob Hackamack, 10/15/07

C_Hacka2-01 This comment requests the SFPUC to discuss plans for compliance with Section 9(h) of the Raker Act. See **Response L_TUD1-05**.

Diana Hall, 10/15/07

C_Hall-01 This comment opposing additional Tuolumne River diversions and supporting a program emphasizing conservation and recycling is noted. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for information related to conservation programs and recycling projects proposed by SFPUC and its wholesale customers.

C_Hall-02 This comment stating that water efficiency measures and implementation of diverse water supplies would help reduce the impacts associated with climate change is noted. Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for response.

Kimberly Hamilton-Lam, 09/20/07

C_Hamil-01 This comment opposes additional Tuolumne River diversions and promotes water conservation as the key to satisfying future water demand and protecting the river. The following comments in this submittal were submitted by numerous commenters:

> " . . outdoor water use drives 60% of the anticipated increase in demand"
>
> "Water conservation is cheap, relatively easy and much less destructive to the environment."
>
> "The Bay Area lags behind other metropolitan areas when it comes to water conservation."

Please see **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14). Refer to the discussion in Section 14.2.2, under the heading Outdoor Water Use, regarding estimates of outdoor water demand, and to the discussion in Section 14.2.3, under the heading Frequently Submitted Comments Addressing Conservation and Recycling, regarding comparisons to other areas. Refer also to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

Carol Hankermeyer, 09/25/07

C_Hanke-01 This comment opposing additional diversions from the Tuolumne River is acknowledged. Please refer to **Response L_Tuol1-09** regarding the potential effects of the WSIP on those reaches of the Tuolumne River designated as wild and scenic. Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.5) and to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7. Chapter 14, Section 14.7.6) for clarification regarding current and estimated future municipal and agricultural diversions from the Tuolumne River.

C_Hanke-02 This comment stating that 60 percent of the proposed increase in Tuolumne River diversions is due to outdoor water use and that the Bay Area falls behind other California metropolitan areas in conservation is acknowledged. These comments were submitted by numerous commenters and are responded to in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14); refer to Section 14.2.2, under the heading

Outdoor Water Use, regarding estimates of outdoor water demand, and to the discussion in Section 14.2.3, under the heading Frequently Submitted Comments Addressing Conservation and Recycling, regarding comparisons to other areas and the need for conservation and efficiency to meet increases in outdoor water demand.

C_Hanke-03 This comment expresses concern regarding impacts to the San Francisco Bay-Delta's estuarine ecosystem as a result of additional Tuolumne River diversions. Please refer to **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14, Section 14.8.2).

C_Hanke-04 This comment opposing additional Tuolumne River diversions is acknowledged.

Tomer Hasson, 09/20/07

[See Public Hearing Transcript, San Francisco City Hall, September 20, 2007, pp. 15-18]

C_Hasso-01 This comment supporting seismic improvements to the regional water system is acknowledged.

C_Hasso-02 This comment opposing additional Tuolumne River diversions and encouraging increased conservation and water efficiency is acknowledged. Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.5), and to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.6) for clarification regarding current and estimated future municipal and agricultural diversions from the Tuolumne River. Please refer to the discussion in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2) under the heading Outdoor Water Use, regarding estimates of outdoor water demand. The characterization of the methodology used to project water demand is incorrect; see Section 14.2.2. Regarding the comparison to other metropolitan areas, see Section 14.2.3 under the heading Frequently Submitted Comments Addressing Conservation and Recycling.

C_Hasso-03 This comment, regarding demand modeling, per-capita demand, the SFPUC's studies on conservation and recycling, and comparisons to other areas, was submitted by numerous commenters and is responded to in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14).

C_Hasso-04 This comment requests that the Draft PEIR address the concept of global warming. Please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14).

Alex Helldoevker, 08/15/07

C_Helld-01 This comment, which expresses support for more conservation and recycling to meet water demand and opposition to additional diversions from the Tuolumne River, especially for outdoor use, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). For additional information, including information on projected outdoor use as well as conservation programs and recycling projects in the SFPUC service area, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3).

Leah Henry, 09/20/07

C_Henry-01 This comment opposing additional Tuolumne River diversions is acknowledged.

Kristin Herron, 09/25/07

C_HerroK-01 This comment, which expresses the commenter's opinion that the environmental impacts of increased water diversions outweigh the need for lawns and sprawl in the East Bay, support for more conservation and recycling to meet water demand, is acknowledged. The California Environmental Quality Act (CEQA) requires a public agency with approval authority over a project to balance a project's benefits (economic, legal, social, technological, or other) against any unavoidable environmental risks (the "costs" implied in this comment) when determining whether to approve the project.[2] When an agency approves a project that will result in the occurrence of significant effects that are not avoided or substantially lessened through adopted mitigation measures, the agency must state in writing the specific reasons to support its action. Alternatively, the agency can adopt measures to mitigate significant

2 CEQA Guidelines Sections 15043 and 15093.

environmental effects or adopt an alternative to the project that lessens the project's effects.

As stated in Draft PEIR (Vol. 1, Chapter 1, p. 1-1 and p. 1-9), the San Francisco Planning Department prepared the Draft PEIR to provide the public and responsible and trustee agencies with information about the potentially significant environmental effects of the proposed program, to identify possible ways to minimize the potentially significant effects, and to describe and evaluate feasible alternatives to the proposed program. Upon certification of the PEIR, the SFPUC may proceed to take action on program approval.

Regarding conservation and recycling in the SFPUC service area, the 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects proposed by SFPUC and its wholesale customers.

The statement that 60 percent of proposed increase in diversions would go to the East Bay is incorrect; please refer to **Response C_Agarw-01**, above.

Christopher Hest, 10/16/07

C_Hest-01 This comment opposing additional Tuolumne River diversions is acknowledged.

Sidney Higgins, 09/20/07

C_Higgi-01 This comment does not address the content or adequacy of the Draft PEIR; no response is needed.

Jeff Hoel, 10/01/07

C_Hoel-01 The purpose and objectives of the WSIP are described in the Draft PEIR (Vol. 1, Chapter 3, pp. 3-5 to 3-10), and the components of the WSIP addressed in the Draft PEIR are described in Sections 3.6 to 3.8 (pp. 3-33 to

3-73). The use of chlorine and chloramines for disinfection of the SFPUC's water supply is part of the ongoing system operations and maintenance and not directly related to implementation of the WSIP. The SFPUC acknowledges that both chlorine and chloramine are considered for planning, operational flexibility, and emergency purposes. As part of ongoing system operations, discharges containing residual disinfectants—chlorine or chloramines—are dechlorinated to address environmental concerns per RWQCB requirements. Chloramine is used to ensure compliance with the federal drinking water regulations (Stage 1 and 2 Disinfectants and Disinfection Byproducts Rule, as discussed in Draft PEIR, Vol. 1, Chapter 2, 2-32). Therefore, consistent with the WSIP water quality objectives; use of chloramine cannot be discontinued for the duration of the WSIP construction projects.

Both chlorine and chloramines are toxic to aquatic species, and would need to be removed from any discharges to surface waters. Because the chlorine or chloramine would be removed from the water prior to discharge, the impacts of discharge of water containing either disinfectant would be the same as described in the Draft PEIR (Vol. 2, Chapter 4, pp. 4.5-35 to 4.5-49; and Vol. 3, Chapter 5, p. 5.5.3-3). Dechlorination removes the toxic chlorine from both waters containing free chlorine and those containing chloramines. The SFPUC does not propose to switch to free chlorine during construction as it would jeopardize the reliability of complying with public health and water quality regulations.

C_Hoel-02 The commenter asks why there would be increased need for chloramination or chlorination supplies in a drought year. There would be no increase in *total systemwide* volume of chloramination or chlorination supplies in a drought year based on the fact that overall system deliveries would be the same or less than a typical year. However, under the WSIP, during drought years the first stage of response would be to implement the supplemental dry-year water supplies, namely the conjunctive-use program within the Westside Groundwater Basin and the TID and MID water transfer (Vol. 1, Chapter 3, pp. 3-42 and 3-43). If supplemental dry-year water supplies are needed from the conjunctive-use program in the Westside Groundwater Basin, chlorination or chloramination of supplies may be required for groundwater sources used during drought years depending on water quality and water demand conditions. This would result in a *localized* increase in chlorination or chloramination supplies to disinfect this water source to meet public health requirements. Groundwater pumped from the Westside Groundwater Basin under the Local and Regional Groundwater Projects (SF-2) will require disinfection prior to being used in the regional water supply system. As discussed in the Draft PEIR (Vol. 1, p. 3-71), this would require approximately 14 new well stations (one for each groundwater production well). Since disinfection would be accomplished with either chlorination or chloramination, the operational change described in

Table 3-12 reflects the materials needed for disinfection of the groundwater during a drought year when groundwater resources would be used.

C_Hoel-03 The comment regarding the State Water Resources Control Board's statement on chloramines is acknowledged.

Construction-related pollutants are listed in the Draft PEIR in Table 4.5-3 (Vol. 2, Chapter 4, p. 4.5-22). The Draft PEIR states "Through compliance with existing regulations and established project procedures as well as implementation of mitigation measures specified in this section, these impacts would be less than significant" (Vol. 2, Chapter 4, p. 4.5-21). With regard to "potential" impacts, impacts are a function of time of year, receiving water volume and water quality, as well as discharge volume and water quality. For construction projects, the SFPUC obtains construction permits and implements Storm Water Pollution Prevention Plans (SWPPP) as required by regulations to minimize erosion and turbid water runoff. In addition, the SFPUC follows sanitary work practices and emergency response plans for these projects. Disinfectants in discharged water are dechlorinated per RWQCB requirements.

The Draft PEIR further states "The San Francisco Bay Basin Plan standard for residual chlorine is 0.0 milligrams per liter and the Central Valley Region General Order for Dewatering and Other Low Threat Discharges to Surface Waters standard for residual chlorine is 0.02 milligrams per liter; thus, dechlorination of any discharges would be required in order to remove all residual chlorine prior to discharge to surface waters, and to assure compliance with RWQCB requirements" (Vol. 2, Chapter 4, p. 4.5-42).

With regards to impacts of environmental effects of chloraminated water, see **Response C_Hoel-01**.

Both chlorine and chloramine dissipate in the water over time. The rate of dissipation depends on many factors such as pH, temperature, disinfectant concentration, dilution, exposure to sunlight etc. Chloramine takes longer to dissipate, but it is not a persistent disinfectant. Discharges containing residual disinfectants chlorine or chloramine are dechlorinated to address environmental concerns per RWQCB requirements. Dechlorination removes the toxic chlorine from both waters containing free chlorine and those containing chloramines. Residual disinfectant chloramine is dechlorinated per RWQCB requirements.

The comment expressing an opinion on the Draft PEIR concerning the efficacy of treatment of chlorine and chloramines is acknowledged. Free chlorine (sodium hypochlorite) is used at the treatment plant to address pathogens (e.g., giardia, viruses). Prior to leaving the treatment plant free chlorine levels are increased and ammonia added to form chloramines. The use of chloramines serves the dual purpose of persistent residual disinfection in the distribution system and reduces the formation of disinfection byproducts. This process meets the Department of Public Health total coliform rule and disinfection byproduct rule. http://www.cdph.ca.gov/certlic/drinkingwater/Pages/default.aspx

The comment stating that "chloramine are more persistent than chlorine" is acknowledged.

The U.S. Environmental Protection Agency provides a comprehensive treatment of chlorine, chloramines, and ammonia in the documents listed below. Toxicity impacts on aquatic organisms for chlorine and chloramines are similar. There is widely available literature on these subjects as well. Presentation of organism-specific effects are discussed to some extent in the following documents, but are not exhaustive.

U.S. Environmental Protection Agency. 1996. Quality Criteria for Water. Office of Water, Regulations and Standards Agency. Washington, DC, EPA 440/5-86-001. May 1. http://www.epa.gov/waterscience/criteria/goldbook.pdf

U.S. Environmental Protection Agency. 1985. *Ambient Water Quality Criteria for Chlorine - 1984*. Office of Water, Regulations and Standards Criteria and Standards Divisions, Washington, D.C. EPA-440/5-84-030. January. http://www.epa.gov/waterscience/criteria/library/ambientwqc/chlorine1984.pdf

U.S. Environmental Protection Agency. 1999. Alternative Disinfectants and Oxidants Guidance Manual. Office of Water. EPA-440/5-84-030. April. http://www.epa.gov/safewater/mdbp/alternative_disinfectants_guidance.pdf

U.S. Environmental Protection Agency. 1999. *1999 Update of Ambient Water Quality Criteria for Ammonia*. Office of Water, Office of Science and Technology, Washington, D.C. EPA-822-R-99-014. December. http://www.epa.gov/waterscience/standards/ammonia/99update.pdf

Humans are not considered aquatic organisms, and use of chlorine, ammonia, and chloramines as disinfection agents is consistent with U.S. EPA drinking water regulations designed for protection of public health.

The comment is acknowledged that the San Francisco Bay Basin Plan standard for residual chlorine is 0.0 milligrams per liter (Vol. 2, Chapter 4, p. 4.5-42; Vol. 3, Chapter 5, p. 5.5.3-3), and that the Draft PEIR identifies four limits, all less than 0.02 mg/L, but not equal to zero. The Central Valley Region General Order for Dewatering and Other Low Threat Discharges to Surface Water standards for residual chlorine is 0.02 mg/l (Vol. 2, Chapter 4, p. 4.5-42). The

Draft PEIR states that “dechlorination of any discharges would be required in order to remove all residual chlorine prior to discharge to surface waters, and to assure compliance with RWQCB requirements” (Vol. 2, Chapter 4, p. 4.5-42). Note that many instruments cannot accurately measure residual chlorine below 0.02 mg/L thus this value was used in the report.

Before SFPUC discharges system water into Crystal Springs Reservoir, the treated water is dechlorinated per RWQCB requirements and ammonia is removed to limit the potential for eutrophication in the reservoir and for operational reasons.

C_Hoel-04 The commenter indicates concern regarding the amount of ammonia removed from system water prior to discharge to Crystal Springs Reservoir. The removal of ammonia is based on flow rate (and thus mass). The Pulgas Dechloramination Facility was designed to remove 90 percent of ammonia for all flows between 10 million gallons per day and 100 million gallons per day.

Ammonia in chloramine that is not removed when water is discharged to Crystal Springs Reservoir, will convert to nitrate via nitrification, as described in the Draft PEIR (Vol. 3, Chapter 5, p. 5.5.3-4) and will not have to be removed prior to treatment.

The Draft PEIR, Section 5.5.3, has been revised to correct the spelling of “phosphorus.” Please see Chapter 16 of this Comments and Responses document.

C_Hoel-05 Reference material cited in the Draft PEIR is available for review by contacting the San Francisco Planning Department at 1650 Mission Street, Suite 400, San Francisco, CA 94103.

The comment on pipe material and the effects of chloramines on pipe materials is acknowledged. The American Water Works Association (http://www.awwa.org/) (AWWA) has published guidelines for chemical compatibility of different materials commonly used in drinking water facilities with chloramine at residual disinfectant concentrations (<4 mg/L). These guidelines are being used during final design for all materials selection decisions. Where new pipe welded steel pipe with cement mortar lining will be employed. Other pipeline materials may be considered on a case by case basis, but consistent with AWWA guidelines.

Jeff Hoffman, 09/20/07

C_Hoffm-01 This comment opposing additional Tuolumne River diversions is acknowledged. The Draft PEIR (Vol. 3, Chapter 5, Sections 5.3.1 through 5.3.8) analyzed the effects of the WSIP on the hydrology, geomorphology, water quality, groundwater, terrestrial biology, fisheries, recreation, and visual quality of the Tuolumne River corridor. As described, implementation of the WSIP would result in several potentially significant adverse impacts on the Tuolumne River and its resources; the Draft PEIR identified mitigation measures to reduce these impacts to less-than-significant levels. Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.5) and to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.6) for clarification regarding current and estimated future municipal and agricultural diversions from the Tuolumne River. Refer also to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

C_Hoffm-02 The opinion of the commenter regarding the San Francisco ballot initiative authorizing the WSIP is acknowledged.

C_Hoffm-03 This comment states that the actions of the SFPUC outside of San Francisco are in direct opposition to the will of San Francisco residents. Extensive public comments were received on the Draft PEIR; these comments, representing a wide range of opinions, are included in Vol. 1 of this Comments and Responses document. A programmatic analysis of the environmental impacts of the facility improvement projects located outside of San Francisco is included in the Draft PEIR (Vol. 2, Chapter 4).

Pei-Lin Hsiung, 10/12/07

C_Hsiun-01 The Draft PEIR analyzed the effects of the WSIP on the hydrology, geomorphology, water quality, groundwater, terrestrial biology, fisheries, and recreation and visual quality of the Tuolumne River corridor in Vol. 3, Chapter 5, Sections 5.3.1 through 5.3.8. Several potentially significant adverse impacts of the WSIP on the Tuolumne River and its resources were identified and mitigation measures developed to reduce the impacts to a less-than-significant level. As this comment does not specify the particular issue(s) in which the commenter believes the analysis presented in the Draft PEIR is inadequate, no specific response is provided. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects proposed by SFPUC and its wholesale customers.

C_Hsiun-02 These comments were submitted by numerous commenters and are responded to in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3).

Noah Hughes, 09/05/07

[See Public Hearing Transcript, Sonora, pp. 41-43]

C_Hughe1-01 This comment states that the use of monthly average values of river flow are inappropriate for analysis of environmental elements that may be affected by hourly, weekly, or daily flows. Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.3).

C_Hughe1-02 The opinion of the commenter expressing the Board of Supervisors' position on the preferred alternative is acknowledged.

C_Hughe1-03 This comment expressing the commenter's understanding of fiscal management of the regional system in the 1990s is acknowledged. This comment does not address the accuracy or adequacy of the Draft PEIR; no response is provided.

Noah Hughes, 09/06/07

[See Public Hearing Transcript, Modesto, pp. 16-18]

C_Hughe2-01 This comment opposing additional Tuolumne River diversions is acknowledged. Regarding environmental sustainability, see **Response C_Clark1-16**.

C_Hughe2-02 This comment states that the use of monthly average values of river flow are inappropriate because it conceals extreme values and understates impacts. Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Sections 14.5.3 and 14.5.4).

Kile Ikemoto, 08/15/07

C_Ikemo-01 This comment opposing additional Tuolumne River diversions and in support of conservation and recycling is acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) regarding conservation to address outdoor water demand in the SFPUC service area and for information related to other conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

Marian Isaac, 09/28/07

C_Issac-01 This comment, which expresses support for more conservation, recycling, and desalination to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Draft PEIR, Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following. For additional information related to conservation programs and recycling projects being implemented or proposed by SFPUC and its wholesale customers, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3). Regarding the use of desalination technologies as a supplemental water supply, refer to **Response C_BramlD1-02**.

Richard Izmirian, 10/01/07

C_Izmir-01 This comment requests for clarification as to why SFPUC is exempt from Section 5937 of the State Fish and Game Code, NOAA requirements, and the Federal Endangered Species Act (FESA). The Draft PEIR describes all of the relevant state and federal regulatory requirements that are applicable to the SFPUC regional water system (see Vol. 1, Chapter 2, Section 2.4, pp. 2-31 thru 2-35). As this comment does not relate to the adequacy of the Draft PEIR, no additional response is provided.

C_Izmir-02 This comment requests that the analysis be revised to include SFPUC's responsibility to release adequate flows downstream of its dams. The Draft PEIR (Vol. 1, Chapter 2, pp. 2-39 to 2-43) describes the SFPUC's obligations for instream flow releases.

Mitchell Johnson, 09/13/07

C_JohnsM-01 This comment, which expresses opposition to additional diversions from the Tuolumne River and support for more conservation to meet water demand, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for a discussion of conservation programs and recycling projects being implemented or proposed by SFPUC and its wholesale customers.

Sieglinde Johnson, 09/20/07

C_JohnSie-01 This comment, which expresses support for more conservation and recycling to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Draft PEIR, Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives evaluated in the Draft PEIR that do not include additional diversions from the Tuolumne River, refer to the descriptions of the Year-round Desalination at Oceanside Alternative (Vol. 4, Chapter 9, Section 9.2.4), and Aggressive Conservation/Water Recycling and Local Groundwater Alternative (Without Tuolumne River Supplement) (Vol. 4, Chapter 9, Section 9.2.6). Please also refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by SFPUC and its wholesale customers.

Silvia Johnson, 09/20/07

[See Public Hearing Transcript, San Francisco City Hall, September 20, 2007, pp. 35-36]

C_JohnsSil-01 This comment does not address the content or the adequacy of the Draft PEIR; no response is needed.

Lindsay and Ken Joye, 09/11/07

C_Joye-01 This comment, requesting that SFPUC consider the conservation programs of other progressive water agencies, and consider incentive programs and landscape standards, is acknowledged. The reference to the efforts by other water agencies is similar to comments submitted by numerous commenters which are responded to in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) under the heading Frequently Submitted Comments Addressing Conservation and Recycling. Please also refer to Tables 14.2-6, 14.2-7, 14.2-8 regarding the conservation programs, including programs to reduce outdoor water use, being implemented or proposed by the SFPUC and its wholesale customers. Regarding the statement that a comprehensive watershed study should be completed, please refer to **Response C_Breso-01**.

Mike Kahn, 09/17/07

C_Kahn-01 This comment, which expresses support for more conservation and recycling to meet water demand and opposition to additional diversions from the Tuolumne River or any other water source, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Draft PEIR, Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives evaluated in the Draft PEIR that do not include additional diversions from the Tuolumne River, refer to the descriptions of the Year-round Desalination at Oceanside Alternative (Vol. 4, Chapter 9, Section 9.2.4), and Aggressive Conservation/Water Recycling and Local Groundwater Alternative (Without Tuolumne River Supplement) (Vol. 4, Chapter 9, Section 9.2.6). Please also refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by SFPUC and its wholesale customers.

Gwynn Kaliner-MacKellen, 09/20/07

C_Kalin-01 This comment, which expresses support for more conservation and recycling to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects proposed by SFPUC and its wholesale customers. Regarding graywater systems, refer to the discussion in Section 14.2.3 under the heading Conservation Measures Suggested by Commenters. Regarding the effects of climate change on the Tuolumne River, refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14, Section 14.11.4).

Emeric Kalman, 09/20/07

[See Public Hearing Transcript, San Francisco City Hall, September 20, 2007, pp. 33-35]

C_Kalma-01 This comment expresses an opinion that there was inadequate noticing of the Draft PEIR public hearing dates. Please see **Responses F_USDAFS-05** and **L_SFCPC1-01**, and **Appendix J1** (Vol. 8) of this Comments and Responses document for detailed information on the public outreach efforts conducted by the San Francisco Planning Department's Major Environmental Analysis Division.

Suzanne Keebra, 10/01/07

C_Keebr-01 The comment expresses support for retrofitting the Hetch Hetchy system, and (with Comment C_Keebr-02) asserts that the SFPUC should separate the seismic improvements from the proposed water supply option. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.5) regarding the integration of the seismic improvements and water supply option to meet program objectives, and for a discussion of the advantages of using a program EIR to evaluate the proposed program as a whole.

C_Keebr-02 This comment expressing support of more conservation and recycling to meet water demand and against additional diversions from the Tuolumne River is acknowledged. Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for discussion of conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers. Regarding graywater systems, refer to the discussion in Section 14.2.3 under the heading Conservation Measures Suggested by Commenters.

Michael Kelleher, 10/01/07

C_Kelle-01 This comment expresses an opinion about the value of natural resources and requests that CCSF "give careful consideration to the recommendations you get from all sides and make a decision that will benefit California in perpetuity." This comment is acknowledged.

Michelle Kim, 09/20/07

C_Kim-01 This comment, which expresses support for more conservation and recycling to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers. Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

The comment also requests that the economic consequences of the proposed program be evaluated. Refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.6) regarding the scope of the PEIR with respect to economic evaluations.

Carl King, 10/01/07

C_KingC-01 This comment expressing support of more conservation and recycling to meet water demand and opposing additional diversions from the Tuolumne River is acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for a discussion of conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers. The comment also states that the plan to increase diversions does not adequately consider the recreational benefits of the wild and scenic Tuolumne River. Please refer to **Response C_Barsa-01** for a discussion of potential impacts on future whitewater recreation under the WSIP. Please refer also to **Response L_Tuol1-09** regarding the potential effects of the WSIP on those reaches of the Tuolumne River designated as wild and scenic.

David King, 10/01/07

C_KingD-01 This comment opposing urban sprawl is acknowledged.

Kenneth King, 10/15/07

C_KingK-01 This comment opposing additional Tuolumne River diversions and expressing support for sustainable alternatives is acknowledged. For descriptions of alternatives evaluated in the Draft PEIR that do not include additional diversions from the Tuolumne River, refer to the descriptions of the Year-round Desalination at Oceanside Alternative (Vol. 4, Chapter 9, Section 9.2.4), and Aggressive Conservation/Water Recycling and Local Groundwater Alternative (Without Tuolumne River Supplement) (Vol. 4, Chapter 9, Section 9.2.6). Please also refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

John Kramer, 09/05/07

C_Krame1-01 This comment questions how the WSIP would address counties of origin water rights. Please refer to **Response L_Tuol1-04**.

C_Krame1-02 Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.5) regarding the integration of the seismic improvements and water supply option to meet program objectives, and for a discussion of the advantages of using a program EIR to evaluate the proposed program as a whole.

John Kramer, 10/11/07

C_Krame2-01 The Draft PEIR (Vol. 3, Chapter 5, Sections 5.3.1 through 5.3.8) analyzed the effects of the WSIP on the hydrology, geomorphology, water quality, groundwater, terrestrial biology, fisheries, recreation, and visual quality of the

Tuolumne River corridor. As described, implementation of the WSIP would result in several potentially significant adverse impacts on the Tuolumne River and its resources; the Draft PEIR identified mitigation measures to reduce these impacts to less-than-significant levels. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.6) for pertinent response regarding the scope of the PEIR with respect to economic evaluations.

C_Krame2-02 See **Response C_Krame1-02**.

Aldora Lee, 09/25/07

C_Lee-01 This comment stressing the importance of seismic improvements to the regional water system is acknowledged.

C_Lee-02 This comment opposing additional Tuolumne River diversions is acknowledged. Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

C_Lee-03 This comment states that demand analyses do not sufficiently take into consideration conservation and recycling. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Draft PEIR, Vol. 1, Chapter 3, pp. 3-16 to 3-22). Please refer also to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2) regarding the methodology used by the SFPUC in collaboration with its wholesale customers and BAWSCA to project demand and to Section 14.2.3 (Vol. 7, Chapter 14, Section 14.2) for additional information related to conservation programs and recycling projects being implemented or proposed by SFPUC and its wholesale customers.

C_Lee-04 Please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14) for additional discussion of climate change to augment the discussion presented in Section 5.7.6 of the Draft PEIR (Vol. 3, Chapter 5, pp. 5.7-92 to 5.7-96). Section 14.11 of this document provides more detailed and up-to-date information on climate change as it relates to the SFPUC regional water supply and the proposed WSIP.

Ben Leet, 08/16/07

C_Leet-01 This comment expressing support for conservation is acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects proposed by SFPUC and its wholesale customers.

Linda Lewin, 09/20/07

C_Lewin-01 See **Response C_HerroK-01**.

C_Lewin-02 This comment expressing support for more conservation and recycling to meet water demand and against additional diversions from the Tuolumne River is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, Section 3.4.4, pp. 3-16 to 3-22). For descriptions of alternatives that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

Sidney Liebes, 09/19/07

[See Public Hearing Transcript, Palo Alto, p. 23]

C_Liebe-01 This comment endorses the remarks of Peter Drekmeier (Bay Area Program Director at the Tuolumne River Trust) regarding the WSIP. This comment is acknowledged. Regarding environmental sustainability, refer to **Response C_Clark1-16**.

Kingman Lim, 09/11/07

C_Lim-01 This comment, which expresses support for more conservation to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Draft PEIR, Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives evaluated in the Draft PEIR that do not include additional diversions from the Tuolumne River, refer to the descriptions of the Year-round Desalination at Oceanside Alternative (Vol. 4, Chapter 9, Section 9.2.4), and Aggressive Conservation/Water Recycling and Local Groundwater Alternative (Without Tuolumne River Supplement) (Vol. 4, Chapter 9, Section 9.2.6). Please also refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

Carissa Look, 09/20/07

C_Look-01 This comment, which expresses support for more conservation and recycling to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers; regarding comparisons to the achievements in other areas in reducing demand, refer to the discussion under Frequently Submitted Comments Addressing Conservation and Recycling.

Regarding the location of the SFPUC service area, refer to Draft PEIR Figure 3.2 (Vol. 1, Chapter 3, p. 3-6); as shown, the service area includes portions of the South Bay and San Francisco Peninsula in addition to portions of the East Bay and San Francisco. Regarding specific projections of future demand and purchases from the SFPUC regional system, refer to Table 3.3 or Table 7.2 (Vol. 1, Chapter 3, p. 3-18 and Vol.4, Chapter 7, p. 7-15, respectively). Table 3.4 and Table 7.3 (Vol. 1, Chapter 3, p. 3-19 and Vol. 4, Chapter 7, p. 7-18, respectively) include information on projected increases in demand and purchases from the 2001 base year used in the demand projections.

Judith LoVuolo-Bhushan, 09/24/07

C_LoVuo-01 This comment expressing concern about increased diversions and support for more conservation to meet water demand, and suggesting that the SFPUC work with Acterra on a conservation plan, is acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects proposed by SFPUC and its wholesale customers.

Janet Lowry, 10/01/07

C_Lowry-01 This comment, which expresses support for more conservation and recycling to meet water demand and for alternatives that protect the Tuolumne River from additional diversions, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

Sheri Lubin, 09/19/07

C_Lubin-01 The commenter’s support for conservation, conservation outreach, recycling, and replacement of lawns with low/no-water-use landscaping is acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) regarding the specific conservation measures currently being implemented and those to which the SFPUC and its wholesale customers have committed under the WSIP.

Erik Lundberg, 09/19/07

C_Lundb-01 This comment opposing additional Tuolumne River diversions is acknowledged.

Tyana Maddock, 09/18/07

C_Maddo-01 This comment opposing additional Tuolumne River diversions is acknowledged. Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

Ramses Madou, 09/19/07

[See Public Hearing Transcript, Palo Alto, p. 17]

C_Madou-01 This comment opposing additional Tuolumne River diversions, urging additional conservation to reduce future water demand, and expressing concern for biological resources in the Tuolumne River watershed, is acknowledged**.** Impacts of the proposed diversions on biological and fisheries resources of the Tuolumne River corridor were analyzed in the Draft PEIR (Vol. 3, Chapter 5, Sections 5.3.6 and 5.3.7). As described, implementation of the WSIP would result in several potentially significant adverse impacts on the Tuolumne River and its resources; the Draft PEIR identified mitigation measures to reduce these impacts to less-than-significant levels. Refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

Nick Magol, 09/20/07

C_Magol-01 This comment opposing additional Tuolumne River diversions and expressing support for additional water conservation is acknowledged. Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

Mary Jane Marcus, 09/19/07

[See Public Hearing Transcript, Palo Alto, pp. 10-12]

C_Marcu-01 This comment, which advocates more conservation through public awareness, education, and involvement in determining conservation potential, and expresses opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

Elliot Margolies, 09/19/07

[See Public Hearing Transcript, Palo Alto, pp. 35-36]

C_Margo-01 This comment encouraging additional water conservation and recycling is acknowledged. Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for pertinent response related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

James Marshall, 09/09/07

C_Marsh-01 This comment, which expresses support for more conservation and recycling to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

Michael Martin, 09/26/07

C_MartiM-01 This comment expresses concerns related to the effects of additional Tuolumne River diversions on spring-run Chinook salmon, fall-run Chinook salmon, and Central Valley steelhead below La Grange Dam. As described in the Draft PEIR, the San Francisco Planning Department determined that long-term WSIP-induced flow changes in the Tuolumne River below La Grange Dam could have a significant adverse effect on anadromous fish, including steelhead and fall-run Chinook salmon, along this reach of river (Vol. 3, Chapter 5, pp. 5.3.6-28 to 5.3.6-32). No spring-run Chinook salmon currently exist in the Tuolumne River. Spring-run Chinook typically spawn in the upper reaches of watersheds, which have been inaccessible to migratory fish in the Tuolumne River for more than 100 years.

The Draft PEIR determined that WSIP effects on flow and temperature would infrequently contribute to potentially significant effects on these fishery resources. As a result, the impact of the WSIP on these fishery resources in the lower Tuolumne River was determined to be potentially significant. Implementation of Mitigation Measures 5.3.6-4a (Avoidance of Flow Changes By Reducing Demand for Don Pedro Reservoir Water), or 5.3.6-4b (Fishery Habitat Enhancement) would reduce these impacts to a less-than-significant level (Vol. 4, Chapter 6, pp. 6-48 and 6-49). Please see **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Sections 14.7.2 and 14.7.3) for supplementary information on the presence of steelhead and Chinook salmon along this reach of the lower river, and additional discussion on Mitigation Measures 5.3.6-4a and 5.3.6-4b, including text revisions to Measure 5.3.6-4b that add further definition to the habitat enhancement effort.

C_MartiM-02 This comment correctly states that the majority of the future demand resides outside of San Francisco, as shown in Draft PEIR Table 3.3 (Vol.1, Chapter 3, p. 3-18). The comments on outdoor use and demand projections were submitted by numerous commenters and are responded to in **Section 14.2, Master Response on Demand Projections, Conservation and Recycling** (Vol. 7, Chapter 14, Section 14.2.2). Regarding the statement in support of conservation and recycling to meet future increases in demand, the 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78).

C_MartiM-03 This comment expresses concern regarding the effects of additional Tuolumne River diversions on property values, tourism, and recreation resources in the upper Tuolumne River watershed. For a discussion of CEQA requirements with respect to economic effects on Tuolumne County residents, businesses, and tourism prior, please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.6).

C_MartiM-04 This comment expresses concern regarding the potential effects of climate change and how it will affect water supply. More specifically, the commenter requests that the PEIR include an analysis of the effects of drought and water shortage and provide a discussion regarding how the SFPUC would meet demand during those critical times. Refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14, Section 14.11.4) for information regarding effects of climate change on the Tuolumne River watershed and associated effects on SFPUC's system operations and water yield. Please also refer to Section 14.11.5 under the heading SFPUC's Actions to Address Climate Change for information regarding SFPUC's current efforts to evaluate their water supply planning with respect to climate change.

This comment also states that reduced flows in the San Joaquin River basin has resulted in low recruitment of anadromous salmonid populations. See **Section 14.8, Master Response on Delta and San Joaquin River Issues** (Vol. 7, Chapter 14, Section 14.8.2) for a discussion of WSIP effects on the San Joaquin River and Delta.

C_MartiM-05 This comment expressing support for alternatives that would avoid increases in diversions from the Tuolumne River is acknowledged. These alternatives include the Year-round Desalination at Oceanside Alternative (see Draft PEIR Vol. 4, Chapter 9, Section 9.2.6, p. 9-66) and Aggressive Conservation/Water Recycling and Local Groundwater Alternative (Without Tuolumne River Supplement) (see Section 9.2.4, p. 9-47). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

C_MartiM-06 This comment states that the Draft PEIR lacks sufficient description of the potential impacts of the WSIP on the Lower Tuolumne River, particularly with respect to anadromous fish populations. See **Response C_MartiM-01**. This comment also states that the WSIP fails to address consistency with on-going State and Federal resource agency activities, studies, and actions that may be compromised by additional Tuolumne River Diversions. Refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.5) and **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.6) for clarification regarding current and estimated future municipal and agricultural diversions from the Tuolumne River. With respect to the commenter's request for additional studies, please refer to **Response C_Breso-01**.

Sofia Martinez, 08/15/07

C_MartiS-01 This comment, which expresses support for using recycled water for outdoor water use and opposition to additional diversions from the Tuolumne River, is acknowledged. The proposed WSIP includes recycled water projects in the SFPUC service area totaling 9 to 14 mgd by 2030 (Vol. 1, Chapter 3, pp. 3-18 and 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please also refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers; regarding conservation and recycling to meet outdoor water demand refer to the discussion under the heading Frequently Submitted Comments on Conservation and Recycling.

Len Materman, 09/19/07

[See Public Hearing Transcript, Palo Alto, pp. 44-45]

C_Mater-01 This comment states that the Draft PEIR inadequately and inconsistently addresses the topic of climate change and global warming. Please see **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14) for additional discussion of climate change to augment the discussion presented in Section 5.7.6 of the Draft PEIR (Vol. 3, Chapter 5, pp. 5.7-92 to 5.7-96). Section 14.11 of this document provides more detailed and up-to-date information on climate change as it relates to the SFPUC regional water supply and the proposed WSIP.

C_Mater-02 The commenter states that although impacts to special-status species were discussed, ecosystems were not adequately addressed. In both Chapter 4 (Vol. 2, Chapter 4, Section 4.6) and in Chapter 5 (Vol. 3, Chapter 5, Sections 5.3.7, 5.4.6 and 5.5.6), impacts on both special-status species and sensitive natural communities are analyzed.

Jonathan McClelland, 09/26/07

C_McCle-01 This comment, which expresses support for more conservation to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers. Tables 14.2-6, 14.2-7, and 14.2-8 in Section 14.2 show the specific conservation measures currently being implemented and those to which the SFPUC and SFPUC wholesale customers have committed under the WSIP.

Karl McCollom, 11/07/07

C_McCol-01 Please refer to **Response C_Breso-01**.

C_McCol-02 This comment expressing support for more conservation and recycling to meet water demand and for alternatives that protect the Tuolumne River from additional diversions is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, Section 3.4.4, pp. 3-16 to 3-22). Alternatives that would reduce diversions from the Tuolumne River are described in the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

Mike McConnell, 09/07/07

C_McCon-01 This comment, which expresses support for more conservation and recycling to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

Keith & Luella McFarland, 09/13/07

C_McFar-01 This comment opposing additional Tuolumne River diversions is acknowledged.

Julie McKee, 09/29/07

C_McKee-01 This comment, which expresses support for more conservation to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect

22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects proposed by SFPUC and its wholesale customers.

Robert Means, 09/18/07

C_Means1-01 This comment states that water needs are best addressed through conservation. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

Robert Means, 09/18/07

[See Public Hearing Transcript, Fremont, pp. 20-22]

C_Means2-01 This comment, which expresses support for more conservation and recycling to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78).

Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.5), and to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7., Chapter 14, Section 14.7.6) for clarification regarding current and estimated future municipal and agricultural diversions from the Tuolumne River.

Regarding the assertion that demand projections are faulty, and for a discussion of current and planned conservation and recycling in the SFPUC service area, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14).

C_Means2-02 The methodology used to develop demand projections is described in Draft PEIR Chapter 3 and in more detail in Appendix E.2 (Vol. 5). Refer also to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2). This part of Section 14.2 also addresses the commenter's assertion regarding per capita demand, which was submitted by many commenters. Regarding the commenter's support for more conservation and efficiency to meet future demand, the 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). Alternatives to the WSIP that would reduce diversions from the Tuolumne River, are described in the following sections of Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

Christina and Chet Melnarik, 09/18/07

C_Melna-01 This comment expressing the commenter's opinion that the environmental impacts of water diversions from the Tuolumne River outweigh the benefit and that Bay Area water districts should be leaders in conservation and recycling is acknowledged. The California Environmental Quality Act (CEQA) requires a public agency with approval authority over a project to balance a project's benefits (economic, legal, social, technological, or other) against any unavoidable environmental risks (the "costs" implied in this comment) when determining whether to approve the project.[3] When an agency approves a project that will result in the occurrence of significant effects that are not avoided or substantially lessened through adopted mitigation measures, the

[3] CEQA Guidelines Sections 15043 and 15093.

agency must state in writing the specific reasons to support its action. Alternatively, the agency can adopt measures to mitigate significant environmental effects or adopt an alternative to the project that lessens the project's effects.

As stated in Draft PEIR (Vol. 1, Chapter 1, p. 1-1 and p. 1-9), the San Francisco Planning Department prepared the Draft PEIR to provide the public and responsible and trustee agencies with information about the potentially significant environmental effects of the proposed program, to identify possible ways to minimize the potentially significant effects, and to describe and evaluate feasible alternatives to the proposed program. Upon certification of the PEIR, the SFPUC may proceed to take action on program approval.

Regarding conservation and recycling in the SFPUC service area, the 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers. Regarding the use of graywater, refer to the discussion in Section 14.2.3 under the heading Conservation Measures Suggested by Commenters.

Bill Mensing, 09/06/07

C_Mensi-01 This comment opposing additional Tuolumne River diversions is acknowledged.

Karen Menuz, 09/09/07

C_Menuz-01 This comment, which expresses support for more conservation and recycling to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

Steven Merlo, 09/20/07

C_Merlo-01 This comment opposing additional Tuolumne River diversions and supporting more efficiency is acknowledged. For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

Ivo Mijac, 10/01/07

C_Mijac-01 This comment supporting adoption of landscaping policies, more conservation and recycling to meet water demand, and opposition to additional diversions from the Tuolumne River, is acknowledged. Refer to **Tables 14.2.2**, **14.2.3**, and **14.2.4** of **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) regarding the specific conservation measures currently being implemented and those to which SFPUC and its wholesale customers have committed under the WSIP. As shown, measures include landscape audits and, in the wholesale customer service area, xeriscape education.

With respect to conservation and recycling, the 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers. Regarding the commenter's request for additional studies to adequately identify and address impacts on the Tuolumne River, please refer to **Response C_Breso-01**. Regarding the effects of climate change on the river, please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14, Section 14.11.4).

Eric Millette, 10/01/07

C_Mille-01 This comment, which expresses support for more conservation to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

Naomi Mindelzun, 09/20/07

C_MindeN-01 This comment, which expresses support for more conservation and efficiency measures to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). For information on the demand projections prepared for the WSIP and additional information on conservation and recycling, please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14). Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7. Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

Robert E. Mindelzun, 09/23/07

C_MindeR-01 This comment, which expresses support for more conservation and efficiency measures to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers. Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7. Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

Peter Neal, 09/21/07

C_Neal-01 This comment stresses the need for seismic improvements to the regional water system but opposes additional Tuolumne River diversions. The commenter also states that the Draft PEIR does not adequately address the impacts of additional Tuolumne River diversions and recommends that the SFPUC use a two-tiered approach that separates the seismic improvements from the proposed water supply option.

The Draft PEIR (Vol. 3, Chapter 5, Sections 5.3.1 through 5.3.8) analyzed the effects of the WSIP on the hydrology, geomorphology, water quality, groundwater, terrestrial biology, fisheries, recreation, and visual quality of the Tuolumne River corridor. As described, implementation of the WSIP would result in several potentially significant adverse impacts on the Tuolumne River and its resources; the Draft PEIR identified mitigation measures to reduce these impacts to less-than-significant levels. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.5) regarding the integration of the seismic improvements and water supply option to meet program objectives, and for a discussion of the advantages of using a program EIR to evaluate the proposed program as a whole.

Erna Nore, 09/26/07

C_Nore-01 This comment, which expresses support for more conservation and recycling to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7. Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

William Noren, 10/10/07

C_Noren1-01 This comment expresses opposition to additional Tuolumne River diversions and requests that additional studies be conducted before the PEIR is finalized. Please see **Response C_Breso-01**.

C_Noren1-02 This comment expressing support for alternatives that would avoid increases in diversions from the Tuolumne River is acknowledged. These alternatives include the Year-round Desalination at Oceanside Alternative (see Draft PEIR Vol. 4, Chapter 9, Section 9.2.6, p. 9-66) and the Aggressive Conservation/Water Recycling and Local Groundwater Alternative (Without Tuolumne River Supplement) (see Section 9.2.4, p. 9-47).

C_Noren1-03 This comment, which expresses support for more conservation and recycling as a means to meet water demand while minimizing impacts on the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7. Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

C_Noren1-04 This comment, which expresses the commenter's opinion that agribusiness wastes more water than cities do, but that use and disposal of water by residences and businesses in cities requires more energy, and that water use must be addressed on both fronts, is acknowledged. Refer also to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7. Chapter 14, Section 14.2.3) for information on the specific conservation measures currently being implemented and those to which the SFPUC and its wholesale customers have committed under the WSIP. Regarding water use by the agricultural sector, the commenter may be interested to note that a component of the Modified WSIP Alternative involves the yearly transfer of *conserved* agricultural water from the Modesto and Turlock irrigation districts to the SFPUC (Vol. 4, Chapter 9, p 9-79).

C_Noren1-05 This comment expressing support for implementation of water saving technology and reducing water waste by agribusiness is noted. Regarding conservation under the WSIP, please refer to **Response C_Noren1-03**.

William Noren, 09/18/07

[See Public Hearing Transcript, Fremont, pp. 22-24]

C_Noren2-01 This comment expressing an opinion regarding sustainable resource management is acknowledged; as it does not address the adequacy or accuracy of the PEIR, no response is provided.

Margaret Okuzumi, 10/12/07

C_Okuzu-01 The comment states that a comprehensive study of baseline conditions must be conducted in order to properly analyze the impacts of the project on the upper Tuolumne River. Please refer to **Response C_Breso-01**. Please also refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7. Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

C_Okuzu-02 This comment opposes additional Tuolumne River diversions. The Draft PEIR includes a detailed analysis of the potential impacts of the proposed WSIP water supply and system operations on the Tuolumne River (Vol. 3, Chapter 5, Section 5.3). Section 5.3 addresses environmental resources that could be affected by the proposed water supply option and system operations: surface water hydrology, geomorphology, water quality, groundwater, fisheries and aquatic resources, riparian resources, recreational and visual resources, Delta water supplies, and energy. As indicated in Section 5.3.6 (beginning on p. 5.3.6-25), impacts to fishery resources in Hetch Hetchy Reservoir and Don Pedro Reservoir, and along the Tuolumne River between Hetch Hetchy Reservoir and Don Pedro Reservoir would be less than significant. Impacts to fishery resources along the Tuolumne River below La Grange Dam would be potentially significant, but would be reduced to less-than-significant levels with implementation of either Measure 5.3.6-4a (Vol. 4, Chapter 6, p. 6-48), or (if Measure 5.3.6a proves to be infeasible) Measure 5.3.6b (pp. 6-48 and 6-49). As indicated in Section 5.3.3 (beginning on p. 5.3-13), the effects of the WSIP on water quality along the San Joaquin River and the Sacramento-San Joaquin Delta would be less than significant. Further, as discussed in Section 5.3.8 (p. 5.3.8-23), the effects of the WSIP on recreational uses along the Tuolumne River would also be less than significant. Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7. Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

C_Okuzu-03 This comment, which expresses the commenter's opinion that the environmentally superior alternative is one that requires more conservation and recycling, rather than additional diversions from the Tuolumne River, and that the PEIR should reach this conclusion, is acknowledged. Alternatives that would reduce diversions from the Tuolumne River are described in the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). The Draft PEIR (Vol. 4, Chapter 9, p. 9-95 to 9-96) identified the Modified WSIP Alternative, which includes more conservation, water recycling and local groundwater projects than does the WSIP, as the environmentally superior alternative. Refer to pp. 9-95 to 9-96 for more information on the basis for identifying the Modified WSIP Alternative as the environmentally superior alternative. Please also refer to **Section 14.10, Master Response on Modified WSIP Alternative** (Vol. 7, Chapter 14, Section 14.10.3) for additional information.

The statement that the employment projections used to develop future demand estimates are inflated was submitted by numerous commenters and is responded to in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7. Chapter 14, Section 14.2.2). For information regarding the conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers please also refer to **Section 14.2** (Vol. 7. Chapter 14, Section 14.2.3).

Jenna Olsen, 09/20/07

[See Public Hearing Transcript, San Francisco City Hall, September 20, 2007, pp. 23-25]

C_Olsen-01 This comment expresses an opinion that San Francisco should strive to be a leading city in sustainable water management and encourages increased water efficiency and conservation. Please refer to **Response C_Clark1-16**.

Kay O'Neill, 09/19/07

C_ONeil-01 This comment, which expresses support for more conservation and recycling to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7. Chapter 14, Section 14.2.3), for information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

The commenter's opinion that agricultural and industrial water use needs to be reviewed and not subsidized is acknowledged. The proposed WSIP would involve neither agricultural subsidy nor use of water for agriculture. Regarding the implication that industrial water use is subsidized, note that the SFPUC and all but one of the wholesale customers implement California Urban Water Conservation Council Best Management Practice No. 4, Metering with Commodity Pricing, as shown in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7. Chapter 14, Section 14.2.3). For additional discussion of projected nonresidential water use refer to Section 14.2.2).

Ellie Owen, 09/05/07

[See Public Hearing Transcript, Sonora, p. 31]

C_Owen-01 This comment questions how the yield of water is calculated from a glacier and requests additional information regarding the coupled effect of drought and global warming. Please see **Section 14.11, Master Response on Climate Change** (Vol. 7. Chapter 14) for additional discussion of climate change to augment the discussion presented in Section 5.7.6 of the Draft PEIR (Vol. 3, Chapter 5, pp. 5.7-92 to 5.7-96).

Anne Pagliarulo, 09/20/07

C_Pagli-01 This comment, which expresses support for more conservation and recycling to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7. Chapter 14, Section 14.2.3) for information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

Doug Parkes, 09/29/07

C_Parke-01 This comment recommends that the SFPUC pursue a two-tiered approach that separates the seismic improvements from the proposed changes in water supply sources. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.5) regarding the integration of the seismic improvements and water supply option to meet program objectives, and for a discussion of the advantages of using a program EIR to evaluate the proposed program as a whole. (Note that the correct name of the proposed program is the Water System Improvement Program [WSIP], and not the Water Improvement Program ([WIP].)

C_Parke-02 This comment that the demand forecasts pay little attention to conservation or changes in the price of water requires clarification and is essentially incorrect. The estimated water *purchases* from the SFPUC (that is, the demand on the SFPUC regional system) consider conservation and the future price of water; refer to **Section 14.2, Master Response on Demand Projections, Conservation and Recycling** (Vol. 7. Chapter 14, Section 14.2.2). This comment correctly states that 4 percent of demand is expected to be met by conservation; this level refers to savings from active conservation programs to which the SFPUC and wholesale customers have committed. Draft PEIR

Table 3.3 (Vol. 1, p. 3-18) and Table 7.2 (Vol. 4, p. 7-15) show the estimated level of water conservation assumed in the purchase estimates submitted by each water customer. The average of the estimated range of conservation (13-19 mgd) represent about 4 percent of the total 2030 demand (417 mgd) for the service area. Note that an additional 36 mgd is expected to result from implementation of plumbing code requirements (or "passive conservation"). As part of the planning effort for the proposed program, the SFPUC, in conjunction with its wholesale customers and BAWSCA, conducted extensive studies—including technical studies on conservation and recycled water use potential. These studies are described in the Draft PEIR (Vol. 1, Chapter 3, pp. 3.16 to 3-22, and Vol. 5, Appendix E.2) and in **Section 14.2, Master Response on Demand Projections, Conservation and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) under the heading Background.

Regarding the statements in this comment about per-capita and outdoor water use; please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7. Chapter 14, Section 14.2.2), under the headings Per-Capita Demand and Outdoor Water Use, respectively.

C_Parke-03 This comment expressing support for more conservation and recycling to meet water demand and opposition to additional diversions from the Tuolumne River is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, Section 3.4.4, pp. 3-16 to 3-22). For descriptions of alternatives that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7. Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects proposed by SFPUC and its wholesale customers. Regarding the specific conservation measures currently being implemented and those to which the SFPUC and its wholesale customers have committed under the WSIP, refer to Section 14.2.

C_Parke-04 This comment, requesting that additional studies on the Tuolumne River, was submitted by numerous commenters; see **Response C_Breso-01** for response.

Kathy Perl, 09/20/07

C_Perl-01 This comment expressing support for more conservation, recycling, and desalination to meet water demand and opposition to additional diversions from the Tuolumne River is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7. Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

The Draft PEIR analyzes the use of desalination technologies as a supplemental water supply in the discussions for the Year-round Desalination at Oceanside Alternative (Vol. 4, Chapter 9, Section 9.2.6) and Variant 2 – Regional Desalination for Drought (Vol. 4, Chapter 9, Section 9.2.7). As indicated in Table 9-6 (pp. 9-14 thru 9-16), it is uncertain whether these two alternatives are capable of meeting all WSIP goals and objectives related to sustainability and the cost-effective use of funds, and these alternatives would only partially meet the WSIP objective of maintaining a gravity-driven system. Also, the Year-round Desalination at Oceanside Alternative would only partially meet WSIP objectives related to delivery reliability during planned maintenance. The commenter’s opinion that the planet is endangered by overpopulation is acknowledged.

Ron Pickup, 09/05/07

[See Public Hearing Transcript, Sonora, pp. 37-38]

C_Picku-01 This comment, which expresses support for more conservation and recycling to develop a more sustainable water supply, as many other cities have accomplished, and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7. Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

The statement that the “county of origin … has already provided you 20 million gallons per day [mgd] from our river” is incorrect. Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.5) and to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.6) for clarification regarding current and estimated future municipal and agricultural diversions from the Tuolumne River.

J. Poulton, 09/26/07

C_Poult-01 This comment incorrectly states that the proposed WSIP does not include conservation, and expresses support for alternatives that reduce Tuolumne River diversions. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). Alternatives to the WSIP that would reduce diversions from the Tuolumne River are described in the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7. Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects proposed by SFPUC and its wholesale customers.

Regarding the Draft PEIR consideration of impacts on the river or people living near it, the Draft PEIR (Vol. 3, Chapter 5, Sections 5.3.1 through 5.3.8) analyzed the effects of the WSIP on the hydrology, geomorphology, water quality, groundwater, terrestrial biology, fisheries, recreation, and visual quality of the Tuolumne River corridor. As described, implementation of the WSIP would result in several potentially significant adverse impacts on the Tuolumne River and its resources; the Draft PEIR identified mitigation measures to reduce these impacts to less-than-significant levels. Assuming this comment also refers to potential economic impacts, please refer **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 4, Section 14.1.6) regarding CEQA requirements related to economic evaluations, and the environmental effects that some commenters perceive could cause economic impacts for Tuolumne County residents, businesses, and tourism.

Paul Raffaeli, 10/01/07

C_Raffa-01 This comment opposing additional Tuolumne River diversions is acknowledged.

C_Raffa-02 This comment opposes additional Tuolumne River diversions and refers to the specific comments presented in Comments C_Raffa-03 through C_Raffa-12; refer to **Responses C_Raffa-03** through **C_Raffa-12** for the specific responses.

C_Raffa-03 The background information related to the Tuolumne River watershed corroborates information presented in the Draft PEIR (Vol. 3, Chapter 5, Sections 5.2 and 5.3). The range of current SFPUC diversions from the Tuolumne River presented in this comment is inaccurate. Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.5) and to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.6) for clarification regarding current and estimated future municipal and agricultural diversions from the Tuolumne River. Please also refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

Regarding the statement that outdoor water use is driving 60 percent of the anticipated increase in water demand, refer to **Section 14.2, Master Response on Demand Projections, Conservation and Recycling** (Vol. 7, Chapter 14, Section 14.2.2), under the heading Outdoor Water Use.

C_Raffa-04 The comment that the Draft PEIR used flawed modeling to determine the anticipated increase in water demand, thus inflating future needs was submitted by numerous commenters and is responded to in **Section 14.2, Master Response on Demand Projections, Conservation and Recycling** (Vol. 7, Chapter 14, Section 14.2.2). The statement that the anticipated increase in demand projected by the SFPUC is “large and out of step” compared to other metropolitan areas also was submitted by numerous commenters and is responded to in **Section 14.2** (Vol. 7, Chapter 14, Section 14.2.3) under the heading Frequently Submitted Comments Addressing Conservation and Recycling.

C_Raffa-05 This comment states that there is a lack of adequate baseline data for the Tuolumne River to properly analyze the environmental consequences of additional diversions. Please refer to **Response C_Breso-01** for response.

C_Raffa-06 This comment states that the Draft PEIR does not take into consideration the impact of climate change on precipitation in the Tuolumne River watershed. Please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14, Section 14.11.4) for information regarding current studies and models that are being used to forecast the effects of climate change on the SFPUC’s regional water system.

C_Raffa-07 These comments were submitted by numerous commenters and are responded to in **Section 14.2, Master Response on Demand Projections, Conservation and Recycling** (Vol. 7, Chapter 14, Section 14.2.3).

C_Raffa-08 This comment encourages the SFPUC to reduce its reliance on the Tuolumne River to protect the ecosystems and functions of the river and to prepare for uncertainties regarding climate change. Refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14, Section 14.11.5) for information regarding the effects of climate change on Tuolumne River water supplies.

C_Raffa-09 This comment states that "by pursuing a plan to divert additional water from the Tuolumne River, the SFPUC risks delaying their capital improvement program" among other things. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.5) regarding the integration of the seismic improvements and water supply option to meet program objectives, and for a discussion of the advantages of using a program EIR to evaluate the proposed program as a whole.

C_Raffa-10 This comment, stating that the SFPUC should re-evaluate their projections in light of flaws and inaccuracies, was submitted by numerous commenters. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation and Recycling** (Vol. 7, Chapter 14, Section 14.2.2) for response.

C_Raffa-11 These comments were submitted by numerous commenters; please refer to **Section 14.2, Master Response on Demand Projections, Conservation and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) regarding conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers and the study requested in this comment.

C_Raffa-12 This comment suggesting that the SFPUC adopt a policy of reducing diversions from the Tuolumne River is acknowledged.

C_Raffa-13 This comment requests that a comprehensive watershed study be completed in order to adequately assess the environmental impacts of the WSIP. Refer to **Response C_Breso-01,** above.

David Raube, 10/01/07

C_Raube-01 This comment, which expresses support for more conservation, recycling, and desalination to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers. The Draft PEIR analyzes the use of desalination technologies as a supplemental water supply in the discussions for the Year-round Desalination at Oceanside Alternative (Vol. 4, Chapter 9, Section 9.2.6) and Variant 2 – Regional Desalination for Drought (Vol. 4, Chapter 9, Section 9.2.7). As indicated in Table 9-6 (pp. 9-14 thru 9-16), it is uncertain whether these two alternatives are capable of meeting all WSIP goals and objectives related to sustainability and the cost-effective use of funds, and these alternatives would only partially meet the WSIP objective of maintaining a gravity-driven system. Also, the Year-round Desalination at Oceanside Alternative would only partially meet WSIP objectives related to delivery reliability during planned maintenance.

Mark Reedy, 09/19/07

C_Reedy-01 This comment, which expresses support for more conservation and recycling to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers. Regarding environmental sustainability, refer to **Response C_Clark1-16**.

Stefani Reichle, 09/05/07

C_Reich-01 This comment, which suggests that the Bay Area lags behind other metropolitan areas in terms of conservation and could instead be a leader in this area was submitted by numerous commenters and is responded to in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) under the heading Frequently Submitted Comments Addressing Conservation and Recycling.

Matthew Richardson, 09/06/07

C_Richa-01 This comment opposing additional Tuolumne River diversions is acknowledged.

C_Richa-02 This comment recommending additional public awareness programs to promote conservation is acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) regarding the specific conservation measures currently being implemented and those to which SFPUC and its wholesale customers have committed under the WSIP.

C_Richa-03 This comment encouraging additional water conservation and recycling is acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information on the recycled water potential studies that were conducted and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

C_Richa-04 This comment opposing the construction of new dams is acknowledged. The proposed program does not include the construction of new dams. The WSIP proposes implementation of two facility improvement projects that would retrofit two existing dams at Bay Area water supply reservoirs in order to meet seismic standards, protect public safety, and restore full, historical water storage capacity: the Calaveras Dam Replacement (SV-2) and Lower Crystal Springs Dam Improvements (PN-4) projects.

C_Richa-05 This comment expressing support for desalination technologies is acknowledged. Please refer to **Response C_BramlD1-02**.

Leah Rogers, 09/19/07

[See Public Hearing Transcript, Palo Alto, pp. 39-40]

C_Roger-01 This comment expresses an opinion about water consumption by industrial and agricultural uses. As this comment does not address the adequacy or accuracy of the PEIR, no response is needed.

Jim Ross, 10/03/07

C_Ross-01 See **Response C_Raffa-03**.

C_Ross-02 These comments have been submitted by numerous commenters and are responded to in **Section 14.2, Master Response on Demand Projections, Conservation and Recycling** (Vol. 7, Chapter 14, Section 14.2.3).

C_Ross-03 See **Response C_Breso-01**.

C_Ross-04 See **Response C_Raffa-06**.

C_Ross-05 These comments have been submitted by numerous commenters and are responded to in **Section 14.2, Master Response on Demand Projections, Conservation and Recycling** (Vol. 7, Chapter 14, Section 14.2.3).

C_Ross-06 See **Response C_Raffa-08**.

C_Ross-07 See **Response C_Raffa-09**.

C_Ross-08 The concerns reflected in this comment regarding demand projections and the level of proposed conservation were submitted by numerous commenters and are responded to in **Section 14.2, Master Response on Demand Projections, Conservation and Recycling** (Vol. 7, Chapter 14).

C_Ross-09 These comments were submitted by numerous commenters and are responded to in **Section 14.2, Master Response on Demand Projections, Conservation and Recycling** (Vol. 7, Chapter 14, Section 14.2.3).

C_Ross-10 See **Response C_Raffa-12**.

C_Ross-11 See **Response C_Raffa-13**.

Trish Rowe, 10/11/07

C_Rowe-01 This comment expressing an opinion regarding water usage and management is acknowledged. This comment also endorses a statement made by California Department of Fish and Game (CDFG) that is presented in Comment C_Rowe-02; refer to **Response C_Rowe-02** below.

C_Rowe-02 This comment is an excerpt from the comment letter submitted by CDFG on the Draft PEIR dated October 1, 2007. The full text of this letter can be found in Comment Letter S_CDFG2. This excerpt is contained within Comment S_CDFG2-05; refer to **Response S_CDFG2-05** for the specific response.

Ron Schmidt, 09/11/07

C_SchmiR-01 This comment opposing additional Tuolumne River diversions is acknowledged. Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

Judy Schriebman, 09/25/07

C_Schri-01 This comment questioning the methodology used to project future water demand was submitted by numerous commenters and is responded to in **Section 14.2, Master Response on Demand Projections, Conservation and Recycling** (Vol. 7, Chapter 14, Section 14.2.2). Refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

C_Schri-02 This comment opposing additional Tuolumne River diversions and supporting conservation and recycling is acknowledged. For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers. Regarding the Draft PEIR's consideration of the Tuolumne River's status as a federally designated Wild and Scenic River and potential impacts relevant to that designation, please refer to **Response L_Tuol1-09**.

Urs Schuler, 09/17/07

C_Schul-01 This comment, which expresses support for more conservation and recycling to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

Kelly Shea, 09/20/07

C_Shea-01 This comment which expresses concern about the environmental effects of the WSIP, opposition to additional diversions from the Tuolumne, and support for more conservation and recycling to meet water demand, and suggests that the Bay Area emulate conservation efforts in Seattle and Los Angeles, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

John Simpkin, 09/14/07

C_Simpk-01 This comment expressing opposition to additional Tuolumne River diversions is acknowledged.

Ann Sloan, 09/06/07

C_Sloan-01 This comment expressing opposition to additional Tuolumne River diversions is acknowledged.

Evan Winslow Smith, 09/26/07

C_SmithE-01 This comment expressing support for seismic improvements to the regional water system but urging additional recycling and conservation is acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for information on conservation programs and recycling projects proposed by SFPUC and its wholesale customers.

Paul Smith, 09/30/07

C_SmithP-01 This comment expressing an opinion regarding agricultural water use is acknowledged.

Cindy Spring, 09/25/07

C_Sprin-01 The commenter's opinion expressing concern regarding environmental impacts to the Tuolumne River and the associated habitat for fish and wildlife is acknowledged. Please refer to **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14) and **Section 14.7, Master Response on Lower Tuolumne Issues** (Vol. 7, Chapter 14) for additional discussion on WSIP-induced flow changes and their effects on public trust values.

C_Sprin-02 This comment on water conservation is acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects proposed by SFPUC and its wholesale customers.

Peter Steinhart, 09/26/07

C_Stein-01 This comment criticizes evaluation of seismic improvements and the proposed water supply option as part of the same program. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.5) regarding the integration of the seismic improvements and water supply option to meet program objectives, and for a discussion of the advantages of using a program EIR to evaluate the proposed program as a whole.

C_Stein-02 These comments were submitted by numerous commenters and are responded to in **Section 14.2, Master Response on Demand Projections, Conservation and Recycling** (Vol. 7, Chapter 14).

C_Stein-03 This comment states that the discussion of potential impacts of global warming on the Tuolumne's future flows is inadequate and that the discussion shrugs off impacts as being similar under both the existing conditions and with the proposed program. Please refer to **Section 14.11**, **Master Response on Climate Change** (Vol. 7, Chapter 14, Section 14.11.4) for information on current studies and models that are being used to forecast the effects of climate change on the SFPUC's regional water system.

C_Stein-04 This comment requests for additional studies on the upper Tuolumne River and states that climate change coupled with increased diversions from the Tuolumne could result in significant impacts on the health of the Sacramento Delta and San Francisco Bay. Please refer to **Response C_Breso-01** for response related to the need for additional studies to analyze impacts. Please refer to **Section 14.11**, **Master Response on Climate Change** (Vol. 7, Chapter 14, Section 14.11.4) for a qualitative assessment of effects of the WSIP with consideration of climate change.

Jon Sturtevant, 09/05/07

[See Public Hearing Transcript, Sonora, pp. 36-37]

C_Sturt-01 This comment opposing additional Tuolumne River diversions and encouraging additional conservation and recycling efforts to serve future water demand is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2

through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please also refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers and discussion regarding comparisons to other areas, which were submitted by numerous commenters.

Marc Sugars, 09/26/07

C_Sugar-01 This comment has been submitted by numerous commenters. Please refer to **Response C_Breso-01**.

C_Sugar-02 This comment, which expresses support for more conservation to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers and discussion regarding comparisons to other areas, which were submitted by numerous commenters. Regarding the effects of global warming on the Tuolumne River, refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14, Section 14.11.4).

Karen Sundback, 10/01/07

C_Sundb-01 This comment regarding Governor Schwarzenegger's support for the peripheral canal and questioning how water rights along the Tuolumne River would be affected if the peripheral canal were implemented is noted. This comment does not address the accuracy or adequacy of the Draft PEIR; no response is provided.

Barbara Symons, 09/20/07

C_Symon-01 This comment recommending that the SFPUC use a two-tiered approach that separates the seismic improvements from the proposed water supply option is acknowledged. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need** (Vol. 7, Chapter 14, Section 14.1.5) regarding the integration of the seismic improvements and water supply option to meet program objectives, and for a discussion of the advantages of using a program EIR to evaluate the proposed program as a whole. Refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

Jean Taylor, 09/06/07

[See Public Hearing Transcript, Modesto, pp. 26-27]

C_TayloJ-01 This comment opposing additional Tuolumne River diversions and expressing concern for the current condition of the Tuolumne River is acknowledged. Because this comment does not address the accuracy or adequacy of the Draft PEIR, no response is needed.

Scott Taylor, 10/01/07

C_TayloS-01 This comment opposing additional Tuolumne River diversions and supporting conservation and recycling is acknowledged. Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

M. Teves, 09/19/07

C_Teves-01 This comment supporting conservation is acknowledged. The suggestion that conservation is not included in WSIP planning is incorrect. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in

Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information on the conservation and recycled water potential studies that were conducted and the conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

Betsy Thagard, 09/25/07

C_Thaga-01 This comment expressing an opinion that the SFPUC should adopt a policy to reduce diversions from the Tuolumne River is acknowledged.

C_Thaga-02 These comments were submitted by numerous commenters. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation and Recycling** (Vol. 7, Chapter 14, Section 14.2.3). The commenter's suggestion to reduce withdrawals from the Tuolumne River over time is acknowledged.

Julia Thollaug, 09/11/07

C_Tholl-01 This comment opposing additional Tuolumne River diversions and expressing concern for the Tuolumne River is acknowledged. Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

Dennis Thomas, 05/02/07

C_Thoma-01 Regarding the Draft PEIR's consideration of the Tuolumne River's status as a federally designated Wild and Scenic River and potential impacts relevant to that designation, please refer to **Response L_Tuol1-09**. The comments in support of meeting additional water demands through conservation and recycling and drawing comparisons to other areas were submitted by numerous commenters and are addressed in **Section 14.2, Master Response on Demand Projections, Conservation and Recycling** (Vol. 7, Chapter 14, Section 14.2.3).

Tibor Toth, 09/04/07

C_Toth-01 Regarding potential impacts to the Delta from increased diversions from the Tuolumne River, refer to **Section 14.8, Master Response on Delta and**

San Joaquin Issues (Vol. 7, Chapter 14, Section 14.8.2). As stated in that section, impacts on the Delta attributable to the WSIP were determined to be less than significant.

C_Toth-02 This comment opposing additional Tuolumne River diversions and supporting desalination technologies is acknowledged. Please refer to **Response C_BramlD1-02**.

Marianna Tubman, 09/26/07

C_Tubma-01 This comment stating that the future demand estimates used in the WSIP PEIR are based on inflated projections was submitted by numerous commenters and is responded to in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.2). This comment also states that the WSIP does not do enough to protect the Tuolumne River and other watersheds. The Draft PEIR includes a programmatic evaluation of the environmental impacts of the proposed facility improvement projects by topical area (Vol. 2, Chapter 4). A project-level evaluation of the potential environmental impacts of the proposed additional Tuolumne River diversions and changes in regional water system operations are organized by watershed in the Draft PEIR (Vol. 3, Chapter 5). Several potentially significant impacts were identified and mitigation measures developed to reduce the impacts to a less-than-significant level.

C_Tubma-02 This comment, which expresses support for more conservation to meet water demand, opposition to additional diversions from the Tuolumne River, and the opinion that fish and plant life need the water more than people, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers. Regarding the effects of climate change on the Tuolumne River, refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14, Section 14.11.4). Regarding the effects of the WSIP on fish and plant life, the Draft PEIR (Vol. 3, Chapter 5, Sections 5.3.1 through 5.3.8) analyzed the effects of the WSIP on the hydrology, geomorphology, water quality, groundwater, terrestrial biology, fisheries, recreation, and visual quality of the Tuolumne River corridor. As described, implementation of the WSIP would result in several potentially significant adverse impacts on the Tuolumne River and its resources; the Draft PEIR identified mitigation measures to reduce these impacts to less-than-significant levels.

C_Tubma-03 This comment, expressing the commenter's belief that population in the area will not increase significantly due to housing prices is acknowledged. The methodology used to project future demand, which involved selection of a published population projection source, is described in Draft PEIR Chapter 3 (Vol. 1, pp. 3-16 to 3-21) and described in more detail in Appendix E.2 (Vol. 5). As described in Draft PEIR Chapter 7 (Vol. 4, p. 7-34), growth in many of the jurisdictions served by the SFPUC is expected to be accommodated by infill development, redevelopment, and increasing densities, as this comment suggests. There are some exceptions to this; some new housing in several areas[4] is expected to be on comparatively large lots with more landscaping and higher water use (refer to Vol.5, Appendix E.2, pp E.2-7 to E.2-9).

C_Tubma-04 This comment, which urges promotion of aggressive conservation measures and watershed protection, is acknowledged. The Draft PEIR (Vol. 4, Chapter 9) evaluates various supplemental water supply alternatives involving more conservation and water recycling (see the Aggressive Conservation/Water Recycling and Local Groundwater Alternative, Sections 9.2.4 and 9.2.5). Please also refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

Kristen Tucker, 09/11/07

C_Tucke-01 This comment opposing additional Tuolumne River diversions and supporting conservation and recycling is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR:

[4] For example, the demand model was adjusted for Estero Municipal Improvement District, Hayward, and Milpitas to include new account categories for new residences on larger lots with higher water use levels than current residences, and model adjustments were made for Purissima Hills Water District and Santa Clara to reflect observed higher water use rates for newer single family residences. (Refer also to Comment L_Milpitas-13 and **Response L_Milpitas-13** regarding the city's commitment to smart growth and the Draft PEIR information on model adjustments.)

Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

Unreadable commenter name, 09/20/07

C_Unreadable1-01 The comment regarding the need for more conservation to meet water demand and conservation achievements in other urban areas was submitted by numerous commenters; please refer to **Section 14.2, Master Response on Demand Projections, Conservation and Recycling** (Vol. 7, Chapter 14, Section 14.2.3)**.** Regarding the location of the SFPUC service area, refer to Draft PEIR Figure 3.2 (Vol. 1, Chapter 3, p. 3-6); as shown, the service area includes portions of the South Bay and San Francisco Peninsula in addition to portions of the East Bay and San Francisco. Regarding specific projections of future demand and purchases from the SFPUC regional system, refer to Table 3.3 or Table 7.2 (Vol. 1, Chapter 3, p. 3-18 and Vol.4, Chapter 7, p. 7-15, respectively). Table 7.3 (Vol. 4, Chapter 7, p. 7-18) includes information on projected increases in demand and purchases from the 2001 base year used in the demand projections. Regarding the effects of climate change on the Tuolumne River, refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14).

Unreadable commenter name, 08/15/07

C_Unreadable2-01 This comment opposing additional Tuolumne River diversions is acknowledged.

Unreadable commenter name, 09/20/07

C_Unreadable3-01 This comment, which expresses support for conservation and opposition to additional diversions from the Tuolumne River, especially for outdoor use, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to

9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for more information regarding conservation to address outdoor water demand and conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

Unreadable commenter name, 08/15/07

C_Unreadable4-01 This comment expressing opposition to additional diversions from the Tuolumne River and support for conservation and recycling to meet demand is acknowledged. The statement that the increased diversion under the WSIP would be used only to water lawns is incorrect. Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14) regarding the percentage of additional demand that would be for outdoor use, as well as information on conservation and recycling measure being implemented or planned in the SFPUC service area. Please refer to **Section 14.5, Master Response on Water Resources Modeling** (Vol. 7, Chapter 14, Section 14.5.9) for an explanation of the relationship between the average annual increase in purchase requests and the average annual increase in Tuolumne River diversions.

Unreadable commenter name, 08/15/07

C_Unreadable5-01 This comment opposing additional Tuolumne River diversions is acknowledged.

Matthew Urdan, 09/27/07

C_Urdan-01 This comment has been submitted by numerous commenters. Please refer to **Response C_Breso-01**.

C_Urdan-02 This comment expressing support for more conservation and recycling to meet water demand and for alternatives that protect the Tuolumne River from additional diversions is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, Section 3.4.4, pp. 3-16 to 3-22). For descriptions of alternatives that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand**

Projections, Conservation, and Recycling (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

Paul Vadopalas, 10/01/07

C_Vadop-01 This comment opposing additional Tuolumne River diversions and supporting desalination technologies is acknowledged. Please refer to **Response C_BramlD1-02**.

Jim Vermeys, 09/30/07

C_VermeJ-01 This comment, which expresses support for more conservation and recycling to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers. Regarding the request to “take a better look” at environmental impacts, please refer to **Response C_Breso-01**.

Karen Vermeys, 09/24/07

C_VermeK-01 This comment opposing additional Tuolumne River diversions is acknowledged.

Ashleigh Voyikes, 08/15/07

C_Voyik-01 This comment opposing additional Tuolumne River diversions is acknowledged.

Leo Vrana, 09/20/07

C_Vrana-01 This comment expressing support for more conservation and recycling to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers and discussion regarding comparisons to other areas, which were submitted by numerous commenters.

C_Vrana-02 This comment requesting that CCSF take the proper steps to make the Bay Area a leader in water conservation is noted; please refer to **Response C_Vrana-01**.

Patricia Walker, 10/13/07

C_Walke-01 This comment expresses concern that the proposed water supply option may delay implementation of seismic improvements to the regional water system. Please refer to **Section 14.1, Master Response on WSIP Purpose and Need**, (Vol. 7, Chapter 14, Section 14.1.5) regarding the integration of the seismic improvements and water supply option to meet program objectives, and for a discussion of the advantages of using a program EIR to evaluate the proposed program as a whole.

C_Walke-02 The first part of the comment stating that the SFPUC should take the lead in reducing water demand by implementing more stringent water conservation measures is acknowledged. Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information on conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers. The second part of the comment states that the Draft PEIR fails to address the environmental impacts associated with the increased diversion of water from the Tuolumne River, including the projected reduction in flows due to reduced snowpack. The Draft PEIR (Vol. 3, Chapter 5, Sections 5.3.1 through 5.3.8) analyzed the effects of the WSIP on the hydrology, geomorphology, water quality, groundwater, terrestrial biology, fisheries, recreation, and visual quality of the Tuolumne River corridor. As described, implementation of the WSIP would result in several potentially significant adverse impacts on the Tuolumne River and its resources; the Draft PEIR identified mitigation measures to reduce these impacts to less-than-significant levels. Refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14, Section 14.11.4) for information regarding current studies and models that are being used to forecast the effects of climate change on the SFPUC's regional water system.

C_Walke-03 This first part of this comment was submitted by numerous commenters and is responded to in **Section 14.2, Master Response on Demand Projections, Conservation and Recycling, of this Comments and Responses Document** (Vol. 7, Chapter 14, Section 14.2.3) under the heading Frequently Submitted Comments Addressing Conservation and Recycling. The second part of this comment, which states that the PEIR does not address the potential to increase water supplies by water recycling, is incorrect. As shown in Draft PEIR Table 3.3 (Vol. 1, Chapter 3, p. 3-18), the 2030 purchase estimates prepared for the WSIP reflect 9-14 mgd in recycled water supply.

Pete Wallstrom, 09/27/07

C_Walls-01 This comment opposing additional Tuolumne River diversions is acknowledged.

C_Walls-02 This comment expresses support for the CEQA alternatives that would not include additional Tuolumne River diversions and that would promote additional conservation, efficiency, and recycling to prevent the need for additional Tuolumne River diversions. For a discussion of the alternatives evaluated in the Draft PEIR that do not include additional diversions from the Tuolumne River, refer to the descriptions of the Year-round Desalination at Oceanside Alternative (Vol. 4, Chapter 9, Section 9.2.4), and Aggressive Conservation/Water Recycling and Local Groundwater Alternative (Without Tuolumne River Supplement) (Vol. 4, Chapter 9, Section 9.2.6). Refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information regarding conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

Richard Weiss, 09/26/07

C_Weiss-01 This comment asserts that the Draft PEIR fails to adequately address environmental impacts to the Tuolumne River and urges SFPUC to conduct additional studies of the Tuolumne River before finishing environmental review of the WSIP. See **Response C_Breso-01**.

C_Weiss-02 This comment expressing support for the CEQA alternatives that would not include additional Tuolumne River diversions and that would promote additional conservation, efficiency, and recycling to prevent the need for additional Tuolumne River diversions is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For a discussion of the alternatives evaluated in the Draft PEIR that do not include additional diversions from the Tuolumne River, refer to the descriptions of the Year-round Desalination at Oceanside Alternative (Vol. 4, Chapter 9, Section 9.2.6, p. 9-66) and Aggressive Conservation/Water Recycling and Local Groundwater Alternative (Without Tuolumne River Supplement) (see Section 9.2.4, p. 9-47). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

Bart Westcott, 09/12/07

C_Westc-01 This comment opposing additional Tuolumne River diversions is acknowledged.

Doris Williams, 09/25/07

C_Willi-01 This comment, which expresses support for more conservation and recycling to meet water demand and opposition to additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to

9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects proposed by SFPUC and its wholesale customers.

C_Willi-02 The statement that the demand modeling was flawed was submitted by numerous commenters and is responded to in **Section 14.2, Master Response on Demand Projections, Conservation and Recycling** (Vol. 7, Chapter 14, Section 14.2.2). Please also refer to the discussion of comparisons to other areas in Section 14.2 (Vol. 7, Chapter 14, Section 14.2.3), under the heading Frequently Submitted Comments Addressing Conservation and Recycling.

C_Willi-03 This comment has been submitted by numerous commenters; please refer to **Response C_Breso-01**.

C_Willi-04 This comment states that the Draft PEIR does not take into consideration the impact of climate change on precipitation in the Tuolumne River Watershed and recommends decreasing reliance on the Tuolumne River. Please refer to **Section 14.11, Master Response on Climate Change** (Vol. 7, Chapter 14, Section 14.11.5) for information regarding current studies and models that are being used to forecast the effects of climate change on the SFPUC's regional water system.

C_Willi-05 This comment has been submitted by numerous commenters and is responded to in **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) under the heading Frequently Submitted Comments Addressing Conservation and Recycling.

Polly P. Wingfield, 09/11/07

C_Wingf-01 This comment opposing additional Tuolumne River diversions is acknowledged.

Elizabeth Wolf, 09/24/07

C_Wolf-01 This comment requests that more research be done before the PEIR is finalized. As this comment does not specify the particular issue(s) in which the commenter believes the analysis presented in the Draft PEIR is inadequate, no specific response is provided.

Benita Zimmerman, 09/28/07

C_Zimme-01 This comment, which expresses support for more conservation and recycling to meet water demand, opposition to additional diversions from the Tuolumne River, and support for a sustainable water plan, is acknowledged. The 2030 purchase estimates prepared for the WSIP reflect 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Vol. 1, Chapter 3, pp. 3-16 to 3-22). For descriptions of alternatives to the WSIP that would reduce diversions from the Tuolumne River, refer to the following sections in Chapter 9 (Vol. 4) of the Draft PEIR: Sections 9.2.2 through 9.2.4 (pp. 9-23 to 9-59), and Sections 9.2.6 and 9.2.7 (pp. 9-66 to 9-78). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3) for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

This comment also expresses concern that any more water diversions would threaten the entire ecosystem in the Bay Area The Draft PEIR (Vol. 3, Chapter 5, Sections 5.3.1 through 5.3.8) analyzed the effects of the WSIP on the hydrology, geomorphology, water quality, groundwater, terrestrial biology, fisheries, recreation, and visual quality of the Tuolumne River corridor. As described, implementation of the WSIP would result in several potentially significant adverse impacts on the Tuolumne River and its resources; the Draft PEIR identified mitigation measures to reduce these impacts to less-than-significant levels. Please see **Section 14.6, Master Response on Upper Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.6.5) and to **Section 14.7, Master Response on Lower Tuolumne River Issues** (Vol. 7, Chapter 14, Section 14.7.6) for clarification regarding current and estimated future municipal and agricultural diversions from the Tuolumne River.

15.6 Form Letters

Form Letter 1

C_FORM1-01 This comment states that the Draft PEIR inadequately addresses all of the environmental impacts that would result from increased Tuolumne River diversions and requests additional studies before finalization of the PEIR. Please refer to **Response C_Breso-01** for response.

C_FORM1-02 This comment, which expresses support for more conservation and recycling to meet water demand and opposing additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP include 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Draft PEIR, Vol. 1, Chapter 3, pp. 3-16 to 3-22). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3), for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

Form Letter 2

C_FORM2-01 This comment, which expresses support for more conservation and recycling to meet water demand and opposing additional diversions from the Tuolumne River, is acknowledged. The 2030 purchase estimates prepared for the WSIP include 22 to 34 mgd of projected water conservation and recycling savings, in addition to 36 mgd of passive conservation savings due to plumbing codes (Draft PEIR, Vol. 1, Chapter 3, pp. 3-16 to 3-22). Please refer to **Section 14.2, Master Response on Demand Projections, Conservation, and Recycling** (Vol. 7, Chapter 14, Section 14.2.3), for additional information related to conservation programs and recycling projects being implemented or proposed by the SFPUC and its wholesale customers.

16. Staff-Initiated Text Changes

CHAPTER 16
Staff-Initiated Text Changes

16.1 Introduction

This chapter presents changes to the text of the Draft PEIR made in response to comments (as presented in Chapters 14 and 15) or to clarify and provide applicable updates of the text in the Draft PEIR. The text revisions in this chapter represent four main categories of changes: (1) clarifications/refinements made in response to comments; (2) updated information due to WSIP revisions; (3) clarification/refinement due to updated information; and (4) clarifications/corrections made due to editorial errors. Text changes are prefaced by a brief explanation, including where appropriate, reference to the master response in Chapter 14 or comment number in Chapter 15. In each change, new language is underlined, while deleted text is shown in ~~strikethrough~~, except where the text is indicated as entirely new, in which case no underlining is used for easier reading.

16.2 Text Revisions

Volume 1, Glossary

Conversion Factors section, Page xxxviii: The following conversion factor is added to the list of conversion factors in response to a comment (see **Response L_ACFCWCD-01**).

Temperature

Degrees Celsius (°C) = 5/9 x (°F – 32)

Degrees Fahrenheit (°F) = 9/5 x (°C) + 32

Volume 1, Summary

Section S.2, page S-4, Figure S.2: This revision is the same as that described below under Volume 1, Chapter 3, Section 3.3, page 3-6, Figure 3.2.

Section S.2, page S-5, Figure S.3: This revision is the same as that described below under Volume 3, Chapter 5, Section 5.1.3, page 5.1-6, Figure 5.1-2.

Section S.2, page S-12, Table S.2: The revisions to projects SV-1 and SV-2 are the same as that described below under Volume 1, Chapter 3, Section 3.8, page 3-50, Table 3.10.

Section S.2, page S-16, Table S.2: This revision to project PN-4 is the same as that described below under Volume 1, Chapter 3, Section 3.8, page 3-54, Table 3.10.

Section S.3, page S-37, Table S.4: Measure 4.8-1a in this table is revised as follows in response to a comment (see **Response L_Fremont-02**).

TABLE S.4
SUMMARY OF FACILITY MITIGATION MEASURES BY IMPACT

Impact	Mitigation Measure(s)
Impact 4.8-1: Temporary reduction in roadway capacity and increased traffic delays.	**Measure 4.8-1a, Traffic Control Plan Measures:** Elements of the traffic control plan could include: circulation and detour plans, designated truck routes, sufficient staging area, access to driveways, use of standard construction specifications for controlling construction vehicle movements, restrictions on truck trips during peak morning and evening commute hours, lane closure restrictions, maintenance of alternate one-way traffic flow, detour signing, pedestrian and bicycle access and circulation, equipment and materials storage, construction worker parking, roadside safety protocols, considerations for sensitive land uses, coordination with local transit service providers, roadway repair, conformance with the ~~state's *Manual of Traffic Controls for Construction and Maintenance Work Areas*~~ *California Manual on Uniform Traffic Control Devices for Streets and Highways: Part 6 Temporary Traffic Control* and *Caltrans' 2006 Standard Plans*.
	Measure 4.8-1b, Coordination of Individual Traffic Control Plans: In the event that more than one construction contract is issued for work along existing or new pipelines, and where construction could occur within and/or across multiple streets in the same vicinity, coordinate the traffic control plans in order to mitigate the impact of traffic disruption by including measures that address overlapping construction schedules and activities, truck arrivals and departures, lane closures and detours, and the adequacy of on-street staging requirements.

Section S.3, pages S-48 through S-60, Tables S.5, S.6, S.7, and S.8: The following footnote is added below each of these tables.

[a] Mitigation measure text is summarized; please see Chapter 6 for details.

Section S.3, page S-50, Table S.5: Measure 5.3.6-4b is revised as shown on the following page to correct an editorial error.

Section S.3, page S-52, Table S.6, Impact 5.4.2-2: This impact is revised as follows in response to a comment (see **Response L_ACWD-13**).

Impact 5.4.2-2: Effect on channel formation and sediment transport along Alameda Creek downstream of the diversion dam and downstream of the San Antonio Creek confluence.

TABLE S.5
SUMMARY OF WATER SUPPLY IMPACTS AND MITIGATION MEASURES – TUOLUMNE RIVER SYSTEM AND DOWNSTREAM WATER BODIES

Impact	Significance Determination						Mitigation Measures
		Biological Resource Impacts					
	All Impacts (except Biological Resources)	Sensitive Habitats	Key Special-Status Species	Other Species of Concern	Common Habitats and Species		
FISHERIES (cont.)							
Impact 5.3.6-4 (cont.)							**Measure 5.3.6-4b, Fishery Habitat Enhancement:** The SFPUC will implement or fund one of two fishery habitat enhancement projects that are consistent with the Lower Tuolumne River Restoration Plan; augmentation of spawning gravel at ~~five~~ three selected sites or the filling or isolation from the river of one of the existing inactive quarry pits.

Section S.3, page S-55, Table S.6, Impact 5.4.7-1 and Impact 5.4.7-2: These impacts are revised as shown on the following page to reflect the change in project description of the Calaveras Dam (SV-2) project.

Section S.3, pages S-56 and S-57, Table S.7: Mitigation measures for Impacts 5.5.3-2, 5.5.5-4, and 5.5.5-5 are revised as shown on pages 16-6 through 16-8 to refine the fishery analysis in the Pilarcitos watershed as determined from the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

Section S.3, page S-58, Table S.7: Mitigation measures for Impacts 5.5.6-4 and 5.5.6-5, and the impact conclusion for Impact 5.5.6-5 are revised as shown on page 16-9 to refine the fishery analysis in the Pilarcitos watershed as determined from the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

Section S.3, page S-62: The second to last sentence of the last full paragraph is revised as follows in response to a comment (see **Response L_Milpts-14**).

> In some jurisdictions (Foster City, Half Moon Bay, Milpitas, and Burlingame), the WSIP could support more population growth than is forecasted in adopted general plans.

Section S.3, page S-63: In first paragraph, under Indirect Effects of Growth Supported by the WSIP, the first sentence is revised as follows to clarify the potential growth inducing impact identified for the WSIP.

> As identified in Impact 7-1, ~~T~~the WSIP would indirectly contribute to environmental impacts caused by growth; some of these impacts would be unavoidable.

Section S.4, page S-67: The last paragraph is revised as follows to reflect augmented impact discussions based on updated information and revisions to WSIP project descriptions.

> While this restoration planning is in progress, because steelhead access does not currently exist and there is no current steelhead migration above the BART weir, there would be no impact on steelhead migration, spawning, or juvenile rearing upstream of the BART weir as a direct result of WSIP implementation compared to the existing condition~~. Further, since a number of steps are required before steelhead migration further upstream can occur, it is speculative to assess the specific impacts that system operation under the WSIP might have on the potential future restoration of steelhead. Thus, no impact analysis or conclusion is developed in this PEIR. If and when steelhead are restored, the SFPUC will be required to conform its system operations to comply with the applicable Endangered Species Act requirements.~~ However, to address the potential that steelhead could regain access to the upper Alameda Creek watershed in the event that planned and proposed projects and actions designed to restore steelhead in Alameda Creek are successfully implemented, a cumulative impact assessment for potential future-occurring steelhead was conducted.

TABLE S.6
SUMMARY OF WATER SUPPLY IMPACTS AND MITIGATION MEASURES – ALAMEDA CREEK WATERSHED

Impact	Significance Determination					Mitigation Measures
	All Impacts (except Biological Resources)	Biological Resource Impacts				
		Sensitive Habitats	Key Special Status-Species	Other Species of Concern	Common Habitats and Species	
RECREATION AND VISUAL						
Impact 5.4.7-1: Effects on recreational facilities and/or activities.	~~PSM~~ LS					~~**Measure 5.4.1-2, Diversion Tunnel Operation** – see description above.~~ None required.
Impact 5.4.7-2: Visual effects on scenic resources or visual character of the water bodies.	~~PSM~~ LS					~~**Measure 5.4.1-2, Diversion Tunnel Operation** – see description above.~~ None required.

TABLE S.7
SUMMARY OF WATER SUPPLY IMPACTS AND MITIGATION MEASURES – PENINSULA WATERSHEDS

Impact	Significance Determination					Mitigation Measures
		Biological Resource Impacts				
	All Impacts (except Biological Resources)	Sensitive Habitats	Key Special-Status Species	Other Species of Concern	Common Habitats and Species	
STREAM FLOW						
Impact 5.5.1-1: Effects on flow along San Mateo Creek.	LS					None required.
Impact 5.5.1-2: Effects on flow along Pilarcitos Creek.	LS					None required.
GEOMORPHOLOGY						
Impact 5.5.2-1: Changes in sediment transport and channel morphology in the Peninsula watershed.	LS					None required.
WATER QUALITY						
Impact 5.5.3-1: Effects on water quality in Crystal Springs Reservoir, San Andreas Reservoir, and San Mateo Creek.	LS					None required.
Impact 5.5.3-2: Effects on water quality in Pilarcitos Reservoir and along Pilarcitos Creek.	PSM					~~**Measure 5.5.3-2, Revised Operations Plan for Pilarcitos Watershed Facilities:** The SFPUC will develop and implement an operations plan for Pilarcitos Reservoir, Stone Dam, and associated diversions that will mimic current operations and will result in reservoir water levels, stream flows, water quality, and conditions for fisheries and terrestrial biological resources that are similar to the current condition.~~ **Measure 5.5.3-2a, Low-head Pumping Station at Pilarcitos Reservoir:** The SFPUC will install a permanent low-head pumping station at Pilarcitos Reservoir which would enable the SFPUC to access and use an additional 350 acre-feet of water from Pilarcitos Reservoir. In years when the WSIP would cause releases from Pilarcitos Reservoir to Pilarcitos Creek to be reduced to reservoir inflow earlier in the summer than under the existing condition (about 25 percent of years in the hydrologic record), the SFPUC will use the pumping station to augment flow in Pilarcitos Creek with water from the reservoir. The pumping station will draw water from the cool pool of water below the thermocline during times when the reservoir is stratified. The pumping station outlet will be designed to ensure that water discharged to the creek is adequately aerated. **Measure 5.5.3-2b, Aeration System at Pilarcitos Reservoir:** The SFPUC will install a permanent aeration system at Pilarcitos Reservoir. The SFPUC will operate the aeration system as necessary to avoid anoxic conditions and maintain good water quality conditions at the reservoir.

TABLE S.7 (Continued)
SUMMARY OF WATER SUPPLY IMPACTS AND MITIGATION MEASURES – PENINSULA WATERSHEDS

Impact	Significance Determination					Mitigation Measures
	All Impacts (except Biological Resources)	Biological Resource Impacts				
		Sensitive Habitats	Key Special -Status Species	Other Species of Concern	Common Habitats and Species	
GROUNDWATER						
Impact 5.5.4-1: Alteration of stream flows along Pilarcitos Creek, which could affect groundwater levels and water quality.	LS					None required.
FISHERIES						
Impact 5.5.5-1: Effects on fishery resources in Crystal Springs Reservoir (Upper and Lower).	PSU					**Measure 5.5.5-1, Create New Spawning Habitat Above Crystal Springs Reservoir:** The SFPUC will survey the extent and quality of fish spawning habitat lost due to inundation and, if feasible, create new spawning habitat at a higher elevation. The specifics of this mitigation measure will be determined as part of project-level CEQA review.
Impact 5.5.5-2: Effects on fishery resources in San Andreas Reservoir.	LS					None required.
Impact 5.5.5-3: Effects on fishery resources along San Mateo Creek.	LS					None required.
Impact 5.5.5-4: Effects on fishery resources in Pilarcitos Reservoir.	PSM					~~**Measure 5.5.3-2, Revised Operations Plan for Pilarcitos Watershed Facilities**~~ **Measure 5.5.3-2b, Aeration System at Pilarcitos Reservoir –** see description above.
Impact 5.5.5-5: Effects on fishery resources along Pilarcitos Creek below Pilarcitos Reservoir.	PSM					~~**Measure 5.5.3-2, Revised Operations Plan for Pilarcitos Watershed Facilities**~~ **Measure 5.5.3-2a, Low-head Pumping Station at Pilarcitos Reservoir** – see description above. **Measure 5.5.5-5 Establish Flow Criteria, Monitor and Augment Flow –** The SFPUC will develop a monitoring and operations plan for Stone Dam to ensure WSIP-related flow reductions downstream of Stone Dam do not impair steelhead passage and spawning during the winter months of normal and wetter hydrologic years.

TABLE S.7 (Continued)
SUMMARY OF WATER SUPPLY IMPACTS AND MITIGATION MEASURES – PENINSULA WATERSHEDS

Impact	Significance Determination					Mitigation Measures
	All Impacts (except Biological Resources)	Biological Resource Impacts				
		Sensitive Habitats	Key Special -Status Species	Other Species of Concern	Common Habitats and Species	
TERRESTRIAL BIOLOGY						
Impact 5.5.6-1: Impacts on biological resources in Upper and Lower Crystal Springs Reservoirs.		PSM	PSM	PSM	PSM	The SFPUC will implement Measures 5.5.6-1a and 5.5.6-1b to reduce adverse impacts on sensitive habitats, key special-status species, other species of concern, and common habitats and species to a less-than-significant level. In addition, the SFPUC will implement Measure 5.5.6-1c to mitigate adverse impacts to key special-status plant species (i.e., fountain thistle) adapted to serpentine seeps. **Measure 5.5.6-1a, Adaptive Management of Freshwater Marsh and Wetlands at Upper and Lower Crystal Springs Reservoirs:** The SFPUC will develop an adaptive management plan to minimize adverse effects of the WSIP-induced rise in average water levels, and periodic drawdown of reservoir water levels for maintenance, on San Francisco garter snakes and red-legged frogs. **Measure 5.5.6-1b, Compensation for Impacts on Terrestrial Biological Resources:** The SFPUC will protect, restore, and enhance existing wetland and upland habitat and/or create new habitat that compensates for WSIP-induced habitat losses at Crystal Springs Reservoir. Compensatory habitat may be provided as part of the SFPUC's Habitat Reserve Program. **Measure 5.5.6-1c, Compensation for Serpentine Seep-Related Special-Status Plants:** The SFPUC will protect, restore, and enhance existing habitat and/or create new habitat that compensates for WSIP-induced habitat losses for plant species adapted to serpentine seeps.

TABLE S.7 (Continued)
SUMMARY OF WATER SUPPLY IMPACTS AND MITIGATION MEASURES – PENINSULA WATERSHEDS

Impact	Significance Determination					Mitigation Measures
	All Impacts (except Biological Resources)	Biological Resource Impacts				
		Sensitive Habitats	Key Special -Status Species	Other Species of Concern	Common Habitats and Species	
TERRESTRIAL BIOLOGY (Cont.)						
Impact 5.5.6-4: Impacts on biological resources in Pilarcitos Reservoir.		LS	PSM	LS	LS	~~The SFPUC will implement Measure 5.5.3-2 to reduce adverse impacts on key special-status species to a less-than-significant level.~~ ~~**Measure 5.5.3-2, Revised Operations Plan for Pilarcitos Watershed Facilities** – see description above.~~ **Measure 5.5.3-2c, Habitat monitoring and Compensation -** The SFPUC will protect, restore, and enhance existing habitat and/or create new habitat that compensates for WSIP-induced habitat losses at Pilarcitos Reservoir. Compensatory habitat may be provided as part of the SFPUC's Habitat Reserve Program.
Impact 5.5.6-5: Impacts on biological resources along Pilarcitos Creek below Pilarcitos Reservoir.		~~PSM~~ LS	LS	LS	LS	~~The SFPUC will implement Measure 5.5.3-2 to reduce adverse impacts on sensitive habitats to a less-than-significant level.~~ ~~**Measure 5.5.3-2, Revised Operations Plan for Pilarcitos Watershed Facilities** – see description above.~~ None required.

Section S.6,page S-71: The first sentence of the last paragraph is revised as follows to reflect an updated request from the SFPUC.

> The SFPUC requested that the PEIR also include environmental assessment of ~~three~~ four variants to the WSIP.

Section S.6, page S-73: The following text is inserted after the first partial paragraph on page S-73 to reflect an updated request from the SFPUC.

Variant 4 – Phased WSIP

> Variant 4 – Phased WSIP would generally be the same as the WSIP, except that an interim mid-term planning horizon of 2018 would be used instead of the WSIP 2030 planning horizon. Under this variant, all facility improvement projects would be implemented, and the SFPUC would make a decision about future water supply to its customers through 2018 only and defer a decision regarding long-term water supply until after 2018. Variant 4 would limit deliveries from SFPUC watersheds to an annual average of 265 mgd through 2018 and would promote development and implementation of 10 to 20 mgd of additional local conservation, water recycling, and groundwater projects. The environmental impacts of Variant 4 would be essentially the same as those for the WSIP or Modified WSIP Alternative, except for a reduction in impacts on Tuolumne River resources. However, it would result in additional impacts associated with construction and operation of recycled water and groundwater facilities similar to those of the Modified WSIP Alternative.

Volume 1, Chapter 1

Section 1.3.5, page 1-8: The second to last bullet is revised as follows to correct an editorial error.

- City of Redwood City, *Downtown Precise Plan Draft Environmental Impact Report* (October 2006) and *Final Environmental Impact Report*, State Clearinghouse #2006~~5~~052027 certified March 2007a.

Volume 1, Chapter 2

Section 2.2.1, page 2-6, Table 2.2: On row 6, under "Major Storage Facilities," the capacity of Crystal Springs Reservoir is revised to reflect updated information from recent SFPUC studies.

TABLE 2.2
EXISTING CAPACITY OF MAJOR FACILITIES IN THE REGIONAL WATER SYSTEM

Facility	Capacity	Notes
Crystal Springs Reservoir[b]	~~58,400~~ 56,800 acre-feet (interim conditions as required by the Division of Safety of Dams) ~~69,300~~ 68,000 acre-feet (normal conditions)	~~19.0~~ 18.5 billion gallons ~~22.6~~ 22.2 billion gallons

Section 2.3.4, page 2-24: The second to last sentence of the fourth paragraph is revised as follows in response to a comment (see **Response L_CoastsideCWD-07**).

> In the summer months, when Coastside CWD's water demand is at its seasonal maximum, its water supply from Pilarcitos Creek ~~is supplemented by water pumped from Crystal Springs Reservoir.~~ becomes insufficient to meet its needs. At that point, Coastside CWD ceases diversions from Pilarcitos Creek and obtains its water by pumping from Crystal Springs Reservoir.

Section 2.5.6, page 2-46, Table 2.3: The following row is added at the end of Table 2.3 in response to a comment (see **Response SI_ACA1-17**).

TABLE 2.3
SFPUC WATER RESOURCES POLICIES RELATED TO THE WSIP

Date	Resolution Number	Description
June 2006	06-0105	*Water Enterprise Environmental Stewardship Policy* The Environmental Stewardship Policy will be integrated into SFPUC Water Enterprise planning and decision-making processes and also directly implemented through a number of efforts, including: • Implementation and updating of the existing Alameda and Peninsula Watershed Management Plans • Development of Habitat Conservation Plans for the Alameda and Peninsula Watersheds • Development and implementation of the Watershed and Environmental Improvement Program, which will cover the Tuolumne River, Alameda Creek, and Peninsula watersheds • Development of the Lake Merced Watershed Plan • Active participation in local forums, including coordination with Yosemite National Park Service and Stanislaus National Forest in the Tuolumne River watershed, the Tuolumne River Technical Advisory Committee, the Alameda Creek Fisheries Restoration Workgroup, the Pilarcitos Creek Restoration Workgroup, and the Lake Merced Task Force • Integration of the policy into the WSIP and individual infrastructure projects (i.e., repair and replacement programs) • Reliance on the policy to guide the development of project descriptions, alternatives and mitigation for all SFPUC projects during the environmental review process under CEQA and/or NEPA • Providing support for and encouragement to all employees to integrate environmental stewardship into daily operations through communication and training

SOURCES: SFPUC, 1993a to 1993f; 2000c; 2000d; 2006b.

	City of Menlo Park*[b]	

* Indicates customers that currently receive additional water supplies from sources other than the SFPUC.

[a] Not shown on the table because they are not a BAWSCA member, the Cordilleras Mutual Water Association is also a wholesale customer receiving water from the SFPUC. It is a small water association serving 18 single-family homes located in San Mateo County.

[b] Menlo Park receives all of its water supply from the SFPUC; however, a portion of the supply is obtained indirectly from the SFPUC through purchases from East Palo Alto (BAWSCA, 2006).

SOURCES: CDM, 2005; URS, 2004a.

Section 3.4.4, page 3-19: Table 3.4 is revised as shown below in response to a comment (see **Response L_Menlo1-08**).

TABLE 3.4
SUMMARY OF SFPUC 2030 PURCHASE ESTIMATES

SFPUC Customer	Fiscal Year 2001/2002 Purchases from the SFPUC (mgd)	2030 Purchase Estimates (mgd)	Change in Water Purchases from the SFPUC (mgd)
Wholesale Customers			
City of Menlo Park[~~a,c~~ g]	3.57	4.54	0.97

[a] Wholesale customer that currently receives water supplies from sources other than the SFPUC, including local groundwater, local surface water, recycled water, and other sources of supply.

[c] Wholesale customer that currently receive water supplies from other sources but projects receiving only SFPUC water by 2030

[g] Menlo Park purchased 96 percent of its 2001/2002 supply directly from the SFPUC; the balance of its 2001/2002 purchases also came from the SFPUC regional system, but was purchased from East Palo Alto. Menlo Park projects that it will purchase all of its 2030 supply directly from the SFPUC.

SFPUC Water System Improvement Program . 203287

Figure 3.2 (Revised)
SFPUC Water Service Area - San Francisco and SFPUC Wholesale Customers

Section 3.4.4, page 3-22: The first paragraph is revised as follows to incorporate information from recent planning efforts.

Recycled Water Potential

The SFPUC evaluated recycled water potential by considering existing recycled water programs, plans to expand uses in the future, and the amount of potable water that could potentially be offset by future recycled water uses. The studies indicated that there is a range of about 47 to 53 mgd in potential for recycled water use in the wholesale and retail service areas, including current plus additional uses through 2020 (RMC, 2004). The *Recycled Water Master Plan* (RMC, 2006) assesses the technical feasibility of recycled water projects in the westside area of San Francisco; it identifies projects with the potential to provide approximately 6.2 mgd of recycled water to irrigate Golden Gate Park, Lincoln Park, Harding Park, the San Francisco Zoo, San Francisco State University, and other locations, as well as provide a supplemental water supply for Lake Merced. The first phase of projects identified in the report would provide 4.1 mgd of recycled water to this area (RMC, 2006). These San Francisco projects are included in the total SFPUC service area recycled water potential of 47 to 53 mgd in 2020 (RMC, 2004). It should be noted, however, that during the project planning and design phase of recycled water projects, the recycled water potential of specific users will be refined and could potentially be reduced. As such, it is assumed that 100 percent of these specific users' demand represents an offset in potable surface water supplies and that could be met by other appropriate sources of alternative water supply such as groundwater and/or stormwater if recycled water is deemed inappropriate for the specified use (SFPUC, 2008a).

Section 3.4.6, page 3-24: The text following the list under the heading "B. Regional Projects" is revised as follows to reflect the determination made by the San Francisco Planning Department in March 2008 regarding the independent utility of certain WSIP projects.

In September 2005, the Notice of Preparation (NOP) on the WSIP PEIR identified most of the projects listed above as projects that might undergo environmental review independent of and possibly in advance of the PEIR (refer to the NOP in Appendix A of this PEIR for brief descriptions of these projects). As a result of reclassification of projects and program refinement since the issuance of the NOP, the San Francisco Planning Department has determined that three other projects not listed in the NOP as such are appropriate for environmental review separate from the PEIR: Alameda Siphons (previously classified as part of the Irvington Tunnel project), San Antonio Pump Station Upgrade and Capuchino Valve Lot Improvements. The Planning Department is preparing or has completed environmental review for all of the projects listed above separate from the PEIR, and the SFPUC has already implemented some of the projects. The Planning Department has determined that these projects may appropriately proceed with environmental review in advance of completion of the WSIP PEIR for several reasons: (1) these projects are necessary irrespective of whether the SFPUC approves the overall WSIP goals and objectives or any other WSIP facility project; (2) construction of the particular project will not increase the normal operating or delivery capacity of the SFPUC's regional system, change the manner in which water is dispersed, increase the storage capacity of the system, or increase or alter the nature of any treatment capacity of the system; (3) these projects do not commit the SFPUC to any other WSIP project; and (4) any cumulative impacts associated with the individual project can be and are adequately addressed by the analysis in the individual environmental review documents. Although the independent utility projects may contribute to the overall reliability of the regional water system, the primary purpose of these projects is to rehabilitate existing facilities and provide flexibility for maintenance and emergency response.

Subsequent to Draft PEIR publication in June 2007 and based on more detailed project information, the San Francisco Planning Department determined that five additional regional WSIP projects, previously identified as Key Regional Projects in category A above, could appropriately proceed with environmental review independent of the WSIP PEIR: Rehabilitation of Existing San Joaquin Pipelines, BDPL Nos. 3 and 4 Crossovers, Seismic Upgrade of BDPL Nos. 3 and 4 at Hayward Fault, Baden and San Pedro Valve Lots Improvements, and Pulgas Balancing Reservoir Rehabilitation (all phases). Thus, these five additional projects have been determined to have independent utility from the overall program analyzed in the WSIP PEIR (SFPUC, 2008b) and can undergo environmental review independent of and possibly in advance of the PEIR.

Section 3.4.6, page 3-25: Item E is revised as follows in response to a comment (see **Response L_BAWSCA1-70**).

E. **Regional Recycled Water Projects** (note that these are different than the project #22, Recycled Water Projects, listed above under A). The SFPUC expects ~~to consider and develop~~ that some recycled water projects that would be located outside of San Francisco will be developed in coordination with other jurisdictions. As these projects are developed and designed, they will be reviewed to determine the appropriate lead agency and level of environmental review.

Section 3.5.1, page 3-27: The following text is inserted as the new last paragraph of Section 3.5.1 in response to a comment (see **Response L_BAWSCA1-71**).

Other water quality regulations of significance to the SFPUC could include the Stage 2 Disinfectants and Disinfection Byproducts Rule, Candidate Contaminant List, California Action Levels, and California Public Health Goals. The SFPUC will address these regulations as appropriate as part of its ongoing operations as well as to ensure consistency with the WSIP water quality levels of service.

Section 3.6.1, page 3-34: The second bullet under the second full paragraph is revised as follows to incorporate information from recent planning efforts.

- *Recycled Water Projects*. One of the WSIP facility improvement projects described in Section 3.8 includes treatment, storage, and distribution facilities to provide about 4 mgd of recycled water to irrigation users on the west side of San Francisco based on preliminary estimates of recycled water demand. However, due to ongoing planning efforts and demand projection refinements, the project sizes may be reduced to match the refined demands (SFPUC, 2008a).

Section 3.6.2, page 3-36: The first bullet under the first paragraph in this section is revised as follows to incorporate information from updated modeling efforts. As described in Section 13.3 of this document, this revision does not result in any increase of average annual diversions from the Tuolumne River or in any change in the impact analysis presented in Volume 3, Chapter 5 of the Draft PEIR. The increase in magnitude of dry-year water transfers is a reflection of updated modeling input to assumptions for both the existing condition and WSIP and better reflects the modeled estimate for dry-year water transfers needed to achieve the WSIP level of service objectives over the design drought.

- *Water transfers*. Utilize up to an equivalent of ~~23~~ 26 mgd (annual average over 8.5-year design drought) of supplemental Tuolumne River water through water transfer agreements with TID and MID.

Section 3.7.1, page 3-42: The last sentence of the first full paragraph is revised as follows in response to a comment (see **Response L_DalyCty-31**).

> In exchange, those customers would increase groundwater pumping during drought periods, thereby reducing the amount of their purchase requests during a drought and ~~creating a temporary reduction system demand~~ making more water available for serving regional water system demand.

Section 3.8, pages 3-50 and 3-54, Table 3.10: The following text in the fourth and fifth columns in **Table 3.10** is revised as shown on the following page to reflect the change in project description of the Calaveras Dam (SV-2) and Alameda Creek Fishery (SV-1) projects and to reflect updated information from SFPUC studies.

Section 3.8, page 3-60, Table 3.11: The entry located in the third to last row, second to last column in Table 3.11 is deleted as shown on page 16-19 in response to a comment (see **Response L_Brisbane-03**).

Section 3.8, page 3-60, Table 3.11: The entry located in the second to last row, last column to the right in Table 3.11 is revised as shown on page 16-19 in response to a comment (see **Response L_DalyCty-33**).

Section 3.8, page 3-60, Table 3.11: The entry located in the 15th row, 8th column of Table 3.11 is revised as shown on page 16-19 in response to a comment (see **Response L_Milpts-10**).

Section 3.8, page 3-63, Table 3.12: The first region listed in the first row of Table 3.12 is revised as follows to correct an editorial error.

> ~~Sunol~~ San Joaquin Region

Section 3.10, page 3-82: The third paragraph is revised as follows to correct an editorial error.

> In addition, the SFPUC is committed to the following GHG reduction actions as part of the WSIP program. The SFPUC will include the first two ~~following~~ measures in all WSIP contractor specifications and implement the third measure during project planning and

TABLE 3.10 (same as **TABLE S.2)**
WSIP FACILITY IMPROVEMENT PROJECTS

No.	Project Title	Principal Type of Facility/ Objectives[b]	Location of Preferred Project[c]	Project Description
SV-1	Alameda Creek Fishery Enhancement	Other / Water Supply, Sustainability	Structural Alternatives: Alameda Creek in Sunol Valley, downstream of Calaveras Dam	This project would recapture the water released as part of the Calaveras Dam project (SV-2) and return it back to the regional system for use. A number of structural and non-structural recovery alternatives are under consideration for this project, including: a water recapture facility downstream of the Sunol Valley WTP, conjunctive groundwater use, horizontal collector wells, or other groundwater recovery systems yet to be defined. Other alternative designs for this project could be developed. If a structural alternative involving construction of a recapture facility is selected, the recapture facility would be located at the downstream end of the reach of Alameda Creek between the lower Sunol Valley and the confluence with Arroyo de la Laguna. As an alternative to the recapture facility, the SFPUC may coordinate with other water agencies to develop and implement other means of recapturing fishery enhancement flows consistent with the 1997 CDFG MOU.
SV-2	Calaveras Dam Replacement	Storage / Water Supply, Delivery and Seismic Reliability	Sunol Valley, immediately downstream of existing dam and at the Alameda Creek Diversion Dam	This project would provide for the planning, design, and construction of a replacement dam at Calaveras Reservoir to meet seismic safety requirements. The new dam would provide for a reservoir with the same storage capacity as the original reservoir (96,800 acre-feet), but the replacement dam would be designed to accommodate enlargement of the dam in the future. The preferred project would include construction of: • New earthfill dam • New intake tower and new outlet valve for water releases for instream flow requirements • New or rehabilitated outlet works for seismic safety and improved operations and maintenance • New bypass structure at the Alameda Creek Diversion Dam As part of this project, Calaveras Reservoir and the proposed bypass structure at the diversion dam would be operated to release up to 6,300 acre-feet per year (5.5 mgd) of water to Alameda Creek in support of fisheries in compliance with the 1997 CDFG MOU. When flow is available in Alameda Creek, releases would be made through the proposed bypass structure at the Alameda Creek Diversion Dam and would be supplemented as necessary with releases from Calaveras Dam.
PN-4	Lower Crystal Springs Dam Improvements	Storage / Water Supply and Delivery Reliability	Lower Crystal Springs Dam	This project would consist of major repairs and improvements to Lower Crystal Springs Dam to provide adequate protection of the dam and downstream areas from the probable maximum flood, as defined by the DSOD. DSOD has placed operational restrictions on the dam, and the capacity of the reservoir is limited to ~~58,400~~ 56,800 acre-feet. The project would restore the historical reservoir capacity of ~~69,300~~ 68,000 acre-feet. The project would be coordinated with San Mateo County, which is concurrently planning the replacement of the existing county bridge built above the crest of the dam. Project elements would include: • Lowering the existing parapet wall on either side of the existing spillway to lengthen the overflow weir (central spillway) from the reservoir • Raising the remaining parapet walls and adding two new spillway bays, one on each side of the existing central spillway • Enlarging the spillway stilling basin to accommodated the probable maximum flood • Installing four gates (with control building) or installing a fixed weir within the spillway to restore the historical storage capacity

design, which in addition to having other environmental benefits, would also help reduce GHG emissions.

Section 3.11, page 3-82: The third sentence of the last paragraph is revised as follows in response to a comment (see **Response L_BAWSCA1-86**).

> As the preliminary schedule indicates, construction of projects is expected ~~to begin in 2008 and~~ to be completed by the end of 2014; there would be an intense period of construction from 2009 to 2010, when 18 of the 22 projects would be under construction ~~constructed~~ concurrently.

Section 3.13, page 3-86: The fourth full paragraph on the page is revised as follows in response to comments described in **Section 14.4, Master Response on Appropriate Level of Analysis**.

> Each of the individual WSIP facility improvement projects will undergo project-level CEQA review, and CEQA documents developed through those reviews will identify needed approvals by local, state, and federal agencies for individual projects. Table C.6 of Appendix C presents the specific permits and approvals that could be required for individual projects as well as interested agencies that have requested early consultation and coordination with the SFPUC. Several projects are expected to require U.S. Department of the Army permits to comply with the Clean Water Act, which, in turn, will require compliance with the Federal Endangered Species Act, the Clean Water Act Section 401, and the National Historic Preservation Act. Several projects are expected to require Streambed Alteration Agreements from the California Department of Fish and Game and compliance with the California Endangered Species Act. When individual projects undergo CEQA review, the project's environmental documentation will provide more detailed and up-to-date information on the required approvals and need for consultation with interested agencies. The approval and adoption of the overall WSIP as a program and policy are distinct actions from the approvals for individual facility improvement projects.

Volume 2, Chapter 4

4.2 Plans and Policies

Section 4.2.2, page 4.2-4: The following text is added after the discussion of the San Francisco Sustainability Plan to incorporate recent planning efforts applicable to the WSIP.

> ***San Francisco Municipal Green Building Program***
>
> San Francisco's Green Building Program was founded in 1999 when the CCSF adopted the Resource Efficient Building Ordinance, which established green building standards for municipal buildings to increase energy efficiency, conserve CCSF finances, reduce the environmental impacts of demolition, construction, and operation of buildings, and create safe workplaces for CCSF employees and visitors. The ordinance created the inter-departmental Resource Efficient Building (REB) Task Force and charged the San Francisco Department of Environment with implementing the ordinance in partnership with the Department of Public Works and other REB Task Force departments. In 2004, amendments to Chapter 7 of the Environment Code set LEED (Leadership in Energy and Environmental Design) Silver Certification by the U.S. Building Council as the minimum environmental performance requirement for all municipal projects over 5,000 square feet. The REB Task Force assists City departments in compliance with the LEED Silver Certification requirement and helps to determine which projects are applicable for LEED ratings. For all municipal construction projects, including those projects that do not involve buildings and are not required to obtain LEED Silver Certification, the REB Task Force provides recommended best practices and sample specifications for building materials (e.g. recycled content of steel and concrete) (SF Dept of Environment, 2004-2007).

Section 4.2.2, page 4.2-7: The first paragraph is revised as follows in response to a comment (see **Response F_NPS-GGNRA-01**).

> In 1969, the CCSF granted two easements over the vast majority of the Peninsula watershed to the Department of the Interior. The easements were granted to the federal government in order to obtain a change in the route of Interstate 280 (I-280) (and an increase in the federal share of costs) to a less environmentally damaging location further east of Crystal Springs Reservoir. The approximately 19,000-acre Scenic Easement covers the lands west of Crystal Springs and San Andreas Reservoirs. The approximately 4,000-acre Scenic and Recreation Easement applies to lands in the vicinity of I-280. ~~Cañada Road demarcates these easements: t~~The CS/SA Transmission project (PN-2), Lower Crystal Springs Dam project (PN-4), and the Pulgas Channel and sediment catch basin components of the Pulgas Balancing Reservoir project (PN-5) are within the Scenic Easement, while the Pulgas Balancing Reservoir itself is within the Scenic and Recreation Easement. The easements cover nearly all of the CCSF-owned Peninsula watershed lands and place restrictive covenants on use of the lands that are unrelated to the SFPUC's overall management of the land for utility purposes. The provisions of the easement include:

Section 4.2.2, page 4.2-8: The second paragraph is revised as follows in response to a comment (see **Response L_BCDC-02**).

San Francisco Bay Conservation and Development Commission, San Francisco Bay Plan

The San Francisco Bay Plan (SF Bay Plan), prepared by the San Francisco Bay Conservation and Development Commission (BCDC) in 1968 in accordance with the McAteer-Petris Act of 1965, is an enforceable plan that guides the protection and use of San Francisco Bay and its shoreline (BCDC, 2005). Under the McAteer-Petris Act, BCDC has the authority to issue or deny permit applications for placing fill, extracting materials, or changing the use of any land, water, or structure within the area of its jurisdiction and to enforce policies aimed at protecting the bay and its shoreline.[3a] The SF Bay Plan designates shoreline areas that should be reserved for water-related purposes like ports, industry, public recreation, airports, and wildlife refugees. Since its adoption by BCDC in 1968, the SF Bay Plan has been amended periodically to keep pace with changing conditions and to incorporate new information concerning the bay. The new Bay Division Pipeline Tunnel No. 5 proposed under the BDPL Reliability Upgrade project (BD-1) includes approximately five miles of tunnel under the Don Edwards San Francisco Bay Wildlife Refuge, Newark Slough, and San Francisco Bay. The pipeline would be buried between 100 and 150 feet below mean sea level and result in approximately 355,000 cubic yards of bay mud excavation/spoils. As a result, this project could be subject to ~~certain provisions~~ SF Bay Plan policies concerning the placement of fill in the bay, dredging, public access, and other policies and provisions contained in the SF Bay Plan (BCDC, 2005), depending on the final siting, construction, and operation of the BDPL Reliability Upgrade project.

[3a] BCDC has jurisdiction over all of San Francisco Bay up to mean high tide, areas of marsh up to 5 feet above mean sea level, a shoreline band lying 100 feet inland from the bay, as well as salt ponds, managed wetlands, and certain waterways.

Section 4.2.3, page 4.2-15: The following text is added after the discussion of WSIP consistency with the San Francisco Sustainability Plan, the first full paragraph on the page, to address recent planning efforts applicable to the WSIP.

San Francisco Municipal Green Building Program

The San Francisco Municipal Green Building Program was developed for the purpose of improving the environmental performance of municipal buildings. The WSIP facility improvement projects would be consistent with the San Francisco Municipal Green Building Program, since all applicable facility improvement projects constructed under the WSIP would be designed, constructed, and operated in accordance with the City's Green Building requirements. The SFPUC would complete and submit LEED checklists to the REB Task Force on all applicable WSIP projects.

Section 4.2.3, page 4.2-16: The fourth full paragraph is revised as follows in response to a comment (see **Response L_BCDC-02**).

San Francisco Bay Plan

Implementation of the Bay Division Pipeline Reliability Upgrade project (BD-1) includes construction of a tunnel to replace aboveground pipelines located in San Francisco Bay. Depending on the final scope of work undertaken with respect to this project, SF Bay Plan policies could be relevant to the project. The proposed five-mile tunnel under Don Edwards San Francisco Bay Wildlife Refuge, Newark Slough, and San Francisco Bay is generally straight, which provides for ease in constructability, but is also designed to minimize environmental disruption, particularly with respect to protected species. Programmatic mitigation measures described in Chapter 6, if determined to be applicable, identify measures to protect and restore natural resources and habitats, including special-status species. Compliance with BCDC permitting requirements and consideration of applicable SF Bay Plan policies would also ensure that relevant policies of the SF Bay Plan are addressed and carried out to minimize environmental effects on the bay. The WSIP would, on the whole, be consistent with policies contained in the SF Bay Plan.

Section 4.2.5, page 4.2-18: The following reference is added after (BCDC, 2005) to support updated information.

San Francisco Department of Environment, *San Francisco Municipal Green Building Report 2004-2007*.

Section 4.2, page 4.2-19: The following reference is added after (Tuolumne County, 1996) in response to a comment (see **Response L_Tuol2-06**).

USDA Forest Service, *Sierra Nevada Forest Plan Amendment Final Supplemental Environmental Impact Statement*, January 2004.

4.5 Hydrology and Water Quality

Section 4.5.1, page 4.5-9: The last sentence of the first paragraph is revised as follows in response to a comment (see **Response S_RWQCBCV-01**).

These agencies also implement the Waste Discharge Requirements (WDR) Program, which regulates discharges of waste to land under the California Water Code as well as discharges of waste into waters of the state that are outside federal jurisdiction, as defined under the Clean Water Act.

Section 4.5.1, page 4.5-9: The end of the second full paragraph is revised as follows in response to a comment (see **Response S_RWQCBCV-01**).

The San Francisco Bay RWQCB adopted its Basin Plan in 1995, and most recently revised the plan in December 2006. ~~November 2004. A general update to the plan was approved by the San Francisco Bay RWQCB in 2005 and by the SWRCB in April 2006. The update is undergoing review by the Office of Administrative Law.~~ The Central Valley RWQCB (Region#5) has regulatory authority over water bodies in the San Joaquin Region. The Central Valley RWQCB adopted its Basin Plan in 1998, and most recently revised the plan in October 2007~~September 2004~~.

Section 4.5.1, page 4.5-9: The third full paragraph is revised as follows in response to a comment (see **Response S_RWQCBCV_02**).

> Beneficial uses ~~of surface waters~~ serve as a basis for establishing water quality objectives and discharge prohibitions to attain ~~beneficial use goals~~ the goal of achieving the highest water quality consistent with the maximum benefit to the people of the state. Beneficial uses are designated in Basin Plans for surface waters and groundwater basins, and in the case of the San Francisco Bay Basin, wetlands. **Table 4.5-1** lists the designated beneficial uses for those water bodies that could be affected by the WSIP. ~~project activities, as defined in the Basin Plans.~~ The beneficial uses of the water bodies generally apply to all tributaries.

Section 4.5.1, page 4.5-10: Table 4.5-1 is revised as follows in response to a comment (see **Response S_RWQCBSF-02**).

TABLE 4.5-1
DESIGNATED BENEFICIAL USES

Water Body	Designated Beneficial Uses

San Antonio Reservoir	COLD, MUN, REC-1 (limited), REC-2, SPWN, WARM, WILD
Niles Cone Groundwater	MUN, PROC, IND, AGR
Bay Division Region	
Guadalupe River	COLD, MIGR (potential), REC-1 (potential), REC-2, SPWN (potential), WARM, WILD
Santa Clara Valley Groundwater	MUN, PROC, IND, AGR (potential)
Peninsula Region	
San Mateo Creek	COLD (potential), FRSH, RARE, REC-1 (potential), REC-2 (potential), SPWN, WILD
Crystal Springs Reservoir	COLD, MUN, RARE, REC-2, SPWN, WARM, WILD
San Andreas Reservoir	COLD, MUN, RARE, REC-1 (limited), REC-2, SPWN, WARM, WILD
San Mateo Plain Groundwater	MUN, PROC, IND, AGR (potential)
San Francisco Region	
Lake Merced	COLD, MUN (potential), REC-1, REC-2, SPWN, WARM, WILD
Westside Groundwater	MUN, PROC (potential), IND (potential), AGR
San Francisco Bay	
San Francisco Bay, Lower	COMM, EST, IND, MIGR, NAV, RARE, REC-1, REC-2, SHELL, SPWN (potential), WILD
San Francisco Bay, South	COMM, EST, IND, MIGR, NAV, RARE, REC-1, REC-2, SHELL, SPWN (potential), WILD

Beneficial Uses Key:

MUN (Municipal and Domestic Supply); AGR (Agriculture); REC-1 (Body Contact Recreation); REC-2 (Noncontact Recreation); WARM (Warm Freshwater Habitat); COLD (Cold Freshwater Habitat); MIGR (Fish Migration); SPWN (Fish Spawning); WILD (Wildlife Habitat); NAV (Navigation); GWR (Groundwater Recharge); FRSH (Freshwater Replenishment); RARE (Preservation of Rare and Endangered Species); SHELL (Shellfish Harvesting); COMM (Ocean, Commercial, and Sport Fishing); EST (Estuarine Habitat); IND (Industrial Service Supply); PROC (Industrial Process).

Note: Beneficial uses for specific wetland sites affected by the WSIP facility improvement projects in the San Francisco Bay region will be determined as needed based on the process described in the San Francisco Bay Basin Plan.

Section 4.5.1, page 4.5-12: The following paragraph is inserted as the first paragraph under the heading “Construction in Waters of the State and of the United States” in response to a comment (see **Response S_RWQCBCV-03**).

> The Regional Water Quality Control Board (RWQCB) has regulatory authority over construction in waters of the United States and waters of the state, including activities in wetlands, under both the Clean Water Act and the State of California’s Porter-Cologne Water Quality Control Act (California Water Code, Division 7). Under the Clean Water Act, the RWQCB has regulatory authority over actions in waters of the United States through the issuance of water quality certifications under Section 401 of the Clean Water Act, which are issued in conjunction with permits issued by the Army Corps of Engineers (Corps) under Section 404 of the Clean Water Act. When the RWQCB issues a Section 401 certification for a project, the project is also regulated under State Water Resources Control Board Order No. 2003-0017-DWQ, “General Waste Discharge Requirements for Dredge and Fill Discharges That Have Received State Water Quality Certification,” which requires compliance with all conditions of the water quality certification. Activities in areas that are outside the jurisdiction of the Corps (e.g., isolated wetlands, vernal pools, or stream banks above the ordinary high water mark) are regulated by the RWQCB under the authority of the Porter-Cologne Act. Activities that lie outside of Corps jurisdiction may require the issuance of either individual or general waste discharge permits.

Section 4.5.1, page 4.5-13: The second full paragraph is revised as follows in response to a comment (see **Response S_RWQCBSF-04**).

> The C.3 requirements are similar for all counties. However, local municipalities are phasing in these requirements, and specific procedures and application requirements may differ from one municipality to another. Reconstruction projects located within ~~Projects completed in~~ a public street or road right-of-way, such as some pipeline projects proposed as part of the WSIP, are exempt from the C.3 requirements where ~~when~~ both sides of the right-of-way are developed.

Section 4.5.2, page 4.5-31: The last paragraph is revised as follows in response to a comment (see **Response S_RWQCBSF-07**).

> For projects that are subject to the Construction General Permit (described in Impact 4.5-1, above), the discharges could possibly be made in accordance with this permit, provided it could be demonstrated that the water is uncontaminated. … Discharges to a local sanitary sewer system would comply with the requirement of the local permitting agency. Other General Permits in the San Francisco Region under which dewatered groundwater may be discharged include the following General NPDES Permits:
>
> - General NPDES Permit for VOC Cleanups (Order No. R2-2004-0055)
> - General NPDES Permit for Fuel Cleanups (Order No. R2-2006-0075)
> - General NPDES Permit for Groundwater Dewatering (Order No. R2-2006-0075)

Before discharging under any general permit, the SFPUC must submit a completed Notice of Intent that includes a dewatering plan with appropriate treatment and monitoring specifications. The SFPUC should also allow at least 60 days for the RWQCB review and acceptance of the Notice of Intent and dewatering plans.

Section 4.5.2, page 4.5-39: The third full paragraph is revised as follows to correct an editorial error.

The Calaveras Dam (SV-2), 40-mgd Treated Water (SV-3), and Treated Water Reservoirs (SV-5) projects would not be located within a mapped 100-year floodplain. Therefore, flooding impacts would *not apply* to these projects.

Section 4.5.2, page 4.5-50: The first and second full paragraphs are revised as follows in response to a comment (see **Response S_RWQCBSF-09**).

With the exception of San Francisco and San Joaquin County, the municipal stormwater permits for the counties within the WSIP study area require new development and redevelopment projects that involve the creation or replacement of impervious surfaces to incorporate treatment measures and other appropriate source control and site design features to reduce the pollutant load in stormwater discharges and to manage runoff flows; the applicability of countywide MS4 stormwater management controls to the WSIP will be determined on a project-by-project basis as part of project-level review of individual WSIP projects. In each county, projects subject to these controls that involve the creation or replacement of one or more acres of impervious surfaces were required to comply with the new development and redevelopment requirements as of February 15, 2005. Projects subject to countywide MS4 stormwater management controls that involve the creation or replacement of 10,000 square feet or more of impervious surfaces were required to comply with the requirements by August 15, 2006. These thresholds apply to individual projects and are not applied to a cumulative set of projects if the locations of the cumulative set of projects under a single program are noncontiguous and/or are not part of a single common plan of development. To the extent that projects subject to countywide MS4 stormwater management controls are part of a single common plan of development that cumulatively exceeds 10,000 square feet of new or replaced impervious surface, the smaller amount of impervious surface from each sub-project would require appropriately sized stormwater treatment BMPs. ~~such as the WSIP. The applicability of the municipal stormwater permit requirements to specific projects would depend on the amount of impervious surface that would be created or replaced.~~

In addition, projects subject to countywide MS4 stormwater management controls that involve land disturbance of more than one acre would be required to include post-construction erosion and sediment control BMPs in the SWPPP prepared for the project (Described in the Setting and in Impact 4.5-1). For projects subject to countywide MS4 stormwater management controls, the post-construction erosion and sediment control BMPs for projects located in Alameda, Santa Clara, and San Mateo Counties and creating or replacing more than one acre of impervious surface must also comply with requirements in the Hydrograph Modification Management Plans for those counties. Post-construction BMPs could include minimizing land disturbance or the amount of impervious surfaces; treating stormwater runoff using infiltration, detention/retention, or biofilters; using efficient irrigation systems; ensuring that interior drains are not connected to a storm sewer system; and using appropriately designed and constructed energy dissipation devices. These measures would be designed to ensure that drainage patterns are not changed in a way that results in offsite erosion or flooding, and must be consistent with all local post-construction stormwater management requirements, policies, and guidelines. Coverage under the General Construction Permit cannot be terminated until the site is in compliance with all local stormwater management requirements and a post-construction stormwater management plan is in place, as described in the SWPPP.

4.6 Biological Resources

Section 4.6.1, page 4.6-22: The third full paragraph is revised as follows to correct an editorial error. The footnote in this paragraph remains unchanged and is not shown below.

Program Area Occurrence. ~~A~~ Two adult San Joaquin kit fox were~~was~~ sighted recently on another SFPUC project site in the Sunol Valley. Despite this sighting of ~~Since this was a single sighting,~~ apparently ~~of~~ a pair of ~~single~~ transient animals, this species is not otherwise considered present in the Sunol Region. Salt marsh harvest mouse occurs most frequently in suitable habitat that lies generally south of a line between Redwood City and Hayward (Goals Project, 2000).

Section 4.6.1, page 4.6-32: The fourth full paragraph is revised as follows in response to a comment (see **Response S_RWQCBCV-03**).

The state's authority to regulate activities in wetlands and water at the project sites resides primarily with the ~~State Water Resources Control Board (SWRCB)~~ California Regional Water Quality Control Board (RWQCB), which regulates construction in waters of the United States and waters of the state, including activities in wetlands, under both the Clean Water Act and the State of California's Porter-Cologne Water Quality Control Act. .... The RWQCB ~~SWRCB, acting through the nine Regional Water Quality Control Boards,~~ must certify that a Corps permit action meets state water quality objectives (Section 401, Clean Water Act).

Section 4.6.1, page 4.6-33: The following text is added before the second full paragraph on the page in response to a comment (see **Response L_BCDC-03**).

Local Laws, Regulations, and Policies Applying to Natural Resource Protection

The San Francisco Bay Conservation and Development Commission (BCDC) was formed in 1969 under the McAteer-Petris Act to regulate development in and around San Francisco Bay. BCDC developed the San Francisco Bay Plan to guide the wise use of the bay's water and shorelines. In reviewing permit applications for projects within its jurisdiction, BCDC relies on its Bay Plan policies to ensure the protection of habitats and biological resources, including fish, other aquatic organisms, and wildlife, and water quality; as well as policies on uses of the bay and shoreline.

Section 4.6.2, page 4.6-37: The third bullet is revised as follows in response to a comment (see **Response S_RWQCBCV-05**).

- Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act and as protected under the Porter-Cologne Water Quality Control Act (including but not limited to marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means (Evaluated in this section)

Section 4.6.2, page 4.6-47: The first sentence in the first full paragraph is revised as follows to be consistent with the updated project description of the Calaveras Dam Replacement project (SV-2).

The Calaveras Dam project (SV-2) would affect about 100 acres of habitat in the ~~dam~~ construction area, including portions of Calaveras Creek downstream from the existing dam and portions of Alameda Creek in the vicinity of the Alameda Creek Diversion Dam.

Section 4.6.2, page 4.6-55: The sixth sentence in the third full paragraph (starting on line 13 of this paragraph) is revised as follows to be consistent with the updated project description of the Calaveras Dam Replacement project (SV-2).

Established critical habitat in the Sunol Valley includes the area between Arroyo Hondo and Calaveras Reservoir (for California tiger salamander) and the area between the Alameda Creek Diversion Dam, Calaveras Reservoir and San Antonio Reservoir (for Alameda whipsnake).

4.7 Cultural Resources

Section 4.7.1, page 4.7-24: The following text is added after the first partial paragraph on the page in response to a comment (see **Response L_SFLandmarks-04**).

Opposition to construction of the Hetch Hetchy project came from a variety of interests. Understandably, the Spring Valley Water Company opposed this project, which effectively ended the company's role as the utility company supplying San Francisco with its municipal and domestic water.[21a] The Hetch Hetchy project was designed to transmit electrical power to San Francisco from a power plant at Moccasin. A politically charged conflict over this electric power and associated revenue pitted public power advocates against the privately financed electric power industry. Opposition came from electrical power generating companies like Pacific Gas and Electric Company (PG&E) and Great Western Power Company (GWP), two utilities that served San Francisco and the Bay Area. These private power companies opposed the competing generation and sale of electricity by public agencies, which was a provision of the Raker Act. The CCSF planned to acquire PG&E and GWP's distribution systems within its service area, but between 1927 and 1941 the public consistently rejected bond issues required to fund their acquisition; allegedly, this opposition to the bond measures was largely funded by PG&E.[21b] The CCSF's agreements to have PG&E (which had acquired GWP in the 1930s) wheel its power through the company's existing transmission and distribution systems for delivery to San Francisco agencies, and its purchase of city power for resale, caused a longstanding controversy between the federal government, public power advocates, and the CCSF.[21c]

Section 4.7.1, page 4.7-24: The following text is added after the third full paragraph in response to a comment (see **Response L_SFLandmarks-06**).

Multi-purpose dam and water conveyance projects proliferated within river basins throughout America in the early decades of the 20th century. The projects were built for a variety of purposes: municipal water supplies, federal land reclamation, irrigation, and electric power generation. Thousands of workers contributed to this construction work, often under tight schedules and difficult, even dangerous, conditions. Hetch Hetchy water project contract workers and wage laborers consisted of a varied group of individuals stratified by skill, race, and ethnicity. The largest proportion was low-paid, unskilled laborers, both native-born and immigrants. Above them were the better-paid skilled workers and craftsmen, and at the top was a smaller group consisting of managers, supervisors, administrative personnel, and skilled professionals such as civil and electrical engineers, hydrographers, and surveyors. Over more than 25 years of construction activity, the Hetch Hetchy project provided employment to many thousands of workers in many fields of industrial labor; these workers built everything from mountain roads, railroads, labor camps, buildings, bridges, and trestles that served as project infrastructure, to dams, tunnels, pipelines, siphons, and penstocks that stored and conveyed municipal water. Many of the lesser-skilled construction laborers were highly migratory, non-unionized workers whose employment was seasonal, with peak employment coming during the summer and autumn and minimal opportunities in winter and spring.

While some workers were more sedentary and lived in towns or work camps with their families, the majority of the workers—who were predominantly unmarried, mobile, and male—resided in boardinghouses or labor camps near their work sites. The ethnic makeup of the workingmen's boarding houses was often quite diverse, according to 1920 census records. For example, one lumber camp near Groveland was operated by an American civil engineer whose wife kept house with the assistance of one cook. Twenty-five boarders lived there, including painters, carpenters, contractors, lumberjacks, millwrights, and the lumberyard foreman. While the nationality of the boarders was predominately native-born, there were also Hungarians, Poles, Swedes, Germans, and Italians represented among the lodgers. Similarly, a tunnel camp in Groveland Precinct in 1920 contained boarding houses operated by a Swedish immigrant and a Canadian-born mine superintendent. While the Swedish-run operation catered mostly to about 20 Swedish, Norwegian, and native-born tunnel workers, the Canadian establishment lodged a diverse clientele of 22 workers, including tunnel miners and laborers, blacksmiths, foremen, and electricians. They were a diverse lot by nationality, including Canadians, native-born Americans, Spanish, German, Swedish, Italian, Irish, and Austrian workers. This pattern of boarding house occupation by workers of various nationalities was borne out at other tunnel camps and dam construction camps located outside the town of Groveland and at Lake Eleanor.[21d]

Unsafe working conditions and inadequate wages were issues that periodically contributed to labor strife and fostered efforts to unionize the rural industrial labor force assembled to construct the Hetch Hetchy project. During August of 1920, workers at some of the city's construction camps, particularly in the Mountain Tunnel Division, staged a general strike that lasted until May 1921. City officials, particularly O'Shaughnessy, had expressed general support for trade or craft unionism, but objected to "radicals" who organized the day laborers/construction workers hired by the CCSF and advocated worker solidarity, class conflict, and direct action (strikes) at the point of production. These radical labor leaders included representatives of the Industrial Workers of the World (I.W.W., or "Wobblies"), which variously functioned as an umbrella labor organization and revolutionary social movement, and the International Union of Mine, Mill & Smelter Workers, a labor union with militant roots in the copper, nickel, lead, and gold mines of the American West and British Columbia. During the 1920s and 1930s, Mine and Mill, as the union was known, made concerted efforts to organize unskilled national minorities such as Mexican-Americans and African-Americans in the American Southwest. City records indicated that Swedish/Finnish tunnel crews and Mexican laborers were among the more ardent supporters of the radical unionization effort.[21e]

Construction of Hetch Hetchy Dam, ancillary water storage structures, the city's extensive water conveyance system, and its power plant at Moccasin proceeded over several decades, from 1913 into the late 1930s. In 1925, in his report to the CCSF on Hetch Hetchy's progress, O'Shaughnessy made little mention of labor problems or strife over organizing, and no comments related to national groups and/or the ethnic composition of the workforce. He reported that the total number of "men" productively employed on the project between 1914 and mid-1925 ranged from over 500 at the end of 1914, less than a hundred at the beginning of 1915, and then a gradual increase (with ebbs and flows) to about 750 in 1919. Thereafter the numbers increased quickly, reaching over 2,000 in 1922, before dropping off again to less than 400 by mid-1925.[21f] After 1925, the bulk of the construction effort shifted to the Foothill and Coast Range Tunnels and installation of the San Joaquin Pipeline, leading eventually to the delivery of Hetch Hetchy water into the city in October 1934.[21g]

Section 4.7.1, page 4.7-24: The following footnotes are added in response to two comments (see **Responses L_SFLandmarks-04** and **L_SFLandmarks-06**):

Section 4.7.1, page 4.7-25: The following text is added after the third full paragraph in response to a comment (see **Response L_SFLandmarks-04**):

O'Shaughnessy Dam was designed and built in a manner that would allow it to be raised. In the 1930s, President Franklin D. Roosevelt sought to provide America with a New Deal, a government-sponsored socioeconomic initiative that among its most prominent programs included dam construction projects as massive public works. Not long after Roosevelt's election (November 1932) and the start of the New Deal (after his inauguration in March 1933), the CCSF received a grant from the federal government covering 30 percent of the cost of labor and materials for raising O'Shaughnessy Dam. The money came from the National Recovery Administration, which was formed by the National Industrial Recovery Act of June 1933. The SFPUC reported that on November 7, 1933, the citizens of San Francisco passed a bond measure for $3.5 million to cover the city's portion of the cost of enlarging O'Shaughnessy Dam. The federal grant also stipulated that all available unemployed workers in Tuolumne County had to be put to work before unemployed people from San Francisco could be used. Soon thereafter, the state requested that the CCSF use 500 to 600 unemployed laborers it had available for "maintenance of municipal property" under the State Emergency Relief Act (SERA). By March 1934, the CCSF had erected seven SERA work camps capable of housing and feeding nearly 700 workers. Later, the state's SERA program for unemployment relief was absorbed into the federal Works Progress Administration. The CCSF issued the contract for the Hetch Hetchy Dam enlargement project on April 8, 1935 to the Transbay Construction Company, and the dam's raising was completed more than three years later, on July 1, 1938.[22a]

Section 4.7.1, page 4.7-25: The following footnote is added in response to a comment (see **Response L_SFLandmarks-04**):

[22a] San Francisco Public Utilities Commission (SFPUC), *San Francisco Water and Power,* pp. 59–60, June 1949; Ted Wurm, *Hetch Hetchy and its Dam Railroad*, Trans-Anglo Books, Glendale, CA, p. 251, 1973.

Section 4.7.2, page 4.7-37: The following footnote is added at the end of second full paragraph in response to a comment (see **Response L_SFLandmarks-05**):

> [29a] These properties have been determined eligible for listing in the National Register through consensus between a federal agency and the State Historic Preservation Officer. Information regarding National Register eligibility was acquired through a records search conducted at the Northwest Information Center at Sonoma State University, which is one of regional offices of the California Historical Resources Information System established by the California Office of Historic Preservation.

Section 4.7.2, page 4.7-39: The fourth bullet at the bottom of the page is revised as follows to clarify the current understanding of the historical status of the Coast Range Tunnel.

- *Hetch Hetchy Coast Range Tunnel*. This facility is listed as a California Historic Civil Engineering Landmark and appears to meet the criteria ~~is eligible~~ for listing in the National and California Register.

Section 4.7.3, page 4.7-51, Table 4.7-2: The text for the Baden and San Pedro Valve Lots project (row 19 below the table header) is revised as follows to correct an editorial oversight.

TABLE 4.7-2
POTENTIAL FOR PALEONTOLOGICAL IMPACTS

Project No.	Project Name	Would the WSIP project be located in an area of geologic formations where there is a high likelihood of paleontological impact?[a]	Have fossil localities been identified at other locations within the geologic formation?[a]	What is the potential for impacts on paleontological resources?	Impact significance
PN-1	Baden and San Pedro Valve Lots Improvements	Yes, ~~marine deposits, possible Merced Formation~~ Butano Sandstone/Whiskey Hill Formation	Yes	High	PSM

Section 4.7.3, page 4.7-54: The first paragraph under the subheading "Peninsula Region" is revised as follows, including a new footnote shown below, to correct an editorial oversight.

> Paleontological resources could be encountered during construction work for the Baden and San Pedro Valve Lots (PN-1), HTWTP Long-Term (PN-3), and Pulgas Balancing Reservoir (PN-5) projects. These project areas overlie marine sedimentary geologic units that have recorded fossil localities. The ~~Baden and San Pedro Valve Lots and~~ HTWTP Long-Term project~~s~~ overlies the Merced Formation, a marine sandstone, siltstone, claystone, and conglomerate deposit that contains numerous invertebrate fossil localities throughout the San Francisco Peninsula. The Pulgas Balancing Reservoir and Baden and San Pedro Valve Lots Improvements projects include construction ~~is~~ at the southern end of Crystal Springs Reservoir, in ~~an~~ areas underlain by Butano Formation sandstone/Whiskey Hill Formation[32a] and other fossil-bearing marine sandstones and shales. The Butano Formation/Whiskey Hill Formation contains numerous fossil localities throughout

San Mateo County (UCMP, 2006). Given the high likelihood that these projects could affect paleontological resources, this impact would be *potentially significant*, but could be reduced to a less-than-significant level by suspending work if a paleontological resource is identified and having the site inspected by a qualified paleontologist (Measure 4.7-1).

(Footnote to be added as part of the above new text):

[32a] The Whiskey Hill Formation was previously mapped as the Butano sandstone. However, in 1993 the USGS determined that the Butano sandstone was actually composed of two similar sandstones indistinguishable in lithology and age but separated by the San Andreas-Pilarcitos fault system and having different stratigraphic relations to other geologic units. As a result of this determination, the geologic unit in the vicinity of the southern end of Crystal Springs Reservoir is now identified as the Whiskey Hill Formation, but references prepared prior to 1993 (including the University of California Museum of Paleontology Collections Database) refer to the Butano sandstone instead of the Whiskey Hill Formation. For this reason, the formation is referred to as the Butano sandstone/Whiskey Hill Formation in this analysis.

Section 4.7.3, pages 4.7-64 and 4.7-65, Table 4.7-4: The third and ninth rows, excluding headers, of Table 4.7-4 are revised as follows to correct inadvertent omissions of potentially affected facilities.

TABLE 4.7-4
HISTORIC ARCHITECTURAL RESOURCES IMPACT POTENTIAL ON REGIONAL WATER SYSTEM FACILITIES

WSIP Facility Improvement Project	Construction Date of Potentially Affected Facilities	Would the project affect a potential historic district?	Significance determination for impacts on the historical significance of a potential historic district	Would the project demolish or alter the historic fabric or function of a specific existing facility?	Significance determination for impacts on the historical significance of the individual facility
SV-4: New Irvington Tunnel	Irvington Tunnel: 1934 Irvington Portal: 1934 Alameda West Portal: 1934 Coast Range Tunnel: 1934	Yes, the existing Irvington Tunnel and the Irvington and Alameda West Portals could be contributors to a potential historic district related to the implementation of John R. Freeman's plan for the development of the Hetch Hetchy system. Because the existing Irvington Tunnel and Alameda West Portal would continue as originally designed, and the project would create a new component of the system (a new, redundant tunnel) rather than eliminate the existing tunnel, the impact on such a potential historic district would be less than significant. However, the existing Irvington Portal would be demolished as part of this project, which would result in a potentially significant impact on the potential historic district. This impact could likely be reduced to a less-than-significant level.	PSM	Yes, the project would demolish the unique spherical Irvington Portal (in Fremont) that was built in the 1930s. Since retaining the portal is not feasible due to safety concerns, the impact on the historic facility would be potentially significant and unavoidable, if the portal were determined to be a historical resource for the purposes of CEQA compliance.	PSU

4.8 Traffic, Transportation, and Circulation

Section 4.8.2, page 4.8-22: The third full paragraph is revised as follows in response to a comment (see **Response L_EBRPD-06**):

> Construction of Calaveras Dam (SV-2) would require temporary closure of Calaveras Road between Geary Road and Felter Road to through-traffic during the two- to three-year construction period. Through-traffic using Calaveras Road would be required to find an alternate route for the duration of the construction period and would likely use I-680. Access to the East Bay Regional Park District's (EBRPD) Sunol Regional Wilderness would still be provided via Calaveras Road and Geary Road from the north, and emergency vehicles would continue to have access to temporarily closed roads. Direct access to ~~some~~ the EBRPD Ohlone Wilderness Regional Trail may be restricted, including access to the Bay Area Ridge Trail connection from the west. There are no private residences or commercial uses on this segment of Calaveras Road. This project would be evaluated as part of separate, project-level CEQA review. Implementation of SFPUC Construction Measure #5 (traffic control plan) and additional traffic control measures identified in Measure 4.8-1a would be adequate to ensure acceptable levels of traffic, pedestrian, and bicycle flow and to reduce any *potentially significant* circulation and access impacts to a less-than-significant level.

4.9 Air Quality

Section 4.9.2, page 4.9-17: The following text is added after the first paragraph to reflect updated information implemented by the city and county of San Francisco. This change does not affect the GHG impact analysis in the Draft PEIR.

Greenhouse Gas Reduction Ordinance

In May 2008, San Francisco adopted an ordinance amending its Environment Code to establish greenhouse gas emission targets and action plans, to authorize the Department of the Environment to coordinate efforts to meet these targets, and to make environmental findings (CCSF, 2008). The ordinance establishes the following greenhouse gas emission reduction limits for San Francisco and the target dates to achieve them:

- Determine 1990 City greenhouse gas emissions by 2008, the baseline level with reference to which target reductions are set;
- Reduce greenhouse gas emissions by 25 percent below 1990 levels by 2017;
- Reduce greenhouse gas emissions by 40 percent below 1990 levels by 2025; and
- Reduce greenhouse gas emissions by 80 percent below 1990 levels by 2050.

The ordinance also specifies requirements for City departments to prepare Climate Action Plans that assess and report GHG emissions and prepare recommendations to reduce emissions. As part of this, the San Francisco Planning Department is required to: (1) update and amend the City's applicable General Plan elements to include the emissions reduction limits set forth in this ordinance and policies to achieve those targets; (2) consider a project's impact on the City's GHG reduction limits specified in this ordinance as part of its review under CEQA; and (3) work with other City departments to enhance the "transit first" policy to encourage a shift to sustainable modes of transportation thereby reducing emissions and helping to achieve the targets set forth by this ordinance.

Section 4.9.2, page 4.9-19: The text following the heading "SFPUC GHG Reduction Actions as Part of the WSIP" is revised as follows to correct an editorial error.

A. The SFPUC will include the first two ~~following~~ measures in all WSIP contractor specifications and will implement the third during project planning and design, which in addition to having other environmental benefits, would also help reduce GHG emissions.

Section 4.9.3, page 4.9-20: The third bullet under Significance Criteria is revised as follows to reflect the updated criterion used by the San Francisco Planning Department and to clarify the intent of the greenhouse gases (GHGs) analysis in the Draft PEIR. This change does not affect the GHG impact analysis in the Draft PEIR.

- Conflict with the state goal of reducing GHG emissions in California to 1990 levels by 2020, as set forth by the timetable established in AB 32, California Global Warming Solutions Act of 2006, such that the project's GHG emissions would result in a substantial contribution to global climate change (Evaluated in this section).

Section 4.9.4, page 4.9-48: The following reference is added after (Cal-EPA, 2005) to reflect updated information implemented by the City and County of San Francisco.

City and County of San Francisco (CCSF), Environment Code, Chapter 9: Greenhouse Gas Emissions Targets and Departmental Actions, (Ordinance 81-08, File No. 071294), May 13, 2008.

4.11 Public Services and Utilities

Section 4.11.1, page 4.11-4, Table 4.11-2: Table 4.11-2 is revised as shown on the following page in response to a comment (see **Response L_EBRPD-23**).

TABLE 4.11-2
LAW ENFORCEMENT AND FIRE PROTECTION SERVICE PROVIDERS WITHIN THE WSIP STUDY AREA

Jurisdiction	Law Enforcement Agencies	Fire Protection Service Agencies
Alameda County		
Unincorporated areas including, San Lorenzo and Castro Valley	Alameda County Sheriff's Department East Bay Regional Park District Police Department	Alameda County Fire Department East Bay Regional Park District Fire Department

Section 4.11.1, page 4.11-8: The first sentence in the first paragraph is revised as follows to correct an editorial error.

California Integrated Waste Management Act of 1989

The California Integrated Waste Management Act of 1989 (Public Resources Code [PRC], Division 30), enacted through Assembly Bill (AB) 939 and modified by subsequent legislation, requires all California cities and counties to implement programs to reduce, recycle, and compost at least 50 percent of wastes by the year 2000~~, and to divert at least 75 percent by 2010~~ (PRC Section 41780).

4.12 Recreational Resources

Section 4.12.1, page 4.12-2: The last paragraph is revised as follows in response to a comment (see **Response L_EBRPD-19**).

East Bay Regional Parks. The EBRPD has jurisdiction over numerous regional parks located in Alameda and Contra Costa Counties. Several major EBRPD facilities encompassing thousands of acres of parks and open space are clustered in the East County/Sunol Valley area, including Del Valle Regional Park, Ohlone Regional Wilderness, Sunol Regional Wilderness, Vargas Plateau Regional Preserve, and Mission Peak Regional Park. The long-term goal of the EBRPD is to adopt land use plans to guide the management and use of all of its facilities. The EBRPD has adopted a land use plan for Del Valle Regional Park; other land use plans are in draft form at various stages of planning.

Section 4.12.1, page 4.12-7: The last two paragraphs are revised as follows in response to a comment (see **Response L_SFBayTrl-02**).

The Bay Trail. Senate Bill 100, passed in 1987, directed the Association of Bay Area Governments (ABAG) to identify an alignment and develop a plan to create a public trail system encircling San Francisco Bay. The *Bay Trail Plan*, adopted by ABAG in 1989, proposed a continuous 400-mile corridor that would eventually link the shorelines of all nine Bay Area counties and 47 cities around San Francisco and San Pablo Bays. Since its adoption, the *Bay Trail Plan* has received widespread public support as a means of preserving and enhancing public access to the San Francisco Bay waterfront. Most of the jurisdictions along the proposed trail alignment have adopted the plan and incorporated the appropriate Bay Trail segments into their local plans and policies. When complete, the Bay Trail corridor will be 500 miles long.

Development of the Bay Trail is overseen by the Bay Trail Project, a nonprofit organization established in 1990. The Bay Trail Project does not own land or easements; instead, it encourages local jurisdictions to construct and maintain segments of the Bay Trail, often in partnership with other local nonprofit groups. ~~As of 2005, a~~Approximately ~~280~~290 miles, or just over half of the envisioned trail, ~~had~~has been completed. Some portions of the Bay Trail are paved pathways, while others consist of dirt trails or sidewalks. The main trail, referred to as the "spine trail," follows the San Francisco Bay shoreline to the extent possible. Where it is not able to follow the shoreline, “spur trails” provide access from the spine trail to points of interest along the waterfront. In addition, “connector trails” provide links to other nearby recreational facilities, residential neighborhoods and employment centers (Association of Bay Area Governments Bay Trail Project, 2005). Segments of the Bay Trail exist near the proposed pipeline alignments for the BDPL Reliability Upgrade (BD-1) project.

Section 4.12.1, page 4.12-10: The fourth paragraph is revised as follows in response to a comment (see **Response L_PaloAlto-14**).

City of Palo Alto

According to the City of Palo Alto, the city has a total of 4,358 acres of parkland and open space areas, including 32 urban parks encompassing approximately 200 acres and several large open-space and nature preserves. Foothill Park is approximately 1,400 acres and the Arastradero Preserve is approximately 610 acres (City of Palo Alto, 2007). ~~Palo Alto operates 29 parks encompassing approximately 190 acres. Palo Alto Baylands Nature Preserve, a popular hiking and bird-watching area on San Francisco Bay, encompasses 1,940 acres and contains 15 miles of multi-use trails, a segment of the Bay Trail, an athletic center, picnic facilities, an art park, and the Baylands Nature Interpretive Center.~~ The City of Palo Alto owns the wetlands south of Cooley Landing (in East Palo Alto) in the vicinity of the BDPL Reliability Upgrade (BD-1) pipeline alignment (City of Palo Alto, 1998). A BDPL Nos. 3 and 4 Crossovers (BD-2) crossover facility would be adjacent to the sports fields at Gunn High School.

Section 4.12.1, page 4.12-11: The first full paragraph is revised as follows in response to a comment (see **Response L_RdwdCty-06**).

City of Redwood City

Redwood City owns and operates 30 parks, including small neighborhood parks, larger multi-use parks, a dog park, a skate park, and two outdoor pools (City of Redwood City, 2007~~c~~a). The BDPL Reliability Upgrade project (BD-1) is in the vicinity of Fleishman Park, Hawes Park, and Red Morton Park. The 0.64~~0.63-~~acre Fleishman Park has play equipment, a play area, picnic area, barbeque pits, and restrooms (City of Redwood City, 2007~~a~~b). Hawes Park contains ball fields and restroom facilities on ~~covering~~ 1.59 acres (City of Redwood City, 2007b). Red Morton Park encompasses 30.89 ~~31.74~~ acres and has pools, ball fields, play areas and equipment, picnic areas, barbeque pits, tennis courts, basketball courts, and restroom facilities (City of Redwood City, 2007b~~d~~). An alternative site for the BDPL 3 and 4 Crossovers project (BD-2) could also be located in Redwood City (City of Redwood City, 1991).

Section 4.12.2, page 4.12-18: The second paragraph is revised as follows in response to a comment (see **Response L_EBRPD-02**).

To determine potential direct effects of WSIP projects construction activities and/or land acquisition, project areas were compared with the locations of identified recreational

> resources. Potential indirect effects on recreational resources were identified through the same means, as well as by reviewing the impact findings from Section 4.3, Land Use and Visual Quality; Section 4.5, Hydrology and Water Quality; Section 4.9, Air Quality; and Section 4.10, Noise and Vibration. Indirect impacts that would typically result from other physical impacts and could adversely affect the recreational experience include the following: removal of vegetation that could alter views (Section 4.3, Land Use and Visual Quality); construction-related noise that could affect hiking or nature appreciation (Section 4.10, Noise); or impeded access to hiking trails (Section 4.8, Traffic, Transportation, and Circulation).

Section 4.12.2, page 4.12-22, Table 4.12-2: Table 4.12-2 is revised as follows in response to a comment (see **Response L_SFBayTrl-04**).

TABLE 4.12-2
PUBLIC PARKS AND RECREATIONAL FACILITIES IN THE PROJECT VICINITY

Projects	Potentially Affected Recreational Resources
BD-1: Bay Division Pipeline Reliability Upgrade	Don Edwards San Francisco Bay Regional Wildlife Refuge; Ravenswood Open Space Preserve; San Francisco Bay Trail; local parks in Fremont, Newark, San Mateo County, and Redwood City; numerous school properties in East Palo Alto, Fremont, Menlo Park, Newark, and Redwood City

Section 4.12.2, page 4.12-24: The first full paragraph is revised as follows in response to a comment (see **Response L_SFBayTrl-04**).

> Of the WSIP projects proposed for construction in the Bay Division Region, the BDPL Reliability Upgrade project (BD-1) would have the greatest potential impact on recreational facilities in the area. The preferred pipeline alignment for the new Bay Division Pipeline (No. 5) would pass beneath the Don Edwards San Francisco Bay Regional Wildlife Refuge, with an approximately five-mile tunnel segment installed beneath marshlands and San Francisco Bay. The two cut-and-cover sections of pipeline (approximately seven miles from the Irvington Tunnel Portal to the Newark Valve House and nine miles from the Ravenswood Valve House to the Pulgas Tunnel Portal) would be located within the existing SFPUC right-of-way. The Ravenswood Open Space Preserve and San Francisco Bay Trail are also located in the vicinity of the Ravenswood Valve House.

Section 4.12.3, page 4.12-29: The following reference is added after (City of Palo Alto, 1998) in response to a comment (see **Response L_PaloAlto-14**).

> City of Palo Alto, Yoriko Kishimoto, Mayor, letter communication, September 25, 2007.

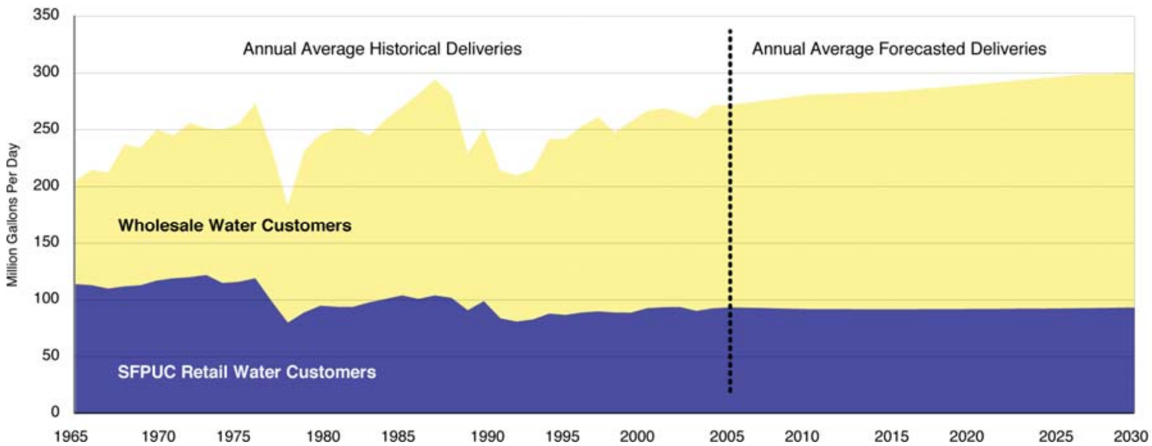
Volume 3, Chapter 5

5.1 Overview

Section 5.1.3, page 5.1-5. This is the same revision as described above for Section 3.6.2, page 3-36, in the first bullet under the first paragraph under the heading "Proposed Drought-Year Water Supplies."

Section 5.1.3, page 5.1-6, Figure 5.1-2: The label on the right-hand side of the figure is revised as shown on the following page in response to a comment (see **Response L_BAWSCA1-57**).



SFPUC Water System Improvement Program ▪ 203287

SOURCE: SFPUC, 2007b

Figure 5.1-2 (Revised)
Annual Average Historical and
Projected Future Customer Purchase Requests

Section 5.1.4, page 5.1-9. The second paragraph under the heading "Hetch Hetchy/Local Simulation Model" is revised as follows and text is added to provide information regarding the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

> A general overview of this modeling tool and the basic assumptions about the system included in the model are described in this section. **Appendix H1** provides a more detailed description of the model and how it was used for the PEIR water supply and system operations impact analysis; **Appendix H2** provides supporting details and an explanation of the 2007 raw data output from the model.
>
> Following publication of the Draft PEIR, the SFPUC conducted updated model runs in 2008 using more recent input assumptions for several model parameters as part of its ongoing system planning and management. The revised input assumptions included: adjusted capacity for Crystal Springs Reservoir from recent survey data; more accurate assumptions for Pilarcitos facilities operations; improved data regarding the historical hydrology in the Alameda Creek watershed; updated agricultural demands in the Modesto and Turlock Irrigation Districts service area to be consistent with data used in recent

> statewide planning documents; and a refinement of water release protocols at Don Pedro Reservoir. Review of the 2008 model output indicated that the results are generally consistent with the 2007 results used in the Draft PEIR analysis, and that the analyses and impact determinations presented in the Draft PEIR remain valid. With one exception, no changes in the impact approach, analysis or conclusions presented in the Draft PEIR are necessary for the water supply and system operations impact assessments that were based on the 2007 results. The sole exception is the approach to the impact analysis of Pilarcitos watershed resources, for which only semi-quantitative data were previously available. Therefore, the 2008 data were used to conduct a refined impact analysis of the Pilarcitos watershed resources; no new impacts were identified. The results of the refined impact analysis for the Pilarcitos watershed are summarized in Chapter 13 (Section 13.3, pp. 13-6 to 13-7).

Section 5.1.4, page 5.1-14: The last paragraph is deleted as follows to reflect the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

> ~~For example, the HH/LSM was used to estimate baseline and with-WSIP water levels in all SFPUC reservoirs except for Pilarcitos Reservoir. Model results for the Pilarcitos watershed were not directly used to analyze existing and projected water levels in Pilarcitos Reservoir or flows in Pilarcitos Creek. The model does not currently reflect a complete contemporary depiction of the physical operation of the Pilarcitos watershed's facilities. Although adequate for SFPUC's systemwide water supply planning purposes, HH/LSM results for the Pilarcitos watershed at times required supplemental refinement and analysis to accurately reflect the physical infrastructure in place in the watershed.~~

Section 5.1.4, page 5.1-17: The first sentence of the first paragraph is revised as follows to reflect the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

> The HH/LSM was ~~also~~ used to estimate baseline and with-WSIP flows in the Tuolumne River, ~~and~~ Alameda Creek, and Pilarcitos Creek.

Section 5.1.4, page 5.1-17. The third paragraph is revised as follows to provide information regarding the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

> For the reasons noted above, HH/LSM results were not used to predict ~~water levels in Pilarcitos Reservoir, flows in Pilarcitos Creek, or~~ the magnitude and timing of spills or releases from Crystal Springs and San Antonio Reservoirs. In addition, HH/LSM results were not used to predict the magnitude and timing of spills or releases from Crystal Springs Reservoir. In these cases, the likely effects of the WSIP were determined through a review of historical data and consultation with individuals knowledgeable about the past and predicted future reservoir operating practices as well as output from the updated 2008 HH/LSM results.

5.2 Plans and Policies

Section 5.2.2, page 5.2-4, Table 5.2-1: The following rows are added under the heading State of California in response to two comments as shown on the following page (see **Response L_BCDC-04** and **Response SI_TRT-CWA-SierraC-84**).

Section 5.2.2, page 5.2-6: The following text is added at the end of the fourth full paragraph in response to a comment (see **Response S_RWQCBCV-08**).

> Under Section 401 of the Clean Water Act, every applicant for a federal permit for any activity that may affect waters of the state must obtain a water quality certification that the proposed activity will comply with state water quality standards.

Section 5.2.2, page 5.2-6: The following text is added under the heading Federal Statutes and Agreements in response to a comment (see **Response L_Tuol2-06**).

National Forest Management Act

> The National Forest Management Act, enacted by Congress in 1976, is the primary statute governing the administration of national forests. The act requires the Secretary of Agriculture to assess forest lands, and to develop and implement a resource management plan for each unit of the National Forest System. The management plans must: ensure consideration of both economic and environmental factors; provide for wildlife and fish; provide for the diversity of plant and animal communities; ensure timber harvesting will occur only where water quality and fish habitat are adequately protected from serious detriment; and ensure clearcutting and other harvesting will occur only where it may be done in a manner consistent with the protection of soil, watersheds, fish, wildlife, recreation, aesthetic resources, and regeneration of the timber resource. The management plans must be updated at least once every 15 years. In the overall WSIP region, the Sierra Nevada Framework is the management plan governing Stanislaus National Forest. The provisions of the Sierra Nevada Framework are implemented by the U.S. Forest Service.

Section 5.2.2, page 5.2-10: The following text is added under the State Agencies heading in response to a comment (see **Response SI_TRT-CWA-SierraC-84**).

California Fish and Game Commission

> The California Fish and Game Commission (Commission) has the statutory authority to formulate guidance policies for the California Department of Fish and Game (CDFG). The Commission has over 200 powers and duties listed in the statutes of the Fish and Game Code. Principal among these are legislatively granted powers for the regulation of the sport take and possession of birds, mammals, fish, amphibians, and reptiles. The Commission oversees the establishment of wildlife areas and ecological reserves and regulates their use, and prescribes the terms and conditions under which permits or licenses may be issued by the CDFG. A primary responsibility of the Commission is to afford an opportunity for full public input and participation in the decision- and policy-making process of adopting regulations or taking other actions related to the well-being of California's fish and wildlife resources.

TABLE 5.2-1
APPLICABLE FEDERAL, STATE, AND LOCAL STATUTES AND AGREEMENTS

Statute or Agreement / Responsible Agency[a]	Summary Description	Associated Statutes and Plans	Applicability to WSIP Water Supply and System Operations Issues
State of California			
McAteer-Petris Act / BCDC	Promotes responsible planning and regulation of San Francisco Bay. Establishes BCDC as the agency responsible for carrying out the provisions of the act and of the SF Bay Plan.	San Francisco Bay Plan	Described in Section 5.2.3 and evaluated in Section 5.2.4 for consistency. Analyzed in Section 5.3.3.
California Fish and Game Code / Fish and Game Commission and CDFG	Provides a system for the restoration and preservation of California's fish and wildlife resources	California Endangered Species Act (CESA), California Environmental Quality Act (CEQA), Lake and Streambed Alterations	CEQA review of the proposed water supply and system operations aspects of the WSIP is presented in Chapter 5, including the impacts of the WSIP on species listed under CESA, as discussed in Sections 5.3.7, 5.4.6, and 5.5.6.

The Commission sets policy for the CDFG, while the CDFG is the lead state agency charged with implementing, safeguarding, and regulating the uses of fish and wildlife.

California Department of Fish and Game

The mission of the CDFG is to manage California's diverse fish, wildlife, and plant resources, and the habitats upon which they depend, for their ecological values and for their use and enjoyment by the public. The CDFG enforces multiple programs dedicated to the conservation and preservation of habitats and species in California, including the California Endangered Species Act (CESA), California Environmental Quality Act (CEQA), and California Fish and Game Code. Under CESA, the CDFG is responsible for consulting with state lead agencies to determine if their actions would affect a state-listed threatened or endangered species. Under CEQA, the CDFG is responsible for consulting with lead and responsible agencies and providing the requisite biological expertise to review and comment upon environmental documents and impacts arising from project activities. The CDFG is also responsible for enforcing the provisions of the California Fish and Came Code.

Section 5.2.2, page 5.2-11: The following text is added under the State Statutes and Agreements heading in response to a comment (see **Response SI_TRT-CWA-SierraC-84**).

California Fish and Game Code

The Fish and Game Code provides a system for the protection of California's fish and wildlife resources and includes: provisions related to fish and wildlife protection and conservation; fish and game management; wetlands mitigation banking; endangered species; and operation of dams, conduits, and screens.

Section 5.2.2, page 5.2-12: The following paragraph is added above the heading Porter-Cologne Water Quality Control Act in response to a comment (see **Response L_BCDC-04**).

McAteer-Petris Act

The McAteer-Petris Act was passed by the state legislature in 1965 to promote responsible planning and regulation of San Francisco Bay. The act designates the San Francisco Bay Conservation and Development Commission (BCDC) as the agency responsible for maintaining and carrying out the provisions of the act and the SF Bay Plan (for additional information on the act, see Chapter 4, Section 4.2, p. 4.2-8).

Section 5.2.2, page 5.2-12: The following paragraph is added under the heading Local and Regional Agencies heading, below City and County of San Francisco, in response to a comment (see **Response L_BCDC-04**).

San Francisco Bay Conservation and Development Commission

The San Francisco Bay Conservation and Development Commission (BCDC) is the agency responsible for maintaining and carrying out the provisions of the McAteer-Petris Act and the SF Bay Plan. In the public interest, BCDC is authorized to control bay filling and dredging and bay-related shoreline development. Due to the regulatory authority of the State Water Resources Control Board (SWRCB), San Francisco Bay Regional Water Quality Control Board, U.S. Environmental Protection Agency, and the U.S. Army Corps of Engineers, BCDC's scope of authority over water quality issues is limited. (For additional information on BCDC's regulatory authority, see Chapter 4, Section 4.2, p. 4.2-8.)

Section 5.2.3, page 5.2-14: The following text is added under the heading Relevant Plans, Policies, and Planning Actions in response to a comment (see Response **Response L_Tuol2-06**).

U.S. Forest Service, Sierra Nevada Framework

In January 2001, the U.S. Forest Service adopted the Sierra Nevada Forest Plan Amendment (SNFPA or Sierra Nevada Framework), a plan for the management of 11 national forests and 11.5 million acres of national forest land in the Sierra Nevada mountain range, including Stanislaus National Forest. In January 2004, in response to concerns about the flexibility and compatibility of the SNFPA with other programs related to wildland fire management, the U.S. Forest Service amended the Sierra Nevada Framework to provide additional provisions for fire and fuels treatments. The amended Framework outlines procedures used to manage and protect forests, wildlife habitats, and communities from a variety of threats, including catastrophic fires, and provides a programmatic framework within which project-level decisions are designed and implemented. Key aspects of the SNFPA include: a commitment to restoration and protection of old-growth forest habitat; protection of all trees greater than 30 inches on 11 million of the 11.5 million acres of public land managed by the U.S. Forest Service; designation of riparian conservation areas; improvement and protection of suitable habitat for California spotted owl (*Strix occidentalis occidentalis*), northern goshawk (*Accipiter gentiles*), and willow flycatcher (*Empidonax traillii*); adoption of an integrated vegetation management strategy with the primary objective of protecting communities and modifying landscape-scale fire behavior to reduce the size and severity of fires; and provisions for increased land use management, including grazing, timber production, road construction, and recreation activities. The SNFPA is administered by the U.S. Forest Service (USDA Forest Service, 2004). As no WSIP facility improvement projects are proposed within Stanislaus National Forest, and the resources protected by the SNFPA would not be affected by the WSIP water supply and system operations, the WSIP would be consistent with the provisions of the SNFPA.

Section 5.2.3, page 5.2-15: The following text is added under the heading Regional Natural Resource Protection Plans in response to a comment (see **Response L_Tuol2-06)**.

Bay Delta Conservation Plan

The Bay Delta Conservation Plan (BDCP) is an effort driven by Delta water users to provide for the conservation and management of certain aquatic species, both listed and non-listed, and their habitats, while providing for regulatory assurances related to water supply reliability and water quality for the Sacramento–San Joaquin River Delta. Activities that would be covered under the BDCP include water supply operations related to the State Water Project and the Central Valley Project, and the power plant operations of the Mirant Corporation. Under the BDCP, water users would pay for new infrastructure, wetlands restoration, and other related projects in return for guaranteed stable water supplies. As the BDCP is still under development and is not yet adopted, no determination regarding potential conflicts of the WSIP with its provisions has been made.

Section 5.2.3, page 5.2-20: The following paragraph is added above the Regional Habitat Conservation Plans heading in response to a comment (see **Response L_BCDC-04**).

San Francisco Bay Plan

The SF Bay Plan, completed and adopted by BCDC in 1968, is an enforceable plan that guides the protection and use of San Francisco Bay and its shoreline. For a discussion of the SF Bay Plan's applicability to individual WSIP facility projects, see Section 4.2 (Vol. 2, Chapter 4, p. 4.2-16).

The SF Bay Plan is founded on the belief that water quality in San Francisco Bay will be maintained at levels sufficiently high to protect the beneficial uses of the bay. The SF Bay Plan includes findings and policies related to freshwater inflow and changes in salinity. The freshwater inflow findings contained in the SF Bay Plan stress the importance of maintaining a balance between fresh and saltwater. The related policies assert that the impact of freshwater diversions should be monitored by the SWRCB to ensure compliance with water quality standards.

Section 5.2.4, page 5.2-27: The second full paragraph is revised as follows in response to a comment (see **Response L_BCDC-04**).

Consistency with Regional Natural Resource Protection Plans

WQCPs [water quality control plans] identify water quality issues and prescribe enforceable water quality objectives/criteria for specific water bodies and their tributaries. Because these standards are based on designated beneficial uses of the respective waterways, violation of the water quality objectives/criteria can adversely affect fish, wildlife, and other protected resources. SFPUC operations currently comply with water quality standards contained in the WQCPs, and the WSIP goals and objectives would be consistent with the applicable WQCPs. Further, as future SFPUC operations would be consistent with the water quality standards contained in the WQCPs, SFPUC operations would also be consistent with the SF Bay Plan freshwater inflow policies. The potential impacts of WSIP implementation on water quality in the Tuolumne River watershed and Sacramento–San Joaquin Delta, Alameda Creek watershed, Peninsula watershed, and Westside Groundwater Basin are analyzed in Sections 5.3.3, 5.4.3, 5.5.3, and 5.6, respectively.

Section 5.2.4, page 5.2-30: The following reference is added after (Pilarcitos Creek Restoration Workgroup, 2007) in response to a comment (see **Response L_BCDC-04)**.

San Francisco Bay Conservation and Development Commission, *San Francisco Bay Plan*, 1968, reprinted in January 2008.

5.3 Tuolumne River System and Downstream Water Bodies

Section 5.3.1.1, page 5.3.1-8: The fourth sentence of the second full paragraph is revised as follows to correct an editorial error.

> TID and MID ~~typically~~ divert ~~800,000 to 900,000 afy~~ an annual average of about 867,000 acre-feet from the Tuolumne River.

Section 5.3.1.2, page 5.3.1-25: Third full paragraph, last sentence is revised as follows to correct an editorial error.

> Under the existing condition, the model indicates that the minimum release would be made ~~84.2~~ 85.1 percent of the time (837 months in the ~~987~~984-month hydrologic record); with the WSIP the minimum release would be made ~~85.4~~ 85.7 percent of the time (843 months in the ~~987~~984-month hydrologic record).

Section 5.3.1.2, page 5.3.1-34: Third full paragraph, last sentence is revised as follows to correct an editorial error.

> Under the existing condition, the model indicates that the minimum release would be made ~~72.6~~ 72.9 percent of the time (717 months in the ~~987~~984-month hydrologic record); with the WSIP the minimum release would be made ~~74.4~~ 74.6 percent of the time (734 months in the ~~987~~984-month hydrologic record).

Section 5.3.3.1, page 5.3.3-1: The following text is inserted at the end of the second full paragraph in response to a comment (see **Response S_RWQCBCV-02**).

> The Tuolumne River flows from the crest of the Sierra Nevada westward to its confluence with the San Joaquin River. The San Joaquin River flows north to the Sacramento–San Joaquin Delta. Water from the Delta discharges to the San Francisco Bay Estuary and the Pacific Ocean. The Tuolumne River system and downstream water bodies are shown in Figure 5.1-1. Beneficial uses of the Tuolumne River, as designated in the *Water Quality Control Plan for the Sacramento and San Joaquin River Basins*, include the following:
>
> - Source to (New) Don Pedro Reservoir: Municipal and Domestic Supply (MUN); Agricultural Supply (AGR); Hydropower Generation (POW); Water Contact Recreation (REC-1); Non-water Contact Recreation (REC-2); Warm Freshwater Habitat (WARM); Cold Freshwater Habitat (COLD); and Wildlife Habitat (WILD)
> - New Don Pedro Reservoir: MUN (Potential); POW; REC-1; REC-2; WARM; COLD; and WILD
> - New Don Pedro Dam to San Joaquin River: MUN (Potential); AGR; REC-1; REC-2; WARM; COLD; Migration of Aquatic Organisms (MIGR); Spawning, Reproduction, and/or Early Development (SPWN); and WILD

Section 5.3.3.1, page 5.3.3-10, Table 5.3.3-6: The text in the first row, fourth column of Table 5.3.3-6 is revised as follows in response to a comment (see **Response SI_TRT-CWA-SierraC-138**):

> 6.0 mg/L (September 1 to November 30) and 5.0 mg/L (December 1 to August 30)

Section 5.3.3, page 5.3.3-21: The following reference is added to the end of Section 5.3.3 in response to a comment (see **Response S_RWQCBCV-02**).

> State Water Resources Control Board (SWRCB), California Regional Water Quality Control Board, Central Valley Region, *Water Quality Control Plan (Basin Plan) for the Sacramento and San Joaquin River Basins*, Fourth Edition, Revised October 2007 with approved amendments.

Section 5.3.4.2, pages 5.3.4-5 and 5.3.4-6: The last paragraph on page 5.3.4-5 is revised as follows in response to a comment (see **Response SI_TRT-CWA-SierraC-140**).

> As described in Section 5.3.1, under existing conditions in the majority of years classified as below-normal or drier, almost all of the winter and spring runoff from the watershed upstream of Don Pedro Reservoir on the Tuolumne River is captured in the reservoir. Only the minimum required releases to the Tuolumne River below La Grange Dam are made. The WSIP would have no effect on flow in the Tuolumne River below La Grange Dam or the San Joaquin River ~~under these conditions~~ in months when only the minimum flows are currently released. In years when the reservoir fills, usually wet or above-normal years, excess water is released in some months to the Tuolumne River. In the future with the WSIP, TID and MID would draw Don Pedro Reservoir down farther in most years than they would under the existing condition, and consequently a greater proportion of spring runoff would be needed to refill the reservoir. As a result, the volume of excess water released to the Tuolumne River would be reduced in ~~some normal, above normal and wet years compared to the existing condition~~ all wet years, most above-normal years, and occasional below-normal and dry years.

Section 5.3.5.1, page 5.3.5-1: The following text is added at the end of the second full paragraph in response to a comment (see **Response S_RWQCBCBV-02**).

> The Tuolumne River flows from the crest of the Sierra Nevada westward to its confluence with the San Joaquin River. The San Joaquin River flows north to the Sacramento–San Joaquin Delta. The Tuolumne River system and downstream water bodies are shown in Figure 5.3.1-1. Unless otherwise designated by the California Regional Water Quality Control Board, all groundwaters in the Central Valley region are considered to be suitable or potentially suitable, at a minimum, for municipal and domestic supply, agricultural supply, industrial service supply, and industrial process supply.

Section 5.3.6.2, page 5.3.6-26: Second paragraph under Impact 5.3.6-2, the third to last sentence is revised as follows to correct an editorial error.

> The modeling analysis indicates that, under the existing condition, the minimum flow release would be made ~~84.2~~ 85.1 percent of the time (837 months in the ~~987~~984-month hydrologic record), while under the WSIP the minimum flow release would be made 85.4 percent of the time (in 6 more months, or 843 months in the ~~987~~984-month hydrologic record).

Section 5.3.6.2, page 5.3.6-32: The fourth sentence of the first paragraph is revised as follows in response to a comment (see **Response SI_TRT-CWA-SierraC-169**).

> These adverse effects on flows and temperature in the river under the WSIP would not substantially alter or degrade ~~fishery habitat~~ salmonid habitat in most years or jeopardize the continuation of the ~~fishery~~ salmonid populations in the lower Tuolumne River ~~in most years~~.

Section 5.3.8.1, page 5.3.8-10: The first and second sentence of the third paragraph is revised as follows in response to a comment (see **Response SI_TROA-03**).

> ~~A 900-cfs~~ A 1,100-cfs flow at Lumsden Campground is the minimum required for whitewater paddle boats and oar boats; a ~~600-cfs~~ 900-cfs flow is the minimum required for kayaks ~~and oar boats~~, and a ~~1,200-cfs~~ 1,500- to 2,000-cfs flow is considered optimal. The commercial outfitters prefer ~~a six-hour~~ an eight-hour release, but a ~~three-hour~~ four-hour release allows them to launch one-, two- and three-day trips.

Section 5.3.8.2, page 5.3.8-33: The first sentence of the first paragraph under River Recreation Below La Grange Dam is revised as follows to correct an editorial error.

> Under existing conditions, most of the time (717 months in the ~~987~~984-month hydrologic record) flow in the Tuolumne River below La Grange Dam consists of the minimum required instream flows.

5.4 Alameda Creek Watershed Streams and Reservoirs

Section 5.4.1.1, page 5.4.1-4: The last sentence of the third full paragraph is revised as follows in response to a comment (see **Response L_ACFCWCD-13**).

> A flow control structure known as the BART weir (owned by the ACFCWCD and located where the BART and railroad tracks cross Alameda Creek in Fremont) provides ~~grade control~~ structural protection of the footings of the BART and railroad bridge crossing and is a barrier to fish passage along this reach.

Section 5.4.1.1, page 5.4.1-9: The fourth paragraph, second sentence is revised as follows to better describe existing conditions as determined from the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

> Average monthly storage in Calaveras Reservoir under restricted operations ranges from about ~~31,000~~ 28,000 to 38,000 acre-feet in all conditions and months.

Section 5.4.1.1, page 5.4.1-13: The first paragraph, first sentence is revised as follows to better describe existing conditions as determined from the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

> The SFPUC estimates that, prior to lowering Calaveras Reservoir water levels (pre-2002 conditions), about ~~6,000~~ 8,000 afy had been diverted from Alameda Creek to Calaveras Reservoir in years with normal rainfall, with lesser diversions in dry and below-normal years.

Section 5.4.1.1, page 5.4.1-16: In the paragraph under the heading "San Antonio Creek Below San Antonio Reservoir," the first sentence is revised as follows to better describe existing conditions as determined from the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

> Modeled uncontrolled releases from San Antonio Reservoir to San Antonio Creek average about ~~1,700~~ 1,000 afy, ranging from no releases in below-normal and dry years to about ~~8,500~~ 3,200 acre-feet in very wet years.

Section 5.4.1.2, page 5.4.1-19: The second paragraph is revised as follows to reflect the change in project descriptions of the Calaveras Dam (SV-2) and Alameda Creek Fishery (SV-1) projects.

> Reservoir storage is constrained to approximately 37,800 acre-feet (except on a temporary basis), about 40 percent of its design capacity. Under the WSIP, Calaveras Reservoir would be restored to its full design capacity (approximately 96,800 acre-feet), which would allow the SFPUC to maximize the use of local watershed supplies. Furthermore, fishery releases from the proposed bypass flow structure at the Alameda Creek Diversion Dam and/or from the reservoir ~~(measured below the confluence of Alameda and Calaveras Creeks)~~ and flow recapture would be implemented under the WSIP in accordance with the 1997 MOU (compliance with the 1997 MOU is measured below the confluence of Alameda and Calaveras Creeks). The fishery releases from the diversion dam bypass flow structure to Alameda Creek and from Calaveras Reservoir to Calaveras Creek would be recaptured downstream and returned to the SFPUC water supply in compliance with the 1997 MOU.

Section 5.4.1.2, page 5.4.1-19: The fourth paragraph is revised as follows to reflect the change in project description of the Calaveras Dam (SV-2) related to the proposed release of bypass flows at the diversion dam.

> **Figure 5.4.1-5** illustrates the modeled chronological storage and stream releases from Calaveras Reservoir for both the existing condition and the WSIP using hydrologic data from the period 1920 to 2002. Releases to Calaveras Creek from Calaveras Reservoir represent both controlled releases through the cone valve and uncontrolled releases over the spillway. The graphs also show how peak flows in Calaveras Creek downstream of the dam tend to correspond to periods when Calaveras Reservoir is operating at or near capacity. This figure assumes the SFPUC would make fishery releases in compliance with the 1997 MOU from Calaveras Reservoir only and does not account for the proposed bypass flows

from the diversion dam; this represents a worst-case condition for the range of fluctuation in Calaveras Reservoir water levels.

Section 5.4.1.2, page 5.4.1-22: The first, second, third and fourth full paragraphs are revised as follows to reflect the change in project description of the Calaveras Dam (SV-2) project and to refine and update the impact discussion based on the modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

Figure 5.4.1-6 presents the estimated change in average monthly reservoir water surface elevation under existing conditions and after implementation of the WSIP. This figure assumes the SFPUC would make fishery releases in compliance with the 1997 MOU from Calaveras Reservoir only and does not account for the proposed bypass flows from the diversion dam; this represents a worst-case condition for the range of fluctuation in Calaveras Reservoir water levels. The water level in Calaveras Reservoir would be higher year-round with the WSIP; the increase in average monthly storage would be mostly attributable to completion of the Calaveras Dam project (SV-2) and the removal of the DSOD storage limitations. During rainy months, the reservoir water level would be kept near the wintertime storage objective, or roughly 20 to 30 feet higher than under existing conditions. The average water surface elevation would be substantially greater than under current conditions, but only 6 to 12 feet higher than pre-2002 conditions (prior to the DSOD restrictions).

With implementation of the WSIP, the change in operation of Calaveras Reservoir storage would affect hydrologic conditions elsewhere in the watershed. As described below, the restored capacity of Calaveras Reservoir would affect the operation of the Alameda Creek Diversion Dam and Tunnel, and thus the inflow to Calaveras Reservoir and flow to Alameda Creek below the diversion dam. The proposed bypass structure at the Alameda Creek Diversion Dam and the ~~The~~ restored storage capacity would also allow for implementation of the 1997 MOU-required releases from either the new bypass structure or Calaveras Reservoir in support of fisheries.

Compared to existing conditions, the WSIP would change the nature of releases from Calaveras Reservoir to Calaveras Creek. With implementation of the fishery releases from the new bypass flow structure at the diversion dam and from Calaveras Reservoir (up to 6,300 afy), there would at times be releases from the reservoir under the WSIP that are not made under existing conditions. These flows would be gaged and maintained below the confluence of Alameda and Calaveras Creeks. Contributing to these flows would be: (1) flows that spill past the Alameda Creek Diversion Dam, (2) unregulated runoff from accretions (inflow) between the diversion dam and the Calaveras Creek confluence, (3) unregulated runoff between Calaveras Dam and the confluence, ~~and~~ (4) operational releases from Calaveras Reservoir for reservoir regulation purposes, and (5) operational releases from the Alameda Creek Diversion Dam to support fishery releases when there is available flow in Alameda Creek.

Figure 5.4.1-7 illustrates the modeled chronological releases of water below Calaveras Dam to Calaveras Creek for both existing conditions and with the WSIP; this figure assumes the

> SFPUC would make fishery releases in compliance with the 1997 MOU from Calaveras Reservoir only and does not account for the proposed bypass flows from the diversion dam. Operational releases from Calaveras Reservoir occur in about ~~40~~ 50 percent of the years under the modeled existing condition and ~~slightly less frequently~~ in about 35 percent of the years under the WSIP (with the exception of 1997 MOU releases, which would occur in all years), with most of these years being classified as above-normal or wet. **Table 5.4.1-7** shows the releases from the reservoir for various representative hydrologic year types and assumes the SFPUC would make fishery releases in compliance with the 1997 MOU from Calaveras Reservoir only and does not account for the proposed bypass flows from the diversion dam. As shown in the table, releases with the WSIP would be substantially diminished in the winter months of normal, above-normal, and wet years, with up to a 70 percent reduction. This reduction in the frequency and magnitude of releases would primarily result from removal of the DSOD storage constraint following construction of the Calaveras Dam project (SV-2). With greater operational capacity, more local runoff would be stored and used for water supply. During all months of below-normal and dry years and the majority of months in normal, above-normal, and wet years, the volume of releases would remain nearly the same or would be slightly diminished with the WSIP compared to existing conditions. However, in several scenarios, releases would be eliminated under WSIP operations.

Section 5.4.1.2, page 5.4.1-25: In the first paragraph, the last sentence is revised as follows to reflect the change in project description of the Calaveras Dam (SV-2) project.

> With implementation of the WSIP, summer base flows (flows that occur in the absence of any recent rainfall) in Calaveras Creek below the dam would increase due to the required fishery releases below Calaveras Dam (shown in Table 5.4.1-5). The maximum supplemental release of 6,300 afy might not be needed in every year due to other flows reaching the confluence, including bypass flows at the Alameda Creek Diversion Dam~~; therefore, supplemental instream flow releases would range from about 2,250 afy to the full 6,300 afy~~.

Section 5.4.1.2, page 5.4.1-27: In the partial paragraph at the top of the page, the first full sentence is revised as follows to refine and update the impact discussion based on the modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3, as well as to reflect the change in project description of the Calaveras Dam (SV-2) project.

> Flows past the diversion dam would be reduced in ~~all hydrologic year types, and nearly eliminated in below-normal and dry years~~ wet, above normal, and normal year types, although when flow is available, the SFPUC would allow for minimum bypass flows consistent with the requirements of the 1997 CDFG MOU.

Section 5.4.1.2, page. 5.4.1-27: In the first full paragraph, the last sentence is revised as follows to reflect the change in project description of the Calaveras Dam (SV-2) project.

> ~~Because the~~ The existing diversion dam facilities seep, and therefore, summer and fall base flows of less than about 1 cfs ~~would~~ continue down the creek and these flows would be

> expected to continue down the creek under the WSIP via the new bypass facilities ~~would not be affected by WSIP operations~~.

Section 5.4.1.2, pages 5.4.1-27 and 5.4.1-33: The last paragraph on page 5.4.1-27 and ending on page 5.4.1-33 is revised as follows to refine and update the impact discussion based on the modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

> **Table 5.4.1-8** presents modeled flow data for the Calaveras confluence in terms of the monthly average flow within year type. As shown in the table, there would be a substantial reduction (up to 44 percent) in wintertime flow at the confluence during normal, above-normal and wet years. As with the upstream reach, peak flows would also be substantially reduced ~~in drier years~~, primarily as a result of renewed upstream diversions. However, overall flows would be increased due to fishery releases.

Section 5.4.1.2, page 5.4.1-32, Table 5.4.1-8: The data in Table 5.4.1-8 showing flow in Alameda Creek below the Calaveras Creek confluence in the units of acre-feet per month are replaced with the same data in the units of cubic feet per second to be consistent with the format of similar tables in the PEIR. Due to rounding, the numbers and percentages representing the difference between existing conditions and the proposed WSIP have slightly changed. The replacement table is shown on the following page and for ease of reading, revised data are not shown in underlined format.

Section 5.4.1.2, page 5.4.1-33: In the second full paragraph, the first sentence is revised as follows to reflect the change in project description of the Calaveras Dam (SV-2) project and to refine and update the impact discussion based on the modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

> Under the WSIP, the SFPUC would augment flow below the confluence of Calaveras and Alameda Creeks by bypassing/releasing water from the Alameda Creek Diversion Dam and Calaveras Reservoir; as a result, there would be an increase in flow at the confluence in ~~almost all other months~~ April to November of wet and above-normal rainfall years and in all instances of other years.

Section 5.4.1.2, page 5.4.1-36: The first and second full paragraphs are revised as follows and Figure 5.4.1-14 (shown on page 16-55) is revised to reflect the updated impact discussion based on the modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

> **Figure 5.4.1-14** illustrates the modeled chronological operation of San Antonio Reservoir for both the existing condition and with the WSIP. The figure shows the reservoir's storage, inflow from the Hetch Hetchy system, and releases to San Antonio Creek for each condition. ~~As illustrated in the figure, San Antonio Reservoir storage operations are typically cyclical: the reservoir fills in the late winter/early spring and is depleted during the summer. During a drought, reservoir storage would be additionally depleted by the slow, successive drawdown due to drafting to the Sunol Valley WTP in excess of watershed runoff and replenishment by Hetch Hetchy flows.~~

SFPUC Water System Improvement Program . 203287

Figure 5.4.1-14 (Revised)
Chronological Operation of San Antonio Reservoir

> ~~Typically, San Antonio Reservoir would remain slightly fuller under the WSIP than under modeled existing conditions because the restored capacity of Calaveras Reservoir would provide additional local water supply to serve customer demand, reducing the need to use water from San Antonio Reservoir.~~ WSIP operations involve keeping local reservoirs higher for delivery reliability and system maintenance purposes. This supply would be used to maintain the Sunol Valley WTP's minimum throughput of 20 mgd and to satisfy water demand in excess of Hetch Hetchy flows. ~~The exception to this higher storage would occur e~~Every fifth year storage levels would drop when planned maintenance for the Mountain Tunnel would reduce Hetch Hetchy flows to the Bay Area during the winter. During this period, San Antonio Reservoir would be drawn to replace the flows not provided from the Hetch Hetchy system. The reservoir would refill to typical operating levels within one to two years after the maintenance period.

Section 5.4.1.2, page 5.4.1-36: The fourth full paragraph on page 5.4.1-36 and the fifth partial paragraph starting on page 5.4.1-36 and ending on page 5.4.1-39 are revised as follows to refine and update the impact discussion based on the modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

> As indicated in the table, the WSIP would have ~~no~~ a minimal effect on flow in San Antonio Creek ~~in dry, below-normal, and normal years~~. The proposed program would result in minor increases and decreases in winter and spring flows in some above-normal years. Occasionally, the WSIP could result in spills to San Antonio Creek that would not occur under existing conditions. ~~These occasional spills would occur because the reservoir would be drawn down less often due to the restoration of Calaveras Reservoir storage capacity, the fishery releases that would be recaptured, and local reservoirs that would be kept slightly fuller for delivery reliability and system maintenance purposes.~~

> **Figure 5.4.1-15** illustrates the modeled chronological release of water below Turner Dam under the existing condition and with the WSIP. Releases from San Antonio Reservoir to San Antonio Creek have historically been rare and would continue to be rare with the WSIP. Releases past the dam are modeled to occur ~~in about 20 percent of the years under the existing condition and~~ at about the same frequency with the WSIP—mostly in above-normal or wet years. ~~The change in releases would occur primarily during January, February, and March of these years, with increases in average monthly flows of up to 15 cfs in some months countered by decreases of up to 15 cfs in some months countered by decreases of up to 16 cfs in others.~~ It should be noted that under actual operations, these changes in modeled average monthly flows could take the form of a few days of larger releases.

Section 5.4.1.2, page 5.4.1-39: The last full paragraph is revised as follows to refine and update the impact discussion based on the modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

> **Figure 5.4.1-16** illustrates the modeled flow at the confluence during the various rainfall scenarios for the existing condition and with the WSIP. **Table 5.4.1-11** presents modeled flows at the confluence in terms of the average monthly flow within hydrologic year type.

As shown in the figure and table, there would be a substantial (8 to 52 percent) reduction in flow volumes at the confluence during January, February, and March of normal or wetter years, depending on the rainfall distribution. The majority of this effect would occur due to the reduction in spills from Calaveras Reservoir and~~, to a lesser degree,~~ increased diversions from the Alameda Creek Diversion Dam during these periods. However, in April of normal years, the modeled data indicate a moderate increase in total flow volumes (about 14 percent), again due to the change in operation of Calaveras Reservoir, as described above.

Section 5.4.2.2, page 5.4.2-3, Table 5.4.2-1: Impact 5.4.2-2 is revised as follows in response to a comment (see **Response L_ACWD-13**).

TABLE 5.4.2-1
SUMMARY OF IMPACTS – GEOMORPHOLOGY OF THE ALAMEDA CREEK WATERSHED

Impact	Significance Determination
Impact 5.4.2-1: Effects on channel formation and sediment transport along Calaveras Creek	LS
Impact 5.4.2-2: Effects on channel formation and sediment transport along Alameda Creek downstream of the diversion dam and downstream of the San Antonio Creek confluence.	LS
Impact 5.4.2-3: Effects on channel formation and sediment transport along San Antonio Creek downstream of San Antonio Reservoir	LS

LS = Less than Significant impact, no mitigation required

Section 5.4.2.2, page 5.4.2-3: Impact 5.4.2-2 is revised as follows in response to a comment (see **Response L_ACWD-13**).

Impact 5.4.2-2: Effect on channel formation and sediment transport along Alameda Creek downstream of the diversion dam and downstream of the San Antonio Creek confluence.

Section 5.4.2.2, page 5.4.2-4: The following text is added after the first partial paragraph in response to a comment (see **Response L_ACWD-13**).

Implementation of the WSIP would reduce flow in Alameda Creek downstream of the San Antonio Creek confluence in winter months of normal to wet years, ranging from a -18 percent decrease to a +13 percent increase in flow at the USGS Niles gage station. In the majority of winter months (December to March), flows at this location would decrease, but in April and May the flows would exhibit small to moderate increases. Although implementation of the WSIP would result in additional flow in Alameda Creek in summer months as part of the 1997 CDFG MOU releases, these additional flows would not mobilize significant amounts of sediment and could be recaptured at a location downstream of the Sunol Valley WTP. This net decrease in flow in Alameda Creek below the San Antonio

Creek confluence when compared to the existing condition would likely result in a slight decrease in the amount of sediment transported in Niles Canyon and lower Alameda Creek and would therefore decrease sediment and debris loading on lower Alameda Creek facilities.

As noted in Impacts 5.4.2-1 and 5.4.2-3, flows and the resulting impacts on geomorphology upstream of the San Antonio Creek confluence are expected to be within the range of conditions that have been experienced since development of water supply and flood control facilities in the upper and lower Alameda Creek watershed. Therefore, implementation of the WSIP would not significantly alter bed or channel form or introduce substantial new sources of sediment.

As a result of this net decrease in sediment transport in Niles Canyon and the less-than-significant impacts in upper Alameda Creek, the impact related to geomorphologic characteristics and sediment transport along Alameda Creek downstream of the San Antonio Creek confluence would be *less than significant*. It should also be noted that the Arroyo de la Laguna watershed is the major contributor to sediment supply in Niles Canyon and lower Alameda Creek.

Section 5.4.3.1, page 5.4.3-4: The first paragraph under the heading “Alameda Creek Below the Diversion Dam” is revised as follows in response to a comment (see **Response L_ACWD-14**).

Water quality in Alameda Creek is generally good and is protective of beneficial uses. In terms of aquatic life, the key water quality parameter is temperature, which is directly related to hydrologic flow conditions. **Table 5.4.3-3** summarizes weekly water temperature data collected by the ACWD near Sunol, above Arroyo de la Laguna, from 1997 through 2005. ~~The ACWD continuously samples, analyzes, and monitors the quality of water in Alameda Creek at a special monitoring facility located at the mouth of Niles Canyon near Mission Boulevard and at other key locations throughout the watershed (ACWD, 2007).~~ Average monthly water temperatures show an expected seasonal trend (i.e., cooler during the winter and warmer during the summer).

Section 5.4.3.1, page 5.4.3-5: The source footnote in Table 5.4.3-3 is revised as follows in response to a comment (see **Response L_ACWD-14**).

SOURCES: ACWD (raw data provided by Laura Hidas); Merritt Smith Consulting (data reduction). Note that ACWD temperature data may not have been subject to the rigorous QA/QC procedures required for scientific studies, and therefore should be used only to indicate general conditions (unless otherwise specified by the ACWD).

Section 5.4.3.1, page 5.4.3-5: The last two sentences of the first full paragraph are revised as follows in response to a comment (see **Response L_ACWD-15**).

~~In addition, most of the summer and fall flows in Alameda Creek below its confluence with Arroyo de la Laguna originate from the South Bay Aqueduct. This South Bay Aqueduct water may be warmer and is higher in total dissolved solids (TDS) than the flows in Alameda Creek originating from the Sunol Valley watershed.~~ Summer and fall flows in

Alameda Creek and its tributaries are at their seasonal low. Thus, flows in Alameda Creek below its confluence with Arroyo de la Laguna tend to be warm during these periods, because coldwater sources are largely unavailable in these reaches and base flows are low during this time of year, allowing waters to warm towards their natural temperature in equilibrium with meteorological conditions. In addition, flows in Arroyo de la Laguna appears to be higher in total dissolved solids (TDS) than the flows in Alameda Creek originating from the watershed upstream of Arroyo de la Laguna (RWQCB, 2008).

Section 5.4.3.1, page 5.4.3-6: The source footnote in Table 5.4.3-4 is revised as follows in response to a comment (see **Response L_ACWD-14**).

SOURCES: ACWD (raw data provided Laura Hidas); Merritt Smith Consulting (data reduction). Note that ACWD TDS data may not have been subject to the rigorous QA/QC procedures required for scientific studies, and therefore should be used only to indicate general conditions (unless otherwise specified by the ACWD).

Section 5.4.3.2, page 5.4.3-10: The third paragraph is revised as follows to reflect the change in project description of the Calaveras Dam (SV-2) project.

Studies conducted for the 1997 MOU between the CDFG and CCSF contemplated that a 7-cfs release from Calaveras Reservoir would result in cooler temperatures for the upper half of the stream reach between the Alameda/Calaveras ~~River~~ Creek confluence and the Sunol Valley WTP. Furthermore, the existing oxygenation system, which is also planned to be used in future operations, would maintain desired DO conditions in reservoir waters, which would further enhance DO conditions in the downstream reach. If MOU releases are from Alameda Creek upstream of Calaveras Creek, then Calaveras Creek would not receive the temperature benefits of these releases, and temperatures would remain as in the base case.

Section 5.4.3.2, page 5.4.3-11: The following text is added after the third paragraph under the heading “Reach 1” in response to a comment (see **Response S_RWQCBSF-15**).

Settleable Materials, Suspended Materials, and Turbidity. Sections 5.4.1.1 and 5.4.2.1 describes the SFPUC flushing activities intended to remove accumulations of coarse sediment to protect the facility, maintain storage capacity (and thus diversion capacity) above the Alameda Creek Diversion Dam, and support downstream geomorphic processes by passing sediment. The flushing procedure involves opening the sluice gates to flush coarse sediments from upstream of the diversion dam. Sediment flushing discharges approximately 900 cubic yards of sediment from behind the diversion dam each year, and typically occurs in February. This sediment typically consists of sands and gravels. Operations normally occur over a 48-hour period during high-flow events to develop the necessary velocity to mobilize the coarse sediments behind the dam. Flushing operations occur whether or not flows from the creek are being diverted to the diversion tunnel. The sluice gates remain closed year-round, except during the sluicing procedure. If water is not diverted via the diversion gates to the reservoir, the entire volume of the creek flows through the sluice gates in the dam or over the top of the dam. It is assumed that these SFPUC sediment flushing activities and sluice gate operations would continue under the WSIP.

Three water quality parameters—settleable materials, suspended materials, and turbidity—could be affected by changes in the Alameda Creek Diversion Dam operations and sediment flushing procedures. It is likely that more sediment would be transported to Calaveras Reservoir with the WSIP than under current conditions because of increased flows diverted to Calaveras Reservoir. Many of these sediments would settle out in the reservoir, reducing the overall quantity of sediments in the creek. Therefore, less sediment would be available for transport (either in flows over the dam or via sluicing/flushing operations) down Alameda Creek compared to the existing condition. Therefore, the sluicing/flushing procedures under the WSIP would have less-than-significant water quality impacts with respect to settleable materials, suspended materials, and turbidity.

Section 5.4.3, page 5.4.3-12: The following reference is added after "Merrit-Smith Consultants" in response to a comment (see **Response L_ACWD-15**).

Regional Water Quality Control Board - San Francisco Bay (RWQCB). 2008. Final Order No. R2-2008-0011, NPDES Permit No. CAG982001 General Permit for Discharges from Aggregate Mining, Sand Washing, and Sand Offloading Facilities to Surface Waters. February 15. http://www.waterboards.ca.gov/sanfranciscobay/board_decisions/adopted_orders/2008/february/r2-2008-0011final.pdf

Section 5.4.4.2, pages 5.4.4-6 and 5.4.4-7: The last partial paragraph that begins on page 5.4.4-6 and ends on page 5.4.4-7 is revised as follows in response to a comment (see **Response L_ACWD-17**).

Impact 5.4.4-1: Changes in groundwater levels, flows, quality, and supplies.

Compared to current conditions, increased diversions and storage under the WSIP would reduce peak flows in Alameda Creek between the diversion dam and the confluence with San Antonio Creek. Seasonally, the WSIP would reduce flows in the high-flow months and increase flows in the low-flow months due to fishery releases. It would also increase storage in Calaveras Reservoir. The overall effect of these changes in groundwater supplies downstream in the Sunol aquifer areas is expected to be minor (either slightly positive or slightly negative), depending on the year's rainfall and seasonal conditions. The WSIP would reduce potential infiltration in the Sunol groundwater basin by reducing peak flows in wet years. ~~However, impacts on groundwater in the Niles Cone would be dampened by inflow from non-SFPUC watershed streams and aquifers, removal of the Sunol and Niles Dams, and ongoing withdrawals at the infiltration galleries above the water temple; as a result, impacts are expected to be minimal.~~ Impacts on groundwater in the Niles Cone would be less than significant because flows in Alameda Creek downstream of Niles Canyon would be maintained within the range of flows experienced since the Niles Cone began to be managed and utilized as a water supply resource. The program's minor changes in groundwater levels would not affect groundwater quality. This impact would be *less than significant*, and no mitigation measures would be required.

Section 5.4.5.1, page 5.4.5-9: The first bulleted paragraph is revised as follows in response to comments described in **Section 14.9, Master Response on Alameda Creek Fishery Issues**.

- Alameda County Flood Control and Water Conservation District's BART Weir – several studies have been conducted regarding potential designs to provide passage at this location. The most recent effort is a report (Wood Rogers, 2006) that outlines options ranging from total removal of the structure ("roughened channel") to three ladder and screen alternatives. The range of low flows estimated to allow suitable passage for adult steelhead among these four options is 10–50 cfs. However, other barriers (e.g., ACWD middle and upper rubber dams, PG&E Drop Structure – see below) within Alameda Creek may be impassable at these low flows. ~~There is currently no schedule or budget for this project, and environmental review has yet to begin.~~ On July 31, 2007, the Alameda County Flood Control and Water Conservation District and the ACWD entered into an agreement to design a fish passage facility over the BART weir and the middle inflatable dam in the Alameda County Flood Control Channel to improve steelhead passage within the Alameda Creek watershed.

Section 5.4.5.1, page 5.4.5-11: The first paragraph under the heading "Potential Steelhead Restoration" is revised as follows in response to comments described in **Section 14.9, Master Response on Alameda Creek Fishery Issues**.

Potential Steelhead Restoration

For the purposes of full disclosure, the PEIR provides this discussion of steelhead in lower Alameda Creek, and the potential for steelhead to be restored to the upper reaches of Alameda Creek (above the BART weir). However, because this steelhead access does not currently exist and there is no current steelhead migration above the BART weir, ~~there would be no~~ the potential impact on steelhead migration, spawning, or juvenile rearing upstream of the BART weir as a result of WSIP implementation is not analyzed in this section, which addresses WSIP impacts relative to existing conditions, but instead is analyzed as a future, cumulative impact in Section 5.7.3. ~~Further, as described in the preceding discussion, since a number of steps are required before steelhead migration further upstream can occur, it is speculative to assess the specific impacts that system operation under the WSIP might have on the potential future restoration of steelhead. Thus, no impact analysis or conclusion is developed in this PEIR. If and when steelhead are restored, the SFPUC will be required to conform its system operations to comply with the applicable Endangered Species Act requirements.~~

Section 5.4.5.2, page 5.4.5-19: The first full paragraph is revised as follows to reflect the change in project description of the Calaveras Dam (SV-2) project.

As described in Section 5.4.1, under the WSIP, reservoir operations would be restored, and the diversion dam would be operated to divert most flows that currently flow down upper Alameda Creek (up to a maximum diversion of approximately 650 cfs) through the diversion tunnel and into the reservoir. Under the proposed program, the SFPUC would construct a bypass flow structure at the Alameda Creek Diversion Dam and would implement bypass flows consistent with the 1997 CDFG MOU when flows are available

> ~~there is no requirement for maintaining minimum instream flows within Alameda Creek~~ to support fishery habitat downstream of the dam. The proposed diversion of most Alameda Creek flows below 650 cfs would result in a significant change in hydrologic conditions in Alameda Creek downstream of the diversion dam when compared to existing conditions. Diversion of most or all flows during the late winter and spring months could adversely affect the ability of resident rainbow trout to spawn and for eggs to successfully incubate in this reach, although the proposed bypass flows at the diversion dam would reduce the severity of this effect. In the future, with Calaveras Reservoir storage operating at higher levels for longer periods under the WSIP, diversions to storage are expected to be reduced and the frequency and magnitude of spills from the reservoir increased.

Section 5.4.5.2, page 5.4.5-20: The last paragraph is revised as follows to reflect the change in the description of the Calaveras Dam (SV-2) project.

> Overall, WSIP-related impacts on fishery habitat along Alameda Creek immediately downstream of the diversion dam would be *potentially significant*, despite proposed implementation of bypass flows at the diversion dam. Implementation of Measure 5.4.5-3a: Minimum Flows for Resident Trout on Alameda Creek, which would require the SFPUC to develop operational guidelines and implement minimum instream flow requirements for Alameda Creek downstream of the diversion dam from December through April to support resident trout spawning and egg incubation, would reduce this impact to a less-than-significant level. Measure 5.4.5-3a in conjunction with the proposed bypass flows at the diversion dam may be sufficient to fully mitigate WSIP effects on resident trout in Alameda Creek, including the effects of entrainment through the diversion tunnel. If, after monitoring of this measure and adaptive management of the minimum flow requirements, the monitoring indicates that WSIP effects are not fully mitigated, then the SFPUC also will implement Measure 5.4.5-3b: Alameda Diversion Dam Diversion Restrictions or Fish Screens, to either modify seasonal diversions schedules to minimize impacts on fish or screen its diversion facilities. This measure may be refined as it would be developed in more detail and implemented as part of the Calaveras Dam (SV-2) project.

Section 5.4.6.2, page 5.4.6-19: The third full paragraph is revised as follows in response to comments (see **Response S_CDFG2-15** and **Section 14.9)**.

> Overall, implementation of the proposed WSIP water supply and system operations would result in *potentially significant* impacts on terrestrial biological resources due to a potential reduction in aquatic breeding habitat for key special-status species. Measure 5.4.1-2, Diversion Tunnel Operation, calls for operation of the diversion tunnel in a manner that ensures that flows not required to maintain storage in Calaveras Reservoir are passed down Alameda Creek at the diversion dam. Measure 5.4.5-3a, Minimum Flows for Resident Trout on Alameda Creek, calls for developing and implementing an operational plan to provide minimum bypass flows below the diversion dam to support habitat for rainbow trout and other native stream-dependent species from December through April. Implementation of these measures would ensure that minimum flows in Alameda Creek are

allowed to pass by the diversion dam. Taken together, these measures would reduce adverse impacts on key special-status species to a less-than-significant level.

Section 5.4.6.2, page 5.4.6-20: The third and fourth paragraphs are revised as follows to reflect the change in project description of the Calaveras Dam (SV-2) project.

Flows in Calaveras Creek below Calaveras Dam would be altered in two ways during the two- to five-year period when the reservoir is being refilled. First, there would be no cone valve releases into Calaveras Creek below the dam. Second, the SFPUC would initiate required minimum instream flow releases (see Table 5.4.1-9) when construction of the new Calaveras Dam is completed. When flows at the confluence of Alameda and Calaveras Creeks fall below the minimum required flow, generally during protracted dry periods, releases would be made from Calaveras Dam or upstream on Alameda Creek. These releases would ensure that existing riparian habitat would be sustained; therefore, impacts on riparian habitats related to filling the reservoir would be *less than significant*, and no mitigation measures would be required.

Impacts from Minimum Flows. Under the WSIP, minimum flows ~~would~~ may be maintained year-round, ~~an increase over both existing conditions and pre-2002 conditions~~ depending if flow releases are from Calaveras Reservoir or from upstream on Alameda Creek. Sustained minimum flows during the dry season could slightly increase groundwater recharge. It could also facilitate the conversion from riparian habitats that require only seasonally flowing water to those that require permanent flowing water, such as alder riparian forest. This potential replacement of one sensitive riparian habitat with another one (with no change in the total extent of riparian habitat) would be *less than significant*.

Section 5.4.6.2, pages 5.4.6-23 and 5.4.6-24: The last partial paragraph on page 5.4.6-23 continuing to the first paragraph on page 5.4.6-24 and the first full paragraph on page 5.4.6-24 are revised as follows to refine and update the impact discussion based on the modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

Sensitive Habitats

Sensitive habitats that could be affected by operations of San Antonio Reservoir include small areas of freshwater marsh and riparian scrub on gently sloping reservoir margins. ~~The average reservoir levels would be higher with the WSIP than under existing conditions, but t~~The maximum reservoir levels would not change. No upland habitats would be affected. ~~The average range of reservoir elevations under the WSIP would be slightly less than under existing conditions. Little perennial freshwater marsh or riparian scrub would be inundated to the extent that it would be permanently lost. Any loss of such habitat would be balanced by development of similar habitat at higher elevations.~~ As discussed in Section 5.4.1, storage levels at San Antonio Reservoir would drop every fifth year for planned system maintenance. The reservoir would be refilled to typical operating levels within one to two years after the maintenance period. The depth and duration of drawdown would be within the range of historic operating conditions. Thus, WSIP impacts on riparian and freshwater

> marsh habitat along the margins of San Antonio Reservoir would be *less than significant*, and no mitigation measures would be required.
>
> ~~Drawdown once every five years during late fall or early winter would have a less-than-significant impact on habitat, since reservoir levels would be restored within a few months after system maintenance is completed.~~

Section 5.4.6.2, page 5.4.6-24: The second full paragraph, last sentence is revised as follows to refine and update the impact discussion based on the modeling results conducted in 2008 as discussed in Chapter 13, Section 13.3.

> However, impacts ~~related to the negligible changes in the extent of~~ on riparian scrub and freshwater marsh habitat would be less than significant, and therefore impacts on the habitat of California red-legged frog and California tiger salamander would be *less than significant*, and no mitigation measures would be required.

Section 5.4.6.2, page 5.4.6-24: The third full paragraph, first sentence is revised as follows to refine and update the impact discussion based on the modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

Other Species of Concern

> San Antonio Reservoir ~~would be kept near maximum levels for longer periods, the~~ maximum water surface elevation would not change, and ~~only minor~~ fluctuations in water level that would occur ~~(apart from maintenance drawdown)~~ would be within the historic operating range.

Section 5.4.7.1, page 5.4.7-1: The third paragraph is revised as follows in response to a comment (see **Response L_EBRPD-26**).

Alameda Creek Recreation and Visual Quality

> Alameda Creek runs through several local parks, ~~and~~ municipalities (including ~~Sunol Regional Wilderness,~~ Alameda County), and the cities of Fremont and Union City. Alameda Creek also runs through the Sunol Regional Wilderness and is adjacent to the Vargas Plateau Regional Preserve, Quarry Lakes Regional Recreation Area, and Coyote Hills Regional Park, all of which are operated by the EBRPD. The recreational uses of the creek are described below.

Section 5.4.7.1, page 5.4.7-3, the following text is added after the first partial paragraph in response to a comment (see **Response L_EBRPD-26**).

Vargas Plateau Regional Preserve

> The Vargas Plateau Regional Preserve, managed by the EBRPD, is located adjacent to the SFPUC Alameda watershed along a common boundary line on the east side of the preserve. Its northern boundary touches Alameda Creek for a distance of about 2,500 feet. A portion

> of the decommissioned Sunol Aqueduct crosses the park within a utility easement. Currently, the preserve is not suitable for active public use due to the lack of public road access, the need to protect natural or man-made resources, and other factors related to public safety and access. The EBRPD is currently in the process of adopting the *Vargas Plateau Regional Park Land Use Plan*, which would create a regional park that provides trails, outdoor recreation, campgrounds, and nature appreciation areas (EBRPD, 2007e).

Section 5.4.7.2, page 5.4.7-5, Table 5.4.7-1: Table 5.4.7-1 is revised as follows to reflect the change in project description of the Calaveras Dam (SV-2) project.

TABLE 5.4.7-1
SUMMARY OF IMPACTS –
RECREATIONAL AND VISUAL RESOURCES IN THE ALAMEDA CREEK WATERSHED

Impact	Significance Determination
Impact 5.4.7-1: Effects on recreational facilities and/or activities	~~PSM~~LS
Impact 5.4.7-2: Visual effects on scenic resources or the visual character of water bodies	~~PSM~~LS

~~PSM = Potentially Significant impact, can be mitigated to less than significant~~ LS = Less than Significant impact, no mitigation required

Section 5.4.7.2, page 5.4.7-5: The last paragraph is revised as follows to reflect the change in project description of the Calaveras Dam (SV-2) project.

> The WSIP would not affect water-related recreational facilities or activities in the Alameda Creek watershed. As described above in Section 5.4.7.1, Setting, water recreation is not allowed on the SFPUC reservoirs; because there would be no change to this policy under the WSIP, impacts on recreation would not occur as a result of water level changes in the reservoir. With respect to recreation in and along the creeks in the watershed~~, for most portions of the watershed,~~ there is either: (1) no or only very limited water recreation occurring at present, and/or (2) the WSIP-related flow changes described in Section 5.4.1 would not change creek flows to an extent that existing recreational use would be affected. ~~However, the~~ The proposed program would ~~substantially~~ reduce peak flows along Alameda Creek in the Sunol Regional Wilderness in the winter and early spring months. The reduced flows would somewhat degrade the recreational experience for hikers on the trails near (or with views of) Alameda Creek, ~~resulting in a *potentially*~~ however, with the proposed minimum flows for resident trout on Alameda Creek to be released from the Alameda Creek Diversion Dam when such flows are present, this would be a *less-than-significant* impact. ~~Implementation of Measure 5.4.1-2, Diversion Tunnel Operation, and Measure 5.4.5-3a, Minimum Flows for Resident Trout on Alameda Creek, would reduce this impact to a less-than-significant level.~~

Section 5.4.7.2, page 5.4.7-6: The first and second paragraphs are revised as follows to reflect the change in project description of the Calaveras Dam project (SV-2).

> As described in Section 5.4.1, changes in stream flow and reservoir water levels under the WSIP are not beyond the range of flow and water level variation that occurs now. The reductions in peak flows in average, above-average, and wet years under the proposed program would not be visually apparent to most recreational users and others viewing the creeks and reservoirs. The main exception would be the ~~substantial~~ reductions in <u>peak</u> flows in Alameda Creek in the Sunol Regional Wilderness, including the scenic Little Yosemite area, during winter and spring months. Reduced <u>peak</u> flows in Alameda Creek in the Little Yosemite area would ~~result in a *potentially significant* impact on scenic resources. Implementation of Measure 5.4.1-2, Diversion Tunnel Operation, and Measure 5.4.5-3a, Minimum Flows for Resident Trout on Alameda Creek, would reduce potential impacts on scenic resources along Alameda Creek in the Sunol Regional Wilderness to a less-than-significant level.~~ <u>somewhat degrade the visual character Alameda Creek, however, with the proposed minimum flows for resident trout on Alameda Creek to be released from the Alameda Creek Diversion Dam when such flows are present, this would be a *less-than-significant* impact.</u>
>
> Proposed <u>summer</u> releases to support fisheries would increase flows in Calaveras Creek and downstream in Alameda Creek and would have a beneficial visual effect, because the releases would enhance the creek's appearance in the summer months when recreational use is highest. Therefore, no significant adverse visual impacts would occur, and no mitigation is required.

Section 5.4.7.2, page 5.4.7-6: The following reference is added after (EBRPD, 2007d) in response to a comment (see Response **Response L_EBRPD-26**).

> <u>East Bay Regional Park District (EBRPD), *Draft Vargas Plateau Regional Park Land Use Plan*, October 2007e, available online at http://www.ebparks.org/planning/lup, accessed January 25, 2008.</u>

5.5 San Francisco Peninsula Streams and Reservoirs

Section 5.5.1.1, page 5.5.1-5: The second paragraph, sixth sentence is revised as follows to reflect updated information on the Crystal Springs Reservoir capacity from recent SFPUC studies.

> The current maximum capacities of San Andreas~~, Upper Crystal Springs,~~ and ~~Lower~~ Crystal Springs Reservoirs are 19,000~~, 23,360,~~ and ~~35,040~~ <u>56,800</u> acre-feet, respectively.

Section 5.5.1.1, page 5.5.1-9: The last sentence of the third full paragraph is revised as follows in response to a comment (see **Response L_CoastsideCWD-11**).

> After the reservoir has filled, the ~~only water~~ SFPUC <u>attempts to limit</u> releases from Pilarcitos Reservoir ~~is~~ <u>to</u> that amount requested by Coastside CWD to meet its water needs. <u>However, at times, additional water may be released from Pilarcitos Reservoir and diverted</u>

to Crystal Springs Reservoir at Stone Dam or released from Stone Dam (see discussion below regarding experimental releases from Stone Dam to Pilarcitos Creek).

Section 5.5.1.2, page 5.5.1-13: The first paragraph under “Approach to Analysis” is revised as follows to better describe the refined analysis of impacts on resources in the Pilarcitos watershed as determined from the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

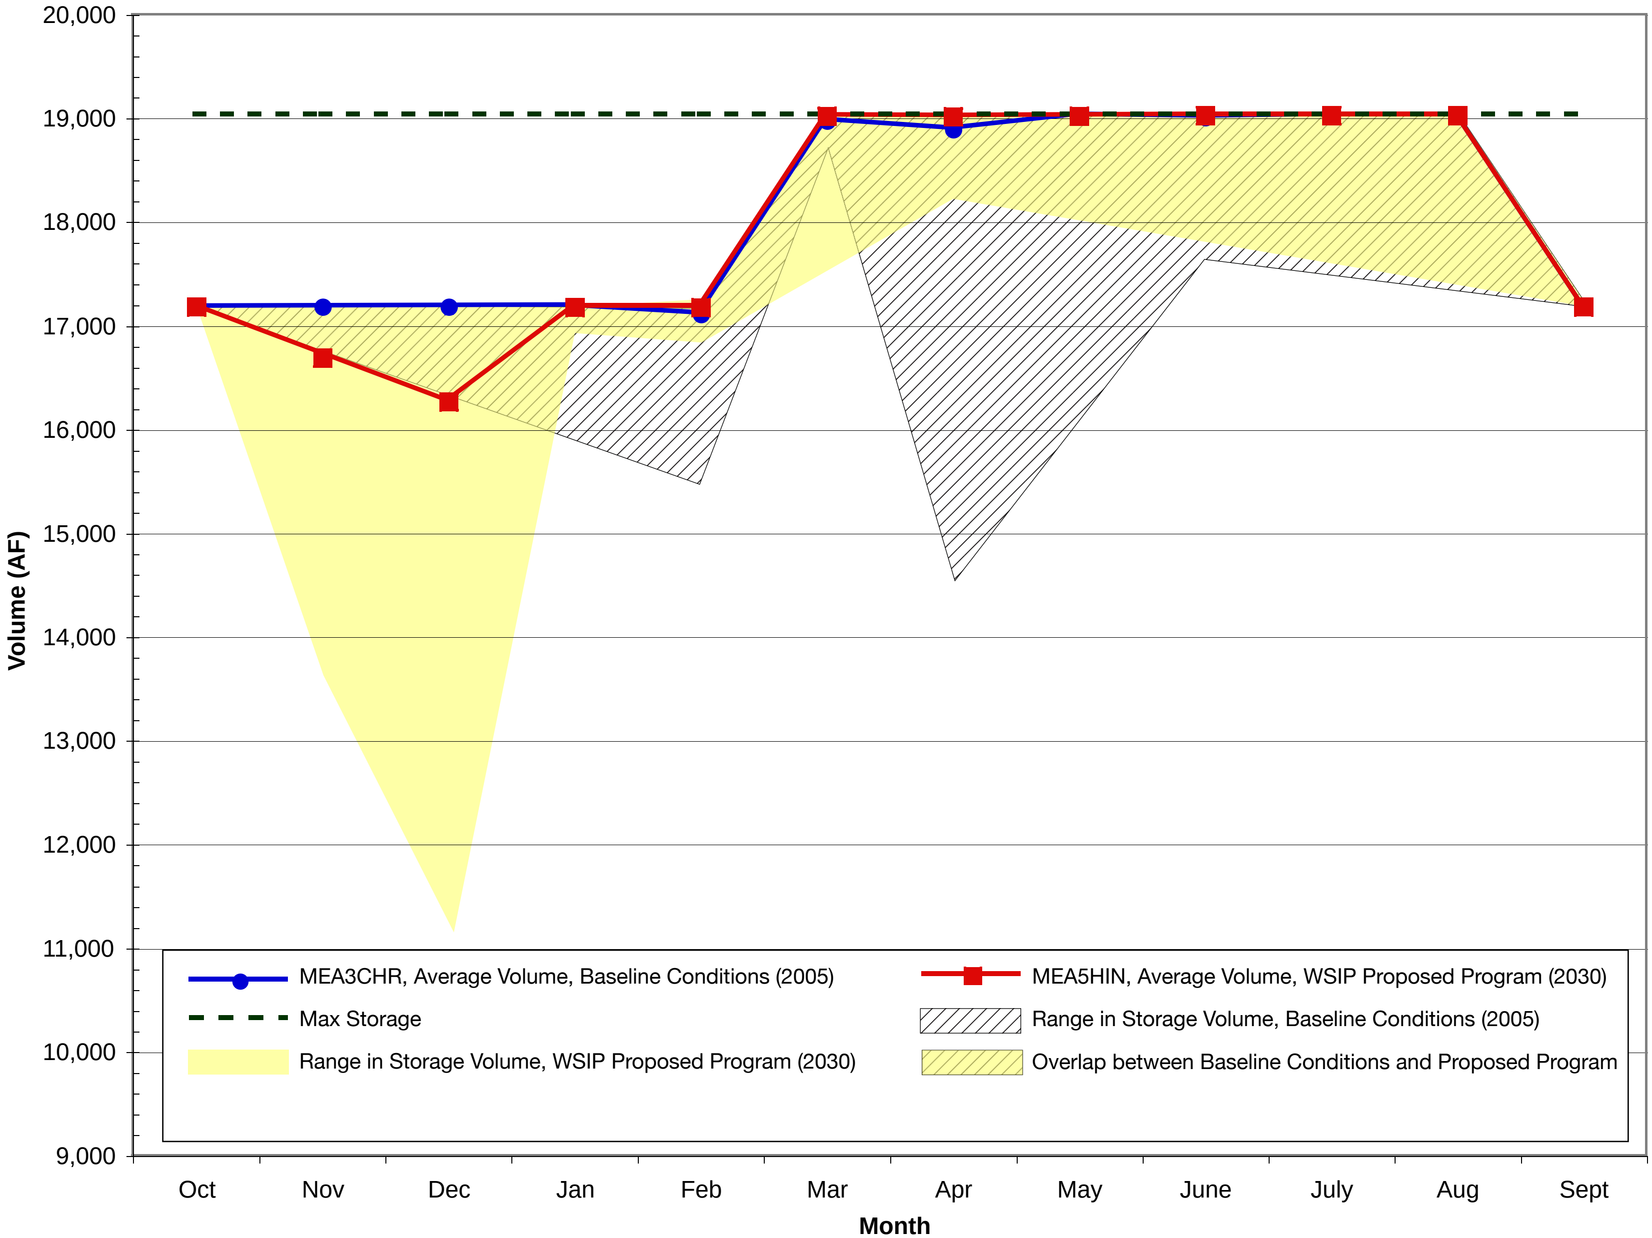
Approach to Analysis

Changes in reservoir storage and water levels attributable to the WSIP in the San Mateo Creek watershed and changes in reservoir storage, water levels and stream flows in the Pilarcitos Creek watershed attributable to the WSIP were estimated using the Hetch Hetchy/Local Simulation Model (HH/LSM). An overview of the model is provided in Section 5.1. Detailed information on the model and the assumptions that underlie it ~~is~~ are provided in Appendix H. Stream flows in San Mateo Creek and stream flows and changes in reservoir storage and water levels for the Pilarcitos Creek watershed were estimated semi-quantitatively based on results from the model in addition to interviews with individuals knowledgeable about historical, current and expected future (with-WSIP) water system operations. Information on the limitations of the HH/LSM and reasons for using supplemental information are provided in Section 5.1. Information on current and expected future operations in the Pilarcitos Creek watershed is provided in Appendix H2-3 and H2-7.

Section 5.5.1.2, page 5.5.1-14: The second paragraph is revised as follows to reflect updated information on the Crystal Springs Reservoir capacity from recent SFPUC studies.

The proposed program would increase average monthly storage in Crystal Springs Reservoir year-round compared to the existing condition. **Figure 5.5.1-7** shows average monthly storage in the reservoir. The increase in average monthly storage would mostly be attributable to the Lower Crystal Springs Dam project (PN-4), but also to improvements to the SFPUC regional water system as a whole. The improvements to Crystal Springs Dam are part of the WSIP and would allow the reservoir to be operated at its full capacity of ~~69,300~~ 68,000 acre-feet, or ~~22.6~~ 22.2 billion gallons. The Division of Safety of Dams currently limits the maximum storage capacity in Crystal Springs Reservoir to ~~58,400~~ 56,800 acre-feet (~~19~~ 18.5 billion gallons) due to concerns regarding the ability of the dam spillway to safely pass the largest floods that could occur in the watershed. …

Section 5.5.1.2, page 5.5.1-18: The legend in **Figure 5.5.1-9** is revised to show the correct range in storage volume of the San Andreas Reservoir. The Draft PEIR incorrectly labeled the yellow area as “Range in Storage Volume, Baseline Conditions (2005)” and the hatched area as “Range in Storage Volume, WSIP Proposed Program (2030).” Figure 5.5.1-9 is revised as shown on the following page.



SOURCE: SFPUC, HH/LSM (see Appendix H)

SFPUC Water System Improvement Program . 203287

Figure 5.5.1-9 (Revised)
Average Monthly Storage Volume,
San Andreas Reservoir

Section 5.5.1.2, page 5.5.1-20: The two paragraphs under "Water Storage and Water Levels in Pilarcitos Reservoir" are revised as follows, including insertion of a new figure, Figure 5.5.1-10, to refine the flow analysis in the Pilarcitos watershed as determined from the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

Water Storage and Water Levels in Pilarcitos Reservoir

Seasonal changes in storage and water surface elevation in Pilarcitos Reservoir under the existing condition are shown in Figure 5.5.1-6. **Figure 5.5.1-10** shows chronological modeled storage in Pilarcitos Reservoir using hydrology data from the period 1920 to 2002. The figure compares the WSIP to the existing condition. With the WSIP, storage in the reservoir would follow a similar seasonal pattern as under the existing condition, but would average somewhat less than under the existing condition and would be drawn down more rapidly in some years in the late spring and summer. The increased rate of drawdown is primarily attributable to increased water demand in the Coastside CWD service area, which is served by releases from the reservoir, and increased transfers of water to the San Mateo Creek watershed. As water demand increases in the Coastside CWD service area, additional water would be drawn from Pilarcitos Reservoir to meet demand, although diversion of water from Pilarcitos Creek to Coastside CWD is currently limited to a maximum of 2 mgd because of pipeline capacity. The HH/LSM assumes that when Coastside CWD's monthly demand from Pilarcitos Creek exceeds 2 mgd the SFPUC serves Coastside CWD from Crystal Springs Reservoir. Additional water would also be transferred from the Pilarcitos Creek watershed to the SFPUC's reservoirs in the San Mateo Creek watershed with the WSIP than under the existing condition. This is because with the WSIP more reservoir capacity in the San Mateo Creek watershed would be available at times when water is available from Pilarcitos Creek.

~~Storage in Pilarcitos Reservoir with the WSIP would be reduced much of the time, except when the reservoir is full and spilling, or at its minimum elevation and no further diversions can be made.~~ Under existing conditions and in most years ~~dry periods~~, storage in ~~the~~ Pilarcitos ~~r~~Reservoir becomes depleted by the late summer, and the only releases made to Pilarcitos Creek are the consequence of inflow from groundwater and tributary streams. Depletion of the reservoir in dry periods would occur earlier in the year with the WSIP.

Section 5.5.1.2, page 5.5.1-20: A new table, **Table 5.5.1-2**, and the following new paragraph are inserted immediately under the heading "Flow in Pilarcitos Creek between Pilarcitos Reservoir and Stone Dam" to refine the flow analysis in the Pilarcitos watershed as determined from the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

Flow in Pilarcitos Creek between Pilarcitos Reservoir and Stone Dam

Releases to Pilarcitos Creek from Pilarcitos Reservoir under the existing condition and with the WSIP are shown in Figure 5.5.1-10. In normal, below normal, and dry years, the WSIP would have little or no effect on releases to Pilarcitos Creek from the reservoir. In average wet years and with the WSIP, releases would be reduced by about 6 percent. In average

NOTES: Hydrologic year types were determined by rank ordering of total SFPUC Bay Area reservoir inflow.
Year Types: Wet, AN -- Above Normal, Normal, BN -- Below Normal, and Dry

SOURCE: SFPUC, HH/LSM (see Appendix H)

above normal years and with the WSIP, releases would be reduced by about 34 percent. The differences between releases under the existing condition and with the WSIP are shown in Table 5.5.1-2 in every month for the period 1921 through 2002. Negative values indicate the months in which releases to the creek with the WSIP would be less than under the existing condition.

Section 5.5.1.2, pages 5.5.1-20 and 5.5.1-21: The last partial paragraph on page 5.5.1-20 continuing to page 5.5.1-21 and the first full paragraph on page 5.5.1-21 are revised as follows to refine the flow analysis in the Pilarcitos watershed as determined from the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

Most runoff into Pilarcitos Reservoir occurs between November and April. In normal, above-normal, and wet years, when the reservoir is full and runoff exceeds the capacity of the diversion tunnels to San Andreas and Crystal Springs Reservoirs, or those reservoirs are full, the reservoir spills to Pilarcitos Creek. ~~Because Pilarcitos Reservoir is drawn down to its minimum elevation in late summer in all but the wettest years, the WSIP would have a negligible effect on wintertime spills to Pilarcitos Creek in most years.~~ ~~Some reduction in spills could occur in wet years~~. As shown in Figure 5.5.1-10, the WSIP would not affect wintertime spills in most years, but it would reduce spills in some wet and above normal years. Occasionally (for example, under 1940, 1943, 1965 and 1976 hydrologic conditions), wintertime spills that occur under the existing condition would be completely or almost completely eliminated with the WSIP.

The WSIP would increase flow in Pilarcitos Creek immediately below Pilarcitos Reservoir in some late spring and summer months of most hydrologic year types as a result of increased releases from the reservoir to meet Coastside CWD's needs. <u>The increases are shown as positive values in April, May, June and July in Table 5.5.1-2.</u> In the summer months of ~~dry~~ <u>some</u> years, Pilarcitos Reservoir would become depleted earlier in the year with the WSIP than it does under the existing condition. Coastside CWD would activate its pumps and draw water from Crystal Springs Reservoir earlier in the year than it does under the existing condition. At such times, there would be no releases from Pilarcitos Reservoir to the creek except for dry season inflow to the reservoir. Flow in the creek below the reservoir would be the same as under the existing condition, consisting of inflow releases, seepage from the dam, infiltration from groundwater, and tributary flow. The period of minimal flow below Pilarcitos Reservoir would be extended with the WSIP, because the reservoir would be drawn down to its minimum elevation earlier in the year. <u>Table 5.5.1-2 shows negative values in some years between May and September. These are months in which releases from Pilarcitos Reservoir occur under the existing condition but which would be reduced or eliminated under the WSIP.</u>

Section 5.5.1.2, page 5.5.1-21: The first and second paragraphs under "Flow in Pilarcitos Creek below Stone Dam" are revised as follows to refine the flow analysis in the Pilarcitos watershed as determined from the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

Flow in Pilarcitos Creek Below Stone Dam

Under the existing condition, water occasionally spills over Stone Dam to Pilarcitos Creek. There is little flow in Pilarcitos Creek immediately below Stone Dam most of the time, and no flow in dry periods. Spills over Stone Dam occur when releases from Pilarcitos Reservoir and runoff into Pilarcitos Creek between the reservoir and Stone Dam exceed the capacity of the diversion at Stone Dam. Occasional spills over Stone Dam would continue under the WSIP. The volume of spills would be reduced by the additional amount of Pilarcitos Creek water the SFPUC supplies to Coastside CWD <u>or diverts to its reservoirs in the San Mateo Creek watershed.</u>

~~In most months of wet years, spills over Stone Dam with the WSIP and under the existing condition would be the same. In some winter and early spring months, spills with the WSIP would probably be less than under the existing condition.~~ Spills at Stone Dam typically occur ~~in wet years~~ when Pilarcitos Reservoir is full, Coastside CWD's demand is met, and the SFPUC cannot transfer water to the San Mateo Creek watershed, either because available water in the Pilarcitos Creek watershed exceeds the capacity of the SFPUC's tunnels to San Andreas and Crystal Springs Reservoir<u>s,</u> or those reservoirs are already full. <u>Spills very rarely occur in dry and below normal years under the existing condition and would very rarely occur with the WSIP. With the WSIP, average annual spills in wet, above normal and normal years would be reduced by about 11, 60, and 25 percent, respectively, compared to the existing condition.</u>

Section 5.5.3.1, page 5.5.3-1: The last full sentence on the page is revised as follows to correct the spelling of "phosphorus" and in response to a comment (see **Response C_Hoel-04**).

> Past studies have shown that the growth of algae in Crystal Springs Reservoir is limited by a lack of nitrogen and phosphor~~o~~us, both of which are plant nutrients; therefore, an increase in the concentration of either could increase the growth of algae.

Section 5.5.3.2, page 5.5.3-4: The first paragraph under "Approach to Analysis" is revised as follows to better describe the refined analysis of impacts on resources in the Pilarcitos watershed as determined from the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

Approach to Analysis

> Changes in reservoir storage and water levels in the San Mateo Creek watershed and changes in reservoir storage, water levels and stream flows in the Pilarcitos Creek watershed attributable to the WSIP were estimated using the HH/LSM. An overview of the model is presented in Section 5.1. Detailed information on the model and the assumptions that underlie it ~~is~~ are provided in Appendix H. Changes in stream flows in ~~both~~ the San Mateo Creek ~~and Pilarcitos watersheds and changes in reservoir storage and water levels for the Pilarcitos Creek~~ watershed attributable to the WSIP were estimated semi-quantitatively in consultation with individuals knowledgeable about historical, current, and expected future (with-WSIP) water system operations.

Section 5.5.3.2, page 5.5.3-6: The first partial paragraph and the first full paragraph on page 5.5.3-6 are revised as follows to correct the spelling of "phosphorus" and in response to a comment (see **Response C_Hoel-04**).

> …bottom of the reservoir. If the proposed program increased the volume of oxygen-depleted water at the bottom of the reservoir, it could increase the release of phosphor~~o~~us. Increased release of phosphor~~o~~us and increased phosphor~~o~~us concentrations in reservoir water would have the potential to increase the growth of algae.
>
> Studies completed over the last several years indicate that the growth of algae in Crystal Springs Reservoir has historically been limited by both nitrogen and phosphor~~o~~us concentrations. After the SFPUC began disinfecting Hetch Hetchy water with chloramine, the nitrogen concentration in the reservoir increased, and the concentration of phosphor~~o~~us in reservoir water became the factor limiting the growth of algae. Thus, the addition of more nitrogen as a result of a WSIP-induced increase in the proportion of Hetch Hetchy water in Crystal Springs Reservoir would not alone increase the growth of algae. Increased phosphor~~o~~us concentrations in the reservoir as a result of the more stable thermal stratification induced by the WSIP would increase the growth of algae.

Section 5.5.3.2, page 5.5.3-7: The first paragraph under the heading "Pilarcitos Reservoir" is revised as follows to refine the water quality analysis in the Pilarcitos watershed as determined from the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

Pilarcitos Reservoir

Figure 5.5.1-6 shows recent past storage levels in Pilarcitos Reservoir from 1998 to 2006. Under the existing condition, the reservoir is drawn down through the summer, reaching minimum storage in October and November, just before the rainy season begins. With the WSIP, drawdown would occur more rapidly in ~~many~~ some years. The ~~increased~~ more rapid drawdown attributable to the proposed program could cause the reservoir to destratify earlier than under existing conditions. This would not adversely affect water quality; in fact, mechanical destratification in the fall has been recommended to the SFPUC as a means of improving water quality (SFPUC, 2002).

Section 5.5.3.2, page 5.5.3-7: The first paragraph under the heading "Pilarcitos Creek between Pilarcitos Reservoir and Stone Dam" is revised as follows to refine the water quality analysis in the Pilarcitos watershed as determined from the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

Pilarcitos Creek Between Pilarcitos Reservoir and Stone Dam

The WSIP could affect water quality in Pilarcitos Creek between Pilarcitos Reservoir and Stone Dam in two ways – by altering the quality of water released from Pilarcitos Reservoir to the creek and by altering flow in the creek. As discussed above, with the WSIP in place, the volume of the pool of cool water in Pilarcitos Reservoir below the thermocline would be reduced earlier in the year in some years compared to the existing condition, but the quality of water released to Pilarcitos Creek from the reservoir would change little.

Section 5.5.3.2, page 5.5.3-8: The first full paragraph is revised as follows to refine the water quality analysis in the Pilarcitos watershed as determined from the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

The proposed program would also reduce flow in Pilarcitos Creek between Pilarcitos Reservoir and Stone Dam in wet months of some wet years. It is not expected that the wet-year flow reductions would have an adverse effect on water quality in the stream because, during the winter, water in the creek would be cool and well oxygenated.

Section 5.5.3.2, page 5.5.3-8: The second paragraph under the heading "Pilarcitos Creek Below Stone Dam" is revised as follows to refine the water quality analysis in the Pilarcitos watershed as determined from the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

With the WSIP, less water would pass over Stone Dam in ~~wet~~ winters of wet, above normal, and normal years than it does under the existing condition. It is unlikely that the reductions in spill over Stone Dam would have much effect on water quality in Pilarcitos Creek below Stone Dam. The reductions in spills would occur in months of wet, above normal, and normal years when runoff from the Pilarcitos Creek watershed below Stone Dam would be high. For this reason, the effect of the flow reductions on water quality in the creek below Stone Dam would be minor.

Section 5.5.3.2, page 5.5.3-9: The text under the heading "Impact Summary" is revised as follows to refine the water quality analysis in the Pilarcitos watershed as determined from the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

Impact Summary

The ~~Overall~~ adverse impacts of the WSIP on water quality ~~in Pilarcitos Reservoir and~~ along Pilarcitos Creek between Pilarcitos Reservoir and Stone Dam would be *potentially significant*; however implementation of Measure 5.5.3-2a~~, Revised Operations Plan for Pilarcitos Watershed Facilities~~ Low-head Pumping Station at Pilarcitos Reservoir, would restore flow to this reach of Pilarcitos Creek in the late summer ~~maintain the current storage levels in the reservoir~~ and reduce the impact to a less than significant level.

The adverse impacts of the WSIP on water quality in Pilarcitos Reservoir would also be potentially significant. Furthermore, Measure 5.5.3-2a, Low-head Pumping Station at Pilarcitos Reservoir, would exacerbate adverse impacts on water quality at the reservoir by lowering the water level in some summers. Implementation of Measure 5.5.3-2b, Aeration System at Pilarcitos Reservoir, would improve water quality and reduce impacts in the reservoir to a less than significant level.

Section 5.5.5.2, page 5.5.5-5: The text under "Approach to Analysis" is revised as follows to better describe the refined analysis of impacts on resources in the Pilarcitos watershed as determined from the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

Approach to Analysis

Changes in reservoir storage and water levels in the San Mateo Creek watershed and changes in reservoir storage, water levels and stream flows in the Pilarcitos Creek watershed attributable to the WSIP were estimated using the HH/LSM. An overview of the model is presented in Section 5.1. Detailed information on the model and the assumptions that underlie it ~~is~~ are provided in Appendix H. Changes in flow in streams in the San Mateo Creek ~~and Pilarcitos watersheds and changes in reservoir storage and water levels in the Pilarcitos~~ watershed attributable to the WSIP were estimated semi-quantitatively based on interviews with individuals knowledgeable about the historical, current, and expected future (with-WSIP) water system operations.

Section 5.5.5.2, page 5.5.5-6, Table 5.5.5-1: Table 5.5.5-1 is revised as follows to reflect the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

TABLE 5.5.5-1
SUMMARY OF IMPACTS – FISHERIES
IN SAN FRANCISCO PENINSULA STREAMS AND RESERVOIRS

Impact	Significance Determination
Impact 5.5.5-1: Effects on fishery resources in Crystal Springs Reservoir (Upper and Lower)	PSU
Impact 5.5.5-2: Effects on fishery resources in San Andreas Reservoir	LS
Impact 5.5.5-3: Effects on fishery resources along San Mateo Creek	LS
Impact 5.5.5-4: Effects on fishery resources in Pilarcitos Reservoir	PSM*
Impact 5.5.5-5: Effects on fishery resources along Pilarcitos Creek below Pilarcitos Reservoir	PSM

LS = Less than Significant impact, no mitigation required
PSM = Potentially Significant impact, can be mitigated to less than significant
PSU = Potentially Significant impact, unavoidable

* Based on the refined Pilarcitos watershed impact analysis (see Section 13.3), this impact is PSM due to adverse effects that would result from implementing replacement Measure 5.5.3-2a.

Section 5.5.5.2, pages 5.5.5-7 and 5.5.5-8: The text under Impact 5.5.5-4, Effects on fishery resources in Pilarcitos Reservoir, is revised as follows to refine the fishery analysis in the Pilarcitos watershed as determined from the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

> Storage in Pilarcitos Reservoir varies seasonally. The reservoir typically fills in the winter and is drawn down in the late spring and summer. By late summer, releases from the reservoir are typically limited to reservoir inflow. The volume of habitat available for resident aquatic species varies seasonally from about 3,000 acre-feet in the winter and spring to 1,600 acre-feet in the late summer or fall.
>
> With the WSIP, the reservoir would be drawn down more rapidly and earlier in the season than under the existing condition. The period in which the reservoir would be at its minimum elevation would be extended by days or weeks. ~~The reduction in summer storage would reduce the~~The volume of habitat ~~potentially~~ available for resident aquatic species would be at its minimum. ~~This impact would be *potentially significant*.~~ Because the WSIP would cause ~~Reductions in~~ the volume of water stored within Pilarcitos Reservoir to reach its seasonal minimum several days or weeks earlier in the year than under the existing condition, it ~~under proposed operations~~ would also be expected to reduce the coldwater pool volume within the reservoir hypolimnion to its seasonal minimum earlier in the year. This ~~which~~ could in turn have an adverse effect on resident coldwater species in the reservoir. However, because water is released from close to the surface of the reservoir, a cool water pool is usually retained below the level of the outlet. ~~Still, WSIP-induced water quality impacts on fishery habitat in the reservoir would be potentially significant.~~ Overall, the impacts of the proposed program on ~~related to a reduction in the volume and suitability of habitat potentially available for~~ resident aquatic species in Pilarcitos Reservoir would be *less than* ~~*potentially*~~ *significant.*

Implementation of Measure 5.5.3-2a, ~~Revised Operations Plan for Pilarcitos Watershed Facilities~~ Low-head Pumping Station at Pilarcitos Reservoir, would ~~maintain the current storage levels in the reservoir and reduce these impacts to a less-than-significant level~~ reduce the storage volume in Pilarcitos Reservoir by about 350 acre-feet in the late summer and fall of about one in four years. In these years, the seasonal minimum storage volume in Pilarcitos Reservoir would be 1,600 to 1,700 acre-feet. However, implementation of Measure 5.5.3-2b, Aeration System at Pilarcitos Reservoir, would improve water quality at such times as the reservoir was drawn down. The periodic reduction in volume of water available to aquatic species, attributable to Measure 5.5.3-2a, coupled with the improvement in water quality attributable to Measure 5.5.3-2b would have a *less-than-significant* impact on resident aquatic species.

Section 5.5.5.2, page 5.5.5-8: The text under the heading “Pilarcitos Creek Below Pilarcitos Reservoir” is revised as follows to refine the fishery analysis in the Pilarcitos watershed as determined from the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

Pilarcitos Creek Below Pilarcitos Reservoir

Flow in Pilarcitos Creek would increase during many spring and early summer months as a result of the WSIP; however, flow reductions would occur during the summer of dry years. Under the WSIP ~~proposed operations~~, instream flow releases (other than dam seepage and reservoir inflow) would cease in Pilarcitos Creek downstream of Pilarcitos Reservoir during summer months of dry years at an earlier date ~~with the WSIP~~ than under the existing condition. Flow reductions in Pilarcitos Creek downstream of Pilarcitos Reservoir under the WSIP ~~proposed operations~~ would result in potentially significant impacts on resident trout, other resident fish species and aquatic resources.~~ and habitat quality and availability for anadromous steelhead.~~

In addition, as described above, releases from Pilarcitos Reservoir to Pilarcitos Creek are made from close to the surface of the reservoir, so summer and fall releases under existing conditions are warm. With the proposed program in place, summer and fall releases would also be warm (possibly warmer at times ~~in the fall~~), because Pilarcitos Reservoir would be drawn down several days or weeks earlier ~~farther~~ than under the existing condition. Exposure to higher water temperatures in the late summer and fall could significantly affect habitat quality and availability for coldwater fish species inhabiting Pilarcitos Creek below Pilarcitos Reservoir, including ~~both~~ resident trout ~~and anadromous steelhead~~. This would be a potentially significant impact.

Section 5.5.5.2, page 5.5.5-8 and 5.5.5-9. The text under the heading “Pilarcitos Creek Below Stone Dam” is revised as follows to refine the fishery analysis in the Pilarcitos watershed as determined from the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

Pilarcitos Creek Below Stone Dam

~~Pilarcitos Creek below Stone Dam provides potential habitat for anadromous salmonids.~~ Pilarcitos Creek supports a population of anadromous steelhead. The creek channel is used as a migration corridor for upstream migration of adults and downstream migration of both adults and juvenile steelhead between approximately December 1 and May 31. Under the proposed WSIP, winter flows within the creek below Stone Dam, during normal or wetter hydrologic years, would be reduced. Although no specific barriers to passage have been identified downstream of Stone Dam, this reduction in peak winter flows could potentially adversely impact steelhead migratory passage and spawning at critical riffles and gravel bars due to the shallow nature of these habitat types.

Currently, there are occasional spills over Stone Dam when releases from Pilarcitos Reservoir and runoff into Pilarcitos Creek above Stone Dam exceed the capacity of the diversion at the dam. The spills occur in the winter months of wet, above normal and normal years. With implementation of the proposed program, occasional spills over Stone Dam would continue but with ~~somewhat~~ reduced frequency and magnitude. The volume of spills in average wet, above normal, and normal years would be reduced by 11, 60, and 25 percent, respectively.

Approximately, one-third of the Pilarcitos Creek watershed lies upstream of Stone Dam, and most of the runoff from the watershed is used for municipal water supply by the SFPUC and Coastside CWD. Spills over Stone Dam currently provide up to ~~one third~~ 15 percent of the flow in the ~~this~~ lower reach of Pilarcitos Creek in Half Moon Bay, based on data from gages just downstream of Stone Dam and in Half Moon Bay.

With the WSIP, spills would be reduced and flow in Pilarcitos Creek would be reduced in the winter months, when occasional large flows are important to migratory fish. The effects of the reduced spills would be primarily felt in the reach of Pilarcitos Creek from Stone Dam to the first major downstream tributary at Albert Canyon. ~~Consequently, t~~The reduction in flows due to the WSIP ~~operations~~ and related impacts on fish habitat would be potentially significant. In addition, the National Marine Fisheries Service has raised concerns regarding stream flows in Pilarcitos Creek below Stone Dam, and the SFPUC is currently making experimental summer releases and undertaking studies in an effort to address these concerns.

Section 5.5.5.2, page 5.5.5-9: The text under the heading “Impact Conclusions” is revised as follows to refine the fishery analysis in the Pilarcitos watershed as determined from the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

Impact Conclusions

Overall, impacts on fishery resources along Pilarcitos Creek between ~~below~~ Pilarcitos Reservoir and Stone Dam related to reduced flows, degraded water quality and elevated temperatures in the late summer and fall ~~and reduced flows in the winter months~~ would be *potentially significant*. Implementation of Measures 5.5.3-2a, Low-head Pumping Station at Pilarcitos Reservoir, and Measure 5.5.3-2b, Aeration System at Pilarcitos Reservoir, ~~Revised Operations Plan for Pilarcitos Watershed Facilities~~ would reduce this potential impact to a less-than-significant level.

Impacts on fishery resources in Pilarcitos Creek below Stone Dam related to reduced wintertime flows would be *potentially significant*. Implementation of Measure 5.5.5-5, Establish Flow Criteria, Monitor and Augment Flow, would reduce this potential impact to a *less-than-significant* level.

Section 5.5.6.2, page 5.5.6-14, Table 5.5.6-4: Table 5.5.6-4 is revised as follows to reflect the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

TABLE 5.5.6-4
SUMMARY OF IMPACTS –
TERRESTRIAL BIOLOGICAL RESOURCES IN THE PENINSULA WATERSHED

Impacts	Sensitive Habitats	Key Special-Status Species	Other Species of Concern	Common Habitats and Species
Impact 5.5.6-1: Impacts on biological resources in Upper and Lower Crystal Springs Reservoirs	PSM	PSM	PSM	PSM
Impact 5.5.6-2: Impacts on biological resources in San Andreas Reservoir	LS	LS	LS	LS
Impact 5.5.6-3: Impacts on biological resources along San Mateo Creek below Lower Crystal Springs Dam	LS	LS	LS	LS
Impact 5.5.6-4: Impacts on biological resources in Pilarcitos Reservoir	LS	PSM*	LS	LS
Impact 5.5.6-5: Impacts on biological resources along Pilarcitos Creek below Pilarcitos Reservoir	~~PSM~~LS	LS	LS	LS
Impact 5.5.6-6: Impacts on biological resources along Pilarcitos Creek below Stone Dam	LS	LS	LS	LS
Impact 5.5.6-7: Conflicts with the provisions of adopted conservation plans or other approved biological resource plans	LS			

LS = Less than Significant impact, no mitigation required
PSM= Potentially Significant impact, can be mitigated to less than significant

* Based on the refined Pilarcitos watershed impact analysis (see Section 13.3), this impact is PSM due to adverse effects that would result from implementing replacement Measure 5.5.3-2a.

Section 5.5.6.2, page 5.5.6-19: The first two paragraphs in Impact 5.5.6-4 are revised as follows to refine the biological resources analysis in the Pilarcitos watershed as determined from the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

Sensitive Habitats

~~Greater~~ The earlier drawdown of the reservoir under the WSIP would not increase the extent of unvegetated, weedy, or seasonal wetland areas below the maximum water levels, although these areas would be exposed several days or weeks earlier than under the existing condition in some years. ~~Existing freshwater emergent vegetation is already limited to areas that receive groundwater seepage or year-round surface water flow at the mouths of the tributary streams. Although the greater drawdown could slightly reduce the extent of areas supporting sensitive freshwater marsh habitat, t~~This impact would be less-than-significant.

Key Special-Status Species

Proposed operations with the WSIP at Pilarcitos Reservoir would have no effect on ~~slightly reduce~~ the extent of suitable habitat at the ~~Pilarcitos~~ ~~R~~reservoir for California red-legged frog and San Francisco garter snake. ~~, a *potentially significant* impact.~~ ~~However,~~ Similarly, the extent and condition of adjacent upland vegetation would not be affected by the proposed reservoir operations. As a result, the WSIP would have no effect on species such as the marbled murrelet that ~~this impact would not apply to~~ nest~~ing~~ or forage~~ing~~ in upland habitats adjacent to the reservoir.~~for species such as the marbled murrelet.~~

Section 5.5.6.2, page 5.5.6-20: The second paragraph on this page is revised as follows to refine the biological resources analysis in the Pilarcitos watershed as determined from the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

Impact Conclusions

Impacts of the WSIP on sensitive habitats, key special-status species, other species of concern, and common habitats and species at Pilarcitos Reservoir would be *less than* ~~*potentially*~~ *significant.* However, ~~I~~implementation of Measure 5.5.3-2a, Low-head Pumping Station at Pilarcitos Reservoir, ~~Revised Operations Plan for Pilarcitos Watershed Facilities, would maintain storage levels similar to existing conditions and~~ would lower the water level in the reservoir by 3 or 4 feet in some summers. This could have a potentially significant impact on the extent of suitable habitat at the reservoir for California red-legged frog and the San Francisco garter snake. Implementation of Measure 5.5.3-2c, Habitat Monitoring and Compensation, would reduce this impact to a less-than-significant level.

Section 5.5.6.2, page 5.5.6-20: The text under Impact 5.5.6-5 under the heading "Sensitive Habitats" is revised as follows to refine the biological resources analysis in the Pilarcitos watershed as determined from the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

Sensitive Habitats

Under the WSIP, flow in Pilarcitos Creek between Pilarcitos Reservoir and Stone Dam would increase in some spring months ~~during normal and better~~ ~~rainfall years~~, a beneficial impact. In the summer months of some drier ~~dry~~ years, the period during which releases from Pilarcitos Reservoir would be limited to reservoir inflow ~~cease~~ would be extended, potentially for up to three months. Because willows exist ~~White alder, the dominant species~~ in the riparian forest in this section, ~~requires~~ it is apparent that the riparian forest is adapted to periods without flowing water ~~and without it could become stressed or could die~~. ~~Although there is some seepage from Pilarcitos Dam as well as flow from lateral tributaries, this seepage would decrease during an extended drought.~~ The channel-forming processes in Pilarcitos Creek would be reduced insignificantly under the WSIP. Thus, some changes in flow would be beneficial and some adverse. ~~Conservatively, t~~The overall impact on sensitive riparian habitat is considered *less than* ~~*potentially*~~ *significant.*

Section 5.5.6.2, page 5.5.6-21: The text under the heading "Impact Conclusions" is revised as follows to refine the biological resources analysis in the Pilarcitos watershed as determined from the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

Impact Conclusions

Impacts on sensitive riparian habitat at Pilarcitos Creek ~~below~~ between Pilarcitos Reservoir and Stone Dam would be *less than* ~~*potentially*~~ *significant*. ~~Implementation of Implementation of Measure 5.5.3-2, Revised Operations Plan for Pilarcitos Watershed Facilities, would maintain reservoir storage levels similar to existing conditions and would reduce this impact to a less-than-significant level.~~

Section 5.5.7.1, p. 5.5.7-3: The first and second paragraphs are revised as follows in response to a comment (see **Response L_CoastsideCWD-17**).

Pilarcitos Creek starts at Pilarcitos Reservoir within the SFPUC Peninsula watershed. No water recreation or access to this reservoir is allowed. The creek runs south until it reaches Highway 92, then runs west ~~through portions of the Golden Gate National Recreation Area (GGNRA) and Rancho Corral de Tierra~~ to its mouth on the Pacific Ocean within Half Moon Bay State Beach. ~~Numerous public trails throughout the GGNRA and Rancho Corral del Tierra provide access to Pilarcitos Creek.~~ No organized recreational activities are established within or adjacent to the creek in the upper watershed. However, ~~T~~trails within Half Moon Bay State Beach run adjacent to and across Pilarcitos Creek, and the public is allowed access to portions of ~~the~~ this stretch of the creek (Bay Area Hiker, 2007).

5.6 Westside Groundwater Basin Resources

Section 5.6.1.3, page 5.6-8: The last paragraph is revised as follows in response to a comment (see **Response SI_TRT-CWA-SierraC-27**).

Other continued uses of irrigation pumping in the South Westside Groundwater Basin in 2005 were consistent with historical pumping rates and are estimated at up to 2.1 mgd (2,400 afy) of irrigation pumping for cemeteries in Colma, and 0.1 mgd (120 to 150 afy) of irrigation pumping for the California Golf Club[8] in South San Francisco~~, and an undetermined amount of groundwater pumping for irrigation of the Golden Gate National Cemetery in San Bruno~~ (Luhdorff and Scalmanini, 2006). The Golden Gate National Cemetery in San Bruno has historically used groundwater for irrigation, but the cemetery has not been irrigated using groundwater for over 20 years (Schem, 2007).

Section 5.6.1.5, page 5.6-13: The text as follows is added at the end of the third paragraph in response to a comment (see **Response L_DalyCty-38**).

However, Lake Merced has not been used as a potable water supply since the 1930s. Refer to Table 4.5-1 for a description of the existing beneficial uses of Lake Merced.

Section 5.6.1.7, page 5.6-17: The last sentence of the first full paragraph is revised as follows in response to a comment (see **Response L_SBruno-06**).

> The City of San Bruno ~~is~~ constructed~~ing~~ two monitoring well~~s~~ clusters in 2006 along the bay side that ~~should~~ have provided additional geologic information and allow for monitoring of groundwater levels and groundwater quality at different depths along the bay margin. ~~insight into the mechanisms preventing seawater intrusion.~~

Section 5.6.1.8, page 5.6-17: The last sentence of the third full paragraph is revised as follows in response to a comment (see **Response L_SBruno-07**).

> In the South Westside Groundwater Basin, manganese has exceeded the secondary drinking water standard in San Bruno and Daly City in the untreated groundwater, but the water is treated to meet secondary standards prior to use in the water supply.

Section 5.6.1.11, page 5.6-21: The last sentence of the third paragraph is revised as follows in response to a comment (see **Response L_DalyCty-41**):

> Chapter 13.20 of the Daly City Municipal Code specifies well permitting requirements for Daly City. ~~, but~~ Although this code does not include provisions related to overdraft of the Westside Groundwater Basin, Section 13.20.070 allows for denial of a permit when the request is judged not to be in the public interest.

Section 5.6.1.11, pages 5.6-21 to 5.6-22: The last partial paragraph that begins on page 5.6-21 and ends on page 5.6-22 is revised as follows in response to a comment (see **Response L_SBruno-09**):

> In accordance with Section 4.68.225 of the San Mateo County Code, the San Mateo County Environmental Health Division would not grant a well permit for a large well[12] ~~in a public park, cemetery, or golf course~~ that could potentially cause overdraft of the South Westside Groundwater Basin or be located in an area subject to a specific and localized groundwater problem. The Environmental Health Division could also deny, revoke, or suspend a permit for a large well to avoid pollution or contamination of water resources.

Section 5.6.2.2, page 5.6-25: The last sentence of the third full paragraph is revised as follows in response to a comment (see **Response L_DalyCty-42**).

> During drought conditions, the SFPUC would be able to reduce the quantity of SFPUC system water delivered to the participating pumpers, and the stored groundwater, or banked water, would be available for local use to supplement supplies from the regional water system.

Section 5.6.2.2, page 5.6-33: The following reference is added after (SFPUC, 2007) in response to a comment (see **Response SI_TRT-CWA-SierraC-27**).

> Schem, Clifford, U.S. Department of Veterans Affairs, National Cemetery Administration, personal communication with Greg Bartow, San Francisco Public Utilities Commission, September 7, 2007.

5.7 Cumulative Projects and Impacts Related to WSIP Water Supply and System Operations

Section 5.7.2.1, page 5.7-11: The first sentence of the third full paragraph under the heading "Expansion of MID Municipal Treatment Plant" is revised as follows to correct an editorial error:

> MID owns and operates a ~~30~~ 40-mgd municipal water treatment plant that obtains water from Modesto Reservoir.

Section 5.7.3.2, page 5.7-55, Figure 5.7-3: This figure is revised as shown on the following page in response to comments described in **Section 14.9, Master Response on Alameda Creek and Fishery Issues**.

Section 5.7.3.2, page 5.7-65: The first full paragraph is revised as follows in response to comments described in **Section 14.9, Master Response on Alameda Creek and Fishery Issues**.

> **Cumulative Effects and WSIP Contribution**
>
> **Table 5.7-15** summarizes the effects of past and present projects, the impacts of the WSIP, the effects of probable future projects, and the combined impacts of the WSIP plus probable future projects on the Alameda Creek watershed. Past and present projects have substantially altered the hydrology, geomorphology, surface water quality, groundwater, fisheries, and terrestrial biology of this portion of the Alameda Creek watershed compared to pre-Euro-American settlement conditions. Visual and recreational resources have been moderately altered. The existing condition, which serves as the baseline for the analysis of the WSIP, reflects the substantial environmental changes that have occurred as a result of the past projects. Because past and present actions have drastically altered ~~this portion of~~ the Alameda Creek watershed, some of the environmental resources are more sensitive to small adverse changes than they would be if the ~~reach~~ watershed had remained relatively unaltered from pre-Euro-American settlement conditions.

Section 5.7.3.2, page 5.7-65, Table 5.7-15: The last row of Table 5.7-15 is revised as follows to reflect the change in project description of the Calaveras Dam (SV-2) project.

TABLE 5.7-15
CUMULATIVE EFFECTS ON THE ALAMEDA CREEK WATERSHED

Resource	Effects of Past and Present Projects	Impacts of WSIP (prior to mitigation/ after mitigation)	Effects of Other Future Projects	Cumulative Impact (WSIP after mitigation + Future Projects)	WSIP Contribution Cumulatively Considerable?

Figure 5.7-3 (Revised)
Future Projects in the Alameda Creek Watershed Considered in the Cumulative Analysis

THIS PAGE INTENTIONALLY LEFT BLANK

Section 5.7.3.2, page 5.7-66: The third full paragraph on page 5.7-66 is revised as follows and the following paragraph is inserted after the third full paragraph on this page in response to comments described in **Section 14.9, Master Response on Alameda Creek Fishery Issues**.

> Implementation of the WSIP would substantially reduce flows in the reach of Alameda Creek from the diversion dam to below its confluence with Calaveras Creek compared to existing conditions (Impact 5.4.1-2). This impact was determined to be significant and unavoidable, even with implementation of Measure 5.4.1-2 (Diversion Tunnel Operation) and bypass flows included as part of the protective measures in the Calaveras Dam Replacement project (SV-2). However, no other past, present, or future projects were identified that would further reduce the stream flow in this reach of Alameda Creek, and some of the projects listed in Table 5.7-13 could enhance the flow. Thus, there would be no adverse cumulative impact on hydrology associated with past, present, and future projects, and the WSIP's contribution to the cumulative impact on hydrology is not applicable.
>
> Due to agreements and ongoing actions regarding the implementation of fish passage improvement projects in lower Alameda Creek (as described in Section 5.4.5 of the Draft PEIR), it is possible that steelhead will be restored to the Alameda Creek watershed reaches upstream of the BART weir by 2030. More specifically, steelhead may be restored during construction or operation of the Calaveras Dam Replacement project (SV-2) under the WSIP. In response to this scenario, the SFPUC has modified the WSIP program description—mainly that of the Alameda Creek Fishery Enhancement (SV-1) and Calaveras Dam Replacement (SV-2) projects—to incorporate protective measures for steelhead in the event that man-made barriers in Alameda Creek have been successfully removed and that steelhead migration, spawning, and rearing have been restored in Alameda Creek above the BART weir. The protective measures incorporated into the operations of the Calaveras Dam Replacement project would address future-occurring steelhead and would provide for a range of minimum bypass flows and releases at the Alameda Creek Diversion Dam and Calaveras Dam to support steelhead migration, spawning, and rearing. The program as revised, and with implementation of mitigation measures identified in the Draft PEIR, which together include minimum bypass flows to support the various life stages and habitat requirements for steelhead, would have a less-than-significant contribution to cumulative impacts on fishery resources in the Alameda Creek watershed. Please refer to Chapter 14, Section 14.9, of the Final PEIR for further discussion.

Section 5.7.4.1, page 5.7-71: The legend for Figure 5.7-4 is revised as follows in response to a comment (see **Response SI_CNPS-SCV1-09**) and to correct an editorial error. The revised figure is shown on page 16-89.

> PP-1a Peninsula Watershed Habitat Conservation Plan (sub-project of ~~Alameda~~ Peninsula WMP)

Section 5.7.5.1, page 5.7-87: The first bullet under the heading "Municipal Pumping" is revised as follows in response to a comment (see **Response L_DalyCty-44**).

- In its 2005 UWMP, the City of Daly City estimates that future municipal groundwater pumping under the WSIP conjunctive-use program (Regional Groundwater Projects, SF-2) would range from 1.34 mgd (1,501 afy) during a nondrought year when surface water is supplied by the SFPUC to 3.76 mgd (4,212 afy) during a drought year when the city is also allowed to pump its banked groundwater (City of Daly City, 2005). These projected pumping volumes are presented in Table 4-4 of the 2005 UWMP.

Section 5.7.5.1, page 5.7-87: The third bullet is revised as follows in response to two comments (see **Responses L_SBruno-12 and L_SBruno-17**).

- The 20067 UWMP for the San Bruno does not yet reflect long-term participation in the SFPUC's proposed conjunctive-use program, but, if approved, participation in this program is expected to be included in the next revision of its UWMP. In its 20067 UWMP, the City of San Bruno estimates that overall, groundwater usage will decrease from 2.5 mgd (2,800 afy) in 2010 to zero in 2030 through implementation of conservation measures and increased purchases from the SFPUC. In a drought year, groundwater use between 2010 and 2030 is projected to range from 0.80 mgd (896 afy) to a maximum of 2.5 mgd (2,800 afy) (City of San Bruno, 20067).

Section 5.7.5.2, page 5.7-90: The first sentence of under Impact 5.7.5-2 is revised as follows in response to a comment (see **Response L_SBruno-13**).

Future and continuing projects identified in the northern portion of the South Westside Groundwater Basin include the WSIP conjunctive-use program (the regional component of SF-2), municipal pumping by the participating pumpers, and continued irrigation pumping at 2,600 afy.

Section 5.7.5.2, page 5.7-91: The second bullet is revised as follows in response to a comment (see **Response L_DalyCty-45**).

- Under the proposed conjunctive-use program, the participating pumpers collectively would not be allowed to pump more than the quantity of banked groundwater resulting from the in-lieu delivery of SFPUC system water.

Section 5.7.5.2, page 5.7-91: The first sentence of the last paragraph is revised as follows in response to a comment (see **Response L_SBruno-09**).

Furthermore, as discussed in Section 5.6, the San Mateo County Environmental Health Division would not grant a well permit for a large well[1] in a public park, cemetery, or golf

[1] A large well means any individual well that pumps an amount equal to or greater than 50 gallons per minute or 1,000 gallons per day, or multiple small wells on the same land use parcel which cumulatively pump an amount equal to or greater the 50 gallons per minute or 1,000 gallons per day.

Volume 4, Chapter 6

6.3 Mitigation Measures to Minimize Facilities Impacts

Section 6.3.5, page 6-11: The first paragraph of Measure 4.6-1b is revised as follows in response to comments (see **Responses S_RWQCBCV-06** and **S_RWQCBSF-06**).

Measure 4.6-1b: If the wetland delineation indicates that the WSIP project will affect jurisdictional wetlands or aquatic resources, then, in accordance with state and federal permit requirements, the SFPUC will avoid and minimize direct and indirect impacts such as erosion and sedimentation, alteration of hydrology, and degradation of water quality. As a first priority, the SFPUC will implement (1) avoidance measures. For unavoidable impacts, the SFPUC will implement (2) minimization of unavoidable impacts, (3) restoration procedures, and (4) compensatory creation or enhancement to ensure no net loss of wetland extent or function.

Section 6.3.5, page 6-11: The third sentence of the second paragraph of Measure 4.6-1b is revised as follows in response to a comment (see **Response SI_ACA1-21**).

For each WSIP project, a qualified biologist will quantify the magnitude and extent of impacts to wetlands, sensitive habitats, and key special-status species and other species of concern, and the SFPUC will develop and implement <u>restoration and/or </u>compensation plans that meet the appropriate regulatory requirements and permit conditions with respect to <u>restoration and/or </u>compensation ratios<u>. Compensation ratios typically range from a minimum of 1:1 for common habitats to 2:1 or higher for rare and sensitive habitats. If individual project requirements of the RWQCB, CDFG, or USFWS differ somewhat from these ratios, they are still intended to achieve the same purpose of full restoration and/or compensation</u>, <s>other conservation measures and management requirements </s>to mitigate project impacts to less-than-significant levels<u>, and to ensure no net reduction in the populations of any species listed as threatened or endangered by the state or federal resource agencies</u>.

Section 6.3.5, page 6-14, Table 6-1: The revision in the sixth column of Table 6-1 (Measure 4.6-3b) is made to correct an editorial error.

TABLE 6.1 (SEE MEASURE 4.6-3b)
MITIGATION MEASURES FOR KEY SPECIAL-STATUS SPECIES

No.	**Project Name** **Notes:** **1. This table is for guidance only and is not intended as a complete list of mitigations for all projects, which must be assessed individually at the project-specific level.** **2. Standard measure B.4 (general surveys for raptors and protection of raptor nests) apply to all projects.**	**Suites of Key Special-Status Species**					
		Vernal Pool Invertebrates	Vernal Pool Plants	Riparian and Reservoir Species	Native Grassland Species	Salt Marsh Species	Fishes
SV-2	Calaveras Dam Replacement			B.5	I.3<s>, M.4</s>		F.1
SV-3	Additional 40-mgd Treated Water Supply			B.5	<s>M.4</s>		
SV-4	New Irvington Tunnel			B.5	<s>M.4</s>		F.1
SV-5	SVWTP – New Treated Water Reservoirs			B.5	<s>M.4</s>		F.1
SV-6	San Antonio Backup Pipeline			B.5	<s>M.4</s>		F.1

Section 6.3.5, page 6-20, Table 6-2: The following text in the last row of Table 6-2 (Measure 4.6-3b) is revised as follows to correct an editorial error.

TABLE 6.2 (MEASURE 4.6-3b)
STANDARD PROGRAMMATIC BIOLOGICAL RESOURCES MITIGATION MEASURES

Biological Resource Species and Status	Standard Mitigation Measures for Specific Plants and Animals
San ~~Francisco~~ Mateo Woolly Sunflower (FE/CE), Marin Western Flax (FT/CT) Fountain thistle (FE/CE)	**P.4:** Surveys for San ~~Francisco~~ Mateo woolly sunflower, fountain thistle and Marin western flax will be carried out at an appropriate time of year for projects located within the known range of the species. Any populations found will be avoided. An approved biological monitor will be present during all construction activities. A plan will be developed to protect populations located along Crystal Springs and Polhemus Roads where project-related construction vehicle traffic will occur. Where populations cannot be avoided, salvage of plants or seed will be implemented, along with a program to compensate for losses.

Section 6.3.6, page 6-27: The following text is added to the end of Mitigation Measure 4.7-4a in response to a comment (see **Response L_SFLandmarks-03**).

> Representative features such as aqueduct/pipe sections, valves subject to replacement, decorative elements, or plaques/inscriptions from buildings or other portions of structures demolished as a part of the WSIP projects could be preserved and displayed. Most of these types of structures are of sufficient size that they would form "monumental" commemorative structures. For example, an original pipeline valve replaced by modern equipment might be mounted and displayed on publicly accessible SFPUC property with informative placards. Such displays, if located in other jurisdictions, might be subject to those jurisdiction's requirements related to public art, safety, and liability considerations.

Section 6.3.7, page 6-31: The last bullet item under Measure 4.8-1a is revised as follows in response to a comment (see **Response L_Fremont-02**).

- To the extent applicable, the traffic control plan will conform to the ~~state's~~ ~~*Manual of Traffic Controls for Construction and Maintenance Work Areas*~~ *California Manual on Uniform Traffic Control Devices for Streets and Highways: Part 6 Temporary Traffic Control* and *Caltrans' 2006 Standard Plans*.

Section 6.3.8, pages 6-38 and 6-39: Measure 4.16-7b is revised as follows to clarify appropriate application of this measure in the Sunol Valley Region.

Health Risk Screening or use of Soot Filters for All Projects in the San Joaquin and Sunol Valley Regions

Measure 4.16-7b: Measure 4.9-2a requires specific projects to either conduct a health risk assessment or use soot filters to reduce DPM emissions associated with haul trucks. To address collective DPM impacts, this measure will be required for all WSIP projects in the San Joaquin and Sunol Valley Regions. This measure would only apply in the Sunol Valley Region if, under Measure 4.9-2b, the SFPUC elects not to vacate the two SFPUC Land Managers' residences in the Sunol Valley. ~~When~~ If this requirement is applied to the New Irvington Tunnel project (SV-4), it shall be applied to both the Sunol Valley and Fremont tunnel portals, taking into account truck traffic from other WSIP projects in the vicinity of both portals.

6.4 Mitigation Measures to Minimize Water Supply and System Operations Impacts

Section 6.4.2, page 6-48: The first sentence of Mitigation Measure 5.3.6-4a, Avoidance of Flow Changes by Reducing Demand for Don Pedro Reservoir Water, is clarified as follows in response to comments received on the Draft PEIR (see **Response S_CDFG2-07** and **Section 14.10, Master Response on Modified WSIP Alternative**).

> **Measure 5.3.6-4a:** The SFPUC will pursue a water transfer arrangement with MID/TID and/or other water agencies such that the water acquired is developed through actions that result in reduction of demand on Don Pedro Reservoir as a result of conservation, improved delivery efficiency, inter-agency ~~water~~ transfer of conserved water, or use of an alternative supply such as groundwater.

Section 6.4.2, pages 6-48 and 6-49: Measure 5.3.6-4b is revised as follows in response to several comments described in **Section 14.7, Master Response on Lower Tuolumne River Issues**.

> **Fishery Habitat Enhancement**
>
> **Measure 5.3.6-4b:** If Measure 5.3.6-4a is not implemented, then the SFPUC will mitigate potential fishery effects on the lower Tuolumne River by implementing (or funding) one of the following two habitat enhancement actions ~~directed at fish habitat improvements~~ that are designed to sustain fishery resources under the river's flow regime, which are consistent with the Habitat Restoration Plan for the Lower Tuolumne River Corridor: gravel augmentation/habitat enhancement to provide salmonid spawning and rearing habitat, or isolating or filling a captured former gravel quarry pit along the river that provides habitat for salmonid predators.
>
> The gravel augmentation/habitat enhancement project ~~Spawning gravel enhancement~~ will be implemented to increase salmonid spawning success and to improve the survival of rearing salmonids in the reach of the river downstream of La Grange Dam. Spawning success will be improved by the addition of suitable gravel to the stream channel. Other habitat features will be created to provide cover for juvenile salmonids and to increase the availability of substrate for macroinvertebrates ~~production~~ that would be used as ~~an enhanced~~ food ~~supply~~ by rearing juvenile salmon and steelhead~~and other species~~. The ~~spawning~~ gravel augmentation/habitat enhancement project will involve the planning, design, permitting, purchase, placement, and monitoring of suitable gravel and associated habitat enhancements~~to be placed~~ at three riffle locations within the spawning reach between Basso Bridge and La Grange Dam. The three locations will meet ~~that meets~~ the criteria for suitable habitat as described in the Habitat Restoration Plan for the Lower Tuolumne River Corridor~~ at each location~~. The gravel will preferentially be rounded river rock of native origin that would be sized and pre-washed before placement into the river. The gravel augmentation/habitat enhancement project will also involve the addition of large woody debris and boulders to create increased habitat complexity and diversity at each of the three enhancement sites. After construction of the gravel augmentation/habitat enhancement project, it will be surveyed to establish its baseline condition. A survey of the three sites will be made at a minimum of five-year intervals by a qualified fisheries biologist. The fisheries biologist will determine whether the three sites continue to meet established criteria for salmonid spawning and rearing habitat. If the sites do not meet the criteria, as part of its long-term operations, the SFPUC will make the

> improvements necessary to return it to the baseline conditions. ~~The depth and quality (e.g., percentage fines and cementation) of gravel will be monitored at five-year intervals and if the gravel deposits do not meet the criteria for suitable habitat SFPUC will be obligated to further augment or enhance the gravel deposits. The SFPUC will continue this gravel augmentation project and periodic monitoring as part of long-term system operations.~~
>
> ~~Alternately~~As an alternative to the gravel augmentation project, the SFPUC will remove from the lower river channel one of the former gravel quarry pits that has been "captured" by the river and acts as predator zones for fish such as largemouth and striped bass to prey on rearing and emigrating juvenile salmonids. ~~This~~Removal could be accomplished by filling the pit or installing a levee berm around the pit to isolate it permanently from the river channel. The SFPUC could implement this action directly or fund implementation by another entity involved in river restoration.
>
> The performance standard for gravel pit removal would be an established permanent reduction in area of salmonid predator habitat. The SFPUC will monitor the pit removal project at five-year intervals. If floods have eroded the fill or damaged the levees in a manner that restores salmonid predator habitat, the SFPUC will make the necessary repairs. The SFPUC will continue periodic monitoring and repair as part of long-term system operations.

Section 6.4.2, page 6-50: The first full paragraph (last paragraph of Measure 5.3.7-2 (Controlled Releases to Recharge Groundwater in Streamside Meadows and Other Alluvial Deposits) is revised as follows for clarification. There are no revisions to the footnote in this paragraph, so it is not included here but it should be retained as part of the text.

> As part of this measure the SFPUC will gather baseline data regarding the extent, species composition and condition of the existing meadow vegetation within the Poopenaut Valley. Some of these environmental baseline data may be available as a result of current study efforts in the Poopenaut Valley. As needed, the SFPUC will augment this information by carrying out vegetation composition surveys in the meadow before implementing the WSIP and at 5 year intervals after WSIP implementation to assess the efficacy of mitigation releases in maintaining or improving the percentage cover of meadow species as described by Ratliff (1985). The basic methodology for baseline vegetation survey and subsequent mitigation monitoring will be generally accepted quantitative vegetation sampling methods to permit statistical comparison of vegetation composition over time, as well as mapping the meadow vegetation in the Poopenaut Valley. The SFPUC will retain the services of a qualified biologist to assist in shaping the releases from Hetch Hetchy Reservoir in consideration of baseline and future meadow vegetation data. If a significant decline in the extent or diversity of native meadow vegetation occurs, releases will be modified as needed to achieve the mitigating effect of sustaining the existing meadow communities.

Section 6.4.3, pages 6-52 and 6-53: Measure 5.4.5-3a is revised as follows to reflect the change in project description of the Calaveras Dam (SV-2) project. The first sentence of the first paragraph as well as the last sentence of the fourth paragraph is revised as follows in response to comments (see **Response S_CDFG2-13, Response CDFG2-15** and **Section 14.9, Master response on Alameda Creek Fishery Issues**).

Minimum Flows for Resident Trout on Alameda Creek

Measure 5.4.5-3a: The SFPUC shall develop and carry out as part of the implementation of the Calaveras Dam Replacement (SV-2) project, an operational plan to implement minimum ~~stream~~ bypass flows when precipitation generates runoff into the creek below the diversion dam to the Calaveras Creek confluence from December 1 through April 30 to support ~~resident trout~~ spawning and egg incubation for resident trout as well as breeding habitat for other native stream-dependent amphibians. This is the period when winter precipitation typically would produce flows for spawning and egg incubation and breeding habitat for other native stream-dependent species. The operational plan will identify the specific minimum flow requirements to support resident trout spawning and egg incubation, and a detailed monitoring plan to survey and document trout spawning and egg incubation and any diversion facility modifications that are needed to implement the minimum stream flows. This measure will be implemented in conjunction with the proposed bypass flows at the diversion dam to meet the 1997 CDFG MOU flow requirements.

Minimum flow requirements to support resident trout spawning and egg incubation vary depending on stream reach conditions. Although site-specific studies are needed to determine an appropriate minimum flow requirement for each specific creek reach, based on the general size and characteristics of the Alameda Creek channel immediately downstream of the diversion structure it has been suggested that a minimum flow on the order of 10 cfs may be needed to support trout spawning and egg incubation. The SFPUC's Natural Resources Division will complete the site-specific studies needed to determine the appropriate minimum stream flow for this reach of the creek; studies may show that the minimum flow requirement is more or less than 10 cfs. This minimum flow requirement would be met when precipitation would naturally generate runoff in the creek (below the diversion dam) under unimpaired conditions between December 1 and April 30. When precipitation generates runoff in the creek, the SFPUC shall provide for bypass of flow up to the required minimum flow amount. The operational plan will allow for adapting minimum flow amounts to support resident trout spawning and egg incubation and other native stream-dependent species based on the monitoring results and best available scientific information.

The monitoring plan will be provided to appropriate resource agencies for review and comment and will subsequently be implemented by the SFPUC's Natural Resources Division staff. Monitoring results shall be provided to the resource agencies as requested. Monitoring shall occur for a minimum of five years and a maximum of ten years following completion of the Calaveras Dam Replacement project. At the completion of the monitoring period the SFPUC shall produce a draft comprehensive report describing the methods, data collected, and results used to assess the performance of the minimum streamflow in providing suitable habitat for resident trout spawning and egg incubation.

The Alameda Creek Fisheries Restoration Workgroup is currently overseeing collaborative studies to better characterize the flow-habitat relationships for trout spawning within Alameda Creek, and the SFPUC is providing staff and funding to support this effort. Information from these studies will also be used in developing the specific range of minimum stream flows needed to support suitable habitat within the reach below the diversion dam to the Calaveras Creek confluence. ~~Identification of any SFPUC facilities modifications needed to allow the designated minimum flow to pass downstream of the diversion dam will be described and evaluated as necessary in the project-level EIR for the Calaveras Dam Replacement project (SV-2).~~

This measure addresses two areas of impact to the resident trout fishery in Alameda Creek below the diversion dam. First, it addresses the decrease in flow below the diversion dam that would occur under the WSIP as a result of re-instituting flow diversions to Calaveras Reservoir once the dam is replaced (WSIP Project SV-2) and current DSOD storage capacity restrictions are removed. Second, it addresses the loss of fish from the lower creek system that would result from fish entrainment through the unscreened diversion tunnel to Calaveras Reservoir. Providing for minimum stream flows in Alameda Creek below the diversion dam, as required by the mitigation measure, would support resident trout spawning and egg incubation and it is expected that this measure would be sufficient to sustain the trout population in this reach of the creek. This would fully address/mitigate for both areas of WSIP impact to the resident trout fishery below the diversion dam. If monitoring indicates that this measure is adequate to sustain the resident trout population below the diversion dam, then no additional mitigation action would be required. If monitoring indicates that this measure does not sustain the resident trout fishery in this reach, then the SFPUC shall either modify the minimum stream flow to enhance downstream habitat conditions to fully meet the mitigation requirement or also implement Measure 5.4.5-3b Diversion Restrictions or Fish Screens.

Section 6.4.3, page 6-55: The first sentence of the second full paragraph is revised as follows in response to a comment (see **Response L_EBRPD-25**).

One alternative for implementing such habitat compensation is the Habitat Reserve Program (HRP) currently being developed by the SFPUC. The purpose of the HRP is to provide a comprehensive, coordinated approach to mitigation and related regulatory compliance for WSIP projects and operations. This related SFPUC project is described further in Chapter 3.0, Section ~~3.11~~ 3.12.3.

Section 6.4.4, page 6-56: Under the heading "Surface Water Quality," Measure 5.5.3-2 is replaced with Measure 5.5.3-2a and Measure 5.5.3-2b below as substitute mitigation for the Revised Operations Plan for Pilarcitos Watershed Facilities, which, upon subsequent analysis, was determined to be technically challenging and was replaced with more practical measures.

~~Revised Operations Plan for Pilarcitos Watershed Facilities~~

~~**Measure 5.5.3-2:** The SFPUC will develop an operations plan for Pilarcitos Reservoir, Stone Dam, and associated diversions that would manage storage in Pilarcitos Reservoir and releases to Pilarcitos Creek so that flows in Pilarcitos Creek between Pilarcitos Reservoir and Stone Dam would be similar to those that occur under the existing condition. This could be achieved by supplying Coastside CWD's increased future purchase request from Crystal Springs Reservoir in a pattern of diversion that would allow Pilarcitos Reservoir to be operated in a manner that approximates historical operations. Because, with this mitigation measure in place, storage in Pilarcitos Reservoir would be similar with the~~

~~WSIP and under existing conditions, spills at Stone Dam with the WSIP and under existing conditions would also be similar.~~

Low-head Pumping Station at Pilarcitos Reservoir

Measure 5.5.3-2a: The SFPUC shall install a permanent low-head pumping station at Pilarcitos Reservoir which would enable the SFPUC to access and use an additional 350 acre-feet of water from Pilarcitos Reservoir. In years when the WSIP would cause releases from Pilarcitos Reservoir to Pilarcitos Creek to be reduced to reservoir inflow earlier in the summer than under the existing condition (about 25 percent of years in the hydrologic record), the SFPUC will use the pumping station to augment flow in Pilarcitos Creek with water from the reservoir. The pumping station will draw water from the cool pool of water below the thermocline during times when the reservoir is stratified. The pumping station outlet will be designed to ensure that water discharged to the creek is adequately aerated.

Aeration System at Pilarcitos Reservoir

Measure 5.5.3-2b: The SFPUC shall install a permanent aeration system at Pilarcitos Reservoir. The SFPUC will operate the aeration system as necessary to avoid anoxic conditions and maintain good water quality conditions at the reservoir.

Section 6.4.4, page 6-56: Under the heading "Fisheries," Measure 5.5.5-5 is inserted as substitute mitigation for Measure 5.5.3-2, Revised Operations Plan for Pilarcitos Watershed Facilities, which was previously intended to provide mitigation for Impact 5.5.5-5, but, upon subsequent analysis, was determined to be technically challenging and was replaced with more practical measures.

Establish Flow Criteria, Monitor and Augment Flow

Measure 5.5.5-5: The SFPUC shall develop a monitoring and operations plan for Stone Dam to ensure WSIP-related flow reductions downstream of Stone Dam do not impair steelhead passage and spawning during the winter months of normal and wetter hydrologic years. This operational plan will provide for minimum stream flows to support existing adult steelhead passage and spawning downstream of Stone Dam, in the reach between Stone Dam and the confluence with the tributary at Albert Canyon, approximately 3.5 miles downstream. Downstream of Albert Canyon, WSIP flow reductions are unlikely to cause a significant impact to steelhead migration and spawning due to contributing flows from numerous downstream tributaries being sufficient to maintain adult upstream passage and spawning conditions within the creek. Monitoring and implementation of the operational plan will occur when precipitation generates runoff into Pilarcitos Creek below Stone Dam from December 1 through April 30 of normal and wetter years. This monitoring and operations plan will be established within five years of the approval of the PEIR.

Specific instream flows needed to support anadromous steelhead downstream of Stone Dam have not yet been identified. Suitable instream flows for steelhead passage on Pilarcitos Creek may be defined as providing a water depth of at least 0.6 feet over 25 percent of the total wetted channel cross-sectional area with 10 percent being contiguous. In cooperation with CDFG and NMFS, the SFPUC will identify up to five critical riffles, downstream of Stone Dam and upstream of Albert Canyon that may cause a passage impediment/barrier to steelhead migration at reduced flows as defined by the water depth criterion above. Such habitat types will be selected for survey because they represent the shallowest habitat type and thus would most likely represent low flow passage barriers under WSIP-related reduced flow scenarios. This monitoring plan will survey and document the critical riffles identified to determine physical conditions (e.g., depth, velocity, and top width of the channel) present at various flow levels. The SFPUC will measure the stage-discharge relationship at each of the five critical riffles and identify the minimum stream flow that meets the steelhead passage criterion at the most restrictive of the five riffle locations.

The SFPUC will calibrate and validate the flow measurements made at the existing flow monitoring gage (USGS Gage 11162620) located immediately downstream of Stone Dam. The SFPUC will then develop a statistical relationship between the flow measurements at the existing gage and the flow at the most restrictive critical riffle downstream of Stone Dam to establish minimum average daily flows necessary to meet steelhead passage criterion. The SFPUC will monitor average daily flows at the stream flow gage during the period from December 1 through April 30 each year. If average daily flow, as measured at the gage, indicates that the minimum stream flow at the downstream critical riffle is not met, the SFPUC will release bypass flows from Stone Dam at a rate sufficient to meet the minimum stream flow for steelhead passage at a release rate up to, but not exceeding, the average daily inflow into Pilarcitos Reservoir as determined by SFPUC operators.

The SFPUC's Natural Resources Division will complete the site-specific studies needed to determine the appropriate minimum stream flow for the most restrictive critical riffle identified during monitoring. This minimum flow criterion will be met when WSIP diversions occur between December 1 and April 30 of normal and wetter hydrologic years. The operational plan will allow for adapting minimum flow amounts to support steelhead migration based on the monitoring results and best available scientific information. Monitoring and flow management will be continued for a minimum period of five years and a maximum period of ten years, at which time the SFPUC will prepare a technical report describing results of the stream flow monitoring, identifying whether or not operation of Stone Dam reduced passage flows below the minimum criteria, and identifying, if needed, an appropriate bypass flow for future operations at Stone Dam (a minimum flow below which water could not be diverted to storage between December and April 30). The technical report will be provided to CDFG and NMFS.

Section 6.4.4, page 6-57: Under the heading "Terrestrial Biological Resources," Measure 5.5.3-2c is inserted to mitigate impacts on terrestrial biological resources associated with implementation of the replacement Measure 5.5.3-2a, Low-head Pumping Station at Pilarcitos Reservoir.

Habitat Monitoring and Compensation

Measure 5.5.3-2c The SFPUC shall compensate for reduced productivity and diversity of San Francisco garter snake (SFGS) and California red-legged frog (CRLF) wetland habitat which could occur as a result of greater variability, extent and duration in drawdowns at Pilarcitos Reservoir as a result of implementation of Revised Measure 5.5.3-2a (Low-head Pumping Station at Pilarcitos Reservoir). To offset the potential loss of habitat quality, the SFPUC will develop an adaptive management plan for managing and maintaining freshwater marsh and other wetlands around the periphery of Pilarcitos Reservoir. This adaptive management plan would include pre- implementation monitoring and post-implementation monitoring for up to 10 years to ensure that habitat is sustained at Pilarcitos Reservoir, to achieve no net loss of habitat and value for SFGS and CRLF habitat and document changes (if any) in extent or quality of the habitat attributable to operation of the low-head pumping station.

In the event that habitat is reduced, one alternative for implementing such habitat compensation is the Habitat Reserve Program (HRP) currently being developed by the SFPUC. The purpose of the HRP is to provide a comprehensive, coordinated approach to mitigation and related regulatory compliance for WSIP projects and operations. The HRP is described further in the Draft PEIR, Chapter 3.0, Section 3.12.3. Under the proposed HRP, the SFPUC would proceed as soon as possible with identifying, securing (through designation, management agreement, conservation easement, or acquisition of fee title) and improving lands to be used for habitat compensation so that mitigation is underway concurrent with habitat loss related to WSIP program activities, further ensuring no net loss of resources. The proposed HRP is undergoing CEQA environmental review in 2008 and 2009 and is targeted for implementation as soon as possible thereafter. Once the HRP is approved and implemented, the SFPUC will use this as one vehicle or method for implementing the mitigation requirements for WSIP-related activities. Otherwise, where appropriate and necessary, the SFPUC will develop and implement appropriate habitat compensation mitigation for WSIP system operational effects on Pilarcitos Reservoir, independent of the HRP.

6.6 Summary Tables of All Impacts and Mitigation Measures

Section 6.6, page 6-85, Table 6.4: The third and fourth rows of Table 6.4 are revised as follows to correct an editorial error.

IMPACT	Alameda Creek Fishery Enhancement SV-1	Calaveras Dam Replacement SV-2	Additional 40-mgd Treated Water Supply SV-3	New Irvington Tunnel SV-4	SVWTP – Treated Water Reservoirs SV-5	San Antonia Backup Pipeline SV-6

Volume 4, Chapter 7

Section 7.1.2, page 7-7: The last complete dash is revised in response to two comments (see **Response L_Milpts-14** and **Response L_RdwdCty-08**).

– The population growth assumed in the demand projections for most (~~17~~15 of ~~20~~19) of the water customers for which comparable general plan projections are available is similar to the growth anticipated in the general plans of the cities served by them.

Section 7.2.1, page 7-10, Figure 7.1: This revision is the same as that described above under Vol. 1, Chapter 3, Section 3.3, page 3-6, Figure 3.2.

Section 7.3.1, page 7-21, Table 7.5: Table 7.5 is revised as shown below to correct an editorial error.

TABLE 7.5
EMPLOYMENT AND POPULATION PROJECTIONS USED FOR WATER DEMAND ESTIMATES: SUMMARY BY COUNTY[a]

	Employment			Population		
	2001	2030	% change	2001	2030	% change
Wholesale Customers						
Alameda County	238,565	335,701	41%	456,962	542,688	19%
Santa Clara County	501,186	635,809	27%	466,452	580,391	24%
San Mateo County[b]	394,346	517,056	31%	703,185	814,904	16%
Total Wholesale Customers	1,134,097	1,488,566	31~~21~~%	1,626,599	1,937,983	19%
Retail Customers						
San Francisco (City and County)[c]	638,840	795,400	25%	760,075	849,942	12%
Total	1,772,937	2,283,966	29%	2,386,674	2,787,925	17%

Section 7.3.3, page 7-27: The second sentence of the first paragraph and the footnotes for that sentence are revised as follows in response to a comment (see **Response L_RdwdCty-08**).

The general plans of ~~22~~21 cities that are served in whole or part by SFPUC and its wholesale customers have population projections that are generally comparable to the water customer-selected population projections.[19, 20]

[19] ….The ~~22~~21 cities, served by ~~20~~19 water customers, represent approximately two-thirds of 32 cities served by the SFPUC regional system.

[20] The ~~22~~21 cities are served by ~~19~~18 wholesale customers and the SFPUC (for the retail service area), referred to collectively here as ~~20~~19 water customers.

Section 7.3.3, page 7-27: The first bullet item is revised as follows in response to a comment (see **Response L_Milpts-14**).

- The population projections used for ~~three~~ two of the wholesale customers (East Palo Alto~~,~~ ~~Milpitas,~~ and Sunnyvale) in the water demand studies are less than (from 2 to 6 percent less) the projections assumed in the general plans of the jurisdictions served by them.

Section 7.3.3, page 7-27: The second bullet item is revised as follows in response to a comment (see **Response L_RdwdCty-08**).

- The population projections assumed for ~~14~~13 of the water customers (ACWD, CWS-South San Francisco in combination with Westborough Water District, Daly City, Hayward, Hillsborough, Mid-Peninsula Water District, Millbrae, Mountain View, Palo Alto, ~~Redwood City,~~ San Bruno, San Francisco, and Santa Clara) are higher but within 1 to 10 percent of the projections presented in the respective general plans.

Section 7.3.3, page 7-28, Table 7.8: Table 7.8 is revised on the following page in response to two comments (see **Response L_Milpts-14** and **Response L_RdwdCty-08**). In addition, the table heading is revised to correct an editorial error.

Section 7.3.3, page 7-29: The first two bulleted items are revised in response to a comment (see **Response L_Milpts-14**).

- The population projections assumed by ~~three~~four of the water customers (Burlingame, Coastside County Water District, ~~and~~ Estero Municipal Improvement District, and Milpitas) appear to be more than 10 percent greater than the projections assumed in the respective general plans. The difference in these projections results from the longer 2030 planning horizon used for water planning and differences in the geographic area covered by the two sets of projections. Based on the difference in projections, however, the growth assumed in the demand models of these wholesale customers does not appear to be fully addressed in the general plans of the cities served by these customers.

- Two of the ~~three~~four customers assuming greater population growth than is reflected in the respective general plan also show somewhat greater growth than is forecasted in *Projections 2005*. Both of these customers (Burlingame and Estero MID) serve unincorporated areas outside the city's jurisdictional boundaries and ABAG subregional areas. In addition, Estero MID serves a non-segrable part of the city of San Mateo that is not included with the *Projections 2005* forecast for Foster City used in this comparison. The other customer (Coastside County Water District) assumes less growth than is forecasted in *Projections 2005* for 2030.

Section 7.3.6, page 7-50: The first full paragraph is revised as follows in response to a comment (see **Response L_Milpts-14**).

The customer-selected population projection used for Milpitas in the demand study is ~~generally consistent with~~ approximately 15 percent greater than the growth identified in the city's general plan and is generally consistent with (about 3 percent less than) the growth projected by ABAG. ~~The 2030 Milpitas population presented in the demand study is~~

TABLE 7.8
COMPARISION OF WATER DEMAND POPULATION ESTIMATES AND GENERAL PLAN POPULATION ESTIMATES

Customer	UWMP Population in 2030	*Projections 2005* Population in 2030	Water Customer-Selected Population Projection for 2030	General Plan Population Projection for General Plan Projection Year[a]	General Plan Projection Year[a]	Difference: Water Customer Population and General Plan Population	% Difference (Water Customer Population and General Plan Population)

City of Milpitas[~~b~~ i]	91,400	91,400	88,841	94,400	2020	5,559	-5.9%
Coastside County Water District[j]	24,973	27,100	24,973	21,065	2020	3,908	18.6%
Estero Municipal Improvement District (MID)[j,k]	40,866	32,500	40,096	30,803	2010	9,293	30.2%

NOTE: Most wholesale customer service areas are not contiguous with city limits (or with the city and its planning area), and therefore the population projections from the jurisdictions' general plans and ABAG should be considered as general comparisons only. The following are not included, because the water service area and jurisdictional boundaries are not comparable or the general plan of the corresponding jurisdiction does not provide a comparable population projection: Brisbane, CWS–Bear Gulch, CWS–Mid-Peninsula, Menlo Park, North Coast County Water District, Purissima Hills Water District, Redwood City, San Jose North, Skyline County Water District, and Stanford University.

a The general plan population projection and projection year are the most distant population projection and the year of the most distant population projection available in the general plan or general plan element.

~~b The general plan population is based on the population shown in the general plan (77,100) plus the additional population accommodated by the Milpitas Midtown Specific Plan, as advised by Milpitas Planning Department staff (Carrington, 2006), to account for 5,000 additional units with an assumed density of 3.46 persons per unit (i.e., an added population of 17,300). The City has amended to general plan to incorporate the specific plan.~~

b~~c~~ The service area of Sunnyvale's water district is contiguous with the city limits; however, another water utility (CWS) serves several small areas within the city.

c~~d~~ CWS = California Water Service Company.

d~~e~~ CWS–South San Francisco serves South San Francisco, Colma, a small portion of Daly City, and the unincorporated area of Broadmoor. The water customer estimate for the Westborough Water District is from the district's Urban Water Management Plan. The general plan figure is the combined total projected population in the South San Francisco and Colma general plans (67,400 and 1,285 respectively); the general plan projection year shown (2020) is for South San Francisco, the projection year for Colma is 2005. The *Projections 2005* figure is for South San Francisco and Colma (71,800 and 1,860, respectively).

e~~f~~ The Mid-Peninsula Water District serves Belmont, portions of San Carlos, and unincorporated areas of San Mateo County. The general plan figure is for the city of Belmont, from the 2002 housing element.

f~~g~~ The San Bruno UWMP (City of San Bruno, 2007) shows two population projections for 2030: 50,700, based on ABAG's *Projections 2005*, and 48,229, based on the City's Adjusted Draft General Plan.

g~~h~~ UWMP and *Projections 2005* figures are for household population, since the customer-selected figure is for household population.

h~~i~~ Burlingame's water system also serves portions of unincorporated Burlingame and a few properties in the city of San Mateo and town of Hillsborough.

i The general plan population is based on the 2002 Milpitas general Plan.

j The general plan figure is for the city of Half Moon Bay only, from the 1993 Half Moon Bay Local Coastal Program Land Use Plan (Table 9.3, Chapter 9, page 189). In addition to incorporated Half Moon Bay, the Coastside County Water District serves unincorporated areas of Half Moon Bay and the unincorporated communities of El Granada, Miramar, and Princeton by the Sea.

k Estero MID serves Foster City and a portion of the city of San Mateo. The general plan figure is for Foster City.

> ~~approximately 6 percent less than that cited in the city's general plan, as amended by the Midtown Milpitas Specific Plan, and projected by ABAG.~~ <u>The City of Milpitas is currently preparing a Transit Area Specific Plan that is expected, upon adoption, to result in a buildout population of 95,014, somewhat greater than the population projection used in the demand study (Williams, 2007).</u>

Section 7.3.6, page 7-52: The third sentence of the fourth paragraph is revised as follows in response to a comment (see **Response L_PHWD1-09**).

> In 2001, the Purissima Hills Water District served 6,032—or 64 percent—of the approximately ~~94,555~~ <u>9,455</u> residences estimated for the town and its sphere of influence in 2000.

Section 7.3.6, p. 7-53: The third full paragraph is revised as follows in response to a comment (see **Response L_RdwdCty-08**).

> The customer-selected population projection used for Redwood City in the demand study is ~~generally consistent with the buildout population identified in the city's general plan (which has a 2020 planning horizon), and~~ 24 percent lower than ABAG's 2030 population projection of 122,300 for the city and its sphere of influence. The 2030 Redwood City population used in the demand study is approximately 7 percent more than the 2020 projection shown in the city's Downtown Precise Plan ~~(a recent amendment of the general plan)~~, which cites ABAG's *Projections 2005* forecast for 2020 for the city within its jurisdictional boundary. The city's water service area includes only a portion of the city's sphere of influence (Bonte, 2006), which probably accounts for the difference between the ABAG projection for the city and its sphere of influence and that assumed in the demand study. ABAG's 2030 projection of 94,300 for Redwood City within the city limits only is within 1 percent of the demand study projection. <u>Because the population projection included in the city's 1990 general plan is for 2000 (earlier than 2005), it is not considered comparable to the 2030 WSIP population projection for this analysis. According to the city, the 2003 UWMP was selected for use in the demand study because the UWMP contained the most current population and employment projections at the time.</u>

Section 7.4.1, page 7-62: The second to the last bullet is revised as follows in response to a comment (see **Response L_PHWD1-11**).

- Town of Los Altos Hills General Plan (1975), General Plan Path Element (1996), 2002 Housing Element (2002), Circulation Element (1999), Land Use <u>Element (n.d.) and</u> Open Space~~,~~ and Recreation Element~~s~~ ~~(n.d.)~~ <u>(2007).</u>

Volume 4, Chapter 8

Section 8.1, pages 8-1 and 8-2: The first and second paragraphs are revised as follows to reflect project sponsor requested revisions subsequent to the publication of the Draft PEIR.

The San Francisco Public Utilities Commission (SFPUC) has requested that this Program Environmental Impact Report (PEIR) include environmental analysis of three variants to the Water System Improvement Program (WSIP or proposed program). The WSIP variants are variations of the proposed program which are designed to meet or exceed all WSIP goals and objectives but differ with respect to water supply source or drought-year level of service. The variants are not necessarily intended to be alternatives to the proposed program that would lessen or avoid environmental impacts as required by the California Environmental Quality Act (CEQA); the CEQA alternatives are described and analyzed in Chapter 9.

Subsequent to the publication of the Draft PEIR, the SFPUC requested that the PEIR address a fourth variant. Please refer to Chapter 13 (Vol. 7) of the PEIR, Section 13.4 for a description and analysis of the fourth variant, the *Phased WSIP Variant.*

This chapter describes and analyzes the potential environmental effects of three WSIP variants: *WSIP Variant 1 – All Tuolumne*; *WSIP Variant 2 – Regional Desalination for*

> *Drought*; and *WSIP Variant 3 – 10% Rationing*. The variants include the same fundamental facility components and operation/maintenance plan as the proposed WSIP. The major difference between the variants and the proposed program is either in the proposed source(s) of water supply or in the drought-year rationing level of service.

Section 8.5, page 8-59, Table 8.6: The last two rows in Table 8.6 are revised as shown on the following page to reflect the change in project description of the Calaveras Dam (SV-2) project.

Section 8.5, pages 8-61, 8-62, and 8-65, Table 8.7: The impact descriptions for Impacts 5.5.3-2, 5.5.5-4, and 5.5.6-4 as well as the impact conclusion for Impact 5.5.6-5 are revised as shown on pages 16-109 to 16-110 to refine the surface water quality and biological resources analyses in the Pilarcitos Watershed as determined from the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

Volume 4, Chapter 9

Section 9.2.1, page 9-19: Table 9.8 is revised as shown on page 16-111 to reflect the change in project description of the Calaveras Dam (SV-2) project.

Section 9.2.1, pages 9-20 and 9-21, Table 9.9: The impact descriptions for Impacts 5.5.3-2, 5.5.5-4, and 5.5.6-4 as well as the impact conclusions for Impact 5.5.6-5, Sensitive habitats, are revised as shown on page 16-112 to refine the biological resources analysis in the Pilarcitos Watershed as determined from the updated modeling results conducted in 2008, as discussed in Chapter 13, Section 13.3.

Section 9.2.8, page 9-78: The following footnote is added to the first sentence of the first paragraph under the heading "9.2.8 Modified WSIP Alternative" in response to comments described in **Section 14.10, Master Response on Modified WSIP Alternative.**

> The Modified WSIP Alternative incorporates changes in the proposed WSIP primarily to modify the proposed water supply and system operations so as to minimize environmental effects.[11]
>
> [11] The description and analysis of the Modified WSIP Alternative has been updated in the Comment and Responses document. Please see Section **14.10, Master Response on the Modified WSIP Alternative** (Vol. 7, Chapter 14) for detailed information.

Section 9.3.1, page 9-90: The fourth sentence of the second paragraph is revised as follows in response to a comment (see **Response L_CoastsideCWD-27**).

> The SFPUC currently serves Coastside CWD ~~primarily~~ with about equal quantities of water from ~~the~~ Pilarcitos ~~Reservoir~~ Creek and Crystal Springs Reservoir.

TABLE 8.6 (Continued)
SUMMARY OF WATER SUPPLY AND SYSTEM OPERATIONS IMPACTS FOR THE WSIP VARIANTS COMPARED TO EXISTING CONDITIONS – ALAMEDA WATERSHED

Impact	Proposed Program	Variant 1 – All Tuolumne	Variant 2 – Regional Desal for Drought	Variant 3 – 10% Rationing
Impact 5.4.7-1: Effects on recreation facilities and/or activities	Under both existing and future conditions, water recreation is prohibited in SFPUC reservoirs. Thus, changes in reservoir water levels would not adversely affect recreation. Operations under the WSIP would substantially reduced flows along Alameda Creek in the Sunol Regional Wilderness during winter and early spring months and adversely affect the recreational experience of hikers; however, with the changes in project description for the Calaveras Dam Replacement (SV-2) project, bypass flows would be reduced from the diversion dam when flows are present. (~~PSM~~ LS)	Same as proposed program (~~PSM~~ LS)	Same as proposed program (~~PSM~~ LS)	Same as proposed program (~~PSM~~ LS)
Impact 5.4.7-2: Visual effects on scenic resources or visual character of water bodies	Apart from raised water levels in Calaveras Reservoir and substantial reductions in flows along Alameda Creek in the Sunol Regional Wilderness area during winter and spring months, changes in stream flow and reservoir elevations in the Alameda watershed would not be apparent to most recreational users. WSIP-induced reductions in stream flows along Alameda Creek would substantially change quality of visual resources in the Sunol Regional Wilderness area; however, with the changes in project description for the Calaveras Dam Replacement (SV-2) project, bypass flows would be reduced from the diversion dam when flows are present. (~~PSM~~ LS)	Same as proposed program (~~PSM~~ LS)	Same as proposed program (~~PSM~~ LS)	Same as proposed program (~~PSM~~ LS)

TABLE 8.7
SUMMARY OF WATER SUPPLY AND SYSTEM OPERATIONS IMPACTS FOR THE WSIP VARIANTS COMPARED TO EXISTING CONDITION – PENINSULA WATERSHED

Impact	Proposed Program	Variant 1 – All Tuolumne	Variant 2 – Regional Desalination for Drought	Variant 3 – 10% Rationing
Impact 5.5.3-2: Effects on water quality in Pilarcitos Reservoir and along Pilarcitos Creek	~~Operations under the WSIP would increase summer drawdown of Pilarcitos Reservoir and could cause the reservoir to destratify earlier in the season, which may improve water quality. However, the ability of the reservoir to support cold freshwater habitat could be reduced due to a reduced volume of cool water below thermocline.~~ Proposed operations would generally be within the same range as existing conditions although replacement Measure 5.5.3-2a would cause Pilarcitos Reservoir to be drawn down earlier in the summer compared to existing conditions. Water temperature could increase and dissolved oxygen content could be reduced. During dry years summertime releases from Pilarcitos Reservoir to Pilarcitos Creek would be eliminated or reduced to a low level for a longer period of time with the WSIP, which would increase the temperature of instream flows between Pilarcitos Creek and Stone Dam and reduce the creek's ability to support designated cold freshwater habitat along this reach. Slight reductions in spill over Stone Dam would be minor and would not adversely affect water quality along Pilarcitos Creek. (PSM)	Similar to proposed program. (PSM)	Similar to proposed program. (PSM)	Similar to proposed program. (PSM)
Impact 5.5.5-4: Effects on fisheries resources in Pilarcitos Reservoir	~~Reduction in average monthly storage~~ Proposed operations would be within the same range as existing conditions although replacement Measure 5.5.3-2a would cause Pilarcitos Reservoir to be drawn down earlier in the summer compared to existing conditions. This would reduce the volume and quality of coldwater habitat available for resident fish species. (PSM)	Similar to proposed program. (PSM)	Similar to proposed program. (PSM)	Similar to proposed program. (PSM)
Impact 5.5.6-4: Impacts on biological resources in Pilarcitos Reservoir				
• Sensitive Habitats	Reduced water elevations could slightly reduce the extent of areas supporting sensitive freshwater marsh habitat. (LS)	Similar to proposed program (LS)	Same as proposed program (LS)	Similar to proposed program (LS)

TABLE 8.7 (Continued)
SUMMARY OF WATER SUPPLY AND SYSTEM OPERATIONS IMPACTS FOR THE WSIP VARIANTS COMPARED TO EXISTING CONDITION – PENINSULA WATERSHED

Impact	Proposed Program	Variant 1 – All Tuolumne	Variant 2 – Regional Desalination for Drought	Variant 3 – 10% Rationing
• Key Special Status Species	Proposed operations would be within the same range as existing conditions, although replacement Measure 5.5.3-2a would cause Pilarcitos Reservoir to be drawn down earlier in the summer compared to existing conditions. This cwould reduce the extent of suitable habitat for California red-legged frog and San Francisco garter snake. Special status species that utilize adjacent upland vegetation would not be affected. (PSM)	Similar to proposed program (PSM)	Similar to proposed program (PSM)	Similar to proposed program (PSM)
Impact 5.5.6-5: Impacts on biological resources along Pilarcitos Creek below Pilarcitos Reservoir				
• Sensitive Habitats	In summer months of dry years, an extended period of no or little flow would stress or kill riparian vegetation. Proposed operations would result in flows within the range of historical conditions, to which sensitive habitats have adapted. (PSM LS)	Similar to proposed program (PSM LS)	Similar to proposed program (PSM LS)	Similar to proposed program (PSM LS)

TABLE 9.8
SUMMARY OF SIGNIFICANT WATER SUPPLY AND SYSTEM OPERATIONS IMPACTS FOR CEQA ALTERNATIVES – ALAMEDA WATERSHED

Impact	Proposed Program	No Program Alternative	No Purchase Request Increase Alternative	Aggressive Conservation/Water Recycling and Local Groundwater Alternative		Lower Tuolumne River Diversion Alternative	Year-round Desalination at Oceanside Alternative	Regional Desalination for Drought Alternative	Modified WSIP Alternative
				No Supplemental Tuolumne River Water	With Supplemental Tuolumne River Water				
Section 5.4.7, Recreational and Visual Resources									
Impact 5.4.7-1: Effects on recreation									
	Operations under the WSIP would substantially reduce flows along Alameda Creek in the Sunol Regional Wilderness during winter and early spring months and adversely affect the recreational experience of hikers; however, with the changes in project description for the Calaveras Dam Replacement (SV-2) project, bypass flows would be reduced from the diversion dam when flows are present. Appendix E.4 Growth Trends

Appendix E.4, page E.4-3, Table E.4.1: Table E.4.1 is revised in response to two comments as shown on page 16-120 (see **Responses L_Milpts-14** and **L_RdwdCty-08**).

Appendix E.4, p. E.4-8: The last sentence of the second paragraph is revised as follows in response to a comment (see **Response L_Milpts-14**):

> With the Midtown Milpitas Specific Plan, the city's general plan population at buildout is projected to be 77,100 ~~94,400~~ (City of Milpitas, 2002a; City of Milpitas, 2002c~~; Carrington, 2006~~).

Appendix E.4, page E.4-14: The fourth and fifth sentences of the first full paragraph on this page are revised as follows in response to a comment (see **Response L_RdwdCty-08**).

> During the 1970s and 1980s, changes in industry and housing occurred, with the craft industries of the city's early years giving way to high-technology and information-age industries (City of Redwood City, 1990). The 1990 Redwood City General Plan indicated that the city was expected to reach a population of 70,000 by the year 2000 (Redwood City, 1990, Chapter 4, p. 4-1). The EIR for the Downtown Precise Plan~~, a recent amendment of the general plan,~~ cites ABAG's *Projections 2005* forecasts for the city (not including its sphere of influence) of 87,100 in 2020.

SF-2	Groundwater Projects (Local and Regional)									Possible				X				X		
SF-3	Recycled Water Projects									Possible				X		X				

NOTES: ACOE = U.S. Army Corps of Engineers; BAAQMD = Bay Area Air Quality Management District; BCDC = San Francisco Bay Conservation and Development Commission; Caltrans = California Department of Fish and GameTransportation; CDFG = California Department of Fish and Game; CUPA = Certified Unified Program Agency; DHS = California Department of Health Services; DWR = California Department of Water Resources; EC = Early Coordination Requested; (FWCA = Fish and Wildlife Coordination Act); GGNRA = Golden Gate National Recreation Area; MOA = Memorandum of Agreement; NMFS = U.S. National Marine Fisheries Service; (NWP = National Permit for Stream and Wetland Restoration Activities); RWQCB = Regional Water Quality Control Board; SHPO = State Historic Preservation Office; SWPPP = stormwater pollution prevention plan; SWRCB = State Water Resources Control Board; TBD = To Be Determined; TS = Thomas Shaft; USFWS = U.S. Fish and Wildlife Service.

[a] Additional approvals may be identified for WSIP facility projects when separate, project-level CEQA analysis is completed.

[b] The GGNRA requests consultation during project development and advance notification of meetings and would like to assist in creating mitigations for potential impacts from these projects.

[c] Section 6327 of the Public Resources Code provides that if a facility is for the "procurement of fresh-water from and construction of drainage facilities into navigable rivers, streams, lakes and bays," and if the applicant obtains a permit from the local reclamation district, State Reclamation Board, the U.S. Army Corps of Engineers, or the Department of Water Resources, then an application shall not be required by the State Lands Commission. Since the proposed program appears to fall within this section, a lease from the Commission would not be required, provided one of the above-listed permits is obtained.

[d] As part of project-level CEQA review, Caltrans requests that each facility improvement project be reviewed to determine if it encroaches on any state facilities. Any encroachment on Caltrans right-of-way would require an encroachment permit, and CEQA-related environmental studies may be necessary (including studies related to biological resources, cultural resources, and hazardous materials). A qualified professional must conduct these studies to satisfy Caltrans's environmental review policies. Ground-disturbing activities on the site prior to completing and/or approving the required environmental documents could affect Caltrans' ability to issue a permit for the project.

[e] The USFWS and the Coastal Conservancy are interested in acquiring clean dredge material generated by this project for use in wetland restoration associated with the South Bay Salt Pond Restoration Project, particularly within the Don Edwards San Francisco Bay National Wildlife Refuge (contact Clyde Morris, Manager, 510-792-0222, ext. 25). The USFWS recommends that the SFPUC coordinate with the USFWS's Division of Endangered Species at the Sacramento Fish and Wildlife Office (916-414-6600).

TABLE C.6
PERMITS, APPROVALS, AND EARLY COORDINATION WITH OTHER AGENCIES THAT MAY BE REQUIRED (CONT'D)

Project Number	Project Name	San Mateo County Transit District	Coastal Conservancy	Association of Bay Area Governments	Local Flood Control Districts[f]	Alameda County Flood Control and Water Conservation District	Alameda County Water District[g]	East Bay Regional Park District[h]	City of Fremont[i]	City of Menlo Park	City of Palo Alto	Coastside County Water District

BD-2	BDPL Nos. 3 and 4 Crossovers				Possible						EC[n]	
BD-3	Seismic Upgrade of BDPLs Nos. 3 and 4 at Hayward Fault				Possible				EC			
PN-1	Baden and San Pedro Valve Lot Improvements											
PN-2	Crystal Springs/San Andreas Transmission Upgrade				Possible							
PN-3	HTWTP Long-Term Improvements											
PN-4	Lower Crystal Springs Dam Improvements											EC[o]
PN-5	Pulgas Balancing Reservoir Rehabilitation											
SF-1	San Andreas Pipeline No. 3 Installation				Possible							
SF-2	Groundwater Projects (Local and Regional)				Possible							
SF-3	Recycled Water Projects				Possible							

NOTE: EC = Early Coordination Requested

[f] As part of project-level CEQA review, the Alameda County Flood Control and Water Conservation District requests that each facility improvement project that includes pipelines be reviewed to determine if an encroachment permit is required where the pipelines cross the District's channels and creek inverts.

[g] The ACWD requests that the BD-1 project be coordinated with the ACWD earlier (during project planning and design phases, rather than during the construction phase) to minimize impacts associated with conflicting water facilities and potential impacts on the ACWD's ability to meet customer demands and fire flow requirements. In addition, all Sunol Valley projects (SV-1 through SV-6) will need to take into account potential effects of facility construction on downstream water intakes at ACWD's facilities in the flood control channel. The project-level CEQA review for the SV-2 project will need to consider coordination and notification related to Calaveras Reservoir release protocols that could affect downstream groundwater recharge and the potential for flooding.

[h] As part of project-level CEQA review, each facility improvement project in the Sunol Valley region should be reviewed to determine if it encroaches on EBRPD property. The EBRPD requests coordination of construction mitigation measures for certain WSIP projects in the Sunol Valley to minimize construction impacts on recreational uses and allow coordination of fire suppression planning and response (including review of traffic control plans). As part of the project-level EIR for SV-2, the EBRPD states that the SFPUC needs to coordinate the timing of water releases from Calaveras Dam to maximize benefits to amphibians and anadromous fish species.

[i] The City of Fremont requests consultation (regarding the applicability of encroachment permits, and development and review of traffic control plans) during the planning and design phases of the SV-2, BD-1, and BD-3 projects as well as any other WSIP project that could affect the Fremont transportation network.

[j] As part of the project-level CEQA review, mitigation measures should be developed to establish coordination and notification protocols between the SFPUC and the ACFCWCD regarding Calaveras Reservoir releases that could affect the potential for downstream flooding.

[k] The USFWS requests that the BD-1 project be coordinated with the Transit District's Dumbarton Rail Project to minimize habitat impacts for both projects.

[l] The Coastal Conservancy requests that the SFPUC coordinate with the Coastal Conservancy and Association of Bay Area Government's Bay Trail project (regarding completion of the Bay Trail gap through SFPUC lands).

[m] The City of Menlo Park requests coordination of construction mitigation measures for the BD-1 project to minimize construction impacts (e.g., access and parking) on local residents and businesses, including the Menlo Business Park.

[n] The City of Palo Alto requests early consultation on the BD-2 project.

[o] The Coastside CWD requests consultation during development of the adaptive management program for Crystal Springs Reservoir as part of the operations phase of the PN-4 project.

TABLE E.3.34
COMPARISON OF GENERAL PLAN POPULATION PROJECTIONS TO ABAG PROJECTIONS 2005, UWMPS, AND WATER CUSTOMER DEMAND PROJECTIONS FOR GENERAL PLAN PROJECTION YEAR

n.a. = Not available.

[a] Population shown is for the year of the most distant population projection available in the general plan, housing element, or other relevant local document (see note b). For example, populations in all columns for cities in the group titled “Cities with GP Population Projections for 2005” are populations projected for or estimated in 2005.

[b] Population estimates are from each city’s general plan (GP) or the general plan’s EIR.

[c] Estimates for years between 2001 and 2030 are derived by Mundie & Associates, based on linear interpolations of water customer projections, except for the 2020 San Francisco projection, which is included in the Retail Demand Study (Hannaford and Hydroconsult, 2004).

[d] CWS – South San Francisco District (Colma, parts of Daly City and South San Francisco, plus unincorporated areas) UWMP projection for 2020 is 64,050, and Westborough Water District (which serves part of South San Francisco) UWMP projection for 2020 is 14,150; the CWS-South San Francisco water customer projection for 2020 is 56,006 and the Westborough Water District water customer projection is the same as its UWMP projection (14,150).

TABLE E.3.34 (Continued)
COMPARISON OF GENERAL PLAN POPULATION PROJECTIONS TO ABAG PROJECTIONS 2005, UWMPS, AND WATER CUSTOMER DEMAND PROJECTIONS FOR GENERAL PLAN PROJECTION YEAR

Figures shown are for Estero MID (Foster City and part of San Mateo).

f Mid-Peninsula Water District (Belmont, part of San Carlos, and portions of unincorporated San Mateo County) UWMP projection for 2010 is 26,130; water customer projection is 26,925.

g Figures shown are for the City of Menlo Park water agency, which serves part of Menlo Park (less than half of the city's population).

h CWS – Mid-Peninsula District (parts of the cities of San Mateo and San Carlos plus unincorporated areas) UWMP projection for 2010 is 129,070; water customer projection is 126,746. Part of San Mateo is served by Estero MID.

i CWS – Bear Gulch District (Atherton, parts of Menlo Park, Portola Valley, and Woodside, plus unincorporated areas) UWMP projection for 2020 is 57,730; water customer projection for 2020 is 71,125.

j Figures shown are for City of Daly City water agency, which serves part of Daly City.

k Alameda County Water District (cities of Fremont, Newark, and Union City) projection is 358,066 in 2020.

l Based on Milpitas General Plan ~~adjusted to include 5,000 housing units added by the Midtown Milpitas Specific Plan~~.

m ~~Figure shown is for City of Redwood City water agency, which also serves part of the City of San Carlos, part of the Town of Woodside, and portions of unincorporated San Mateo County.~~ The UWMP (Table 2) reports three population projections: the draft general plan (2006), ABAG subregional (2005), and adjusted draft general plan (2001), although the draft general plan (2006) does not include a projection for 2020. The projections for 2020 are, respectively, 43,400 (based on a straight-line interpolation from projections shown for 2005 and 2025), 47,700, and 43,400.

n Figure is for Household Population in 2020 as shown in the Retail Demand Study (Hannaford and Hydroconsult, 2004)

o Purissima Water District (part of Los Altos Hills and some unincorporated areas) water customer projection is 6,763.

p Los Trancos County Water District was acquired by CWS in 2006, and is now part of the CWS – Bear Gulch District. Because it was a separate entity when these projections were prepared, it is presented separately in this analysis.

q CWS – Bear Gulch District (Atherton, parts of Menlo Park, Portola Valley, and Woodside, plus unincorporated areas) UWMP projection for 2030 is 59,220; water customer projection is 73,719 (excluding Los Trancos).

a CWS – South San Francisco District (Colma, parts of Daly City and South San Francisco, plus unincorporated areas) UWMP projection for 2030 is 60,150; water customer projection for 2030 is 59,584.
b Estero MID (Foster City and part of San Mateo) projection for 2030 is 40,096.
c Mid-Peninsula Water District (Belmont, part of San Carlos, and portions of unincorporated San Mateo County) UWMP projection for 2030 is 28,930; water customer projection is 27,997.
d Figure shown is for the City of Burlingame Water Agency, which also serves some unincorporated area.
e Figure shown is for the portion of Menlo Park (less than half of the city's population) served by the City of Menlo Park Water Agency.
f CWS – Bear Gulch District (Atherton, parts of Menlo Park, Portola Valley, and Woodside, plus unincorporated areas) projection for 2030 is 73,719; UWMP population projection is 59,220 in 2030.
g Figure shown is for the City of Mountain View Water Agency, which serves most of Mountain View.
h CWS – Mid-Peninsula District (parts of the cities of San Mateo and San Carlos plus unincorporated areas) water customer population projection for 2030 is 139,834; UWMP population projection for 2030 is 134,010.
i The Housing Element of the Daly City General Plan projects this population within the city limits and a population of 120,000 within the (planning) area that corresponds to the ABAG subregional study area.
j Figure shown is for the portion of Daly City served by the City of Daly City Water Agency.
k Parts of Daly City and South San Francisco are served by CWS – South San Francisco District.
l Alameda County Water District (cities of Fremont, Newark, and Union City) projection for 2030 is 379,931.
m Figure shown is for the Coastside County Water District, which also serves unincorporated Half Moon Bay.
n Based on Milpitas General Plan~~ adjusted to include 5,000 housing units added by the Midtown Milpitas Specific Plan (Carrington, 2006)~~.
~~o~~ ~~Figure shown is for City of Redwood City Water Agency, which also serves part of the City of San Carlos, part of the Town of Woodside, and portions of unincorporated San Mateo County.~~
~~p~~o San Bruno UWMP (City of San Bruno,2007) shows two population projections for 2030: 50,700, based on ABAG's *Projections 2005*, and 48,229, based on the City's Adjusted Draft General Plan.
~~q~~p Figure shown is for the City of San Bruno Water Agency, which also serves some unincorporated areas.
~~r~~q Figures shown are for the CWS – South San Francisco District plus Westborough Water District. For the Westborough Water District, the water customer projection is the same as the UWMP projection.
~~s~~r Figure shown is for the Town of Hillsborough Water Agency, which also serves some unincorporated area.
~~t~~s Purissima Hills Water District, (part of Los Altos Hills and some unincorporated area) projection is 6,763.
~~u~~t Los Trancos County Water District was acquired by CWS in 2006, and is now part of the CWS – Bear Gulch District. Because it was a separate entity when these projections were prepared, it is presented separately in this analysis.
~~v~~u Includes a portion of Portola Valley.
~~w~~v Portola Valley is served by CWS – Bear Gulch District; a portion of the city was previously served by the Los Trancos County Water District, which is now part of CWS – Bear Gulch.

[a] ACWD = Alameda County Water District; U.S. Census, ABAG, Department of Finance (DOF), and general plan figures are the combined estimates for Fremont, Newark and Union City.
[b] The Newark general plan projection shown is from the 2002 housing element. The general plan (adopted in 1992) projected a buildout population of 51,942 by the year 2007.
[c] The general plan population is based on the population shown in the general plan~~ (77,100) plus the additional population accommodated by the Milpitas Midtown Specific Plan, as advised by Milpitas Planning Department staff (Carrington, 2006), to account for 5,000 additional units with an assumed density of 3.46 persons per unit (i.e., an added population of 17,300). The City has amended to general plan to incorporate the specific plan~~.
[d] The general plan figure for Santa Clara is the average of the range projected in the general plan at buildout of 124,800 to 135,000.
[e] The SFPUC provides 100 percent of Redwood City's potable water. The remaining 8 percent of demand indicated here is met by recycled water.
[f] The city of San Mateo is served by the CWS–Mid-Peninsula District and Estero MID, both of which serve other jurisdictions as well; therefore, the 2030 population assumed by the wholesale customers is not comparable to projections for the city. The SFPUC supplies all of the CWS–Mid Peninsula District's and Estero MID's water.
[g] The customer-selected projection is the combined 2030 estimates for the CWS–South San Francisco District (which also serves Colma and a small portion of unincorporated San Mateo County), based on the 2004 demand study, and the Westborough Water District, based on the district's 2005 UWMP. The SFPUC would supply approximately 85 percent of the CWS–South San Francisco District's water supply in 2030 and 100 percent of Westborough Water District's. The other figures are for South San Francisco only.

APPENDIX J1

Public Hearing Summary

Summary of WSIP Draft PEIR Notification and Public Hearings

The San Francisco Planning Department published the Draft Program Environmental Impact Report (PEIR) on the San Francisco Public Utilities Commission's Water System Improvement Program (WSIP) on June 29, 2007. The public comment period to review the Draft PEIR began on Friday, June 29, 2007 with submittal of the Draft PEIR to the State Clearinghouse and the issuance of the Notice of Availability (NOA). The Draft PEIR and NOA included notification of the public comment period and public hearings, and announced that public meetings were to be held on September 5, 6, 18, 19, and 20 and written comments were to be accepted to be through October 1, 2007. After the public hearing on September 20, the San Francisco Planning Department scheduled an additional public hearing for October 11 and extended the official public comment period to October 15, 2007.

Notification of Release of Draft PEIR

The San Francisco Planning Department notified agencies and the public in writing regarding about the availability of the Draft PEIR and the public hearing dates and locations. The notification provided details on the comment process. The following methods of notification were used:

Mailing List. A mailing list was compiled, including over 1600 contacts for direct mail and 300 for e-mail, representing affected federal, state, regional, and local agencies; federal, state, regional, and local elected officials; regional and local interest groups; member agencies of the Bay Area Water Supply and Conservation Agency (BAWSCA); other potentially affected water and irrigation districts; SFPUC Community Advisory Committee members; information repositories; media contacts; and individuals who attended the scoping and other past meetings on the WSIP PEIR.

Draft PEIR and NOA. On June 29th, printed copies of the Draft PEIR were distributed to 70 state and local agencies, and 15 hardcopies of the Draft PEIR Summary, 15 CDs containing the full Draft PEIR, and one hardcopy of the Notice of Completion were delivered to the State Clearinghouse. Copies of the Draft PEIR or CDs of the draft document were also sent to 365 additional organizations and individuals. In addition, a Notice of Availability (NOA) of the draft document was distributed via first-class mail to the entire mailing list.

Meeting Notification. Notice of the initial five public hearings was provided to individuals and the general public through the following means:

Direct mail of the NOA and notice of public hearings

- On 6/29/07 the NOA, including notice of public hearings, was sent by first class mail to a contact list of approximately 1,627 entities (individuals or organizations).
- On 8/27/07 a post card follow up notice of the public hearings and comment period was sent by first class mail to an expanded contact list of approximately 1,751 entities.

E-mail notice of NOA

- On 6/29-30/07 an electronic NOA and notice of public hearings was emailed to a list of 818 e-mails.
- On 8/24/07 a follow-up email notice of the public hearings and public comment period was sent to an expanded e-mail list of 1,124.
- On 10/8-9/07 an additional follow-up email notice of the public hearings and public comment period was sent to the e-mail list of 1,124 noticing the extended comment period and additional public hearing.

Legal Notices

Notices of the public hearings and information on how to obtain a copy of the Draft PEIR and provide public comment were placed and run in the legal classified section of the following newspapers on the following dates:

- Modesto Bee, 6/29/07 and 7/13/07
- Sonora Union Democrat, 7/2/07
- Stockton Record, 7/3/07
- San Francisco Chronicle, 6/29/07
- San Mateo County Times 6/29/07

Display Ads

Display ads with information about the public meetings and information on how to obtain a copy of the Draft PEIR and provide public comment were placed and run in the following newspapers on the following dates:

- Modesto Bee, 8/27/07
- Sonoma Union Democrat, 8/27/07
- Stockton Record, 9/10/07
- San Mateo County Times, 9/7/07
- SF Examiner, 9/10/07

Website

The SFPUC updated the WSIP PEIR webpage on sfwater.org (http://PEIR.sfwater.org) to include the NOA and notice of public hearings, and similar information was posted on the Planning Department’s website at www.sfgov.org/site/planning/mea.

Information Repositories

Printed copies of the Draft PEIR and associated reference materials (in some cases as noted below), as well as the NOA and notice of the public hearings were posted in the following locations:

- Alameda County/City of Fremont Library (copy of Draft PEIR and associated reference materials)
- San Francisco Main Library (copy of Draft PEIR and associated reference materials)
- Stockton – San Joaquin County Public Library (copy of Draft PEIR and associated reference materials)
- City of San Mateo Main Library (copy of Draft PEIR and associated reference materials)
- San Jose – Dr. Martin Luther King, Jr. Library (copy of Draft PEIR and associated reference materials)
- Modesto Library (copy of Draft PEIR and associated reference materials)
- San Francisco Planning Department (copy of Draft PEIR only is available)
- San Francisco Public Utilities Commission, by appointment (copy of Draft PEIR and associated reference materials)
- Tuolumne County Library (copy of Draft PEIR and associated reference materials)

In addition, a copy of the Draft PEIR was posted to www.sfgov.org/planning/mea on June 29th and a link on the http:PEIR.sfwater.org Web site directed viewers to the www.sfgov.org Web site for document review. Table J-1 presents a breakdown of the categories of recipients who were on the mailing list:

TABLE J-1
NUMBER OF RECIPIENTS ON MAILING LIST FOR DRAFT PEIR AND NOA

Category	Number of Recipients of Draft PEIR	Number of Recipients of Public Hearing Notices (NOA, E-notice and/or Postcard notice)	Number of Recipients of Public Hearing Notices and Draft PEIR
Federal Agencies/Elected Officials	25	70	95
State and Regional Agencies/Elected Officials	42	118	160
Local Agencies/Elected Officials	66	566	632
Water Agencies/Irrigation Districts	85	238	323
Special Interest and Environmental Groups	79	256	335
Businesses or other Organizations	64	83	147
Media, Libraries, and Individuals	76	166	242
TOTAL	**437**[a]	**1,497**[b]	**1,934**

[a] Received either printed copy or CD
[b] Received at least one notice (printed copy NOA, email notice, or postcard notice)

Public Hearings on Draft PEIR

The San Francisco Planning Department held public hearings at five locations along or near the SFPUC's regional water system during September 2007 and one public hearing in San Francisco in October 2007. The locations and dates of the meetings, and approximate number of attendees, are noted below.

1. Sonora: Wednesday, September 5, 2007 (Sonora Opera House)

Approximately 92 attendees based on sign-in sheets, including:

- Government agencies: Tuolumne County CAO's Office, Office of Congressman George Radanovich, Tuolumne County Board of Supervisors, Tuolumne Utilities District,
- Water agencies: Turlock Irrigation District, Bay Area Water Supply and Conservation Agency (BAWSCA)
- Environmental interests: Restore Hetch Hetchy, Tuolumne River Trust, Sierra Club, Stanislaus National Forest, California Native Plant Society, Review Trust, Land Trust, Audubon, Central Sierra Environmental Resource Center
- Commercial interests: Condor Earth Tech., Arta River Trips,
- Other interests: Bramlette Consulting, RHN, CSCN, Tuolumne County Farm Bureau
- Media: Clarke Broadcasting, KVMV, Star 92.7, 93.5 KKBN
- Public Citizens

25 total speakers (21 unique speakers since some speakers spoke more than once):

- Stan Kellog, Tuolumne County Farm Bureau
- Dolores Boutin, Tuolumne River Trust, Sierra Club, Save the Bay
- Cynthia King, Tuolumne River Trust
- Fred Boutin
- Nicole Sandkulla, Bay Area Water Supply and Conservation Agency
- Bob Hackamack, Restore Hetch Hetchy
- Jerry Cadagan
- Galen Weston, Tuolumne River Trust
- Darryl Bramlette, Bramlette Consulting
- Ellie Owen
- Patricia Elliott
- Jimmy Gado
- Pete Kampa, Tuolumne Utilities District
- Jon Sturtevant
- Ron Pickup
- Doris Grinn
- Jim Grinnell
- Noah Hughes
- Robert Gelman
- Joseph Day, Tuolumne Utilities District

2. Modesto: Thursday, September 6, 2007 (Thomas Downey High School Cafeteria)

Approximately 54 attendees based on sign-in sheet, including:

- Government agencies: Tuolumne River Regional Park, Stanislaus County, Stanislaus County Department of Environmental Resources, Waterford River Park, National Resource Conservation Service (NRCS),
- Water agencies: Turlock Irrigation District, Bay Area Water Supply and Conservation Agency (BAWSCA), California Department of Water Resources, Oakdale Irrigation District, Modesto Irrigation District
- Environmental interests: Tuolumne River Trust, Sierra Club
- Commercial interests:
- Other interests: Bramlette Consulting, GUM, Kronick Moskovitz Tiedemann & Girard, the Great Valley Museum
- Media: Modesto Bee, Capitol Press, Modesto Irrigation District
- Public Citizens

9 total speakers:

- Meg Gonzalez, Tuolumne River Trust
- Nicole Sandkulla, Bay Area Water Supply and Conservation Agency
- Darryl Bramlette, Bramlette Consulting
- Noah Hughes
- Patrick Koepele, Tuolumne River Trust
- Eric Wesselman, Tuolumne River Trust
- Walt Ward, Modesto Irrigation District
- Jean Taylor
- Sandra Wilson, Sierra Club

3. Fremont: Tuesday, September 18, 2007 (Fremont Main Library)

Approximately 36 attendees based on sign-in sheet, including:

- Government agencies: Office of Assembly Member Gene Mullin, Menlo Park Planning Commission, City of Fremont Planning, City of Daly City, City of Newark
- Water agencies: Alameda County Water District
- Environmental interests: Tuolumne River Trust, Sierra Club, Alameda Creek Alliance
- Commercial interests: The Shaw Group
- Other interests: League of Women Voters, Northern California Council-Federation of Fly Fishers
- Media: No members of the media were present
- Public Citizens

8 total speakers:

- John Cant
- Dave Ellison
- Eric Wesselman, Tuolumne River Trust
- Jeff Miller, Alameda Creek Alliance
- Robert Means
- William Noren
- Kirsten Keith, Menlo Park Planning Commission
- Lech Naumovich, California Native Plant Society

4. Palo Alto: Wednesday, September 19, 2007 (Avenidas Senior Center)

Approximately 87 attendees based on sign-in sheet, including:

- Government agencies: City of Sunnyvale, City of Menlo Park, City of Palo Alto, City of Brisbane, City of Mountain View
- Water agencies: Purissima Hills Water District, Stanford Utilities, Santa Clara Valley Water District, Coastside County Water District
- Environmental interests: Tuolumne River Trust, Sierra Club, Conexions.org, Valley of Hearts Delight, Acterra, California Native Plant Society
- Commercial interests:
- Other interests: Avenidas Senior Center, Somatic Recovery, League of Women Voters
- Media: Sonora Cable Access, The Almanac
- Officials: Kelly Fergusson
- Public Citizens

18 total speakers:

- Mary Jane Marcus
- Peter Drekmeier, Tuolumne River Trust
- Ramses Madou
- Dan Dippery
- Bill Young, Sierra Club
- Richard Zimmerman, Sierra Club
- Sidney Liebes
- Daniel Seidel, Purissima Hills Water District
- Claire Elliott
- Amy Fowler, Santa Clara Valley Water District
- Amy Adams
- Elliot Margolies
- Cedric de la Beavjardiere, Valley of Hearts Delight Conexions.org
- Katherine Forrest, Commonweal Institute
- Leah Rogers
- Jeb Eddy
- Kelly Fergusson, Menlo Park
- Len Materman

5. San Francisco: Thursday, September 20, 2007 (San Francisco Planning Commission)

San Francisco Public Hearings were held as part of the San Francisco Planning Commissions regularly scheduled meetings. Therefore, attendance tracking was not available.

18 total speakers:

- John Barbey
- Steven Miller, BAWSCA
- Gwynn MacKellen, Sierra Club
- Tony Ganter, District 3 Democratic Club
- Cindy Charles , Golden West Women Fly Fishers
- Tomer Hasson
- Eric Wesselman, Tuolumne River Trust
- Jennifer Clary, Clean Water Action
- Jenna Olsen
- Johnn Rizzo, Sierra Club-San Francisco Bay Chapter
- Joan Girardot, Coalition for San Francisco Neighborhoods
- Bernie Chodeu
- Ann Clark
- Shawna Gokener
- Emeric Kalman
- Silvia Johnson
- June Bug
- Denise Dougherty

6. San Francisco: Thursday, October 11, 2007 (San Francisco Planning Commission)

San Francisco Public Hearings were held as part of the San Francisco Planning Commissions regularly scheduled meetings. Therefore, attendance tracking was not available.

3 total speakers:

- Peter Drekmeier, Tuolumne River Trust
- Art Jensen, Bay Area Water Supply and Conservation Agency
- John Rizzo, Sierra Club
